 90488 from the **-v** option written to standard error.

90489 *NLSPATH* Determine the location of messages objects and message catalogs.

#### 90490 **ASYNCHRONOUS EVENTS**

90491 Default.

#### 90492 **STDOUT**

90493 For the *compress* and *uncompress* utilities, the standard output shall be used if no *file* operands are  
 90494 specified, if a *file* operand is '-', or if the **-c** option is specified. Otherwise, the standard output  
 90495 shall not be used.

90496 The *zcat* utility shall write the decompressed data to the standard output.

#### 90497 **STDERR**

90498 The standard error shall be used only for diagnostic and prompt messages, the optional warning  
 90499 message described in DESCRIPTION, and the output from **-v**.

#### 90500 **OUTPUT FILES**

90501 When decompressing input files other than standard input, the corresponding output files shall  
 90502 contain the decompressed input data. When compressing input files other than standard input,  
 90503 the corresponding output files shall contain the compressed input data. If the selected *algo* is  
 90504 **deflate** or **gzip**, the compressed output shall be in the GZIP format described in RFC 1952. For  
 90505 other algorithms, the compressed output file format is implementation-defined and interchange  
 90506 of such files between implementations (including access via unspecified file sharing  
 90507 mechanisms) is not required by POSIX.1-2024.

#### 90508 **EXTENDED DESCRIPTION**

90509 None.

#### 90510 **EXIT STATUS**

90511 The following exit values shall be returned for *compress*:

90512 0 Successful completion.

90513 1 An error occurred.

90514 2 One or more files were not compressed because they would have increased in size (and the  
 90515 **-f** option was not specified).

90516 >2 An error occurred.

90517 The following exit values shall be returned for *uncompress* and *zcat*:

90518 0 Successful completion.

90519 >0 An error occurred.

#### 90520 **CONSEQUENCES OF ERRORS**

90521 If an error occurs while compressing or decompressing an input file other than standard input,  
 90522 the input file shall remain unmodified.

**90523 APPLICATION USAGE**

90524 The amount of compression obtained depends on the size of the input, the number of bits per  
90525 code, and the distribution of common substrings. Typically, text such as source code or English is  
90526 reduced by 50-60%. Compression is generally much better than that achieved by Huffman  
90527 coding or adaptive Huffman coding (*compact*), and takes less time to compute.

90528 Although *compress* strictly follows the default actions upon receipt of a signal or when an error  
90529 occurs, some unexpected results may occur. In some implementations it is likely that a partially  
90530 compressed file is left in place, alongside its uncompressed input file. Since the general  
90531 operation of *compress* is to delete the uncompressed file only after the *.Z* file has been  
90532 successfully filled, an application should always carefully check the exit status of *compress* before  
90533 arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

90534 In addition to trying *file* and *file.Z* when looking for a file to decompress, some implementations  
90535 of *uncompress* and *zcat* also try suffixes for other known compression algorithms if neither *file* nor  
90536 *file.Z* is found. This version of the standard allows, but does not require this behavior. Portable  
90537 applications should always specify the full pathname (including the suffix) of files to be  
90538 decompressed.

**90539 EXAMPLES**

90540 None.

**90541 RATIONALE**

90542 Earlier versions of this standard limited the number of bits used by conforming applications for  
90543 the *lzw* algorithm to 14 due to address space limitations on 16-bit architectures. Using 15 or 16 is  
90544 a much more common default when using current hardware.

90545 Earlier versions of this standard only supported LZW compression. The standard developers  
90546 noted that existing implementations added other compression utilities, such as *gzip*, and found it  
90547 desirable to support this widespread usage. Some implementations had extended the *compress*  
90548 utility to support such other schemes. The standard developers generalized this practice by the  
90549 addition of the *-m* option, even though this was not previous practice.

90550 The *uncompress -d* option is added to match undocumented existing practice of tested  
90551 implementations.

**90552 FUTURE DIRECTIONS**

90553 If this utility is directed to create a new directory entry that contains any bytes that have the  
90554 encoded value of a <newline> character, implementations are encouraged to treat this as an  
90555 error. A future version of this standard may require implementations to treat this as an error.

90556 When decompressing a file, the requirement to add *.Z* to a *file* operand if the given pathname  
90557 does not include a suffix associated with a known compression algorithm or if *file* does not exist  
90558 and does not already have a *.Z* extension is an obsolescent feature and may be removed in a  
90559 future version.

**90560 SEE ALSO**

90561 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**90562 CHANGE HISTORY**

90563 First released in Issue 4.

**90564 Issue 6**

90565 The normative text is reworded to avoid use of the term “must” for application requirements.

90566 An error case is added for systems not supporting adaptive Lempel-Ziv coding.

90567 **Issue 7**

90568 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90569 Austin Group Interpretation 1003.1-2001 #125 is applied, revising the ENVIRONMENT  
90570 VARIABLES section.

90571 **Issue 8**

90572 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
90573 filenames containing any bytes that have the encoded value of a <newline> character.

90574 Austin Group Defect 1041 is applied, combining the *compress*, *uncompress* and *zcat* pages into one  
90575 and extensively modifying most sections.

90576 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

90577 **NAME**

90578 cp — copy files

90579 **SYNOPSIS**90580 cp [-PfiP] *source\_file target\_file*90581 cp [-PfiP] *source\_file... target*90582 cp -R [-H|-L|-P] [-fiP] *source\_file... target*90583 **DESCRIPTION**

90584 The first synopsis form is denoted by two operands, neither of which are existing files of type  
 90585 directory. The *cp* utility shall copy the contents of *source\_file* (or, if *source\_file* is a file of type  
 90586 symbolic link, the contents of the file referenced by *source\_file*) to the destination path named by  
 90587 *target\_file*.

90588 The second synopsis form is denoted by two or more operands where the **-R** option is not  
 90589 specified and the first synopsis form is not applicable. It shall be an error if any *source\_file* is a file  
 90590 of type directory, if *target* does not exist, or if *target* does not name a directory. The *cp* utility shall  
 90591 copy the contents of each *source\_file* (or, if *source\_file* is a file of type symbolic link, the contents of  
 90592 the file referenced by *source\_file*) to the destination path named by the concatenation of *target*, a  
 90593 single *<slash>* character if *target* did not end in a *<slash>*, and the last component of *source\_file*.

90594 The third synopsis form is denoted by two or more operands where the **-R** option is specified.  
 90595 The *cp* utility shall copy each file in the file hierarchy rooted in each *source\_file* to a destination  
 90596 path named as follows:

- 90597 • If *target* exists and names an existing directory, the name of the corresponding destination  
 90598 path for each file in the file hierarchy shall be the concatenation of *target*, a single *<slash>*  
 90599 character if *target* did not end in a *<slash>*, and the pathname of the file relative to the  
 90600 directory containing *source\_file*.
- 90601 • If *target* does not exist and two operands are specified, the name of the corresponding  
 90602 destination path for *source\_file* shall be *target*; the name of the corresponding destination  
 90603 path for all other files in the file hierarchy shall be the concatenation of *target*, a *<slash>*  
 90604 character, and the pathname of the file relative to *source\_file*.

90605 It shall be an error if *target* does not exist and more than two operands are specified, or if *target*  
 90606 exists and does not name a directory.

90607 In the following description, the term *dest\_file* refers to the file named by the destination path.  
 90608 The term *source\_file* refers to the file that is being copied, whether specified as an operand or a  
 90609 file in a file hierarchy rooted in a *source\_file* operand. If *source\_file* is a file of type symbolic link:

- 90610 • If the **-R** option was not specified, *cp* shall take actions based on the type and contents of  
 90611 the file referenced by the symbolic link, and not by the symbolic link itself, unless the **-P**  
 90612 option was specified.
- 90613 • If the **-R** option was specified:
  - 90614 — If none of the options **-H**, **-L**, nor **-P** were specified, it is unspecified which of **-H**,  
 90615 **-L**, or **-P** will be used as a default.
  - 90616 — If the **-H** option was specified, *cp* shall take actions based on the type and contents of  
 90617 the file referenced by any symbolic link specified as a *source\_file* operand.
  - 90618 — If the **-L** option was specified, *cp* shall take actions based on the type and contents of  
 90619 the file referenced by any symbolic link specified as a *source\_file* operand or any  
 90620 symbolic links encountered during traversal of a file hierarchy.

90621 — If the **-P** option was specified, *cp* shall copy any symbolic link specified as a  
 90622 *source\_file* operand and any symbolic links encountered during traversal of a file  
 90623 hierarchy, and shall not follow any symbolic links.

90624 For each *source\_file*, the following steps shall be taken:

90625 1. If *source\_file* references the same file as *dest\_file*, *cp* may write a diagnostic message to  
 90626 standard error; it shall do nothing more with *source\_file* and shall go on to any remaining  
 90627 files.

90628 2. If *source\_file* is of type directory, the following steps shall be taken:

90629 a. If the **-R** option was not specified, *cp* shall write a diagnostic message to standard  
 90630 error, do nothing more with *source\_file*, and go on to any remaining files.

90631 b. If *source\_file* was not specified as an operand and *source\_file* is dot or dot-dot, *cp*  
 90632 shall do nothing more with *source\_file* and go on to any remaining files.

90633 c. If *dest\_file* exists and it is a file type not specified by the System Interfaces volume  
 90634 of POSIX.1-2024, the behavior is implementation-defined.

90635 d. If *dest\_file* exists and it is not of type directory, *cp* shall write a diagnostic message  
 90636 to standard error, do nothing more with *source\_file* or any files below *source\_file* in  
 90637 the file hierarchy, and go on to any remaining files.

90638 e. If the directory *dest\_file* does not exist, it shall be created with file permission bits  
 90639 set to the same value as those of *source\_file*, modified by the file creation mask of  
 90640 the user if the **-p** option was not specified, and then bitwise-inclusively OR'ed  
 90641 with S\_IRWXU. If *dest\_file* cannot be created, *cp* shall write a diagnostic message to  
 90642 standard error, do nothing more with *source\_file*, and go on to any remaining files.  
 90643 It is unspecified if *cp* attempts to copy files in the file hierarchy rooted in *source\_file*.

90644 f. The files in the directory *source\_file* shall be copied to the directory *dest\_file*, taking  
 90645 the four steps (1 to 4) listed here with the files as *source\_files*.

90646 g. If *dest\_file* was created, its file permission bits shall be changed (if necessary) to be  
 90647 the same as those of *source\_file*, modified by the file creation mask of the user if the  
 90648 **-p** option was not specified.

90649 h. The *cp* utility shall do nothing more with *source\_file* and go on to any remaining  
 90650 files.

90651 3. If *source\_file* is of type regular file, the following steps shall be taken:

90652 a. The behavior is unspecified if *dest\_file* exists and was written by a previous step.  
 90653 Otherwise, if *dest\_file* exists, the following steps shall be taken:

90654 i. If the **-i** option is in effect, the *cp* utility shall write a prompt to the standard  
 90655 error and read a line from the standard input. If the response is not  
 90656 affirmative, *cp* shall do nothing more with *source\_file* and go on to any  
 90657 remaining files.

90658 ii. A file descriptor for *dest\_file* shall be obtained by performing actions  
 90659 equivalent to the *open()* function defined in the System Interfaces volume of  
 90660 POSIX.1-2024 called using *dest\_file* as the *path* argument, and the bitwise-  
 90661 inclusive OR of O\_WRONLY and O\_TRUNC as the *oflag* argument.

90662 iii. If the attempt to obtain a file descriptor fails and the **-f** option is in effect, *cp*  
 90663 shall attempt to remove the file by performing actions equivalent to the  
 90664 *unlink()* function defined in the System Interfaces volume of POSIX.1-2024

90665 called using *dest\_file* as the *path* argument. If this attempt succeeds, *cp* shall  
90666 continue with step 3b.

90667 b. If *dest\_file* does not exist, a file descriptor shall be obtained by performing actions  
90668 equivalent to the *open()* function defined in the System Interfaces volume of  
90669 POSIX.1-2024 called using *dest\_file* as the *path* argument, and the bitwise-inclusive  
90670 OR of *O\_WRONLY* and *O\_CREAT* as the *oflag* argument. The file permission bits  
90671 of *source\_file* shall be the *mode* argument.

90672 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to  
90673 standard error, do nothing more with *source\_file*, and go on to any remaining files.

90674 d. The contents of *source\_file* shall be written to the file descriptor. Any write errors  
90675 shall cause *cp* to write a diagnostic message to standard error and continue to step  
90676 3e.

90677 e. The file descriptor shall be closed.

90678 f. The *cp* utility shall do nothing more with *source\_file*. If a write error occurred in  
90679 step 3d, it is unspecified if *cp* continues with any remaining files. If no write error  
90680 occurred in step 3d, *cp* shall go on to any remaining files.

90681 4. Otherwise, the **-R** option was specified, and the following steps shall be taken:

90682 a. The *dest\_file* shall be created with the same file type as *source\_file*.

90683 b. If *source\_file* is a file of type FIFO, the file permission bits shall be the same as those  
90684 of *source\_file*, modified by the file creation mask of the user if the **-p** option was not  
90685 specified. Otherwise, the permissions, owner ID, and group ID of *dest\_file* are  
90686 implementation-defined.

90687 If this creation fails for any reason, *cp* shall write a diagnostic message to standard  
90688 error, do nothing more with *source\_file*, and go on to any remaining files.

90689 c. If *source\_file* is a file of type symbolic link, and the options require the symbolic link  
90690 itself to be acted upon, the pathname contained in *dest\_file* shall be the same as the  
90691 pathname contained in *source\_file*.

90692 If this fails for any reason, *cp* shall write a diagnostic message to standard error, do  
90693 nothing more with *source\_file*, and go on to any remaining files.

90694 If the implementation provides additional or alternate access control mechanisms (see XBD  
90695 [Section 4.7](#), on page 97), their effect on copies of files is implementation-defined.

## 90696 OPTIONS

90697 The *cp* utility shall conform to XBD [Section 12.2](#) (on page 215).

90698 The following options shall be supported:

90699 **-f** If a file descriptor for a destination file cannot be obtained, as described in step  
90700 3.a.ii., attempt to unlink the destination file and proceed.

90701 **-H** Take actions based on the type and contents of the file referenced by any symbolic  
90702 link specified as a *source\_file* operand.

90703 **-i** Write a prompt to standard error before copying to any existing non-directory  
90704 destination file. If the response from the standard input is affirmative, the copy  
90705 shall be attempted; otherwise, it shall not.

90706	<b>-L</b>	Take actions based on the type and contents of the file referenced by any symbolic link specified as a <i>source_file</i> operand or any symbolic links encountered during traversal of a file hierarchy.
90707		
90708		
90709	<b>-P</b>	Take actions on any symbolic link specified as a <i>source_file</i> operand or any symbolic link encountered during traversal of a file hierarchy.
90710		
90711	<b>-p</b>	Duplicate the following characteristics of each source file in the corresponding destination file:
90712		
90713		1. The time of last data modification and time of last access. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.
90714		
90715		2. The user ID and group ID. If this duplication fails for any reason, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.
90716		
90717		3. The file permission bits and the S_ISUID and S_ISGID bits. Other, implementation-defined, bits may be duplicated as well. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.
90718		
90719		
90720		If the user ID or the group ID cannot be duplicated, the file permission bits S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but are not duplicated in the destination file, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.
90721		
90722		
90723		
90724		The order in which the preceding characteristics are duplicated is unspecified. The <i>dest_file</i> shall not be deleted if these characteristics cannot be preserved.
90725		
90726	<b>-R</b>	Copy file hierarchies.
90727		Specifying more than one of the mutually-exclusive options <b>-H</b> , <b>-L</b> , and <b>-P</b> shall not be considered an error. The last option specified shall determine the behavior of the utility.
90728		
90729	<b>OPERANDS</b>	
90730		The following operands shall be supported:
90731	<i>source_file</i>	A pathname of a file to be copied. If a <i>source_file</i> operand is '-', it shall refer to a file named -; implementations shall not treat it as meaning standard input.
90732		
90733	<i>target_file</i>	A pathname of an existing or nonexistent file, used for the output when a single file is copied. If a <i>target_file</i> operand is '-', it shall refer to a file named -; implementations shall not treat it as meaning standard output.
90734		
90735		
90736	<i>target</i>	A pathname of a directory to contain the copied files.
90737	<b>STDIN</b>	
90738		The standard input shall be used to read an input line in response to each prompt specified in the STDERR section. Otherwise, the standard input shall not be used.
90739		
90740	<b>INPUT FILES</b>	
90741		The input files specified as operands may be of any file type.
90742	<b>ENVIRONMENT VARIABLES</b>	
90743		The following environment variables shall affect the execution of <i>cp</i> :
90744	<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)
90745		
90746		

90747	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
90748		
90749	<i>LC_COLLATE</i>	
90750		Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements used in the extended regular expression defined for the <b>yesexpr</b> locale keyword in the <i>LC_MESSAGES</i> category.
90751		
90752		
90753	<i>LC_CTYPE</i>	
90754		Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files) and the behavior of character classes used in the extended regular expression defined for the <b>yesexpr</b> locale keyword in the <i>LC_MESSAGES</i> category.
90755		
90756		
90757		
90758	<i>LC_MESSAGES</i>	
90759		Determine the locale used to process affirmative responses, and the locale used to affect the format and contents of diagnostic messages and prompts written to standard error.
90760		
90761		
90762	XSI <i>NLSPATH</i>	Determine the location of messages objects and message catalogs.
90763	<b>ASYNCHRONOUS EVENTS</b>	
90764		Default.
90765	<b>STDOUT</b>	
90766		Not used.
90767	<b>STDERR</b>	
90768		A prompt shall be written to standard error under the conditions specified in the <i>DESCRIPTION</i> section. The prompt shall contain the destination pathname, but its format is otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic messages.
90769		
90770		
90771	<b>OUTPUT FILES</b>	
90772		The output files may be of any type.
90773	<b>EXTENDED DESCRIPTION</b>	
90774		None.
90775	<b>EXIT STATUS</b>	
90776		The following exit values shall be returned:
90777		0 All requested files (excluding files where a non-affirmative response was given to a request for confirmation) were successfully copied.
90778		
90779		>0 An error occurred.
90780	<b>CONSEQUENCES OF ERRORS</b>	
90781		If <i>cp</i> is prematurely terminated by a signal or error, files or file hierarchies may be only partially copied and files and directories may have incorrect permissions or access and modification times.
90782		
90783		

90784 **APPLICATION USAGE**

90785 The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to  
 90786 prevent users from creating programs that are set-user-ID or set-group-ID to them when copying  
 90787 files or to make set-user-ID or set-group-ID files accessible to new groups of users. For example,  
 90788 if a file is set-user-ID and the copy has a different group ID than the source, a new group of users  
 90789 has execute permission to a set-user-ID program than did previously. In particular, this is a  
 90790 problem for superusers copying users' trees.

90791 **EXAMPLES**

90792 None.

90793 **RATIONALE**

90794 The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally  
 90795 removing files when copying. Although the 4.3 BSD version does not prompt if the standard  
 90796 input is not a terminal, the standard developers decided that use of `-i` is a request for  
 90797 interaction, so when the destination path exists, the utility takes instructions from whatever  
 90798 responds on standard input.

90799 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 90800 contents of prompts are specified because implementations may desire more descriptive  
 90801 prompts than those used on historical implementations. Therefore, an application using the `-i`  
 90802 option relies on the system to provide the most suitable dialog directly with the user, based on  
 90803 the behavior specified.

90804 The `-p` option is historical practice on BSD systems, duplicating the time of last data  
 90805 modification and time of last access. This volume of POSIX.1-2024 extends it to preserve the user  
 90806 and group IDs, as well as the file permissions. This requirement has obvious problems in that  
 90807 the directories are almost certainly modified after being copied. This volume of POSIX.1-2024  
 90808 requires that the modification times be preserved. The statement that the order in which the  
 90809 characteristics are duplicated is unspecified is to permit implementations to provide the  
 90810 maximum amount of security for the user. Implementations should take into account the  
 90811 obvious security issues involved in setting the owner, group, and mode in the wrong order or  
 90812 creating files with an owner, group, or mode different from the final value.

90813 It is unspecified whether `cp` writes diagnostic messages when the user and group IDs cannot be  
 90814 set due to the widespread practice of users using `-p` to duplicate some portion of the file  
 90815 characteristics, indifferent to the duplication of others. Historic implementations only write  
 90816 diagnostic messages on errors other than [EPERM].

90817 Earlier versions of this standard included support for the `-r` option to copy file hierarchies. The  
 90818 `-r` option is historical practice on BSD and BSD-derived systems. This option is no longer  
 90819 specified by POSIX.1-2024 but may be present in some implementations. The `-R` option was  
 90820 added as a close synonym to the `-r` option, selected for consistency with all other options in this  
 90821 volume of POSIX.1-2024 that do recursive directory descent.

90822 The difference between `-R` and the removed `-r` option is in the treatment by `cp` of file types other  
 90823 than regular and directory. It was implementation-defined how the `-` option treated special files  
 90824 to allow both historical implementations and those that chose to support `-r` with the same  
 90825 abilities as `-R` defined by this volume of POSIX.1-2024. The original `-r` flag, for historic reasons,  
 90826 did not handle special files any differently from regular files, but always read the file and copied  
 90827 its contents. This had obvious problems in the presence of special file types; for example,  
 90828 character devices, FIFOs, and sockets.

90829 When a failure occurs during the copying of a file hierarchy, `cp` is required to attempt to copy  
 90830 files that are on the same level in the hierarchy or above the file where the failure occurred. It is  
 90831 unspecified if `cp` shall attempt to copy files below the file where the failure occurred (which

90832 cannot succeed in any case).

90833 Permissions, owners, and groups of created special file types have been deliberately left as  
90834 implementation-defined. This is to allow systems to satisfy special requirements (for example,  
90835 allowing users to create character special devices, but requiring them to be owned by a certain  
90836 group). In general, it is strongly suggested that the permissions, owner, and group be the same  
90837 as if the user had run the historical *mknod*, *ln*, or other utility to create the file. It is also probable  
90838 that additional privileges are required to create block, character, or other implementation-  
90839 defined special file types.

90840 Additionally, the `-p` option explicitly requires that all set-user-ID and set-group-ID permissions  
90841 be discarded if any of the owner or group IDs cannot be set. This is to keep users from  
90842 unintentionally giving away special privilege when copying programs.

90843 When creating regular files, historical versions of *cp* use the mode of the source file as modified  
90844 by the file mode creation mask. Other choices would have been to use the mode of the source file  
90845 unmodified by the creation mask or to use the same mode as would be given to a new file  
90846 created by the user (plus the execution bits of the source file) and then modify it by the file mode  
90847 creation mask. In the absence of any strong reason to change historic practice, it was in large part  
90848 retained.

90849 When creating directories, historical versions of *cp* use the mode of the source directory, plus  
90850 read, write, and search bits for the owner, as modified by the file mode creation mask. This is  
90851 done so that *cp* can copy trees where the user has read permission, but the owner does not. A  
90852 side-effect is that if the file creation mask denies the owner permissions, *cp* fails. Also, once the  
90853 copy is done, historical versions of *cp* set the permissions on the created directory to be the same  
90854 as the source directory, unmodified by the file creation mask.

90855 This behavior has been modified so that *cp* is always able to create the contents of the directory,  
90856 regardless of the file creation mask. After the copy is done, the permissions are set to be the same  
90857 as the source directory, as modified by the file creation mask. This latter change from historical  
90858 behavior is to prevent users from accidentally creating directories with permissions beyond  
90859 those they would normally set and for consistency with the behavior of *cp* in creating files.

90860 It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations  
90861 are strongly encouraged to do so. Historical implementations have detected the attempt in most  
90862 cases.

90863 There are two methods of copying subtrees in this volume of POSIX.1-2024. The other method is  
90864 described as part of the *pax* utility (see *pax*). Both methods are historical practice. The *cp* utility  
90865 provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each  
90866 provides additional functionality to the other; in particular, *pax* maintains the hard-link structure  
90867 of the hierarchy, while *cp* does not. It is the intention of the standard developers that the results  
90868 be similar (using appropriate option combinations in both utilities). The results are not required  
90869 to be identical; there seemed insufficient gain to applications to balance the difficulty of  
90870 implementations having to guarantee that the results would be exactly identical.

90871 The wording allowing *cp* to copy a directory to implementation-defined file types not specified  
90872 by the System Interfaces volume of POSIX.1-2024 is provided so that implementations  
90873 supporting symbolic links are not required to prohibit copying directories to symbolic links.  
90874 Other extensions to the System Interfaces volume of POSIX.1-2024 file types may need to use  
90875 this loophole as well.

**90876 FUTURE DIRECTIONS**

90877 If this utility is directed to create a new directory entry that contains any bytes that have the  
90878 encoded value of a <newline> character, implementations are encouraged to treat this as an  
90879 error. A future version of this standard may require implementations to treat this as an error.

**90884 CHANGE HISTORY**

90885 First released in Issue 2.

**90886 Issue 6**

90887 The **-r** option is marked obsolescent.

90888 The new options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
90889 options affect the processing of symbolic links.

90890 IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the **-P** option.

90891 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the  
90892 SEE ALSO section.

**90893 Issue 7**

90894 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
90895 *LC\_MESSAGES* environment variable.

90896 Austin Group Interpretations 1003.1-2001 #092, #164, #165, and #168 are applied.

90897 SD5-XCU-ERN-31 and SD5-XCU-ERN-42 are applied, updating the DESCRIPTION.

90898 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90899 SD5-XCU-ERN-102 is applied, clarifying the **-i** option within the OPTIONS section.

90900 The obsolescent **-r** option is removed.

90901 The **-P** option is added to the SYNOPSIS and to the DESCRIPTION with respect to the **-R**  
90902 option.

**90903 Issue 8**

90904 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
90905 filenames containing any bytes that have the encoded value of a <newline> character.

90906 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

90907 Austin Group Defect 1732 is applied, changing the EXIT STATUS section.

90908 **NAME**

90909 crontab — schedule periodic background work

90910 **SYNOPSIS**90911 crontab [*file*]90912 UP crontab [**-e** | **-l** | **-r**]90913 **DESCRIPTION**

90914 UP The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of  
 90915 commands and the times at which they shall be executed. The new crontab entry can be input by  
 90916 UP specifying *file* or input from standard input if no *file* operand is specified, or by using an editor,  
 90917 if **-e** is specified.

90918 Upon execution of a command from a crontab entry, the implementation shall supply a default  
 90919 environment, defining at least the following environment variables:

90920 *HOME* A pathname of the user's home directory.90921 *LOGNAME* The user's login name.90922 *PATH* A string representing a search path guaranteed to find all of the standard utilities.90923 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by  
 90924 this volume of POSIX.1-2024, the value shall be a pathname for *sh*.

90925 The values of these variables when *crontab* is invoked as specified by this volume of  
 90926 POSIX.1-2024 shall not affect the default values provided when the scheduled command is run.

90927 If standard output and standard error are not redirected by commands executed from the  
 90928 crontab entry, any generated output or errors shall be mailed, via an implementation-defined  
 90929 method, to the user.

90930 XSI Users shall be permitted to use *crontab* if their names appear in the file **cron.allow** which is  
 90931 located in an implementation-defined directory. If that file does not exist, the file **cron.deny**,  
 90932 which is located in an implementation-defined directory, shall be checked to determine whether  
 90933 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate  
 90934 privileges shall be allowed to submit a job. If only **cron.deny** exists and is empty, global usage  
 90935 shall be permitted. The **cron.allow** and **cron.deny** files shall consist of one user name per line.

90936 **OPTIONS**90937 The *crontab* utility shall conform to XBD [Section 12.2](#) (on page 215).

90938 The following options shall be supported:

90939 UP **-e** Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if  
 90940 the crontab entry does not exist. When editing is complete, the entry shall be  
 90941 installed as the user's crontab entry.

90942 **-l** (The letter ell.) List the invoking user's crontab entry.90943 **-r** Remove the invoking user's crontab entry.90944 **OPERANDS**

90945 The following operand shall be supported:

90946 *file* The pathname of a file that contains specifications, in the format defined in the  
 90947 INPUT FILES section, for crontab entries.

90948 **STDIN**

90949 See the INPUT FILES section.

90950 **INPUT FILES**

90951 In the POSIX locale, the user or application shall ensure that a crontab entry is a text file  
 90952 consisting of lines of six fields each. The fields shall be separated by <blank> characters. The  
 90953 first five fields shall be integer patterns that specify the following:

- 90954 1. Minute [0,59]
- 90955 2. Hour [0,23]
- 90956 3. Day of the month [1,31]
- 90957 4. Month of the year [1,12]
- 90958 5. Day of the week ([0,6] with 0=Sunday)

90959 Each of these patterns can be either an <asterisk> (meaning all valid values), an element, or a list  
 90960 of elements separated by <comma> characters. An element shall be either a number or two  
 90961 numbers separated by a <hyphen-minus> (meaning an inclusive range). The specification of  
 90962 days can be made by two fields (day of the month and day of the week). If month, day of month,  
 90963 and day of week are all <asterisk> characters, every day shall be matched. If either the month or  
 90964 day of month is specified as an element or list, but the day of week is an <asterisk>, the month  
 90965 and day of month fields shall specify the days that match. If both month and day of month are  
 90966 specified as an <asterisk>, but day of week is an element or list, then only the specified days of  
 90967 the week match. Finally, if either the month or day of month is specified as an element or list,  
 90968 and the day of week is also specified as an element or list, then any day matching either the  
 90969 month and day of month, or the day of week, shall be matched.

90970 The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified  
 90971 times. A <percent-sign> character in this field shall be translated to a <newline>. Any character  
 90972 preceded by a <backslash> (including the '%') shall cause that character to be treated literally.  
 90973 Only the first line (up to a '%' or end-of-line) of the command field shall be executed by the  
 90974 command interpreter. The other lines shall be made available to the command as standard input.

90975 Blank lines and those whose first non-<blank> is '#' shall be ignored.

90976 XSI The text files **cron.allow** and **cron.deny**, which are located in an implementation-defined  
 90977 directory, shall contain zero or more user names, one per line, of users who are, respectively,  
 90978 authorized or denied access to the service underlying the *crontab* utility.

90979 **ENVIRONMENT VARIABLES**

90980 The following environment variables shall affect the execution of *crontab*:

90981 **EDITOR** Determine the editor to be invoked when the **-e** option is specified. The default  
 90982 editor shall be *vi*.

90983 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 90984 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 90985 variables used to determine the values of locale categories.)

90986 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 90987 internationalization variables.

90988 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 90989 characters (for example, single-byte as opposed to multi-byte characters in  
 90990 arguments and input files).

90991 *LC\_MESSAGES*  
 90992 Determine the locale that should be used to affect the format and contents of  
 90993 diagnostic messages written to standard error.

90994 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

90995 **ASYNCHRONOUS EVENTS**  
 90996 Default.

90997 **STDOUT**  
 90998 If the `-l` option is specified, the crontab entry shall be written to the standard output.

90999 **STDERR**  
 91000 The standard error shall be used only for diagnostic messages.

91001 **OUTPUT FILES**  
 91002 None.

91003 **EXTENDED DESCRIPTION**  
 91004 None.

91005 **EXIT STATUS**  
 91006 The following exit values shall be returned:  
 91007 0 Successful completion.  
 91008 >0 An error occurred.

91009 **CONSEQUENCES OF ERRORS**  
 91010 UP The user's crontab entry is not submitted, removed, `edited`, or listed.

91011 **APPLICATION USAGE**  
 91012 The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other  
 91013 cultures may be supported with substantially different interfaces, although implementations are  
 91014 encouraged to provide comparable levels of functionality.

91015 The default settings of the *HOME*, *LOGNAME*, *PATH*, and *SHELL* variables that are given to the  
 91016 scheduled job are not affected by the settings of those variables when *crontab* is run; as stated,  
 91017 they are defaults. The text about "invoked as specified by this volume of POSIX.1-2024" means  
 91018 that the implementation may provide extensions that allow these variables to be affected at  
 91019 runtime, but that the user has to take explicit action in order to access the extension, such as give  
 91020 a new option flag or modify the format of the crontab entry.

91021 A typical user error is to type only *crontab*; this causes the system to wait for the new crontab  
 91022 entry on standard input. If end-of-file is typed (generally `<control>-D`), the crontab entry is  
 91023 replaced by an empty file. In this case, the user should type the interrupt character, which  
 91024 prevents the crontab entry from being replaced.

91025 **EXAMPLES**

91026 1. Clean up files named **core** every weekday morning at 3:15 am:  
 91027 `15 3 * * 1-5 find "$HOME" -name core -exec rm -f {} + 2>/dev/null`

91028 2. Mail a birthday greeting:  
 91029 `0 12 14 2 * mailx john%Happy Birthday!%Time for lunch.`

91030 3. As an example of specifying the two types of days:  
 91031 `0 0 1,15 * 1`

91032 would run a command on the first and fifteenth of each month, as well as on every  
91033 Monday. To specify days by only one field, the other field should be set to '\*'; for  
91034 example:

91035 0 0 \* \* 1

91036 would run a command only on Mondays.

#### 91037 RATIONALE

91038 All references to a *cron* daemon and to *cron files* have been omitted. Although historical  
91039 implementations have used this arrangement, there is no reason to limit future implementations.

91040 This description of *crontab* is designed to support only users with normal privileges. The format  
91041 of the input is based on the System V *crontab*; however, there is no requirement here that the  
91042 actual system database used by the *cron* daemon (or a similar mechanism) use this format  
91043 internally. For example, systems derived from BSD are likely to have an additional field  
91044 appended that indicates the user identity to be used when the job is submitted.

91045 The `-e` option was adopted from the SVID as a user convenience, although it does not exist in all  
91046 historical implementations.

#### 91047 FUTURE DIRECTIONS

91048 None.

#### 91049 SEE ALSO

91050 *at*

91051 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 91052 CHANGE HISTORY

91053 First released in Issue 2.

#### 91054 Issue 6

91055 This utility is marked as part of the User Portability Utilities option.

91056 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 91057 Issue 7

91058 The *crontab* utility (except for the `-e` option) is moved from the User Portability Utilities option  
91059 to the Base. User Portability Utilities is now an option for interactive utilities.

91060 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
91061 by the *crontab* utility.

91062 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91063 The first example is changed to remove the unreliable use of `find | xargs`.

91064 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0079 [584] is applied.

#### 91065 Issue 8

91066 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91067 Austin Group Defect 1141 is applied, changing “core files” to “files named core”.

91068 **NAME**

91069           csplit — split files based on context

91070 **SYNOPSIS**91071           csplit [-ks] [-f *prefix*] [-n *number*] *file arg...*91072 **DESCRIPTION**91073           The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into  
91074           other files as directed by the *arg* operands, and write the sizes of the files.91075 **OPTIONS**91076           The *csplit* utility shall conform to XBD [Section 12.2](#) (on page 215).

91077           The following options shall be supported:

91078           **-f** *prefix*   Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is *xx00 ... xxn*. If  
91079           the *prefix* argument would create a filename exceeding {NAME\_MAX} bytes, an  
91080           error shall result, *csplit* shall exit with a diagnostic message, and no files shall be  
91081           created.91082           **-k**           Leave previously created files intact. By default, *csplit* shall remove created files if  
91083           an error occurs.91084           **-n** *number*   Use *number* decimal digits to form filenames for the file pieces. The default shall be  
91085           2.91086           **-s**           Suppress the output of file size messages.91087 **OPERANDS**

91088           The following operands shall be supported:

91089           *file*           The pathname of a text file to be split. If *file* is '-', the standard input shall be  
91090           used.91091           Each *arg* operand can be one of the following:91092           /*rexp*/*offset*91093           A file shall be created using the content of the lines from the current line up to, but  
91094           not including, the line that results from the evaluation of the regular expression  
91095           with *offset*, if any, applied. The regular expression *rexp* shall follow the rules for  
91096           basic regular expressions described in XBD [Section 9.3](#) (on page 181). The  
91097           application shall use the sequence "\/" to specify a <slash> character within the  
91098           *rexp*. The optional offset shall be a positive or negative integer value representing a  
91099           number of lines. A positive integer value can be preceded by '+'. If the selection  
91100           of lines from an *offset* expression of this type would create a file with zero lines, or  
91101           one with greater than the number of lines left in the input file, the results are  
91102           unspecified. After the section is created, the current line shall be set to the line that  
91103           results from the evaluation of the regular expression with any offset applied. If the  
91104           current line is the first line in the file and a regular expression operation has not yet  
91105           been performed, the pattern match of *rexp* shall be applied from the current line to  
91106           the end of the file. Otherwise, the pattern match of *rexp* shall be applied from the  
91107           line following the current line to the end of the file.91108           %*rexp*%*offset*91109           Equivalent to */rexp/offset*, except that no file shall be created for the selected  
91110           section of the input file. The application shall use the sequence "%%" to specify a  
91111           <percent-sign> character within the *rexp*.

- 91112 *line\_no* Create a file from the current line up to (but not including) the line number *line\_no*.  
 91113 Lines in the file shall be numbered starting at one. The current line becomes  
 91114 *line\_no*.
- 91115 {*num*} Repeat operand. This operand can follow any of the operands described  
 91116 previously. If it follows a *rexp* type operand, that operand shall be applied *num*  
 91117 more times. If it follows a *line\_no* operand, the file shall be split every *line\_no* lines,  
 91118 *num* times, from that point.
- 91119 An error shall be reported if an operand does not reference a line between the current position  
 91120 and the end of the file.
- 91121 **STDIN**
- 91122 See the INPUT FILES section.
- 91123 **INPUT FILES**
- 91124 The input file shall be a text file.
- 91125 **ENVIRONMENT VARIABLES**
- 91126 The following environment variables shall affect the execution of *csplit*:
- 91127 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91128 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 91129 variables used to determine the values of locale categories.)
- 91130 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91131 internationalization variables.
- 91132 *LC\_COLLATE*
- 91133 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 91134 character collating elements within regular expressions.
- 91135 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91136 characters (for example, single-byte as opposed to multi-byte characters in  
 91137 arguments and input files) and the behavior of character classes within regular  
 91138 expressions.
- 91139 *LC\_MESSAGES*
- 91140 Determine the locale that should be used to affect the format and contents of  
 91141 diagnostic messages written to standard error.
- 91142 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 91143 **ASYNCHRONOUS EVENTS**
- 91144 If the *-k* option is specified, created files shall be retained. Otherwise, the default action occurs.
- 91145 **STDOUT**
- 91146 Unless the *-s* option is used, the standard output shall consist of one line per file created, with a  
 91147 format as follows:
- 91148 "%d\n", <*file size in bytes*>
- 91149 **STDERR**
- 91150 The standard error shall be used only for diagnostic messages.
- 91151 **OUTPUT FILES**
- 91152 The output files shall contain portions of the original input file; otherwise, unchanged.

**91153 EXTENDED DESCRIPTION**

91154 None.

**91155 EXIT STATUS**

91156 The following exit values shall be returned:

91157 0 Successful completion.

91158 >0 An error occurred.

**91159 CONSEQUENCES OF ERRORS**

91160 By default, created files shall be removed if an error occurs. When the `-k` option is specified,  
91161 created files shall not be removed if an error occurs.

**91162 APPLICATION USAGE**

91163 None.

**91164 EXAMPLES**

91165 1. This example creates four files, `cobol00` ... `cobol03`:

91166 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

91167 After editing the split files, they can be recombined as follows:

91168 `cat cobol0[0-3] > file`

91169 Note that this example overwrites the original file.

91170 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up  
91171 to 9999 lines; this is because lines in the file are numbered from 1 rather than zero, for  
91172 historical reasons:

91173 `csplit -k file 100 {99}`

91174 3. Assuming that `prog.c` follows the C-language coding convention of ending routines with  
91175 a `'}'` at the beginning of the line, this example creates a file containing each separate C  
91176 routine (up to 21) in `prog.c`:

91177 `csplit -k prog.c '%main(%' '/^}'+1' {20}`

**91178 RATIONALE**

91179 The `-n` option was added to extend the range of filenames that could be handled.

91180 Consideration was given to adding a `-a` flag to use the alphabetic filename generation used by  
91181 the historical `split` utility, but the functionality added by the `-n` option was deemed to make  
91182 alphabetic naming unnecessary.

**91183 FUTURE DIRECTIONS**

91184 If this utility is directed to create a new directory entry that contains any bytes that have the  
91185 encoded value of a `<newline>` character, implementations are encouraged to treat this as an  
91186 error. A future version of this standard may require implementations to treat this as an error.

**91187 SEE ALSO**

91189 XBD Chapter 8 (on page 167), Section 9.3 (on page 181), Section 12.2 (on page 215)

**91190 CHANGE HISTORY**

91191 First released in Issue 2.

- 91192 **Issue 5**  
91193 The FUTURE DIRECTIONS section is added.
- 91194 **Issue 6**  
91195 This utility is marked as part of the User Portability Utilities option.  
91196 The APPLICATION USAGE section is added.  
91197 The description of regular expression operands is changed to align with the IEEE P1003.2b draft  
91198 standard.  
91199 The normative text is reworded to avoid use of the term “must” for application requirements.
- 91200 **Issue 7**  
91201 The *csplit* utility is moved from the User Portability Utilities option to the Base. User Portability  
91202 Utilities is now an option for interactive utilities.  
91203 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.  
91204 The SYNOPSIS and OPERANDS sections are revised to use a single *arg* to split a file into two  
91205 pieces.
- 91206 **Issue 8**  
91207 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
91208 filenames containing any bytes that have the encoded value of a <newline> character.  
91209 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91210 **NAME**91211 ctags — create a tags file (**DEVELOPMENT**)91212 **SYNOPSIS**91213 CD SD ctags [-a] [-f *tagsfile*] *pathname...*91214 ctags -x *pathname...*91215 **DESCRIPTION**

91216 The *ctags* utility shall write a *tagsfile* or an index of objects from C-language source files specified  
 91217 by the *pathname* operands. The *tagsfile* shall list the locators of C-language objects within the  
 91218 source files. A locator consists of a name, *pathname*, and either a search pattern or a line number  
 91219 that can be used in searching for the object definition. The objects that shall be recognized are  
 91220 specified in the EXTENDED DESCRIPTION section.

91221 **OPTIONS**91222 The *ctags* utility shall conform to XBD [Section 12.2](#) (on page 215).

91223 The following options shall be supported:

91224 **-a** Append to *tagsfile*.91225 **-f *tagsfile*** Write the object locator lists into *tagsfile* instead of the default file named **tags** in the  
91226 current directory.91227 **-x** Produce a list of object names, the line number, and filename in which each is  
91228 defined, as well as the text of that line, and write this to the standard output. A  
91229 *tagsfile* shall not be created when **-x** is specified.91230 **OPERANDS**91231 The following *pathname* operands are supported:91232 ***file.c*** Files with basenames ending with the **.c** suffix shall be treated as C-language  
91233 source code. Such files that are not valid input to *c17* produce unspecified results.91234 ***file.h*** Files with basenames ending with the **.h** suffix shall be treated as C-language  
91235 source code. Such files that are not valid input to *c17* produce unspecified results.

91236 The handling of other files is implementation-defined.

91237 **STDIN**

91238 See the INPUT FILES section.

91239 **INPUT FILES**

91240 The input files shall be text files containing C-language source code.

91241 **ENVIRONMENT VARIABLES**91242 The following environment variables shall affect the execution of *ctags*:91243 **LANG** Provide a default value for the internationalization variables that are unset or null.  
91244 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
91245 variables used to determine the values of locale categories.)91246 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
91247 internationalization variables.91248 **LC\_COLLATE**91249 Determine the order in which output is sorted for the **-x** option. The POSIX locale  
91250 determines the order in which the *tagsfile* is written.

- 91251 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 91252 characters (for example, single-byte as opposed to multi-byte characters in  
 91253 arguments and input files). If the locale is not compatible with the C locale  
 91254 described by the ISO C standard, the results are unspecified.
- 91255 **LC\_MESSAGES**  
 91256 Determine the locale that should be used to affect the format and contents of  
 91257 diagnostic messages written to standard error.
- 91258 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 91259 **ASYNCHRONOUS EVENTS**  
 91260 Default.
- 91261 **STDOUT**  
 91262 The list of object name information produced by the `-x` option shall be written to standard  
 91263 output in the following format:  
 91264 `"%s %d %s %s", <object-name>, <line-number>, <filename>, <text>`  
 91265 where `<text>` is the text of line `<line-number>` of file `<filename>`.
- 91266 **STDERR**  
 91267 The standard error shall be used only for diagnostic messages.
- 91268 **OUTPUT FILES**  
 91269 When the `-x` option is not specified, the format of the output file shall be:  
 91270 `"%s\t%s\t/%s/\n", <identifier>, <filename>, <pattern>`  
 91271 where `<pattern>` is a search pattern that could be used by an editor to find the defining instance  
 91272 of `<identifier>` in `<filename>` (where *defining instance* is indicated by the declarations listed in the  
 91273 EXTENDED DESCRIPTION).  
 91274 An optional `<circumflex>` (`'^'`) can be added as a prefix to `<pattern>`, and an optional `<dollar-`  
 91275 `sign>` can be appended to `<pattern>` to indicate that the pattern is anchored to the beginning  
 91276 (end) of a line of text. Any `<slash>` or `<backslash>` characters in `<pattern>` shall be preceded by a  
 91277 `<backslash>` character. The anchoring `<circumflex>`, `<dollar-sign>`, and escaping `<backslash>`  
 91278 characters shall not be considered part of the search pattern. All other characters in the search  
 91279 pattern shall be considered literal characters.  
 91280 An alternative format is:  
 91281 `"%s\t%s\t?%s?\n", <identifier>, <filename>, <pattern>`  
 91282 which is identical to the first format except that `<slash>` characters in `<pattern>` shall not be  
 91283 preceded by escaping `<backslash>` characters, and `<question-mark>` characters in `<pattern>`  
 91284 shall be preceded by `<backslash>` characters.  
 91285 A second alternative format is:  
 91286 `"%s\t%s\t%d\n", <identifier>, <filename>, <lineno>`  
 91287 where `<lineno>` is a decimal line number that could be used by an editor to find `<identifier>` in  
 91288 `<filename>`.  
 91289 Neither alternative format shall be produced by `ctags` when it is used as described by  
 91290 POSIX.1-2024, but the standard utilities that process tags files shall be able to process those  
 91291 formats as well as the first format.  
 91292 In any of these formats, the file shall be sorted by identifier, based on the collation sequence in

91293 the POSIX locale.

91294 **EXTENDED DESCRIPTION**

91295 The *ctags* utility shall attempt to produce an output line for each of the following objects:

- 91296 • Function definitions
- 91297 • Type definitions
- 91298 • Macros with arguments

91299 It may also produce output for any of the following objects:

- 91300 • Function prototypes
- 91301 • Structures
- 91302 • Unions
- 91303 • Global variable definitions
- 91304 • Enumeration types
- 91305 • Macros without arguments
- 91306 • **#define** statements
- 91307 • **#line** statements

91308 Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C  
91309 programs. The tag formed shall be created by prefixing **M** to the name of the file, with the  
91310 trailing *.c*, and leading pathname components (if any) removed.

91311 It is implementation-defined what other objects (including duplicate identifiers) produce output.

91312 On systems that do not support the C-Language Development Utilities option, if *ctags* is  
91313 supported it produces unspecified results for C-language source code files. It should write to  
91314 standard error a message identifying this condition and cause a non-zero exit status to be  
91315 produced.

91316 **EXIT STATUS**

91317 The following exit values shall be returned:

- 91318 0 Successful completion.
- 91319 >0 An error occurred.

91320 **CONSEQUENCES OF ERRORS**

91321 Default.

91322 **APPLICATION USAGE**

91323 The output with *-x* is meant to be a simple index that can be written out as an off-line readable  
91324 function index. If the input files to *ctags* (such as *.c* files) were not created using the same locale  
91325 as that in effect when *ctags -x* is run, results might not be as expected.

91326 The description of C-language processing says “attempts to” because the C language can be  
91327 greatly confused, especially through the use of **#defines**, and this utility would be of no use if  
91328 the real C preprocessor were run to identify them. The output from *ctags* may be fooled and  
91329 incorrect for various constructs.

91330 **EXAMPLES**

91331 None.

91332 **RATIONALE**

91333 The option list was significantly reduced from that provided by historical implementations. The  
 91334 `-F` option was omitted as redundant, since it is the default. The `-B` option was omitted as being  
 91335 of very limited usefulness. The `-t` option was omitted since the recognition of **typedefs** is now  
 91336 required for C source files. The `-u` option was omitted because the update function was judged  
 91337 to be not only inefficient, but also rarely needed.

91338 An early proposal included a `-w` option to suppress warning diagnostics. Since the types of such  
 91339 diagnostics could not be described, the option was omitted as being not useful.

91340 The text for `LC_CTYPE` about compatibility with the C locale acknowledges that the ISO C  
 91341 standard imposes requirements on the locale used to process C source. This could easily be a  
 91342 superset of that known as “the C locale” by way of implementation extensions, or one of a few  
 91343 alternative locales for systems supporting different codesets.

91344 The collation sequence of the tags file is not affected by `LC_COLLATE` because it is typically not  
 91345 used by human readers, but only by programs such as *vi* to locate the tag within the source files.  
 91346 Using the POSIX locale eliminates some of the problems of coordinating locales between the  
 91347 *ctags* file creator and the *vi* file reader.

91348 Historically, the tags file has been used only by *ex* and *vi*. However, the format of the tags file  
 91349 has been published to encourage other programs to use the tags in new ways. The format allows  
 91350 either patterns or line numbers to find the identifiers because the historical *vi* recognizes either.  
 91351 The *ctags* utility does not produce the format using line numbers because it is not useful  
 91352 following any source file changes that add or delete lines. The documented search patterns  
 91353 match historical practice. It should be noted that literal leading `<circumflex>` or trailing `<dollar-`  
 91354 `sign>` characters in the search pattern will only behave correctly if anchored to the beginning of  
 91355 the line or end of the line by an additional `<circumflex>` or `<dollar-sign>` character.

91356 Historical implementations also understand the objects used by the languages FORTRAN,  
 91357 Pascal, and sometimes LISP, and they understand the C source output by *lex* and *yacc*. The *ctags*  
 91358 utility is not required to accommodate these languages, although implementors are encouraged  
 91359 to do so.

91360 The following historical option was not specified, as *vgrind* is not included in this volume of  
 91361 POSIX.1-2024:

91362 `-v` If the `-v` flag is given, an index of the form expected by *vgrind* is produced on the  
 91363 standard output. This listing contains the function name, filename, and page  
 91364 number (assuming 64-line pages). Since the output is sorted into lexicographic  
 91365 order, it may be desired to run the output through `sort -f`. Sample use:

```
91366     ctags -v files | sort -f > index
91367     vgrind -x index
```

91368 The special treatment of the tag **main** makes the use of *ctags* practical in directories with more  
 91369 than one program.

91370 **FUTURE DIRECTIONS**

91371 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 91372 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
 91373 format being used, implementations are encouraged to treat this as an error. A future version of  
 91374 this standard may require implementations to treat this as an error.

91375 If this utility is directed to create a new directory entry that contains any bytes that have the

91376 encoded value of a <newline> character, implementations are encouraged to treat this as an  
91377 error. A future version of this standard may require implementations to treat this as an error.

91378 **SEE ALSO**

91379 *c17, vi*

91380 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

91381 **CHANGE HISTORY**

91382 First released in Issue 4.

91383 **Issue 5**

91384 The FUTURE DIRECTIONS section is added.

91385 **Issue 6**

91386 This utility is marked as part of the User Portability Utilities option.

91387 The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

91388 The normative text is reworded to avoid use of the term “must” for application requirements.

91389 IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the  
91390 DESCRIPTION.

91391 **Issue 7**

91392 The *ctags* utility is no longer dependent on support for the User Portability Utilities option.

91393 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91394 **Issue 8**

91395 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:

91396 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
91397 have the encoded value of a <newline> character when <newline> is a terminator or  
91398 separator in the output format being used.

91399 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
91400 <newline> character.

91401 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91402 Austin Group Defect 1312 is applied, inserting a missing line break in the example commands in  
91403 the RATIONALE section.

91404 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

91405 **NAME**

91406 cut — cut out selected fields of each line of a file

91407 **SYNOPSIS**91408 cut -b *list* [-n] [*file...*]91409 cut -c *list* [*file...*]91410 cut -f *list* [-d *delim*] [-s] [*file...*]91411 **DESCRIPTION**

91412 The *cut* utility shall cut out bytes (**-b** option), characters (**-c** option), or character-delimited fields  
 91413 (**-f** option) from each line in one or more files, concatenate them, and write them to standard  
 91414 output.

91415 **OPTIONS**91416 The *cut* utility shall conform to XBD [Section 12.2](#) (on page 215).

91417 The application shall ensure that the option-argument *list* (see options **-b**, **-c**, and **-f** below) is a  
 91418 <comma>-separated list or <blank>-separated list of positive numbers and ranges. Ranges can  
 91419 be in three forms. The first is two positive numbers separated by a <hyphen-minus> (*low-high*),  
 91420 which represents all fields from the first number to the second number. The second is a positive  
 91421 number preceded by a <hyphen-minus> (*-high*), which represents all fields from field number 1  
 91422 to that number. The third is a positive number followed by a <hyphen-minus> (*low-*), which  
 91423 represents that number to the last field, inclusive. The elements in *list* can be repeated, can  
 91424 overlap, and can be specified in any order, but the bytes, characters, or fields selected shall be  
 91425 written in the order of the input data. If an element appears in the selection list more than once,  
 91426 it shall be written exactly once.

91427 The following options shall be supported:

91428 **-b list** Cut based on a *list* of bytes. Each selected byte shall be output unless the **-n** option  
 91429 is also specified. It shall not be an error to select bytes not present in the input line.

91430 **-c list** Cut based on a *list* of characters. Each selected character shall be output. It shall  
 91431 not be an error to select characters not present in the input line.

91432 **-d delim** Set the field delimiter to the character *delim*. The default is the <tab>.

91433 **-f list** Cut based on a *list* of fields, assumed to be separated in the file by a delimiter  
 91434 character (see **-d**). Each selected field shall be output. Output fields shall be  
 91435 separated by a single occurrence of the field delimiter character. Lines with no field  
 91436 delimiters shall be passed through intact, unless **-s** is specified. It shall not be an  
 91437 error to select fields not present in the input line.

91438 **-n** Do not split characters. When specified with the **-b** option, each element in *list* of  
 91439 the form *low-high* (<hyphen-minus>-separated numbers) shall be modified as  
 91440 follows:

- 91441 • If the byte selected by *low* is not the first byte of a character, *low* shall be  
 91442 decremented to select the first byte of the character originally selected by *low*.  
 91443 If the byte selected by *high* is not the last byte of a character, *high* shall be  
 91444 decremented to select the last byte of the character prior to the character  
 91445 originally selected by *high*, or zero if there is no prior character. If the  
 91446 resulting range element has *high* equal to zero or *low* greater than *high*, the list  
 91447 element shall be dropped from *list* for that input line without causing an  
 91448 error.

91449 Each element in *list* of the form *low-* shall be treated as above with *high* set to the

91450 number of bytes in the current line, not including the terminating <newline>. Each  
 91451 element in *list* of the form *-high* shall be treated as above with *low* set to 1. Each  
 91452 element in *list* of the form *num* (a single number) shall be treated as above with *low*  
 91453 set to *num* and *high* set to *num*.

91454 **-s** Suppress lines with no delimiter characters, when used with the *-f* option. Unless  
 91455 specified, lines with no delimiters shall be passed through untouched.

#### 91456 OPERANDS

91457 The following operand shall be supported:

91458 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 91459 '-', the standard input shall be used.

#### 91460 STDIN

91461 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 91462 See the INPUT FILES section.

#### 91463 INPUT FILES

91464 The input files shall be text files, except that line lengths shall be unlimited.

#### 91465 ENVIRONMENT VARIABLES

91466 The following environment variables shall affect the execution of *cut*:

91467 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91468 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 91469 variables used to determine the values of locale categories.)

91470 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91471 internationalization variables.

91472 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91473 characters (for example, single-byte as opposed to multi-byte characters in  
 91474 arguments and input files).

#### 91475 *LC\_MESSAGES*

91476 Determine the locale that should be used to affect the format and contents of  
 91477 diagnostic messages written to standard error.

91478 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.

#### 91479 ASYNCHRONOUS EVENTS

91480 Default.

#### 91481 STDOUT

91482 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of  
 91483 the following):

91484 "%s\n", <concatenation of bytes>

91485 "%s\n", <concatenation of characters>

91486 "%s\n", <concatenation of fields and field delimiters>

#### 91487 STDERR

91488 The standard error shall be used only for diagnostic messages.

91489 **OUTPUT FILES**

91490 None.

91491 **EXTENDED DESCRIPTION**

91492 None.

91493 **EXIT STATUS**

91494 The following exit values shall be returned:

91495 0 All input files were output successfully.

91496 &gt;0 An error occurred.

91497 **CONSEQUENCES OF ERRORS**

91498 Default.

91499 **APPLICATION USAGE**

91500 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
 91501 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
 91502 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

91503 Earlier versions of the *cut* utility worked in an environment where bytes and characters were  
 91504 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In  
 91505 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option  
 91506 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The  
 91507 algorithm specified for **-n** guarantees that:

```
91508 cut -b 1-500 -n file > file1
91509 cut -b 501- -n file > file2
```

91510 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,  
 91511 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

91512 **EXAMPLES**

91513 Examples of the option qualifier list:

91514 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

91515 1-3,8 Equivalent to 1,2,3,8.

91516 -5,10 Equivalent to 1,2,3,4,5,10.

91517 3- Equivalent to third to last, inclusive.

91518 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte  
 91519 characters; see the description of **-n**.

91520 The following command:

91521 

```
cut -d : -f 1,6 /etc/passwd
```

91522 reads the System V password file (user database) and produces lines of the form:

91523 

```
<user ID>:<home directory>
```

91524 Most utilities in this volume of POSIX.1-2024 work on text files. The *cut* utility can be used to  
 91525 turn files with arbitrary line lengths into a set of text files containing the same data. The *paste*  
 91526 utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**  
 91527 contains long lines:

```
91528 cut -b 1-500 -n file > file1
91529 cut -b 501- -n file > file2
```

91530 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
91531 contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in  
91532 **file** that are longer than 500 + {LINE\_MAX} bytes.) The original file can be recreated from **file1**  
91533 and **file2** using the command:

```
91534 paste -d "\0" file1 file2 > file
```

#### 91535 RATIONALE

91536 Some historical implementations do not count <backspace> characters in determining character  
91537 counts with the `-c` option. This may be useful for using `cut` for processing `nroff` output. It was  
91538 deliberately decided not to have the `-c` option treat either <backspace> or <tab> characters in  
91539 any special fashion. The `fold` utility does treat these characters specially.

91540 Unlike other utilities, some historical implementations of `cut` exit after not finding an input file,  
91541 rather than continuing to process the remaining `file` operands. This behavior is prohibited by this  
91542 volume of POSIX.1-2024, where only the exit status is affected by this problem.

91543 The behavior of `cut` when provided with either mutually-exclusive options or options that do  
91544 not work logically together has been deliberately left unspecified in favor of global wording in  
91545 [Section 1.4](#) (on page 2462).

91546 The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The  
91547 change represents historical practice on all known systems. The original standard was  
91548 ambiguous on the nature of the output.

91549 The `list` option-arguments are historically used to select the portions of the line to be written, but  
91550 do not affect the order of the data. For example:

```
91551 echo abcdefghi | cut -c6,2,4-7,1
```

91552 yields "abdefg".

91553 A proposal to enhance `cut` with the following option:

91554 `-o` Preserve the selected field order. When this option is specified, each byte, character, or field  
91555 (or ranges of such) shall be written in the order specified by the `list` option-argument, even if  
91556 this requires multiple outputs of the same bytes, characters, or fields.

91557 was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft  
91558 standard.

#### 91559 FUTURE DIRECTIONS

91560 None.

#### 91561 SEE ALSO

91562 [Section 2.5](#) (on page 2478), [fold](#), [grep](#), [paste](#)

91563 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 91564 CHANGE HISTORY

91565 First released in Issue 2.

#### 91566 Issue 6

91567 The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

91568 The normative text is reworded to avoid use of the term “must” for application requirements.

91569 **Issue 7**

91570 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91571 SD5-XCU-ERN-171 is applied, adding APPLICATION USAGE.

91572 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0080 [584] is applied.

91573 **Issue 8**

91574 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91575 **NAME**91576 cxref — generate a C-language program cross-reference table (**DEVELOPMENT**)91577 **SYNOPSIS**

```
91578 XSI  cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...
91579      [-U name]... file...
```

91580 **DESCRIPTION**

91581 The *cxref* utility shall analyze a collection of C-language *files* and attempt to build a cross-  
 91582 reference table. Information from **#define** lines shall be included in the symbol table. A sorted  
 91583 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*  
 91584 separately, or with the **-c** option, in combination. Each symbol shall contain an <asterisk> before  
 91585 the declaring reference.

91586 **OPTIONS**

91587 The *cxref* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**,  
 91588 **-I**, and **-U** options (which are identical to their interpretation by *c17*) is significant. The  
 91589 following options shall be supported:

- 91590 **-c** Write a combined cross-reference of all input files.
- 91591 **-s** Operate silently; do not print input filenames.
- 91592 **-o file** Direct output to named *file*.
- 91593 **-w num** Format output no wider than *num* (decimal) columns. This option defaults to 80 if  
 91594 *num* is not specified or is less than 51.
- 91595 **-D** Equivalent to *c17*.
- 91596 **-I** Equivalent to *c17*.
- 91597 **-U** Equivalent to *c17*.

91598 **OPERANDS**

91599 The following operand shall be supported:

- 91600 *file* A pathname of a C-language source file.

91601 **STDIN**

91602 Not used.

91603 **INPUT FILES**

91604 The input files are C-language source files.

91605 **ENVIRONMENT VARIABLES**

91606 The following environment variables shall affect the execution of *cxref*:

- 91607 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 91608 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 91609 variables used to determine the values of locale categories.)
- 91610 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 91611 internationalization variables.
- 91612 **LC\_COLLATE**  
 91613 Determine the locale for the ordering of the output.
- 91614 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 91615 characters (for example, single-byte as opposed to multi-byte characters in  
 91616 arguments and input files).

- 91617 *LC\_MESSAGES*
- 91618 Determine the locale that should be used to affect the format and contents of
- 91619 diagnostic messages written to standard error.
- 91620 *NLSPATH* Determine the location of messages objects and message catalogs.
- 91621 **ASYNCHRONOUS EVENTS**
- 91622 Default.
- 91623 **STDOUT**
- 91624 The standard output shall be used for the cross-reference listing, unless the `-o` option is used to
- 91625 select a different output file.
- 91626 The format of standard output is unspecified, except that the following information shall be
- 91627 included:
- 91628 • If the `-c` option is not specified, each portion of the listing shall start with the name of the
  - 91629 input file on a separate line.
  - 91630 • The name line shall be followed by a sorted list of symbols, each with its associated
  - 91631 location pathname, the name of the function in which it appears (if it is not a function
  - 91632 name itself), and line number references.
  - 91633 • Each line number may be preceded by an <asterisk> ('\*') flag, meaning that this is the
  - 91634 declaring reference. Other single-character flags, with implementation-defined meanings,
  - 91635 may be included.
- 91636 **STDERR**
- 91637 The standard error shall be used only for diagnostic messages.
- 91638 **OUTPUT FILES**
- 91639 The output file named by the `-o` option shall be used instead of standard output.
- 91640 **EXTENDED DESCRIPTION**
- 91641 None.
- 91642 **EXIT STATUS**
- 91643 The following exit values shall be returned:
- 91644 0 Successful completion.
  - 91645 >0 An error occurred.
- 91646 **CONSEQUENCES OF ERRORS**
- 91647 Default.
- 91648 **APPLICATION USAGE**
- 91649 None.
- 91650 **EXAMPLES**
- 91651 None.
- 91652 **RATIONALE**
- 91653 None.
- 91654 **FUTURE DIRECTIONS**
- 91655 If this utility is directed to display a pathname that contains any bytes that have the encoded
- 91656 value of a <newline> character when <newline> is a terminator or separator in the output
- 91657 format being used, implementations are encouraged to treat this as an error. A future version of
- 91658 this standard may require implementations to treat this as an error.

91659 **SEE ALSO**91660 [c17](#)91661 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)91662 **CHANGE HISTORY**

91663 First released in Issue 2.

91664 **Issue 5**91665 In the SYNOPSIS, `[-U dir]` is changed to `[-U name]`.91666 **Issue 6**

91667 The APPLICATION USAGE section is added.

91668 **Issue 7**

91669 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91670 **Issue 8**91671 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
91672 directed to display a pathname that contains any bytes that have the encoded value of a  
91673 `<newline>` character when `<newline>` is a terminator or separator in the output format being  
91674 used.91675 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91676 **NAME**

91677 date — write the date and time

91678 **SYNOPSIS**

91679 date [-u] [+format]

91680 XSI date [-u] *mmddhhmm* [[*cc*]*yy*]91681 **DESCRIPTION**

91682 XSI The *date* utility shall write the date and time to standard output or attempt to set the system  
 91683 date and time. By default, the current date and time shall be written. If an operand beginning  
 91684 with '+' is specified, the output format of *date* shall be controlled by the conversion  
 91685 specifications and other text in the operand.

91686 **OPTIONS**91687 The *date* utility shall conform to XBD Section 12.2 (on page 215).

91688 The following option shall be supported:

91689 **-u** Perform operations as if the *TZ* environment variable was set to the string "UTC0",  
 91690 or its equivalent historical value of "GMT0". Otherwise, *date* shall use the timezone  
 91691 indicated by the *TZ* environment variable or the system default if that variable is  
 91692 unset or null.

91693 **OPERANDS**

91694 The following operands shall be supported:

91695 **+format** When the format is specified, the output shall be formatted as if by *strftime()* with  
 91696 the specified format string, and a *timeptr* argument that is the equivalent of  
 91697 *localtime(&now)* if **-u** is not specified or *gmtime(&now)* if **-u** is specified, where *now*  
 91698 is an object of type **time\_t** containing the return value of *time(0)*.

91699 A <newline> shall always be appended to the output of *strftime()*.91700 XSI *mmddhhmm*[[*cc*]*yy*]

91701 Attempt to set the system date and time from the value given in the operand. This  
 91702 is only possible if the user has appropriate privileges and the system permits the  
 91703 setting of the system date and time. The first *mm* is the month (number); *dd* is the  
 91704 day (number); *hh* is the hour (number, 24-hour system); the second *mm* is the  
 91705 minute (number); *cc* is the century and is the first two digits of the year (this is  
 91706 optional); *yy* is the last two digits of the year and is optional. If century is not  
 91707 specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive,  
 91708 and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The  
 91709 current year is the default if *yy* is omitted.

91710 **Note:** It is expected that in a future version of this standard the default century inferred  
 91711 from a 2-digit year will change. (This would apply to all commands accepting a  
 91712 2-digit year as input.)

91713 **STDIN**

91714 Not used.

91715 **INPUT FILES**

91716 None.

91717 **ENVIRONMENT VARIABLES**91718 The following environment variables shall affect the execution of *date*:

91719 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91720 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 91721 variables used to determine the values of locale categories.)

91722 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91723 internationalization variables.

91724 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91725 characters (for example, single-byte as opposed to multi-byte characters in  
 91726 arguments).

91727 *LC\_MESSAGES*

91728 Determine the locale that should be used to affect the format and contents of  
 91729 diagnostic messages written to standard error.

91730 *LC\_TIME* Determine the format and contents of date and time strings written by *date*.

91731 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

91732 *TZ* Determine the timezone in which the time and date are written, unless the *-u*  
 91733 option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an  
 91734 unspecified system default timezone is used.

91735 **ASYNCHRONOUS EVENTS**

91736 Default.

91737 **STDOUT**

91738 When no formatting operand is specified, the output in the POSIX locale shall be equivalent to  
 91739 specifying:

91740 `date "+%a %b %e %H:%M:%S %Z %Y"`91741 **STDERR**

91742 The standard error shall be used only for diagnostic messages.

91743 **OUTPUT FILES**

91744 None.

91745 **EXTENDED DESCRIPTION**

91746 None.

91747 **EXIT STATUS**

91748 The following exit values shall be returned:

91749 0 The date was written successfully.

91750 &gt;0 An error occurred.

91751 **CONSEQUENCES OF ERRORS**

91752 Default.

## 91753 APPLICATION USAGE

91754 Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can  
 91755 contain <newline> characters in some locales, so it may be difficult to use the format shown in  
 91756 standard output for parsing the output of *date* in those locales.

91757 Since the default *date* utility format for locales other than the POSIX or C locale is not required to  
 91758 include anything beyond the date and time, whereas for the POSIX or C locale it also includes  
 91759 the day name and time zone, it may be necessary to specify a format (or override the locale-  
 91760 selection environment variables) to ensure this information is included when desired.

91761 The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap  
 91762 second.

91763 Although certain of the conversion specifiers in the POSIX locale (such as the name of the  
 91764 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
 91765 using these fields may need to adjust the capitalization if the output is going to be used at the  
 91766 beginning of a sentence.

91767 The date string formatting capabilities are intended for use in Gregorian-style calendars,  
 91768 possibly with a different starting year (or years). The %x and %c conversion specifications,  
 91769 however, are intended for local representation; these may be based on a different, non-Gregorian  
 91770 calendar.

91771 The %C conversion specification was introduced to allow a fallback for the %EC (alternative year  
 91772 format base year); it can be viewed as the base of the current subdivision in the Gregorian  
 91773 calendar. The century number is calculated as the year divided by 100 and truncated to an  
 91774 integer; it should not be confused with the use of ordinal numbers for centuries (for example,  
 91775 ``twenty-first century``.) Both the %Ey and %y can then be viewed as the offset from %EC and %C,  
 91776 respectively.

91777 The E and O modifiers modify the traditional conversion specifiers, so that they can always be  
 91778 used, even if the implementation (or the current locale) does not support the modifier.

91779 The E modifier supports alternative date formats, such as the Japanese Emperor's Era, as long as  
 91780 these are based on the Gregorian calendar system. Extending the E modifiers to other date  
 91781 elements may provide an implementation-defined extension capable of supporting other  
 91782 calendar systems, especially in combination with the O modifier.

91783 The O modifier supports time and date formats using the locale's alternative numerical symbols,  
 91784 such as Kanji or Hindi digits or ordinal number representation.

91785 Non-European locales, whether they use Latin digits in computational items or not, often have  
 91786 local forms of the digits for use in date formats. This is not totally unknown even in Europe; a  
 91787 variant of dates uses Roman numerals for the months: the third day of September 1991 would be  
 91788 written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking  
 91789 countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %y conversion  
 91790 specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O  
 91791 modifier was introduced to support the use for display purposes of non-Latin digits. In the  
 91792 *LC\_TIME* category in *localedef*, the optional **alt\_digits** keyword is intended for this purpose. As  
 91793 an example, assume the following (partial) *localedef* source:

```
91794 alt_digits  " "; "I"; "II"; "III"; "IV"; "V"; "VI"; "VII"; "VIII" \  

  91795            "IX"; "X"; "XI"; "XII"  

  91796 d_fmt      "%e.%Om.%Y"
```

91797 With the above date, the command:

```
91798 date "+%x"
```

91799 would yield 3.IX.1991. With the same `d_fmt`, but without the `alt_digits`, the command would  
 91800 yield 3.9.1991.

## 91801 EXAMPLES

91802 1. The following are input/output examples of `date` used at arbitrary times in the POSIX  
 91803 locale:

```
91804 $ date
```

```
91805 Tue Jun 26 09:58:10 PDT 1990
```

```
91806 $ date "+DATE: %m/%d/%y%nTIME: %H:%M:%S"
```

```
91807 DATE: 11/02/91
```

```
91808 TIME: 13:36:16
```

```
91809 $ date "+TIME: %r"
```

```
91810 TIME: 01:36:32 PM
```

91811 2. Examples for Denmark, where the default date and time format is `%a %d %b %Y %T %Z`:

```
91812 $ LANG=da_DK.iso_8859-1 date
```

```
91813 ons 02 okt 1991 15:03:32 CET
```

```
91814 $ LANG=da_DK.iso_8859-1 \
```

```
91815 date "+DATO: %A den %e. %B %Y%nKLOKKEN: %H:%M:%S"
```

```
91816 DATO: onsdag den 2. oktober 1991
```

```
91817 KLOKKEN: 15:03:56
```

91818 3. Examples for Germany, where the default date and time format is `%a %d.%h.%Y, %T %Z`:

```
91819 $ LANG=De_DE.88591 date
```

```
91820 Mi 02.Okt.1991, 15:01:21 MEZ
```

```
91821 $ LANG=De_DE.88591 date "+DATUM: %A, %d. %B %Y%nZEIT: %H:%M:%S"
```

```
91822 DATUM: Mittwoch, 02. Oktober 1991
```

```
91823 ZEIT: 15:02:02
```

91824 4. Examples for France, where the default date and time format is `%a %d %h %Y %Z %T`:

```
91825 $ LANG=Fr_FR.88591 date
```

```
91826 Mer 02 oct 1991 MET 15:03:32
```

```
91827 $ LANG=Fr_FR.88591 date "+JOUR: %A %d %B %Y%nHEURE: %H:%M:%S"
```

```
91828 JOUR: Mercredi 02 octobre 1991
```

```
91829 HEURE: 15:03:56
```

## 91830 RATIONALE

91831 Some of the new options for formatting are from the ISO C standard. The `-u` option was  
 91832 introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is  
 91833 allowed as an equivalent `TZ` value to be compatible with all of the systems using the BSD  
 91834 implementation, where this option originated.

91835 The `%e` format conversion specification (adopted from System V) was added because the ISO C  
 91836 standard conversion specifications did not provide any way to produce the historical default  
 91837 `date` output during the first nine days of any month.

91838 There are two varieties of day and week numbering supported (in addition to any others created  
 91839 with the locale-dependent `%E` and `%O` modifier characters):

91840 • The historical variety in which Sunday is the first day of the week and the weekdays  
 91841 preceding the first Sunday of the year are considered week 0. These are represented by %w  
 91842 and %U. A variant of this is %W, using Monday as the first day of the week, but still  
 91843 referring to week 0. This view of the calendar was retained because so many historical  
 91844 applications depend on it and the ISO C standard *strftime()* function, on which many *date*  
 91845 implementations are based, was defined in this way.

91846 • The international standard, based on the ISO 8601-1:2019 standard where Monday is the  
 91847 first weekday and the algorithm for the first week number is more complex: If the week  
 91848 (Monday to Sunday) containing January 1 has four or more days in the new year, then it is  
 91849 week 1; otherwise, it is week 53 of the previous year, and the next week is week 1. These  
 91850 are represented by the new conversion specifications %u and %v, added as a result of  
 91851 international comments.

91852 Although this standard only requires the default *date* utility format, for locales other than the  
 91853 POSIX or C locale, to include the date and time, it is common for implementations to include  
 91854 day name and time zone information as well. (For the POSIX locale this is required, with the day  
 91855 name in %a format at the beginning and the time zone in %Z format before the year.)  
 91856 Implementations are encouraged to include the day name (in %a or %A format) and the time  
 91857 zone (in %Z or %z format) in the default *date* utility format for all of the locales they provide.

91858 Some implementations have a **date\_fmt** locale keyword (see [Section 7.3.5](#), on page 152) as an  
 91859 extension, to specify the default *date* utility format for each locale. On such implementations, if  
 91860 the *localedef* utility is used to create a locale that does not have this information, the *date* utility  
 91861 must by default still produce output for that locale that includes both the time and the date.

#### 91862 **FUTURE DIRECTIONS**

91863 None.

#### 91864 **SEE ALSO**

91865 XBD [Section 7.3.5](#) (on page 152), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 91867 **CHANGE HISTORY**

91868 First released in Issue 2.

#### 91869 **Issue 5**

91870 Changes are made for Year 2000 alignment.

#### 91871 **Issue 6**

91872 The following new requirements on POSIX implementations derive from alignment with the  
 91873 Single UNIX Specification:

- 91874 • The %EX modified conversion specification is added.

91875 The Open Group Corrigendum U048/2 is applied, correcting the examples.

91876 The DESCRIPTION is updated to refer to conversion specifications, instead of field descriptors  
 91877 for consistency with the *LC\_TIME* category.

91878 A clarification is made such that the current year is the default if the *yy* argument is omitted  
 91879 when setting the system date and time.

91880 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/19 is applied, correcting the CHANGE  
 91881 HISTORY section.

91882 **Issue 8**

91883 Austin Group Defect 466 is applied, replacing the list of conversion specifications for the *+format*  
91884 operand with a requirement that the output is formatted as if by a call to *strftime()* with specific  
91885 arguments.

91886 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

91887 Austin Group Defect 1345 is applied, adding paragraphs to APPLICATION USAGE and  
91888 RATIONALE about the default *date* utility format.

91889 **NAME**

91890 dd — convert and copy a file

91891 **SYNOPSIS**91892 dd [*operand...*]91893 **DESCRIPTION**

91894 The *dd* utility shall copy the specified input file to the specified output file with possible  
91895 conversions using specific input and output block sizes. It shall read the input one block at a  
91896 time, using the specified input block size; it shall then process the block of data actually  
91897 returned, which could be smaller than the requested block size. It shall apply any conversions  
91898 that have been specified and write the resulting data to the output in blocks of the specified  
91899 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,  
91900 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a  
91901 separate output block; if the read returns less than a full block and the **sync** conversion is not  
91902 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**  
91903 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the  
91904 input shall be processed and collected into full-sized output blocks until the end of the input is  
91905 reached.

91906 The processing order shall be as follows:

- 91907 1. An input block is read. If the **iflags=fullblock** operand is specified, this might entail  
91908 multiple reads; otherwise, the input block shall be used even if the read was shorter than  
91909 the specified block size.
- 91910 2. If the input block is shorter than the specified input block size and the **sync** conversion is  
91911 specified, null bytes shall be appended to the input data up to the specified size. (If either  
91912 **block** or **unblock** is also specified, <space> characters shall be appended instead of null  
91913 bytes.) The remaining conversions and output shall include the pad characters as if they  
91914 had been read from the input.
- 91915 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is  
91916 requested, the resulting data shall be written to the output as a single block, and the  
91917 remaining steps are omitted.
- 91918 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If  
91919 there is an odd number of bytes in the input block, the last byte in the input record shall  
91920 not be swapped.
- 91921 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These  
91922 conversions shall operate on the input data independently of the input blocking; an input  
91923 or output fixed-length record may span block boundaries.
- 91924 6. The data resulting from input or conversion or both shall be aggregated into output  
91925 blocks of the specified size. After the end of input is reached, any remaining output shall  
91926 be written as a block without padding if **conv=sync** is not specified; thus, the final output  
91927 block may be shorter than the output block size.

91928 **OPTIONS**

91929 None.

91930 **OPERANDS**

91931 All of the operands shall be processed before any input is read. The following operands shall be  
91932 supported:

91933	<b>if=file</b>	Specify the input pathname; the default is standard input.
91934	<b>of=file</b>	Specify the output pathname; the default is standard output. If the <b>seek=expr</b>
91935		conversion is not also specified, the output file shall be truncated before the copy
91936		begins if an explicit <b>of=file</b> operand is specified, unless <b>conv=notrunc</b> is specified.
91937		If <b>seek=expr</b> is specified, but <b>conv=notrunc</b> is not, the effect of the copy shall be to
91938		preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of
91939		the output file shall be preserved. (If the size of the seek plus the size of the input
91940		file is less than the previous size of the output file, the output file shall be
91941		shortened by the copy. If the input file is empty and either the size of the seek is
91942		greater than the previous size of the output file or the output file did not
91943		previously exist, the size of the output file shall be set to the file offset after the
91944		seek.)
91945	<b>ibs=expr</b>	Specify the input block size, in bytes, by <i>expr</i> (default is 512).
91946	<b>obs=expr</b>	Specify the output block size, in bytes, by <i>expr</i> (default is 512).
91947	<b>bs=expr</b>	Set both input and output block sizes to <i>expr</i> bytes, superseding <b>ibs=</b> and <b>obs=</b> . If
91948		no conversion other than <b>sync</b> , <b>noerror</b> , and <b>notrunc</b> is specified, each input block
91949		shall be copied to the output as a single block without aggregating short blocks.
91950	<b>cbs=expr</b>	Specify the conversion block size for <b>block</b> and <b>unblock</b> in bytes by <i>expr</i> (default is
91951		zero). If <b>cbs=</b> is omitted or given a value of zero, using <b>block</b> or <b>unblock</b> produces
91952		unspecified results.
91953	XSI	The application shall ensure that this operand is also specified if the <b>conv=</b>
91954		operand is specified with a value of <b>ascii</b> , <b>ebcdic</b> , or <b>ibm</b> . For a <b>conv=</b> operand
91955		with an <b>ascii</b> value, the input is handled as described for the <b>unblock</b> value, except
91956		that characters are converted to ASCII before any trailing <space> characters are
91957		deleted. For <b>conv=</b> operands with <b>ebcdic</b> or <b>ibm</b> values, the input is handled as
91958		described for the <b>block</b> value except that the characters are converted to EBCDIC
91959		or IBM EBCDIC, respectively, after any trailing <space> characters are added.
91960	<b>skip=n</b>	Skip <i>n</i> input blocks (using the specified input block size) before starting to copy.
91961		On seekable files, the implementation shall read the blocks or seek past them; on
91962		non-seekable files, the blocks shall be read and the data shall be discarded.
91963	<b>seek=n</b>	Skip <i>n</i> blocks (using the specified output block size) from the beginning of the
91964		output file before copying. On non-seekable files, existing blocks shall be read and
91965		space from the current end-of-file to the specified offset, if any, filled with null
91966		bytes; on seekable files, the implementation shall seek to the specified offset or
91967		read the blocks as described for non-seekable files.
91968	<b>count=n</b>	Copy only <i>n</i> input blocks. If <i>n</i> is zero, it is unspecified whether no blocks or all
91969		blocks are copied.
91970	<b>conv=value[,value ...]</b>	
91971		Where <i>values</i> are <comma>-separated symbols from the following list:
91972	XSI	<b>ascii</b> Convert EBCDIC to ASCII; see <a href="#">Table 3-8</a> (on page 2780).
91973	XSI	<b>ebcdic</b> Convert ASCII to EBCDIC; see <a href="#">Table 3-8</a> (on page 2780).
91974	XSI	<b>ibm</b> Convert ASCII to a different EBCDIC set; see <a href="#">Table 3-9</a> (on page 2781).
91975	XSI	The <b>ascii</b> , <b>ebcdic</b> , and <b>ibm</b> values are mutually-exclusive.

91976	<b>block</b>	Treat the input as a sequence of <newline>-terminated or end-of-file-terminated variable-length records independent of the input block boundaries. Each record shall be converted to a record with a fixed length specified by the conversion block size. Any <newline> shall be removed from the input line; <space> characters shall be appended to lines that are shorter than their conversion block size to fill the block. Lines that are longer than the conversion block size shall be truncated to the largest number of characters that fit into that size; the number of truncated lines shall be reported (see the STDERR section).
91977		
91978		
91979		
91980		
91981		
91982		
91983		
91984		
91985		The <b>block</b> and <b>unblock</b> values are mutually-exclusive.
91986	<b>unblock</b>	Convert fixed-length records to variable length. Read a number of bytes equal to the conversion block size (or the number of bytes remaining in the input, if less than the conversion block size), delete all trailing <space> characters, and append a <newline>.
91987		
91988		
91989		
91990	<b>lcase</b>	Map uppercase characters specified by the <i>LC_CTYPE</i> keyword <b>tolower</b> to the corresponding lowercase character. Characters for which no mapping is specified shall not be modified by this conversion.
91991		
91992		
91993		The <b>lcase</b> and <b>ucase</b> symbols are mutually-exclusive.
91994	<b>ucase</b>	Map lowercase characters specified by the <i>LC_CTYPE</i> keyword <b>toupper</b> to the corresponding uppercase character. Characters for which no mapping is specified shall not be modified by this conversion.
91995		
91996		
91997	<b>swab</b>	Swap every pair of input bytes.
91998	<b>noerror</b>	Do not stop processing on an input error. When an input error occurs, a diagnostic message shall be written on standard error, followed by the current input and output block counts in the same format as used at completion (see the STDERR section). If the <b>sync</b> conversion is specified, the missing input shall be replaced with null bytes and processed normally; otherwise, the input block shall be omitted from the output.
91999		
92000		
92001		
92002		
92003		
92004		
92005	<b>notrunc</b>	Do not truncate the output file. Preserve blocks in the output file not explicitly written by this invocation of the <i>dd</i> utility. (See also the preceding <b>of=file</b> operand.)
92006		
92007		
92008	<b>sync</b>	Pad every input block to the size of the <b>ibs=</b> buffer, appending null bytes. (If either <b>block</b> or <b>unblock</b> is also specified, append <space> characters, rather than null bytes.)
92009		
92010		
92011	<b>iflags=fullblock</b>	
92012		Perform as many reads as required to reach the full input block size or end of file, rather than acting on partial reads. If this operand is in effect, then the <b>count=</b> operand refers to the number of full input blocks rather than reads. The behavior is unspecified if <b>iflags=fullblock</b> is requested alongside the <b>sync</b> , <b>block</b> , or <b>unblock</b> conversions.
92013		
92014		
92015		
92016		
92017		The behavior is unspecified if operands other than <b>conv=</b> are specified more than once.
92018		For the <b>bs=</b> , <b>cbs=</b> , <b>ibs=</b> , and <b>obs=</b> operands, the application shall supply an expression specifying a size in bytes. The expression, <i>expr</i> , can be:
92019		

- 92020 1. A positive decimal number
- 92021 2. A positive decimal number followed by  $k$ , specifying multiplication by 1 024
- 92022 3. A positive decimal number followed by  $b$ , specifying multiplication by 512
- 92023 4. Two or more positive decimal numbers (with or without  $k$  or  $b$ ) separated by  $x$ , specifying
- 92024 the product of the indicated values

92025 All of the operands are processed before any input is read.

92026 XSI The following two tables display the octal number character values used for the **ascii** and **ebcdic**

92027 conversions (first table) and for the **ibm** conversion (second table). In both tables, the ASCII

92028 values are the row and column headers and the EBCDIC values are found at their intersections.

92029 For example, ASCII 0012 (LF) is the second row, third column, yielding 0045 in EBCDIC. The

92030 inverted tables (for EBCDIC to ASCII conversion) are not shown, but are in one-to-one

92031 correspondence with these tables. The differences between the two tables are highlighted by

92032 small boxes drawn around five entries.

Table 3-8 ASCII to EBCDIC Conversion

92035 **STDIN**

92036 If no **if=** operand is specified, the standard input shall be used. See the INPUT FILES section.

92037 **INPUT FILES**

92038 The input file can be any file type.

92039 **ENVIRONMENT VARIABLES**

92040 The following environment variables shall affect the execution of *dd*:

92041 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92042 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 92043 variables used to determine the values of locale categories.)

92044 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92045 internationalization variables.

92046 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 92047 characters (for example, single-byte as opposed to multi-byte characters in  
 92048 arguments and input files), the classification of characters as uppercase or  
 92049 lowercase, and the mapping of characters from one case to the other.

92050 **LC\_MESSAGES**

92051 Determine the locale that should be used to affect the format and contents of  
 92052 diagnostic messages written to standard error and informative messages written to  
 92053 standard output.

92054 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

92055 **ASYNCHRONOUS EVENTS**

92056 For SIGINT, the *dd* utility shall interrupt its current processing, write status information to  
 92057 standard error, and terminate abnormally as if by the default action for SIGINT. One or more  
 92058 implementation defined non-job-control signals other than SIGABRT, SIGHUP, and SIGTERM  
 92059 may write status information to standard error and continue processing. All other signals  
 92060 (including job control signals, SIGABRT, SIGHUP, and SIGTERM) shall take their default action;  
 92061 see the ASYNCHRONOUS EVENTS section in Section 1.4 (on page 2462).

92062 **STDOUT**

92063 If no **of=** operand is specified, the standard output shall be used. The nature of the output  
 92064 depends on the operands selected.

92065 **STDERR**

92066 On completion, *dd* shall write the number of input and output blocks to standard error. In the  
 92067 POSIX locale the following formats shall be used:

92068 "%u+%u records in\n", <number of whole input blocks>,  
 92069 <number of partial input blocks>

92070 "%u+%u records out\n", <number of whole output blocks>,  
 92071 <number of partial output blocks>

92072 A partial input block is one for which *read()* returned less than the input block size. A partial  
 92073 output block is one that was written with fewer bytes than specified by the output block size.

92074 In addition, when there is at least one truncated block, the number of truncated blocks shall be  
 92075 written to standard error. In the POSIX locale, the format shall be:

92076 "%u truncated %s\n", <number of truncated blocks>, "record" (if  
 92077 <number of truncated blocks> is one) "records" (otherwise)

92078 Diagnostic messages may also be written to standard error.

92079 **OUTPUT FILES**

92080 If the **of=** operand is used, the output shall be the same as described in the STDOUT section.

92081 **EXTENDED DESCRIPTION**

92082 None.

92083 **EXIT STATUS**

92084 The following exit values shall be returned:

92085 0 Successful completion.

92086 >0 An error occurred.

92087 **CONSEQUENCES OF ERRORS**

92088 If an input error is detected and the **noerror** conversion has not been specified, any partial  
92089 output block shall be written to the output file, a diagnostic message shall be written, and the  
92090 copy operation shall be discontinued. If some other error is detected, a diagnostic message shall  
92091 be written and the copy operation shall be discontinued.

92092 **APPLICATION USAGE**

92093 The input and output block size can be specified to take advantage of raw physical I/O.

92094 There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions  
92095 specified for the *dd* utility perform conversions for the version specified by the tables.

92096 Using the **count=** operand of *dd* with a pipe or FIFO as the input can lead to surprising results,  
92097 since these file types are prone to encountering short reads for any input block size other than 1.  
92098 Unless the **iflags=fullblock** operand is in effect, *dd* will stop after the specified number of reads,  
92099 rather than full input blocks, and therefore can often result in fewer bytes being output than the  
92100 product of the count and input block size.

92101 **EXAMPLES**

92102 The following command:

```
92103 dd if=/dev/rmt0h of=/dev/rmt1h
```

92104 copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

92105 The following command:

```
92106 dd ibs=10 skip=1
```

92107 strips the first 10 bytes from standard input.

92108 This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the  
92109 ASCII file *x*:

```
92110 dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase
```

92111 **RATIONALE**

92112 The OPTIONS section is listed as “None” because there are no options recognized by historical  
92113 *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax  
92114 Guidelines, which would have resulted in the classic hyphenated option letters. In this version  
92115 of this volume of POSIX.1-2024, *dd* retains its curious JCL-like syntax due to the large number of  
92116 applications that depend on the historical implementation.

92117 A suggested implementation technique for **conv=noerror, sync** is to zero (or <space>-fill, if  
92118 **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input  
92119 buffer to the output even after an error. In this manner, any data transferred to the input buffer  
92120 before the error was detected is preserved. Another point is that a failed read on a regular file or  
92121 a disk generally does not increment the file offset, and *dd* must then seek past the block on which

92122 the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic  
 92123 tape, however, the tape normally has passed the block containing the error when the error is  
 92124 reported, and thus no seek is necessary.

92125 The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely  
 92126 portable) scripts that assume these values. If they were left unspecified, unusual results could  
 92127 occur if an implementation chose an odd block size.

92128 Historical implementations of *dd* used *creat()* when processing **of=file**. This makes the **seek=**  
 92129 operand unusable except on special files. The **conv=notrunc** feature was added because more  
 92130 recent BSD-based implementations use *open()* (without `O_TRUNC`) instead of *creat()*, but they  
 92131 fail to delete output file contents after the data copied.

92132 The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to  
 92133 mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of  
 92134 POSIX.1-2024.

92135 Standard EBCDIC does not have the characters '[' and ']'. The values used in the table are  
 92136 taken from a common print train that does contain them. Other than those characters, the print  
 92137 train values are not filled in, but appear to provide some of the motivation for the historical  
 92138 choice of translations reflected here.

92139 The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.

92140 The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ  
 92141 in such a way that:

- 92142 1. EBCDIC 0112 ('ϕ') and 0152 (broken pipe) do not appear in the table.
- 92143 2. EBCDIC 0137 ('↵') translates to/from ASCII 0236 ('^'). In the standard table, EBCDIC  
 92144 0232 (no graphic) is used.
- 92145 3. EBCDIC 0241 ('~') translates to/from ASCII 0176 ('~'). In the standard table, EBCDIC  
 92146 0137 ('↵') is used.
- 92147 4. 0255 ('[') and 0275 (']') appear twice, once in the same place as for the standard table  
 92148 and once in place of 0112 ('ϕ') and 0241 ('~').

92149 In net result:

92150 EBCDIC 0275 (']') displaced EBCDIC 0241 ('~') in cell 0345.

92151 That displaced EBCDIC 0137 ('↵') in cell 0176.

92152 That displaced EBCDIC 0232 (no graphic) in cell 0136.

92153 That replaced EBCDIC 0152 (broken pipe) in cell 0313.

92154 EBCDIC 0255 ('[') replaced EBCDIC 0112 ('ϕ').

92155 This translation, however, reflects historical practice that (ASCII) '~' and '↵' were often  
 92156 mapped to each other, as were '[' and 'ϕ'; and ']' and (EBCDIC) '~'.

92157 The **chs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the  
 92158 **ascii** operand, the input is handled as described for the **unblock** operand except that characters  
 92159 are converted to ASCII before the trailing <space> characters are deleted. For the **ebcdic** and  
 92160 **ibm** operands, the input is handled as described for the **block** operand except that the characters  
 92161 are converted to EBCDIC or IBM EBCDIC after the trailing <space> characters are added.

92162 The **block** and **unblock** keywords are from historical BSD practice.

- 92163 The consistent use of the word **record** in standard error messages matches most historical  
92164 practice. An earlier version of System V used **block**, but this has been updated in more recent  
92165 releases.
- 92166 Early proposals only allowed two numbers separated by **x** to be used in a product when  
92167 specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of  
92168 allowing multiple numbers in the product as provided by Version 7 and all releases of System V  
92169 and BSD.
- 92170 A change to the **swab** conversion is required to match historical practice and is the result of IEEE  
92171 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.
- 92172 A change to the handling of SIGINT is required to match historical practice and is the result of  
92173 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.
- 92174 **FUTURE DIRECTIONS**
- 92175 If this utility is directed to create a new directory entry that contains any bytes that have the  
92176 encoded value of a <newline> character, implementations are encouraged to treat this as an  
92177 error. A future version of this standard may require implementations to treat this as an error.
- 92178 A future version of this standard may introduce the SIGINFO signal; on platforms where such a  
92179 signal is available, it is recommended that this signal be used for reporting status without  
92180 terminating the process.

- 92183 [XBD Chapter 8](#) (on page 167)
- 92184 **CHANGE HISTORY**
- 92185 First released in Issue 2.
- 92186 **Issue 5**
- 92187 The second paragraph of the **cbs=** description is reworded and marked EX.
- 92188 The FUTURE DIRECTIONS section is added.
- 92189 **Issue 6**
- 92190 Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b  
92191 draft standard.
- 92192 The normative text is reworded to avoid use of the term “must” for application requirements.
- 92193 IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between **dd of=file** and  
92194 **conv=notrunc**.
- 92195 **Issue 7**
- 92196 Austin Group Interpretation 1003.1-2001 #102 is applied.
- 92197 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 92198 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0081 [907] is applied.
- 92199 **Issue 8**
- 92200 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
92201 filenames containing any bytes that have the encoded value of a <newline> character.
- 92202 Austin Group Defect 406 is applied, adding the **iflags=fullblock** operand.
- 92203 Austin Group Defect 1122 is applied, changing the description of **NLSPATH**.
- 92204 Austin Group Defect 1159 is applied, changing the ASYNCHRONOUS EVENTS and FUTURE

92205

DIRECTIONS sections.

92206

Austin Group Defect 1497 is applied, changing the EXIT STATUS section.

92207 **NAME**92208 delta — make a delta (change) to an SCCS file (**DEVELOPMENT**)92209 **SYNOPSIS**92210 XSI `delta [-nps] [-g list] [-m mrlist] [-r SID] [-y[comment]] file...`92211 **DESCRIPTION**92212 The *delta* utility shall be used to permanently introduce into the named SCCS files changes that  
92213 were made to the files retrieved by *get* (called the *g-files*, or generated files).92214 **OPTIONS**92215 The *delta* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the `-y` option has an  
92216 optional option-argument. This optional option-argument shall not be presented as a separate  
92217 argument.

92218 The following options shall be supported:

92219 `-r SID` Uniquely identify which delta is to be made to the SCCS file. The use of this option  
92220 shall be necessary only if two or more outstanding *get* commands for editing (*get*  
92221 `-e`) on the same SCCS file were done by the same person (login name). The SID  
92222 value specified with the `-r` option can be either the SID specified on the *get*  
92223 command line or the SID to be made as reported by the *get* utility; see *get* (on page  
92224 2964).92225 `-s` Suppress the report to standard output of the activity associated with each *file*. See  
92226 the `STDOUT` section.92227 `-n` Specify retention of the edited *g-file* (normally removed at completion of delta  
92228 processing).92229 `-g list` Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when  
92230 the file is accessed at the change level (SID) created by this delta.92231 `-m mrlist` Specify a modification request (MR) number that the application shall supply as  
92232 the reason for creating the new delta. This shall be used if the SCCS file has the `v`  
92233 flag set; see *admin*.92234 If `-m` is not used and `'-'` is not specified as a file argument, and the standard  
92235 input is a terminal, the prompt described in the `STDOUT` section shall be written  
92236 to standard output before the standard input is read; if the standard input is not a  
92237 terminal, no prompt shall be issued.92238 MRs in a list shall be separated by `<blank>` characters or escaped `<newline>`  
92239 characters. An unescaped `<newline>` shall terminate the MR list. The escape  
92240 character is `<backslash>`.92241 If the `v` flag has a value, it shall be taken to be the name of a program which  
92242 validates the correctness of the MR numbers. If a non-zero exit status is returned  
92243 from the MR number validation program, the *delta* utility shall terminate. (It is  
92244 assumed that the MR numbers were not all valid.)92245 `-y[comment]` Describe the reason for making the delta. The *comment* shall be an arbitrary group  
92246 of lines that would meet the definition of a text file. Implementations shall support  
92247 *comments* from zero to 512 bytes and may support longer values. A null string  
92248 (specified as either `-y`, `-y"`, or in response to a prompt for a comment) shall be  
92249 considered a valid *comment*.92250 If `-y` is not specified and `'-'` is not specified as a file argument, and the standard

92251 input is a terminal, the prompt described in the STDOUT section shall be written  
 92252 to standard output before the standard input is read; if the standard input is not a  
 92253 terminal, no prompt shall be issued. An unescaped <newline> shall terminate the  
 92254 comment text. The escape character is <backslash>.

92255 The `-y` option shall be required if the *file* operand is specified as `'-'`.

92256 **-p** Write (to standard output) the SCCS file differences before and after the delta is  
 92257 applied in *diff* format; see *diff*.

## 92258 OPERANDS

92259 The following operand shall be supported:

92260 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*  
 92261 utility shall behave as though each file in the directory were specified as a named  
 92262 file, except that non-SCCS files (last component of the pathname does not begin  
 92263 with **s**.) and unreadable files shall be silently ignored.

92264 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;  
 92265 each line of the standard input shall be taken to be the name of an SCCS file to be  
 92266 processed. Non-SCCS files and unreadable files shall be silently ignored.

## 92267 STDIN

92268 The standard input shall be a text file used only in the following cases:

- 92269 • To read an *mrlist* or a *comment* (see the `-m` and `-y` options).
- 92270 • A *file* operand shall be specified as `'-'`. In this case, the `-y` option needs to be used to  
 92271 specify the comment, and if the SCCS file has the **v** flag set, the `-m` option also needs to be  
 92272 used to specify the MR list.

## 92273 INPUT FILES

92274 Input files shall be text files whose data is to be included in the SCCS files. If the first character of  
 92275 any line of an input file is <SOH> in the POSIX locale, the results are unspecified. If this file  
 92276 contains more than 99 999 lines, the number of lines recorded in the header for this file shall be  
 92277 99 999 for this delta.

## 92278 ENVIRONMENT VARIABLES

92279 The following environment variables shall affect the execution of *delta*:

92280 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92281 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 92282 variables used to determine the values of locale categories.)

92283 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92284 internationalization variables.

92285 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 92286 characters (for example, single-byte as opposed to multi-byte characters in  
 92287 arguments and input files).

92288 **LC\_MESSAGES**

92289 Determine the locale that should be used to affect the format and contents of  
 92290 diagnostic messages written to standard error, and informative messages written  
 92291 to standard output.

92292 **NLSPATH** Determine the location of messages objects and message catalogs.

92293 *TZ* Determine the timezone in which the time and date are written in the SCCS file. If  
 92294 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

### 92295 **ASYNCHRONOUS EVENTS**

92296 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit  
 92297 code. The standard action shall be taken for all other signals; see [Section 1.4](#) (on page 2462).

### 92298 **STDOUT**

92299 The standard output shall be used only for the following messages in the POSIX locale:

- 92300 • Prompts (see the *-m* and *-y* options) in the following formats:

92301 "MRs? "

92302 "comments? "

92303 The MR prompt, if written, shall always precede the comments prompt.

- 92304 • A report of each file's activities (unless the *-s* option is specified) in the following format:

92305 "%s\n%d inserted\n%d deleted\n%d unchanged\n", *<New SID>*,  
 92306 *<number of lines inserted>*, *<number of lines deleted>*,  
 92307 *<number of lines unchanged>*

### 92308 **STDERR**

92309 The standard error shall be used only for diagnostic messages.

### 92310 **OUTPUT FILES**

92311 Any SCCS files updated shall be files of an unspecified format.

### 92312 **EXTENDED DESCRIPTION**

#### 92313 **System Date and Time**

92314 When a *delta* is added to an SCCS file, the system date and time shall be recorded for the new  
 92315 *delta*. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the  
 92316 behavior is unspecified.

### 92317 **EXIT STATUS**

92318 The following exit values shall be returned:

92319 0 Successful completion.

92320 >0 An error occurred.

### 92321 **CONSEQUENCES OF ERRORS**

92322 Default.

### 92323 **APPLICATION USAGE**

92324 Problems can arise if the system date and time have been modified (for example, put forward  
 92325 and then back again, or unsynchronized clocks across a network) and can also arise when  
 92326 different values of the *TZ* environment variable are used.

92327 Problems of a similar nature can also arise for the operation of the *get* utility, which records the  
 92328 date and time in the file body.

### 92329 **EXAMPLES**

92330 None.

**92331 RATIONALE**

92332 None.

**92333 FUTURE DIRECTIONS**

92334 If this utility is directed to display a pathname that contains any bytes that have the encoded  
92335 value of a <newline> character when <newline> is a terminator or separator in the output  
92336 format being used, implementations are encouraged to treat this as an error. A future version of  
92337 this standard may require implementations to treat this as an error.

92338 If this utility is directed to create a new directory entry that contains any bytes that have the  
92339 encoded value of a <newline> character, implementations are encouraged to treat this as an  
92340 error. A future version of this standard may require implementations to treat this as an error.

**92341 SEE ALSO**

92342 [Section 1.4](#) (on page 2462), *admin*, *diff*, *get*, *prs*, *rmdel*

92343 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**92344 CHANGE HISTORY**

92345 First released in Issue 2.

**92346 Issue 5**

92347 The output format description in the STDOUT section is corrected.

**92348 Issue 6**

92349 The APPLICATION USAGE section is added.

92350 The normative text is reworded to avoid use of the term “must” for application requirements.

92351 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 92352 • The use of '-' as a file argument is clarified.
- 92353 • The use of STDIN is added.
- 92354 • The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement  
92355 that implementations re-signal themselves when catching a normally fatal signal.
- 92356 • New text is added to the INPUT FILES section warning that the maximum lines recorded  
92357 in the file is 99 999.

92358 New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
92359 regarding how the system date and time may be taken into account, and the TZ environment  
92360 variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base  
92361 Resolution bwg2001-007.

**92362 Issue 7**

92363 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**92364 Issue 8**

92365 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:

- 92366 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
92367 have the encoded value of a <newline> character when <newline> is a terminator or  
92368 separator in the output format being used.
- 92369 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
92370 <newline> character.

92371 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

92372 **NAME**

92373 df — report free disk space

92374 **SYNOPSIS**92375 XSI df [-k] [-P|-t] [*file...*]92376 **DESCRIPTION**

92377 XSI The *df* utility shall write the amount of available space and file slots for file systems on which  
 92378 the invoking user has appropriate read access. File systems shall be specified by the *file*  
 92379 operands; when none are specified, information shall be written for all file systems. The format  
 92380 of the default output from *df* is unspecified, but all space figures are reported in 512-byte units,  
 92381 unless the **-k** option is specified. This output shall contain at least the file system names, amount  
 92382 XSI of available space on each of these file systems, and, if no options other than **-t** are specified, the  
 92383 number of free file slots, or *inodes*, available; when **-t** is specified, the output shall contain the  
 92384 total allocated space as well.

92385 **OPTIONS**92386 The *df* utility shall conform to XBD Section 12.2 (on page 215).

92387 The following options shall be supported:

92388 **-k** Use 1024-byte units, instead of the default 512-byte units, when writing space  
 92389 figures.

92390 **-P** Produce output in the format described in the STDOUT section.

92391 XSI **-t** Include total allocated-space figures in the output.

92392 **OPERANDS**

92393 The following operand shall be supported:

92394 *file* A pathname of a file within the hierarchy of the desired file system. If a file other  
 92395 XSI than a FIFO, a regular file, a directory, or a special file representing the device  
 92396 containing the file system (for example, */dev/dsk/0s1*) is specified, the results are  
 92397 unspecified. If the *file* operand names a file other than a special file containing a file  
 92398 system, *df* shall write the amount of free space in the file system containing the  
 92399 XSI specified *file* operand. Otherwise, *df* shall write the amount of free space in that  
 92400 file system.

92401 **STDIN**

92402 Not used.

92403 **INPUT FILES**

92404 None.

92405 **ENVIRONMENT VARIABLES**92406 The following environment variables shall affect the execution of *df*:

92407 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92408 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 92409 variables used to determine the values of locale categories.)

92410 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92411 internationalization variables.

92412 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92413 characters (for example, single-byte as opposed to multi-byte characters in  
 92414 arguments).

92415 *LC\_MESSAGES*

92416 Determine the locale that should be used to affect the format and contents of

92417 diagnostic messages written to standard error and informative messages written to

92418 standard output.

92419 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

92420 **ASYNCHRONOUS EVENTS**

92421 Default.

92422 **STDOUT**

92423 When both the **-k** and **-P** options are specified, the following header line shall be written (in the

92424 POSIX locale):

92425 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"

92426 When the **-P** option is specified without the **-k** option, the following header line shall be written

92427 (in the POSIX locale):

92428 "Filesystem 512-blocks Used Available Capacity Mounted on\n"

92429 The implementation may adjust the spacing of the header line and the individual data lines so

92430 that the information is presented in orderly columns.

92431 The remaining output with **-P** shall consist of one line of information for each specified file

92432 system. These lines shall be formatted as follows:

92433 "%s %d %d %d %d%% %s\n", <file system name>, <total space>,  
 92434 <space used>, <space free>, <percentage used>,  
 92435 <file system root>

92436 In the following list, all quantities expressed in 512-byte units (1 024-byte when **-k** is specified)

92437 shall be rounded up to the next higher unit. The fields are:

92438 <file system name>

92439 The name of the file system, in an implementation-defined format.

92440 <total space> The total size of the file system in 512-byte units. The exact meaning of this figure

92441 is implementation-defined, but should include <space used>, <space free>, plus any

92442 space reserved by the system not normally available to a user.

92443 <space used> The total amount of space allocated to existing files in the file system, in 512-byte

92444 units.

92445 <space free> The total amount of space available within the file system for the creation of new

92446 files by unprivileged users, in 512-byte units. When this figure is less than or equal

92447 to zero, it shall not be possible to create any new files on the file system without

92448 first deleting others, unless the process has appropriate privileges. The figure

92449 written may be less than zero.

92450 <percentage used>

92451 The percentage of the normally available space that is currently allocated to all files

92452 on the file system. This shall be calculated using the fraction:

92453 
$$\frac{\text{<space used>}}{(\text{<space used>} + \text{<space free>})}$$

92454 expressed as a percentage. This percentage may be greater than 100 if <space free>

92455 is less than zero. The percentage value shall be expressed as a positive integer, with

92456 any fractional result causing it to be rounded to the next highest integer.

92457 <file system root>  
 92458 The directory below which the file system hierarchy appears.

92459 XSI The output format is unspecified when `-t` is used.

#### 92460 **STDERR**

92461 The standard error shall be used only for diagnostic messages.

#### 92462 **OUTPUT FILES**

92463 None.

#### 92464 **EXTENDED DESCRIPTION**

92465 None.

#### 92466 **EXIT STATUS**

92467 The following exit values shall be returned:

92468 0 Successful completion.

92469 >0 An error occurred.

#### 92470 **CONSEQUENCES OF ERRORS**

92471 Default.

#### 92472 **APPLICATION USAGE**

92473 On most systems, the “name of the file system, in an implementation-defined format” is the  
 92474 special file on which the file system is mounted.

92475 On large file systems, the calculation specified for percentage used can create huge rounding  
 92476 errors.

#### 92477 **EXAMPLES**

92478 1. The following example writes portable information about the `/usr` file system:

```
92479 df -P /usr
```

92480 2. Assuming that `/usr/src` is part of the `/usr` file system, the following produces the same  
 92481 output as the previous example:

```
92482 df -P /usr/src
```

#### 92483 **RATIONALE**

92484 The behavior of `df` with the `-P` option is the default action of the 4.2 BSD `df` utility. The uppercase  
 92485 `-P` was selected to avoid collision with a known industry extension using `-p`.

92486 Historical `df` implementations vary considerably in their default output. It was therefore  
 92487 necessary to describe the default output in a loose manner to accommodate all known historical  
 92488 implementations and to add a portable option (`-P`) to provide information in a portable format.

92489 The use of 512-byte units is historical practice and maintains compatibility with `ls` and other  
 92490 utilities in this volume of POSIX.1-2024. This does not mandate that the file system itself be  
 92491 based on 512-byte blocks. The `-k` option was added as a compromise measure. It was agreed by  
 92492 the standard developers that 512 bytes was the best default unit because of its complete  
 92493 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
 92494 that a `-k` option to switch to 1024-byte units was a good compromise. Users who prefer the  
 92495 more logical 1024-byte quantity can easily alias `df` to `df -k` without breaking many historical  
 92496 scripts relying on the 512-byte units.

92497 It was suggested that `df` and the various related utilities be modified to access a `BLOCKSIZE`  
 92498 environment variable to achieve consistency and user acceptance. Since this is not historical

92499 practice on any system, it is left as a possible area for system extensions and will be re-evaluated  
92500 in a future version if it is widely implemented.

92501 **FUTURE DIRECTIONS**

92502 If this utility is directed to display a pathname that contains any bytes that have the encoded  
92503 value of a <newline> character when <newline> is a terminator or separator in the output  
92504 format being used, implementations are encouraged to treat this as an error. A future version of  
92505 this standard may require implementations to treat this as an error.

92506 **SEE ALSO**

92507 *find*

92508 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

92509 **CHANGE HISTORY**

92510 First released in Issue 2.

92511 **Issue 6**

92512 This utility is marked as part of the User Portability Utilities option.

92513 **Issue 7**

92514 Austin Group Interpretation 1003.1-2001 #099 is applied.

92515 The *df* utility is removed from the User Portability Utilities option. User Portability Utilities is  
92516 now an option for interactive utilities.

92517 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92518 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0082 [156] is applied.

92519 **Issue 8**

92520 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
92521 directed to display a pathname that contains any bytes that have the encoded value of a  
92522 <newline> character when <newline> is a terminator or separator in the output format being  
92523 used.

92524 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

92525 **NAME**

92526 diff — compare two files

92527 **SYNOPSIS**92528 diff [-c|-e|-f|-u|-C *n*|-U *n*] [-br] *file1 file2*92529 **DESCRIPTION**

92530 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of  
 92531 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be  
 92532 produced if the files are identical.

92533 **OPTIONS**92534 The *diff* utility shall conform to XBD [Section 12.2](#) (on page 215).

92535 The following options shall be supported:

92536 **-b** Cause any amount of white space at the end of a line to be treated as a single  
 92537 <newline> (that is, the white-space characters preceding the <newline> are  
 92538 ignored) and other strings of white-space characters, not including <newline>  
 92539 characters, to compare equal.

92540 **-c** Produce output in a form that provides three lines of copied context.

92541 **-C *n*** Produce output in a form that provides *n* lines of copied context (where *n* shall be  
 92542 interpreted as a positive decimal integer).

92543 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be used  
 92544 to convert *file1* into *file2*.

92545 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to  
 92546 be suitable as input for the *ed* utility, and in the opposite order.

92547 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*  
 92548 are both directories.

92549 The *diff* utility shall detect infinite loops; that is, entering a previously visited  
 92550 directory that is an ancestor of the last file encountered. When it detects an infinite  
 92551 loop, *diff* shall write a diagnostic message to standard error and shall either recover  
 92552 its position in the hierarchy or terminate.

92553 **-u** Produce output in a form that provides three lines of unified context.

92554 **-U *n*** Produce output in a form that provides *n* lines of unified context (where *n* shall be  
 92555 interpreted as a non-negative decimal integer).

92556 **OPERANDS**

92557 The following operands shall be supported:

92558 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is '-', the  
 92559 standard input shall be used in its place.

92560 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special  
 92561 files, or FIFO special files to any files and shall not compare regular files to directories. Further  
 92562 details are as specified in [Diff Directory Comparison Format](#) (on page 2796). The behavior of *diff*  
 92563 on other file types is implementation-defined when found in directories.

92564 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file  
 92565 contained in the directory file with a filename that is the same as the last component of the non-  
 92566 directory file.

92567 **STDIN**

92568 The standard input shall be used only if one of the *file1* or *file2* operands references standard  
 92569 input. See the INPUT FILES section.

92570 **INPUT FILES**

92571 The input files may be of any type.

92572 **ENVIRONMENT VARIABLES**

92573 The following environment variables shall affect the execution of *diff*:

92574 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92575 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 92576 variables used to determine the values of locale categories.)

92577 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92578 internationalization variables.

92579 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 92580 characters (for example, single-byte as opposed to multi-byte characters in  
 92581 arguments and input files).

92582 **LC\_MESSAGES**

92583 Determine the locale that should be used to affect the format and contents of  
 92584 diagnostic messages written to standard error and informative messages written to  
 92585 standard output.

92586 **LC\_TIME** Determine the locale for affecting the format of file timestamps written with the **-C**  
 92587 and **-c** options.

92588 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

92589 **TZ** Determine the timezone used for calculating file timestamps written with a context  
 92590 format. If *TZ* is unset or null, an unspecified default timezone shall be used.

92591 **ASYNCHRONOUS EVENTS**

92592 Default.

92593 **STDOUT**92594 **Diff Directory Comparison Format**

92595 If both *file1* and *file2* are directories, the following output formats shall be used.

92596 In the POSIX locale, each file that is present in only one directory shall be reported using the  
 92597 following format:

92598 "Only in %s: %s\n", <directory pathname>, <filename>

92599 In the POSIX locale, subdirectories that are common to the two directories may be reported with  
 92600 the following format:

92601 "Common subdirectories: %s and %s\n", <directory1 pathname>,  
 92602 <directory2 pathname>

92603 For each file common to the two directories, if the two files are not to be compared: if the two  
 92604 files have the same device ID and file serial number, or are both block special files that refer to  
 92605 the same device, or are both character special files that refer to the same device, in the POSIX  
 92606 locale the output format is unspecified. Otherwise, in the POSIX locale an unspecified format  
 92607 shall be used that contains the pathnames of the two files.

92608 For each file common to the two directories, if the files are compared and are identical, no

92609 output shall be written. If the two files differ, the following format is written:

92610 "diff %s %s %s\n", <diff\_options>, <filename1>, <filename2>

92611 where <diff\_options> are the options as specified on the command line.

92612 All directory pathnames listed in this section shall be relative to the original command line  
 92613 arguments. All other names of files listed in this section shall be filenames (pathname  
 92614 components).

### 92615 **Diff Binary Output Format**

92616 In the POSIX locale, if one or both of the files being compared are not text files, it is  
 92617 implementation-defined whether *diff* uses the binary file output format or the other formats as  
 92618 specified below. The binary file output format shall contain the pathnames of two files being  
 92619 compared and the string "differ".

92620 If both files being compared are text files, depending on the options specified, one of the  
 92621 following formats shall be used to write the differences.

### 92622 **Diff Default Output Format**

92623 The default (without *-e*, *-f*, *-c*, *-C*, *-u*, or *-U* options) *diff* utility output shall contain lines of  
 92624 these forms:

92625 "%da%d\n", <num1>, <num2>

92626 "%da%d,%d\n", <num1>, <num2>, <num3>

92627 "%dd%d\n", <num1>, <num2>

92628 "%d,%dd%d\n", <num1>, <num2>, <num3>

92629 "%dc%d\n", <num1>, <num2>

92630 "%d,%dc%d\n", <num1>, <num2>, <num3>

92631 "%dc%d,%d\n", <num1>, <num2>, <num3>

92632 "%d,%dc%d,%d\n", <num1>, <num2>, <num3>, <num4>

92633 These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the  
 92634 action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d*  
 92635 and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in  
 92636 *ed*, identical pairs (where *num1*=*num2*) are abbreviated as a single number.

92637 Following each of these lines, *diff* shall write to standard output all lines affected in the first file  
 92638 using the format:

92639 "<Δ%s", <line>

92640 and all lines affected in the second file using the format:

92641 ">Δ%s", <line>

92642 If there are lines affected in both *file1* and *file2* (as with the *c* subcommand), the changes are  
 92643 separated with a line consisting of three <hyphen-minus> characters:

92644 "---\n"

92645 **Diff -e Output Format**

92646 With the `-e` option, a script shall be produced that shall, when provided as input to `ed`, along  
 92647 with an appended `w` (write) command, convert *file1* into *file2*. Only the `a` (append), `c` (change), `d`  
 92648 (delete), `i` (insert), and `s` (substitute) commands of `ed` shall be used in this script. Text lines,  
 92649 except those consisting of the single character `<period>` (`'.'`), shall be output as they appear in  
 92650 the file.

92651 **Diff -f Output Format**

92652 With the `-f` option, an alternative format of script shall be produced. It is similar to that  
 92653 produced by `-e`, with the following differences:

- 92654 1. It is expressed in reverse sequence; the output of `-e` orders changes from the end of the  
 92655 file to the beginning; the `-f` from beginning to end.
- 92656 2. The command form `<lines> <command-letter>` used by `-e` is reversed. For example,  
 92657 `10c` with `-e` would be `c10` with `-f`.
- 92658 3. The form used for ranges of line numbers is `<space>`-separated, rather than  
 92659 `<comma>`-separated.

92660 **Diff -c or -C Output Format**

92661 With the `-c` or `-C` option, the output format shall consist of affected lines along with  
 92662 surrounding lines of context. The affected lines shall show which ones need to be deleted or  
 92663 changed in *file1*, and those added from *file2*. With the `-c` option, three lines of context, if  
 92664 available, shall be written before and after the affected lines. With the `-C` option, the user can  
 92665 specify how many lines of context are written. The exact format follows.

92666 The name and last modification time of each file shall be output in the following format:

```
92667 "*** %s %s\n", file1, <file1 timestamp>
92668 "--- %s %s\n", file2, <file2 timestamp>
```

92669 Each `<file>` field shall be the pathname of the corresponding file being compared. The pathname  
 92670 written for standard input is unspecified.

92671 In the POSIX locale, each `<timestamp>` field shall be equivalent to the output from the following  
 92672 command:

```
92673 date "+%a %b %e %T %Y"
```

92674 without the trailing `<newline>`, executed at the time of last modification of the corresponding  
 92675 file (or the current time, if the file is standard input).

92676 Then, the following output formats shall be applied for every set of changes.

92677 First, a line shall be written in the following format:

```
92678 "*****\n"
```

92679 Next, the range of lines in *file1* shall be written in the following format if the range contains two  
 92680 or more lines:

```
92681 "*** %d,%d ***\n", <beginning line number>, <ending line number>
```

92682 and the following format otherwise:

```
92683 "*** %d ***\n", <ending line number>
```

92684 The ending line number of an empty range shall be the number of the preceding line, or 0 if the

92685 range is at the start of the file.

92686 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected  
92687 lines shall be written in the following format:

92688 " $\Delta$ %s", <unaffected\_line>

92689 Deleted lines shall be written as:

92690 "- $\Delta$ %s", <deleted\_line>

92691 Changed lines shall be written as:

92692 "! $\Delta$ %s", <changed\_line>

92693 Next, the range of lines in *file2* shall be written in the following format if the range contains two  
92694 or more lines:

92695 "--- %d,%d ----\n", <beginning line number>, <ending line number>

92696 and the following format otherwise:

92697 "--- %d ----\n", <ending line number>

92698 Then, lines of context and changed lines shall be written as described in the previous formats.  
92699 Lines added from *file2* shall be written in the following format:

92700 "+ $\Delta$ %s", <added\_line>

#### 92701 **Diff -u or -U Output Format**

92702 The -u or -U options behave like the -c or -C options, except that the context lines are not  
92703 repeated; instead, the context, deleted, and added lines are shown together, interleaved. The  
92704 exact format follows.

92705 The name and last modification time of each file shall be output in the following format:

92706 "--- $\Delta$ %s\t%s%s $\Delta$ %s\n", file1, <file1 timestamp>, <file1 frac>, <file1 zone>  
92707 "+++ $\Delta$ %s\t%s%s $\Delta$ %s\n", file2, <file2 timestamp>, <file2 frac>, <file2 zone>

92708 Each <file> field shall be the pathname of the corresponding file being compared, or the single  
92709 character '-' if standard input is being compared. However, if the pathname contains a <tab>  
92710 or a <newline>, or if it does not consist entirely of characters taken from the portable character  
92711 set, the behavior is implementation-defined.

92712 Each <timestamp> field shall be equivalent to the output from the following command:

92713 date '+%Y-%m-%d $\Delta$ %H:%M:%S'

92714 without the trailing <newline>, executed at the time of last modification of the corresponding  
92715 file (or the current time, if the file is standard input).

92716 Each <frac> field shall be either empty, or a decimal point followed by at least one decimal digit,  
92717 indicating the fractional-seconds part (if any) of the file timestamp. The number of fractional  
92718 digits shall be at least the number needed to represent the file's timestamp without loss of  
92719 information.

92720 Each <zone> field shall be of the form "shhmm", where "shh" is a signed two-digit decimal  
92721 number in the range -24 through +25, and "mm" is an unsigned two-digit decimal number in the  
92722 range 00 through 59. It represents the timezone of the timestamp as the number of hours (hh)  
92723 and minutes (mm) east (+) or west (-) of UTC for the timestamp. If the hours and minutes are  
92724 both zero, the sign shall be '+'. However, if the timezone is not an integral number of minutes

92725 away from UTC, the `<zone>` field is implementation-defined.

92726 Then, the following output formats shall be applied for every set of changes.

92727 First, the range of lines in each file shall be written in the following format:

92728 `"@@Δ-%sΔ+%sΔ@@", <file1 range>, <file2 range>`

92729 Each `<range>` field shall be of the form:

92730 `"%ld", <beginning line number>`

92731 or:

92732 `"%ld,1", <beginning line number>`

92733 if the range contains exactly one line, and:

92734 `"%ld,%ld", <beginning line number>, <number of lines>`

92735 otherwise. If a range is empty, its beginning line number shall be the number of the line just

92736 before the range, or 0 if the empty range starts the file.

92737 Next, the affected lines along with lines of context shall be written. Each non-empty unaffected

92738 line shall be written in the following format:

92739 `"Δ%s", <unaffected_line>`

92740 where the contents of the unaffected line shall be taken from *file1*. It is implementation-defined

92741 whether an empty unaffected line is written as an empty line or a line containing a single

92742 `<space>` character. This line also represents the same line of *file2*, even though *file2*'s line may

92743 contain different contents due to the `-b`. Deleted lines shall be written as:

92744 `"-%s", <deleted_line>`

92745 Added lines shall be written as:

92746 `"+%s", <added_line>`

92747 The order of lines written shall be the same as that of the corresponding file. A deleted line shall

92748 never be written immediately after an added line.

92749 If `-U n` is specified, the output shall contain no more than  $2n$  consecutive unaffected lines; and if

92750 the output contains an affected line and this line is adjacent to up to  $n$  consecutive unaffected

92751 lines in the corresponding file, the output shall contain these unaffected lines. `-u` shall act like

92752 `-U3`.

92753 **STDERR**

92754 The standard error shall be used only for diagnostic messages.

92755 **OUTPUT FILES**

92756 None.

92757 **EXTENDED DESCRIPTION**

92758 None.

92759 **EXIT STATUS**

92760 The following exit values shall be returned:

92761 0 No differences were found.

92762 1 Differences were found and all differences were successfully output.

92763 >1 An error occurred.

## 92764 CONSEQUENCES OF ERRORS

92765 Default.

## 92766 APPLICATION USAGE

92767 If lines at the end of a file are changed and other lines are added, *diff* output may show this as a  
 92768 delete and add, as a change, or as a change and add; *diff* is not expected to know which  
 92769 happened and users should not care about the difference in output as long as it clearly shows  
 92770 the differences between the files.

## 92771 EXAMPLES

92772 If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory  
 92773 named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**,  
 92774 the command:

```
92775 diff -r dir1 dir2
```

92776 could produce output similar to:

```
92777 Common subdirectories: dir1/x and dir2/x
92778 Only in dir2/x: y
92779 diff -r dir1/x/date.out dir2/x/date.out
92780 1c1
92781 < Mon Jul  2 13:12:16 PDT 1990
92782 ---
92783 > Tue Jun 19 21:41:39 PDT 1990
```

## 92784 RATIONALE

92785 The **-h** option was omitted because it was insufficiently specified and does not add to  
 92786 applications portability.

92787 Historical implementations employ algorithms that do not always produce a minimum list of  
 92788 differences; the current language about making every effort is the best this volume of  
 92789 POSIX.1-2024 can do, as there is no metric that could be employed to judge the quality of  
 92790 implementations against any and all file contents. The statement “This list should be minimal”  
 92791 clearly implies that implementations are not expected to provide the following output when  
 92792 comparing two 100-line files that differ in only one character on a single line:

```
92793 1,100c1,100
92794 all 100 lines from file1 preceded with "< "
92795 ---
92796 all 100 lines from file2 preceded with "> "
```

92797 The “Only in” messages required when the **-r** option is specified are not used by most historical  
 92798 implementations if the **-e** option is also specified. It is required here because it provides useful  
 92799 information that must be provided to update a target directory hierarchy to match a source  
 92800 hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when  
 92801 the **-r** option is specified. They are allowed here but are not required because they are reporting  
 92802 on something that is the same, not reporting a difference, and are not needed to update a target  
 92803 hierarchy.

92804 The **-c** option, which writes output in a format using lines of context, has been included. The  
 92805 format is useful for a variety of reasons, among them being much improved readability and the  
 92806 ability to understand difference changes when the target file has line numbers that differ from  
 92807 another similar, but slightly different, copy. The *patch* utility is most valuable when working  
 92808 with difference listings using a context format. The BSD version of **-c** takes an optional

92809 argument specifying the amount of context. Rather than overloading `-c` and breaking the Utility  
 92810 Syntax Guidelines for *diff*, the standard developers decided to add a separate option for  
 92811 specifying a context *diff* with a specified amount of context (`-C`). Also, the format for context  
 92812 *diffs* was extended slightly in 4.3 BSD to allow multiple changes that are within context lines  
 92813 from each other to be merged together. The output format contains an additional four `<asterisk>`  
 92814 characters after the range of affected lines in the first filename. This was to provide a flag for old  
 92815 programs (like old versions of *patch*) that only understand the old context format. The version of  
 92816 context described here does not require that multiple changes within context lines be merged,  
 92817 but it does not prohibit it either. The extension is upwards-compatible, so any vendors that wish  
 92818 to retain the old version of *diff* can do so by adding the extra four `<asterisk>` characters (that is,  
 92819 utilities that currently use *diff* and understand the new merged format will also understand the  
 92820 old unmerged format, but not *vice versa*).

92821 The `-u` and `-U` options of GNU *diff* have been included. Their output format, designed by  
 92822 Wayne Davison, takes up less space than `-c` and `-C` format, and in many cases is easier to read.  
 92823 The format's timestamps do not vary by locale, so `LC_TIME` does not affect it. The format's line  
 92824 numbers are rendered with the `%1d` format, not `%d`, because the file format notation rules would  
 92825 allow extra `<blank>` characters to appear around the numbers.

92826 The substitute command was added as an additional format for the `-e` option. This was added  
 92827 to provide implementations with a way to fix the classic ```dot alone on a line``` bug present in  
 92828 many versions of *diff*. Since many implementations have fixed this bug, the standard developers  
 92829 decided not to standardize broken behavior, but rather to provide the necessary tool for fixing  
 92830 the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then  
 92831 terminate the append command with a period, and then use the substitute command to convert  
 92832 the two periods into one period.

92833 The BSD-derived `-r` option was added to provide a mechanism for using *diff* to compare two file  
 92834 system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not  
 92835 easily reproducible with the *find* utility.

92836 The requirement that *diff* not compare files in some circumstances, even though they have the  
 92837 same name, is based on the actual output of historical implementations. The specified behavior  
 92838 precludes the problems arising from running into FIFOs and other files that would cause *diff*  
 92839 to hang waiting for input with no indication to the user that *diff* was hung. An earlier version of  
 92840 this standard specified the output format more precisely, but in practice this requirement was  
 92841 widely ignored and the benefit of standardization seemed small, so it is now unspecified. In  
 92842 most common usage, *diff -r* should indicate differences in the file hierarchies, not the difference  
 92843 of contents of devices pointed to by the hierarchies.

92844 Many early implementations of *diff* require seekable files. Since the System Interfaces volume of  
 92845 POSIX.1-2024 supports named pipes, the standard developers decided that such a restriction  
 92846 was unreasonable. Note also that the allowed filename – almost always refers to a pipe.

92847 No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in  
 92848 that it prints out all of the differences at the current level, including the statements about all  
 92849 common subdirectories before recursing into those subdirectories.

92850 The message:

92851 `"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>`

92852 does not vary by locale because it is the representation of a command, not an English sentence.

**92853 FUTURE DIRECTIONS**

92854 If this utility is directed to display a pathname that contains any bytes that have the encoded  
92855 value of a <newline> character when <newline> is a terminator or separator in the output  
92856 format being used, implementations are encouraged to treat this as an error. A future version of  
92857 this standard may require implementations to treat this as an error.

**92858 SEE ALSO**

92859 *cmp, comm, ed, find*

92860 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

**92861 CHANGE HISTORY**

92862 First released in Issue 2.

**92863 Issue 5**

92864 The FUTURE DIRECTIONS section is added.

**92865 Issue 6**

92866 The following new requirements on POSIX implementations derive from alignment with the  
92867 Single UNIX Specification:

- 92868 • The `-f` option is added.

92869 The output format for `-c` or `-C` format is changed to align with changes to the IEEE P1003.2b  
92870 draft standard resulting from IEEE PASC Interpretation 1003.2 #71.

92871 The normative text is reworded to avoid use of the term “must” for application requirements.

92872 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT  
92873 section. This changes the specification of *diff -c* so that it agrees with existing practice when  
92874 contexts contain zero lines or one line.

**92875 Issue 7**

92876 Austin Group Interpretations 1003.1-2001 #115 and #114 are applied.

92877 Austin Group Interpretation 1003.1-2001 #192 is applied, clarifying the behavior if both files are  
92878 non-text files.

92879 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92880 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

92881 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0082 [584], XCU/TC2-2008/0083  
92882 [950], XCU/TC2-2008/0084 [969], and XCU/TC2-2008/0085 [929] are applied.

**92883 Issue 8**

92884 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
92885 directed to display a pathname that contains any bytes that have the encoded value of a  
92886 <newline> character when <newline> is a terminator or separator in the output format being  
92887 used.

92888 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

92889 Austin Group Defect 1498 is applied, changing the EXIT STATUS section.

92890 **NAME**

92891           dirname — return the directory portion of a pathname

92892 **SYNOPSIS**92893           dirname *string*92894 **DESCRIPTION**

92895           The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.254](#) (on page 68),  
 92896           and shall be converted to a pathname of the directory containing the entry of the final pathname  
 92897           component. The resulting string shall be written to standard output. The *dirname* utility shall not  
 92898           perform pathname resolution; the result shall not be affected by whether or not a file with the  
 92899           pathname *string* exists or by its file type. Trailing '/' characters in *string* that are not also  
 92900           leading '/' characters shall not be counted as part of the pathname. If the pathname does not  
 92901           contain a '/', the resulting string shall be ".". If *string* is an empty string, the resulting string  
 92902           shall be ".".

92903           It is unspecified whether redundant '/' characters and '.' pathname components in *string* are  
 92904           removed after determining the pathname to output. However, "." pathname components  
 92905           occurring prior to the final component shall not be removed.

92906 **OPTIONS**

92907           None.

92908 **OPERANDS**

92909           The following operand shall be supported:

92910           *string*           A string.92911 **STDIN**

92912           Not used.

92913 **INPUT FILES**

92914           None.

92915 **ENVIRONMENT VARIABLES**92916           The following environment variables shall affect the execution of *dirname*:

92917           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 92918           (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 92919           variables used to determine the values of locale categories.)

92920           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 92921           internationalization variables.

92922           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 92923           characters (for example, single-byte as opposed to multi-byte characters in  
 92924           arguments).

92925           *LC\_MESSAGES*

92926           Determine the locale that should be used to affect the format and contents of  
 92927           diagnostic messages written to standard error.

92928   XSI       *NLSPATH*   Determine the location of messages objects and message catalogs.

92929 **ASYNCHRONOUS EVENTS**

92930           Default.

92931 **STDOUT**

92932 The *dirname* utility shall write a line to the standard output in the following format:

92933 "%s\n", <resulting string>

92934 **STDERR**

92935 The standard error shall be used only for diagnostic messages.

92936 **OUTPUT FILES**

92937 None.

92938 **EXTENDED DESCRIPTION**

92939 None.

92940 **EXIT STATUS**

92941 The following exit values shall be returned:

92942 0 Successful completion.

92943 >0 An error occurred.

92944 **CONSEQUENCES OF ERRORS**

92945 Default.

92946 **APPLICATION USAGE**

92947 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
92948 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
92949 to the beginning of a pathname unless they can ensure that there are more or less than two or are  
92950 prepared to deal with the implementation-defined consequences.

92951 **EXAMPLES**

92952 The EXAMPLES section of the *basename()* function (see XSH *basename()*) includes a table  
92953 showing examples of the results of processing several sample pathnames by the *basename()* and  
92954 *dirname()* functions and by the *basename* and *dirname* utilities.

92955 See also the examples for the *basename* utility.

92956 **RATIONALE**

92957 The behaviors of *basename* and *dirname* in this volume of POSIX.1-2024 have been coordinated so  
92958 that when *string* is a valid pathname:

92959 `$(basename -- "string")`

92960 would be a valid filename for the file in the directory:

92961 `$(dirname -- "string")`

92962 This would not work for the versions of these utilities in early proposals due to the way  
92963 processing of trailing <slash> characters was specified. Consideration was given to leaving  
92964 processing unspecified if there were trailing <slash> characters, but this cannot be done; XBD  
92965 [Section 3.254](#) (on page 68) allows trailing <slash> characters. The *basename* and *dirname* utilities  
92966 have to specify consistent handling for all valid pathnames.

92967 The *dirname* utility is not specified in terms of the *dirname()* function, because the two may  
92968 produce slightly different output where both output forms are still compliant. An  
92969 implementation should prefer the shortest output possible; however, this is not required, in part  
92970 because earlier versions of the standard did not permit elision of redundant <slash> characters  
92971 or dot ('.') components. Removal of the dot-dot ("..") pathname component is not permitted,  
92972 because eliding it correctly would require performing pathname resolution to ensure the  
92973 resulting string would still point to the correct pathname if the original string resolved as a

92974 pathname. On implementations where pathname "/" has an implementation-defined meaning  
92975 distinct from the pathname "/", the dirname of "/" will be "/".

#### 92976 **FUTURE DIRECTIONS**

92977 If this utility is directed to display a pathname that contains any bytes that have the encoded  
92978 value of a <newline> character when <newline> is a terminator or separator in the output  
92979 format being used, implementations are encouraged to treat this as an error. A future version of  
92980 this standard may require implementations to treat this as an error.

#### 92981 **SEE ALSO**

92982 [Section 2.5](#) (on page 2478), *basename*  
92983 [XBD Section 3.254](#) (on page 68), [Chapter 8](#) (on page 167)  
92984 XSH *basename()*, *dirname()*

#### 92985 **CHANGE HISTORY**

92986 First released in Issue 2.

#### 92987 **Issue 7**

92988 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0083 [192,430], XCU/TC1-2008/0084  
92989 [192], and XCU/TC1-2008/0085 [192] are applied.

92990 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0086 [612], XCU/TC2-2008/0087  
92991 [620], and XCU/TC2-2008/0088 [612] are applied.

#### 92992 **Issue 8**

92993 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
92994 directed to display a pathname that contains any bytes that have the encoded value of a  
92995 <newline> character when <newline> is a terminator or separator in the output format being  
92996 used.

92997 Austin Group Defect 1073 is applied, replacing the DESCRIPTION section with one that matches  
92998 the *dirname()* function.

92999 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

93000 **NAME**

93001 du — estimate file space usage

93002 **SYNOPSIS**93003 du [-a|-s] [-kx] [-H|-L] [*file*...]93004 **DESCRIPTION**

93005 By default, the *du* utility shall write to standard output the size of the file space allocated to, and  
 93006 the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the  
 93007 specified files. By default, when a symbolic link is encountered on the command line or in the  
 93008 file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the  
 93009 link), and shall not follow the link to another portion of the file hierarchy. The size of the file  
 93010 space allocated to a file of type directory shall be defined as the sum total of space allocated to  
 93011 all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

93012 When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the  
 93013 final exit status is affected. A file that occurs multiple times shall be counted and written for only  
 93014 one entry, even if the occurrences are under different file operands. The directory entry that is  
 93015 selected in the report is unspecified. By default, file sizes shall be written in 512-byte units,  
 93016 rounded up to the next 512-byte unit.

93017 **OPTIONS**93018 The *du* utility shall conform to XBD [Section 12.2](#) (on page 215).

93019 The following options shall be supported:

93020 **-a** In addition to the default output, report the size of each file not of type directory in  
 93021 the file hierarchy rooted in the specified file. The **-a** option shall not affect whether  
 93022 non-directories given as *file* operands are listed.

93023 **-H** If a symbolic link is specified on the command line, *du* shall count the size of the  
 93024 file or file hierarchy referenced by the link.

93025 **-k** Write the files sizes in units of 1024 bytes, rather than the default 512-byte units.

93026 **-L** If a symbolic link is specified on the command line or encountered during the  
 93027 traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy  
 93028 referenced by the link.

93029 **-s** Instead of the default output, report only the total sum for each of the specified  
 93030 files.

93031 **-x** When evaluating file sizes, evaluate only those files that have the same device as  
 93032 the file specified by the *file* operand.

93033 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 93034 an error. The last option specified shall determine the behavior of the utility.

93035 **OPERANDS**

93036 The following operand shall be supported:

93037 *file* The pathname of a file whose size is to be written. If no *file* is specified, the current  
 93038 directory shall be used.

93039 **STDIN**

93040 Not used.

93041 **INPUT FILES**

93042 None.

93043 **ENVIRONMENT VARIABLES**93044 The following environment variables shall affect the execution of *du*:

93045 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93046 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 93047 variables used to determine the values of locale categories.)

93048 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93049 internationalization variables.

93050 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93051 characters (for example, single-byte as opposed to multi-byte characters in  
 93052 arguments).

93053 *LC\_MESSAGES*

93054 Determine the locale that should be used to affect the format and contents of  
 93055 diagnostic messages written to standard error.

93056 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

93057 **ASYNCHRONOUS EVENTS**

93058 Default.

93059 **STDOUT**

93060 The output from *du* shall consist of the amount of space allocated to a file and the name of the  
 93061 file, in the following format:

93062 "%d %s\n", &lt;size&gt;, &lt;pathname&gt;

93063 **STDERR**

93064 The standard error shall be used only for diagnostic messages.

93065 **OUTPUT FILES**

93066 None.

93067 **EXTENDED DESCRIPTION**

93068 None.

93069 **EXIT STATUS**

93070 The following exit values shall be returned:

93071 0 Successful completion.

93072 &gt;0 An error occurred.

93073 **CONSEQUENCES OF ERRORS**

93074 Default.

## 93075 APPLICATION USAGE

93076 None.

## 93077 EXAMPLES

93078 None.

## 93079 RATIONALE

93080 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
93081 utilities in this volume of POSIX.1-2024. This does not mandate that the file system itself be  
93082 based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed by  
93083 the standard developers that 512 bytes was the best default unit because of its complete  
93084 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
93085 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the  
93086 1024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts  
93087 relying on the 512-byte units.

93088 The **-b** option was added to an early proposal to provide a resolution to the situation where  
93089 System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-  
93090 defined concept. (In common usage, the block size is 512 bytes for System V and 1024 bytes for  
93091 BSD systems.) However, **-b** was later deleted, since the default was eventually decided as  
93092 512-byte units.

93093 Historical file systems provided no way to obtain exact figures for the space allocation given to  
93094 files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks*  
93095 being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is  
93096 space used by the file system in the storage of the file, but that need not be counted in the space  
93097 allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position  
93098 beyond the end of the file and data has subsequently been written at that point. A file system  
93099 need not allocate all the intervening zero-filled blocks to such a file. It is up to the  
93100 implementation to define exactly how accurate its methods are.

93101 The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell  
93102 and Utilities description is implied by the language in the SVID where **-s** is described as causing  
93103 “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly  
93104 Conforming POSIX Shell and Utilities Application cannot use that combination.

93105 The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not  
93106 listing non-directories explicitly given as operands, unless the **-a** option is specified, was  
93107 considered a bug; the BSD-based behavior (report for all operands) is mandated. The default  
93108 behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no  
93109 messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and  
93110 Utilities default behavior shall be to produce such messages. These messages can be turned off  
93111 with shell redirection to achieve the System V behavior.

93112 The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of  
93113 POSIX.1-2024 because there was no other historical method of limiting the *du* search to a single  
93114 file hierarchy. This limitation of the search is necessary to make it possible to obtain file space  
93115 usage information about a file system on which other file systems are mounted, without having  
93116 to resort to a lengthy *find* and *awk* script.

93117 The use of the **-L** option, or of multiple *file* operands, requires that *du* track all file entries  
93118 encountered, even with a link count of one. However, when **-L** is not used and only a single *file*  
93119 operand is given, an implementation can optimize by only tracking files with a link count  
93120 greater than one, since in that scenario, those are the only files that could be encountered more  
93121 than once.

**93122 FUTURE DIRECTIONS**

93123 If this utility is directed to display a pathname that contains any bytes that have the encoded  
93124 value of a <newline> character when <newline> is a terminator or separator in the output  
93125 format being used, implementations are encouraged to treat this as an error. A future version of  
93126 this standard may require implementations to treat this as an error.

**93131 CHANGE HISTORY**

93132 First released in Issue 2.

**93133 Issue 6**

93134 This utility is marked as part of the User Portability Utilities option.

93135 The APPLICATION USAGE section is added.

93136 The obsolescent `-r` option is removed.

93137 The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had  
93138 incorrectly been marked LEGACY in Issue 5.

93139 The `-H` and `-L` options for symbolic links are added as described in the IEEE P1003.2b draft  
93140 standard.

**93141 Issue 7**

93142 The *du* utility is moved from the User Portability Utilities option to the Base. User Portability  
93143 Utilities is now an option for interactive utilities.

93144 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93145 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0089 [527] is applied.

**93146 Issue 8**

93147 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
93148 directed to display a pathname that contains any bytes that have the encoded value of a  
93149 <newline> character when <newline> is a terminator or separator in the output format being  
93150 used.

93151 Austin Group Defect 539 is applied, requiring a file that occurs multiple times to be counted and  
93152 written for only one entry.

93153 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

93154 **NAME**

93155 echo — write arguments to standard output

93156 **SYNOPSIS**93157 echo [*string...*]93158 **DESCRIPTION**93159 The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are  
93160 no arguments, only the <newline> is written.93161 **OPTIONS**93162 The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10  
93163 of XBD [Section 12.2](#) (on page 215); "--" shall be recognized as a string operand.

93164 Implementations shall not support any options.

93165 **OPERANDS**

93166 The following operands shall be supported:

93167 *string* A string to be written to standard output. If the first operand consists of a '-'  
93168 followed by one or more characters from the set {'e', 'E', 'n'}, or if any of the  
93169 operands contain a <backslash> character, the results are implementation-defined.93170 XSI On XSI-conformant systems, if the first operand consists of a '-' followed by one  
93171 or more characters from the set {'e', 'E', 'n'}, it shall be treated as a string to be  
93172 written. The following character sequences shall be recognized on XSI-conformant  
93173 systems within any of the arguments:

93174	\a	Write an <alert>.
93175	\b	Write a <backspace>.
93176	\c	Suppress the <newline> that otherwise follows the final argument in the 93177 output. All characters following the '\c' in the arguments shall be 93178 ignored.
93179	\f	Write a <form-feed>.
93180	\n	Write a <newline>.
93181	\r	Write a <carriage-return>.
93182	\t	Write a <tab>.
93183	\v	Write a <vertical-tab>.
93184	\\	Write a <backslash> character.
93185	\0 <i>num</i>	Write an 8-bit value that is the zero, one, two, or three-digit octal number 93186 <i>num</i> .

93187 **STDIN**

93188 Not used.

93189 **INPUT FILES**

93190 None.

93191 **ENVIRONMENT VARIABLES**93192 The following environment variables shall affect the execution of *echo*:

93193		<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)
93194			
93195			
93196		<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
93197			
93198	XSI	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
93199			
93200			
93201		<i>LC_MESSAGES</i>	
93202			Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
93203			
93204	XSI	<i>NLSPATH</i>	Determine the location of messages objects and message catalogs.
93205		<b>ASYNCHRONOUS EVENTS</b>	
93206			Default.
93207		<b>STDOUT</b>	
93208			The <i>echo</i> utility arguments shall be separated by single <space> characters and a <newline> character shall follow the last argument. Output transformations shall occur based on the escape sequences in the input. See the OPERANDS section.
93209	XSI		
93210			
93211		<b>STDERR</b>	
93212			The standard error shall be used only for diagnostic messages.
93213		<b>OUTPUT FILES</b>	
93214			None.
93215		<b>EXTENDED DESCRIPTION</b>	
93216			None.
93217		<b>EXIT STATUS</b>	
93218			The following exit values shall be returned:
93219		0	Successful completion.
93220		>0	An error occurred.
93221		<b>CONSEQUENCES OF ERRORS</b>	
93222			Default.
93223		<b>APPLICATION USAGE</b>	
93224			It is not possible to use <i>echo</i> portably across all POSIX systems unless escape sequences are omitted, and the first argument does not consist of a '-' followed by one or more characters from the set {'e', 'E', 'n'}.
93225			
93226			
93227			The <i>printf</i> utility can be used portably to emulate any of the traditional behaviors of the <i>echo</i> utility as follows (assuming that <i>IFS</i> has its standard value or is unset):
93228			
93229			• The historic System V <i>echo</i> and the requirements on XSI implementations in this volume of POSIX.1-2024 are equivalent to:
93230			
93231			<code>printf "%b\n" "\$*"</code>
93232			• The BSD <i>echo</i> is equivalent to:
93233			<code>if [ "X\$1" = "X-n" ]</code>
93234			<code>then</code>

```

93235         shift
93236         printf "%s" "$*"
93237     else
93238         printf "%s\n" "$*"
93239     fi

```

93240 New applications are encouraged to use *printf* instead of *echo*.

#### 93241 EXAMPLES

93242 None.

#### 93243 RATIONALE

93244 The *echo* utility has not been made obsolescent because of its extremely widespread use in  
 93245 historical applications. Conforming applications that wish to do prompting without <newline>  
 93246 characters or that could possibly be expecting to echo a string consisting of a '-' followed by  
 93247 one or more characters from the set {'e', 'E', 'n'} should use the *printf* utility.

93248 At the time that the IEEE Std 1003.2-1992 standard was being developed, the two different  
 93249 historical versions of *echo* that were considered for standardization varied in incompatible ways.

93250 The BSD *echo* checked the first argument for the string *-n* which caused it to suppress the  
 93251 <newline> that would otherwise follow the final argument in the output.

93252 The System V *echo* treated all arguments as strings to be written, but allowed escape sequences  
 93253 within them, as described for XSI implementations in the OPERANDS section, including *\c* to  
 93254 suppress a trailing <newline>.

93255 Thus the IEEE Std 1003.2-1992 standard said that the behavior was implementation-defined if  
 93256 the first operand is *-n* or if any of the operands contain a <backslash> character. It also specified  
 93257 that the *echo* utility does not support Utility Syntax Guideline 10 because historical applications  
 93258 depended on *echo* to echo *all* of its arguments, except for the *-n* first argument in the BSD  
 93259 version.

93260 The Single UNIX Specification, Version 1 required the System V behavior, and this became the  
 93261 XSI requirement when Version 2 and POSIX.2 were merged with POSIX.1 to form the joint  
 93262 IEEE Std 1003.1-2001 / Single UNIX Specification, Version 3 standard.

93263 This standard now treats a first operand of *-e* or *-E* the same as *-n* in recognition that support  
 93264 for them has become more widespread in non-XSI implementations. Where supported, *-e*  
 93265 enables processing of escape sequences in the remaining operands (in situations where it is  
 93266 disabled by default), and *-E* disables it (in situations where it is enabled by default). A first  
 93267 operand containing a combination of these three letters, in the same manner as option grouping,  
 93268 also results in implementation-defined behavior.

#### 93269 FUTURE DIRECTIONS

93270 None.

93273 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 93274 CHANGE HISTORY

93275 First released in Issue 2.

93276 **Issue 5**93277  
93278

In the OPTIONS section, the last sentence is changed to indicate that implementations “do not” support any options; in the previous issue this said “need not”.

93279 **Issue 6**93280  
93281

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

93282  
93283  
93284

- A set of character sequences is defined as *string* operands.
- *LC\_CTYPE* is added to the list of environment variables affecting *echo*.
- In the OPTIONS section, implementations shall not support any options.

93285  
93286

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can accommodate historical BSD behavior.

93287 **Issue 7**

93288

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93289 **Issue 8**

93290

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

93291  
93292  
93293

Austin Group Defect 1222 is applied, making the results implementation-defined, on systems that are not XSI-conformant, if the first operand consists of a '-' followed by one or more characters from the set {'e', 'E', 'n'}.

93294 **NAME**

93295 ed — edit text

93296 **SYNOPSIS**93297 ed [-p *string*] [-s] [*file*]93298 **DESCRIPTION**

93299 The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*. In  
 93300 command mode the input characters shall be interpreted as commands, and in input mode they  
 93301 shall be interpreted as text. See the EXTENDED DESCRIPTION section.

93302 If an operand is '-', the results are unspecified.

93303 **OPTIONS**

93304 The *ed* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
 93305 of '-'.

93306 The following options shall be supported:

93307 **-p** *string* Use *string* as the prompt string when in command mode. By default, there shall be  
 93308 no prompt string.

93309 **-s** Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the '!'  
 93310 prompt after a *!command*.

93311 **OPERANDS**

93312 The following operand shall be supported:

93313 *file* If the *file* argument is given, *ed* shall perform the effect of an **e** command on the  
 93314 pathname *file* before accepting commands from the standard input, except that *file*  
 93315 can contain a <newline>, even though this is not possible for the argument to the **e**  
 93316 command.

93317 **STDIN**

93318 The standard input shall be a text file consisting of commands, as described in the EXTENDED  
 93319 DESCRIPTION section.

93320 **INPUT FILES**

93321 The input files shall be text files.

93322 **ENVIRONMENT VARIABLES**93323 The following environment variables shall affect the execution of *ed*:

93324 **HOME** Determine the pathname of the user's home directory.

93325 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 93326 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 93327 variables used to determine the values of locale categories.)

93328 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 93329 internationalization variables.

93330 **LC\_COLLATE**

93331 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 93332 character collating elements within regular expressions.

93333 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 93334 characters (for example, single-byte as opposed to multi-byte characters in  
 93335 arguments and input files) and the behavior of character classes within regular  
 93336 expressions.

- 93337 *LC\_MESSAGES*
- 93338 Determine the locale that should be used to affect the format and contents of
- 93339 diagnostic messages written to standard error and informative messages written to
- 93340 standard output.
- 93341 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 93342 **ASYNCHRONOUS EVENTS**
- 93343 The *ed* utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS
- 93344 section in [Section 1.4](#), on page 2462) with the following exceptions:
- 93345 **SIGINT** The *ed* utility shall interrupt its current activity, write the string "?\n" to standard
- 93346 output, and return to command mode (see the EXTENDED DESCRIPTION
- 93347 section).
- 93348 **SIGHUP** If the buffer is not empty and the buffer change flag is currently set to either
- 93349 **changed** or **changed-and-warned** (see the EXTENDED DESCRIPTION section),
- 93350 the *ed* utility shall attempt to write a copy of the buffer in a file. First, the file
- 93351 named **ed.hup** in the current directory shall be used; if that fails, the file named
- 93352 **ed.hup** in the directory named by the *HOME* environment variable shall be used.
- 93353 In any case, the *ed* utility shall exit without writing the file to the currently
- 93354 remembered pathname and without returning to command mode.
- 93355 **SIGQUIT** The *ed* utility shall ignore this event.
- 93356 **STDOUT**
- 93357 Various editing commands and the prompting feature (see **-p**) write to standard output, as
- 93358 described in the EXTENDED DESCRIPTION section.
- 93359 **STDERR**
- 93360 The standard error shall be used for diagnostic messages and may be used for warning
- 93361 messages.
- 93362 **OUTPUT FILES**
- 93363 The output files shall be text files whose formats are dependent on the editing commands given.
- 93364 **EXTENDED DESCRIPTION**
- 93365 The *ed* utility shall operate on a copy of the file it is editing; changes made to the copy shall have
- 93366 no effect on the file until a **w** (write) command is given. The copy of the text is called the *buffer*.
- 93367 The *ed* utility shall keep track of whether the buffer has been modified. This shall be maintained
- 93368 as if via a tri-state internal flag with the state values **unchanged**, **changed**, and **changed-and-**
- 93369 **warned**, which is:
- 93370 • Initially set to **unchanged**
  - 93371 • Set to **changed** by any command that modifies the buffer
  - 93372 • Set to **unchanged** by an **e** or **E** command that reloads (or empties) the buffer, or a **w**
  - 93373 command that writes the entire buffer
  - 93374 • Set to either **changed-and-warned** or **unchanged** by an **e** or **q** command that warns an
  - 93375 attempt was made to destroy the editor buffer
- 93376 A command that makes changes to the buffer in such a way that its contents are the same after
- 93377 the command (for example **s/a/a/**) shall be considered to have modified the buffer, unless
- 93378 explicitly stated otherwise. In the remainder of the description, this flag is referred to as the
- 93379 *buffer change flag*.
- 93380 Commands to *ed* have a simple and regular structure: zero, one, or two *addresses* followed by a

93381 single-character *command*, possibly followed by parameters to that command. These addresses  
 93382 specify one or more lines in the buffer. Every command that requires addresses has default  
 93383 addresses, so that the addresses very often can be omitted. If the `-p` option is specified, the  
 93384 prompt string shall be written to standard output before each command is read.

93385 In general, only one command can appear on a line. Certain commands allow text to be input.  
 93386 This text is placed in the appropriate place in the buffer. While *ed* is accepting text, it is said to be  
 93387 in *input mode*. In this mode, no commands shall be recognized; all input is merely collected.  
 93388 Input mode is terminated by entering a line consisting of two characters: a <period> ( ' . ' )  
 93389 followed by a <newline>. This line is not considered part of the input text.

### 93390 **Regular Expressions in ed**

93391 The *ed* utility shall support basic regular expressions, as described in XBD [Section 9.3](#) (on page  
 93392 181). Since regular expressions in *ed* are always matched against single lines (excluding the  
 93393 terminating <newline> characters), never against any larger section of text, there is no way for a  
 93394 regular expression to match a <newline>.

93395 A null RE shall be equivalent to the last RE encountered.

93396 Regular expressions are used in addresses to specify lines, and in some commands (for example,  
 93397 the *s* substitute command) to specify portions of a line to be substituted.

93398 The start and end of a regular expression (RE) are marked by a delimiter character (although in  
 93399 some circumstances the end delimiter can be omitted). In addresses, the delimiter is either  
 93400 <slash> or <question-mark>. In commands, other characters can be used as the delimiter, as  
 93401 specified in the description of the command. Within the RE (as an *ed* extension to the BRE  
 93402 syntax), the delimiter shall not terminate the RE if it is the second character of an escape  
 93403 sequence (see XBD [Section 9.1](#), on page 179) and the escaped delimiter shall be treated as that  
 93404 literal character in the RE (losing any special meaning it would have had if it was not used as the  
 93405 delimiter and was not escaped). In addition, the delimiter character shall not terminate the RE  
 93406 when it appears within a bracket expression, and shall have its normal meaning in the bracket  
 93407 expression. For example, the command `"g%[%]p"` is equivalent to `"g/[ ]/p"`, and the  
 93408 command `"s-[0-9]--g"` is equivalent to `"s/[0-9]/g"`.

### 93409 **Addresses in ed**

93410 Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a  
 93411 command. The current line number is the address of the current line. If the edit buffer is not  
 93412 empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

93413 Addresses shall be constructed as follows:

- 93414 1. The <period> character ( ' . ' ) shall address the current line.
- 93415 2. The <dollar-sign> character ( ' \$ ' ) shall address the last line of the edit buffer.
- 93416 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 93417 4. The <apostrophe>-*x* character pair ( " ' x " ) shall address the line marked with the mark  
 93418 name character *x*, which shall be a lowercase letter from the portable character set. It shall  
 93419 be an error if the character has not been set to mark a line or if the line that was marked is  
 93420 not currently present in the edit buffer.
- 93421 5. A BRE enclosed by <slash> characters ( ' / ' ) shall address the first line found by  
 93422 searching forwards from the line following the current line toward the end of the edit  
 93423 buffer and stopping at the first line for which the line excluding the terminating  
 93424 <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of

93425 <slash> characters shall address the next line for which the line excluding the terminating  
 93426 <newline> matches the last BRE encountered. In addition, the second <slash> can be  
 93427 omitted at the end of a command line. Within the BRE, a <backslash>-<slash> pair ("`\`")  
 93428 shall represent a literal <slash> instead of the BRE delimiter. If necessary, the search shall  
 93429 wrap around to the beginning of the buffer and continue up to and including the current  
 93430 line, so that the entire buffer is searched.

93431 6. A BRE enclosed by <question-mark> characters ('?') shall address the first line found by  
 93432 searching backwards from the line preceding the current line toward the beginning of the  
 93433 edit buffer and stopping at the first line for which the line excluding the terminating  
 93434 <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of  
 93435 <question-mark> characters ("??") shall address the previous line for which the line  
 93436 excluding the terminating <newline> matches the last BRE encountered. In addition, the  
 93437 second <question-mark> can be omitted at the end of a command line. Within the BRE, a  
 93438 <backslash>-<question-mark> pair ("\?") shall represent a literal <question-mark>  
 93439 instead of the BRE delimiter. If necessary, the search shall wrap around to the end of the  
 93440 buffer and continue up to and including the current line, so that the entire buffer is  
 93441 searched.

93442 7. A <plus-sign> ('+') or <hyphen-minus> character ('-') followed by a decimal number  
 93443 shall address the current line plus or minus the number. A <plus-sign> or <hyphen-  
 93444 minus> character not followed by a decimal number shall address the current line plus or  
 93445 minus 1.

93446 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.  
 93447 Address offsets are constructed as follows:

- 93448 • A <plus-sign> or <hyphen-minus> character followed by a decimal number shall add or  
 93449 subtract, respectively, the indicated number of lines to or from the address. A <plus-sign>  
 93450 or <hyphen-minus> character not followed by a decimal number shall add or subtract 1 to  
 93451 or from the address.
- 93452 • A decimal number shall add the indicated number of lines to the address.

93453 It shall not be an error for an intermediate address value to be less than zero or greater than the  
 93454 last line in the edit buffer. It shall be an error for the final address value to be less than zero or  
 93455 greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a  
 93456 matching line.

93457 Commands accept zero, one, or two addresses. If one or more addresses are provided to a  
 93458 command that requires zero addresses, it shall be an error. Otherwise, if more than the  
 93459 maximum number of accepted addresses are provided to a command, the addresses shall be  
 93460 evaluated from first to last and then discarded, until the maximum number of accepted  
 93461 addresses for that command remain.

93462 Addresses shall be separated from each other by a <comma> (',') or <semicolon> character  
 93463 (';'). In the case of a <semicolon> separator, the current line ('.') shall be set to the first  
 93464 address, and only then shall the second address be calculated. This feature can be used to  
 93465 determine the starting line for forwards and backwards searches; see rules 5. and 6.

93466 Addresses can be omitted on either side of the <comma> or <semicolon> separator, in which  
 93467 case the resulting address pairs shall be as follows:

93468  
93469  
93470  
93471  
93472  
93473  
93474

Specified	Resulting
,	1 , \$
, addr	1 , addr
addr ,	addr , addr
;	. ; \$
; addr	. ; addr
addr ;	addr ; addr

93475  
93476  
93477  
93478

If an address is omitted between two separators, the rule shall be applied to the first separator and the resulting second address shall be used as the first address for the second separator. For example, with the address list ", , " the first ', ' becomes "1, \$" and the '\$' is treated as the first address for the second ', ', resulting in "1, \$, \$".

93479  
93480

Any <blank> characters included between addresses, address separators, or address offsets shall be ignored.

93481

### Commands in ed

93482  
93483  
93484

In the following list of *ed* commands, the default addresses are shown in parentheses. The number of addresses shown in the default shall be the number expected by the command. The parentheses are not part of the address; they show that the given addresses are the default.

93485  
93486  
93487  
93488  
93489  
93490  
93491  
93492  
93493

It is generally invalid for more than one command to appear on a line. However, any command (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but it is unspecified whether the suffix writes the current line again in the requested format or whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l** suffix) shall either write just the current line or write it twice—once as specified for **p** and once as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

93494  
93495  
93496

Each address component can be preceded by zero or more <blank> characters. The command letter can be preceded by zero or more <blank> characters. If a suffix letter (**l**, **n**, or **p**) is given, the application shall ensure that it immediately follows the command.

93497  
93498

The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the command letter by one or more <blank> characters.

93499  
93500

If the buffer change flag is currently set to **changed**, *ed* shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands. The *ed* utility shall write the string:

93501

"?\n"

93502  
93503  
93504  
93505  
93506

(followed by an explanatory message if *help mode* has been enabled via the **H** command) to standard output and shall continue in command mode with the buffer change flag set to either **changed-and-warned** or **unchanged** and the current line number unchanged. If another **e** or **q** command is then attempted with no intervening command that sets the buffer change flag to **changed**, it shall take effect.

93507  
93508

If a terminal disconnect (see XBD Chapter 11 (on page 199), Modem Disconnect and Closing a Device Terminal), is detected:

93509  
93510

- If accompanied by a SIGHUP signal, the *ed* utility shall operate as described in the ASYNCHRONOUS EVENTS section for a SIGHUP signal.

- 93511           • If not accompanied by a SIGHUP signal, the *ed* utility shall act as if an end-of-file had been  
93512 detected on standard input.

93513 If an end-of-file is detected on standard input:

- 93514           • If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command  
93515 mode. It is unspecified if any partially entered lines (that is, input text without a  
93516 terminating <newline>) are discarded from the input text.
- 93517           • If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.

93518 In the following commands, if a closing delimiter would be the last character before a <newline>  
93519 then that character can be omitted with the behavior shown:

- 93520           • For the **g** and **v** commands the addressed line(s) shall be written as if a closing delimiter  
93521 followed by a **p** were appended to the command.
- 93522           • For the **G** and **V** commands no additional action shall be taken.
- 93523           • For the **s** command, only the closing delimiter of the replacement can be omitted, in which  
93524 case the result of the substitution shall be written as if the **p** flag were appended.
- 93525           • For the null command, the addressed line(s) shall be written as if the closing delimiter  
93526 were appended.

93527 For example, the following pairs of commands are equivalent:

```
93528 s/s1/s2    s/s1/s2/p
93529 g/s1       g/s1/p
93530 ?s1       ?s1?
```

93531 If an invalid command is entered, *ed* shall write the string:

93532 "?\n"

93533 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to  
93534 standard output and shall continue in command mode with the current line number unchanged.

### 93535 **Append Command**

```
93536 Synopsis:  (.) a
93537             <text>
93538             .
```

93539 The **a** command shall read the given text and append it after the addressed line; the current line  
93540 number shall become the address of the last inserted line or, if there were none, the addressed  
93541 line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at  
93542 the beginning of the buffer. If <text> is empty (that is, the terminating ' .' immediately follows  
93543 the 'a'), the buffer change flag shall not be altered.

### 93544 **Change Command**

```
93545 Synopsis:  (.,.) c
93546             <text>
93547             .
```

93548 The **c** command shall delete the addressed lines, then accept input text that replaces these lines;  
93549 the current line shall be set to the address of the last line input; or, if there were none, at the line  
93550 after the last line deleted; if the lines deleted were originally at the end of the buffer, the current  
93551 line number shall be set to the address of the new last line; if no lines remain in the buffer, the

93552 current line number shall be set to zero.

### 93553 **Delete Command**

93554 *Synopsis:* ( , . ) d

93555 The **d** command shall delete the addressed lines from the buffer. The address of the line after the  
 93556 last line deleted shall become the current line number; if the lines deleted were originally at the  
 93557 end of the buffer, the current line number shall be set to the address of the new last line; if no  
 93558 lines remain in the buffer, the current line number shall be set to zero.

### 93559 **Edit Command**

93560 *Synopsis:* e [*file*]

93561 The **e** command shall delete the entire contents of the buffer and then read in the file named by  
 93562 the pathname *file*. The current line number shall be set to the address of the last line of the  
 93563 buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see  
 93564 the **f** command). If the pathname names a file that does not exist and the buffer change flag is  
 93565 currently set to **unchanged**, it is unspecified whether this is treated as an error, or whether the  
 93566 resulting buffer is emptied and a warning is written to standard error instead of writing the byte  
 93567 count to standard out. The number of bytes read shall be written to standard output, unless the  
 93568 **-s** option was specified, in the following format:

93569 "%d\n", <number of bytes read>

93570 The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**,  
 93571 and **w** commands. If *file* is replaced by '!', the rest of the line shall be taken to be a shell  
 93572 command line whose output is to be read. Such a shell command line shall not be remembered  
 93573 as the current *file*. All marks shall be discarded upon the completion of a successful **e** command.  
 93574 If the buffer change flag is currently set to **changed**, the user shall be warned, as described  
 93575 previously.

### 93576 **Edit Without Checking Command**

93577 *Synopsis:* E [*file*]

93578 The **E** command shall possess all properties and restrictions of the **e** command except that the  
 93579 editor shall not check the current state of the buffer change flag.

### 93580 **Filename Command**

93581 *Synopsis:* f [*file*]

93582 If *file* is given, the **f** command shall change the currently remembered pathname to *file*, whether  
 93583 or not *file* names an existing file; whether the name is changed or not, it shall then write the  
 93584 (possibly new) currently remembered pathname to the standard output in the following format:

93585 "%s\n", <pathname>

93586 The current line number shall be unchanged.

93587 **Global Command**93588 *Synopsis:* (1, \$)g/RE/command list

93589 In the **g** command, the first step shall be to mark every line for which the line excluding the  
 93590 terminating <newline> matches the given RE. Then, going sequentially from the beginning of  
 93591 the file to the end of the file, the given *command list* shall be executed for each marked line, with  
 93592 the current line number set to the address of that line. Any line modified by the *command list*  
 93593 shall be unmarked. When the **g** command completes, the current line number shall have the  
 93594 value assigned by the last command in the *command list*. If there were no matching lines, the  
 93595 current line number shall not be changed. A single command or the first of a list of commands  
 93596 shall appear on the same line as the global command. All lines of a multi-line list except the last  
 93597 line shall be ended with a <backslash> preceding the terminating <newline>; the **a**, **i**, and **c**  
 93598 commands and associated input are permitted. The '.' terminating input mode can be omitted  
 93599 if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the **p**  
 93600 command. The use of the **g**, **G**, **v**, **V**, and **!** commands in the *command list* produces undefined  
 93601 results. Any character other than <backslash>, <space>, or <newline> can be used instead of a  
 93602 <slash> to delimit the RE. Within the RE, in certain circumstances the RE delimiter can be used  
 93603 as a literal character; see [Regular Expressions in ed](#) (on page 2817).

93604 **Interactive Global Command**93605 *Synopsis:* (1, \$)G/RE/

93606 In the **G** command, the first step shall be to mark every line for which the line excluding the  
 93607 terminating <newline> matches the given RE. Then, for every such line, that line shall be  
 93608 written, the current line number shall be set to the address of that line, and any one command  
 93609 (other than one of the **a**, **c**, **i**, **g**, **G**, **v**, and **V** commands) shall be read and executed. A <newline>  
 93610 shall act as a null command (causing no action to be taken on the current line); an '&' shall  
 93611 cause the re-execution of the most recent non-null command executed within the current  
 93612 invocation of **G**. Note that the commands input as part of the execution of the **G** command can  
 93613 address and affect any lines in the buffer. Any line modified by the command shall be  
 93614 unmarked. The final value of the current line number shall be the value set by the last command  
 93615 successfully executed. (Note that the last command successfully executed shall be the **G**  
 93616 command itself if a command fails or the null command is specified.) If there were no matching  
 93617 lines, the current line number shall not be changed. The **G** command can be terminated by a  
 93618 SIGINT signal. Any character other than <backslash>, <space>, or <newline> can be used  
 93619 instead of a <slash> to delimit the RE. Within the RE, in certain circumstances the RE delimiter  
 93620 can be used as a literal character; see [Regular Expressions in ed](#) (on page 2817).

93621 **Help Command**93622 *Synopsis:* h

93623 The **h** command shall write a short message to standard output that explains the reason for the  
 93624 most recent '?' notification. The current line number shall be unchanged.

93625 **Help-Mode Command**93626 *Synopsis:*     H

93627 The **H** command shall cause *ed* to enter a mode in which help messages (see the **h** command)  
 93628 shall be written to standard output for all subsequent '?' notifications. The **H** command  
 93629 alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on,  
 93630 the **H** command also explains the previous '?' notification, if there was one. The current line  
 93631 number shall be unchanged.

93632 **Insert Command**

93633 *Synopsis:*     ( . ) i  
 93634                 <text>  
 93635                 .

93636 The **i** command shall insert the given text before the addressed line; the current line is set to the  
 93637 last inserted line or, if there was none, to the addressed line. This command differs from the **a**  
 93638 command only in the placement of the input text. Address 0 shall be valid for this command; it  
 93639 is unspecified whether it causes the inserted text to be placed at the beginning of the buffer or it  
 93640 is interpreted as if address 1 were specified. (These two allowed behaviors differ in the case that  
 93641 the buffer is empty.) If <text> is empty (that is, the terminating '.' immediately follows the  
 93642 'i'), the buffer change flag shall not be altered.

93643 **Join Command**93644 *Synopsis:*     ( . , .+1 ) j

93645 The **j** command shall join contiguous lines by removing the appropriate <newline> characters. If  
 93646 exactly one address is given, this command shall do nothing. If lines are joined, the current line  
 93647 number shall be set to the address of the joined line; otherwise, the current line number shall be  
 93648 unchanged.

93649 **Mark Command**93650 *Synopsis:*     ( . ) k x

93651 The **k** command shall mark the addressed line with name *x*, which the application shall ensure  
 93652 is a lowercase letter from the portable character set. The address "'x" shall then refer to this  
 93653 line; the current line number shall be unchanged.

93654 **List Command**93655 *Synopsis:*     ( . , . ) l

93656 The **l** command shall write to standard output the addressed lines in a visually unambiguous  
 93657 form. The characters listed in XBD Table 5-1 (on page 113) ('\ ', '\a', '\b', '\f', '\r',  
 93658 '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not  
 93659 applicable. Non-printable characters not in the table shall be written as one three-digit octal  
 93660 number (with a preceding <backslash> character) for each byte in the character (most significant  
 93661 byte first).

93662 Long lines shall be folded, with the point of folding indicated by <newline> preceded by a  
 93663 <backslash>; the length at which folding occurs is unspecified, but should be appropriate for the  
 93664 output device. The end of each line shall be marked with a '\$', and '\$' characters within the  
 93665 text shall be written with a preceding <backslash>. An **l** command can be appended to any  
 93666 other command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**. The current line number shall be set to the

93667 address of the last line written.

### 93668 **Move Command**

93669 *Synopsis:* ( , . ) *address*

93670 The **m** command shall reposition the addressed lines after the line addressed by *address*.  
93671 Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning  
93672 of the buffer. It shall be an error if address *address* falls within the range of moved lines. The  
93673 current line number shall be set to the address of the last line moved.

### 93674 **Number Command**

93675 *Synopsis:* ( , . ) *n*

93676 The **n** command shall write to standard output the addressed lines, preceding each line by its  
93677 line number and a <tab>; the current line number shall be set to the address of the last line  
93678 written. The **n** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

### 93679 **Print Command**

93680 *Synopsis:* ( , . ) *p*

93681 The **p** command shall write to standard output the addressed lines; the current line number shall  
93682 be set to the address of the last line written. The **p** command can be appended to any command  
93683 other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

### 93684 **Prompt Command**

93685 *Synopsis:* **P**

93686 The **P** command shall cause *ed* to prompt with an <asterisk> ('\*') (or *string*, if **-p** is specified)  
93687 for all subsequent commands. The **P** command alternatively shall turn this mode on and off; it  
93688 shall be initially on if the **-p** option is specified; otherwise, off. The current line number shall be  
93689 unchanged.

### 93690 **Quit Command**

93691 *Synopsis:* **q**

93692 The **q** command shall cause *ed* to exit. If the buffer change flag is currently set to **changed**, the  
93693 user shall be warned, as described previously.

### 93694 **Quit Without Checking Command**

93695 *Synopsis:* **Q**

93696 The **Q** command shall cause *ed* to exit without checking the current state of the buffer change  
93697 flag.

93698 **Read Command**93699 *Synopsis:* (\$) **r** [*file*]

93700 The **r** command shall read in the file named by the pathname *file* and append it after the  
 93701 addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be  
 93702 used (see the **e** and **f** commands). The currently remembered pathname shall not be changed  
 93703 unless there is no remembered pathname. Address 0 shall be valid for **r** and shall cause the file  
 93704 to be read at the beginning of the buffer. If the read is successful, and **-s** was not specified, the  
 93705 number of bytes read shall be written to standard output in the following format:

93706 "%d\n", &lt;number of bytes read&gt;

93707 The current line number shall be set to the address of the last line read in. If *file* is replaced by  
 93708 '!', the rest of the line shall be taken to be a shell command line whose output is to be read.  
 93709 Such a shell command line shall not be remembered as the current pathname.

93710 If the number of bytes read is 0 it is unspecified whether the buffer change flag is set to **changed**  
 93711 or left unaltered.

93712 **Substitute Command**93713 *Synopsis:* (.,.) **s**/RE/replacement/flags

93714 The **s** command shall search each addressed line for an occurrence of the specified RE and  
 93715 replace either the first or all (non-overlapped) matched strings with the *replacement*; see the  
 93716 following description of the **g** suffix. Any character other than <backslash>, <space>, or  
 93717 <newline> can be used instead of a <slash> to delimit the RE and the replacement. Within the  
 93718 RE, in certain circumstances the RE delimiter can be used as a literal character; see [Regular](#)  
 93719 [Expressions in ed](#) (on page 2817). Within the replacement, the delimiter shall not terminate the  
 93720 replacement if it is the second character of an escape sequence (see [XBD Section 9.1](#), on page 179)  
 93721 and the escaped delimiter shall be treated as that literal character in the replacement (losing any  
 93722 special meaning it would have had if it was not used as the delimiter and was not escaped). It  
 93723 shall be an error if the substitution fails on every addressed line. The current line shall be set to  
 93724 the address of the last line on which a substitution occurred.

93725 An unescaped <ampersand> ('&') appearing in the replacement shall be replaced by the string  
 93726 matching the RE on the current line. As a more general feature, the characters '\n', where the  
 93727 <backslash> is unescaped and *n* is a digit, shall be replaced by the text matched by the  
 93728 corresponding back-reference expression. If the corresponding back-reference expression does  
 93729 not match, then the characters '\n' shall be replaced by the empty string. When the character  
 93730 '%' is the only character in *replacement*, the *replacement* used in the most recent substitute  
 93731 command shall be used as *replacement* in the current substitute command; if there was no  
 93732 previous substitute command, the use of '%' in this manner shall be an error. The '%' shall lose  
 93733 its special meaning when it is in a replacement string of more than one character or is escaped. It  
 93734 is unspecified what special meaning is given to any character other than <backslash>, '&', '%',  
 93735 or digits.

93736 A line can be split by substituting a <newline> into it. The application shall ensure it escapes the  
 93737 <newline> in the *replacement* by preceding it by <backslash>. Such substitution cannot be done  
 93738 as part of a **g** or **v** *command list*. The current line number shall be set to the address of the last  
 93739 line on which a substitution is performed. If no substitution is performed, the current line  
 93740 number shall be unchanged. If a line is split, a substitution shall be considered to have been  
 93741 performed on each of the new lines for the purpose of determining the new current line number.  
 93742 A substitution shall be considered to have been performed even if the replacement string is  
 93743 identical to the string that it replaces.

- 93744 The application shall ensure that the value of *flags* is zero or more of:
- 93745 *count* Substitute for the *count*th occurrence only of the RE found on each addressed line.
- 93746 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first  
93747 one. If both **g** and *count* are specified, the results are unspecified.
- 93748 **l** Write to standard output the final line in which a substitution was made. The line shall  
93749 be written in the format specified for the **l** command.
- 93750 **n** Write to standard output the final line in which a substitution was made. The line shall  
93751 be written in the format specified for the **n** command.
- 93752 **p** Write to standard output the final line in which a substitution was made. The line shall  
93753 be written in the format specified for the **p** command.

### 93754 **Copy Command**

93755 *Synopsis:* (*, .*)*taddress*

93756 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines  
93757 shall be placed after address *address* (which can be 0); the current line number shall be set to the  
93758 address of the last line added.

### 93759 **Undo Command**

93760 *Synopsis:* *u*

93761 The **u** command shall nullify the effect of the most recent command that modified anything in  
93762 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes  
93763 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no  
93764 changes were made by the global command (such as with **g/RE/p**), the **u** command shall have  
93765 no effect. The current line number shall be set to the value it had immediately before the  
93766 command being undone started.

### 93767 **Global Non-Matched Command**

93768 *Synopsis:* (1, \$)*v/RE/command list*

93769 This command shall be equivalent to the global command **g** except that the lines that are marked  
93770 during the first step shall be those for which the line excluding the terminating <newline> does  
93771 not match the RE.

### 93772 **Interactive Global Not-Matched Command**

93773 *Synopsis:* (1, \$)*V/RE/*

93774 This command shall be equivalent to the interactive global command **G** except that the lines that  
93775 are marked during the first step shall be those for which the line excluding the terminating  
93776 <newline> does not match the RE.

93777 **Write Command**93778 *Synopsis:* (1, \$)w [*file*]

93779 The **w** command shall write the addressed lines into the file named by the pathname *file*. The  
 93780 command shall create the file, if it does not exist, or shall replace the contents of the existing file.  
 93781 The currently remembered pathname shall not be changed unless there is no remembered  
 93782 pathname. If no pathname is given, the currently remembered pathname, if any, shall be used  
 93783 (see the **e** and **f** commands); the current line number shall be unchanged. If the command is  
 93784 successful, the number of bytes written shall be written to standard output, unless the **-s** option  
 93785 was specified, in the following format:

93786 "%d\n", &lt;number of bytes written&gt;

93787 If *file* begins with '!', the rest of the line shall be taken to be a shell command line whose  
 93788 standard input shall be the addressed lines. Such a shell command line shall not be remembered  
 93789 as the current pathname. This usage of the **w** command with '!' shall not alter the buffer  
 93790 change flag; thus, this alone shall not prevent the warning to the user if an attempt is made to  
 93791 destroy the editor buffer via the **e** or **q** commands.

93792 **Line Number Command**93793 *Synopsis:* (\$) =

93794 The line number of the addressed line shall be written to standard output in the following  
 93795 format:

93796 "%d\n", &lt;line number&gt;

93797 The current line number shall be unchanged by this command.

93798 **Shell Escape Command**93799 *Synopsis:* !*command*

93800 The remainder of the line after the '!' shall be sent to the command interpreter to be  
 93801 interpreted as a shell command line. Within the text of that shell command line, the unescaped  
 93802 character '%' shall be replaced with the remembered pathname; if a '!' appears as the first  
 93803 character of the command, it shall be replaced with the text of the previous shell command  
 93804 executed via '!'. Thus, "!!" shall repeat the previous !*command*. If any replacements of '%' or  
 93805 '!' are performed, the modified line shall be written to the standard output before *command* is  
 93806 executed. The ! command shall write:

93807 "!\n"

93808 to standard output upon completion, unless the **-s** option is specified. The current line number  
 93809 shall be unchanged.

93810 **Null Command**93811 *Synopsis:* (.+1)

93812 An address alone on a line shall cause the addressed line to be written. A <newline> alone shall  
 93813 be equivalent to "+1p". The current line number shall be set to the address of the written line.

93814 **EXIT STATUS**

93815 The following exit values shall be returned:

93816 0 Successful completion without any file or command errors.

93817 >0 An error occurred.

### 93818 CONSEQUENCES OF ERRORS

93819 When an error in the input script is encountered, or when an error is detected that is a  
93820 consequence of the data (not) present in the file or due to an external condition such as a read or  
93821 write error:

93822 • If the standard input is a terminal device file, all input shall be flushed, and a new  
93823 command read.

93824 • If the standard input is not a terminal device file, *ed* shall behave as described under  
93825 CONSEQUENCES OF ERRORS in [Section 1.4](#) (on page 2462).

### 93826 APPLICATION USAGE

93827 Because of the extremely terse nature of the default error messages, the prudent script writer  
93828 begins the *ed* input commands with an **H** command, so that if any errors do occur at least some  
93829 clue as to the cause is made available.

93830 In earlier versions of this standard, an obsolescent `-` option was described. This is no longer  
93831 specified. Applications should use the `-s` option. Using `-` as a *file* operand now produces  
93832 unspecified results. This allows implementations to continue to support the former required  
93833 behavior.

### 93834 EXAMPLES

93835 None.

### 93836 RATIONALE

93837 The initial description of this utility was adapted from the SVID. It contains some features not  
93838 found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and  
93839 BSD *ed* utilities include, but need not be limited to:

- 93840 • The BSD `-` option does not suppress the `!'` prompt after a `!` command.
- 93841 • BSD does not support the special meanings of the `'%` and `!'` characters within a `!`  
93842 command.
- 93843 • BSD does not support the *addresses* `';` and `',`.
- 93844 • BSD allows the command/suffix pairs `pp`, `ll`, and so on, which are unspecified in this  
93845 volume of POSIX.1-2024.
- 93846 • BSD does not support the `!'` character part of the `e`, `r`, or `w` commands.
- 93847 • A failed `g` command in BSD sets the line number to the last line searched if there are no  
93848 matches.
- 93849 • BSD does not default the *command list* to the `p` command.
- 93850 • BSD does not support the `G`, `h`, `H`, `n`, or `V` commands.
- 93851 • On BSD, if there is no inserted text, the insert command changes the current line to the  
93852 referenced line `-1`; that is, the line before the specified line.
- 93853 • On BSD, the `j` command with only a single address changes the current line to that  
93854 address.
- 93855 • BSD does not support the `P` command; moreover, in BSD it is synonymous with the `p`  
93856 command.

- 93857           • BSD does not support the *undo* of the commands **j**, **m**, **r**, **s**, or **t**.
- 93858           • The Version 7 *ed* command **W**, and the BSD *ed* commands **W**, **wq**, and **z** are not present in
- 93859           this volume of POSIX.1-2024.
  
- 93860           The **-s** option was added to allow the functionality of the removed **-** option in a manner
- 93861           compatible with the Utility Syntax Guidelines.
  
- 93862           In early proposals there was a limit, {ED\_FILE\_MAX}, that described the historical limitations of
- 93863           some *ed* utilities in their handling of large files; some of these have had problems with files
- 93864           larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a
- 93865           *split* command in this volume of POSIX.1-2024. Since this limit was removed, this volume of
- 93866           POSIX.1-2024 requires that implementations document the file size limits imposed by *ed* in the
- 93867           conformance document. The limit {ED\_LINE\_MAX} was also removed; therefore, the global
- 93868           limit {LINE\_MAX} is used for input and output lines.
  
- 93869           The manner in which the **l** command writes non-printable characters was changed to avoid the
- 93870           historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous
- 93871           because most terminals simply replace overstruck characters, making the **l** format not useful for
- 93872           its intended purpose of unambiguously understanding the content of the line. The historical
- 93873           <backslash>-escapes were also ambiguous. (The string "a\0011" could represent a line
- 93874           containing those six characters or a line containing the three characters 'a', a byte with a binary
- 93875           value of 1, and a 1.) In the format required here, a <backslash> appearing in the line is written as
- 93876           "\" so that the output is truly unambiguous. The method of marking the ends of lines was
- 93877           adopted from the *ex* editor and is required for any line ending in <space> characters; the '\$' is
- 93878           placed on all lines so that a real '\$' at the end of a line cannot be misinterpreted.
  
- 93879           Earlier versions of this standard allowed for implementations with bytes other than eight bits,
- 93880           but this has been modified in this version.
  
- 93881           The description of how a NUL is written was removed. The NUL character cannot be in text
- 93882           files, and this volume of POSIX.1-2024 should not dictate behavior in the case of undefined,
- 93883           erroneous input.
  
- 93884           Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands
- 93885           are not patterns.
  
- 93886           Early proposals stated that the **-p** option worked only when standard input was associated with
- 93887           a terminal device. This has been changed to conform to historical implementations, thereby
- 93888           allowing applications to interpose themselves between a user and the *ed* utility.
  
- 93889           The form of the substitute command that uses the **n** suffix was limited in some historical
- 93890           documentation (where this was described incorrectly as “backreferencing”). This limit has been
- 93891           omitted because there is no reason why an editor processing lines of {LINE\_MAX} length should
- 93892           have this restriction. The command **s/x/X/2047** should be able to substitute the 2 047th occurrence
- 93893           of 'x' on a line.
  
- 93894           The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made
- 93895           unspecified because BSD-based systems allow this, whereas System V does not.
  
- 93896           Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file
- 93897           have been deleted. Since this volume of POSIX.1-2024 refers to the **q** command in this instance,
- 93898           such behavior is not allowed.
  
- 93899           Some historical implementations returned exit status zero even if command errors had occurred;
- 93900           this is not allowed by this volume of POSIX.1-2024.
  
- 93901           Some historical implementations contained a bug that allowed a single <period> to be entered in

93902 input mode as `<backslash> <period> <newline>`. This is not allowed by *ed* because there is no  
 93903 description of escaping any of the characters in input mode; `<backslash>` characters are entered  
 93904 into the buffer exactly as typed. The typical method of entering a single `<period>` has been to  
 93905 precede it with another character and then use the substitute command to delete that character.

93906 It is difficult under some modes of some versions of historical operating system terminal drivers  
 93907 to distinguish between an end-of-file condition and terminal disconnect. POSIX.1-2024 does not  
 93908 require implementations to distinguish between the two situations, which permits historical  
 93909 implementations of the *ed* utility on historical platforms to conform. Implementations are  
 93910 encouraged to distinguish between the two, if possible, and take appropriate action on terminal  
 93911 disconnect.

93912 Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the  
 93913 start of the edit buffer. When the buffer was empty the command `.=` returned zero. POSIX.1-2024  
 93914 requires conformance to historical practice.

93915 For consistency with the **a** and **r** commands and better user functionality, the **i** command also  
 93916 accepts an address of 0. However, it is unspecified if `0i` is treated as `1i` (which will fail if the  
 93917 buffer is empty), or means insert at the beginning of the buffer (which will succeed even if the  
 93918 buffer is empty). Earlier versions of this standard required address 0 for the **c** command to be  
 93919 treated as 1 also, but this requirement has been removed, though implementations are permitted  
 93920 to do this as an extension.

93921 All of the following are valid addresses:

93922	<code>+++</code>	Three lines after the current line.
93923	<code>/pattern/-</code>	One line before the next occurrence of pattern.
93924	<code>-2</code>	Two lines before the current line.
93925	<code>3 ---- 2</code>	Line one (note the intermediate negative address).
93926	<code>1 2 3</code>	Line six.

93927 More than the maximum number of accepted addresses can be provided to commands taking  
 93928 addresses; for example, `"1,2,3,4,5p"` prints lines 4 and 5, because two is the maximum  
 93929 number of addresses accepted by the **print** command. This, in combination with the  
 93930 `<semicolon>` delimiter, permits users to create commands based on ordered patterns in the file.  
 93931 For example, the command `"3;/foo/;+2p"` will display the first line after line 3 that contains  
 93932 the pattern `foo`, plus the next two lines. Note that the address `"3;"` must still be evaluated before  
 93933 being discarded, because the search origin for the `"/foo/"` address depends on this.

93934 Historically, *ed* disallowed address chains, as discussed above, consisting solely of `<comma>` or  
 93935 `<semicolon>` separators; for example, `","` or `";;"` were considered an error. For  
 93936 consistency of address specification, this restriction is removed. The following table lists some of  
 93937 the address forms now possible:

	Address	Addr1	Addr2	Status	Comment
93938					
93939	7,	7	7	Historical	
93940	7,5,	5	5	Historical	
93941	7,5,9	5	9	Historical	
93942	7,9	7	9	Historical	
93943	7,+	7	.+	Historical	
93944	,	1	\$	Historical	
93945	,7	1	7	Extension	
93946	,,	\$	\$	Extension	
93947	,;	\$	\$	Extension	
93948	7;	7	7	Historical	
93949	7;5;	5	5	Historical	
93950	7;5;9	5	9	Historical	
93951	7;5,9	5	9	Historical	
93952	7;\$;4	\$	4	Historical	Valid, but erroneous.
93953	7;9	7	9	Historical	
93954	7;+	7	8	Historical	
93955	;	.	\$	Historical	
93956	;7	.	7	Extension	
93957	;;	\$	\$	Extension	
93958	;,	\$	\$	Extension	

93959 Historically, *ed* accepted the '^' character as an address, in which case it was identical to the  
 93960 <hyphen-minus> character. POSIX.1-2024 does not require or prohibit this behavior.

93961 Implementations are encouraged to set the buffer change flag to **changed-and-warned** when an  
 93962 **e** or **q** command warns that an attempt was made to destroy the editor buffer. Some existing  
 93963 implementations set it to **unchanged**, but this has the undesirable side-effect that a SIGHUP  
 93964 received after the warning is given does not write the buffer to **ed.hup**.

#### 93965 FUTURE DIRECTIONS

93966 If this utility is directed to create a new directory entry that contains any bytes that have the  
 93967 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 93968 error. A future version of this standard may require implementations to treat this as an error.

93969 A future version of this standard may require that the buffer change flag is set to **changed-and-**  
 93970 **warned** when an **e** or **q** command warns that an attempt was made to destroy the editor buffer.

93972 [Section 1.4](#) (on page 2462), *ex*, *sed*, *sh*, *vi*

93973 [XBD Table 5-1](#) (on page 113), [Chapter 8](#) (on page 167), [Section 9.3](#) (on page 181), [Chapter 11](#) (on  
 93974 page 199), [Section 12.2](#) (on page 215)

#### 93975 CHANGE HISTORY

93976 First released in Issue 2.

#### 93977 Issue 5

93978 In the OPTIONS section, the meaning of **-s** and **-** is clarified.

93979 A second FUTURE DIRECTION is added.

#### 93980 Issue 6

93981 The obsolescent single-minus form is removed.

93982 A second APPLICATION USAGE note is added.

- 93983 The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.
- 93984 The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition  
93985 of the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing  
93986 when end-of-file is detected and when terminal disconnect is detected.
- 93987 The normative text is reworded to avoid use of the term “must” for application requirements.
- 93988 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: “Any line  
93989 modified by the *command list* shall be unmarked.” to the **G** command. This change corresponds  
93990 to a similar change made to the **g** command in the first version of this standard.
- 93991 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/7 is applied, removing text describing  
93992 behavior on systems with bytes consisting of more than eight bits.
- 93993 **Issue 7**
- 93994 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
93995 ‘-’.
- 93996 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.
- 93997 SD5-XCU-ERN-94 is applied, updating text in the EXTENDED DESCRIPTION where a terminal  
93998 disconnect is detected (in Commands in *ed*).
- 93999 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 94000 SD5-XCU-ERN-135 is applied, removing some RATIONALE text that is no longer applicable.
- 94001 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0090 [584], XCU/TC2-2008/0091  
94002 [584], and XCU/TC2-2008/0092 [584] are applied.
- 94003 **Issue 8**
- 94004 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
94005 filenames containing any bytes that have the encoded value of a <newline> character.
- 94006 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 94007 Austin Group Defect 1130 is applied, removing the requirement for the **c** command to accept an  
94008 address of 0 and updating the information about address 0 in the RATIONALE section.
- 94009 Austin Group Defect 1131 is applied, changing the address 0 requirements for the **i** command.
- 94010 Austin Group Defect 1204 is applied, clarifying the behavior when a closing delimiter that  
94011 would be the last character before a <newline> is omitted.
- 94012 Austin Group Defect 1281 is applied, moving some text in the description of the **s** command and  
94013 changing it to use “shall”.
- 94014 Austin Group Defect 1298 is applied, changing the CONSEQUENCES OF ERRORS section.
- 94015 Austin Group Defect 1308 is applied, changing the **Addr2** value for address 7, + in the table of  
94016 address forms in the RATIONALE section.
- 94017 Austin Group Defect 1311 is applied, changing “*join* command” to “**j** command” in the  
94018 RATIONALE section.
- 94019 Austin Group Defect 1582 is applied, clarifying the behavior when an address is omitted  
94020 between two address separators.
- 94021 Austin Group Defect 1607 is applied, clarifying the behavior when more than the maximum  
94022 number of accepted addresses are provided to a command.
- 94023 Austin Group Defect 1662 is applied, clarifying requirements relating to delimiters in addresses

94024 and in `s` commands.

94025 Austin Group Defect 1786 is applied, clarifying the behavior when an `e` command names a file  
94026 that does not exist, and clarifying how the `ed` utility keeps track of whether the buffer has been  
94027 modified.

94028 **NAME**94029 `env` — set the environment for command invocation94030 **SYNOPSIS**94031 `env [-i] [name=value]... [utility [argument...]]`94032 **DESCRIPTION**94033 The `env` utility shall obtain the current environment, modify it according to its arguments, then  
94034 invoke the utility named by the *utility* operand with the modified environment.94035 Optional arguments shall be passed to *utility*.94036 If no *utility* operand is specified, the resulting environment shall be written to the standard  
94037 output, with one *name=value* pair per line.

94038 If the first argument is '-', the results are unspecified.

94039 **OPTIONS**94040 The `env` utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
94041 of '-'.  
94042 The following options shall be supported:

94042 The following options shall be supported:

94043 **-i** Invoke *utility* with exactly the environment specified by the arguments; the  
94044 inherited environment shall be ignored completely.94045 **OPERANDS**

94046 The following operands shall be supported:

94047 *name=value* Arguments of the form *name=value* shall modify the execution environment, and  
94048 shall be placed into the inherited environment before the *utility* is invoked.94049 *utility* The name of the utility to be invoked. If the *utility* operand names any of the  
94050 special built-in utilities in [Section 2.15](#) (on page 2526), the results are undefined.94051 *argument* A string to pass as an argument for the invoked utility.94052 **STDIN**

94053 Not used.

94054 **INPUT FILES**

94055 None.

94056 **ENVIRONMENT VARIABLES**94057 The following environment variables shall affect the execution of `env`:94058 **LANG** Provide a default value for the internationalization variables that are unset or null.  
94059 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
94060 variables used to determine the values of locale categories.)94061 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
94062 internationalization variables.94063 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
94064 characters (for example, single-byte as opposed to multi-byte characters in  
94065 arguments).94066 **LC\_MESSAGES**94067 Determine the locale that should be used to affect the format and contents of  
94068 diagnostic messages written to standard error.

94069	XSI	<b>NLSPATH</b>	Determine the location of messages objects and message catalogs.
94070		<b>PATH</b>	Determine the location of the <i>utility</i> , as described in XBD <a href="#">Chapter 8</a> (on page 167).
94071			If <i>PATH</i> is specified as a <i>name=value</i> operand to <i>env</i> , the <i>value</i> given shall be used in
94072			the search for <i>utility</i> .
94073		<b>ASYNCHRONOUS EVENTS</b>	
94074			Default.
94075		<b>STDOUT</b>	
94076			If no <i>utility</i> operand is specified, each <i>name=value</i> pair in the resulting environment shall be
94077			written in the form:
94078			"%s=%s\n", <name>, <value>
94079			If the <i>utility</i> operand is specified, the <i>env</i> utility shall not write to standard output.
94080		<b>STDERR</b>	
94081			The standard error shall be used only for diagnostic messages.
94082		<b>OUTPUT FILES</b>	
94083			None.
94084		<b>EXTENDED DESCRIPTION</b>	
94085			None.
94086		<b>EXIT STATUS</b>	
94087			If <i>utility</i> is invoked, the exit status of <i>env</i> shall be the exit status of <i>utility</i> ; otherwise, the <i>env</i>
94088			utility shall exit with one of the following values:
94089		0	The <i>env</i> utility completed successfully.
94090		1–125	An error occurred in the <i>env</i> utility.
94091		126	The utility specified by <i>utility</i> was found but could not be invoked.
94092		127	The utility specified by <i>utility</i> could not be found.
94093		<b>CONSEQUENCES OF ERRORS</b>	
94094			Default.
94095		<b>APPLICATION USAGE</b>	
94096			The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , <i>timeout</i> , and <i>xargs</i> utilities have been specified to use exit
94097			code 127 if a utility to be invoked cannot be found, so that applications can distinguish “failure
94098			to find a utility” from “invoked utility exited with an error indication”. The value 127 was
94099			chosen because it is not commonly used for other meanings; most utilities use small values for
94100			“normal error conditions” and the values above 128 can be confused with termination due to
94101			receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could
94102			be found, but not invoked. Some scripts produce meaningful error messages differentiating the
94103			126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice
94104			that uses 127 when all attempts to <i>exec</i> the utility fail with [ENOENT], and uses 126 when any
94105			attempt to <i>exec</i> the utility fails for any other reason.
94106			Historical implementations of the <i>env</i> utility use the <i>execvp()</i> or <i>execlp()</i> functions defined in the
94107			System Interfaces volume of POSIX.1-2024 to invoke the specified utility; this provides better
94108			performance and keeps users from having to escape characters with special meaning to the shell.
94109			Therefore, shell functions, special built-ins, and built-ins that are only provided by the shell are
94110			not found by this type of <i>env</i> implementation. However, <i>env</i> can be implemented as a shell built-
94111			in, in which case it may be able to execute shell functions and built-ins. An application wishing
94112			to ensure execution of a non-built-in utility can use <i>exec</i> in a subshell for this purpose.

94113 **EXAMPLES**

94114 The following command:

94115 `env -i PATH=/mybin:"$PATH" $(getconf V7_ENV) mygrep xyz myfile`94116 invokes the command *mygrep* with a new *PATH* value as the only entry in its environment other  
94117 than any variables required by the implementation for conformance. In this case, *PATH* is used  
94118 to locate *mygrep*, which is expected to reside in */mybin*.94119 **RATIONALE**94120 As with all other utilities that invoke other utilities, this volume of POSIX.1-2024 only specifies  
94121 what *env* does with standard input, standard output, standard error, input files, and output files.  
94122 If a utility is executed, it is not constrained by the specification of input and output by *env*.94123 The *-i* option was added to allow the functionality of the removed *-* option in a manner  
94124 compatible with the Utility Syntax Guidelines. It is possible to create a non-conforming  
94125 environment using the *-i* option, as it may remove environment variables required by the  
94126 implementation for conformance. The following will preserve these environment variables as  
94127 well as preserve the *PATH* for conforming utilities:

```

94128 IFS='
94129 '
94130 # The preceding value should be <space><tab><newline>.
94131 # Set IFS to its default value.

94132 set -f
94133 # disable pathname expansion

94134 \unalias -a
94135 # Unset all possible aliases.
94136 # Note that unalias is escaped to prevent an alias
94137 # being used for unalias.
94138 # This step is not strictly necessary, since aliases are not inherited,
94139 # and the ENV environment variable is only used by interactive shells,
94140 # the only way any aliases can exist in a script is if it defines them
94141 # itself.

94142 unset -f env getconf
94143 # Ensure env and getconf are not user functions.

94144 env -i $(getconf V7_ENV) PATH="$(getconf PATH)" command

```

94145 Some have suggested that *env* is redundant since the same effect is achieved by:94146 `name=value ... utility [ argument ... ]`94147 The example is equivalent to *env* when an environment variable is being added to the  
94148 environment of the command, but not when the environment is being set to the given value.  
94149 The *env* utility also writes out the current environment if invoked without arguments. There is  
94150 sufficient functionality beyond what the example provides to justify inclusion of *env*.94151 **FUTURE DIRECTIONS**

94152 None.

94153 **SEE ALSO**94154 [Section 2.15](#) (on page 2526), [Section 2.5](#) (on page 2478)94155 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

94156 **CHANGE HISTORY**

94157 First released in Issue 2.

94158 **Issue 7**94159 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
94160 argument is '- '.94161 Austin Group Interpretation 1003.1-2001 #047 is applied, providing RATIONALE on how to use  
94162 the *env* utility to preserve a conforming environment.

94163 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94164 The EXAMPLES section is revised to change the use of *env -i*.94165 **Issue 8**94166 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.94167 Austin Group Defect 1157 is applied, adding a note about shell built-in implementations of *env*  
94168 to the APPLICATION USAGE section.94169 Austin Group Defect 1586 is applied, adding the *timeout* utility.

94170 Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

94171 **NAME**

94172 ex — text editor

94173 **SYNOPSIS**94174 UP `ex [-rR] [-s|-v] [-c command] [-t tagstring] [-w size] [file...]`94175 **DESCRIPTION**

94176 The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and  
 94177 visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**  
 94178 and **visual** commands and in *vi*.

94179 If an operand is '-', the results are unspecified.

94180 This section uses the term *edit buffer* to describe the current working text. No specific  
 94181 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 94182 and no changes to it shall affect any file until an editor command writes the file.

94183 Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,  
 94184 such as the full-screen editing commands (*visual mode* or *open mode*). When these commands  
 94185 cannot be supported on such terminals, this condition shall not produce an error message such  
 94186 as “not an editor command” or report a syntax error. The implementation may either accept the  
 94187 commands and produce results on the screen that are the result of an unsuccessful attempt to  
 94188 meet the requirements of this volume of POSIX.1-2024 or report an error describing the terminal-  
 94189 related deficiency.

94190 **OPTIONS**

94191 The *ex* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
 94192 of '-', and that '+' may be recognized as an option delimiter as well as '-'.

94193 The following options shall be supported:

94194 **-c *command*** Specify an initial command to be executed in the first edit buffer loaded from an  
 94195 existing file (see the EXTENDED DESCRIPTION section). Implementations may  
 94196 support more than a single -c option. In such implementations, the specified  
 94197 commands shall be executed in the order specified on the command line.

94198 **-r** Recover the named files (see the EXTENDED DESCRIPTION section). Recovery  
 94199 information for a file shall be saved during an editor or system crash (for example,  
 94200 when the editor is terminated by a signal which the editor can catch), or after the  
 94201 use of an *ex* **preserve** command.

94202 A *crash* in this context is an unexpected failure of the system or utility that requires  
 94203 restarting the failed system or utility. A system crash implies that any utilities  
 94204 running at the time also crash. In the case of an editor or system crash, the number  
 94205 of changes to the edit buffer (since the most recent **preserve** command) that will be  
 94206 recovered is unspecified.

94207 If no *file* operands are given and the -t option is not specified, all other options, the  
 94208 *EXINIT* variable, and any **.exrc** files shall be ignored; a list of all recoverable files  
 94209 available to the invoking user shall be written, and the editor shall exit normally  
 94210 without further action.

94211 **-R** Set **readonly** edit option.

94212 **-s** Prepare *ex* for batch use by taking the following actions:

- 94213 • Suppress writing prompts and informational (but not diagnostic) messages.
- 94214 • Ignore the value of *TERM* and any implementation default terminal type and
- 94215 assume the terminal is a type incapable of supporting open or visual modes;
- 94216 see the **visual** command and the description of *vi*.
- 94217 • Suppress the use of the *EXINIT* environment variable and the reading of any
- 94218 **.exrc** file; see the EXTENDED DESCRIPTION section.
- 94219 • Suppress autoindentation, ignoring the value of the **autoindent** edit option.
- 94220 **-t tagstring** Edit the file containing the specified *tagstring*; see *ctags*. The tags feature
- 94221 represented by **-t tagstring** and the **tag** command is optional. It shall be provided
- 94222 on any system that also provides a conforming implementation of *ctags*; otherwise,
- 94223 the use of **-t** produces undefined results. On any system, it shall be an error to
- 94224 specify more than a single **-t** option.
- 94225 **-v** Begin in visual mode (see *vi*).
- 94226 **-w size** Set the value of the *window* editor option to *size*.

#### 94227 OPERANDS

94228 The following operand shall be supported:

94229 *file* A pathname of a file to be edited.

#### 94230 STDIN

94231 The standard input consists of a series of commands and input text, as described in the

94232 EXTENDED DESCRIPTION section. The implementation may limit each line of standard input

94233 to a length of {LINE\_MAX}.

94234 If the standard input is not a terminal device, it shall be as if the **-s** option had been specified.

94235 If a read from the standard input returns an error, or if the editor detects an end-of-file condition

94236 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

#### 94237 INPUT FILES

94238 Input files shall be text files or files that would be text files except for an incomplete last line that

94239 is not longer than {LINE\_MAX}-1 bytes in length and contains no NUL characters. By default,

94240 any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other

94241 forms of files may optionally be allowed by *ex* implementations.

94242 The **.exrc** files and source files shall be text files consisting of *ex* commands; see the EXTENDED

94243 DESCRIPTION section.

94244 By default, the editor shall read lines from the files to be edited without interpreting any of those

94245 lines as any form of editor command.

#### 94246 ENVIRONMENT VARIABLES

94247 The following environment variables shall affect the execution of *ex*:

94248 *COLUMNS* Override the system-selected horizontal screen size. See XBD Chapter 8 (on page

94249 167) for valid values and results when it is unset or null.

94250 *EXINIT* Determine a list of *ex* commands that are executed on editor start-up. See the

94251 EXTENDED DESCRIPTION section for more details of the initialization phase.

94252 *HOME* Determine a pathname of a directory that shall be searched for an editor start-up

94253 file named **.exrc**; see the EXTENDED DESCRIPTION section.

94254	<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)
94255		
94256		
94257	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
94258		
94259	<i>LC_COLLATE</i>	
94260		Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.
94261		
94262	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the classification of characters as uppercase or lowercase letters, the case conversion of letters, and the detection of word boundaries.
94263		
94264		
94265		
94266		
94267	<i>LC_MESSAGES</i>	
94268		Determine the locale used to process affirmative responses, and the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
94269		
94270		
94271	<i>LINES</i>	Override the system-selected vertical screen size, used as the number of lines in a screenful and the vertical screen size in visual mode. See XBD <a href="#">Chapter 8</a> (on page 167) for valid values and results when it is unset or null.
94272		
94273		
94274	XSI <i>NLSPATH</i>	Determine the location of messages objects and message catalogs.
94275	<i>PATH</i>	Determine the search path for the shell command specified in the <i>ex</i> editor commands <b>!</b> , <b>shell</b> , <b>read</b> , and <b>write</b> , and the open and visual mode command <b>!</b> ; see the description of command search and execution in <a href="#">Section 2.9.1.4</a> (on page 2502).
94276		
94277		
94278	<i>SHELL</i>	Determine the preferred command line interpreter for use as the default value of the <b>shell</b> edit option.
94279		
94280	<i>TERM</i>	Determine the name of the terminal type. If this variable is unset or null, an unspecified default terminal type shall be used.
94281		
94282	<b>ASYNCHRONOUS EVENTS</b>	
94283		The following term is used in this and following sections to specify command and asynchronous event actions:
94284		
94285	<i>complete write</i>	
94286		A complete write is a write of the entire contents of the edit buffer to a file of a type other than a terminal device, or the saving of the edit buffer caused by the user executing the <i>ex</i> <b>preserve</b> command. Writing the contents of the edit buffer to a temporary file that will be removed when the editor exits shall not be considered a complete write.
94287		
94288		
94289		
94290		
94291		The following actions shall be taken upon receipt of signals:
94292	<i>SIGINT</i>	If the standard input is not a terminal device, <i>ex</i> shall not write the file or return to command or text input mode, and shall exit with a non-zero exit status.
94293		
94294		Otherwise, if executing an open or visual text input mode command, <i>ex</i> in receipt of <i>SIGINT</i> shall behave identically to its receipt of the <ESC> character.
94295		
94296		Otherwise:

- 94297 1. If executing an *ex* text input mode command, all input lines that have been  
 94298 completely entered shall be resolved into the edit buffer, and any partially  
 94299 entered line shall be discarded.
- 94300 2. If there is a currently executing command, it shall be aborted and a message  
 94301 displayed. Unless otherwise specified by the *ex* or *vi* command descriptions,  
 94302 it is unspecified whether any lines modified by the executing command  
 94303 appear modified, or as they were before being modified by the executing  
 94304 command, in the buffer.
- 94305 If the currently executing command was a motion command, its associated  
 94306 command shall be discarded.
- 94307 3. If in open or visual command mode, the terminal shall be alerted.
- 94308 4. The editor shall then return to command mode.
- 94309 SIGCONT If *ex* is in open mode or visual mode, the actions described below for SIGWINCH  
 94310 shall be taken, except that the screen shall always be refreshed (regardless of  
 94311 whether the terminal window size changed).
- 94312 SIGHUP If the edit buffer has been modified since the last complete write, *ex* shall attempt  
 94313 to save the edit buffer so that it can be recovered later using the `-r` option or the *ex*  
 94314 **recover** command. The editor shall not write the file or return to command or text  
 94315 input mode, and shall terminate with a non-zero exit status.
- 94316 SIGTERM Refer to SIGHUP.
- 94317 SIGWINCH If *ex* is in open mode or visual mode, the current terminal window size associated  
 94318 with the terminal on standard output shall be obtained, as if by a call to XSH  
 94319 `tcgetwinsize()`. If the terminal window size is successfully obtained, it shall be used  
 94320 as follows:
- 94321 • If the *COLUMNS* environment variable is unset or does not contain a  
 94322 number, the horizontal screen size shall be set to the number of columns in  
 94323 the obtained terminal window size.
  - 94324 • If *ex* is in visual mode, the `-w` option was not specified and the *LINES*  
 94325 environment variable is unset or does not contain a number, the vertical  
 94326 screen size shall be set to the number of rows in the obtained terminal  
 94327 window size.
- 94328 If the above resulted in either the vertical screen size or the horizontal screen size  
 94329 (or both) changing to a different value, *ex* shall update the values it has for the  
 94330 number of lines and columns in the display and shall adjust the **window** edit  
 94331 option and the column number at which the **wrapmargin** edit option takes effect  
 94332 (if non-zero) accordingly (see [Edit Options in ex](#), on page 2877) and refresh the  
 94333 screen; otherwise, *ex* may refresh the screen.
- 94334 The action taken for all other signals is unspecified.
- 94335 **STDOUT**
- 94336 The standard output shall be used only for writing prompts to the user, for informational  
 94337 messages, and for writing lines from the file.

94338 **STDERR**

94339 The standard error shall be used only for diagnostic messages.

94340 **OUTPUT FILES**94341 The output from *ex* shall be text files.94342 **EXTENDED DESCRIPTION**94343 Only the *ex* mode of the editor is described in this section. See *vi* for additional editing  
94344 capabilities available in *ex*.94345 When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such  
94346 as inverse video), the message shall be written in standout mode. If the terminal does not  
94347 support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the  
94348 error message.94349 By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the  
94350 **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;  
94351 it can be exited (and command mode re-entered) by typing a <period> ('.') alone at the  
94352 beginning of a line.94353 **Initialization in *ex* and *vi***94354 The following symbols are used in this and following sections to specify locations in the edit  
94355 buffer:94356 *alternate and current pathnames*94357 Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex*  
94358 commands that take filenames as arguments shall set them as follows:

- 94359 1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag**  
94360 command replaces the contents of the edit buffer.
  - 94361 a. If the command replaces the contents of the edit buffer, the current pathname  
94362 shall be set to the *file* argument or the file indicated by the tag, and the  
94363 alternate pathname shall be set to the previous value of the current pathname.
  - 94364 b. Otherwise, the alternate pathname shall be set to the *file* argument.
- 94365 2. If a *file* argument is specified to the *ex* **next** command:
  - 94366 a. If the command replaces the contents of the edit buffer, the current pathname  
94367 shall be set to the first *file* argument, and the alternate pathname shall be set to  
94368 the previous value of the current pathname.
- 94369 3. If a *file* argument is specified to the *ex* **file** command, the current pathname shall be  
94370 set to the *file* argument, and the alternate pathname shall be set to the previous value  
94371 of the current pathname.
- 94372 4. If a *file* argument is specified to the *ex* **read** and **write** commands (that is, when  
94373 reading or writing a file, and not to the program named by the **shell** edit option), or a  
94374 *file* argument is specified to the *ex* **xit** command:
  - 94375 a. If the current pathname has no value, the current pathname shall be set to the  
94376 *file* argument.
  - 94377 b. Otherwise, the alternate pathname shall be set to the *file* argument.

94378 If the alternate pathname is set to the previous value of the current pathname when the  
94379 current pathname had no previous value, then the alternate pathname shall have no value  
94380 as a result.

94381 *current line*  
 94382 The line of the edit buffer referenced by the cursor. Each command description specifies the  
 94383 current line after the command has been executed, as the *current line value*. When the edit  
 94384 buffer contains no lines, the current line shall be zero; see [Addressing in ex](#) (on page 2845).

94385 *current column*  
 94386 The current display line column occupied by the cursor. (The columns shall be numbered  
 94387 beginning at 1.) Each command description specifies the current column after the command  
 94388 has been executed, as the *current column value*. This column is an *ideal* column that is  
 94389 remembered over the lifetime of the editor. The actual display line column upon which the  
 94390 cursor rests may be different from the current column; see the cursor positioning discussion  
 94391 in [Command Descriptions in vi](#) (on page 3527).

94392 *set to non-<blank>*  
 94393 A description for a current column value, meaning that the current column shall be set to  
 94394 the last display line column on which is displayed any part of the first non-<blank> of the  
 94395 line. If the line has no non-<blank> non-<newline> characters, the current column shall be  
 94396 set to the last display line column on which is displayed any part of the last non-<newline>  
 94397 character in the line. If the line is empty, the current column shall be set to column position  
 94398 1.

94399 The length of lines in the edit buffer may be limited to {LINE\_MAX} bytes. In open and visual  
 94400 mode, the length of lines in the edit buffer may be limited to the number of characters that will  
 94401 fit in the display. If either limit is exceeded during editing, an error message shall be written. If  
 94402 either limit is exceeded by a line read in from a file, an error message shall be written and the  
 94403 edit session may be terminated.

94404 If the editor stops running due to any reason other than a user command, and the edit buffer has  
 94405 been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous  
 94406 event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.

94407 During initialization (before the first file is copied into the edit buffer or any user commands  
 94408 from the terminal are processed) the following shall occur:

- 94409 1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands  
 94410 contained in that variable.
- 94411 2. If the *EXINIT* variable is not set, and all of the following are true:
  - 94412 a. The *HOME* environment variable is not null and not empty.
  - 94413 b. The file *.exrc* in the directory referred to by the *HOME* environment variable:
    - 94414 i. Exists
    - 94415 ii. Is owned by the same user ID as the real user ID of the process or the  
 94416 process has appropriate privileges
    - 94417 iii. Is not writable by anyone other than the owner

94418 the editor shall execute the *ex* commands contained in that file.

- 94419 3. If and only if all of the following are true:
  - 94420 a. The current directory is not referred to by the *HOME* environment variable.
  - 94421 b. A command in the *EXINIT* environment variable or a command in the *.exrc* file in  
 94422 the directory referred to by the *HOME* environment variable sets the editor option  
 94423 **exrc**.

- 94424 c. The **.exrc** file in the current directory:
- 94425 i. Exists
- 94426 ii. Is owned by the same user ID as the real user ID of the process, or by one of
- 94427 a set of implementation-defined user IDs
- 94428 iii. Is not writable by anyone other than the owner

94429 the editor shall attempt to execute the *ex* commands contained in that file.

94430 Lines in any **.exrc** file that are blank lines shall be ignored. If any **.exrc** file exists, but is not read

94431 for ownership or permission reasons, it shall be an error.

94432 After the *EXINIT* variable and any **.exrc** files are processed, the first file specified by the user

94433 shall be edited, as follows:

- 94434 1. If the user specified the **-t** option, the effect shall be as if the *ex tag* command was entered
- 94435 with the specified argument, with the exception that if tag processing does not result in a
- 94436 file to edit, the effect shall be as described in step 3. below.
- 94437 2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if
- 94438 the *ex edit* command was entered with the first of those arguments as its *file* argument.
- 94439 3. Otherwise, the effect shall be as if the *ex edit* command was entered with a nonexistent
- 94440 filename as its *file* argument. It is unspecified whether this action shall set the current
- 94441 pathname. In an implementation where this action does not set the current pathname, any
- 94442 editor command using the current pathname shall fail until an editor command sets the
- 94443 current pathname.

94444 If the **-r** option was specified, the first time a file in the initial argument list or a file specified by

94445 the **-t** option is edited, if recovery information has previously been saved about it, that

94446 information shall be recovered and the editor shall behave as if the contents of the edit buffer

94447 have already been modified. If there are multiple instances of the file to be recovered, the one

94448 most recently saved shall be recovered, and an informational message that there are previous

94449 versions of the file that can be recovered shall be written. If no recovery information about a file

94450 is available, an informational message to this effect shall be written, and the edit shall proceed as

94451 usual.

94452 If the **-c** option was specified, the first time a file that already exists (including a file that might

94453 not exist but for which recovery information is available, when the **-r** option is specified)

94454 replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of

94455 the edit buffer, the current column shall be set to non-<blank>, and the *ex* commands specified

94456 with the **-c** option shall be executed. In this case, the current line and current column shall not

94457 be set as described for the command associated with the replacement or initialization of the edit

94458 buffer contents. However, if the **-t** option or a **tag** command is associated with this action, the **-c**

94459 option commands shall be executed and then the movement to the tag shall be performed.

94460 The current argument list shall initially be set to the filenames specified by the user on the

94461 command line. If no filenames are specified by the user, the current argument list shall be empty.

94462 If the **-t** option was specified, it is unspecified whether any filename resulting from tag

94463 processing shall be prepended to the current argument list. In the case where the filename is

94464 added as a prefix to the current argument list, the current argument list reference shall be set to

94465 that filename. In the case where the filename is not added as a prefix to the current argument

94466 list, the current argument list reference shall logically be located before the first of the filenames

94467 specified on the command line (for example, a subsequent *ex next* command shall edit the first

94468 filename from the command line). If the **-t** option was not specified, the current argument list

94469 reference shall be to the first of the filenames on the command line.

94470 **Addressing in ex**

94471 Addressing in *ex* relates to the current line and the current column; the address of a line is its  
 94472 1-based line number, the address of a column is its 1-based count from the beginning of the line.  
 94473 Generally, the current line is the last line affected by a command. The current line number is the  
 94474 address of the current line. In each command description, the effect of the command on the  
 94475 current line number and the current column is described.

94476 Addresses are constructed as follows:

- 94477 1. The character '.' (period) shall address the current line.
- 94478 2. The character '\$' shall address the last line of the edit buffer.
- 94479 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 94480 4. The address "'x" refers to the line marked with the mark name character 'x', which  
 94481 shall be a lowercase letter from the portable character set, the backquote character, or the  
 94482 single-quote character. It shall be an error if the line that was marked is not currently  
 94483 present in the edit buffer or the mark has not been set. Lines can be marked with the *ex*  
 94484 **mark** or **k** commands, or the *vi* **m** command.
- 94485 5. A regular expression enclosed by <slash> characters ('/') shall address the first line  
 94486 found by searching forwards from the line following the current line toward the end of  
 94487 the edit buffer and stopping at the first line for which the line excluding the terminating  
 94488 <newline> matches the regular expression. As stated in [Regular Expressions in ex](#) (on  
 94489 page 2875), an address consisting of a null regular expression delimited by <slash>  
 94490 characters ("/") shall address the next line for which the line excluding the terminating  
 94491 <newline> matches the last regular expression encountered. In addition, the second  
 94492 <slash> can be omitted at the end of a command line. If the **wrapsan** edit option is set,  
 94493 the search shall wrap around to the beginning of the edit buffer and continue up to and  
 94494 including the current line, so that the entire edit buffer is searched. Within the regular  
 94495 expression, the sequence "\/" shall represent a literal <slash> instead of the regular  
 94496 expression delimiter.
- 94497 6. A regular expression enclosed in <question-mark> characters ('?') shall address the first  
 94498 line found by searching backwards from the line preceding the current line toward the  
 94499 beginning of the edit buffer and stopping at the first line for which the line excluding the  
 94500 terminating <newline> matches the regular expression. An address consisting of a null  
 94501 regular expression delimited by <question-mark> characters ("??") shall address the  
 94502 previous line for which the line excluding the terminating <newline> matches the last  
 94503 regular expression encountered. In addition, the second <question-mark> can be omitted  
 94504 at the end of a command line. If the **wrapsan** edit option is set, the search shall wrap  
 94505 around from the beginning of the edit buffer to the end of the edit buffer and continue up  
 94506 to and including the current line, so that the entire edit buffer is searched. Within the  
 94507 regular expression, the sequence "\?" shall represent a literal <question-mark> instead  
 94508 of the RE delimiter.
- 94509 7. A <plus-sign> ('+') or a <hyphen-minus> ('-') followed by a decimal number shall  
 94510 address the current line plus or minus the number. A '+' or '-' not followed by a  
 94511 decimal number shall address the current line plus or minus 1.

94512 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.  
 94513 Address offsets are constructed as follows:

94514 1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the  
 94515 indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal  
 94516 number shall add (subtract) 1 to (from) the address.

94517 2. A decimal number shall add the indicated number of lines to the address.

94518 It shall not be an error for an intermediate address value to be less than zero or greater than the  
 94519 last line in the edit buffer. It shall be an error for the final address value to be less than zero or  
 94520 greater than the last line in the edit buffer.

94521 Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in  
 94522 [Command Descriptions in ex](#) (on page 2852). If more than the required number of addresses are  
 94523 provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than  
 94524 the required number of addresses are provided to a command, the addresses specified first shall  
 94525 be evaluated and then discarded until the maximum number of valid addresses remain.

94526 Addresses shall be separated from each other by a <comma> (', ') or a <semicolon> ('; '). If  
 94527 no address is specified before or after a <comma> or <semicolon> separator, it shall be as if the  
 94528 address of the current line was specified before or after the separator. In the case of a  
 94529 <semicolon> separator, the current line ('. ') shall be set to the first address, and only then shall  
 94530 the next address be calculated. This feature can be used to determine the starting line for  
 94531 forwards and backwards searches (see rules 5. and 6.).

94532 A <percent-sign> ('%') shall be equivalent to entering the two addresses "1, \$".

94533 Any delimiting <blank> characters between addresses, address separators, or address offsets  
 94534 shall be discarded.

### 94535 **Command Line Parsing in ex**

94536 The following symbol is used in this and following sections to describe parsing behavior:

94537 *escape* If a character is referred to as ``<backslash>-escaped'' or ``<control>-V-escaped'', it  
 94538 shall mean that the character acquired or lost a special meaning by virtue of being  
 94539 preceded, respectively, by a <backslash> or <control>-V character. Unless  
 94540 otherwise specified, the escaping character shall be discarded at that time and shall  
 94541 not be further considered for any purpose.

94542 Command-line parsing shall be done in the following steps. For each step, characters already  
 94543 evaluated shall be ignored; that is, the phrase ``leading character'' refers to the next character  
 94544 that has not yet been evaluated.

94545 1. Leading <colon> characters shall be skipped.

94546 2. Leading <blank> characters shall be skipped.

94547 3. If the leading character is a double-quote character, the characters up to and including the  
 94548 next non-<backslash>-escaped <newline> shall be discarded, and any subsequent  
 94549 characters shall be parsed as a separate command.

94550 4. Leading characters that can be interpreted as addresses shall be evaluated; see  
 94551 [Addressing in ex](#) (on page 2845).

94552 5. Leading <blank> characters shall be skipped.

94553 6. If the next character is a <vertical-line> character or a <newline>:

94554 a. If the next character is a <newline>:

- 94555 i. If *ex* is in open or visual mode, the current line shall be set to the last  
94556 address specified, if any.
- 94557 ii. Otherwise, if the last command was terminated by a <vertical-line>  
94558 character, no action shall be taken; for example, the command  
94559 " | | <newline> " shall execute two implied commands, not three.
- 94560 iii. Otherwise, step 6.b. shall apply.
- 94561 b. Otherwise, the implied command shall be the **print** command. The last #, **p**, and **l**  
94562 flags specified to any *ex* command shall be remembered and shall apply to this  
94563 implied command. Executing the *ex* **number**, **print**, or **list** command shall set the  
94564 remembered flags to #, nothing, and **l**, respectively, plus any other flags specified  
94565 for that execution of the **number**, **print**, or **list** command.
- 94566 If *ex* is not currently performing a **global** or **v** command, and no address or count  
94567 is specified, the current line shall be incremented by 1 before the command is  
94568 executed. If incrementing the current line would result in an address past the last  
94569 line in the edit buffer, the command shall fail, and the increment shall not happen.
- 94570 c. The <newline> or <vertical-line> character shall be discarded and any subsequent  
94571 characters shall be parsed as a separate command.
- 94572 7. The command name shall be comprised of the next character (if the character is not  
94573 alphabetic), or the next character and any subsequent alphabetic characters (if the  
94574 character is alphabetic), with the following exceptions:
- 94575 a. Commands that consist of any prefix of the characters in the command name  
94576 **delete**, followed immediately by any of the characters 'l', 'p', '+', '-', or '#'  
94577 shall be interpreted as a **delete** command, followed by a <blank>, followed by the  
94578 characters that were not part of the prefix of the **delete** command. The maximum  
94579 number of characters shall be matched to the command name **delete**; for example,  
94580 "de1" shall not be treated as "de" followed by the flag **l**.
- 94581 b. Commands that consist of the character 'k', followed by a character that can be  
94582 used as the name of a mark, shall be equivalent to the mark command followed by  
94583 a <blank>, followed by the character that followed the 'k'.
- 94584 c. Commands that consist of the character 's', followed by characters that could be  
94585 interpreted as valid options to the **s** command, shall be the equivalent of the **s**  
94586 command, without any pattern or replacement values, followed by a <blank>,  
94587 followed by the characters after the 's'.
- 94588 8. The command name shall be matched against the possible command names, and a  
94589 command name that contains a prefix matching the characters specified by the user shall  
94590 be the executed command. In the case of commands where the characters specified by the  
94591 user could be ambiguous, the executed command shall be as follows:

a	append	n	next	t	t
c	change	p	print	u	undo
ch	change	pr	print	un	undo
e	edit	r	read	v	v
m	move	re	read	w	write
ma	mark	s	s		

94598 Implementation extensions with names causing similar ambiguities shall not be checked  
94599 for a match until all possible matches for commands specified by POSIX.1-2024 have been

- 94600 checked.
- 94601 9. If the command is a **!** command, or if the command is a **read** command followed by zero
- 94602 or more <blank> characters and a **!**, or if the command is a **write** command followed by
- 94603 one or more <blank> characters and a **!**, the rest of the command shall include all
- 94604 characters up to a non-<backslash>-escaped <newline>. The <newline> shall be
- 94605 discarded and any subsequent characters shall be parsed as a separate *ex* command.
- 94606 10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while
- 94607 in open or visual mode, the next part of the command shall be parsed as follows:
- 94608 a. Any **'!'** character immediately following the command shall be skipped and be
- 94609 part of the command.
- 94610 b. Any leading <blank> characters shall be skipped and be part of the command.
- 94611 c. If the next character is a **'+'**, characters up to the first non-<backslash>-escaped
- 94612 <newline> or non-<backslash>-escaped <blank> shall be skipped and be part of
- 94613 the command.
- 94614 d. The rest of the command shall be determined by the steps specified in paragraph
- 94615 12.
- 94616 11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the
- 94617 command shall be parsed as follows:
- 94618 a. Any leading <blank> characters shall be skipped and be part of the command.
- 94619 b. If the next character is not an alphanumeric, double-quote, <newline>,
- 94620 <backslash>, or <vertical-line> character:
- 94621 i. The next character shall be used as a command delimiter.
- 94622 ii. If the command is a **global**, **open**, or **v** command, characters up to the first
- 94623 non-<backslash>-escaped <newline>, or first non-<backslash>-escaped
- 94624 delimiter character, shall be skipped and be part of the command.
- 94625 iii. If the command is an **s** command, characters up to the first
- 94626 non-<backslash>-escaped <newline>, or second non-<backslash>-escaped
- 94627 delimiter character, shall be skipped and be part of the command.
- 94628 c. If the command is a **global** or **v** command, characters up to the first
- 94629 non-<backslash>-escaped <newline> shall be skipped and be part of the
- 94630 command.
- 94631 d. Otherwise, the rest of the command shall be determined by the steps specified in
- 94632 paragraph 12.
- 94633 12. Otherwise:
- 94634 a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command,
- 94635 characters up to the first non-<control>-V-escaped <newline>, <vertical-line>, or
- 94636 double-quote character shall be skipped and be part of the command.
- 94637 b. Otherwise, characters up to the first non-<backslash>-escaped <newline>,
- 94638 <vertical-line>, or double-quote character shall be skipped and be part of the
- 94639 command.
- 94640 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.
- 94641 ended at a <vertical-line> character, any subsequent characters, up to the next
- 94642 non-<backslash>-escaped <newline> shall be used as input text to the command.

- 94643 d. If the command was ended by a double-quote character, all subsequent characters,  
94644 up to the next non-`<backslash>`-escaped `<newline>`, shall be discarded.
- 94645 e. The terminating `<newline>` or `<vertical-line>` character shall be discarded and any  
94646 subsequent characters shall be parsed as a separate *ex* command.

94647 Command arguments shall be parsed as described by the Synopsis and Description of each  
94648 individual *ex* command. This parsing shall not be `<blank>`-sensitive, except for the `!` argument,  
94649 which has to follow the command name without intervening `<blank>` characters, and where it  
94650 would otherwise be ambiguous. For example, *count* and *flag* arguments need not be  
94651 `<blank>`-separated because `"d22p"` is not ambiguous, but *file* arguments to the *ex next*  
94652 command need to be separated by one or more `<blank>` characters. Any `<blank>` in command  
94653 arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands can be  
94654 `<control>`-V-escaped, in which case the `<blank>` shall not be used as an argument delimiter. Any  
94655 `<blank>` in the command argument for any other command can be `<backslash>`-escaped, in  
94656 which case that `<blank>` shall not be used as an argument delimiter.

94657 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,  
94658 any character can be `<control>`-V-escaped. All such escaped characters shall be treated literally  
94659 and shall have no special meaning. Within command arguments for all other *ex* commands that  
94660 are not regular expressions or replacement strings, any character that would otherwise have a  
94661 special meaning can be `<backslash>`-escaped. Escaped characters shall be treated literally,  
94662 without special meaning as shell expansion characters or `'!'`, `'%'`, and `'#'` expansion  
94663 characters. See [Regular Expressions in ex](#) (on page 2875) and [Replacement Strings in ex](#) (on page  
94664 2876) for descriptions of command arguments that are regular expressions or replacement  
94665 strings.

94666 Non-`<backslash>`-escaped `'%'` characters appearing in *file* arguments to any *ex* command shall  
94667 be replaced by the current pathname; unescaped `'#'` characters shall be replaced by the  
94668 alternate pathname. It shall be an error if `'%'` or `'#'` characters appear unescaped in an  
94669 argument and their corresponding values are not set.

94670 Non-`<backslash>`-escaped `'!'` characters in the arguments to either the *ex !* command or the  
94671 open and visual mode `!` command, or in the arguments to the *ex read* command, where the first  
94672 non-`<blank>` after the command name is a `'!'` character, or in the arguments to the *ex write*  
94673 command where the command name is followed by one or more `<blank>` characters and the  
94674 first non-`<blank>` after the command name is a `'!'` character, shall be replaced with the  
94675 arguments to the last of those three commands as they appeared after all unescaped `'%'`, `'#'`,  
94676 and `'!'` characters were replaced. It shall be an error if `'!'` characters appear unescaped in one  
94677 of these commands and there has been no previous execution of one of these commands.

94678 If an error occurs during the parsing or execution of an *ex* command:

- 94679 • An informational message to this effect shall be written. Execution of the *ex* command shall  
94680 stop, and the cursor (for example, the current line and column) shall not be further  
94681 modified.
- 94682 • If the *ex* command resulted from a map expansion, all characters from that map expansion  
94683 shall be discarded, except as otherwise specified by the **map** command.
- 94684 • Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment  
94685 variable, a **.exrc** file, a **:source** command, a `-c` option, or a `+command` specified to an *ex edit*,  
94686 *ex next*, or *visual* command, no further commands from the source of the commands shall  
94687 be executed.

- 94688 • Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v**
- 94689 command, no further commands caused by the execution of the buffer or the **global** or **v**
- 94690 command shall be executed.
- 94691 • Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and
- 94692 including the next non-<backslash>-escaped <newline> shall be discarded.

### 94693 **Input Editing in ex**

94694 The following symbol is used in this and the following sections to specify command actions:

94695 *word* In the POSIX locale, a word consists of a maximal sequence of letters, digits, and

94696 underscores, delimited at both ends by characters other than letters, digits, or

94697 underscores, or by the beginning or end of a line or the edit buffer.

94698 When accepting input characters from the user, in either *ex* command mode or *ex* text input

94699 mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces

94700 volume of POSIX.1-2024.

94701 If in *ex* text input mode:

- 94702 1. If the **number** edit option is set, *ex* shall prompt for input using the line number that
- 94703 would be assigned to the line if it is entered, in the format specified for the *ex* **number**
- 94704 command.
- 94705 2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters,
- 94706 as described by the **autoindent** edit option. **autoindent** characters shall follow the line
- 94707 number, if any.

94708 If in *ex* command mode:

- 94709 1. If the **prompt** edit option is set, input shall be prompted for using a single ' : ' character;
- 94710 otherwise, there shall be no prompt.

94711 The input characters in the following sections shall have the following effects on the input line.

### 94712 **Scroll**

94713 *Synopsis:* eof

94714 See the description of the *stty eof* character in *stty*.

94715 If in *ex* command mode:

94716 If the *eof* character is the first character entered on the line, the line shall be evaluated as if

94717 it contained two characters: a <control>-D and a <newline>.

94718 Otherwise, the *eof* character shall have no special meaning.

94719 If in *ex* text input mode:

94720 If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be  
 94721 modified so that a part of the next text input character is displayed on the first column in  
 94722 the line after the previous **shiftwidth** edit option column boundary, and the user shall be  
 94723 prompted again for input for the same line.

94724 Otherwise, if the cursor follows a '0', which follows an **autoindent** character, and the '0'  
 94725 was the previous text input character, the '0' and all **autoindent** characters in the line  
 94726 shall be discarded, and the user shall be prompted again for input for the same line.

94727 Otherwise, if the cursor follows a '^', which follows an **autoindent** character, and the '^'  
 94728 was the previous text input character, the '^' and all **autoindent** characters in the line  
 94729 shall be discarded, and the user shall be prompted again for input for the same line. In  
 94730 addition, the **autoindent** level for the next input line shall be derived from the same line  
 94731 from which the **autoindent** level for the current input line was derived.

94732 Otherwise, if there are no **autoindent** or text input characters in the line, the *eof* character  
 94733 shall be discarded.

94734 Otherwise, the *eof* character shall have no special meaning.

#### 94735 <newline>

94736 *Synopsis:* <newline>  
 94737 <control>-J

94738 If in *ex* command mode:

94739 Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for  
 94740 this purpose.

94741 If in *ex* text input mode:

94742 Terminate the current line. If there are no characters other than **autoindent** characters on  
 94743 the line, all characters on the line shall be discarded.

94744 Prompt for text input on a new line after the current line. If the **autoindent** edit option is  
 94745 set, an appropriate number of **autoindent** characters shall be added as a prefix to the line  
 94746 as described by the *ex* **autoindent** edit option.

#### 94747 <backslash>

94748 *Synopsis:* <backslash>

94749 Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any  
 94750 special meaning that it may have to the editor during text input mode. The <backslash>  
 94751 character shall be retained and evaluated when the command line is parsed, or retained and  
 94752 included when the input text becomes part of the edit buffer.

## 94753 &lt;control&gt;-V

94754 *Synopsis:* <control>-V

94755 Allow the entry of any subsequent character as a literal character, removing any special meaning  
 94756 that it may have to the editor during text input mode. The <control>-V character shall be  
 94757 discarded before the command line is parsed or the input text becomes part of the edit buffer.

94758 If the ``literal next'' functionality is performed by the underlying system, it is implementation-  
 94759 defined whether a character other than <control>-V performs this function.

## 94760 &lt;control&gt;-W

94761 *Synopsis:* <control>-W

94762 Discard the <control>-W, and the word previous to it in the input line, including any <blank>  
 94763 characters following the word and preceding the <control>-W. If the ``word erase'' functionality  
 94764 is performed by the underlying system, it is implementation-defined whether a character other  
 94765 than <control>-W performs this function.

94766 **Command Descriptions in ex**

94767 The following symbols are used in this section to represent command modifiers. Some of these  
 94768 modifiers can be omitted, in which case the specified defaults shall be used.

94769 *1addr* A single line address, given in any of the forms described in [Addressing in ex](#) (on  
 94770 page 2845); the default shall be the current line ( ' . ' ), unless otherwise specified.

94771 If the line address is zero, it shall be an error, unless otherwise specified in the  
 94772 following command descriptions.

94773 If the edit buffer is empty, and the address is specified with a command other than  
 94774 =, **append**, **insert**, **open**, **put**, **read**, or **visual**, or the address is not zero, it shall be  
 94775 an error.

94776 *2addr* Two addresses specifying an inclusive range of lines. If no addresses are specified,  
 94777 the default for *2addr* shall be the current line only ( " . , . " ), unless otherwise  
 94778 specified in the following command descriptions. If one address is specified, *2addr*  
 94779 shall specify that line only, unless otherwise specified in the following command  
 94780 descriptions.

94781 It shall be an error if the first address is greater than the second address.

94782 If the edit buffer is empty, and the two addresses are specified with a command  
 94783 other than the **!**, **write**, **wq**, or **xit** commands, or either address is not zero, it shall  
 94784 be an error.

94785 *count* A positive decimal number. If *count* is specified, it shall be equivalent to specifying  
 94786 an additional address to the command, unless otherwise specified by the following  
 94787 command descriptions. The additional address shall be equal to the last address  
 94788 specified to the command (either explicitly or by default) plus *count*-1.

94789 If this would result in an address greater than the last line of the edit buffer, it shall  
 94790 be corrected to equal the last line of the edit buffer.

94791 *flags* One or more of the characters '+', '-', '#', 'p', or 'l' (ell). The flag characters  
 94792 can be <blank>-separated, and in any order or combination. The characters '#',  
 94793 'p', and 'l' shall cause lines to be written in the format specified by the **print**  
 94794 command with the specified *flags*.

94795 The lines to be written are as follows:

- 94796 1. All edit buffer lines written during the execution of the *ex* **&**, **~**, **list**, **number**,  
94797 **open**, **print**, **s**, **visual**, and **z** commands shall be written as specified by *flags*.
- 94798 2. After the completion of an *ex* command with a flag as an argument, the  
94799 current line shall be written as specified by *flags*, unless the current line was  
94800 the last line written by the command.

94801 The characters '+' and '-' cause the value of the current line after the execution  
94802 of the *ex* command to be adjusted by the offset address as described in [Addressing](#)  
94803 [in ex](#) (on page 2845). This adjustment shall occur before the current line is written  
94804 as described in 2. above.

94805 The default for *flags* shall be none.

94806 *buffer* One of a number of named areas for holding text. The named buffers are specified  
94807 by the alphanumeric characters of the POSIX locale. There shall also be one  
94808 "unnamed" buffer. When no buffer is specified for editor commands that use a  
94809 buffer, the unnamed buffer shall be used. Commands that store text into buffers  
94810 shall store the text as it was before the command took effect, and shall store text  
94811 occurring earlier in the file before text occurring later in the file, regardless of how  
94812 the text region was specified. Commands that store text into buffers shall store the  
94813 text into the unnamed buffer as well as any specified buffer.

94814 In *ex* commands, buffer names are specified as the name by itself. In open or visual  
94815 mode commands the name is preceded by a double-quote ('"') character.

94816 If the specified buffer name is an uppercase character, and the buffer contents are  
94817 to be modified, the buffer shall be appended to rather than being overwritten. If  
94818 the buffer is not being modified, specifying the buffer name in lowercase and  
94819 uppercase shall have identical results.

94820 There shall also be buffers named by the numbers 1 through 9. In open and visual  
94821 mode, if a region of text including characters from more than a single line is being  
94822 modified by the *vi* **c** or **d** commands, the motion character associated with the **c** or  
94823 **d** commands specifies that the buffer text shall be in line mode, or the commands  
94824 **%**, **`**, **/**, **?**, **(**, **)**, **N**, **n**, **{**, or **}** are used to define a region of text for the **c** or **d** commands,  
94825 the contents of buffers 1 through 8 shall be moved into the buffer named by the  
94826 next numerically greater value, the contents of buffer 9 shall be discarded, and the  
94827 region of text shall be copied into buffer 1. This shall be in addition to copying the  
94828 text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can  
94829 be specified as a source buffer for open and visual mode commands; however,  
94830 specifying a numeric buffer as the write target of an open or visual mode  
94831 command shall have unspecified results.

94832 The text of each buffer shall have the characteristic of being in either line or  
94833 character mode. Appending text to a non-empty buffer shall set the mode to match  
94834 the characteristic of the text being appended. Appending text to a buffer shall  
94835 cause the creation of at least one additional line in the buffer. All text stored into  
94836 buffers by *ex* commands shall be in line mode. The *ex* commands that use buffers  
94837 as the source of text specify individually how buffers of different modes are  
94838 handled. Each open or visual mode command that uses buffers for any purpose  
94839 specifies individually the mode of the text stored into the buffer and how buffers  
94840 of different modes are handled.

94841 *file* Command text used to derive a pathname. The default shall be the current  
 94842 pathname, as defined previously, in which case, if no current pathname has yet  
 94843 been established it shall be an error, except where specifically noted in the  
 94844 individual command descriptions that follow. If the command text contains any of  
 94845 the characters '~', '{', '[', '\*', '?', '\$', '"', backquote, single-quote, and  
 94846 <backslash>, it shall be subjected to the process of "shell expansions", as described  
 94847 below; if more than a single pathname results and the command expects only one,  
 94848 it shall be an error.

94849 The process of shell expansions in the editor shall be done as follows. The *ex* utility  
 94850 shall pass two arguments to the program named by the shell edit option; the first  
 94851 shall be `-c`, and the second shall be the string "echo" and the command text as a  
 94852 single argument. The standard output and standard error of that command shall  
 94853 replace the command text.

94854 **!** A character that can be appended to the command name to modify its operation,  
 94855 as detailed in the individual command descriptions. With the exception of the *ex*  
 94856 **read**, **write**, and **!** commands, the '!' character shall only act as a modifier if there  
 94857 are no <blank> characters between it and the command name.

94858 *remembered search direction*

94859 The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in  
 94860 the edit buffer based on a remembered search direction, which is initially unset,  
 94861 and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* **/** and **?** commands.

## 94862 Abbreviate

94863 *Synopsis:* `ab[breviate] [lhs rhs]`

94864 If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.

94865 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
 94866 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
 94867 implementation-defined.

94868 In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the character  
 94869 shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.

94870 In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a  
 94871 <control>-V character is entered after a word character, a check shall be made for a set of  
 94872 characters matching *lhs*, in the text input entered during this command. If it is found, the effect  
 94873 shall be as if *rhs* was entered instead of *lhs*.

94874 The set of characters that are checked is defined as follows:

- 94875 1. If there are no characters inserted before the word and non-word or <ESC> characters  
 94876 that triggered the check, the set of characters shall consist of the word character.
- 94877 2. If the character inserted before the word and non-word or <ESC> characters that  
 94878 triggered the check is a word character, the set of characters shall consist of the characters  
 94879 inserted immediately before the triggering characters that are word characters, plus the  
 94880 triggering word character.
- 94881 3. If the character inserted before the word and non-word or <ESC> characters that  
 94882 triggered the check is not a word character, the set of characters shall consist of the  
 94883 characters that were inserted before the triggering characters that are neither <blank>  
 94884 characters nor word characters, plus the triggering word character.

94885 It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate**  
94886 commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the  
94887 effect of the command shall be as if the replacement had not occurred.

94888 *Current line*: Unchanged.

94889 *Current column*: Unchanged.

## 94890 **Append**

94891 *Synopsis*: `[1addr] a[ppend] [!]`

94892 Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is  
94893 specified, the text shall be placed at the beginning of the edit buffer.

94894 This command shall be affected by the **number** and **autoindent** edit options; following the  
94895 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
94896 duration of this command only.

94897 *Current line*: Set to the last input line; if no lines were input, set to the specified line, or to the first  
94898 line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.

94899 *Current column*: Set to non-<blank>.

## 94900 **Arguments**

94901 *Synopsis*: `ar[gs]`

94902 Write the current argument list, with the current argument-list entry, if any, between '[' and  
94903 ']' characters.

94904 *Current line*: Unchanged.

94905 *Current column*: Unchanged.

## 94906 **Change**

94907 *Synopsis*: `[2addr] c[hange] [!][count]`

94908 Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall  
94909 be copied into the unnamed buffer, which shall become a line mode buffer.

94910 This command shall be affected by the **number** and **autoindent** edit options; following the  
94911 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
94912 duration of this command only.

94913 *Current line*: Set to the last input line; if no lines were input, set to the line before the first  
94914 address, or to the first line of the edit buffer if there are no lines preceding the first address, or to  
94915 zero if the edit buffer is empty.

94916 *Current column*: Set to non-<blank>.

94917 **Change Directory**

94918 *Synopsis:*    chd[ir][!][*directory*]  
 94919            cd[!][*directory*]

94920 Change the current working directory to *directory*.

94921 If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null  
 94922 and non-empty value, *directory* shall default to the value named in the *HOME* environment  
 94923 variable. If the *HOME* environment variable is empty or is undefined, the default value of  
 94924 *directory* is implementation-defined.

94925 If no '!' is appended to the command name, and the edit buffer has been modified since the  
 94926 last complete write, and the current pathname does not begin with a '/', it shall be an error.

94927 *Current line:* Unchanged.

94928 *Current column:* Unchanged.

94929 **Copy**

94930 *Synopsis:*    [*2addr*] co[py] *laddr* [*flags*]  
 94931            [*2addr*] t *laddr* [*flags*]

94932 Copy the specified lines after the specified destination line; line zero specifies that the lines shall  
 94933 be placed at the beginning of the edit buffer.

94934 *Current line:* Set to the last line copied.

94935 *Current column:* Set to non-<blank>.

94936 **Delete**

94937 *Synopsis:*    [*2addr*] d[ele]te[ ] [*buffer*] [*count*] [*flags*]

94938 Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a  
 94939 line-mode buffer.

94940 Flags can immediately follow the command name; see [Command Line Parsing in ex](#) (on page  
 94941 2846).

94942 *Current line:* Set to the line following the deleted lines, or to the last line in the edit buffer if that  
 94943 line is past the end of the edit buffer, or to zero if the edit buffer is empty.

94944 *Current column:* Set to non-<blank>.

94945 **Edit**

94946 *Synopsis:*    e[dit][!][+*command*] [*file*]  
 94947            ex[!][+*command*] [*file*]

94948 If no '!' is appended to the command name, and the edit buffer has been modified since the  
 94949 last complete write, it shall be an error.

94950 If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*,  
 94951 and set the current pathname to *file*. If *file* is not specified, replace the current contents of the  
 94952 edit buffer with the current contents of the file named by the current pathname. If for any reason  
 94953 the current contents of the file cannot be accessed, the edit buffer shall be empty.

94954 The +*command* option shall be <blank>-delimited; <blank> characters within the +*command* can  
 94955 be escaped by preceding them with a <backslash> character. The +*command* shall be interpreted

94956 as an *ex* command immediately after the contents of the edit buffer have been replaced and the  
94957 current line and column have been set.

94958 If the edit buffer is empty:

94959 *Current line*: Set to 0.

94960 *Current column*: Set to 1.

94961 Otherwise, if executed while in *ex* command mode or if the *+command* argument is specified:

94962 *Current line*: Set to the last line of the edit buffer.

94963 *Current column*: Set to non-<blank>.

94964 Otherwise, if *file* is omitted or results in the current pathname:

94965 *Current line*: Set to the first line of the edit buffer.

94966 *Current column*: Set to non-<blank>.

94967 Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if  
94968 the file was previously edited, the line and column may be set as follows:

94969 *Current line*: Set to the last value held when that file was last edited. If this value is not a valid  
94970 line in the new edit buffer, set to the first line of the edit buffer.

94971 *Current column*: If the current line was set to the last value held when the file was last edited, set  
94972 to the last value held when the file was last edited. Otherwise, or if the last value is not a valid  
94973 column in the new edit buffer, set to non-<blank>.

94974 Otherwise:

94975 *Current line*: Set to the first line of the edit buffer.

94976 *Current column*: Set to non-<blank>.

## 94977 **File**

94978 *Synopsis*: `f[file] [file]`

94979 If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and  
94980 the current pathname shall be set to *file*.

94981 Write an informational message. If the file has a current pathname, it shall be included in this  
94982 message; otherwise, the message shall indicate that there is no current pathname. If the edit  
94983 buffer contains lines, the current line number and the number of lines in the edit buffer shall be  
94984 included in this message; otherwise, the message shall indicate that the edit buffer is empty. If  
94985 the edit buffer has been modified since the last complete write, this fact shall be included in this  
94986 message. If the **readonly** edit option is set, this fact shall be included in this message. The  
94987 message may contain other unspecified information.

94988 *Current line*: Unchanged.

94989 *Current column*: Unchanged.

94990 **Global**

94991 *Synopsis:* `[2addr] g[lobal] /pattern/ [commands]`  
 94992 `[2addr] v /pattern/ [commands]`

94993 The optional `!` character after the **global** command shall be the same as executing the **v**  
 94994 command.

94995 If *pattern* is empty (for example, `"/"/`) or not specified, the last regular expression used in the  
 94996 editor command shall be used as the *pattern*. The *pattern* can be delimited by `<slash>` characters  
 94997 (shown in the Synopsis), as well as any non-alphanumeric or non-`<blank>` other than  
 94998 `<backslash>`, `<vertical-line>`, `<newline>`, or double-quote. Within the pattern, in certain  
 94999 circumstances the delimiter can be used as a literal character; see [Regular Expressions in ex](#) (on  
 95000 page 2875).

95001 If no lines are specified, the lines shall default to the entire file.

95002 The **global** and **v** commands are logically two-pass operations. First, mark the lines within the  
 95003 specified lines for which the line excluding the terminating `<newline>` matches (**global**) or does  
 95004 not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by  
 95005 *commands*, with the current line (`'.'`) set to each marked line. If an error occurs during this  
 95006 process, or the contents of the edit buffer are replaced (for example, by the *ex* **edit** command) an  
 95007 error message shall be written and no more commands resulting from the execution of this  
 95008 command shall be processed.

95009 Multiple *ex* commands can be specified by entering multiple commands on a single line using a  
 95010 `<vertical-line>` to delimit them, or one per line, by escaping each `<newline>` with a `<backslash>`.

95011 If no commands are specified:

- 95012 1. If in *ex* command mode, it shall be as if the **print** command were specified.
- 95013 2. Otherwise, no command shall be executed.

95014 For the **append**, **change**, and **insert** commands, the input text shall be included as part of the  
 95015 command, and the terminating `<period>` can be omitted if the command ends the list of  
 95016 commands. The **open** and **visual** commands can be specified as one of the commands, in which  
 95017 case each marked line shall cause the editor to enter open or visual mode. If open or visual mode  
 95018 is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open  
 95019 or visual mode reentered, until the list of marked lines is exhausted.

95020 The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted  
 95021 by commands executed for lines occurring earlier in the file than the marked lines. In this case,  
 95022 no commands shall be executed for the deleted lines.

95023 If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

95024 The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v**  
 95025 command.

95026 *Current line:* If no commands executed, set to the last marked line. Otherwise, as specified for the  
 95027 executed *ex* commands.

95028 *Current column:* If no commands are executed, set to non-`<blank>`; otherwise, as specified for the  
 95029 individual *ex* commands.

95030 **Insert**95031 *Synopsis:* `[1addr] i[nsert] [!]`95032 Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero  
95033 or 1, the text shall be placed at the beginning of the edit buffer.95034 This command shall be affected by the **number** and **autoindent** edit options; following the  
95035 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
95036 duration of this command only.95037 *Current line:* Set to the last input line; if no lines were input, set to the line before the specified  
95038 line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero  
95039 if the edit buffer is empty.95040 *Current column:* Set to non-<blank>.95041 **Join**95042 *Synopsis:* `[2addr] j[oin] [!] [count] [flags]`95043 If *count* is specified:95044 If no address was specified, the **join** command shall behave as if *2addr* were the current  
95045 line and the current line plus *count* (*.,. + count*).95046 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
95047 address and the specified address plus *count* (*addr,addr + count*).95048 If two addresses were specified, the **join** command shall behave as if an additional  
95049 address, equal to the last address plus *count* -1 (*addr1,addr2,addr2 + count -1*), was  
95050 specified.95051 If this would result in a second address greater than the last line of the edit buffer, it shall  
95052 be corrected to be equal to the last line of the edit buffer.95053 If no *count* is specified:95054 If no address was specified, the **join** command shall behave as if *2addr* were the current  
95055 line and the next line (*.,. +1*).95056 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
95057 address and the next line (*addr,addr +1*).95058 Join the text from the specified lines together into a single line, which shall replace the specified  
95059 lines.95060 If a '!' character is appended to the command name, the **join** shall be without modification of  
95061 any line, independent of the current locale.95062 Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for  
95063 each subsequent line, proceed as follows:

- 95064
1. Discard leading <space> characters from the line to be joined.
  - 95065 2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
  - 95066 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) '  
95067 character, join the lines without further modification.

- 95068 4. If the last character of the current line is a ' . ', join the lines with two <space> characters  
 95069 between them.
- 95070 5. Otherwise, join the lines with a single <space> between them.

95071 *Current line*: Set to the first line specified.

95072 *Current column*: Set to non-<blank>.

### 95073 List

95074 *Synopsis*: `[2addr] l[ist] [count] [flags]`

95075 This command shall be equivalent to the *ex* command:

95076 `[2addr] p[rint] [count] l[flags]`

95077 See [Print](#) (on page 2864).

### 95078 Map

95079 *Synopsis*: `map[!][lhs rhs]`

95080 If *lhs* and *rhs* are not specified:

- 95081 1. If '!' is specified, write the current list of text input mode maps.
- 95082 2. Otherwise, write the current list of command mode maps.
- 95083 3. Do nothing more.

95084 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
 95085 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
 95086 implementation-defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V,  
 95087 in which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V  
 95088 shall be discarded.

95089 If the character '!' is appended to the **map** command name, the mapping shall be effective  
 95090 during open or visual text input mode rather than **open** or **visual** command mode. This allows  
 95091 *lhs* to have two different **map** definitions at the same time: one for command mode and one for  
 95092 text input mode.

95093 For command mode mappings:

95094 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as  
 95095 part of the arguments to the command), the action shall be as if the corresponding *rhs* had  
 95096 been entered.

95097 If any character in the command, other than the first, is escaped using a <control>-V  
 95098 character, that character shall not be part of a match to an *lhs*.

95099 It is unspecified whether implementations shall support **map** commands where the *lhs* is  
 95100 more than a single character in length, where the first character of the *lhs* is printable.

95101 If *lhs* contains more than one character and the first character is '#', followed by a  
 95102 sequence of digits corresponding to a numbered function key, then when this function key  
 95103 is typed it shall be mapped to *rhs*. Characters other than digits following a '#' character  
 95104 also represent the function key named by the characters in the *lhs* following the '#' and  
 95105 may be mapped to *rhs*. It is unspecified how function keys are named or what function  
 95106 keys are supported.

- 95107 For text input mode mappings:
- 95108 When the *lhs* is entered as any part of text entered in open or visual text input modes, the  
95109 action shall be as if the corresponding *rhs* had been entered.
- 95110 If any character in the input text is escaped using a <control>-V character, that character  
95111 shall not be part of a match to an *lhs*.
- 95112 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is  
95113 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or  
95114 not the display appears as if the corresponding *rhs* text was entered, the effect of the  
95115 command shall be as if the *lhs* text was entered.
- 95116 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,  
95117 possibly matching characters before treating the already entered characters as not matching the  
95118 *lhs*.
- 95119 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the  
95120 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those  
95121 characters shall not be remapped.
- 95122 On block-mode terminals, the mapping need not occur immediately (for example, it may occur  
95123 after the terminal transmits a group of characters to the system), but it shall achieve the same  
95124 results as if it occurred immediately.
- 95125 *Current line*: Unchanged.
- 95126 *Current column*: Unchanged.
- 95127 **Mark**
- 95128 *Synopsis:* `[laddr] ma[rk] character`  
95129 `[laddr] k character`
- 95130 Implementations shall support *character* values of a single lowercase letter of the POSIX locale  
95131 and the backquote and single-quote characters; support of other characters is implementation-  
95132 defined.
- 95133 If executing the *vi* **m** command, set the specified mark to the current line and 1-based numbered  
95134 character referenced by the current column, if any; otherwise, column position 1.
- 95135 Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank>  
95136 non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any;  
95137 otherwise, column position 1.
- 95138 The mark shall remain associated with the line until the mark is reset or the line is deleted. If a  
95139 deleted line is restored by a subsequent **undo** command, any marks previously associated with  
95140 the line, which have not been reset, shall be restored as well. Any use of a mark not associated  
95141 with a current line in the edit buffer shall be an error.
- 95142 The marks ` and ' shall be set as described previously, immediately before the following events  
95143 occur in the editor:
- 95144 1. The use of '\$' as an *ex* address
  - 95145 2. The use of a positive decimal number as an *ex* address
  - 95146 3. The use of a search command as an *ex* address

- 95147 4. The use of a mark reference as an *ex* address
- 95148 5. The use of the following open and visual mode commands: <control>-, %, (, ), [, ], {, }
- 95149 6. The use of the following open and visual mode commands: ', **G**, **H**, **L**, **M**, **z** if the current
- 95150 line will change as a result of the command
- 95151 7. The use of the open and visual mode commands: /, ?, **N**, `, **n** if the current line or column
- 95152 will change as a result of the command
- 95153 8. The use of the *ex* mode commands: **z**, **undo**, **global**, **v**

95154 For rules 1., 2., 3., and 4., the ` and ' marks shall not be set if the *ex* command is parsed as

95155 specified by rule 6.a. in [Command Line Parsing in ex](#) (on page 2846).

95156 For rules 5., 6., and 7., the ` and ' marks shall not be set if the commands are used as motion

95157 commands in open and visual mode.

95158 For rules 1., 2., 3., 4., 5., 6., 7., and 8., the ` and ' marks shall not be set if the command fails.

95159 The ` and ' marks shall be set as described previously, each time the contents of the edit buffer

95160 are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex**

95161 mode and the edit buffer is not empty, before any commands or movements (including

95162 commands or movements specified by the **-c** or **-t** options or the **+command** argument) are

95163 executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the *vi*

95164 **m** command; otherwise, as if executing the *ex* **mark** command.

95165 When changing from **ex** mode to open or visual mode, if the ` and ' marks are not already set,

95166 the ` and ' marks shall be set as described previously.

95167 *Current line*: Unchanged.

95168 *Current column*: Unchanged.

## 95169 **Move**

95170 *Synopsis*: **[2addr] m[ove] laddr [flags]**

95171 Move the specified lines after the specified destination line. A destination of line zero specifies

95172 that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the

95173 destination line is within the range of lines to be moved.

95174 *Current line*: Set to the last of the moved lines.

95175 *Current column*: Set to non-<blank>.

## 95176 **Next**

95177 *Synopsis*: **n[ext] [!] [+command] [file ...]**

95178 If no '!' is appended to the command name, and the edit buffer has been modified since the

95179 last complete write, it shall be an error, unless the file is successfully written as specified by the

95180 **autowrite** option.

95181 If one or more files is specified:

- 95182 1. Set the argument list to the specified filenames.
- 95183 2. Set the current argument list reference to be the first entry in the argument list.

95184 3. Set the current pathname to the first filename specified.

95185 Otherwise:

95186 1. It shall be an error if there are no more filenames in the argument list after the filename  
95187 currently referenced.

95188 2. Set the current pathname and the current argument list reference to the filename after the  
95189 filename currently referenced in the argument list.

95190 Replace the contents of the edit buffer with the contents of the file named by the current  
95191 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
95192 empty.

95193 This command shall be affected by the **autowrite** and **writeany** edit options.

95194 The *+command* option shall be <blank>-delimited; <blank> characters can be escaped by  
95195 preceding them with a <backslash> character. The *+command* shall be interpreted as an *ex*  
95196 command immediately after the contents of the edit buffer have been replaced and the current  
95197 line and column have been set.

95198 *Current line*: Set as described for the **edit** command.

95199 *Current column*: Set as described for the **edit** command.

## 95200 **Number**

95201 *Synopsis*: `[2addr] nu[mber] [count] [flags]`  
95202 `[2addr] #[count] [flags]`

95203 These commands shall be equivalent to the *ex* command:

95204 `[2addr] p[rint] [count] #[flags]`

95205 See [Print](#) (on page 2864).

## 95206 **Open**

95207 *Synopsis*: `[laddr] o[pen] /pattern/ [flags]`

95208 This command need not be supported on block-mode terminals or terminals with insufficient  
95209 capabilities. If standard input, standard output, or standard error are not terminal devices, the  
95210 results are unspecified.

95211 Enter open mode.

95212 The trailing delimiter can be omitted from *pattern* at the end of the command line. If *pattern* is  
95213 empty (for example, `"/"/`) or not specified, the last regular expression used in the editor shall  
95214 be used as the pattern. The pattern can be delimited by <slash> characters (shown in the  
95215 Synopsis), as well as any alphanumeric, or non-<blank> other than <backslash>, <vertical-line>,  
95216 <newline>, or double-quote.

95217 *Current line*: Set to the specified line.

95218 *Current column*: Set to non-<blank>.

95219 **Preserve**95220 *Synopsis:*    pre[serve]

95221 Save the edit buffer in a form that can later be recovered by using the **-r** option or by using the  
 95222 *ex* **recover** command. After the file has been preserved, a mail message shall be sent to the user.  
 95223 This message shall be readable by invoking the *mailx* utility. The message shall contain the name  
 95224 of the file, the time of preservation, and an *ex* command that could be used to recover the file.  
 95225 Additional information may be included in the mail message.

95226 *Current line:* Unchanged.95227 *Current column:* Unchanged.95228 **Print**95229 *Synopsis:*    [2addr] p[rint][count][flags]

95230 Write the addressed lines. The behavior is unspecified if the number of columns on the display is  
 95231 less than the number of columns required to write any single character in the lines being written.

95232 Non-printable characters, except for the <tab>, shall be written as implementation-defined  
 95233 multi-character sequences.

95234 If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line  
 95235 number in the following format:

95236 "%6dΔΔ", &lt;line number&gt;

95237 If the l flag is specified or the **list** edit option is set:

- 95238 1. The characters listed in XBD Table 5-1 (on page 113) shall be written as the corresponding  
 95239 escape sequence.
- 95240 2. Non-printable characters not in XBD Table 5-1 (on page 113) shall be written as one three-  
 95241 digit octal number (with a preceding <backslash>) for each byte in the character (most  
 95242 significant byte first).
- 95243 3. The end of each line shall be marked with a '\$', and literal '\$' characters within the line  
 95244 shall be written with a preceding <backslash>.

95245 Long lines shall be folded; the length at which folding occurs is unspecified, but should be  
 95246 appropriate for the output terminal, considering the number of columns of the terminal.

95247 If a line is folded, and the l flag is not specified and the **list** edit option is not set, it is unspecified  
 95248 whether a multi-column character at the folding position is separated; it shall not be discarded.

95249 *Current line:* Set to the last written line.95250 *Current column:* Unchanged if the current line is unchanged; otherwise, set to non-<blank>.95251 **Put**95252 *Synopsis:*    [laddr] pu[t][buffer]

95253 Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line  
 95254 zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a  
 95255 line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

95256 *Current line:* Set to the last line entered into the edit buffer.95257 *Current column:* Set to non-<blank>.

95258 **Quit**95259 *Synopsis:* `q[uit][!]`95260 If no `!` is appended to the command name:

- 95261 1. If the edit buffer has been modified since the last complete write, it shall be an error.
- 95262 2. If there are filenames in the argument list after the filename currently referenced, and the
- 95263 last command was not a **quit**, **wq**, **xit**, or **ZZ** (see [Exit](#), on page 3561) command, it shall be
- 95264 an error.

95265 Otherwise, terminate the editing session.

95266 **Read**95267 *Synopsis:* `[laddr] r[ead][!][file]`

95268 If `!` is not the first non-`<blank>` to follow the command name, a copy of the specified file shall

95269 be appended into the edit buffer after the specified line; line zero specifies that the copy shall be

95270 placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If

95271 no *file* is named, the current pathname shall be the default. If there is no current pathname, then

95272 *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be

95273 an error. Specifying a *file* that is not of type regular shall have unspecified results.

95274 Otherwise, if *file* is preceded by `!`, the rest of the line after the `!` shall have `%`, `#`, and

95275 `!` characters expanded as described in [Command Line Parsing in ex](#) (on page 2846).

95276 The *ex* utility shall then pass two arguments to the program named by the shell edit option; the

95277 first shall be `-c` and the second shall be the expanded arguments to the **read** command as a

95278 single argument. The standard input of the program shall be set to the standard input of the *ex*

95279 program when it was invoked. The standard error and standard output of the program shall be

95280 appended into the edit buffer after the specified line.

95281 Each line in the copied file or program output (as delimited by `<newline>` characters or the end

95282 of the file or output if it is not immediately preceded by a `<newline>`), shall be a separate line in

95283 the edit buffer. Any occurrences of `<carriage-return>` and `<newline>` pairs in the output shall be

95284 treated as single `<newline>` characters.

95285 The special meaning of the `!` following the **read** command can be overridden by escaping it

95286 with a `<backslash>` character.

95287 *Current line:* If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual

95288 mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into

95289 the edit buffer.

95290 *Current column:* Set to non-`<blank>`.95291 **Recover**95292 *Synopsis:* `rec[over][!]file`

95293 If no `!` is appended to the command name, and the edit buffer has been modified since the

95294 last complete write, it shall be an error.

95295 If no *file* operand is specified, then the current pathname shall be used. If there is no current

95296 pathname or *file* operand, it shall be an error.

95297 If no recovery information has previously been saved about *file*, the **recover** command shall

95298 behave identically to the **edit** command, and an informational message to this effect shall be

95299 written.

95300 Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer  
 95301 with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the  
 95302 one most recently saved shall be recovered, and an informational message that there are  
 95303 previous versions of the file that can be recovered shall be written. The editor shall behave as if  
 95304 the contents of the edit buffer have already been modified.

95305 *Current file*: Set as described for the **edit** command.

95306 *Current column*: Set as described for the **edit** command.

## 95307 **Rewind**

95308 *Synopsis*: `rew[ind] [!]`

95309 If no `!` is appended to the command name, and the edit buffer has been modified since the  
 95310 last complete write, it shall be an error, unless the file is successfully written as specified by the  
 95311 **autowrite** option.

95312 If the argument list is empty, it shall be an error.

95313 The current argument list reference and the current pathname shall be set to the first filename in  
 95314 the argument list.

95315 Replace the contents of the edit buffer with the contents of the file named by the current  
 95316 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
 95317 empty.

95318 This command shall be affected by the **autowrite** and **writeany** edit options.

95319 *Current line*: Set as described for the **edit** command.

95320 *Current column*: Set as described for the **edit** command.

## 95321 **Set**

95322 *Synopsis*: `se[t] [ option[=value] ... ] [ nooption ... ] [ option? ... ] [ all ]`

95323 When no arguments are specified, write the value of the **term** edit option and those options  
 95324 whose values have been changed from the default settings; when the argument *all* is specified,  
 95325 write all of the option values.

95326 Giving an option name followed by the character `?` shall cause the current value of that  
 95327 option to be written. The `?` can be separated from the option name by zero or more `<blank>`  
 95328 characters. The `?` shall be necessary only for Boolean valued options. Boolean options can be  
 95329 given values by the form **set option** to turn them on or **set nooption** to turn them off; string and  
 95330 numeric options can be assigned by the form **set option=*value***. Any `<blank>` characters in strings  
 95331 can be included as is by preceding each `<blank>` with an escaping `<backslash>`. More than one  
 95332 option can be set or listed by a single set command by specifying multiple arguments, each  
 95333 separated from the next by one or more `<blank>` characters. Arguments can appear in any order  
 95334 and shall be processed in the specified order.

95335 See [Edit Options in ex](#) (on page 2877) for details about specific options.

95336 *Current line*: Unchanged.

95337 *Current column*: Unchanged.

95338 **Shell**95339 *Synopsis:* `sh[ell]`95340 Invoke the program named in the **shell** edit option with the single argument **-i** (interactive  
95341 mode). Editing shall be resumed when the program exits.95342 *Current line:* Unchanged.95343 *Current column:* Unchanged.95344 **Source**95345 *Synopsis:* `so[urce] file`95346 Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.95347 *Current line:* As specified for the individual *ex* commands.95348 *Current column:* As specified for the individual *ex* commands.95349 **Substitute**95350 *Synopsis:* `[2addr] s[substitute] [/pattern/repl/] [options] [count] [flags]`  
95351 `[2addr] & [options] [count] [flags]`  
95352 `[2addr] ~ [options] [count] [flags]`95353 Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See  
95354 [Regular Expressions in ex](#) (on page 2875) and [Replacement Strings in ex](#) (on page 2876).) Any  
95355 non-alphabetic, non-`<blank>` delimiter other than `<backslash>`, `'|'`, `<newline>`, or double-  
95356 quote can be used instead of `'/'`. Within the pattern, in certain circumstances the delimiter can  
95357 be used as a literal character; see [Regular Expressions in ex](#) (on page 2875). Within the  
95358 replacement, the delimiter shall not terminate the replacement if it is the second character of an  
95359 escape sequence (see XBD [Section 9.1](#), on page 179) and the escaped delimiter shall be treated as  
95360 that literal character in the replacement (losing any special meaning it would have had if it was  
95361 not used as the delimiter and was not escaped). It shall be an error if the substitution fails on  
95362 every addressed line.95363 The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If  
95364 both *pattern* and *repl* are not specified or are empty (for example, `"/"/`), the last `s` command  
95365 shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in  
95366 the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be  
95367 replaced by nothing. If the entire replacement pattern is `'%'`, the last replacement pattern to an  
95368 `s` command shall be used.95369 Entering a `<carriage-return>` in *repl* (which requires an escaping `<backslash>` in *ex* mode and an  
95370 escaping `<control>-V` in open or *vi* mode) shall split the line at that point, creating a new line in  
95371 the edit buffer. The `<carriage-return>` shall be discarded.95372 If *options* includes the letter `'g'` (**global**), all non-overlapping instances of the pattern in the line  
95373 shall be replaced.95374 If *options* includes the letter `'c'` (**confirm**), then before each substitution the line shall be written;  
95375 the written line shall reflect all previous substitutions. On the following line, `<space>` characters  
95376 shall be written beneath the characters from the line that are before the *pattern* to be replaced,  
95377 and `'^'` characters written beneath the characters included in the *pattern* to be replaced. The *ex*  
95378 utility shall then wait for a response from the user. An affirmative response shall cause the  
95379 substitution to be done, while any other input shall not make the substitution. An affirmative  
95380 response shall consist of a line with the affirmative response (as defined by the current locale) at

95381 the beginning of the line. This line shall be subject to editing in the same way as the *ex* command  
95382 line.

95383 If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the  
95384 user shall be preserved in the edit buffer after the interrupt.

95385 If the remembered search direction is not set, the *s* command shall set it to forward.

95386 In the second Synopsis, the *&* command shall repeat the previous substitution, as if the *&*  
95387 command were replaced by:

95388 *s/pattern/repl/*

95389 where *pattern* and *repl* are as specified in the previous *s*, *&*, or *~* command.

95390 In the third Synopsis, the *~* command shall repeat the previous substitution, as if the '*~*' were  
95391 replaced by:

95392 *s/pattern/repl/*

95393 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from  
95394 the previous substitution (including *&* and *~*) command.

95395 These commands shall be affected by the *LC\_MESSAGES* environment variable.

95396 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no substitution  
95397 occurred.

95398 *Current column*: Set to non-<blank>.

## 95399 Suspend

95400 *Synopsis:* *su[spend] [!]*

95401 *st[op] [!]*

95402 Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the  
95403 SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell  
95404 (see the description of *set -m*).

95405 These commands shall be affected by the **autowrite** and **writeany** edit options.

95406 The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

## 95407 Tag

95408 *Synopsis:* *ta[g] [!] tagstring*

95409 The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see  
95410 *ctags*) description.

95411 The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in  
95412 the order they are specified, until a reference to *tagstring* is found. Files shall be searched from  
95413 beginning to end. If no reference is found, it shall be an error and an error message to this effect  
95414 shall be written. If the reference is not found, or if an error occurs while processing a file referred  
95415 to in the **tag** edit option, it shall be an error, and an error message shall be written at the first  
95416 occurrence of such an error.

95417 Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression  
95418 used in the editor; for example, for the purposes of the *s* command.

95419 If the *tagstring* is in a file with a different name than the current pathname, set the current  
95420 pathname to the name of that file, and replace the contents of the edit buffer with the contents of

95421 that file. In this case, if no '!' is appended to the command name, and the edit buffer has been  
 95422 modified since the last complete write, it shall be an error, unless the file is successfully written  
 95423 as specified by the **autowrite** option.

95424 This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

95425 *Current line*: If the tags file contained a line number, set to that line number. If the line number is  
 95426 larger than the last line in the edit buffer, an error message shall be written and the current line  
 95427 shall be set as specified for the **edit** command.

95428 If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no  
 95429 matching pattern is found, an error message shall be written and the current line shall be set as  
 95430 specified for the **edit** command.

95431 *Current column*: If the tags file contained a line-number reference and that line-number was not  
 95432 larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern  
 95433 was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

### 95434 **Unabbreviate**

95435 *Synopsis*:    una[bbrev] lhs

95436 If *lhs* is not an entry in the current list of abbreviations (see [Abbreviate](#), on page 2854), it shall be  
 95437 an error. Otherwise, delete *lhs* from the list of abbreviations.

95438 *Current line*: Unchanged.

95439 *Current column*: Unchanged.

### 95440 **Undo**

95441 *Synopsis*:    u[ndo]

95442 Reverse the changes made by the last command that modified the contents of the edit buffer,  
 95443 including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands  
 95444 resulting from buffer executions and mapped character expansions, are considered single  
 95445 commands.

95446 If no action that can be undone preceded the **undo** command, it shall be an error.

95447 If the **undo** command restores lines that were marked, the mark shall also be restored unless it  
 95448 was reset subsequent to the deletion of the lines.

95449 *Current line*:

- 95450     1. If lines are added or changed in the file, set to the first line added or changed.
- 95451     2. Set to the line before the first line deleted, if it exists.
- 95452     3. Set to 1 if the edit buffer is not empty.
- 95453     4. Set to zero.

95454 *Current column*: Set to non-<blank>.

95455 **Unmap**95456 *Synopsis:* `unm[ap][!] lhs`95457 If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode  
95458 map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map  
95459 definitions.95460 If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command  
95461 mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode  
95462 map definitions.95463 *Current line:* Unchanged.95464 *Current column:* Unchanged.95465 **Version**95466 *Synopsis:* `ve[rsion]`95467 Write a message containing version information for the editor. The format of the message is  
95468 unspecified.95469 *Current line:* Unchanged.95470 *Current column:* Unchanged.95471 **Visual**95472 *Synopsis:* `[laddr] vi[sual][type][count][flags]`95473 If *ex* is currently in open or visual mode, the Synopsis and behavior of the visual command shall  
95474 be the same as the **edit** command, as specified by **Edit** (on page 2856).95475 Otherwise, this command need not be supported on block-mode terminals or terminals with  
95476 insufficient capabilities. If standard input, standard output, or standard error are not terminal  
95477 devices, the results are unspecified.95478 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in  
95479 **window**, on page 2883). If the '^' type character was also specified, the **window** edit option  
95480 shall be set before being used by the type character.95481 Enter visual mode. If *type* is not specified, it shall be as if a *type* of '+' was specified. The *type*  
95482 shall cause the following effects:

95483 + Place the beginning of the specified line at the top of the display.

95484 - Place the end of the specified line at the bottom of the display.

95485 . Place the beginning of the specified line in the middle of the display.

95486 ^ If the specified line is less than or equal to the value of the **window** edit option, set the line  
95487 to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place  
95488 the beginning of this line as close to the bottom of the displayed lines as possible, while still  
95489 displaying the value of the **window** edit option number of lines.95490 *Current line:* Set to the specified line.95491 *Current column:* Set to non-<blank>.

95492 **Write**

95493 *Synopsis:* `[2addr] w[rite] [!] [>>] [file]`  
 95494 `[2addr] w[rite] [!] [file]`  
 95495 `[2addr] wq[!] [>>] [file]`

95496 If no lines are specified, the lines shall default to the entire file.

95497 The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!**  
 95498 shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the  
 95499 **quit** shall not be attempted.

95500 If the command name is not followed by one or more <blank> characters, or *file* is not preceded  
 95501 by a **'!'** character, the **write** shall be to a file.

- 95502 1. If the **>>** argument is specified, and the file already exists, the lines shall be appended to  
 95503 the file instead of replacing its contents. If the **>>** argument is specified, and the file does  
 95504 not already exist, it is unspecified whether the write shall proceed as if the **>>** argument  
 95505 had not been specified or if the write shall fail.
- 95506 2. If the **readonly** edit option is set (see [readonly](#), on page 2880), the **write** shall fail.
- 95507 3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
- 95508 4. If *file* is not specified, the current pathname shall be used. If there is no current pathname,  
 95509 the **write** command shall fail.
- 95510 5. If the current pathname is used, and the current pathname has been changed by the **file**  
 95511 or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,  
 95512 subsequent **writes** shall not fail for this reason (unless the current pathname is changed  
 95513 again).
- 95514 6. If the whole edit buffer is not being written, and the file to be written exists, the **write**  
 95515 shall fail.

95516 For rules 1., 2., 3., and 5., the **write** can be forced by appending the character **'!'** to the  
 95517 command name.

95518 For rules 2., 3., and 5., the **write** can be forced by setting the **writeany** edit option.

95519 Additional, implementation-defined tests may cause the **write** to fail.

95520 If the edit buffer is empty, a file without any contents shall be written.

95521 An informational message shall be written noting the number of lines and bytes written.

95522 Otherwise, if the command is followed by one or more <blank> characters, and the file is  
 95523 preceded by **'!'**, the rest of the line after the **'!'** shall have **'%'**, **'#'**, and **'!'** characters  
 95524 expanded as described in [Command Line Parsing in ex](#) (on page 2846).

95525 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the  
 95526 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a  
 95527 single argument. The specified lines shall be written to the standard input of the command. The  
 95528 standard error and standard output of the program, if any, shall be written as described for the  
 95529 **print** command. If the last character in that output is not a <newline>, a <newline> shall be  
 95530 written at the end of the output.

95531 The special meaning of the **'!'** following the **write** command can be overridden by escaping it  
 95532 with a <backslash> character.

95533 *Current line:* Unchanged.

95534 *Current column*: Unchanged.

### 95535 **Write and Exit**

95536 *Synopsis*: `[2addr] x[it] [!] [file]`

95537 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to  
95538 the **quit** command, or if a '!' is appended to the command name, to **quit!**.

95539 Otherwise, **xit** shall be equivalent to the **wq** command, or if a '!' is appended to the command  
95540 name, to **wq!**.

95541 *Current line*: Unchanged.

95542 *Current column*: Unchanged.

### 95543 **Yank**

95544 *Synopsis*: `[2addr] ya[nk] [ buffer] [count]`

95545 Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall  
95546 become a line-mode buffer.

95547 *Current line*: Unchanged.

95548 *Current column*: Unchanged.

### 95549 **Adjust Window**

95550 *Synopsis*: `[laddr] z[!][type ...] [count] [flags]`

95551 If no line is specified, the current line shall be the default; if *type* is omitted as well, the current  
95552 line value shall first be incremented by 1. If incrementing the current line would cause it to be  
95553 greater than the last line in the edit buffer, it shall be an error.

95554 If there are <blank> characters between the *type* argument and the preceding **z** command name  
95555 or optional '!' character, it shall be an error.

95556 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in  
95557 [window](#), on page 2883). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit  
95558 option, or if ! was specified, the number of lines in the display minus 1.

95559 If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise,  
95560 *count* lines starting with the line specified by the *type* argument shall be written.

95561 The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

95562 – The specified line shall be decremented by the following value:

95563  $((\text{number of '-' characters}) \times \text{count}) - 1$

95564 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
95565 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
95566 buffer has been written.

95567 + The specified line shall be incremented by the following value:

95568  $((\text{number of '+' characters}) - 1) \times \text{count} + 1$

95569 If the calculation would result in a number greater than the last line in the edit buffer, it  
95570 shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count*  
95571 lines or the last line in the edit buffer has been written.

95572 =, . If more than a single ' . ' or '=' is specified, it shall be an error. The following steps shall  
95573 be taken:

- 95574 1. If *count* is zero, nothing shall be written.
- 95575 2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count*  
95576 or '!' was specified, *N* shall be:
- 95577  $(count - 1) / 2$
- 95578 Otherwise, *N* shall be:
- 95579  $(count - 3) / 2$
- 95580 If *N* is a number less than 3, no lines shall be written.
- 95581 3. If '=' was specified as the type character, write a line consisting of the smaller of the  
95582 number of columns in the display divided by two, or 40 '-' characters.
- 95583 4. Write the current line.
- 95584 5. Repeat step 3.
- 95585 6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall  
95586 be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count*  
95587 is less than 3, no lines shall be written.

95588 ^ The specified line shall be decremented by the following value:

95589  $((\text{number of '^' characters}) + 1) \times count - 1$

95590 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
95591 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
95592 buffer has been written.

95593 *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified  
95594 line.

95595 *Current column*: Set to non-<blank>.

## 95596 Escape

95597 *Synopsis*: !*command*  
95598 [2*addr*] !*command*

95599 The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as  
95600 described in [Command Line Parsing in ex](#) (on page 2846). If the expansion causes the text of the  
95601 line to change, it shall be redisplayed, preceded by a single '!' character.

95602 The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two  
95603 arguments to the program; the first shall be -c, and the second shall be the expanded arguments  
95604 to the ! command as a single argument.

95605 If no lines are specified, the standard input, standard output, and standard error of the program  
95606 shall be set to the standard input, standard output, and standard error of the *ex* program when it  
95607 was invoked. In addition, a warning message shall be written if the edit buffer has been  
95608 modified since the last complete write, and the **warn** edit option is set.

95609 If lines are specified, they shall be passed to the program as standard input, and the standard  
95610 output and standard error of the program shall replace those lines in the edit buffer. Each line in  
95611 the program output (as delimited by <newline> characters or the end of the output if it is not  
95612 immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any

95613 occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single  
 95614 <newline> characters. The specified lines shall be copied into the unnamed buffer before they  
 95615 are replaced, and the unnamed buffer shall become a line-mode buffer.

95616 If in *ex* mode, a single '!' character shall be written when the program completes.

95617 This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this  
 95618 command shall be affected by the **autowrite** and **writeany** edit options. If lines are specified, this  
 95619 command shall be affected by the **autoprint** edit option.

95620 *Current line:*

- 95621 1. If no lines are specified, unchanged.
- 95622 2. Otherwise, set to the last line read in, if any lines are read in.
- 95623 3. Otherwise, set to the line before the first line of the lines specified, if that line exists.
- 95624 4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.
- 95625 5. Otherwise, set to zero.

95626 *Current column:* If no lines are specified, unchanged. Otherwise, set to non-<blank>.

### 95627 **Shift Left**

95628 *Synopsis:* `[2addr] <[< . . . ] [count] [flags]`

95629 Shift the specified lines to the start of the line; the number of column positions to be shifted shall  
 95630 be the number of command characters times the value of the **shiftwidth** edit option. Only  
 95631 leading <blank> characters shall be deleted or changed into other <blank> characters in shifting;  
 95632 other characters shall not be affected.

95633 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
 95634 buffer.

95635 This command shall be affected by the **autoprint** edit option.

95636 *Current line:* Set to the last line in the lines specified.

95637 *Current column:* Set to non-<blank>.

### 95638 **Shift Right**

95639 *Synopsis:* `[2addr] >[> . . . ] [count] [flags]`

95640 Shift the specified lines away from the start of the line; the number of column positions to be  
 95641 shifted shall be the number of command characters times the value of the **shiftwidth** edit  
 95642 option. The shift shall be accomplished by adding <blank> characters as a prefix to the line or  
 95643 changing leading <blank> characters into other <blank> characters. Empty lines shall not be  
 95644 changed.

95645 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
 95646 buffer.

95647 This command shall be affected by the **autoprint** edit option.

95648 *Current line:* Set to the last line in the lines specified.

95649 *Current column:* Set to non-<blank>.

95650 **<control>-D**95651 *Synopsis:*     <control>-D95652 Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the  
95653 number of lines after the current line in the edit buffer. If the current line is the last line of the  
95654 edit buffer it shall be an error.95655 *Current line:* Set to the last line written.95656 *Current column:* Set to non-<blank>.95657 **Write Line Number**95658 *Synopsis:*     [*laddr*] = [*flags*]95659 If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of  
95660 the specified line.95661 *Current line:* Unchanged.95662 *Current column:* Unchanged.95663 **Execute**95664 *Synopsis:*     [*2addr*] @ *buffer*95665                [*2addr*] \* *buffer*95666 If no *buffer* is specified or is specified as '@' or '\*', the last *buffer* executed shall be used. If no  
95667 previous *buffer* has been executed, it shall be an error.95668 For each line specified by the addresses, set the current line ('.') to the specified line, and  
95669 execute the contents of the named *buffer* (as they were at the time the @ command was executed)  
95670 as *ex* commands. For each line of a line-mode *buffer*, and all but the last line of a character-mode  
95671 *buffer*, the *ex* command parser shall behave as if the line was terminated by a <newline>.95672 If an error occurs during this process, or a line specified by the addresses does not exist when  
95673 the current line would be set to it, or more than a single line was specified by the addresses, and  
95674 the contents of the edit buffer are replaced (for example, by the *ex* :edit command) an error  
95675 message shall be written, and no more commands resulting from the execution of this command  
95676 shall be processed.95677 *Current line:* As specified for the individual *ex* commands.95678 *Current column:* As specified for the individual *ex* commands.95679 **Regular Expressions in ex**95680 The *ex* utility shall support regular expressions that are a superset of the basic regular  
95681 expressions described in XBD [Section 9.3](#) (on page 181). A null regular expression ("/") shall  
95682 be equivalent to the last regular expression encountered.95683 Regular expressions can be used in addresses to specify lines and, in some commands (for  
95684 example, the **substitute** command), to specify portions of a line to be substituted.95685 The start and end of a regular expression (RE) are marked by a delimiter character (although in  
95686 some circumstances the end delimiter can be omitted). In addresses, the delimiter is either  
95687 <slash> or <question-mark>. In commands, other characters can be used as the delimiter, as  
95688 specified in the description of the command. Within the RE (as an *ex* extension to the BRE  
95689 syntax), the delimiter shall not terminate the RE if it is the second character of an escape

95690 sequence (see XBD [Section 9.1](#), on page 179) and the escaped delimiter shall be treated as that  
 95691 literal character in the RE (losing any special meaning it would have had if it was not used as the  
 95692 delimiter and was not escaped). In addition, the delimiter character shall not terminate the RE  
 95693 when it appears within a bracket expression, and shall have its normal meaning in the bracket  
 95694 expression. For example, the command "g[%]p" is equivalent to "g/[%]/p", and the  
 95695 command "s-[0-9]--g" is equivalent to "s/[0-9]//g".

95696 The following constructs can be used to enhance the basic regular expressions:

95697 \< Match the beginning of a *word*. (See the definition of *word* at the beginning of [Command](#)  
 95698 [Descriptions in ex](#) (on page 2852).)

95699 \> Match the end of a *word*.

95700 ~ Match the replacement part of the last **substitute** command. The <tilde> ('~') character can  
 95701 be escaped in a regular expression to become a normal character with no special meaning.  
 95702 The <backslash> shall be discarded.

95703 When the editor option **magic** is not set, the only characters with special meanings shall be '^'  
 95704 at the beginning of a pattern, '\$' at the end of a pattern, and <backslash>. The characters '.',  
 95705 '\*', '[', and '~' shall be treated as ordinary characters unless preceded by a <backslash>;  
 95706 when preceded by a <backslash> they shall regain their special meaning, or in the case of  
 95707 <backslash>, be handled as a single <backslash>. <backslash> characters used to escape other  
 95708 characters shall be discarded.

### 95709 Replacement Strings in ex

95710 Certain characters and strings have special meaning in replacement strings when the character,  
 95711 or the first character of the string, is unescaped.

95712 The character '&' ('\&' if the editor option **magic** is not set) in the replacement string shall  
 95713 stand for the text matched by the pattern to be replaced. The character '~' ('\~' if **magic** is not  
 95714 set) shall be replaced by the replacement part of the previous **substitute** command. The  
 95715 sequence '\n', where *n* is an integer, shall be replaced by the text matched by the  
 95716 corresponding back-reference expression. If the corresponding back-reference expression does  
 95717 not match, then the characters '\n' shall be replaced by the empty string.

95718 The strings '\l', '\u', '\L', and '\U' can be used to modify the case of elements in the  
 95719 replacement string (using the '\&' or "\"digit) notation. The string '\l' ('\u') shall cause  
 95720 the character that follows to be converted to lowercase (uppercase). The string '\L' ('\U') shall  
 95721 cause all characters subsequent to it to be converted to lowercase (uppercase) as they are  
 95722 inserted by the substitution until the string '\e' or '\E', or the end of the replacement string,  
 95723 is encountered.

95724 Otherwise, any character following an unescaped <backslash> shall be treated as that literal  
 95725 character, and the escaping <backslash> shall be discarded.

95726 An example of case conversion with the **s** command is as follows:

```
95727 :p
95728 The cat sat on the mat.
95729 :s/\<.at\>/\u&/gp
95730 The Cat Sat on the Mat.
95731 :s/S\ (.*)M/S\U\1\eM/p
95732 The Cat SAT ON THE Mat.
```

95733 **Edit Options in ex**

95734 The *ex* utility has a number of options that modify its behavior. These options have default  
95735 settings, which can be changed using the **set** command.

95736 Options are Boolean unless otherwise specified.

95737 **autoindent, ai**

95738 [Default *unset*]

95739 If **autoindent** is set, each line in input mode shall be indented (using first as many <tab>  
95740 characters as possible, as determined by the editor option **tabstop**, and then using <space>  
95741 characters) to align with another line, as follows:

- 95742 1. If in open or visual mode and the text input is part of a line-oriented command (see the  
95743 EXTENDED DESCRIPTION in *vi*), align to the first column.
- 95744 2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
  - 95745 a. If a line was previously inserted as part of this command, it shall be set to the  
95746 indentation of the last inserted line by default, or as otherwise specified for the  
95747 <control>-D character in **Input Mode Commands in vi** (on page 3561).
  - 95748 b. Otherwise, it shall be set to the indentation of the previous current line, if any;  
95749 otherwise, to the first column.
- 95750 3. For the *ex a*, *i*, and *c* commands, indentation for each line shall be set as follows:
  - 95751 a. If a line was previously inserted as part of this command, it shall be set to the  
95752 indentation of the last inserted line by default, or as otherwise specified for the *eof*  
95753 character in **Scroll** (on page 2850).
  - 95754 b. Otherwise, if the command is the *ex a* command, it shall be set to the line  
95755 appended after, if any; otherwise to the first column.
  - 95756 c. Otherwise, if the command is the *ex i* command, it shall be set to the line inserted  
95757 before, if any; otherwise to the first column.
  - 95758 d. Otherwise, if the command is the *ex c* command, it shall be set to the indentation of  
95759 the line replaced.

95760 **autoprint, ap**

95761 [Default *set*]

95762 If **autoprint** is set, the current line shall be written after each *ex* command that modifies the  
95763 contents of the current edit buffer, and after each **tag** command for which the tag search pattern  
95764 was found or tag line number was valid, unless:

- 95765 1. The command was executed while in open or visual mode.
- 95766 2. The command was executed as part of a **global** or **v** command or **@** buffer execution.
- 95767 3. The command was the form of the **read** command that reads a file into the edit buffer.
- 95768 4. The command was the **append**, **change**, or **insert** command.
- 95769 5. The command was not terminated by a <newline>.

95770 6. The current line shall be written by a flag specified to the command; for example, **delete #**  
 95771 shall write the current line as specified for the flag modifier to the **delete** command, and  
 95772 not as specified by the **autoprint** edit option.

95773 **autowrite, aw**

95774 [Default *unset*]

95775 If **autowrite** is set, and the edit buffer has been modified since it was last completely written to  
 95776 any file, the contents of the edit buffer shall be written as if the *ex* **write** command had been  
 95777 specified without arguments, before each command affected by the **autowrite** edit option is  
 95778 executed. Appending the character '!' to the command name of any of the *ex* commands  
 95779 except '!' shall prevent the write. If the write fails, it shall be an error and the command shall  
 95780 not be executed.

95781 **beautify, bf**

95782 XSI [Default *unset*]

95783 If **beautify** is set, all non-printable characters, other than <tab>, <newline>, and <form-feed>  
 95784 characters, shall be discarded from text read in from files.

95785 **directory, dir**

95786 [Default *implementation-defined*]

95787 The value of this option specifies the directory in which the editor buffer is to be placed. If this  
 95788 directory is not writable by the user, the editor shall quit.

95789 **edcompatible, ed**

95790 [Default *unset*]

95791 Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled  
 95792 by repeating the suffixes.

95793 **errorbells, eb**

95794 [Default *unset*]

95795 If the editor is in *ex* mode, and the terminal does not support a standout mode (such as inverse  
 95796 video), and **errorbells** is set, error messages shall be preceded by alerting the terminal.

95797 **exrc**

95798 [Default *unset*]

95799 If **exrc** is set, *ex* shall access any **.exrc** file in the current directory, as described in [Initialization in](#)  
 95800 [ex and vi](#) (on page 2842). If **exrc** is not set, *ex* shall ignore any **.exrc** file in the current directory  
 95801 during initialization, unless the current directory is that named by the *HOME* environment  
 95802 variable.

95803 **ignorecase, ic**95804 [Default *unset*]

95805 If **ignorecase** is set, characters that have uppercase and lowercase representations shall have  
95806 those representations considered as equivalent for purposes of regular expression comparison.

95807 The **ignorecase** edit option shall affect all remembered regular expressions; for example,  
95808 unsetting the **ignorecase** edit option shall cause a subsequent *vi n* command to search for the  
95809 last basic regular expression in a case-sensitive fashion.

95810 **list**95811 [Default *unset*]

95812 If **list** is set, edit buffer lines written while in *ex* command mode shall be written as specified for  
95813 the **print** command with the **l** flag specified. In open or visual mode, each edit buffer line shall  
95814 be displayed as specified for the *ex print* command with the **l** flag specified. In open or visual  
95815 text input mode, when the cursor does not rest on any character in the line, it shall rest on the  
95816 ' \$ ' marking the end of the line.

95817 **magic**95818 [Default *set*]

95819 If **magic** is set, modify the interpretation of characters in regular expressions and substitution  
95820 replacement strings (see [Regular Expressions in ex](#) (on page 2875) and [Replacement Strings in](#)  
95821 [ex](#), on page 2876).

95822 **mesg**95823 [Default *set*]

95824 If **mesg** is set, the permission for others to use the **write** or **talk** commands to write to the  
95825 terminal shall be turned on while in open or visual mode. The shell-level command *mesg n* shall  
95826 take precedence over any setting of the *ex mesg* option; that is, if **mesg y** was issued before the  
95827 editor started (or in a shell escape), such as:

95828 `:!mesg y`

95829 the **mesg** option in *ex* shall suppress incoming messages, but the **mesg** option shall not enable  
95830 incoming messages if **mesg n** was issued.

95831 **number, nu**95832 [Default *unset*]

95833 If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line  
95834 numbers, in the format specified by the **print** command with the **#** flag specified. In *ex* text input  
95835 mode, each line shall be preceded by the line number it will have in the file.

95836 In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in  
95837 the format specified by the *ex print* command with the **#** flag specified. This line number shall  
95838 not be considered part of the line for the purposes of evaluating the current column; that is,  
95839 column position 1 shall be the first column position after the format specified by the **print**  
95840 command.

95841 **paragraphs, para**95842 [Default in the POSIX locale `IPLPPPQPP LIpplpipbp`]

95843 The **paragraphs** edit option shall define additional paragraph boundaries for the open and  
95844 visual mode commands. The **paragraphs** edit option can be set to a character string consisting of  
95845 zero or more character pairs. It shall be an error to set it to an odd number of characters.

95846 **prompt**95847 [Default *set*]

95848 If **prompt** is set, *ex* command mode input shall be prompted for with a <colon> (':'); when  
95849 unset, no prompt shall be written.

95850 **readonly**95851 [Default *see text*]

95852 If the **readonly** edit option is set, read-only mode shall be enabled (see [Write](#), on page 2871). The  
95853 **readonly** edit option shall be initialized to set if either of the following conditions are true:

- 95854 • The command-line option `-R` was specified.
- 95855 • Performing actions equivalent to the `access()` function called with the following arguments  
95856 indicates that the file lacks write permission:
  - 95857 1. The current pathname is used as the *path* argument.
  - 95858 2. The constant `W_OK` is used as the *amode* argument.

95859 The **readonly** edit option may be initialized to set for other, implementation-defined reasons.  
95860 The **readonly** edit option shall not be initialized to unset based on any special privileges of the  
95861 user or process. The **readonly** edit option shall be reinitialized each time that the contents of the  
95862 edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly  
95863 set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again  
95864 be reinitialized each time that the contents of the edit buffer are replaced.

95865 **redraw**95866 [Default *unset*]

95867 If **redraw** is set and the terminal is a type incapable of supporting open or visual modes, the  
95868 editor shall redraw the screen when necessary in order to update its contents. (Since this is  
95869 likely to require a large amount of output to the terminal, it is useful only at high transmission  
95870 speeds.)

95871 **remap**95872 [Default *set*]

95873 If **remap** is set, map translation shall allow for maps defined in terms of other maps; translation  
95874 shall continue until a final product is obtained. If unset, only a one-step translation shall be  
95875 done.

95876 **report**

95877 [Default 5]

95878 The value of this **report** edit option specifies what number of lines being added, copied, deleted,  
 95879 or modified in the edit buffer will cause an informational message to be written to the user. The  
 95880 following conditions shall cause an informational message. The message shall contain the  
 95881 number of lines added, copied, deleted, or modified, but is otherwise unspecified.

- 95882 • An *ex* or *vi* editor command, other than **open**, **undo**, or **visual**, that modifies at least the  
 95883 value of the **report** edit option number of lines, and which is not part of an *ex* **global** or *v*  
 95884 command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- 95885 • An *ex* **yank** or *vi* **y** or **Y** command, that copies at least the value of the **report** edit option  
 95886 plus 1 number of lines, and which is not part of an *ex* **global** or *v* command, or *ex* or *vi*  
 95887 buffer execution, shall cause an informational message to be written.
- 95888 • An *ex* **global**, *v*, **open**, **undo**, or **visual** command or *ex* or *vi* buffer execution, that adds or  
 95889 deletes a total of at least the value of the **report** edit option number of lines, and which is  
 95890 not part of an *ex* **global** or *v* command, or *ex* or *vi* buffer execution, shall cause an  
 95891 informational message to be written. (For example, if 3 lines were added and 8 lines  
 95892 deleted during an *ex* **visual** command, 5 would be the number compared against the  
 95893 **report** edit option after the command completed.)

95894 **scroll, scr**

95895 [Default (number of lines in the display -1)/2]

95896 The value of the **scroll** edit option shall determine the number of lines scrolled by the *ex*  
 95897 <control>-D and **z** commands. For the *vi* <control>-D and <control>-U commands, it shall be the  
 95898 initial number of lines to scroll when no previous <control>-D or <control>-U command has  
 95899 been executed.

95900 **sections**95901 [Default in the POSIX locale `NHSHH HUnhsh`]

95902 The **sections** edit option shall define additional section boundaries for the open and visual mode  
 95903 commands. The **sections** edit option can be set to a character string consisting of zero or more  
 95904 character pairs; it shall be an error to set it to an odd number of characters.

95905 **shell, sh**95906 [Default from the environment variable `SHELL`]

95907 The value of this option shall be a string. The default shall be taken from the `SHELL`  
 95908 environment variable. If the `SHELL` environment variable is null or empty, the *sh* (see *sh*) utility  
 95909 shall be the default.

**95910 shiftwidth, sw**

95911 [Default 8]

95912 The value of this option shall give the width in columns of an indentation level used during  
95913 autoindentation and by the shift commands (< and >).

**95914 showmatch, sm**

95915 [Default *unset*]

95916 The functionality described for the **showmatch** edit option need not be supported on block-  
95917 mode terminals or terminals with insufficient capabilities.

95918 If **showmatch** is set, in open or visual mode, when a ')' or '}' is typed, if the matching '(' or  
95919 '{' is currently visible on the display, the matching '(' or '{' shall be flagged moving the  
95920 cursor to its location for an unspecified amount of time.

**95921 showmode**

95922 [Default *unset*]

95923 If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be  
95924 displayed on the last line of the display. Command mode and text input mode shall be  
95925 differentiated; other unspecified modes and implementation-defined information may be  
95926 displayed.

**95927 slowopen**

95928 [Default *unset*]

95929 If **slowopen** is set during open and visual text input modes, the editor shall not update portions  
95930 of the display other than those display line columns that display the characters entered by the  
95931 user (see [Input Mode Commands in vi](#), on page 3561).

**95932 tabstop, ts**

95933 [Default 8]

95934 The value of this edit option shall specify the column boundary used by a <tab> in the display  
95935 (see [autoprint, ap](#) (on page 2877) and [Input Mode Commands in vi](#), on page 3561).

**95936 taglength, tl**

95937 [Default zero]

95938 The value of this edit option shall specify the maximum number of characters that are  
95939 considered significant in the user-specified tag name and in the tag name from the tags file. If  
95940 the value is zero, all characters in both tag names shall be significant.

- 95941           **tags**
- 95942           [Default *see text*]
- 95943           The value of this edit option shall be a string of <blank>-delimited pathnames of files used by  
95944           the **tag** command. The default value is unspecified.
- 95945           **term**
- 95946           [Default from the environment variable *TERM*]
- 95947           The value of this edit option shall be a string. The default shall be taken from the *TERM* variable  
95948           in the environment. If the *TERM* environment variable is empty or null, the default is  
95949           unspecified. The editor shall use the value of this edit option to determine the type of the display  
95950           device.
- 95951           The results are unspecified if the user changes the value of the term edit option after editor  
95952           initialization.
- 95953           **terse**
- 95954           [Default *unset*]
- 95955           If **terse** is set, error messages may be less verbose. However, except for this caveat, error  
95956           messages are unspecified. Furthermore, not all error messages need change for different settings  
95957           of this option.
- 95958           **warn**
- 95959           [Default *set*]
- 95960           If **warn** is set, and the contents of the edit buffer have been modified since they were last  
95961           completely written, the editor shall write a warning message before certain ! commands (see  
95962           [Escape](#), on page 2873).
- 95963           **window**
- 95964           [Default *see text*]
- 95965           A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in  
95966           visual mode, to specify the number of lines displayed when the screen is repainted.
- 95967           If the **-w** command-line option is not specified, the default value shall be set to the value of the  
95968           *LINES* environment variable. If the *LINES* environment variable is empty or null, the default  
95969           shall be the number of lines in the display minus 1.
- 95970           Setting the **window** edit option to zero or to a value greater than the number of lines in the  
95971           display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable)  
95972           shall cause the **window** edit option to be set to the number of lines in the display minus 1.
- 95973           The baud rate of the terminal line may change the default in an implementation-defined manner.

95974 **wrapmargin, wm**

95975 [Default 0]

95976 If the value of this edit option is zero, it shall have no effect.

95977 If not in the POSIX locale, the effect of this edit option is implementation-defined.

95978 Otherwise, it shall specify a number of columns from the ending margin of the terminal.

95979 During open and visual text input modes, for each character for which any part of the character  
 95980 is displayed in a column that is less than **wrapmargin** columns from the ending margin of the  
 95981 display line, the editor shall behave as follows:

- 95982 1. If the character triggering this event is a <blank>, it, and all immediately preceding  
 95983 <blank> characters on the current line entered during the execution of the current text  
 95984 input command, shall be discarded, and the editor shall behave as if the user had entered  
 95985 a single <newline> instead. In addition, if the next user-entered character is a <space>, it  
 95986 shall be discarded as well.
- 95987 2. Otherwise, if there are one or more <blank> characters on the current line immediately  
 95988 preceding the last group of inserted non-<blank> characters which was entered during  
 95989 the execution of the current text input command, the <blank> characters shall be replaced  
 95990 as if the user had entered a single <newline> instead.

95991 If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any  
 95992 <blank> characters at or after the cursor in the current line shall be discarded.

95993 The ending margin shall be determined by the system or overridden by the user, as described for  
 95994 **COLUMNS** in the ENVIRONMENT VARIABLES section and XBD [Chapter 8](#) (on page 167).

95995 **wrapsan, ws**95996 [Default *set*]

95997 If **wrapsan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, **N**, and **n**  
 95998 commands) shall wrap around the beginning or end of the edit buffer; when unset, searches  
 95999 shall stop at the beginning or end of the edit buffer.

96000 **writeany, wa**96001 [Default *unset*]

96002 If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be  
 96003 inhibited, as described in editor option **autowrite**.

96004 **EXIT STATUS**

96005 The following exit values shall be returned:

- 96006 0 Successful completion.
- 96007 >0 An error occurred.

96008 **CONSEQUENCES OF ERRORS**

96009 When any error is encountered and the standard input is not a terminal device file, in addition  
 96010 to the default requirements described in [Section 1.4](#) (on page 2462), *ex* shall neither write the file  
 96011 (if one has been opened) nor return to command or text input mode.

96012 Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP  
 96013 asynchronous event.

96014 Otherwise, when an error is encountered, the editor shall behave as specified in [Command Line](#)  
 96015 [Parsing in ex](#) (on page 2846).

## 96016 APPLICATION USAGE

96017 If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.

96018 The **next** command can accept more than one file, so usage such as:

```
96019 next `ls [abc]*`
```

96020 is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect  
 96021 only one file and unspecified results occur.

96022 Unlike the *system()* function, *ex* does not pass "--" between the "-c" argument and the  
 96023 command string, so that programs for which -c takes an option-argument can be used in the  
 96024 **shell** edit option. Users who want to use an **escape** command to execute a utility whose name  
 96025 starts with '-' or '+' need to provide a pathname for that utility that does not start with either  
 96026 of those characters, or precede the utility name with a <blank> character.

## 96027 EXAMPLES

96028 None.

## 96029 RATIONALE

96030 The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V  
 96031 implementations of *ex* and *vi*.

96032 A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and  
 96033 rejected for inclusion. Neither option provided the level of security that users might expect.

96034 It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to  
 96035 implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor  
 96036 addressing; thus, it is not a mandatory requirement that such features should work on all  
 96037 terminals. It is the intention, however, that an *ex* implementation should provide the full set of  
 96038 capabilities on all terminals capable of supporting them.

## 96039 Options

96040 The -c replacement for +*command* was inspired by the -e option of *sed*. Historically, all such  
 96041 commands (see **edit** and **next** as well) were executed from the last line of the edit buffer. This  
 96042 meant, for example, that "+/pattern" would fail unless the **wrapsan** option was set.  
 96043 POSIX.1-2024 requires conformance to historical practice. The +*command* option is no longer  
 96044 specified by POSIX.1-2024 but may be present in some implementations. Historically, some  
 96045 implementations restricted the *ex* commands that could be listed as part of the command line  
 96046 arguments. For consistency, POSIX.1-2024 does not permit these restrictions.

96047 In historical implementations of the editor, the -R option (and the **readonly** edit option) only  
 96048 prevented overwriting of files; appending to files was still permitted, mapping loosely into the  
 96049 *bash* **noclobber** variable. Some implementations, however, have not followed this semantic, and  
 96050 **readonly** does not permit appending either. POSIX.1-2024 follows the latter practice, believing  
 96051 that it is a more obvious and intuitive meaning of **readonly**.

96052 The -s option suppresses all interactive user feedback and is useful for editing scripts in batch  
 96053 jobs. The list of specific effects is historical practice. The terminal type "incapable of supporting  
 96054 open and visual modes" has historically been named "dumb".

96055 The -t option was required because the *ctags* utility appears in POSIX.1-2024 and the option is  
 96056 available in all historical implementations of *ex*.

96057 Historically, the *ex* and *vi* utilities accepted a -x option, which did encryption based on the

96058 algorithm found in the historical *crypt* utility. The `-x` option for encryption, and the associated  
 96059 *crypt* utility, were omitted because the algorithm used was not specifiable and the export control  
 96060 laws of some nations make it difficult to export cryptographic technology. In addition, it did not  
 96061 historically provide the level of security that users might expect.

### 96062 **Standard Input**

96063 An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file  
 96064 character, `<control>-D`, is historically an *ex* command.

96065 There was no maximum line length in historical implementations of *ex*. Specifically, as it was  
 96066 parsed in chunks, the addresses had a different maximum length than the filenames. Further, the  
 96067 maximum line buffer size was declared as `BUFSIZ`, which was different lengths on different  
 96068 systems. This version selected the value of `{LINE_MAX}` to impose a reasonable restriction on  
 96069 portable usage of *ex* and to aid test suite writers in their development of realistic tests that  
 96070 exercise this limit.

### 96071 **Input Files**

96072 It was an explicit decision by the standard developers that a `<newline>` be added to any file  
 96073 lacking one. It was believed that this feature of *ex* and *vi* was relied on by users in order to make  
 96074 text files lacking a trailing `<newline>` more portable. It is recognized that this will require a user-  
 96075 specified option or extension for implementations that permit *ex* and *vi* to edit files of type other  
 96076 than text if such files are not otherwise identified by the system. It was agreed that the ability to  
 96077 edit files of arbitrary type can be useful, but it was not considered necessary to mandate that an  
 96078 *ex* or *vi* implementation be required to handle files other than text files.

96079 The paragraph in the INPUT FILES section, “By default, ...”, is intended to close a long-  
 96080 standing security problem in *ex* and *vi*; that of the “`modeline`” or “`modelines`” edit option. This  
 96081 feature allows any line in the first or last five lines of the file containing the strings “`ex:`” or  
 96082 “`vi:`” (and, apparently, “`ei:`” or “`vx:`”) to be a line containing editor commands, and *ex*  
 96083 interprets all the text up to the next `:` or `<newline>` as a command. Consider the  
 96084 consequences, for example, of an unsuspecting user using *ex* or *vi* as the editor when replying to  
 96085 a mail message in which a line such as:

```
96086 ex:! rm -rf :
```

96087 appeared in the signature lines. The standard developers believed strongly that an editor should  
 96088 not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from  
 96089 their implementations of *ex* and *vi*.

### 96090 **Asynchronous Events**

96091 The intention of the phrase “complete write” is that the entire edit buffer be written to stable  
 96092 storage. The note regarding temporary files is intended for implementations that use temporary  
 96093 files to back edit buffers unnamed by the user.

96094 Historically, `SIGQUIT` was ignored by *ex*, but was the equivalent of the `Q` command in visual  
 96095 mode; that is, it exited visual mode and entered *ex* mode. POSIX.1-2024 permits, but does not  
 96096 require, this behavior. Historically, `SIGINT` was often used by *vi* users to terminate text input  
 96097 mode (`<control>-C` is often easier to enter than `<ESC>`). Some implementations of *vi* alerted the  
 96098 terminal on this event, and some did not. POSIX.1-2024 requires that `SIGINT` behave identically  
 96099 to `<ESC>`, and that the terminal not be alerted.

96100 Historically, suspending the *ex* editor during text input mode was similar to `SIGINT`, as  
 96101 completed lines were retained, but any partial line discarded, and the editor returned to

96102 command mode. POSIX.1-2024 is silent on this issue; implementations are encouraged to follow  
96103 historical practice, where possible.

96104 Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore  
96105 impossible to suspend the editor in visual text input mode. There are two major reasons for this.  
96106 The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where  
96107 the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if  
96108 SIGTSTP was delivered to the process group in the default manner. The second was that most  
96109 implementations of the UNIX *curses* package did not handle SIGTSTP safely, and the receipt of  
96110 SIGTSTP at the wrong time would cause them to crash. POSIX.1-2024 is silent on this issue;  
96111 implementations are encouraged to treat suspension as an asynchronous event if possible.

96112 Historically, modifications to the edit buffer made before SIGINT interrupted an operation were  
96113 retained; that is, anywhere from zero to all of the lines to be modified might have been modified  
96114 by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT.  
96115 POSIX.1-2024 permits this behavior, noting that the **undo** command is required to be able to  
96116 undo these partially completed commands.

96117 The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is  
96118 unspecified because some implementations attempt to save the edit buffer in a useful state when  
96119 other signals are received.

## 96120 Standard Error

96121 For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to  
96122 invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination  
96123 condition. Diagnostic messages should not be confused with the error messages generated by  
96124 inappropriate or illegal user commands.

## 96125 Initialization in *ex* and *vi*

96126 If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the  
96127 alternate and current pathnames will be set. Informally, they are set as follows:

- 96128 1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the  
96129 current pathname will be set to the filename argument (the first filename argument in the  
96130 case of the **next** command) and the alternate pathname will be set to the previous current  
96131 pathname, if there was one.
- 96132 2. In the case of the file read/write forms of the **read** and **write** commands, if there is no  
96133 current pathname, the current pathname will be set to the filename argument.
- 96134 3. Otherwise, the alternate pathname will be set to the filename argument.

96135 For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there  
96136 was a previous current pathname, the alternate pathname. The commands **:write**, **!command**,  
96137 and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for  
96138 some reason, the alternate pathname would be set. The **read** and **write** commands set the  
96139 alternate pathname to their *file* argument, unless the current pathname is not set, in which case  
96140 they set the current pathname to their *file* arguments. The alternate pathname was not  
96141 historically set by the **:source** command. POSIX.1-2024 requires conformance to historical  
96142 practice. Implementations adding commands that take filenames as arguments are encouraged  
96143 to set the alternate pathname as described here.

96144 Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed  
96145 in the *\$HOME* directory. POSIX.1-2024 prohibits this behavior.

96146 Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local *.exrc* files if they were owned by the  
96147 real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was  
96148 a security problem because it is possible to put normal UNIX system commands inside a *.exrc*  
96149 file. POSIX.1-2024 does not specify the **sourceany** option, and historical implementations are  
96150 encouraged to delete it.

96151 The *.exrc* files must be owned by the real ID of the user, and not writable by anyone other than  
96152 the owner. The appropriate privileges exception is intended to permit users to acquire special  
96153 privileges, but continue to use the *.exrc* files in their home directories.

96154 System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is  
96155 that local *.exrc* files are read-only if the **exrc** option is set. The default for the **exrc** option was off,  
96156 so by default, local *.exrc* files were not read. The problem this was intended to solve was that  
96157 System V permitted users to give away files, so there is no possible ownership or writeability  
96158 test to ensure that the file is safe. This is still a security problem on systems where users can give  
96159 away files, but there is nothing additional that POSIX.1-2024 can do. The implementation-  
96160 defined exception is intended to permit groups to have local *.exrc* files that are shared by users,  
96161 by creating pseudo-users to own the shared files.

96162 POSIX.1-2024 does not mention system-wide *ex* and *vi* start-up files. While they exist in several  
96163 implementations of *ex* and *vi*, they are not present in any implementations considered historical  
96164 practice by POSIX.1-2024. Implementations that have such files should use them only if they are  
96165 owned by the real user ID or an appropriate user (for example, root on UNIX systems) and if  
96166 they are not writable by any user other than their owner. System-wide start-up files should be  
96167 read before the *EXINIT* variable, *\$HOME/.exrc*, or local *.exrc* files are evaluated.

96168 Historically, any *ex* command could be entered in the *EXINIT* variable or the *.exrc* file, although  
96169 ones requiring that the edit buffer already contain lines of text generally caused historical  
96170 implementations of the editor to drop **core**. POSIX.1-2024 requires that any *ex* command be  
96171 permitted in the *EXINIT* variable and *.exrc* files, for simplicity of specification and consistency,  
96172 although many of them will obviously fail under many circumstances.

96173 The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with  
96174 regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded  
96175 during the initialization phase not be lost; that is, loading the edit buffer should fail if the *.exrc*  
96176 file read in the contents of a file and did not subsequently write the edit buffer. An additional  
96177 intent of this phrase is to specify that the initial current line and column is set as specified for the  
96178 individual *ex* commands.

96179 Historically, the **-t** option behaved as if the tag search were a *+command*; that is, it was executed  
96180 from the last line of the file specified by the tag. This resulted in the search failing if the pattern  
96181 was a forward search pattern and the **wrapsan** edit option was not set. POSIX.1-2024 does not  
96182 permit this behavior, requiring that the search for the tag pattern be performed on the entire file,  
96183 and, if not found, that the current line be set to a more reasonable location in the file.

96184 Historically, the empty edit buffer presented for editing when a file was not specified by the user  
96185 was unnamed. This is permitted by POSIX.1-2024; however, implementations are encouraged to  
96186 provide users a temporary filename for this buffer because it permits them the use of *ex*  
96187 commands that use the current pathname during temporary edit sessions.

96188 Historically, the file specified using the **-t** option was not part of the current argument list. This  
96189 practice is permitted by POSIX.1-2024; however, implementations are encouraged to include its  
96190 name in the current argument list for consistency.

96191 Historically, the **-c** command was generally not executed until a file that already exists was  
96192 edited. POSIX.1-2024 requires conformance to this historical practice. Commands that could

96193 cause the `-c` command to be executed include the *ex* commands **edit**, **next**, **recover**, **rewind**, and  
 96194 **tag**, and the *vi* commands `<control>-^` and `<control>-]`. Historically, reading a file into an edit  
 96195 buffer did not cause the `-c` command to be executed (even though it might set the current  
 96196 pathname) with the exception that it did cause the `-c` command to be executed if: the editor was  
 96197 in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read  
 96198 commands had yet been attempted. For consistency and simplicity of specification,  
 96199 POSIX.1-2024 does not permit this behavior.

96200 Historically, the `-r` option was the same as a normal edit session if there was no recovery  
 96201 information available for the file. This allowed users to enter:

```
96202 vi -r *.c
```

96203 and recover whatever files were recoverable. In some implementations, recovery was attempted  
 96204 only on the first file named, and the file was not entered into the argument list; in others,  
 96205 recovery was attempted for each file named. In addition, some historical implementations  
 96206 ignored `-r` if `-t` was specified or did not support command line *file* arguments with the `-t` option.  
 96207 For consistency and simplicity of specification, POSIX.1-2024 disallows these special cases, and  
 96208 requires that recovery be attempted the first time each file is edited.

96209 Historically, *vi* initialized the ``` and `'` marks, but *ex* did not. This meant that if the first command  
 96210 in *ex* mode was **visual** or if an *ex* command was executed first (for example, *vi +10 file*), *vi* was  
 96211 entered without the marks being initialized. Because the standard developers believed the marks  
 96212 to be generally useful, and for consistency and simplicity of specification, POSIX.1-2024 requires  
 96213 that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is  
 96214 not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however,  
 96215 it has always been possible to set (and use) marks in empty edit buffers in open and visual mode  
 96216 edit sessions.

## 96217 Addressing

96218 Historically, *ex* and *vi* accepted the additional addressing forms `'\/'` and `'\?'`. They were  
 96219 equivalent to `"//"` and `"??"`, respectively. They are not required by POSIX.1-2024, mostly  
 96220 because nobody can remember whether they ever did anything different historically.

96221 Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the `%`  
 96222 address in empty files for others. For consistency, POSIX.1-2024 requires support for the former  
 96223 in the few commands where it makes sense, and disallows it otherwise. In addition, because  
 96224 POSIX.1-2024 requires that `%` be logically equivalent to `"1,$"`, it is also supported where it  
 96225 makes sense and disallowed otherwise.

96226 Historically, the `%` address could not be followed by further addresses. For consistency and  
 96227 simplicity of specification, POSIX.1-2024 requires that additional addresses be supported.

96228 All of the following are valid *addresses*:

```
96229 +++           Three lines after the current line.
96230 /re/-        One line before the next occurrence of re.
96231 -2           Two lines before the current line.
96232 3 ---- 2    Line one (note intermediate negative address).
96233 1 2 3       Line six.
```

96234 Any number of addresses can be provided to commands taking addresses; for example,  
 96235 `"1,2,3,4,5p"` prints lines 4 and 5, because two is the greatest valid number of addresses  
 96236 accepted by the **print** command. This, in combination with the `<semicolon>` delimiter, permits

96237 users to create commands based on ordered patterns in the file. For example, the command  
 96238 **3;/foo/;+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next  
 96239 two lines. Note that the address **3;** must be evaluated before being discarded because the search  
 96240 origin for the **/foo/** command depends on this.

96241 Historically, values could be added to addresses by including them after one or more <blank>  
 96242 characters; for example, **3 – 5p** wrote the seventh line of the file, and **/foo/ 5** was the same as  
 96243 **/foo/+5**. However, only absolute values could be added; for example, **5 /foo/** was an error.  
 96244 POSIX.1-2024 requires conformance to historical practice. Address offsets are separately  
 96245 specified from addresses because they could historically be provided to visual mode search  
 96246 commands.

96247 Historically, any missing addresses defaulted to the current line. This was true for leading and  
 96248 trailing <comma>-delimited addresses, and for trailing <semicolon>-delimited addresses. For  
 96249 consistency, POSIX.1-2024 requires it for leading <semicolon> addresses as well.

96250 Historically, *ex* and *vi* accepted the '^' character as both an address and as a flag offset for  
 96251 commands. In both cases it was identical to the '-' character. POSIX.1-2024 does not require or  
 96252 prohibit this behavior.

96253 Historically, the enhancements to basic regular expressions could be used in addressing; for  
 96254 example, '~', '\<', and '\>'. POSIX.1-2024 requires conformance to historical practice; that  
 96255 is, that regular expression usage be consistent, and that regular expression enhancements be  
 96256 supported wherever regular expressions are used.

### 96257 Command Line Parsing in ex

96258 Historical *ex* command parsing was even more complex than that described here. POSIX.1-2024  
 96259 requires the subset of the command parsing that the standard developers believed was  
 96260 documented and that users could reasonably be expected to use in a portable fashion, and that  
 96261 was historically consistent between implementations. (The discarded functionality is obscure, at  
 96262 best.) Historical implementations will require changes in order to comply with POSIX.1-2024;  
 96263 however, users are not expected to notice any of these changes. Most of the complexity in *ex*  
 96264 parsing is to handle three special termination cases:

- 96265 1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by  
 96266 <newline> characters (they can contain <vertical-line> characters that are usually shell  
 96267 pipes).
- 96268 2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands,  
 96269 optionally containing <vertical-line> characters, as their first arguments.
- 96270 3. The **s** command takes a regular expression as its first argument, and uses the delimiting  
 96271 characters to delimit the command.

96272 Historically, <vertical-line> characters in the *+command* argument of the **ex**, **edit**, **next**, **vi**, and  
 96273 **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the  
 96274 command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did  
 96275 not delimit the command at all. For example, the following commands are all valid:

```
96276 :edit +25 | s/abc/ABC/ file.c
96277 :s/ | /PIPE/
96278 :read !spell % | columnate
96279 :global/pattern/p | l
96280 :s/a/b/ | s/c/d | set
```

96281 Historically, empty or <blank> filled lines in **.exrc** files and **sourced** files (as well as *EXINIT*

96282 variables and *ex* command scripts) were treated as default commands; that is, **print** commands.  
 96283 POSIX.1-2024 specifically requires that they be ignored when encountered in **.exrc** and **sourced**  
 96284 files to eliminate a common source of new user error.

96285 Historically, *ex* commands with multiple adjacent (or <blank>-separated) vertical lines were  
 96286 handled oddly when executed from *ex* mode. For example, the command `|||<carriage-return>`,  
 96287 when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `|`  
 96288 would only display the line after the next line, instead of the next two lines. The former worked  
 96289 more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. POSIX.1-2024  
 96290 requires the *vi* behavior; that is, a single default command and line number increment for each  
 96291 command separator, and trailing <newline> characters after <vertical-line> separators are  
 96292 discarded.

96293 Historically, *ex* permitted a single extra <colon> as a leading command character; for example,  
 96294 **:g/pattern/:p** was a valid command. POSIX.1-2024 generalizes this to require that any number of  
 96295 leading <colon> characters be stripped.

96296 Historically, any prefix of the **delete** command could be followed without intervening <blank>  
 96297 characters by a flag character because in the command **d p**, *p* is interpreted as the buffer *p*.  
 96298 POSIX.1-2024 requires conformance to historical practice.

96299 Historically, the **k** command could be followed by the mark name without intervening <blank>  
 96300 characters. POSIX.1-2024 requires conformance to historical practice.

96301 Historically, the **s** command could be immediately followed by flag and option characters; for  
 96302 example, **s/e/E/|s|sgc3p** was a valid command. However, flag characters could not stand alone;  
 96303 for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would  
 96304 succeed. (Obviously, the '#' flag character was used as a delimiter character if it followed the  
 96305 command.) Another issue was that option characters had to precede flag characters even when  
 96306 the command was fully specified; for example, the command **s/e/E/pg** would fail, while the  
 96307 command **s/e/E/gp** would succeed. POSIX.1-2024 requires conformance to historical practice.

96308 Historically, the first command name that had a prefix matching the input from the user was the  
 96309 executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command.  
 96310 Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**.  
 96311 POSIX.1-2024 requires conformance to historical practice. The restriction on command search  
 96312 order for implementations with extensions is to avoid the addition of commands such that the  
 96313 historical prefixes would fail to work portably.

96314 Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands,  
 96315 separated by <vertical-line> characters, that entered or exited visual mode or the editor. Because  
 96316 implementations of *vi* exist that do not exhibit this failure mode, POSIX.1-2024 does not permit  
 96317 it.

96318 The requirement that alphabetic command names consist of all following alphabetic characters  
 96319 up to the next non-alphabetic character means that alphabetic command names must be  
 96320 separated from their arguments by one or more non-alphabetic characters, normally a <blank>  
 96321 or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

96322 Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*,  
 96323 <newline>, <carriage-return>) erased any prompting character and displayed the next lines  
 96324 without scrolling the terminal; that is, immediately below any previously displayed lines. This  
 96325 provided a cleaner presentation of the lines in the file for the user. POSIX.1-2024 does not require  
 96326 this behavior because it may be impossible in some situations; however, implementations are  
 96327 strongly encouraged to provide this semantic if possible.

96328 Historically, it was possible to change files in the middle of a command, and have the rest of the

96329 command executed in the new file; for example:

```
96330 :edit +25 file.c | s/abc/ABC/ | 1
```

96331 was a valid command, and the substitution was attempted in the newly edited file.  
 96332 POSIX.1-2024 requires conformance to historical practice. The following commands are  
 96333 examples that exercise the *ex* parser:

```
96334 echo 'foo | bar' > file1; echo 'foo/bar' > file2;
```

```
96335 vi
```

```
96336 :edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\/SLASH/ | wq
```

96337 Historically, there was no protection in editor implementations to avoid *ex* **global**, **v**, **@**, or **\***  
 96338 commands changing edit buffers during execution of their associated commands. Because this  
 96339 would almost invariably result in catastrophic failure of the editor, and implementations exist  
 96340 that do exhibit these problems, POSIX.1-2024 requires that changing the edit buffer during a  
 96341 **global** or **v** command, or during a **@** or **\*** command for which there will be more than a single  
 96342 execution, be an error. Implementations supporting multiple edit buffers simultaneously are  
 96343 strongly encouraged to apply the same semantics to switching between buffers as well.

96344 The *ex* command quoting required by POSIX.1-2024 is a superset of the quoting in historical  
 96345 implementations of the editor. For example, it was not historically possible to escape a <blank>  
 96346 in a filename; for example, **:edit foo\\\ bar** would report that too many filenames had been  
 96347 entered for the edit command, and there was no method of escaping a <blank> in the first  
 96348 argument of an **edit**, **ex**, **next**, or **visual** command at all. POSIX.1-2024 extends historical  
 96349 practice, requiring that quoting behavior be made consistent across all *ex* commands, except for  
 96350 the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V  
 96351 instead of <backslash> characters for quoting. For those four commands, POSIX.1-2024 requires  
 96352 conformance to historical practice.

96353 Backslash quoting in *ex* is non-intuitive. <backslash>-escapes are ignored unless they escape a  
 96354 special character; for example, when performing *file* argument expansion, the string "\\%" is  
 96355 equivalent to '\%', not "\<current pathname>". This can be confusing for users because  
 96356 <backslash> is usually one of the characters that causes shell expansion to be performed, and  
 96357 therefore shell quoting rules must be taken into consideration. Generally, quoting characters are  
 96358 only considered if they escape a special character, and a quoting character must be provided for  
 96359 each layer of parsing for which the character is special. As another example, only a single  
 96360 <backslash> is necessary for the '\1' sequence in substitute replacement patterns, because the  
 96361 character '1' is not special to any parsing layer above it.

96362 <control>-V quoting in *ex* is slightly different from backslash quoting. In the four commands  
 96363 where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character  
 96364 may be escaped by a <control>-V whether it would have a special meaning or not. POSIX.1-2024  
 96365 requires conformance to historical practice.

96366 Historical implementations of the editor did not require delimiters within character classes to be  
 96367 escaped; for example, the command **:s/[/]//** on the string "xxx/yyy" would delete the '/' from  
 96368 the string. POSIX.1-2024 disallows this historical practice for consistency and because it places a  
 96369 large burden on implementations by requiring that knowledge of regular expressions be built  
 96370 into the editor parser.

96371 Historically, quoting <newline> characters in *ex* commands was handled inconsistently. In most  
 96372 cases, the <newline> character always terminated the command, regardless of any preceding  
 96373 escape character, because <backslash> characters did not escape <newline> characters for most  
 96374 *ex* commands. However, some *ex* commands (for example, **s**, **map**, and **abbreviation**) permitted  
 96375 <newline> characters to be escaped (although in the case of **map** and **abbreviation**, <control>-V

96376 characters escaped them instead of <backslash> characters). This was true in not only the  
96377 command line, but also **.exrc** and **sourced** files. For example, the command:

```
96378 map = foo<control-V><newline>bar
```

96379 would succeed, although it was sometimes difficult to get the <control>-V and the inserted  
96380 <newline> passed to the *ex* parser. For consistency and simplicity of specification, POSIX.1-2024  
96381 requires that it be possible to escape <newline> characters in *ex* commands at all times, using  
96382 <backslash> characters for most *ex* commands, and using <control>-V characters for the **map**  
96383 and **abbreviation** commands. For example, the command **print<newline>list** is required to be  
96384 parsed as the single command **print<newline>list**. While this differs from historical practice,  
96385 POSIX.1-2024 developers believed it unlikely that any script or user depended on the historical  
96386 behavior.

96387 Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c**  
96388 commands to be discarded. POSIX.1-2024 disallows this for consistency with mapped keys, the  
96389 **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc** files.

### 96390 Input Editing in *ex*

96391 One of the common uses of the historical *ex* editor is over slow network connections. Editors that  
96392 run in canonical mode can require far less traffic to and from, and far less processing on, the host  
96393 machine, as well as more easily supporting block-mode terminals. For these reasons,  
96394 POSIX.1-2024 requires that *ex* be implemented using canonical mode input processing, as was  
96395 done historically.

96396 POSIX.1-2024 does not require the historical 4 BSD input editing characters “word erase” or  
96397 “literal next”. For this reason, it is unspecified how they are handled by *ex*, although they must  
96398 have the required effect. Implementations that resolve them after the line has been ended using a  
96399 <newline> or <control>-M character, and implementations that rely on the underlying system  
96400 terminal support for this processing, are both conforming. Implementations are strongly urged  
96401 to use the underlying system functionality, if at all possible, for compatibility with other system  
96402 text input interfaces.

96403 Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor  
96404 moved to display the new end of the **autoindent** characters, but did not move the cursor to a  
96405 new line, nor did it erase the <control>-D character from the line. POSIX.1-2024 does not specify  
96406 that the cursor remain on the same line or that the rest of the line is erased; however,  
96407 implementations are strongly encouraged to provide the best possible user interface; that is, the  
96408 cursor should remain on the same line, and any <control>-D character on the line should be  
96409 erased.

96410 POSIX.1-2024 does not require the historical 4 BSD input editing character “reprint”,  
96411 traditionally <control>-R, which redisplayed the current input from the user. For this reason,  
96412 and because the functionality cannot be implemented after the line has been terminated by the  
96413 user, POSIX.1-2024 makes no requirements about this functionality. Implementations are  
96414 strongly urged to make this historical functionality available, if possible.

96415 Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*.  
96416 POSIX.1-2024 requires conformance to historical practice to avoid breaking historical *ex* scripts  
96417 and **.exrc** files.

96418 **eof**

96419 Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left  
 96420 unspecified so that implementations can conform in the presence of systems that do not support  
 96421 this functionality. Implementations are encouraged to modify the line and redisplay it  
 96422 immediately, if possible.

96423 The specification of the handling of the *eof* character differs from historical practice only in that  
 96424 *eof* characters are not discarded if they follow normal characters in the text input. Historically,  
 96425 they were always discarded.

### 96426 **Command Descriptions in ex**

96427 Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and  
 96428 **~**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit  
 96429 addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or  
 96430 command execution in an empty file, make sense only for commands that add new text to the  
 96431 edit buffer or write commands (because users may wish to write empty files). POSIX.1-2024  
 96432 requires this behavior for such commands and disallows it otherwise, for consistency and  
 96433 simplicity of specification.

96434 A count to an *ex* command has been historically corrected to be no greater than the last line in a  
 96435 file; for example, in a five-line file, the command **1,6print** would fail, but the command  
 96436 **1print300** would succeed. POSIX.1-2024 requires conformance to historical practice.

96437 Historically, the use of flags in *ex* commands could be obscure. General historical practice was as  
 96438 described by POSIX.1-2024, but there were some special cases. For instance, the **list**, **number**,  
 96439 and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line  
 96440 3, and 3 would be the current line after the execution of the command. The **open** and **visual**  
 96441 commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the  
 96442 **open** and **visual** commands interacted badly with the **list** edit option, and setting and then  
 96443 unsetting it during the open/visual session would cause *vi* to stop displaying lines in the  
 96444 specified format. For consistency and simplicity of specification, POSIX.1-2024 does not permit  
 96445 any of these exceptions to the general rule.

96446 POSIX.1-2024 uses the word *copy* in several places when discussing buffers. This is not intended  
 96447 to imply implementation.

96448 Historically, *ex* users could not specify numeric buffers because of the ambiguity this would  
 96449 cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a  
 96450 *count*. POSIX.1-2024 requires conformance to historical practice by default, but does not  
 96451 preclude extensions.

96452 Historically, the contents of the unnamed buffer were frequently discarded after commands that  
 96453 did not explicitly affect it; for example, when using the **edit** command to switch files. For  
 96454 consistency and simplicity of specification, POSIX.1-2024 does not permit this behavior.

96455 The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting  
 96456 lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user  
 96457 switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric  
 96458 buffers would not have changed. POSIX.1-2024 requires conformance to historical practice.  
 96459 Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a  
 96460 single location in POSIX.1-2024.

96461 The metacharacters that trigger shell expansion in *file* arguments match historical practice, as  
 96462 does the method for doing shell expansion. Implementations wishing to provide users with the  
 96463 flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit

96464 option.

96465 Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to  
 96466 do so; for example, `!date > /dev/null` does not require a screen refresh because the output of  
 96467 the UNIX *date* command requires only a single line of the screen. POSIX.1-2024 requires that the  
 96468 screen be refreshed if it has been overwritten, but makes no requirements as to how an  
 96469 implementation should make that determination. Implementations may prompt and refresh the  
 96470 screen regardless.

### 96471 Abbreviate

96472 Historical practice was that characters that were entered as part of an abbreviation replacement  
 96473 were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions,  
 96474 and so on; that is, they were logically pushed onto the terminal input queue, and were not a  
 96475 simple replacement. POSIX.1-2024 requires conformance to historical practice. Historical  
 96476 practice was that whenever a non-word character (that had not been escaped by a `<control>-V`)  
 96477 was entered after a word character, *vi* would check for abbreviations. The check was based on  
 96478 the type of the character entered before the word character of the word/non-word pair that  
 96479 triggered the check. The word character of the word/non-word pair that triggered the check and  
 96480 all characters entered before the trigger pair that were of that type were included in the check,  
 96481 with the exception of `<blank>` characters, which always delimited the abbreviation.

96482 This means that, for the abbreviation to work, the *lhs* must end with a word character, there can  
 96483 be no transitions from word to non-word characters (or *vice versa*) other than between the last  
 96484 and next-to-last characters in the *lhs*, and there can be no `<blank>` characters in the *lhs*. In  
 96485 addition, because of the historical quoting rules, it was impossible to enter a literal `<control>-V`  
 96486 in the *lhs*. POSIX.1-2024 requires conformance to historical practice. Historical implementations  
 96487 did not inform users when abbreviations that could never be used were entered;  
 96488 implementations are strongly encouraged to do so.

96489 For example, the following abbreviations will work:

```
96490 :ab (p REPLACE
96491 :ab p REPLACE
96492 :ab ( (p REPLACE
```

96493 The following abbreviations will not work:

```
96494 :ab ( REPLACE
96495 :ab (pp REPLACE
```

96496 Historical practice is that words on the *vi* colon command line were subject to abbreviation  
 96497 expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev**  
 96498 command. Because there are implementations that do not do abbreviation expansion for the first  
 96499 argument to those commands, this is permitted, but not required, by POSIX.1-2024. However,  
 96500 the following sequence:

```
96501 :ab foo bar
96502 :ab foo baz
```

96503 resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and  
 96504 the sequence:

```
96505 :ab foo1 bar
96506 :ab foo2 bar
96507 :unabbreviate foo2
```

96508 deleted the abbreviation "foo1", not "foo2". These behaviors are not permitted by

96509 POSIX.1-2024 because they clearly violate the expectations of the user.

96510 It was historical practice that <control>-V, not <backslash>, characters be interpreted as escaping  
 96511 subsequent characters in the **abbreviate** command. POSIX.1-2024 requires conformance to  
 96512 historical practice; however, it should be noted that an abbreviation containing a <blank> will  
 96513 never work.

### 96514 **Append**

96515 Historically, any text following a <vertical-line> command separator after an **append**, **change**, or  
 96516 **insert** command became part of the insert text. For example, in the command:

```
96517 :g/pattern/append|stuff1
```

96518 a line containing the text "stuff1" would be appended to each line matching pattern. It was  
 96519 also historically valid to enter:

```
96520 :append|stuff1
96521 stuff2
96522 .
```

96523 and the text on the *ex* command line would be appended along with the text inserted after it.  
 96524 There was an historical bug, however, that the user had to enter two terminating lines (the ' . '  
 96525 lines) to terminate text input mode in this case. POSIX.1-2024 requires conformance to historical  
 96526 practice, but disallows the historical need for multiple terminating lines.

### 96527 **Change**

96528 See the RATIONALE for the **append** command. Historical practice for cursor positioning after  
 96529 the change command when no text is input, is as described in POSIX.1-2024. However, one  
 96530 System V implementation is known to have been modified such that the cursor is positioned on  
 96531 the first address specified, and not on the line before the first address. POSIX.1-2024 disallows  
 96532 this modification for consistency.

96533 Historically, the **change** command did not support buffer arguments, although some  
 96534 implementations allow the specification of an optional buffer. This behavior is neither required  
 96535 nor disallowed by POSIX.1-2024.

### 96536 **Change Directory**

96537 A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as  
 96538 prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have  
 96539 ' . ' or " . . " as their first component. Elements in the **cdpath** edit option are <colon>-separated.  
 96540 The initial value of the **cdpath** edit option is the value of the shell *CDPATH* environment  
 96541 variable. This feature was not included in POSIX.1-2024 because it does not exist in any of the  
 96542 implementations considered historical practice.

### 96543 **Copy**

96544 Historical implementations of *ex* permitted copies to lines inside of the specified range; for  
 96545 example, **:2,5copy3** was a valid command. POSIX.1-2024 requires conformance to historical  
 96546 practice.

96547

**Delete**

96548

POSIX.1-2024 requires support for the historical parsing of a **delete** command followed by flags, without any intervening <blank> characters. For example:

96549

96550

**1dp** Deletes the first line and prints the line that was second.

96551

**1delep** As for **1dp**.

96552

**1d** Deletes the first line, saving it in buffer *p*.

96553

**1d p1l** (Pee-one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was second.

96554

96555

**Edit**

96556

Historically, any *ex* command could be entered as a *+command* argument to the **edit** command, although some (for example, **insert** and **append**) were known to confuse historical implementations. For consistency and simplicity of specification, POSIX.1-2024 requires that any command be supported as an argument to the **edit** command.

96557

96558

96559

96560

Historically, the command argument was executed with the current line set to the last line of the file, regardless of whether the **edit** command was executed from visual mode or not. POSIX.1-2024 requires conformance to historical practice.

96561

96562

96563

Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first <blank>, and there was no way to quote them. For consistency, POSIX.1-2024 requires that the usual *ex* backslash quoting be provided.

96564

96565

96566

Historically, specifying the *+command* argument to the edit command required a filename to be specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of specification, POSIX.1-2024 does not permit this usage to fail for that reason.

96567

96568

96569

Historically, only the cursor position of the last file edited was remembered by the editor. POSIX.1-2024 requires that this be supported; however, implementations are permitted to remember and restore the cursor position for any file previously edited.

96570

96571

96572

**File**

96573

Historical versions of the *ex* editor **file** command displayed a current line and number of lines in the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a current line and number of lines in the edit buffer of 1 in the same situation. POSIX.1-2024 does not permit this discrepancy, instead requiring that a message be displayed indicating that the file is empty.

96574

96575

96576

96577

96578

**Global**

96579

The two-pass operation of the **global** and **v** commands is not intended to imply implementation, only the required result of the operation.

96580

96581

The current line and column are set as specified for the individual *ex* commands. This requirement is cumulative; that is, the current line and column must track across all the commands executed by the **global** or **v** commands.

96582

96583

96584 **Insert**96585 See the RATIONALE for the **append** command.96586 Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer  
96587 was empty. POSIX.1-2024 requires that this command behave consistently with the **append**  
96588 command.96589 **Join**96590 The action of the **join** command in relation to the special characters is only defined for the  
96591 POSIX locale because the correct amount of white space after a period varies; in Japanese none is  
96592 required, in French only a single space, and so on.96593 **List**96594 The historical output of the **list** command was potentially ambiguous. The standard developers  
96595 believed correcting this to be more important than adhering to historical practice, and  
96596 POSIX.1-2024 requires unambiguous output.96597 **Map**96598 Historically, command mode maps only applied to command names; for example, if the  
96599 character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y'  
96600 character. POSIX.1-2024 requires this behavior. Historically, entering <control>-V as the first  
96601 character of a *vi* command was an error. Several implementations have extended the semantics  
96602 of *vi* such that <control>-V means that the subsequent command character is not mapped. This  
96603 is permitted, but not required, by POSIX.1-2024. Regardless, using <control>-V to escape the  
96604 second or later character in a sequence of characters that might match a **map** command, or any  
96605 character in text input mode, is historical practice, and stops the entered keys from matching a  
96606 map. POSIX.1-2024 requires conformance to historical practice.96607 Historically implementations permitted digits to be used as a **map** command *lhs*, but then ignored  
96608 the map. POSIX.1-2024 requires that the mapped digits not be ignored.96609 The historical implementation of the **map** command did not permit **map** commands that were  
96610 more than a single character in length if the first character was printable. This behavior is  
96611 permitted, but not required, by POSIX.1-2024.96612 Historically, mapped characters were remapped unless the **remap** edit option was not set, or the  
96613 prefix of the mapped characters matched the mapping characters; for example, in the **map**:96614 

```
:map ab abcd
```

96615 the characters "ab" were used as is and were not remapped, but the characters "cd" were  
96616 mapped if appropriate. This can cause infinite loops in the *vi* mapping mechanisms.  
96617 POSIX.1-2024 requires conformance to historical practice, and that such loops be interruptible.96618 Text input maps had the same problems with expanding the *lhs* for the **ex map!** and **unmap!**  
96619 command as did the **ex abbreviate** and **unabbreviate** commands. See the RATIONALE for the **ex**  
96620 **abbreviate** command. POSIX.1-2024 requires similar modification of some historical practice for  
96621 the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.96622 Historically, **maps** that were subsets of other **maps** behaved differently depending on the order  
96623 in which they were defined. For example:96624 

```
:map! ab      short  
96625 :map! abc     long
```

96626 would always translate the characters "ab" to "short", regardless of how fast the characters  
96627 "abc" were entered. If the entry order was reversed:

```
96628 :map! abc    long
96629 :map! ab     short
```

96630 the characters "ab" would cause the editor to pause, waiting for the completing 'c' character,  
96631 and the characters might never be mapped to "short". For consistency and simplicity of  
96632 specification, POSIX.1-2024 requires that the shortest match be used at all times.

96633 The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified  
96634 because the timing capabilities of systems are often inexact and variable, and it may depend on  
96635 other factors such as the speed of the connection. The time should be long enough for the user to  
96636 be able to complete the sequence, but not long enough for the user to have to wait. Some  
96637 implementations of *vi* have added a **keytime** option, which permits users to set the number of  
96638 0,1 seconds the editor waits for the completing characters. Because mapped terminal function  
96639 and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input  
96640 mode, **maps** starting with <ESC> characters are generally exempted from this timeout period,  
96641 or, at least timed out differently.

## 96642 Mark

96643 Historically, users were able to set the ``previous context'' marks explicitly. In addition, the *ex*  
96644 commands " and " and the *vi* commands ", `', and " all referred to the same mark. In addition,  
96645 the previous context marks were not set if the command, with which the address setting the  
96646 mark was associated, failed. POSIX.1-2024 requires conformance to historical practice.  
96647 Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the  
96648 change was undone. POSIX.1-2024 requires conformance to historical practice.

96649 The description of the special events that set the ` and ' marks matches historical practice. For  
96650 example, historically the command */a/,b/* did not set the ` and ' marks, but the command  
96651 */a/,b/delete* did.

## 96652 Next

96653 Historically, any *ex* command could be entered as a *+command* argument to the **next** command,  
96654 although some (for example, **insert** and **append**) were known to confuse historical  
96655 implementations. POSIX.1-2024 requires that any command be permitted and that it behave as  
96656 specified. The **next** command can accept more than one file, so usage such as:

```
96657 next `ls [abc] `
```

96658 is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect  
96659 only one filename.

96660 Historically, the **next** command behaved differently from the **:rewind** command in that it  
96661 ignored the force flag if the **autowrite** flag was set. For consistency, POSIX.1-2024 does not  
96662 permit this behavior.

96663 Historically, the **next** command positioned the cursor as if the file had never been edited before,  
96664 regardless. POSIX.1-2024 does not permit this behavior, for consistency with the **edit** command.

96665 Implementations wanting to provide a counterpart to the **next** command that edited the  
96666 previous file have used the command **prev[ious]**, which takes no *file* argument. POSIX.1-2024  
96667 does not require this command.

96668 **Open**

96669 Historically, the **open** command would fail if the **open** edit option was not set. POSIX.1-2024  
 96670 does not mention the **open** edit option and does not require this behavior. Some historical  
 96671 implementations do not permit entering open mode from open or visual mode, only from *ex*  
 96672 mode. For consistency, POSIX.1-2024 does not permit this behavior.

96673 Historically, entering open mode from the command line (that is, *vi +open*) resulted in  
 96674 anomalous behaviors; for example, the *ex* file and *set* commands, and the *vi* command  
 96675 <control>-G did not work. For consistency, POSIX.1-2024 does not permit this behavior.

96676 Historically, the **open** command only permitted ' / ' characters to be used as the search pattern  
 96677 delimiter. For consistency, POSIX.1-2024 requires that the search delimiters used by the **s**, **global**,  
 96678 and **v** commands be accepted as well.

96679 **Preserve**

96680 The **preserve** command does not historically cause the file to be considered unmodified for the  
 96681 purposes of future commands that may exit the editor. POSIX.1-2024 requires conformance to  
 96682 historical practice.

96683 Historical documentation stated that mail was not sent to the user when preserve was executed;  
 96684 however, historical implementations did send mail in this case. POSIX.1-2024 requires  
 96685 conformance to the historical implementations.

96686 **Print**

96687 The writing of NUL by the **print** command is not specified as a special case because the standard  
 96688 developers did not want to require *ex* to support NUL characters. Historically, characters were  
 96689 displayed using the ARPA standard mappings, which are as follows:

- 96690 1. Printable characters are left alone.
- 96691 2. Control characters less than \177 are represented as '^' followed by the character offset  
 96692 from the '@' character in the ASCII map; for example, \007 is represented as '^G'.
- 96693 3. \177 is represented as '^?' followed by '? '.

96694 The display of characters having their eighth bit set was less standard. Existing implementations  
 96695 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their  
 96696 eighth bit set as the two characters "M-" followed by the seven-bit display as described above.)  
 96697 The latter probably has the best claim to historical practice because it was used for the **-v** option  
 96698 of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

96699 No specific display format is required by POSIX.1-2024.

96700 Explicit dependence on the ASCII character set has been avoided where possible, hence the use  
 96701 of the phrase an "implementation-defined multi-character sequence" for the display of non-  
 96702 printable characters in preference to the historical usage of, for instance, "^I" for the <tab>.  
 96703 Implementations are encouraged to conform to historical practice in the absence of any strong  
 96704 reason to diverge.

96705 Historically, all *ex* commands beginning with the letter 'p' could be entered using capitalized  
 96706 versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command  
 96707 names. POSIX.1-2024 permits, but does not require, this historical practice because capital forms  
 96708 of the commands are used by some implementations for other purposes.

96709

**Put**

96710

96711

96712

96713

96714

96715

96716

96717

96718

96719

Historically, an *ex* **put** command, executed from open or visual mode, was the same as the open or visual mode **P** command, if the buffer was named and was cut in character mode, and the same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer was the source of the text, the entire line from which the text was taken was usually **put**, and the buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior. In addition, using the **Q** command to switch into *ex* mode, and then doing a **put** often resulted in errors as well, such as appending text that was unrelated to the (supposed) contents of the buffer. For consistency and simplicity of specification, POSIX.1-2024 does not permit these behaviors. All *ex* **put** commands are required to operate in line mode, and the contents of the buffers are not altered by changing the mode of the editor.

96720

**Read**

96721

96722

96723

96724

96725

Historically, an *ex* **read** command executed from open or visual mode, executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-2024 does not permit this behavior. Historically, a **read** in open or visual mode from a program left the cursor at the last line read in, not the first. For consistency, POSIX.1-2024 does not permit this behavior.

96726

96727

Historical implementations of *ex* were unable to undo **read** commands that read from the output of a program. For consistency, POSIX.1-2024 does not permit this behavior.

96728

96729

96730

96731

96732

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified ``characters'', not ``bytes''. POSIX.1-2024 requires that the number of bytes be displayed, not the number of characters, because it may be difficult in multi-byte implementations to determine the number of characters read. Implementations are encouraged to clarify the message displayed to the user.

96733

96734

96735

96736

Historically, reads were not permitted on files other than type regular, except that FIFO files could be read (probably only because they did not exist when *ex* and *vi* were originally written). Because the historical *ex* evaluated **read!** and **read !** equivalently, there can be no optional way to force the read. POSIX.1-2024 permits, but does not require, this behavior.

96737

**Recover**

96738

96739

96740

96741

Some historical implementations of the editor permitted users to recover the edit buffer contents from a previous edit session, and then exit without saving those contents (or explicitly discarding them). The intent of POSIX.1-2024 in requiring that the edit buffer be treated as already modified is to prevent this user error.

96742

**Rewind**

96743

96744

96745

Historical implementations supported the **rewind** command when the user was editing the first file in the list; that is, the file that the **rewind** command would edit. POSIX.1-2024 requires conformance to historical practice.

96746 **Substitute**

96747 Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the  
 96748 last regular expression used in any command as the pattern, the same as the **~** command. The **r**  
 96749 option is not required by POSIX.1-2024. Historically, the **c** and **g** options were toggled; for  
 96750 example, the command **:s/abc/def/** was the same as **s/abc/def/ccccgggg**. For simplicity of  
 96751 specification, POSIX.1-2024 does not permit this behavior.

96752 The tilde command is often used to replace the last search RE. For example, in the sequence:

```
96753 s/red/blue/  
96754 /green  
96755 ~
```

96756 the **~** command is equivalent to:

```
96757 s/green/blue/
```

96758 Historically, *ex* accepted all of the following forms:

```
96759 s/abc/def/  
96760 s/abc/def  
96761 s/abc/  
96762 s/abc
```

96763 POSIX.1-2024 requires conformance to this historical practice.

96764 The **s** command presumes that the **^** character only occupies a single column in the display.  
 96765 Much of the *ex* and *vi* specification presumes that the **<space>** only occupies a single column in  
 96766 the display. There are no known character sets for which this is not true.

96767 Historically, the final column position for the substitute commands was based on previous  
 96768 column movements; a search for a pattern followed by a substitution would leave the column  
 96769 position unchanged, while a **0** command followed by a substitution would change the column  
 96770 position to the first non-**<blank>**. For consistency and simplicity of specification, POSIX.1-2024  
 96771 requires that the final column position always be set to the first non-**<blank>**.

96772 **Set**

96773 Historical implementations redisplayed all of the options for each occurrence of the **all** keyword.  
 96774 POSIX.1-2024 permits, but does not require, this behavior.

96775 **Tag**

96776 No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry.  
 96777 Historical practice has been to look for the path found in the **tags** file, based on the current  
 96778 directory. A useful extension found in some implementations is to look based on the directory  
 96779 containing the tags file that held the entry, as well. No requirement is made as to which reference  
 96780 for the tag in the tags file is used. This is deliberate, in order to permit extensions such as  
 96781 multiple entries in a tags file for a tag.

96782 Because users often specify many different tags files, some of which need not be relevant or exist  
 96783 at any particular time, POSIX.1-2024 requires that error messages about problem tags files be  
 96784 displayed only if the requested tag is not found, and then, only once for each time that the **tag**  
 96785 edit option is changed.

96786 The requirement that the current edit buffer be unmodified is only necessary if the file indicated  
 96787 by the tag entry is not the same as the current file (as defined by the current pathname).  
 96788 Historically, the file would be reloaded if the filename had changed, as well as if the filename

96789 was different from the current pathname. For consistency and simplicity of specification,  
96790 POSIX.1-2024 does not permit this behavior, requiring that the name be the only factor in the  
96791 decision.

96792 Historically, *vi* only searched for tags in the current file from the current cursor to the end of the  
96793 file, and therefore, if the **wrapsan** option was not set, tags occurring before the current cursor  
96794 were not found. POSIX.1-2024 considers this a bug, and implementations are required to search  
96795 for the first occurrence in the file, regardless.

#### 96796 **Undo**

96797 The **undo** description deliberately uses the word “modified”. The **undo** command is not  
96798 intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**,  
96799 or **recover**.

96800 Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes  
96801 attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and  
96802 sometimes, in the presence of maps, placing the cursor on the last line added or changed instead  
96803 of the first. POSIX.1-2024 requires a simplified behavior for consistency and simplicity of  
96804 specification.

#### 96805 **Version**

96806 The **version** command cannot be exactly specified since there is no widely-accepted definition of  
96807 what the version information should contain. Implementations are encouraged to do something  
96808 reasonably intelligent.

#### 96809 **Write**

96810 Historically, the *ex* and *vi* message after a successful **read** or **write** command specified  
96811 “characters”, not “bytes”. POSIX.1-2024 requires that the number of bytes be displayed, not the  
96812 number of characters because it may be difficult in multi-byte implementations to determine the  
96813 number of characters written. Implementations are encouraged to clarify the message displayed  
96814 to the user.

96815 Implementation-defined tests are permitted so that implementations can make additional  
96816 checks; for example, for locks or file modification times.

96817 Historically, attempting to append to a nonexistent file caused an error. It has been left  
96818 unspecified in POSIX.1-2024 to permit implementations to let the **write** succeed, so that the  
96819 append semantics are similar to those of the historical *cs*.

96820 Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around  
96821 dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote  
96822 them as files of a single, empty line. POSIX.1-2024 does not permit this behavior.

96823 Historically, *ex* restored standard output and standard error to their values as of when *ex* was  
96824 invoked, before writes to programs were performed. This could disturb the terminal  
96825 configuration as well as be a security issue for some terminals. POSIX.1-2024 does not permit  
96826 this, requiring that the program output be captured and displayed as if by the *ex* **print**  
96827 command.

### 96828 Adjust Window

96829 Historically, the line count was set to the value of the **scroll** option if the type character was end-  
 96830 of-file. This feature was broken on most historical implementations long ago, however, and is  
 96831 not documented anywhere. For this reason, POSIX.1-2024 is resolutely silent.

96832 Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+**  
 96833 and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =**  
 96834 were historically invalid.) POSIX.1-2024 requires conformance to this historical practice.

96835 Historically, the **z** command was further <blank>-sensitive in that the *count* could not be  
 96836 <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the  
 96837 *count* is not ambiguous with respect to either the type character or the flags, this is not permitted  
 96838 by POSIX.1-2024.

### 96839 Escape

96840 Historically, *ex* filter commands only read the standard output of the commands, letting  
 96841 standard error appear on the terminal as usual. The *vi* utility, however, read both standard  
 96842 output and standard error. POSIX.1-2024 requires the latter behavior for both *ex* and *vi*, for  
 96843 consistency.

96844 In Issue 8 the *system()* function was changed to require that the POSIX shell be invoked with  
 96845 "sh", "-c", "--", and *command* arguments to make it easier to execute programs with  
 96846 <hyphen-minus> ('-') or <plus-sign> ('+') as the first character of the program's filename. A  
 96847 similar request to have the *ex* **escape** command do the same was not accepted. Unlike *system()*  
 96848 (which always invokes a POSIX shell), *ex* invokes the program named by the **shell** edit option.  
 96849 For example, the *csh* and *tsh* shells that are frequently used as login shells do not recognize  
 96850 "--" after "-c" as an end-of-options indicator. The program need not even be one that  
 96851 recognizes any POSIX shell command line syntax. Some users invoke shell scripts to process  
 96852 lines that are being supplied to the specified utility. These utilities know that they will be given  
 96853 "-c" as a first argument and just ignore it. Any utilities used in this manner would have to be  
 96854 modified to skip over another argument (the "--") to find the desired argument.

### 96855 Shift Left and Shift Right

96856 Historically, it was possible to add shift characters to increase the effect of the command; for  
 96857 example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default  
 96858 1. POSIX.1-2024 requires conformance to historical practice.

### 96859 <control>-D

96860 Historically, the <control>-D command erased the prompt, providing the user with an unbroken  
 96861 presentation of lines from the edit buffer. This is not required by POSIX.1-2024; implementations  
 96862 are encouraged to provide it if possible. Historically, the <control>-D command took, and then  
 96863 ignored, a *count*. POSIX.1-2024 does not permit this behavior.

96864 **Write Line Number**

96865 Historically, the `ex =` command, when executed in `ex` mode in an empty edit buffer, reported 0,  
 96866 and from open or visual mode, reported 1. For consistency and simplicity of specification,  
 96867 POSIX.1-2024 does not permit this behavior.

96868 **Execute**

96869 Historically, `ex` did not correctly handle the inclusion of text input commands (that is, **append**,  
 96870 **insert**, and **change**) in executed buffers. POSIX.1-2024 does not permit this exclusion for  
 96871 consistency.

96872 Historically, the logical contents of the buffer being executed did not change if the buffer itself  
 96873 were modified by the commands being executed; that is, buffer execution did not support self-  
 96874 modifying code. POSIX.1-2024 requires conformance to historical practice.

96875 Historically, the `@` command took a range of lines, and the `@` buffer was executed once per line,  
 96876 with the current line (`'.'`) set to each specified line. POSIX.1-2024 requires conformance to  
 96877 historical practice.

96878 Some historical implementations did not notice if errors occurred during buffer execution. This,  
 96879 coupled with the ability to specify a range of lines for the `ex @` command, makes it trivial to  
 96880 cause them to drop **core**. POSIX.1-2024 requires that implementations stop buffer execution if  
 96881 any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer itself are  
 96882 replaced (for example, the buffer executes the `ex :edit` command).

96883 **Regular Expressions in ex**

96884 Historical practice is that the characters in the replacement part of the last `s` command—that is,  
 96885 those matched by entering a `'~'` in the regular expression—were not further expanded by the  
 96886 regular expression engine. So, if the characters contained the string `"a."`, they would match  
 96887 `'a'` followed by `"."`, and not `'a'` followed by any character. POSIX.1-2024 requires  
 96888 conformance to historical practice.

96889 **Edit Options in ex**

96890 The following paragraphs describe the historical behavior of some edit options that were not, for  
 96891 whatever reason, included in POSIX.1-2024. Implementations are strongly encouraged to only  
 96892 use these names if the functionality described here is fully supported.

96893 **extended** The **extended** edit option has been used in some implementations of `vi` to provide  
 96894 extended regular expressions instead of basic regular expressions. This option was  
 96895 omitted from POSIX.1-2024 because it is not widespread historical practice.

96896 **flash** The **flash** edit option historically caused the screen to flash instead of beeping on  
 96897 error. This option was omitted from POSIX.1-2024 because it is not found in some  
 96898 historical implementations.

96899 **hardtabs** The **hardtabs** edit option historically defined the number of columns between  
 96900 hardware tab settings. This option was omitted from POSIX.1-2024 because it was  
 96901 believed to no longer be generally useful.

96902 **modeline** The **modeline** (sometimes named **modelines**) edit option historically caused `ex` or  
 96903 `vi` to read the five first and last lines of the file for editor commands. This option is  
 96904 a security problem, and vendors are strongly encouraged to delete it from  
 96905 historical implementations.

96906	<b>open</b>	The <b>open</b> edit option historically disallowed the <i>ex</i> <b>open</b> and <b>visual</b> commands. This edit option was omitted because these commands are required by POSIX.1-2024.
96907		
96908		
96909	<b>optimize</b>	The <b>optimize</b> edit option historically expedited text throughput by setting the terminal to not do automatic <carriage-return> characters when printing more than one logical line of output. This option was omitted from POSIX.1-2024 because it was intended for terminals without addressable cursors, which are rarely, if ever, still used.
96910		
96911		
96912		
96913		
96914	<b>ruler</b>	The <b>ruler</b> edit option has been used in some implementations of <i>vi</i> to present a current row/column ruler for the user. This option was omitted from POSIX.1-2024 because it is not widespread historical practice.
96915		
96916		
96917	<b>sourceany</b>	The <b>sourceany</b> edit option historically caused <i>ex</i> or <i>vi</i> to source start-up files that were owned by users other than the user running the editor. This option is a security problem, and vendors are strongly encouraged to remove it from their implementations.
96918		
96919		
96920		
96921	<b>timeout</b>	The <b>timeout</b> edit option historically enabled the (now standard) feature of only waiting for a short period before returning keys that could be part of a macro. This feature was omitted from POSIX.1-2024 because its behavior is now standard, it is not widely useful, and it was rarely documented.
96922		
96923		
96924		
96925	<b>verbose</b>	The <b>verbose</b> edit option has been used in some implementations of <i>vi</i> to cause <i>vi</i> to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical <i>vi</i> only alerted the terminal and presented no message for such errors. The historical editor option <b>terse</b> did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from POSIX.1-2024 because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users.
96926		
96927		
96928		
96929		
96930		
96931		
96932		
96933		
96934	<b>wraplen</b>	The <b>wraplen</b> edit option has been used in some implementations of <i>vi</i> to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This option was omitted from POSIX.1-2024 because it is not widespread historical practice; however, implementors are encouraged to use it if they add this functionality.
96935		
96936		
96937		
96938		
96939		
96940	<b>autoindent, ai</b>	
96941		Historically, the command <b>0a</b> did not do any autoindentation, regardless of the current indentation of line 1. POSIX.1-2024 requires that any indentation present in line 1 be used.
96942		
96943	<b>autoprint, ap</b>	
96944		Historically, the <b>autoprint</b> edit option was not completely consistent or based solely on modifications to the edit buffer. Exceptions were the <b>read</b> command (when reading from a file, but not from a filter), the <b>append</b> , <b>change</b> , <b>insert</b> , <b>global</b> , and <b>v</b> commands, all of which were not affected by <b>autoprint</b> , and the <b>tag</b> command, which was affected by <b>autoprint</b> . POSIX.1-2024 requires conformance to historical practice.
96945		
96946		
96947		
96948		
96949		Historically, the <b>autoprint</b> option only applied to the last of multiple commands entered using <vertical-line> delimiters; for example, <b>delete</b> <newline> was affected by <b>autoprint</b> , but
96950		

96951 **delete** | **version** <newline> was not. POSIX.1-2024 requires conformance to historical practice.

96952 **autowrite, aw**

96953 Appending the '!' character to the *ex* **next** command to avoid performing an automatic write  
96954 was not supported in historical implementations. POSIX.1-2024 requires that the behavior match  
96955 the other *ex* commands for consistency.

96956 **ignorecase, ic**

96957 Historical implementations of case-insensitive matching (the **ignorecase** edit option) lead to  
96958 counter-intuitive situations when uppercase characters were used in range expressions.  
96959 Historically, the process was as follows:

- 96960 1. Take a line of text from the edit buffer.
- 96961 2. Convert uppercase to lowercase in text line.
- 96962 3. Convert uppercase to lowercase in regular expressions, except in character class  
96963 specifications.
- 96964 4. Match regular expressions against text.

96965 This would mean that, with **ignorecase** in effect, the text:

96966 The cat sat on the mat

96967 would be matched by

96968 /<sup>^</sup>the/

96969 but not by:

96970 /<sup>^</sup>[A-Z]he/

96971 For consistency with other commands implementing regular expressions, POSIX.1-2024 does not  
96972 permit this behavior.

96973 **paragraphs, para**

96974 The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options  
96975 implementation-defined, arguing they were historically oriented to the UNIX system *troff* text  
96976 formatter, and a “portable user” could use the {, }, [[, ]], (, and ) commands in open or visual  
96977 mode and have the cursor stop in unexpected places. POSIX.1-2024 specifies their values in the  
96978 POSIX locale because the unusual grouping (they only work when grouped into two characters  
96979 at a time) means that they cannot be used for general-purpose movement, regardless.

96980 **readonly**

96981 Implementations are encouraged to provide the best possible information to the user as to the  
96982 read-only status of the file, with the exception that they should not consider the current special  
96983 privileges of the process. This provides users with a safety net because they must force the  
96984 overwrite of read-only files, even when running with additional privileges.

96985 The **readonly** edit option specification largely conforms to historical practice. The only  
96986 difference is that historical implementations did not notice that the user had set the **readonly**  
96987 edit option in cases where the file was already marked read-only for some reason, and would  
96988 therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were  
96989 replaced. This behavior is disallowed by POSIX.1-2024.

96990 **report**

96991 The requirement that lines copied to a buffer interact differently than deleted lines is historical  
 96992 practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be  
 96993 written, but 4 lines must be copied before a report is written.

96994 The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based  
 96995 on the total number of lines added or deleted during the command execution, and that  
 96996 commands executed by the **global** and **v** commands not present reports, is historical practice.  
 96997 POSIX.1-2024 extends historical practice by requiring that buffer execution be treated similarly.  
 96998 The reasons for this are two-fold. Historically, only the report by the last command executed  
 96999 from the buffer would be seen by the user, as each new report would overwrite the last. In  
 97000 addition, the standard developers believed that buffer execution had more in common with  
 97001 **global** and **v** commands than it did with other *ex* commands, and should behave similarly, for  
 97002 consistency and simplicity of specification.

97003 **showmatch, sm**

97004 The length of time the cursor spends on the matching character is unspecified because the  
 97005 timing capabilities of systems are often inexact and variable. The time should be long enough for  
 97006 the user to notice, but not long enough for the user to become annoyed. Some implementations  
 97007 of *vi* have added a **matchtime** option that permits users to set the number of 0,1 second intervals  
 97008 the cursor pauses on the matching character.

97009 **showmode**

97010 The **showmode** option has been used in some historical implementations of *ex* and *vi* to display  
 97011 the current editing mode when in open or visual mode. The editing modes have generally  
 97012 included “command” and “input”, and sometimes other modes such as “replace” and  
 97013 “change”. The string was usually displayed on the bottom line of the screen at the far right-hand  
 97014 corner. In addition, a preceding '\*' character often denoted whether the contents of the edit  
 97015 buffer had been modified. The latter display has sometimes been part of the **showmode** option,  
 97016 and sometimes based on another option. This option was not available in the 4 BSD historical  
 97017 implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is  
 97018 required by POSIX.1-2024.

97019 The **smd** shorthand for the **showmode** option was not present in all historical implementations  
 97020 of the editor. POSIX.1-2024 requires it, for consistency.

97021 Not all historical implementations of the editor displayed a mode string for command mode,  
 97022 differentiating command mode from text input mode by the absence of a mode string.  
 97023 POSIX.1-2024 permits this behavior for consistency with historical practice, but implementations  
 97024 are encouraged to provide a display string for both modes.

97025 **slowopen**

97026 Historically, the **slowopen** option was automatically set if the terminal baud rate was less than  
 97027 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen**  
 97028 option had two effects. First, when inserting characters in the middle of a line, characters after  
 97029 the cursor would not be pushed ahead, but would appear to be overwritten. Second, when  
 97030 creating a new line of text, lines after the current line would not be scrolled down, but would  
 97031 appear to be overwritten. In both cases, ending text input mode would cause the screen to be  
 97032 refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently  
 97033 intelligent caused the editor to ignore the **slowopen** option. POSIX.1-2024 permits most  
 97034 historical behavior, extending historical practice to require **slowopen** behaviors if the edit option

97035 is set by the user.

#### 97036 **tags**

97037 The default path for tags files is left unspecified as implementations may have their own **tags**  
97038 implementations that do not correspond to the historical ones. The default **tags** option value  
97039 should probably at least include the file **./tags**.

#### 97040 **term**

97041 Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial  
97042 terminal information was loaded. This is permitted by POSIX.1-2024; however, implementations  
97043 are encouraged to permit the user to modify their terminal type at any time.

#### 97044 **terse**

97045 Historically, the **terse** edit option optionally provided a shorter, less descriptive error message,  
97046 for some error messages. This is permitted, but not required, by POSIX.1-2024. Historically, most  
97047 common visual mode errors (for example, trying to move the cursor past the end of a line) did  
97048 not result in an error message, but simply alerted the terminal. Implementations wishing to  
97049 provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not  
97050 **terse**.

#### 97051 **window**

97052 In historical implementations, the default for the **window** edit option was based on the baud  
97053 rate as follows:

97054 1. If the baud rate was less than 1 200, the **edit** option **w300** set the window value; for  
97055 example, the line:

```
97056 set w300=12
```

97057 would set the window option to 12 if the baud rate was less than 1 200.

97058 2. If the baud rate was equal to 1 200, the **edit** option **w1200** set the window value.

97059 3. If the baud rate was greater than 1 200, the **edit** option **w9600** set the window value.

97060 The **w300**, **w1200**, and **w9600** options do not appear in POSIX.1-2024 because of their  
97061 dependence on specific baud rates.

97062 In historical implementations, the size of the window displayed by various commands was  
97063 related to, but not necessarily the same as, the **window** edit option. For example, the size of the  
97064 window was set by the *ex* command **visual 10**, but it did not change the value of the **window**  
97065 edit option. However, changing the value of the **window** edit option did change the number of  
97066 lines that were displayed when the screen was repainted. POSIX.1-2024 does not permit this  
97067 behavior in the interests of consistency and simplicity of specification, and requires that all  
97068 commands that change the number of lines that are displayed do it by setting the value of the  
97069 **window** edit option.

97070 **wrapmargin, wm**

97071 Historically, the **wrapmargin** option did not affect maps inserting characters that also had  
 97072 associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used  
 97073 maps that depend on this behavior. For consistency and simplicity of specification,  
 97074 POSIX.1-2024 does not permit this behavior.

97075 Historically, **wrapmargin** was calculated using the column display width of all characters on the  
 97076 screen. For example, an implementation using "**^I**" to represent <tab> characters when the **list**  
 97077 edit option was set, where '**^**' and '**I**' each took up a single column on the screen, would  
 97078 calculate the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option  
 97079 similarly changed the effective length of the line as well. POSIX.1-2024 requires conformance to  
 97080 historical practice.

97081 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
 97082 but this has been modified in this version.

97083 **FUTURE DIRECTIONS**

97084 If this utility is directed to create a new directory entry that contains any bytes that have the  
 97085 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 97086 error. A future version of this standard may require implementations to treat this as an error.

97092 **CHANGE HISTORY**

97093 First released in Issue 2.

97094 **Issue 5**

97095 The FUTURE DIRECTIONS section is added.

97096 **Issue 6**

97097 This utility is marked as part of the User Portability Utilities option.

97098 The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

97099 The following new requirements on POSIX implementations derive from alignment with the  
 97100 Single UNIX Specification:

- 97101 • In the **map** command description, the sequence *#digit* is added.
- 97102 • The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.

97103 The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This  
 97104 includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52,  
 97105 #55, #56, #57, #61, #62, #63, #64, #65, and #78.

97106 The **-l** option is removed.

97107 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.

97108 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/8 is applied, making an editorial  
 97109 correction in the EXTENDED DESCRIPTION.

97110 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/9 is applied, removing text describing  
 97111 behavior on systems with bytes consisting of more than eight bits.

97112 **Issue 7**

97113 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
97114 ' \_ '.

97115 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

97116 Austin Group Interpretation 1003.1-2001 #121 is applied, clarifying the *ex write* command.

97117 Austin Group Interpretation 1003.1-2001 #156 is applied.

97118 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

97119 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0093 [584] is applied.

97120 **Issue 8**

97121 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
97122 filenames containing any bytes that have the encoded value of a <newline> character.

97123 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

97124 Austin Group Defect 1185 is applied, changing the SIGCONT entry in ASYNCHRONOUS  
97125 EVENTS and adding a SIGWINCH entry.

97126 Austin Group Defect 1251 is applied, clarifying the *set* command, changing ``addr`` to ``2addr``  
97127 in the *!* command synopsis, and adding spaces in some synopsis lines.

97128 Austin Group Defect 1281 is applied, changing the description of the *substitute* command to  
97129 clarify that it is an error if the substitution fails on every addressed line.

97130 Austin Group Defect 1298 is applied, changing the CONSEQUENCES OF ERRORS section.

97131 Austin Group Defect 1378 is applied, changing the description of the *LC\_MESSAGES*  
97132 environment variable.

97133 Austin Group Defect 1529 is applied, changing the synopsis of the *escape* command and adding  
97134 related paragraphs to the APPLICATION USAGE and RATIONALE sections.

97135 Austin Group Defect 1642 is applied, changing the description of the *redraw* edit option.

97136 Austin Group Defect 1662 is applied, clarifying requirements relating to delimiters in addresses  
97137 and in *s* commands.

97138 **NAME**

97139 expand — convert tabs to spaces

97140 **SYNOPSIS**97141 expand [-t *tablist*] [*file...*]97142 **DESCRIPTION**

97143 The *expand* utility shall write files or the standard input to the standard output with <tab>  
 97144 characters replaced with one or more <space> characters needed to pad to the next tab stop. Any  
 97145 <backspace> characters shall be copied to the output and cause the column position count for  
 97146 tab stop calculations to be decremented; the column position count shall not be decremented  
 97147 below zero.

97148 **OPTIONS**97149 The *expand* utility shall conform to XBD [Section 12.2](#) (on page 215).

97150 The following option shall be supported:

97151 **-t *tablist*** Specify the tab stops. The application shall ensure that the argument *tablist* consists  
 97152 of either a single positive decimal integer or a list of tabstops. If a single number is  
 97153 given, tabs shall be set that number of column positions apart instead of the  
 97154 default 8.

97155 If a list of tabstops is given, the application shall ensure that it consists of a list of  
 97156 two or more positive decimal integers, separated by <blank> or <comma>  
 97157 characters, in ascending order. The <tab> characters shall be set at those specific  
 97158 column positions. Each tab stop *N* shall be an integer value greater than zero, and  
 97159 the list is in strictly ascending order. This is taken to mean that, from the start of a  
 97160 line of output, tabbing to position *N* shall cause the next character output to be in  
 97161 the (*N*+1)th column position on that line.

97162 In the event of *expand* having to process a <tab> at a position beyond the last of  
 97163 those specified in a multiple tab-stop list, the <tab> shall be replaced by a single  
 97164 <space> in the output.

97165 **OPERANDS**

97166 The following operand shall be supported:

97167 *file* The pathname of a text file to be used as input.97168 **STDIN**

97169 See the INPUT FILES section.

97170 **INPUT FILES**

97171 Input files shall be text files.

97172 **ENVIRONMENT VARIABLES**97173 The following environment variables shall affect the execution of *expand*:

97174 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 97175 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 97176 variables used to determine the values of locale categories.)

97177 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 97178 internationalization variables.

97179 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 97180 characters (for example, single-byte as opposed to multi-byte characters in  
 97181 arguments and input files), the processing of <tab> and <space> characters, and  
 97182 for the determination of the width in column positions each character would

- 97183                    occupy on an output device.
- 97184            *LC\_MESSAGES*
- 97185                    Determine the locale that should be used to affect the format and contents of
- 97186                    diagnostic messages written to standard error.
- 
- 97187 XSI            *NLSPATH*    Determine the location of messages objects and message catalogs.
- 97188 **ASYNCHRONOUS EVENTS**
- 97189            Default.
- 97190 **STDOUT**
- 97191            The standard output shall be equivalent to the input files with <tab> characters converted into
- 97192            the appropriate number of <space> characters.
- 97193 **STDERR**
- 97194            The standard error shall be used only for diagnostic messages.
- 97195 **OUTPUT FILES**
- 97196            None.
- 97197 **EXTENDED DESCRIPTION**
- 97198            None.
- 97199 **EXIT STATUS**
- 97200            The following exit values shall be returned:
- 97201            0    Successful completion
- 97202            >0   An error occurred.
- 97203 **CONSEQUENCES OF ERRORS**
- 97204            The *expand* utility shall terminate with an error message and non-zero exit status upon
- 97205            encountering difficulties accessing one of the *file* operands.
- 97206 **APPLICATION USAGE**
- 97207            None.
- 97208 **EXAMPLES**
- 97209            None.
- 97210 **RATIONALE**
- 97211            The *expand* utility is useful for preprocessing text files (before sorting, looking at specific
- 97212            columns, and so on) that contain <tab> characters.
- 97213            See XBD [Section 3.75](#) (on page 42).
- 97214            The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8
- 97215            mandates that *expand* shall accept the integers (within the single argument) separated using
- 97216            either <comma> or <blank> characters.
- 97217            Earlier versions of this standard allowed the following form in the SYNOPSIS:
- 97218            `expand [-tabstop] [-tab1,tab2,...,tabn] [file ...]`
- 97219            This form is no longer specified by POSIX.1-2024 but may be present in some implementations.
- 97220 **FUTURE DIRECTIONS**
- 97221            None.

97222 **SEE ALSO**97223 *tabs, unexpand*97224 XBD [Section 3.75](#) (on page 42), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)97225 **CHANGE HISTORY**

97226 First released in Issue 4.

97227 **Issue 6**

97228 This utility is marked as part of the User Portability Utilities option.

97229 The APPLICATION USAGE section is added.

97230 The obsolescent SYNOPSIS is removed.

97231 The *LC\_CTYPE* environment variable description is updated to align with the IEEE P1003.2b draft standard.

97233 The normative text is reworded to avoid use of the term “must” for application requirements.

97234 **Issue 7**

97235 Austin Group Interpretation 1003.1-2001 #027 is applied.

97236 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

97237 The *expand* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.97239 **Issue 8**97240 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

97241 **NAME**97242            *expr* — evaluate arguments as an expression97243 **SYNOPSIS**97244            *expr operand...*97245 **DESCRIPTION**97246            The *expr* utility shall evaluate an expression and write the result to standard output.97247 **OPTIONS**

97248            None.

97249 **OPERANDS**97250            The single expression evaluated by *expr* shall be formed from the *operand* operands, as described in the EXTENDED DESCRIPTION section. The application shall ensure that each of the expression operator symbols:

97253            ( ) | &amp; = &gt; &gt;= &lt; &lt;= != + - \* / % :

97254            and the symbols *integer* and *string* in the table are provided as separate arguments to *expr*.97255 **STDIN**

97256            Not used.

97257 **INPUT FILES**

97258            None.

97259 **ENVIRONMENT VARIABLES**97260            The following environment variables shall affect the execution of *expr*:97261            *LANG*        Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)97264            *LC\_ALL*     If set to a non-empty string value, override the values of all the other internationalization variables.97266            *LC\_COLLATE*

97267                    Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions and by the string comparison operators.

97270            *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and the behavior of character classes within regular expressions.97273            *LC\_MESSAGES*

97274                    Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

97276 XSI        *NLSPATH* Determine the location of messages objects and message catalogs.97277 **ASYNCHRONOUS EVENTS**

97278            Default.

97279 **STDOUT**97280            The *expr* utility shall evaluate the expression and write the result, followed by a <newline>, to standard output.

97281

97282 **STDERR**

97283 The standard error shall be used only for diagnostic messages.

97284 **OUTPUT FILES**

97285 None.

97286 **EXTENDED DESCRIPTION**

97287 The formation of the expression to be evaluated is shown in the following table. The symbols  
 97288 *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the  
 97289 expression operator symbols (all separate arguments) by recursive application of the constructs  
 97290 described in the table. The expressions are listed in order of decreasing precedence, with equal-  
 97291 precedence operators grouped between horizontal lines. All of the operators shall be left-  
 97292 associative.

Expression	Description
<i>integer</i>	An argument consisting only of an (optional) unary minus followed by digits.
<i>string</i>	A string argument; see below.
( <i>expr</i> )	Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.
<i>expr1</i> : <i>expr2</i>	Matching expression; see below.
<i>expr1</i> * <i>expr2</i> <i>expr1</i> / <i>expr2</i>	Multiplication of decimal integer-valued arguments. Integer division of decimal integer-valued arguments, producing an integer result.
<i>expr1</i> % <i>expr2</i>	Remainder of integer division of decimal integer-valued arguments.
<i>expr1</i> + <i>expr2</i> <i>expr1</i> - <i>expr2</i>	Addition of decimal integer-valued arguments. Subtraction of decimal integer-valued arguments.
<i>expr1</i> = <i>expr2</i> <i>expr1</i> > <i>expr2</i> <i>expr1</i> >= <i>expr2</i> <i>expr1</i> < <i>expr2</i> <i>expr1</i> <= <i>expr2</i> <i>expr1</i> != <i>expr2</i>	Returns the result of a decimal integer comparison if both arguments are integers; otherwise, returns the result of a string comparison using the locale-specific collation sequence. The result of each comparison is 1 if the specified relationship is true, or 0 if the relationship is false. Equal. Greater than. Greater than or equal. Less than. Less than or equal. Not equal.
<i>expr1</i> & <i>expr2</i>	Returns the evaluation of <i>expr1</i> if neither expression evaluates to null or zero; otherwise, returns zero.
<i>expr1</i>   <i>expr2</i>	Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.

97324 **Matching Expression**

97325 The ':' matching operator shall compare the string resulting from the evaluation of *expr1* with  
 97326 the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax  
 97327 shall be that defined in XBD [Section 9.3](#) (on page 181), except that all patterns are anchored to  
 97328 the beginning of the string (that is, only sequences starting at the first character of a string are  
 97329 matched by the regular expression) and, therefore, it is unspecified whether '^' is a special  
 97330 character in that context. Usually, the matching operator shall return a string representing the  
 97331 number of characters matched ('0' on failure). Alternatively, if the pattern contains at least one  
 97332 regular expression subexpression "\(...\)", the string matched by the back-reference  
 97333 expression "\1" shall be returned. If the back-reference expression "\1" does not match, then  
 97334 the null string shall be returned.

97335 **Identification as Integer or String**

97336 An argument or the value of a subexpression that consists only of an optional unary minus  
 97337 followed by digits is a candidate for treatment as an integer if it is used as the left argument to  
 97338 the | operator or as either argument to any of the following operators: & = > >= < <= != +  
 97339 - \* / %. Otherwise, the argument or subexpression value shall be treated as a string.

97340 The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

97341 **EXIT STATUS**

97342 The following exit values shall be returned:

- 97343 0 The *expression* evaluated to neither null nor zero, and the output specified in STDOUT was  
 97344 successfully written to standard output.
- 97345 1 The *expression* evaluated to null or zero, and the output specified in STDOUT was  
 97346 successfully written to standard output.
- 97347 2 Invalid *expression* error.
- 97348 >2 Another error occurred.

97349 **CONSEQUENCES OF ERRORS**

97350 Default.

97351 **APPLICATION USAGE**

97352 The *expr* utility has a rather difficult syntax:

- 97353 • Many of the operators are also shell control operators or reserved words, so they have to  
 97354 be escaped on the command line.
- 97355 • Each part of the expression is composed of separate arguments, so liberal usage of <blank>  
 97356 characters is required. For example:

97357	Invalid	Valid
97358	<i>expr</i> 1+2	<i>expr</i> 1 + 2
97359	<i>expr</i> "1 + 2"	<i>expr</i> 1 + 2
97360	<i>expr</i> 1 + (2 * 3)	<i>expr</i> 1 + \( 2 \* 3 \)

97361 In many cases, the arithmetic and string features provided as part of the shell command  
 97362 language are easier to use than their equivalents in *expr*. Newly written scripts should avoid  
 97363 *expr* in favor of the new features within the shell; see [Section 2.5](#) (on page 2478) and [Section 2.6.4](#)  
 97364 (on page 2490).

97365 After argument processing by the shell, *expr* is not required to be able to tell the difference  
 97366 between an operator and an operand except by the value. If "\$a" is '=', the command:

97367 `expr "$a" = '='`

97368 looks like:

97369 `expr = = =`

97370 as the arguments are passed to *expr* (and they all may be taken as the '=' operator). The  
97371 following works reliably:

97372 `expr "X$a" = X=`

97373 Also note that this volume of POSIX.1-2024 permits implementations to extend utilities. The *expr*  
97374 utility permits the integer arguments to be preceded with a unary minus. This means that an  
97375 integer argument could look like an option. Therefore, the conforming application must employ  
97376 the "--" construct of Guideline 10 of XBD [Section 12.2](#) (on page 215) to protect its operands if  
97377 there is any chance the first operand might be a negative integer (or any string with a leading  
97378 minus).

97379 For testing string equality the *test* utility is preferred over *expr*, as it is usually implemented as a  
97380 shell built-in. However, the functionality is not quite the same because the *expr* = and !=  
97381 operators check whether strings collate equally, whereas *test* checks whether they are identical.  
97382 Therefore, they can produce different results in locales where the collation sequence does not  
97383 have a total ordering of all characters (see XBD [Section 7.3.2](#), on page 139).

#### 97384 EXAMPLES

97385 The following command:

97386 `a=$(expr "$a" + 1)`

97387 adds 1 to the variable *a*.

97388 The following command, for "\$a" equal to either */usr/abc/file* or just *file*:

97389 `expr $a : '.*\/(.*)' \| $a`

97390 returns the last segment of a pathname (that is, *file*). Applications should avoid the character  
97391 '/' used alone as an argument; *expr* may interpret it as the division operator.

97392 The following command:

97393 `expr "//$a" : '.*\/(.*)'`

97394 is a better representation of the previous example. The addition of the "//" characters  
97395 eliminates any ambiguity about the division operator and simplifies the whole expression. Also  
97396 note that pathnames may contain characters contained in the *IFS* variable and should be quoted  
97397 to avoid having "\$a" expand into multiple arguments.

97398 The following command:

97399 `expr "X$VAR" : '.*' - 1`

97400 returns the number of characters in *VAR*.

#### 97401 RATIONALE

97402 In an early proposal, EREs were used in the matching expression syntax. This was changed to  
97403 BREs to avoid breaking historical applications.

97404 The use of a leading <circumflex> in the BRE is unspecified because many historical  
97405 implementations have treated it as a special character, despite their system documentation. For  
97406 example:

97407 `expr foo : ^foo`      `expr ^foo : ^foo`

97408 return 3 and 0, respectively, on those systems; their documentation would imply the reverse.  
97409 Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on  
97410 this undocumented feature.

#### 97411 **FUTURE DIRECTIONS**

97412 None.

#### 97413 **SEE ALSO**

97414 [Section 2.5](#) (on page 2478), [Section 2.6.4](#) (on page 2490)

97415 [XBD Section 7.3.2](#) (on page 139), [Chapter 8](#) (on page 167), [Section 9.3](#) (on page 181), [Section 12.2](#)  
97416 (on page 215)

#### 97417 **CHANGE HISTORY**

97418 First released in Issue 2.

#### 97419 **Issue 5**

97420 The FUTURE DIRECTIONS section is added.

#### 97421 **Issue 6**

97422 The *expr* utility is aligned with the IEEE P1003.2b draft standard, to include resolution of IEEE  
97423 PASC Interpretation 1003.2 #104.

97424 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 97425 **Issue 7**

97426 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

97427 The SYNOPSIS and OPERANDS sections are revised to explicitly state that the name of each of  
97428 the operands is *operand*.

97429 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0094 [942], XCU/TC2-2008/0095  
97430 [709], XCU/TC2-2008/0096 [942], XCU/TC2-2008/0097 [963], and XCU/TC2-2008/0098 [942]  
97431 are applied.

#### 97432 **Issue 8**

97433 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

97434 Austin Group Defect 1500 is applied, changing the EXIT STATUS section.

97435 Austin Group Defect 1757 is applied, changing "`[\ ( . . . \ ) ]`" to "`[\ ( . . . \ ) ]`".

97436 **NAME**

97437 false — return false value

97438 **SYNOPSIS**

97439 false

97440 **DESCRIPTION**97441 The *false* utility shall return with a non-zero exit code.97442 **OPTIONS**

97443 None.

97444 **OPERANDS**

97445 None.

97446 **STDIN**

97447 Not used.

97448 **INPUT FILES**

97449 None.

97450 **ENVIRONMENT VARIABLES**

97451 None.

97452 **ASYNCHRONOUS EVENTS**

97453 Default.

97454 **STDOUT**

97455 Not used.

97456 **STDERR**

97457 Not used.

97458 **OUTPUT FILES**

97459 None.

97460 **EXTENDED DESCRIPTION**

97461 None.

97462 **EXIT STATUS**97463 The *false* utility shall always exit with a value between 1 and 125, inclusive.97464 **CONSEQUENCES OF ERRORS**

97465 Default.

97466 **APPLICATION USAGE**

97467 None.

97468 **EXAMPLES**

97469 None.

97470 **RATIONALE**

97471 None.

97474 **SEE ALSO**97475 *true*

97476 **CHANGE HISTORY**

97477 First released in Issue 2.

97478 **Issue 6**97479 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR  
97480 section from ``None.'' to ``Not used.'' for alignment with [Section 1.4](#) (on page 2462).97481 **Issue 8**

97482 Austin Group Defect 1321 is applied, changing the EXIT STATUS section.

97483 **NAME**97484 `fc` — process the command history list97485 **SYNOPSIS**

```
97486 UP fc [-r] [-e editor] [first [last]]
97487 fc -l [-nr] [first [last]]
97488 fc -s [old=new] [first]
```

97489 **DESCRIPTION**

97490 The `fc` utility shall list, or shall edit and re-execute, commands previously entered to an  
 97491 interactive `sh`.

97492 The command history list shall reference commands by number. The first number in the list is  
 97493 selected arbitrarily. The relationship of a number to its command shall not change except when  
 97494 the user logs in and no other process is accessing the list, at which time the system may reset the  
 97495 numbering to start the oldest retained command at another number (usually 1). When the  
 97496 number reaches an implementation-defined upper limit, which shall be no smaller than the  
 97497 value in `HISTSIZE` or 32767 (whichever is greater), the shell may wrap the numbers, starting the  
 97498 next command with a lower number (usually 1). However, despite this optional wrapping of  
 97499 numbers, `fc` shall maintain the time-ordering sequence of the commands. For example, if four  
 97500 commands in sequence are given the numbers 32766, 32767, 1 (wrapped), and 2 as they are  
 97501 executed, command 32767 is considered the command previous to 1, even though its number is  
 97502 higher.

97503 When commands are edited (when the `-l` option is not specified), the resulting lines shall be  
 97504 entered at the end of the history list and then re-executed by `sh`. The `fc` command that caused the  
 97505 editing shall not be entered into the history list. If the editor returns a non-zero exit status, this  
 97506 shall suppress the entry into the history list and the command re-execution. Any command line  
 97507 variable assignments or redirection operators used with `fc` shall affect both the `fc` command itself  
 97508 as well as the command that results; for example:

```
97509 fc -s -- -l 2>/dev/null
```

97510 reinvokes the previous command, suppressing standard error for both `fc` and the previous  
 97511 command.

97512 **OPTIONS**

97513 The `fc` utility shall conform to XBD [Section 12.2](#) (on page 215).

97514 The following options shall be supported:

- 97515 **-e editor** Use the editor named by `editor` to edit the commands. The `editor` string is a utility  
 97516 name, subject to search via the `PATH` variable (see XBD [Chapter 8](#), on page 167).  
 97517 The value in the `FCEDIT` variable shall be used as a default when `-e` is not  
 97518 specified. If `FCEDIT` is null or unset, `ed` shall be used as the editor.
- 97519 **-l** (The letter ell.) List the commands rather than invoking an editor on them. The  
 97520 commands shall be written in the sequence indicated by the `first` and `last` operands,  
 97521 as affected by `-r`, with each command preceded by the command number.
- 97522 **-n** Suppress command numbers when listing with `-l`.
- 97523 **-r** Reverse the order of the commands listed (with `-l`) or edited (with neither `-l` nor  
 97524 `-s`).

- 97525            -s            Re-execute the command without invoking an editor.
- 97526   **OPERANDS**
- 97527            The following operands shall be supported:
- 97528            *first, last*    Select the commands to list or edit. The number of previous commands that can be accessed shall be determined by the value of the *HISTSIZE* variable. The value of *first* or *last* or both shall be one of the following:
- 97531            [+]*number*    A positive number representing a command number; command numbers can be displayed with the -l option.
- 97532
- 97533            -*number*        A negative decimal number representing the command that was executed *number* of commands previously. For example, -1 is the immediately previous command.
- 97534
- 97535
- 97536            *string*         A string indicating the most recently entered command that begins with that string. If the *old=new* operand is not also specified with -s, the string form of the *first* operand cannot contain an embedded <equals-sign>.
- 97537
- 97538
- 97539
- 97540            When the synopsis form with -s is used:
- 97541
  - If *first* is omitted, the previous command shall be used.

97542            For the synopsis forms without -s:

97543            
  - If *last* is omitted, *last* shall default to the previous command when -l is specified; otherwise, it shall default to *first*.
  - If *first* and *last* are both omitted, the previous 16 commands shall be listed or the previous single command shall be edited (based on the -l option).
  - If *first* and *last* are both present, all of the commands from *first* to *last* shall be edited (without -l) or listed (with -l). Editing multiple commands shall be accomplished by presenting to the editor all of the commands at one time, each command starting on a new line. If *first* represents a newer command than *last*, the commands shall be listed or edited in reverse sequence, equivalent to using -r. For example, the following commands on the first line are equivalent to the corresponding commands on the second:

97544

97545            fc -r 10 20        fc     30 40

97546            fc     20 10        fc -r 40 30

97547

97548

97549

97550

97551

97552

97553

97554

97555

97556            
  - When a range of commands is used, it shall not be an error to specify *first* or *last* values that are not in the history list; *fc* shall substitute the value representing the oldest or newest command in the list, as appropriate. For example, if there are only ten commands in the history list, numbered 1 to 10:

97557

97558            fc -l

97559            fc 1 99

97560

97561

97562            shall list and edit, respectively, all ten commands.

97563            *old=new*        Replace the first occurrence of string *old* in the commands to be re-executed by the string *new*.

97564

97565 **STDIN**

97566 Not used.

97567 **INPUT FILES**

97568 None.

97569 **ENVIRONMENT VARIABLES**97570 The following environment variables shall affect the execution of *fc*:

97571 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 97572 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 97573 used as the editor.

97574 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 97575 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 97576 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 97577 and write access to, or create, the history file, it shall use an unspecified  
 97578 mechanism that allows the history to operate properly. (References to history ``file''  
 97579 in this section shall be understood to mean this unspecified mechanism in such  
 97580 cases.) An implementation may choose to access this variable only when  
 97581 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 97582 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 97583 by the user, the file named by the *ENV* variable, or implementation-defined system  
 97584 start-up files. In some historical shells, the history file is initialized just after the  
 97585 *ENV* file has been processed. Therefore, it is implementation-defined whether  
 97586 changes made to *HISTFILE* after the history file has been initialized are effective.  
 97587 Implementations may choose to disable the history list mechanism for users with  
 97588 appropriate privileges who do not set *HISTFILE*; the specific circumstances under  
 97589 which this occurs are implementation-defined. If more than one instance of the  
 97590 shell is using the same history file, it is unspecified how updates to the history file  
 97591 from those shells interact. As entries are deleted from the history file, they shall be  
 97592 deleted oldest first. It is unspecified when history file entries are physically  
 97593 removed from the history file.

97594 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 97595 commands that are accessible. If this variable is unset, an unspecified default  
 97596 greater than or equal to 128 shall be used. The maximum number of commands in  
 97597 the history list is unspecified, but shall be at least 128. An implementation may  
 97598 choose to access this variable only when initializing the history file, as described  
 97599 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 97600 after the history file has been initialized are effective.

97601 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97602 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 97603 variables used to determine the values of locale categories.)

97604 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 97605 internationalization variables.

97606 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 97607 characters (for example, single-byte as opposed to multi-byte characters in  
 97608 arguments and input files).

97609 *LC\_MESSAGES*

97610 Determine the locale that should be used to affect the format and contents of  
 97611 diagnostic messages written to standard error.

- 97612 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 97613 **ASYNCHRONOUS EVENTS**
- 97614 Default.
- 97615 **STDOUT**
- 97616 When the `-l` option is used to list commands, the format of each command in the list shall be as
- 97617 follows:
- 97618 `"%d\t%s\n", <line number>, <command>`
- 97619 If both the `-l` and `-n` options are specified, the format of each command shall be:
- 97620 `"\t%s\n", <command>`
- 97621 If the `<command>` consists of more than one line, the lines after the first shall be displayed as:
- 97622 `"\t%s\n", <continued-command>`
- 97623 **STDERR**
- 97624 The standard error shall be used only for diagnostic messages.
- 97625 **OUTPUT FILES**
- 97626 None.
- 97627 **EXTENDED DESCRIPTION**
- 97628 None.
- 97629 **EXIT STATUS**
- 97630 The following exit values shall be returned:
- 97631 0 Successful completion of the listing.
- 97632 >0 An error occurred.
- 97633 Otherwise, the exit status shall be that of the commands executed by `fc`.
- 97634 **CONSEQUENCES OF ERRORS**
- 97635 Default.
- 97636 **APPLICATION USAGE**
- 97637 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.
- 97638 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file
- 97639 descriptors as part of the `fc` command can produce unexpected results. For example, if `vi` is the
- 97640 `FCEDIT` editor, the command:
- 97641 `fc -s | more`
- 97642 does not work correctly on many systems.
- 97643 Users on windowing systems may want to have separate history files for each window by
- 97644 setting `HISTFILE` as follows:
- 97645 `HISTFILE=$HOME/.sh_hist$$`
- 97646 **EXAMPLES**
- 97647 None.
- 97648 **RATIONALE**
- 97649 This utility is based on the `fc` built-in of the KornShell.
- 97650 An early proposal specified the `-e` option as `[-e editor [old= new ]]`, which is not historical
- 97651 practice. Historical practice in `fc` of either `[-e editor]` or `[-e - [ old= new ]]` is acceptable, but not

97652 both together. To clarify this, a new option `-s` was introduced replacing the `[-e -]`. This resolves  
 97653 the conflict and makes `fc` conform to the Utility Syntax Guidelines.

97654 **HISTFILE** Some implementations of the KornShell check for the superuser and do not create  
 97655 a history file unless `HISTFILE` is set. This is done primarily to avoid creating  
 97656 unlinked files in the root file system when logging in during single-user mode.  
 97657 `HISTFILE` must be set for the superuser to have history.

97658 **HISTSIZE** Needed to limit the size of history files. It is the intent of the standard developers  
 97659 that when two shells share the same history file, commands that are entered in one  
 97660 shell shall be accessible by the other shell. Because of the difficulties of  
 97661 synchronization over a network, the exact nature of the interaction is unspecified.

97662 The initialization process for the history file can be dependent on the system start-up files, in  
 97663 that they may contain commands that effectively preempt the settings the user has for `HISTFILE`  
 97664 and `HISTSIZE`. For example, function definition commands are recorded in the history file. If  
 97665 the system administrator includes function definitions in some system start-up file called before  
 97666 the `ENV` file, the history file is initialized before the user can influence its characteristics. In some  
 97667 historical shells, the history file is initialized just after the `ENV` file has been processed. Because  
 97668 of these situations, the text requires the initialization process to be implementation-defined.

97669 Consideration was given to omitting the `fc` utility in favor of the command line editing feature in  
 97670 `sh`. For example, in `vi` editing mode, typing "`<ESC> v`" is equivalent to:

```
97671 EDITOR=vi fc
```

97672 However, the `fc` utility allows the user the flexibility to edit multiple commands simultaneously  
 97673 (such as `fc 10 20`) and to use editors other than those supported by `sh` for command line editing.

97674 In the KornShell, the alias `r` (``re-do``) is preset to `fc -e -` (equivalent to the POSIX `fc -s`). This is  
 97675 probably an easier command name to remember than `fc` (``fix command``), but it does not meet  
 97676 the Utility Syntax Guidelines. Renaming `fc` to `hist` or `redo` was considered, but since this  
 97677 description closely matches historical KornShell practice already, such a renaming was seen as  
 97678 gratuitous. Users are free to create aliases whenever odd historical names such as `fc`, `awk`, `cat`,  
 97679 `grep`, or `yacc` are standardized by POSIX.

97680 Command numbers have no ordering effects; they are like serial numbers. The `-r` option and  
 97681 `-number` operand address the sequence of command execution, regardless of serial numbers. So,  
 97682 for example, if the command number wrapped back to 1 at some arbitrary point, there would be  
 97683 no ambiguity associated with traversing the wrap point. For example, if the command history  
 97684 were:

```
97685 32766: echo 1
97686 32767: echo 2
97687 1: echo 3
```

97688 the number `-2` refers to command 32767 because it is the second previous command, regardless  
 97689 of serial number.

## 97690 FUTURE DIRECTIONS

97691 None.

## 97692 SEE ALSO

97693 [`sh`](#)

97694 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**97695 CHANGE HISTORY**

97696 First released in Issue 4.

**97697 Issue 5**

97698 The FUTURE DIRECTIONS section is added.

**97699 Issue 6**

97700 This utility is marked as part of the User Portability Utilities option.

97701 In the ENVIRONMENT VARIABLES section, the text ``user's home directory'' is updated to  
97702 ``directory referred to by the *HOME* environment variable''.

**97703 Issue 7**

97704 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**97705 Issue 8**

97706 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
97707 this utility is required to be intrinsic.

97708 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

97709 **NAME**

97710 fg — run jobs in the foreground

97711 **SYNOPSIS**97712 UP fg [*job\_id*]97713 **DESCRIPTION**

97714 If job control is enabled (see the description of *set -m*), the shell is interactive, and the current  
 97715 shell execution environment (see [Section 2.13](#), on page 2522) is not a subshell environment, the *fg*  
 97716 utility shall move a background job in the current execution environment into the foreground, as  
 97717 described in [Section 2.11](#) (on page 2518); it may also do so if the shell is non-interactive or the  
 97718 current shell execution environment is a subshell environment.

97719 Using *fg* to place a job into the foreground shall remove its process ID from the list of those  
 97720 “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page 2506).

97721 **OPTIONS**

97722 None.

97723 **OPERANDS**

97724 The following operand shall be supported:

97725 *job\_id* Specify the job to be run as a foreground job. If no *job\_id* operand is given, the  
 97726 *job\_id* for the job that was most recently suspended, placed in the background, or  
 97727 run as a background job shall be used. The format of *job\_id* is described in XBD  
 97728 [Section 3.182](#) (on page 57).

97729 **STDIN**

97730 Not used.

97731 **INPUT FILES**

97732 None.

97733 **ENVIRONMENT VARIABLES**97734 The following environment variables shall affect the execution of *fg*:

97735 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97736 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 97737 variables used to determine the values of locale categories.)

97738 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 97739 internationalization variables.

97740 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 97741 characters (for example, single-byte as opposed to multi-byte characters in  
 97742 arguments).

97743 *LC\_MESSAGES*

97744 Determine the locale that should be used to affect the format and contents of  
 97745 diagnostic messages written to standard error.

97746 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

97747 **ASYNCHRONOUS EVENTS**

97748 Default.

**97749 STDOUT**

97750 The *fg* utility shall write the command line of the job to standard output in the following format:

97751 "%s\n", <command>

**97752 STDERR**

97753 The standard error shall be used only for diagnostic messages.

**97754 OUTPUT FILES**

97755 None.

**97756 EXTENDED DESCRIPTION**

97757 None.

**97758 EXIT STATUS**

97759 If the *fg* utility succeeds, it does not return an exit status. Instead, the shell waits for the job that  
97760 *fg* moved into the foreground.

97761 If *fg* does not move a job into the foreground, the following exit value shall be returned:

97762 >0 An error occurred.

**97763 CONSEQUENCES OF ERRORS**

97764 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the  
97765 foreground.

**97766 APPLICATION USAGE**

97767 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

97768 The *fg* utility does not work as expected when it is operating in its own utility execution  
97769 environment because that environment has no applicable jobs to manipulate. See the  
97770 APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell  
97771 regular built-in.

**97772 EXAMPLES**

97773 None.

**97774 RATIONALE**

97775 The extensions to the shell specified in this volume of POSIX.1-2024 have mostly been based on  
97776 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
97777 based on the KornShell. The standard developers examined the characteristics of the C shell  
97778 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
97779 the KornShell versions were selected for this volume of POSIX.1-2024 to maintain a degree of  
97780 uniformity with the rest of the KornShell features selected (such as the very popular command  
97781 line editing features).

**97782 FUTURE DIRECTIONS**

97783 None.

**97784 SEE ALSO**

97785 [Section 2.9.3.1](#) (on page 2506), [Section 2.13](#) (on page 2522), *bg*, *kill*, *jobs*, *wait*

97786 XBD [Section 3.182](#) (on page 57), [Chapter 8](#) (on page 167)

**97787 CHANGE HISTORY**

97788 First released in Issue 4.

97789 **Issue 6**

97790 This utility is marked as part of the User Portability Utilities option.

97791 The APPLICATION USAGE section is added.

97792 The JC marking is removed from the SYNOPSIS since job control is mandatory in this version.

97793 **Issue 8**

97794 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
97795 this utility is required to be intrinsic.

97796 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

97797 Austin Group Defect 1254 is applied, updating the DESCRIPTION to account for the addition of  
97798 [Section 2.11](#) (on page 2518) and changing the EXIT STATUS section.

97799 **NAME**

97800 file — determine file type

97801 **SYNOPSIS**97802 file [-dh] [-M *file*] [-m *file*] *file*...97803 file -i [-h] *file*...97804 **DESCRIPTION**97805 The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to  
97806 classify it:

- 97807 1. If *file* does not exist, cannot be read, or its file status could not be determined, the output  
97808 shall indicate that the file was processed, but that its type could not be determined.
- 97809 2. If the file is not a regular file, its file type shall be identified. The file types directory,  
97810 FIFO, socket, block special, and character special shall be identified as such. Other  
97811 implementation-defined file types may also be identified. If *file* is a symbolic link, by  
97812 default the link shall be resolved and *file* shall test the type of file referenced by the  
97813 symbolic link. (See the **-h** and **-i** options below.)
- 97814 3. If the length of *file* is zero, it shall be identified as an empty file.
- 97815 4. The *file* utility shall examine an initial segment of *file* and shall make a guess at  
97816 identifying its contents based on position-sensitive tests. (The answer is not guaranteed to  
97817 be correct; see the **-d**, **-M**, and **-m** options below.)
- 97818 5. The *file* utility shall examine *file* and make a guess at identifying its contents based on  
97819 context-sensitive default system tests. (The answer is not guaranteed to be correct.)
- 97820 6. The file shall be identified as a data file.

97821 If *file* does not exist, cannot be read, or its file status could not be determined, the output shall  
97822 indicate that the file was processed, but that its type could not be determined.97823 If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file  
97824 referenced by the symbolic link.97825 **OPTIONS**97826 The *file* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-m**,  
97827 **-d**, and **-M** options shall be significant.

97828 The following options shall be supported by the implementation:

- 97829 **-d** Apply any position-sensitive default system tests and context-sensitive default  
97830 system tests to the file. This is the default if no **-M** or **-m** option is specified.
- 97831 **-h** When a symbolic link is encountered, identify the file as a symbolic link. If **-h** is  
97832 not specified and *file* is a symbolic link that refers to a nonexistent file, *file* shall  
97833 identify the file as a symbolic link, as if **-h** had been specified.
- 97834 **-i** If a file is a regular file, do not attempt to classify the type of the file further, but  
97835 identify the file as specified in the **STDOUT** section.
- 97836 **-M *file*** Specify the name of a file containing position-sensitive tests that shall be applied to  
97837 a file in order to classify it (see the **EXTENDED DESCRIPTION**). No position-  
97838 sensitive default system tests nor context-sensitive default system tests shall be  
97839 applied unless the **-d** option is also specified.

97840 **-m file** Specify the name of a file containing position-sensitive tests that shall be applied to  
 97841 a file in order to classify it (see the EXTENDED DESCRIPTION).

97842 If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-  
 97843 sensitive default system tests shall be applied after the position-sensitive tests specified by the  
 97844 **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**  
 97845 option is specified with the **-d** option, the concatenation of the position-sensitive tests specified  
 97846 by these options shall be applied in the order specified by the appearance of these options. If a  
 97847 **-M** or **-m file** option-argument is **-**, the results are unspecified.

#### 97848 OPERANDS

97849 The following operand shall be supported:

97850 *file* A pathname of a file to be tested.

#### 97851 STDIN

97852 The standard input shall be used if a *file* operand is **'-'** and the implementation treats the **'-'**  
 97853 as meaning standard input. Otherwise, the standard input shall not be used.

#### 97854 INPUT FILES

97855 The *file* can be any file type.

#### 97856 ENVIRONMENT VARIABLES

97857 The following environment variables shall affect the execution of *file*:

97858 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97859 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 97860 variables used to determine the values of locale categories.)

97861 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 97862 internationalization variables.

97863 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 97864 characters (for example, single-byte as opposed to multi-byte characters in  
 97865 arguments and input files).

97866 *LC\_MESSAGES*

97867 Determine the locale that should be used to affect the format and contents of  
 97868 diagnostic messages written to standard error and informative messages written to  
 97869 standard output.

97870 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

#### 97871 ASYNCHRONOUS EVENTS

97872 Default.

#### 97873 STDOUT

97874 In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

97875 "%s: %s\n", *<file>*, *<type>*

97876 The values for *<type>* are unspecified, except that in the POSIX locale, if *file* is identified as one  
 97877 of the types listed in the following table, *<type>* shall contain (but is not limited to) the  
 97878 corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or  
 97879 **-m** option. Each *<space>* shown in the strings shall be exactly one *<space>*.

97880

Table 3-10 File Utility Output Strings

	If <i>file</i> is:	< <i>type</i> > shall contain the string:	Notes
97881	Nonexistent	cannot open	
97882	Block special	block special	1
97883	Character special	character special	1
97884	Directory	directory	1
97885	FIFO	fifo	1
97886	Socket	socket	1
97887	Symbolic link	symbolic link to	1
97888	Regular file	regular file	1,2
97889	Empty regular file	empty	3
97890	Regular file that cannot be read	cannot open	3
97891	Executable binary	executable	3,4,6
97892	<i>ar</i> archive library (see <i>ar</i> )	archive	3,4,6
97893	Extended <i>cpio</i> format (see <i>pax</i> )	cpio archive	3,4,6
97894	Extended <i>tar</i> format (see <b>ustar</b> in <i>pax</i> )	tar archive	3,4,6
97895	Shell script	commands text	3,5,6
97896	C-language source	c program text	3,5,6
97897	FORTRAN source	fortran program text	3,5,6
97898	Regular file whose type cannot be determined	data	3
97899			

97900

**Notes:**

97901

1. This is a file type test.

97902

2. This test is applied only if the **-i** option is specified.

97903

3. This test is applied only if the **-i** option is not specified.

97904

4. This is a position-sensitive default system test.

97905

5. This is a context-sensitive default system test.

97906

6. Position-sensitive default system tests and context-sensitive default system tests are not applied if the **-M** option is specified unless the **-d** option is also specified.

97907

97908

In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following alternative output format shall be used:

97909

97910

```
"%s: %s %s\n", <file>, <type>, <contents of link>"
```

97911

If the file named by the *file* operand does not exist, cannot be read, or the type of the file named by the *file* operand cannot be determined, this shall not be considered an error that affects the exit status.

97912

97913

97914

**STDERR**

97915

The standard error shall be used only for diagnostic messages.

97916

**OUTPUT FILES**

97917

None.

## 97918 EXTENDED DESCRIPTION

97919 A file specified as an option-argument to the `-m` or `-M` options shall contain one position-  
 97920 sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of  
 97921 the line shall be printed and no further tests shall be applied, with the exception that tests on  
 97922 immediately following lines beginning with a single `'>'` character shall be applied.

97923 Each line shall be composed of the following four `<tab>`-separated fields. (Implementations may  
 97924 allow any combination of one or more white-space characters other than `<newline>` to act as  
 97925 field separators.)

97926 *offset* An unsigned number (optionally preceded by a single `'>'` character) specifying  
 97927 the *offset*, in bytes, of the value in the file that is to be compared against the *value*  
 97928 field of the line. If the file is shorter than the specified offset, the test shall fail.

97929 If the *offset* begins with the character `'>'`, the test contained in the line shall not be  
 97930 applied to the file unless the test on the last line for which the *offset* did not begin  
 97931 with a `'>'` was successful. By default, the *offset* shall be interpreted as an unsigned  
 97932 decimal number. With a leading `0x` or `0X`, the *offset* shall be interpreted as a  
 97933 hexadecimal number; otherwise, with a leading `0`, the *offset* shall be interpreted as  
 97934 an octal number.

97935 *type* The type of the value in the file to be tested. The type shall consist of the type  
 97936 specification characters `d`, `s`, and `u`, specifying signed decimal, string, and  
 97937 unsigned decimal, respectively.

97938 The *type* string shall be interpreted as the bytes from the file starting at the  
 97939 specified *offset* and including the same number of bytes specified by the *value* field.  
 97940 If insufficient bytes remain in the file past the *offset* to match the *value* field, the test  
 97941 shall fail.

97942 The type specification characters `d` and `u` can be followed by an optional unsigned  
 97943 decimal integer that specifies the number of bytes represented by the type. The  
 97944 type specification characters `d` and `u` can be followed by an optional `C`, `S`, `I`, or `L`,  
 97945 indicating that the value is of type **char**, **short**, **int**, or **long**, respectively.

97946 The default number of bytes represented by the type specifiers `d`, `f`, and `u` shall  
 97947 correspond to their respective C-language types as follows. If the system claims  
 97948 conformance to the C-Language Development Utilities option, those specifiers  
 97949 shall correspond to the default sizes used in the `c17` utility. Otherwise, the default  
 97950 sizes shall be implementation-defined.

97951 For the type specifier characters `d` and `u`, the default number of bytes shall  
 97952 correspond to the size of a basic integer type of the implementation. For these  
 97953 specifier characters, the implementation shall support values of the optional  
 97954 number of bytes to be converted corresponding to the number of bytes in the C-  
 97955 language types **char**, **short**, **int**, or **long**. These numbers can also be specified by an  
 97956 application as the characters `C`, `S`, `I`, and `L`, respectively. The byte order used when  
 97957 interpreting numeric values is implementation-defined, but shall correspond to the  
 97958 order in which a constant of the corresponding type is stored in memory on the  
 97959 system.

97960 All type specifiers, except for `s`, can be followed by a mask specifier of the form  
 97961 `&number`. The mask value shall be AND'ed with the value of the input file before  
 97962 the comparison with the *value* field of the line is made. By default, the mask shall  
 97963 be interpreted as an unsigned decimal number. With a leading `0x` or `0X`, the mask  
 97964 shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading

97965		0, the mask shall be interpreted as an unsigned octal number.
97966		The strings <b>byte</b> , <b>short</b> , <b>long</b> , and <b>string</b> shall also be supported as type fields,
97967		being interpreted as dC, dS, dL, and s, respectively.
97968	<i>value</i>	The <i>value</i> to be compared with the value from the file.
97969		If the specifier from the type field is s or <b>string</b> , then interpret the value as a string.
97970		Otherwise, interpret it as a number. If the value is a string, then the test shall
97971		succeed only when a string value exactly matches the bytes from the file.
97972		If the <i>value</i> is a string, it can contain the following sequences:
97973	<i>\character</i>	The <backslash>-escape sequences as specified in XBD Table 5-1
97974		(on page 113) ('\a', '\b', '\f', '\n', '\r', '\t',
97975		'\v'). In addition, the escape sequence '\ ' (the <backslash>
97976		character followed by a <space> character) shall be recognized to
97977		represent a <space> character. The results of using any other
97978		character, other than an octal digit, following the <backslash>
97979		are unspecified.
97980	<i>\octal</i>	Octal sequences that can be used to represent characters with
97981		specific coded values. An octal sequence shall consist of a
97982		<backslash> followed by the longest sequence of one, two, or
97983		three octal-digit characters (01234567).
97984		By default, any value that is not a string shall be interpreted as a signed decimal
97985		number. Any such value, with a leading 0x or 0X, shall be interpreted as an
97986		unsigned hexadecimal number; otherwise, with a leading zero, the value shall be
97987		interpreted as an unsigned octal number.
97988		If the value is not a string, it can be preceded by a character indicating the
97989		comparison to be performed. Permissible characters and the comparisons they
97990		specify are as follows:
97991	=	The test shall succeed if the value from the file equals the <i>value</i> field.
97992	<	The test shall succeed if the value from the file is less than the <i>value</i> field.
97993	>	The test shall succeed if the value from the file is greater than the <i>value</i> field.
97994	&	The test shall succeed if all of the set bits in the <i>value</i> field are set in the value
97995		from the file.
97996	^	The test shall succeed if at least one of the set bits in the <i>value</i> field is not set in
97997		the value from the file.
97998	x	The test shall succeed if the file is large enough to contain a value of the type
97999		specified starting at the offset specified.
98000	<i>message</i>	The <i>message</i> to be printed if the test succeeds. The <i>message</i> shall be interpreted
98001		using the notation for the <i>printf</i> formatting specification; see <i>printf</i> . If the <i>value</i>
98002		field was a string, then the value from the file shall be the argument for the <i>printf</i>
98003		formatting specification; otherwise, the value from the file shall be the argument.

98004 **EXIT STATUS**

98005 The following exit values shall be returned:

98006 0 Successful completion.

98007 &gt;0 An error occurred.

98008 **CONSEQUENCES OF ERRORS**

98009 Default.

98010 **APPLICATION USAGE**98011 The *file* utility can only be required to guess at many of the file types because only exhaustive  
98012 testing can determine some types with certainty. For example, binary data on some  
98013 implementations might match the initial segment of an executable or a *tar* archive.98014 Note that the table indicates that the output contains the stated string. Systems may add text  
98015 before or after the string. For executables, as an example, the machine architecture and various  
98016 facts about how the file was link-edited may be included. Note also that on systems that  
98017 recognize shell script files starting with "#!" as executable files, these may be identified as  
98018 executable binary files rather than as shell scripts.98019 **EXAMPLES**

98020 Determine whether an argument is a binary executable file:

98021 

```
file -- "$1" | grep -q '.*executable' &&  
98022     printf "%s is executable.\n" "$1"
```

98023 **RATIONALE**98024 The *-f* option was omitted because the same effect can (and should) be obtained using the *xargs*  
98025 utility.98026 Historical versions of the *file* utility attempt to identify the following types of files: symbolic link,  
98027 directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive  
98028 library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler  
98029 source, *nroff/troff/eqn/tbl* source *troff* output, shell script, C shell script, English text, ASCII text,  
98030 various executables, APL workspace, compiled terminfo entries, and CURSES screen images.  
98031 Only those types that are reasonably well specified in POSIX or are directly related to POSIX  
98032 utilities are listed in the table.98033 Historical systems have used a "magic file" named */etc/magic* to help identify file types. Because  
98034 it is generally useful for users and scripts to be able to identify special file types, the *-m* flag and  
98035 a portable format for user-created magic files has been specified. No requirement is made that an  
98036 implementation of *file* use this method of identifying files, only that users be permitted to add  
98037 their own classifying tests.98038 In addition, three options have been added to historical practice. The *-d* flag has been added to  
98039 permit users to cause their tests to follow any default system tests. The *-i* flag has been added to  
98040 permit users to test portably for regular files in shell scripts. The *-M* flag has been added to  
98041 permit users to ignore any default system tests.98042 The POSIX.1-2024 description of default system tests and the interaction between the *-d*, *-M*,  
98043 and *-m* options did not clearly indicate that there were two types of "default system tests". The  
98044 "position-sensitive tests" determine file types by looking for certain string or binary values at  
98045 specific offsets in the file being examined. These position-sensitive tests were implemented in  
98046 historical systems using the magic file described above. Some of these tests are now built into  
98047 the *file* utility itself on some implementations so the output can provide more detail than can be  
98048 provided by magic files. For example, a magic file can easily identify a file containing a core  
98049 image on most implementations, but cannot name the program file that dropped the core. A

98050 magic file could produce output such as:

98051 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1

98052 but by building the test into the *file* utility, you could get output such as:

98053 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'

98054 These extended built-in tests are still to be treated as position-sensitive default system tests even  
98055 if they are not listed in */etc/magic* or any other magic file.

98056 The context-sensitive default system tests were always built into the *file* utility. These tests  
98057 looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and  
98058 other computer language source files, and even plain text files. With the addition of the *-m* and  
98059 *-M* options the distinction between position-sensitive and context-sensitive default system tests  
98060 became important because the order of testing is important. The context-sensitive system default  
98061 tests should never be applied before any position-sensitive tests even if the *-d* option is specified  
98062 before a *-m* option or *-M* option due to the high probability that the context-sensitive system  
98063 default tests will incorrectly identify arbitrary text files as text files before position-sensitive tests  
98064 specified by the *-m* or *-M* option would be applied to give a more accurate identification.

98065 Leaving the meaning of *-M* – and *-m* – unspecified allows an existing prototype of these  
98066 options to continue to work in a backwards-compatible manner. (In that implementation, *-M* –  
98067 was roughly equivalent to *-d* in POSIX.1-2024.)

98068 The historical *-c* option was omitted as not particularly useful to users or portable shell scripts.  
98069 In addition, a reasonable implementation of the *file* utility would report any errors found each  
98070 time the magic file is read.

98071 The historical format of the magic file was the same as that specified by the Rationale in the  
98072 ISO POSIX-2:1993 standard for the *offset*, *value*, and *message* fields; however, it used less precise  
98073 type fields than the format specified by the current normative text. The new type field values are  
98074 a superset of the historical ones.

98075 The following is an example magic file:

```

98076 0 short      070707          cpio archive
98077 0 short      0143561        Byte-swapped cpio archive
98078 0 string     070707          ASCII cpio archive
98079 0 long       0177555        Very old archive
98080 0 short      0177545        Old archive
98081 0 short      017437         Old packed data
98082 0 string     \037\036       Packed data
98083 0 string     \377\037       Compacted data
98084 0 string     \037\235       Compressed data
98085 >2 byte&0x80 >0          Block compressed
98086 >2 byte&0x1f x           %d bits
98087 0 string     \032\001       Compiled Terminfo Entry
98088 0 short      0433           Curses screen image
98089 0 short      0434           Curses screen image
98090 0 string     <ar>           System V Release 1 archive
98091 0 string     !<arch>\n___.SYMDEF Archive random library
98092 0 string     !<arch>        Archive
98093 0 string     ARF_BEGARF     PHIGS clear text archive
98094 0 long       0x137A2950     Scalable OpenFont binary
98095 0 long       0x137A2951     Encrypted scalable OpenFont binary

```

98096 The use of a basic integer data type is intended to allow the implementation to choose a word  
98097 size commonly used by applications on that architecture.

98098 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
98099 but this has been modified in this version.

#### 98100 FUTURE DIRECTIONS

98101 If this utility is directed to display a pathname that contains any bytes that have the encoded  
98102 value of a <newline> character when <newline> is a terminator or separator in the output  
98103 format being used, implementations are encouraged to treat this as an error. A future version of  
98104 this standard may require implementations to treat this as an error.

#### 98105 SEE ALSO

98106 *ar, ls, pax, printf*

98107 XBD [Table 5-1](#) (on page 113), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 98108 CHANGE HISTORY

98109 First released in Issue 4.

#### 98110 Issue 6

98111 This utility is marked as part of the User Portability Utilities option.

98112 Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft  
98113 standard.

98114 IEEE PASC Interpretations 1003.2 #192 and #178 are applied.

98115 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to  
98116 address ambiguities raised in defect reports.

98117 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the  
98118 OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the  
98119 Utility Syntax Guidelines.

98120 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/10 is applied, clarifying the specification  
98121 characters.

98122 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/11 is applied, allowing application  
98123 developers to create portable magic files that can match characters in strings, and allowing  
98124 common extensions found in existing implementations.

98125 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/12 is applied, removing text describing  
98126 behavior on systems with bytes consisting of more than eight bits.

#### 98127 Issue 7

98128 Austin Group Interpretation 1003.1-2001 #092 is applied.

98129 SD5-XCU-ERN-4 is applied, adding further entries in the Notes column in [Table 3-10](#).

98130 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

98131 The *file* utility is moved from the User Portability Utilities option to the Base. User Portability  
98132 Utilities is now an option for interactive utilities.

98133 The EXAMPLES section is revised to correct an error with the pathname "\$1".

#### 98134 Issue 8

98135 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
98136 directed to display a pathname that contains any bytes that have the encoded value of a  
98137 <newline> character when <newline> is a terminator or separator in the output format being

98138

used.

98139

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

98140

Austin Group Defect 1141 is applied, changing ``core file'' to ``file containing a core image''.

98141 **NAME**

98142 find — find files

98143 **SYNOPSIS**98144 find [-H|-L] *path...* [*operand\_expression...*]98145 **DESCRIPTION**

98146 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,  
 98147 evaluating a Boolean expression composed of the primaries described in the OPERANDS section  
 98148 for each file encountered. Each *path* operand shall be evaluated unaltered as it was provided,  
 98149 including all trailing <slash> characters; all pathnames for other files encountered in the  
 98150 hierarchy shall consist of the concatenation of the current *path* operand, a <slash> if the current  
 98151 *path* operand did not end in one, and the filename relative to the *path* operand. The relative  
 98152 portion shall contain no dot or dot-dot components, no trailing <slash> characters, and only  
 98153 single <slash> characters between pathname components.

98154 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail  
 98155 due to path length limitations (unless a *path* operand specified by the application exceeds  
 98156 {PATH\_MAX} requirements).

98157 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 98158 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a  
 98159 diagnostic message to standard error and shall either recover its position in the hierarchy or  
 98160 terminate. In either case, the final exit status shall be non-zero.

98161 If a file is removed from or added to the directory hierarchy being searched it is unspecified  
 98162 whether or not *find* includes that file in its search.

98163 **OPTIONS**98164 The *find* utility shall conform to XBD [Section 12.2](#) (on page 215).

98165 The following options shall be supported by the implementation:

98166 **-H** Cause the file information and file type evaluated for each symbolic link  
 98167 encountered as a *path* operand on the command line to be those of the file  
 98168 referenced by the link, and not the link itself. If the referenced file does not exist,  
 98169 the file information and type shall be for the link itself. File information and type  
 98170 for symbolic links encountered during the traversal of a file hierarchy shall be that  
 98171 of the link itself.

98172 **-L** Cause the file information and file type evaluated for each symbolic link  
 98173 encountered as a *path* operand on the command line or encountered during the  
 98174 traversal of a file hierarchy to be those of the file referenced by the link, and not the  
 98175 link itself. If the referenced file does not exist, the file information and type shall be  
 98176 for the link itself.

98177 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 98178 an error. The last option specified shall determine the behavior of the utility. If neither the **-H**  
 98179 nor the **-L** option is specified, then the file information and type for symbolic links encountered  
 98180 as a *path* operand on the command line or encountered during the traversal of a file hierarchy  
 98181 shall be that of the link itself.

98182 **OPERANDS**

98183 The following operands shall be supported:

98184 The first operand and subsequent operands up to but not including the first operand that starts  
 98185 with a '-', or is a '!' or a '(', shall be interpreted as *path* operands. If the first operand starts  
 98186 with a '-', or is a '!' or a '(', the behavior is unspecified. Each *path* operand is a pathname of

- 98187 a starting point in the file hierarchy.
- 98188 The first operand that starts with a '-', or is a '!' or a '(' , and all subsequent arguments shall  
 98189 be interpreted as an *expression* made up of the following primaries and operators. In the  
 98190 descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal  
 98191 integer optionally preceded by a <plus-sign> ('+') or <hyphen-minus> ('-'), as follows:
- 98192 **+n** More than *n*.
- 98193 **n** Exactly *n*.
- 98194 **-n** Less than *n*.
- 98195 The following primaries shall be supported:
- 98196 **-name pattern**  
 98197 The primary shall evaluate as true if the basename of the current pathname  
 98198 matches *pattern* using the pattern matching notation described in [Section 2.14](#) (on  
 98199 page 2523). The additional rules in [Section 2.14.3](#) (on page 2525) do not apply as  
 98200 this is a matching operation, not an expansion.
- 98201 **-iname pattern**  
 98202 The **-iname** primary shall be equivalent to **-name**, except that the match shall be  
 98203 case insensitive. See [XBD Section 4.1](#) (on page 95).
- 98204 **-path pattern**  
 98205 The primary shall evaluate as true if the current pathname matches *pattern* using  
 98206 the pattern matching notation described in [Section 2.14](#) (on page 2523). The  
 98207 additional rules in [Section 2.14.3](#) (on page 2525) do not apply as this is a matching  
 98208 operation, not an expansion.
- 98209 **-nouser** The primary shall evaluate as true if the file belongs to a user ID for which the  
 98210 *getpwuid()* function defined in the System Interfaces volume of POSIX.1-2024 (or  
 98211 equivalent) returns NULL.
- 98212 **-nogroup** The primary shall evaluate as true if the file belongs to a group ID for which the  
 98213 *getgrgid()* function defined in the System Interfaces volume of POSIX.1-2024 (or  
 98214 equivalent) returns NULL.
- 98215 **-mount** The primary shall always evaluate as true; it shall cause *find* to act only on files that  
 98216 have the same device ID (*st\_dev*, see [XSH fstatat\(\)](#)) as the *path* operand below  
 98217 which they are encountered and cause *find* not to descend below directories that  
 98218 have a different device ID than that *path* operand. If any **-mount** primary is  
 98219 specified, it shall apply to the entire expression even if the **-mount** primary would  
 98220 not normally be evaluated.
- 98221 **-xdev** The primary shall always evaluate as true; it shall cause *find* not to descend below  
 98222 directories that have a different device ID (*st\_dev*, see [XSH fstatat\(\)](#)) than the *path*  
 98223 operand below which they are encountered; that is, when a directory with a  
 98224 different device ID is encountered, *find* shall act on the directory itself (unless  
 98225 **-mount** is specified) but shall not act on any files below the directory. If any **-xdev**  
 98226 primary is specified, it shall apply to the entire expression even if the **-xdev**  
 98227 primary would not normally be evaluated.
- 98228 **-prune** The primary shall always evaluate as true; it shall cause *find* not to descend the  
 98229 current pathname if it is a directory. If the **-depth** primary is specified, the **-prune**  
 98230 primary shall have no effect.

98231 **-perm [-]mode**  
 98232 The *mode* argument is used to represent file mode bits. It shall be processed in an  
 98233 identical manner to the *symbolic\_mode* operand described in *chmod*, except that:

- 98234 1. The changes to file mode bits shall be applied to a template instead of to any  
 98235 files. The template shall initially have all file mode bits cleared.
- 98236 2. The *op* symbol '-' cannot be the first character of *mode*; this avoids  
 98237 ambiguity with the optional leading <hyphen-minus>. Since the initial  
 98238 mode is all bits off, there are not any symbolic modes that need to use '-'  
 98239 as the first character.

98240 If the <hyphen-minus> is omitted, the primary shall evaluate as true when the file  
 98241 permission bits exactly match the value of the resulting template.

98242 Otherwise, if *mode* is prefixed by a <hyphen-minus>, the primary shall evaluate as  
 98243 true if at least all the bits in the resulting template are set in the file permission bits.

98244 **-perm [-]onum**  
 98245 If the <hyphen-minus> is omitted, the primary shall evaluate as true when the file  
 98246 mode bits exactly match the value of the octal number *onum* (see the description of  
 98247 the octal *mode* in *chmod*). Otherwise, if *onum* is prefixed by a <hyphen-minus>, the  
 98248 primary shall evaluate as true if at least all of the bits specified in *onum* are set. In  
 98249 both cases, the behavior is unspecified when *onum* exceeds 07777.

98250 **-type c** The primary shall evaluate as true if the type of the file is *c*, where *c* is 'b', 'c',  
 98251 'd', 'l', 'p', 'f', or 's' for block special file, character special file, directory,  
 98252 symbolic link, FIFO, regular file, or socket, respectively.

98253 **-links n** The primary shall evaluate as true if the file has *n* links.

98254 **-user uname** The primary shall evaluate as true if the file belongs to the user *uname*. If *uname* is  
 98255 a decimal integer and the *getpwnam()* (or equivalent) function does not return a  
 98256 valid user name, *uname* shall be interpreted as a user ID.

98257 **-group gname**  
 98258 The primary shall evaluate as true if the file belongs to the group *gname*. If *gname*  
 98259 is a decimal integer and the *getgrnam()* (or equivalent) function does not return a  
 98260 valid group name, *gname* shall be interpreted as a group ID.

98261 **-size n[c]** The primary shall evaluate as true if the file size in bytes, divided by 512 and  
 98262 rounded up to the next integer, is *n*. If *n* is followed by the character 'c', the size  
 98263 shall be in bytes.

98264 **-atime n** The primary shall evaluate as true if the file access time subtracted from the  
 98265 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

98266 **-ctime n** The primary shall evaluate as true if the time of last change of file status  
 98267 information subtracted from the initialization time, divided by 86 400 (with any  
 98268 remainder discarded), is *n*.

98269 **-mtime n** The primary shall evaluate as true if the file modification time subtracted from the  
 98270 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

98271 **-exec utility\_name [argument ...];**  
 98272 **-exec utility\_name [argument ...] {} +**  
 98273 The end of the primary expression shall be punctuated by a <semicolon> or by a  
 98274 <plus-sign>. Only a <plus-sign> that immediately follows an argument  
 98275 containing only the two characters "{}" shall punctuate the end of the primary

- 98276 expression. Other uses of the <plus-sign> shall not be treated as special.
- 98277 If the primary expression is punctuated by a <semicolon>, the utility *utility\_name*  
 98278 shall be invoked once for each pathname and the primary shall evaluate as true if  
 98279 the utility returns a zero value as exit status. A *utility\_name* or *argument* containing  
 98280 only the two characters "{}" shall be replaced by the current pathname. If a  
 98281 *utility\_name* or *argument* string contains the two characters "{}", but not just the  
 98282 two characters "{}", it is implementation-defined whether *find* replaces those two  
 98283 characters or uses the string without change.
- 98284 If the primary expression is punctuated by a <plus-sign>, the primary shall always  
 98285 evaluate as true, and the pathnames for which the primary is evaluated shall be  
 98286 aggregated into sets. The utility *utility\_name* shall be invoked once for each set of  
 98287 aggregated pathnames. Each invocation shall begin after the last pathname in the  
 98288 set is aggregated, and shall be completed before the *find* utility exits and before the  
 98289 first pathname in the next set (if any) is aggregated for this primary, but it is  
 98290 otherwise unspecified whether the invocation occurs before, during, or after the  
 98291 evaluations of other primaries. If any invocation returns a non-zero value as exit  
 98292 status, the *find* utility shall return a non-zero exit status. An argument containing  
 98293 only the two characters "{}" shall be replaced by the set of aggregated  
 98294 pathnames, with each pathname passed as a separate argument to the invoked  
 98295 utility in the same order that it was aggregated. The size of any set of two or more  
 98296 pathnames shall be limited such that execution of the utility does not cause the  
 98297 system's {ARG\_MAX} limit to be exceeded. If more than one argument containing  
 98298 the two characters "{}" is present, the behavior is unspecified.
- 98299 The current directory for the invocation of *utility\_name* shall be the same as the  
 98300 current directory when the *find* utility was started. If the *utility\_name* names any of  
 98301 the special built-in utilities (see Section 2.15, on page 2526), the results are  
 98302 undefined.
- 98303 **-ok** *utility\_name* [*argument* ...];  
 98304 The **-ok** primary shall be equivalent to **-exec**, except that the use of a <plus-sign>  
 98305 to punctuate the end of the primary expression need not be supported, and *find*  
 98306 shall request affirmation of the invocation of *utility\_name* using the current file as  
 98307 an argument by writing to standard error as described in the STDERR section. If  
 98308 the response on standard input is affirmative, the utility shall be invoked.  
 98309 Otherwise, the command shall not be invoked and the value of the **-ok** operand  
 98310 shall be false.
- 98311 **-print** The primary shall always evaluate as true; it shall cause the current pathname to  
 98312 be written to standard output, followed by a <newline>.
- 98313 **-print0** The primary shall always evaluate as true; it shall cause the current pathname to  
 98314 be written to standard output, followed by a null byte.
- 98315 **-newer** *file* The primary shall evaluate as true if the modification time of the current file is  
 98316 more recent than the modification time of the file named by the pathname *file*. If  
 98317 *file* names a symbolic link, the modification time used shall be that of the file  
 98318 referenced by the symbolic link if either the **-H** or **-L** option is specified; if neither  
 98319 **-H** nor **-L** is specified, it is unspecified whether the modification time is that of the  
 98320 symbolic link itself or of the file referenced by the symbolic link. In either case, if  
 98321 the referenced file does not exist, the modification time used shall be that of the  
 98322 link itself. If *file* is a relative pathname, it shall be resolved relative to the current  
 98323 working directory that was inherited by *find* when it was invoked.

98324        **-depth**     The primary shall always evaluate as true; it shall cause descent of the directory  
 98325                    hierarchy to be done so that all entries in a directory are acted on before the  
 98326                    directory itself. If a **-depth** primary is not specified, all entries in a directory shall  
 98327                    be acted on after the directory itself. If any **-depth** primary is specified, it shall  
 98328                    apply to the entire expression even if the **-depth** primary would not normally be  
 98329                    evaluated.

98330        The primaries can be combined using the following operators (in order of decreasing  
 98331                    precedence):

98332        (*expression* ) True if *expression* is true.

98333        !*expression*   Negation of a primary; the unary NOT operator.

98334        *expression* [-**a**] *expression*

98335                    Conjunction of primaries; the AND operator is implied by the juxtaposition of two  
 98336                    primaries or made explicit by the optional **-a** operator. The second expression shall  
 98337                    not be evaluated if the first expression is false.

98338        *expression* -**o** *expression*

98339                    Alternation of primaries; the OR operator. The second expression shall not be  
 98340                    evaluated if the first expression is true.

98341        If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given  
 98342        expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression  
 98343        shall be effectively replaced by:

98344        ( *given\_expression* ) -print

98345        The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only  
 98346        once.

98347        When the file type evaluated for the current file is a symbolic link, the results of evaluating the  
 98348        **-perm** primary are implementation-defined.

#### 98349   **STDIN**

98350        If the **-ok** primary is used, the response shall be read from the standard input. An entire line  
 98351        shall be read as the response. Otherwise, the standard input shall not be used.

#### 98352   **INPUT FILES**

98353        None.

#### 98354   **ENVIRONMENT VARIABLES**

98355        The following environment variables shall affect the execution of *find*:

98356        **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 98357                    (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 98358                    variables used to determine the values of locale categories.)

98359        **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 98360                    internationalization variables.

98361        **LC\_COLLATE**

98362                    Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 98363                    character collating elements used in the pattern matching notation for the **-name**,  
 98364                    **-iname**, and **-path** primaries and in the extended regular expression defined for  
 98365                    the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

- 98366 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 98367 text data as characters (for example, single-byte as opposed to multi-byte  
 98368 characters in arguments), the behavior of character classes within the pattern  
 98369 matching notation used for the **-name**, **-iname**, and **-path** primaries, and the  
 98370 behavior of character classes within regular expressions used in the extended  
 98371 regular expression defined for the **yesexpr** locale keyword in the **LC\_MESSAGES**  
 98372 category.
- 98373 **LC\_MESSAGES**  
 98374 Determine the locale used to process affirmative responses, and the locale used to  
 98375 affect the format and contents of diagnostic messages and prompts written to  
 98376 standard error.
- 98377 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 98378 **PATH** Determine the location of the *utility\_name* for the **-exec** and **-ok** primaries, as  
 98379 described in XBD Chapter 8 (on page 167).
- 98380 **ASYNCHRONOUS EVENTS**  
 98381 Default.
- 98382 **STDOUT**  
 98383 The **-print** primary shall cause the current pathname to be written to standard output. The  
 98384 format shall be:  
 98385 "%s\n", <path>  
 98386 The **-print0** primary shall cause the current pathname to be written to standard output,  
 98387 followed by a null byte.
- 98388 **STDERR**  
 98389 The **-ok** primary shall write a prompt to standard error containing at least the *utility\_name* to be  
 98390 invoked and the current pathname. In the POSIX locale, the last non-<blank> in the prompt shall  
 98391 be ' ? '. The exact format used is unspecified.  
 98392 Otherwise, the standard error shall be used only for diagnostic messages.
- 98393 **OUTPUT FILES**  
 98394 None.
- 98395 **EXTENDED DESCRIPTION**  
 98396 None.
- 98397 **EXIT STATUS**  
 98398 The following exit values shall be returned:  
 98399 0 All *path* operands were traversed successfully, the output (if any) specified in **STDOUT** was  
 98400 successfully written to standard output, and all commands (if any) executed using the **-exec**  
 98401 primary punctuated by a <plus-sign> exited with exit status 0.  
 98402 >0 A command executed using the **-exec** primary punctuated by a <plus-sign> exited with  
 98403 non-zero status, or an error occurred.
- 98404 **CONSEQUENCES OF ERRORS**  
 98405 Default.

## 98406 APPLICATION USAGE

98407 When used in operands, pattern matching notation, <semicolon>, <left-parenthesis>, and  
 98408 <right-parenthesis> characters are special to the shell and must be quoted (see [Section 2.2](#), on  
 98409 page 2472).

98410 When restricting the search to files on one file system, it can sometimes be desirable for the  
 98411 crossing points themselves to be acted on and sometimes for them not to be acted on. (Crossing  
 98412 points are mount points and, if the **-L** option is specified, symbolic links to directories on other  
 98413 file systems.) The **-xdev** primary acts on them and the **-mount** primary does not. However,  
 98414 **-mount** also does not act on symbolic links to non-directory files on other file systems (if **-L**  
 98415 is specified). If there is a need for an application to exclude crossing points but include symbolic  
 98416 links to non-directory files on other file systems, this can be achieved by using two *find*  
 98417 commands as follows:

```
98418 find -L dir -mount -type d -print
98419 find -L dir -xdev ! -type d -print
```

98420 (in a subshell whose output is piped to *sort*, if the order matters).

98421 If both **-mount** and **-xdev** are specified, *find* obeys both primaries but the end result is the same  
 98422 as if **-xdev** were not specified.

98423 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary  
 98424 using the octal number argument form. Since this bit is not defined by this volume of  
 98425 POSIX.1-2024, applications must not assume that it actually refers to the traditional sticky bit.

## 98426 EXAMPLES

98427 1. The following commands are equivalent:

```
98428 find .
98429 find . -print
```

98430 They both write out the entire directory hierarchy from the current directory.

98431 With this output format, if any pathnames include <newline> characters, it is not possible  
 98432 to tell where each pathname begins and ends. This problem can be avoided by omitting  
 98433 such pathnames:

```
98434 LC_ALL=POSIX find . -name $'*\n*' -prune -o -print
```

98435 or by using a sentinel in the pathname that *find* would never otherwise produce, such as:

```
98436 find .//. -print
```

98437 or by using **-print0** instead of **-print** and processing the output with a utility that can  
 98438 accept null-terminated pathnames as input, such as *xargs* with the **-0** option or *read* with  
 98439 **-d ""**, for example:

```
98440 find . -print0 | while IFS= read -rd "" file
98441 do
98442     # process "$file"
98443 done
```

98444 It should be noted that using *find* with **-print0** to pipe input to *xargs* **-r0** is less safe than  
 98445 using *find* with **-exec** because if *find* **-print0** is terminated after it has written a partial  
 98446 pathname, the partial pathname may be processed as if it was a complete pathname.

- 98447 2. The following command:
- ```
98448 find / \( -name tmp -o -name '*.xx' \) ! -type d -mtime +7 \
98449 -exec rm {} +
```
- 98450 removes all files named **tmp** or ending in **.xx** that have not been modified for more than  
98451 seven (that is, eight or more) 24-hour periods.
- 98452 3. The following command:
- ```
98453 find . -perm -o+w,+s
```
- 98454 prints (**-print** is assumed) the names of all files in or below the current directory, with all  
98455 of the file permission bits **S\_ISUID**, **S\_ISGID**, and **S\_IWOTH** set, regardless of the value of  
98456 the file creation mask. (Note that the file creation mask is only specified for the file  
98457 permission bits, and not **S\_ISUID**, **S\_ISGID** or **S\_ISVTX**.)
- 98458 4. The following command:
- ```
98459 find . -perm -+w
```
- 98460 prints (**-print** is assumed) the names of all files in or below the current directory, with  
98461 **S\_IWUSR** set if the file creation mask does not have **S\_IWUSR** set (otherwise the  
98462 **S\_IWUSR** bit is ignored), **S\_IWGRP** set if the file creation mask does not have **S\_IWGRP**  
98463 set (otherwise **S\_IWGRP** is ignored), and **S\_IWOTH** set if the file creation mask does not  
98464 have **S\_IWOTH** set (otherwise **S\_IWOTH** is ignored).
- 98465 5. The following command:
- ```
98466 find . -name SCCS -prune -o -print
```
- 98467 recursively prints pathnames of all files in the current directory and below, but skips  
98468 directories named **SCCS** and files in them.
- 98469 6. The following command:
- ```
98470 find . -print -name SCCS -prune
```
- 98471 behaves as in the previous example, but prints the names of the **SCCS** directories.
- 98472 7. The following command is roughly equivalent to the **-nt** extension to *test*:
- ```
98473 if [ -n "$(find file1 -prune -newer file2)" ]; then
98474     printf %s\\n "file1 is newer than file2"
98475 fi
```
- 98476 8. The descriptions of **-atime**, **-ctime**, and **-mtime** use the terminology *n* “86 400 second  
98477 periods (days)”. For example, a file accessed at 23:59 is selected by:
- ```
98478 find . -atime -1 -print
```
- 98479 at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight  
98480 boundary between days has no effect on the 24-hour calculation.
- 98481 9. The following command:
- ```
98482 find . ! -name . -prune -name '*.old' -exec \
98483     sh -c 'mv "$@" ../old/' sh {} +
```
- 98484 performs the same task as:
- ```
98485 mv /*.old ../old /*.old ../old/
```
- 98486 while avoiding an “Argument list too long” error if there are a large number of files

98487 ending with **.old** and without running *mv* if there are no such files (and avoiding “No  
98488 such file or directory” errors if **.old** does not exist or no files match **/\*.old** or **/\*.old**).

98489 The alternative:

```
98490 find . ! -name . -prune -name '*.old' -exec mv {} ../old/ \;
```

98491 is less efficient if there are many files to move because it executes one *mv* command per  
98492 file.

98493 10. On systems configured to mount removable media on directories under **/media**, the  
98494 following command searches the file hierarchy for files of size larger than 100 000 KiB  
98495 without searching any mounted removable media:

```
98496 find / -path /media -prune -o -size +200000 -print
```

98497 11. Except for the root directory, and **"/"** on implementations where **"/"** does not refer to  
98498 the root directory, no pattern given to **-name** will match a **<slash>**, because trailing  
98499 **<slash>** characters are ignored when computing the basename of the file under  
98500 evaluation. Given two empty directories named **foo** and **bar**, the following command:

```
98501 find foo/// bar/// -name foo -o -name 'bar?*' 
```

98502 prints only the line **foo///**.

#### 98503 RATIONALE

98504 The **-a** operator was retained as an optional operator for compatibility with historical shell  
98505 scripts, even though it is redundant with expression concatenation.

98506 The descriptions of the **'-'** modifier on the *mode* and *onum* arguments to the **-perm** primary  
98507 agree with historical practice on BSD and System V implementations. System V and BSD  
98508 documentation both describe it in terms of checking additional bits; in fact, it uses the same bits,  
98509 but checks for having at least all of the matching bits set instead of having exactly the matching  
98510 bits set.

98511 The exact format of the interactive prompts is unspecified. Only the general nature of the  
98512 contents of prompts are specified because:

- 98513 • Implementations may desire more descriptive prompts than those used on historical  
98514 implementations.
- 98515 • Since the historical prompt strings do not terminate with **<newline>** characters, there is no  
98516 portable way for another program to interact with the prompts of this utility via pipes.

98517 Therefore, an application using this prompting option relies on the system to provide the most  
98518 suitable dialog directly with the user, based on the general guidelines specified.

98519 The **-size** operand refers to the size of a file, rather than the number of blocks it may occupy in  
98520 the file system. The intent is that the *st\_size* field defined in the System Interfaces volume of  
98521 POSIX.1-2024 should be used, not the *st\_blocks* found in historical implementations. There are at  
98522 least two reasons for this:

- 98523 1. In both System V and BSD, *find* only uses *st\_size* in size calculations for the operands  
98524 specified by this volume of POSIX.1-2024. (BSD uses *st\_blocks* only when processing the  
98525 **-ls** primary.)
- 98526 2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls*  
98527 utility for the output from the **-l** option. (In both System V and BSD, *ls* uses *st\_size* for the  
98528 **-l** option size field and uses *st\_blocks* for the *ls -s* calculations. This volume of  
98529 POSIX.1-2024 does not specify *ls -s*.)

98530 The descriptions of **-atime**, **-ctime**, and **-mtime** were changed from the SVID description of *n*  
 98531 ``days'' to *n* being the result of the integer division of the time difference in seconds by 86 400.  
 98532 The description is also different in terms of the exact timeframe for the *n* case (*versus* the *+n* or  
 98533 *-n*), but it matches all known historical implementations. It refers to one 86 400 second period in  
 98534 the past, not any time from the beginning of that period to the current time. For example, **-atime**  
 98535 2 is true if the file was accessed any time in the period from 72 hours to 48 hours ago.

98536 Historical implementations do not modify "{ }" when it appears as a substring of an **-exec** or  
 98537 **-ok utility\_name** or argument string. There have been numerous user requests for this extension,  
 98538 so this volume of POSIX.1-2024 allows the desired behavior. At least one recent implementation  
 98539 does support this feature, but encountered several problems in managing memory allocation  
 98540 and dealing with multiple occurrences of "{ }" in a string while it was being developed, so it is  
 98541 not yet required behavior.

98542 Assuming the presence of **-print** was added to correct a historical pitfall that plagues novice  
 98543 users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest  
 98544 form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers  
 98545 agreed that adding **-print** as a default expression was the correct decision and have added the  
 98546 fast *find* functionality within a new utility called *locate*.

98547 Historically, the **-L** option was implemented using the primary **-follow**. The **-H** and **-L** options  
 98548 were added for two reasons. First, they offer a finer granularity of control and consistency with  
 98549 other programs that walk file hierarchies. Second, the **-follow** primary always evaluated to true.  
 98550 As they were historically really global variables that took effect before the traversal began, some  
 98551 valid expressions had unexpected results. An example is the expression **-print -o -follow**.  
 98552 Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow**  
 98553 would never be evaluated. This was never the case. Historical practice for the **-follow** primary,  
 98554 however, is not consistent. Some implementations always follow symbolic links on the  
 98555 command line whether **-follow** is specified or not. Others follow symbolic links on the  
 98556 command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L**  
 98557 options, but scripts using the current **-follow** primary would be broken if the **-follow** option is  
 98558 specified to work either way.

98559 Since the **-L** option resolves all symbolic links and the **-type l** primary is true for symbolic links  
 98560 that still exist after symbolic links have been resolved, the command:

```
98561 find -L . -type l
```

98562 prints a list of symbolic links reachable from the current directory that do not resolve to  
 98563 accessible files.

98564 A feature of SVR4's *find* utility was the **-exec** primary's + terminator. This allowed filenames  
 98565 containing special characters (especially <newline> characters) to be grouped together without  
 98566 the problems that occur if such filenames are piped to *xargs*.

98567 The "**-exec ... {} +**" syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210.  
 98568 It should be noted that this is an incompatible change to IEEE Std 1003.2-1992. For example, the  
 98569 following command printed all files with a '-' after their name if they are regular files, and a  
 98570 '+' otherwise:

```
98571 find / -type f -exec echo {} - ';' -o -exec echo {} + ';' -
```

98572 The change invalidates usage like this. Even though the previous standard stated that this usage  
 98573 would work, in practice many did not support it and the standard developers felt it better to  
 98574 now state that this was not allowable.

98575 Historically, many *find* implementations supported **-mount** and **-xdev** as synonymous

98576 primaries and earlier versions of this standard only required support for `-xdev`. However, the  
 98577 behavior of `find` with `-xdev` differed from that of the `nftw()` function with `FTW_MOUNT` as  
 98578 regards whether the mount point itself was included or excluded. Therefore the standard now  
 98579 requires support for both primaries with slightly differing behaviors: `-mount` behaves in the  
 98580 manner of `nftw()` with the traditional `FTW_MOUNT` flag, and `-xdev` in the manner of `nftw()`  
 98581 with a new `FTW_XDEV` flag.

#### 98582 FUTURE DIRECTIONS

98583 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 98584 value of a <newline> character when <newline> is a terminator or separator in the output  
 98585 format being used, implementations are encouraged to treat this as an error. A future version of  
 98586 this standard may require implementations to treat this as an error.

#### 98592 CHANGE HISTORY

98593 First released in Issue 2.

#### 98594 Issue 5

98595 The FUTURE DIRECTIONS section is added.

#### 98596 Issue 6

98597 The following new requirements on POSIX implementations derive from alignment with the  
 98598 Single UNIX Specification:

- 98599 • The `-perm [-]onum` primary is supported.

98600 The `find` utility is aligned with the IEEE P1003.2b draft standard, to include processing of  
 98601 symbolic links and changes to the description of the `atime`, `ctime`, and `mtime` operands.

98602 IEEE PASC Interpretation 1003.2 #210 is applied, extending the `-exec` operand.

98603 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/13 is applied, updating the RATIONALE  
 98604 section to be consistent with the normative text.

#### 98605 Issue 7

98606 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
 98607 `LC_MESSAGES` environment variable.

98608 Austin Group Interpretation 1003.1-2001 #127 is applied, rephrasing the description of the `-exec`  
 98609 primary to be “immediately follows”.

98610 Austin Group Interpretation 1003.1-2001 #185 is applied, clarifying the requirements for the `-H`  
 98611 and `-L` options.

98612 Austin Group Interpretation 1003.1-2001 #186 is applied, clarifying the requirements for the  
 98613 evaluation of `path` operands.

98614 Austin Group Interpretation 1003.1-2001 #195 is applied, clarifying the interpretation of the first  
 98615 operand.

98616 SD5-XCU-ERN-48 is applied, clarifying the `-L` option in the case that the referenced file does not  
 98617 exist.

98618 SD5-XCU-ERN-89 is applied, updating the OPERANDS section.

- 98619 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 98620 SD5-XCU-ERN-117 is applied, clarifying the **-perm** operand.
- 98621 SD5-XCU-ERN-122 is applied, adding a new EXAMPLE.
- 98622 The description of the **-name** primary is revised and the **-path** primary is added (with a new  
98623 example).
- 98624 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0086 [365], XCU/TC1-2008/0087  
98625 [310], XCU/TC1-2008/0088 [309,310,430], XCU/TC1-2008/0089 [235], and XCU/TC1-2008/0090  
98626 [445] are applied.
- 98627 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0099 [584], XCU/TC2-2008/0100  
98628 [584], and XCU/TC2-2008/0101 [584] are applied.
- 98629 **Issue 8**
- 98630 Austin Group Defect 243 is applied, adding the **-print0** primary.
- 98631 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
98632 directed to display a pathname that contains any bytes that have the encoded value of a  
98633 <newline> character when <newline> is a terminator or separator in the output format being  
98634 used.
- 98635 Austin Group Defect 1031 is applied, adding the **-iname** primary.
- 98636 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 98637 Austin Group Defect 1133 is applied, adding the **-mount** primary.
- 98638 Austin Group Defects 1259 and 1777 are applied, changing the EXAMPLES section.
- 98639 Austin Group Defect 1392 is applied, changing the effect of the file creation mask on the *mode*  
98640 argument for the **-perm** primary to be consistent with *chmod*.
- 98641 Austin Group Defect 1501 is applied, changing the EXIT STATUS section.
- 98642 Austin Group Defect 1553 is applied, changing the ENVIRONMENT VARIABLES section.
- 98643 Austin Group Defect 1554 is applied, changing the RATIONALE section.
- 98644 Austin Group Defect 1606 is applied, clarifying that if *find* detects an infinite loop and recovers  
98645 its position, the final exit status is non-zero.
- 98646 Austin Group Defect 1776 is applied, clarifying how symbolic links are handled by the **-newer**  
98647 *file* primary.

98648 **NAME**

98649 fold — filter for folding lines

98650 **SYNOPSIS**98651 fold [-bs] [-w *width*] [*file...*]98652 **DESCRIPTION**

98653 The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a  
 98654 maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be  
 98655 broken by the insertion of a <newline> such that each output line (referred to later in this section  
 98656 as a *segment*) is the maximum width possible that does not exceed the specified number of  
 98657 column positions (or bytes). A line shall not be broken in the middle of a character. The behavior  
 98658 is undefined if *width* is less than the number of columns any single character in the input would  
 98659 occupy.

98660 If the <carriage-return>, <backspace>, or <tab> characters are encountered in the input, and the  
 98661 **-b** option is not specified, they shall be treated specially:

98662 <backspace> The current count of line width shall be decremented by one, although the count  
 98663 never shall become negative. The *fold* utility shall not insert a <newline>  
 98664 immediately before or after any <backspace>, unless the following character has a  
 98665 width greater than 1 and would cause the line width to exceed *width*.

98666 <carriage-return>  
 98667 The current count of line width shall be set to zero. The *fold* utility shall not insert a  
 98668 <newline> immediately before or after any <carriage-return>.

98669 <tab> Each <tab> encountered shall advance the column position pointer to the next tab  
 98670 stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

98671 **OPTIONS**98672 The *fold* utility shall conform to XBD [Section 12.2](#) (on page 215).

98673 The following options shall be supported:

98674 **-b** Count *width* in bytes rather than column positions.

98675 **-s** If a segment of a line contains a <blank> within the first *width* column positions (or  
 98676 bytes), break the line after the last such <blank> meeting the width constraints. If  
 98677 there is no <blank> meeting the requirements, the **-s** option shall have no effect for  
 98678 that output segment of the input line.

98679 **-w *width*** Specify the maximum line length, in column positions (or bytes if **-b** is specified).  
 98680 The results are unspecified if *width* is not a positive decimal number. The default  
 98681 value shall be 80.

98682 **OPERANDS**

98683 The following operand shall be supported:

98684 *file* A pathname of a text file to be folded. If no *file* operands are specified, the standard  
 98685 input shall be used.

98686 **STDIN**

98687 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 98688 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 98689 the standard input shall not be used. See the INPUT FILES section.

98690 **INPUT FILES**

98691 If the **-b** option is specified, the input files shall be text files except that the lines are not limited  
98692 to {LINE\_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

98693 **ENVIRONMENT VARIABLES**

98694 The following environment variables shall affect the execution of *fold*:

98695 **LANG** Provide a default value for the internationalization variables that are unset or null.  
98696 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
98697 variables used to determine the values of locale categories.)

98698 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
98699 internationalization variables.

98700 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
98701 characters (for example, single-byte as opposed to multi-byte characters in  
98702 arguments and input files), and for the determination of the width in column  
98703 positions each character would occupy on a constant-width font output device.

98704 **LC\_MESSAGES**

98705 Determine the locale that should be used to affect the format and contents of  
98706 diagnostic messages written to standard error.

98707 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

98708 **ASYNCHRONOUS EVENTS**

98709 Default.

98710 **STDOUT**

98711 The standard output shall be a file containing a sequence of characters whose order shall be  
98712 preserved from the input files, possibly with inserted <newline> characters.

98713 **STDERR**

98714 The standard error shall be used only for diagnostic messages.

98715 **OUTPUT FILES**

98716 None.

98717 **EXTENDED DESCRIPTION**

98718 None.

98719 **EXIT STATUS**

98720 The following exit values shall be returned:

98721 0 All input files were processed successfully.

98722 >0 An error occurred.

98723 **CONSEQUENCES OF ERRORS**

98724 Default.

**98725 APPLICATION USAGE**

98726 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
98727 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
98728 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

98729 The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines  
98730 wider than the printer is able to print (usually 80 or 132 column positions).

**98731 EXAMPLES**

98732 An example invocation that submits a file of possibly long lines to the printer (under the  
98733 assumption that the user knows the line width of the printer to be assigned by *lp*):

```
98734 fold -w 132 bigfile | lp
```

**98735 RATIONALE**

98736 Although terminal input in canonical processing mode requires the erase character (frequently  
98737 set to <backspace>) to erase the previous character (not byte or column position), terminal  
98738 output is not buffered and is extremely difficult, if not impossible, to parse correctly; the  
98739 interpretation depends entirely on the physical device that actually displays/prints/stores the  
98740 output. In all known internationalized implementations, the utilities producing output for  
98741 mixed column-width output assume that a <backspace> character backs up one column position  
98742 and outputs enough <backspace> characters to return to the start of the character when  
98743 <backspace> is used to provide local line motions to support underlining and boldening  
98744 operations. Since *fold* without the **-b** option is dealing with these same constraints, <backspace>  
98745 is always treated as backing up one column position rather than backing up one character.

98746 Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column  
98747 position when written out. This is no longer always true. Since the most common usage of *fold* is  
98748 believed to be folding long lines for output to limited-length output devices, this capability was  
98749 preserved as the default case. The **-b** option was added so that applications could *fold* files with  
98750 arbitrary length lines into text files that could then be processed by the standard utilities. Note  
98751 that although the width for the **-b** option is in bytes, a line is never split in the middle of a  
98752 character. (It is unspecified what happens if a width is specified that is too small to hold a single  
98753 character found in the input followed by a <newline>.)

98754 The tab stops are hardcoded to be every eighth column to meet historical practice. No new  
98755 method of specifying other tab stops was invented.

**98756 FUTURE DIRECTIONS**

98757 None.

**98758 SEE ALSO**

98759 *cut*

98760 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**98761 CHANGE HISTORY**

98762 First released in Issue 4.

**98763 Issue 6**

98764 The normative text is reworded to avoid use of the term “must” for application requirements.

**98765 Issue 7**

98766 Austin Group Interpretation 1003.1-2001 #092 is applied.

- 98767 Austin Group Interpretation 1003.1-2001 #204 is applied, updating the DESCRIPTION to clarify  
98768 when a <newline> can be inserted before or after a <backspace>.
- 98769 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 98770 **Issue 8**  
98771 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

98772 **NAME**

98773 fuser — list process IDs of all processes that are using one or more named files

98774 **SYNOPSIS**98775 XSI `fuser [-cfu] file...`98776 **DESCRIPTION**

98777 For each *file* operand, in order, *fuser* shall write one line of output, some of it to standard output,  
 98778 and the rest to standard error, giving information about processes running on the local system  
 98779 that are using the file. A process shall be considered to be using a file if it has at least one open  
 98780 file descriptor associated with the file or if the file is a directory that is the current working  
 98781 directory or the root directory for the process, and may be considered to be using a file for other  
 98782 implementation-dependent reasons. If *file* names a block special device that contains a mounted  
 98783 file system, and the `-f` option is not specified, any processes using any file on that mounted file  
 98784 system and any processes that are using the device file itself shall be listed.

98785 Any output for processes running on remote systems that are using a named file is unspecified.

98786 A user may need appropriate privileges to invoke the *fuser* utility.

98787 When standard output and standard error are directed to the same file, the output for each *file*  
 98788 operand shall be interleaved so that it is written to the file in the following order:

- 98789 • On standard error, a pathname for the file, immediately followed by a <colon> and zero or  
 98790 more <blank> characters. The pathname shall be either the file operand (unaltered) or the  
 98791 pathname that would result from a successful call to the *realpath()* function, defined in the  
 98792 System Interfaces volume of POSIX.1-2024, with the *file* operand as its *file\_name* argument.

- 98793 • For each process using the file:

- 98794 — On standard output, the process ID in the format:

98795 " %1d", <process ID>

- 98796 — On standard error, information about the file's use by the process, in the following  
 98797 format:

98798 "%s", <use chars>

98799 if the `-u` option is not specified, or in the following format:

98800 "%s(%s)", <use chars>, <user name>

98801 if the `-u` option is specified, where <use chars> is a string of zero or more characters  
 98802 indicating the use of the file and <user name> is the user name corresponding to the  
 98803 real user ID of the process or, if the user name cannot be resolved from the real user  
 98804 ID of the process, the real user ID of the process in decimal. The value of <use chars>  
 98805 shall include the character 'c' if the process is using the file as its current directory  
 98806 and the character 'r' if the process is using the file as its root directory;  
 98807 implementations may include other alphabetic characters to indicate other uses of  
 98808 the file.

- 98809 • On standard error, a <newline> character.

98810 When standard output and standard error are not directed to the same file, the data written to  
 98811 each shall be as described above but the ordering of writes to standard output relative to writes  
 98812 to standard error is unspecified. For example, *fuser* might first write the information for all file  
 98813 operands to standard error and then write all of the process IDs to standard output.

98814 **OPTIONS**98815 The *fuser* utility shall conform to XBD [Section 12.2](#) (on page 215).

98816 The following options shall be supported:

98817 **-c** If a *file* operand names a directory that is the mount point of a mounted file system,  
98818 all processes using any file on that file system shall be listed as if they were using  
98819 the named directory. The behavior for any *file* operand that names an existing file  
98820 that is not the mount point of a mounted file system is unspecified.98821 **-f** The report shall be only for the named files.98822 **-u** The user name, in parentheses, associated with each process ID written to standard  
98823 output shall be written to standard error.98824 **OPERANDS**

98825 The following operand shall be supported:

98826 *file* A pathname of a file for which the processes using the file are to be reported.98827 **STDIN**

98828 Not used.

98829 **INPUT FILES**

98830 The user database.

98831 **ENVIRONMENT VARIABLES**98832 The following environment variables shall affect the execution of *fuser*:98833 *LANG* Provide a default value for the internationalization variables that are unset or null.  
98834 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
98835 variables used to determine the values of locale categories.)98836 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
98837 internationalization variables.98838 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
98839 characters (for example, single-byte as opposed to multi-byte characters in  
98840 arguments).98841 *LC\_MESSAGES*98842 Determine the locale that should be used to affect the format and contents of  
98843 diagnostic messages written to standard error.98844 *NLSPATH* Determine the location of messages objects and message catalogs.98845 **ASYNCHRONOUS EVENTS**

98846 Default.

98847 **STDOUT**

98848 See DESCRIPTION.

98849 **STDERR**98850 The *fuser* utility shall write diagnostic messages to standard error.98851 The *fuser* utility also shall write information to standard error as specified in the DESCRIPTION  
98852 section.

98853 **OUTPUT FILES**

98854 None.

98855 **EXTENDED DESCRIPTION**

98856 None.

98857 **EXIT STATUS**

98858 The following exit values shall be returned:

98859 0 Successful completion.

98860 &gt;0 An error occurred.

98861 **CONSEQUENCES OF ERRORS**

98862 Default.

98863 **APPLICATION USAGE**98864 Things can change while *fuser* is running; the snapshot it gives is only true for an instant, and  
98865 might not be accurate by the time it is displayed.98866 **EXAMPLES**

98867 The command:

98868 `fuser -fu .`98869 writes to standard output the process IDs of processes that are using the current directory and  
98870 writes to standard error an indication of how those processes are using the directory and the  
98871 user names associated with the processes that are using the current directory.98872 `fuser -c <mount point>`98873 writes to standard output the process IDs of processes that are using any file in the file system  
98874 which is mounted on *<mount point>* and writes to standard error an indication of how those  
98875 processes are using the files.98876 `fuser <mount point>`98877 writes to standard output the process IDs of processes that are using the file which is named by  
98878 *<mount point>* and writes to standard error an indication of how those processes are using the  
98879 file.98880 `fuser <mounted block device>`98881 writes to standard output the process IDs of processes that are using any file on the mounted file  
98882 system contained by *<mounted block device>* and of processes that are using the device file  
98883 *<mounted block device>* itself, and writes to standard error an indication of how those processes  
98884 are using the files.98885 `fuser -f <mounted block device>`98886 writes to standard output the process IDs of processes that are using the file *<mounted block  
98887 device>* itself and writes to standard error an indication of how those processes are using the file.98888 **RATIONALE**98889 The definition of the *fuser* utility follows existing practice.98890 **FUTURE DIRECTIONS**98891 If this utility is directed to display a pathname that contains any bytes that have the encoded  
98892 value of a *<newline>* character when *<newline>* is a terminator or separator in the output  
98893 format being used, implementations are encouraged to treat this as an error. A future version of  
98894 this standard may require implementations to treat this as an error.

98895 **SEE ALSO**

98896 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

98897 **CHANGE HISTORY**

98898 First released in Issue 5.

98899 **Issue 7**

98900 SD5-XCU-ERN-90 is applied, updating the EXAMPLES section.

98901 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

98902 **Issue 8**

98903 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
98904 directed to display a pathname that contains any bytes that have the encoded value of a  
98905 <newline> character when <newline> is a terminator or separator in the output format being  
98906 used.

98907 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

98908 Austin Group Defect 1746 is applied, clarifying the output written to standard output and  
98909 standard error.

98910 **NAME**

98911 gencat — generate a formatted message catalog

98912 **SYNOPSIS**98913 gencat *catfile* *msgfile*...98914 **DESCRIPTION**

98915 The *gencat* utility shall merge the message text source file *msgfile* into a formatted message  
 98916 catalog *catfile*. The file *catfile* shall be created if it does not already exist. If *catfile* does exist, its  
 98917 messages shall be included in the new *catfile*. If set and message numbers collide, the new  
 98918 message text defined in *msgfile* shall replace the old message text currently contained in *catfile*.

98919 **OPTIONS**

98920 None.

98921 **OPERANDS**

98922 The following operands shall be supported:

98923 *catfile* A pathname of the formatted message catalog. If '-' is specified, standard output  
 98924 shall be used. The format of the message catalog produced is unspecified.

98925 *msgfile* A pathname of a message text source file. If '-' is specified for an instance of  
 98926 *msgfile*, standard input shall be used. The format of message text source files is  
 98927 defined in the EXTENDED DESCRIPTION section.

98928 **STDIN**98929 The standard input shall not be used unless a *msgfile* operand is specified as '-'.98930 **INPUT FILES**

98931 The input files shall be text files.

98932 **ENVIRONMENT VARIABLES**98933 The following environment variables shall affect the execution of *gencat*:

98934 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 98935 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 98936 variables used to determine the values of locale categories.)

98937 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 98938 internationalization variables.

98939 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 98940 characters (for example, single-byte as opposed to multi-byte characters in  
 98941 arguments and input files).

98942 *LC\_MESSAGES*

98943 Determine the locale that should be used to affect the format and contents of  
 98944 diagnostic messages written to standard error.

98945 XSI *NLSPATH* Determine the location of messages objects and message catalogs.98946 **ASYNCHRONOUS EVENTS**

98947 Default.

98948 **STDOUT**98949 The standard output shall not be used unless the *catfile* operand is specified as '-'.

98950 **STDERR**

98951 The standard error shall be used only for diagnostic messages.

98952 **OUTPUT FILES**

98953 None.

98954 **EXTENDED DESCRIPTION**98955 The content of a message text file shall be in the format defined as follows. Note that the fields of  
98956 a message text source line are separated by a single <blank> character. Any other <blank>  
98957 characters are considered to be part of the subsequent field.98958 **\$set** *n comment*98959 This line specifies the set identifier of the following messages until the next **\$set** or  
98960 end-of-file appears. The *n* denotes the set identifier, which is defined as a number  
98961 in the range [1, {NL\_SETMAX}] (see the <limits.h> header defined in the Base  
98962 Definitions volume of POSIX.1-2024). The application shall ensure that set  
98963 identifiers are presented in ascending order within a single source file, but need  
98964 not be contiguous. Any string following the set identifier shall be treated as a  
98965 comment. If no **\$set** directive is specified in a message text source file, all messages  
98966 shall be located in an implementation-defined default message set NL\_SETD (see  
98967 the <nl\_types.h> header defined in the Base Definitions volume of POSIX.1-2024).98968 **\$delset** *n comment*98969 This line deletes message set *n* from an existing message catalog. The *n* denotes the  
98970 set number [1, {NL\_SETMAX}]. Any string following the set number shall be  
98971 treated as a comment.98972 **\$ comment** A line beginning with '\$' followed by a <blank> shall be treated as a comment.98973 *m message-text*98974 The *m* denotes the message identifier, which is defined as a number in the range [1,  
98975 {NL\_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the  
98976 message catalog with the set identifier specified by the last **\$set** directive, and with  
98977 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is  
98978 present, an empty string shall be stored in the message catalog. If a message source  
98979 line has a message number, but neither a field separator nor *message-text*, the  
98980 existing message with that number (if any) shall be deleted from the catalog. The  
98981 application shall ensure that message identifiers are in ascending order within a  
98982 single set, but need not be contiguous. The application shall ensure that the length  
98983 of *message-text* is in the range [0, {NL\_TEXTMAX}] (see the <limits.h> header).98984 **\$quote** *c* This line specifies an optional quote character *c*, which can be used to surround  
98985 *message-text* so that trailing <space> characters or null (empty) messages are visible  
98986 in a message source line. By default, or if an empty **\$quote** directive is supplied, no  
98987 quoting of *message-text* shall be recognized.98988 Empty lines in a message text source file shall be ignored. The effects of lines starting with any  
98989 character other than those defined above are implementation-defined.98990 Text strings can contain the special characters and escape sequences defined in the following  
98991 table:

|       | Description       | Symbol | Sequence |
|-------|-------------------|--------|----------|
| 98992 | <newline>         | NL(LF) | \n       |
| 98993 | Horizontal-tab    | HT     | \t       |
| 98994 | <vertical-tab>    | VT     | \v       |
| 98995 | <backspace>       | BS     | \b       |
| 98996 | <carriage-return> | CR     | \r       |
| 98997 | <form-feed>       | FF     | \f       |
| 98998 | Backslash         | \      | \\       |
| 98999 | Bit pattern       | ddd    | \ddd     |
| 99000 |                   |        |          |

99001 The escape sequence "\ddd" consists of <backslash> followed by one, two, or three octal digits,  
 99002 which shall be taken to specify the value of the desired character. If the character following a  
 99003 <backslash> is not one of those specified, the <backslash> shall be ignored.

99004 A <backslash> followed by a <newline> is also used to continue a string on the following line.  
 99005 Thus, the following two lines describe a single message string:

```
99006 1 This line continues \  

  99007 to the next line
```

99008 which shall be equivalent to:

```
99009 1 This line continues to the next line
```

#### 99010 EXIT STATUS

99011 The following exit values shall be returned:

99012 0 Successful completion.

99013 >0 An error occurred.

#### 99014 CONSEQUENCES OF ERRORS

99015 Default.

#### 99016 APPLICATION USAGE

99017 Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot  
 99018 be guaranteed between different types of machine. Thus, just as C programs need to be  
 99019 recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

#### 99020 EXAMPLES

99021 None.

#### 99022 RATIONALE

99023 None.

#### 99024 FUTURE DIRECTIONS

99025 None.

#### 99026 SEE ALSO

99028 XBD Chapter 8 (on page 167), [<limits.h>](#), [<nl\\_types.h>](#)

#### 99029 CHANGE HISTORY

99030 First released in Issue 3.

#### 99031 Issue 6

99032 The normative text is reworded to avoid use of the term “must” for application requirements.

99033 **Issue 7**

99034 The *gencat* utility is moved from the XSI option to the Base.

99035 **Issue 8**

99036 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

99037 Austin Group Defect 1463 is applied, changing *n* to *c* in the definition of **\$quote**.

99038 Austin Group Defect 1516 is applied, adding XSI shading to text relating to *NLSPATH*.

99039 **NAME**99040 get — get a version of an SCCS file (**DEVELOPMENT**)99041 **SYNOPSIS**99042 XSI `get [-begkmlLpst] [-c cutoff] [-i list] [-r SID] [-x list] file...`99043 **DESCRIPTION**99044 The *get* utility shall generate a text file from each named SCCS *file* according to the specifications  
99045 given by its options.99046 The generated text shall normally be written into a file called the **g-file** whose name is derived  
99047 from the SCCS filename by simply removing the leading "s.". 99048 **OPTIONS**99049 The *get* utility shall conform to XBD [Section 12.2](#) (on page 215).

99050 The following options shall be supported:

99051 **-r** *SID* Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file  
99052 to be retrieved. The table shows, for the most useful cases, what version of an  
99053 SCCS file is retrieved (as well as the SID of the version to be eventually created by  
99054 *delta* if the **-e** option is also used), as a function of the SID specified.99055 **-c** *cutoff* Indicate the *cutoff* date-time, in the form:99056 `YY[MM[DD[HH[MM[SS]]]]]`99057 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
99058 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.99059 **Note:** It is expected that in a future version of this standard the default century inferred  
99060 from a 2-digit year will change. (This would apply to all commands accepting a  
99061 2-digit year as input.)99062 No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
99063 date-time shall be included in the generated text file. Units omitted from the date-  
99064 time default to their maximum possible values; for example, **-c** 7502 is equivalent  
99065 to **-c** 750228235959.99066 Any number of non-numeric characters may separate the various 2-digit pieces of  
99067 the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:  
99068 **-c** "77/2/2 9:22:25".99069 **-e** Indicate that the *get* is for the purpose of editing or making a change (delta) to the  
99070 SCCS file via a subsequent use of *delta*. The **-e** option used in a *get* for a particular  
99071 version (SID) of the SCCS file shall prevent further *get* commands from editing on  
99072 the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.  
99073 Concurrent use of *get* **-e** for different SIDs is always allowed.99074 If the **g-file** generated by *get* with a **-e** option is accidentally ruined in the process  
99075 of editing, it may be regenerated by re-executing the *get* command with the **-k**  
99076 option in place of the **-e** option.99077 SCCS file protection specified via the ceiling, floor, and authorized user list stored  
99078 in the SCCS file shall be enforced when the **-e** option is used.99079 **-b** Use with the **-e** option to indicate that the new delta should have an SID in a new  
99080 branch as shown in the table below. This option shall be ignored if the **b** flag is not  
99081 present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that  
99082 has no successors on the SCCS file tree.)

- 99083                   **Note:**       A branch delta may always be created from a non-leaf delta.
- 99084           **-i list**       Indicate a *list* of deltas to be included (forced to be applied) in the creation of the  
99085                   generated file. The *list* has the following syntax:
- 99086                   <list> ::= <range> | <list> , <range>  
99087                   <range> ::= SID | SID - SID
- 99088                   SID, the SCCS Identification of a delta, may be in any form shown in the "SID  
99089                   Specified" column of the table in the EXTENDED DESCRIPTION section, except  
99090                   that the result of supplying a partial SID is unspecified. A diagnostic message shall  
99091                   be written if the first SID in the range is not an ancestor of the second SID in the  
99092                   range.
- 99093           **-x list**       Indicate a *list* of deltas to be excluded (forced not to be applied) in the creation of  
99094                   the generated file. See the **-i** option for the *list* format.
- 99095           **-k**           Suppress replacement of identification keywords (see below) in the retrieved text  
99096                   by their value. The **-k** option shall be implied by the **-e** option.
- 99097           **-l**           Write a delta summary into an **l-file**.
- 99098           **-L**           Write a delta summary to standard output. All informative output that normally is  
99099                   written to standard output shall be written to standard error instead, unless the **-s**  
99100                   option is used, in which case it shall be suppressed.
- 99101           **-p**           Write the text retrieved from the SCCS file to the standard output. No **g-file** shall  
99102                   be created. All informative output that normally goes to the standard output shall  
99103                   go to standard error instead, unless the **-s** option is used, in which case it shall  
99104                   disappear.
- 99105           **-s**           Suppress all informative output normally written to standard output. However,  
99106                   fatal error messages (which shall always be written to the standard error) shall  
99107                   remain unaffected.
- 99108           **-m**           Precede each text line retrieved from the SCCS file by the SID of the delta that  
99109                   inserted the text line in the SCCS file. The format shall be:
- 99110                   "%s\t%s", <SID>, <text line>
- 99111           **-n**           Precede each generated text line with the %M% identification keyword value (see  
99112                   below). The format shall be:
- 99113                   "%s\t%s", <%M% value>, <text line>
- 99114                   When both the **-m** and **-n** options are used, the <text line> shall be replaced by the  
99115                   **-m** option-generated format.
- 99116           **-g**           Suppress the actual retrieval of text from the SCCS file. It is primarily used to  
99117                   generate an **l-file**, or to verify the existence of a particular SID.
- 99118           **-t**           Use to access the most recently created (top) delta in a given release (for example,  
99119                   **-r 1**), or release and level (for example, **-r 1.2**).

99120 **OPERANDS**

99121 The following operands shall be supported:

99122 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get*  
 99123 utility shall behave as though each file in the directory were specified as a named  
 99124 file, except that non-SCCS files (last component of the pathname does not begin  
 99125 with **s**.) and unreadable files shall be silently ignored.

99126 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 99127 each line of the standard input is taken to be the name of an SCCS file to be  
 99128 processed. Non-SCCS files and unreadable files shall be silently ignored.

99129 **STDIN**

99130 The standard input shall be a text file used only if the *file* operand is specified as **'-'**. Each line  
 99131 of the text file shall be interpreted as an SCCS pathname.

99132 **INPUT FILES**

99133 The SCCS files shall be files of an unspecified format.

99134 **ENVIRONMENT VARIABLES**99135 The following environment variables shall affect the execution of *get*:

99136 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 99137 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 99138 variables used to determine the values of locale categories.)

99139 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 99140 internationalization variables.

99141 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99142 characters (for example, single-byte as opposed to multi-byte characters in  
 99143 arguments and input files).

99144 *LC\_MESSAGES*

99145 Determine the locale that should be used to affect the format and contents of  
 99146 diagnostic messages written to standard error, and informative messages written  
 99147 to standard output (or standard error, if the **-p** option is used).

99148 *NLSPATH* Determine the location of messages objects and message catalogs.

99149 *TZ* Determine the timezone in which the times and dates written in the SCCS file are  
 99150 evaluated. If the *TZ* variable is unset or NULL, an unspecified system default  
 99151 timezone is used.

99152 **ASYNCHRONOUS EVENTS**

99153 Default.

99154 **STDOUT**

99155 For each file processed, *get* shall write to standard output the SID being accessed and the  
 99156 number of lines retrieved from the SCCS file, in the following format:

99157 "%s\n%d lines\n", &lt;SID&gt;, &lt;number of lines&gt;

99158 If the **-e** option is used, the SID of the delta to be made shall appear after the SID accessed and  
 99159 before the number of lines generated, in the POSIX locale:

99160 "%s\nnew delta %s\n%d lines\n", <SID accessed>,  
 99161 <SID to be made>, <number of lines>

99162 If there is more than one named file or if a directory or standard input is named, each pathname

99163 shall be written before each of the lines shown in one of the preceding formats:

99164 `"\n%s:\n", <pathname>`

99165 If the `-L` option is used, a delta summary shall be written following the format specified below  
99166 for **l-files**.

99167 If the `-i` option is used, included deltas shall be listed following the notation, in the POSIX  
99168 locale:

99169 `"Included:\n"`

99170 If the `-x` option is used, excluded deltas shall be listed following the notation, in the POSIX  
99171 locale:

99172 `"Excluded:\n"`

99173 If the `-p` or `-L` options are specified, the standard output shall consist of the text retrieved from  
99174 the SCCS file.

#### 99175 **STDERR**

99176 The standard error shall be used only for diagnostic messages, except if the `-p` or `-L` options are  
99177 specified, it shall include all informative messages normally sent to standard output.

#### 99178 **OUTPUT FILES**

99179 Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-**  
99180 **file**, **p-file**, and **z-file**. The letter before the <hyphen-minus> is called the *tag*. An auxiliary  
99181 filename shall be formed from the SCCS filename: the application shall ensure that the last  
99182 component of all SCCS filenames is of the form *s.module-name*; the auxiliary files shall be named  
99183 by replacing the leading *s* with the tag. The **g-file** shall be an exception to this scheme: the **g-file**  
99184 is named by removing the *s*. prefix. For example, for *s.xyz.c*, the auxiliary filenames would be  
99185 *xyz.c*, *l.xyz.c*, *p.xyz.c*, and *z.xyz.c*, respectively.

99186 The **g-file**, which contains the generated text, shall be created in the current directory (unless the  
99187 `-p` option is used). A **g-file** shall be created in all cases, whether or not any lines of text were  
99188 generated by the *get*. It shall be owned by the real user. If the `-k` option is used or implied, the  
99189 **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be  
99190 read-only. Only the real user need have write permission in the current directory.

99191 The **l-file** shall contain a table showing which deltas were applied in generating the retrieved  
99192 text. The **l-file** shall be created in the current directory if the `-l` option is used; it shall be read-  
99193 only and it is owned by the real user. Only the real user need have write permission in the  
99194 current directory.

99195 Lines in the **l-file** shall have the following format:

99196 `"%c%c%cΔ%s\t%sΔ%s\n", <code1>, <code2>, <code3>,  
99197 <SID>, <date-time>, <login>`

99198 where the entries are:

99199 `<code1>` A <space> if the delta was applied; ' \* ' otherwise.

99200 `<code2>` A <space> if the delta was applied or was not applied and ignored; ' \* ' if the delta  
99201 was not applied and was not ignored.

99202 `<code3>` A character indicating a special reason why the delta was or was not applied:

99203 **I** Included.

99204 X Excluded.

99205 C Cut off (by a `-c` option).

99206 `<date-time>` Date and time (using the format of the `date` utility's `%Y/%m/%d %T` conversion  
99207 specification format) of creation.

99208 `<login>` Login name of person who created `delta`.

99209 The comments and MR data shall follow on subsequent lines, indented one `<tab>`. A blank line  
99210 shall terminate each entry.

99211 The **p-file** shall be used to pass information resulting from a `get` with a `-e` option along to `delta`.  
99212 Its contents shall also be used to prevent a subsequent execution of `get` with a `-e` option for the  
99213 same SID until `delta` is executed or the joint edit flag, `j`, is set in the SCCS file. The **p-file** shall be  
99214 created in the directory containing the SCCS file and the application shall ensure that the  
99215 effective user has write permission in that directory. It shall be writable by owner only, and  
99216 owned by the effective user. Each line in the **p-file** shall have the following format:

99217 `"%sΔ%sΔ%sΔ%s%s%s\n", <g-file SID>,  
99218 <SID of new delta>, <login-name of real user>,  
99219 <date-time>, <i-value>, <x-value>`

99220 where `<i-value>` uses the format " " if no `-i` option was specified, and shall use the format:

99221 `"Δ-i%s", <-i option option-argument>`

99222 if a `-i` option was specified and `<x-value>` uses the format " " if no `-x` option was specified, and  
99223 shall use the format:

99224 `"Δ-x%s", <-x option option-argument>`

99225 if a `-x` option was specified. There can be an arbitrary number of lines in the **p-file** at any time;  
99226 no two lines shall have the same new delta SID.

99227 The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall  
99228 be the binary process ID of the command (that is, `get`) that created it. The **z-file** shall be created  
99229 in the directory containing the SCCS file for the duration of `get`. The same protection restrictions  
99230 as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.

## 99231 EXTENDED DESCRIPTION

| Determination of SCCS Identification String |                    |                  |                                             |                            |                |

| 99238                                       | R                  | no               | R = mR                                      | mR.mL                      | mR.(mL+1)      |
| 99239                                       | R                  | yes              | R > mR                                      | mR.mL                      | mR.mL.(mB+1).1 |
| 99240                                       | R                  | yes              | R = mR                                      | mR.mL                      | mR.mL.(mB+1).1 |
| 99241                                       | R                  | -                | R < mR and R does not exist                 | hR.mL**                    | hR.mL.(mB+1).1 |
| 99242                                       |                    |                  |                                             |                            |                |
| 99243                                       | R                  | -                | Trunk successor in release > R and R exists | R.mL                       | R.mL.(mB+1).1  |
| 99244                                       |                    |                  |                                             |                            |                |
| 99245                                       | R.L                | no               | No trunk successor                          | R.L                        | R.(L+1)        |
| 99246                                       | R.L                | yes              | No trunk successor                          | R.L                        | R.L.(mB+1).1   |
| 99247                                       | R.L                | -                | Trunk successor in release ≥ R              | R.L                        | R.L.(mB+1).1   |
| 99248                                       |                    |                  |                                             |                            |                |
| 99249                                       | R.L.B              | no               | No branch successor                         | R.L.B.mS                   | R.L.B.(mS+1)   |
| 99250                                       | R.L.B              | yes              | No branch successor                         | R.L.B.mS                   | R.L.(mB+1).1   |
| 99251                                       | R.L.B.S            | no               | No branch successor                         | R.L.B.S                    | R.L.B.(S+1)    |
| 99252                                       | R.L.B.S            | yes              | No branch successor                         | R.L.B.S                    | R.L.(mB+1).1   |
| 99253                                       | R.L.B.S            | -                | Branch successor                            | R.L.B.S                    | R.L.(mB+1).1   |

99254 \* R, L, B, and S are the release, level, branch, and sequence components of the SID,  
 99255 respectively; m means maximum. Thus, for example, R.mL means “the maximum level  
 99256 number within release R”; R.L.(mB+1).1 means “the first sequence number on the new  
 99257 branch (that is, maximum branch number plus one) of level L within release R”. Note  
 99258 that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified  
 99259 components shall exist.

99260 \*\* hR is the highest existing release that is lower than the specified, nonexistent, release R.

99261 \*\*\* This is used to force creation of the first delta in a new release.

99262 † The -b option is effective only if the b flag is present in the file. An entry of ‘-’ means  
 99263 “irrelevant”.

99264 ‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is  
 99265 present in the file, then the SID obtained from the d flag is interpreted as if it had been  
 99266 specified on the command line. Thus, one of the other cases in this table applies.

99267 **System Date and Time**

99268 When a **g-file** is generated, the creation time of deltas in the SCCS file may be taken into  
 99269 account. If any of these times are apparently in the future, the behavior is unspecified.

99270 **Identification Keywords**

99271 Identifying information shall be inserted into the text retrieved from the SCCS file by replacing  
 99272 identification keywords with their value wherever they occur. The following keywords may be  
 99273 used in the text stored in an SCCS file:

99274 **%M%** Module name: either the value of the **m** flag in the file, or if absent, the name of the  
 99275 SCCS file with the leading **s.** removed.

99276 **%I%** SCCS identification (SID) (**%R%.%L%** or **%R%.%L%.%B%.%S%**) of the retrieved  
 99277 text.

99278 **%R%** Release.

99279 **%L%** Level.

99280 **%B%** Branch.

99281 **%S%** Sequence.

99282 **%D%** Current date (*YY/MM/DD*).

99283 **%H%** Current date (*MM/DD/YY*).

99284 **%T%** Current time (*HH:MM:SS*).

99285 **%E%** Date newest applied delta was created (*YY/MM/DD*).

99286 **%G%** Date newest applied delta was created (*MM/DD/YY*).

99287 **%U%** Time newest applied delta was created (*HH:MM:SS*).

99288 **%Y%** Module type: value of the **t** flag in the SCCS file.

99289 **%F%** SCCS filename.

99290 **%P%** SCCS absolute pathname.

99291 **%Q%** The value of the **q** flag in the file.

99292 **%C%** Current line number. This keyword is intended for identifying messages output by  
 99293 the program, such as "this should not have happened" type errors. It is not  
 99294 intended to be used on every line to provide sequence numbers.

99295 **%Z%** The four-character string "**@ (#)**" recognizable by *what*.

99296 **%W%** A shorthand notation for constructing *what* strings:

99297 `%W%=%Z%%M%<tab>%I%`

99298 **%A%** Another shorthand notation for constructing *what* strings:

99299 `%A%=%Z%%Y%%M%%I%%Z%`

99300 **EXIT STATUS**

99301 The following exit values shall be returned:

99302 0 Successful completion.

99303 >0 An error occurred.

99304 **CONSEQUENCES OF ERRORS**

99305 Default.

99306 **APPLICATION USAGE**

99307 Problems can arise if the system date and time have been modified (for example, put forward  
99308 and then back again, or unsynchronized clocks across a network) and can also arise when  
99309 different values of the *TZ* environment variable are used.

99310 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares  
99311 the previous file body against the working file as part of its normal operation.

99312 **EXAMPLES**

99313 None.

99314 **RATIONALE**

99315 None.

99316 **FUTURE DIRECTIONS**

99317 If this utility is directed to display a pathname that contains any bytes that have the encoded  
99318 value of a <newline> character when <newline> is a terminator or separator in the output  
99319 format being used, implementations are encouraged to treat this as an error. A future version of  
99320 this standard may require implementations to treat this as an error.

99321 If this utility is directed to create a new directory entry that contains any bytes that have the  
99322 encoded value of a <newline> character, implementations are encouraged to treat this as an  
99323 error. A future version of this standard may require implementations to treat this as an error.

99324 **SEE ALSO**

99325 *admin, delta, prs, what*

99326 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

99327 **CHANGE HISTORY**

99328 First released in Issue 2.

99329 **Issue 5**

99330 A correction is made to the first format string in STDOUT.

99331 The interpretation of the *YY* component of the *-c cutoff* argument is noted.

99332 **Issue 6**

99333 The obsolescent SYNOPSIS is removed, removing the *-lp* option.

99334 The normative text is reworded to avoid use of the term “must” for application requirements.

99335 The Open Group Corrigendum U025/5 is applied, correcting text in the OPTIONS section.

99336 The Open Group Corrigendum U048/1 is applied.

99337 The Open Group Interpretation PIN4C.00014 is applied.

99338 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 99339 • The EXTENDED DESCRIPTION section is updated to make partial SID handling
- 99340 unspecified, reflecting common usage, and to clarify SID ranges.
- 99341 • New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections
- 99342 regarding how the system date and time may be taken into account.

99343 • The *TZ* environment variable is added to the ENVIRONMENT VARIABLES section.

99344 **Issue 7**

99345 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99346 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0104 [584] is applied.

99347 **Issue 8**

99348 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:

99349 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
99350 have the encoded value of a <newline> character when <newline> is a terminator or  
99351 separator in the output format being used.

99352 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
99353 <newline> character.

99354 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

99355 **NAME**99356 `getconf` — get configuration values99357 **SYNOPSIS**99358 `getconf [-v specification] system_var`99359 `getconf [-v specification] path_var pathname`99360 **DESCRIPTION**99361 In the first synopsis form, the `getconf` utility shall write to the standard output the value of the  
99362 variable specified by the `system_var` operand.99363 In the second synopsis form, the `getconf` utility shall write to the standard output the value of the  
99364 variable specified by the `path_var` operand for the path specified by the `pathname` operand.99365 The value of each configuration variable shall be determined as if it were obtained by calling the  
99366 function from which it is defined to be available by this volume of POSIX.1-2024 or by the  
99367 System Interfaces volume of POSIX.1-2024 (see the OPERANDS section). The value shall reflect  
99368 conditions in the current operating environment.99369 **OPTIONS**99370 The `getconf` utility shall conform to XBD [Section 12.2](#) (on page 215).

99371 The following option shall be supported:

99372 `-v specification`99373 Indicate a specific specification and version for which configuration variables shall  
99374 be determined. If this option is not specified, the values returned correspond to an  
99375 implementation default conforming compilation environment.

99376 If the command:

99377 `getconf _POSIX_V8_ILP32_OFF32`99378 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of  
99379 the form:99380 `getconf -v POSIX_V8_ILP32_OFF32 ...`99381 determine values for configuration variables corresponding to the  
99382 POSIX\_V8\_ILP32\_OFF32 compilation environment specified in [c17](#), the  
99383 EXTENDED DESCRIPTION.

99384 If the command:

99385 `getconf _POSIX_V8_ILP32_OFFBIG`99386 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of  
99387 the form:99388 `getconf -v POSIX_V8_ILP32_OFFBIG ...`99389 determine values for configuration variables corresponding to the  
99390 POSIX\_V8\_ILP32\_OFFBIG compilation environment specified in [c17](#), the  
99391 EXTENDED DESCRIPTION.

99392 If the command:

99393 `getconf _POSIX_V8_LP64_OFF64`99394 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of  
99395 the form:

99396 `getconf -v POSIX_V8_LP64_OFF64 ...`  
 99397 determine values for configuration variables corresponding to the  
 99398 `POSIX_V8_LP64_OFF64` compilation environment specified in *c17*, the  
 99399 EXTENDED DESCRIPTION.

99400 If the command:

99401 `getconf _POSIX_V8_LPBIG_OFFBIG`

99402 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of  
 99403 the form:

99404 `getconf -v POSIX_V8_LPBIG_OFFBIG ...`

99405 determine values for configuration variables corresponding to the  
 99406 `POSIX_V8_LPBIG_OFFBIG` compilation environment specified in *c17*, the  
 99407 EXTENDED DESCRIPTION.

## 99408 OPERANDS

99409 The following operands shall be supported:

99410 *path\_var* A name of a configuration variable. All of the variables in the Variable column of  
 99411 the table in the DESCRIPTION of the *fpathconf()* function defined in the System  
 99412 Interfaces volume of POSIX.1-2024, without the enclosing braces, shall be  
 99413 supported. The implementation may add other local variables.

99414 *pathname* A pathname for which the variable specified by *path\_var* is to be determined.

99415 *system\_var* A name of a configuration variable. All of the following variables shall be  
 99416 supported:

- 99417 • The names, without the enclosing braces, in the Variable column of the table
- 99418 in the DESCRIPTION of the *sysconf()* function in the System Interfaces
- 99419 volume of POSIX.1-2024, except for the entries corresponding to
- 99420 `_SC_CLK_TCK`, `_SC_GETGR_R_SIZE_MAX`, `_SC_GETPW_R_SIZE_MAX`,
- 99421 `_SC_NPROCESSORS_CONF`, `_SC_NPROCESSORS_ONLN`, and `_SC_NSIG`.

99422 For compatibility with earlier versions, the following variable names shall  
 99423 also be supported:

99424 `POSIX2_C_BIND`  
 99425 `POSIX2_C_DEV`  
 99426 `POSIX2_CHAR_TERM`  
 99427 `POSIX2_FORT_RUN`  
 99428 `POSIX2_LOCALEDEF`  
 99429 `POSIX2_SW_DEV`  
 99430 `POSIX2_UPE`  
 99431 `POSIX2_VERSION`

99432 and shall be equivalent to the same name prefixed with an `<underscore>`.  
 99433 This requirement may be removed in a future version.

- 99434 • The names `NPROCESSORS_CONF` and `NPROCESSORS_ONLN`. The values
- 99435 of these configuration variables shall be determined as if they were obtained
- 99436 by calling the function *sysconf()* with the argument
- 99437 `_SC_NPROCESSORS_CONF` or `_SC_NPROCESSORS_ONLN`, respectively.

99438 • The names of the symbolic constants used as the *name* argument of the  
 99439 *confstr()* function in the System Interfaces volume of POSIX.1-2024, without  
 99440 the *\_CS\_* prefix.

99441 • The names of the symbolic constants listed under the headings “Maximum  
 99442 Values” and “Minimum Values” in the description of the **<limits.h>** header  
 99443 in the Base Definitions volume of POSIX.1-2024, without the enclosing  
 99444 braces.

99445 For compatibility with earlier versions, the following variable names shall  
 99446 also be supported:

99447 POSIX2\_BC\_BASE\_MAX  
 99448 POSIX2\_BC\_DIM\_MAX  
 99449 POSIX2\_BC\_SCALE\_MAX  
 99450 POSIX2\_BC\_STRING\_MAX  
 99451 POSIX2\_COLL\_WEIGHTS\_MAX  
 99452 POSIX2\_EXPR\_NEST\_MAX  
 99453 POSIX2\_LINE\_MAX  
 99454 POSIX2\_RE\_DUP\_MAX

99455 and shall be equivalent to the same name prefixed with an *<underscore>*.  
 99456 This requirement may be removed in a future version.

99457 The implementation may add other local values.

#### 99458 **STDIN**

99459 Not used.

#### 99460 **INPUT FILES**

99461 None.

#### 99462 **ENVIRONMENT VARIABLES**

99463 The following environment variables shall affect the execution of *getconf*:

99464 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 99465 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 99466 variables used to determine the values of locale categories.)

99467 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 99468 internationalization variables.

99469 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99470 characters (for example, single-byte as opposed to multi-byte characters in  
 99471 arguments).

99472 *LC\_MESSAGES*

99473 Determine the locale that should be used to affect the format and contents of  
 99474 diagnostic messages written to standard error.

99475 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

#### 99476 **ASYNCHRONOUS EVENTS**

99477 Default.

**99478 STDOUT**

99479 If the specified variable is defined on the system and its value is described to be available from  
 99480 the *confstr()* function defined in the System Interfaces volume of POSIX.1-2024, its value shall be  
 99481 written in the following format:

99482 `"%s\n", <value>`

99483 Otherwise, if the specified variable is defined on the system, its value shall be written in the  
 99484 following format:

99485 `"%d\n", <value>`

99486 If the specified variable is valid, but is undefined on the system, *getconf* shall write using the  
 99487 following format:

99488 `"undefined\n"`

99489 If the variable name is invalid or an error occurs, nothing shall be written to standard output.

**99490 STDERR**

99491 The standard error shall be used only for diagnostic messages.

**99492 OUTPUT FILES**

99493 None.

**99494 EXTENDED DESCRIPTION**

99495 None.

**99496 EXIT STATUS**

99497 The following exit values shall be returned:

99498 0 The specified variable is valid and information about its current state was written  
 99499 successfully.

99500 >0 An error occurred.

**99501 CONSEQUENCES OF ERRORS**

99502 Default.

**99503 APPLICATION USAGE**

99504 None.

**99505 EXAMPLES**

99506 The following example illustrates the value of {NGROUPS\_MAX}:

99507 `getconf NGROUPS_MAX`

99508 The following example illustrates the value of {NAME\_MAX} for a specific directory:

99509 `getconf NAME_MAX /usr`

99510 The following example shows how to deal more carefully with results that might be unspecified:

```
99511 if value=$(getconf PATH_MAX /usr); then
99512     if [ "$value" = "undefined" ]; then
99513         echo PATH_MAX in /usr is indeterminate.
99514     else
99515         echo PATH_MAX in /usr is $value.
99516     fi
99517 else
99518     echo Error in getconf.
99519 fi
```

99520 **RATIONALE**

99521 The original need for this utility, and for the *confstr()* function, was to provide a way of finding  
 99522 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be  
 99523 modified by the user to include directories that could contain utilities replacing the standard  
 99524 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable  
 99525 value that contains the correct search path for the standard utilities. It was later suggested that  
 99526 access to the other variables described in this volume of POSIX.1-2024 could also be useful to  
 99527 applications.

99528 This functionality of *getconf* would not be adequately subsumed by another command such as:

99529 `grep var /etc/conf`

99530 because such a strategy would provide correct values for neither those variables that can vary at  
 99531 runtime, nor those that can vary depending on the path.

99532 Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid,  
 99533 but not defined on the system. The output string "undefined" is now used to specify this case  
 99534 with exit code 0 because so many things depend on an exit code of zero when an invoked utility  
 99535 is successful.

99536 **FUTURE DIRECTIONS**

99537 None.

99538 **SEE ALSO**

99539 *c17*

99541 XSH *confstr()*, *fpathconf()*, *sysconf()*, *system()*

99542 **CHANGE HISTORY**

99543 First released in Issue 4.

99544 **Issue 5**

99545 In the OPERANDS section:

- 99546 • {NL\_MAX} is changed to {NL\_NMAX}.
- 99547 • Entries beginning NL\_ are deleted from the list of standard configuration variables.
- 99548 • The list of variables previously marked UX is merged with the list marked EX.
- 99549 • Operands are added to support new Option Groups.
- 99550 • Operands are added so that *getconf* can determine supported programming environments.

99551 **Issue 6**

99552 The Open Group Corrigendum U029/4 is applied, correcting the example command in the last  
 99553 paragraph of the OPTIONS section.

99554 The following new requirements on POSIX implementations derive from alignment with the  
 99555 Single UNIX Specification:

- 99556 • Operands are added to determine supported programming environments.

99557 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard. Specifically,  
 99558 new macros for *c99* programming environments are introduced.

99559 XSI marked *system\_var* (XBS5\_\*) values are marked LEGACY.

99560 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/27 is applied, correcting the descriptions

99561 of *path\_var* and *system\_var* in the OPERANDS section.

99562 **Issue 7**

99563 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99564 The EXAMPLES section is corrected.

99565 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0091 [125] is applied.

99566 **Issue 8**

99567 Austin Group Defect 339 is applied, adding the *system\_var* names NPROCESSORS\_CONF and  
99568 NPROCESSORS\_ONLN.

99569 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

99570 Austin Group Defect 1330 is applied, removing obsolescent interfaces and changing ``\_V7\_'' to  
99571 ``\_V8\_''.

99572 **NAME**

99573 getopts — parse utility options

99574 **SYNOPSIS**99575 `getopts optstring name [param...]`99576 **DESCRIPTION**

99577 The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall  
 99578 support the Utility Syntax Guidelines 3 to 10, inclusive, described in XBD Section 12.2 (on page  
 99579 215).

99580 When the shell is first invoked, the shell variable *OPTIND* shall be initialized to 1. Each time  
 99581 *getopts* is invoked, it shall place the value of the next option found in the parameter list in the  
 99582 shell variable specified by the *name* operand and the shell variable *OPTIND* shall be set as  
 99583 follows:

- 99584 • When *getopts* successfully parses an option that takes an option-argument (that is, a  
 99585 character followed by <colon> in *optstring*, and exit status is 0), the value of *OPTIND* shall  
 99586 be the integer index of the next element of the parameter list (if any; see OPERANDS  
 99587 below) to be searched for an option character. Index 1 identifies the first element of the  
 99588 parameter list.
- 99589 • When *getopts* reports end of options (that is, when exit status is 1), the value of *OPTIND*  
 99590 shall be the integer index of the next element of the parameter list (if any).
- 99591 • In all other cases, the value of *OPTIND* is unspecified, but shall encode the information  
 99592 needed for the next invocation of *getopts* to resume parsing options after the option just  
 99593 parsed.

99594 When the option requires an option-argument, the *getopts* utility shall place it in the shell  
 99595 variable *OPTARG*. If no option was found, or if the option that was found does not have an  
 99596 option-argument, *OPTARG* shall be unset.

99597 If an option character not contained in the *optstring* operand is found where an option character  
 99598 is expected, the shell variable specified by *name* shall be set to the <question-mark> ('?')  
 99599 character. In this case, if the first character in *optstring* is a <colon> (':'), the shell variable  
 99600 *OPTARG* shall be set to the option character found, but no output shall be written to standard  
 99601 error; otherwise, the shell variable *OPTARG* shall be unset and a diagnostic message shall be  
 99602 written to standard error. This condition shall be considered to be an error detected in the way  
 99603 arguments were presented to the invoking application, but shall not be an error in *getopts*  
 99604 processing.

99605 If an option-argument is missing:

- 99606 • If the first character of *optstring* is a <colon>, the shell variable specified by *name* shall be  
 99607 set to the <colon> character and the shell variable *OPTARG* shall be set to the option  
 99608 character found.
- 99609 • Otherwise, the shell variable specified by *name* shall be set to the <question-mark>  
 99610 character, the shell variable *OPTARG* shall be unset, and a diagnostic message shall be  
 99611 written to standard error. This condition shall be considered to be an error detected in the  
 99612 way arguments were presented to the invoking application, but shall not be an error in  
 99613 *getopts* processing; a diagnostic message shall be written as stated, but the exit status shall  
 99614 be zero.

99615 When the end of options is encountered, the *getopts* utility shall exit with a return value of one;  
 99616 the shell variable *OPTIND* shall be set to the index of the argument containing the first operand  
 99617 in the parameter list, or the value 1 plus the number of elements in the parameter list if there are

99618 no operands in the parameter list; the *name* variable shall be set to the <question-mark>  
 99619 character. Any of the following shall identify the end of options: the first "--" element of the  
 99620 parameter list that is not an option-argument, finding an element of the parameter list that is not  
 99621 an option-argument and does not begin with a '-', or encountering an error.

99622 The shell variables *OPTIND* and *OPTARG* shall not be exported by default. An error in setting  
 99623 any of these variables (such as if *name* has previously been marked *readonly*) shall be considered  
 99624 an error of *getopts* processing, and shall result in a return value greater than one.

99625 The *getopts* utility can affect *OPTIND*, *OPTARG*, and the shell variable specified by the *name*  
 99626 operand, within the current shell execution environment; see [Section 2.13](#) (on page 2522).

99627 If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the  
 99628 current positional parameters or new *param* values. Any other attempt to invoke *getopts* multiple  
 99629 times in a single shell execution environment with parameters (positional parameters or *param*  
 99630 operands) that are not the same in all invocations, or with an *OPTIND* value modified by the  
 99631 application to be a value other than 1, produces unspecified results.

#### 99632 OPTIONS

99633 None.

#### 99634 OPERANDS

99635 The following operands shall be supported:

99636 *optstring* A string containing the option characters recognized by the utility invoking *getopts*.  
 99637 If a character is followed by a <colon>, the option shall be expected to have an  
 99638 argument, which should be supplied as a separate argument. Applications should  
 99639 specify an option character and its option-argument as separate arguments, but  
 99640 *getopts* shall interpret the characters following an option character requiring  
 99641 arguments as an argument whether or not this is done. An explicit null option-  
 99642 argument need not be recognized if it is not supplied as a separate argument when  
 99643 *getopts* is invoked. (See also the *getopt()* function defined in the System Interfaces  
 99644 volume of POSIX.1-2024.) The characters <question-mark> and <colon> shall not  
 99645 be used as option characters by an application. The use of other option characters  
 99646 that are not alphanumeric produces unspecified results. Whether or not the option-  
 99647 argument is supplied as a separate argument from the option character, the value  
 99648 in *OPTARG* shall only be the characters of the option-argument. The first character  
 99649 in *optstring* determines how *getopts* behaves if an option character is not known or  
 99650 an option-argument is missing.

99651 *name* The name of a shell variable that shall be set by the *getopts* utility to the option  
 99652 character that was found.

99653 By default, the list of parameters parsed by the *getopts* utility shall be the positional parameters  
 99654 currently set in the invoking shell environment ("\${@}"). If *param* operands are given, they shall  
 99655 be parsed instead of the positional parameters. Note that the next element of the parameter list  
 99656 need not exist; in this case, *OPTIND* will be set to \$#+1 or the number of *param* operands plus 1.

#### 99657 STDIN

99658 Not used.

#### 99659 INPUT FILES

99660 None.

99661 **ENVIRONMENT VARIABLES**99662 The following environment variables shall affect the execution of *getopts*:

99663 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 99664 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 99665 variables used to determine the values of locale categories.)

99666 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 99667 internationalization variables.

99668 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99669 characters (for example, single-byte as opposed to multi-byte characters in  
 99670 arguments and input files).

99671 *LC\_MESSAGES*

99672 Determine the locale that should be used to affect the format and contents of  
 99673 diagnostic messages written to standard error.

99674 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

99675 *OPTIND* This variable shall be used by the *getopts* utility as the index of the next argument  
 99676 to be processed.

99677 **ASYNCHRONOUS EVENTS**

99678 Default.

99679 **STDOUT**

99680 Not used.

99681 **STDERR**

99682 Whenever an error is detected and the first character in the *optstring* operand is not a <colon>  
 99683 (' : '), a diagnostic message shall be written to standard error with the following information in  
 99684 an unspecified format:

- 99685 • The invoking program name shall be identified in the message. The invoking program  
 99686 name shall be the value of the shell special parameter 0 (see Section 2.5.2, on page 2479) at  
 99687 the time the *getopts* utility is invoked. A name equivalent to:

99688 `basename "$0"`

99689 may be used.

- 99690 • If an option is found that was not specified in *optstring*, this error is identified and the  
 99691 invalid option character shall be identified in the message.

- 99692 • If an option requiring an option-argument is found, but an option-argument is not found,  
 99693 this error shall be identified and the invalid option character shall be identified in the  
 99694 message.

99695 **OUTPUT FILES**

99696 None.

99697 **EXTENDED DESCRIPTION**

99698 None.

99699 **EXIT STATUS**

99700 The following exit values shall be returned:

99701 0 An option, specified or unspecified by *optstring*, was found.

99702           1 The end of options was encountered.

99703           >1 An error occurred.

## 99704 CONSEQUENCES OF ERRORS

99705           Default.

## 99706 APPLICATION USAGE

99707           This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

99708           Since *getopts* affects the current shell execution environment, it is generally provided as a shell  
99709           regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
99710           of the following:

```
99711           (getopts abc value "$@")
99712           nohup getopts ...
99713           find . -exec getopts ... \;
```

99714           it does not affect the shell variables in the caller's environment.

99715           Note that shell functions share *OPTIND* with the calling shell even though the positional  
99716           parameters are changed. If the calling shell and any of its functions uses *getopts* to parse  
99717           arguments, the results are unspecified.

## 99718 EXAMPLES

99719           The following example script parses and displays its arguments:

```
99720           aflag=
99721           bflag=
99722           while getopts ab: name
99723           do
99724               case $name in
99725               a)     aflag=1;;
99726               b)     bflag=1
99727                     bval="$OPTARG";;
99728               ?)     printf "Usage: %s: [-a] [-b value] args\n" $0
99729                     exit 2;;
99730               esac
99731           done
99732           if [ -n "$aflag" ]; then
99733               printf "Option -a specified\n"
99734           fi
99735           if [ -n "$bflag" ]; then
99736               printf 'Option -b "%s" specified\n' "$bval"
99737           fi
99738           shift $((OPTIND - 1))
99739           printf "Remaining arguments are: %s\n" "$*"
```

## 99740 RATIONALE

99741           The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles  
99742           option-arguments containing <blank> characters.

99743           The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it  
99744           does not affect the execution of *getopts*; it is one of the few "output-only" variables used by the  
99745           standard utilities.

99746           The <colon> is not allowed as an option character because that is not historical behavior, and it  
99747           violates the Utility Syntax Guidelines. The <colon> is now specified to behave as in the

99748 KornShell version of the *getopts* utility; when used as the first character in the *optstring* operand,  
 99749 it disables diagnostics concerning missing option-arguments and unexpected option characters.  
 99750 This replaces the use of the *OPTERR* variable that was specified in an early proposal.

99751 Although a leading *<plus-sign>* in *optstring* is required to have no effect on the behavior of  
 99752 *getopt()*, this standard intentionally allows implementations of the *getopts* utility to use a leading  
 99753 *<plus-sign>* as an extension that alters behavior. In fact, a *<plus-sign>* anywhere in the *optstring*  
 99754 in the *getopts* utility produces unspecified behavior.

99755 The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function  
 99756 are not fully specified because implementations with superior (“friendlier”) formats objected to  
 99757 the formats used by some historical implementations. The standard developers considered it  
 99758 important that the information in the messages used be uniform between *getopts* and *getopt()*.  
 99759 Exact duplication of the messages might not be possible, particularly if a utility is built on  
 99760 another system that has a different *getopt()* function, but the messages must have specific  
 99761 information included so that the program name, invalid option character, and type of error can  
 99762 be distinguished by a user.

99763 Only a rare application program intercepts a *getopts* standard error message and wants to parse  
 99764 it. Therefore, implementations are free to choose the most usable messages they can devise. The  
 99765 following formats are used by many historical implementations:

99766 "%s: illegal option -- %c\n", *<program name>*, *<option character>*

99767 "%s: option requires an argument -- %c\n", *<program name>*, \  
 99768 *<option character>*

99769 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,  
 99770 frequently not even indicating the option character found in error.

#### 99771 FUTURE DIRECTIONS

99772 None.

#### 99773 SEE ALSO

99774 [Section 2.5.2](#) (on page 2479)

99775 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

99776 [XSH \*getopt\(\)\*](#)

#### 99777 CHANGE HISTORY

99778 First released in Issue 4.

#### 99779 Issue 6

99780 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 99781 Issue 7

99782 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0092 [159] is applied.

#### 99783 Issue 8

99784 Austin Group Defect 191 is applied, adding a paragraph about leading *<plus-sign>* to the  
 99785 RATIONALE section.

99786 Austin Group Defect 367 is applied, requiring that *getopts* distinguishes between encountering  
 99787 the end of options and an error occurring, setting its exit status to one and greater than one,  
 99788 respectively.

99789 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
 99790 this utility is required to be intrinsic.

- 99791 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 99792 Austin Group Defect 1442 is applied, changing the EXAMPLES section.
- 99793 Austin Group Defect 1784 is applied, clarifying several aspects of *getopts* behavior and changing
- 99794 the value of *OPTIND* to be unspecified in some circumstances.

99795 **NAME**99796 `gettext, ngettext` — retrieve text string from messages object99797 **SYNOPSIS**99798 `gettext [-e|-E] [-d textdomain] [textdomain] msgid`99799 `gettext [-e|-E] [-n] -s [-d textdomain] msgid...`99800 `ngettext [-e|-E] [-d textdomain] [textdomain] msgid msgid_plural n`99801 **DESCRIPTION**99802 The *gettext* and *ngettext* utilities shall write to standard output the message string(s) that would  
99803 result from the following calls to functions defined in the System Interfaces volume of  
99804 POSIX.1-2024:

```

99805 if (textdomainname == NULL || textdomainname[0] == '\0')
99806     message_string = msgid;
99807 else {
99808     setlocale(LC_ALL, "");
99809     if (textdomaindir != NULL)
99810         bindtextdomain(textdomainname, textdomaindir);
99811     if (msgid_plural == NULL)
99812         message_string = dgettext(textdomainname, msgid);
99813     else
99814         message_string = dngettext(textdomainname, msgid, msgid_plural, n);
99815 }

```

99816 where:

- 99817 • The *textdomaindir* variable is a string containing the value of the *TEXTDOMAINDIR*  
99818 environment variable, if set and not empty, or is NULL otherwise.
- 99819 • The *textdomainname* variable is a string containing the text domain name obtained from, in  
99820 decreasing order of precedence:
  - 99821 — The optional operand *textdomain*, if present
  - 99822 — The *-d textdomain* option, if specified
  - 99823 — The *TEXTDOMAIN* environment variable, if set and not empty
- 99824 If the text domain name cannot be obtained from these sources, the *textdomainname*  
99825 variable is NULL.
- 99826 • If the *-s* option of *gettext* is not specified and for the *ngettext* utility, the *msgid* variable is a  
99827 string containing:
  - 99828 — The value of the *msgid* operand, if the *-E* option is specified
  - 99829 — The value of the *msgid* operand with C-language escape sequences processed (see  
99830 below), if the *-e* option is specified
  - 99831 — The value of the *msgid* operand with C-language escape sequences optionally  
99832 processed (see below), otherwise
- 99833 • If the *-s* option of *gettext* is specified, the *msgid* variable is a string containing:
  - 99834 — The value of each *msgid* operand in turn, if the *-E* option is specified or neither the *-e*  
99835 nor the *-E* option is specified

- 99836 — The value of each *msgid* operand in turn with C-language escape sequences  
99837 processed (see below), if the `-e` option is specified
- 99838 • For the *gettext* utility, the *msgid\_plural* variable is NULL. For the *ngettext* utility, the  
99839 *msgid\_plural* variable is a string containing:
  - 99840 — The value of the *msgid\_plural* operand, if the `-E` option is specified
  - 99841 — The value of the *msgid\_plural* operand with C-language escape sequences processed  
99842 (see below), if the `-e` option is specified
  - 99843 — The value of the *msgid\_plural* operand with C-language escape sequences optionally  
99844 processed (see below), otherwise
- 99845 • For the *gettext* utility, the *n* variable is 1 (one). For the *ngettext* utility the *n* variable is the *n*  
99846 operand, parsed as an integer as if by using the *strtoul()* function with a *base* argument of  
99847 10.

99848 When C-language escape sequences are processed, they shall be processed as specified for  
99849 character string literals in the ISO C standard, except that *universal-character-name* escape  
99850 sequences need not be supported. Implementations may also support a `<backslash> 'c'` escape  
99851 sequence; if supported, the `'\c'` and all characters following it shall be removed and, if the `-s`  
99852 option is specified, the behavior shall be as if the `-n` option is also specified.

99853 For the *ngettext* utility, and for the *gettext* utility if the `-s` option is not specified, the resulting  
99854 message string shall be written to standard output. If the `-s` option of *gettext* is specified, the  
99855 resulting message string for each *msgid* shall be written to standard output with consecutive  
99856 message strings separated by a single `<space>` character and, if the `-n` option is not specified, a  
99857 `<newline>` shall be written after the last message string. If the `-s` and `-n` options are specified,  
99858 the trailing `<newline>` shall be omitted.

99859 Under conditions where the *textdomainname* variable in the above code would be NULL, these  
99860 utilities may write a diagnostic message to standard error and exit with non-zero status.

## 99861 OPTIONS

99862 These utilities shall conform to XBD [Section 12.2](#) (on page 215).

99863 The following options shall be supported:

- 99864 `-d textdomain`  
99865 Retrieve the translated message from the domain *textdomain*, if *textdomain* is not  
99866 specified as an operand.
- 99867 `-e` Process C-language escape sequences in *msgid* and *msgid\_plural* operands.
- 99868 `-E` Do not process C-language escape sequences in *msgid* and *msgid\_plural* operands.

99869 The *gettext* utility shall also support the following options:

- 99870 `-n` Modify the behavior of the `-s` option such that a `<newline>` is not appended to the  
99871 output.
- 99872 `-s` Separate the message strings obtained from each *msgid* operand with `<space>`  
99873 characters in the output, and (if `-n` is not also specified) append a `<newline>` to the  
99874 output.

99875 If neither of the mutually exclusive `-e` and `-E` options is specified, it is unspecified which is the  
99876 default, except that if the `-s` option of *gettext* is specified then `-E` shall be the default.

99877 **OPERANDS**

99878 The following operands shall be supported:

99879 *textdomain* A text domain name used to retrieve the translated message. This shall override  
99880 the specification by the `-d` option, if present.99881 *msgid* A key to retrieve the translated message.99882 *msgid\_plural* A default plural if no corresponding plural message can be found.99883 *n* A non-negative decimal integer to be used as the *n* argument to `dngettext()` (see the  
99884 DESCRIPTION).99885 **STDIN**

99886 Not used.

99887 **INPUT FILES**99888 The input files are messages object files (see *msgfmt*).99889 **ENVIRONMENT VARIABLES**99890 The following environment variables shall affect the execution of *gettext* and *ngettext*:99891 *LANG* Provide a default value for the internationalization variables that are unset or null.  
99892 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
99893 variables used to determine the values of locale categories.)99894 XSI *LANGUAGE* Determine the location of messages objects if *NLSPATH* is not set or the evaluation  
99895 of *NLSPATH* did not lead to a suitable messages object being found.99896 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
99897 internationalization variables.99898 *LC\_MESSAGES*99899 Determine the locale name used to locate messages objects, and the locale that  
99900 should be used to affect the format and contents of diagnostic messages written to  
99901 standard error.99902 XSI *NLSPATH* Determine the location of messages objects and message catalogs.99903 *TEXTDOMAIN*

99904 Specify the text domain name. (See XBD Section 3.386 (on page 88).)

99905 *TEXTDOMAINDIR*99906 XSI Specify the pathname to the messages object hierarchy. *NLSPATH* shall have  
99907 precedence over *TEXTDOMAINDIR*.99908 **ASYNCHRONOUS EVENTS**

99909 Default.

99910 **STDOUT**

99911 See DESCRIPTION.

99912 **STDERR**

99913 The standard error shall be used only for diagnostic messages.

99914 **OUTPUT FILES**

99915 None.

99916 **EXTENDED DESCRIPTION**

99917 None.

99918 **EXIT STATUS**

99919 The following exit values shall be returned:

99920 0 Successful completion.

99921 &gt;0 An error occurred.

99922 **CONSEQUENCES OF ERRORS**

99923 Default.

99924 **APPLICATION USAGE**

99925 Since it is unspecified which of the `-e` or `-E` options is the default, except when the `-s` option of  
 99926 `gettext` is specified, portable applications need to ensure that `-e`, `-E`, or (for `gettext`) `-s` is specified  
 99927 whenever a `msgid` or `msgid_plural` operand contains, or might contain, a `<backslash>` character.

99928 Note that, unless the `-s` option of `gettext` is specified without `-n`, the message(s) written to  
 99929 standard output are not followed by a `<newline>`. (Therefore the output only ends with a  
 99930 `<newline>` if the last message ends with one.)

99931 Both `msgid` and `msgid_plural` should be properly quoted for the shell.99932 **EXAMPLES**

99933 The following examples assume that the following portable messages object source file (dot-po  
 99934 file) has been compiled to a valid file **mail.mo** by the `msgfmt` utility. See the EXTENDED  
 99935 DESCRIPTION section of the `msgfmt` utility for a description of the dot-po file format.

```
99936 msgid ""
99937 msgstr ""
99938 "Content-Type: text/plain; charset=utf-8\n"
99939 "Plural-Forms: nplurals=4; plural=n==1?0: (n>1&&n<=10)?1: (n==0)?2:3;\n"
```

```
99940 msgid "recipient"
99941 msgid_plural "recipients"
99942 msgstr[0] "1 recipient"
99943 msgstr[1] "2 to 10 recipients"
99944 msgstr[2] "no recipients"
99945 msgstr[3] "more than 10 recipients"
```

```
99946 msgid "%d attachment\n"
99947 msgid_plural "%d attachments\n"
99948 msgstr[0] "1 (%d) attachment\n"
99949 msgstr[1] "2 to 10 (%d) attachments\n"
99950 msgstr[2] "no (%d) attachments\n"
99951 msgstr[3] "more than 10 (%d) attachments\n"
```

99952 They also assume that **mail.mo** is installed in the directory that `gettext` and `ngettext` search for the  
 99953 current locale. See the **OPTIONS** and **ENVIRONMENT VARIABLES** sections above and the  
 99954 description of `gettext()` for details on how this search is performed.

99955 The command

99956 `ngettext -d mail recipient recipients 0`

99957 will write "no recipients".

99958 The command

99959 `ngettext -d mail recipient recipients 1`  
99960 will write "1 recipient".  
99961 The command  
99962 `ngettext -d mail recipient recipients 5`  
99963 will write "2 to 10 recipients".  
99964 The command  
99965 `ngettext -d mail recipient recipients 11`  
99966 will write "more than 10 recipients".  
99967 The command  
99968 `ngettext -d mail Call Calls 1`  
99969 will write "Call". Note that "Call" is not in the messages object.  
99970 The command  
99971 `ngettext -d mail Call Calls 0`  
99972 will write "Calls".  
99973 The command  
99974 `ngettext -d mail Call Calls 10`  
99975 will write "Calls".  
99976 The command  
99977 `ngettext -ed mail "%d attachment\n" "%d attachments\n" 1`  
99978 will write the same as  
99979 `printf "1 (%d) attachment\n"`  
99980 (i.e. "1 (%d) attachment" followed by a <newline> character). The output of *ngettext* can be  
99981 used as a format string for *printf*.  
99982 The command  
99983 `printf "$ (ngettext -ed mail "%d attachment\n" "%d attachments\n" 1)" 10`  
99984 will write the same as  
99985 `printf "1 (%d) attachment\n" 10`  
99986 (i.e. "1 (10) attachment" followed by a <newline> character).  
99987 The command  
99988 `ngettext -e -d mail "\tsubject\n" "\tsubjects\n" 0`  
99989 will write the same as  
99990 `printf "\tsubjects\n"`  
99991 (i.e. a <tab> character, followed by "subjects" followed by a <newline> character). Note that  
99992 "\tsubject\n" is not in the messages object.  
99993 The command

99994 `printf "%s\n" "$(gettext -E -d mail "subject" "subjects" 0) "`  
99995 will write the same as  
99996 `printf "subjects\n"`  
99997 (i.e. "subjects" followed by a <newline> character). Note that "subject" is not in the  
99998 messages object.  
99999 The command  
100000 `gettext -s -d mail "recipient"`  
100001 will write "1 recipient" followed by a <newline> character.  
100002 The command  
100003 `gettext -s -n -d mail "recipient"`  
100004 will write "1 recipient" without a <newline> character.  
100005 **RATIONALE**  
100006 Historical implementations did not support the '\a' C-language escape sequence. This  
100007 standard requires it to be supported for consistency with other utilities that support the table in  
100008 XBD [Chapter 5](#) (on page 113).  
100009 Unlike other standard utilities, the behavior of *gettext* and *gettext* is not undefined when  
100010 *NLSPATH* overrides the system default path; see XBD [Section 8.2](#) (on page 169). This is so that  
100011 applications can use these utilities to obtain message strings from messages objects in other  
100012 locations. However, it also means that they need to be implemented in such a way that they do  
100013 not do anything that would result in undefined behavior when they need to write a diagnostic  
100014 message. In particular, they should not use a string obtained from a message catalog or a  
100015 messages object as a format string (or should only do so after checking that the string contains  
100016 the correct conversions).  
100017 **FUTURE DIRECTIONS**  
100018 None.

100023 **CHANGE HISTORY**  
100024 First released in Issue 8.

100025 **NAME**100026 `grep` — search a file for a pattern100027 **SYNOPSIS**

```
100028  grep [-E|-F] [-c|-l|-q] [-insvx] -e pattern_list
100029      [-e pattern_list]... [-f pattern_file]... [file...]
100030  grep [-E|-F] [-c|-l|-q] [-insvx] [-e pattern_list]...
100031      -f pattern_file [-f pattern_file]... [file...]
100032  grep [-E|-F] [-c|-l|-q] [-insvx] pattern_list [file...]
```

100033 **DESCRIPTION**

100034 The `grep` utility shall search the input files, selecting lines matching one or more patterns; the  
 100035 types of patterns are controlled by the options specified. The patterns are specified by the `-e`  
 100036 option, `-f` option, or the `pattern_list` operand. The `pattern_list`'s value shall consist of one or more  
 100037 patterns separated by <newline> characters; the `pattern_file`'s contents shall consist of one or  
 100038 more patterns terminated by a <newline> character. By default, an input line shall be selected if  
 100039 any pattern, treated as an entire basic regular expression (BRE) as described in XBD [Section 9.3](#)  
 100040 (on page 181), matches any part of the line excluding the terminating <newline>; a null BRE  
 100041 shall match every line. By default, each selected input line shall be written to the standard  
 100042 output.

100043 Regular expression matching shall be based on text lines. Since a <newline> separates or  
 100044 terminates patterns (see the `-e` and `-f` options below), regular expressions cannot contain a  
 100045 <newline>. Similarly, since patterns are matched against individual lines (excluding the  
 100046 terminating <newline> characters) of the input, there is no way for a pattern to match a  
 100047 <newline> found in the input.

100048 **OPTIONS**100049 The `grep` utility shall conform to XBD [Section 12.2](#) (on page 215).

100050 The following options shall be supported:

100051 `-E` Match using extended regular expressions. Treat each pattern specified as an ERE,  
 100052 as described in XBD [Section 9.4](#) (on page 187). If any entire ERE pattern matches  
 100053 some part of an input line excluding the terminating <newline>, the line shall be  
 100054 matched. A null ERE shall match every line.

100055 `-F` Match using fixed strings. Treat each pattern specified as a string instead of a  
 100056 regular expression. If an input line contains any of the patterns as a contiguous  
 100057 sequence of bytes, the line shall be matched. A null string shall match every line.

100058 `-c` Write only a count of selected lines to standard output.

100059 `-e pattern_list`

100060 Specify one or more patterns to be used during the search for input. The  
 100061 application shall ensure that patterns in `pattern_list` are separated by a <newline>.  
 100062 A null pattern can be specified by two adjacent <newline> characters in  
 100063 `pattern_list`. Unless the `-E` or `-F` option is also specified, each pattern shall be  
 100064 treated as a BRE, as described in XBD [Section 9.3](#) (on page 181). Multiple `-e` and `-f`  
 100065 options shall be accepted by the `grep` utility. All of the specified patterns shall be  
 100066 used when matching lines, but the order of evaluation is unspecified.

100067 `-f pattern_file`

100068 Read one or more patterns from the file named by the pathname `pattern_file`.  
 100069 Patterns in `pattern_file` shall be terminated by a <newline>. A null pattern can be  
 100070 specified by an empty line in `pattern_file`. Unless the `-E` or `-F` option is also

- 100071 specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#)  
 100072 (on page 181).
- 100073 **-i** Perform pattern matching in a case-insensitive manner; see XBD [Section 9.2](#) (on  
 100074 page 180).
- 100075 **-l** (The letter ell.) Write only the names of files containing selected lines to standard  
 100076 output. Pathnames shall be written once per file searched. If the standard input is  
 100077 searched, a pathname of "(standard input)" shall be written, in the POSIX  
 100078 locale. In other locales, "standard input" may be replaced by something more  
 100079 appropriate in those locales.
- 100080 **-n** Precede each output line by its relative line number in the file, each file starting at  
 100081 line 1. The line number counter shall be reset for each file processed.
- 100082 **-q** Quiet. Nothing shall be written to the standard output, regardless of matching  
 100083 lines. Exit with zero status if an input line is selected.
- 100084 **-s** Suppress the error messages ordinarily written for nonexistent or unreadable files.  
 100085 Other error messages shall not be suppressed.
- 100086 **-v** Select lines not matching any of the specified patterns. If the **-v** option is not  
 100087 specified, selected lines shall be those that match any of the specified patterns.
- 100088 **-x** Consider only input lines that use all characters in the line excluding the  
 100089 terminating <newline> to match an entire fixed string or regular expression to be  
 100090 matching lines.

**100091 OPERANDS**

100092 The following operands shall be supported:

- 100093 *pattern\_list* Specify one or more patterns to be used during the search for input. This operand  
 100094 shall be treated as if it were specified as **-e pattern\_list**.
- 100095 *file* A pathname of a file to be searched for the patterns. If no *file* operands are  
 100096 specified, the standard input shall be used.

**100097 STDIN**

100098 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 100099 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 100100 the standard input shall not be used. See the INPUT FILES section.

**100101 INPUT FILES**

100102 The input files shall be text files.

**100103 ENVIRONMENT VARIABLES**

100104 The following environment variables shall affect the execution of *grep*:

- 100105 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100106 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 100107 variables used to determine the values of locale categories.)
- 100108 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100109 internationalization variables.
- 100110 *LC\_COLLATE*  
 100111 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 100112 character collating elements within regular expressions.

|        |                             |                                                                                                                                                                                                                                                            |
|--------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100113 | <i>LC_CTYPE</i>             | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files) and the behavior of character classes within regular expressions. |
| 100114 |                             |                                                                                                                                                                                                                                                            |
| 100115 |                             |                                                                                                                                                                                                                                                            |
| 100116 |                             |                                                                                                                                                                                                                                                            |
| 100117 | <i>LC_MESSAGES</i>          |                                                                                                                                                                                                                                                            |
| 100118 |                             | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                               |
| 100119 |                             |                                                                                                                                                                                                                                                            |
| 100120 | XSI <i>NLSPATH</i>          | Determine the location of messages objects and message catalogs.                                                                                                                                                                                           |
| 100121 | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                                                                                                                                                                            |
| 100122 |                             | Default.                                                                                                                                                                                                                                                   |
| 100123 | <b>STDOUT</b>               |                                                                                                                                                                                                                                                            |
| 100124 |                             | If the <b>-l</b> option is in effect, the following shall be written for each file containing at least one selected input line:                                                                                                                            |
| 100125 |                             |                                                                                                                                                                                                                                                            |
| 100126 |                             | <code>"%s\n", &lt;file&gt;</code>                                                                                                                                                                                                                          |
| 100127 |                             | Otherwise, if more than one <i>file</i> argument appears, and <b>-q</b> is not specified, the <i>grep</i> utility shall prefix each output line by:                                                                                                        |
| 100128 |                             |                                                                                                                                                                                                                                                            |
| 100129 |                             | <code>"%s:", &lt;file&gt;</code>                                                                                                                                                                                                                           |
| 100130 |                             | The remainder of each output line shall depend on the other options specified:                                                                                                                                                                             |
| 100131 |                             | • If the <b>-c</b> option is in effect, the remainder of each output line shall contain:                                                                                                                                                                   |
| 100132 |                             | <code>"%d\n", &lt;count&gt;</code>                                                                                                                                                                                                                         |
| 100133 |                             | • Otherwise, if <b>-c</b> is not in effect and the <b>-n</b> option is in effect, the following shall be written to standard output:                                                                                                                       |
| 100134 |                             |                                                                                                                                                                                                                                                            |
| 100135 |                             | <code>"%d:", &lt;line number&gt;</code>                                                                                                                                                                                                                    |
| 100136 |                             | • Finally, the following shall be written to standard output:                                                                                                                                                                                              |
| 100137 |                             | <code>"%s", &lt;selected-line contents&gt;</code>                                                                                                                                                                                                          |
| 100138 | <b>STDERR</b>               |                                                                                                                                                                                                                                                            |
| 100139 |                             | The standard error shall be used only for diagnostic messages.                                                                                                                                                                                             |
| 100140 | <b>OUTPUT FILES</b>         |                                                                                                                                                                                                                                                            |
| 100141 |                             | None.                                                                                                                                                                                                                                                      |
| 100142 | <b>EXTENDED DESCRIPTION</b> |                                                                                                                                                                                                                                                            |

| 100144 | <b>EXIT STATUS</b>          |                                                                                                                                                                                                                                                            |
| 100145 |                             | The following exit values shall be returned:                                                                                                                                                                                                               |
| 100146 | 0                           | One or more lines were selected and the output specified in <b>STDOUT</b> was successfully written to standard output.                                                                                                                                     |
| 100147 |                             |                                                                                                                                                                                                                                                            |
| 100148 | 1                           | No lines were selected.                                                                                                                                                                                                                                    |
| 100149 | >1                          | An error occurred.                                                                                                                                                                                                                                         |

## 100150 CONSEQUENCES OF ERRORS

100151 If the `-q` option is specified, the exit status shall be zero if an input line is selected, even if an  
 100152 error was detected. Otherwise, default actions shall be performed.

## 100153 APPLICATION USAGE

100154 Care should be taken when using characters in *pattern\_list* that may also be meaningful to the  
 100155 command interpreter. It is safest to enclose the entire *pattern\_list* argument in single-quotes:

100156 ' . . . '

100157 The `-e pattern_list` option has the same effect as the *pattern\_list* operand, but is useful when  
 100158 *pattern\_list* begins with the <hyphen-minus> delimiter. It is also useful when it is more  
 100159 convenient to provide multiple patterns as separate arguments.

100160 Multiple `-e` and `-f` options are accepted and *grep* uses all of the patterns it is given while  
 100161 matching input text lines. (Note that the order of evaluation is not specified. If an  
 100162 implementation finds a null string as a pattern, it is allowed to use that pattern first, matching  
 100163 every line, and effectively ignore any other patterns.)

100164 The `-q` option provides a means of easily determining whether or not a pattern (or string) exists  
 100165 in a group of files. When searching several files, it provides a performance improvement  
 100166 (because it can quit as soon as it finds the first match) and requires less care by the user in  
 100167 choosing the set of files to supply as arguments (because it exits zero if it finds a match even if  
 100168 *grep* detected an access or read error on earlier *file* operands).

100169 When using *grep* to process pathnames, it is recommended that `LC_ALL`, or at least `LC_CTYPE`  
 100170 and `LC_COLLATE`, are set to `POSIX` or `C` in the environment, since pathnames can contain byte  
 100171 sequences that do not form valid characters in some locales, in which case the utility's behavior  
 100172 would be undefined. In the `POSIX` locale each byte is a valid single-byte character, and therefore  
 100173 this problem is avoided.

## 100174 EXAMPLES

100175 1. To find all uses of the word "Posix" (in any case) in file **text.mm** and write with line  
 100176 numbers:

100177 `grep -i -n posix text.mm`

100178 2. To find all empty lines in the standard input:

100179 `grep ^$`

100180 or:

100181 `grep -v .`

100182 3. Both of the following commands print all lines containing strings "abc" or "def" or  
 100183 both:

100184 `grep -E 'abc|def'`

100185 `grep -F 'abc  
 100186 def'`

100187 4. Both of the following commands print all lines matching exactly "abc" or "def":

100188 `grep -E '^abc$|^def$'`

100189 `grep -F -x 'abc  
 100190 def'`

100191 **RATIONALE**

100192 This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of  
 100193 the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard  
 100194 developers to consolidate the three *greps* into a single command.

100195 The old *egrep* and *fgrep* commands are likely to be supported for many years to come as  
 100196 implementation extensions, allowing historical applications to operate unmodified.

100197 Historical implementations usually silently ignored all but one of multiply-specified *-e* and *-f*  
 100198 options, but were not consistent as to which specification was actually used.

100199 The *-b* option was omitted from the OPTIONS section because block numbers are  
 100200 implementation-defined.

100201 The System V restriction on using *-* to mean standard input was omitted.

100202 A definition of action taken when given a null BRE or ERE is specified. This is an error  
 100203 condition in some historical implementations.

100204 The *-I* option previously indicated that its use was undefined when no files were explicitly  
 100205 named. This behavior was historical and placed an unnecessary restriction on future  
 100206 implementations. It has been removed.

100207 The historical BSD *grep -s* option practice is easily duplicated by redirecting standard output to  
 100208 */dev/null*. The *-s* option required here is from System V.

100209 The *-x* option, historically available only with *fgrep*, is available here for all of the non-  
 100210 obsolescent versions.

100211 **FUTURE DIRECTIONS**

100212 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 100213 value of a <newline> character when <newline> is a terminator or separator in the output  
 100214 format being used, implementations are encouraged to treat this as an error. A future version of  
 100215 this standard may require implementations to treat this as an error.

100218 XBD [Chapter 8](#) (on page 167), [Chapter 9](#) (on page 179), [Section 12.2](#) (on page 215)

100219 **CHANGE HISTORY**

100220 First released in Issue 2.

100221 **Issue 6**

100222 The Open Group Corrigendum U029/5 is applied, correcting the SYNOPSIS.

100223 The normative text is reworded to avoid use of the term “must” for application requirements.

100224 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/28 is applied, correcting the examples  
 100225 using the *grep -F* option which did not match the normative description of the *-F* option.

100226 **Issue 7**

100227 Austin Group Interpretation 1003.1-2001 #092 is applied.

100228 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100229 SD5-XCU-ERN-98 is applied, updating the STDOUT section.

100230 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0105 [584] and XCU/TC2-2008/0106  
 100231 [663] are applied.

100232 **Issue 8**

- 100233 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is directed to display a pathname that contains any bytes that have the encoded value of a <newline> character when <newline> is a terminator or separator in the output format being used.
- 100234
- 100235
- 100236
- 100237 Austin Group Defect 1031 is applied, changing the description of the `-i` option.
- 100238 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.
- 100239 Austin Group Defect 1502 is applied, changing the EXIT STATUS section.

100240 **NAME**

100241 hash — remember or report utility locations

100242 **SYNOPSIS**100243 hash [*utility*...]

100244 hash -r

100245 **DESCRIPTION**

100246 The *hash* utility shall affect the way the current shell environment remembers the locations of  
 100247 utilities found as described in [Section 2.9.1.4](#) (on page 2502). Depending on the arguments  
 100248 specified, it shall add utility locations to its list of remembered locations or it shall purge the  
 100249 contents of the list. When no arguments are specified, it shall report on the contents of the list.

100250 Utilities provided as built-ins to the shell and functions shall not be reported by *hash*.100251 **OPTIONS**100252 The *hash* utility shall conform to XBD [Section 12.2](#) (on page 215).

100253 The following option shall be supported:

100254 -r Forget all previously remembered utility locations.

100255 **OPERANDS**

100256 The following operand shall be supported:

100257 *utility* The name of a utility to be searched for and added to the list of remembered  
 100258 locations. If the search does not find *utility*, it is unspecified whether or not this is  
 100259 treated as an error. If *utility* contains one or more <slash> characters, the results are  
 100260 unspecified.

100261 **STDIN**

100262 Not used.

100263 **INPUT FILES**

100264 None.

100265 **ENVIRONMENT VARIABLES**100266 The following environment variables shall affect the execution of *hash*:

100267 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100268 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 100269 variables used to determine the values of locale categories.)

100270 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100271 internationalization variables.

100272 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100273 characters (for example, single-byte as opposed to multi-byte characters in  
 100274 arguments).

100275 *LC\_MESSAGES*

100276 Determine the locale that should be used to affect the format and contents of  
 100277 diagnostic messages written to standard error.

100278 XSI *NLSPATH* Determine the location of messages objects and message catalogs.100279 *PATH* Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 167).

100280 **ASYNCHRONOUS EVENTS**

100281 Default.

100282 **STDOUT**

100283 The standard output of *hash* shall be used when no arguments are specified. Its format is  
100284 unspecified, but includes the pathname of each utility in the list of remembered locations for the  
100285 current shell environment. This list shall consist of those utilities named in previous *hash*  
100286 invocations that have been invoked, and may contain those invoked and found through the  
100287 normal command search process. This list shall be cleared when the contents of the *PATH*  
100288 environment variable are changed.

100289 **STDERR**

100290 The standard error shall be used only for diagnostic messages.

100291 **OUTPUT FILES**

100292 None.

100293 **EXTENDED DESCRIPTION**

100294 None.

100295 **EXIT STATUS**

100296 The following exit values shall be returned:

100297 0 Successful completion.

100298 &gt;0 An error occurred.

100299 **CONSEQUENCES OF ERRORS**

100300 Default.

100301 **APPLICATION USAGE**100302 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

100303 Since *hash* affects the current shell execution environment, it is always provided as a shell  
100304 regular built-in. If it is called in a separate utility execution environment, such as one of the  
100305 following:

```
100306 nohup hash -r  
100307 find . -type f -exec hash {} +
```

100308 it does not affect the command search process of the caller's environment.

100309 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities  
100310 found through normal command search are not listed by the *hash* command.

100311 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the  
100312 simplest form, this can be:

100313 `PATH="$PATH"`

100314 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a  
100315 performance improvement on a few implementations; normally, the hashing process is included  
100316 by default.

100317 **EXAMPLES**

100318 None.

100319 **RATIONALE**

100320 None.

100321 **FUTURE DIRECTIONS**

100322 If this utility is directed to display a pathname that contains any bytes that have the encoded  
100323 value of a <newline> character when <newline> is a terminator or separator in the output  
100324 format being used, implementations are encouraged to treat this as an error. A future version of  
100325 this standard may require implementations to treat this as an error.

100326 **SEE ALSO**100327 [Section 2.9.1.4](#) (on page 2502)100328 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)100329 **CHANGE HISTORY**

100330 First released in Issue 2.

100331 **Issue 7**100332 The *hash* utility is moved from the XSI option to the Base.

100333 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0093 [241] is applied.

100334 **Issue 8**100335 Austin Group Defect 248 is applied, changing a command line in the APPLICATION USAGE  
100336 section.

100337 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
100338 directed to display a pathname that contains any bytes that have the encoded value of a  
100339 <newline> character when <newline> is a terminator or separator in the output format being  
100340 used.

100341 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
100342 this utility is required to be intrinsic.

100343 Austin Group Defect 1063 is applied, clarifying that functions are not reported by *hash*, and that  
100344 the list of remembered locations is cleared when the contents of *PATH* are changed.

100345 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

100346 Austin Group Defect 1460 is applied, making it explicitly unspecified whether or not *hash*  
100347 reports an error if it cannot find *utility*.

100348 **NAME**

100349 head — copy the first part of files

100350 **SYNOPSIS**100351 head [-c *number*|-n *number*] [*file*...]100352 **DESCRIPTION**100353 The *head* utility shall copy its input files to the standard output, ending the output for each file at  
100354 a designated point.100355 Copying shall end at the point in the file indicated by the *-c number* or *-n number* options. The  
100356 option-argument *number* shall be counted in units of lines or bytes, according to the options *-n*  
100357 and *-c*. Both line and byte counts start from 1.100358 **OPTIONS**100359 The *head* utility shall conform to XBD [Section 12.2](#) (on page 215).

100360 The following options shall be supported:

100361 *-c number* The first *number* bytes of each input file shall be copied to standard output. The  
100362 application shall ensure that the *number* option-argument is a positive decimal  
100363 integer.100364 *-n number* This option shall be equivalent to *-c number*, except that the ending location in the  
100365 file shall be measured in lines instead of bytes.100366 When a file contains less than *number* bytes or lines, it shall be copied to standard output in its  
100367 entirety. This shall not be an error.100368 If no options are specified, *head* shall act as if *-n 10* had been specified.100369 **OPERANDS**

100370 The following operand shall be supported:

100371 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
100372 shall be used.100373 **STDIN**100374 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
100375 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
100376 the standard input shall not be used. See the INPUT FILES section.100377 **INPUT FILES**100378 If the *-c* option is specified, the input files can contain arbitrary data; otherwise, the input files  
100379 shall be text files, but the line length shall not be restricted to {LINE\_MAX} bytes.100380 **ENVIRONMENT VARIABLES**100381 The following environment variables shall affect the execution of *head*:100382 *LANG* Provide a default value for the internationalization variables that are unset or null.  
100383 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
100384 variables used to determine the values of locale categories.)100385 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
100386 internationalization variables.100387 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
100388 characters (for example, single-byte as opposed to multi-byte characters in  
100389 arguments and input files).

- 100390 **LC\_MESSAGES**
- 100391 Determine the locale that should be used to affect the format and contents of
- 100392 diagnostic messages written to standard error.
- 100393 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 100394 **ASYNCHRONOUS EVENTS**
- 100395 Default.
- 100396 **STDOUT**
- 100397 The standard output shall contain designated portions of the input files.
- 100398 If multiple *file* operands are specified, *head* shall precede the output for each with the header:
- 100399 "\n==> %s <==\n", <pathname>
- 100400 except that the first header written shall not include the initial <newline>.
- 100401 **STDERR**
- 100402 The standard error shall be used only for diagnostic messages.
- 100403 **OUTPUT FILES**
- 100404 None.
- 100405 **EXTENDED DESCRIPTION**
- 100406 None.
- 100407 **EXIT STATUS**
- 100408 The following exit values shall be returned:
- 100409 0 Successful completion.
- 100410 >0 An error occurred.
- 100411 **CONSEQUENCES OF ERRORS**
- 100412 Default.
- 100413 **APPLICATION USAGE**
- 100414 When using *head* to process pathnames, it is recommended that *LC\_ALL*, or at least *LC\_CTYPE*
- 100415 and *LC\_COLLATE*, are set to *POSIX* or *C* in the environment, since pathnames can contain byte
- 100416 sequences that do not form valid characters in some locales, in which case the utility's behavior
- 100417 would be undefined. In the *POSIX* locale each byte is a valid single-byte character, and therefore
- 100418 this problem is avoided.
- 100419 **EXAMPLES**
- 100420 To write the first ten lines of all files (except those with a leading period) in the directory:
- 100421 `head -- *`
- 100422 **RATIONALE**
- 100423 Although it is possible to simulate *head* with *sed* 10q for a single file, the standard developers
- 100424 decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside
- 100425 *tail*.
- 100426 *POSIX.1-2024* version of *head* follows the Utility Syntax Guidelines. The `-n` option was added to
- 100427 this new interface so that *head* and *tail* would be more logically related. Earlier versions of this
- 100428 standard allowed a `-number` option. This form is no longer specified by *POSIX.1-2024* but may
- 100429 be present in some implementations.
- 100430 The *head* and *tail* utilities have not historically been symmetric. For example, this standard only
- 100431 requires *tail* to support at most one file operand, while *head* must operate on multiple files.

100432 Conversely, this standard requires *tail* to be able to start at a position relative to the start of a file,  
100433 but *head* need not support stopping at a position relative to the end of the file. Implementations  
100434 may choose to make *head* and *tail* symmetric as an extension, but applications should not rely on  
100435 this.

100436 Older implementations of *head* did not support `-c number`, but emulating this via `dd ibs=1`  
100437 `count=number` is much less efficient and emulating via `dd obs=pipe_buf | dd ibs=size`  
100438 `count=number_of_blocks` is cumbersome, somewhat less efficient, and can only be used if  
100439 the number of bytes to be copied is a multiple of a suitable block size less than or equal to  
100440 `{PIPE_BUF}`.

#### 100441 FUTURE DIRECTIONS

100442 If this utility is directed to display a pathname that contains any bytes that have the encoded  
100443 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
100444 format being used, implementations are encouraged to treat this as an error. A future version of  
100445 this standard may require implementations to treat this as an error.

#### 100446 SEE ALSO

100447 *dd*, *sed*, *tail*

100448 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 100449 CHANGE HISTORY

100450 First released in Issue 4.

#### 100451 Issue 6

100452 The obsolescent `-number` form is removed.

100453 The normative text is reworded to avoid use of the term “must” for application requirements.

100454 The DESCRIPTION is updated to clarify that when a file contains less than the number of lines  
100455 requested, the entire file is copied to standard output.

#### 100456 Issue 7

100457 Austin Group Interpretations 1003.1-2001 #027 and #092 are applied.

100458 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100459 The APPLICATION USAGE section is removed and the EXAMPLES section is corrected.

100460 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0107 [663] is applied.

#### 100461 Issue 8

100462 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
100463 directed to display a pathname that contains any bytes that have the encoded value of a  
100464 `<newline>` character when `<newline>` is a terminator or separator in the output format being  
100465 used.

100466 Austin Group Defect 407 is applied, adding the `-c number` option.

100467 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

100468 **NAME**

100469 iconv — codeset conversion

100470 **SYNOPSIS**100471 iconv [-cs] -f *frommap* -t *tomap* [*file...*]100472 iconv -f *fromcode* [-cs] [-t *tocode*] [*file...*]100473 iconv -t *tocode* [-cs] [-f *fromcode*] [*file...*]

100474 iconv -l

100475 **DESCRIPTION**100476 The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and  
100477 write the results to standard output.100478 When the options indicate that charmap files are used to specify the codesets (see **OPTIONS**),  
100479 the codeset conversion shall be accomplished by performing a logical join on the symbolic  
100480 character names in the two charmaps. The implementation need not support the use of charmap  
100481 files for codeset conversion unless the POSIX2\_LOCALEDEF symbol is defined on the system.100482 **OPTIONS**100483 The *iconv* utility shall conform to XBD [Section 12.2](#) (on page 215).

100484 The following options shall be supported:

100485 **-c** Omit any characters that are invalid in the codeset of the input file from the  
100486 output. When **-c** is not used, the results of encountering invalid characters in the  
100487 input stream (either those that are not characters in the codeset of the input file or  
100488 that have no corresponding character in the codeset of the output file) shall be  
100489 specified in the system documentation. The presence or absence of **-c** shall not  
100490 affect the exit status of *iconv*.100491 **-f** *fromcodeset*100492 Identify the codeset of the input file. The implementation shall recognize the  
100493 following two forms of the *fromcodeset* option-argument:100494 *fromcode* The *fromcode* option-argument can not contain a <slash> character. It  
100495 shall be interpreted as the name of one of the codeset descriptions  
100496 provided by the implementation in an unspecified format. Valid  
100497 values of *fromcode* are implementation-defined.100498 *frommap* The *frommap* option-argument needs to contain a <slash> character. It  
100499 shall be interpreted as the pathname of a charmap file as defined in  
100500 XBD [Section 6.4](#) (on page 121). If the pathname does not represent a  
100501 valid, readable charmap file, the results are undefined.

100502 If this option is omitted, the codeset of the current locale shall be used.

100503 **-l** Write all supported *fromcode* and *tocode* values to standard output in an unspecified  
100504 format.100505 **-s** Suppress any messages written to standard error concerning invalid characters.  
100506 When **-s** is not used, the results of encountering invalid characters in the input  
100507 stream (either those that are not valid characters in the codeset of the input file or  
100508 that have no corresponding character in the codeset of the output file) shall be  
100509 specified in the system documentation. The presence or absence of **-s** shall not  
100510 affect the exit status of *iconv*.

- 100511        **-t tocodeset** Identify the codeset to be used for the output file. The implementation shall  
100512                                   recognize the following two forms of the *tocodeset* option-argument:
- 100513                    *tocode*            The semantics shall be equivalent to the **-f fromcode** option.
- 100514                    *tomap*             The semantics shall be equivalent to the **-f frommap** option.
- 100515                    If this option is omitted, the codeset of the current locale shall be used.
- 100516            If either **-f** or **-t** represents a charmap file, but the other does not (or is omitted), or both **-f** and  
100517            **-t** are omitted, the results are undefined.
- 100518 **OPERANDS**
- 100519        The following operand shall be supported:
- 100520        *file*            A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
100521                                   '-' , the standard input shall be used.
- 100522 **STDIN**
- 100523        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-' .
- 100524 **INPUT FILES**
- 100525        The input file shall be a text file.
- 100526 **ENVIRONMENT VARIABLES**
- 100527        The following environment variables shall affect the execution of *iconv*:
- 100528        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
100529                                   (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
100530                                   variables used to determine the values of locale categories.)
- 100531        **LC\_ALL**           If set to a non-empty string value, override the values of all the other  
100532                                   internationalization variables.
- 100533        **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
100534                                   characters (for example, single-byte as opposed to multi-byte characters in  
100535                                   arguments). During translation of the file, this variable is superseded by the use of  
100536                                   the *fromcode* option-argument.
- 100537        **LC\_MESSAGES**
- 100538                                   Determine the locale that should be used to affect the format and contents of  
100539                                   diagnostic messages written to standard error.
- 100540 XSI        **NLSPATH**        Determine the location of messages objects and message catalogs.
- 100541 **ASYNCHRONOUS EVENTS**
- 100542        Default.
- 100543 **STDOUT**
- 100544        When the **-I** option is used, the standard output shall contain all supported *fromcode* and *tocode*  
100545                                   values, written in an unspecified format.
- 100546        When the **-I** option is not used, the standard output shall contain the sequence of characters  
100547                                   read from the input files, translated to the specified codeset. Nothing else shall be written to the  
100548                                   standard output.
- 100549 **STDERR**
- 100550        The standard error shall be used only for diagnostic messages.

100551 **OUTPUT FILES**

100552 None.

100553 **EXTENDED DESCRIPTION**

100554 None.

100555 **EXIT STATUS**

100556 The following exit values shall be returned:

100557 0 Successful completion.

100558 &gt;0 An error occurred.

100559 **CONSEQUENCES OF ERRORS**

100560 Default.

100561 **APPLICATION USAGE**100562 The user must ensure that both charmap files use the same symbolic names for characters the  
100563 two codesets have in common.100564 **EXAMPLES**100565 The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:2001  
100566 standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file  
100567 **mail.local**:100568 `iconv -f IS6937 -t IS8859 mail.x400 > mail.local`100569 **RATIONALE**100570 The *iconv* utility can be used portably only when the user provides two charmap files as option-  
100571 arguments. This is because a single charmap provided by the user cannot reliably be joined with  
100572 the names in a system-provided character set description. The valid values for *fromcode* and  
100573 *tocode* are implementation-defined and do not have to have any relation to the charmap  
100574 mechanisms. As an aid to interactive users, the `-I` option was adopted from the Plan 9 operating  
100575 system. It writes information concerning these implementation-defined values. The format is  
100576 unspecified because there are many possible useful formats that could be chosen, such as a  
100577 matrix of valid combinations of *fromcode* and *tocode*. The `-I` option is not intended for shell script  
100578 usage; conforming applications will have to use charmaps.100579 The *iconv* utility may support the conversion between ASCII and EBCDIC-based encodings, but  
100580 is not required to do so. In an XSI-compliant implementation, the *dd* utility is the only method  
100581 guaranteed to support conversion between these two character sets.100582 **FUTURE DIRECTIONS**

100583 None.

100584 **SEE ALSO**100585 *dd*, *gencat*100586 XBD [Section 6.4](#) (on page 121), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)100587 **CHANGE HISTORY**

100588 First released in Issue 3.

100589 **Issue 6**100590 This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the  
100591 ability to use charmap files for conversion has been added.100592 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address  
100593 inconsistencies with the *iconv()* function in the System Interfaces volume of POSIX.1-2024.

100594 **Issue 7**

100595 Austin Group Interpretation 1003.1-2001 #206 is applied, correcting the *tomap* option.

100596 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100597 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0094 [291] and XCU/TC1-2008/0095  
100598 [291] are applied.

100599 **Issue 8**

100600 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

100601 **NAME**100602 `id` — return user identity100603 **SYNOPSIS**100604 `id` [*user*]100605 `id -G [-n] [user]`100606 `id -g [-nr] [user]`100607 `id -u [-nr] [user]`100608 **DESCRIPTION**

100609 If no *user* operand is provided, the *id* utility shall write the user and group IDs and the  
 100610 corresponding user and group names of the invoking process to standard output. If the effective  
 100611 and real IDs do not match, both shall be written. If multiple groups are supported by the  
 100612 underlying system (see the description of {NGROUPS\_MAX} in the System Interfaces volume of  
 100613 POSIX.1-2024), the supplementary group affiliations of the invoking process shall also be  
 100614 written.

100615 If a *user* operand is provided and the process has appropriate privileges, the user and group IDs  
 100616 of the selected user shall be written. In this case, effective IDs shall be assumed to be identical to  
 100617 real IDs. If the selected user has more than one allowable group membership listed in the group  
 100618 database, these shall be written in the same manner as the supplementary groups described in  
 100619 the preceding paragraph.

100620 **OPTIONS**100621 The *id* utility shall conform to XBD [Section 12.2](#) (on page 215).

100622 The following options shall be supported:

100623 **-G** Output all different group IDs (effective, real, and supplementary) only, using the  
 100624 format "`%u\n`". If there is more than one distinct group affiliation, output each  
 100625 such affiliation, using the format "`%u`", before the <newline> is output.

100626 **-g** Output only the effective group ID, using the format "`%u\n`".

100627 **-n** Output the name in the format "`%s`" instead of the numeric ID using the format  
 100628 "`%u`".

100629 **-r** Output the real ID instead of the effective ID.

100630 **-u** Output only the effective user ID, using the format "`%u\n`".

100631 **OPERANDS**

100632 The following operand shall be supported:

100633 *user* The login name for which information is to be written.

100634 **STDIN**

100635 Not used.

100636 **INPUT FILES**

100637 None.

100638 **ENVIRONMENT VARIABLES**100639 The following environment variables shall affect the execution of *id*:

100640 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100641 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 100642 variables used to determine the values of locale categories.)

100643 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
100644 internationalization variables.

100645 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
100646 characters (for example, single-byte as opposed to multi-byte characters in  
100647 arguments).

100648 *LC\_MESSAGES*  
100649 Determine the locale that should be used to affect the format and contents of  
100650 diagnostic messages written to standard error and informative messages written to  
100651 standard output.

100652 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

100653 **ASYNCHRONOUS EVENTS**  
100654 Default.

100655 **STDOUT**  
100656 The following formats shall be used when the *LC\_MESSAGES* locale category specifies the  
100657 POSIX locale. In other locales, the strings *uid*, *gid*, *euid*, *egid*, and *groups* may be replaced with  
100658 more appropriate strings corresponding to the locale.

100659 "uid=%u(%s) gid=%u(%s)\n", <real user ID>, <user-name>,  
100660 <real group ID>, <group-name>

100661 If the effective and real user IDs do not match, the following shall be inserted immediately  
100662 before the '\n' character in the previous format:

100663 " euid=%u(%s) "

100664 with the following arguments added at the end of the argument list:

100665 <effective user ID>, <effective user-name>

100666 If the effective and real group IDs do not match, the following shall be inserted directly before  
100667 the '\n' character in the format string (and after any addition resulting from the effective and  
100668 real user IDs not matching):

100669 " egid=%u(%s) "

100670 with the following arguments added at the end of the argument list:

100671 <effective group-ID>, <effective group name>

100672 If the process has supplementary group affiliations or the selected user is allowed to belong to  
100673 multiple groups, the first shall be added directly before the <newline> in the format string:

100674 " groups=%u(%s) "

100675 with the following arguments added at the end of the argument list:

100676 <supplementary group ID>, <supplementary group name>

100677 and the necessary number of the following added after that for any remaining supplementary  
100678 group IDs:

100679 ", %u(%s) "

100680 and the necessary number of the following arguments added at the end of the argument list:

100681 <supplementary group ID>, <supplementary group name>

100682 If any of the user ID, group ID, effective user ID, effective group ID, or supplementary/multiple

100683 group IDs cannot be mapped by the system into printable user or group names, the  
100684 corresponding "(%s)" and *name* argument shall be omitted from the corresponding format  
100685 string.

100686 When any of the options are specified, the output format shall be as described in the OPTIONS  
100687 section.

#### 100688 **STDERR**

100689 The standard error shall be used only for diagnostic messages.

#### 100690 **OUTPUT FILES**

100691 None.

#### 100692 **EXTENDED DESCRIPTION**

100693 None.

#### 100694 **EXIT STATUS**

100695 The following exit values shall be returned:

100696 0 Successful completion.

100697 >0 An error occurred.

#### 100698 **CONSEQUENCES OF ERRORS**

100699 Default.

#### 100700 **APPLICATION USAGE**

100701 Output produced by the **-G** option and by the default case could potentially produce very long  
100702 lines on systems that support large numbers of supplementary groups. (On systems with user  
100703 and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per  
100704 name, 93 supplementary groups plus distinct effective and real group and user IDs could  
100705 theoretically overflow the 2048-byte {LINE\_MAX} text file line limit on the default output case.  
100706 It would take about 186 supplementary groups to overflow the 2048-byte barrier using *id -G*.)  
100707 This is not expected to be a problem in practice, but in cases where it is a concern, applications  
100708 should consider using *fold -s* before post-processing the output of *id*.

#### 100709 **EXAMPLES**

100710 None.

#### 100711 **RATIONALE**

100712 The functionality provided by the 4 BSD *groups* utility can be simulated using:

```
100713 id -Gn [ user ]
```

100714 The 4 BSD command *groups* was considered, but it was not included because it did not provide  
100715 the functionality of the *id* utility of the SVID. Also, it was thought that it would be easier to  
100716 modify *id* to provide the additional functionality necessary to systems with multiple groups than  
100717 to invent another command.

100718 The options **-u**, **-g**, **-n**, and **-r** were added to ease the use of *id* with shell commands  
100719 substitution. Without these options it is necessary to use some preprocessor such as *sed* to select  
100720 the desired piece of information. Since output such as that produced by:

```
100721 id -u -n
```

100722 is frequently wanted, it seemed desirable to add the options.

100723 **FUTURE DIRECTIONS**

100724 None.

100725 **SEE ALSO**100726 *fold, logname, who*

100727 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

100728 XSH *getgid()*, *getgroups()*, *getuid()*100729 **CHANGE HISTORY**

100730 First released in Issue 2.

100731 **Issue 7**

100732 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100733 **Issue 8**100734 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

100735 **NAME**

100736 ipcrm — remove an XSI message queue, semaphore set, or shared memory segment identifier

100737 **SYNOPSIS**

```
100738 XSI ipcrm [-q msgid|-Q msgkey|-s semid|-S semkey|-m shmid|-M shmkey]...
```

100739 **DESCRIPTION**

100740 The *ipcrm* utility shall remove zero or more message queues, semaphore sets, or shared memory  
100741 segments. The interprocess communication facilities to be removed are specified by the options.

100742 Only a user with appropriate privileges shall be allowed to remove an interprocess  
100743 communication facility that was not created by or owned by the user invoking *ipcrm*.

100744 **OPTIONS**

100745 The *ipcrm* utility shall conform to XBD [Section 12.2](#) (on page 215).

100746 The following options shall be supported:

100747 **-q** *msgid* Remove the message queue identifier *msgid* from the system and destroy the  
100748 message queue and data structure associated with it.

100749 **-m** *shmid* Remove the shared memory identifier *shmid* from the system. The shared memory  
100750 segment and data structure associated with it shall be destroyed when all  
100751 processes with the segment attached have either detached the segment or  
100752 terminated. If the segment is not attached to any process, it shall be destroyed  
100753 immediately.

100754 **-s** *semid* Remove the semaphore identifier *semid* from the system and destroy the set of  
100755 semaphores and data structure associated with it.

100756 **-Q** *msgkey* Remove the message queue identifier, created with key *msgkey*, from the system  
100757 and destroy the message queue and data structure associated with it.

100758 **-M** *shmkey* Remove the shared memory identifier, created with key *shmkey*, from the system.  
100759 The shared memory segment and data structure associated with it shall be  
100760 destroyed after the last detach.

100761 **-S** *semkey* Remove the semaphore identifier, created with key *semkey*, from the system and  
100762 destroy the set of semaphores and data structure associated with it.

100763 **OPERANDS**

100764 None.

100765 **STDIN**

100766 Not used.

100767 **INPUT FILES**

100768 None.

100769 **ENVIRONMENT VARIABLES**

100770 The following environment variables shall affect the execution of *ipcrm*:

100771 **LANG** Provide a default value for the internationalization variables that are unset or null.  
100772 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
100773 variables used to determine the values of locale categories.)

100774 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
100775 internationalization variables.

- 100776 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
- 100777
- 100778
- 100779 **LC\_MESSAGES**
- 100780 Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
- 100781
- 100782 **NLSPATH** Determine the location of messages objects and message catalogs.
- 100783 **ASYNCHRONOUS EVENTS**
- 100784 Default.
- 100785 **STDOUT**
- 100786 Not used.
- 100787 **STDERR**
- 100788 The standard error shall be used only for diagnostic messages.
- 100789 **OUTPUT FILES**
- 100790 None.
- 100791 **EXTENDED DESCRIPTION**
- 100792 None.
- 100793 **EXIT STATUS**
- 100794 The following exit values shall be returned:
- 100795 0 Successful completion.
- 100796 >0 An error occurred.
- 100797 **CONSEQUENCES OF ERRORS**
- 100798 Default.
- 100799 **APPLICATION USAGE**
- 100800 None.
- 100801 **EXAMPLES**
- 100802 None.
- 100803 **RATIONALE**
- 100804 None.

100815 **Issue 8**

100816 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

100817 Austin Group Defect 1240 is applied, clarifying the description of the **-m** option.

100818 **NAME**

100819 ipcs — report XSI interprocess communication facilities status

100820 **SYNOPSIS**100821 XSI `ipcs [-qms] [-a|-bcopt]`100822 **DESCRIPTION**100823 The *ipcs* utility shall write information about active interprocess communication facilities.

100824 Without options, information shall be written in short format for message queues, shared  
 100825 memory segments, and semaphore sets that are currently active in the system. Otherwise, the  
 100826 information that is displayed is controlled by the options specified.

100827 **OPTIONS**100828 The *ipcs* utility shall conform to XBD [Section 12.2](#) (on page 215).100829 The *ipcs* utility accepts the following options:100830 **-q** Write information about active message queues.100831 **-m** Write information about active shared memory segments.100832 **-s** Write information about active semaphore sets.

100833 If **-q**, **-m**, or **-s** are specified, only information about those facilities shall be written. If none of  
 100834 these three are specified, information about all three shall be written subject to the following  
 100835 options:

100836 **-a** Use all print options. (This is a shorthand notation for **-b**, **-c**, **-o**, **-p**, and **-t**.)

100837 **-b** Write information on maximum allowable size. (Maximum number of bytes in  
 100838 messages on queue for message queues, size of segments for shared memory, and  
 100839 number of semaphores in each set for semaphores.)

100840 **-c** Write creator's user name and group name; see below.

100841 **-o** Write information on outstanding usage. (Number of messages on queue and total  
 100842 number of bytes in messages on queue for message queues, and number of  
 100843 processes attached to shared memory segments.)

100844 **-p** Write process number information. (Process ID of the last process to send a  
 100845 message and process ID of the last process to receive a message on message  
 100846 queues, process ID of the creating process, and process ID of the last process to  
 100847 attach or detach on shared memory segments.)

100848 **-t** Write time information. (Time of the last control operation that changed the access  
 100849 permissions for all facilities, time of the last *msgsnd()* and *msgrcv()* operations on  
 100850 message queues, time of the last *shmat()* and *shmdt()* operations on shared  
 100851 memory, and time of the last *semop()* operation on semaphores.)

100852 **OPERANDS**

100853 None.

100854 **STDIN**

100855 Not used.

100856 **INPUT FILES**

100857 • The group database

- The user database

## 100859 ENVIRONMENT VARIABLES

100860 The following environment variables shall affect the execution of *ipcs*:

100861 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100862 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 100863 variables used to determine the values of locale categories.)

100864 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100865 internationalization variables.

100866 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100867 characters (for example, single-byte as opposed to multi-byte characters in  
 100868 arguments).

100869 *LC\_MESSAGES*  
 100870 Determine the locale that should be used to affect the format and contents of  
 100871 diagnostic messages written to standard error.

100872 *NLSPATH* Determine the location of messages objects and message catalogs.

100873 *TZ* Determine the timezone for the date and time strings written by *ipcs*. If *TZ* is unset  
 100874 or null, an unspecified default timezone shall be used.

## 100875 ASYNCHRONOUS EVENTS

100876 Default.

## 100877 STDOUT

100878 An introductory line shall be written with the format:

100879 `"IPC status from %s as of %s\n", <source>, <date>`

100880 where *<source>* indicates the source used to gather the statistics and *<date>* is the information  
 100881 that would be produced by the *date* command when invoked in the POSIX locale.

100882 The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options.  
 100883 The first report shall indicate the status of message queues, the second report shall indicate the  
 100884 status of shared memory segments, and the third report shall indicate the status of semaphore  
 100885 sets.

100886 If the corresponding facility is not installed or has not been used since the last reboot, then the  
 100887 report shall be written out in the format:

100888 `"%s facility not in system.\n", <facility>`

100889 where *<facility>* is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has  
 100890 been installed and has been used since the last reboot, column headings separated by one or  
 100891 more *<space>* characters and followed by a *<newline>* shall be written as indicated below  
 100892 followed by the facility name written out using the format:

100893 `"%s:\n", <facility>`

100894 where *<facility>* is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second  
 100895 and third reports the column headings need not be written if the last column headings written  
 100896 already provide column headings for all information in that report.

100897 The column headings provided in the first column below and the meaning of the information in  
 100898 those columns shall be given in order below; the letters in parentheses indicate the options that  
 100899 shall cause the corresponding column to appear; "all" means that the column shall always  
 100900 appear. Each column is separated by one or more *<space>* characters. Note that these options

| 100926 |            | The next nine characters shall be interpreted as three sets of three bits each. The first set refers to the owner's permissions; the next to permissions of others in the usergroup of the facility entry; and the last to all others. Within each set, the first character indicates permission to read, the second character indicates permission to write or alter the facility entry, and the last character is a <hyphen-minus> ('-'). |

| 100984 |               |                                                                                                                                                                                                                                                                                                               |

100985 shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format  
100986 " no-entry" shall be written.

100987 The following eight columns shall be only written out for shared memory segments.

100988 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
100989 found in the user database, at least the first eight column positions of the  
100990 name shall be written using the format %s. Otherwise, the user ID of the  
100991 creator shall be written using the format %d.

100992 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
100993 creator is found in the group database, at least the first eight column positions  
100994 of the name shall be written using the format %s. Otherwise, the group ID of  
100995 the creator shall be written using the format %d.

100996 NATTCH (a,o) The number of processes attached to the associated shared memory segment.  
100997 This field shall be written using the format %d.

100998 SEGSZ (a,b) The size of the associated shared memory segment. This field shall be written  
100999 using the format %d.

101000 CPID (a,p) The process ID of the creator of the shared memory entry. This field shall be  
101001 written using the format %d.

101002 LPID (a,p) The process ID of the last process to attach or detach the shared memory  
101003 segment. This field shall be written using the format:

101004 "%d", <pid>

101005 where <pid> is 0 if no process has attached the corresponding shared memory  
101006 segment; otherwise, <pid> shall be the process ID of the last process to attach  
101007 or detach the segment.

101008 ATIME (a,t) The time the last attach on the associated shared memory segment was  
101009 completed. If the corresponding shared memory segment has ever been  
101010 attached, the hour, minute, and second of the last time the segment was  
101011 attached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
101012 format " no-entry" shall be written.

101013 DTIME (a,t) The time the last detach on the associated shared memory segment was  
101014 completed. If the corresponding shared memory segment has ever been  
101015 detached, the hour, minute, and second of the last time the segment was  
101016 detached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
101017 format " no-entry" shall be written.

101018 The following four columns shall be only written out for semaphore sets:

101019 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
101020 found in the user database, at least the first eight column positions of the  
101021 name shall be written using the format %s. Otherwise, the user ID of the  
101022 creator shall be written using the format %d.

101023 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
101024 creator is found in the group database, at least the first eight column positions  
101025 of the name shall be written using the format %s. Otherwise, the group ID of  
101026 the creator shall be written using the format %d.

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 101027 | <b>NSEMS (a,b)</b>            | The number of semaphores in the set associated with the semaphore entry.                                                                                                                                                                                                                                                                                                         |
| 101028 |                               | This field shall be written using the format %d.                                                                                                                                                                                                                                                                                                                                 |
| 101029 | <b>OTIME (a,t)</b>            | The time the last semaphore operation on the set associated with the semaphore entry was completed. If a semaphore operation has ever been performed on the corresponding semaphore set, the hour, minute, and second of the last semaphore operation on the semaphore set shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be written. |

| 101059 |                               | If this utility is directed to display a pathname that contains any bytes that have the encoded value of a <newline> character when <newline> is a terminator or separator in the output format being used, implementations are encouraged to treat this as an error. A future version of this standard may require implementations to treat this as an error.                   |

101067 **CHANGE HISTORY**

101068 First released in Issue 5.

101069 **Issue 6**

101070 The Open Group Corrigendum U020/1 is applied, correcting the SYNOPSIS.

101071 The Open Group Corrigenda U032/1 and U032/2 are applied, clarifying the output format.

101072 The Open Group Base Resolution bwg98-004 is applied.

101073 **Issue 7**

101074 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101075 SD5-XCU-ERN-139 is applied, adding the *ipcrm* utility to the SEE ALSO section.

101076 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0108 [584] is applied.

101077 **Issue 8**101078 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
101079 directed to display a pathname that contains any bytes that have the encoded value of a  
101080 <newline> character when <newline> is a terminator or separator in the output format being  
101081 used.101082 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

101083 **NAME**

101084 jobs — display status of jobs in the current shell execution environment

101085 **SYNOPSIS**101086 UP `jobs [-l | -p] [job_id...]`101087 **DESCRIPTION**

101088 If the current shell execution environment (see [Section 2.13](#), on page 2522) is not a subshell  
 101089 environment, the *jobs* utility shall display the status of background jobs that were created in the  
 101090 current shell execution environment; it may also do so if the current shell execution environment  
 101091 is a subshell environment.

101092 When *jobs* reports the termination status of a job, the shell shall remove the job from the  
 101093 background jobs list and the associated process ID from the list of those “known in the current  
 101094 shell execution environment”; see [Section 2.9.3.1](#) (on page 2506). If a write error occurs when  
 101095 *jobs* writes to standard output, some process IDs might have been removed from the list but not  
 101096 successfully reported.

101097 **OPTIONS**101098 The *jobs* utility shall conform to XBD [Section 12.2](#) (on page 215).

101099 The following options shall be supported:

101100 **-l** (The letter ell.) Provide more information about each job listed. See STDOUT for  
 101101 details.

101102 **-p** Display only the process IDs for the process group leaders of job-control  
 101103 background jobs and the process IDs associated with non-job-control background  
 101104 jobs (if supported).

101105 By default, the *jobs* utility shall display the status of all background jobs, both running and  
 101106 suspended, and all jobs whose status has changed and have not been reported by the shell.

101107 **OPERANDS**

101108 The following operand shall be supported:

101109 *job\_id* Specifies the jobs for which the status is to be displayed. If no *job\_id* is given, the  
 101110 status information for all jobs shall be displayed. The format of *job\_id* is described  
 101111 in XBD [Section 3.182](#) (on page 57).

101112 **STDIN**

101113 Not used.

101114 **INPUT FILES**

101115 None.

101116 **ENVIRONMENT VARIABLES**101117 The following environment variables shall affect the execution of *jobs*:

101118 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 101119 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 101120 variables used to determine the values of locale categories.)

101121 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 101122 internationalization variables.

101123 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 101124 characters (for example, single-byte as opposed to multi-byte characters in  
 101125 arguments).

- 101126 *LC\_MESSAGES*
- 101127 Determine the locale that should be used to affect the format and contents of
- 101128 diagnostic messages written to standard error and informative messages written to
- 101129 standard output.
- 101130 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 101131 **ASYNCHRONOUS EVENTS**
- 101132 Default.
- 101133 **STDOUT**
- 101134 If the **-p** option is specified, the output shall consist of one line for each process ID:
- 101135 "%d\n", <process ID>
- 101136 Otherwise, if the **-l** option is not specified, the output shall be a series of lines of the form:
- 101137 "[%d] %c %s %s\n", <job-number>, <current>, <state>, <command>
- 101138 where the fields shall be as follows:
- 101139 <current> The character '+' identifies the job that would be used as a default for the *fg* or *bg*
- 101140 utilities; this job can also be specified using the *job\_id* %+ or "%%". The character
- 101141 '-' identifies the job that would become the default if the current default job were
- 101142 to exit; this job can also be specified using the *job\_id* %-. For other jobs, this field is
- 101143 a <space>. At most one job can be identified with '+' and at most one job can be
- 101144 identified with '-'. If there is any suspended job, then the current job shall be a
- 101145 suspended job. If there are at least two suspended jobs, then the previous job also
- 101146 shall be a suspended job.
- 101147 <job-number> A number that can be used to identify the job to the *wait*, *fg*, *bg*, and *kill* utilities.
- 101148 Using these utilities, the job can be identified by prefixing the job number with
- 101149 '% '.
- 101150 <state> One of the following strings (in the POSIX locale):
- 101151 **Running** Indicates that the job has not been suspended by a signal and has not
- 101152 exited.
- 101153 **Done** Indicates that the job completed and returned exit status zero.
- 101154 **Done(code)** Indicates that the job completed normally and that it exited with the
- 101155 specified non-zero exit status, *code*, expressed as a decimal number.
- 101156 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.
- 101157 **Stopped (SIGTSTP)**
- 101158 Indicates that the job was suspended by the SIGTSTP signal.
- 101159 **Stopped (SIGSTOP)**
- 101160 Indicates that the job was suspended by the SIGSTOP signal.
- 101161 **Stopped (SIGTTIN)**
- 101162 Indicates that the job was suspended by the SIGTTIN signal.
- 101163 **Stopped (SIGTTOU)**
- 101164 Indicates that the job was suspended by the SIGTTOU signal.
- 101165 The implementation may substitute the string **Suspended** in place of **Stopped**. If
- 101166 the job was terminated by a signal, the format of <state> is unspecified, but it shall
- 101167 be visibly distinct from all of the other <state> formats shown here and shall

- 101168 indicate the name or description of the signal causing the termination.
- 101169 `<command>` The associated command that was given to the shell.
- 101170 If the `-l` option is specified:
- 101171 • For job-control background jobs, a field containing the process group ID shall be inserted
  - 101172 before the `<state>` field. Also, more processes in a process group may be output on separate
  - 101173 lines, using only the process ID and `<command>` fields.
  - 101174 • For non-job-control background jobs (if supported), a field containing the process ID
  - 101175 associated with the job shall be inserted before the `<state>` field. Also, more processes
  - 101176 created to execute the job may be output on separate lines, using only the process ID and
  - 101177 `<command>` fields.
- 101178 **STDERR**
- 101179 The standard error shall be used only for diagnostic messages.
- 101180 **OUTPUT FILES**
- 101181 None.
- 101182 **EXTENDED DESCRIPTION**
- 101183 None.
- 101184 **EXIT STATUS**
- 101185 The following exit values shall be returned:
- 101186 0 The output specified in `STDOUT` was successfully written to standard output.
- 101187 >0 An error occurred.
- 101188 **CONSEQUENCES OF ERRORS**
- 101189 Default.
- 101190 **APPLICATION USAGE**
- 101191 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.
- 101192 The `-p` option is the only portable way to find out the process group of a job-control background
- 101193 job because different implementations have different strategies for defining the process group of
- 101194 the job. Usage such as `$(jobs -p)` provides a way of referring to the process group of the job in an
- 101195 implementation-independent way.
- 101196 The `jobs` utility does not work as expected when it is operating in its own utility execution
- 101197 environment because that environment has no applicable jobs to manipulate. See the
- 101198 **APPLICATION USAGE** section for `bg`. For this reason, `jobs` is generally implemented as a shell
- 101199 regular built-in.
- 101200 **EXAMPLES**
- 101201 None.
- 101202 **RATIONALE**
- 101203 Both "`%%`" and "`%+`" are used to refer to the current job. Both forms are of equal validity—the
- 101204 "`%%`" mirroring "`$$`" and "`%+`" mirroring the output of `jobs`. Both forms reflect historical
- 101205 practice of the KornShell and the C shell with job control.
- 101206 The job control features provided by `bg`, `fg`, and `jobs` are based on the KornShell. The standard
- 101207 developers examined the characteristics of the C shell versions of these utilities and found that
- 101208 differences exist. Despite widespread use of the C shell, the KornShell versions were selected for
- 101209 this volume of POSIX.1-2024 to maintain a degree of uniformity with the rest of the KornShell
- 101210 features selected (such as the very popular command line editing features).

101211 The *jobs* utility is not dependent on job control being enabled, as are the seemingly related *bg*  
 101212 and *fg* utilities because *jobs* is useful for examining background jobs, regardless of the current  
 101213 state of job control. When job control has been disabled using *set +m*, the *jobs* utility can still be  
 101214 used to examine the job-control background jobs and (if supported) non-job-control background  
 101215 jobs that were created in the current shell execution environment. See also the RATIONALE for  
 101216 *kill* and *wait*.

101217 The output for terminated jobs is left unspecified to accommodate various historical systems.  
 101218 The following formats have been witnessed:

- 101219 1. **Killed**(*signal name*)
- 101220 2. *signal name*
- 101221 3. *signal name*(**coredump**)
- 101222 4. *signal description*– **core dumped**

101223 Most users should be able to understand these formats, although it means that applications have  
 101224 trouble parsing them.

101225 The calculation of job IDs was not described since this would suggest an implementation, which  
 101226 may impose unnecessary restrictions.

101227 In an early proposal, a **-n** option was included to “Display the status of jobs that have changed,  
 101228 exited, or stopped since the last status report”. It was removed because the shell always writes  
 101229 any changed status of jobs before each prompt.

101230 If *jobs* uses buffered writes to standard output, a write error could be detected when attempting  
 101231 to flush a buffer containing multiple reports of terminated jobs, resulting in some unreported  
 101232 jobs having their process IDs removed from the list of those known in the current shell execution  
 101233 environment (because they were removed when the report was added to the buffer).

#### 101234 FUTURE DIRECTIONS

101235 None.

#### 101236 SEE ALSO

101237 [Section 2.13](#) (on page 2522), *bg*, *fg*, *kill*, *wait*

101238 [XBD Section 3.182](#) (on page 57), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 101239 CHANGE HISTORY

101240 First released in Issue 4.

#### 101241 Issue 6

101242 This utility is marked as part of the User Portability Utilities option.

101243 The JC shading is removed as job control is mandatory in this version.

#### 101244 Issue 7

101245 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 101246 Issue 8

101247 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
 101248 this utility is required to be intrinsic.

101249 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

101250 Austin Group Defect 1254 is applied, updating various requirements for the *jobs* utility to  
 101251 account for the addition of [Section 2.11](#) (on page 2518).

101252 Austin Group Defect 1492 is applied, clarifying the requirements when a write error to standard

101253

output occurs.

101254 **NAME**

101255 join — relational database operator

101256 **SYNOPSIS**

```
101257 join [-a file_number|-v file_number] [-e string] [-o list] [-t char]
101258      [-1 field] [-2 field] file1 file2
```

101259 **DESCRIPTION**

101260 The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be  
 101261 written to the standard output.

101262 The join field is a field in each file on which the files are compared. The *join* utility shall write  
 101263 one line in the output for each pair of lines in *file1* and *file2* that have join fields that collate  
 101264 equally. The output line by default shall consist of the join field, then the remaining fields from  
 101265 *file1*, then the remaining fields from *file2*. This format can be changed by using the **-o** option  
 101266 (see below). The **-a** option can be used to add unmatched lines to the output. The **-v** option can  
 101267 be used to output only unmatched lines.

101268 The files *file1* and *file2* shall be ordered in the collating sequence of *sort -b* on the fields on which  
 101269 they shall be joined, by default the first in each line. All selected output shall be written in the  
 101270 same collating sequence.

101271 The default input field separators shall be <blank> characters. In this case, multiple separators  
 101272 shall count as one field separator, and leading separators shall be ignored. The default output  
 101273 field separator shall be a <space>.

101274 The field separator and collating sequence can be changed by using the **-t** option (see below).

101275 If the same key appears more than once in either file, all combinations of the set of remaining  
 101276 fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines  
 101277 encountered.

101278 If the input files are not in the appropriate collating sequence, the results are unspecified.

101279 **OPTIONS**

101280 The *join* utility shall conform to XBD [Section 12.2](#) (on page 215).

101281 The following options shall be supported:

101282 **-a** *file\_number*

101283 Produce a line for each unpairable line in file *file\_number*, where *file\_number* is 1 or  
 101284 2, in addition to the default output. If both **-a1** and **-a2** are specified, all unpairable  
 101285 lines shall be output.

101286 **-e** *string* Replace empty output fields in the list selected by **-o** with the string *string*.

101287 **-o** *list* Construct the output line to comprise the fields specified in *list*, each element of  
 101288 which shall have one of the following two forms:

101289 1. *file\_number.field*, where *file\_number* is a file number and *field* is a decimal  
 101290 integer field number

101291 2. 0 (zero), representing the join field

101292 The elements of *list* shall be either <comma>-separated or <blank>-separated, as  
 101293 specified in Guideline 8 of XBD [Section 12.2](#) (on page 215). The fields specified by  
 101294 *list* shall be written for all selected output lines. Fields selected by *list* that do not  
 101295 appear in the input shall be treated as empty output fields. (See the **-e** option.)  
 101296 Only specifically requested fields shall be written. The application shall ensure that  
 101297 *list* is a single command line argument.

101298        **-t char**        Use character *char* as a separator, for both input and output. Every appearance of  
 101299        *char* in a line shall be significant. When this option is specified, the collating  
 101300        sequence shall be the same as *sort* without the **-b** option.

101301        **-v file\_number**  
 101302                    Instead of the default output, produce a line only for each unpairable line in  
 101303                    *file\_number*, where *file\_number* is 1 or 2. If both **-v1** and **-v2** are specified, all  
 101304                    unpairable lines shall be output.

101305        **-1 field**        Join on the *fieldth* field of file 1. Fields are decimal integers starting with 1.

101306        **-2 field**        Join on the *fieldth* field of file 2. Fields are decimal integers starting with 1.

#### 101307 OPERANDS

101308        The following operands shall be supported:

101309        *file1, file2*     A pathname of a file to be joined. If either of the *file1* or *file2* operands is '-', the  
 101310        standard input shall be used in its place.

#### 101311 STDIN

101312        The standard input shall be used only if the *file1* or *file2* operand is '-'. See the INPUT FILES  
 101313        section.

#### 101314 INPUT FILES

101315        The input files shall be text files.

#### 101316 ENVIRONMENT VARIABLES

101317        The following environment variables shall affect the execution of *join*:

101318        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 101319                    (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 101320                    variables used to determine the values of locale categories.)

101321        **LC\_ALL**         If set to a non-empty string value, override the values of all the other  
 101322        internationalization variables.

101323        **LC\_COLLATE**

101324                    Determine the locale of the collating sequence *join* expects to have been used when  
 101325                    the input files were sorted.

101326        **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 101327                    characters (for example, single-byte as opposed to multi-byte characters in  
 101328                    arguments and input files).

101329        **LC\_MESSAGES**

101330                    Determine the locale that should be used to affect the format and contents of  
 101331                    diagnostic messages written to standard error.

101332 XSI        **NLSPATH**     Determine the location of messages objects and message catalogs.

#### 101333 ASYNCHRONOUS EVENTS

101334        Default.

#### 101335 STDOUT

101336        The *join* utility output shall be a concatenation of selected character fields. When the **-o** option  
 101337        is not specified, the output shall be:

101338        "*%s%s%s\n*", *<join field>*, *<other file1 fields>*,  
 101339                    *<other file2 fields>*

101340        If the join field is not the first field in a file, the *<other file fields>* for that file shall be:

101341 <fields preceding join field>, <fields following join field>

101342 When the **-o** option is specified, the output format shall be:

101343 "%s\n", <concatenation of fields>

101344 where the concatenation of fields is described by the **-o** option, above.

101345 For either format, each field (except the last) shall be written with its trailing separator character.  
 101346 If the separator is the default (<blank> characters), a single <space> shall be written after each  
 101347 field (except the last).

#### 101348 **STDERR**

101349 The standard error shall be used only for diagnostic messages.

#### 101350 **OUTPUT FILES**

101351 None.

#### 101352 **EXTENDED DESCRIPTION**

101353 None.

#### 101354 **EXIT STATUS**

101355 The following exit values shall be returned:

101356 0 All input files were output successfully.

101357 >0 An error occurred.

#### 101358 **CONSEQUENCES OF ERRORS**

101359 Default.

#### 101360 **APPLICATION USAGE**

101361 Pathnames consisting of numeric digits or of the form *string.string* should not be specified  
 101362 directly following the **-o** list.

101363 If the collating sequence of the current locale does not have a total ordering of all characters (see  
 101364 XBD Section 7.3.2, on page 139), *join* treats fields that collate equally but are not identical as  
 101365 being the same. If this behavior is not desired, it can be avoided by forcing the use of the POSIX  
 101366 locale (although this means re-sorting the input files into the POSIX locale collating sequence.)

101367 When using *join* to process pathnames, it is recommended that **LC\_ALL**, or at least **LC\_CTYPE**  
 101368 and **LC\_COLLATE**, are set to **POSIX** or **C** in the environment, since pathnames can contain byte  
 101369 sequences that do not form valid characters in some locales, in which case the utility's behavior  
 101370 would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore  
 101371 this problem is avoided.

#### 101372 **EXAMPLES**

101373 The **-o 0** field essentially selects the union of the join fields. For example, given file **phone**:

```
101374 !Name           Phone Number
101375 Don             +1 123-456-7890
101376 Hal            +1 234-567-8901
101377 Yasushi        +2 345-678-9012
```

101378 and file **fax**:

```
101379 !Name           Fax Number
101380 Don             +1 123-456-7899
101381 Keith          +1 456-789-0122
101382 Yasushi        +2 345-678-9011
```

101383 (where the large expanses of white space are meant to each represent a single <tab>), the  
101384 command:

```
101385 join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax
```

101386 (where <tab> is a literal <tab> character) would produce:

| 101387 | !Name   | Phone Number    | Fax Number      |
|--------|---------|-----------------|-----------------|
| 101388 | Don     | +1 123-456-7890 | +1 123-456-7899 |
| 101389 | Hal     | +1 234-567-8901 | (unknown)       |
| 101390 | Keith   | (unknown)       | +1 456-789-0122 |
| 101391 | Yasushi | +2 345-678-9012 | +2 345-678-9011 |

101392 Multiple instances of the same key will produce combinatorial results. The following:

```
101393 fa:
101394     a x
101395     a y
101396     a z
101397 fb:
101398     a p
```

101399 will produce:

```
101400 a x p
101401 a y p
101402 a z p
```

101403 And the following:

```
101404 fa:
101405     a b c
101406     a d e
101407 fb:
101408     a w x
101409     a y z
101410     a o p
```

101411 will produce:

```
101412 a b c w x
101413 a b c y z
101414 a b c o p
101415 a d e w x
101416 a d e y z
101417 a d e o p
```

#### 101418 RATIONALE

101419 The **-e** option is only effective when used with **-o** because, unless specific fields are identified  
101420 using **-o**, *join* is not aware of what fields might be empty. The exception to this is the join field,  
101421 but identifying an empty join field with the **-e** string is not historical practice and some scripts  
101422 might break if this were changed.

101423 The 0 field in the **-o** list was adopted from the Tenth Edition version of *join* to satisfy  
101424 international objections that the *join* in the base documents for IEEE Std 1003.2-1992 did not  
101425 support the "full join" or "outer join" described in relational database literature. Although it has  
101426 been possible to include a join field in the output (by default, or by field number using **-o**), the  
101427 join field could not be included for an unpaired line selected by **-a**. The **-o 0** field essentially

- 101428 selects the union of the join fields.
- 101429 This sort of outer join was not possible with the *join* commands in the base documents for  
101430 IEEE Std 1003.2-1992. The `-o 0` field was chosen because it is an upwards-compatible change for  
101431 applications. An alternative was considered: have the join field represent the union of the fields  
101432 in the files (where they are identical for matched lines, and one or both are null for unmatched  
101433 lines). This was not adopted because it would break some historical applications.
- 101434 The ability to specify *file2* as `-` is not historical practice; it was added for completeness.
- 101435 The `-v` option is not historical practice, but was considered necessary because it permitted the  
101436 writing of *only* those lines that do not match on the join field, as opposed to the `-a` option, which  
101437 prints both lines that do and do not match. This additional facility is parallel with the `-v` option  
101438 of *grep*.
- 101439 Some historical implementations have been encountered where a blank line in one of the input  
101440 files was considered to be the end of the file; the description in this volume of POSIX.1-2024 does  
101441 not cite this as an allowable case.
- 101442 Earlier versions of this standard allowed `-j`, `-j1`, `-j2` options, and a form of the `-o` option that  
101443 allowed the *list* option-argument to be multiple arguments. These forms are no longer specified  
101444 by POSIX.1-2024 but may be present in some implementations.
- 101445 **FUTURE DIRECTIONS**
- 101446 None.
- 101447 **SEE ALSO**
- 101448 [\*awk\*](#), [\*comm\*](#), [\*sort\*](#), [\*uniq\*](#)
- 101449 XBD [Section 7.3.2](#) (on page 139), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)
- 101450 **CHANGE HISTORY**
- 101451 First released in Issue 2.
- 101452 **Issue 6**
- 101453 The obsolescent `-j` options and the multi-argument `-o` option are removed in this version.
- 101454 The normative text is reworded to avoid use of the term “must” for application requirements.
- 101455 **Issue 7**
- 101456 Austin Group Interpretation 1003.1-2001 #027 is applied.
- 101457 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 101458 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0109 [963], XCU/TC2-2008/0110 [663],  
101459 XCU/TC2-2008/0111 [971], and XCU/TC2-2008/0112 [885] are applied.
- 101460 **Issue 8**
- 101461 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

101462 **NAME**

101463 kill — terminate or signal processes

101464 **SYNOPSIS**101465 kill [-s *signal\_name*] *pid*...101466 kill -l [*exit\_status*]101467 XSI kill [-*signal\_name*] *pid*...101468 kill [-*signal\_number*] *pid*...101469 **DESCRIPTION**101470 The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.101471 For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function  
101472 defined in the System Interfaces volume of POSIX.1-2024 called with the following arguments:

- 101473 • The value of the *pid* operand shall be used as the *pid* argument.
- 101474 • The *sig* argument is the value specified by the `-s` option, `-signal_number` option, or the  
101475 `-signal_name` option, or by SIGTERM, if none of these options is specified.

101476 **OPTIONS**101477 XSI The *kill* utility shall conform to XBD Section 12.2 (on page 215), except that in the last two  
101478 SYNOPSIS forms, the `-signal_number` and `-signal_name` options are usually more than a single  
101479 character.

101480 The following options shall be supported:

101481 **-l** (The letter ell.) Write all values of *signal\_name* supported by the implementation, if  
101482 no operand is given. If an *exit\_status* operand is given and it is a value of the '?'  
101483 shell special parameter (see Section 2.5.2 (on page 2479) and *wait*) corresponding to  
101484 a process that was terminated or stopped by a signal, the *signal\_name*  
101485 corresponding to the signal that terminated or stopped the process shall be written.  
101486 If an *exit\_status* operand is given and it is the unsigned decimal integer value of a  
101487 signal number, the *signal\_name* (the symbolic constant name without the **SIG** prefix  
101488 defined in the Base Definitions volume of POSIX.1-2024) corresponding to that  
101489 signal shall be written. Otherwise, the results are unspecified.

101490 **-s *signal\_name***

101491 Specify the signal to send, using one of the symbolic names defined in the  
101492 `<signal.h>` header. Values of *signal\_name* shall be recognized in a case-independent  
101493 fashion, without the **SIG** prefix. In addition, the symbolic name 0 shall be  
101494 recognized, representing the signal value zero. The corresponding signal shall be  
101495 sent instead of SIGTERM.

101496 XSI **-*signal\_name***101497 Equivalent to `-s signal_name`.101498 XSI **-*signal\_number***

101499 Specify a non-negative decimal integer, *signal\_number*, representing the signal to be  
101500 used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The  
101501 correspondence between integer values and the *sig* value used is shown in the  
101502 following list.

101503 The effects of specifying any *signal\_number* other than those listed below are  
101504 undefined.

|        |                                                                                                 |         |
|--------|-------------------------------------------------------------------------------------------------|---------|
| 101505 | 0                                                                                               | 0       |
| 101506 | 1                                                                                               | SIGHUP  |
| 101507 | 2                                                                                               | SIGINT  |
| 101508 | 3                                                                                               | SIGQUIT |
| 101509 | 6                                                                                               | SIGABRT |
| 101510 | 9                                                                                               | SIGKILL |
| 101511 | 14                                                                                              | SIGALRM |
| 101512 | 15                                                                                              | SIGTERM |
| 101513 | If the first argument is a negative integer, it shall be interpreted as a <i>-signal_number</i> |         |
| 101514 | option, not as a negative <i>pid</i> operand specifying a process group.                        |         |

### 101515 OPERANDS

101516 The following operands shall be supported:

101517 *pid* One of the following:

- 101518 1. A decimal integer specifying a process or process group to be signaled. The  
101519 process or processes selected by positive, negative, and zero values of the  
101520 *pid* operand shall be as described for the *kill()* function. If process number 0  
101521 is specified, all processes in the current process group shall be signaled. For  
101522 the effects of negative *pid* numbers, see the *kill()* function defined in the  
101523 System Interfaces volume of POSIX.1-2024. If the first *pid* operand is  
101524 negative, it should be preceded by "--" to keep it from being interpreted as  
101525 an option.
  - 101526 2. A job ID (see XBD Section 3.182, on page 57) that identifies a process group  
101527 in the case of a job-control background job, or a process ID in the case of a  
101528 non-job-control background job (if supported), to be signaled. The job ID  
101529 notation is applicable only for invocations of *kill* in the current shell  
101530 execution environment; see Section 2.13 (on page 2522).
- 101531 **Note:** The job ID type of *pid* is only available on systems supporting the User  
101532 Portability Utilities option or supporting non-job-control background  
101533 jobs.

101534 *exit\_status* A decimal integer specifying a signal number or the exit status of a process  
101535 terminated by a signal.

### 101536 STDIN

101537 Not used.

### 101538 INPUT FILES

101539 None.

### 101540 ENVIRONMENT VARIABLES

101541 The following environment variables shall affect the execution of *kill*:

101542 *LANG* Provide a default value for the internationalization variables that are unset or null.  
101543 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
101544 variables used to determine the values of locale categories.)

101545 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
101546 internationalization variables.

- 101547 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 101548 characters (for example, single-byte as opposed to multi-byte characters in  
 101549 arguments).
- 101550 *LC\_MESSAGES*  
 101551 Determine the locale that should be used to affect the format and contents of  
 101552 diagnostic messages written to standard error.
- 101553 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 101554 **ASYNCHRONOUS EVENTS**  
 101555 Default.
- 101556 **STDOUT**  
 101557 When the `-l` option is not specified, the standard output shall not be used.  
 101558 When the `-l` option is specified, the symbolic name of each signal shall be written in the  
 101559 following format:  
 101560 `"%s%c", <signal_name>, <separator>`  
 101561 where the `<signal_name>` is in uppercase, without the **SIG** prefix, and the `<separator>` shall be  
 101562 either a `<newline>` or a `<space>`. For the last signal written, `<separator>` shall be a `<newline>`.  
 101563 When both the `-l` option and `exit_status` operand are specified, the symbolic name of the  
 101564 corresponding signal shall be written in the following format:  
 101565 `"%s\n", <signal_name>`
- 101566 **STDERR**  
 101567 The standard error shall be used only for diagnostic messages.
- 101568 **OUTPUT FILES**  
 101569 None.
- 101570 **EXTENDED DESCRIPTION**  
 101571 None.
- 101572 **EXIT STATUS**  
 101573 The following exit values shall be returned:  
 101574 0 The `-l` option was specified and the output specified in **STDOUT** was successfully written  
 101575 to standard output; or, the `-l` option was not specified, at least one matching process was  
 101576 found for each `pid` operand, and the specified signal was successfully processed for at least  
 101577 one matching process.  
 101578 >0 An error occurred.
- 101579 **CONSEQUENCES OF ERRORS**  
 101580 Default.

101581 **APPLICATION USAGE**

101582 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

101583 Process numbers can be found by using *ps*.

101584 The use of job ID notation is not dependent on job control being enabled. When job control has  
 101585 been disabled using *set +m*, *kill* can still be used to signal the process group associated with a  
 101586 job-control background job, or the process ID associated with a non-control background job (if  
 101587 supported), using

```
101588 kill %<background job number>
```

101589 See also the RATIONALE for *jobs* and *wait*.

101590 The job ID notation is not required to work as expected when *kill* is operating in its own utility  
 101591 execution environment. In either of the following examples:

```
101592 nohup kill %1 &  
101593 system("kill %1");
```

101594 the *kill* operates in a different environment and does not share the shell's understanding of job  
 101595 numbers.

101596 **EXAMPLES**

101597 Any of the commands:

```
101598 kill -9 100 -165  
101599 kill -s kill 100 -165  
101600 kill -s KILL 100 -165
```

101601 sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose  
 101602 process group ID is 165, assuming the sending process has permission to send that signal to the  
 101603 specified processes, and that they exist.

101604 The System Interfaces volume of POSIX.1-2024 and this volume of POSIX.1-2024 do not require  
 101605 specific signal numbers for any *signal\_names*. Even the *-signal\_number* option provides symbolic  
 101606 (although numeric) names for signals. If a process is terminated by a signal, its exit status  
 101607 indicates the signal that killed it, but the exact values are not specified. The *kill -l* option,  
 101608 however, can be used to map decimal signal numbers and exit status values into the name of a  
 101609 signal. The following example reports the status of a terminated job:

```
101610 job  
101611 stat=$?  
101612 if [ $stat -eq 0 ]  
101613 then  
101614     echo job completed successfully.  
101615 elif [ $stat -gt 128 ]  
101616 then  
101617     echo job terminated by signal SIG$(kill -l $stat).  
101618 else  
101619     echo job terminated with error code $stat.  
101620 fi
```

101621 To send the default signal to a process group (say 123), an application should use a command  
 101622 similar to one of the following:

```
101623 kill -s TERM -- -123  
101624 kill -- -123
```

101625 **RATIONALE**

101626 The `-l` option originated from the C shell, and is also implemented in the KornShell. The C shell  
 101627 output can consist of multiple output lines because the signal names do not always fit on a  
 101628 single line on some terminal screens. The KornShell output also included the implementation-  
 101629 defined signal numbers and was considered by the standard developers to be too difficult for  
 101630 scripts to parse conveniently. The specified output format is intended not only to accommodate  
 101631 the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing  
 101632 on systems for which this is appropriate.

101633 An early proposal invented the name `SIGNULL` as a *signal\_name* for signal 0 (used by the System  
 101634 Interfaces volume of POSIX.1-2024 to test for the existence of a process without sending it a  
 101635 signal). Since the *signal\_name* 0 can be used in this case unambiguously, `SIGNULL` has been  
 101636 removed.

101637 An early proposal also required symbolic *signal\_names* to be recognized with or without the **SIG**  
 101638 prefix. Historical versions of *kill* have not written the **SIG** prefix for the `-l` option and have not  
 101639 recognized the **SIG** prefix on *signal\_names*. Since neither applications portability nor ease-of-use  
 101640 would be improved by requiring this extension, it is no longer required.

101641 To avoid an ambiguity of an initial negative number argument specifying either a signal number  
 101642 or a process group, POSIX.1-2024 mandates that it is always considered the former by  
 101643 implementations that support the XSI option. It also requires that conforming applications  
 101644 always use the `--` options terminator argument when specifying a process group.

101645 The `-s` option was added in response to international interest in providing some form of *kill* that  
 101646 meets the Utility Syntax Guidelines.

101647 The job ID notation is not required to work as expected when *kill* is operating in its own utility  
 101648 execution environment. In either of the following examples:

```
101649 nohup kill %1 &  
101650 system("kill %1");
```

101651 the *kill* operates in a different environment and does not understand how the shell has managed  
 101652 its job numbers.

101653 **FUTURE DIRECTIONS**

101654 None.

101659 **CHANGE HISTORY**

101660 First released in Issue 2.

101661 **Issue 6**

101662 The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI  
 101663 option, corresponding to a similar change in the *trap* special built-in.

101664 **Issue 7**

101665 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101666 **Issue 8**

101667 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
101668 this utility is required to be intrinsic.

101669 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

101670 Austin Group Defect 1254 is applied, clarifying the *-I* option with regard to an *exit\_status*  
101671 operand corresponding to a stopped process, changing ``job control job ID'' to ``job ID'', and  
101672 adding a paragraph to the RATIONALE section.

101673 Austin Group Defect 1260 is applied, changing the SYNOPSIS and EXAMPLES sections in  
101674 relation to the *-s* option, and the RATIONALE section in relation to the use of "--" when  
101675 specifying a process group.

101676 Austin Group Defect 1504 is applied, changing the EXIT STATUS section.

101677 **NAME**101678 lex — generate programs for lexical tasks (**DEVELOPMENT**)101679 **SYNOPSIS**101680 CD `lex [-t] [-n|-v] [file...]`101681 **DESCRIPTION**

101682 The *lex* utility shall generate C programs to be used in lexical processing of character input, and  
 101683 that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code  
 101684 and conform to the ISO C standard, without depending on any undefined, unspecified, or  
 101685 implementation-defined behavior, except in cases where the code is copied directly from the  
 101686 supplied source, or in cases that are documented by the implementation. Usually, the *lex* utility  
 101687 shall write the program it generates to the file `lex.yy.c`; the state of this file is unspecified if *lex*  
 101688 exits with a non-zero exit status. See the EXTENDED DESCRIPTION section for a complete  
 101689 description of the *lex* input language.

101690 **OPTIONS**101691 The *lex* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

101692 The following options shall be supported:

- 101693 **-n** Suppress the summary of statistics usually written with the `-v` option. If no table  
 101694 sizes are specified in the *lex* source code and the `-v` option is not specified, then `-n`  
 101695 is implied.
- 101696 **-t** Write the resulting program to standard output instead of `lex.yy.c`.
- 101697 **-v** Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*  
 101698 table sizes in [Definitions in lex](#) (on page 3039).) If the `-t` option is specified and `-n`  
 101699 is not specified, this report shall be written to standard error. If table sizes are  
 101700 specified in the *lex* source code, and if the `-n` option is not specified, the `-v` option  
 101701 may be enabled.

101702 **OPERANDS**

101703 The following operand shall be supported:

- 101704 *file* A pathname of an input file. If more than one such *file* is specified, all files shall be  
 101705 concatenated to produce a single *lex* program. If no *file* operands are specified, or if  
 101706 a *file* operand is `'-'`, the standard input shall be used.

101707 **STDIN**

101708 The standard input shall be used if no *file* operands are specified, or if a *file* operand is `'-'`. See  
 101709 INPUT FILES.

101710 **INPUT FILES**

101711 The input files shall be text files containing *lex* source code, as described in the EXTENDED  
 101712 DESCRIPTION section.

101713 **ENVIRONMENT VARIABLES**101714 The following environment variables shall affect the execution of *lex*:

- 101715 *LANG* Provide a default value for the internationalization variables that are unset or null.
- 101716 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 101717 internationalization variables.
- 101718 *LC\_COLLATE*  
 101719 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 101720 character collating elements within regular expressions.

101721 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 101722 characters (for example, single-byte as opposed to multi-byte characters in  
 101723 arguments and input files), and the behavior of character classes within regular  
 101724 expressions.

101725 **LC\_MESSAGES**  
 101726 Determine the locale that should be used to affect the format and contents of  
 101727 diagnostic messages written to standard error.

101728 XSI **NLSPATH** Determine the location of messages objects and message catalogs.  
 101729 If the values (if any) of the *LANG*, *LC\_COLLATE*, *LC\_CTYPE*, and *LC\_ALL* variables result in the  
 101730 locale in effect for the *LC\_CTYPE* or *LC\_COLLATE* category not being the POSIX locale, the  
 101731 behavior is unspecified. (See XBD Section 8.2 (on page 169) for the precedence of  
 101732 internationalization variables used to determine the values of locale categories.)

### 101733 ASYNCHRONOUS EVENTS

101734 Default.

### 101735 STDOUT

101736 If the `-t` option is specified, the text file of C source code output of *lex* shall be written to  
 101737 standard output.

101738 If the `-t` option is not specified:

- 101739 • Implementation-defined informational, error, and warning messages concerning the  
 101740 contents of *lex* source code input shall be written to either the standard output or standard  
 101741 error.
- 101742 • If the `-v` option is specified and the `-n` option is not specified, *lex* statistics shall also be  
 101743 written to either the standard output or standard error, in an implementation-defined  
 101744 format. These statistics may also be generated if table sizes are specified with a '%'   
 101745 operator in the *Definitions* section, as long as the `-n` option is not specified.

### 101746 STDERR

101747 If the `-t` option is specified, implementation-defined informational, error, and warning messages  
 101748 concerning the contents of *lex* source code input shall be written to the standard error.

101749 If the `-t` option is not specified:

- 101750 1. Implementation-defined informational, error, and warning messages concerning the  
 101751 contents of *lex* source code input shall be written to either the standard output or  
 101752 standard error.
- 101753 2. If the `-v` option is specified and the `-n` option is not specified, *lex* statistics shall also be  
 101754 written to either the standard output or standard error, in an implementation-defined  
 101755 format. These statistics may also be generated if table sizes are specified with a '%'   
 101756 operator in the *Definitions* section, as long as the `-n` option is not specified.

### 101757 OUTPUT FILES

101758 A text file containing C source code shall be written to **lex.yy.c**, or to the standard output if the `-t`  
 101759 option is present.

### 101760 EXTENDED DESCRIPTION

101761 Each input file shall contain *lex* source code, which is a table of regular expressions with  
 101762 corresponding actions in the form of C program fragments.

101763 When **lex.yy.c** is compiled and linked with the *lex* library (using the `-ll` operand with *c17*), the  
 101764 resulting program shall read character input from the standard input and shall partition it into

101765 strings that match the given expressions.

101766 When an expression is matched, these actions shall occur:

- 101767 • The input string that was matched shall be left in *ytext* as a null-terminated string; *ytext*
- 101768 shall either be an external character array or a pointer to a character string. As explained in
- 101769 [Definitions in lex](#), the type can be explicitly selected using the `%array` or `%pointer`
- 101770 declarations, but the default is implementation-defined.
- 101771 • The external `int yyleng` shall be set to the length of the matching string.
- 101772 • The expression's corresponding program fragment, or action, shall be executed.

101773 During pattern matching, *lex* shall search the set of patterns for the single longest possible

101774 match. Among rules that match the same number of characters, the rule given first shall be

101775 chosen.

101776 The general format of *lex* source shall be:

```
101777     Definitions
101778     %%
101779     Rules
101780     %%
101781     UserSubroutines
```

101782 The first "%%" is required to mark the beginning of the rules (regular expressions and actions);

101783 the second "%%" is required only if user subroutines follow.

101784 Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program

101785 fragment and shall be copied to the external definition area of the `lex.yy.c` file. Similarly,

101786 anything in the *Definitions* section included between delimiter lines containing only "%{" and

101787 "%}" shall also be copied unchanged to the external definition area of the `lex.yy.c` file.

101788 Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing

101789 at the beginning of the *Rules* section before any rules are specified shall be written to `lex.yy.c`

101790 after the declarations of variables for the `yylex()` function and before the first line of code in

101791 `yylex()`. Thus, user variables local to `yylex()` can be declared here, as well as application code to

101792 execute upon entry to `yylex()`.

101793 The action taken by *lex* when encountering any input beginning with a <blank> or within "%{"

101794 and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is

101795 undefined. The presence of such input may result in an erroneous definition of the `yylex()`

101796 function.

101797 C-language code in the input shall not contain C-language trigraphs. The C-language code

101798 within "%{" and "%}" delimiter lines shall not contain any lines consisting only of "%}", or

101799 only of "%%".

## 101800 **Definitions in lex**

101801 *Definitions* appear before the first "%%" delimiter. Any line in this section not contained between

101802 "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex*

101803 substitution string. The format of these lines shall be:

```
101804     name substitute
```

101805 If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is

101806 undefined. The string *substitute* shall replace the string {*name*} when it is used in a rule. The *name*

101807 string shall be recognized in this context only when the braces are provided and when it does

101808 not appear within a bracket expression or within double-quotes.

101809 In the *Definitions* section, any line beginning with a <percent-sign> ('%') character and followed  
 101810 by an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions.  
 101811 Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall  
 101812 define a set of exclusive start conditions. When the generated scanner is in a %s state, patterns  
 101813 with no state specified shall be also active; in a %x state, such patterns shall not be active. The  
 101814 rest of the line, after the first word, shall be considered to be one or more <blank>-separated  
 101815 names of start conditions. Start condition names shall be constructed in the same way as  
 101816 definition names. Start conditions can be used to restrict the matching of regular expressions to  
 101817 one or more states as described in [Regular Expressions in lex](#) (on page 3041).

101818 Implementations shall accept either of the following two mutually-exclusive declarations in the  
 101819 *Definitions* section:

101820 **%array** Declare the type of *yytext* to be a null-terminated character array.

101821 **%pointer** Declare the type of *yytext* to be a pointer to a null-terminated character string.

101822 The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of  
 101823 the scanner source file (that is, via an **extern**), the application shall include the appropriate  
 101824 **%array** or **%pointer** declaration in the scanner source file.

101825 Implementations shall accept declarations in the *Definitions* section for setting certain internal  
 101826 table sizes. The declarations are shown in the following table.

101827 **Table 3-11** Table Size Declarations in *lex*

| Declaration        | Description                        | Minimum Value |
|--------------------|------------------------------------|---------------|
| 101828 %p <i>n</i> | Number of positions                | 2 500         |
| 101829 %n <i>n</i> | Number of states                   | 500           |
| 101830 %a <i>n</i> | Number of transitions              | 2 000         |
| 101831 %e <i>n</i> | Number of parse tree nodes         | 1 000         |
| 101832 %k <i>n</i> | Number of packed character classes | 1 000         |
| 101833 %o <i>n</i> | Size of the output array           | 3 000         |

101835 In the table, *n* represents a positive decimal integer, preceded by one or more <blank>  
 101836 characters. The exact meaning of these table size numbers is implementation-defined. The  
 101837 implementation shall document how these numbers affect the *lex* utility and how they are  
 101838 related to any output that may be generated by the implementation should limitations be  
 101839 encountered during the execution of *lex*. It shall be possible to determine from this output  
 101840 which of the table size values needs to be modified to permit *lex* to successfully generate tables  
 101841 for the input language. The values in the column Minimum Value represent the lowest values  
 101842 conforming implementations shall provide.

### 101843 Rules in *lex*

101844 The rules in *lex* source files are a table in which the left column contains regular expressions and  
 101845 the right column contains actions (C program fragments) to be executed when the expressions  
 101846 are recognized.

101847 *ERE action*

101848 *ERE action*

101849 ...

101850 The extended regular expression (ERE) portion of a row shall be separated from *action* by one or  
 101851 more <blank> characters. A regular expression containing <blank> characters shall be

101852 recognized under one of the following conditions:

- 101853 • The entire expression appears within double-quotes.
- 101854 • The <blank> characters appear within double-quotes or square brackets.
- 101855 • Each <blank> is preceded by a <backslash> character.

### 101856 **User Subroutines in lex**

101857 Anything in the user subroutines section shall be copied to `lex.yy.c` following `yylex()`.

### 101858 **Regular Expressions in lex**

101859 The *lex* utility shall support the set of extended regular expressions (see XBD [Section 9.4](#), on page  
101860 187), with the following additions and exceptions to the syntax:

101861 ". . ." Any string enclosed in double-quotes shall represent the characters within the  
101862 double-quotes as themselves, except that <backslash>-escapes (which appear in  
101863 the following table) shall be recognized. Any <backslash>-escape sequence shall be  
101864 terminated by the closing quote. For example, "\01"1" represents a single  
101865 string: the octal value 1 followed by the character '1'.

101866 <state>*r*, <state1, state2, . . .>*r*

101867 The regular expression *r* shall be matched only when the program is in one of the  
101868 start conditions indicated by *state*, *state1*, and so on; see [Actions in lex](#) (on page  
101869 3043). (As an exception to the typographical conventions of the rest of this volume  
101870 of POSIX.1-2024, in this case <state> does not represent a metavariable, but the  
101871 literal angle-bracket characters surrounding a symbol.) The start condition shall be  
101872 recognized as such only at the beginning of a regular expression.

101873 *r/x* The regular expression *r* shall be matched only if it is followed by an occurrence of  
101874 regular expression *x* (*x* is the instance of trailing context, further defined below).  
101875 The token returned in *yytext* shall only match *r*. If the trailing portion of *r* matches  
101876 the beginning of *x*, the result is unspecified. The *r* expression cannot include  
101877 further trailing context or the '\$' (match-end-of-line) operator; *x* cannot include  
101878 the '^' (match-beginning-of-line) operator, nor trailing context, nor the '\$'  
101879 operator. That is, only one occurrence of trailing context is allowed in a *lex* regular  
101880 expression, and the '^' operator only can be used at the beginning of such an  
101881 expression.

101882 {*name*} When *name* is one of the substitution symbols from the *Definitions* section, the  
101883 string, including the enclosing braces, shall be replaced by the *substitute* value. The  
101884 *substitute* value shall be treated in the extended regular expression as if it were  
101885 enclosed in parentheses. No substitution shall occur if {*name*} occurs within a  
101886 bracket expression or within double-quotes.

101887 Within an ERE, a <backslash> character shall be considered to begin an escape sequence as  
101888 specified in the table in XBD [Chapter 5](#) (on page 113) ('\ ', '\a', '\b', '\f', '\n', '\r',  
101889 '\t', '\v'). In addition, the escape sequences in the following table shall be recognized.

101890 A literal <newline> cannot occur within an ERE; the escape sequence '\n' can be used to  
101891 represent a <newline>. A <newline> shall not be matched by a period operator.

| Escape Sequence       | Description                                                                                                                                                                                                                                                                                                       | Meaning                                                                                                                                                                                                                                            |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\digits</code>  | A <code>&lt;backslash&gt;</code> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.                                                                        | The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <code>&lt;backslash&gt;</code> for each byte. |
| <code>\xdigits</code> | A <code>&lt;backslash&gt;</code> character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.                                                                         | The character whose encoding is represented by the hexadecimal integer.                                                                                                                                                                            |
| <code>\c</code>       | A <code>&lt;backslash&gt;</code> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 113) ( <code>'\'</code> , <code>'\a'</code> , <code>'\b'</code> , <code>'\f'</code> , <code>'\n'</code> , <code>'\r'</code> , <code>'\t'</code> , <code>'\v'</code> ). | The character <code>'c'</code> , unchanged.                                                                                                                                                                                                        |

101914

101915

101916

**Note:** If a `'\x'` sequence needs to be immediately followed by a hexadecimal digit character, a sequence such as `"\x1" "1"` can be used, which represents a character containing the value 1, followed by the character `'1'`.

101917

101918

101919

The order of precedence given to extended regular expressions for *lex* differs from that specified in XBD Section 9.4 (on page 187). The order of precedence for *lex* shall be as shown in the following table, from high to low.

101920

101921

101922

101923

101924

**Note:** The escaped characters entry is not meant to imply that these are operators, but they are included in the table to show their relationships to the true operators. The start condition, trailing context, and anchoring notations have been omitted from the table because of the placement restrictions described in this section; they can only appear at the beginning or ending of an ERE.

101925

Table 3-13 ERE Precedence in *lex*

101926

101927

101928

101929

101930

101931

101932

101933

101934

101935

101936

| Extended Regular Expression              | Precedence                                               |
|------------------------------------------|----------------------------------------------------------|
| <i>collation-related bracket symbols</i> | <code>[= =]</code> <code>[: :]</code> <code>[. .]</code> |
| <i>escaped characters</i>                | <code>\&lt;special character&gt;</code>                  |
| <i>bracket expression</i>                | <code>[ ]</code>                                         |
| <i>quoting</i>                           | <code>"..."</code>                                       |
| <i>grouping</i>                          | <code>( )</code>                                         |
| <i>definition</i>                        | <code>{name}</code>                                      |
| <i>single-character RE duplication</i>   | <code>*</code> <code>+</code> <code>?</code>             |
| <i>concatenation</i>                     |                                                          |
| <i>interval expression</i>               | <code>{m,n}</code>                                       |
| <i>alternation</i>                       | <code> </code>                                           |

101937

The ERE anchoring operators `'^'` and `'$'` do not appear in the table. With *lex* regular

101938 expressions, these operators are restricted in their use: the '^' operator can only be used at the  
 101939 beginning of an entire regular expression, and the '\$' operator only at the end. The operators  
 101940 apply to the entire regular expression. Thus, for example, the pattern "(^abc) | (def\$)" is  
 101941 undefined; it can instead be written as two separate rules, one with the regular expression  
 101942 "^abc" and one with "def\$", which share a common action via the special '|' action (see  
 101943 below). If the pattern were written "^abc|def\$", it would match either "abc" or "def" on a  
 101944 line by itself.

101945 Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex*  
 101946 implementations. An example of embedded anchoring would be for patterns such as  
 101947 "(^| )foo( |\$)" to match "foo" when it exists as a complete word. This functionality can  
 101948 be obtained using existing *lex* features:

```
101949 ^foo/[ \n]      |  
101950 "foo"/[ \n]    /* Found foo as a separate word. */
```

101951 Note also that '\$' is a form of trailing context (it is equivalent to "/\n") and as such cannot be  
 101952 used with regular expressions containing another instance of the operator (see the preceding  
 101953 discussion of trailing context).

101954 The additional regular expressions trailing-context operator '/' can be used as an ordinary  
 101955 character if presented within double-quotes, "/"; preceded by a <backslash>, "\/"; or within a  
 101956 bracket expression, "[/]". The start-condition '<' and '>' operators shall be special only in a  
 101957 start condition at the beginning of a regular expression; elsewhere in the regular expression they  
 101958 shall be treated as ordinary characters.

#### 101959 **Actions in lex**

101960 The action to be taken when an ERE is matched can be a C program fragment or the special  
 101961 actions described below; the program fragment can contain one or more C statements, and can  
 101962 also include special actions. The empty C statement ';' shall be a valid action; any string in the  
 101963 **lex.yy.c** input that matches the pattern portion of such a rule is effectively ignored or skipped.  
 101964 However, the absence of an action shall not be valid, and the action *lex* takes in such a condition  
 101965 is undefined.

101966 The specification for an action, including C statements and special actions, can extend across  
 101967 several lines if enclosed in braces:

```
101968 ERE <one or more blanks> { program statement  
101969                          program statement }
```

101970 The program statements shall not contain unbalanced curly brace preprocessing tokens.

101971 The default action when a string in the input to a **lex.yy.c** program is not matched by any  
 101972 expression shall be to copy the string to the output. Because the default behavior of a program  
 101973 generated by *lex* is to read the input and copy it to the output, a minimal *lex* source program that  
 101974 has just "%%" shall generate a C program that simply copies the input to the output unchanged.

101975 Four special actions shall be available:

```
101976 | ECHO; REJECT; BEGIN
```

101977 | The action '|' means that the action for the next rule is the action for this rule.  
 101978 Unlike the other three actions, '|' cannot be enclosed in braces or be  
 101979 <semicolon>-terminated; the application shall ensure that it is specified alone, with  
 101980 no other actions.

101981       **ECHO;**       Write the contents of the string *yytext* on the output.

101982       **REJECT;**      Usually only a single expression is matched by a given string in the input.  
 101983       **REJECT** means “continue to the next expression that matches the current input”,  
 101984       and shall cause whatever rule was the second choice after the current rule to be  
 101985       executed for the same input. Thus, multiple rules can be matched and executed for  
 101986       one input string or overlapping input strings. For example, given the regular  
 101987       expressions "xyz" and "xy" and the input "xyz", usually only the regular  
 101988       expression "xyz" would match. The next attempted match would start after **z**. If  
 101989       the last action in the "xyz" rule is **REJECT**, both this rule and the "xy" rule  
 101990       would be executed. The **REJECT** action may be implemented in such a fashion that  
 101991       flow of control does not continue after it, as if it were equivalent to a **goto** to  
 101992       another part of *yylex()*. The use of **REJECT** may result in somewhat larger and  
 101993       slower scanners.

101994       **BEGIN**        The action:  
 101995                    BEGIN *newstate*;  
 101996                    switches the state (start condition) to *newstate*. If the string *newstate* has not been  
 101997                    declared previously as a start condition in the *Definitions* section, the results are  
 101998                    unspecified. The initial state is indicated by the digit '0' or the token **INITIAL**.

101999       The functions or macros described below are accessible to user code included in the *lex* input. It  
 102000       is unspecified whether they appear in the C code output of *lex*, or are accessible only through the  
 102001       **-ll** operand to *c17* (the *lex* library).

102002       **int yylex(void)**  
 102003                    Performs lexical analysis on the input; this is the primary function generated by the *lex*  
 102004                    utility. The function shall return zero when the end of input is reached; otherwise, it shall  
 102005                    return non-zero values (tokens) determined by the actions that are selected.

102006       **int yymore(void)**  
 102007                    When called, indicates that when the next input string is recognized, it is to be appended to  
 102008                    the current value of *yytext* rather than replacing it; the value in *yylen* shall be adjusted  
 102009                    accordingly.

102010       **int yyless(int n)**  
 102011                    Retains *n* initial characters in *yytext*, NUL-terminated, and treats the remaining characters as  
 102012                    if they had not been read; the value in *yylen* shall be adjusted accordingly.

102013       **int input(void)**  
 102014                    Returns the next character from the input, or zero on end-of-file. It shall obtain input from  
 102015                    the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning  
 102016                    has begun, the effect of altering the value of *yyin* is undefined. The character read shall be  
 102017                    removed from the input stream of the scanner without any processing by the scanner.

102018       **int unput(int c)**  
 102019                    Returns the character 'c' to the input; *yytext* and *yylen* are undefined until the next  
 102020                    expression is matched. The result of using *unput()* for more characters than have been input  
 102021                    is unspecified.

102022       The following functions shall appear only in the *lex* library accessible through the **-ll** operand;  
 102023       they can therefore be redefined by a conforming application:

102024       **int yywrap(void)**  
 102025                    Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application  
 102026                    requires *yylex()* to continue processing with another source of input, then the application

102027 can include a function *yywrap()*, which associates another file with the external variable  
 102028 **FILE** \* *yyin* and shall return a value of zero.

102029 **int** *main*(**int** *argc*, **char** \**argv*[])

102030 Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to  
 102031 perform application-specific operations, calling *yylex()* as applicable.

102032 Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin  
 102033 with the prefix **yy** or **YY**.

#### 102034 EXIT STATUS

102035 The following exit values shall be returned:

102036 0 Successful completion.

102037 >0 An error occurred.

#### 102038 CONSEQUENCES OF ERRORS

102039 Default.

#### 102040 APPLICATION USAGE

102041 Conforming applications are warned that in the *Rules* section, an ERE without an action is not  
 102042 acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or  
 102043 runtime errors.

102044 The purpose of *input()* is to take characters off the input stream and discard them as far as the  
 102045 lexical analysis is concerned. A common use is to discard the body of a comment once the  
 102046 beginning of a comment is recognized.

102047 The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex*  
 102048 source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer  
 102049 interpret the regular expressions given in the *lex* source according to the environment specified  
 102050 when the lexical analyzer is executed, but this is not possible with the current *lex* technology.  
 102051 Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the  
 102052 lexical requirements of the input language being described, which is frequently locale-specific  
 102053 anyway. (For example, writing an analyzer that is used for French text is not automatically  
 102054 useful for processing other languages.)

#### 102055 EXAMPLES

102056 The following is an example of a *lex* program that implements a rudimentary scanner for a  
 102057 Pascal-like syntax:

```

102058 %{
102059 /* Need this for the call to atof() below. */
102060 #include <math.h>
102061 /* Need this for printf(), fopen(), and stdin below. */
102062 #include <stdio.h>
102063 %}
102064
102064 DIGIT    [0-9]
102065 ID       [a-z][a-z0-9]*
102066 %%
102067
102067 {DIGIT}+ {
102068     printf("An integer: %s (%d)\n", yytext,
102069         atoi(yytext));
102070 }
```

```

102071     {DIGIT}+"."{DIGIT}*      {
102072         printf("A float: %s (%g)\n", yytext,
102073             atof(yytext));
102074     }

102075     if|then|begin|end|procedure|function      {
102076         printf("A keyword: %s\n", yytext);
102077     }

102078     {ID}      printf("An identifier: %s\n", yytext);

102079     "+"|"-"|"*"|"|" /"      printf("An operator: %s\n", yytext);

102080     "{"[^]\n}*"      /* Eat up one-line comments. */
102081     [ \t\n]+      /* Eat up white space. */

102082     .      printf("Unrecognized character: %s\n", yytext);
102083     %%

102084     int main(int argc, char *argv[])
102085     {
102086         ++argv, --argc; /* Skip over program name. */
102087         if (argc > 0)
102088             yyin = fopen(argv[0], "r");
102089         else
102090             yyin = stdin;

102091         yylex();
102092     }

```

## 102093 RATIONALE

102094 Even though references to the C language are retained in this description, *lex* may be generalized  
102095 to other languages, as was done at one time for EFL, the Extended FORTRAN Language. Since  
102096 the *lex* input specification is essentially language-independent, versions of this utility could be  
102097 written to produce Ada, Modula-2, or Pascal code, and there are known historical  
102098 implementations that do so.

102099 The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex*  
102100 source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is  
102101 assumed to be presented in the POSIX locale, but input and output are in the locale specified by  
102102 the environment variables), then the tables in the lexical analyzer produced by *lex* would  
102103 interpret EREs specified in the *lex* source in terms of the environment variables specified when  
102104 *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs  
102105 given in the *lex* source according to the environment specified when the lexical analyzer is  
102106 executed, but this is not possible with the current *lex* technology.

102107 The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard  
102108 use of escape sequences.

102109 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
102110 but this has been modified in this version.

102111 There is no detailed output format specification. The observed behavior of *lex* under four  
102112 different historical implementations was that none of these implementations consistently  
102113 reported the line numbers for error and warning messages. Furthermore, there was a desire that  
102114 *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified  
102115 avoids these formatting questions and problems with internationalization.

102116 Although the %x specifier for *exclusive* start conditions is not historical practice, it is believed to  
102117 be a minor change to historical implementations and greatly enhances the usability of *lex*  
102118 programs since it permits an application to obtain the expected functionality with fewer  
102119 statements.

102120 The %array and %pointer declarations were added as a compromise between historical systems.  
102121 The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in  
102122 BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements  
102123 are available for some scanners. Most historical programs should require no change in porting  
102124 from one system to another because the string being referenced is null-terminated in both cases.  
102125 (The method used by *flex* in its case is to null-terminate the token in place by remembering the  
102126 character that used to come right after the token and replacing it before continuing on to the next  
102127 scan.) Multi-file programs with external references to *yytext* outside the scanner source file  
102128 should continue to operate on their historical systems, but would require one of the new  
102129 declarations to be considered strictly portable.

102130 The description of EREs avoids unnecessary duplication of ERE details because their meanings  
102131 within a *lex* ERE are the same as that for the ERE in this volume of POSIX.1-2024.

102132 The reason for the undefined condition associated with text beginning with a <blank> or within  
102133 "%{ " and "%}" delimiter lines appearing in the *Rules* section is historical practice. Both the BSD  
102134 and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the  
102135 beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break*  
102136 statement). In some cases, the System V *lex* generates an error message or a syntax error,  
102137 depending on the form of indented input.

102138 The intention in breaking the list of functions into those that may appear in *lex.yy.c* versus those  
102139 that only appear in *libl.a* is that only those functions in *libl.a* can be reliably redefined by a  
102140 conforming application.

102141 The descriptions of standard output and standard error are somewhat complicated because  
102142 historical *lex* implementations chose to issue diagnostic messages to standard output (unless *-t*  
102143 was given). POSIX.1-2024 allows this behavior, but leaves an opening for the more expected  
102144 behavior of using standard error for diagnostics. Also, the System V behavior of writing the  
102145 statistics when any table sizes are given is allowed, while BSD-derived systems can avoid it. The  
102146 programmer can always precisely obtain the desired results by using either the *-t* or *-n* options.

102147 The OPERANDS section does not mention the use of *-* as a synonym for standard input; not all  
102148 historical implementations support such usage for any of the *file* operands.

102149 A description of the *translation table* was deleted from early proposals because of its relatively  
102150 low usage in historical applications.

102151 The change to the definition of the *input()* function that allows buffering of input presents the  
102152 opportunity for major performance gains in some applications.

102153 The following examples clarify the differences between *lex* regular expressions and regular  
102154 expressions appearing elsewhere in this volume of POSIX.1-2024. For regular expressions of the  
102155 form "*r/x*", the string matching *r* is always returned; confusion may arise when the beginning  
102156 of *x* matches the trailing portion of *r*. For example, given the regular expression "*a\*b/cc*" and  
102157 the input "*aaabcc*", *yytext* would contain the string "*aaab*" on this match. But given the  
102158 regular expression "*x\*/xy*" and the input "*xxxxy*", the token *xxx*, not *xx*, is returned by some  
102159 implementations because *xxx* matches "*x\**".

102160 In the rule "*ab\*/bc*", the "*b\**" at the end of *r* extends *r*'s match into the beginning of the  
102161 trailing context, so the result is unspecified. If this rule were "*ab/bc*", however, the rule  
102162 matches the text "*ab*" when it is followed by the text "*bc*". In this latter case, the matching of *r*

- 102163 cannot extend into the beginning of *x*, so the result is specified.
- 102164 **FUTURE DIRECTIONS**
- 102165 None.

- 102172 **Issue 6**
- 102173 This utility is marked as part of the C-Language Development Utilities option.
- 102174 The obsolescent `-c` option is removed.
- 102175 The normative text is reworded to avoid use of the term “must” for application requirements.
- 102176 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/14 is applied, removing text describing  
102177 behavior on systems with bytes consisting of more than eight bits.
- 102178 **Issue 7**
- 102179 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for  
102180 generated code to conform to the ISO C standard.
- 102181 Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language  
102182 trigraphs and curly brace preprocessing tokens.
- 102183 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
102184 apply.
- 102185 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 102186 **Issue 8**
- 102187 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 102188 Austin Group Defect 1453 is applied, changing the ENVIRONMENT VARIABLES section.
- 102189 Austin Group Defect 1517 is applied, removing a reference to the `-c` option from the  
102190 RATIONALE section.

102191 **NAME**102192 link — call *link()* function102193 **SYNOPSIS**102194 XSI `link file1 file2`102195 **DESCRIPTION**102196 The *link* utility shall perform the function call:102197 `link(file1, file2);`102198 A user may need appropriate privileges to invoke the *link* utility.102199 **OPTIONS**

102200 None.

102201 **OPERANDS**

102202 The following operands shall be supported:

102203 *file1* The pathname of an existing file.102204 *file2* The pathname of the new directory entry to be created.102205 **STDIN**

102206 Not used.

102207 **INPUT FILES**

102208 Not used.

102209 **ENVIRONMENT VARIABLES**102210 The following environment variables shall affect the execution of *link*:102211 *LANG* Provide a default value for the internationalization variables that are unset or null.  
102212 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
102213 variables used to determine the values of locale categories.)102214 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
102215 internationalization variables.102216 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
102217 characters (for example, single-byte as opposed to multi-byte characters in  
102218 arguments).102219 *LC\_MESSAGES*102220 Determine the locale that should be used to affect the format and contents of  
102221 diagnostic messages written to standard error.102222 *NLSPATH* Determine the location of messages objects and message catalogs.102223 **ASYNCHRONOUS EVENTS**

102224 Default.

102225 **STDOUT**

102226 None.

102227 **STDERR**

102228 The standard error shall be used only for diagnostic messages.

**102229 OUTPUT FILES**

102230 None.

**102231 EXTENDED DESCRIPTION**

102232 None.

**102233 EXIT STATUS**

102234 The following exit values shall be returned:

102235 0 Successful completion.

102236 >0 An error occurred.

**102237 CONSEQUENCES OF ERRORS**

102238 Default.

**102239 APPLICATION USAGE**

102240 None.

**102241 EXAMPLES**

102242 None.

**102243 RATIONALE**

102244 None.

**102245 FUTURE DIRECTIONS**

102246 If this utility is directed to create a new directory entry that contains any bytes that have the  
102247 encoded value of a <newline> character, implementations are encouraged to treat this as an  
102248 error. A future version of this standard may require implementations to treat this as an error.

102251 XBD [Chapter 8](#) (on page 167)

102252 XSH [link\(\)](#)

**102253 CHANGE HISTORY**

102254 First released in Issue 5.

**102255 Issue 8**

102256 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
102257 filenames containing any bytes that have the encoded value of a <newline> character.

102258 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

102259 **NAME**

102260 ln — link files

102261 **SYNOPSIS**102262 ln [-fs] [-L|-P] *source\_file target\_file*102263 ln [-fs] [-L|-P] *source\_file... target\_dir*102264 **DESCRIPTION**

102265 In the first synopsis form, the *ln* utility shall create a new directory entry at the destination path  
 102266 specified by the *target\_file* operand. If the *-s* option is specified, a symbolic link shall be created  
 102267 with the contents specified by the *source\_file* operand (which need not name an existing file);  
 102268 otherwise, a hard link shall be created to the file named by the *source\_file* operand. This first  
 102269 synopsis form shall be assumed when the final operand does not name an existing directory; if  
 102270 more than two operands are specified and the final is not an existing directory, an error shall  
 102271 result.

102272 In the second synopsis form, the *ln* utility shall create a new directory entry for each *source\_file*  
 102273 operand, at a destination path in the existing directory named by *target\_dir*. If the *-s* option is  
 102274 specified, a symbolic link shall be created with the contents specified by each *source\_file* operand  
 102275 (which need not name an existing file); otherwise, a hard link shall be created to each file named  
 102276 by a *source\_file* operand.

102277 If the last operand specifies an existing file of a type not specified by the System Interfaces  
 102278 volume of POSIX.1-2024, the behavior is implementation-defined.

102279 The corresponding destination path for each *source\_file* shall be the concatenation of the target  
 102280 directory pathname, a <slash> character if the target directory pathname did not end in a  
 102281 <slash>, and the last pathname component of the *source\_file*. The second synopsis form shall be  
 102282 assumed when the final operand names an existing directory.

102283 For each *source\_file*:

- 102284 1. If the destination path exists and was created by a previous step, it is unspecified whether  
 102285 *ln* writes a diagnostic message to standard error, does nothing more with the current  
 102286 *source\_file*, and goes on to any remaining *source\_files*; or continues processing the current  
 102287 *source\_file*. If the destination path exists:
  - 102288 a. If the *-f* option is not specified, *ln* shall write a diagnostic message to standard  
 102289 error, do nothing more with the current *source\_file*, and go on to any remaining  
 102290 *source\_files*.
  - 102291 b. If the destination path names the same directory entry as the current *source\_file* *ln*  
 102292 shall write a diagnostic message to standard error, do nothing more with the  
 102293 current *source\_file*, and go on to any remaining *source\_files*.
  - 102294 c. Actions shall be performed equivalent to the *unlink()* function defined in the  
 102295 System Interfaces volume of POSIX.1-2024, called using the destination path as the  
 102296 *path* argument. If this fails for any reason, *ln* shall write a diagnostic message to  
 102297 standard error, do nothing more with the current *source\_file*, and go on to any  
 102298 remaining *source\_files*.
- 102299 2. If the *-s* option is specified, actions shall be performed equivalent to the *symlink()*  
 102300 function with *source\_file* as the *path1* argument and the destination path as the *path2*  
 102301 argument. The *ln* utility shall do nothing more with *source\_file* and shall go on to any  
 102302 remaining files.

- 102303 3. If *source\_file* is a symbolic link:
- 102304 a. If the **-P** option is in effect, actions shall be performed equivalent to the *linkat()*
- 102305 function with *source\_file* as the *path1* argument, the destination path as the *path2*
- 102306 argument, `AT_FDCWD` as the *fd1* and *fd2* arguments, and zero as the *flag*
- 102307 argument.
- 102308 b. If the **-L** option is in effect, actions shall be performed equivalent to the *linkat()*
- 102309 function with *source\_file* as the *path1* argument, the destination path as the *path2*
- 102310 argument, `AT_FDCWD` as the *fd1* and *fd2* arguments, and
- 102311 `AT_SYMLINK_FOLLOW` as the *flag* argument.
- 102312 The *ln* utility shall do nothing more with *source\_file* and shall go on to any remaining files.
- 102313 4. Actions shall be performed equivalent to the *link()* function defined in the System
- 102314 Interfaces volume of POSIX.1-2024 using *source\_file* as the *path1* argument, and the
- 102315 destination path as the *path2* argument.

### 102316 OPTIONS

102317 The *ln* utility shall conform to XBD [Section 12.2](#) (on page 215).

102318 The following options shall be supported:

- 102319 **-f** Force existing destination pathnames to be removed to allow the link.
- 102320 **-L** For each *source\_file* operand that names a file of type symbolic link, create a hard
- 102321 link to the file referenced by the symbolic link.
- 102322 **-P** For each *source\_file* operand that names a file of type symbolic link, create a hard
- 102323 link to the symbolic link itself.
- 102324 **-s** Create symbolic links instead of hard links. If the **-s** option is specified, the **-L** and
- 102325 **-P** options shall be silently ignored.

102326 Specifying more than one of the mutually-exclusive options **-L** and **-P** shall not be considered

102327 an error. The last option specified shall determine the behavior of the utility (unless the **-s**

102328 option causes it to be ignored).

102329 If the **-s** option is not specified and neither a **-L** nor a **-P** option is specified, it is

102330 implementation-defined which of the **-L** and **-P** options is used as the default.

### 102331 OPERANDS

102332 The following operands shall be supported:

- 102333 *source\_file* A pathname of a file to be linked. If the **-s** option is specified, no restrictions on the
- 102334 type of file or on its existence shall be made. If the **-s** option is not specified,
- 102335 whether a directory can be linked is implementation-defined.
- 102336 *target\_file* The pathname of the new directory entry to be created.
- 102337 *target\_dir* A pathname of an existing directory in which the new directory entries are created.

### 102338 STDIN

102339 Not used.

### 102340 INPUT FILES

102341 None.

102342 **ENVIRONMENT VARIABLES**

102343 The following environment variables shall affect the execution of *ln*:

102344 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102345 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 102346 variables used to determine the values of locale categories.)

102347 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102348 internationalization variables.

102349 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102350 characters (for example, single-byte as opposed to multi-byte characters in  
 102351 arguments).

102352 *LC\_MESSAGES*

102353 Determine the locale that should be used to affect the format and contents of  
 102354 diagnostic messages written to standard error.

102355 *XSI NLSPATH* Determine the location of messages objects and message catalogs.

102356 **ASYNCHRONOUS EVENTS**

102357 Default.

102358 **STDOUT**

102359 Not used.

102360 **STDERR**

102361 The standard error shall be used only for diagnostic messages.

102362 **OUTPUT FILES**

102363 None.

102364 **EXTENDED DESCRIPTION**

102365 None.

102366 **EXIT STATUS**

102367 The following exit values shall be returned:

102368 0 Successful completion.

102369 >0 An error occurred.

102370 **CONSEQUENCES OF ERRORS**

102371 Default.

102372 **APPLICATION USAGE**

102373 None.

102374 **EXAMPLES**

102375 None.

102376 **RATIONALE**

102377 The CONSEQUENCES OF ERRORS section does not require *ln -f a b* to remove *b* if a  
 102378 subsequent link operation would fail.

102379 Some historic versions of *ln* (including the one specified by the SVID) unlink the destination file,  
 102380 if it exists, by default. If the mode does not permit writing, these versions prompt for  
 102381 confirmation before attempting the unlink. In these versions the *-f* option causes *ln* not to  
 102382 attempt to prompt for confirmation.

102383 This allows *ln* to succeed in creating links when the target file already exists, even if the file itself

- 102384 is not writable (although the directory must be). Early proposals specified this functionality.
- 102385 This volume of POSIX.1-2024 does not allow the *ln* utility to unlink existing destination paths by  
102386 default for the following reasons:
- 102387 • The *ln* utility has historically been used to provide locking for shell applications, a usage  
102388 that is incompatible with *ln* unlinking the destination path by default. There was no  
102389 corresponding technical advantage to adding this functionality.
  - 102390 • This functionality gave *ln* the ability to destroy the link structure of files, which changes  
102391 the historical behavior of *ln*.
  - 102392 • This functionality is easily replicated with a combination of *rm* and *ln*.
  - 102393 • It is not historical practice in many systems; BSD and BSD-derived systems do not support  
102394 this behavior. Unfortunately, whichever behavior is selected can cause scripts written  
102395 expecting the other behavior to fail.
  - 102396 • It is preferable that *ln* perform in the same manner as the *link()* function, which does not  
102397 permit the target to exist already.
- 102398 This volume of POSIX.1-2024 retains the `-f` option to provide support for shell scripts depending  
102399 on the SVID semantics. It seems likely that shell scripts would not be written to handle  
102400 prompting by *ln* and would therefore have specified the `-f` option.
- 102401 The `-f` option is an undocumented feature of many historical versions of the *ln* utility, allowing  
102402 linking to directories. These versions require modification.
- 102403 Early proposals of this volume of POSIX.1-2024 also required a `-i` option, which behaved like the  
102404 `-i` options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This was not  
102405 historical practice for the *ln* utility and has been omitted.
- 102406 The `-L` and `-P` options allow for implementing both common behaviors of the *ln* utility. Earlier  
102407 versions of this standard did not specify these options and required the behavior now described  
102408 for the `-L` option. Many systems by default or as an alternative provided a non-conforming *ln*  
102409 utility with the behavior now described for the `-P` option. Since applications could not rely on *ln*  
102410 following links in practice, the `-L` and `-P` options were added to specify the desired behavior for  
102411 the application.
- 102412 The `-L` and `-P` options are ignored when `-s` is specified in order to allow an alias to be created to  
102413 alter the default behavior when creating hard links (for example, *alias ln='ln -L'*). They serve no  
102414 purpose when `-s` is specified, since *source\_file* is then just a string to be used as the contents of  
102415 the created symbolic link and need not exist as a file.
- 102416 The specification ensures that *ln a a* with or without the `-f` option will not unlink the file *a*.  
102417 Earlier versions of this standard were unclear in this case.
- 102418 **FUTURE DIRECTIONS**
- 102419 If this utility is directed to create a new directory entry that contains any bytes that have the  
102420 encoded value of a <newline> character, implementations are encouraged to treat this as an  
102421 error. A future version of this standard may require implementations to treat this as an error.
- 102422 **SEE ALSO**
- 102423 *chmod, find, pax, readlink, realpath, rm*

102426 **CHANGE HISTORY**

102427 First released in Issue 2.

102428 **Issue 6**102429 The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b  
102430 draft standard.102431 **Issue 7**

102432 Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

102433 SD5-XCU-ERN-27 is applied, adding a new paragraph to the RATIONALE.

102434 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102435 The **-L** and **-P** options are added to make it implementation-defined whether the *ln* utility  
102436 follows symbolic links.

102437 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0096 [136] is applied.

102438 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0113 [930] is applied.

102439 **Issue 8**102440 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
102441 filenames containing any bytes that have the encoded value of a <newline> character.102442 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.102443 Austin Group Defect 1380 is applied, changing text using the term “link” in line with its  
102444 updated definition.102445 Austin Group Defect 1457 is applied, adding *readlink* and *realpath* to the SEE ALSO section.

102446 Austin Group Defect 1506 is applied, changing the EXIT STATUS section.

102447 **NAME**

102448 locale — get locale-specific information

102449 **SYNOPSIS**

102450 locale [-a|-m]

102451 locale [-ck] name...

102452 **DESCRIPTION**

102453 The *locale* utility shall write information about the current locale environment, or all public  
 102454 locales, to the standard output. For the purposes of this section, a *public locale* is one provided by  
 102455 the implementation that is accessible to the application.

102456 When *locale* is invoked without any arguments, it shall summarize the current locale  
 102457 environment for each locale category as determined by the settings of the environment variables  
 102458 defined in XBD [Chapter 7](#) (on page 127).

102459 When invoked with operands, it shall write values that have been assigned to the keywords in  
 102460 the locale categories, as follows:

- 102461 • Specifying a keyword name shall select the named keyword and the category containing  
 102462 that keyword.
- 102463 • Specifying a category name shall select the named category and all keywords in that  
 102464 category.

102465 **OPTIONS**102466 The *locale* utility shall conform to XBD [Section 12.2](#) (on page 215).

102467 The following options shall be supported:

- 102468 **-a** Write information about all available public locales. The available locales shall  
 102469 include **POSIX**, representing the POSIX locale. The manner in which the  
 102470 implementation determines what other locales are available is implementation-  
 102471 defined.
- 102472 **-c** Write the names of selected locale categories; see the **STDOUT** section. The **-c**  
 102473 option increases readability when more than one category is selected (for example,  
 102474 via more than one keyword name or via a category name). It is valid both with  
 102475 and without the **-k** option.
- 102476 **-k** Write the names and values of selected keywords. The implementation may omit  
 102477 values for some keywords; see the **OPERANDS** section.
- 102478 **-m** Write names of available charmaps; see XBD [Section 6.1](#) (on page 117).

102479 **OPERANDS**

102480 The following operand shall be supported:

- 102481 *name* The name of a locale category as defined in XBD [Chapter 7](#) (on page 127), the name  
 102482 of a keyword in a locale category, or the reserved name **charmap**. The named  
 102483 category or keyword shall be selected for output. If a single *name* represents both a  
 102484 locale category name and a keyword name in the current locale, the results are  
 102485 unspecified. Otherwise, both category and keyword names can be specified as  
 102486 *name* operands, in any sequence. It is implementation-defined whether any  
 102487 keyword values are written for the categories *LC\_CTYPE* and *LC\_COLLATE*.

102488 **STDIN**

102489 Not used.

102490 **INPUT FILES**

102491 None.

102492 **ENVIRONMENT VARIABLES**102493 The following environment variables shall affect the execution of *locale*:

102494 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102495 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 102496 variables used to determine the values of locale categories.)

102497 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102498 internationalization variables.

102499 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102500 characters (for example, single-byte as opposed to multi-byte characters in  
 102501 arguments and input files).

102502 *LC\_MESSAGES*

102503 Determine the locale that should be used to affect the format and contents of  
 102504 diagnostic messages written to standard error.

102505 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

102506 XSI The application shall ensure that the *LANG*, *LC\_\**, and *NLSPATH* environment variables specify  
 102507 the current locale environment to be written out; they shall be used if the **-a** option is not  
 102508 specified.

102509 **ASYNCHRONOUS EVENTS**

102510 Default.

102511 **STDOUT**102512 The *LANG* variable shall be written first using the format:102513 "*LANG*=%s\n", *<value>*102514 If *LANG* is not set or is an empty string, the value is the empty string.

102515 If *locale* is invoked without any options or operands, the names and values of the *LC\_\**  
 102516 environment variables described in this volume of POSIX.1-2024 shall be written to the standard  
 102517 output, one variable per line, and each line using the following format. Only those variables set  
 102518 in the environment and not overridden by *LC\_ALL* shall be written using this format:

102519 "%s=%s\n", *<variable\_name>*, *<value>*

102520 The names of those *LC\_\** variables associated with locale categories defined in this volume of  
 102521 POSIX.1-2024 that are not set in the environment or are overridden by *LC\_ALL* shall be written  
 102522 in the following format:

102523 "%s=\"%s\"\n", *<variable\_name>*, *<implied value>*

102524 The *<implied value>* shall be the name of the locale that has been selected for that category by the  
 102525 implementation, based on the values in *LANG* and *LC\_ALL*, as described in XBD Chapter 8 (on  
 102526 page 167).

102527 The *<value>* and *<implied value>* shown above shall be properly quoted for possible later reentry  
 102528 to the shell. The *<value>* shall not be quoted using double-quotes (so that it can be distinguished  
 102529 by the user from the *<implied value>* case, which always requires double-quotes).

102530 The `LC_ALL` variable shall be written last, using the first format shown above. If it is not set, it  
 102531 shall be written as:

102532 `"LC_ALL=\n"`

102533 If any arguments are specified:

102534 1. If the `-a` option is specified, the names of all the public locales shall be written, each in the  
 102535 following format:

102536 `"%s\n", <locale name>`

102537 2. If the `-c` option is specified, the names of all selected categories shall be written, each in  
 102538 the following format:

102539 `"%s\n", <category name>`

102540 If keywords are also selected for writing (see following items), the category name output  
 102541 shall precede the keyword output for that category.

102542 If the `-c` option is not specified, the names of the categories shall not be written; only the  
 102543 keywords, as selected by the `<name>` operand, shall be written.

102544 3. If the `-k` option is specified, the names and values of selected keywords shall be written.  
 102545 If a value is non-numeric and is not a compound keyword value, it shall be written in the  
 102546 following format:

102547 `"%s=\"%s\"\n", <keyword name>, <keyword value>`

102548 If a value is a non-numeric compound keyword value, it shall either be written in the  
 102549 format:

102550 `"%s=\"%s\"\n", <keyword name>, <keyword value>`

102551 where the `<keyword value>` is a single string of values separated by `<semicolon>`  
 102552 characters, or it shall be written in the format:

102553 `"%s=%s\n", <keyword name>, <keyword value>`

102554 where the `<keyword value>` is encoded as a set of strings, each enclosed in double-  
 102555 quotation-marks, separated by `<semicolon>` characters.

102556 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
 102557 `localedef -f` option when the locale was created shall be written, with the word **charmap** as  
 102558 `<keyword name>`.

102559 If a value is numeric, it shall be written in one of the following formats:

102560 `"%s=%d\n", <keyword name>, <keyword value>`

102561 `"%s=%c%o\n", <keyword name>, <escape character>, <keyword value>`

102562 `"%s=%cx%x\n", <keyword name>, <escape character>, <keyword value>`

102563 where the `<escape character>` is that identified by the **escape\_char** keyword in the current  
 102564 locale; see XBD [Section 7.3](#) (on page 128).

102565 Compound keyword values (list entries) shall be separated in the output by `<semicolon>`  
 102566 characters. When included in keyword values, the `<semicolon>`, `<backslash>`, double-  
 102567 quote, and any control character shall be preceded (escaped) with the escape character.

102568 4. If the `-k` option is not specified, selected keyword values shall be written, each in the  
102569 following format:

102570 "%s\n", <keyword value>

102571 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
102572 `localedef -f` option when the locale was created shall be written.

102573 5. If the `-m` option is specified, then a list of all available charmaps shall be written, each in  
102574 the format:

102575 "%s\n", <charmap>

102576 where <charmap> is in a format suitable for use as the option-argument to the `localedef -f`  
102577 option.

#### 102578 **STDERR**

102579 The standard error shall be used only for diagnostic messages.

#### 102580 **OUTPUT FILES**

102581 None.

#### 102582 **EXTENDED DESCRIPTION**

102583 None.

#### 102584 **EXIT STATUS**

102585 The following exit values shall be returned:

102586 0 All the requested information was found and output successfully.

102587 >0 An error occurred.

#### 102588 **CONSEQUENCES OF ERRORS**

102589 Default.

#### 102590 **APPLICATION USAGE**

102591 If the `LANG` environment variable is not set or set to an empty value, or one of the `LC_*`  
102592 environment variables is set to an unrecognized value, the actual locales assumed (if any) are  
102593 implementation-defined as described in XBD [Chapter 8](#) (on page 167).

102594 Implementations are not required to write out the actual values for keywords in the categories  
102595 `LC_CTYPE` and `LC_COLLATE`; however, they must write out the categories (allowing an  
102596 application to determine, for example, which character classes are available).

#### 102597 **EXAMPLES**

102598 In the following examples, the assumption is that locale environment variables are set as  
102599 follows:

102600 LANG=locale\_x

102601 LC\_COLLATE=locale\_y

102602 The command `locale` would result in the following output:

102603 LANG=locale\_x

102604 LC\_CTYPE="locale\_x"

102605 LC\_COLLATE=locale\_y

102606 LC\_TIME="locale\_x"

102607 LC\_NUMERIC="locale\_x"

102608 LC\_MONETARY="locale\_x"

102609 LC\_MESSAGES="locale\_x"

102610 LC\_ALL=

102611 The order of presentation of the categories is not specified by this volume of POSIX.1-2024.

102612 The command:

```
102613 LC_ALL=POSIX locale -ck decimal_point
```

102614 would produce:

```
102615 LC_NUMERIC
102616 decimal_point="."
```

102617 The following command shows an application of *locale* to determine whether a user-supplied  
102618 response is affirmative:

```
102619 printf 'Prompt for response: '
102620 read response
102621 if printf "%s\n" "$response" | grep -Eq -- "${locale yesexpr}"
102622 then
102623     affirmative processing goes here
102624 else
102625     non-affirmative processing goes here
102626 fi
```

#### 102627 RATIONALE

102628 The output for categories *LC\_CTYPE* and *LC\_COLLATE* has been made implementation-defined  
102629 because there is a questionable value in having a shell script receive an entire array of characters.  
102630 It is also difficult to return a logical collation description, short of returning a complete *localedef*  
102631 source.

102632 The **-m** option was included to allow applications to query for the existence of charmaps. The  
102633 output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the  
102634 system.

102635 The **-c** option was included for readability when more than one category is selected (for  
102636 example, via more than one keyword name or via a category name). It is valid both with and  
102637 without the **-k** option.

102638 The **charmap** keyword, which returns the name of the charmap (if any) that was used when the  
102639 current locale was created, was included to allow applications needing the information to  
102640 retrieve it.

102641 According to XBD [Section 6.1](#) (on page 117), the standard requires that all supported locales  
102642 must have the same encoding for <period> and <slash>, because these two characters are used  
102643 within the locale-independent pathname resolution sequence. Therefore, it would be an error if  
102644 *locale -a* listed both ASCII and EBCDIC-based locales, since those two encodings do not share  
102645 the same representation for either <period> or <slash>. Any system that supports both  
102646 environments would be expected to provide two POSIX locales, one in either codeset, where  
102647 only the locales appropriate to the current environment can be visible at a time. In an XSI-  
102648 compliant implementation, the *dd* utility is the only portable means for performing conversions  
102649 between the two character sets.

#### 102650 FUTURE DIRECTIONS

102651 None.

#### 102652 SEE ALSO

102653 *localedef*

102654 XBD [Section 6.1](#) (on page 117), [Chapter 7](#) (on page 127), [Chapter 8](#) (on page 167), [Section 12.2](#) (on  
102655 page 215)

102656 **CHANGE HISTORY**

102657 First released in Issue 4.

102658 **Issue 5**

102659 The FUTURE DIRECTIONS section is added.

102660 **Issue 6**

102661 The normative text is reworded to avoid use of the term “must” for application requirements.

102662 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error  
102663 in the STDOUT section.

102664 **Issue 7**

102665 Austin Group Interpretations 1003.1-2001 #017, #021, and #088 are applied, clarifying the  
102666 standard output for the `-k` option when `LANG` is not set or is an empty string.

102667 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102668 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0097 [291] is applied.

102669 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0114 [941] is applied.

102670 **Issue 8**

102671 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

102672 Austin Group Defect 1262 is applied, changing the EXAMPLES section.

102673 **NAME**

102674 localedef — define locale environment

102675 **SYNOPSIS**102676 localedef [-c] [-f *charmap*] [-i *sourcefile*] [-u *code\_set\_name*] *name*102677 **DESCRIPTION**

102678 The *localedef* utility shall convert source definitions for locale categories into a format usable by  
 102679 the functions and utilities whose operational behavior is determined by the setting of the locale  
 102680 environment variables defined in XBD [Chapter 7](#) (on page 127). It is implementation-defined  
 102681 whether users have the capability to create new locales, in addition to those supplied by the  
 102682 implementation. If the symbolic constant POSIX2\_LOCALEDEF is defined, the system supports  
 102683 XSI the creation of new locales. On XSI-conformant systems, the symbolic constant  
 102684 POSIX2\_LOCALEDEF shall be defined.

102685 The utility shall read source definitions for one or more locale categories belonging to the same  
 102686 locale from the file named in the -i option (if specified) or from standard input.

102687 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or  
 102688 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may  
 102689 restrict the capability to create or modify public locales to users with appropriate privileges.

102690 Each category source definition shall be identified by the corresponding environment variable  
 102691 name and terminated by an **END** *category-name* statement. The following categories shall be  
 102692 supported. In addition, the input may contain source for implementation-defined categories.

102693 *LC\_CTYPE* Defines character classification and case conversion.

102694 *LC\_COLLATE*  
 102695 Defines collation rules.

102696 *LC\_MONETARY*  
 102697 Defines the format and symbols used in formatting of monetary information.

102698 *LC\_NUMERIC*  
 102699 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary  
 102700 numeric editing.

102701 *LC\_TIME* Defines the format and content of date and time information.

102702 *LC\_MESSAGES*  
 102703 Defines the format and values of affirmative and negative responses.

102704 If the *LC\_COLLATE* category defines a collation sequence that does not have a total ordering of  
 102705 all characters, *localedef* shall write a warning message to standard error and, if the exit status  
 102706 would otherwise have been zero, shall exit with status 1.

102707 **OPTIONS**

102708 The *localedef* utility shall conform to XBD [Section 12.2](#) (on page 215).

102709 The following options shall be supported:

102710 **-c** Create permanent output even if warning messages have been issued.

102711 **-f** *charmap* Specify the pathname of a file containing a mapping of character symbols and  
 102712 collating element symbols to actual character encodings. The format of the  
 102713 *charmap* is described in XBD [Section 6.4](#) (on page 121). The application shall ensure  
 102714 that this option is specified if symbolic names (other than collating symbols  
 102715 defined in a **collating-symbol** keyword) are used. If the -f option is not present, an  
 102716 implementation-defined character mapping shall be used.

102717        **-i** *inputfile*    The pathname of a file containing the source definitions. If this option is not  
 102718                            present, source definitions shall be read from standard input. The format of the  
 102719                            *inputfile* is described in XBD [Section 7.3](#) (on page 128).

102720        **-u** *code\_set\_name*   Specify the name of a codeset used as the target mapping of character symbols and  
 102721                            collating element symbols whose encoding values are defined in terms of the  
 102722                            ISO/IEC 10646: 2020 standard position constant values.  
 102723

#### 102724 OPERANDS

102725        The following operand shall be supported:

102726        *name*            Identifies the locale; see XBD [Chapter 7](#) (on page 127) for a description of the use of  
 102727                            this name. If the name contains one or more <slash> characters, *name* shall be  
 102728                            interpreted as a pathname where the created locale definitions shall be stored. If  
 102729                            *name* does not contain any <slash> characters, the interpretation of the name is  
 102730                            implementation-defined and the locale shall be public. The ability to create public  
 102731                            locales in this way may be restricted to users with appropriate privileges. (As a  
 102732                            consequence of specifying one *name*, although several categories can be processed  
 102733                            in one execution, only categories belonging to the same locale can be processed.)

#### 102734 STDIN

102735        Unless the **-i** option is specified, the standard input shall be a text file containing one or more  
 102736        locale category source definitions, as described in XBD [Section 7.3](#) (on page 128). When lines are  
 102737        continued using the escape character mechanism, there is no limit to the length of the  
 102738        accumulated continued line.

#### 102739 INPUT FILES

102740        The character set mapping file specified as the *charmap* option-argument is described in XBD  
 102741        [Section 6.4](#) (on page 121). If a locale category source definition contains a **copy** statement, as  
 102742        defined in XBD [Chapter 7](#) (on page 127), and the **copy** statement names a valid, existing locale,  
 102743        then *localedef* shall behave as if the source definition had contained a valid category source  
 102744        definition for the named locale.

#### 102745 ENVIRONMENT VARIABLES

102746        The following environment variables shall affect the execution of *localedef*:

102747        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 102748                            (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 102749                            variables used to determine the values of locale categories.)

102750        **LC\_ALL**         If set to a non-empty string value, override the values of all the other  
 102751                            internationalization variables.

102752        **LC\_COLLATE**     (This variable has no affect on *localedef*; the POSIX locale is used for this category.)

102754        **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 102755                            characters (for example, single-byte as opposed to multi-byte characters in  
 102756                            arguments and input files). This variable has no affect on the processing of *localedef*  
 102757                            input data; the POSIX locale is used for this purpose, regardless of the value of this  
 102758                            variable.

102759        **LC\_MESSAGES**

102760                            Determine the locale that should be used to affect the format and contents of  
 102761                            diagnostic messages written to standard error.

- 102762 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 102763 **ASYNCHRONOUS EVENTS**
- 102764 Default.
- 102765 **STDOUT**
- 102766 The utility shall report all categories successfully processed, in an unspecified format.
- 102767 **STDERR**
- 102768 The standard error shall be used only for diagnostic messages.
- 102769 **OUTPUT FILES**
- 102770 The format of the created output is unspecified. If the *name* operand does not contain a <slash>, the existence of an output file for the locale is unspecified.
- 102771
- 102772 **EXTENDED DESCRIPTION**
- 102773 When the `-u` option is used, the *code\_set\_name* option-argument shall be interpreted as an implementation-defined name of a codeset to which the ISO/IEC 10646:2020 standard position constant values shall be converted via an implementation-defined method. Both the ISO/IEC 10646:2020 standard position constant values and other formats (decimal, hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset represented by the implementation-defined name can be any codeset that is supported by the implementation.
- 102774
- 102775
- 102776
- 102777
- 102778
- 102779
- 102780 When conflicts occur between the *charmap* specification of <*code\_set\_name*>, <*mb\_cur\_max*>, or <*mb\_cur\_min*> and the implementation-defined interpretation of these respective items for the codeset represented by the `-u` option-argument *code\_set\_name*, the result is unspecified.
- 102781
- 102782
- 102783 When conflicts (including omissions) occur between the *charmap* encoding values specified for symbolic names of characters of the portable character set and the implementation-defined assignment of character encoding values, the result is unspecified. If the result is that *localedef* creates the specified locale, any attempted use of that locale by an application or utility results in undefined behavior.
- 102784
- 102785
- 102786
- 102787
- 102788 If a non-printable character in the *charmap* has a width specified that is not `-1`, the result is undefined.
- 102789
- 102790 **EXIT STATUS**
- 102791 The following exit values shall be returned:
- 102792 0 No errors occurred and the locales were successfully created.
- 102793 1 Warnings occurred and the locales were successfully created.
- 102794 2 The locale specification exceeded implementation limits or the coded character set or sets used were not supported by the implementation, and no locale was created.
- 102795
- 102796 3 The capability to create new locales is not supported by the implementation.
- 102797 >3 Warnings or errors occurred and no output was created.
- 102798 **CONSEQUENCES OF ERRORS**
- 102799 If an error is detected, no permanent output shall be created.
- 102800 If warnings occur, permanent output shall be created if the `-c` option was specified. The following conditions shall cause warning messages to be issued:
- 102801
- 102802 • If a symbolic name not found in the *charmap* file is used for the descriptions of the *LC\_CTYPE* or *LC\_COLLATE* categories (for other categories, this shall be an error condition).
  - 102803
  - 102804

- 102805 • If the number of operands to the **order** keyword exceeds the {COLL\_WEIGHTS\_MAX}
- 102806 limit.
- 102807 • If optional keywords not supported by the implementation are present in the source.
- 102808 Other implementation-defined conditions may also cause warnings.

#### 102809 APPLICATION USAGE

102810 The *charmap* definition is optional, and is contained outside the locale definition. This allows  
 102811 both completely self-defined source files, and generic sources (applicable to more than one  
 102812 codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the  
 102813 portable character set. As explained in XBD [Section 6.4](#) (on page 121), it is implementation-  
 102814 defined whether or not users or applications can provide additional character set description  
 102815 files. Therefore, the **-f** option might be operable only when an implementation-defined *charmap*  
 102816 is named.

#### 102817 EXAMPLES

102818 None.

#### 102819 RATIONALE

102820 The output produced by the *localedef* utility is implementation-defined. The *name* operand is  
 102821 used to identify the specific locale. (As a consequence, although several categories can be  
 102822 processed in one execution, only categories belonging to the same locale can be processed.)

102823 When conflicts (including omissions) occur between the *charmap* encoding values specified for  
 102824 symbolic names of characters of the portable character set and the implementation-defined  
 102825 assignment of character encoding values, it is recommended that *localedef* treats this as an error  
 102826 in order to prevent the undefined behavior that results if *localedef* creates the specified locale and  
 102827 an application or utility attempts to use it.

#### 102828 FUTURE DIRECTIONS

102829 If this utility is directed to create a new directory entry that contains any bytes that have the  
 102830 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 102831 error. A future version of this standard may require implementations to treat this as an error.

#### 102832 SEE ALSO

102833 [locale](#)

102834 XBD [Section 6.4](#) (on page 121), [Chapter 7](#) (on page 127), [Chapter 8](#) (on page 167), [Section 12.2](#) (on  
 102835 page 215)

#### 102836 CHANGE HISTORY

102837 First released in Issue 4.

#### 102838 Issue 6

102839 The **-u** option is added, as specified in the IEEE P1003.2b draft standard.

102840 The normative text is reworded to avoid use of the term “must” for application requirements.

102841 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/15 is applied, rewording text in the  
 102842 OPERANDS section describing the ability to create public locales.

102843 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/16 is applied, making the text consistent  
 102844 with the descriptions of **WIDTH** and **WIDTH\_DEFAULT** in the Base Definitions volume of  
 102845 POSIX.1-2024.

102846 **Issue 7**

102847 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102848 **Issue 8**

102849 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
102850 filenames containing any bytes that have the encoded value of a <newline> character.

102851 Austin Group Defect 1070 is applied, requiring that *localedef* issues a warning if the  
102852 *LC\_COLLATE* category defines a collation sequence that does not have a total ordering of all  
102853 characters.

102854 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

102855 Austin Group Defect 1609 is applied, clarifying the behavior when conflicts (including  
102856 omissions) occur between the *charmap* encoding values specified for symbolic names of  
102857 characters of the portable character set and the implementation-defined assignment of character  
102858 encoding values.

102859 **NAME**

102860           logger — log messages

102861 **SYNOPSIS**102862           logger [-i] [-f *file*] [-p *priority*] [-t *tag*] [*string...*]102863 **DESCRIPTION**

102864           The *logger* utility shall send messages to an implementation-defined logging facility, which may  
 102865           log them in an implementation-defined system log, write them to the system console, forward  
 102866           them to a list of users, or forward them to the logging facility on another host over the network.  
 102867           Each logged message shall include a message header and a message body. The message header  
 102868           shall contain at least a timestamp and a tag string.

102869           If one or more *string* operands are specified, they shall be logged; otherwise, the message bodies  
 102870           to be logged shall be read from standard input if no **-f** option is specified, or from the specified  
 102871           file if the **-f** option is present.

102872           It is implementation-defined whether messages written in locales other than the POSIX locale  
 102873           are effective.

102874 **OPTIONS**102875           The *logger* utility shall conform to XBD [Section 12.2](#) (on page 215).

102876           The following options shall be supported:

102877           **-f** *file*       Read the log message bodies from *file* instead of standard input.102878           **-i**           Log the process ID of the *logger* process with each message.

102879           **-p** *priority*   Log the message with priority set to *priority*. The priority is specified as a  
 102880           *facility.level* pair. The following values for *facility* shall be supported:

102881           user        Messages generated by arbitrary processes.

102882           local0     Reserved for local use.

102883           local1     Reserved for local use.

102884           local2     Reserved for local use.

102885           local3     Reserved for local use.

102886           local4     Reserved for local use.

102887           local5     Reserved for local use.

102888           local6     Reserved for local use.

102889           local7     Reserved for local use.

102890           The following values for *level* shall be supported:

102891           emerg     A panic condition.

102892           alert     A condition that should be corrected immediately, such as a corrupted  
 102893           system database.

102894           crit       Critical conditions, such as hard device errors.

102895           err        Errors.

102896           warning   Warning messages.

|        |                     |                                                                                                    |
|--------|---------------------|----------------------------------------------------------------------------------------------------|
| 102897 | notice              | Conditions that are not error conditions, but that may require special handling.                   |
| 102898 |                     |                                                                                                    |
| 102899 | info                | Informational messages.                                                                            |
| 102900 | debug               | Messages that contain information normally of use only when debugging a program.                   |
| 102901 |                     |                                                                                                    |
| 102902 |                     | If the <code>-p</code> option is not specified, the priority shall be <code>user.notice</code> .   |
| 102903 | <code>-t tag</code> | Use the string <i>tag</i> as the tag string in the message header. The default tag is unspecified. |
| 102904 |                     |                                                                                                    |

#### 102905 OPERANDS

102906 The following operand shall be supported:

|        |               |                                                                                                                                       |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 102907 | <i>string</i> | One of the string arguments whose contents are concatenated together, in the order specified, separated by single <space> characters. |
| 102908 |               |                                                                                                                                       |

#### 102909 STDIN

102910 The standard input shall be used if no *string* operands are specified and either the `-f` option is not specified or the `-f` option is specified with a *file* option-argument of `'-'` and the implementation treats the `'-'` as meaning standard input. Otherwise, the standard input shall not be used. See the INPUT FILES section.

102914 Each non-empty line shall be logged as a separate message. It is unspecified whether an empty line is also logged as a separate message.

#### 102916 INPUT FILES

102917 The input files shall be text files.

#### 102918 ENVIRONMENT VARIABLES

102919 The following environment variables shall affect the execution of *logger*:

|        |             |                                                                                                                                                                                                                                    |
|--------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102920 | <i>LANG</i> | Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.) |
| 102921 |             |                                                                                                                                                                                                                                    |
| 102922 |             |                                                                                                                                                                                                                                    |

|        |               |                                                                                                          |
|--------|---------------|----------------------------------------------------------------------------------------------------------|
| 102923 | <i>LC_ALL</i> | If set to a non-empty string value, override the values of all the other internationalization variables. |
| 102924 |               |                                                                                                          |

|        |                 |                                                                                                                                                                           |
|--------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102925 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments). |
| 102926 |                 |                                                                                                                                                                           |
| 102927 |                 |                                                                                                                                                                           |

|        |                    |  |
|--------|--------------------|--|
| 102928 | <i>LC_MESSAGES</i> |  |
|--------|--------------------|--|

|        |  |                                                                                                                                                                                                                                                                                    |
|--------|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102929 |  | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error. (This means diagnostics from <i>logger</i> to the user or application, not diagnostic messages that the user is sending to the system administrator.) |
| 102930 |  |                                                                                                                                                                                                                                                                                    |
| 102931 |  |                                                                                                                                                                                                                                                                                    |
| 102932 |  |                                                                                                                                                                                                                                                                                    |

|        |            |                |                                                                  |
|--------|------------|----------------|------------------------------------------------------------------|
| 102933 | <i>XSI</i> | <i>NLSPATH</i> | Determine the location of messages objects and message catalogs. |
|--------|------------|----------------|------------------------------------------------------------------|

#### 102934 ASYNCHRONOUS EVENTS

102935 Default.

#### 102936 STDOUT

102937 Not used.

**102938 STDERR**

102939 The standard error shall be used only for diagnostic messages.

**102940 OUTPUT FILES**

102941 Unspecified.

**102942 EXTENDED DESCRIPTION**

102943 None.

**102944 EXIT STATUS**

102945 The following exit values shall be returned:

102946 0 Successful completion.

102947 >0 An error occurred.

**102948 CONSEQUENCES OF ERRORS**

102949 Default.

**102950 APPLICATION USAGE**

102951 This utility allows logging of information for later use by a system administrator or programmer  
102952 in determining why non-interactive utilities have failed. The locations of the saved messages,  
102953 their format, and retention period are all unspecified. There is no method for a conforming  
102954 application to read messages, once written.

**102955 EXAMPLES**

102956 A batch application, running non-interactively, tries to read a configuration file and fails; it may  
102957 attempt to notify the system administrator with:

102958 `logger myname: unable to read file foo. [timestamp]`

**102959 RATIONALE**

102960 The standard developers believed strongly that some method of alerting administrators to errors  
102961 was necessary. The obvious example is a batch utility, running non-interactively, that is unable to  
102962 read its configuration files or that is unable to create or write its results file. However, the  
102963 standard developers did not wish to define the format or delivery mechanisms as they have  
102964 historically been (and will probably continue to be) very system-specific, as well as involving  
102965 functionality clearly outside the scope of this volume of POSIX.1-2024.

102966 The text with *LC\_MESSAGES* about diagnostic messages means diagnostics from *logger* to the  
102967 user or application, not diagnostic messages that the user is sending to the system administrator.

102968 Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

102969 Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient  
102970 justification to exclude these utilities from this volume of POSIX.1-2024. It is also arguable that  
102971 they are, in fact, testable, but that the tests themselves are not portable.

**102972 FUTURE DIRECTIONS**

102973 None.

**102974 SEE ALSO**

102975 *lp*, *mailx*, *write*

102976 XBD Chapter 8 (on page 167)

**102977 CHANGE HISTORY**

102978 First released in Issue 4.

102979 **Issue 7**

102980 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102981 **Issue 8**

102982 Austin Group Defect 917 is applied, adding the **-f**, **-i**, **-p**, and **-t** options, and specifying the  
102983 behavior when *logger* is executed with no operands.

102984 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

102985 **NAME**

102986 logname — return the user's login name

102987 **SYNOPSIS**

102988 logname

102989 **DESCRIPTION**

102990 The *logname* utility shall write the user's login name to standard output. The login name shall be  
 102991 the string that would be returned by the *getlogin()* function defined in the System Interfaces  
 102992 volume of POSIX.1-2024. Under the conditions where the *getlogin()* function would fail, the  
 102993 *logname* utility shall write a diagnostic message to standard error and exit with a non-zero exit  
 102994 status.

102995 **OPTIONS**

102996 None.

102997 **OPERANDS**

102998 None.

102999 **STDIN**

103000 Not used.

103001 **INPUT FILES**

103002 None.

103003 **ENVIRONMENT VARIABLES**103004 The following environment variables shall affect the execution of *logname*:

103005 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103006 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 103007 variables used to determine the values of locale categories.)

103008 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103009 internationalization variables.

103010 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103011 characters (for example, single-byte as opposed to multi-byte characters in  
 103012 arguments).

103013 *LC\_MESSAGES*

103014 Determine the locale that should be used to affect the format and contents of  
 103015 diagnostic messages written to standard error.

103016 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

103017 **ASYNCHRONOUS EVENTS**

103018 Default.

103019 **STDOUT**103020 The *logname* utility output shall be a single line consisting of the user's login name:

103021 "%s\n", &lt;login name&gt;

103022 **STDERR**

103023 The standard error shall be used only for diagnostic messages.

103024 **OUTPUT FILES**

103025 None.

103026 **EXTENDED DESCRIPTION**

103027 None.

103028 **EXIT STATUS**

103029 The following exit values shall be returned:

103030 0 Successful completion.

103031 &gt;0 An error occurred.

103032 **CONSEQUENCES OF ERRORS**

103033 Default.

103034 **APPLICATION USAGE**103035 The *logname* utility explicitly ignores the *LOGNAME* environment variable because environment  
103036 changes could produce erroneous results.103037 **EXAMPLES**

103038 None.

103039 **RATIONALE**103040 The **passwd** file is not listed as required because the implementation may have other means of  
103041 mapping login names.103042 **FUTURE DIRECTIONS**

103043 None.

103044 **SEE ALSO**103045 *id*, *who*

103046 XBD Chapter 8 (on page 167)

103047 XSH *getlogin()*103048 **CHANGE HISTORY**

103049 First released in Issue 2.

103050 **Issue 8**103051 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

103052 **NAME**

103053 lp — send files to a printer

103054 **SYNOPSIS**103055 lp [-c] [-d *dest*] [-n *copies*] [-msw] [-o *option*]... [-t *title*] [*file*...]103056 **DESCRIPTION**

103057 The *lp* utility shall copy the input files to an output destination in an unspecified manner. The  
 103058 default output destination should be to a hardcopy device, such as a printer or microfilm  
 103059 recorder, that produces non-volatile, human-readable documents. If such a device is not  
 103060 available to the application, or if the system provides no such device, the *lp* utility shall exit with  
 103061 a non-zero exit status.

103062 The actual writing to the output device may occur some time after the *lp* utility successfully  
 103063 exits. During the portion of the writing that corresponds to each input file, the implementation  
 103064 shall guarantee exclusive access to the device.

103065 The *lp* utility shall associate a unique *request ID* with each request.

103066 Normally, a banner page is produced to separate and identify each print job. This page may be  
 103067 suppressed by implementation-defined conditions, such as an operator command or one of the  
 103068 **-o** *option* values.

103069 **OPTIONS**

103070 The *lp* utility shall conform to XBD [Section 12.2](#) (on page 215).

103071 The following options shall be supported:

103072 **-c** Exit only after further access to any of the input files is no longer required. The  
 103073 application can then safely delete or modify the files without affecting the output  
 103074 operation. Normally, files are not copied, but are linked whenever possible. If the  
 103075 **-c** option is not given, then the user should be careful not to remove any of the  
 103076 files before the request has been printed in its entirety. It should also be noted that  
 103077 in the absence of the **-c** option, any changes made to the named files after the  
 103078 request is made but before it is printed may be reflected in the printed output. On  
 103079 some implementations, **-c** may be on by default.

103080 **-d** *dest* Specify a string that names the destination (*dest*). If *dest* is a printer, the request  
 103081 shall be printed only on that specific printer. If *dest* is a class of printers, the request  
 103082 shall be printed on the first available printer that is a member of the class. Under  
 103083 certain conditions (printer unavailability, file space limitation, and so on), requests  
 103084 for specific destinations need not be accepted. Destination names vary between  
 103085 systems.

103086 If **-d** is not specified, and neither the *LPDEST* nor *PRINTER* environment variable  
 103087 is set, an unspecified destination is used. The **-d** *dest* option shall take precedence  
 103088 over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are  
 103089 undefined when *dest* contains a value that is not a valid destination name.

103090 **-m** Send mail (see [mailx](#)) after the files have been printed. By default, no mail is sent  
 103091 upon normal completion of the print request.

103092 **-n** *copies* Write *copies* number of copies of the files, where *copies* is a positive decimal integer.  
 103093 The methods for producing multiple copies and for arranging the multiple copies  
 103094 when multiple *file* operands are used are unspecified, except that each file shall be  
 103095 output as an integral whole, not interleaved with portions of other files.

- 103096      **-o option**      Specify printer-dependent or class-dependent *options*. Several such *options* may be collected by specifying the **-o** option more than once.
- 103097
- 103098      **-s**                 Suppress messages from *lp*.
- 103099      **-t title**         Write *title* on the banner page of the output.
- 103100      **-w**                 Write a message on the user's terminal after the files have been printed. If the user is not logged in, then mail shall be sent instead.
- 103101

#### 103102 OPERANDS

103103      The following operand shall be supported:

- 103104      *file*             A pathname of a file to be output. If no *file* operands are specified, or if a *file* operand is '-', the standard input shall be used. If a *file* operand is used, but the **-c** option is not specified, the process performing the writing to the output device may have user and group permissions that differ from that of the process invoking *lp*.
- 103105
- 103106
- 103107
- 103108

#### 103109 STDIN

103110      The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'. See the INPUT FILES section.

103111

#### 103112 INPUT FILES

103113      The input files shall be text files.

#### 103114 ENVIRONMENT VARIABLES

103115      The following environment variables shall affect the execution of *lp*:

- 103116      **LANG**            Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)
- 103117
- 103118

- 103119      **LC\_ALL**          If set to a non-empty string value, override the values of all the other internationalization variables.
- 103120

- 103121      **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
- 103122
- 103123

#### 103124 LC\_MESSAGES

103125      Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.

103126

103127

- 103128      **LC\_TIME**         Determine the format and contents of date and time strings displayed in the *lp* banner page, if any.
- 103129

- 103130      **LPDEST**          Determine the destination. If the *LPDEST* environment variable is not set, the *PRINTER* environment variable shall be used. The **-d dest** option takes precedence over *LPDEST*. Results are undefined when **-d** is not specified and *LPDEST* contains a value that is not a valid destination name.
- 103131
- 103132
- 103133

- 103134 XSI      **NLSPATH**         Determine the location of messages objects and message catalogs.

- 103135      **PRINTER**         Determine the output device or destination. If the *LPDEST* and *PRINTER* environment variables are not set, an unspecified output device is used. The **-d dest** option and the *LPDEST* environment variable shall take precedence over *PRINTER*. Results are undefined when **-d** is not specified, *LPDEST* is unset, and *PRINTER* contains a value that is not a valid device or destination name.
- 103136
- 103137
- 103138
- 103139

103140 *TZ* Determine the timezone used to calculate date and time strings displayed in the *lp*  
 103141 banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be  
 103142 used.

### 103143 ASYNCHRONOUS EVENTS

103144 Default.

### 103145 STDOUT

103146 The *lp* utility shall write a *request ID* to the standard output, unless *-s* is specified. The format of  
 103147 the message is unspecified. The request ID can be used on systems supporting the historical  
 103148 *cancel* and *lpstat* utilities.

### 103149 STDERR

103150 The standard error shall be used only for diagnostic messages.

### 103151 OUTPUT FILES

103152 None.

### 103153 EXTENDED DESCRIPTION

103154 None.

### 103155 EXIT STATUS

103156 The following exit values shall be returned:

103157 0 All input files were processed successfully.

103158 >0 No output device was available, or an error occurred.

### 103159 CONSEQUENCES OF ERRORS

103160 Default.

### 103161 APPLICATION USAGE

103162 The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's  
 103163 default page size.

103164 A conforming application can use one of the *file* operands only with the *-c* option or if the file is  
 103165 publicly readable and guaranteed to be available at the time of printing. This is because  
 103166 POSIX.1-2024 gives the implementation the freedom to queue up the request for printing at  
 103167 some later time by a different process that might not be able to access the file.

### 103168 EXAMPLES

103169 1. To print file *file*:

103170 `lp -c file`

103171 2. To print multiple files with headers:

103172 `pr file1 file2 | lp`

### 103173 RATIONALE

103174 The *lp* utility was designed to be a basic version of a utility that is already available in many  
 103175 historical implementations. The standard developers considered that it should be implementable  
 103176 simply as:

103177 `cat "$@" > /dev/lp`

103178 after appropriate processing of options, if that is how the implementation chose to do it and if  
 103179 exclusive access could be granted (so that two users did not write to the device simultaneously).  
 103180 Although in the future the standard developers may add other options to this utility, it should  
 103181 always be able to execute with no options or operands and send the standard input to an

103182 unspecified output device.

103183 This volume of POSIX.1-2024 makes no representations concerning the format of the printed  
103184 output, except that it must be “human-readable” and “non-volatile”. Thus, writing by default to  
103185 a disk or tape drive or a display terminal would not qualify. (Such destinations are not  
103186 prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)

103187 This volume of POSIX.1-2024 is worded such that a “print job” consisting of multiple input files,  
103188 possibly in multiple copies, is guaranteed to print so that any one file is not intermixed with  
103189 another, but there is no statement that all the files or copies have to print out together.

103190 The `-c` option may imply a spooling operation, but this is not required. The utility can be  
103191 implemented to wait until the printer is ready and then wait until it is finished. Because of that,  
103192 there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).

103193 On some historical systems, the request ID reported on the `STDOUT` can be used to later cancel  
103194 or find the status of a request using utilities not defined in this volume of POSIX.1-2024.

103195 Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality,  
103196 they used different names for the environment variable specifying the destination printer. Since  
103197 the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence  
103198 over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one  
103199 or the other environment variable, the `lp` utility is required to recognize both. If this was not  
103200 done, many applications would send output to unexpected output devices when users moved  
103201 from system to system.

103202 Some have commented that `lp` has far too little functionality to make it worthwhile. Requests  
103203 have proposed additional options or operands or both that added functionality. The requests  
103204 included:

- 103205 • Wording *requiring* the output to be “hardcopy”
- 103206 • A requirement for multiple printers
- 103207 • Options for supporting various page-description languages

103208 Given that a compliant system is not required to even have a printer, placing further restrictions  
103209 upon the behavior of the printer is not useful. Since hardcopy format is so application-  
103210 dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that  
103211 should be required on all compliant systems.

103212 The term *unspecified* is used in this section in lieu of *implementation-defined* as most known  
103213 implementations would not be able to make definitive statements in their conformance  
103214 documents; the existence and usage of printers is very dependent on how the system  
103215 administrator configures each individual system.

103216 Since the default destination, device type, queuing mechanisms, and acceptable forms of input  
103217 are all unspecified, usage guidelines for what a conforming application can do are as follows:

- 103218 • Use the command in a pipeline, or with `-c`, so that there are no permission problems and  
103219 the files can be safely deleted or modified.
- 103220 • Limit output to text files of reasonable line lengths and printable characters and include no  
103221 device-specific formatting information, such as a page description language. The meaning  
103222 of “reasonable” in this context can only be answered as a quality-of-implementation issue,  
103223 but it should be apparent from historical usage patterns in the industry and the locale. The  
103224 `pr` and `fold` utilities can be used to achieve reasonable formatting for the default page size  
103225 of the implementation.

103226 Alternatively, the application can arrange its installation in such a way that it requires the system  
 103227 administrator or operator to provide the appropriate information on *lp* options and environment  
 103228 variable values.

103229 At a minimum, having this utility in this volume of POSIX.1-2024 tells the industry that  
 103230 conforming applications require a means to print output and provides at least a command name  
 103231 and *LPDEST* routing mechanism that can be used for discussions between vendors, application  
 103232 developers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent  
 103233 of the standard developers, even if they cannot mandate that all systems (such as laptops) have  
 103234 printers.

103235 This volume of POSIX.1-2024 does not specify what the ownership of the process performing the  
 103236 writing to the output device may be. If *-c* is not used, it is unspecified whether the process  
 103237 performing the writing to the output device has permission to read *file* if there are any  
 103238 restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the  
 103239 results of deleting *file* before it is printed are unspecified.

#### 103240 FUTURE DIRECTIONS

103241 None.

#### 103242 SEE ALSO

103243 *mailx*

103244 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 103245 CHANGE HISTORY

103246 First released in Issue 2.

#### 103247 Issue 6

103248 The following new requirements on POSIX implementations derive from alignment with the  
 103249 Single UNIX Specification:

- 103250 • In the DESCRIPTION, the requirement to associate a unique request ID, and the normal  
 103251 generation of a banner page is added.
- 103252 • In the OPTIONS section:
  - 103253 — The *-d dest* description is expanded, but references to *lpstat* are removed.
  - 103254 — The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- 103255 • In the ENVIRONMENT VARIABLES section, *LC\_TIME* may now affect the execution.
- 103256 • The STDOUT section is added.

103257 The normative text is reworded to avoid use of the term “must” for application requirements.

103258 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

#### 103259 Issue 7

103260 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 103261 Issue 8

103262 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

103263 **NAME**

103264 ls — list directory contents

103265 **SYNOPSIS**

```
103266 XSI  ls [-ikqrs] [-glnO] [-A|-a] [-C|-m|-x|-l] \
103267      [-F|-p] [-H|-L] [-R|-d] [-S|-f|-t] [-c|-u] [file...]
```

103268 **DESCRIPTION**

103269 For each operand that names a file of a type other than directory or symbolic link to a directory,  
 103270 *ls* shall write the name of the file as well as any requested, associated information. For each  
 103271 operand that names a file of type directory, *ls* shall write the names of files contained within the  
 103272 directory as well as any requested, associated information. Filenames beginning with a <period>  
 103273 ('.') and any associated information shall not be written out unless explicitly referenced, the  
 103274 **-A** or **-a** option is supplied, or an implementation-defined condition causes them to be written.  
 103275 If one or more of the **-d**, **-F**, or **-l** options are specified, and neither the **-H** nor the **-L** option is  
 103276 specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the  
 103277 name of the file as well as any requested, associated information. If none of the **-d**, **-F**, or **-l**  
 103278 options are specified, or the **-H** or **-L** options are specified, for each operand that names a file of  
 103279 type symbolic link to a directory, *ls* shall write the names of files contained within the directory  
 103280 as well as any requested, associated information. In each case where the names of files contained  
 103281 within a directory are written, if the directory contains any symbolic links then *ls* shall evaluate  
 103282 the file information and file type to be those of the symbolic link itself, unless the **-L** option is  
 103283 specified.

103284 If no operands are specified, *ls* shall behave as if a single operand of dot ('.') had been  
 103285 specified. If more than one operand is specified, *ls* shall write non-directory operands first; it  
 103286 shall sort directory and non-directory operands separately according to the collating sequence in  
 103287 the current locale.

103288 Whenever *ls* sorts filenames or pathnames according to the collating sequence in the current  
 103289 locale, if this collating sequence does not have a total ordering of all characters (see XBD [Section](#)  
 103290 [7.3.2](#), on page 139), then any filenames or pathnames that collate equally shall be further  
 103291 compared byte-by-byte using the collating sequence for the POSIX locale.

103292 The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 103293 ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic  
 103294 message to standard error and shall either recover its position in the hierarchy or terminate.

103295 **OPTIONS**

103296 The *ls* utility shall conform to XBD [Section 12.2](#) (on page 215).

103297 The following options shall be supported:

103298 **-A** Write out all directory entries, including those whose names begin with a <period>  
 103299 ('.') but excluding the entries dot and dot-dot (if they exist).

103300 **-C** Write multi-text-column output with entries sorted down the columns, according  
 103301 to the collating sequence. The number of text columns and the column separator  
 103302 characters are unspecified, but should be adapted to the nature of the output  
 103303 device. This option disables long format output.

103304 **Note:** Since the output from this option may use separator characters that include  
 103305 characters that might appear in filenames (in addition to the problems related to  
 103306 <newline>s in filenames), **-C** should not be used when filenames might be  
 103307 extracted from the output by a script.

|            |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103308     | <b>-F</b> | Do not follow symbolic links named as operands unless the <b>-H</b> or <b>-L</b> options are specified. Write a <code>&lt;slash&gt;</code> ( <code>'/'</code> ) immediately after each pathname that is a directory, an <code>&lt;asterisk&gt;</code> ( <code>'*'</code> ) after each that is executable, a <code>&lt;vertical-line&gt;</code> ( <code>' '</code> ) after each that is a FIFO, an <code>&lt;equals-sign&gt;</code> ( <code>'='</code> ) after each that is a socket, and a <code>&lt;commercial-at&gt;</code> ( <code>'@'</code> ) after each that is a symbolic link. For other file types, other symbols may be written. |
| 103309     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 103322     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103323     | <b>-R</b> | Recursively list subdirectories encountered. Subdirectories with filenames beginning with a <code>&lt;period&gt;</code> ( <code>'.'</code> ) shall be recursively listed if and only if the subdirectory name was included in the filenames listed for the containing directory. When a symbolic link to a directory is encountered, the directory shall not be recursively listed unless the <b>-L</b> option is specified. The use of <b>-R</b> with <b>-d</b> or <b>-f</b> produces unspecified results.                                                                                                                                |
| 103324     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 103328     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103329     | <b>-S</b> | Sort with the primary key being file size (in decreasing order) and the secondary key being filename in the collating sequence (in increasing order). For a symbolic link, the size used as the sort key is that of the symbolic link itself, unless <i>ls</i> is evaluating its file information to be that of the file referenced by the link (see the <b>-H</b> and <b>-L</b> options).                                                                                                                                                                                                                                                 |

| 103344 XSI | <b>-g</b> | Turn on the <b>-l</b> (ell) option, but disable writing the file's owner name or number. Disable the <b>-C</b> , <b>-m</b> , and <b>-x</b> options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 103345     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103346 XSI |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103347     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103348     | <b>-i</b> | For each file, write the file's file serial number (see <i>stat()</i> in the System Interfaces volume of POSIX.1-2024).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 103349     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103350     | <b>-k</b> | Set the block size for the <b>-s</b> option and the per-directory block count written for the <b>-l</b> , <b>-n</b> , <b>-s</b> , <b>-g</b> , and <b>-o</b> options (see the STDOUT section) to 1 024 bytes.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 103351 XSI |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

- 103352        **-l**            (The letter ell.) Do not follow symbolic links named as operands unless the **-H** or  
 103353        **-L** options are specified. Write out in long format (see the STDOUT section).  
 103354        Disable the **-C**, **-m**, and **-x** options.
- 103355        **-m**            Stream output format; list pathnames across the page, separated by a <comma>  
 103356        character followed by a <space> character. Use a <newline> character as the list  
 103357        terminator and after the separator sequence when there is not room on a line for  
 103358        the next list entry. This option disables long format output.
- 103359        **-n**            Turn on the **-l** (ell) option, but when writing the file's owner or group, write the  
 103360        file's numeric UID or GID rather than the user or group name, respectively. Disable  
 103361        the **-C**, **-m**, and **-x** options.
- 103362 XSI        **-o**            Turn on the **-l** (ell) option, but disable writing the file's group name or number.  
 103363        Disable the **-C**, **-m**, and **-x** options.
- 103364        **-p**            Write a <slash> ( '/' ) after each pathname if that file is a directory.
- 103365        **-q**            Force each instance of non-printable filename characters (including <newline>,  
 103366        <tab>, and other control characters) to be written as the <question-mark> ( '?' )  
 103367        character. Implementations may provide this option by default if the output is to a  
 103368        terminal device.
- 103369        **-r**            Reverse the order of the sort to get reverse collating sequence, oldest first, or  
 103370        smallest file size first depending on the other options given.
- 103371        **-s**            Indicate the total number of file system blocks consumed by each file displayed. If  
 103372        the **-k** option is also specified, the block size shall be 1024 bytes; otherwise, the  
 103373        block size is implementation-defined.
- 103374        **-t**            Sort with the primary key being time modified (most recently modified first) and  
 103375        the secondary key being filename in the collating sequence. For a symbolic link,  
 103376        the time used as the sort key is that of the symbolic link itself, unless *ls* is  
 103377        evaluating its file information to be that of the file referenced by the link (see the  
 103378        **-H** and **-L** options).
- 103379        **-u**            Use time of last access (see XBD <sys/stat.h>) instead of last modification of the file  
 103380        for sorting (**-t**) or writing (**-l**).
- 103381        **-x**            The same as **-C**, except that the multi-text-column output is produced with entries  
 103382        sorted across, rather than down, the columns. This option disables long format  
 103383        output.
- 103384        **-1**            (The numeric digit one.) Force output to be one entry per line. This option does  
 103385 XSI        not disable long format output. (Long format output is enabled by **-g**, **-l** (ell), **-n**,  
 103386 XSI        and **-o**; and disabled by **-C**, **-m**, and **-x**.)
- 103387 XSI        If an option that enables long format output (**-g**, **-l** (ell), **-n**, and **-o**) is given with an option that  
 103388        disables long format output (**-C**, **-m**, and **-x**), this shall not be considered an error. The last of  
 103389        these options specified shall determine whether long format output is written.
- 103390        If **-R**, **-d**, or **-f** are specified, the results of specifying these mutually-exclusive options are  
 103391        specified by the descriptions of these options above. If more than one of any of the other options  
 103392        shown in the SYNOPSIS section in mutually-exclusive sets are given, this shall not be considered  
 103393        an error; the last option specified in each set shall determine the output.
- 103394        Note that if **-t** is specified, **-c** and **-u** are not only mutually-exclusive with each other, they are  
 103395        also mutually-exclusive with **-S** when determining sort order. But even if **-S** is specified after all  
 103396        occurrences of **-c**, **-t**, and **-u**, the last use of **-c** or **-u** determines the timestamp printed when

103397 producing long format output.

103398 **OPERANDS**

103399 The following operand shall be supported:

103400 *file* A pathname of a file to be written. If the file specified is not found, a diagnostic  
103401 message shall be output on standard error.

103402 **STDIN**

103403 Not used.

103404 **INPUT FILES**

103405 None.

103406 **ENVIRONMENT VARIABLES**

103407 The following environment variables shall affect the execution of *ls*:

103408 *COLUMNS* Override the system-selected horizontal display line size, used to determine the  
103409 column position width for writing multiple text-column output. See XBD [Chapter](#)  
103410 [8](#) (on page 167) for valid values and results when it is unset or null. The *ls* utility  
103411 shall use this value to calculate how many pathname text columns to write (see  
103412 [-C](#)). The column width chosen to write the names of files in any given directory  
103413 shall be constant. Filenames shall not be truncated to fit into the multiple text-  
103414 column output.

103415 *LANG* Provide a default value for the internationalization variables that are unset or null.  
103416 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
103417 variables used to determine the values of locale categories.)

103418 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
103419 internationalization variables.

103420 *LC\_COLLATE*

103421 Determine the locale for character collation information in determining the  
103422 pathname collation sequence.

103423 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
103424 characters (for example, single-byte as opposed to multi-byte characters in  
103425 arguments) and which characters are defined as printable (character class **print**).

103426 *LC\_MESSAGES*

103427 Determine the locale that should be used to affect the format and contents of  
103428 diagnostic messages written to standard error.

103429 *LC\_TIME* Determine the format and contents for date and time strings written by *ls*.

103430 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

103431 *TZ* Determine the timezone for date and time strings written by *ls*. If *TZ* is unset or  
103432 null, an unspecified default timezone shall be used.

103433 **ASYNCHRONOUS EVENTS**

103434 Default.

103435 **STDOUT**

103436 The default format shall be to list one entry per line to standard output; the exceptions are to  
103437 terminals or when one of the [-C](#), [-m](#), or [-x](#) options is specified. If the output is to a terminal, the  
103438 format is implementation-defined.

103439 In the formats specified below, except where specified otherwise the *<pathname>* field shall

103440 consist of the file's pathname and, if the **-F** or **-p** option is specified, any indicator character  
103441 written after the pathname as described for those options.

103442 When **-m** is specified, the format used for the last element of the list shall be:

103443 "%s\n", <pathname>

103444 The format used for each other element of the list shall be:

103445 "%s,%s", <pathname>, <separator>

103446 where, if there is not room for the next element of the list to fit within the current line length,  
103447 <separator> is a string containing an optional <space> character and a mandatory <newline>  
103448 character; otherwise it is a single <space> character.

103449 If the **-i** option is specified, the file's file serial number (see XBD <sys/stat.h>) shall be written in  
103450 the following format before any other output for the corresponding entry:

103451 %u ", <file serial number>

103452 If the **-l** option is specified, the following information shall be written for files other than  
103453 character special and block special files:

103454 "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
103455 <owner name>, <group name>, <size>, <date and time>,  
103456 <pathname>

103457 If the **-l** option is specified, the following information shall be written for character special and  
103458 block special files:

103459 "%s %u %s %s %s %s %s\n", <file mode>, <number of links>,  
103460 <owner name>, <group name>, <device info>, <date and time>,  
103461 <pathname>

103462 In both cases if the file is a symbolic link and the **-L** option is also specified, this information  
103463 shall be for the file resolved from the symbolic link, except that the <pathname> field shall  
103464 contain the pathname of the symbolic link itself. If the file is a symbolic link and the **-L** option is  
103465 not specified, this information shall be about the link itself and the <pathname> field shall be one  
103466 of the following forms:

- 103467 • "%s%sΔ->Δ%s", <pathname of link>, <link type indicator>,  
103468 <contents of link>
- 103469 • "%sΔ->Δ%s%s", <pathname of link>, <contents of link>,  
103470 <file type indicator>
- 103471 • "%s%sΔ->Δ%s%s", <pathname of link>, <link type indicator>,  
103472 <contents of link>, <file type indicator>

103473 where <link type indicator> is a <commercial-at> ('@') if the **-F** option is specified, or an empty  
103474 string otherwise and <file type indicator> is the required indicator character, if any, for the file  
103475 resolved from the symbolic link if the **-F** or **-p** option is specified, or an empty string otherwise.  
103476 If pathname resolution fails when following the symbolic link, this shall not be treated as an  
103477 error and the <file type indicator> field shall be an empty string.

103478 XSI The **-n**, **-g**, and **-o** options use the same format as **-l**, but with omitted items and their  
103479 associated <blank> characters. See the OPTIONS section.

103480 In both the preceding **-l** forms, if <owner name> or <group name> cannot be determined, or if **-n**  
103481 is given, they shall be replaced with their associated numeric values using the format %u.

103482 The *<size>* field shall contain the value that would be returned for the file in the *st\_size* field of  
 103483 **struct stat** (see XBD [<sys/stat.h>](#)). Note that for some file types this value is unspecified.

103484 The *<device info>* field shall contain implementation-defined information associated with the  
 103485 device in question.

103486 The *<date and time>* field shall contain the appropriate date and timestamp of when the file was  
 103487 last modified. In the POSIX locale, the field shall be the equivalent of the output of the following  
 103488 *date* command:

103489 `date "+%b %e %H:%M"`

103490 if the file has been modified in the last six months, or:

103491 `date "+%b %e %Y"`

103492 (where two *<space>* characters are used between *%e* and *%Y*) if the file has not been modified in  
 103493 the last six months or if the modification date is in the future, except that, in both cases, the final  
 103494 *<newline>* produced by *date* shall not be included and the output shall be as if the *date*  
 103495 command were executed at the time of the last modification date of the file rather than the  
 103496 current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format  
 103497 and order of presentation of this field may be used.

103498 If the pathname was specified as a *file* operand, it shall be written as specified.

103499 XSI The file mode written under the *-l*, *-n*, *-g*, and *-o* options shall consist of the following format:

103500 `"%c%s%s%s%s", <entry type>, <owner permissions>,  
 103501 <group permissions>, <other permissions>,  
 103502 <optional alternate access method flag>`

103503 The *<optional alternate access method flag>* shall be the empty string if there is no alternate or  
 103504 additional access control method associated with the file; otherwise, it shall be a string  
 103505 containing a single printable character that is not a *<blank>*.

103506 The *<entry type>* character shall describe the type of file, as follows:

103507 d Directory.  
 103508 b Block special file.  
 103509 c Character special file.  
 103510 l (ell) Symbolic link.  
 103511 p FIFO.  
 103512 s Socket.  
 103513 – Regular file.

103514 Implementations may add other characters to this list to represent other implementation-defined  
 103515 file types.

103516 The next three fields shall be three characters each:

103517 *<owner permissions>*

103518 Permissions for the file owner class (see XBD [Section 4.7](#), on page 97).

103519 *<group permissions>*

103520 Permissions for the file group class.

- 103521 <other permissions>  
 103522 Permissions for the file other class.
- 103523 Each field shall have three character positions:
- 103524 1. If 'r', the file is readable; if '-', the file is not readable.  
 103525 2. If 'w', the file is writable; if '-', the file is not writable.  
 103526 3. The first of the following that applies:
- 103527 S If in <owner permissions>, the file is not executable and set-user-ID mode is set. If in  
 103528 <group permissions>, the file is not executable and set-group-ID mode is set.
- 103529 s If in <owner permissions>, the file is executable and set-user-ID mode is set. If in  
 103530 <group permissions>, the file is executable and set-group-ID mode is set.
- 103531 XSI T If in <other permissions> and the file is a directory, search permission is not granted to  
 103532 others, and the restricted deletion flag is set.
- 103533 XSI t If in <other permissions> and the file is a directory, search permission is granted to  
 103534 others, and the restricted deletion flag is set.
- 103535 x The file is executable or the directory is searchable.
- 103536 - None of the attributes of 'S', 's', 'T', 't', or 'x' applies.
- 103537 Implementations may add other characters to this list for the third character position.  
 103538 Such additions shall, however, be written in lowercase if the file is executable or  
 103539 searchable, and in uppercase if it is not.
- 103540 XSI If any of the **-l**, **-n**, **-s**, **-g**, or **-o** options is specified, each list of files within a directory shall be  
 103541 preceded by a status line indicating the number of file system blocks occupied by the listed files  
 103542 for that directory in 512-byte units if the **-k** option is not specified, or 1 024-byte units if the **-k**  
 103543 option is specified, rounded up to the next integral number of units, if necessary. In the POSIX  
 103544 locale, the format shall be:
- 103545 "total %u\n", <number of units in the directory>
- 103546 If more than one directory, or a combination of non-directory files and directories are written,  
 103547 either as a result of specifying multiple operands, or the **-R** option, each list of files within a  
 103548 directory shall be preceded by:
- 103549 "\n%s:\n", <directory name>
- 103550 The above string may be omitted for the directory named by the operand if only one operand is  
 103551 present. It may also be omitted for dot ( '.' ) if no operands are present. If this string is the first  
 103552 thing to be written, the first <newline> shall not be written. This output shall precede the  
 103553 number of units in the directory.
- 103554 If the **-s** option is given, each file shall be written with the number of blocks used by the file.  
 103555 XSI Along with **-C**, **-l**, **-m**, or **-x**, the number and a <space> shall precede the filename; with **-l**, **-n**,  
 103556 **-g**, or **-o**, they shall precede each line describing a file.
- 103557 **STDERR**  
 103558 The standard error shall be used only for diagnostic messages.
- 103559 **OUTPUT FILES**  
 103560 None.

103561 **EXTENDED DESCRIPTION**

103562 None.

103563 **EXIT STATUS**

103564 The following exit values shall be returned:

103565 0 Successful completion.

103566 &gt;0 An error occurred.

103567 **CONSEQUENCES OF ERRORS**

103568 Default.

103569 **APPLICATION USAGE**

103570 It is difficult for an application to use every part of the file modes field of *ls -l* in a portable  
 103571 manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as  
 103572 implementations may have extensions. Applications can use this field to pass directly to a user  
 103573 printout or prompt, but actions based on its contents should generally be deferred, instead, to  
 103574 the *test* utility.

103575 The output of *ls* (with the *-l* and related options) contains information that logically could be  
 103576 used by utilities such as *chmod* and *touch* to restore files to a known state. However, this  
 103577 information is presented in a format that cannot be used directly by those utilities or be easily  
 103578 translated into a format that can be used. A character has been added to the end of the  
 103579 permissions string so that applications at least have an indication that they may be working in  
 103580 an area they do not understand instead of assuming that they can translate the permissions  
 103581 string into something that can be used. Future versions or related documents may define one or  
 103582 more specific characters to be used based on different standard additional or alternative access  
 103583 control mechanisms.

103584 As with many of the utilities that deal with filenames, the output of *ls* for multiple files or in one  
 103585 of the long listing formats must be used carefully on systems where filenames can contain  
 103586 embedded white space. Systems and system administrators should institute policies and user  
 103587 training to limit the use of such filenames.

103588 The number of disk blocks occupied by the file that it reports varies depending on underlying  
 103589 file system type, block size units reported, and the method of calculating the number of blocks.  
 103590 On some file system types, the number is the actual number of blocks occupied by the file  
 103591 (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the  
 103592 file size (usually making an allowance for indirect blocks, but ignoring holes).

103593 The *total* number provided when using *ls -l* does not necessarily correspond to the space that  
 103594 would be reclaimed if all the listed files were removed, because of hard links (and symbolic links  
 103595 if *-L* is present). The space for each listed file is counted in the total regardless of any  
 103596 relationship between the files.

103597 **EXAMPLES**103598 An example of a small directory tree being fully listed with *ls -laRF a* in the POSIX locale:

```

103599 a:
103600 total 11
103601 drwxr-xr-x  3 fox   prog           64 Jul  4 12:07 ./
103602 drwxrwxrwx  4 fox   prog        3264 Jul  4 12:09 ../
103603 drwxr-xr-x  2 fox   prog           48 Jul  4 12:07 b/
103604 -rwxr--r--  1 fox   prog          572 Jul  4 12:07 foo*

103605 a/b:
103606 total 4

```

```

103607      drwxr-xr-x   2 fox      prog      48 Jul  4 12:07 ./
103608      drwxr-xr-x   3 fox      prog      64 Jul  4 12:07 ../
103609      -rw-r--r--   1 fox      prog      700 Jul  4 12:07 bar

```

103610 where the "a:" line may be omitted by some implementations.

#### 103611 RATIONALE

103612 Some historical implementations of the *ls* utility show all entries in a directory except dot and  
 103613 dot-dot when a superuser invokes *ls* without specifying the `-a` option. When "normal" users  
 103614 invoke *ls* without specifying `-a`, they should not see information about any files with names  
 103615 beginning with a <period> unless they were named as *file* operands.

103616 Implementations are expected to traverse arbitrary depths when processing the `-R` option. The  
 103617 only limitation on depth should be based on running out of physical storage for keeping track of  
 103618 untraversed directories.

103619 The `-1` (one) option was historically found in BSD and BSD-derived implementations only. It is  
 103620 required in this volume of POSIX.1-2024 so that conforming applications might ensure that  
 103621 output is one entry per line, even if the output is to a terminal.

103622 The `-S` option was added in Issue 7, but had been provided by several implementations for  
 103623 many years. The description given in the standard documents historic practice, but does not  
 103624 match much of the documentation that described its behavior. Historical documentation  
 103625 typically described it as something like:

```

103626      -S          Sort by size (largest size first) instead of by name. Special character devices (listed
103627                  last) are sorted by name.

```

103628 even though the file type was never considered when sorting the output. Character special files  
 103629 do typically sort close to the end of the list because their file size on most implementations is  
 103630 zero. But they are sorted alphabetically with any other files that happen to have the same file  
 103631 size (zero), not sorted separately and added to the end.

103632 This volume of POSIX.1-2024 is frequently silent about what happens when mutually-exclusive  
 103633 options are specified. Except for `-R`, `-d`, and `-f`, the *ls* utility is required to accept multiple  
 103634 options from each mutually-exclusive option set without treating them as errors and to use the  
 103635 behavior specified by the last option given in each mutually-exclusive set. Since *ls* is one of the  
 103636 most aliased commands, it is important that the implementation perform intuitively. For  
 103637 example, if the alias were:

```

103638      alias ls="ls -C"

```

103639 and the user typed *ls -1* (one), single-text-column output should result, not an error.

103640 The `-g`, `-l` (ell), `-n`, and `-o` options are not mutually-exclusive options. They all enable long  
 103641 format output. They work together to determine whether the file's owner is written (no if `-g` is  
 103642 present), file's group is written (no if `-o` is present), and if the file's group or owner is written  
 103643 whether it is written as the name (default) or a string representation of the UID or GID number  
 103644 (if `-n` is present). The `-C`, `-m`, `-x`, and `-1` (one) are mutually-exclusive options and the first three  
 103645 of these disable long format output. The `-1` (one) option does not directly change whether or not  
 103646 long format output is enabled, but by overriding `-C`, `-m`, and `-x`, it can re-enable long format  
 103647 output that had been disabled by one of these options.

103648 Earlier versions of this standard did not describe the BSD `-A` option (like `-a`, but dot and dot-dot  
 103649 are not written out). It has been added due to widespread implementation.

103650 Implementations may make `-q` the default for terminals to prevent trojan horse attacks on  
 103651 terminals with special escape sequences. This is not required because:

103652 • Some control characters may be useful on some terminals; for example, a system might  
103653 write them as "\001" or "^A".

103654 • Special behavior for terminals is not relevant to applications portability.

103655 An early proposal specified that the *<optional alternate access method flag>* had to be '+' if there  
103656 was an alternate access method used on the file or *<space>* if there was not. This was changed to  
103657 be *<space>* if there is not and a single printable character if there is. This was done for three  
103658 reasons:

- 103659 1. There are historical implementations using characters other than '+'.
- 103660 2. There are implementations that vary this character used in that position to distinguish  
103661 between various alternate access methods in use.
- 103662 3. The standard developers did not want to preclude future specifications that might need a  
103663 way to specify more than one alternate access method.

103664 Nonetheless, implementations providing a single alternate access method are encouraged to use  
103665 '+'.

103666 Earlier versions of this standard did not have the *-k* option, which meant that the *-s* option  
103667 could not be used portably as its block size was implementation-defined, and the units used to  
103668 specify the number of blocks occupied by files in a directory in an *ls -l* listing were fixed as  
103669 512-byte units. The *-k* option has been added to provide a way for the *-s* option to be used  
103670 portably, and for consistency it also changes the aforementioned units from 512-byte to  
103671 1 024-byte.

103672 The *<date and time>* field in the *-l* format is specified only for the POSIX locale. As noted, the  
103673 format can be different in other locales. No mechanism for defining this is present in this volume  
103674 of POSIX.1-2024, as the appropriate vehicle is a messaging system; that is, the format should be  
103675 specified as a "message".

#### 103676 FUTURE DIRECTIONS

103677 If this utility is directed to display a pathname that contains any bytes that have the encoded  
103678 value of a *<newline>* character when *<newline>* is a terminator or separator in the output  
103679 format being used, implementations are encouraged to treat this as an error. A future version of  
103680 this standard may require implementations to treat this as an error.

103681 Allowing *-f* to ignore the *-A*, *-g*, *-l*, *-n*, *-o*, and *-s* options may be removed in a future version.

#### 103687 CHANGE HISTORY

103688 First released in Issue 2.

#### 103689 Issue 5

103690 A second FUTURE DIRECTION is added.

#### 103691 Issue 6

103692 The following new requirements on POSIX implementations derive from alignment with the  
103693 Single UNIX Specification:

- 103694           • In the **-F** option, other symbols are allowed for other file types.
- 103695           Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.
- 103696           The Open Group Base Resolution bwg2001-010 is applied, adding the **T** and **t** fields as part of
- 103697           the **XSI** option.
- 103698   **Issue 7**
- 103699           Austin Group Interpretation 1003.1-2001 #101 is applied, clarifying the optional alternate access
- 103700           method flag in the **STDOUT** section.
- 103701           Austin Group Interpretation 1003.1-2001 #128 is applied, clarifying the **DESCRIPTION** and the
- 103702           definition of the **-R** option.
- 103703           Austin Group Interpretation 1003.1-2001 #129 is applied, clarifying the behavior of *ls* when no
- 103704           operands are specified.
- 103705           Austin Group Interpretation 1003.1-2001 #198 is applied, clarifying the requirements for the **-H**
- 103706           option.
- 103707           SD5-XCU-ERN-50 is applied, adding the **-A** option.
- 103708           SD5-XCU-ERN-97 is applied, updating the **SYNOPSIS**.
- 103709           The **-S** option is added from The Open Group Technical Standard, 2006, Extended API Set
- 103710           Part 1.
- 103711           The **-f**, **-m**, **-n**, **-p**, **-s**, and **-x** options are moved from the **XSI** option to the **Base**.
- 103712           The description of the **-f**, **-s**, and **-t** options are revised and the **-k** option is added.
- 103713           POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0098 [424], XCU/TC1-2008/0099
- 103714           [424], XCU/TC1-2008/0100 [424], XCU/TC1-2008/0101 [424], XCU/TC1-2008/0102 [424],
- 103715           XCU/TC1-2008/0103 [424], XCU/TC1-2008/0104 [424], XCU/TC1-2008/0105 [423,424],
- 103716           XCU/TC1-2008/0106 [424], XCU/TC1-2008/0107 [424], XCU/TC1-2008/0108 [424],
- 103717           XCU/TC1-2008/0109 [424], XCU/TC1-2008/0110 [424], XCU/TC1-2008/0111 [423],
- 103718           XCU/TC1-2008/0112 [117], XCU/TC1-2008/0113 [117], XCU/TC1-2008/0114 [117],
- 103719           XCU/TC1-2008/0115 [424], and XCU/TC1-2008/0116 [424] are applied.
- 103720           POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0115 [963] and XCU/TC2-2008/0116
- 103721           [963] are applied.
- 103722   **Issue 8**
- 103723           Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is
- 103724           directed to display a pathname that contains any bytes that have the encoded value of a
- 103725           <newline> character when <newline> is a terminator or separator in the output format being
- 103726           used.
- 103727           Austin Group Defect 1023 is applied, clarifying the **-R** option with respect to subdirectory
- 103728           filenames beginning with a <period>.
- 103729           Austin Group Defect 1070 is applied, requiring that any filenames or pathnames that collate
- 103730           equally are further compared byte-by-byte using the collating sequence for the POSIX locale.
- 103731           Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 103732           Austin Group Defect 1146 is applied, clarifying the requirements for the status line written by *ls*
- 103733           **-l**.
- 103734           Austin Group Defect 1147 is applied, clarifying the requirements for trailing file type indicators
- 103735           (such as **' / '** for a directory).

- 103736 Austin Group Defect 1148 is applied, clarifying the behavior of the `-S` option for symbolic links.
- 103737 Austin Group Defect 1149 is applied, inserting a comma in the description of the `-r` option.
- 103738 Austin Group Defect 1185 is applied, changing the `COLUMNS` entry in ENVIRONMENT  
103739 VARIABLES.
- 103740 Austin Group Defect 1217 is applied, adding file type indicators for sockets.
- 103741 Austin Group Defect 1261 is applied, changing the STDOUT and EXAMPLES sections in relation  
103742 to the `<directory name>` output.
- 103743 Austin Group Defect 1457 is applied, adding `readlink` to the SEE ALSO section.
- 103744 Austin Group Defect 1703 is applied, changing ```at-sign``` to ```<commercial-at>```.

103745 **NAME**

103746 m4 — macro processor

103747 **SYNOPSIS**103748 m4 [-s] [-D *name*[=*val*]]... [-U *name*]... [*file*...]103749 **DESCRIPTION**103750 The *m4* utility is a macro processor that shall read one or more text files, process them according  
103751 to their included macro statements, and write the results to standard output.103752 **OPTIONS**103753 The *m4* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**  
103754 and **-U** options shall be significant, and options can be interspersed with operands.

103755 The following options shall be supported:

103756 **-s** Enable line synchronization output for the *c17* preprocessor phase (that is, **#line**  
103757 directives).103758 **-D *name*[=*val*]**103759 Define *name* to *val* or to null if *=val* is omitted.103760 **-U *name*** Undefine *name*.103761 **OPERANDS**

103762 The following operand shall be supported:

103763 *file* A pathname of a text file to be processed. If no *file* is given, or if it is '-', the  
103764 standard input shall be read.103765 **STDIN**103766 The standard input shall be a text file that is used if no *file* operand is given, or if it is '-'.103767 **INPUT FILES**103768 The input file named by the *file* operand shall be a text file.103769 **ENVIRONMENT VARIABLES**103770 The following environment variables shall affect the execution of *m4*:103771 **LANG** Provide a default value for the internationalization variables that are unset or null.  
103772 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
103773 variables used to determine the values of locale categories.)103774 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
103775 internationalization variables.103776 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
103777 characters (for example, single-byte as opposed to multi-byte characters in  
103778 arguments and input files).103779 **LC\_MESSAGES**103780 Determine the locale that should be used to affect the format and contents of  
103781 diagnostic messages written to standard error.103782 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.103783 **ASYNCHRONOUS EVENTS**

103784 Default.

103785 **STDOUT**

103786 The standard output shall be the same as the input files, after being processed for macro  
103787 expansion.

103788 **STDERR**

103789 The standard error shall be used to display strings with the **errprint** macro, macro tracing  
103790 enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for  
103791 diagnostic messages.

103792 **OUTPUT FILES**

103793 None.

103794 **EXTENDED DESCRIPTION**

103795 The *m4* utility shall compare each token from the input against the set of built-in and user-  
103796 defined macros. If the token matches the name of a macro, then the token shall be replaced by  
103797 the macro's defining text, if any, then scanning for tokens shall resume at the start of the macro's  
103798 defining text concatenated with the subsequent input. If a token does not match the name of a  
103799 macro, it shall be written to standard output. Macros may have arguments, in which case the  
103800 arguments shall be substituted into the defining text before it is rescanned.

103801 No special meaning shall be given to characters enclosed between matching left and right  
103802 quoting strings, other than identifying nested quoting while finding the matching right quoting  
103803 string, but the outermost quoting strings shall themselves be discarded. By default, the left  
103804 quoting string consists of a grave accent (backquote) and the right quoting string consists of an  
103805 acute accent (single-quote); see also the **changequote** macro.

103806 Comments are written but not scanned for matching macro names; by default, the begin-  
103807 comment string consists of the <number-sign> character and the end-comment string consists of  
103808 a <newline>. See also the **changecom** and **dnl** macros.

103809 Name tokens shall consist of the longest possible sequence of letters, digits, and underscores,  
103810 where the first character is not a digit. Tokens not of this form shall not be treated as name  
103811 tokens. A macro call is a name token that matches the name of a built-in or user-defined macro.  
103812 Macro calls can have either of the following forms, which shall be distinguished by whether or  
103813 not the macro name is immediately followed by a <left-parenthesis>:

103814 *name*

103815 *name(arg1, arg2, ..., argn)*

103816 The application shall ensure that the <left-parenthesis> immediately follows the name of the  
103817 macro. If a token matching the name of a macro is not followed by a <left-parenthesis>, it shall  
103818 be handled as a use of that macro without arguments.

103819 If a macro name is followed by a <left-parenthesis>, the subsequent text shall be tokenized and  
103820 expanded until a token is encountered that is not a quoted string and whose expansion includes  
103821 a matching unquoted <right-parenthesis>. The expanded text between the <left-parenthesis>  
103822 and the matching unquoted <right-parenthesis> is the macro's argument text. An unquoted  
103823 <comma> character within the macro's argument text shall mark the end of one argument and  
103824 the beginning of the next argument unless the unquoted <comma> is enclosed within a nested  
103825 unquoted <left-parenthesis>, <right-parenthesis> pair. The unquoted <comma> characters that  
103826 separate the arguments, and any unquoted white-space characters at the beginning of each  
103827 argument, shall be discarded. All other characters in the macro's argument text, including any  
103828 white-space characters at the end of an argument and any nested parenthesized text, shall be  
103829 retained. The input text containing the macro name, the following <left-parenthesis>, and all  
103830 tokens up to and including the token whose expansion contained the matching unquoted <right-  
103831 parenthesis> shall be replaced, and tokenization shall resume on the result of performing

103832 argument substitution on the macro's defining text followed by any expanded text that followed  
 103833 the matching unquoted <right-parenthesis>. Otherwise, the macro name was not followed by a  
 103834 <left-parenthesis>, and tokenization shall resume on the result of performing argument  
 103835 substitution with zero arguments on the macro's defining text.

103836 During argument substitution, arguments shall be positionally defined and referenced. The  
 103837 string "\$1" in the defining text shall be replaced by the first argument. Systems shall support at  
 103838 least nine arguments; only the first nine can be referenced, using the strings "\$1" to "\$9",  
 103839 inclusive. The string "\$0" shall be replaced with the name of the macro. The string "\$#" shall  
 103840 be replaced by the number of arguments as a minimal string of decimal digits ('0' if the macro  
 103841 was invoked without being followed by a <left-parenthesis>, otherwise 1 more than the number  
 103842 of unquoted <comma> characters that divided arguments in the macro's argument text). The  
 103843 string "\$\*" shall be replaced by a list of all of the arguments, separated by <comma> characters.  
 103844 The string "\$@" shall be replaced by a list of all of the arguments separated by <comma>  
 103845 characters, and each argument shall be quoted using the current left and right quoting strings.  
 103846 The string "\${" produces unspecified behavior.

103847 If fewer arguments are supplied than are in the macro definition, the omitted arguments are  
 103848 taken to be null. It is not an error if more arguments are supplied than are in the macro  
 103849 definition.

103850 The *m4* utility shall make available the following built-in macros. They can be redefined, but  
 103851 once this is done the original meaning is lost. Their values shall be null unless otherwise stated.  
 103852 In the descriptions below, the term *defining text* refers to the value of the macro: the second  
 103853 argument to the **define** macro, among other things. Except for the first argument to the **eval**  
 103854 macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The  
 103855 string values produced as the defining text of the **decr**, **divnum**, **incr**, **index**, **len**, and **sysval**  
 103856 built-in macros shall be in the form of a decimal-constant as defined in the C language.

103857 **changecom** The **changecom** macro shall set the begin-comment and end-comment strings.  
 103858 With no arguments, the comment mechanism shall be disabled. With a single non-  
 103859 null argument, that argument shall become the begin-comment and the <newline>  
 103860 shall become the end-comment string. With two non-null arguments, the first  
 103861 argument shall become the begin-comment string and the second argument shall  
 103862 become the end-comment string. The behavior is unspecified if either argument is  
 103863 provided but null, or if either argument includes letters, digits, underscore, or  
 103864 <left-parenthesis>. Systems shall support comment strings of at least five  
 103865 characters.

103866 **changequote** The **changequote** macro shall set the begin-quote and end-quote strings. With no  
 103867 arguments, the quote strings shall be set to the default values (that is, ` `'). The  
 103868 behavior is unspecified if there is a single argument, or if either argument is null or  
 103869 includes letters, digits, underscore, or <left-parenthesis>. With two non-null  
 103870 arguments, the first argument shall become the begin-quote string and the second  
 103871 argument shall become the end-quote string. Systems shall support quote strings  
 103872 of at least five characters.

103873 **decr** The defining text of the **decr** macro shall be its first argument decremented by 1. It  
 103874 shall be an error to specify an argument containing any non-numeric characters.  
 103875 The behavior is unspecified if **decr** is not immediately followed by a <left-  
 103876 parenthesis>.

103877 **define** The second argument shall become the defining text of the macro whose name is  
 103878 the first argument. It is unspecified whether the **define** macro deletes all prior  
 103879 definitions of the macro named by its first argument or preserves all but the

|        |                 |                                                                                                |
|--------|-----------------|------------------------------------------------------------------------------------------------|
| 103880 |                 | current definition of the macro. The behavior is unspecified if <b>define</b> is not           |
| 103881 |                 | immediately followed by a <left-parenthesis>.                                                  |
| 103882 | <b>defn</b>     | The defining text of the <b>defn</b> macro shall be the quoted definition (using the           |
| 103883 |                 | current quoting strings) of its arguments. The behavior is unspecified if <b>defn</b> is not   |
| 103884 |                 | immediately followed by a <left-parenthesis>.                                                  |
| 103885 | <b>divert</b>   | The <i>m4</i> utility maintains nine temporary buffers, numbered 1 to 9, inclusive.            |
| 103886 |                 | When the last of the input has been processed, any output that has been placed in              |
| 103887 |                 | these buffers shall be written to standard output in buffer-numerical order. The               |
| 103888 |                 | <b>divert</b> macro shall divert future output to the buffer specified by its argument.        |
| 103889 |                 | Specifying no argument or an argument of 0 shall resume the normal output                      |
| 103890 |                 | process. Output diverted to a stream with a negative number shall be discarded.                |
| 103891 |                 | Behavior is implementation-defined if a stream number larger than 9 is specified. It           |
| 103892 |                 | shall be an error to specify an argument containing any non-numeric characters.                |
| 103893 | <b>divnum</b>   | The defining text of the <b>divnum</b> macro shall be the number of the current output         |
| 103894 |                 | stream as a string.                                                                            |
| 103895 | <b>dnl</b>      | The <b>dnl</b> macro shall cause <i>m4</i> to discard all input characters up to and including |
| 103896 |                 | the next <newline>.                                                                            |
| 103897 | <b>dumpdef</b>  | The <b>dumpdef</b> macro shall write the defined text to standard error for each of the        |
| 103898 |                 | macros specified as arguments, or, if no arguments are specified, for all macros.              |
| 103899 | <b>errprint</b> | The <b>errprint</b> macro shall write its arguments to standard error. The behavior is         |
| 103900 |                 | unspecified if <b>errprint</b> is not immediately followed by a <left-parenthesis>.            |
| 103901 | <b>eval</b>     | The <b>eval</b> macro shall evaluate its first argument as an arithmetic expression, using     |
| 103902 |                 | signed integer arithmetic with at least 32-bit precision. At least the following C-            |
| 103903 |                 | language operators shall be supported, with precedence, associativity, and                     |
| 103904 |                 | behavior as described in <a href="#">Section 1.1.2.1</a> (on page 2457):                       |
| 103905 |                 | ( )                                                                                            |
| 103906 |                 | unary +                                                                                        |
| 103907 |                 | unary -                                                                                        |
| 103908 |                 | ~                                                                                              |
| 103909 |                 | !                                                                                              |
| 103910 |                 | binary *                                                                                       |
| 103911 |                 | /                                                                                              |
| 103912 |                 | %                                                                                              |
| 103913 |                 | binary +                                                                                       |
| 103914 |                 | binary -                                                                                       |
| 103915 |                 | <<                                                                                             |
| 103916 |                 | >>                                                                                             |
| 103917 |                 | <                                                                                              |
| 103918 |                 | <=                                                                                             |
| 103919 |                 | >                                                                                              |
| 103920 |                 | >=                                                                                             |
| 103921 |                 | ==                                                                                             |
| 103922 |                 | !=                                                                                             |
| 103923 |                 | binary &                                                                                       |
| 103924 |                 | ^                                                                                              |
| 103925 |                 |                                                                                                |
| 103926 |                 | &&                                                                                             |

|        |                |                                                                                                    |
|--------|----------------|----------------------------------------------------------------------------------------------------|
| 103927 |                |                                                                                                    |
| 103928 |                | Systems shall support octal and hexadecimal numbers as in the ISO C standard.                      |
| 103929 |                | The second argument, if specified, shall set the radix for the result; if the argument             |
| 103930 |                | is blank or unspecified, the default is 10. Behavior is unspecified if the radix falls             |
| 103931 |                | outside the range 2 to 36, inclusive. The third argument, if specified, sets the                   |
| 103932 |                | minimum number of digits in the result. Behavior is unspecified if the third                       |
| 103933 |                | argument is less than zero. It shall be an error to specify the second or third                    |
| 103934 |                | argument containing any non-numeric characters. The behavior is unspecified if                     |
| 103935 |                | <b>eval</b> is not immediately followed by a <left-parenthesis>.                                   |
| 103936 | <b>ifdef</b>   | If the first argument to the <b>ifdef</b> macro is defined, the defining text shall be the         |
| 103937 |                | second argument. Otherwise, the defining text shall be the third argument, if                      |
| 103938 |                | specified, or the null string, if not. The behavior is unspecified if <b>ifdef</b> is not          |
| 103939 |                | immediately followed by a <left-parenthesis>.                                                      |
| 103940 | <b>ifelse</b>  | The <b>ifelse</b> macro takes three or more arguments. If the first two arguments                  |
| 103941 |                | compare as equal strings, the defining text shall be the third argument. If the first              |
| 103942 |                | two arguments do not compare as equal strings and there are three arguments, the                   |
| 103943 |                | defining text shall be null. If the first two arguments do not compare as equal                    |
| 103944 |                | strings and there are four or five arguments, the defining text shall be the fourth                |
| 103945 |                | argument. If the first two arguments do not compare as equal strings and there are                 |
| 103946 |                | six or more arguments, the first three arguments shall be discarded and processing                 |
| 103947 |                | shall restart with the remaining arguments. The behavior is unspecified if <b>ifelse</b> is        |
| 103948 |                | not immediately followed by a <left-parenthesis>.                                                  |
| 103949 | <b>include</b> | The defining text for the <b>include</b> macro shall be the contents of the file named by          |
| 103950 |                | the first argument. It shall be an error if the file cannot be read. The behavior is               |
| 103951 |                | unspecified if <b>include</b> is not immediately followed by a <left-parenthesis>.                 |
| 103952 | <b>incr</b>    | The defining text of the <b>incr</b> macro shall be its first argument incremented by 1. It        |
| 103953 |                | shall be an error to specify an argument containing any non-numeric characters.                    |
| 103954 |                | The behavior is unspecified if <b>incr</b> is not immediately followed by a <left-                 |
| 103955 |                | parenthesis>.                                                                                      |
| 103956 | <b>index</b>   | The defining text of the <b>index</b> macro shall be the first character position (as a            |
| 103957 |                | string) in the first argument where a string matching the second argument begins                   |
| 103958 |                | (zero origin), or -1 if the second argument does not occur. The behavior is                        |
| 103959 |                | unspecified if <b>index</b> is not immediately followed by a <left-parenthesis>.                   |
| 103960 | <b>len</b>     | The defining text of the <b>len</b> macro shall be the length (as a string) of the first           |
| 103961 |                | argument. The behavior is unspecified if <b>len</b> is not immediately followed by a               |
| 103962 |                | <left-parenthesis>.                                                                                |
| 103963 | <b>m4exit</b>  | Exit from the <i>m4</i> utility. If the first argument is specified, it shall be the exit code. If |
| 103964 |                | no argument is specified, the exit code shall be zero. It shall be an error to specify             |
| 103965 |                | an argument containing any non-numeric characters. If the first argument is zero                   |
| 103966 |                | or no argument is specified, and an error has previously occurred (for example, a                  |
| 103967 |                | <i>file</i> operand that could not be opened), the exit status shall be non-zero.                  |
| 103968 | <b>m4wrap</b>  | The first argument shall be processed when EOF is reached. If the <b>m4wrap</b> macro              |
| 103969 |                | is used multiple times, the arguments specified shall be processed in the order in                 |
| 103970 |                | which the <b>m4wrap</b> macros were processed. The behavior is unspecified if <b>m4wrap</b>        |
| 103971 |                | is not immediately followed by a <left-parenthesis>.                                               |

|        |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103972 | <b>mkstemp</b>  | The defining text shall be as if it were the resulting pathname after a successful call to the <i>mkstemp</i> ( <i>)</i> function defined in the System Interfaces volume of POSIX.1-2024 called with the first argument to the macro invocation. If a file is created, that file shall be closed. If a file could not be created, the <i>m4</i> utility shall write a diagnostic message to standard error and shall continue processing input but its final exit status shall be non-zero; the defining text of the macro shall be the empty string. The behavior is unspecified if <b>mkstemp</b> is not immediately followed by a <left-parenthesis>.                                                 |
| 103973 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 103974 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 103975 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 103976 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 103977 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 103978 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 103995 | <b>substr</b>   | The defining text for the <b>substr</b> macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. The behavior is unspecified if <b>substr</b> is not immediately followed by a <left-parenthesis>. |
| 103996 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 104004 | <b>syscmd</b>   | The <b>syscmd</b> macro shall interpret its first argument as a shell command line. The defining text shall be the string result of that command. The string result shall not be rescanned for macros while setting the defining text. No output redirection shall be performed by the <i>m4</i> utility. The exit status value from the command can be retrieved using the <b>sysval</b> macro. The behavior is unspecified if <b>syscmd</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                        |

| 104008 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 104009 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 104010 | <b>sysval</b>   | The defining text of the <b>sysval</b> macro shall be the exit value of the utility last invoked by the <b>syscmd</b> macro (as a string).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 104011 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 104012 | <b>traceon</b>  | The <b>traceon</b> macro shall enable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros. The trace output shall be written to standard error in an unspecified format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 104013 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 104014 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 104015 | <b>traceoff</b> | The <b>traceoff</b> macro shall disable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 104016 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

104017       **translit**     The defining text of the **translit** macro shall be the first argument with every  
 104018                   character that occurs in the second argument replaced with the corresponding  
 104019                   character from the third argument. If no replacement character is specified for  
 104020                   some source character because the second argument is longer than the third  
 104021                   argument, that character shall be deleted from the first argument in **translit**'s  
 104022                   defining text. The behavior is unspecified if the '-' character appears within the  
 104023                   second or third argument anywhere besides the first or last character. The behavior  
 104024                   is unspecified if the same character appears more than once in the second  
 104025                   argument. The behavior is unspecified if **translit** is not immediately followed by a  
 104026                   <left-parenthesis>.

104027       **undefine**    The **undefine** macro shall delete all definitions (including those preserved using  
 104028                   the **pushdef** macro) of the macros named by its arguments. The behavior is  
 104029                   unspecified if **undefine** is not immediately followed by a <left-parenthesis>.

104030       **undivert**    The **undivert** macro shall cause immediate output of any text in temporary buffers  
 104031                   named as arguments, or all temporary buffers if no arguments are specified.  
 104032                   Buffers can be undiverted into other temporary buffers. Undiverting shall discard  
 104033                   the contents of the temporary buffer. The behavior is unspecified if an argument  
 104034                   contains any non-numeric characters.

#### 104035 EXIT STATUS

104036       The following exit values shall be returned:

104037       0    Successful completion.

104038       >0   An error occurred

104039       If the **m4exit** macro is used, the exit value can be specified by the input file.

#### 104040 CONSEQUENCES OF ERRORS

104041       Default.

#### 104042 APPLICATION USAGE

104043       The **defn** macro is useful for renaming macros, especially built-ins.

104044       Since **eval** defers to the ISO C standard, some operations have undefined behavior. In some  
 104045       implementations, division or remainder by zero cause a fatal signal, even if the division occurs  
 104046       on the short-circuited branch of "&&" or "||". Any operation that overflows in signed  
 104047       arithmetic produces undefined behavior. Likewise, using the **shift** operators with a shift amount  
 104048       that is not positive and smaller than the precision is undefined, as is shifting a negative number  
 104049       to the right. Historically, not all implementations obeyed C-language precedence rules: '~' and  
 104050       '!' were lower than '=='; '==' and '!=' were not lower than '<'; and '|' was not lower  
 104051       than '^'; the liberal use of "()" can force the desired precedence even with these non-  
 104052       compliant implementations. Furthermore, some traditional implementations treated '^' as an  
 104053       exponentiation operator, although most implementations now use "\*\*\*" as an extension for this  
 104054       purpose.

104055       When a macro has been multiply defined via the **pushdef** macro, it is unspecified whether the  
 104056       **define** macro will alter only the most recent definition (as though by **popdef** and **pushdef**), or  
 104057       replace the entire stack of definitions with a single definition (as though by **undefine** and  
 104058       **pushdef**). An application desiring particular behavior for the **define** macro in this case can  
 104059       redefine it accordingly.

104060 **EXAMPLES**

104061 If the file **m4src** contains the lines:

```
104062 The value of `VER' is "VER".
104063 ifdef(`VER', ``VER' is defined to be VER., VER is not defined.)
104064 ifelse(VER, 1, ``VER' is `VER'.)
104065 ifelse(VER, 2, ``VER' is `VER'., ``VER' is not 2.)
104066 end
```

104067 then the command

```
104068 m4 m4src
```

104069 or the command:

```
104070 m4 -U VER m4src
```

104071 produces the output:

```
104072 The value of VER is "VER".
104073 VER is not defined.
104074 VER is not 2.
104075 end
```

104076 The command:

```
104077 m4 -D VER m4src
```

104078 produces the output:

```
104079 The value of VER is ".
104080 VER is defined to be .
104081 VER is not 2.
104082 end
```

104083 The command:

```
104084 m4 -D VER=1 m4src
```

104085 produces the output:

```
104086 The value of VER is "1".
104087 VER is defined to be 1.
104088 VER is 1.
104089 VER is not 2.
104090 end
```

104091 The command:

```
104092 m4 -D VER=2 m4src
```

104093 produces the output:

```
104094 The value of VER is "2".
104095 VER is defined to be 2.
104096 VER is 2.
104097 end
```

104098 In the following six examples, an additional line is evaluated after this prologue of three  
104099 definitions:

```

104100 define(`macro', `argument 2 is :`$2':, called with $# arguments')dnl
104101 define(`argument$a', `Arguments')dnl
104102 define(`a', `.`)dnl

```

104103 1. The additional line:

```

104104 macro`'a
104105 produces:
104106 argument 2 is ::, called with 0 arguments.

```

104107 Explanation: *macro* is called with 0 arguments (as shown by the \$# substitution), the substitution of \$2 is the empty string, and the empty quoted string after the expansion text prevents concatenation with the subsequent 'a', which in turn lets macro *a* expand to the final '.'

104108

104109

104110

104111 2. The additional line:

```

104112 macro()a
104113 produces:
104114 argument 2 is ::, called with 1 Arguments

```

104115 Explanation: *macro* is called with one (empty string) argument; then the defining text ending in "arguments" is concatenated with the subsequent 'a' to form the next macro name *argument\$a* which is expanded into *Arguments* before the final output.

104116

104117

104118 3. The additional line:

```

104119 macro( 1, ( ,2,) , `3')
104120 produces:
104121 argument 2 is :( ,2,) :, called with 3 arguments

```

104122 Explanation: Leading (but not internal or trailing) space is removed before the argument substituted for \$2, and the unquoted commas embedded in parentheses do not delineate arguments.

104123

104124

104125 4. The additional line:

```

104126 macro( `1', `mac2(,`2',)', `3')
104127 produces:
104128 argument 2 is :mac2(,`2',):, called with 3 arguments

```

104129 Explanation: Regardless of whether *mac2* is a defined macro, quoting in the macro call prevents interpretation of "mac2" during argument collection, and the quoting in the defining text of *macro* prevents interpretation of "mac2" in the substitution of \$2 during rescan of the output of *macro*.

104130

104131

104132

104133 5. The additional line:

```

104134 undefine(`mac2')macro( 1, mac2(,2,), 3)
104135 produces:
104136 argument 2 is :mac2(,2,):, called with 3 arguments

```

104137 Explanation: *mac2* is not a macro name when scanned during argument collection, so it and the subsequent parenthesized text are used literally.

104138

104139 6. The additional line:  
 104140 `define(`mac2', `hi $@')macro( 1, mac2( ,2, ), 3)`  
 104141 produces:  
 104142 `argument 2 is :hi :, called with 5 arguments`  
 104143 Explanation: *mac2* is a macro name, so collecting the arguments to *macro* requires  
 104144 scanning the output of *mac2(,2,)* (the text `hi `',`2',`'` after substitution of `$@`); this  
 104145 output contains unquoted commas causing additional arguments to be visible to *macro*.

#### 104146 RATIONALE

104147 Historic System V-based behavior treated "`#{`" in a macro definition as two literal characters.  
 104148 However, this sequence is left unspecified so that implementations may offer extensions such as  
 104149 "`#{11}`" meaning the eleventh argument. Macros can still be defined with appropriate uses of  
 104150 nested quoting to result in a literal "`#{`" in the output after rescanning removes the nested  
 104151 quotes.

104152 In the **translit** built-in, historic System V-based behavior treated `'-'` as a literal; GNU behavior  
 104153 treats it as a range. This version of the standard allows either behavior.

104154 Earlier versions of this standard allowed the exit status to be either zero or non-zero when  
 104155 `m4exit(0)` is called after an error has occurred. Exiting with zero status is now disallowed as  
 104156 this hides the fact that an error occurred from shell scripts that check the exit status of *m4*.

#### 104157 FUTURE DIRECTIONS

104158 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 104159 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
 104160 format being used, implementations are encouraged to treat this as an error. A future version of  
 104161 this standard may require implementations to treat this as an error.

#### 104162 SEE ALSO

104163 [c17](#)  
 104164 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 104165 CHANGE HISTORY

104166 First released in Issue 2.

#### 104167 Issue 5

104168 The phrase "the defined text for macros written by the **dumpdef** macro" is added to the  
 104169 description of **STDERR**, and the description of **dumpdef** is updated to indicate that output is  
 104170 written to standard error. The description of **eval** is updated to indicate that the list of excluded  
 104171 C operators excludes unary `'&'` and `'.'`. In the description of **ifdef**, the phrase "and it is not  
 104172 defined to be zero" is deleted.

#### 104173 Issue 6

104174 In the EXTENDED DESCRIPTION, the **eval** text is updated to include a `'&'` character in the  
 104175 excepted list.

104176 The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion  
 104177 buffers.

104178 The normative text is reworded to avoid use of the term "must" for application requirements.

104179 The Open Group Base Resolution bwg2000-006 is applied.

104180 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES  
 104181 section.

104182 **Issue 7**

104183 Austin Group Interpretation 1003.1-2001 #117 is applied, marking the **maketemp** macro  
104184 obsolescent and adding a new **mkstemp** macro.

104185 Austin Group Interpretation 1003.1-2001 #207 is applied, clarifying the handling of white-space  
104186 characters that precede or trail any macro arguments.

104187 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
104188 apply (options can be interspersed with operands).

104189 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104190 SD5-XCU-ERN-99 is applied, clarifying the definition of the **divert** macro in the EXTENDED  
104191 DESCRIPTION.

104192 SD5-XCU-ERN-100 is applied, clarifying the definition of the **syscmd** macro in the EXTENDED  
104193 DESCRIPTION.

104194 SD5-XCU-ERN-101 is applied, clarifying the definition of the **undivert** macro in the EXTENDED  
104195 DESCRIPTION.

104196 SD5-XCU-ERN-111 is applied to the EXTENDED DESCRIPTION, clarifying that the string "\$ {"  
104197 produces unspecified behavior.

104198 SD5-XCU-ERN-112 is applied, updating the **changequote** macro.

104199 SD5-XCU-ERN-118 is applied, clarifying the definition of the **define** macro in the EXTENDED  
104200 DESCRIPTION and APPLICATION USAGE sections.

104201 SD5-XCU-ERN-119 is applied, clarifying the definition of the **translit** macro in the EXTENDED  
104202 DESCRIPTION and RATIONALE sections.

104203 SD5-XCU-ERN-130, SD5-XCU-ERN-131, and SD5-XCU-ERN-137 are applied.

104204 The *m4* utility is moved from the XSI option to the Base.

104205 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0117 [241], XCU/TC1-2008/0118  
104206 [242,431], XCU/TC1-2008/0119 [242,431], and XCU/TC1-2008/0120 [325,430] are applied.

104207 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0117 [964], XCU/TC2-2008/0118 [970],  
104208 and XCU/TC2-2008/0119 [964] are applied.

104209 **Issue 8**

104210 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
104211 directed to display a pathname that contains any bytes that have the encoded value of a  
104212 <newline> character when <newline> is a terminator or separator in the output format being  
104213 used.

104214 Austin Group Defect 984 is applied, requiring that the exit status of *m4* is non-zero when **m4exit**  
104215 is called with a first argument of zero or with no arguments after an error has occurred.

104216 Austin Group Defect 1072 is applied, clarifying the handling of macro arguments.

104217 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

104218 Austin Group Defect 1330 is applied, removing the obsolescent **maketemp** macro.

104219 Austin Group Defect 1514 is applied, changing the RATIONALE section to use the same  
104220 terminology as the normative text to which it refers.

104221 Austin Group Defect 1570 is applied, removing extra spacing in "==".

104222 Austin Group Defect 1658 is applied, changing ``whitespace characters'' to ``white-space

104223

characters”.

104224

Austin Group Defect 1730 is applied, adding square brackets around *file...* in the SYNOPSIS.

104225

104226 **NAME**

104227 mailx — process messages

104228 **SYNOPSIS**104229 **Send Mode**104230 mailx [-E] [-s *subject*] *address*...104231 **Receive Mode**

104232 UP mailx -e

104233 mailx [-HiNn] [-F] [-u *user*]104234 mailx -f [-HiNn] [-F] [*file*]104235 **DESCRIPTION**

104236 The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
 104237 selected by the options used: Send Mode and Receive Mode.

104238 On systems that do not support the User Portability Utilities option, an application using *mailx*  
 104239 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
 104240 character of one or more lines is <tilde> ('~'), all characters in the input message shall appear in  
 104241 the delivered message, but additional characters may be inserted in the message before it is  
 104242 retrieved.

104243 UP On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
 104244 interactive features, Receive Mode, described below, also shall be enabled.

104245 **Send Mode**

104246 Send Mode can be used by applications or users to send messages from the text in standard  
 104247 input. The message shall be passed to the mail delivery software. The mail delivery software  
 104248 shall process passed messages according to the rules of IETF RFC 5322.

104249 UP **Receive Mode**

104250 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this  
 104251 interactive mode.

104252 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
 104253 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
 104254 message as it is entered.

104255 Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
 104256 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
 104257 mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
 104258 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
 104259 called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
 104260 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
 104261 Messages shall remain in this file until explicitly removed. When the *-f* option is used to read  
 104262 mail messages from secondary files, messages shall be retained in those files unless specifically  
 104263 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
 104264 to in this section as simply “mailboxes”, unless more specific identification is required.

104265 **OPTIONS**

- 104266 The *mailx* utility shall conform to XBD [Section 12.2](#) (on page 215).
- 104267 The following options shall be supported. (Only the **-E** and **-s subject** options are required on all  
104268 systems. The other options are required only on systems supporting the User Portability Utilities  
104269 option.)
- 104270 **-E** Discard messages with an empty message body.
- 104271 UP **-e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write  
104272 nothing and exit with a successful return code if there is mail to read.
- 104273 UP **-f** Read messages from the file named by the *file* operand instead of the system  
104274 mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox**  
104275 instead of the system mailbox.
- 104276 UP **-F** Record the message in a file named after the first recipient. The name is the login-  
104277 name portion of the address found first in the **To** field in the message header.  
104278 Overrides the **record** variable, if set (see [Internal Variables in mailx](#), on page 3109).
- 104279 UP **-H** Write a header summary only.
- 104280 UP **-i** Ignore interrupts. (See also **ignore**.)
- 104281 UP **-n** Do not initialize from the system default start-up file. See the EXTENDED  
104282 DESCRIPTION section.
- 104283 UP **-N** Do not write an initial header summary.
- 104284 **-s subject** Set the **Subject** header field to *subject*. All characters in the *subject* string shall  
104285 appear in the delivered message. The results are unspecified if *subject* is longer  
104286 than {LINE\_MAX} – 10 bytes or contains a <newline>.
- 104287 UP **-u user** Read the system mailbox of the login name *user*. This shall only be successful if  
104288 the invoking user has appropriate privileges to read the system mailbox of that  
104289 user.

104290 **OPERANDS**

- 104291 The following operands shall be supported:
- 104292 *address* Addressee of message. When **-n** is specified and no user start-up files are accessed  
104293 (see the EXTENDED DESCRIPTION section), the user or application shall ensure  
104294 this is an address to pass to the mail delivery system. Any system or user start-up  
104295 files may enable aliases (see **alias** under [Commands in mailx](#), on page 3112) that  
104296 may modify the form of *address* before it is passed to the mail delivery system.
- 104297 UP *file* A pathname of a file to be read instead of the system mailbox when **-f** is specified.  
104298 The meaning of the *file* operand shall be affected by the contents of the **folder**  
104299 internal variable; see [Internal Variables in mailx](#) (on page 3109).

104300 **STDIN**

- 104301 When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the  
104302 UP message to be delivered to the specified addresses. When in Receive Mode, user commands  
104303 shall be accepted from *stdin*. If the User Portability Utilities option is not supported, standard  
104304 input lines beginning with a <tilde> ('~') character produce unspecified results.
- 104305 UP If the User Portability Utilities option is supported, then in both Send and Receive Modes,  
104306 standard input lines beginning with the escape character (usually <tilde> ('~')) shall affect  
104307 processing as described in [Command Escapes in mailx](#) (on page 3122).

104308 **INPUT FILES**

104309 When *mailx* is used as described by this volume of POSIX.1-2024, the *file* operand (see the `-f`  
 104310 option) and the **mbox** shall be text files containing mail messages, formatted as described in the  
 104311 OUTPUT FILES section. The nature of the system mailbox is unspecified; it need not be a file.

104312 **ENVIRONMENT VARIABLES**

104313 UP Some of the functionality described in this section shall be provided on implementations that  
 104314 support the User Portability Utilities option as described in the text, and is not further shaded  
 104315 for this option.

104316 The following environment variables shall affect the execution of *mailx*:

104317 **DEAD** Determine the pathname of the file in which to save partial messages in case of  
 104318 interrupts or delivery errors. The default shall be **dead.letter** in the directory  
 104319 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is  
 104320 unspecified if the User Portability Utilities option is not supported and *DEAD* is  
 104321 not defined with the value **/dev/null**.

104322 **EDITOR** Determine the name of a utility to invoke when the **edit** (see [Commands in mailx](#),  
 104323 on page 3112) or **~e** (see [Command Escapes in mailx](#), on page 3122) command is  
 104324 XSI used. The default editor is unspecified. On XSI-conformant systems it is *ed*. The  
 104325 effects of this variable are unspecified if the User Portability Utilities option is not  
 104326 supported.

104327 **HOME** Determine the pathname of the user's home directory.

104328 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 104329 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 104330 variables used to determine the values of locale categories.)

104331 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 104332 internationalization variables.

104333 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 104334 characters (for example, single-byte as opposed to multi-byte characters in  
 104335 arguments and input files) and the handling of case-insensitive address and header  
 104336 field name comparisons.

104337 **LC\_TIME** This variable may determine the format and contents of the date and time strings  
 104338 written by *mailx*. This volume of POSIX.1-2024 specifies the effects of this variable  
 104339 only for systems supporting the User Portability Utilities option.

104340 **LC\_MESSAGES**

104341 Determine the locale that should be used to affect the format and contents of  
 104342 diagnostic messages written to standard error and informative messages written to  
 104343 standard output.

104344 **LISTER** Determine a string representing the command for writing the contents of the  
 104345 **folder** directory to standard output when the **folders** command is given (see  
 104346 **folders** in [Commands in mailx](#), on page 3112). Any string acceptable as a  
 104347 *command\_string* operand to the *sh -c* command shall be valid. If this variable is null  
 104348 or not set, the output command shall be *ls*. The effects of this variable are  
 104349 unspecified if the User Portability Utilities option is not supported.

104350 **MAILRC** Determine the pathname of the user start-up file. The default shall be **.mailrc** in the  
 104351 directory referred to by the *HOME* environment variable. The behavior of *mailx* is  
 104352 unspecified if the User Portability Utilities option is not supported and *MAILRC* is  
 104353 not defined with the value **/dev/null**.

|        |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104354 |     | <i>MBOX</i>                   | Determine a pathname of the file to save messages from the system mailbox that have been read. The <b>exit</b> command shall override this function, as shall saving the message explicitly in another file. The default shall be <b>mbox</b> in the directory named by the <i>HOME</i> variable. The effects of this variable are unspecified if the User Portability Utilities option is not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 104359 | XSI | <i>NLSPATH</i>                | Determine the location of messages objects and message catalogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 104360 |     | <i>PAGER</i>                  | Determine a string representing an output filtering or pagination command for writing the output to the terminal. Any string acceptable as a <i>command_string</i> operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal device, the message output shall be piped through the command if the <i>mailx</i> internal variable <b>crf</b> is set to a value less than the total number of lines in the message; see <a href="#">Internal Variables in mailx</a> (on page 3109). When standard output is not a terminal device, it is unspecified whether the message output is written directly to standard output or is subject to pagination. If the <i>PAGER</i> variable is null or not set, the paginator shall be either <i>more</i> or another paginator utility documented in the system documentation. The effects of this variable are unspecified if the User Portability Utilities option is not supported. |

| 104393 | UP  | 1.                            | If in command mode, the current command, if there is one, shall be aborted, and a command-mode prompt shall be written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 104394 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104395 |     | 2.                            | If in input mode:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 104396 | UP  | a.                            | If <b>ignore</b> is set, <i>mailx</i> shall write "@\n", discard the current input line, and continue processing, bypassing the message-abort mechanism described in item 2b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 104397 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104398 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- 104399 UP            b. If the interrupt was received while sending mail, either when in Receive Mode or  
 104400            in Send Mode, a message shall be written, and another subsequent interrupt, with  
 104401            no other intervening characters typed, shall be required to abort the mail message.  
 104402 UP            If in Receive Mode and another interrupt is received, a command-mode prompt  
 104403            shall be written. If in Send Mode and another interrupt is received, *mailx* shall  
 104404            terminate with a non-zero status.

104405            In both cases listed in item b, if the message is not empty:

- 104406 UP            i. If **save** is enabled and the file named by *DEAD* can be created, the message  
 104407            shall be written to the file named by *DEAD*. If the file exists, the message  
 104408            shall be written to replace the contents of the file.
- 104409 UP            ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
 104410            message shall not be saved.

104411            The *mailx* utility shall take the standard action for all other signals.

#### 104412 **STDOUT**

104413            In command and input modes, all output, including prompts and messages, shall be written to  
 104414            standard output.

#### 104415 **STDERR**

104416            The standard error shall be used only for diagnostic messages.

#### 104417 **OUTPUT FILES**

104418            Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
 104419            the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
 104420            POSIX.1-2024, these files shall be text files, formatted as follows:

104421            line beginning with **From<space>**  
 104422            [one or more *header fields*; see [Commands in mailx](#) (on page 3112)]  
 104423            *empty line*  
 104424            [zero or more *body lines*  
 104425            *empty line*]  
 104426            [line beginning with **From<space> . . . ]**

104427            where each message begins with the **From <space>** line shown, preceded by the beginning of  
 104428            the file or an empty line. (The **From <space>** line is considered to be part of the message header,  
 104429            but not one of the header fields referred to in [Commands in mailx](#) (on page 3112); thus, it shall  
 104430            not be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
 104431            **From <space>** line and any additional header lines are unspecified, except that none shall be  
 104432            empty. The format of a message body line is also unspecified, except that no line following an  
 104433            empty line shall start with **From <space>**; *mailx* shall modify any such user-entered message  
 104434            body lines (following an empty line and beginning with **From <space>**) by adding one or more  
 104435            characters to precede the 'F'; it may add these characters to **From <space>** lines that are not  
 104436            preceded by an empty line.

104437            When a message from the system mailbox or entered by the user is not a text file, it is  
 104438            implementation-defined how such a message is stored in files written by *mailx*.

#### 104439 **EXTENDED DESCRIPTION**

104440 UP            The functionality in the entire EXTENDED DESCRIPTION section shall be provided on  
 104441            implementations supporting the User Portability Utilities option. The functionality described in  
 104442            this section shall be provided on implementations that support the User Portability Utilities  
 104443            option (and the rest of this section is not further shaded for this option).

104444 The *mailx* utility need not support for all character encodings in all circumstances. For example,  
 104445 inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data need not  
 104446 be portable to non-internationalized systems, and so on. Under these circumstances, it is  
 104447 recommended that only characters defined in the ISO/IEC 646:1991 standard International  
 104448 Reference Version (equivalent to ASCII) 7-bit range of characters be used.

104449 When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of  
 104450 header-summary lines (if `-N` was not specified and there are messages, see below), followed by  
 104451 a prompt indicating that *mailx* can accept regular commands (see [Commands in mailx](#), on page  
 104452 3112); this is termed *command mode*. The page of header-summary lines shall contain the first  
 104453 new message if there are new messages, or the first unread message if there are unread  
 104454 messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and  
 104455 standard input is a terminal, if no subject is specified on the command line and the `asksub`  
 104456 variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input  
 104457 mode. This input mode shall also be entered when using one of the Receive Mode synopsis  
 104458 forms and a reply or new message is composed using the **reply**, **Reply**, **followup**, **Followup**, or  
 104459 **mail** commands and standard input is a terminal. When the message is typed and the end of the  
 104460 message is encountered, the message shall be passed to the mail delivery software. Commands  
 104461 can be entered by beginning a line with the escape character (by default, `<tilde>` ('~')) followed  
 104462 by a single command letter and optional arguments. See [Commands in mailx](#) (on page 3112) for  
 104463 a summary of these commands. It is unspecified what effect these commands will have if  
 104464 standard input is not a terminal when a message is entered using either the Send Mode  
 104465 synopsis, or the Read Mode commands **reply**, **Reply**, **followup**, **Followup**, or **mail**.

104466 **Note:** For notational convenience, this section uses the default escape character, `<tilde>`, in all  
 104467 references and examples.

104468 At any time, the behavior of *mailx* shall be governed by a set of environmental and internal  
 104469 variables. These are flags and valued parameters that can be set and cleared via the *mailx set*  
 104470 and *unset* commands.

104471 Regular commands are of the form:

104472 `[command] [msglist] [argument ...]`

104473 If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands  
 104474 shall be recognized by the escape character, and lines not treated as commands shall be taken as  
 104475 input for the message.

104476 In command mode, each message shall be assigned a sequential number, starting with 1.

104477 All messages have a state that shall affect how they are displayed in the header summary and  
 104478 how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a  
 104479 *current* message, which shall be marked by a '>' at the beginning of a line in the header  
 104480 summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current  
 104481 message shall be the first new message, if there is a new message, or the first unread message if  
 104482 there is an unread message, or the first message if there are any messages, or unspecified if there  
 104483 are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*)  
 104484 or an optional single message (*message*) on which to operate shall leave the current message set  
 104485 to the highest-numbered message of the messages specified, unless the command deletes  
 104486 messages, in which case the current message shall be set to the first undeleted message (that is, a  
 104487 message not in the deleted state) after the highest-numbered message deleted by the command,  
 104488 if one exists, or the first undeleted message before the highest-numbered message deleted by the  
 104489 command, if one exists, or to an unspecified value if there are no remaining undeleted messages.  
 104490 All messages shall be in one of the following states:

|        |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 104504 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 104505 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete</b> , <b>dp</b> , <b>dt</b> . Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the undelete command; for example, the message specification <i>/string</i> shall only search the <b>Subject</b> header fields of messages that have not yet been deleted, unless the command operating on the list of messages is <b>undelete</b> . No deleted message or deleted message header shall be displayed by any <i>mailx</i> command other than <b>undelete</b> .                                                                                                                                                                                                        |

| 104515 | <i>saved</i>     | The message has been processed by one of the following commands: <b>save</b> or <b>write</b> . If the current mailbox is the system mailbox, and the internal variable <b>keepsave</b> is set, messages in the state <i>saved</i> shall be saved to the file designated by the <b>MBOX</b> variable (see the ENVIRONMENT VARIABLES section). If the current mailbox is the system mailbox, messages in the state <i>saved</i> shall be deleted from the current mailbox, when the <b>quit</b> or <b>file</b> command is used to exit the current mailbox.                                                                                                                                                                                                                                                                                                                         |

| 104530 | <b>^</b>         | The first undeleted message, or the first deleted message for the <b>undelete</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104531 | <b>\$</b>        | The last message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 104532 | <b>*</b>         | All messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- 104533        *n-m*     An inclusive range of message numbers.
- 104534        *address*   All messages from *address*; any address as shown in a header summary shall be  
104535                          matchable in this form.
- 104536        */string*   All messages with *string* in the **Subject** header field (case ignored).
- 104537        *:c*        All messages of type *c*, where *c* shall be one of:
- 104538                          *d*     Deleted messages.
- 104539                          *n*     New messages.
- 104540                          *o*     Old messages (any not in state *read* or *new*).
- 104541                          *r*     Read messages.
- 104542                          *u*     Unread messages.

104543        Other commands take an optional message (*message*) on which to operate, which defaults to the  
104544                          current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more  
104545                          than one message is specified, only the first shall be operated on.

104546        Other arguments are usually arbitrary strings whose usage depends on the command involved.

### 104547        **Start-Up in mailx**

104548        At start-up time, *mailx* shall take the following steps in sequence:

- 104549                          1. Establish all variables at their stated default values.
- 104550                          2. Process command line options, overriding corresponding default values.
- 104551                          3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables  
104552                          that are present in the environment, overriding the corresponding default values.
- 104553                          4. Read *mailx* commands from an unspecified system start-up file, unless the **-n** option is  
104554                          given, to initialize any internal *mailx* variables and aliases.
- 104555                          5. Process the user start-up file of *mailx* commands named in the user *MAILRC* variable.

104556        Most regular *mailx* commands are valid inside start-up files, the most common use being to set  
104557                          up initial display options and alias lists. The following commands shall be invalid in a start-up  
104558                          file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **Save**, **shell**, **visual**, **Copy**, **followup**, and  
104559                          **Followup**. Any errors in a start-up file shall either cause *mailx* to terminate with a diagnostic  
104560                          message and a non-zero status or to continue after writing a diagnostic message, ignoring the  
104561                          remainder of the lines in the file.

104562        A blank line in a start-up file shall be ignored.

### 104563        **Internal Variables in mailx**

104564        The following variables are internal *mailx* variables. Each internal variable can be set via the  
104565                          *mailx set* command at any time. The **unset** and **set noname** commands can be used to erase  
104566                          variables.

104567        In the following list, variables shown as:

104568        *variable*

104569        represent Boolean values. Variables shown as:

104570        *variable=value*

- 104571 shall be assigned string or numeric values. For string values, the rules in [Commands in mailx](#)  
104572 (on page 3112) concerning filenames and quoting shall also apply.
- 104573 The defaults specified here may be changed by the unspecified system start-up file unless the  
104574 user specifies the **-n** option.
- 104575 **allnet** All network names whose login name components match shall be treated as  
104576 identical. This shall cause the *msglist* message specifications to behave similarly.  
104577 The default shall be **noallnet**. See also the **alternates** command and the **metoo**  
104578 variable.
- 104579 **append** Append messages to the end of the **mbox** file upon termination instead of placing  
104580 them at the beginning. The default shall be **noappend**. This variable shall not  
104581 affect the **save** command when saving to **mbox**.
- 104582 **ask, asksub** Prompt for a value for the **Subject** header field on outgoing mail if one is not  
104583 specified on the command line with the **-s** option. The **ask** and **asksub** forms are  
104584 synonyms; the system shall refer to **asksub** and **noasksub** in its messages, but shall  
104585 accept **ask** and **noask** as user input to mean **asksub** and **noasksub**. It shall not be  
104586 possible to set both **ask** and **noasksub**, or **noask** and **asksub**. The default shall be  
104587 **asksub**, but no prompting shall be done if standard input is not a terminal.
- 104588 **askbcc** Prompt for the blind copy list. The default shall be **noaskbcc**.
- 104589 **askcc** Prompt for the copy list. The default shall be **noaskcc**.
- 104590 **autoprint** Enable automatic writing of messages after **delete** and **undelete** commands. The  
104591 default shall be **noautoprint**.
- 104592 **bang** Enable the special-case treatment of <exclamation-mark> characters ('!') in !  
104593 commands and *~!command* escapes; see the **Invoke Shell Command** command and  
104594 [Command Escapes in mailx](#) (on page 3122). The default shall be **nobang**, disabling  
104595 the expansion of '!' in the *command* argument to the ! command and the  
104596 *~!command* escape.
- 104597 **cmd=command**  
104598 Set the default command to be invoked by the **pipe** command. The default shall be  
104599 **nocmd**.
- 104600 **crt=number** Paginate message output as described for the *PAGER* variable. The default shall be  
104601 **nocrt**, disabling this pagination. If it is set to null, the value used is  
104602 implementation-defined.
- 104603 XSI **debug** Enable verbose diagnostics for debugging. Messages are not delivered. The  
104604 default shall be **nodebug**.
- 104605 **dot** When **dot** is set, a <period> on a line by itself during message input from a  
104606 terminal shall also signify end-of-file (in addition to normal end-of-file). The  
104607 default shall be **nodot**. If **ignoreeof** is set (see below), a setting of **nodot** shall be  
104608 ignored and <period> and the *~.* command escape are the only methods to  
104609 terminate input mode.
- 104610 **escape=c** Set the command escape character to be the character 'c'. By default, the  
104611 command escape character shall be <tilde>. If **escape** is unset, <tilde> shall be  
104612 used; if it is set to null, command escaping shall be disabled.
- 104613 **flipr** Reverse the meanings of the **R** and **r** commands. The default shall be **noflipr**.

|        |                                     |                                                                                                            |
|--------|-------------------------------------|------------------------------------------------------------------------------------------------------------|
| 104614 | <b>folder</b> = <i>directory</i>    |                                                                                                            |
| 104615 |                                     | The default directory for saving mail files. User-specified filenames beginning with                       |
| 104616 |                                     | a <plus-sign> ('+') shall be expanded by preceding the filename with this                                  |
| 104617 |                                     | directory name to obtain the real pathname. If <i>directory</i> does not start with a                      |
| 104618 |                                     | <slash> ('/'), the contents of <i>HOME</i> shall be prefixed to it. The default shall be                   |
| 104619 |                                     | <b>nofolder</b> . If <b>folder</b> is unset, user-specified filenames beginning with '+' shall             |
| 104620 |                                     | refer to files in the current directory that begin with the literal '+' character. See                     |
| 104621 |                                     | also <b>outfolder</b> below. The <b>folder</b> value need not affect the processing of the files           |
| 104622 |                                     | named in <i>MBOX</i> and <i>DEAD</i> .                                                                     |
| 104623 | <b>header</b>                       | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The                       |
| 104624 |                                     | default shall be <b>header</b> .                                                                           |
| 104625 | <b>hold</b>                         | Disable message moving of read messages from the system mailbox to the <b>mbox</b>                         |
| 104626 |                                     | save file upon normal program termination or folder change. This automatic mail                            |
| 104627 |                                     | management is complemented with the commands <b>hold</b> (and <b>preserve</b> ), <b>mbox</b> ,             |
| 104628 |                                     | and <b>touch</b> , which partially override the <b>hold</b> variable. The default shall be <b>nohold</b> . |
| 104629 | <b>ignore</b>                       | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                          |
| 104630 | <b>ignoreeof</b>                    | Ignore normal end-of-file during message input. Input can be terminated only by                            |
| 104631 |                                     | entering a <period> ('.') on a line by itself or by the ~. command escape. The                             |
| 104632 |                                     | default shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                           |
| 104633 | <b>indentprefix</b> = <i>string</i> |                                                                                                            |
| 104634 |                                     | A string that shall be added as a prefix to each line that is inserted into the message                    |
| 104635 |                                     | by the ~m command escape. This variable shall default to one <tab>.                                        |
| 104636 | <b>keep</b>                         | When a system mailbox, secondary mailbox, or <b>mbox</b> is empty, truncate it to zero                     |
| 104637 |                                     | length instead of removing it. The default shall be <b>nokeep</b> .                                        |
| 104638 | <b>keepsave</b>                     | Keep the messages that have been saved from the system mailbox into other files                            |
| 104639 |                                     | in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default                 |
| 104640 |                                     | shall be <b>nokeepsave</b> .                                                                               |
| 104641 | <b>metoo</b>                        | Suppress the deletion of the user's login name from the recipient list when                                |
| 104642 |                                     | replying to a message or sending to a group. The default shall be <b>nometoo</b> .                         |
| 104643 | <b>onehop</b>                       | When responding to a message that was originally sent to several recipients, the                           |
| 104644 |                                     | other recipient addresses are normally forced to be relative to the originating                            |
| 104645 |                                     | author's machine for the response. This flag disables alteration of the recipients'                        |
| 104646 |                                     | addresses, improving efficiency in a network where all machines can send directly                          |
| 104647 |                                     | to all other machines (that is, one hop away). The default shall be <b>noonehop</b> .                      |
| 104648 | <b>outfolder</b>                    | Cause the files used to record outgoing messages to be located in the directory                            |
| 104649 |                                     | specified by the <b>folder</b> variable unless the pathname is absolute. The default shall                 |
| 104650 |                                     | be <b>nooutfolder</b> . See the <b>record</b> variable.                                                    |
| 104651 | <b>page</b>                         | Insert a <form-feed> after each message sent through the pipe created by the <b>pipe</b>                   |
| 104652 |                                     | command. The default shall be <b>nopage</b> .                                                              |
| 104653 | <b>prompt</b> = <i>string</i>       |                                                                                                            |
| 104654 |                                     | Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if <b>noprompt</b> is set, no   |
| 104655 |                                     | prompting shall occur. The default shall be to prompt with the string "? ".                                |
| 104656 | <b>quiet</b>                        | Refrain from writing the opening message and version when entering <i>mailx</i> . The                      |
| 104657 |                                     | default shall be <b>noquiet</b> .                                                                          |

- 104658        **record=***file*    Record all outgoing mail in the file with the pathname *file*. The default shall be  
104659        **norecord**. See also **outfolder** above.
- 104660        **save**            Enable saving of messages in the dead-letter file on interrupt or delivery error. See  
104661        the variable *DEAD* for the location of the dead-letter file. The default shall be **save**.
- 104662        **screen=***number*  
104663                Set the number of lines in a screenful of headers for the **headers** and **z** commands.  
104664                If **screen** is not specified, a value based on the terminal type identified by the  
104665                *TERM* environment variable, the window size, the baud rate, or some combination  
104666                of these shall be used. The default shall be **noscreen**.
- 104667        **sendwait**        Wait for the background mailer to finish before returning. The default shall be  
104668        **nosendwait**.
- 104669        **showto**         When the sender of the message was the user who is invoking *mailx*, write the  
104670        information from the **To** field instead of the **From** field in the header summary. The  
104671        default shall be **noshowto**.
- 104672        **sign=***string*    Set the variable inserted into the text of a message when the **~a** command escape is  
104673        given. The default shall be **nosign**. The character sequences '\t' and '\n' shall  
104674        be recognized in the variable as <tab> and <newline> characters, respectively. (See  
104675        also **~i** in [Command Escapes in mailx](#) (on page 3122).)
- 104676        **Sign=***string*    Set the variable inserted into the text of a message when the **~A** command escape is  
104677        given. The default shall be **noSign**. The character sequences '\t' and '\n' shall  
104678        be recognized in the variable as <tab> and <newline> characters, respectively.
- 104679        **toplines=***number*  
104680                Set the number of lines of the message to write with the **top** command. The default  
104681                shall be 5.

### 104682        **Commands in mailx**

104683        The following *mailx* commands shall be provided. In the following list, *header* refers to lines from  
104684        the message header, as shown in the OUTPUT FILES section. *Header field* refers to a line or set of  
104685        lines within the header that begins with one or more non-white-space characters immediately  
104686        followed by a <colon> and white space, and continuing up to and including a <newline> that  
104687        immediately precedes either the next line beginning with a non-white-space character or an  
104688        empty line. *Field name* refers to the portion of a header field prior to the first <colon>.

104689        For each of the commands listed below, the command can be entered as the abbreviation (those  
104690        characters in the Synopsis command word preceding the '['), the full command (all characters  
104691        shown for the command word, omitting the '[' and ']'), or any truncation of the full  
104692        command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the  
104693        Synopsis) can be entered as **ex**, **exi**, or **exit**.

104694        The arguments to commands can be quoted, using the following methods:

- 104695        • An argument can be enclosed between paired double-quotes (" ") or single-quotes (' ');  
104696        any white space, shell word expansion, or <backslash> characters within the quotes shall  
104697        be treated literally as part of the argument. A double-quote shall be treated literally within  
104698        single-quotes and *vice versa*. These special properties of the <quotation-mark> characters  
104699        shall occur only when they are paired at the beginning and end of the argument.
- 104700        • A <backslash> outside of the enclosing quotes shall be discarded and the following  
104701        character treated literally as part of the argument.

- 104702           • An unquoted <backslash> at the end of a command line shall be discarded and the next  
104703           line shall continue the command.

104704           Filenames, where expected, shall be subjected to the following transformations, in sequence:

- 104705           • If the filename begins with an unquoted <plus-sign>, and the **folder** variable is defined  
104706           (see the **folder** variable), the <plus-sign> shall be replaced by the value of the **folder**  
104707           variable followed by a <slash>. If the **folder** variable is unset or is set to null, the filename  
104708           shall be unchanged.
- 104709           • Shell word expansions shall be applied to the filename (see [Section 2.6](#), on page 2483). If  
104710           more than a single pathname results from this expansion and the command is expecting  
104711           one file, the effects are unspecified.

### 104712           **Declare Aliases**

104713           *Synopsis:*     a[lias] [alias [address...]]  
104714                   g[roup] [alias [address...]]

104715           Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
104716           *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
104717           recipients addressed indirectly through the **reply** command shall not be substituted in this  
104718           manner). Mail address alias substitution shall apply only when the alias string is used as a full  
104719           address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution.  
104720           Recursive expansion of an alias group member can be prevented by prefixing it with an  
104721           unquoted <backslash>. If no arguments are given, write a listing of the current aliases to  
104722           standard output. If only an *alias* argument is given, write a listing of the specified alias to  
104723           standard output. These listings need not reflect the same order of addresses that were entered.

### 104724           **Declare Alternatives**

104725           *Synopsis:*     alt[ernates] name...

104726           Declare a list of alternative addresses for the address consisting of the user's login name. When  
104727           responding to a message, these alternative addresses shall be removed from the list of recipients.  
104728           The comparison of addresses shall be performed in a case-insensitive manner. With no  
104729           arguments, **alternates** shall write the current list of alternative addresses.

### 104730           **Change Current Directory**

104731           *Synopsis:*     cd [directory]  
104732                   ch[dir] [directory]

104733           Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

### 104734           **Copy Messages**

104735           *Synopsis:*     c[opy] [file]  
104736                   c[opy] [msglist] file  
104737                   C[opy] [msglist]

104738           Copy messages to the file named by the pathname *file* without marking the messages as saved.  
104739           Otherwise, it shall be equivalent to the **save** command.

104740           In the capitalized form, save the specified messages in a file whose name is derived from the  
104741           author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
104742           be equivalent to the **Save** command.

104743 **Delete Messages**104744 *Synopsis:* d[*delete*] [*msglist*]

104745 Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see  
 104746 the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there  
 104747 are messages remaining after the **delete** command, the current message shall be written as  
 104748 described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be  
 104749 written.

104750 **Discard Header Fields**

104751 *Synopsis:* di[*scard*] [*field-name...*]  
 104752 ig[*nore*] [*field-name...*]

104753 Suppress header fields with the specified field names when writing messages. Specified *field-*  
 104754 *name* arguments shall be added to the list of suppressed field names. Examples of field names to  
 104755 ignore are **status** and **cc**. The header fields shall be included when the message is saved. The  
 104756 **Print** and **Type** commands shall override this command. The comparison of field names shall be  
 104757 performed in a case-insensitive manner. If no arguments are specified, write a list of the  
 104758 currently suppressed field names to standard output; the listing need not reflect the same order  
 104759 of field names that were entered.

104760 If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

104761 **Delete Messages and Display**

104762 *Synopsis:* dp [*msglist*]  
 104763 dt [*msglist*]

104764 Delete the specified messages as described for the **delete** command, except that the **autoprint**  
 104765 variable shall have no effect, and the current message shall be written only if it was set to a  
 104766 message after the last message deleted by the command. Otherwise, an informational message  
 104767 to the effect that there are no further messages in the mailbox shall be written, followed by the  
 104768 *mailx* prompt.

104769 **Echo a String**

104770 *Synopsis:* ec[*ho*] *string* ...

104771 Echo the given strings, equivalent to the shell *echo* utility.

104772 **Edit Messages**

104773 *Synopsis:* e[*dit*] [*msglist*]

104774 Edit the given messages. The messages shall be placed in a temporary file and the utility named  
 104775 by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is  
 104776 unspecified.

104777 The **edit** command does not modify the contents of those messages in the mailbox.

104778 **Exit**

104779 *Synopsis:*    ex[it]  
104780                   x[it]

104781 Exit from *mailx* without performing automatic message moving, or any other management tasks.  
104782 See also **quit**.

104783 **Change Folder**

104784 *Synopsis:*    fi[le] [*file*]  
104785                   fold[er] [*file*]

104786 If no argument is given, write the name and status of the current mailbox. Otherwise, close the  
104787 current file of messages after performing actions as specified for the **quit** command (except for  
104788 terminating *mailx*) and then read in the file named by the pathname *file*. The behavior is  
104789 unspecified if *file* is not a valid **mbox**.

104790 Several unquoted special characters shall be recognized when used as *file* names, with the  
104791 following substitutions:

- 104792 %           The system mailbox for the invoking user.  
104793 %*user*    The system mailbox for *user*.  
104794 #           The previous file.  
104795 &          The current **mbox**.  
104796 +*file*    The named file in the **folder** directory. (See the **folder** variable.)  
104797 The default file shall be the current mailbox.

104798 **Display List of Folders**

104799 *Synopsis:*    folders

104800 Write the names of the files in the directory set by the **folder** variable. The command specified  
104801 by the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES  
104802 section).

104803 **Follow Up Specified Messages**

104804 *Synopsis:*    fo[llowup] [*message*]  
104805                   F[ollowup] [*msglist*]

104806 The **followup** and **Followup** commands shall be equivalent to **reply** and **Reply**, respectively,  
104807 except that:

- 104808       • They shall ignore the **record** variable.  
104809       • The **followup** command shall record the response in a file whose name is derived from the  
104810       author of the *message*.  
104811       • The **Followup** command shall record the response in a file whose name is derived from the  
104812       author of the first message in the *msglist*.

104813 See also the **save** and **copy** commands and **outfolder**.

104814 **Display Header Summary for Specified Messages**104815 *Synopsis:* f[rom] [msglist]

104816 Write the header summary for the specified messages.

104817 **Display Header Summaries**104818 *Synopsis:* h[eaders] [message]

104819 Write the page of header summaries that includes the message specified. If the *message*  
 104820 argument is not specified, the current message shall not change. However, if the *message*  
 104821 argument is specified, the current message shall become the message that appears at the top of  
 104822 the page of header summaries that includes the message specified. The **screen** variable sets the  
 104823 number of header summaries per page. See also the **z** command.

104824 **Help**104825 *Synopsis:* hel[p]

104826 ?

104827 Write a summary of commands.

104828 **Hold Messages**104829 *Synopsis:* ho[ld] [msglist]

104830 pre[serve] [msglist]

104831 Allowed only in the system mailbox. Mark the messages in *msglist* to be preserved, as if the **hold**  
 104832 variable were set, upon normal termination or when the folder is changed. This shall override  
 104833 any commands that might previously have marked the messages to be deleted, and only the  
 104834 **delete**, **dp**, or **dt**, as well as the **mbox** and **touch** commands, shall remove the *preserve* mark of a  
 104835 message.

104836 **Execute Commands Conditionally**104837 *Synopsis:* i[f] s|r104838 *mail-commands*

104839 el[se]

104840 *mail-commands*

104841 en[dif]

104842 Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an  
 104843 **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be  
 104844 executed only in Receive Mode.

104845 **List Available Commands**104846 *Synopsis:* l[ist]

104847 Write a list of all commands available. No explanation shall be given.

104848 **Mail a Message**104849 *Synopsis:* m[ail] address...

104850 Mail a message to the specified addresses or aliases.

104851 **Direct Messages to mbox**104852 *Synopsis:* mb[ox] [msglist]

104853 Allowed only in the system mailbox. Arrange for the given messages to end up in the secondary  
104854 mailbox, overriding a possibly set **hold** variable, upon normal termination or when the folder is  
104855 changed. Overrides a former **hold** or **preserve** request. See *MBOX* in the ENVIRONMENT  
104856 VARIABLES section. See also the **exit** and **quit** commands.

104857 **Process Next Specified Message**104858 *Synopsis:* n[ext] [message]

104859 If the current message has not been written (for example, by the **print** command) since *mailx*  
104860 started or since any other message was the current message, behave as if the **print** command  
104861 was entered. Otherwise, if there is an undeleted message after the current message, make it the  
104862 current message and behave as if the **print** command was entered. Otherwise, an informational  
104863 message to the effect that there are no further messages in the mailbox shall be written, followed  
104864 by the *mailx* prompt. Should the current message location be the result of an immediately  
104865 preceding **hold**, **mbox**, **preserve**, or **touch** command, **next** shall act as if the current message has  
104866 already been written.

104867 **Pipe Message**104868 *Synopsis:* pi[pe] [[msglist] command]  
104869 | [[msglist] command]

104870 Pipe the messages through the given *command* by invoking the command interpreter specified  
104871 by *SHELL* with three arguments: "-c", "--", and *command*. (See also *sh -c*.) The application  
104872 shall ensure that the command is given as a single argument. Quoting, described previously, can  
104873 be used to accomplish this. If no arguments are given, the current message shall be piped  
104874 through the command specified by the value of the **cmd** variable. If the **page** variable is set, a  
104875 <form-feed> shall be inserted after each message.

104876 **Display Message with Header**104877 *Synopsis:* P[rint] [msglist]  
104878 T[ype] [msglist]

104879 Write the specified messages, including all header fields, to standard output. This command  
104880 shall override suppression of header fields by the **discard**, **ignore**, and **retain** commands. If **crt** is  
104881 set, the output shall be paginated as described for the *PAGER* variable.

104882      **Display Message**

104883      *Synopsis:*    p[rint] [msglist]  
 104884                    t[type] [msglist]

104885      Write the specified messages to standard output. If **crt** is set, the output shall be paginated as  
 104886      described for the *PAGER* variable.

104887      **Quit**

104888      *Synopsis:*    q[uit]  
 104889                    end-of-file

104890      Terminate *mailx* normally, performing automatic message moving as specified in the description  
 104891      of the variable **hold**, deleting messages that have been explicitly saved (unless **keepsave** is set),  
 104892      discarding messages that have been deleted, and saving all remaining messages in the mailbox.

104893      **Reply to a Message or a Message List**

104894      *Synopsis:*    r[eply] [message]  
 104895                    r[espond] [message]  
 104896                    R[eply] [msglist]  
 104897                    R[espond] [msglist]

104898      Mail a reply message to one or more addresses taken from certain header fields in the specified  
 104899      message or message list. If the **flipr** variable is unset, these commands shall behave as described  
 104900      below. If the **flipr** variable is set, commands in the lowercase form shall behave as described  
 104901      below for commands in the capitalized form, and *vice versa*; the synopsis forms shown above  
 104902      shall also be swapped accordingly.

104903      The recipients of the reply message shall be determined by first constructing an initial list of  
 104904      recipients and then modifying it to form the list that is in effect when *mailx* enters input mode.

104905      In the capitalized form, the initial list of recipients shall be taken from the header of each  
 104906      message in the *msglist* as follows:

- 104907            • If the header contains a **Reply-To** field, the address or addresses in that field shall be  
 104908            added to the list.
- 104909            • Otherwise, the address or addresses in the **From** field of the header shall be added to the  
 104910            list.

104911      In the lowercase form, the initial list of recipients shall be taken from the header of the *message* as  
 104912      follows:

- 104913            • If the header does not contain a **Reply-To** field, all of the addresses in the **From**, **To**, and **Cc**  
 104914            fields shall be included in the list.
- 104915            • Otherwise, it is implementation-defined whether all of the addresses in the **Reply-To**, **To**,  
 104916            and **Cc** fields are included in the list or only the address or addresses in the **Reply-To** field.

104917      The initial list of recipients shall be marked for placement in the header fields of the reply  
 104918      message as follows. Recipient addresses taken from a **From** or **Reply-To** header field shall be  
 104919      marked for placement in the **To** field of the reply message. Recipient addresses taken from a **Cc**  
 104920      header field shall be marked for placement in the **Cc** field of the reply message. Recipient  
 104921      addresses taken from a **To** header field shall be marked for placement in either the **To** or the **Cc**  
 104922      field of the reply message. Implementations shall provide a way to place them in the **To** field.  
 104923      Implementations may, but need not, provide an implementation-defined way to place them in  
 104924      the **Cc** field.

104925 The modifications applied to the initial list of recipients shall be as follows:

- 104926 • If the **metoo** variable is unset, addresses consisting of the login name of the user and any
- 104927 alternative addresses declared using the **alternates** command shall be removed from the
- 104928 list.
- 104929 • The set of recipients marked for placement in the **To** header field of the reply message shall
- 104930 have duplicates within that set removed.
- 104931 • The set of recipients marked for placement in the **Cc** header field of the reply message shall
- 104932 have duplicates within that set removed and may have recipients that are also marked for
- 104933 placement in the **To** field removed.

104934 The values for the **To** and **Cc** header fields of the reply message shall be constructed from the

104935 addresses in the modified list of recipients that are marked for placement in each of those fields.

104936 The value for the **Subject** header field of the reply message shall be formed from the value of the

104937 **Subject** header field of the *message* or the first message in *msglist* by prefixing it with

104938 **Re:**<space>, unless it already begins with that string.

104939 The values of the **To**, **Cc**, and **Subject** header fields set as described above can be modified by

104940 the user after *mailx* enters input mode through the use of the **~t**, **~c**, **~s**, and **~h** command escapes.

104941 If **record** is set to a pathname, the response shall be saved at the end of that file.

#### 104942 **Retain Header Fields**

104943 *Synopsis:*     **ret**[ain] [*field-name...*]

104944 Retain header fields with the specified field names when writing messages. This command shall

104945 override all **discard** and **ignore** commands. The comparison of field names shall be performed

104946 in a case-insensitive manner. If no arguments are specified, write a list of the currently retained

104947 field names to standard output; the listing need not reflect the same order of field names that

104948 were entered.

#### 104949 **Save Messages**

104950 *Synopsis:*     **s**[ave] [*file*]

104951               **s**[ave] [*msglist*] *file*

104952               **S**[ave] [*msglist*]

104953 Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file*

104954 argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be

104955 appended to the file. The message shall be put in the state *saved*, and shall behave as specified in

104956 the description of the *saved* state when the current mailbox is exited by the **quit** or **file**

104957 command.

104958 In the capitalized form, save the specified messages in a file whose name is derived from the

104959 author of the first message. The name of the file shall be taken to be the author's name with all

104960 network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and

104961 **outfolder** variable.

**104962 Set Variables**

104963 *Synopsis:*    `se[t] [name=[string]] ... [name=number ...] [noname ...]`

104964 Define one or more variables called *name*. The variable can be given a null, string, or numeric  
104965 value. Quoting and <backslash>-escapes can occur anywhere in *string*, as described previously,  
104966 as if the *string* portion of the argument were the entire argument. The forms *name* and *name=*  
104967 shall be equivalent to *name=""* for variables that take string values. The **set** command without  
104968 arguments shall write a list of all defined variables and their values. The **no name** form shall be  
104969 equivalent to **unset name**.

**104970 Invoke a Shell**

104971 *Synopsis:*    `sh[ell]`

104972 Invoke an interactive command interpreter (see also *SHELL*).

**104973 Display Message Size**

104974 *Synopsis:*    `si[ze] [msglist]`

104975 Write the size in bytes of each of the specified messages.

**104976 Read mailx Commands From a File**

104977 *Synopsis:*    `so[urce] file`

104978 Read and execute commands from the file named by the pathname *file* and return to command  
104979 mode.

**104980 Display Beginning of Messages**

104981 *Synopsis:*    `to[p] [msglist]`

104982 Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken  
104983 as the number of lines to write. The default shall be 5.

**104984 Touch Messages**

104985 *Synopsis:*    `tou[ch] [msglist]`

104986 Allowed only in the system mailbox. Touch the specified messages. Unless overridden by the  
104987 **hold** variable, any message in *msglist* that is not specifically deleted nor saved in a file shall be  
104988 placed in the **mbox** upon normal termination or when the folder is changed. Overrides a former  
104989 **hold** or **preserve** request.

**104990 Delete Aliases**

104991 *Synopsis:*    `una[lias] [alias] ...`

104992 Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

**104993 Undelete Messages**

104994 *Synopsis:* u[ndelete] [*msglist*]

104995 Change the state of the specified messages from deleted to read. If **autoprint** is set, the last  
104996 message of those restored shall be written. If *msglist* is not specified, the message shall be  
104997 selected as follows:

- 104998 • If there are any deleted messages that follow the current message, the first of these shall be  
104999 chosen.
- 105000 • Otherwise, the last deleted message that also precedes the current message shall be chosen.

**105001 Unset Variables**

105002 *Synopsis:* uns[et] *name*...

105003 Cause the specified variables to be erased.

**105004 Edit Message with Full-Screen Editor**

105005 *Synopsis:* v[isual] [*msglist*]

105006 Edit the given messages with a screen editor. Each message shall be placed in a temporary file,  
105007 and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The  
105008 default editor shall be *vi*.

105009 The **visual** command does not modify the contents of those messages in the mailbox.

**105010 Write Messages to a File**

105011 *Synopsis:* w[rite] [*msglist*] *file*

105012 Write the given messages to the file specified by the pathname *file*, minus the message header.  
105013 Otherwise, it shall be equivalent to the **save** command.

**105014 Scroll Header Display**

105015 *Synopsis:* z[+|-]

105016 Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if  
105017 '-' is specified) one screenful. The number of header summaries written shall be set by the  
105018 **screen** variable.

**105019 Invoke Shell Command**

105020 *Synopsis:* !*command*

105021 Invoke the command interpreter specified by *SHELL* with three arguments: "-c", "--", and  
105022 *command*. (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in  
105023 *command* shall be replaced with the command executed by the previous ! command or ~!  
105024 command escape.

105025 **Null Command**105026 *Synopsis:* # *comment*105027 This null command (comment) shall be ignored by *mailx*.105028 **Display Current Message Number**105029 *Synopsis:* =

105030 Write the current message number.

105031 **Command Escapes in mailx**

105032 The following commands can be entered only from input mode, by beginning a line with the  
 105033 escape character (by default, <tilde> ('~')). See the **escape** variable description for changing  
 105034 this special character. The format for the commands shall be:

105035 &lt;escape-character&gt;&lt;command-char&gt;&lt;separator&gt; [&lt;arguments&gt;]

105036 where the &lt;separator&gt; can be zero or more &lt;blank&gt; characters.

105037 In the following descriptions, the application shall ensure that the argument *command* (but not  
 105038 *mailx-command*) is a shell command string. Any string acceptable to the command interpreter  
 105039 specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid.  
 105040 The command can be presented as multiple arguments (that is, quoting is not required).

105041 Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send  
 105042 Mode and produce unspecified results.

105043 **~! command** Invoke the command interpreter specified by *SHELL* with three arguments: "-c",  
 105044 "--", and *command*; and then return to input mode. If the **bang** variable is set,  
 105045 each unescaped occurrence of '!' in *command* shall be replaced with the command  
 105046 executed by the previous ! command or ~! command escape.

105047 **~.** Simulate end-of-file (terminate message input).

105048 **~: mailx-command, ~\_ mailx-command**  
 105049 Perform the command-level request.

105050 **~?** Write a summary of command escapes.105051 **~A** This shall be equivalent to **~i Sign**.105052 **~a** This shall be equivalent to **~i sign**.105053 **~b name...** Add the *names* to the blind carbon copy (**Bcc**) list.105054 **~c name...** Add the *names* to the carbon copy (**Cc**) list.105055 **~d** Read in the dead-letter file. See *DEAD* for a description of this file.

105056 **~e** Invoke the editor, as specified by the *EDITOR* environment variable, on the partial  
 105057 message.

105058 **~f [msglist]** Forward the specified messages. The specified messages, including their headers,  
 105059 shall be inserted into the current message without alteration. The header fields  
 105060 included in each header shall be affected by the **discard**, **ignore**, and **retain**  
 105061 commands.

- 105062        **~F** [*msglist*] This shall be the equivalent of the **~f** command escape, except that all header fields  
105063 shall be included in the message headers, regardless of previous **discard**, **ignore**,  
105064 and **retain** commands.
- 105065        **~h**            If standard input is a terminal, prompt for values for the **Subject**, **To**, **Cc**, and **Bcc**  
105066 header fields. Other implementation-defined header fields may also be presented  
105067 for editing. If the header field is written with an initial value, it can be edited as if it  
105068 had just been typed.
- 105069        **~i** *string*      Insert the value of the named variable, followed by a <newline>, into the text of  
105070 the message. If the string is unset or null, the message shall not be changed.
- 105071        **~m** [*msglist*] Insert the specified messages, including their headers, into the current message,  
105072 prefixing non-empty lines with the string in the **indentprefix** variable. The header  
105073 fields included in each header shall be affected by the **discard**, **ignore**, and **retain**  
105074 commands.
- 105075        **~M** [*msglist*] This shall be the equivalent of the **~m** command escape, except that all header  
105076 fields shall be included in the message headers, regardless of previous **discard**,  
105077 **ignore**, and **retain** commands.
- 105078        **~p**            Write the message being entered. If the message is longer than **crt** lines (see  
105079 [Internal Variables in mailx](#), on page 3109), the output shall be paginated as  
105080 described for the **PAGER** variable.
- 105081        **~q**            Quit (see the **quit** command) from input mode by simulating an interrupt. If the  
105082 body of the message is not empty, the partial message shall be saved in the dead-  
105083 letter file. See **DEAD** for a description of this file.
- 105084        **~r** *file*, **~<** *file*, **~r !command**, **~< !command**  
105085                    Read in the file specified by the pathname *file*. If the argument begins with an  
105086 <exclamation-mark> ('!'), the rest of the string shall be taken as an arbitrary  
105087 system command; the command interpreter specified by **SHELL** shall be invoked  
105088 with three arguments: "-c", "--", and *command*. The standard output of  
105089 *command* shall be inserted into the message.
- 105090        **~s** *string*      Set the value for the **Subject** header field to *string*.
- 105091        **~t** *name...*    Add the given *names* to the **To** list.
- 105092        **~v**            Invoke the full-screen editor, as specified by the **VISUAL** environment variable, on  
105093 the partial message.
- 105094        **~w** *file*        Write the partial message, without the header, onto the file named by the  
105095 pathname *file*. The file shall be created or the message shall be appended to it if  
105096 the file exists.
- 105097        **~x**            Exit as with **~q**, except the message shall not be saved in the dead-letter file.
- 105098        **~|** *command*    Pipe the body of the message through the given *command* by invoking the  
105099 command interpreter specified by **SHELL** with three arguments: "-c", "--", and  
105100 *command*. If the *command* returns a successful exit status, the standard output of  
105101 the command shall replace the message. Otherwise, the message shall remain  
105102 unchanged. If the *command* fails, an error message giving the exit status shall be  
105103 written.

105104 **EXIT STATUS**

105105 UP When the `-e` option is specified, the following exit values are returned:

105106 0 Mail was found.

105107 >0 Mail was not found or an error occurred.

105108 Otherwise, the following exit values are returned:

105109 0 Successful completion; note that this status implies that any messages that *mailx* was  
 105110 instructed to send were all successfully either *sent* or discarded (see `-E`), but it gives no  
 105111 assurances that any of them were actually *delivered*.

105112 >0 An error occurred.

105113 **CONSEQUENCES OF ERRORS**

105114 UP When in `input mode (Receive Mode)` or Send Mode:

105115 • If an error is encountered processing an input line beginning with a `<tilde>` (`'~'`)  
 105116 UP character, (see [Command Escapes in mailx](#), on page 3122), a diagnostic message shall be  
 105117 written to standard error, and the message being composed may be modified, but this  
 105118 condition shall not prevent the message from being sent.

105119 • Other errors shall prevent the sending of the message.

105120 UP When in command mode:

105121 • Default.

105122 **APPLICATION USAGE**

105123 Delivery of messages to remote systems requires the existence of communication paths to such  
 105124 systems. These need not exist.

105125 Input lines are limited to `{LINE_MAX}` bytes, but mailers between systems may impose more  
 105126 severe line-length restrictions. This volume of POSIX.1-2024 does not place any restrictions on  
 105127 the length of messages handled by *mailx*, and for delivery of local messages the only limitations  
 105128 should be the normal problems of available disk space for the target mail file. When sending  
 105129 messages to external machines, applications are advised to limit messages to less than 100 000  
 105130 bytes because some mail gateways impose message-length restrictions.

105131 The format of the system mailbox is intentionally unspecified. Not all systems implement  
 105132 system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
 105133 system mailboxes may be multiple files, others records in a database. The internal format of the  
 105134 messages themselves is specified with the historical format from Version 7, but only after the  
 105135 messages have been saved in some file other than the system mailbox. This was done so that  
 105136 many historical applications expecting text-file mailboxes are not broken.

105137 Some new formats for messages can be expected in the future, probably including binary data,  
 105138 bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
 105139 handling such messages, but it must store them as text files in secondary mailboxes (unless some  
 105140 extension, such as a variable or command line option, is used to change the stored format). Its  
 105141 method of doing so is implementation-defined and might include translating the data into text  
 105142 file-compatible or readable form or omitting certain portions of the message from the stored  
 105143 output.

105144 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
 105145 command discards all header fields except those explicitly retained. The **discard** command

105146 keeps all header fields except those explicitly discarded. If field names exist on the retained field  
 105147 names list, **discard** and **ignore** commands are ignored.

#### 105148 EXAMPLES

105149 None.

#### 105150 RATIONALE

105151 The standard developers felt strongly that a method for applications to send messages to specific  
 105152 users was necessary. The obvious example is a batch utility, running non-interactively, that  
 105153 wishes to communicate errors or results to a user. However, the actual format, delivery  
 105154 mechanism, and method of reading the message are clearly beyond the scope of this volume of  
 105155 POSIX.1-2024.

105156 The intent of this command is to provide a simple, portable interface for sending messages non-  
 105157 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that  
 105158 implementations explicitly denote the sender and recipient in the body of the delivered message.  
 105159 Further specification of formats for either the message envelope or the message itself were  
 105160 deliberately not made, as the industry is in the midst of changing from the current standards to a  
 105161 more internationalized standard and it is probably incorrect, at this time, to require either one.

105162 Implementations are encouraged to conform to the various delivery mechanisms described in  
 105163 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request  
 105164 for Comment (RFC) documents RFC 819, RFC 920, RFC 921, RFC 1123, and RFC 5322.

105165 Many historical systems modified each body line that started with **From** by prefixing the 'F'  
 105166 with '>'. It is unnecessary, but allowed, to do that when the string does not follow a blank line  
 105167 because it cannot be confused with the next header.

105168 The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do  
 105169 not modify the contents of those messages in the mailbox; such a capability could be added as an  
 105170 extension, such as by using different command names.

105171 The restriction on the value for a **Subject** header field being {LINE\_MAX}-10 bytes is based on  
 105172 the historical format that consumes 10 bytes for **Subject:** and the trailing <newline>. Many  
 105173 historical mailers that a message may encounter on other systems are not able to handle lines  
 105174 that long, however.

105175 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient  
 105176 justification to exclude this utility from this volume of POSIX.1-2024. It is also arguable that it is,  
 105177 in fact, testable, but that the tests themselves are not portable.

105178 When *mailx* is being used by an application that wishes to receive the results as if none of the  
 105179 User Portability Utilities option features were supported, the *DEAD* environment variable must  
 105180 be set to */dev/null*. Otherwise, it may be subject to the file creations described in *mailx*  
 105181 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to  
 105182 */dev/null*, historical versions of *mailx* and *Mail* read initialization commands from a file before  
 105183 processing begins. Since the initialization that a user specifies could alter the contents of  
 105184 messages an application is trying to send, such applications must set *MAILRC* to */dev/null*.

105185 The description of *LC\_TIME* uses “may affect” because many historical implementations do not  
 105186 or cannot manipulate the date and time strings in the incoming mail headers. Some header fields  
 105187 found in incoming mail do not have enough information to determine the timezone in which the  
 105188 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal  
 105189 form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account.  
 105190 Changing all these times to a user-specified format is allowed, but not required.

105191 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System

105192 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by  
 105193 declaring that *cat* is the paginator, would not meet with the intended meaning of this  
 105194 description. However, any “portable user” would have to set *PAGER* explicitly to get his or her  
 105195 preferred paginator on all systems. The paginator choice was made partially unspecified, unlike  
 105196 the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common  
 105197 theme of user input, whereas editors differ dramatically.

105198 Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to  
 105199 be format details and were omitted.

105200 A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them  
 105201 were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an  
 105202 appropriate marketing distinction between systems.

105203 In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file*  
 105204 option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain  
 105205 portable. However, it does force implementations to support usage such as:

```
105206 mailx -fin mymail.box
```

105207 The **no name** method of unsetting variables is not present in all historical systems, but it is in  
 105208 System V and provides a logical set of commands corresponding to the format of the display of  
 105209 options from the *mailx set* command without arguments.

105210 The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the  
 105211 same feature. They are synonyms in this volume of POSIX.1-2024.

105212 The *mailx echo* command was not documented in the BSD version and has been omitted here  
 105213 because it is not obviously useful for interactive users.

105214 The default prompt on the System V *mailx* is a <question-mark>, on BSD *Mail* an <ampersand>.  
 105215 Since this volume of POSIX.1-2024 chose the *mailx* name, it kept the System V default, assuming  
 105216 that BSD users would not have difficulty with this minor incompatibility (that they can  
 105217 override).

105218 The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again,  
 105219 since this volume of POSIX.1-2024 chose the *mailx* name, it kept the System V default, but allows  
 105220 the SunOS user to achieve the desired results using **flipr**, an internal variable in System V *mailx*,  
 105221 although it has not been documented in the SVID.

105222 The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command  
 105223 escapes were adopted from 4.3 BSD *Mail*.

105224 The **version** command was not included because no sufficiently general specification of the  
 105225 version information could be devised that would still be useful to a portable user. This  
 105226 command name should be used by suppliers who wish to provide version information about the  
 105227 *mailx* command.

105228 The “implementation-specific (unspecified) system start-up file” historically has been named  
 105229 **/etc/mailx.rc**, but this specific name and location are not required.

105230 The intent of the wording for the **next** command is that if any command has already displayed  
 105231 the current message it should display a following message, but, otherwise, it should display the  
 105232 current message. Consider the command sequence:

```
105233 next 3
105234 delete 3
105235 next
```

105236 where the **autoprint** option was not set. The normative text specifies that the second **next**  
 105237 command should display a message following the third message, because even though the  
 105238 current message has not been displayed since it was set by the **delete** command, it has been  
 105239 displayed since the current message was anything other than message number 3. This does not  
 105240 always match historical practice in some implementations, where the command file address  
 105241 followed by **next** (or the default command) would skip the message for which the user had  
 105242 searched.

#### 105243 FUTURE DIRECTIONS

105244 If this utility is directed to create a new directory entry that contains any bytes that have the  
 105245 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 105246 error. A future version of this standard may require implementations to treat this as an error.

#### 105247 SEE ALSO

105248 [Chapter 2](#) (on page 2472), *ed*, *ls*, *more*, *vi*  
 105249 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 105250 CHANGE HISTORY

105251 First released in Issue 2.

#### 105252 Issue 5

105253 The description of the *EDITOR* environment variable is changed to indicate that *ed* is the default  
 105254 editor if this variable is not set. In previous issues, this default was not stated explicitly at this  
 105255 point but was implied further down in the text.

105256 The FUTURE DIRECTIONS section is added.

#### 105257 Issue 6

105258 The following new requirements on POSIX implementations derive from alignment with the  
 105259 Single UNIX Specification:

- 105260 • The **-F** option is added.
- 105261 • The **allnet**, **debug**, and **sendwait** internal variables are added.
- 105262 • The **C**, **ec**, **fo**, **F**, and **S** *mailx* commands are added.

105263 In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “*HOME*  
 105264 directory” is replaced by “directory referred to by the *HOME* environment variable”.

105265 The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which includes various  
 105266 clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993  
 105267 standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11,  
 105268 #103, #106, #108, #114, #115, #122, and #129.

105269 The normative text is reworded to avoid use of the term “must” for application requirements.

105270 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

105271 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the  
 105272 EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was  
 105273 overlooked in the first version of this standard.

105274 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/17 is applied, updating the EXTENDED  
 105275 DESCRIPTION (Internal Variables in *mailx*). The system start-up file is changed from  
 105276 “implementation-defined” to “unspecified” for consistency with other text in the EXTENDED  
 105277 DESCRIPTION.

105278 **Issue 7**

105279 Austin Group Interpretation 1003.1-2001 #089 is applied, clarifying the effect of the *LC\_TIME*  
105280 environment variable.

105281 Austin Group Interpretation 1003.1-2001 #090 is applied, updating the description of the **next**  
105282 command.

105283 SD5-XCU-ERN-69 is applied.

105284 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105285 Shading to indicate support for the User Portability Utilities option is added.

105286 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0120 [855] and XCU/TC2-2008/0121  
105287 [619] are applied.

105288 **Issue 8**

105289 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
105290 filenames containing any bytes that have the encoded value of a <newline> character.

105291 Austin Group Defect 956 is applied, clarifying how the *PAGER* environment variable and the **cr**  
105292 internal variable affect pagination.

105293 Austin Group Defects 990 and 991 are applied, changing the description of the **mbox** command.

105294 Austin Group Defect 999 is applied, adding **Save** to the list of commands that are invalid in a  
105295 start-up file.

105296 Austin Group Defect 1034 is applied, clarifying that `~.` can be used to terminate input mode  
105297 when **ignoreeof** is set.

105298 Austin Group Defect 1109 is applied, changing the description of the **bang** internal variable.

105299 Austin Group Defect 1113 is applied, changing the description of the *read* state.

105300 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

105301 Austin Group Defect 1176 is applied, changing ``option-argument'' to ``operand''.

105302 Austin Group Defect 1306 is applied, changing the description of the **folder** internal variable.

105303 Austin Group Defect 1367 is applied, adding the **-E** option.

105304 Austin Group Defect 1401 is applied, changing the requirements for the **reply**, **Reply**, **followup**,  
105305 and **Followup** commands.

105306 Austin Group Defect 1405 is applied, changing the terminology related to mail messages to  
105307 match IETF RFC 5322.

105308 Austin Group Defect 1408 is applied, changing the description of Send Mode.

105309 Austin Group Defect 1507 is applied, changing the EXIT STATUS section.

105310 Austin Group Defect 1528 is applied, adding a "--" argument to be passed between "-c" and  
105311 *command* when executing shell commands.

105312 Austin Group Defect 1634 is applied, clarifying handling of the system mailbox.

105313 Austin Group Defect 1685 is applied, updating RFC references.

105314 Austin Group Defect 1725 is applied, clarifying that the default for the **screen** internal variable is  
105315 **noscreen**.

105316 Austin Group Defect 1743 is applied, changing the descriptions of the **metoo** internal variable

105317

and the **alternates** command.

105318

Austin Group Defect 1747 is applied, changing the description of the **alias** command.

105319 **NAME**105320 make — maintain, update, and regenerate files (**DEVELOPMENT**)105321 **SYNOPSIS**

```
105322 SD make [-einpqrst] [-f makefile]... [-j maxjobs] [-k|-S]
105323      [macro[:[:]]=value...] [target_name...]
```

105324 **DESCRIPTION**

105325 The *make* utility shall update files that are derived from other files. A typical case is one where  
 105326 object files are derived from the corresponding source files. The *make* utility examines time  
 105327 relationships and shall update those derived files (called targets) that have modified times  
 105328 earlier than the modified times of the files (called prerequisites) from which they are derived. A  
 105329 description file (makefile) contains a description of the relationships between files, and the  
 105330 commands that need to be executed to update the targets to reflect changes in their  
 105331 prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and  
 105332 optional commands to be executed when a prerequisite is newer than the target. There are two  
 105333 kinds of rule:

- 105334 1. *Inference rules*, which have one target name with at least one <period> ('.') and no  
 105335 <slash> ('/')
- 105336 2. *Target rules*, which can have more than one target name

105337 In addition, *make* shall have a collection of built-in macros and inference rules that infer  
 105338 prerequisite relationships to simplify maintenance of programs.

105339 To receive exactly the behavior described in this section, a portable makefile shall:

- 105340 • Include the special target **.POSIX**
- 105341 • Omit any special target reserved for implementations (a leading period followed by  
 105342 uppercase letters) that has not been specified by this section

105343 The behavior of *make* is unspecified if either or both of these conditions are not met.

105344 **OPTIONS**

105345 The *make* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

105346 The following options shall be supported:

- 105347 **-e** Cause environment variables, including those with null values, to override macro  
 105348 assignments within makefiles.
- 105349 **-f *makefile*** Specify a different makefile. The argument *makefile* is a pathname of a description  
 105350 file, which is also referred to as the *makefile*. A pathname of '-' shall denote the  
 105351 standard input. There can be multiple instances of this option, and they shall be  
 105352 processed in the order specified. The effect of specifying the same option-argument  
 105353 more than once is unspecified.
- 105354 **-i** Ignore error codes returned by invoked commands. This mode shall be the same as  
 105355 if the special target **.IGNORE** were specified without prerequisites.
- 105356 **-j *maxjobs*** Set the maximum number of targets that can be updated concurrently. If this  
 105357 option is specified multiple times, the last value of *maxjobs* specified shall take  
 105358 precedence. If this option is not specified, or if *maxjobs* is 1, only one target shall be  
 105359 updated at a time (no parallelization). If the value of *maxjobs* is non-positive, the  
 105360 behavior is unspecified. When *maxjobs* is greater than 1, *make* shall create a pool of  
 105361 up to *maxjobs* - 1 tokens. (Note that implementations are not required to create a  
 105362 pool of exactly *maxjobs* - 1 tokens. For example, an implementation could limit the

- 105363 pool size based on the number of processors available.) If the size of the token pool  
 105364 would be 0, *make* need not implement a token pool.
- 105365 When all of the following are true:
- 105366 • There is a target with commands that is not up-to-date
  - 105367 • The target's prerequisites (if any) are up-to-date
  - 105368 • *make* is not waiting to bring the target up-to-date (see **.WAIT**)
  - 105369 • *make* is currently bringing a different target with commands up-to-date
  - 105370 • *make* is not currently bringing *maxjobs* targets up-to-date in parallel
  - 105371 • The special target **.NOTPARALLEL** is not specified
  - 105372 • The token pool is not empty
- 105373 then *make* may attempt to remove one token from the pool. If a token is  
 105374 successfully removed, it shall attempt to bring this target up-to-date in parallel,  
 105375 and after this processing completes shall return the token to the pool. When *make* is  
 105376 bringing a target without commands up-to-date, it need not remove a token from  
 105377 the pool.
- 105378 If a rule invokes a sub-*make* either via the **MAKE** macro or via a command line that  
 105379 begins with ' + ', the sub-*make* is the same implementation as the *make* that invoked  
 105380 the sub-*make*, and the **-j** option is passed to the sub-*make* via the **MAKEFLAGS**  
 105381 environment variable with the same *maxjobs* value and is not overridden by a  
 105382 *maxjobs* value from another source (even if it has the same value), the sub-*make*  
 105383 shall use the same token pool as its invoking *make* rather than create a new token  
 105384 pool. Otherwise, it is unspecified whether the sub-*make* uses the same token pool  
 105385 as its invoking *make* or creates a new token pool. If a rule executes multiple sub-  
 105386 *make* processes asynchronously the behavior is unspecified.
- 105387 **-k** Continue to update other targets that do not depend on the current target if a non-  
 105388 ignored error occurs while executing the commands to bring a target up-to-date.
- 105389 **-n** Write commands that would be executed on standard output, but do not execute  
 105390 them. However, lines with a <plus-sign> ('+') prefix, lines that expand the **MAKE**  
 105391 macro, and lines being processed in order to create an include file or to bring it up-  
 105392 to-date (see **Include Lines** in the EXTENDED DESCRIPTION section) shall be  
 105393 executed. In this mode, lines with a <commercial-at> ('@') character prefix shall  
 105394 be written to standard output.
- 105395 **-p** Write to standard output the complete set of macro definitions and target  
 105396 descriptions. The output format is unspecified.
- 105397 **-q** Return a zero exit value if the target file is up-to-date; otherwise, return an exit  
 105398 value of 1. Targets shall not be updated if this option is specified. However, a  
 105399 makefile command line (associated with the targets) with a <plus-sign> ('+')  
 105400 prefix shall be executed and it is unspecified whether command lines that do not  
 105401 have a <plus-sign> prefix and either expand the **MAKE** macro or are being  
 105402 processed in order to create an include file or to bring it up-to-date (see **Include**  
 105403 **Lines** in the EXTENDED DESCRIPTION section) are executed.
- 105404 **-r** Clear the suffix list and do not use the built-in rules.

- 105405        **-S**            Terminate *make* if an error occurs while executing the commands to bring a target  
105406                   up-to-date. This shall be the default and the opposite of **-k**.
- 105407        **-s**            Do not write makefile *execution lines* (see [Makefile Execution](#), on page 3136) or  
105408                   touch messages (see **-t**) to standard output before executing. This mode shall be  
105409                   the same as if the special target **.SILENT** were specified without prerequisites.
- 105410        **-t**            Update the modification time of each target as though a *touch target* had been  
105411                   executed. Targets that have prerequisites but no commands (see [Target Rules](#), on  
105412                   page 3137), or that are already up-to-date, shall not be touched in this manner.  
105413                   Write messages to standard output for each target file indicating the name of the  
105414                   file and that it was touched. Normally, the *makefile* command lines associated with  
105415                   each target are not executed. However, a command line with a <plus-sign> ('+')  
105416                   prefix shall be executed and it is unspecified whether command lines that do not  
105417                   have a <plus-sign> prefix and either expand the *MAKE* macro or are being  
105418                   processed in order to create an include file or to bring it up-to-date (see **Include**  
105419                   **Lines** in the EXTENDED DESCRIPTION section) are executed.
- 105420            Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any  
105421            options specified on the *make* utility command line. If the **-k** and **-S** options are both specified  
105422            on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option  
105423            specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment  
105424            variable, the result is undefined.

#### 105425 OPERANDS

- 105426            The following operands shall be supported:
- 105427            *target\_name*        Target names, as defined in the EXTENDED DESCRIPTION section. If no target  
105428                   is specified, while *make* is processing the makefiles, the first target that *make*  
105429                   encounters that is not a special target or an inference rule shall be used.
- 105430            *macro=value*  
105431            *macro::=value*  
105432            *macro:::=value*        Delayed and immediate expansion macro definitions, as defined in [Macros](#) (on  
105433                   page 3139).
- 105434            Delayed and immediate expansion macro definitions can be intermixed, and shall be processed  
105435            in the order specified. If any macro definition appears after a *target\_name* operand on the *make*  
105436            utility command line, the results are unspecified.

#### 105437 STDIN

- 105438            The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT  
105439            FILES section.

#### 105440 INPUT FILES

- 105441            The input file, otherwise known as the makefile, is a text file containing rules, macro definitions,  
105442            include lines, and comments. See the EXTENDED DESCRIPTION section.

#### 105443 ENVIRONMENT VARIABLES

- 105444            The following environment variables shall affect the execution of *make*:
- 105445            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
105446                   (See [XBD Section 8.2](#) (on page 169) for the precedence of internationalization  
105447                   variables used to determine the values of locale categories.)
- 105448            **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
105449                   internationalization variables.

- 105450 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 105451 characters (for example, single-byte as opposed to multi-byte characters in  
 105452 arguments and input files).
- 105453 **LC\_MESSAGES**  
 105454 Determine the locale that should be used to affect the format and contents of  
 105455 diagnostic messages written to standard error.
- 105456 **MAKEFLAGS**  
 105457 This variable shall be interpreted as a character string representing a series of  
 105458 option characters to be used as the default options. The implementation shall  
 105459 accept both of the following formats (but need not accept them when intermixed):
- 105460 • The characters are option letters without the leading <hyphen-minus>  
 105461 characters or <blank> separation used on a *make* utility command line.
  - 105462 • The characters are formatted in a manner similar to the use of the *make* utility  
 105463 in shell commands: options are preceded by <hyphen-minus> characters and  
 105464 <blank>-separated as described in XBD [Section 12.2](#) (on page 215). The  
 105465 *macro=value* macro definition operands can also be included. The difference  
 105466 between the contents of *MAKEFLAGS* and the use of the *make* utility in shell  
 105467 commands is that the contents of the variable shall not be subjected to the  
 105468 word expansions (see [Section 2.6](#), on page 2483) associated with parsing shell  
 105469 command lines.
- 105470 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 105471 XSI **PROJECTDIR**  
 105472 Provide a directory to be used to search for SCCS files not found in the current  
 105473 directory. In all of the following cases, the search for SCCS files is made in the  
 105474 directory **SCCS** in the identified directory. If the value of *PROJECTDIR* begins with  
 105475 a <slash>, it shall be considered an absolute pathname; otherwise, the value of  
 105476 *PROJECTDIR* is treated as a user name and that user's initial working directory  
 105477 shall be examined for a subdirectory **src** or **source**. If such a directory is found, it  
 105478 shall be used. Otherwise, the value is used as a relative pathname.
- 105479 If *PROJECTDIR* is not set or has a null value, the search for SCCS files shall be  
 105480 made in the directory **SCCS** in the current directory.
- 105481 The setting of *PROJECTDIR* affects all files listed in the remainder of this utility  
 105482 description for files with a component named **SCCS**.
- 105483 The value of the *SHELL* environment variable shall not be used as a macro and shall not be  
 105484 modified by defining the *SHELL* macro in a makefile or on the command line. All other  
 105485 environment variables, including those with null values, shall be used as macros, as defined in  
 105486 [Macros](#) (on page 3139).
- 105487 **ASYNCHRONOUS EVENTS**  
 105488 For **SIGHUP**, **SIGINT**, **SIGQUIT**, and **SIGTERM** signals, if the signal was not inherited as  
 105489 ignored, none of the **-n**, **-p**, or **-q** options was specified, *make* is currently processing a target or  
 105490 inference rule, and the current target is neither a directory nor a prerequisite of the special  
 105491 targets **.PHONY** or **.PRECIOUS**:
- 105492 • The *make* utility shall catch the signal and, if the time of last data modification of the  
 105493 current target has changed since *make* began processing the rule to bring that target up to  
 105494 date, remove that target; it may also remove that target if the time of last data modification  
 105495 has not changed. Any targets removed in this manner shall be reported in diagnostic or

105496 informational messages of unspecified format, written to standard error.

105497 • If *make* writes a diagnostic message to standard error, it shall exit with a status that  
105498 indicates an error occurred; otherwise, it shall set the signal to default and re-signal itself.

105499 In all other circumstances, *make* shall take the standard action for all signals; see [Section 1.4](#) (on  
105500 page 2462).

#### 105501 **STDOUT**

105502 If *make* is invoked without any work needing to be done, it may write a message to standard  
105503 output indicating that no action was taken. Otherwise, the *make* utility shall write all commands  
105504 to be executed (and the filenames of files touched for the `-t` option in a message of unspecified  
105505 format) to standard output unless the `-s` option was specified, the command is prefixed with a  
105506 `<commercial-at>` ('@'), or the special target `.SILENT` has either the current target as a  
105507 prerequisite or has no prerequisites.

#### 105508 **STDERR**

105509 The standard error shall be used for diagnostic messages and may be used for informational  
105510 messages about target removals (see ASYNCHRONOUS EVENTS).

#### 105511 **OUTPUT FILES**

105512 Files can be created when the `-t` option is present. Additional files can also be created by the  
105513 utilities invoked by *make*.

#### 105514 **EXTENDED DESCRIPTION**

105515 The *make* utility attempts to perform the actions, specified in one or more makefiles, required to  
105516 ensure that specified targets are up-to-date. By default, the following files shall be tried in  
105517 sequence: `./makefile` and `./Makefile`. If neither `./makefile` nor `./Makefile` is found, other  
105518 XSI implementation-defined files may also be tried. On XSI-conformant systems, the additional  
105519 files `./s.makefile`, `SCCS/s.makefile`, `./s.Makefile`, and `SCCS/s.Makefile` shall also be tried. The  
105520 `-f` option shall direct *make* to ignore any of these default files and use the specified option-  
105521 argument as a makefile instead. If this option-argument is `'-'`, standard input shall be used.

105522 The term *makefile* is used to refer to any makefile contents provided by the user, whether in  
105523 `./makefile` or its variants, or specified by the `-f` option.

105524 A target shall be considered up-to-date if it exists and is newer than all of its prerequisites, or if it  
105525 has already been made up-to-date by the current invocation of *make* (regardless of the target's  
105526 existence or age), except that targets that are made up-to-date in order for them to be processed  
105527 as include line pathnames (see **Include Lines** below) need not be considered up-to-date during  
105528 later processing. A target may also be considered up-to-date if it exists, is the same age as one or  
105529 more of its prerequisites, and is newer than the remaining prerequisites (if any). The *make* utility  
105530 shall treat all prerequisites as targets themselves and recursively ensure that they are up-to-date,  
105531 processing them in the order in which they appear in the rule. The *make* utility shall use the  
105532 modification times of files to determine whether the corresponding targets are out-of-date.

105533 To ensure that a target is up-to-date, *make* shall ensure that all of the prerequisites of the target  
105534 are up-to-date, then check to see if the target itself is up-to-date. If the target is not up-to-date,  
105535 the target shall be made up-to-date by executing the rule's commands (if any). If the target does  
105536 not exist after the target has been successfully made up-to-date, the target shall be treated as  
105537 being newer than any target for which it is a prerequisite.

105538 If a target exists and there is neither a target rule nor an inference rule for the target, the target  
105539 shall be considered up-to-date. It shall be an error if *make* attempts to ensure that a target is up-  
105540 to-date but the target does not exist and there is neither a target rule nor an inference rule for the  
105541 target.

105542 **Makefile Syntax**

105543 A makefile can contain rules, macro definitions (see [Macros](#), on page 3139), include lines, and  
 105544 comments. There are two kinds of rules: *target rules*, including special targets (see [Target Rules](#),  
 105545 on page 3137), and *inference rules* (see [Inference Rules](#), on page 3143). The *make* utility shall  
 105546 contain a set of built-in inference rules. If the `-r` option is present, the built-in rules shall not be  
 105547 used and the suffix list shall be cleared. Additional rules of both kinds can be specified in a  
 105548 makefile. If a rule is defined more than once, the value of the rule shall be that of the last one  
 105549 specified. Macros can also be defined more than once, and the value of the macro is specified in  
 105550 [Macros](#) (on page 3139). There are three kinds of comments: blank lines, empty lines, and a  
 105551 `<number-sign>` ('#') and all following characters up to the first unescaped `<newline>`  
 105552 character. Blank lines, empty lines, and lines with `<number-sign>` ('#') as the first character on  
 105553 the line are also known as comment lines.

105554 Target and inference rules can contain *command lines*. Command lines can have a prefix that  
 105555 shall be removed before execution (see [Makefile Execution](#), on page 3136).

105556 When an escaped `<newline>` (one preceded by a `<backslash>`) is found anywhere in the  
 105557 makefile except in a command line after macro expansion, an include line, or a line immediately  
 105558 preceding an include line, it shall be replaced, along with any leading white space on the next  
 105559 line, with a single `<space>`. After all macro expansion is complete, when an escaped `<newline>`  
 105560 is found in a command line in a makefile, the command line that is executed shall contain the  
 105561 `<backslash>`, the `<newline>`, and the next line, except that the first character of the next line shall  
 105562 not be included if it is a `<tab>`. When an escaped `<newline>` is found in an include line or in a  
 105563 line immediately preceding an include line, the behavior is unspecified.

105564 **Include Lines**

105565 If the word **include**, optionally prefixed with a `<hyphen-minus>` character, appears at the  
 105566 beginning of a line and is followed by one or more `<blank>` characters, the string formed by the  
 105567 remainder of the line shall be processed as follows to produce one or more pathnames:

- 105568 • The trailing `<newline>`, any `<blank>` characters immediately preceding a comment, and  
 105569 any comment shall be discarded. If the resulting string contains any double-quote  
 105570 characters ('"') the behavior is unspecified.
- 105571 • The resulting string shall be processed for macro expansion (see [Macros](#), on page 3139).
- 105572 • Any `<blank>` characters that appear after the first non-`<blank>` shall be used as separators  
 105573 to divide the macro-expanded string into fields. It is unspecified whether pathname  
 105574 expansion (see [Section 2.14](#), on page 2523) is also performed.
- 105575 • If the processing of separators and optional pathname expansion results in zero non-empty  
 105576 fields, the behavior is unspecified. If it results in at least one non-empty field, these fields  
 105577 are taken as pathnames.

105578 For each pathname so identified, in the order specified:

- 105579 • If the pathname does not begin with a `'/'`, it shall be treated as relative to the current  
 105580 working directory of the process, not relative to the directory containing the makefile.
- 105581 • The *make* utility shall use one of the following two methods to attempt to create the file or  
 105582 bring it up-to-date:
  - 105583 1. The “immediate remaking” method
    - 105584 If *make* uses this method, any target rules or inference rules for the pathname that  
 105585 were parsed before the include line was parsed shall be used to attempt to create the

- 105586 file or to bring it up-to-date before opening the file.
- 105587 2. The “delayed remaking” method
- 105588 If *make* uses this method, no attempt shall be made to create the file or bring it up-
- 105589 to-date until after the makefile(s) have been read. During processing of the include
- 105590 line, *make* shall read the current contents of the file, if it exists, or treat it as an empty
- 105591 file if it does not exist. Once the makefile(s) have been read, *make* shall use any
- 105592 applicable target rule or inference rule for the pathname, regardless of whether it is
- 105593 parsed before or after the include line, when creating the file or bringing it up-to-
- 105594 date. Additionally in this case, the new contents of the file, if it is successfully
- 105595 created or updated, shall be used when processing rules for the following targets
- 105596 after the makefile(s) have been read:
- 105597 • The *target\_name* operands, if any.
  - 105598 • The first target *make* encounters that is not a special target or an inference rule,
  - 105599 if no *target\_name* operands are specified.
  - 105600 • All targets that are prerequisites, directly or recursively, of the above targets.
- 105601 If the pathname is relative, the file does not exist, and an attempt to create it using a rule
- 105602 has not been made and will not be made, it is unspecified whether additional directories
- 105603 are searched for an existing file of the same relative pathname.
- 105604 If, after proceeding as described above, the file still cannot be opened:
- 105605 • If the word **include** was prefixed with a <hyphen-minus> character, the file shall be
  - 105606 ignored.
  - 105607 • Otherwise, an error shall occur.
- 105608 • The contents of the file specified by the pathname shall be read and processed as if they
  - 105609 appeared in the makefile in place of the include line. If the file ends with an escaped
  - 105610 <newline> the behavior is unspecified.
  - 105611 • The file may itself contain further include lines. Implementations shall support nesting of
  - 105612 include files up to a depth of at least 16.

### 105613 Makefile Execution

- 105614 Makefile command lines shall be processed one at a time.
- 105615 Makefile command lines can have one or more of the following prefixes: a <hyphen-minus>
- 105616 ('-'), a <commercial-at> ('@'), or a <plus-sign> ('+'). These shall modify the way in which
- 105617 *make* processes the command.
- 105618 – If the command prefix contains a <hyphen-minus>, or the `-i` option is present, or the special
  - 105619 target **.IGNORE** has either the current target as a prerequisite or has no prerequisites, any
  - 105620 error found while executing the command shall be ignored.
  - 105621 @ If the command prefix contains a <commercial-at> and the *make* utility command line `-n`
  - 105622 option is not specified, or the `-s` option is present, or the special target **.SILENT** has either
  - 105623 the current target as a prerequisite or has no prerequisites, the command shall not be
  - 105624 written to standard output before it is executed.
  - 105625 + If the command prefix contains a <plus-sign>, the command shall be executed even if `-n`,
  - 105626 `-q`, or `-t` is specified.
- 105627 An *execution line* is built from the command line by removing any prefix characters. Except as

105628 described under the <commercial-at> ('@') prefix, the execution line shall be written to the  
 105629 standard output, optionally preceded by a <tab>. The execution line shall then be executed by a  
 105630 shell as if it were passed as the argument to the *system()* interface, except that if errors are not  
 105631 being ignored then the shell *-e* option shall also be in effect. If errors are being ignored for the  
 105632 command (as a result of the *-i* option, a '-' command prefix, or a **.IGNORE** special target), the  
 105633 shell *-e* option shall not be in effect. The environment for the command being executed shall  
 105634 contain all of the variables in the environment of *make*.

105635 By default, when *make* receives a non-zero status from the execution of a command, it shall  
 105636 terminate with an error message to standard error.

## 105637 Target Rules

105638 Target rules are formatted as follows:

```
105639 target [target...]: [prerequisite...][;command]
105640 [<tab>command
105641 <tab>command
105642 ...]
```

105643 Target entries are specified by a <blank>-separated, non-null list of targets, then a <colon>, then  
 105644 a <blank>-separated, possibly empty list of prerequisites. Text following a <semicolon>, if any,  
 105645 and all following lines that begin with a <tab>, are makefile command lines to be executed to  
 105646 update the target. The first non-empty line that does not begin with a <tab> or '#' shall begin a  
 105647 new entry. Any comment line may begin a new entry.

105648 Applications shall select target names from the set of characters consisting solely of slashes,  
 105649 hyphens, periods, underscores, digits, and alphabets from the portable character set (see XBD  
 105650 Section 6.1, on page 117). Implementations may allow other characters in target names as  
 105651 extensions. The interpretation of targets containing the characters '%' and '"' is  
 105652 implementation-defined.

105653 A target that has prerequisites, but does not have any commands, can be used to add to the  
 105654 prerequisite list for that target. Only one target rule for any given target can contain commands.

105655 Lines that begin with one of the following are called *special targets* and control the operation of  
 105656 *make*:

105657 **.DEFAULT** If the makefile contains this special target, the application shall ensure that it is  
 105658 specified with commands, but without prerequisites. The commands shall be used  
 105659 by *make* if there are no other rules available to build a target.

105660 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors  
 105661 from commands associated with them to be ignored in the same manner as  
 105662 specified by the *-i* option. Subsequent occurrences of **.IGNORE** shall add to the  
 105663 list of targets ignoring command errors. If no prerequisites are specified, *make* shall  
 105664 behave as if the *-i* option had been specified and errors from all commands  
 105665 associated with all targets shall be ignored.

## 105666 .NOTPARALLEL

105667 The application shall ensure that this special target is specified without  
 105668 prerequisites or commands. When specified, *make* shall update one target at a time,  
 105669 regardless of whether the *-j maxjobs* option is specified. If the *-j maxjobs* option  
 105670 is specified, the option shall continue to be passed unchanged to sub-*make*  
 105671 invocations via *MAKEFLAGS*.

- 105672       **.PHONY**     Prerequisites of this special target are targets themselves; these targets (known as  
105673                   *phony targets*) shall be considered always out-of-date when the *make* utility begins  
105674                   executing. If a phony target's commands are executed, that phony target shall then  
105675                   be considered up-to-date until the execution of *make* completes. Subsequent  
105676                   occurrences of **.PHONY** shall add to the list of phony targets. A **.PHONY** special  
105677                   target with no prerequisites shall be ignored. If the `-t` option is specified, phony  
105678                   targets shall not be touched. Phony targets shall not be removed if *make* receives  
105679                   one of the asynchronous events explicitly described in the ASYNCHRONOUS  
105680                   EVENTS section.
- 105681       **.POSIX**     The application shall ensure that this special target is specified without  
105682                   prerequisites or commands. If it appears as the first non-comment line in the  
105683                   makefile, *make* shall process the makefile as specified by this section; otherwise, the  
105684                   behavior of *make* is unspecified.
- 105685       **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
105686                   asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
105687                   section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
105688                   files. If no prerequisites are specified, all targets in the makefile shall be treated as  
105689                   if specified with **.PRECIOUS**.
- 105690 XSI     **.SCCS\_GET** The application shall ensure that this special target is specified without  
105691                   prerequisites. If this special target is included in a makefile, the commands  
105692                   specified with this target shall replace the default commands associated with this  
105693                   special target (see [Default Rules](#), on page 3146). The commands specified with this  
105694                   target are used to get all SCCS files that are not found in the current directory.
- 105695                   When source files are named in a list of prerequisites, *make* shall treat them just like  
105696                   any other target. Because the source file is presumed to be present in the directory,  
105697                   there is no need to add an entry for it to the makefile. When a target has no  
105698                   prerequisites, but is present in the directory, *make* shall assume that that file is up-  
105699                   to-date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
105700                   *source\_file*, *make* compares the timestamp of the target file with that of the  
105701                   **SCCS/s.source\_file** to ensure the target is up-to-date. If the target is missing, or if  
105702                   the SCCS file is newer, *make* shall automatically issue the commands specified for  
105703                   the **.SCCS\_GET** special target to retrieve the most recent version. However, if the  
105704                   target is writable by anyone, *make* shall not retrieve a new version.
- 105705       **.SILENT**   Prerequisites of this special target are targets themselves; this shall cause  
105706                   commands associated with them not to be written to the standard output before  
105707                   they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
105708                   targets with silent commands. If no prerequisites are specified, *make* shall behave  
105709                   as if the `-s` option had been specified and no commands or touch messages  
105710                   associated with any target shall be written to standard output.
- 105711       **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
105712                   used in conjunction with the inference rules (see [Inference Rules](#), on page 3143). If  
105713                   **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
105714                   cleared.
- 105715       **.WAIT**     The application shall ensure that this special target, if specified as a target, is  
105716                   specified without prerequisites or commands. When **.WAIT** appears as a target, it  
105717                   shall have no effect. When **.WAIT** appears in a target rule as a prerequisite, it shall  
105718                   not itself be treated as a prerequisite; however, *make* shall not recursively process  
105719                   the prerequisites (if any) to the right of the **.WAIT** until the prerequisites (if any) to

105720 the left of it have been brought up-to-date. Implementations may also enforce the  
 105721 same ordering between the affected prerequisites while processing other target  
 105722 rules that have some or all of the same affected prerequisites.

105723 The special targets **.IGNORE**, **.NOTPARALLEL**, **.PHONY**, **.POSIX**, **.PRECIOUS**, **.SILENT**,  
 105724 **.SUFFIXES**, and **.WAIT** shall be specified without commands.

105725 Targets and prerequisites consisting of a leading <period> followed by the uppercase letters  
 105726 "POSIX" and then any other characters are reserved for future standardization. Targets and  
 105727 prerequisites consisting of a leading <period> followed by one or more uppercase letters, that  
 105728 are not described above, are reserved for implementation extensions.

## 105729 **Macros**

105730 A macro can be one of two flavors, *delayed-expansion* or *immediate-expansion*.

105731 The following form defines a delayed-expansion macro (replacing any previous definition of the  
 105732 macro named by *string1*):

```
105733 string1 = [string2]
```

105734 The following form defines an immediate-expansion macro (replacing any previous definition of  
 105735 the macro named by *string1*):

```
105736 string1 ::= [string2]
```

105737 The following form defines a delayed-expansion macro (replacing any previous definition of the  
 105738 macro named by *string1*):

```
105739 string1 ::= [string2]
```

105740 by immediately expanding macros in *string2*, if any, before assigning the value.

105741 The following form defines a delayed-expansion macro (replacing any previous definition of the  
 105742 macro named by *string1*):

```
105743 string1 != [string2]
```

105744 by immediately expanding macros in *string2*, if any, and then executing the result as a shell  
 105745 command as if it were passed as the argument to the *system()* interface. The *make* utility shall  
 105746 capture the standard output from the shell execution and shall remove all white space at the  
 105747 beginning, remove a single trailing <newline> character (if there is one), and then replace all  
 105748 remaining <newline> characters with <space> characters to produce the value assigned to the  
 105749 macro named by *string1*. It shall not be an error if the shell command has non-zero exit status.

105750 The following form defines a delayed-expansion macro, but only if the macro named by *string1*  
 105751 is not already defined:

```
105752 string1 ?= [string2]
```

105753 The following form (the *append* form) appends additional text to the value of a macro:

```
105754 string1 += [string2]
```

105755 When using the append form:

- 105756 • If the macro named by *string1* does not exist, this form shall be equivalent to the delayed-  
 105757 expansion form

```
105758 string1 = [string2]
```

105759 • If the macro named by *string1* exists and is an immediate-expansion macro, then a <space>  
 105760 or <tab> character followed by the evaluation of *string2* shall be appended to the value  
 105761 currently assigned to the macro named by *string1*.

105762 • If the macro named by *string1* exists and is a delayed-expansion macro, then a <space> or  
 105763 <tab> character followed by the unevaluated *string2* shall be appended to the value  
 105764 currently assigned to the macro named by *string1*.

105765 In all cases the value of *string1* is defined as all characters from the first non-<blank> character to  
 105766 the last non-<blank> character, inclusive, before the =, ::=, :::=, !=, ?=, or +=. Portable  
 105767 applications shall ensure that a <blank> precedes the ::=, :::=, !=, ?=, or += in those forms to  
 105768 avoid any parsing ambiguity with implementations that permit <colon>, <exclamation-mark>,  
 105769 <question-mark>, or <plus-sign> in macro names as extensions. The value of *string2* is defined  
 105770 as all characters from the first non-<blank> character, if any, after the <equals-sign>, up to but  
 105771 not including a comment character (' # ') or an unescaped <newline>.

105772 Portable applications shall select macro names from the set of characters consisting solely of  
 105773 characters from the portable filename character set. Implementations may allow other characters  
 105774 in macro names as extensions; however, a macro name shall not contain an <equals-sign>,  
 105775 <blank>, or control character.

105776 Macro expansions in *string1* of macro definition lines shall be evaluated when read. Macro  
 105777 expansions in *string2* of macro definition lines shall be performed according to the form of  
 105778 macro definition used. In immediate-expansion forms (including appending to an existing  
 105779 immediate-expansion macro), they shall be expanded in the macro definition line and the result  
 105780 of the expansion shall not be scanned for further macros when the macro identified by *string1* is  
 105781 expanded. In delayed-expansion forms (including appending to an existing delayed-expansion  
 105782 macro, and conditional assignment to a macro not previously existing), they shall not be  
 105783 expanded in the macro definition line; they shall be expanded when the macro identified by  
 105784 *string1* is expanded, and the result of the expansion shall be scanned for further macros.  
 105785 Implementations shall support at least 100 levels of indirection.

105786 Macros can appear anywhere in the makefile. Macro expansions using the forms  $\$(string1)$  or  
 105787  $\${string1}$  shall be replaced by *string2*, as follows:

- 105788 • Macros in target lines shall be evaluated when the target line is read.
- 105789 • Macros in makefile command lines shall be evaluated when the command is executed.
- 105790 • Macros in the string before the <equals-sign> in a macro definition shall be evaluated  
 105791 when the macro assignment is made.
- 105792 • Immediate-expansion macros shall be evaluated immediately when the macro assignment  
 105793 is made, and this value shall be used as the replacement until the immediate-expansion  
 105794 macro is redefined.
- 105795 • Delayed-expansion macros after the <equals-sign> in macro definitions other than the  
 105796 ::=, !=, and += forms, and after the <equals-sign> in += form macro definitions where  
 105797 the macro named by *string1* exists and is a delayed-expansion macro, shall only be  
 105798 evaluated when the defined macro is expanded.

105799 The parentheses or braces are optional if *string1* is a single character. The string "\$\$" shall be  
 105800 replaced by the single character '\$', except during the immediate expansion performed for the  
 105801 ::= operator, where it shall be left unmodified. If *string1* in a macro expansion contains a  
 105802 macro expansion, that inner macro expansion shall be performed first and the result substituted  
 105803 into *string1* to produce the macro name used for the outer macro expansion.

105804 Macro expansions using the forms  $\$(string1:subst1=[subst2])$  or  $\${string1:subst1=[subst2]}$  can be

105805 used to replace all occurrences of *subst1* with *subst2* when the macro substitution is performed.  
 105806 The *subst1* to be replaced shall be recognized when it is a suffix at the end of a word in *string1*  
 105807 (where a *word*, in this context, is defined to be a string delimited by the beginning of the value, a  
 105808 <blank>, or a <newline>). If *string1* in a macro expansion contains a macro expansion, that inner  
 105809 macro expansion shall be performed as described above and the result substituted into *string1*  
 105810 to produce the macro name used for the outer macro expansion.

105811 Macro expansions using the forms  $\$(string1:[op]\%[os]=[np][\%][ns])$  or  
 105812  $\${string1:[op]\%[os]=[np][\%][ns]}$  are called pattern macro expansions, where *op* is the old prefix,  
 105813 *os* is the old suffix, *np* is the new prefix and *ns* is the new suffix. Any item inside square brackets  
 105814 is optional. With this form, when the macro *string1* is expanded each white-space-separated  
 105815 word that completely matches the  $[op]\%[os]$  pattern on the left-hand side of the <equals-sign>  
 105816 ('='), where the <percent> ('%') character matches zero or more characters, shall be replaced  
 105817 by the right-hand side of the <equals-sign> and shall then be further modified according to the  
 105818 use of <percent> characters as described below. Any words that do not match shall be  
 105819 unmodified in the expansion.

105820 If more than one <percent> character appears on the left-hand side of the <equals-sign> ('='),  
 105821 the second and subsequent <percent> characters shall be treated as literal characters in *os*.

105822 If no <percent> character appears on the right-hand side of the <equals-sign>, no further  
 105823 modification of the word shall be performed. If a single <percent> character appears on the  
 105824 right-hand side, the <percent> character in the word shall be replaced with the characters  
 105825 matched by the <percent> on the left-hand side. If more than one <percent> character appears  
 105826 on the right-hand side, it is unspecified whether the first <percent> character in the word is  
 105827 replaced with the characters matched by the <percent> on the left-hand side and all remaining  
 105828 <percent> characters are left unchanged, or each <percent> character is replaced with the  
 105829 characters matched by the <percent> on the left-hand side.

105830 In both macro expansion forms, any macro expansions on the right-hand side of the <colon>  
 105831 shall be recursively expanded before further examination. If this results in more than one  
 105832 <equals-sign> after the <colon>, the first one shall be the separator.

105833 In all forms of macro expansion, if the value of the macro named by *string1* is an empty string, or  
 105834 if the macro named by *string1* does not exist, the final result shall be an empty string.

105835 **Note:** It is not safe to assume that a macro which has not intentionally been set to a specific value will  
 105836 not exist. See APPLICATION USAGE for more information.

105837 Macro definitions shall be taken from the following sources, in the following logical order,  
 105838 before the makefile(s) are read.

- 105839 1. Macros specified on the *make* utility command line, in the order specified on the  
 105840 command line. It is unspecified whether the internal macros defined in [Internal Macros](#)  
 105841 (on page 3144) are accepted from this source.
- 105842 2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the  
 105843 environment variable. It is unspecified whether the internal macros defined in [Internal](#)  
 105844 [Macros](#) (on page 3144) are accepted from this source.
- 105845 3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and  
 105846 including the variables with null values.
- 105847 4. Macros defined in the inference rules built into *make*.

105848 Macro definitions from these sources shall not override macro definitions from a lower-  
 105849 numbered source. Macro definitions from a single source (for example, the *make* utility  
 105850 command line, the *MAKEFLAGS* environment variable, or the other environment variables)

105851 shall override previous macro definitions from the same source.

105852 Macros defined in the makefile(s) shall override macro definitions that occur before them in the  
105853 makefile(s) and macro definitions from source 4. If the `-e` option is not specified, macros defined  
105854 in the makefile(s) shall override macro definitions from source 3. Macros defined in the  
105855 makefile(s) shall not override macro definitions from source 1 or source 2.

105856 Before the makefile(s) are read, all of the *make* utility command line options (except `-f` and `-p`)  
105857 and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not  
105858 already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted  
105859 in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance  
105860 of the *make* command, the original macro's value is recovered. Other implementation-defined  
105861 options and macros, with the exception of the *CURDIR* macro, may also be added to the  
105862 *MAKEFLAGS* macro. If this modifies the value of the *MAKEFLAGS* macro, or, if the  
105863 *MAKEFLAGS* macro is modified at any subsequent time, the *MAKEFLAGS* environment variable  
105864 shall be modified to match the new value of the *MAKEFLAGS* macro. The result of setting  
105865 *MAKEFLAGS* in the Makefile is unspecified.

105866 Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the  
105867 *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other  
105868 implementation-defined variables may also be added to the environment of *make*. Macros  
105869 defined by the *MAKEFLAGS* environment variable and macros defined in the makefile(s) shall  
105870 not be added to the environment of *make* if they are not already in its environment. With the  
105871 exception of *SHELL* (see below), it is unspecified whether macros defined in these ways update  
105872 the value of an environment variable that already exists in the environment of *make*.

105873 The *MAKE* macro shall be treated specially. If *MAKE* is not defined in the environment, the  
105874 *MAKE* macro shall be provided by *make* and set to the value of *argv*[0] passed to *main*() (or  
105875 equivalent, if *make* is not a C program). If this value contains at least one `</code>slash>` and is a relative  
105876 pathname, *make* shall convert it to an absolute pathname. If *MAKE* is defined in the makefile or  
105877 is specified on the command line, it shall replace the original value of the *MAKE* macro.

105878 The *SHELL* macro shall be treated specially. It shall be provided by *make* and set to the pathname  
105879 of the shell command language interpreter (see *sh*). The *SHELL* environment variable shall not  
105880 affect the value of the *SHELL* macro. If *SHELL* is defined in the makefile or is specified on the  
105881 command line, it shall replace the original value of the *SHELL* macro, but shall not affect the  
105882 *SHELL* environment variable. Other effects of defining *SHELL* in the makefile or on the  
105883 command line are implementation-defined.

105884 The *CURDIR* macro shall be treated specially. It shall be provided by *make* and set to an absolute  
105885 pathname of the current working directory when *make* is executed. The value shall be the same  
105886 as the pathname that would be output by the *pwd* utility with either the `-L` or `-P` option; if they  
105887 differ, it is unspecified which value is used. The *CURDIR* environment variable shall not affect  
105888 the value of the *CURDIR* macro unless the `-e` option is specified. If the `-e` option is not specified,  
105889 there is a *CURDIR* environment variable set, and its value is different from the *CURDIR* macro  
105890 value, the environment variable value shall be set to the macro value. If *CURDIR* is defined in  
105891 the makefile, present in the *MAKEFLAGS* environment variable, or specified on the command  
105892 line, it shall replace the original value of the *CURDIR* macro in accordance with the logical order  
105893 described above, but shall not cause *make* to change its current working directory.

105894 **Inference Rules**

105895 Inference rules are formatted as follows:

```

105896 target:
105897 <tab>command
105898 [<tab>command]
105899 ...
105900 line that does not begin with <tab> or #

```

105901 The application shall ensure that the *target* portion is a valid target name (see [Target Rules](#), on  
 105902 page 3137) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as  
 105903 prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any *<slash>* or  
 105904 *<period>* characters.) If there is only one *<period>* in the target, it is a single-suffix inference  
 105905 rule. Targets with two periods are double-suffix inference rules. Inference rules can have only  
 105906 one target before the *<colon>*.

105907 The application shall ensure that the makefile does not specify prerequisites for inference rules;  
 105908 no characters other than white space shall follow the *<colon>* in the first line, except when  
 105909 creating the *empty rule*, described below. Prerequisites are inferred, as described below.

105910 Inference rules can be redefined. A target that matches an existing inference rule shall overwrite  
 105911 the old inference rule. An empty rule can be created with a command consisting of simply a  
 105912 *<semicolon>* (that is, the rule still exists and is found during inference rule search, but since it is  
 105913 empty, execution has no effect). The empty rule can also be formatted as follows:

```

105914 rule: ;

```

105915 where zero or more *<blank>* characters separate the *<colon>* and *<semicolon>*.

105916 The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be  
 105917 made up-to-date. A list of inference rules defines the commands to be executed. By default, *make*  
 105918 contains a built-in set of inference rules. Additional rules can be specified in the makefile.

105919 The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by  
 105920 the inference rules. The order in which the suffixes are specified defines the order in which the  
 105921 inference rules for the suffixes are used. New suffixes shall be appended to the current list by  
 105922 specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites  
 105923 shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is  
 105924 required to change the order of the suffixes.

105925 Normally, the user would provide an inference rule for each suffix. The inference rule to update  
 105926 a target with a suffix *.s1* from a prerequisite with a suffix *.s2* is specified as a target *.s2.s1*. The  
 105927 internal macros provide the means to specify general inference rules (see [Internal Macros](#), on  
 105928 page 3144).

105929 When no target rule with commands is found to update a target, the inference rules shall be  
 105930 checked. The suffix of the target (*.s1*) to be built shall be compared to the list of suffixes specified  
 105931 by the **.SUFFIXES** special targets. If the *.s1* suffix is found in **.SUFFIXES**, the inference rules  
 105932 shall be searched in the order defined for the first *.s2.s1* rule whose prerequisite file (*\$.s2*) exists.  
 105933 If the target is out-of-date with respect to this prerequisite, the commands for that inference rule  
 105934 shall be executed. Prerequisites added by target rules without commands shall not affect the  
 105935 selection of the applicable inference rule.

105936 If the target to be built does not contain a suffix and there is no rule for the target, the single-  
 105937 suffix inference rules shall be checked. The single-suffix inference rules define how to build a  
 105938 target if a file is found with a name that matches the target name with one of the single suffixes

105939 appended. A rule with one suffix *.s2* is the definition of how to build *target* from *target.s2*. The  
 105940 other suffix (*.s1*) is treated as null.

105941 XSI A <tilde> ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule  
 105942 *.c.o* would transform an SCCS C-language source file into an object file (*.o*). Because the *s.* of  
 105943 the SCCS files is a prefix, it is incompatible with *make's* suffix point of view. Hence, the '~' is a  
 105944 way of changing any file reference into an SCCS file reference.

### 105945 Libraries

105946 If a target or prerequisite contains parentheses, it shall be treated as a member of an archive  
 105947 library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o*  
 105948 to the member name. The application shall ensure that the member is an object file with the *.o*  
 105949 suffix. The modification time of the expression is the modification time for the member as kept  
 105950 in the archive library; see *ar*. The *.a* suffix shall refer to an archive library. The *.s2.a* rule shall be  
 105951 used to update a member in the library from a file with a suffix *.s2*.

### 105952 Internal Macros

105953 The *make* utility shall maintain a set of internal macros that can be used in the commands of  
 105954 target and inference rules, as described below. In order to clearly define the meaning of these  
 105955 macros, some clarification of the terms *target rule*, *inference rule*, *target*, and *prerequisite* is  
 105956 necessary.

105957 Target rules are specified by the user in a makefile for a particular target. Inference rules are  
 105958 user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites  
 105959 are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those  
 105960 prerequisites that are generated when inference rules are used. Inference rules are applied to  
 105961 implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in  
 105962 the makefile. Target rules are applied to targets specified in the makefile.

105963 Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit)  
 105964 shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon  
 105965 recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be  
 105966 processed recursively until a target is found that has no prerequisites, or further recursion would  
 105967 require applying two inference rules one immediately after the other, at which point the  
 105968 recursion shall stop. As an extension, implementations may continue recursion when two or  
 105969 more successive inference rules need to be applied; however, if there are multiple different  
 105970 chains of such rules that could be used to create the target, it is unspecified which chain is used.  
 105971 The recursion shall then back up, updating each target as it goes.

105972 In the definitions that follow, the word *target* refers to one of:

- 105973 • A target specified in the makefile
- 105974 • An explicit prerequisite specified in the makefile that becomes the target when *make*  
 105975 processes it during recursion
- 105976 • An implicit prerequisite that becomes a target when *make* processes it during recursion

105977 In the definitions that follow, the word *prerequisite* refers to one of:

- 105978 • An explicit prerequisite specified in the makefile for a particular target
- 105979 • An implicit prerequisite generated as a result of locating an appropriate inference rule and  
 105980 corresponding file that matches the suffix of the target

105981 The internal macros are:

- 105982        **\$@**        The **\$@** macro shall evaluate to the full target name of the current target, or the archive  
105983 filename part of a library archive target. It shall be evaluated for both target and  
105984 inference rules.
- 105985                For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built.  
105986 Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-  
105987 date **lib.a**.
- 105988        **\$%**        The **\$%** macro shall be evaluated only when the current target is an archive library  
105989 member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and  
105990 **\$%** shall evaluate to *member.o*. The **\$%** macro shall be evaluated for both target and  
105991 inference rules.
- 105992                For example, in a makefile target rule to build **lib.a(file.o)**, **\$%** represents **file.o**, as  
105993 opposed to **\$@**, which represents **lib.a**.
- 105994        **\$^**        The **\$^** macro shall evaluate to the list of prerequisites for the current target, with any  
105995 duplicates (except the first) removed. It shall be evaluated for both target and inference  
105996 rules. If the list of prerequisites of the target contains any **.WAIT** special targets, the  
105997 results of expanding **\$^** are unspecified.
- 105998                For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
105999 regardless of which prerequisites *prog* is out-of-date with respect to, **\$^** represents  
106000 **file1.o**, **file2.o**, and **file3.o**.
- 106001        **\$+**        The **\$+** macro shall be equivalent to **\$^**, except that duplicates shall not be removed; all  
106002 prerequisites shall appear in the order they were listed in the makefile.
- 106003        **\$?**        The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current  
106004 target. It shall be evaluated for both target and inference rules.
- 106005                For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
106006 where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to  
106007 **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.
- 106008        **\$<**        In an inference rule, the **\$<** macro shall evaluate to the filename whose existence  
106009 allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the **\$<**  
106010 macro shall evaluate to the current target name. The meaning of the **\$<** macro is  
106011 otherwise unspecified.
- 106012                For example, in the **.c.a** inference rule, **\$<** represents the prerequisite **.c** file.
- 106013        **\$\***        The **\$\*** macro shall evaluate to the current target name with its suffix deleted. It shall be  
106014 evaluated at least for inference rules.
- 106015                For example, in the **.c.a** inference rule, **\$.o** represents the out-of-date **.o** file that  
106016 corresponds to the prerequisite **.c** file.
- 106017        Each of the internal macros has an alternative form. When an uppercase 'D' or 'F' is appended  
106018 to any of the macros, the meaning shall be changed to the *directory part* for 'D' and *filename part*  
106019 for 'F'. The directory part is the path prefix of the file without a trailing **<slash>**; for the current  
106020 directory, the directory part is **'.'**. When the **\$?** macro contains more than one prerequisite  
106021 filename, the **\$(?D)** and **\$(?F)** (or **\${?D}** and **\${?F}**) macros expand to a list of directory name parts  
106022 and filename parts respectively.
- 106023        For the target *lib(member.o)* and the **.s2.a** rule, the internal macros shall be defined as:

```

106024    $<    member.s2
106025    $*    member
106026    $@    lib
106027    $^    member.s2
106028    $?    member.s2
106029    $%    member.o

```

### 106030 **Default Rules**

106031 The default rules and macro values for *make* shall achieve results that are the same as if the  
 106032 following were used, except that where a result includes the literal value of a macro, this value  
 106033 may differ. Implementations that do not support the C-Language Development Utilities option  
 106034 may omit **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l**  
 106035 inference rules. Implementations may provide additional macros and rules.

106036 *SPECIAL TARGETS*

```

106037 XSI .SCCS_GET:
106038     sccs $(SCCSFLAGS) get $(SCCSGETFLAGS) $@

```

```

106039 XSI .SUFFIXES: .o .c .y .l .a .sh .c~ .y~ .l~ .sh~

```

### 106040 **MACROS**

```

106041 AR=ar
106042 ARFLAGS=-rv
106043 YACC=yacc
106044 YFLAGS=
106045 LEX=lex
106046 LFLAGS=
106047 LDFLAGS=
106048 CC=c17
106049 CFLAGS=-O 1
106050 XSI GET=get
106051 GFLAGS=
106052 SCCSFLAGS=
106053 SCCSGETFLAGS=-s

```

### 106054 *SINGLE-SUFFIX RULES*

```

106055 .c:
106056     $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<

```

```

106057 .sh:
106058     cp $< $@
106059     chmod a+x $@

```

```

106060 XSI .c~:
106061     $(GET) $(GFLAGS) -p $< > $*.c
106062     $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
106063 .sh~:
106064     $(GET) $(GFLAGS) -p $< > $*.sh

```

```

106065         cp $*.sh $@
106066         chmod a+x $@

106067     DOUBLE-SUFFIX RULES

106068     .c.o:
106069         $(CC) $(CFLAGS) -c $<

106070     .y.o:
106071         $(YACC) $(YFLAGS) $<
106072         $(CC) $(CFLAGS) -c y.tab.c
106073         rm -f y.tab.c
106074         mv y.tab.o $@

106075     .l.o:
106076         $(LEX) $(LFLAGS) $<
106077         $(CC) $(CFLAGS) -c lex.yy.c
106078         rm -f lex.yy.c
106079         mv lex.yy.o $@

106080     .y.c:
106081         $(YACC) $(YFLAGS) $<
106082         mv y.tab.c $@

106083     .l.c:
106084         $(LEX) $(LFLAGS) $<
106085         mv lex.yy.c $@

106086 XSI .c~.o:
106087     $(GET) $(GFLAGS) -p $< > $*.c
106088     $(CC) $(CFLAGS) -c $*.c

106089     .y~.o:
106090     $(GET) $(GFLAGS) -p $< > $*.y
106091     $(YACC) $(YFLAGS) $*.y
106092     $(CC) $(CFLAGS) -c y.tab.c
106093     rm -f y.tab.c
106094     mv y.tab.o $@

106095     .l~.o:
106096     $(GET) $(GFLAGS) -p $< > $*.l
106097     $(LEX) $(LFLAGS) $*.l
106098     $(CC) $(CFLAGS) -c lex.yy.c
106099     rm -f lex.yy.c
106100     mv lex.yy.o $@

106101     .y~.c:
106102     $(GET) $(GFLAGS) -p $< > $*.y
106103     $(YACC) $(YFLAGS) $*.y
106104     mv y.tab.c $@

106105     .l~.c:
106106     $(GET) $(GFLAGS) -p $< > $*.l
106107     $(LEX) $(LFLAGS) $*.l
106108     mv lex.yy.c $@

```

```

106109     .c.o:
106110         $(CC) -c $(CFLAGS) $<
106111         $(AR) $(ARFLAGS) $@ $*.o
106112         rm -f $*.o

```

#### 106113 EXIT STATUS

106114 When the `-q` option is specified, the *make* utility shall exit with one of the following values:

- 106115 0 All specified targets were already up-to-date.
- 106116 1 One or more targets were not up-to-date.
- 106117 >1 An error occurred.

106118 When the `-q` option is not specified, the *make* utility shall exit with one of the following values:

- 106119 0 All specified targets were already up-to-date, or all commands executed to bring targets up-to-date either exited with status 0 or had a non-zero exit status that was specified (via the `-i` option, the special target `.IGNORE`, or a '-' command prefix) to be ignored.
- 106120
- 106121
- 106122 >0 An error occurred, or at least one command executed to bring a target up-to-date exited with a non-zero exit status that was not specified to be ignored.
- 106123

#### 106124 CONSEQUENCES OF ERRORS

106125 Default.

#### 106126 APPLICATION USAGE

106127 If there is a source file (such as `./source.c`) and there are two SCCS files corresponding to it  
 106128 (`./s.source.c` and `./SCCS/s.source.c`), on XSI-conformant systems *make* uses the SCCS file in the  
 106129 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,  
 106130 *get*, and so on) or the *scs* utility for all source files in a given directory. If both forms are used for  
 106131 a given source file, future developers are very likely to be confused.

106132 It is incumbent upon portable makefiles to specify the `.POSIX` special target in order to  
 106133 guarantee that they are not affected by local extensions.

106134 The `-k` and `-S` options are both present so that the relationship between the command line, the  
 106135 `MAKEFLAGS` variable, and the makefile can be controlled precisely. If the `k` flag is passed in  
 106136 `MAKEFLAGS` and a command is of the form:

```
106137 $(MAKE) -S f.o
```

106138 then the default behavior is restored for the child *make*.

106139 When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive  
 106140 *make -n target* to be used to see all of the actions that would be taken to update *target*.

106141 Because of widespread historical practice, interpreting a `<number-sign>` ('#') inside a variable  
 106142 as the start of a comment has the unfortunate side-effect of making it impossible to place a  
 106143 `<number-sign>` in a variable, thus forbidding something like:

```
106144 CFLAGS = -D "COMMENT_CHAR='#'"
```

106145 Many historical *make* utilities stop chaining together inference rules when an intermediate target  
 106146 is nonexistent. For example, it might be possible for a *make* to determine that both `.y.c` and `.c.o`  
 106147 could be used to convert a `.y` to a `.o`. Instead, in this case, *make* requires the use of a `.y.o` rule.

106148 The standard set of default rules uses only features provided by other parts of this volume of  
 106149 POSIX.1-2024. They include rules for optional utilities in this volume of POSIX.1-2024, but only  
 106150 rules pertaining to utilities that are provided are needed in an implementation's default set.

106151 Although *make* expands macros that do not exist to an empty string, it is not safe to assume that  
 106152 a macro which has not intentionally been set to a specific value will expand to an empty string  
 106153 for everyone who uses the makefile. There are two reasons for this:

- 106154 1. When another user executes *make*, they might happen to have an environment variable of  
 106155 the same name (which they have set for some unrelated purpose) with a non-empty  
 106156 value.
- 106157 2. A different implementation of *make* (or a later version of the same implementation) might  
 106158 have a non-empty value for the macro in its default set.

106159 This is one aspect of a more general problem, which is that any macro that is not one for which  
 106160 this standard requires a default value, and is not explicitly set either in the makefile or on the  
 106161 *make* command line, can have an unexpected value (or unexpectedly not exist) when the  
 106162 makefile is used by a different user or with a different *make* implementation.

106163 For this reason, it is recommended that makefile authors do not design makefile schemes in  
 106164 which values for non-standard macros are obtained from the user's environment variables. Safer  
 106165 methods of allowing users to configure macro values include:

- 106166 • Setting the macros to default values in a *make* include file where the user can edit the  
 106167 values.
- 106168 • Executing *make* from one or more wrapper scripts which set macro values on the command  
 106169 line (and which do not obtain those values from environment variables).

106170 Makefile authors who follow this recommendation may wish to check for any macros they have  
 106171 overlooked by using a *make* implementation that provides, as an extension, a command-line  
 106172 option that causes *make* to report attempts to expand (or append to) macros that do not exist.  
 106173 Users of makefiles written by others can also benefit from the use of such an option to detect the  
 106174 opposite problem (where the author had a macro being set from an environment variable but the  
 106175 user does not have the variable set). This can avoid misbehaviors that would otherwise be hard  
 106176 to debug, such as a file-processing utility reading from standard input because it was not given  
 106177 any pathnames to process.

106178 Makefile authors who choose not to follow the recommendation can minimize the risk of  
 106179 misbehavior by ensuring all non-standard macros have names that begin with a suitable project-  
 106180 specific prefix.

106181 Use of the `-e` option is strongly discouraged, as it makes the problem discussed above even  
 106182 more likely by introducing the possibility of unexpected values occurring even for macros set in  
 106183 the makefile. If a specific macro needs a value from the environment to override a value set in  
 106184 the makefile, it is safer to set just that macro on the command line, using for example  
 106185 `make MYPROJ_FOO="$MYPROJ_FOO"`. Alternatively, the makefile can be modified to use the  
 106186 `?=` assignment operator for that macro.

106187 Delayed-expansion macros are evaluated when they are used rather than when they are defined.  
 106188 Therefore:

```
106189 MACRO = value1
106190 Immed ::= $(MACRO)
106191 DELAY = $(MACRO)
106192 MACRO = value2

106193 target:
106194     echo $(Immed) $(DELAY)
```

106195 would produce "value1 value2", since **Immed** was expanded while **MACRO** was *value1*,

106196 but **DELAY** was not expanded until it was needed in the *echo* command line when **MACRO** was  
106197 *value2*.

106198 Because the behavior of the += assignment differs depending on whether the macro being  
106199 appended to is a delayed-expansion macro or an immediate-expansion macro, it is  
106200 recommended that when both macro types are used in a set of multiple makefiles and include  
106201 files, a naming convention is adopted to distinguish the two macro types. This avoids any  
106202 confusion about whether += will append the expanded or unexpanded value. A suitable  
106203 convention might be to name delayed-expansion macros using uppercase and underscore  
106204 characters and immediate-expansion macros using a name that contains at least one lowercase  
106205 character.

106206 Some historical applications have been known to intermix *target\_name* and *macro=name* operands  
106207 on the command line, expecting that all of the macros are processed before any of the targets are  
106208 dealt with. Conforming applications do not do this, although some backwards-compatibility  
106209 support may be included in some implementations.

106210 The following characters in filenames may give trouble: '=', ':', '`', single-quote, and '@'.  
106211 In include filenames, pattern matching characters and '"' should also be avoided, as they may  
106212 be treated as special by some implementations.

106213 For inference rules, the descriptions of \$< and \$? seem similar. However, an example shows the  
106214 minor difference. In a makefile containing:

```
106215 foo.o: foo.h
```

106216 if **foo.h** is newer than **foo.o**, yet **foo.c** is older than **foo.o**, the built-in rule to make **foo.o** from  
106217 **foo.c** is used, with \$< equal to **foo.c** and \$? equal to **foo.h**. If **foo.c** is also newer than **foo.o**, \$<  
106218 is equal to **foo.c** and \$? is equal to **foo.h foo.c**.

106219 As a consequence of the general rules for target updating, a useful special case is that if a target  
106220 has no prerequisites and no commands, and the target of the rule is a nonexistent file, then *make*  
106221 acts as if this target has been updated whenever its rule is run.

106222 **Note:** This implies that all targets depending on this one will always have their commands run.

106223 Shell command sequences like `make; cp original copy`; *make* may have problems on  
106224 filesystems where the timestamp resolution is the minimum (1 second) required by the standard  
106225 and where *make* considers identical timestamps to be up-to-date. Conversely, rules like  
106226 `copy: original; cp -p original copy` will result in redundant work on *make*  
106227 implementations that consider identical timestamps to be out-of-date.

106228 The requirements relating to dynamic include files (ones that have rules to create or update  
106229 them) allow two different methods of implementing them, as explained in RATIONALE below.  
106230 In order to write a set of makefiles and include files (both dynamic and static) that work with  
106231 both methods, applications need to ensure the following:

- 106232 • Rules containing commands for creating dynamic include files (and any prerequisites)  
106233 precede the include line that will cause the file to be read.
- 106234 • Include lines and rules for creating dynamic include files do not depend on the contents of  
106235 any earlier dynamic include file. For example, defining a macro in a dynamic include file  
106236 and using that macro in a later include line should be avoided (unless the later include line  
106237 is itself inside the dynamic include file).
- 106238 • One of the rules used in creating a dynamic include file, or a dynamic prerequisite of an  
106239 include file, contains commands to create its target and does not ignore creation failure.

106240 Note that although the first point above appears at first sight to preclude a dynamic include file

106241 that defines its own prerequisites, this can be achieved by having two include lines that name  
 106242 the same file (provided the rules in the file do not contain command lines), as shown in  
 106243 EXAMPLES.

106244 This standard does not specify precedence between macro definition and include directives.  
 106245 Thus, the behavior of:

```
106246 include =foo.mk
```

106247 is unspecified. To define a variable named include, either the white space before the <equal-  
 106248 sign> should be removed, or another macro should be used, as in:

```
106249 INCLUDE_NAME = include
106250 $(INCLUDE_NAME) =foo.mk
```

106251 On the other hand, if the intent is to include a file which starts with an <equal-sign>, either the  
 106252 filename should be changed to ./=foo.mk, or the makefile should be written as:

```
106253 INCLUDE_FILE = =foo.mk
106254 include $(INCLUDE_FILE)
```

106255 It is important to be careful when using parallel execution (the `-j` option) and archives. If  
 106256 multiple `$(AR)` commands run at the same time on the same archive file, they will not know  
 106257 about each other and can corrupt the file. If the `-j` option is used, it is necessary to use `.WAIT` in  
 106258 between archive member prerequisites to prevent this (see EXAMPLES).

#### 106259 EXAMPLES

106260 1. The following command:

```
106261 make
```

106262 makes the first target found in the makefile.

106263 2. The following command:

```
106264 make junk
```

106265 makes the target **junk**.

106266 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in  
 106267 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

```
106268 .POSIX:
106269 pgm: a.o b.o
106270      c17 a.o b.o -o pgm
106271 a.o: incl.h a.c
106272      c17 -c a.c
106273 b.o: incl.h b.c
106274      c17 -c b.c
```

106275 4. The following is an extended version of the previous example that generates *make* include  
 106276 files containing the prerequisites for each object file. The include file also defines its own  
 106277 prerequisites, and the makefile arranges that these are used by including the file twice.  
 106278 With implementations of *make* that create include files during parsing, the first time *make*  
 106279 is run the file does not exist but the use of the <hyphen-minus> prefix on the first include  
 106280 line means it is ignored and is then generated by the rule preceding the second include  
 106281 line. On subsequent runs, if any of the source or header files previously identified has  
 106282 changed, the include file will be updated. There are other ways of updating the include  
 106283 file when headers change, but they involve recursive execution of *make*.

```

106284     .POSIX:
106285     .SUFFIXES: .c .d

106286     OFILES = a.o b.o

106287     pgm: $(OFILES)
106288         c17 $(OFILES) -o pgm
106289     a.o:
106290         c17 -c a.c
106291     b.o:
106292         c17 -c b.c

106293     -include $(OFILES:.o=.d)
106294     .c.d:
106295         +{ \
106296             set -o pipefail; cfile=$<; ofile=${cfile%.c}.o; \
106297             printf '%s %s: %s ' "$$ofile" $@ $<; \
106298             c17 -E $< | LC_ALL=C sed -n \
106299                 '/^#[[:blank:]]*[[[:digit:]]*/s/.*"\([^"]*\.\h\)"*/\1/p' | \
106300                 LC_ALL=C sort -u | tr '\n' ' '; \
106301             echo; \
106302         } > $@
106303     include $(OFILES:.o=.d)

```

This example does not cope with a header file being removed (*make* will complain that it does not know how to make it), necessitating that \*.d be removed and the *make* run again. Alternatively, this can be handled by updating the commands which generate the .d file so that they add an empty target rule for each of its prerequisites.

5. An example for making optimized .o files from .c files is:

```

106309     .c.o:
106310         c17 -c -O 1 $*.c

106311     or:

106312     .c.o:
106313         c17 -c -O 1 $<

```

6. The most common use of the archive interface follows. Here, it is assumed that the source files are all C-language source:

```

106316     lib.a: lib.a(file1.o) .WAIT lib.a(file2.o) .WAIT lib.a(file3.o)
106317         @echo lib.a is now up-to-date

```

The .c.a rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib.a**.

7. The treatment of escaped <newline> characters throughout the makefile is historical practice. For example, the inference rule:

```

106321     .c.o\
106322     :
106323     works, and the macro:

106324     f= bar baz\
106325         biz
106326     a:

```

```

106327         echo ==$f==
106328     echoes "=="bar baz biz=="
106329     If $? were:
106330     /usr/include/stdio.h /usr/include/unistd.h foo.h
106331     then $(?D) would be:
106332     /usr/include /usr/include .
106333     and $(?F) would be:
106334     stdio.h unistd.h foo.h

```

8. The contents of the built-in rules can be viewed by running:

```

106336     make -p -f /dev/null 2>/dev/null

```

9. With the following makefile, `make -j 10 all` may bring `one` and `two` up-to-date in parallel despite the `.WAIT` in the prerequisite list for `foo`. This is because the `.WAIT` does not stop `make` from recursively processing `bar` and its prerequisites in parallel. However, if only `foo` is specified (`make -j 10 foo`), `make` will wait for `one` to be brought up-to-date before bringing `two` up-to-date. Note also that the `.WAIT` does not create a prerequisite relationship between `one` and `two`, so `make -j 10 two` will not build `one`.

```

106343     all: foo bar
106344     foo: one .WAIT two
106345     bar: one two
106346     foo bar one two: ; @echo $@

```

#### 106347 RATIONALE

106348 The *make* utility described in this volume of POSIX.1-2024 is intended to provide the means for  
 106349 changing portable source code into executables that can be run on a POSIX.1-2024-conforming  
 106350 system. It reflects the most common features present in System V and BSD *makes*.

106351 Historically, the *make* utility has been an especially fertile ground for vendor and research  
 106352 organization-specific syntax modifications and extensions. Examples include:

- 106353 • Syntax supporting parallel execution (such as from various multi-processor vendors, GNU,  
 106354 and others)
- 106355 • Additional “operators” separating targets and their prerequisites (System V, BSD, and  
 106356 others)
- 106357 • Modifications of the meaning of internal macros when referencing libraries (BSD and  
 106358 others)
- 106359 • Using a single instance of the shell for all of the command lines of the target (BSD and  
 106360 others)
- 106361 • Allowing <space> characters as well as <tab> characters to delimit command lines (BSD)
- 106362 • Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and  
 106363 others)
- 106364 • Remote execution of command lines (Sprite and others)
- 106365 • Specifying additional special targets (BSD, System V, and most others)

- Specifying an alternate shell to use to process commands.

106366

106367

106368

106369

106370

106371

Additionally, many vendors and research organizations have rethought the basic concepts of *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of *make* fulfills the needs of a different community of users; it is unreasonable for this volume of POSIX.1-2024 to require behavior that would be incompatible (and probably inferior) to historical practice for such a community.

106372

106373

106374

106375

In similar circumstances, when the industry has enough sufficiently incompatible formats as to make them irreconcilable, this volume of POSIX.1-2024 has followed one or both of two courses of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line options have been provided to select the desired behavior (*grep*, *od*, and *pax*).

106376

106377

106378

106379

106380

106381

106382

106383

106384

106385

106386

106387

Because the syntax specified for the *make* utility was, by and large, a subset of the syntaxes accepted by almost all versions of *make* when the original IEEE Std 1003.2-1992 shell and utilities standard was being developed, it was decided that it would be counter-productive to change the name. And since the makefile itself is a basic unit of portability, it would not be completely effective to reserve a new option letter, such as *make -P*, to achieve the portable behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to specify “standard” behavior. This special target does not preclude extensions in the *make* utility, nor does it preclude such extensions being used by the makefile specifying the target; it does, however, preclude any extensions from being applied that could alter the behavior of previously valid syntax; such extensions must be controlled via command line options or new special targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to guarantee that they are not affected by local extensions.

106388

106389

106390

106391

106392

The portable version of *make* described in this reference page is not intended to be the state-of-the-art software generation tool and, as such, some newer and more leading-edge features have not been included. An attempt has been made to describe the portable makefile in a manner that does not preclude such extensions as long as they do not disturb the portable behavior described here.

106393

106394

When the *-n* option is specified, it is always added to *MAKEFLAGS*. This allows a recursive *make -n target* to be used to see all of the actions that would be taken to update *target*.

106395

106396

106397

The definition of *MAKEFLAGS* allows both the System V letter string and the BSD command line formats. The two formats are sufficiently different to allow implementations to support both without ambiguity.

106398

106399

106400

Early proposals stated that an “unquoted” <number-sign> was treated as the start of a comment. The *make* utility does not pay any attention to quotes. A <number-sign> starts a comment regardless of its surroundings.

106401

106402

106403

106404

106405

106406

The text about “other implementation-defined pathnames may also be tried” in addition to **./makefile** and **./Makefile** is to allow such extensions as **SCCS/s.Makefile** and other variations. It was made an implementation-defined requirement (as opposed to unspecified behavior) to highlight surprising implementations that might select something unexpected like **/etc/Makefile**. XSI-conformant systems also try **./s.makefile**, **SCCS/s.makefile**, **./s.Makefile**, and **SCCS/s.Makefile**.

106407

106408

106409

106410

106411

106412

The default rules are based on System V. The default **CC=** value is *c17* instead of *cc* because this volume of POSIX.1-2024 does not standardize the utility named *cc*. Thus, every conforming application would be required to define **CC=c17** to expect to run. There is no advantage conferred by the hope that the makefile might hit the “preferred” compiler because this cannot be guaranteed to work. Also, since the portable makescript can only use the *c17* options, no advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue

106413 as to whether *c17* is as valuable as *cc*.

106414 Implementations are permitted to include any macro of their choosing in the default set.  
 106415 However, they are encouraged to keep such additions to a minimum in order to reduce the risk  
 106416 of name clashes with user macros.

106417 Implementations are encouraged to provide, as an extension, a command-line option that causes  
 106418 *make* to report attempts to expand (or append to) macros that do not exist. See APPLICATION  
 106419 USAGE for the intended use cases of such an option.

106420 The `-d` option to *make* is frequently used to produce debugging information, but is too  
 106421 implementation-defined to add to this volume of POSIX.1-2024.

106422 The `-p` option is not passed in *MAKEFLAGS* on most historical implementations and to change  
 106423 this would cause many implementations to break without sufficiently increased portability.

106424 Commands that begin with a <plus-sign> ('+') are executed even if the `-n` option is present.  
 106425 Based on the GNU version of *make*, the behavior of `-n` when the <plus-sign> prefix is  
 106426 encountered has been extended to apply to `-q` and `-t` as well. The System V convention of  
 106427 forcing command execution with `-n` when the command line of a target expands the *MAKE*  
 106428 macro was not adopted in earlier versions of this standard, but it is now required because it has  
 106429 become widespread existing practice.

106430 The double <colon> in the target rule format is supported in BSD systems to allow more than  
 106431 one target line containing the same target name to have commands associated with it. Since this  
 106432 is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not  
 106433 mandated.

106434 The default rules are provided with text specifying that the built-in rules shall be the same as if  
 106435 the listed set were used. The intent is that implementations should be able to use the rules  
 106436 without change, but will be allowed to alter them in ways that do not affect the primary  
 106437 behavior.

106438 One point of discussion was whether to drop the default rules list from this volume of  
 106439 POSIX.1-2024. They provide convenience, but do not enhance portability of applications. The  
 106440 prime benefit is in portability of users who wish to type *make command* and have the command  
 106441 build from a **command.c** file.

106442 The historical *MAKESHELL* feature, and related features provided by other *make*  
 106443 implementations, were omitted. In some implementations it is used to let a user override the  
 106444 shell to be used to run *make* commands. This was confusing; for a portable *make*, the shell  
 106445 should be chosen by the makefile writer. Further, a makefile writer cannot require an alternate shell  
 106446 to be used and still consider the makefile portable. While it would be possible to standardize a  
 106447 mechanism for specifying an alternate shell, existing implementations do not agree on such a  
 106448 mechanism, and makefile writers can already invoke an alternate shell by specifying the shell  
 106449 name in the rule for a target; for example:

```
106450 python -c "foo"
```

106451 The *make* utilities in most historical implementations process the prerequisites of a target in left-  
 106452 to-right order, and the makefile format requires this. It supports the standard idiom used in  
 106453 many makefiles that produce *yacc* programs; for example:

```
106454 foo: y.tab.o lex.o main.o
106455      $(CC) $(CFLAGS) -o $@ y.tab.o lex.o main.o
```

106456 In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct  
 106457 **y.tab.h**. Although there may be better ways to express this relationship, it is widely used

106458 historically. Implementations that desire to update prerequisites in parallel should require an  
106459 explicit extension to *make* or the makefile format to accomplish it, as described previously.

106460 The algorithm for determining a new entry for target rules is partially unspecified. Some  
106461 historical *makes* allow comment lines (including blank and empty lines) within the collection of  
106462 commands marked by leading <tab> characters. A conforming makefile must ensure that each  
106463 command starts with a <tab>, but implementations are free to ignore comments without  
106464 triggering the start of a new entry.

106465 The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with  
106466 the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do  
106467 so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned  
106468 up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it  
106469 is required to resend itself the signal it received so that it exits with a status that reflects the  
106470 signal. The results from SIGQUIT are partially unspecified because, on systems that create a file  
106471 named **core** upon receipt of SIGQUIT, the **core** file from *make* would conflict with a **core** file from  
106472 the command that was running when the SIGQUIT arrived. The main concern was to prevent  
106473 damaged files from appearing up-to-date when *make* is rerun.

106474 The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no  
106475 prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites;  
106476 it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of  
106477 targets than for the entire makefile. These extensions to *make* in System V were made to match  
106478 historical practice from the BSD *make*.

106479 Macros are not exported to the environment of commands to be run. This was never the case in  
106480 any historical *make* and would have serious consequences. The environment is the same as the  
106481 environment to *make* except that **MAKEFLAGS** and macros defined on the *make* command line  
106482 are added, and except that macros defined by the **MAKEFLAGS** environment variable and  
106483 macros defined in the makefile(s) may update the value of an existing environment variable  
106484 (other than **SHELL**).

106485 Some implementations do not use *system()* for all command lines, as required by the portable  
106486 makefile format; as a performance enhancement, they select lines without shell metacharacters  
106487 for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but  
106488 merely that the same results be achieved. The metacharacters typically used to bypass the direct  
106489 *execve()* execution have been any of:

106490 = | ^ ( ) ; & < > \* ? [ ] : \$ ` ' " \ \n

106491 The default in some advanced versions of *make* is to group all the command lines for a target and  
106492 execute them using a single shell invocation; the System V method is to pass each line  
106493 individually to a separate shell. The single-shell method has the advantages in performance and  
106494 the lack of a requirement for many continued lines. However, converting to this newer method  
106495 has caused portability problems with many historical makefiles, so the behavior with the POSIX  
106496 makefile is specified to be the same as that of System V. It is suggested that the special target  
106497 **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a  
106498 target or group of targets.

106499 Novice users of *make* have had difficulty with the historical need to start commands with a  
106500 <tab>. Since it is often difficult to discern differences between <tab> and <space> characters on  
106501 terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made  
106502 to correct this problem by allowing leading <blank> characters instead of <tab> characters.  
106503 However, implementors reported many makefiles that failed in subtle ways following this  
106504 change, and it is difficult to implement a *make* that unambiguously can differentiate between  
106505 macro and command lines. There is extensive historical practice of allowing leading <space>

106506 characters before macro definitions. Forcing macro lines into column 1 would be a significant  
106507 backwards-compatibility problem for some makefiles. Therefore, historical practice was  
106508 restored.

106509 There is substantial variation in the handling of include lines by different implementations.  
106510 However, there is enough commonality for the standard to be able to specify a minimum set of  
106511 requirements that allow the feature to be used portably. Known variations have been explicitly  
106512 called out as unspecified behavior in the description.

106513 The System V dynamic dependency feature was not included. It would support:

106514 `cat: $$@.c`

106515 that would expand to;

106516 `cat: cat.c`

106517 This feature exists only in the new version of System V *make* and, while useful, is not in wide  
106518 usage. This means that macros are expanded twice for prerequisites: once at makefile parse time  
106519 and once at target update time.

106520 Consideration was given to adding metarules to the POSIX *make*. This would make `%.o: %.c` the  
106521 same as `.c.o:`. This is quite useful and available from some vendors, but it would cause too many  
106522 changes to this *make* to support. It would have introduced rule chaining and new substitution  
106523 rules. However, the rules for target names have been set to reserve the `'%'` and `'\"'` characters.  
106524 These are traditionally used to implement metarules and quoting of target names, respectively.  
106525 Implementors are strongly encouraged to use these characters only for these purposes.

106526 A request was made to extend the suffix delimiter character from a `<period>` to any character.  
106527 The metarules feature in newer *makes* solves this problem in a more general way. This volume of  
106528 POSIX.1-2024 is staying with the more conservative historical definition.

106529 The standard output format for the `-p` option is not described because it is primarily a  
106530 debugging option and because the format is not generally useful to programs. In historical  
106531 implementations the output is not suitable for use in generating makefiles. The `-p` format has  
106532 been variable across historical implementations. Therefore, the definition of `-p` was only to  
106533 provide a consistently named option for obtaining *make* script debugging information.

106534 Some historical implementations have not cleared the suffix list with `-r`.

106535 Implementations should be aware that some historical applications have intermixed *target\_name*  
106536 and *macro=value* operands on the command line, expecting that all of the macros are processed  
106537 before any of the targets are dealt with. Conforming applications do not do this, but some  
106538 backwards-compatibility support may be warranted.

106539 Empty inference rules are specified with a `<semicolon>` command rather than omitting all  
106540 commands, as described in an early proposal. The latter case has no traditional meaning and is  
106541 reserved for implementation extensions, such as in GNU *make*.

106542 Earlier versions of this standard defined comment lines only as lines with `'#'` as the first  
106543 character. Many places then talked about comments, blank lines, and empty lines; but some  
106544 places inadvertently only mentioned comments when blank lines and empty lines had also been  
106545 accepted in all known implementations. The standard now defines comment lines to be blank  
106546 lines, empty lines, and lines starting with a `'#'` character and explicitly lists cases where blank  
106547 lines and empty lines are not acceptable.

106548 On most historic systems, the *make* utility considered a target with a prerequisite that had an  
106549 identical timestamp as up-to-date. One implementation of *make* treated it as out-of-date. Note  
106550 that up-to-date and out-of-date are antonyms. The standard now allows either behavior, but

106551 implementations are encouraged to treat such targets as out-of-date. This is especially important  
 106552 on file systems where the timestamp resolution is the minimum (1 second) required by the  
 106553 standard. All implementations of *make* should make full use of the finest timestamp resolution  
 106554 available on the file systems holding targets and prerequisites to ensure that targets are up-to-  
 106555 date even for prerequisite files with timestamps that were updated within the same second.  
 106556 However, if the timestamp resolutions of the file systems containing a target and a prerequisite  
 106557 are different, the timestamp with the more precise resolution should be rounded down to the  
 106558 resolution of the less precise timestamp for the comparison.

106559 The traditional semantics of delayed-expansion macros have often been the source of subtle  
 106560 bugs for makefile writers not aware of those semantics. Furthermore, in implementations that  
 106561 support an extension of assigning the output of an arbitrary command to a macro definition, the  
 106562 use of delayed-expansion macros could result in an undesirable growth in execution time, as  
 106563 each use of the macro would re-run the arbitrary command. Historically, several  
 106564 implementations independently developed a form of immediate expansion, usually via the  
 106565 operator `:=`, so that execution of an arbitrary command happens once at the definition of the  
 106566 macro rather than each use of the macro; however, there are subtle differences in the expansion  
 106567 rules of those various implementations when the expanded value of *string2* contained a '\$'.  
 106568 Other implementations used the operator `:=` for conditional expansion, altogether unrelated  
 106569 to immediate-expansion macro definition.

106570 The standard developers felt that immediate-expansion semantics were useful enough to  
 106571 standardize, but requiring the semantics of any one implementation of `:=` would cause  
 106572 confusion in makefiles written for other implementation semantics, necessitating a reader to  
 106573 determine if `.POSIX:` had been specified at the beginning of the file (or worse, at the beginning  
 106574 of some other file that then includes the fragment in question) to know which semantics would  
 106575 be in use. Therefore, the standard developers opted to require two new operators, `:=` and  
 106576 `::=`, with specific semantics; the `::=` operator has semantics closest to the GNU *make*  
 106577 implementation of `:=`, where '\$' characters occurring in the immediate expansion of *string2*  
 106578 are not further expanded in subsequent use of the macro, and the `::=` operator has  
 106579 semantics closest to the BSD *make* and *smake* implementations of `:=`, where immediate  
 106580 expansion is performed when assigning to a delayed-expansion macro and '\$\$' is preserved. It  
 106581 was felt that other implementations could easily support the required semantics.

106582 Implementations that previously provided `:=` as an extension are encouraged to leave this  
 106583 extension intact, with no change in the implementation's particular semantics, to avoid breaking  
 106584 non-portable makefiles that had been targeting that particular implementation. A portable  
 106585 makefile, with `.POSIX:` specified at the beginning, should not use the `:=` operator.

106586 Traditionally, constructs such as

```
106587 DIR: FORCE
106588     (commands)
106589 FORCE:
```

106590 were used to allow `make DIR` to always run `(commands)`; however, this depended on the user  
 106591 never creating a file named **FORCE**. The addition of the **.PHONY** special target provides a more  
 106592 efficient manner of providing a target whose commands are always run, and where the user  
 106593 cannot create a file that influences the behavior in an unexpected manner.

106594 This standard allows two different methods of creating include files or bringing them up-to-  
 106595 date, reflecting established practice in SunPro *make* and GNU *make*. The former performs this  
 106596 action during parsing, before the include file is opened. The latter delays performing the action  
 106597 until after all makefiles have been read. Implementors who opt for the "delayed remaking"  
 106598 method should be aware of the following potential issues:

- 106599 • Diagnostic messages about missing include files must be deferred until the final exit status  
106600 is known. Note that this is a conformance issue, not just a quality of implementation issue.
- 106601 • If the way *make* handles using updated include file contents is to start over after include  
106602 files have been made up-to-date, it is possible for a poorly written makefile to cause *make*  
106603 to enter a sequence of restarts where nothing changes each time, resulting in the sequence  
106604 continuing indefinitely unless the situation is detected. Implementors are encouraged to  
106605 include a mechanism for detecting and reporting this, rather than allowing *make* to  
106606 consume an arbitrary amount of system resource until it is forcibly terminated.
- 106607 • If *make* uses this start-over method, makefile contents read from a pipe on standard input  
106608 or from a FIFO must be copied to a temporary file, and when *make* starts over it must use  
106609 this file instead.
- 106610 • If *make* starts over by executing itself using the *exec* family of functions, the need to replace  
106611 ' - ' or the pathnames of FIFOs with the pathnames of temporary files can lead to the *exec*  
106612 call failing with an [E2BIG] error if the original execution was close to the {ARG\_MAX}  
106613 limit. Although this is a quality of implementation issue, not a conformance issue (since  
106614 the general rules for utility errors allow utilities to fail when they encounter a variety of  
106615 internal errors - see Section 1.4, on page 2462), implementors are encouraged to explore  
106616 ways to prevent it, such as passing information via a temporary file instead of on the  
106617 command line when an [E2BIG] error has occurred. Another solution might be to jump  
106618 (e.g. using *siglongjmp()*) back to the start of *main()* as the way to start over. Making a  
106619 recursive call to *main()* is not recommended, as that would run into the stack limit if  
106620 sufficiently many restarts are needed.

106621 This standard specifies that a non-existent include file is first created if possible, and only if not  
106622 possible can other directories be searched. Historical versions of GNU *make* first searched the  
106623 include directories, then attempted to create the include file. This behavior was not considered  
106624 suitable for standardization as it means writers of portable applications have to use absolute  
106625 pathnames for all include files that need to be created via a rule (because they can never be sure  
106626 what relative pathnames are safe to use, since a file with the same relative pathname might  
106627 happen to exist in one of the searched directories when installing the application on a new  
106628 system). Note, however, that this only applies to directories searched by default. If an  
106629 application uses an extension to specify that one or more directories are searched, this standard  
106630 does not place any constraints on when the specified directories are searched.

106631 This standard specifies a way for portable applications to request parallel updating of targets  
106632 with commands by using the `-j maxjobs` option. This feature is described in terms of a token pool  
106633 initially containing up to `maxjobs - 1` tokens. Note that this is not intended to prescribe a  
106634 particular implementation design; the usual "as if" rule applies.

106635 Implementations are permitted to silently limit the pool size for a few reasons, including:

- 106636 • Implementations that do not support parallelism can support the `-j` option by simply  
106637 ignoring the option (other than passing it to *sub-make* invocations via the `MAKEFLAGS`  
106638 environment variable). In effect, such an implementation silently restricts the size of the  
106639 token pool to zero (and therefore need not create a token pool).
- 106640 • Some historical implementations dynamically limit the token pool size based on the  
106641 current system load to avoid overloading the system.
- 106642 • Implementations may want to limit the token pool size based on the number of processors  
106643 available.

106644 • Implementations may want to limit the token pool size based on resource limits.

106645 Limiting the pool size does not change the value of *maxjobs* that is passed to sub-*make*  
106646 invocations via the *MAKEFLAGS* environment variable.

106647 When a different *maxjobs* value is passed to a sub-*make*, some historical *make* implementations  
106648 created a separate pool of tokens while other historical *make* implementations continued to  
106649 obtain tokens from the invoking *make* but limited the number of tokens held at a time to the new  
106650 value of *maxjobs* – 1. Both behaviors are believed to have merit in different situations: the former  
106651 gives a sub-*make* complete control the amount of parallelism, while the latter allows the user to  
106652 control the overall system load. This standard permits either behavior.

106653 This standard calls for a token pool of size *maxjobs* – 1, and for removal from that pool only for  
106654 the second and subsequent tasks in a set of parallel tasks. This design was chosen because this is  
106655 effectively what existing implementations do, and also because the token consumed by a parallel  
106656 task that invokes a sub-*make* is effectively lent to the sub-*make*. Lending the token to the sub-  
106657 *make* has the following advantages:

106658 • It prevents the sub-*make* from being completely idle due to token starvation, allowing it to  
106659 always make some progress regardless of how many tokens other sub-*make* invocations  
106660 have consumed.

106661 • It prevents token pool exhaustion caused by a long chain of sub-*make* invocations. If the  
106662 token consumed by the invoking rule was not effectively lent to the sub-*make*, then the  
106663 pool would be exhausted by a chain of sub-*make* invocations that is *maxjobs* long. Such a  
106664 chain would never accomplish any work, and would thus never complete.

106665 When a rule invokes multiple sub-*make* processes asynchronously (for example by using an  
106666 asynchronous list in the shell), some implementations allow each sub-*make* to execute at least  
106667 one rule even though this would cause the total number of parallel rule executions across all  
106668 *make* instances to exceed *maxjobs* (after discounting the rules that execute sub-*make* processes).  
106669 This behavior may not be ideal, but it is easier to implement and is unlikely to cause problems in  
106670 practice because applications typically do not have any rules that invoke multiple sub-*make*  
106671 processes asynchronously. For this reason the behavior is unspecified if a rule executes multiple  
106672 sub-*make* processes asynchronously.

106673 When multiple sub-*make* processes are running in parallel there is no requirement placed on the  
106674 ordering of output from these processes. Some implementations of *make* attempt to serialize  
106675 output from each sub-*make*; others make no such attempt. If diagnostic messages from failed  
106676 commands are intermixed, the usual way to deal with this is to repeat the *make* without *-j* (or  
106677 with *-j 1*) so that intermixing will not occur.

#### 106678 FUTURE DIRECTIONS

106679 If this utility is directed to create a new directory entry that contains any bytes that have the  
106680 encoded value of a <newline> character, implementations are encouraged to treat this as an  
106681 error. A future version of this standard may require implementations to treat this as an error.

106682 Some implementations of *make* include an *export* directive to add specified *make* variables to the  
106683 environment. This may be considered for standardization in a future version.

106684 A future version of this standard may add a command-line option that causes *make* to report  
106685 attempts to expand (or append to) macros that do not exist.

106686 A future version of this standard may require that a target with a prerequisite with an identical  
106687 timestamp is considered out-of-date.

106692 **CHANGE HISTORY**

- 106693 First released in Issue 2.

106694 **Issue 5**

- 106695 The FUTURE DIRECTIONS section is added.

106696 **Issue 6**

- 106697 This utility is marked as part of the Software Development Utilities option.
- 106698 The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the  
106699 SPECIAL TARGETS section.
- 106700 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
106701 ``otherwise, the home directory of a user of that name is examined'' to ``otherwise, the value of  
106702 *PROJECTDIR* is treated as a user name and that user's initial working directory is examined''.
- 106703 It is specified whether the command line is related to the makefile or to the *make* command, and  
106704 the macro processing rules are updated to align with the IEEE P1003.2b draft standard.
- 106705 The normative text is reworded to avoid use of the term ``must'' for application requirements.
- 106706 PASC Interpretation 1003.2 #193 is applied.

106707 **Issue 7**

- 106708 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
106709 apply.
- 106710 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 106711 Include lines in makefiles are introduced.
- 106712 Austin Group Interpretation 1003.1-2001 #131 is applied, changing the **Makefile Execution**  
106713 section.
- 106714 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0121 [257] is applied.
- 106715 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0122 [509], XCU/TC2-2008/0123  
106716 [584], XCU/TC2-2008/0124 [857], XCU/TC2-2008/0125 [505], XCU/TC2-2008/0126 [584],  
106717 XCU/TC2-2008/0127 [505], XCU/TC2-2008/0128 [865], XCU/TC2-2008/0129 [693],  
106718 XCU/TC2-2008/0130 [602], XCU/TC2-2008/0131 [848], XCU/TC2-2008/0132 [763],  
106719 XCU/TC2-2008/0133 [857], XCU/TC2-2008/0134 [866], XCU/TC2-2008/0135 [525],  
106720 XCU/TC2-2008/0136 [848], XCU/TC2-2008/0137 [769], XCU/TC2-2008/0138 [525],  
106721 XCU/TC2-2008/0139 [769], XCU/TC2-2008/0140 [505], XCU/TC2-2008/0141 [693],  
106722 XCU/TC2-2008/0142 [505], XCU/TC2-2008/0143 [857], and XCU/TC2-2008/0144 [693,865] are  
106723 applied.

106724 **Issue 8**

- 106725 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
106726 filenames containing any bytes that have the encoded value of a <newline> character.
- 106727 Austin Group Defects 330, 1417, 1422, 1709, and 1710 are applied, adding new forms of macro  
106728 assignment using the " := ", " ?=", and "+=" operators.
- 106729 Austin Group Defect 333 is applied, adding support for ``silent includes'' using **-include**.

- 106730 Austin Group Defects 336 and 1711 are applied, specifying the behavior when *string1* in a macro expansion contains a macro expansion.  
106731
- 106732 Austin Group Defect 337 is applied, adding a new form of macro assignment using the "!=" operator.  
106733
- 106734 Austin Group Defects 373 and 1417 are applied, changing the set of characters that portable applications can use in macro names to the entire portable filename character set (thus adding <hyphen-minus> to the set that could previously be used).  
106735  
106736
- 106737 Austin Group Defects 514 and 1520 are applied, adding the \$+ and \$^ internal macros.
- 106738 Austin Group Defect 518 is applied, allowing multiple files to be specified on an **include** line.
- 106739 Austin Group Defects 519, 1712, and 1715 are applied, adding support for pattern macro expansions.  
106740
- 106741 Austin Group Defects 523, 1708, and 1749 are applied, adding the **.PHONY** special target.
- 106742 Austin Group Defect 875 is applied, clarifying the requirements for inference rules.
- 106743 Austin Group Defect 1104 is applied, changing ``s2.a'' to ``.s2.a''.
- 106744 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 106745 Austin Group Defect 1141 is applied, changing ``core files'' to ``a file named core''.
- 106746 Austin Group Defect 1155 is applied, clarifying the handling of the *MAKE* macro.
- 106747 Austin Group Defect 1325 is applied, adding requirements relating to the creation of include files.  
106748
- 106749 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 106750 Austin Group Defect 1419 is applied, updating the **.SCCS\_GET** default rule.
- 106751 Austin Group Defect 1420 is applied, clarifying where internal macros can be used.
- 106752 Austin Group Defect 1421 is applied, changing the APPLICATION USAGE section.
- 106753 Austin Group Defects 1424, 1658, 1690, 1701, 1702, 1703, 1704, 1707, 1719, 1720, 1721, 1722, and 1750 are applied, making various minor editorial wording changes.  
106754
- 106755 Austin Group Defects 1436, 1437, 1652, 1660, 1661, and 1733 are applied, adding the **-j maxjobs** option and the **.NOTPARALLEL** and **.WAIT** special targets, and changing the **-n** option.  
106756
- 106757 Austin Group Defects 1471 and 1513 are applied, adding a new form of macro assignment using the " : : =" operator.  
106758
- 106759 Austin Group Defect 1479 is applied, clarifying the requirements for default rules and macro values.  
106760
- 106761 Austin Group Defect 1492 is applied, changing the EXIT STATUS section.
- 106762 Austin Group Defect 1505 is applied, clarifying the requirements for expansion of macros that do not exist.  
106763
- 106764 Austin Group Defect 1510 is applied, correcting a typographic error in the RATIONALE section.
- 106765 Austin Group Defect 1549 is applied, clarifying the requirements for an escaped <newline> in a command line.  
106766
- 106767 Austin Group Defect 1615 is applied, allowing target names to contain slashes and hyphens.
- 106768 Austin Group Defect 1626 is applied, adding the *CURDIR* macro.

- 106769 Austin Group Defect 1631 is applied, adding information about use of the `-j` option with the `.ca`  
106770 default rule to the APPLICATION USAGE and EXAMPLES sections.
- 106771 Austin Group Defect 1650 is applied, changing the few occurrences of “dependencies” to use the  
106772 more common “prerequisites”.
- 106773 Austin Group Defect 1653 is applied, clarifying the difference between how `MAKEFLAGS` is  
106774 parsed compared to shell commands that use the `make` utility.
- 106775 Austin Group Defects 1654 and 1655 are applied, changing the APPLICATION USAGE section.
- 106776 Austin Group Defect 1656 is applied, changing the NAME section.
- 106777 Austin Group Defect 1657 is applied, moving some requirements unrelated to makefile syntax  
106778 from the Makefile Syntax subsection to the beginning of the EXTENDED DESCRIPTION section.
- 106779 Austin Group Defect 1689 is applied, removing some redundant wording from the  
106780 DESCRIPTION section.
- 106781 Austin Group Defect 1692 is applied, allowing `make`, when invoked with the `-q` or `-t` option, to  
106782 execute command lines (without a `<plus-sign>` prefix) that expand the `MAKE` macro.
- 106783 Austin Group Defect 1693 is applied, changing “command lines” to “execution lines” in the  
106784 description of the `-s` option.
- 106785 Austin Group Defect 1694 is applied, changing “in the order they appear” to “in the order  
106786 specified” in the OPERANDS section.
- 106787 Austin Group Defect 1696 is applied, changing the STDOUT section.
- 106788 Austin Group Defect 1697 is applied, changing the RATIONALE and FUTURE DIRECTIONS  
106789 sections.
- 106790 Austin Group Defect 1698 is applied, changing “of a target” to “of the target” in the EXTENDED  
106791 DESCRIPTION section.
- 106792 Austin Group Defect 1699 is applied, addressing some inconsistencies in the use of the term  
106793 “rules”.
- 106794 Austin Group Defect 1706 is applied, removing a line from the format specified for target rules.
- 106795 Austin Group Defect 1714 is applied, changing “beginning of the line” to “beginning of the  
106796 value”.
- 106797 Austin Group Defect 1716 is applied, changing the typographic convention used for variable  
106798 elements within target names, in particular the inference rule suffixes `s1` and `s2`.
- 106799 Austin Group Defect 1723 is applied, adding historical context to a paragraph in the  
106800 RATIONALE section.
- 106801 Austin Group Defect 1772 is applied, clarifying the ASYNCHRONOUS EVENTS section.

106802 **NAME**

106803 man — display system documentation

106804 **SYNOPSIS**106805 UP `man [-k] name...`106806 **DESCRIPTION**

106807 The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 106808 standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 106809 standard utility, its options, operands, environment variables affecting its execution, and its list  
 106810 of exit status codes. If more information is available, the *man* utility shall provide it in an  
 106811 implementation-defined manner.

106812 An implementation may provide information for values of *name* other than the standard utilities.  
 106813 Standard utilities that are listed as optional and that are not supported by the implementation  
 106814 either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 106815 of information as described previously.

106816 **OPTIONS**106817 The *man* utility shall conform to XBD [Section 12.2](#) (on page 215).

106818 The following option shall be supported:

106819 **-k** Interpret *name* operands as keywords to be used in searching a utilities summary  
 106820 database that contains a brief purpose entry for each standard utility and write lines  
 106821 from the summary database that match any of the keywords. The keyword search shall  
 106822 produce results that are the equivalent of the output of the following command:

```
106823 grep -Ei '
106824 name
106825 name
106826 ...
106827 ' summary-database
```

106828 This assumes that the *summary-database* is a text file with a single entry per line; this  
 106829 organization is not required and the example using *grep -Ei* is merely illustrative of the  
 106830 type of search intended. The purpose entry to be included in the database shall consist  
 106831 of a terse description of the purpose of the utility.

106832 **OPERANDS**

106833 The following operand shall be supported:

106834 *name* A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 106835 does not represent one of the standard utilities, the results are unspecified.

106836 **STDIN**

106837 Not used.

106838 **INPUT FILES**

106839 None.

106840 **ENVIRONMENT VARIABLES**106841 The following environment variables shall affect the execution of *man*:

106842 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106843 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 106844 variables used to determine the values of locale categories.)

- 106845 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106846 internationalization variables.
- 106847 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106848 characters (for example, single-byte as opposed to multi-byte characters in  
106849 arguments and in the summary database). The value of *LC\_CTYPE* need not affect  
106850 the format of the information written about the *name* operands.
- 106851 *LC\_MESSAGES*  
106852 Determine the locale that should be used to affect the format and contents of  
106853 diagnostic messages written to standard error and informative messages written to  
106854 standard output.
- 106855 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 106856 *PAGER* Determine an output filtering command for writing the output to a terminal. Any  
106857 string acceptable as a *command\_string* operand to the *sh -c* command shall be valid.  
106858 When standard output is a terminal device, the reference page output shall be  
106859 piped through the command. If the *PAGER* variable is null or not set, the command  
106860 shall be either *more* or another paginator utility documented in the system  
106861 documentation.
- 106862 **ASYNCHRONOUS EVENTS**  
106863 Default.
- 106864 **STDOUT**  
106865 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
106866 operands, or, when *-k* is specified, lines from the summary database. The format of this text is  
106867 implementation-defined.
- 106868 **STDERR**  
106869 The standard error shall be used for diagnostic messages, and may also be used for  
106870 informational messages of unspecified format.
- 106871 **OUTPUT FILES**  
106872 None.
- 106873 **EXTENDED DESCRIPTION**  
106874 None.
- 106875 **EXIT STATUS**  
106876 The following exit values shall be returned:  
106877 0 Successful completion.  
106878 >0 An error occurred.
- 106879 **CONSEQUENCES OF ERRORS**  
106880 Default.

106881 **APPLICATION USAGE**

106882 None.

106883 **EXAMPLES**

106884 None.

106885 **RATIONALE**

106886 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 106887 standard developers was strongly divided as to how much or how little information *man* should  
 106888 be required to provide. They considered, however, that the provision of some portable way of  
 106889 accessing documentation would aid user portability. The arguments against a fuller specification  
 106890 were:

- 106891 • Large quantities of documentation should not be required on a system that does not have  
 106892 excess disk space.
- 106893 • The current manual system does not present information in a manner that greatly aids user  
 106894 portability.
- 106895 • A “better help system” is currently an area in which vendors feel that they can add value  
 106896 to their POSIX implementations.

106897 The `-f` option was considered, but due to implementation differences, it was not included in this  
 106898 volume of POSIX.1-2024.

106899 The description was changed to be more specific about what has to be displayed for a utility. The  
 106900 standard developers considered it insufficient to allow a display of only the synopsis without  
 106901 giving a short description of what each option and operand does.

106902 The “purpose” entry to be included in the database can be similar to the section title (less the  
 106903 numeric prefix) from this volume of POSIX.1-2024 for each utility. These titles are similar to  
 106904 those used in historical systems for this purpose.

106905 See *mailx* for rationale concerning the default paginator.

106906 The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an  
 106907 implementation provide reference pages for all of its supported locales on each system;  
 106908 changing *LC\_CTYPE* does not necessarily translate the reference page into another language.  
 106909 This is equivalent to the current state of *LC\_MESSAGES* in POSIX.1-2024—locale-specific  
 106910 messages are not yet a requirement.

106911 The historical *MANPATH* variable is not included in POSIX because no attempt is made to  
 106912 specify naming conventions for reference page files, nor even to mandate that they are files at  
 106913 all. On some implementations they could be a true database, a hypertext file, or even fixed  
 106914 strings within the *man* executable. The standard developers considered the portability of  
 106915 reference pages to be outside their scope of work. However, users should be aware that  
 106916 *MANPATH* is implemented on a number of historical systems and that it can be used to tailor  
 106917 the search pattern for reference pages from the various categories (utilities, functions, file  
 106918 formats, and so on) when the system administrator reveals the location and conventions for  
 106919 reference pages on the system.

106920 The keyword search can rely on at least the text of the section titles from these utility  
 106921 descriptions, and the implementation may add more keywords. The term “section titles” refers  
 106922 to the strings such as:

106923 `man` – Display system documentation  
 106924 `ps` – Report process status

**106925 FUTURE DIRECTIONS**

106926 If this utility is directed to display a pathname that contains any bytes that have the encoded  
106927 value of a <newline> character when <newline> is a terminator or separator in the output  
106928 format being used, implementations are encouraged to treat this as an error. A future version of  
106929 this standard may require implementations to treat this as an error.

**106930 SEE ALSO**

106931 *more*

106932 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**106933 CHANGE HISTORY**

106934 First released in Issue 4.

**106935 Issue 5**

106936 The FUTURE DIRECTIONS section is added.

**106937 Issue 7**

106938 Austin Group Interpretation 1003.1-2001 #108 is applied, clarifying that informational messages  
106939 may appear on standard error.

**106940 Issue 8**

106941 Austin Group Defect 190 is applied, marking the *man* utility as part of the User Portability  
106942 Utilities option, and adding a requirement for the message it writes for a standard utility to  
106943 include the environment variables affecting its execution and its list of exit status codes.

106944 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
106945 directed to display a pathname that contains any bytes that have the encoded value of a  
106946 <newline> character when <newline> is a terminator or separator in the output format being  
106947 used.

106948 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

106949 **NAME**

106950 mesg — permit or deny messages

106951 **SYNOPSIS**106952 mesg [*y* | *n*]106953 **DESCRIPTION**

106954 The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 106955 other utilities to a terminal device. The terminal device affected shall be determined by searching  
 106956 for the first terminal in the sequence of devices associated with standard input, standard output,  
 106957 and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 106958 changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 106959 independent of the current state.

106960 **OPTIONS**

106961 None.

106962 **OPERANDS**

106963 The following operands shall be supported in the POSIX locale:

106964 *y* Grant permission to other users to send messages to the terminal device.106965 *n* Deny permission to other users to send messages to the terminal device.106966 **STDIN**

106967 Not used.

106968 **INPUT FILES**

106969 None.

106970 **ENVIRONMENT VARIABLES**106971 The following environment variables shall affect the execution of *mesg*:

106972 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106973 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 106974 variables used to determine the values of locale categories.)

106975 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106976 internationalization variables.

106977 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106978 characters (for example, single-byte as opposed to multi-byte characters in  
 106979 arguments).

106980 *LC\_MESSAGES*

106981 Determine the locale that should be used to affect the format and contents of  
 106982 diagnostic messages written (by *mesg*) to standard error.

106983 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.106984 **ASYNCHRONOUS EVENTS**

106985 Default.

106986 **STDOUT**106987 If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.106988 **STDERR**

106989 The standard error shall be used only for diagnostic messages.

106990 **OUTPUT FILES**

106991 None.

106992 **EXTENDED DESCRIPTION**

106993 None.

106994 **EXIT STATUS**

106995 The following exit values shall be returned:

106996 0 Receiving messages is allowed.

106997 1 Receiving messages is not allowed.

106998 &gt;1 An error occurred.

106999 **CONSEQUENCES OF ERRORS**

107000 Default.

107001 **APPLICATION USAGE**

107002 The mechanism by which the message status of the terminal is changed is unspecified.  
107003 Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has  
107004 successfully completed. These actions may include, but are not limited to: another invocation of  
107005 the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or  
107006 *chmod()* function, and so on.

107007 **EXAMPLES**

107008 None.

107009 **RATIONALE**

107010 The terminal changed by *mesg* is that associated with the standard input, output, or error, rather  
107011 than the controlling terminal for the session. This is because users logged in more than once  
107012 should be able to change any of their login terminals without having to stop the job running in  
107013 those sessions. This is not a security problem involving the terminals of other users because  
107014 appropriate privileges would be required to affect the terminal of another user.

107015 The method of checking each of the first three file descriptors in sequence until a terminal is  
107016 found was adopted from System V.

107017 The file */dev/tty* is not specified for the terminal device because it was thought to be too  
107018 restrictive. Typical environment changes for the *n* operand are that write permissions are  
107019 removed for *others* and *group* from the appropriate device. It was decided to leave the actual  
107020 description of what is done as unspecified because of potential differences between  
107021 implementations.

107022 The format for standard output is unspecified because of differences between historical  
107023 implementations. This output is generally not useful to shell scripts (they can use the exit status),  
107024 so exact parsing of the output is unnecessary.

107025 **FUTURE DIRECTIONS**

107026 None.

107027 **SEE ALSO**107028 *talk*, *write*107029 [XBD Chapter 8](#) (on page 167)

107030 **CHANGE HISTORY**

107031 First released in Issue 2.

107032 **Issue 6**

107033 This utility is marked as part of the User Portability Utilities option.

107034 **Issue 7**

107035 The *msg* utility is moved from the User Portability Utilities option to the Base. User Portability  
107036 Utilities is now an option for interactive utilities.

107037 **Issue 8**

107038 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

107039 **NAME**

107040 mkdir — make directories

107041 **SYNOPSIS**107042 mkdir [-p] [-m *mode*] *dir*...107043 **DESCRIPTION**107044 The *mkdir* utility shall create the directories specified by the operands, in the order specified.107045 For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function  
107046 defined in the System Interfaces volume of POSIX.1-2024, called with the following arguments:

- 107047 1. The *dir* operand is used as the *path* argument.
- 107048 2. The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO is used as  
107049 the *mode* argument. (If the **-m** option is specified, the value of the *mkdir()* *mode* argument  
107050 is unspecified, but the directory shall at no time have permissions less restrictive than the  
107051 **-m mode** option-argument.)

107052 **OPTIONS**107053 The *mkdir* utility shall conform to XBD [Section 12.2](#) (on page 215).

107054 The following options shall be supported:

107055 **-m mode** Set the file permission bits of the newly-created directory to the specified *mode*  
107056 value. The *mode* option-argument shall be the same as the *mode* operand defined  
107057 for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-'  
107058 shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add  
107059 permissions to the default mode, '-' shall delete permissions from the default  
107060 mode.

107061 **-p** Create any missing intermediate pathname components.

107062 For each *dir* operand that does not name an existing directory, before performing  
107063 the actions described in the DESCRIPTION above, the *mkdir* utility shall create any  
107064 pathname components of the path prefix of *dir* that do not name an existing  
107065 directory by performing actions equivalent to first calling the *mkdir()* function with  
107066 the following arguments:

- 107067 1. A pathname naming the missing pathname component, ending with a  
107068 trailing <slash> character, as the *path* argument
- 107069 2. The value zero as the *mode* argument

107070 and then calling the *chmod()* function with the following arguments:

- 107071 1. The same *path* argument as in the *mkdir()* call
- 107072 2. The value  $(S\_IWUSR | S\_IXUSR | \sim filemask) \& 0777$  as the *mode*  
107073 argument, where *filemask* is the file mode creation mask of the process (see  
107074 XSH *umask()*)

107075 Each *dir* operand that names an existing directory shall be ignored without error.107076 **OPERANDS**

107077 The following operand shall be supported:

107078 *dir* A pathname of a directory to be created.

107079 **STDIN**

107080 Not used.

107081 **INPUT FILES**

107082 None.

107083 **ENVIRONMENT VARIABLES**107084 The following environment variables shall affect the execution of *mkdir*:

107085 *LANG* Provide a default value for the internationalization variables that are unset or null.  
107086 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
107087 variables used to determine the values of locale categories.)

107088 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107089 internationalization variables.

107090 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107091 characters (for example, single-byte as opposed to multi-byte characters in  
107092 arguments).

107093 *LC\_MESSAGES*

107094 Determine the locale that should be used to affect the format and contents of  
107095 diagnostic messages written to standard error.

107096 *XSI NLSPATH* Determine the location of messages objects and message catalogs.

107097 **ASYNCHRONOUS EVENTS**

107098 Default.

107099 **STDOUT**

107100 Not used.

107101 **STDERR**

107102 The standard error shall be used only for diagnostic messages.

107103 **OUTPUT FILES**

107104 None.

107105 **EXTENDED DESCRIPTION**

107106 None.

107107 **EXIT STATUS**

107108 The following exit values shall be returned:

107109 0 All the specified directories were created successfully, or the **-p** option was specified and all  
107110 the specified directories either already existed or were created successfully.

107111 >0 An error occurred.

107112 **CONSEQUENCES OF ERRORS**

107113 Default.

**107114 APPLICATION USAGE**

107115 The default file mode for directories is *a=rwx* (777 on most systems) with selected permissions  
107116 removed in accordance with the file mode creation mask. For intermediate pathname  
107117 components created by *mkdir*, the mode is the default modified by *u+rwx* so that the  
107118 subdirectories can always be created regardless of the file mode creation mask; if different  
107119 ultimate permissions are desired for the intermediate directories, they can be changed  
107120 afterwards with *chmod*.

107121 Note that some of the requested directories may have been created even if an error occurs.

**107122 EXAMPLES**

107123 None.

**107124 RATIONALE**

107125 The System V *-m* option was included to control the file mode.

107126 The System V *-p* option was included to create any needed intermediate directories and to  
107127 complement the functionality provided by *rmdir* for removing directories in the path prefix as  
107128 they become empty. Because no error is produced if any path component already exists, the *-p*  
107129 option is also useful to ensure that a particular directory exists.

107130 The functionality of *mkdir* is described substantially through a reference to the *mkdir()*  
107131 function in the System Interfaces volume of POSIX.1-2024. For example, by default, the mode of the  
107132 directory is affected by the file mode creation mask in accordance with the specified behavior of  
107133 the *mkdir()* function. In this way, there is less duplication of effort required for describing details  
107134 of the directory creation.

**107135 FUTURE DIRECTIONS**

107136 If this utility is directed to create a new directory entry that contains any bytes that have the  
107137 encoded value of a <newline> character, implementations are encouraged to treat this as an  
107138 error. A future version of this standard may require implementations to treat this as an error.

**107139 SEE ALSO**

107140 *chmod*, *rm*, *rmdir*, *umask*

107141 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

107142 XSH *mkdir()*, *umask()*

**107143 CHANGE HISTORY**

107144 First released in Issue 2.

**107145 Issue 5**

107146 The FUTURE DIRECTIONS section is added.

**107147 Issue 7**

107148 SD5-XCU-ERN-56 is applied, aligning the *-m* option with the IEEE P1003.2b draft standard to  
107149 clarify an ambiguity.

107150 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107151 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0122 [161] is applied.

107152 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0145 [843] is applied.

**107153 Issue 8**

107154 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
107155 filenames containing any bytes that have the encoded value of a <newline> character.

107156

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

107157 **NAME**

107158 mkfifo — make FIFO special files

107159 **SYNOPSIS**107160 `mkfifo [-m mode] file...`107161 **DESCRIPTION**107162 The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order  
107163 specified.107164 For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function  
107165 defined in the System Interfaces volume of POSIX.1-2024, called with the following arguments:

- 107166 1. The *file* operand is used as the *path* argument.
- 107167 2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP,  
107168 S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the `-m` option is specified, the  
107169 value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have  
107170 permissions less restrictive than the `-m mode` option-argument.)

107171 **OPTIONS**107172 The *mkfifo* utility shall conform to XBD [Section 12.2](#) (on page 215).

107173 The following option shall be supported:

107174 `-m mode` Set the file permission bits of the newly-created FIFO to the specified *mode* value.  
107175 The *mode* option-argument shall be the same as the *mode* operand defined for the  
107176 *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be  
107177 interpreted relative to an assumed initial mode of *a=rw*.

107178 **OPERANDS**

107179 The following operand shall be supported:

107180 *file* A pathname of the FIFO special file to be created.107181 **STDIN**

107182 Not used.

107183 **INPUT FILES**

107184 None.

107185 **ENVIRONMENT VARIABLES**107186 The following environment variables shall affect the execution of *mkfifo*:

107187 *LANG* Provide a default value for the internationalization variables that are unset or null.  
107188 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
107189 variables used to determine the values of locale categories.)

107190 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107191 internationalization variables.

107192 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107193 characters (for example, single-byte as opposed to multi-byte characters in  
107194 arguments).

107195 *LC\_MESSAGES*

107196 Determine the locale that should be used to affect the format and contents of  
107197 diagnostic messages written to standard error.

- 107198 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 107199 **ASYNCHRONOUS EVENTS**
- 107200 Default.
- 107201 **STDOUT**
- 107202 Not used.
- 107203 **STDERR**
- 107204 The standard error shall be used only for diagnostic messages.
- 107205 **OUTPUT FILES**
- 107206 None.
- 107207 **EXTENDED DESCRIPTION**
- 107208 None.
- 107209 **EXIT STATUS**
- 107210 The following exit values shall be returned:
- 107211 0 All the specified FIFO special files were created successfully.
- 107212 >0 An error occurred.
- 107213 **CONSEQUENCES OF ERRORS**
- 107214 Default.
- 107215 **APPLICATION USAGE**
- 107216 None.
- 107217 **EXAMPLES**
- 107218 None.
- 107219 **RATIONALE**
- 107220 This utility was added to permit shell applications to create FIFO special files.
- 107221 The **-m** option was added to control the file mode, for consistency with the similar functionality provided by the *mkdir* utility.
- 107222
- 107223 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate directories leading up to the FIFO specified by the final component. This was removed because it is not commonly needed and is not common practice with similar utilities.
- 107224
- 107225
- 107226 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function in the System Interfaces volume of POSIX.1-2024. For example, by default, the mode of the FIFO file is affected by the file mode creation mask in accordance with the specified behavior of the *mkfifo()* function. In this way, there is less duplication of effort required for describing details of the file creation.
- 107227
- 107228
- 107229
- 107230
- 107231 **FUTURE DIRECTIONS**
- 107232 If this utility is directed to create a new directory entry that contains any bytes that have the encoded value of a <newline> character, implementations are encouraged to treat this as an error. A future version of this standard may require implementations to treat this as an error.
- 107233
- 107234
- 107235 **SEE ALSO**
- 107236 *chmod*, *umask*
- 107237 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)
- 107238 XSH *mkfifo()*

107239 **CHANGE HISTORY**

107240 First released in Issue 3.

107241 **Issue 6**

107242 The **-m** option is aligned with the IEEE P1003.2b draft standard to clarify an ambiguity.

107243 **Issue 8**

107244 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of filenames containing any bytes that have the encoded value of a <newline> character.

107246 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

107247 **NAME**107248 `more` — display files on a page-by-page basis107249 **SYNOPSIS**107250 UP `more [-ceisu] [-n number] [-p command] [-t tagstring] [file...]`107251 **DESCRIPTION**

107252 The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 107253 filter them to standard output. If standard output is not a terminal device, all input files shall be  
 107254 copied to standard output in their entirety, without modification, except as specified for the `-s`  
 107255 option. If standard output is a terminal device, the files shall be written a number of lines (one  
 107256 screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 107257 section.

107258 Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 107259 *more* definition; they are incapable of accepting commands that are not terminated with a  
 107260 <newline>. Implementations that support such terminals shall provide an operating mode to  
 107261 *more* in which all commands can be terminated with a <newline> on those terminals. This mode:

- 107262 • Shall be documented in the system documentation
- 107263 • Shall, at invocation, inform the user of the terminal deficiency that requires the <newline>  
 107264 usage and provide instructions on how this warning can be suppressed in future  
 107265 invocations
- 107266 • Shall not be required for implementations supporting only fully capable terminals
- 107267 • Shall not affect commands already requiring <newline> characters
- 107268 • Shall not affect users on the capable terminals from using *more* as described in this volume  
 107269 of POSIX.1-2024

107270 **OPTIONS**

107271 The *more* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
 107272 recognized as an option delimiter as well as '-'.

107273 The following options shall be supported:

- 107274 `-c` If a screen is to be written that has no lines in common with the current screen, or  
 107275 *more* is writing its first screen, *more* shall not scroll the screen, but instead shall  
 107276 redraw each line of the screen in turn, from the top of the screen to the bottom. In  
 107277 addition, if *more* is writing its first screen, the screen shall be cleared. This option  
 107278 may be silently ignored on devices with insufficient terminal capabilities.
- 107279 `-e` Exit immediately after writing the last line of the last file in the argument list; see  
 107280 the EXTENDED DESCRIPTION section.
- 107281 `-i` Perform pattern matching in a case-insensitive manner; see XBD [Section 9.2](#) (on  
 107282 page 180).
- 107283 `-n number` Specify the number of lines per screenful. The *number* argument is a positive  
 107284 decimal integer. The `-n` option shall override any values obtained from any other  
 107285 source.
- 107286 `-p command` Each time a screen from a new file is displayed or redisplayed (including as a  
 107287 result of *more* commands; for example, `:p`), execute the *more* command(s) in the  
 107288 command arguments in the order specified, as if entered by the user after the first  
 107289 screen has been displayed. No intermediate results shall be displayed (that is, if the  
 107290 command is a movement to a screen different from the normal first screen, only the

- 107291 screen resulting from the command shall be displayed.) If any of the commands  
 107292 fail for any reason, an informational message to this effect shall be written, and no  
 107293 further commands specified using the **-p** option shall be executed for this file.
- 107294 **-s** Behave as if consecutive empty lines were a single empty line.
- 107295 **-t tagstring** Write the screenful of the file containing the tag named by the *tagstring*  
 107296 argument. See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**  
 107297 command is optional. It shall be provided on any system that also provides a  
 107298 conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined  
 107299 results.
- 107300 The filename resulting from the **-t** option shall be logically added as a prefix to the  
 107301 list of command line files, as if specified by the user. If the tag named by the  
 107302 *tagstring* argument is not found, it shall be an error, and *more* shall take no further  
 107303 action.
- 107304 If the tag specifies a line number, the first line of the display shall contain the  
 107305 beginning of that line. If the tag specifies a pattern, the first line of the display shall  
 107306 contain the beginning of the matching text from the first line of the file that  
 107307 contains that pattern. If the line does not exist in the file or matching text is not  
 107308 found, an informational message to this effect shall be displayed, and *more* shall  
 107309 display the default screen as if **-t** had not been specified.
- 107310 If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be  
 107311 processed first; that is, the file and starting line for the display shall be as specified  
 107312 by **-t**, and then the **-p more** command shall be executed. If the line (matching text)  
 107313 specified by the **-t** command does not exist (is not found), no **-p more** command  
 107314 shall be executed for this file at any time.
- 107315 **-u** Treat a `<backspace>` as a printable control character, displayed as an  
 107316 implementation-defined character sequence (see the EXTENDED DESCRIPTION  
 107317 section), suppressing backspacing and the special handling that produces  
 107318 underlined or standout mode text on some terminal types. Also, do not ignore a  
 107319 `<carriage-return>` at the end of a line.

#### 107320 OPERANDS

107321 The following operand shall be supported:

- 107322 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
 107323 shall be used. If a *file* is '-', the standard input shall be read at that point in the  
 107324 sequence.

#### 107325 STDIN

107326 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

#### 107327 INPUT FILES

107328 The input files being examined shall be text files. If standard output is a terminal, standard error  
 107329 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 107330 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 107331 the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error  
 107332 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 107333 error shall result if standard error cannot be opened for reading.

107334 **ENVIRONMENT VARIABLES**

107335 The following environment variables shall affect the execution of *more*:

107336 *COLUMNS* Override the system-selected horizontal display line size. See XBD [Chapter 8](#) (on  
107337 page 167) for valid values and results when it is unset or null.

107338 *EDITOR* Used by the *v* command to select an editor. See the EXTENDED DESCRIPTION  
107339 section.

107340 *LANG* Provide a default value for the internationalization variables that are unset or null.  
107341 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
107342 variables used to determine the values of locale categories.)

107343 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107344 internationalization variables.

107345 *LC\_COLLATE*

107346 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
107347 character collating elements within regular expressions.

107348 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107349 characters (for example, single-byte as opposed to multi-byte characters in  
107350 arguments and input files) and the behavior of character classes within regular  
107351 expressions.

107352 *LC\_MESSAGES*

107353 Determine the locale that should be used to affect the format and contents of  
107354 diagnostic messages written to standard error and informative messages written to  
107355 standard output.

107356 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

107357 *LINES* Override the system-selected vertical screen size, used as the number of lines in a  
107358 screenful. See XBD [Chapter 8](#) (on page 167) for valid values and results when it is  
107359 unset or null. The *-n* option shall take precedence over the *LINES* variable for  
107360 determining the number of lines in a screenful.

107361 *MORE* Determine a string containing options described in the OPTIONS section preceded  
107362 with <hyphen-minus> characters and <blank>-separated as on the command line.  
107363 Any command line options shall be processed after those in the *MORE* variable, as  
107364 if the command line were:

107365 *more* \$MORE *options operands*

107366 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for  
107367 determining the number of lines in a screenful.

107368 *TERM* Determine the name of the terminal type. If this variable is unset or null, an  
107369 unspecified default terminal type is used.

107370 **ASYNCHRONOUS EVENTS**

107371 The following actions shall be taken upon receipt of signals:

107372 *SIGCONT* The actions described below for *SIGWINCH* shall be taken, except that the screen  
107373 shall always be refreshed (regardless of whether the terminal window size  
107374 changed).

107375 *SIGWINCH* If standard output is a terminal, the current terminal window size associated with  
107376 the terminal on standard output shall be obtained, as if by a call to XSH  
107377 *tcgetwinsize()*. If the terminal window size is successfully obtained, it shall be used

107378 as follows:

- 107379 • If the *COLUMNS* environment variable is unset or does not contain a
- 107380 number, the horizontal display line size shall be set to the number of columns
- 107381 in the obtained terminal window size.
- 107382 • If the *-n* option was not specified (neither on the command line nor via the
- 107383 *MORE* environment variable) and the *LINES* environment variable is unset
- 107384 or does not contain a number, the vertical screen size shall be set to the
- 107385 number of rows in the obtained terminal window size.

107386 If the above resulted in either the vertical screen size or the horizontal display line  
 107387 size (or both) changing to a different value, the number of lines available per  
 107388 screen and the number of columns available per line shall be updated  
 107389 correspondingly (see XBD Chapter 8, on page 167) and the screen shall be  
 107390 refreshed; otherwise, the screen may be refreshed.

107391 The action taken for all other signals shall be the default.

#### 107392 **STDOUT**

107393 The standard output shall be used to write the contents of the input files.

#### 107394 **STDERR**

107395 The standard error shall be used for diagnostic messages and user commands (see the INPUT  
 107396 FILES section), and, if standard output is a terminal device, to write a prompting string. The  
 107397 prompting string shall appear on the screen line below the last line of the file displayed in the  
 107398 current screenful. The prompt shall contain the name of the file currently being examined and  
 107399 shall contain an end-of-file indication and the name of the next file, if any, when prompting at  
 107400 the end-of-file. If an error or informational message is displayed, it is unspecified whether it is  
 107401 contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the  
 107402 user shall be prompted for a continuation character, at which point another message or the user  
 107403 prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether  
 107404 informational messages are written for other user commands.

#### 107405 **OUTPUT FILES**

107406 None.

#### 107407 **EXTENDED DESCRIPTION**

107408 The following section describes the behavior of *more* when the standard output is a terminal  
 107409 device. If the standard output is not a terminal device, no options other than *-s* shall have any  
 107410 effect, and all input files shall be copied to standard output otherwise unmodified, at which time  
 107411 *more* shall exit without further action.

107412 The number of lines available per screen shall be determined by the *-n* option, if present, or by  
 107413 obtaining the vertical screen size from the *LINES* environment variable (see the  
 107414 ENVIRONMENT VARIABLES section) or from the terminal window size associated with the  
 107415 terminal on standard output (see XSH *tcgetwinsize()*), with a default value as described in XBD  
 107416 Chapter 8 (on page 167).

107417 The maximum number of lines written shall be one less than this number, because the screen  
 107418 line after the last line written shall be used to write a user prompt and user input. If the number  
 107419 of lines in the screen is less than two, the results are undefined. It is unspecified whether user  
 107420 input is permitted to be longer than the remainder of the single line where the prompt has been  
 107421 written.

107422 The number of columns available per line shall be determined by obtaining the horizontal  
 107423 display line size from the *COLUMNS* environment variable (see the ENVIRONMENT

107424 VARIABLES section) or from the terminal window size associated with the terminal on standard  
 107425 output (see XSH *tcgetwinsize()*), with a default value as described in XBD Chapter 8 (on page  
 107426 167).

107427 Lines that are longer than the display shall be folded; the length at which folding occurs is  
 107428 unspecified, but should be appropriate for the output device. Folding may occur between glyphs  
 107429 of single characters that take up multiple display columns.

107430 When standard output is a terminal and `-u` is not specified, *more* shall treat `<backspace>` and  
 107431 `<carriage-return>` characters specially:

- 107432 • A character, followed first by a sequence of *n* `<backspace>` characters (where *n* is the same  
 107433 as the number of column positions that the character occupies), then by *n* `<underscore>`  
 107434 characters (`'_'`), shall cause that character to be written as underlined text, if the terminal  
 107435 type supports that. The *n* `<underscore>` characters, followed first by *n* `<backspace>`  
 107436 characters, then any character with *n* column positions, shall also cause that character to be  
 107437 written as underlined text, if the terminal type supports that.
- 107438 • A sequence of *n* `<backspace>` characters (where *n* is the same as the number of column  
 107439 positions that the previous character occupies) that appears between two identical  
 107440 printable characters shall cause the first of those two characters to be written as  
 107441 emboldened text (that is, visually brighter, standout mode, or inverse-video mode), if the  
 107442 terminal type supports that, and the second to be discarded. Immediately subsequent  
 107443 occurrences of `<backspace>/character` pairs for that same character shall also be  
 107444 discarded. (For example, the sequence `"a\ba\ba\ba"` is interpreted as a single  
 107445 emboldened `'a'`.)
- 107446 • The *more* utility shall logically discard all other `<backspace>` characters from the line as  
 107447 well as the character which precedes them, if any.
- 107448 • A `<carriage-return>` at the end of a line shall be ignored, rather than being written as a  
 107449 non-printable character, as described in the next paragraph.

107450 It is implementation-defined how other non-printable characters are written. Implementations  
 107451 should use the same format that they use for the *ex print* command; see the OPTIONS section  
 107452 within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it  
 107453 crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the  
 107454 number of columns on the display is less than the number of columns any single character in the  
 107455 line being displayed would occupy.

107456 When each new file is displayed (or redisplayed), *more* shall write the first screen of the file.  
 107457 Once the initial screen has been written, *more* shall prompt for a user command. If the execution  
 107458 of the user command results in a screen that has lines in common with the current screen, and  
 107459 the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is  
 107460 unspecified whether the screen is scrolled or redrawn.

107461 For all files but the last (including standard input if no file was specified, and for the last file as  
 107462 well, if the `-e` option was not specified), when *more* has written the last line in the file, *more* shall  
 107463 prompt for a user command. This prompt shall contain the name of the next file as well as an  
 107464 indication that *more* has reached end-of-file. If the user command is `f`, `<control>-F`, `<space>`, `j`,  
 107465 `<newline>`, `d`, `<control>-D`, or `s`, *more* shall display the next file. Otherwise, if displaying the last  
 107466 file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

107467 Several of the commands described in this section display a previous screen from the input  
 107468 stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is  
 107469 implementation-defined how much backwards motion is supported. If a command cannot be  
 107470 executed because of a limitation on backwards motion, an error message to this effect shall be

107471 displayed, the current screen shall not change, and the user shall be prompted for another  
107472 command.

107473 If a command cannot be performed because there are insufficient lines to display, *more* shall alert  
107474 the terminal. If a command cannot be performed because there are insufficient lines to display or  
107475 a / command fails: if the input is the standard input, the last screen in the file may be displayed;  
107476 otherwise, the current file and screen shall not change, and the user shall be prompted for  
107477 another command.

107478 The interactive commands in the following sections shall be supported. Some commands can be  
107479 preceded by a decimal integer, called *count* in the following descriptions. If not specified with  
107480 the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular  
107481 expression, as described in XBD [Section 9.3](#) (on page 181). The term “examine” is historical  
107482 usage meaning “open the file for viewing”; for example, *more foo* would be expressed as  
107483 examining file **foo**.

107484 In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a  
107485 line from the file being examined.

107486 In the following descriptions, the *current position* refers to two things:

- 107487 1. The position of the current line on the screen
- 107488 2. The line number (in the file) of the current line on the screen

107489 Usually, the line on the screen corresponding to the current position is the third line on the  
107490 screen. If this is not possible (there are fewer than three lines to display or this is the first page of  
107491 the file, or it is the last page of the file), then the current position is either the first or last line on  
107492 the screen as described later.

## 107493 Help

107494 *Synopsis:*     h

107495 Write a summary of these commands and other implementation-defined commands. The  
107496 behavior shall be as if the *more* utility were executed with the `-e` option on a file that contained  
107497 the summary information. The user shall be prompted as described earlier in this section when  
107498 end-of-file is reached. If the user command is one of those specified to continue to the next file,  
107499 *more* shall return to the file and screen state from which the **h** command was executed.

## 107500 Scroll Forward One Screenful

107501 *Synopsis:*     [*count*]f  
107502                [*count*]<control>-F

107503 Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size,  
107504 only the final screenful shall be written.

## 107505 Scroll Backward One Screenful

107506 *Synopsis:*     [*count*]b  
107507                [*count*]<control>-B

107508 Scroll backward *count* lines, with a default of one screenful (see the `-n` option). If *count* is more  
107509 than the screen size, only the final screenful shall be written.

107510 **Scroll Forward One Line**

107511 *Synopsis:*    [*count*] <space>  
 107512            [*count*] j  
 107513            [*count*] <newline>

107514 Scroll forward *count* lines. The default *count* for the <space> shall be one screenful; for j and  
 107515 <newline>, one line. The entire *count* lines shall be written, even if *count* is more than the screen  
 107516 size.

107517 **Scroll Backward One Line**

107518 *Synopsis:*    [*count*] k

107519 Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the  
 107520 screen size.

107521 **Scroll Forward One Half Screenful**

107522 *Synopsis:*    [*count*] d  
 107523            [*count*] <control>-D

107524 Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 107525 shall become the new default for subsequent **d**, <control>-D, and **u** commands.

107526 **Skip Forward One Line**

107527 *Synopsis:*    [*count*] s

107528 Display the screenful beginning with the line *count* lines after the last line on the current screen.  
 107529 If *count* would cause the current position to be such that less than one screenful would be  
 107530 written, the last screenful in the file shall be written.

107531 **Scroll Backward One Half Screenful**

107532 *Synopsis:*    [*count*] u  
 107533            [*count*] <control>-U

107534 Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 107535 shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands.  
 107536 The entire *count* lines shall be written, even if *count* is more than the screen size.

107537 **Go to Beginning of File**

107538 *Synopsis:*    [*count*] g

107539 Display the screenful beginning with line *count*.

107540 **Go to End-of-File**

107541 *Synopsis:*    [*count*] G

107542 If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the  
 107543 last screenful of the file.

**107544 Refresh the Screen**

107545 *Synopsis:*     r  
107546                   <control>-L

107547 Refresh the screen.

**107548 Discard and Refresh**

107549 *Synopsis:*     R

107550 Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered  
107551 input shall not be discarded and the **R** command shall be equivalent to the **r** command.

**107552 Mark Position**

107553 *Synopsis:*     m*letter*

107554 Mark the current position with the letter named by *letter*, where *letter* represents the name of one  
107555 of the lowercase letters of the portable character set. When a new file is examined, all marks may  
107556 be lost.

**107557 Return to Mark**

107558 *Synopsis:*     '*letter*

107559 Return to the position that was previously marked with the letter named by *letter*, making that  
107560 line the current position.

**107561 Return to Previous Position**

107562 *Synopsis:*     ''

107563 Return to the position from which the last large movement command was executed (where a  
107564 "large movement" is defined as any movement of more than a screenful of lines). If no such  
107565 movements have been made, return to the beginning of the file.

**107566 Search Forward for Pattern**

107567 *Synopsis:*     [*count*]/[!]*pattern*<newline>

107568 Display the screenful beginning with the *count*th line containing the pattern. The search shall  
107569 start after the first line currently displayed. The null regular expression ('/' followed by a  
107570 <newline>) shall repeat the search using the previous regular expression, with a default *count*. If  
107571 the character '!' is included, the matching lines shall be those that do not contain the *pattern*. If  
107572 no match is found for the *pattern*, a message to that effect shall be displayed.

**107573 Search Backward for Pattern**

107574 *Synopsis:*     [*count*?][!]*pattern*<newline>

107575 Display the screenful beginning with the *count*th previous line containing the pattern. The search  
107576 shall start on the last line before the first line currently displayed. The null regular expression  
107577 ('?' followed by a <newline>) shall repeat the search using the previous regular expression,  
107578 with a default *count*. If the character '!' is included, matching lines shall be those that do not  
107579 contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be  
107580 displayed.

**107581 Repeat Search**

107582 *Synopsis:* [count]n

107583 Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last  
107584 *pattern*, if the previous search was "/" or "?").

**107585 Repeat Search in Reverse**

107586 *Synopsis:* [count]N

107587 Repeat the search in the opposite direction of the previous search for the *count*th line containing  
107588 the last *pattern* (or not containing the last *pattern*, if the previous search was "/" or "?").

**107589 Examine New File**

107590 *Synopsis:* :e [filename]<newline>

107591 Examine a new file. If the *filename* argument is not specified, the current file (see the :n and :p  
107592 commands below) shall be re-examined. The *filename* shall be subjected to the process of shell  
107593 word expansions (see Section 2.6, on page 2483); if more than a single pathname results, the  
107594 effects are unspecified. If *filename* is a <number-sign> ('#'), the previously examined file shall  
107595 be re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable  
107596 file), an error message to this effect shall be displayed and the current file and screen shall not  
107597 change.

**107598 Examine Next File**

107599 *Synopsis:* [count]:n

107600 Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If  
107601 *filename* refers to a non-seekable file, the results are unspecified.

**107602 Examine Previous File**

107603 *Synopsis:* [count]:p

107604 Examine the previous file. If a number *count* is specified, the *count*th previous file shall be  
107605 examined. If *filename* refers to a non-seekable file, the results are unspecified.

**107606 Go to Tag**

107607 *Synopsis:* :t tagstring<newline>

107608 If the file containing the tag named by the *tagstring* argument is not the current file, examine the  
107609 file, as if the :e command was executed with that file as the argument. Otherwise, or in addition,  
107610 display the screenful beginning with the tag, as described for the -t option (see the OPTIONS  
107611 section). If the *ctags* utility is not supported by the system, the use of :t produces undefined  
107612 results.

107613 **Invoke Editor**107614 *Synopsis:*    v

107615 Invoke an editor to edit the current file being examined. If standard input is being examined, the  
 107616 results are unspecified. The name of the editor shall be taken from the environment variable  
 107617 *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the  
 107618 editor shall be invoked with a *-c linenum* command line argument, where *linenum* is the  
 107619 line number of the file line containing the display line currently displayed as the first line of the  
 107620 screen. It is implementation-defined whether line-setting options are passed to editors other  
 107621 than *vi* and *ex*.

107622 When the editor exits, *more* shall resume with the same file and screen as when the editor was  
 107623 invoked.

107624 **Display Position**

107625 *Synopsis:*    =  
 107626               <control>-G

107627 Write a message for which the information references the first byte of the line after the last line of  
 107628 the file on the screen. This message shall include the name of the file currently being examined,  
 107629 its number relative to the total number of files there are to examine, the line number in the file,  
 107630 the byte number and the total bytes in the file, and what percentage of the file precedes the  
 107631 current position. If *more* is reading from standard input, or the file is shorter than a single screen,  
 107632 the line number, the byte number, the total bytes, and the percentage need not be written.

107633 **Quit**

107634 *Synopsis:*    q  
 107635               :q  
 107636               ZZ

107637 Exit *more*.107638 **EXIT STATUS**

107639 The following exit values shall be returned:

107640    0 Successful completion.

107641    &gt;0 An error occurred.

107642 **CONSEQUENCES OF ERRORS**

107643 If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to  
 107644 examine the next file in the argument list, but the final exit status shall be affected. If an error is  
 107645 encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file  
 107646 in the argument list, but the final exit status shall be affected. If an error is encountered accessing  
 107647 a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not  
 107648 be affected.

107649 **APPLICATION USAGE**

107650 When the standard output is not a terminal, only the `-s` filter-modification option is effective.  
 107651 This is based on historical practice. For example, a typical implementation of *man* pipes its  
 107652 output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to  
 107653 *lp*, however, it is undesirable for this squeezing to happen.

107654 **EXAMPLES**

107655 The `-p` allows arbitrary commands to be executed at the start of each file. Examples are:

107656 `more -p G file1 file2`

107657 Examine each file starting with its last screenful.

107658 `more -p 100 file1 file2`

107659 Examine each file starting with line 100 in the current position (usually the third line, so line  
 107660 98 would be the first line written).

107661 `more -p /100 file1 file2`

107662 Examine each file starting with the first line containing the string "100" in the current  
 107663 position

107664 **RATIONALE**

107665 The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the  
 107666 POSIX file display program since it is more widely available than either the public-domain  
 107667 program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the  
 107668 features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use  
 107669 and has become more amenable for *vi* users. Several features originally derived from various file  
 107670 editors, found in both *less* and *pg*, have been added to this volume of POSIX.1-2024 as they have  
 107671 proved extremely popular with users.

107672 There are inconsistencies between *more* and *vi* that result from historical practice. For example,  
 107673 the single-character commands **h**, **f**, **b**, and `<space>` are screen movers in *more*, but cursor  
 107674 movers in *vi*. These inconsistencies were maintained because the cursor movements are not  
 107675 applicable to *more* and the powerful functionality achieved without the use of the control key  
 107676 justifies the differences.

107677 The tags interface has been included in a program that is not a text editor because it promotes  
 107678 another degree of consistent operation with *vi*. It is conceivable that the paging environment of  
 107679 *more* would be superior for browsing source code files in some circumstances.

107680 The operating mode referred to for block-mode terminals effectively adds a `<newline>` to each  
 107681 Synopsis line that currently has none. So, for example, `d<newline>` would page one screenful.  
 107682 The mode could be triggered by a command line option, environment variable, or some other  
 107683 method. The details are not imposed by this volume of POSIX.1-2024 because there are so few  
 107684 systems known to support such terminals. Nevertheless, it was considered that all systems  
 107685 should be able to support *more* given the exception cited for this small community of terminals  
 107686 because, in comparison to *vi*, the cursor movements are few and the command set relatively  
 107687 amenable to the optional `<newline>` characters.

107688 Historically some versions of *more* did not obtain the terminal window size on receipt of  
 107689 SIGCONT, resulting in incorrect screen contents when the screen was refreshed if the size had  
 107690 been changed while *more* was suspended. This is considered to be a bug in those  
 107691 implementations.

107692 Some versions of *more* provide a shell escaping mechanism similar to the `ex !` command. The  
 107693 standard developers did not consider that this was necessary in a paginator, particularly given  
 107694 the wide acceptance of multiple window terminals and job control features. (They chose to  
 107695 retain such features in the editors and *mailx* because the shell interaction also gives an

- 107696 opportunity to modify the editing buffer, which is not applicable to *more*.)
- 107697 The `-p` (position) option replaces the `+` command because of the Utility Syntax Guidelines. The  
 107698 `+command` option is no longer specified by POSIX.1-2024 but may be present in some  
 107699 implementations. In early proposals, it took a *pattern* argument, but historical *less* provided the  
 107700 *more* general facility of a command. It would have been desirable to use the same `-c` as *ex* and *vi*,  
 107701 but the letter was already in use.
- 107702 The text stating “from a non-rewindable stream ... implementations may limit the amount of  
 107703 backwards motion supported” would allow an implementation that permitted no backwards  
 107704 motion beyond text already on the screen. It was not possible to require a minimum amount of  
 107705 backwards motion that would be effective for all conceivable device types. The implementation  
 107706 should allow the user to back up as far as possible, within device and reasonable memory  
 107707 allocation constraints.
- 107708 Historically, non-printable characters were displayed using the ARPA standard mappings,  
 107709 which are as follows:
- 107710 1. Printable characters are left alone.
  - 107711 2. Control characters less than `\177` are represented as followed by the character offset from  
 107712 the '@' character in the ASCII map; for example, `\007` is represented as 'G'.
  - 107713 3. `\177` is represented as followed by '?'.
- 107714 The display of characters having their eighth bit set was less standard. Existing implementations  
 107715 use hex (`0x00`), octal (`\000`), and a meta-bit display. (The latter displayed characters with their  
 107716 eighth bit set as the two characters "M-", followed by the seven-bit display as described  
 107717 previously.) The latter probably has the best claim to historical practice because it was used with  
 107718 the `-v` option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.
- 107719 No specific display format is required by POSIX.1-2024. Implementations are encouraged to  
 107720 conform to historic practice in the absence of any strong reason to diverge.
- 107721 **FUTURE DIRECTIONS**
- 107722 None.

- 107727 **CHANGE HISTORY**
- 107728 First released in Issue 4.
- 107729 **Issue 5**
- 107730 The FUTURE DIRECTIONS section is added.
- 107731 **Issue 6**
- 107732 This utility is marked as part of the User Portability Utilities option.
- 107733 The obsolescent SYNOPSIS is removed.
- 107734 The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:
- 107735 • Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
  - 107736 • The *more* utility should be able to handle underlined and emboldened displays of  
 107737 characters that are wider than a single column position.

107738 **Issue 7**

107739 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
107740 as an option delimiter in the OPTIONS section.

107741 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107742 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0123 [265] is applied.

107743 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0146 [584] is applied.

107744 **Issue 8**

107745 Austin Group Defect 1031 is applied, changing the description of the -i option.

107746 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

107747 Austin Group Defect 1185 is applied, changing the ASYNCHRONOUS EVENTS and  
107748 EXTENDED DESCRIPTION sections in relation to the terminal window size.

107749 **NAME**

107750 msgfmt — create messages objects from portable messages object source files

107751 **SYNOPSIS**107752 msgfmt [-cfSv] [-D *dir*] [-o *outputfile*] *pathname...*107753 **DESCRIPTION**107754 The *msgfmt* utility shall create messages object files from portable messages object source files  
107755 (dot-po files).107756 A dot-po file contains messages to be output by system commands or by applications. The  
107757 messages in these files should be able to be translated to any language supported by the system.107758 The *msgfmt* utility shall interpret message strings for output as characters according to the  
107759 codeset specified in the dot-po file or, if not present, the current setting of the *LC\_CTYPE* locale  
107760 category.107761 **OPTIONS**107762 The *msgfmt* utility shall conform to XBD [Section 12.2](#) (on page 215).

107763 The following options shall be supported:

107764 **-c** If this option and **-v** are both specified, *msgfmt* shall detect and diagnose input file  
107765 abnormalities which might represent translation errors. The **msgid** and **msgstr**  
107766 strings shall be compared. It shall be considered abnormal if one string starts or  
107767 ends with a <newline> while the other does not. Also, if the flag **c-format** appears  
107768 in a "#, " comment for a **msgid** directive (see EXTENDED DESCRIPTION), it shall  
107769 be considered abnormal if the strings do not have the same number of '%'   
107770 conversion specifiers, or if corresponding conversion specifiers take different  
107771 argument types (see XSH *fprintf()*, on page 995). If an abnormality is detected, the  
107772 exit status shall be non-zero and a diagnostic message shall be output. Additional  
107773 checks beyond those described here may also be performed. These checks may  
107774 produce diagnostics or informational messages and need not affect the exit status.  
107775 If **-c** is specified without **-v** or **-v** is specified without **-c**, the behavior is  
107776 unspecified.

107777 **-D *dir*** Add *dir* to the list of directories to search for input files.107778 **-f** Use fuzzy entries in output. If this option is not specified, fuzzy entries shall not be  
107779 included in the output.

107780 **-o *outputfile***  
107781 Specify the name of an output file to be used instead of the default filename(s)  
107782 specified in EXTENDED DESCRIPTION. All **domain *domainname*** directives in the  
107783 dot-po file(s) shall be ignored.

107784 **-S** Append the suffix **.mo** to each generated messages object filename if it does not  
107785 have this suffix.107786 **-v** See **-c**.107787 **OPERANDS**

107788 The following operand shall be supported:

107789 *pathname* A pathname of a dot-po file.

- 107790 **STDIN**  
 107791 Not used.
- 107792 **INPUT FILES**  
 107793 The input files shall be text files in the format described in EXTENDED DESCRIPTION.
- 107794 **ENVIRONMENT VARIABLES**  
 107795 The following environment variables shall affect the execution of *msgfmt*:
- 107796 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107797 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 107798 variables used to determine the values of locale categories.)
- 107799 XSI *LANGUAGE* Determine the location of messages objects if *NLSPATH* is not set or the evaluation  
 107800 of *NLSPATH* did not lead to a suitable messages object being found.
- 107801 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107802 internationalization variables.
- 107803 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107804 characters (for example, single-byte as opposed to multi-byte characters in  
 107805 arguments and input files).
- 107806 *LC\_MESSAGES*  
 107807 Determine the locale name used to locate messages objects, and the locale that  
 107808 should be used to affect the format and contents of diagnostic messages written to  
 107809 standard error.
- 107810 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 107811 **ASYNCHRONOUS EVENTS**  
 107812 Default.
- 107813 **STDOUT**  
 107814 Not Used.
- 107815 **STDERR**  
 107816 The standard error shall be used for diagnostic messages and may also be used for warning  
 107817 messages. If the *-c* and *-v* options are specified, additional unspecified informational messages  
 107818 may be written to standard error.
- 107819 **OUTPUT FILES**  
 107820 The format of the created messages object files is unspecified.
- 107821 **EXTENDED DESCRIPTION**  
 107822 The *msgfmt* utility shall accept portable messages object source files (dot-po files) in the  
 107823 following format.
- 107824 A dot-po file contains zero or more lines, with each non-blank line containing a comment, a  
 107825 statement, or a statement continuation. A comment has an unquoted <number-sign> ('#') as  
 107826 the first non-<blank> character and ends with the next <newline> character. A statement  
 107827 continuation is a double-quoted string on a line by itself, optionally preceded and/or followed  
 107828 by <blank> characters, and the string shall be concatenated with the string on the previous  
 107829 statement line. If a comment occurs between a statement and a statement continuation, the  
 107830 behavior is unspecified. All other comments, except for comments beginning with <number-  
 107831 sign><comma> ("#, "), and blank lines shall be ignored.
- 107832 The format of a statement is:  
 107833 *directive value*

107834 The *directive* starts at the first non-`<blank>` character of the line and is separated from the *value*  
 107835 by one or more `<blank>` characters. The *value* consists of a double-quoted string optionally  
 107836 followed by `<blank>` characters. Zero or more statement continuation lines (see above) can  
 107837 follow the statement. The following directives shall be supported:

```
107838 domain domainname
107839 msgid message_identifier
107840 msgid_plural untranslated_string_plural
107841 msgstr message_string
107842 msgstr[index] message_string
```

107843 A dot-po file consists of zero or more sections. Each section specifies the messages to be  
 107844 processed in a domain. The first directive in each section shall be a **domain** directive (except for  
 107845 the first section which shall behave as if

```
107846 domain "messages"
```

107847 had been specified if the first directive is not a **domain** directive).

107848 The behavior of the **domain** directive is affected by the options used. See OPTIONS for the  
 107849 behavior when the `-o` option is specified. If the `-o` option is not specified, all data obtained from  
 107850 the non-**domain** directives in a dot-po section shall be output to the messages object file named  
 107851 *domainname.mo* when the `-S` option is specified. When the `-S` option is not specified, it is  
 107852 implementation-defined whether *domainname* or *domainname.mo* is used.

107853 If multiple **domain** directives specify the same *domainname*, the sections shall be processed as if  
 107854 there was only one section that starts with a **domain** *domainname* statement which contained the  
 107855 statements of the sections, in the same order, excluding all but the first **domain** *domainname*  
 107856 statement.

107857 Within each section, there can be a header. A header is identified by having a **msgid** directive  
 107858 with the empty string ("") as the *message\_identifier* immediately followed by a statement  
 107859 containing a **msgstr** directive. The *message\_string* in this **msgstr** statement in a header shall be  
 107860 treated specially. If *message\_string* contains a specification of the form:

```
107861 "nplurals=count; plural=expression"
```

107862 then *count* indicates the number of plural forms for messages in that domain, and *expression* is a  
 107863 C-language expression that evaluates to an unsigned integer value which determines the  
 107864 **msgstr**[*index*] directive to be used. The value of *expression* is used as the index value. The  
 107865 variable *n* in *expression* is assigned the value of the *n* argument to the *ngettext()*, *ngettext\_l()*,  
 107866 *dngettext()*, *dngettext\_l()*, *dcngettext()*, and *dcngettext\_l()* functions or of the *n* operand of the  
 107867 *ngettext* utility before *expression* is evaluated. The application shall ensure that *expression*  
 107868 evaluates to a non-negative value less than *count* for all *n* that can be supplied by the  
 107869 aforementioned functions and utility.

107870 If *message\_string* in the header contains a specification of the form:

```
107871 "charset=codeset"
```

107872 then *codeset* indicates the codeset to be used to encode the message strings in this section's  
 107873 domain (overriding *LC\_CTYPE*). If the output string's codeset is different from the message  
 107874 string's codeset, codeset conversion from the message string's codeset to the output string's  
 107875 codeset shall be performed by the *gettext* family of functions and by the *gettext* and *ngettext*  
 107876 utilities. See XSH *gettext* and *gettext*. The output string's codeset shall be determined by the  
 107877 current or specified locale's codeset.

107878 **Note:** It is the responsibility of translators to ensure that the characters they enter into message strings  
107879 in a dot-po file are encoded in the codeset specified in the header.

107880 If a header is present in a section, the application shall ensure that the header is provided by the  
107881 first **msgid** directive in that section.

107882 After the header, if present, zero or more messages are identified by a **msgid** directive with a  
107883 *message\_identifier* that is not an empty string. Each of these directives start a subsection that is  
107884 used to get a translated message from the *gettext* family of functions and from the *gettext* and  
107885 *ngettext* utilities. If the *message\_identifier* string is the string identified by the *gettext* family of  
107886 functions *msgid* argument or by the *gettext* and *ngettext* utility *msgid* operand, this subsection  
107887 specifies how that translation is to be processed.

107888 If there is only a singular form for the given *message\_identifier*, the application shall ensure that  
107889 the statement containing the **msgid** directive is immediately followed by a **msgstr** directive.

107890 If there are plural forms for the given *message\_identifier* and the header for this section exists and  
107891 contains an

107892 `"nplurals=count; plural=expression"`

107893 specification, the application shall ensure that the statement containing the **msgid** directive is  
107894 immediately followed by a **msgid\_plural** directive and that each statement containing a  
107895 **msgid\_plural** directive is followed by *count* statements containing **msgstr[index]** directives,  
107896 starting with **msgstr[0]** and ending with **msgstr[count-1]** in increasing order, with no duplicate  
107897 index values. If a header for this section does not exist or does not contain an

107898 `"nplurals=count; plural=expression"`

107899 specification, the application shall ensure that no **msgid\_plural** or **msgstr[index]** directives are  
107900 used in this section.

107901 For example, if the header's *message\_string* contains the specification:

107902 `"nplurals=2; plural= n == 1 ? 0 : 1"`

107903 there are two forms in the domain; **msgstr[0]** is used if *n* is equal to 1, otherwise **msgstr[1]** is  
107904 used. For another example, if the header's *message\_string* contains:

107905 `"nplurals=3; plural= n == 1 ? 0 : n == 2 ? 1 : 2"`

107906 there are three forms in the domain; **msgstr[0]** is used if *n* is equal to 1, **msgstr[1]** is used if *n* is  
107907 equal to 2, otherwise **msgstr[2]** is used.

107908 C-language escape sequences in strings shall be processed as specified for character string  
107909 literals in the ISO C standard, except that *universal-character-name* escape sequences need not be  
107910 supported.

107911 Comments in a dot-po file can be in one of the following formats:

107912 `#: reference`

107913 `#. utility-added-comments`

107914 `#, flag`

107915 `#translator-comments` (where *translator-comments* does not begin with '.', ': ' or ',')

107916 A `#: reference` comment indicates the location(s) of the **msgid** string in the source files, in

107917 `pathname1:linenumber1 [pathname2:linenumber2 ... ]`

107918 format. They can be added, as might "#." prefixed additional comments of unspecified format,  
107919 by the *xgettext* utility. All comments that do not begin with "#," are informative only and shall  
107920 be silently ignored by the *msgfmt* utility. In "#," comments the following values for *flag* can be

107921 specified:

107922 **fuzzy** This flag indicates that the **msgstr** string might not be a correct translation at this  
 107923 point in time. Only the translator can judge if the translation requires further  
 107924 modification or is acceptable as is. Once satisfied with the translation, the  
 107925 translator should remove this **fuzzy** flag. If this flag is specified, the *msgfmt* utility  
 107926 shall not generate the entry for the next following **msgid** in the output message  
 107927 catalog, unless the **-f** option is specified. If other flag comments are specified  
 107928 between **fuzzy** and the **msgid**, the behavior is unspecified.

107929 **c-format**

107930 **no-c-format** The **c-format** flag indicates that the next following **msgid** string contains a *printf()*  
 107931 format string. When the **c-format** flag is given and the **-c** and **-v** options are  
 107932 specified, the *msgfmt* utility shall perform additional tests to check the validity of  
 107933 the translation (see OPTIONS); these additional tests may also be performed if  
 107934 neither **c-format** nor **no-c-format** is given. When the **no-c-format** flag is given for a  
 107935 string, no additional checks shall be performed for the string. When both the **c-**  
 107936 **format** and the **no-c-format** flags are given, the last flag specified takes precedence.

### 107937 EXIT STATUS

107938 The following exit values shall be returned:

107939 0 Successful completion.

107940 >0 An error occurred.

### 107941 CONSEQUENCES OF ERRORS

107942 The *msgfmt* utility need not continue processing later *pathname* operands when an error  
 107943 condition that affects the exit status is detected. It is unspecified whether a messages object file is  
 107944 written when checks performed for the **-c** and **-v** options fail.

### 107945 APPLICATION USAGE

107946 The *xgettext* utility can be used to create template dot-po files from C-language source files.

107947 Installing messages object files for the POSIX or C locale is not recommended, since they may be  
 107948 ignored for the sake of efficiency.

107949 The first section for each domain in a dot-po file should include a header containing a

107950 "charset=codeset"

107951 specification. If this specification is omitted, message conversions in the *gettext* family of  
 107952 functions and in the *gettext* and *ngettext* utilities may fail.

107953 The **msgid\_plural** directive's *untranslated\_string\_plural* string comes from the *msgid\_plural*  
 107954 arguments in calls to the *ngettext()*, *ngettext\_l()*, *dngettext()*, *dngettext\_l()*, *dcngettext()*, and  
 107955 *dcngettext\_l()* functions when a prototype dot-po file is created by the *xgettext* utility. These  
 107956 strings (and the *msgid\_plural* operands in calls to the *ngettext* utility) can provide context when a  
 107957 translator is modifying a template dot-po file into a dot-po file for a specific language. These  
 107958 functions and the *ngettext* utility do not try to match the *msgid\_plural* arguments or operands  
 107959 with anything in a messages object file; they only match the *msgid* arguments and operands.

107960 Unlike shell command language strings, double-quoted strings in dot-po files cannot contain a  
 107961 literal <newline> character.

## 107962 EXAMPLES

```
107963     In this example, module1.po and module2.po are portable messages object source files.
107964     $ cat module1.po
107965     # default domain "messages"
107966     msgid ""
107967     msgstr "charset=utf-8"
107968     msgid "msg 1"
107969     msgstr "msg 1 translation"
107970     #
107971     domain "help_domain"
107972     msgid ""
107973     msgstr "charset=utf-8"
107974     msgid "help 2"
107975     msgstr "help 2 translation"
107976     #
107977     domain "error_domain"
107978     msgid ""
107979     msgstr "charset=utf-8"
107980     msgid "error 3"
107981     msgstr "error 3 translation"
107982
107983     $ cat module2.po
107984     # default domain "messages"
107985     msgid ""
107986     msgstr "charset=utf-8"
107987     msgid "mesg 4"
107988     msgstr "mesg 4 translation"
107989     #
107990     domain "error_domain"
107991     msgid ""
107992     msgstr "charset=utf-8"
107993     #, c-format
107994     msgid "error 5 %s"
107995     msgstr "error 5 translation %s"
107996     #
107997     domain "window_domain"
107998     msgid ""
107999     msgstr "charset=utf-8"
108000     msgid "window 6"
108001     msgstr "window 6 translation"
108002
108003     $ cat module3.po
108004     # default domain "messages"
108005     # header will be used for the whole output file in the third example
108006     msgid ""
108007     msgstr "charset=utf-8"
108008     msgid "info 0"
108009     msgstr "info 0 translation"
108010
108011     $ cat opt_debug.po
108012     #
108013     domain "debug_domain"
108014     msgid "debug 8"
```

108012 **msgstr "debug 8 translation"**

108013 The following command will produce the output files **messages.mo**, **help\_domain.mo**, and  
108014 **error\_domain.mo**:

108015 **\$ msgfmt -S module1.po**

108016 The following command will produce the output files **messages.mo**, **help\_domain.mo**,  
108017 **error\_domain.mo**, and **window\_domain.mo**:

108018 **\$ msgfmt -S module1.po module2.po**

108019 The following command will produce the output file **hello.mo**:

108020 **\$ msgfmt -o hello.mo module3.po opt\_debug.po**

#### 108021 **RATIONALE**

108022 Some implementations are less strict about the format of dot-po files and simply treat all  
108023 occurrences of one or more white space characters as a separator. The format described in this  
108024 standard is accepted by all known implementations.

108025 In some implementations, duplicate **msgid** directives within a domain are ignored, and only an  
108026 entry for the first **msgid** directive and the following **msgid**, **msgid\_plural**, **msgstr**, or  
108027 **msgstr[index]** directives is created. However, some implementations consider duplicate **msgid**  
108028 directives within a domain to be an error and do not produce output at all. Consequently this  
108029 standard does not specify the behavior of *msgfmt* if duplicate **msgid** directives are encountered  
108030 within one domain.

#### 108031 **FUTURE DIRECTIONS**

108032 If this utility is directed to create a new directory entry that contains any bytes that have the  
108033 encoded value of a <newline> character, implementations are encouraged to treat this as an  
108034 error. A future version of this standard may require implementations to treat this as an error.

#### 108038 **CHANGE HISTORY**

108039 First released in Issue 8.

108040 **NAME**

108041 mv — move files

108042 **SYNOPSIS**108043 mv [-if] *source\_file target\_file*108044 mv [-if] *source\_file... target\_dir*108045 **DESCRIPTION**

108046 In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to  
 108047 the destination specified by the *target\_file*. This first synopsis form is assumed when the final  
 108048 operand does not name an existing directory and is not a symbolic link referring to an existing  
 108049 directory. In this case, if *source\_file* names a non-directory file and *target\_file* ends with a trailing  
 108050 <slash> character, *mv* shall treat this as an error and no *source\_file* operands shall be processed.

108051 In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a  
 108052 destination file in the existing directory named by the *target\_dir* operand, or referenced if  
 108053 *target\_dir* is a symbolic link referring to an existing directory. The destination path for each  
 108054 *source\_file* shall be the concatenation of the target directory, a single <slash> character if the  
 108055 target did not end in a <slash>, and the last pathname component of the *source\_file*. This second  
 108056 form is assumed when the final operand names an existing directory.

108057 If any operand specifies an existing file of a type not specified by the System Interfaces volume  
 108058 of POSIX.1-2024, the behavior is implementation-defined.

108059 For each *source\_file* the following steps shall be taken:

108060 1. If the destination path exists, the *-f* option is not specified, and either of the following  
 108061 conditions is true:

108062 a. The permissions of the destination path do not permit writing and the standard  
 108063 input is a terminal.

108064 b. The *-i* option is specified.

108065 the *mv* utility shall write a prompt to standard error and read a line from standard input.  
 108066 If the response is not affirmative, *mv* shall do nothing more with the current *source\_file*  
 108067 and go on to any remaining *source\_files*.

108068 2. If the *source\_file* operand and destination path resolve to either the same existing directory  
 108069 entry or different directory entries for the same existing file, then the destination path  
 108070 shall not be removed, and one of the following shall occur:

108071 a. No change is made to *source\_file*, no error occurs, and no diagnostic is issued.

108072 b. No change is made to *source\_file*, a diagnostic is issued to standard error  
 108073 identifying the two names, and the exit status is affected.

108074 c. If the *source\_file* operand and destination path name distinct directory entries, then  
 108075 the *source\_file* operand is removed, no error occurs, and no diagnostic is issued.

108076 The *mv* utility shall do nothing more with the current *source\_file*, and go on to any  
 108077 remaining *source\_files*.

108078 3. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the  
 108079 System Interfaces volume of POSIX.1-2024, called with the following arguments:

108080 a. The *source\_file* operand is used as the *old* argument.

- 108081           b. The destination path is used as the *new* argument.
- 108082           If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any  
108083           remaining *source\_files*. If this fails for any reasons other than those described for the *errno*  
108084           [EXDEV] in the System Interfaces volume of POSIX.1-2024, *mv* shall write a diagnostic  
108085           message to standard error, do nothing more with the current *source\_file*, and go on to any  
108086           remaining *source\_files*.
- 108087           4. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of  
108088           type directory, or it is a file not of type directory and *source\_file* is a file of type directory,  
108089           *mv* shall write a diagnostic message to standard error, do nothing more with the current  
108090           *source\_file*, and go on to any remaining *source\_files*. If the destination path exists and was  
108091           created by a previous step, it is unspecified whether this will be treated as an error or the  
108092           destination path will be overwritten.
- 108093           5. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv*  
108094           shall write a diagnostic message to standard error, do nothing more with the current  
108095           *source\_file*, and go on to any remaining *source\_files*.
- 108096           6. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the  
108097           destination path. If *source\_file* or any of the files below it in the hierarchy are symbolic  
108098           links, the links themselves shall be duplicated, including their contents, rather than any  
108099           files to which they refer. The following characteristics of each file in the file hierarchy  
108100           shall be duplicated:
- 108101           • The time of last data modification and time of last access
  - 108102           • The user ID and group ID
  - 108103           • The file mode
- 108104           If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode  
108105           bits S\_ISUID and S\_ISGID shall not be duplicated.
- 108106           When files are duplicated to another file system, the implementation may require that the  
108107           process invoking *mv* has read access to each file being duplicated.
- 108108           If files being duplicated to another file system have hard links to other files, it is  
108109           unspecified whether the files copied to the new file system have the hard links preserved  
108110           or separate copies are created for the linked files.
- 108111           If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic  
108112           message to standard error, do nothing more with the current *source\_file*, and go on to any  
108113           remaining *source\_files*.
- 108114           If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic  
108115           message to standard error, but this failure shall not cause *mv* to modify its exit status.
- 108116           7. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv*  
108117           shall write a diagnostic message to the standard error, do nothing more with the current  
108118           *source\_file*, and go on to any remaining *source\_files*.

## 108119 OPTIONS

- 108120           The *mv* utility shall conform to XBD [Section 12.2](#) (on page 215).
- 108121           The following options shall be supported:
- 108122           **-f**           Do not prompt for confirmation if the destination path exists. Any previous  
108123           occurrence of the **-i** option is ignored.

108124 **-i** Prompt for confirmation if the destination path exists. Any previous occurrence of  
 108125 the **-f** option is ignored.

108126 Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option  
 108127 specified shall determine the behavior of *mv*.

#### 108128 OPERANDS

108129 The following operands shall be supported:

108130 *source\_file* A pathname of a file or directory to be moved.

108131 *target\_file* A new pathname for the file or directory being moved.

108132 *target\_dir* A pathname of an existing directory into which to move the input files.

#### 108133 STDIN

108134 The standard input shall be used to read an input line in response to each prompt specified in  
 108135 the STDERR section. Otherwise, the standard input shall not be used.

#### 108136 INPUT FILES

108137 The input files specified by each *source\_file* operand can be of any file type.

#### 108138 ENVIRONMENT VARIABLES

108139 The following environment variables shall affect the execution of *mv*:

108140 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108141 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 108142 variables used to determine the values of locale categories.)

108143 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108144 internationalization variables.

108145 *LC\_COLLATE*

108146 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 108147 character collating elements used in the extended regular expression defined for  
 108148 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

108149 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108150 characters (for example, single-byte as opposed to multi-byte characters in  
 108151 arguments and input files), the behavior of character classes used in the extended  
 108152 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
 108153 category.

108154 *LC\_MESSAGES*

108155 Determine the locale used to process affirmative responses, and the locale used to  
 108156 affect the format and contents of diagnostic messages and prompts written to  
 108157 standard error.

108158 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

#### 108159 ASYNCHRONOUS EVENTS

108160 Default.

#### 108161 STDOUT

108162 Not used.

#### 108163 STDERR

108164 Prompts shall be written to the standard error under the conditions specified in the  
 108165 DESCRIPTION section. The prompts shall contain the destination pathname, but their format is  
 108166 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic

108167 messages.

#### 108168 OUTPUT FILES

108169 The output files may be of any file type.

#### 108170 EXTENDED DESCRIPTION

108171 None.

#### 108172 EXIT STATUS

108173 The following exit values shall be returned:

108174 0 All requested files (excluding files where a non-affirmative response was given to a request  
108175 for confirmation) were successfully moved.

108176 >0 An error occurred.

#### 108177 CONSEQUENCES OF ERRORS

108178 If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may  
108179 leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify  
108180 both *source\_file* and the destination path simultaneously; termination at any point shall leave  
108181 either *source\_file* or the destination path complete.

#### 108182 APPLICATION USAGE

108183 Some implementations mark for update the last file status change timestamp of renamed files  
108184 and some do not. Applications which make use of the last file status change timestamp may  
108185 behave differently with respect to renamed files unless they are designed to allow for either  
108186 behavior.

108187 The specification ensures that *mv a a* will not alter the contents of file *a*, and allows the  
108188 implementation to issue an error that a file cannot be moved onto itself. Likewise, when *a* and *b*  
108189 are hard links to the same file, *mv a b* will not alter *b*, but if a diagnostic is not issued, then it is  
108190 unspecified whether *a* is left untouched (as it would be by the *rename()* function) or unlinked  
108191 (reducing the link count of *b*).

#### 108192 EXAMPLES

108193 If the current directory contains only files *a* (of any type defined by the System Interfaces  
108194 volume of POSIX.1-2024), *b* (also of any type), and a directory *c*:

108195 `mv a b c`

108196 `mv c d`

108197 results with the original files *a* and *b* residing in the directory *d* in the current directory.

#### 108198 RATIONALE

108199 Early proposals diverged from the SVID and BSD historical practice in that they required that  
108200 when the destination path exists, the `-f` option is not specified, and input is not a terminal, *mv*  
108201 fails. This was done for compatibility with *cp*. The current text returns to historical practice. It  
108202 should be noted that this is consistent with the *rename()* function defined in the System  
108203 Interfaces volume of POSIX.1-2024, which does not require write permission on the target.

108204 For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for  
108205 confirmation, should be interpreted in the following manner:

```
108206 if (exists AND (NOT f_option) AND
108207     ((not_writable AND input_is_terminal) OR i_option))
```

108208 The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally  
108209 unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv*  
108210 deletes all existing destination paths without prompting, even when `-i` is specified; this is

108211 inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when  
 108212 the file is unwritable and the standard input is not a terminal. The standard developers decided  
 108213 that use of `-i` is a request for interaction, so when the destination path exists, the utility takes  
 108214 instructions from whatever responds to standard input.

108215 The *rename()* function is able to move directories within the same file system. Some historical  
 108216 versions of *mv* have been able to move directories, but not to a different file system. The  
 108217 standard developers considered that this was an annoying inconsistency, so this volume of  
 108218 POSIX.1-2024 requires directories to be able to be moved even across file systems. There is no `-R`  
 108219 option to confirm that moving a directory is actually intended, since such an option was not  
 108220 required for moving directories in historical practice. Requiring the application to specify it  
 108221 sometimes, depending on the destination, seemed just as inconsistent. The semantics of the  
 108222 *rename()* function were preserved as much as possible. For example, *mv* is not permitted to  
 108223 “rename” files to or from directories, even though they might be empty and removable.

108224 Historic implementations of *mv* did not exit with a non-zero exit status if they were unable to  
 108225 duplicate any file characteristics when moving a file across file systems, nor did they write a  
 108226 diagnostic message for the user. The former behavior has been preserved to prevent scripts from  
 108227 breaking; a diagnostic message is now required, however, so that users are alerted that the file  
 108228 characteristics have changed.

108229 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 108230 contents of prompts are specified because implementations may desire more descriptive  
 108231 prompts than those used on historical implementations. Therefore, an application not using the  
 108232 `-f` option or using the `-i` option relies on the system to provide the most suitable dialog directly  
 108233 with the user, based on the behavior specified.

108234 When *mv* is dealing with a single file system and *source\_file* is a symbolic link, the link itself is  
 108235 moved as a consequence of the dependence on the *rename()* functionality, per the  
 108236 DESCRIPTION. Across file systems, this has to be made explicit.

#### 108237 **FUTURE DIRECTIONS**

108238 If this utility is directed to create a new directory entry that contains any bytes that have the  
 108239 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 108240 error. A future version of this standard may require implementations to treat this as an error.

#### 108245 **CHANGE HISTORY**

108246 First released in Issue 2.

#### 108247 **Issue 6**

108248 The *mv* utility is changed to describe processing of symbolic links as specified in the  
 108249 IEEE P1003.2b draft standard.

108250 The APPLICATION USAGE section is added.

#### 108251 **Issue 7**

108252 Austin Group Interpretation 1003.1-2001 #016 is applied.

108253 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
 108254 *LC\_MESSAGES* environment variable.

108255 Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

- 108256 SD5-XCU-ERN-13 is applied, making an editorial correction to the SYNOPSIS.
- 108257 SD5-XCU-ERN-51 is applied to the DESCRIPTION, defining the behavior for when files are  
108258 being duplicated to another file system while having hard links.
- 108259 Changes are made related to support for finegrained timestamps.
- 108260 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0124 [48] is applied.
- 108261 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0147 [534] is applied.
- 108262 **Issue 8**
- 108263 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
108264 filenames containing any bytes that have the encoded value of a <newline> character.
- 108265 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 108266 Austin Group Defect 1732 is applied, changing the EXIT STATUS section.

108267 **NAME**

108268 newgrp — change to a new group

108269 **SYNOPSIS**108270 newgrp [-l] [*group*]108271 **DESCRIPTION**

108272 The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 108273 group identification. Of the attributes listed in [Section 2.13](#) (on page 2522), the new shell  
 108274 execution environment shall retain the working directory, file creation mask, and exported  
 108275 variables from the previous environment (that is, open files, traps, unexported variables, alias  
 108276 definitions, shell functions, and *set* options may be lost). All other aspects of the process  
 108277 environment that are preserved by the *exec* family of functions defined in the System Interfaces  
 108278 volume of POSIX.1-2024 shall also be preserved by *newgrp*; whether other aspects are preserved  
 108279 is unspecified.

108280 A failure to assign the new group identifications (for example, for security or password-related  
 108281 reasons) shall not prevent the new shell execution environment from being created.

108282 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 108283 • On systems where the effective group ID is normally in the supplementary group list (or  
 108284 whenever the old effective group ID actually is in the supplementary group list):
  - 108285 — If the new effective group ID is also in the supplementary group list, *newgrp* shall  
 108286 change the effective group ID.
  - 108287 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add  
 108288 the new effective group ID to the list, if there is room to add it.
- 108289 • On systems where the effective group ID is not normally in the supplementary group list  
 108290 (or whenever the old effective group ID is not in the supplementary group list):
  - 108291 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete  
 108292 it.
  - 108293 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if  
 108294 there is room.

108295 **Note:** The System Interfaces volume of POSIX.1-2024 does not specify whether the effective group ID  
 108296 of a process is included in its supplementary group list.

108297 With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 108298 user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 108299 database entries.

108300 If the first argument is '-', the results are unspecified.

108301 If a password is required for the specified group, and the user is not listed as a member of that  
 108302 group in the group database, the user shall be prompted to enter the correct password for that  
 108303 group. If the user is listed as a member of that group, no password shall be requested. If no  
 108304 password is required for the specified group, it is implementation-defined whether users not  
 108305 listed as members of that group can change to that group. Whether or not a password is  
 108306 required, implementation-defined system accounting or security mechanisms may impose  
 108307 additional authorization restrictions that may cause *newgrp* to write a diagnostic message and  
 108308 suppress the changing of the group identification.

108309 **OPTIONS**

108310 The *newgrp* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified  
108311 usage of `'-'`.

108312 The following option shall be supported:

108313 `-l` (The letter ell.) Change the environment to what would be expected if the user  
108314 actually logged in again.

108315 **OPERANDS**

108316 The following operand shall be supported:

108317 *group* A group name from the group database or a non-negative numeric group ID.  
108318 Specifies the group ID to which the real and effective group IDs shall be set. If  
108319 *group* is a non-negative numeric string and exists in the group database as a group  
108320 name (see *getgrnam()*), the numeric group ID associated with that group name  
108321 shall be used as the group ID.

108322 **STDIN**

108323 Not used.

108324 **INPUT FILES**

108325 The file `/dev/tty` shall be used to read a single line of text for password checking, when one is  
108326 required.

108327 **ENVIRONMENT VARIABLES**

108328 The following environment variables shall affect the execution of *newgrp*:

108329 *LANG* Provide a default value for the internationalization variables that are unset or null.  
108330 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
108331 variables used to determine the values of locale categories.)

108332 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
108333 internationalization variables.

108334 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
108335 characters (for example, single-byte as opposed to multi-byte characters in  
108336 arguments).

108337 *LC\_MESSAGES*

108338 Determine the locale that should be used to affect the format and contents of  
108339 diagnostic messages written to standard error.

108340 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.

108341 **ASYNCHRONOUS EVENTS**

108342 Default.

108343 **STDOUT**

108344 Not used.

108345 **STDERR**

108346 The standard error shall be used for diagnostic messages and a prompt string for a password, if  
108347 one is required. Diagnostic messages may be written in cases where the exit status is not  
108348 available. See the EXIT STATUS section.

108349 **OUTPUT FILES**

108350 None.

108351 **EXTENDED DESCRIPTION**

108352 None.

108353 **EXIT STATUS**

108354 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group identification was changed successfully, the exit status shall be the exit status of the shell.

108355 Otherwise, the following exit value shall be returned:

108356 &gt;0 An error occurred.

108358 **CONSEQUENCES OF ERRORS**

108359 The invoking shell may terminate.

108360 **APPLICATION USAGE**

108361 There is no convenient way to enter a password into the group database. Use of group passwords is not encouraged, because by their very nature they encourage poor security practices. Group passwords may disappear in the future.

108362 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with *newgrp*, which in turn overlays itself with a new shell after changing group. On some implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

108363 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a useful interface for the support of applications.

108364 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it successfully invokes a new shell and the rest of the original shell script is bypassed when the new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems. But usage such as:

108365 

```
newgrp foo
```

108366 

```
echo $?
```

108367 is not useful because the new shell might not have access to any status *newgrp* may have generated (and most historical systems do not provide this status). A zero status echoed here does not necessarily indicate that the user has changed to the new group successfully. Following *newgrp* with the *id* command provides a portable means of determining whether the group change was successful or not.

108380 **EXAMPLES**

108381 None.

108382 **RATIONALE**

108383 Most historical implementations use one of the *exec* functions to implement the behavior of *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp* issue a diagnostic message to tell the user that the environment changed, it would be inappropriate to require this change to some historical implementations.

108384 The password mechanism is allowed in the group database, but how this would be implemented is not specified.

108385 The *newgrp* utility was retained in this volume of POSIX.1-2024, even given the existence of the multiple group permissions feature in the System Interfaces volume of POSIX.1-2024, for several reasons. First, in some implementations, the group ownership of a newly created file is determined by the group of the directory in which the file is created, as allowed by the System

108394 Interfaces volume of POSIX.1-2024; on other implementations, the group ownership of a newly  
108395 created file is determined by the effective group ID. On implementations of the latter type,  
108396 *newgrp* allows files to be created with a specific group ownership. Finally, many  
108397 implementations use the real group ID in accounting, and on such systems, *newgrp* allows the  
108398 accounting identity of the user to be changed.

108399 **FUTURE DIRECTIONS**

108400 None.

108401 **SEE ALSO**

108403 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

108404 XSH *exec*, *getgrnam()*

108405 **CHANGE HISTORY**

108406 First released in Issue 2.

108407 **Issue 6**

108408 This utility is marked as part of the User Portability Utilities option.

108409 The obsolescent SYNOPSIS is removed.

108410 The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
108411 greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
108412 requirement.

108413 **Issue 7**

108414 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
108415 argument is '- '.

108416 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108417 The *newgrp* utility is moved from the User Portability Utilities option to the Base. User  
108418 Portability Utilities is now an option for interactive utilities.

108419 **Issue 8**

108420 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

108421 **NAME**

108422           ngettext — retrieve text string from messages object

108423 **SYNOPSIS**108424           ngettext [-e|-E] [-d *textdomain*] [*textdomain*] *msgid msgid\_plural n*108425 **DESCRIPTION**108426           Refer to *gettext*.

108427 **NAME**

108428 nice — invoke a utility with an altered nice value

108429 **SYNOPSIS**

108430 nice [-n *increment*] *utility* [*argument...*]

108431 **DESCRIPTION**

108432 The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see  
 108433 XBD [Section 3.225](#), on page 64). With no options, the executed utility shall be run with a nice  
 108434 value that is some implementation-defined quantity greater than or equal to the nice value of the  
 108435 current process. If the user lacks appropriate privileges to affect the nice value in the requested  
 108436 manner, the *nice* utility shall not affect the nice value; in this case, a warning message may be  
 108437 written to standard error, but this shall not prevent the invocation of *utility* or affect the exit  
 108438 status.

108439 **OPTIONS**

108440 The *nice* utility shall conform to XBD [Section 12.2](#) (on page 215).

108441 The following option is supported:

108442 **-n *increment*** A positive or negative decimal integer which shall have the same effect on the  
 108443 execution of the utility as if the utility had called the *nice()* function with the  
 108444 numeric value of the *increment* option-argument.

108445 **OPERANDS**

108446 The following operands shall be supported:

108447 *utility* The name of a utility that is to be invoked. If the *utility* operand names any of the  
 108448 special built-in utilities in [Section 2.15](#) (on page 2526), the results are undefined.

108449 *argument* Any string to be supplied as an argument when invoking the utility named by the  
 108450 *utility* operand.

108451 **STDIN**

108452 Not used.

108453 **INPUT FILES**

108454 None.

108455 **ENVIRONMENT VARIABLES**

108456 The following environment variables shall affect the execution of *nice*:

108457 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108458 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 108459 variables used to determine the values of locale categories.)

108460 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108461 internationalization variables.

108462 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108463 characters (for example, single-byte as opposed to multi-byte characters in  
 108464 arguments).

108465 **LC\_MESSAGES**

108466 Determine the locale that should be used to affect the format and contents of  
 108467 diagnostic messages written to standard error.

108468 **XSIX** **NLSPATH** Determine the location of messages objects and message catalogs.

108469 *PATH* Determine the search path used to locate the utility to be invoked. See XBD  
108470 [Chapter 8](#) (on page 167).

108471 **ASYNCHRONOUS EVENTS**

108472 Default.

108473 **STDOUT**

108474 Not used.

108475 **STDERR**

108476 The standard error shall be used only for diagnostic messages.

108477 **OUTPUT FILES**

108478 None.

108479 **EXTENDED DESCRIPTION**

108480 None.

108481 **EXIT STATUS**

108482 If *utility* is invoked, the exit status of *nice* shall be the exit status of *utility*; otherwise, the *nice*  
108483 utility shall exit with one of the following values:

108484 1-125 An error occurred in the *nice* utility.

108485 126 The utility specified by *utility* was found but could not be invoked.

108486 127 The utility specified by *utility* could not be found.

108487 **CONSEQUENCES OF ERRORS**

108488 Default.

108489 **APPLICATION USAGE**

108490 The only guaranteed portable uses of this utility are:

108491 *nice utility*

108492 Run *utility* with the default higher or equal nice value.

108493 *nice -n <positive integer> utility*

108494 Run *utility* with a higher nice value.

108495 On some implementations they have no discernible effect on the invoked utility and on some  
108496 others they are exactly equivalent.

108497 Historical systems have frequently supported the *<positive integer>* up to 20. Since there is no  
108498 error penalty associated with guessing a number that is too high, users without access to the  
108499 system conformance document (to see what limits are actually in place) could use the historical 1  
108500 to 20 range or attempt to use very large numbers if the job should be truly low priority.

108501 The nice value of a process can be displayed using the command:

108502 `ps -o nice`

108503 The *command*, *env*, *nice*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit  
108504 code 127 if a utility to be invoked cannot be found, so that applications can distinguish “failure  
108505 to find a utility” from “invoked utility exited with an error indication”. The value 127 was  
108506 chosen because it is not commonly used for other meanings; most utilities use small values for  
108507 “normal error conditions” and the values above 128 can be confused with termination due to  
108508 receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could  
108509 be found, but not invoked. Some scripts produce meaningful error messages differentiating the  
108510 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice  
108511 that uses 127 when all attempts to *exec* the utility fail with [ENOENT], and uses 126 when any

108512 attempt to *exec* the utility fails for any other reason.

108513 **EXAMPLES**

108514 None.

108515 **RATIONALE**

108516 The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The  
108517 command *nice -x utility*, for example, would be treated the same as the command *nice --1*  
108518 *utility*. If the user does not have appropriate privileges, this results in a “permission denied”  
108519 error. This is considered a bug.

108520 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
108521 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
108522 run the utility. The standard specifies the System V behavior together with an optional BSD-style  
108523 “permission denied” message.

108524 The C shell has a built-in version of *nice* that has a different interface from the one described in  
108525 this volume of POSIX.1-2024.

108526 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
108527 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
108528 However, “utility” includes user application programs and shell scripts, not just utilities defined  
108529 in this volume of POSIX.1-2024.

108530 Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the  
108531 default nice value being the midpoint of that range. By default, they raise the nice value of the  
108532 executed utility by 10.

108533 Some historical documentation states that the *increment* value must be within a fixed range. This  
108534 is misleading; the valid *increment* values on any invocation are determined by the current  
108535 process nice value, which is not always the default.

108536 The definition of nice value is not intended to suggest that all processes in a system have  
108537 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
108538 System Interfaces volume of POSIX.1-2024 make the notion of a single underlying priority for all  
108539 scheduling policies problematic. Some implementations may implement the *nice*-related features  
108540 to affect all processes on the system, others to affect just the general time-sharing activities  
108541 implied by this volume of POSIX.1-2024, and others may have no effect at all. Because of the use  
108542 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
108543 possible.

108544 Earlier versions of this standard allowed a *-increment* option. This form is no longer specified by  
108545 POSIX.1-2024 but may be present in some implementations.

108546 **FUTURE DIRECTIONS**

108547 None.

108548 **SEE ALSO**

108552 **CHANGE HISTORY**

108553 First released in Issue 4.

108554 **Issue 6**

108555 This utility is marked as part of the User Portability Utilities option.

108556 The obsolescent SYNOPSIS is removed.

108557 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/18 is applied, deleting a paragraph of  
108558 RATIONALE that referred to text no longer in the standard.

108559 **Issue 7**

108560 Austin Group Interpretation 1003.1-2001 #027 is applied.

108561 SD5-XCU-ERN-32 and SD5-XCU-ERN-33 are applied, updating the DESCRIPTION,  
108562 APPLICATION USAGE, and RATIONALE sections.

108563 The *nice* utility is moved from the User Portability Utilities option to the Base. User Portability  
108564 Utilities is now an option for interactive utilities.

108565 **Issue 8**

108566 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

108567 Austin Group Defect 1586 is applied, adding the *timeout* utility.

108568 Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

108569 **NAME**

108570 nl — line numbering filter

108571 **SYNOPSIS**

```
108572 XSI nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num]
108573 [-n format] [-s sep] [-v startnum] [-w width] [file]
```

108574 **DESCRIPTION**

108575 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 108576 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 108577 functionality may be provided in accordance with the command options in effect.

108578 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at  
 108579 the start of each logical page. A logical page consists of a header, a body, and a footer section.  
 108580 Empty sections are valid. Different line numbering options are independently available for  
 108581 header, body, and footer (for example, no numbering of header and footer lines while  
 108582 numbering blank lines only in the body).

108583 The starts of logical page sections shall be signaled by input lines containing nothing but the  
 108584 following delimiter characters:

| Line     | Start of |
|----------|----------|
| \: \: \: | Header   |
| \: \:    | Body     |
| \:       | Footer   |

108585  
 108586  
 108587  
 108588  
 108589 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

108590 **OPTIONS**

108591 The *nl* utility shall conform to XBD [Section 12.2](#) (on page 215). Only one file can be named.

108592 The following options shall be supported:

108593 **-b *type*** Specify which logical page body lines shall be numbered. Recognized *types* and  
 108594 their meaning are:

108595 **a** Number all lines.

108596 **t** Number only non-empty lines.

108597 **n** No line numbering.

108598 **pstring** Number only lines that contain the basic regular expression specified in  
 108599 *string*.

108600 The default *type* for logical page body shall be **t** (text lines numbered).

108601 **-d *delim*** Specify the delimiter characters that indicate the start of a logical page section.  
 108602 These can be changed from the default characters "\: \" to two user-specified  
 108603 characters. If only one character is entered, the second character shall remain the  
 108604 default character ' : '.

108605 **-f *type*** Specify the same as **b *type*** except for footer. The default for logical page footer shall  
 108606 be **n** (no lines numbered).

108607 **-h *type*** Specify the same as **b *type*** except for header. The default *type* for logical page  
 108608 header shall be **n** (no lines numbered).

- 108609        **-i** *incr*        Specify the increment value used to number logical page lines. The default shall be  
108610        1.
- 108611        **-l** *num*         Specify the number of blank lines to be considered as one. For example, **-l 2** results  
108612        in only the second adjacent blank line being numbered (if the appropriate **-h a**,  
108613        **-b a**, or **-f a** option is set). The default shall be 1.
- 108614        **-n** *format*       Specify the line numbering format. Recognized values are: **ln**, left justified, leading  
108615        zeros suppressed; **rn**, right justified, leading zeros suppressed; **rz**, right justified,  
108616        leading zeros kept. The default *format* shall be **rn** (right justified).
- 108617        **-p**             Specify that numbering should not be restarted at logical page delimiters.
- 108618        **-s** *sep*         Specify the characters used in separating the line number and the corresponding  
108619        text line. The default *sep* shall be a <tab>.
- 108620        **-v** *startnum*    Specify the initial value used to number logical page lines. The default shall be 1.
- 108621        **-w** *width*       Specify the number of characters to be used for the line number. The default *width*  
108622        shall be 6.

#### 108623 OPERANDS

108624        The following operand shall be supported:

- 108625        *file*            A pathname of a text file to be line-numbered.

#### 108626 STDIN

108627        The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
108628        operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
108629        the standard input shall not be used. See the INPUT FILES section.

#### 108630 INPUT FILES

108631        The input file shall be a text file.

#### 108632 ENVIRONMENT VARIABLES

108633        The following environment variables shall affect the execution of *nl*:

- 108634        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
108635        (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
108636        variables used to determine the values of locale categories.)

- 108637        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
108638        internationalization variables.

#### 108639 *LC\_COLLATE*

108640        Determine the locale for the behavior of ranges, equivalence classes, and multi-  
108641        character collating elements within regular expressions.

- 108642        *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
108643        characters (for example, single-byte as opposed to multi-byte characters in  
108644        arguments and input files), the behavior of character classes within regular  
108645        expressions, and for deciding which characters are in character class **graph** (for the  
108646        **-b t**, **-f t**, and **-h t** options).

#### 108647 *LC\_MESSAGES*

108648        Determine the locale that should be used to affect the format and contents of  
108649        diagnostic messages written to standard error.

- 108650 *NLSPATH* Determine the location of messages objects and message catalogs.
- 108651 **ASYNCHRONOUS EVENTS**
- 108652 Default.
- 108653 **STDOUT**
- 108654 The standard output shall be a text file in the following format:
- 108655 "%s%s%s", <line number>, <separator>, <input line>
- 108656 where <line number> is one of the following numeric formats:
- 108657 %6d When the **rn** format is used (the default; see **-n**).
- 108658 %06d When the **rz** format is used.
- 108659 %-6d When the **ln** format is used.
- 108660 <empty> When line numbers are suppressed for a portion of the page; the <separator> is also  
108661 suppressed.
- 108662 In the preceding list, the number 6 is the default width; the **-w** option can change this value.
- 108663 **STDERR**
- 108664 The standard error shall be used only for diagnostic messages.
- 108665 **OUTPUT FILES**
- 108666 None.
- 108667 **EXTENDED DESCRIPTION**
- 108668 None.
- 108669 **EXIT STATUS**
- 108670 The following exit values shall be returned:
- 108671 0 Successful completion.
- 108672 >0 An error occurred.
- 108673 **CONSEQUENCES OF ERRORS**
- 108674 Default.
- 108675 **APPLICATION USAGE**
- 108676 In using the **-d** *delim* option, care should be taken to escape characters that have special meaning  
108677 to the command interpreter.
- 108678 **EXAMPLES**
- 108679 The command:
- 108680 `nl -v 10 -i 10 -d \!+ file1`
- 108681 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is  
108682 "!+". Note that the "!" has to be escaped when using *csh* as a command interpreter because of  
108683 its history substitution syntax. For *ksh* and *sh* the escape is not necessary, but does not do any  
108684 harm.
- 108685 **RATIONALE**
- 108686 None.

108687 **FUTURE DIRECTIONS**

108688 None.

108689 **SEE ALSO**108690 *pr*108691 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)108692 **CHANGE HISTORY**

108693 First released in Issue 2.

108694 **Issue 5**108695 The option [-f *type*] is added to the SYNOPSIS. The option descriptions are presented in  
108696 alphabetic order. The description of -bt is changed to ``Number only non-empty lines''.108697 **Issue 6**108698 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
108699 is removed.108700 **Issue 7**

108701 Austin Group Interpretation 1003.1-2001 #092 is applied.

108702 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108703 **Issue 8**108704 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

108705 **NAME**108706 nm — write the name list of an object file (**DEVELOPMENT**)108707 **SYNOPSIS**108708 SD nm [-APv] [-g|-u] [-t *format*] *file...*108709 XSI nm [-APv] [-efox] [-g|-u] [-t *format*] *file...*108710 **DESCRIPTION**

108711 The *nm* utility shall display symbolic information appearing in the object file, executable file, or  
 108712 object-file library named by *file*. If no symbolic information is available for a valid input file, the  
 108713 *nm* utility shall report that fact, but not consider it an error condition.

108714 XSI The default base used when numeric values are written is unspecified. On XSI-conformant  
 108715 systems, it shall be decimal if the **-P** option is not specified.

108716 **OPTIONS**108717 The *nm* utility shall conform to XBD [Section 12.2](#) (on page 215).

108718 The following options shall be supported:

108719 **-A** Write the full pathname or library name of an object on each line.108720 XSI **-e** Write only external (global) and static symbol information.

108721 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally  
 108722 suppressed.

108723 **-g** Write only external (global) symbol information.108724 XSI **-o** Write numeric values in octal (equivalent to **-t o**).108725 **-P** Write information in a portable output format, as specified in the STDOUT section.

108726 **-t *format*** Write each numeric value in the specified format. The format shall be dependent  
 108727 on the single character used as the *format* option-argument:

108728 XSI d decimal (default if **-P** is not specified).

108729 o octal.

108730 x hexadecimal (default if **-P** is specified).108731 **-u** Write only undefined symbols.108732 **-v** Sort output by value instead of by symbol name.108733 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).108734 **OPERANDS**

108735 The following operand shall be supported:

108736 *file* A pathname of an object file, executable file, or object-file library.108737 **STDIN**

108738 See the INPUT FILES section.

108739 **INPUT FILES**

108740 The input file shall be an object file, an object-file library whose format is the same as those  
 108741 produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept  
 108742 additional implementation-defined object library formats for the input file.

108743 **ENVIRONMENT VARIABLES**

108744 The following environment variables shall affect the execution of *nm*:

108745 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108746 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 108747 variables used to determine the values of locale categories.)

108748 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108749 internationalization variables.

108750 *LC\_COLLATE*

108751 Determine the locale for character collation information for the symbol-name and  
 108752 symbol-value collation sequences.

108753 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108754 characters (for example, single-byte as opposed to multi-byte characters in  
 108755 arguments).

108756 *LC\_MESSAGES*

108757 Determine the locale that should be used to affect the format and contents of  
 108758 diagnostic messages written to standard error.

108759 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

108760 **ASYNCHRONOUS EVENTS**

108761 Default.

108762 **STDOUT**

108763 If symbolic information is present in the input files, then for each file or for each member of an  
 108764 archive, the *nm* utility shall write the following information to standard output. By default, the  
 108765 format is unspecified, but the output shall be sorted by symbol name according to the collation  
 108766 sequence in the current locale.

- 108767 • Library or object name, if *-A* is specified
- 108768 • Symbol name
- 108769 • Symbol type, which shall either be one of the following single characters or an  
 108770 implementation-defined type represented by a single character:
  - 108771 A Global absolute symbol.
  - 108772 a Local absolute symbol.
  - 108773 B Global ``bss'' (that is, uninitialized data space) symbol.
  - 108774 b Local bss symbol.
  - 108775 D Global data symbol.
  - 108776 d Local data symbol.
  - 108777 T Global text symbol.
  - 108778 t Local text symbol.
  - 108779 U Undefined symbol.
- 108780 • Value of the symbol
- 108781 • The size associated with the symbol, if applicable

108782 This information may be supplemented by additional information specific to the

108783 implementation.

108784 If the **-P** option is specified, the previous information shall be displayed using the following  
108785 portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,  
108786 respectively:

108787 "%s%s %s %d %d\n", <library/object name>, <name>, <type>,  
108788 <value>, <size>

108789 "%s%s %s %o %o\n", <library/object name>, <name>, <type>,  
108790 <value>, <size>

108791 "%s%s %s %x %x\n", <library/object name>, <name>, <type>,  
108792 <value>, <size>

108793 where <library/object name> shall be formatted as follows:

- 108794 • If **-A** is not specified, <library/object name> shall be an empty string.
- 108795 • If **-A** is specified and the corresponding *file* operand does not name a library:  
108796 "%s: ", <file>
- 108797 • If **-A** is specified and the corresponding *file* operand names a library. In this case,  
108798 <object file> shall name the object file in the library containing the symbol being described:  
108799 "%s[%s]: ", <file>, <object file>

108800 If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is  
108801 specified and it names a library, *nm* shall write a line identifying the object containing the  
108802 following symbols before the lines containing those symbols, in the form:

- 108803 • If the corresponding *file* operand does not name a library:  
108804 "%s:\n", <file>
- 108805 • If the corresponding *file* operand names a library; in this case, <object file> shall be the  
108806 name of the file in the library containing the following symbols:  
108807 "%s[%s]:\n", <file>, <object file>

108808 If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

#### 108809 **STDERR**

108810 The standard error shall be used only for diagnostic messages.

#### 108811 **OUTPUT FILES**

108812 None.

#### 108813 **EXTENDED DESCRIPTION**

108814 None.

#### 108815 **EXIT STATUS**

108816 The following exit values shall be returned:

108817 0 Successful completion.

108818 >0 An error occurred.

#### 108819 **CONSEQUENCES OF ERRORS**

108820 Default.

**108821 APPLICATION USAGE**

108822 Mechanisms for dynamic linking make this utility less meaningful when applied to an  
108823 executable file because a dynamically linked executable may omit numerous library routines  
108824 that would be found in a statically linked executable.

**108825 EXAMPLES**

108826 None.

**108827 RATIONALE**

108828 Historical implementations of *nm* have used different bases for numeric output and supplied  
108829 different default types of symbols that were reported. The `-t format` option, similar to that used  
108830 in *od* and *strings*, can be used to specify the numeric base; `-g` and `-u` can be used to restrict the  
108831 amount of output or the types of symbols included in the output.

108832 The compromise of using `-t format` versus using `-d`, `-o`, and other similar options was necessary  
108833 because of differences in the meaning of `-o` between implementations. The `-o` option from BSD  
108834 has been provided here as `-A` to avoid confusion with the `-o` from System V (which has been  
108835 provided here as `-t` and as `-o` on XSI-conformant systems).

108836 The option list was significantly reduced from that provided by historical implementations.

108837 The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified  
108838 default output.

108839 It was recognized that mechanisms for dynamic linking make this utility less meaningful when  
108840 applied to an executable file (because a dynamically linked executable file may omit numerous  
108841 library routines that would be found in a statically linked executable file), but the value of *nm*  
108842 during software development was judged to outweigh other limitations.

108843 The default output format of *nm* is not specified because of differences in historical  
108844 implementations. The `-P` option was added to allow some type of portable output format. After  
108845 a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to  
108846 create one that did not match the current format of any of these four systems. The format  
108847 devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary  
108848 depending on locale (because no English descriptions are included). All of the systems currently  
108849 have the information available to use this format.

108850 The format given in *nm* STDOUT uses `<space>` characters between the fields, which may be any  
108851 number of `<blank>` characters required to align the columns. The single-character types were  
108852 selected to match historical practice, and the requirement that implementation additions also be  
108853 single characters made parsing the information easier for shell scripts.

**108854 FUTURE DIRECTIONS**

108855 If this utility is directed to display a pathname that contains any bytes that have the encoded  
108856 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
108857 format being used, implementations are encouraged to treat this as an error. A future version of  
108858 this standard may require implementations to treat this as an error.

**108859 SEE ALSO**

108860 *ar*, *c17*

108861 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**108862 CHANGE HISTORY**

108863 First released in Issue 2.

108864 **Issue 6**

108865 This utility is marked as supported when both the User Portability Utilities option and the  
108866 Software Development Utilities option are supported.

108867 **Issue 7**

108868 The *nm* utility is removed from the User Portability Utilities option. User Portability Utilities is  
108869 now an option for interactive utilities.

108870 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108871 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0125 [263] and XCU/TC1-2008/0126  
108872 [263] are applied.

108873 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0148 [744] is applied.

108874 **Issue 8**

108875 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
108876 directed to display a pathname that contains any bytes that have the encoded value of a  
108877 <newline> character when <newline> is a terminator or separator in the output format being  
108878 used.

108879 Austin Group Defect 1062 is applied, inserting an empty line between the two SYNOPSIS forms.

108880 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

108881 **NAME**

108882       nohup — invoke a utility immune to hangups

108883 **SYNOPSIS**108884       nohup *utility* [*argument...*]108885 **DESCRIPTION**

108886       The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
 108887       as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
 108888       set to be ignored.

108889       If standard input is associated with a terminal, the *nohup* utility may redirect standard input  
 108890       from an unspecified file.

108891       If the standard output is a terminal, all output written by the named *utility* to its standard output  
 108892       shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
 108893       be created or opened for appending, the output shall be appended to the end of the file  
 108894       **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
 108895       created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
 108896       permission bits shall be set to S\_IRUSR | S\_IWUSR.

108897       If standard error is a terminal and standard output is open but is not a terminal, all output  
 108898       written by the named utility to its standard error shall be redirected to the same open file  
 108899       description as the standard output. If standard error is a terminal and standard output either is a  
 108900       terminal or is closed, the same output shall instead be appended to the end of the **nohup.out** file  
 108901       as described above.

108902 **OPTIONS**

108903       None.

108904 **OPERANDS**

108905       The following operands shall be supported:

108906       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 108907       special built-in utilities in [Section 2.15](#) (on page 2526), the results are undefined.

108908       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
 108909       *utility* operand.

108910 **STDIN**

108911       Not used.

108912 **INPUT FILES**

108913       None.

108914 **ENVIRONMENT VARIABLES**108915       The following environment variables shall affect the execution of *nohup*:

108916       *HOME*       Determine the pathname of the user's home directory: if the output file **nohup.out**  
 108917       cannot be created in the current directory, the *nohup* utility shall use the directory  
 108918       named by *HOME* to create the file.

108919       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 108920       (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 108921       variables used to determine the values of locale categories.)

108922       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 108923       internationalization variables.

- 108924            *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
108925            characters (for example, single-byte as opposed to multi-byte characters in  
108926            arguments).
- 108927            *LC\_MESSAGES*  
108928            Determine the locale that should be used to affect the format and contents of  
108929            diagnostic messages written to standard error.
- 108930 XSI        *NLSPATH*    Determine the location of messages objects and message catalogs.
- 108931            *PATH*        Determine the search path that is used to locate the utility to be invoked. See XBD  
108932            [Chapter 8](#) (on page 167).
- 108933 **ASYNCHRONOUS EVENTS**  
108934            The *nohup* utility shall take the standard action for all signals except that **SIGHUP** shall be  
108935            ignored.
- 108936 **STDOUT**  
108937            If the standard output is not a terminal, the standard output of *nohup* shall be the standard  
108938            output generated by the execution of the *utility* specified by the operands. Otherwise, nothing  
108939            shall be written to the standard output.
- 108940 **STDERR**  
108941            If the standard output is a terminal, a message shall be written to the standard error, indicating  
108942            the name of the file to which the output is being appended. The name of the file shall be either  
108943            **nohup.out** or **\$HOME/nohup.out**.
- 108944 **OUTPUT FILES**  
108945            Output written by the named utility is appended to the file **nohup.out** (or **\$HOME/nohup.out**),  
108946            if the conditions hold as described in the **DESCRIPTION**.
- 108947 **EXTENDED DESCRIPTION**  
108948            None.
- 108949 **EXIT STATUS**  
108950            The following exit values shall be returned:
- 108951            126        The utility specified by *utility* was found but could not be invoked.
- 108952            127        An error occurred in the *nohup* utility or the utility specified by *utility* could not be  
108953            found.
- 108954            Otherwise, the exit status of *nohup* shall be that of the utility specified by the *utility* operand.
- 108955 **CONSEQUENCES OF ERRORS**  
108956            Default.
- 108957 **APPLICATION USAGE**  
108958            The *command*, *env*, *nice*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit  
108959            code 127 if a utility to be invoked cannot be found, so that applications can distinguish “failure  
108960            to find a utility” from “invoked utility exited with an error indication”. However, the *command*  
108961            and *nohup* utilities also use exit code 127 when an error occurs in those utilities, which means  
108962            exit code 127 is not universally a “not found” indicator. The value 127 was chosen because it is  
108963            not commonly used for other meanings; most utilities use small values for “normal error  
108964            conditions” and the values above 128 can be confused with termination due to receipt of a  
108965            signal. The value 126 was chosen in a similar manner to indicate that the utility could be found,  
108966            but not invoked. Some scripts produce meaningful error messages differentiating the 126 and  
108967            127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice that  
108968            uses 127 when all attempts to *exec* the utility fail with **[ENOENT]**, and uses 126 when any

108969 attempt to *exec* the utility fails for any other reason.

#### 108970 EXAMPLES

108971 It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by  
108972 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
108973 the *nohup* applies to everything in the file.

108974 Alternatively, the following command can be used to apply *nohup* to a complex command:

```
108975 nohup sh -c -- 'complex-command-line' </dev/null
```

#### 108976 RATIONALE

108977 The 4.3 BSD version ignores SIGTERM and SIGHUP, and if **./nohup.out** cannot be used, it fails  
108978 instead of trying to use **\$HOME/nohup.out**.

108979 The *cs* utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this  
108980 volume of POSIX.1-2024.

108981 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
108982 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
108983 includes user application programs and shell scripts, not just the standard utilities.

108984 Historical versions of the *nohup* utility use default file creation semantics. Some more recent  
108985 versions use the permissions specified here as an added security precaution.

108986 Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore  
108987 SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several  
108988 reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this  
108989 volume of POSIX.1-2024.

108990 Historical versions of *nohup* did not affect standard input, but that causes problems in the  
108991 common scenario where the user logs into a system, types the command:

```
108992 nohup make &
```

108993 at the prompt, and then logs out. If standard input is not affected by *nohup*, the login session  
108994 may not terminate for quite some time, since standard input remains open until *make* exits. To  
108995 avoid this problem, POSIX.1-2024 allows implementations to redirect standard input if it is a  
108996 terminal. Since the behavior is implementation-defined, portable applications that may run into  
108997 the problem should redirect standard input themselves. For example, instead of:

```
108998 nohup make &
```

108999 an application can invoke:

```
109000 nohup make </dev/null &
```

#### 109001 FUTURE DIRECTIONS

109002 None.

#### 109007 CHANGE HISTORY

109008 First released in Issue 2.

109009 **Issue 7**

109010 Austin Group Interpretations 1003.1-2001 #104, #105, and #106 are applied.

109011 **Issue 8**

109012 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

109013 Austin Group Defect 1530 is applied, changing ``sh -c'' to ``sh -c --''.

109014 Austin Group Defect 1586 is applied, adding the *timeout* utility.

109015 Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

109016 **NAME**

109017 od — dump files in various formats

109018 **SYNOPSIS**109019 od [-v] [-A *address\_base*] [-j *skip*] [-N *count*] [-t *type\_string*]...  
109020 [*file*...]109021 XSI od [-bcdosx] [*file*] [[+]offset[.][b]]109022 **DESCRIPTION**109023 The *od* utility shall write the contents of its input files to standard output in a user-specified  
109024 format.109025 **OPTIONS**109026 The *od* utility shall conform to XBD Section 12.2 (on page 215), except that the order of  
109027 XSI presentation of the **-t** options and the **-bcdosx** options is significant.

109028 The following options shall be supported:

109029 **-A** *address\_base*109030 Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
109031 application shall ensure that the *address\_base* option-argument is a character. The  
109032 characters 'd', 'o', and 'x' specify that the offset base shall be written in  
109033 decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
109034 offset shall not be written.109035 XSI **-b** Interpret bytes in octal. This shall be equivalent to **-t o1**.109036 XSI **-c** Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
109037 category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
109038 "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
109039 numbers.109040 XSI **-d** Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to  
109041 **-t u2**.109042 **-j** *skip* Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
109043 seek past the first *skip* bytes in the concatenated input files. If the combined input is  
109044 not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
109045 standard error and exit with a non-zero exit status.109046 By default, the *skip* option-argument shall be interpreted as a decimal number.  
109047 With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;  
109048 otherwise, with a leading '0', the offset shall be interpreted as an octal number.  
109049 Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted  
109050 as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is  
109051 hexadecimal, any appended 'b' shall be considered to be the final hexadecimal  
109052 digit.109053 **-N** *count* Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
109054 a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a  
109055 hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
109056 octal number. If *count* bytes of input (after successfully skipping, if **-j** *skip* is  
109057 specified) are not available, it shall not be considered an error; the *od* utility shall  
109058 format the input that is available.

|        |     |                                      |                                                                                                                                            |
|--------|-----|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 109059 | XSI | <b>-o</b>                            | Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to <b>-t o2</b> .                                               |
| 109060 | XSI | <b>-s</b>                            | Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to                                                     |
| 109061 |     | <b>-t d2</b> .                       |                                                                                                                                            |
| 109062 |     | <b>-t</b> <i>type_string</i>         |                                                                                                                                            |
| 109063 |     |                                      | Specify one or more output types. See the EXTENDED DESCRIPTION section. The                                                                |
| 109064 |     |                                      | application shall ensure that the <i>type_string</i> option-argument is a string specifying                                                |
| 109065 |     |                                      | the types to be used when writing the input data. The string shall consist of the                                                          |
| 109066 |     |                                      | type specification characters <i>a</i> , <i>c</i> , <i>d</i> , <i>f</i> , <i>o</i> , <i>u</i> , and <i>x</i> , specifying named character, |
| 109067 |     |                                      | character, signed decimal, floating point, octal, unsigned decimal, and                                                                    |
| 109068 |     |                                      | hexadecimal, respectively. The type specification characters <i>d</i> , <i>f</i> , <i>o</i> , <i>u</i> , and <i>x</i> can be               |
| 109069 |     |                                      | followed by an optional unsigned decimal integer that specifies the number of                                                              |
| 109070 |     |                                      | bytes to be transformed by each instance of the output type. The type specification                                                        |
| 109071 |     |                                      | character <i>f</i> can be followed by an optional <i>F</i> , <i>D</i> , or <i>L</i> indicating that the conversion                         |
| 109072 |     |                                      | should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.                                  |
| 109073 |     |                                      | The type specification characters <i>d</i> , <i>o</i> , <i>u</i> , and <i>x</i> can be followed by an optional <i>C</i> , <i>S</i> ,       |
| 109074 |     |                                      | <i>I</i> , or <i>L</i> indicating that the conversion should be applied to an item of type <b>char</b> ,                                   |
| 109075 |     |                                      | <b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the                                   |
| 109076 |     |                                      | same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be                                             |
| 109077 |     |                                      | written for each type specified in the order in which the type specification                                                               |
| 109078 |     |                                      | characters are specified.                                                                                                                  |
| 109079 |     | <b>-v</b>                            | Write all input data. Without the <b>-v</b> option, any number of groups of output lines,                                                  |
| 109080 |     |                                      | which would be identical to the immediately preceding group of output lines                                                                |
| 109081 |     |                                      | (except for the byte offsets), shall be replaced with a line containing only an                                                            |
| 109082 |     |                                      | <asterisk> ('*').                                                                                                                          |
| 109083 | XSI | <b>-x</b>                            | Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to <b>-t x2</b> .                                         |
| 109084 | XSI |                                      | Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for                                    |
| 109085 |     |                                      | each type specified in the order in which the types are specified.                                                                         |
| 109086 |     | <b>OPERANDS</b>                      |                                                                                                                                            |
| 109087 |     |                                      | The following operands shall be supported:                                                                                                 |
| 109088 |     | <i>file</i>                          | A pathname of a file to be read. If no <i>file</i> operands are specified, the standard input                                              |
| 109089 |     |                                      | shall be used.                                                                                                                             |
| 109090 |     |                                      | If there are no more than two operands, none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , <b>-t</b> , or <b>-v</b> options is                |
| 109091 |     |                                      | specified, and either of the following is true: the first character of the last operand                                                    |
| 109092 |     |                                      | is a <plus-sign> ('+'), or there are two operands and the first character of the last                                                      |
| 109093 | XSI |                                      | operand is numeric; the last operand shall be interpreted as an offset operand on                                                          |
| 109094 |     |                                      | XSI-conformant systems. Under these conditions, the results are unspecified on                                                             |
| 109095 |     |                                      | systems that are not XSI-conformant systems.                                                                                               |
| 109096 | XSI | <b>[+]<i>offset</i>[.][<i>b</i>]</b> | The <i>offset</i> operand specifies the offset in the file where dumping is to commence.                                                   |
| 109097 |     |                                      | This operand is normally interpreted as octal bytes. If '.' is appended, the offset                                                        |
| 109098 |     |                                      | shall be interpreted in decimal. If 'b' is appended, the offset shall be interpreted                                                       |
| 109099 |     |                                      | in units of 512 bytes.                                                                                                                     |
| 109100 |     | <b>STDIN</b>                         |                                                                                                                                            |
| 109101 |     |                                      | The standard input shall be used if no <i>file</i> operands are specified, and shall be used if a <i>file</i>                              |
| 109102 |     |                                      | operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,                                                 |
| 109103 |     |                                      | the standard input shall not be used. See the INPUT FILES section.                                                                         |

109104 **INPUT FILES**

109105 The input files can be any file type.

109106 **ENVIRONMENT VARIABLES**

109107 The following environment variables shall affect the execution of *od*:

109108 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109109 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 109110 variables used to determine the values of locale categories.)

109111 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109112 internationalization variables.

109113 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109114 characters (for example, single-byte as opposed to multi-byte characters in  
 109115 arguments and input files).

109116 *LC\_MESSAGES*

109117 Determine the locale that should be used to affect the format and contents of  
 109118 diagnostic messages written to standard error.

109119 *LC\_NUMERIC*

109120 Determine the locale for selecting the radix character used when writing floating-  
 109121 point formatted output.

109122 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

109123 **ASYNCHRONOUS EVENTS**

109124 Default.

109125 **STDOUT**

109126 See the EXTENDED DESCRIPTION section.

109127 **STDERR**

109128 The standard error shall be used only for diagnostic messages.

109129 **OUTPUT FILES**

109130 None.

109131 **EXTENDED DESCRIPTION**

109132 The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 109133 XSI data according to the output types specified by the *-t* option or the *-bcdosx* options. If no  
 109134 output type is specified, the default output shall be as if *-t oS* had been specified.

109135 The number of bytes transformed by the output type specifier *c* may be variable depending on  
 109136 the *LC\_CTYPE* category.

109137 The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds  
 109138 to the various C-language types as follows. If the *c17* compiler is present on the system, these  
 109139 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 109140 may vary among systems that conform to POSIX.1-2024.

- 109141 • For the type specifier characters *d*, *o*, *u*, and *x*, the default number of bytes shall
- 109142 correspond to the size of the underlying implementation's basic integer type. For these
- 109143 specifier characters, the implementation shall support values of the optional number of
- 109144 bytes to be converted corresponding to the number of bytes in the C-language types **char**,
- 109145 **short**, **int**, and **long**. These numbers can also be specified by an application as the
- 109146 characters 'C', 'S', 'I', and 'L', respectively. The implementation shall also support
- 109147 the values 1, 2, 4, and 8, even if it provides no C-Language types of those sizes. The

109148 implementation shall support the decimal value corresponding to the C-language type  
 109149 **long long**. The byte order used when interpreting numeric values is implementation-  
 109150 defined, but shall correspond to the order in which a constant of the corresponding type is  
 109151 stored in memory on the system.

109152 • For the type specifier character  $\epsilon$ , the default number of bytes shall correspond to the  
 109153 number of bytes in the underlying implementation's basic double precision floating-point  
 109154 data type. The implementation shall support values of the optional number of bytes to be  
 109155 converted corresponding to the number of bytes in the C-language types **float**, **double**,  
 109156 and **long double**. These numbers can also be specified by an application as the characters  
 109157 'F', 'D', and 'L', respectively.

109158 The type specifier character  $a$  specifies that bytes shall be interpreted as named characters from  
 109159 the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least  
 109160 significant seven bits of each byte shall be used for this type specification. Bytes with the values  
 109161 listed in the following table shall be written using the corresponding names for those characters.

109162 **Table 3-14** Named Characters in *od*

| Value | Name | Value | Name | Value | Name      | Value | Name |
|-------|------|-------|------|-------|-----------|-------|------|
| \000  | nul  | \001  | soh  | \002  | stx       | \003  | etx  |
| \004  | eot  | \005  | enq  | \006  | ack       | \007  | bel  |
| \010  | bs   | \011  | ht   | \012  | lf or nl* | \013  | vt   |
| \014  | ff   | \015  | cr   | \016  | so        | \017  | si   |
| \020  | dle  | \021  | dc1  | \022  | dc2       | \023  | dc3  |
| \024  | dc4  | \025  | nak  | \026  | syn       | \027  | etb  |
| \030  | can  | \031  | em   | \032  | sub       | \033  | esc  |
| \034  | fs   | \035  | gs   | \036  | rs        | \037  | us   |
| \040  | sp   | \177  | del  |       |           |       |      |

109173 **Note:** The "\012" value may be written either as **lf** or **nl**.

109174 The type specifier character  $c$  specifies that bytes shall be interpreted as characters specified by  
 109175 the current setting of the *LC\_CTYPE* locale category. Characters listed in the table in XBD  
 109176 [Chapter 5](#) (on page 113) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be written as  
 109177 the corresponding escape sequences, except that <backslash> shall be written as a single  
 109178 <backslash> and a NUL shall be written as '\0'. Other non-printable characters shall be  
 109179 written as one three-digit octal number for each byte in the character. Printable multi-byte  
 109180 characters shall be written in the area corresponding to the first byte of the character; the two-  
 109181 character sequence "\*\*\*" shall be written in the area corresponding to each remaining byte in the  
 109182 character, as an indication that the character is continued. When either the  $-j$  *skip* or  $-N$  *count*  
 109183 option is specified along with the  $c$  type specifier, and this results in an attempt to start or finish  
 109184 in the middle of a multi-byte character, the result is implementation-defined.

109185 The input data shall be manipulated in blocks, where a block is defined as a multiple of the least  
 109186 common multiple of the number of bytes transformed by the specified output types. If the least  
 109187 common multiple is greater than 16, the results are unspecified. Each input block shall be  
 109188 written as transformed by each output type, one per written line, in the order that the output  
 109189 types were specified. If the input block size is larger than the number of bytes transformed by  
 109190 the output type, the output type shall sequentially transform the parts of the input block, and  
 109191 the output from each of the transformations shall be separated by one or more <blank>  
 109192 characters.

109193 If, as a result of the specification of the  $-N$  option or end-of-file being reached on the last input  
 109194 file, input data only partially satisfies an output type, the input shall be extended sufficiently

109195 with null bytes to write the last byte of the input.

109196 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 109197 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 109198 input offset is unspecified; however, it shall not contain any <blank> characters, shall start at the  
 109199 first character of the output line, and shall be followed by one or more <blank> characters. In  
 109200 addition, the offset of the byte following the last byte written shall be written after all the input  
 109201 data has been processed, but shall not be followed by any <blank> characters. If **-A n** is  
 109202 specified, it is unspecified whether the line that would contain this final offset is written as an  
 109203 empty line or is not written.

109204 If no **-A** option is specified, the input offset base is unspecified.

#### 109205 EXIT STATUS

109206 The following exit values shall be returned:

109207 0 All input files were processed successfully.

109208 >0 An error occurred.

#### 109209 CONSEQUENCES OF ERRORS

109210 Default.

#### 109211 APPLICATION USAGE

109212 XSI-conformant applications are warned not to use filenames starting with '+' or a first  
 109213 operand starting with a numeric character so that the old functionality can be maintained by  
 109214 implementations, unless they specify one of the **-A**, **-j**, or **-N** options. To guarantee that one of  
 109215 these filenames is always interpreted as a filename, an application could always specify the  
 109216 address base format with the **-A** option.

#### 109217 EXAMPLES

109218 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 109219 standard input to the command:

```
109220 od -A d -t a
```

109221 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 109222 the current locale setting, would be similar to:

```
109223 0000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
109224 0000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
109225 0000032 sp ! " # $ % & ' ( ) * + , - . /
109226 0000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
109227 0000064 @ A B C D E F G H I J K L M N O
109228 0000080 P Q R S T U V W X Y Z [ \ ] ^ _
109229 0000096 ` a b c d e f g h i j k l m n o
109230 0000112 p q r s t u v w x y z { | } ~ del
109231 0000128
```

109232 Note that this volume of POSIX.1-2024 allows **nl** or **lf** to be used as the name for the  
 109233 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 109234 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 109235 the POSIX locale character set symbolic name for the corresponding character is a <newline>.

109236 The command:

```
109237 od -A o -t o2x2x -N 18
```

109238 on a system with 32-bit words and an implementation using an input block size of 16 bytes

109239 could write 18 bytes in approximately the following format:

```

109240 0000000 032056 031440 041123 042040 052516 044530 020043 031464
109241          342e  3320  4253  4420  554e  4958  2023  3334
109242          342e3320      42534420      554e4958      20233334
109243 0000020 032472
109244          353a
109245          353a0000
109246 0000022
```

109247 The command:

```
109248 od -A d -t f -t o4 -t x4 -N 24 -j 0x15
```

109249 on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point  
 109250 format) would skip 21 bytes of input data and then write 24 bytes in approximately the  
 109251 following format:

```

109252 0000000 1.0000000000000000e+00 1.5735000000000000e+01
109253 07774000000 00000000000 10013674121 35341217270
109254 3ff00000 00000000 402f3851 eb851eb8
109255 0000016 1.4066823000000000e+02
109256 10030312542 04370303230
109257 40619562 23e18698
109258 0000024
```

#### 109259 RATIONALE

109260 The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently  
 109261 *hexdump*. There were several objections to all of these based on the following reasons:

- 109262 • The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- 109263 • The *hexdump* description was much more complex than needed for a simple dump utility.
- 109264 • The *od* utility has been available on all historical implementations and there was no need to  
 109265 create a new name for a utility so similar to the historical *od* utility.

109266 The original reasons for not standardizing historical *od* were also fairly widespread. Those  
 109267 reasons are given below along with rationale explaining why the standard developers believe  
 109268 that this version does not suffer from the indicated problem:

- 109269 • The BSD and System V versions of *od* have diverged, and the intersection of features  
 109270 provided by both does not meet the needs of the user community. In fact, the System V  
 109271 version only provides a mechanism for dumping octal bytes and **shorts**, signed and  
 109272 unsigned decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability  
 109273 to dump **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned  
 109274 decimal, and hexadecimal **longs**. The version presented here provides more normalized  
 109275 forms for dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned  
 109276 decimal, and hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as  
 109277 current locale characters.
- 109278 • It would not be possible to come up with a compatible superset of the BSD and System V  
 109279 flags that met the requirements of the standard developers. The historical default *od* output  
 109280 is the specified default output of this utility. None of the option letters chosen for this  
 109281 version of *od* conflict with any of the options to historical versions of *od*.

109282 • On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps  
 109283 of **ints**, even in the BSD version. Because of the way options are named, the name space  
 109284 could not be extended to solve these problems. This is why the **-t** option was added (with  
 109285 type specifiers more closely matched to the *printf()* formats used in the rest of this volume  
 109286 of POSIX.1-2024) and the optional field sizes were added to the **d**, **f**, **o**, **u**, and **x** type  
 109287 specifiers. It is also one of the reasons why the historical practice was not mandated as a  
 109288 required obsolescent form of *od*. (Although the old versions of *od* are not listed as an  
 109289 obsolescent form, implementations are urged to continue to recognize the older forms for  
 109290 several more years.) The **a**, **c**, **f**, **o**, and **x** types match the meaning of the corresponding  
 109291 format characters in the historical implementations of *od* except for the default sizes of the  
 109292 fields converted. The **d** format is signed in this volume of POSIX.1-2024 to match the  
 109293 *printf()* notation. (Historical versions of *od* used **d** as a synonym for **u** in this version. The  
 109294 System V implementation uses **s** for signed decimal; BSD uses **i** for signed decimal and **s**  
 109295 for null-terminated strings.) Other than **d** and **u**, all of the type specifiers match format  
 109296 characters in the historical BSD version of *od*.

109297 The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are  
 109298 used even though it is recognized that there may be zero or more than one compiler for the  
 109299 C language on an implementation and that they may use different sizes for some of these  
 109300 types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**,  
 109301 while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes  
 109302 **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the  
 109303 implementation for these types, corresponding to the values reported by invocations of the  
 109304 *getconf* utility when called with *system\_var* operands {UCHAR\_MAX}, {USHORT\_MAX},  
 109305 {UINT\_MAX}, and {ULONG\_MAX} for the types **char**, **short**, **int**, and **long**, respectively.  
 109306 There are similar constants required by the ISO C standard, but not required by the System  
 109307 Interfaces volume of POSIX.1-2024 or this volume of POSIX.1-2024. They are  
 109308 {FLT\_MANT\_DIG}, {DBL\_MANT\_DIG}, and {LDBL\_MANT\_DIG} for the types **float**,  
 109309 **double**, and **long double**, respectively. If the optional *c17* utility is provided by the  
 109310 implementation and used as specified by this volume of POSIX.1-2024, these are the sizes  
 109311 that would be provided. If an option is used that specifies different sizes for these types,  
 109312 there is no guarantee that the *od* utility is able to interpret binary data output by such a  
 109313 program correctly.

109314 This volume of POSIX.1-2024 requires that the numeric values of these lengths be  
 109315 recognized by the *od* utility and that symbolic forms also be recognized. Thus, a  
 109316 conforming application can always look at an array of **unsigned long** data elements using  
 109317 *od -t uL*.

109318 • The method of specifying the format for the address field based on specifying a starting  
 109319 offset in a file unnecessarily tied the two together. The **-A** option now specifies the address  
 109320 base and the **-S** option specifies a starting offset.

109321 • It would be difficult to break the dependence on US ASCII to achieve an internationalized  
 109322 utility. It does not seem to be any harder for *od* to dump characters in the current locale  
 109323 than it is for the *ed* or *sed* **I** commands. The **c** type specifier does this without difficulty and  
 109324 is completely compatible with the historical implementations of the **c** format character  
 109325 when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The  
 109326 **a** type specifier (from the BSD **a** format character) was left as a portable means to dump  
 109327 ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by  
 109328 *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard  
 109329 as a subset of their base codeset.

109330 The use of **"\*\*"** as an indication of continuation of a multi-byte character in **c** specifier output

109331 was chosen based on seeing an implementation that uses this method. The continuation bytes  
 109332 have to be marked in a way that is not ambiguous with another single-byte or multi-byte  
 109333 character.

109334 An early proposal used `-S` and `-n`, respectively, for the `-j` and `-N` options eventually selected.  
 109335 These were changed to avoid conflicts with historical implementations.

109336 The original standard specified `-t o2` as the default when no output type was given. This was  
 109337 changed to `-t oS` (the length of a **short**) to accommodate a supercomputer implementation that  
 109338 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
 109339 affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at  
 109340 the same time to address an historical implementation that had no two-byte data types in its C  
 109341 compiler.

109342 The use of a basic integer data type is intended to allow the implementation to choose a word  
 109343 size commonly used by applications on that architecture.

109344 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
 109345 but this has been modified in this version.

#### 109346 **FUTURE DIRECTIONS**

109347 All option and operand interfaces marked XSI may be removed in a future version.

#### 109348 **SEE ALSO**

109349 *c17, sed*

109350 XBD [Chapter 5](#) (on page 113), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 109351 **CHANGE HISTORY**

109352 First released in Issue 2.

#### 109353 **Issue 5**

109354 In the description of the `-c` option, the phrase “This is equivalent to `-t c.`” is deleted.

109355 The FUTURE DIRECTIONS section is modified.

#### 109356 **Issue 6**

109357 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
 109358 revisions in the IEEE P1003.2b draft standard.

109359 The normative text is reworded to avoid use of the term “must” for application requirements.

109360 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/33 is applied, correcting the examples  
 109361 which used an undefined `-n` option, which should have been `-N`.

109362 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/19 is applied, removing text describing  
 109363 behavior on systems with bytes consisting of more than eight bits.

#### 109364 **Issue 7**

109365 Austin Group Interpretation 1003.1-2001 #092 is applied.

109366 SD5-XCU-ERN-37 is applied, updating the OPERANDS section.

109367 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 109368 **Issue 8**

109369 Austin Group Defect 1017 is applied, clarifying that when `-A n` is specified, the line that would  
 109370 contain the final offset can either be written as an empty line or not be written.

109371 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

109372 **NAME**

109373 paste — merge corresponding or subsequent lines of files

109374 **SYNOPSIS**

109375 paste [-s] [-d *list*] *file...*

109376 **DESCRIPTION**

109377 The *paste* utility shall concatenate the corresponding lines of the given input files, and write the  
109378 resulting lines to standard output.

109379 The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
109380 <newline> of every line except the line from the last input file shall be replaced with a <tab>.

109381 If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
109382 behave as though empty lines were read from the files on which end-of-file was detected, unless  
109383 the **-s** option is specified.

109384 **OPTIONS**

109385 The *paste* utility shall conform to XBD [Section 12.2](#) (on page 215).

109386 The following options shall be supported:

109387 **-d list** Unless a <backslash> character appears in *list*, each character in *list* is an element  
109388 specifying a delimiter character. If a <backslash> character appears in *list*, the  
109389 <backslash> character and one or more characters following it are an element  
109390 specifying a delimiter character as described below. These elements specify one or  
109391 more delimiters to use, instead of the default <tab>, to replace the <newline> of  
109392 the input lines. The elements in *list* shall be used circularly; that is, when the list is  
109393 exhausted the first element from the list is reused. When the **-s** option is specified:

- 109394 • The last <newline> in a file shall not be modified.
- 109395 • The delimiter shall be reset to the first element of *list* after each *file* operand is  
109396 processed.

109397 When the **-s** option is not specified:

- 109398 • The <newline> characters in the file specified by the last *file* operand shall  
109399 not be modified.
- 109400 • The delimiter shall be reset to the first element of list each time a line is  
109401 processed from each file.

109402 If a <backslash> character appears in *list*, it and the character following it shall be  
109403 used to represent the following delimiter characters:

109404 \n <newline>.

109405 \t <tab>.

109406 \\ <backslash> character.

109407 \0 Empty string (not a null character). If '\0' is immediately followed by the  
109408 character 'x', the character 'X', or any character defined by the *LC\_CTYPE*  
109409 **digit** keyword (see XBD [Chapter 7](#), on page 127), the results are unspecified.

109410 If any other characters follow the <backslash>, the results are unspecified.

109411 **-s** Concatenate all of the lines from each input file into one line of output per file, in  
109412 command line order. The <newline> of every line except the last line in each input  
109413 file shall be replaced with a <tab>, unless otherwise specified by the **-d** option. If  
109414 an input file is empty, the output line corresponding to that file shall consist of

- 109415 only a <newline> character.
- 109416 **OPERANDS**
- 109417 The following operand shall be supported:
- 109418 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the  
109419 standard input shall be used; the standard input shall be read one line at a time,  
109420 circularly, for each instance of '-'. Implementations shall support pasting of at  
109421 least 12 *file* operands.
- 109422 **STDIN**
- 109423 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES  
109424 section.
- 109425 **INPUT FILES**
- 109426 The input files shall be text files, except that line lengths shall be unlimited.
- 109427 **ENVIRONMENT VARIABLES**
- 109428 The following environment variables shall affect the execution of *paste*:
- 109429 *LANG* Provide a default value for the internationalization variables that are unset or null.  
109430 (See XBD Section 8.2 (on page 169) the precedence of internationalization variables  
109431 used to determine the values of locale categories.)
- 109432 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
109433 internationalization variables.
- 109434 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
109435 characters (for example, single-byte as opposed to multi-byte characters in  
109436 arguments and input files).
- 109437 *LC\_MESSAGES*
- 109438 Determine the locale that should be used to affect the format and contents of  
109439 diagnostic messages written to standard error.
- 109440 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 109441 **ASYNCHRONOUS EVENTS**
- 109442 Default.
- 109443 **STDOUT**
- 109444 Concatenated lines of input files shall be separated by the <tab> (or other characters under the  
109445 control of the -d option) and terminated by a <newline>.
- 109446 **STDERR**
- 109447 The standard error shall be used only for diagnostic messages.
- 109448 **OUTPUT FILES**
- 109449 None.
- 109450 **EXTENDED DESCRIPTION**
- 109451 None.
- 109452 **EXIT STATUS**
- 109453 The following exit values shall be returned:
- 109454 0 Successful completion.
- 109455 >0 An error occurred.

109456 **CONSEQUENCES OF ERRORS**

109457 If one or more input files cannot be opened when the `-s` option is not specified, a diagnostic  
 109458 message shall be written to standard error, but no output is written to standard output. If the `-s`  
 109459 option is specified, the *paste* utility shall provide the default behavior described in [Section 1.4](#) (on  
 109460 page 2462).

109461 **APPLICATION USAGE**

109462 When the escape sequences of the *list* option-argument are used in a shell script, they must be  
 109463 quoted; otherwise, the shell treats the `<backslash>` as a special character.

109464 Conforming applications should only use the specific `<backslash>`-escaped delimiters presented  
 109465 in this volume of POSIX.1-2024. Historical implementations treat `'\x'`, where `'x'` is not in this  
 109466 list, as `'x'`, but future implementations are free to expand this list to recognize other common  
 109467 escapes similar to those accepted by *printf* and other standard utilities.

109468 Most of the standard utilities work on text files. The *cut* utility can be used to turn files with  
 109469 arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used  
 109470 to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
109471 cut -b 1-500 -n file > file1
109472 cut -b 501- -n file > file2
```

109473 creates **file1** (a text file) with lines no longer than 500 bytes (plus the `<newline>`) and **file2** that  
 109474 contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in  
 109475 *file* that are longer than `500 + {LINE_MAX}` bytes. The original file can be recreated from **file1**  
 109476 and **file2** using the command:

```
109477 paste -d "\0" file1 file2 > file
```

109478 The commands:

```
109479 paste -d "\0" ...
109480 paste -d "" ...
```

109481 are not necessarily equivalent; the latter is not specified by this volume of POSIX.1-2024 and  
 109482 may result in an error. The construct `'\0'` is used to mean “no separator” because historical  
 109483 versions of *paste* did not follow the syntax guidelines, and the command:

```
109484 paste -d"" ...
```

109485 could not be handled properly by *getopt()*.

109486 **EXAMPLES**

109487 1. Write out a directory in four columns:

```
109488 ls | paste - - - -
```

109489 2. Combine pairs of lines from a file into single lines:

```
109490 paste -s -d "\t\n" file
```

109491 **RATIONALE**

109492 None.

109493 **FUTURE DIRECTIONS**

109494 None.

109495 **SEE ALSO**109496 [Section 1.4](#) (on page 2462), *cut*, *grep*, *pr*109497 XBD [Chapter 7](#) (on page 127), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)109498 **CHANGE HISTORY**

109499 First released in Issue 2.

109500 **Issue 6**

109501 The normative text is reworded to avoid use of the term “must” for application requirements.

109502 **Issue 7**

109503 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109504 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0149 [973] is applied.

109505 **Issue 8**109506 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

109507 **NAME**

109508 patch — apply changes to files

109509 **SYNOPSIS**

```
109510 patch [-blNR] [-c|-e|-n|-u] [-d dir] [-D define] [-i patchfile]
109511 [-o outfile] [-p num] [-r rejectfile] [file]
```

109512 **DESCRIPTION**

109513 The *patch* utility shall read a source (patch) file containing any of four forms of difference (diff)  
 109514 listings produced by the *diff* utility (normal, copied context, unified context, or in the style of *ed*)  
 109515 and apply those differences to a file. By default, *patch* shall read from the standard input.

109516 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,  
 109517 *-e*, *-n*, or *-u* option.

109518 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
 109519 came from separate patch files. (In this case, the application shall ensure that the name of the  
 109520 patch file is determinable for each *diff* listing.)

109521 **OPTIONS**

109522 The *patch* utility shall conform to XBD [Section 12.2](#) (on page 215).

109523 The following options shall be supported:

109524 **-b** Save a copy of the original contents of each modified file, before the differences are  
 109525 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
 109526 already exists, it shall be overwritten; if multiple patches are applied to the same  
 109527 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option  
 109528 is also specified, *file.orig* shall not be created but, if *outfile* already exists, *outfile.orig*  
 109529 shall be created.

109530 **-c** Interpret the patch file as a copied context difference (the output of the utility *diff*  
 109531 when the *-c* or *-C* options are specified).

109532 **-d dir** Change the current directory to *dir* before processing as described in the  
 109533 EXTENDED DESCRIPTION section.

109534 **-D define** Mark changes with one of the following C preprocessor constructs:

```
109535 #ifdef define
109536 ...
109537 #endif
109538 #ifndef define
109539 ...
109540 #endif
```

109541 optionally combined with the C preprocessor construct **#else**. If the patched file is  
 109542 processed with the C preprocessor, where the macro *define* is defined, the output  
 109543 shall contain the changes from the patch file; otherwise, the output shall not  
 109544 contain the patches specified in the patch file.

109545 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.

109546 **-i patchfile** Read the patch information from the file named by the pathname *patchfile*, rather  
 109547 than the standard input.

109548 **-l** (The letter ell.) Cause any sequence of <blank> characters in the difference script to  
 109549 match any sequence of <blank> characters in the input file. Other characters shall  
 109550 be matched exactly.

- 109551        **-n**            Interpret the script as a normal difference.
- 109552        **-N**            Ignore patches where the differences have already been applied to the file; by  
109553            default, already-applied patches shall be rejected.
- 109554        **-o** *outfile*    Instead of modifying the files (specified by the *file* operand or the difference  
109555            listings) directly, write a copy of the file referenced by each patch, with the  
109556            appropriate differences applied, to *outfile*. Multiple patches for a single file shall be  
109557            applied to the intermediate versions of the file created by any previous patches,  
109558            and shall result in multiple, concatenated versions of the file being written to  
109559            *outfile*.
- 109560        **-p** *num*        For all pathnames in the patch file that indicate the names of files to be patched,  
109561            delete *num* pathname components from the beginning of each pathname. If the  
109562            pathname in the patch file is absolute, any leading <slash> characters shall be  
109563            considered the first component (that is, **-p 1** shall remove the leading <slash>  
109564            characters). Specifying **-p 0** shall cause the full pathname to be used. If **-p** is not  
109565            specified, only the basename (the final pathname component) shall be used.
- 109566        **-R**            Reverse the sense of the patch script; that is, assume that the difference script was  
109567            created from the new version to the old version. The **-R** option cannot be used  
109568            with *ed* scripts. The *patch* utility shall attempt to reverse each portion of the script  
109569            before applying it. Rejected differences shall be saved in swapped format. If this  
109570            option is not specified, and until a portion of the patch file is successfully applied,  
109571            *patch* attempts to apply each portion in its reversed sense as well as in its normal  
109572            sense. If the attempt is successful, the user shall be prompted to determine whether  
109573            the **-R** option should be set.
- 109574        **-r** *rejectfile*    Override the default reject filename. In the default case, the reject file shall have the  
109575            same name as the output file, with the suffix **.rej** appended to it; see [Patch](#)  
109576            [Application](#) (on page 3241).
- 109577        **-u**            Interpret the patch file as a unified context difference (the output of the *diff* utility  
109578            when the **-u** or **-U** options are specified).

**109579 OPERANDS**

109580        The following operand shall be supported:

109581        *file*            A pathname of a file to patch.

**109582 STDIN**

109583        See the INPUT FILES section.

**109584 INPUT FILES**

109585        Input files shall be text files.

**109586 ENVIRONMENT VARIABLES**

109587        The following environment variables shall affect the execution of *patch*:

109588        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
109589            (See [XBD Section 8.2](#) (on page 169) the precedence of internationalization variables  
109590            used to determine the values of locale categories.)

109591        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
109592            internationalization variables.

109593        *LC\_COLLATE*      Determine the locale for the behavior of ranges, equivalence classes, and multi-  
109594            character collating elements used in the extended regular expression defined for  
109595

109596 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

109597 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109598 characters (for example, single-byte as opposed to multi-byte characters in  
 109599 arguments and input files), and the behavior of character classes used in the  
 109600 extended regular expression defined for the **yesexpr** locale keyword in the  
 109601 *LC\_MESSAGES* category.

109602 *LC\_MESSAGES*  
 109603 Determine the locale used to process affirmative responses, and the locale used to  
 109604 affect the format and contents of diagnostic messages and prompts written to  
 109605 standard error.

109606 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

109607 *LC\_TIME* Determine the locale for recognizing the format of file timestamps written by the  
 109608 *diff* utility in a context-difference input file.

109609 **ASYNCHRONOUS EVENTS**

109610 Default.

109611 **STDOUT**

109612 Not used.

109613 **STDERR**

109614 The standard error shall be used for diagnostic and informational messages.

109615 **OUTPUT FILES**

109616 The output of the *patch* utility, the save files (**.orig** suffixes), and the reject files (**.rej** suffixes) shall  
 109617 be text files.

109618 **EXTENDED DESCRIPTION**

109619 A patch file may contain patching instructions for more than one file; filenames shall be  
 109620 determined as specified in [Filename Determination](#) (on page 3241). When the **-b** option is  
 109621 specified, for each patched file, the original shall be saved in a file of the same name with the  
 109622 suffix **.orig** appended to it.

109623 For each patched file, a reject file may also be created as noted in [Patch Application](#) (on page  
 109624 3241). In the absence of a **-r** option, the name of this file shall be formed by appending the suffix  
 109625 **.rej** to the original filename.

109626 **Patch File Format**

109627 The patch file shall contain zero or more lines of header information followed by one or more  
 109628 patches. Each patch shall contain zero or more lines of filename identification in the format  
 109629 produced by the **-c**, **-C**, **-u**, or **-U** options of the *diff* utility, and one or more sets of *diff* output,  
 109630 which are customarily called *hunks*.

109631 The *patch* utility shall recognize the following expression in the header information:

109632 **Index:** *pathname*  
 109633 The file to be patched is named *pathname*.

109634 If all lines (including headers) within a patch begin with the same leading sequence of <blank>  
 109635 characters, the *patch* utility shall remove this sequence before proceeding. Within each patch, if  
 109636 the type of difference is common context, the *patch* utility shall recognize the following  
 109637 expressions:

109638 \*\*\* *filename timestamp*  
 109639 The patches arose from *filename*.

109640 --- *filename timestamp*  
 109641 The patches should be applied to *filename*.

109642 If the type of difference is unified context, the *patch* utility shall recognize the following  
 109643 expressions:

109644 --- *filename timestamp*  
 109645 The patches arose from *filename*.

109646 + + + *filename timestamp*  
 109647 The patches should be applied to *filename*.

109648 Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
 109649 The line numbers for successive hunks within a patch shall occur in ascending order.

### 109650 **Filename Determination**

109651 If no *file* operand is specified, *patch* shall perform the following steps to determine the filename  
 109652 to use:

109653 1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as  
 109654 specified by the **-p** option) from the filename on the line beginning with "\*\*\*\*" (if copied  
 109655 context) or "----" (if unified context), then test for the existence of this file relative to the  
 109656 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 109657 utility shall use this filename.

109658 2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as  
 109659 specified by the **-p** option) from the filename on the line beginning with "----" (if copied  
 109660 context) or "+ + +" (if unified context), then test for the existence of this file relative to the  
 109661 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 109662 utility shall use this filename.

109663 3. If the header information contains a line beginning with the string **Index:**, the *patch* utility  
 109664 shall delete pathname components (as specified by the **-p** option) from this line, then test  
 109665 for the existence of this file relative to the current directory (or the directory specified  
 109666 with the **-d** option). If the file exists, the *patch* utility shall use this filename.

109667 XSI 4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a `get -e`  
 109668 `SCCS/s.filename` command to retrieve an editable version of the file. If the file exists, the  
 109669 *patch* utility shall use this filename.

109670 5. The *patch* utility shall write a prompt to standard output and request a filename  
 109671 interactively from the controlling terminal (for example, **/dev/tty**).

### 109672 **Patch Application**

109673 If the **-c**, **-e**, **-n**, or **-u** option is present, the *patch* utility shall interpret information within each  
 109674 hunk as a copied context difference, an *ed* difference, a normal difference, or a unified context  
 109675 difference, respectively. In the absence of any of these options, the *patch* utility shall determine  
 109676 the type of difference based on the format of information within the hunk.

109677 For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line  
 109678 number at the beginning of the hunk, plus or minus any offset used in applying the previous  
 109679 hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and  
 109680 backwards at least 1 000 bytes for a set of lines that match the hunk context.

109681 If no such place is found and it is a context difference, then another scan shall take place,  
109682 ignoring the first and last line of context. If that fails, the first two and last two lines of context  
109683 shall be ignored and another scan shall be made. Implementations may search more extensively  
109684 for installation locations.

109685 If no location can be found, the *patch* utility shall append the hunk to the reject file. A rejected  
109686 hunk that is a copied context difference, an *ed* difference, or a normal difference shall be written  
109687 in copied-context-difference format regardless of the format of the patch file. It is  
109688 implementation-defined whether a rejected hunk that is a unified context difference is written in  
109689 copied-context-difference format or in unified-context-difference format. If the input was a  
109690 normal or *ed*-style difference, the reject file may contain differences with zero lines of context.  
109691 The line numbers on the hunks in the reject file may be different from the line numbers in the  
109692 patch file since they shall reflect the approximate locations for the failed hunks in the new file  
109693 rather than the old one.

109694 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking  
109695 the *ed* utility.

#### 109696 EXIT STATUS

109697 The following exit values shall be returned:

109698 0 Successful completion.

109699 1 One or more lines were written to a reject file.

109700 >1 An error occurred.

#### 109701 CONSEQUENCES OF ERRORS

109702 Patches that cannot be correctly placed in the file shall be written to a reject file.

#### 109703 APPLICATION USAGE

109704 The **-R** option does not work with *ed* scripts because there is too little information to reconstruct  
109705 the reverse operation.

109706 The **-p** option makes it possible to customize a patch file to local user directory structures  
109707 without manually editing the patch file. For example, if the filename in the patch file was:

109708 `/curds/whey/src/blurfl/blurfl.c`

109709 Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

109710 `curds/whey/src/blurfl/blurfl.c`

109711 without the leading `<slash>`, **-p 4** gives:

109712 `blurfl/blurfl.c`

109713 and not specifying **-p** at all gives:

109714 `blurfl.c .`

#### 109715 EXAMPLES

109716 None.

#### 109717 RATIONALE

109718 Some of the functionality in historical *patch* implementations was not specified. The following  
109719 documents those features present in historical implementations that have not been specified.

109720 A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options  
109721 and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

109722 In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility

109723 would search for the corresponding version information (the string specified in the header,  
109724 delimited by <blank> characters or the beginning or end of a line or the file) anywhere in the  
109725 original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to  
109726 standardize. For example, if:

109727 Prereq: 1.2

109728 were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the  
109729 prerequisite.

109730 The following options were dropped from historical implementations of *patch* as insufficiently  
109731 useful to standardize:

109732 **-b** The **-b** option historically provided a method for changing the name extension of  
109733 the backup file from the default **.orig**. This option has been modified and retained  
109734 in this volume of POSIX.1-2024.

109735 **-F** The **-F** option specified the number of lines of a context diff to ignore when  
109736 searching for a place to install a patch.

109737 **-f** The **-f** option historically caused *patch* not to request additional information from  
109738 the user.

109739 **-r** The **-r** option historically provided a method of overriding the extension of the  
109740 reject file from the default **.rej**.

109741 **-s** The **-s** option historically caused *patch* to work silently unless an error occurred.

109742 **-x** The **-x** option historically set internal debugging flags.

109743 In some file system implementations, the saving of a **.orig** file may produce unwanted results. In  
109744 the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum  
109745 filenames), the **.orig** file overwrites the new file. The reject file may also exceed this filename  
109746 limit. It was suggested, due to some historical practice, that a <tilde> ('~') suffix be used  
109747 instead of **.orig** and some other character instead of the **.rej** suffix. This was rejected because it is  
109748 not obvious to the user which file is which. The suffixes **.orig** and **.rej** are clearer and more  
109749 understandable.

109750 The **-b** option has the opposite sense in some historical implementations—do not save the **.orig**  
109751 file. The default case here is not to save the files, making *patch* behave more consistently with the  
109752 other standard utilities.

109753 The **-w** option in early proposals was changed to **-I** to match historical practice.

109754 The **-N** option was included because without it, a non-interactive application cannot reject  
109755 previously applied patches. For example, if a user is piping the output of *diff* into the *patch*  
109756 utility, and the user only wants to patch a file to a newer version non-interactively, the **-N** option  
109757 is required.

109758 Changes to the **-I** option description were proposed to allow matching across <newline>  
109759 characters in addition to just <blank> characters. Since this is not historical practice, and since  
109760 some ambiguities could result, it is suggested that future developments in this area utilize  
109761 another option letter, such as **-L**.

109762 The **-u** option of GNU *patch* has been added, along with support for unified context formats.

**109763 FUTURE DIRECTIONS**

109764 If this utility is directed to create a new directory entry that contains any bytes that have the  
109765 encoded value of a <newline> character, implementations are encouraged to treat this as an  
109766 error. A future version of this standard may require implementations to treat this as an error.

**109767 SEE ALSO**

109768 *diff, ed*

109769 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**109770 CHANGE HISTORY**

109771 First released in Issue 4.

**109772 Issue 5**

109773 The FUTURE DIRECTIONS section is added.

**109774 Issue 6**

109775 This utility is marked as part of the User Portability Utilities option.

109776 The description of the `-D` option and the steps in [Filename Determination](#) (on page 3241) are  
109777 changed to match historical practice as defined in the IEEE P1003.2b draft standard.

109778 The normative text is reworded to avoid use of the term “must” for application requirements.

109779 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the  
109780 *patch* utility performs `ifdef` selection for the `-D` option.

**109781 Issue 7**

109782 The *patch* utility is moved from the User Portability Utilities option to the Base. User Portability  
109783 Utilities is now an option for interactive utilities.

109784 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109785 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

109786 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
109787 `LC_MESSAGES` and `LC_CTYPE` environment variables and adding the `LC_COLLATE`  
109788 environment variable.

**109789 Issue 8**

109790 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
109791 filenames containing any bytes that have the encoded value of a <newline> character.

109792 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

109793 **NAME**

109794 pathchk — check pathnames

109795 **SYNOPSIS**109796 pathchk [-p] [-P] *pathname*...109797 **DESCRIPTION**

109798 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used  
 109799 to access or create a file without causing syntax errors) and portable (that is, no filename  
 109800 truncation results). More extensive portability checks are provided by the **-p** and **-P** options.

109801 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 109802 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 109803 • Is longer than {PATH\_MAX} bytes (see **Pathname Variable Values** in XBD [<limits.h>](#))
- 109804 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 109805 • Contains any component in a directory that is not searchable
- 109806 • Contains any byte sequence that is not valid in its containing directory

109807 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 109808 the corresponding *pathname* operand.

109809 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 109810 as long as a file matching the pathname specified by the missing components could be created  
 109811 that does not violate any of the checks specified above.

109812 **OPTIONS**109813 The *pathchk* utility shall conform to XBD [Section 12.2](#) (on page 215).

109814 The following option shall be supported:

109815 **-p** Instead of performing checks based on the underlying file system, write a  
 109816 diagnostic for each *pathname* operand that:

- 109817 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in XBD  
 109818 [<limits.h>](#))
- 109819 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
- 109820 • Contains any character in any component that is not in the portable filename  
 109821 character set

109822 **-P** Write a diagnostic for each *pathname* operand that:

- 109823 • Contains a component whose first character is the <hyphen-minus>  
 109824 character
- 109825 • Is empty

109826 **OPERANDS**

109827 The following operand shall be supported:

109828 *pathname* A pathname to be checked.109829 **STDIN**

109830 Not used.

109831 **INPUT FILES**

109832 None.

109833 **ENVIRONMENT VARIABLES**109834 The following environment variables shall affect the execution of *pathchk*:

109835 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109836 (See XBD Section 8.2 (on page 169) the precedence of internationalization variables  
 109837 used to determine the values of locale categories.)

109838 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109839 internationalization variables.

109840 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109841 characters (for example, single-byte as opposed to multi-byte characters in  
 109842 arguments).

109843 *LC\_MESSAGES*

109844 Determine the locale that should be used to affect the format and contents of  
 109845 diagnostic messages written to standard error.

109846 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

109847 **ASYNCHRONOUS EVENTS**

109848 Default.

109849 **STDOUT**

109850 Not used.

109851 **STDERR**

109852 The standard error shall be used only for diagnostic messages.

109853 **OUTPUT FILES**

109854 None.

109855 **EXTENDED DESCRIPTION**

109856 None.

109857 **EXIT STATUS**

109858 The following exit values shall be returned:

109859 0 All *pathname* operands passed all of the checks.

109860 &gt;0 An error occurred.

109861 **CONSEQUENCES OF ERRORS**

109862 Default.

109863 **APPLICATION USAGE**

109864 The *test* utility can be used to determine whether a given pathname names an existing file; it  
 109865 does not, however, give any indication of whether or not any component of the pathname was  
 109866 truncated in a directory where the `_POSIX_NO_TRUNC` feature is not in effect. The *pathchk*  
 109867 utility does not check for file existence; it performs checks to determine whether a pathname  
 109868 does exist or could be created with no pathname component truncation.

109869 The *noclobber* option in the shell (see the *set* special built-in) can be used to atomically create a  
 109870 file. As with all file creation semantics in the System Interfaces volume of POSIX.1-2024, it  
 109871 guarantees atomic creation, but still depends on applications to agree on conventions and  
 109872 cooperate on the use of files after they have been created.

109873 To verify that a pathname meets the requirements of filename portability, applications should

109874 use both the `-p` and `-P` options together.

#### 109875 EXAMPLES

109876 To verify that all pathnames in an imported data interchange archive are legitimate and  
109877 unambiguous on the current system:

```
109878 # This example assumes that no pathnames in the archive
109879 # contain <newline> characters.
109880 pax -f archive | sed -e 's/^[^:alnum:]]/\\&/g' | xargs pathchk --
109881 if [ $? -eq 0 ]
109882 then
109883     pax -r -f archive
109884 else
109885     echo Investigate problems before importing files.
109886     exit 1
109887 fi
```

109888 To verify that all files in the current directory hierarchy could be moved to any system  
109889 conforming to the System Interfaces volume of POSIX.1-2024 that also supports the *pax* utility:

```
109890 find . -exec pathchk -p -P {} +
109891 if [ $? -eq 0 ]
109892 then
109893     pax -w -f ../archive .
109894 else
109895     echo Portable archive cannot be created.
109896     exit 1
109897 fi
```

109898 To verify that a user-supplied pathname names a readable file and that the application can create  
109899 a file extending the given path without truncation and without overwriting any existing file:

```
109900 case $- in
109901     *C*)   reset="";;
109902     *)    reset="set +C"
109903           set -C;;
109904 esac
109905 test -r "$path" && pathchk "$path.out" &&
109906     rm "$path.out" > "$path.out"
109907 if [ $? -ne 0 ]; then
109908     printf "%s: %s not found or %s.out fails \
109909 creation checks.\n" $0 "$path" "$path"
109910     $reset      # Reset the noclobber option in case a trap
109911                # on EXIT depends on it.
109912     exit 1
109913 fi
109914 $reset
109915 PROCESSING < "$path" > "$path.out"
```

109916 The following assumptions are made in this example:

- 109917 1. **PROCESSING** represents the code that is used by the application to use `$path` once it is  
109918 verified that `$path.out` works as intended.

- 109919 2. The state of the *noclobber* option is unknown when this code is invoked and should be set  
 109920 on exit to the state it was in when this code was invoked. (The **reset** variable is used in  
 109921 this example to restore the initial state.)
- 109922 3. Note the usage of:
- 109923 `rm "$path.out" > "$path.out"`
- 109924 a. The *pathchk* command has already verified, at this point, that **\$path.out** is not  
 109925 truncated.
- 109926 b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist  
 109927 before invoking *rm*.
- 109928 c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application  
 109929 can create the file again in the **PROCESSING** step.
- 109930 d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:  
 109931 `rm "$path.out" > "$path.out"`  
 109932 should be replaced with:  
 109933 `> "$path.out"`  
 109934 which verifies that the file did not already exist, but leaves **\$path.out** in place for  
 109935 use by **PROCESSING**.

#### 109936 RATIONALE

109937 The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set*  
 109938 `-C(noclobber)` option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that  
 109939 appeared in early proposals. All of these utilities were attempts to solve several common  
 109940 problems:

- 109941 • Verify the validity (for several different definitions of “valid”) of a pathname supplied by a  
 109942 user, generated by an application, or imported from an external source.
- 109943 • Atomically create a file.
- 109944 • Perform various string handling functions to generate a temporary filename.

109945 The *create* utility, included in an early proposal, provided checking and atomic creation in a  
 109946 single invocation of the utility; these are orthogonal issues and need not be grouped into a single  
 109947 utility. Note that the *noclobber* option also provides a way of creating a lock for process  
 109948 synchronization; since it provides an atomic *create*, there is no race between a test for existence  
 109949 and the following creation if it did not exist.

109950 Having a function like *tmpnam()* in the ISO C standard is important in many high-level  
 109951 languages. The shell programming language, however, has built-in string manipulation  
 109952 facilities, making it very easy to construct temporary filenames. The names needed obviously  
 109953 depend on the application, but are frequently of a form similar to:

109954 `$TMPDIR/application_abbreviation$$ .suffix`

109955 In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop  
 109956 can be used with the shell *noclobber* option to create a file without risk of collisions, as long as  
 109957 applications trying to use the same filename name space are cooperating on the use of files after  
 109958 they have been created.

109959 For historical purposes, `-p` does not check for the use of the <hyphen-minus> character as the  
 109960 first character in a component of the pathname, or for an empty *pathname* operand.

109961 **FUTURE DIRECTIONS**

109962 None.

109963 **SEE ALSO**109964 [Section 2.7](#) (on page 2493), [set](#) (on page 2553), [test](#)109965 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215), [<limits.h>](#)109966 **CHANGE HISTORY**

109967 First released in Issue 4.

109968 **Issue 7**

109969 Austin Group Interpretations 1003.1-2001 #039, #040, and #094 are applied.

109970 SD5-XCU-ERN-121 is applied, updating the EXAMPLES section.

109971 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0127 [291] is applied.

109972 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0150 [584] and XCU/TC2-2008/0151

109973 [584] are applied.

109974 **Issue 8**109975 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

109976 **NAME**

109977 pax — portable archive interchange

109978 **SYNOPSIS**109979 pax [-dv] [-c|-n] [-H|-L] [-o options] [-f archive] [-s replstr]...  
109980 [pattern...]109981 pax -r[-c|-n] [-dikuv] [-H|-L] [-f archive] [-o options]... [-p string]...  
109982 [-s replstr]... [pattern...]109983 pax -w [-dituvX] [-H|-L] [-b blocksize] [[-a] [-f archive]] [-o options]...  
109984 [-s replstr]... [-x format] [file...]109985 pax -r -w [-dikltuvX] [-H|-L] [-o options]... [-p string]...  
109986 [-s replstr]... [file...] directory109987 **DESCRIPTION**109988 The *pax* utility shall read, write, and write lists of the members of archive files and copy  
109989 directory hierarchies. A variety of archive formats shall be supported; see the *-x format* option.109990 The action to be taken depends on the presence of the *-r* and *-w* options. The four combinations  
109991 of *-r* and *-w* are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
109992 corresponding respectively to the four forms shown in the SYNOPSIS section.109993 **list** In **list** mode (when neither *-r* nor *-w* are specified), *pax* shall write the names of  
109994 the members of the archive file read from the standard input, with pathnames  
109995 matching the specified patterns, to standard output. If a named file is of type  
109996 directory, the file hierarchy rooted at that file shall be listed as well.109997 **read** In **read** mode (when *-r* is specified, but *-w* is not), *pax* shall extract the members of  
109998 the archive file read from the standard input, with pathnames matching the  
109999 specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
110000 at that file shall be extracted as well. The extracted files shall be created performing  
110001 pathname resolution with the directory in which *pax* was invoked as the current  
110002 working directory.110003 If an attempt is made to extract a directory when the directory already exists, this  
110004 shall not be considered an error. If an attempt is made to extract a FIFO when the  
110005 FIFO already exists, this shall not be considered an error.110006 The ownership, access, and modification times, and file mode of the restored files  
110007 are discussed under the *-p* option.110008 **write** In **write** mode (when *-w* is specified, but *-r* is not), *pax* shall write the contents of  
110009 the *file* operands to the standard output in an archive format. If no *file* operands are  
110010 specified, a list of files to copy, one per line, shall be read from the standard input  
110011 and each entry in this list shall be processed as if it had been a *file* operand on the  
110012 command line. A file of type directory shall include all of the files in the file  
110013 hierarchy rooted at the file.110014 **copy** In **copy** mode (when both *-r* and *-w* are specified), *pax* shall copy the *file* operands  
110015 to the destination directory.110016 If no *file* operands are specified, a list of files to copy, one per line, shall be read  
110017 from the standard input. A file of type directory shall include all of the files in the  
110018 file hierarchy rooted at the file.110019 The effect of the **copy** shall be as if the copied files were written to a *pax* format  
110020 archive file and then subsequently extracted, except that copying of sockets may be

110021 supported even if archiving them in write mode is not supported, and that there  
 110022 may be hard links between the original and the copied files. If the destination  
 110023 directory is a subdirectory of one of the files to be copied, the results are  
 110024 unspecified. If the destination directory is a file of a type not defined by the System  
 110025 Interfaces volume of POSIX.1-2024, the results are implementation-defined;  
 110026 otherwise, it shall be an error for the file named by the *directory* operand not to  
 110027 exist, not be writable by the user, or not be a file of type directory.

110028 In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member,  
 110029 *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces  
 110030 volume of POSIX.1-2024, called with the following arguments:

- 110031 • The intermediate directory used as the *path* argument
- 110032 • The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode*  
 110033 argument

110034 If any specified *pattern* or *file* operands are not matched by at least one file or archive member,  
 110035 *pax* shall write a diagnostic message to standard error for each one that did not match and exit  
 110036 with a non-zero exit status.

110037 The archive formats described in the EXTENDED DESCRIPTION section shall be automatically  
 110038 detected on input. The default output archive format shall be implementation-defined.

110039 A single archive can span multiple files. The *pax* utility shall determine, in an implementation-  
 110040 defined manner, what file to read or write as the next file.

110041 If the selected archive format supports the specification of linked files, it shall be an error if these  
 110042 files cannot be linked when the archive is extracted. For archive formats that do not store file  
 110043 contents with each name that causes a hard link, if the file that contains the data is not extracted  
 110044 during this *pax* session, either the data shall be restored from the original file, or a diagnostic  
 110045 message shall be displayed with the name of a file that can be used to extract the data. In  
 110046 traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited  
 110047 directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall  
 110048 write a diagnostic message to standard error and shall terminate.

## 110049 OPTIONS

110050 The *pax* utility shall conform to XBD Section 12.2 (on page 215), except that the order of  
 110051 presentation of the **-o**, **-p**, and **-s** options is significant.

110052 The following options shall be supported:

- 110053 **-r** Read an archive file from standard input.
- 110054 **-w** Write files to the standard output in the specified archive format.
- 110055 **-a** Append files to the end of the archive. It is implementation-defined which devices  
 110056 on the system support appending. Additional file formats unspecified by this  
 110057 volume of POSIX.1-2024 may impose restrictions on appending.
- 110058 **-b** *blocksize* Block the output at a positive decimal integer number of bytes per write to the  
 110059 archive file. Devices and archive formats may impose restrictions on blocking.  
 110060 Blocking shall be automatically determined on input. Conforming applications  
 110061 shall not specify a *blocksize* value larger than 32256. Default blocking when  
 110062 creating archives depends on the archive format. (See the **-x** option below.)
- 110063 **-c** Match all file or archive members except those specified by the *pattern* or *file*  
 110064 operands.

|        |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 110065 | -d                | Cause files of type directory being copied or archived or archive members of type directory being extracted or listed to match only the file or archive member itself and not the file hierarchy rooted at the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 110070 | -H                | If a symbolic link referencing a file of type directory is specified on the command line, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line, then <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither -H or -L are specified, shall be to archive the symbolic link itself.                                                                                                                                                                                                                                     |

| 110077 | -i                | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing. |

| 110090 | -l                | (The letter ell.) In <b>copy</b> mode, hard links shall be made between the source and destination file hierarchies whenever possible. If specified in conjunction with -H or -L, when a symbolic link is encountered, the hard link created in the destination file hierarchy shall be to the file referenced by the symbolic link. If specified when neither -H nor -L is specified, when a symbolic link is encountered, the implementation shall create a hard link to the symbolic link in the source file hierarchy or copy the symbolic link to the destination.                                                                                                                                                                                                                                                                |
| 110091 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 110095 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 110096 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 110097 | -L                | If a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither -H or -L are specified, shall be to archive the symbolic link itself.                                                                                                                          |
| 110098 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 110099 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 110108 | -o <i>options</i> | Provide information to the implementation to modify the algorithm for extracting or writing files. The value of <i>options</i> shall consist of one or more <comma>-separated keywords of the form:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 110109 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 110110 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 110111 |                   | <i>keyword</i> [[:]= <i>value</i> ] [, <i>keyword</i> [[:]= <i>value</i> ], ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

110112 Some keywords apply only to certain file formats, as indicated with each  
 110113 description. Use of keywords that are inapplicable to the file format being  
 110114 processed produces undefined results.

110115 Keywords in the *options* argument shall be a string that would be a valid portable  
 110116 filename as described in XBD [Section 3.265](#) (on page 70).

110117 **Note:** Keywords are not expected to be filenames, merely to follow the same character  
 110118 composition rules as portable filenames.

110119 Keywords can be preceded with white space. The *value* field shall consist of zero or  
 110120 more characters; within *value*, the application shall precede any literal <comma>  
 110121 with a <backslash>, which shall be ignored, but preserves the <comma> as part of  
 110122 *value*. A <comma> as the final character, or a <comma> followed solely by white  
 110123 space as the final characters, in *options* shall be ignored. Multiple **-o** options can be  
 110124 specified; if keywords given to these multiple **-o** options conflict, the keywords  
 110125 and values appearing later in command line sequence shall take precedence and  
 110126 the earlier shall be silently ignored. The following keyword values of *options* shall  
 110127 be supported for the file formats as indicated:

110128 **delete=pattern**

110129 (Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax*  
 110130 shall omit from extended header records that it produces any keywords  
 110131 matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore  
 110132 any keywords matching the string pattern in the extended header records. In  
 110133 both cases, matching shall be performed using the pattern matching notation  
 110134 described in [Section 2.14.1](#) (on page 2523) and [Section 2.14.2](#) (on page 2524).  
 110135 For example:

110136 **-o delete=security.\***

110137 would suppress security-related information. See [pax Extended Header](#) (on  
 110138 page 3264) for extended header record keyword usage.

110139 When multiple **-odelete=pattern** options are specified, the patterns shall be  
 110140 additive; all keywords matching the specified string patterns shall be omitted  
 110141 from extended header records that *pax* produces.

110142 **exthdr.name=string**

110143 (Applicable only to the **-x pax** format.) This keyword allows user control over  
 110144 the name that is written into the **ustar** header blocks for the extended header  
 110145 produced under the circumstances described in [pax Header Block](#) (on page  
 110146 3263). The name shall be the contents of *string*, after the following character  
 110147 substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %d                         | The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname. |
| %f                         | The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.      |
| %p                         | The process ID of the <i>pax</i> process.                                                                          |
| %%                         | A '%' character.                                                                                                   |

110156 Any other '%' characters in *string* produce undefined results.

110157 If no **-o exthdr.name=string** is specified, *pax* shall use the following default

110158 value:  
 110159 %d/PaxHeaders.%p/%f

110160 **globexthdr.name=string**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records with **ustar** header blocks that are treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %n                         | An integer that represents the sequence number of the global extended header record in the archive, starting at 1. |
| %p                         | The process ID of the <i>pax</i> process.                                                                          |
| %%                         | A '%' character.                                                                                                   |

110167  
 110168  
 110169  
 110170  
 110171  
 110172

110173 Any other '%' characters in *string* produce undefined results.

110174 If no **-o globexthdr.name=string** is specified, *pax* shall use the following  
 110175 default value:

110176 \$TMPDIR/GlobalHead.%p.%n

110177 where *\$TMPDIR* represents the value of the *TMPDIR* environment variable. If  
 110178 *TMPDIR* is not set, *pax* shall use **/tmp**.

110179 **invalid=action**

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

110186  
 110187  
 110188  
 110189  
 110190  
 110191  
 110192  
 110193  
 110194

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

110195 The following mutually-exclusive values of the *action* argument are supported:

110196 **binary** In **write** mode, *pax* shall generate a **hdrcharset=BINARY**  
 110197 extended header record for each file with a filename, link name,  
 110198 group name, owner name, or any other field in an extended  
 110199 header record that cannot be translated to the UTF-8 codeset,  
 110200 allowing the archive to contain the files with unencoded  
 110201 extended header record values. In **read** or **copy** mode, *pax* shall  
 110202 use the values specified in the header without translation,

110203 regardless of whether this may overwrite an existing file with a  
 110204 valid name. In **list** mode, *pax* shall behave identically to the  
 110205 **bypass** action.

110206 **bypass** In **read** or **copy** mode, *pax* shall bypass the file, causing no  
 110207 change to the destination hierarchy. In **list** mode, *pax* shall write  
 110208 all requested valid values for the file, but its method for writing  
 110209 invalid values is unspecified.

110210 **rename** In **read** or **copy** mode, *pax* shall act as if the **-i** option were in  
 110211 effect for each file with invalid filename or link name values,  
 110212 allowing the user to provide a replacement name interactively.  
 110213 In **list** mode, *pax* shall behave identically to the **bypass** action.

110214 **UTF-8** When used in **read**, **copy**, or **list** mode and a filename, link  
 110215 name, owner name, or any other field in an extended header  
 110216 record cannot be translated from the **pax** UTF-8 codeset format  
 110217 to the codeset and current locale of the implementation, *pax* shall  
 110218 use the actual UTF-8 encoding for the name. If a **hdrcharset**  
 110219 extended header record is in effect for this file, the character set  
 110220 specified by that record shall be used instead of UTF-8. If a  
 110221 **hdrcharset=BINARY** extended header record is in effect for this  
 110222 file, no translation shall be performed.

110223 **write** In **read** or **copy** mode, *pax* shall write the file, translating the  
 110224 name, regardless of whether this may overwrite an existing file  
 110225 with a valid name. In **list** mode, *pax* shall behave identically to  
 110226 the **bypass** action.

110227 If no **-o invalid=option** is specified, *pax* shall act as if **-o invalid=bypass** were  
 110228 specified. Any overwriting of existing files that may be allowed by the  
 110229 **-o invalid=** actions shall be subject to permission (**-p**) and modification time  
 110230 (**-u**) restrictions, and shall be suppressed if the **-k** option is also specified.

110231 **linkdata**  
 110232 (Applicable only to the **-x pax** format.) In **write** mode, *pax* shall write the  
 110233 contents of a file to the archive even when that file is merely a hard link to a  
 110234 file whose contents have already been written to the archive.

110235 **listopt=format**  
 110236 This keyword specifies the output format of the table of contents produced  
 110237 when the **-v** option is specified in **list** mode. See [List Mode Format Specifications](#)  
 110238 (on page 3258). To avoid ambiguity, the **listopt=format** shall be  
 110239 the only or final **keyword=value** pair in a **-o** option-argument; all characters  
 110240 in the remainder of the option-argument shall be considered part of the format  
 110241 string. When multiple **-olistopt=format** options are specified, the format  
 110242 strings shall be considered a single, concatenated string, evaluated in  
 110243 command line order.

110244 **times**  
 110245 (Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax*  
 110246 shall include **atime** and **mtime** extended header records for each file. See [pax Extended Header File Times](#)  
 110247 (on page 3267).

110248 In addition to these keywords, if the **-x pax** format is specified, any of the  
 110249 keywords and values defined in [pax Extended Header](#) (on page 3264), including

110250 implementation extensions, can be used in **-o** option-arguments, in either of two  
110251 modes:

110252 **keyword=***value*

110253 When used in **write** or **copy** mode, these keyword/value pairs shall be  
110254 included at the beginning of the archive as **typeflag g** global extended header  
110255 records. When used in **read** or **list** mode, these keyword/value pairs shall act  
110256 as if they had been at the beginning of the archive as **typeflag g** global  
110257 extended header records.

110258 **keyword:=***value*

110259 When used in **write** or **copy** mode, these keyword/value pairs shall be  
110260 included as records at the beginning of a **typeflag x** extended header for each  
110261 file. (This shall be equivalent to the `<equals-sign>` form except that it creates  
110262 no **typeflag g** global extended header records.) When used in **read** or **list**  
110263 mode, these keyword/value pairs shall act as if they were included as records  
110264 at the end of each extended header; thus, they shall override any global or file-  
110265 specific extended header record keywords of the same names. For example, in  
110266 the command:

```
110267 pax -r -o "  
110268 gname:=mygroup,  
110269 " <archive
```

110270 the group name is forced to a new value for all files read from the archive.

110271 The precedence of **-o** keywords over various fields in the archive is described in  
110272 [pax Extended Header Keyword Precedence](#) (on page 3267). If the **-o**  
110273 **delete=***pattern*, **-o keyword=***value*, or **-o keyword:=***value* options are used to  
110274 override or remove any extended header data needed to find files in an archive  
110275 (e.g., **-o delete=size** for a file whose size cannot be represented in a **ustar**  
110276 header or **-o size=100** for a file whose size is not 100 bytes), the behavior is  
110277 undefined.

110278 **-p** *string*

110279 Specify one or more file characteristic options (privileges). The *string* option-  
110280 argument shall be a string specifying file characteristics to be retained or discarded  
110281 on extraction. The string shall consist of the specification characters *a*, *e*, *m*, *o*, and  
110282 *p*. Other implementation-defined characters can be included. Multiple  
110283 characteristics can be concatenated within the same string and multiple **-p** options  
can be specified. The meaning of the specification characters are as follows:

110284 *a* Do not preserve file access times.

110285 *e* Preserve the user ID, group ID, file mode bits (see XBD [Section 3.145](#), on page  
110286 52), access time, modification time, and any other implementation-defined file  
110287 characteristics.

110288 *m* Do not preserve file modification times.

110289 *o* Preserve the user ID and group ID.

110290 *p* Preserve the file mode bits. Other implementation-defined file mode attributes  
110291 may be preserved.

110292 In the preceding list, “preserve” indicates that an attribute stored in the archive  
110293 shall be given to the extracted file, subject to the permissions of the invoking  
110294 process. The access and modification times of the file shall be preserved unless  
110295 otherwise specified with the **-p** option or not stored in the archive. All attributes

110296 that are not preserved shall be determined as part of the normal file creation action  
 110297 (see [Section 1.1.1.4](#), on page 2454).

110298 If neither the `e` nor the `o` specification character is specified, or the user ID and  
 110299 group ID are not preserved for any reason, *pax* shall not set the `S_ISUID` and  
 110300 `S_ISGID` bits of the file mode.

110301 If the preservation of any of these items fails for any reason, *pax* shall write a  
 110302 diagnostic message to standard error. Failure to preserve these items shall affect  
 110303 the final exit status, but shall not cause the extracted file to be deleted.

110304 If file characteristic letters in any of the *string* option-arguments are duplicated or  
 110305 conflict with each other, the ones given last shall take precedence. For example, if  
 110306 `-p eme` is specified, file modification times are preserved.

110307 `-s replstr` Modify file or archive member names named by *pattern* or *file* operands according  
 110308 to the substitution expression *replstr*, using the syntax of the *ed* utility. The concepts  
 110309 of “address” and “line” are meaningless in the context of the *pax* utility, and shall  
 110310 not be supplied. The format shall be:

110311 `-s /old/new/[gpsS]`

110312 where as in *ed*, *old* is a basic regular expression and *new* can contain an  
 110313 `<ampersand>`, `'\n'` (where *n* is a digit) back-references, or subexpression  
 110314 matching. The *old* string shall also be permitted to contain `<newline>` characters.

110315 Any non-null character can be used as a delimiter (`'/'` shown here). Multiple `-s`  
 110316 expressions can be specified; the expressions shall be applied in the order  
 110317 specified, terminating with the first successful substitution. The optional trailing  
 110318 `'g'` is as defined in the *ed* utility. The optional trailing `'p'` shall cause successful  
 110319 substitutions to be written to standard error. The optional trailing `'s'` and `'S'`  
 110320 control whether the substitutions are applied to symbolic link contents: `'s'` shall  
 110321 cause them not to be applied; `'S'` shall cause them to be applied. If neither is  
 110322 present, it is unspecified which is the default. If both are present, the behavior is  
 110323 unspecified. File or archive member names that substitute to the empty string shall  
 110324 be ignored when reading and writing archives. Symbolic link contents that  
 110325 substitute to the empty string shall not be treated specially.

110326 `-t` When reading files from the file system, and if the user has the permissions  
 110327 required by *futimens()* to do so, set the access time of each file read to the access  
 110328 time that it had before being read by *pax*.

110329 `-u` Ignore files that are older (having a less recent file modification time) than a pre-  
 110330 existing file or archive member with the same name. In **read** mode, an archive  
 110331 member with the same name as a file in the file system shall be extracted if the  
 110332 archive member is newer than the file. In **write** mode, an archive file member with  
 110333 the same name as a file in the file system shall be superseded if the file is newer  
 110334 than the archive member. If `-a` is also specified, this is accomplished by appending  
 110335 to the archive; otherwise, it is unspecified whether this is accomplished by actual  
 110336 replacement in the archive or by appending to the archive. In **copy** mode, the file  
 110337 in the destination hierarchy shall be replaced if the file in the source hierarchy is  
 110338 newer.

110339 `-v` In **list** mode, produce a verbose table of contents (see the **STDOUT** section).  
 110340 Otherwise, write archive member pathnames to standard error (see the **STDERR**  
 110341 section).

- 110342        **-x format**     Specify the output archive format. The *pax* utility shall support the following  
110343                   formats:
- 110344                **cpio**           The **cpio** interchange format; see the EXTENDED DESCRIPTION  
110345                   section. The default *blocksize* for this format for character special  
110346                   archive files shall be 5120. Implementations shall support all  
110347                   *blocksize* values less than or equal to 32256 that are multiples of 512.
- 110348                **pax**            The **pax** interchange format; see the EXTENDED DESCRIPTION  
110349                   section. The default *blocksize* for this format for character special  
110350                   archive files shall be 5120. Implementations shall support all  
110351                   *blocksize* values less than or equal to 32256 that are multiples of 512.
- 110352                **ustar**        The **tar** interchange format; see the EXTENDED DESCRIPTION  
110353                   section. The default *blocksize* for this format for character special  
110354                   archive files shall be 10240. Implementations shall support all  
110355                   *blocksize* values less than or equal to 32256 that are multiples of 512.
- 110356                   Implementation-defined formats shall specify a default block size as well as any  
110357                   other block sizes supported for character special archive files.
- 110358                   Any attempt to append to an archive file in a format different from the existing  
110359                   archive format shall cause *pax* to exit immediately with a non-zero exit status.
- 110360        **-X**            When traversing the file hierarchy specified by a pathname, *pax* shall not descend  
110361                   below directories that have a different device ID (*st\_dev*; see XSH *fstatat()*) than the  
110362                   specified pathname; that is, when a directory with a different device ID is  
110363                   encountered, *pax* shall process (archive or copy) the directory itself but shall not  
110364                   process any files below the directory.
- 110365                   Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
110366                   an error and the last option specified shall determine the behavior of the utility.
- 110367                   The options that operate on the names of files or archive members (**-c**, **-i**, **-n**, **-s**, **-u**, and **-v**)  
110368                   shall interact as follows. In **read** mode, the archive members shall be selected based on the user-  
110369                   specified *pattern* operands as modified by the **-c**, **-n**, and **-u** options. Then, any **-s** and **-i**  
110370                   options shall modify, in that order, the names of the selected files. The **-v** option shall write  
110371                   names resulting from these modifications.
- 110372                   In **write** mode, the files shall be selected based on the user-specified pathnames as modified by  
110373                   the **-u** option. Then, any **-s** and **-i** options shall modify, in that order, the names of these  
110374                   selected files. The **-v** option shall write names resulting from these modifications.
- 110375                   If both the **-u** and **-n** options are specified, *pax* shall not consider a file selected unless it is  
110376                   newer than the file to which it is compared.
- 110377        **List Mode Format Specifications**
- 110378                   In **list** mode with the **-o listopt=format** option, the *format* argument shall be applied for each  
110379                   selected file. The *pax* utility shall append a <newline> to the **listopt** output for each selected file.  
110380                   The *format* argument shall be used as the *format* string described in XBD Chapter 5 (on page 113),  
110381                   with the exceptions 1. through 6. defined in the EXTENDED DESCRIPTION section of *printf*,  
110382                   plus the following exceptions:
- 110383                   7. The sequence (*keyword*) can occur before a format conversion specifier. The conversion  
110384                   argument is defined by the value of *keyword*. The implementation shall support the  
110385                   following keywords:

- 110386 — Any of the Field Name entries in [Table 3-15](#) (on page 3268) and [Table 3-17](#) (on page 3272). The implementation may support the *cpio* keywords without the leading *c\_* in addition to the form required by [Table 3-17](#) (on page 3272).
- 110387
- 110388
- 110389 — Any keyword defined for the extended header in [pax Extended Header](#) (on page 3264).
- 110390
- 110391 — Any keyword provided as an implementation-defined extension within the extended header defined in [pax Extended Header](#) (on page 3264).
- 110392

110393 For example, the sequence "%(charset) s" is the string value of the name of the character set in the extended header.

110394

110395 The result of the keyword conversion argument shall be the value from the applicable header field or extended header, without any trailing NULs.

110396

110397 All keyword values used as conversion arguments shall be translated from the UTF-8 encoding (or alternative encoding specified by any **hdrcharset** extended header record) to the character set appropriate for the local file system, user database, and so on, as applicable.

110398

110399

110400

- 110401 8. An additional conversion specifier character, **T**, shall be used to specify time formats. The **T** conversion specifier character can be preceded by the sequence (*keyword=subformat*), where *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime** and the default subformat shall be:
- 110402
- 110403
- 110404

110405 %b %e %H:%M %Y

- 110406 9. An additional conversion specifier character, **M**, shall be used to specify the file mode string as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used. For example, %.1M writes the single character corresponding to the *<entry type>* field of the *ls -l* command.
- 110407
- 110408
- 110409

- 110410 10. An additional conversion specifier character, **D**, shall be used to specify the device for block or special files, if applicable, in an implementation-defined format. If not applicable, and (*keyword*) is specified, then this conversion shall be equivalent to %(*keyword*)u. If not applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to *<space>*.
- 110411
- 110412
- 110413

- 110414 11. An additional conversion specifier character, **F**, shall be used to specify a pathname. The **F** conversion character can be preceded by a sequence of *<comma>*-separated keywords:
- 110415

110416 (*keyword*[,*keyword*] ... )

110417 The values for all the keywords that are non-null shall be concatenated together, each separated by a '/'. The default shall be (**path**) if the keyword **path** is defined; otherwise, the default shall be (**prefix,name**).

110418

110419

- 110420 12. An additional conversion specifier character, **L**, shall be used to specify a symbolic link expansion. If the current file is a symbolic link, then %L shall expand to:
- 110421

110422 "%s -> %s", *<value of keyword>*, *<contents of link>*

110423 Otherwise, the %L conversion specification shall be the equivalent of %F.

## 110424 OPERANDS

110425 The following operands shall be supported:

110426 *directory* The destination directory pathname for **copy** mode.

- 110427 *file* A pathname of a file to be copied or archived.
- 110428 *pattern* A pattern matching one or more pathnames of archive members. A pattern needs  
110429 to be given in the name-generating notation of the pattern matching notation in  
110430 [Section 2.14](#) (on page 2523), including the filename expansion rules in [Section](#)  
110431 [2.14.3](#) (on page 2525). The default, if no *pattern* is specified, is to select all members  
110432 in the archive.
- 110433 **STDIN**
- 110434 In **write** mode, the standard input shall be used only if no *file* operands are specified. It shall be a  
110435 file containing a list of pathnames, each terminated by a <newline> character.
- 110436 In **list** and **read** modes, if **-f** is not specified, the standard input shall be an archive file.
- 110437 Otherwise, the standard input shall not be used.
- 110438 **INPUT FILES**
- 110439 The input file named by the *archive* option-argument, or standard input when the archive is read  
110440 from there, shall be a file formatted according to one of the specifications in the EXTENDED  
110441 DESCRIPTION section or some other implementation-defined format.
- 110442 The file `/dev/tty` shall be used to write prompts and read responses.
- 110443 **ENVIRONMENT VARIABLES**
- 110444 The following environment variables shall affect the execution of *pax*:
- 110445 *LANG* Provide a default value for the internationalization variables that are unset or null.  
110446 (See [XBD Section 8.2](#) (on page 169) the precedence of internationalization variables  
110447 used to determine the values of locale categories.)
- 110448 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
110449 internationalization variables.
- 110450 *LC\_COLLATE*
- 110451 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
110452 character collating elements used in the pattern matching expressions for the  
110453 *pattern* operand and the basic regular expression for the **-s** option.
- 110454 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
110455 characters (for example, single-byte as opposed to multi-byte characters in  
110456 arguments and input files), and the behavior of character classes used in the  
110457 pattern matching expressions for the *pattern* operand and the basic regular  
110458 expression for the **-s** option.
- 110459 *LC\_MESSAGES*
- 110460 Determine the locale used to affect the format and contents of diagnostic messages  
110461 and prompts written to standard error.
- 110462 *LC\_TIME* Determine the format and contents of date and time strings when the **-v** option is  
110463 specified.
- 110464 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 110465 *TMPDIR* Determine the pathname that provides part of the default global extended header  
110466 record file, as described for the **-o globexthdr=** keyword in the OPTIONS section.
- 110467 *TZ* Determine the timezone used to calculate date and time strings when the **-v** option  
110468 is specified. If *TZ* is unset or null, an unspecified default timezone shall be used.

110469 **ASYNCHRONOUS EVENTS**

110470 Default.

110471 **STDOUT**

110472 In **write** mode, if **-f** is not specified, the standard output shall be the archive formatted  
 110473 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 110474 implementation-defined format (see **-x format**).

110475 In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall  
 110476 be written to standard output using the format described under [List Mode Format Specifications](#)  
 110477 (on page 3258). In **list** mode without the **-olistopt=format** option, the table of contents of the  
 110478 selected archive members shall be written to standard output using the following format:

110479 "%s\n", &lt;pathname&gt;

110480 If the **-v** option is specified in **list** mode, the table of contents of the selected archive members  
 110481 shall be written to standard output using the following formats.

110482 For pathnames representing hard links to previous members of the archive:

110483 "%sΔ==Δ%s\n", &lt;ls -l listing&gt;, &lt;linkname&gt;

110484 For all other pathnames:

110485 "%s\n", &lt;ls -l listing&gt;

110486 where <ls -l listing> shall be the format specified by the *ls* utility with the **-l** option. When  
 110487 writing pathnames in this format, it is unspecified what is written for fields for which the  
 110488 underlying archive format does not have the correct information, although the correct number of  
 110489 <blank>-separated fields shall be written.

110490 In **list** mode, standard output shall not be buffered more than a pathname (plus any associated  
 110491 information and a <newline> terminator) at a time.

110492 **STDERR**

110493 If **-v** is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the  
 110494 standard error output using the following format:

110495 "%s\n", &lt;pathname&gt;

110496 These pathnames shall be written as soon as processing is begun on the file or archive member,  
 110497 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is  
 110498 written when the file has been read or written.

110499 If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be  
 110500 written to standard error in the following format:

110501 "%sΔ&gt;&gt;Δ%s\n", &lt;original pathname&gt;, &lt;new pathname&gt;

110502 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
 110503 archive format and volume number, the number of files, blocks, volumes, and media parts as  
 110504 well as other diagnostic messages may be written to standard error.

110505 In all formats, for both standard output and standard error, it is unspecified how non-printable  
 110506 characters in pathnames or link names are written.

110507 When using the **-xpax** archive format, if a filename, link name, group name, owner name, or any  
 110508 other field in an extended header record cannot be translated between the codeset in use for that  
 110509 extended header record and the character set of the current locale, *pax* shall write a diagnostic  
 110510 message to standard error, shall process the file as described for the **-o invalid=** option, and then  
 110511 shall continue processing with the next file.

110512 **OUTPUT FILES**

110513 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
110514 copied output files shall be the type of the file being copied. In either mode, existing files in the  
110515 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
110516 and invalid-value (**-oinvalid=**) tests allow it.

110517 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
110518 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
110519 implementation-defined format.

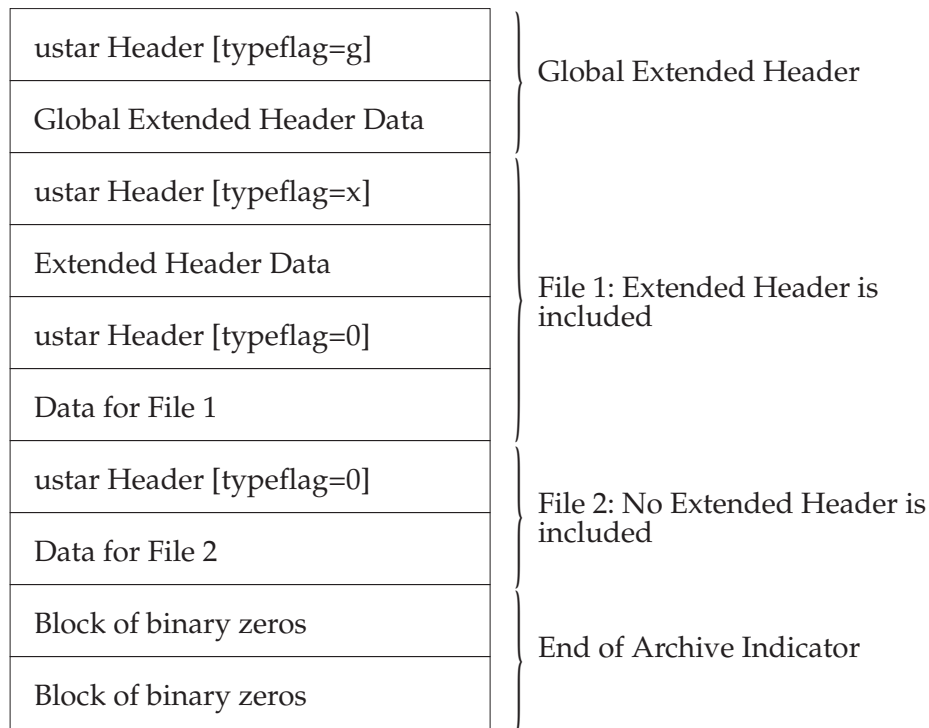

110520 **EXTENDED DESCRIPTION**110521 **pax Interchange Format**

110522 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
110523 physical layout of the archive shall be identical to the **ustar** format described in [ustar](#)  
110524 [Interchange Format](#) (on page 3268). Each file archived shall be represented by the following  
110525 sequence:

- 110526 • An optional header block with extended header records. This header block is of the form  
110527 described in [pax Header Block](#) (on page 3263), with a *typeflag* value of **x** or **g**. The  
110528 extended header records, described in [pax Extended Header](#) (on page 3264), shall be  
110529 included as the data for this header block.
- 110530 • A header block that describes the file. Any fields in the preceding optional extended  
110531 header shall override the associated fields in this header block for this file.
- 110532 • Zero or more blocks that contain the contents of the file.

110533 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,  
110534 interpreted as an end-of-archive indicator.

110535 A schematic of an example archive with global extended header records and two actual files is  
110536 shown in [Figure 3-1](#) (on page 3263). In the example, the second file in the archive has no  
110537 extended header preceding it, presumably because it has no need for extended attributes.

110538

Figure 3-1 pax Format Archive Example

110539

**pax Header Block**

110540

The **pax** header block shall be identical to the **ustar** header block described in [ustar Interchange Format](#) (on page 3268), except that two additional *typeflag* values are defined:

110541

110542

x Represents extended header records for the following file in the archive (which shall have its own **ustar** header block). The format of these extended header records shall be as described in [pax Extended Header](#) (on page 3264).

110543

110544

110545

g Represents global extended header records for the following files in the archive. The format of these extended header records shall be as described in [pax Extended Header](#) (on page 3264). Each value shall affect all subsequent files that do not override that value in their own extended header record and until another global extended header record is reached that provides another value for the same field. The *typeflag* g global headers should not be used with interchange media that could suffer partial data loss in transporting the archive.

110546

110547

110548

110549

110550

110551

For both of these types, the *size* field shall be the size of the extended header records in octets. The other fields in the header block are not meaningful to this version of the *pax* utility. However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2:1993 standard, the header block fields are used to create a regular file that contains the extended header records as data. Therefore, header block field values should be selected to provide reasonable file access to this regular file.

110552

110553

110554

110555

110556

110557

A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit one) (hard link) may be included, which means that the size field may be greater than zero. Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

110558

110559

110560 **pax Extended Header**

110561 A **pax** extended header contains values that are inappropriate for the **ustar** header block because  
 110562 of limitations in that format: fields requiring a character encoding other than that described in  
 110563 the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar**  
 110564 header, and fields whose format or length do not fit the requirements of the **ustar** header. The  
 110565 values in an extended header add attributes to the following file (or files; see the description of  
 110566 the *typeflag* **g** header block) or override values in the following header block(s), as indicated in  
 110567 the following list of keywords.

110568 An extended header shall consist of one or more records, each constructed as follows:

110569 `"%d %s=%s\n", <length>, <keyword>, <value>`

110570 The extended header records shall be encoded according to the ISO/IEC 10646:2020 standard  
 110571 UTF-8 encoding. The *<length>* field, *<blank>*, *<equals-sign>*, and *<newline>* shown shall be  
 110572 limited to the portable character set, as encoded in UTF-8. The *<keyword>* fields can be any  
 110573 UTF-8 characters. The *<length>* field shall be the decimal length of the extended header record  
 110574 in octets, including the trailing *<newline>*. If there is a **hdrcharset** extended header in effect for  
 110575 a file, the *value* field for any **gname**, **linkpath**, **path**, and **uname** extended header records shall be  
 110576 encoded using the character set specified by the **hdrcharset** extended header record; otherwise,  
 110577 the *value* field shall be encoded using UTF-8. The *value* field for all other keywords specified by  
 110578 POSIX.1-2024 shall be encoded using UTF-8.

110579 The *<keyword>* field shall be one of the entries from the following list or a keyword provided as  
 110580 an implementation extension. Keywords consisting entirely of lowercase letters, digits, and  
 110581 periods are reserved for future standardization. A keyword shall not include an *<equals-sign>*.  
 110582 (In the following list, the notations `file(s)` or `block(s)` is used to acknowledge that a keyword  
 110583 affects the following single file after a *typeflag* **x** extended header, but possibly multiple files after  
 110584 *typeflag* **g**. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode  
 110585 shall apply only when such a record has not already been provided through the use of the **-o**  
 110586 option. When used in **copy** mode, *pax* shall behave as if an archive had been created with  
 110587 applicable extended header records and then extracted.)

110588 **atime** The file access time for the following file(s), equivalent to the value of the *st\_atim*  
 110589 member of the **stat** structure for a file, as described by the *stat()* function. The  
 110590 access time shall be restored if the process has appropriate privileges required to  
 110591 do so. The format of the *<value>* shall be as described in [pax Extended Header File](#)  
 110592 [Times](#) (on page 3267).

110593 **charset** The name of the character set used to encode the data in the following file(s). The  
 110594 entries in the following table are defined to refer to known standards; additional  
 110595 names may be agreed on between the originator and recipient.

|        | <value>                 | Formal Standard               |
|--------|-------------------------|-------------------------------|
| 110596 | ISO-IRΔ646Δ1990         | ISO/IEC 646:1990              |
| 110597 | ISO-IRΔ8859Δ1Δ1998      | ISO/IEC 8859-1:1998           |
| 110598 | ISO-IRΔ8859Δ2Δ1999      | ISO/IEC 8859-2:1999           |
| 110599 | ISO-IRΔ8859Δ3Δ1999      | ISO/IEC 8859-3:1999           |
| 110600 | ISO-IRΔ8859Δ4Δ1998      | ISO/IEC 8859-4:1998           |
| 110601 | ISO-IRΔ8859Δ5Δ1999      | ISO/IEC 8859-5:1999           |
| 110602 | ISO-IRΔ8859Δ6Δ1999      | ISO/IEC 8859-6:1999           |
| 110603 | ISO-IRΔ8859Δ7Δ1987      | ISO/IEC 8859-7:1987           |
| 110604 | ISO-IRΔ8859Δ8Δ1999      | ISO/IEC 8859-8:1999           |
| 110605 | ISO-IRΔ8859Δ9Δ1999      | ISO/IEC 8859-9:1999           |
| 110606 | ISO-IRΔ8859Δ10Δ1998     | ISO/IEC 8859-10:1998          |
| 110607 | ISO-IRΔ8859Δ13Δ1998     | ISO/IEC 8859-13:1998          |
| 110608 | ISO-IRΔ8859Δ14Δ1998     | ISO/IEC 8859-14:1998          |
| 110609 | ISO-IRΔ8859Δ15Δ1999     | ISO/IEC 8859-15:1999          |
| 110610 | ISO-IRΔ10646Δ2000       | ISO/IEC 10646:2000            |
| 110611 | ISO-IRΔ10646Δ2000ΔUTF-8 | ISO/IEC 10646, UTF-8 encoding |
| 110612 | BINARY                  | None.                         |

110614 The encoding is included in an extended header for information only; when *pax* is  
 110615 used as described in POSIX.1-2024, it shall not translate the file data into any other  
 110616 encoding. The **BINARY** entry indicates unencoded binary data.

110617 When used in **write** or **copy** mode, it is implementation-defined whether *pax*  
 110618 includes a **charset** extended header record for a file.

110619 **comment** A series of characters used as a comment. All characters in the <value> field shall  
 110620 be ignored by *pax*.

110621 **gid** The group ID of the group that owns the file, expressed as a decimal number using  
 110622 digits from the ISO/IEC 646:1991 standard. This record shall override the *gid* field  
 110623 in the following header block(s). When used in **write** or **copy** mode, *pax* shall  
 110624 include a *gid* extended header record for each file whose group ID is greater than  
 110625 2 097 151 (octal 7 777 777).

110626 **gname** The group of the file(s), formatted as a group name in the group database. This  
 110627 record shall override the *gid* and *gname* fields in the following header block(s), and  
 110628 any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall  
 110629 translate the name from the encoding in the header record to the character set  
 110630 appropriate for the group database on the receiving system. If any of the characters  
 110631 cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the  
 110632 **-oinvalid=binary** option is specified, the results are implementation-defined.  
 110633 When used in **write** or **copy** mode, *pax* shall include a **gname** extended header  
 110634 record for each file whose group name cannot be represented entirely with the  
 110635 letters and digits of the portable character set.

110636 **hdrcharset** The name of the character set used to encode the value field of the **gname**,  
 110637 **linkpath**, **path**, and **uname** *pax* extended header records. The entries in the  
 110638 following table are defined to refer to known standards; additional names may be  
 110639 agreed between the originator and the recipient.

110640  
110641  
110642

| <value>                 | Formal Standard               |
|-------------------------|-------------------------------|
| ISO-IRΔ10646Δ2000ΔUTF-8 | ISO/IEC 10646, UTF-8 encoding |
| BINARY                  | None.                         |

110643  
110644  
110645

If no **hdrcharset** extended header record is specified, the default character set used to encode all values in extended header records shall be the ISO/IEC 10646:2020 standard UTF-8 encoding.

110646  
110647

The **BINARY** entry indicates that all values recorded in extended headers for affected files are unencoded binary data from the underlying system.

110648  
110649  
110650  
110651  
110652  
110653  
110654  
110655  
110656  
110657  
110658

#### **linkpath**

The pathname of a link being created to another file, of any type, previously archived. This record shall override the *linkname* field in the following **ustar** header block(s). The following **ustar** header block shall determine the type of link created. If *typeflag* of the following header block is 1, it shall be a hard link. If *typeflag* is 2, it shall be a symbolic link and the **linkpath** value shall be the contents of the symbolic link. The *pax* utility shall translate the name of the link (contents of the symbolic link) from the encoding in the header to the character set appropriate for the local file system. When used in **write** or **copy** mode, *pax* shall include a **linkpath** extended header record for each link whose pathname cannot be represented entirely with the members of the portable character set other than NUL.

110659  
110660  
110661  
110662  
110663  
110664

#### **mtime**

The file modification time of the following file(s), equivalent to the value of the *st\_mtim* member of the **stat** structure for a file, as described in the *stat()* function. This record shall override the *mtime* field in the following header block(s). The modification time shall be restored if the process has appropriate privileges required to do so. The format of the <value> shall be as described in [pax Extended Header File Times](#) (on page 3267).

110665  
110666  
110667  
110668

#### **path**

The pathname of the following file(s). This record shall override the *name* and *prefix* fields in the following header block(s). The *pax* utility shall translate the pathname of the file from the encoding in the header to the character set appropriate for the local file system.

110669  
110670  
110671

When used in **write** or **copy** mode, *pax* shall include a *path* extended header record for each file whose pathname cannot be represented entirely with the members of the portable character set other than NUL.

110672

**realtime.any** The keywords prefixed by ``realtime.'' are reserved for future standardization.

110673

**security.any** The keywords prefixed by ``security.'' are reserved for future standardization.

110674  
110675  
110676  
110677  
110678

#### **size**

The size of the file in octets, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the *size* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *size* extended header record for each file with a size value greater than 8 589 934 591 (octal 77 777 777 777).

110679  
110680  
110681  
110682  
110683

#### **uid**

The user ID of the file owner, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the *uid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *uid* extended header record for each file whose owner ID is greater than 2 097 151 (octal 7 777 777).

110684 **uname** The owner of the following file(s), formatted as a user name in the user database.  
 110685 This record shall override the *uid* and *uname* fields in the following header block(s),  
 110686 and any *uid* extended header record. When used in **read**, **copy**, or **list** mode, *pax*  
 110687 shall translate the name from the encoding in the header record to the character set  
 110688 appropriate for the user database on the receiving system. If any of the characters  
 110689 cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the  
 110690 **-oinvalid=binary** option is specified, the results are implementation-defined.  
 110691 When used in **write** or **copy** mode, *pax* shall include a **uname** extended header  
 110692 record for each file whose user name cannot be represented entirely with the letters  
 110693 and digits of the portable character set.

110694 If the *<value>* field is zero length, it shall delete any header block field, previously entered  
 110695 extended header value, or global extended header value of the same name.

110696 If a keyword in an extended header record (or in a **-o** option-argument) overrides or deletes a  
 110697 corresponding field in the **ustar** header block, *pax* shall ignore the contents of that header block  
 110698 field.

110699 Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the  
 110700 *<value>* field shall be considered data for the field. None of the length limitations of the **ustar**  
 110701 header block fields in Table 3-15 (on page 3268) shall apply to the extended header records.

#### 110702 **pax Extended Header Keyword Precedence**

110703 This section describes the precedence in which the various header records and fields and  
 110704 command line options are selected to apply to a file in the archive. When *pax* is used in **read** or  
 110705 **list** modes, it shall determine a file attribute in the following sequence:

- 110706 1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step  
 110707 7., if applicable, or ignored otherwise.
- 110708 2. If **-okeyword:=** is used, the affected attributes shall be ignored.
- 110709 3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
- 110710 4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the  
 110711 *<value>*. When extended header records conflict, the last one given in the header shall  
 110712 take precedence.
- 110713 5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
- 110714 6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be  
 110715 assigned the *<value>*. When global extended header records conflict, the last one given in  
 110716 the global header shall take precedence.
- 110717 7. Otherwise, the attribute shall be determined from the **ustar** header block.

#### 110718 **pax Extended Header File Times**

110719 The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's  
 110720 modification time cannot be represented exactly in the **ustar** header logical record described in  
 110721 [ustar Interchange Format](#) (on page 3268). This can occur if the time is out of **ustar** range, or if  
 110722 the file system of the underlying implementation supports non-integer time granularities and  
 110723 the time is not an integer. All of these time records shall be formatted as a decimal representation  
 110724 of the time in seconds since the Epoch. If a *<period>* ( ' . ' ) decimal point character is present,  
 110725 the digits to the right of the point shall represent the units of a subsecond timing granularity,  
 110726 where the first digit is tenths of a second and each subsequent digit is a tenth of the previous  
 110727 digit. In **read** or **copy** mode, the *pax* utility shall truncate the time of a file to the greatest value

110728 that is not greater than the input header file time. In **write** or **copy** mode, the *pax* utility shall  
 110729 output a time exactly if it can be represented exactly as a decimal number, and otherwise shall  
 110730 generate only enough digits so that the same time shall be recovered if the file is extracted on a  
 110731 system whose underlying implementation supports the same time granularity.

### 110732 **ustar Interchange Format**

110733 A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a  
 110734 fixed-size logical record of 512 octets (see below). Although this format may be thought of as  
 110735 being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of  
 110736 transportable media are not excluded. Each file archived shall be represented by a header logical  
 110737 record that describes the file, followed by zero or more logical records that give the contents of  
 110738 the file. At the end of the archive file there shall be two 512-octet logical records filled with  
 110739 binary zeros, interpreted as an end-of-archive indicator.

110740 The logical records may be grouped for physical I/O operations, as described under the  
 110741 **-bblocksize** and **-x ustar** options. Each group of logical records may be written with a single  
 110742 operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a  
 110743 single tape physical block. The last physical block shall always be the full size, so logical records  
 110744 after the two zero logical records may contain undefined data.

110745 The header logical record shall be structured as shown in the following table. All lengths and  
 110746 offsets are in decimal.

110747 **Table 3-15** ustar Header Block

| Field Name      | Octet Offset | Length (in Octets) |
|-----------------|--------------|--------------------|
| <i>name</i>     | 0            | 100                |
| <i>mode</i>     | 100          | 8                  |
| <i>uid</i>      | 108          | 8                  |
| <i>gid</i>      | 116          | 8                  |
| <i>size</i>     | 124          | 12                 |
| <i>mtime</i>    | 136          | 12                 |
| <i>chksum</i>   | 148          | 8                  |
| <i>typeflag</i> | 156          | 1                  |
| <i>linkname</i> | 157          | 100                |
| <i>magic</i>    | 257          | 6                  |
| <i>version</i>  | 263          | 2                  |
| <i>uname</i>    | 265          | 32                 |
| <i>gname</i>    | 297          | 32                 |
| <i>devmajor</i> | 329          | 8                  |
| <i>devminor</i> | 337          | 8                  |
| <i>prefix</i>   | 345          | 155                |

110765 All characters in the header logical record shall be represented in the coded character set of the  
 110766 ISO/IEC 646: 1991 standard. For maximum portability between implementations, names should  
 110767 be selected from characters represented by the portable filename character set as octets with the  
 110768 most significant bit zero. If an implementation supports the use of characters outside of <slash>  
 110769 and the portable filename character set in names for files, users, and groups, one or more  
 110770 implementation-defined encodings of these characters shall be provided for interchange  
 110771 purposes.

110772 However, the *pax* utility shall never create filenames on the local system that cannot be accessed

110773 via the procedures described in POSIX.1-2024. If a filename is found on the medium that would  
 110774 create an invalid filename, it is implementation-defined whether the data from the file is stored  
 110775 on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these  
 110776 files as long as it produces an error indicating that the file is being ignored.

110777 Each field within the header logical record is contiguous; that is, there is no padding used. Each  
 110778 character on the archive medium shall be stored contiguously.

110779 The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character.  
 110780 The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all  
 110781 characters in the array contain non-NUL characters including the last character. The *version* field  
 110782 is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character.  
 110783 All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991  
 110784 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

110785 The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be  
 110786 formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up  
 110787 to the first NUL character), a <slash> character, and *name*; otherwise, *name* is used alone. In  
 110788 either case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it  
 110789 shall be ignored. In this manner, pathnames of at most 256 characters can be supported. If a  
 110790 pathname does not fit in the space provided, *pax* shall notify the user of the error, and shall not  
 110791 store any part of the file—header or data—on the medium.

110792 The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a  
 110793 *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall  
 110794 notify the user of the error, and shall not attempt to store the link on the medium.

110795 The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit  
 110796 representation. The encoded bits shall represent the following values:

110797 **Table 3-16** *ustar mode* Field

| 110798 | Bit Value | POSIX.1-2024 Bit | Description                                     |
|--------|-----------|------------------|-------------------------------------------------|
| 110799 | 04 000    | S_ISUID          | Set UID on execution.                           |
| 110800 | 02 000    | S_ISGID          | Set GID on execution.                           |
| 110801 | 01 000    | <reserved>       | Reserved for future standardization.            |
| 110802 | 00 400    | S_IRUSR          | Read permission for file owner class.           |
| 110803 | 00 200    | S_IWUSR          | Write permission for file owner class.          |
| 110804 | 00 100    | S_IXUSR          | Execute/search permission for file owner class. |
| 110805 | 00 040    | S_IRGRP          | Read permission for file group class.           |
| 110806 | 00 020    | S_IWGRP          | Write permission for file group class.          |
| 110807 | 00 010    | S_IXGRP          | Execute/search permission for file group class. |
| 110808 | 00 004    | S_IROTH          | Read permission for file other class.           |
| 110809 | 00 002    | S_IWOTH          | Write permission for file other class.          |
| 110810 | 00 001    | S_IXOTH          | Execute/search permission for file other class. |

110811 When appropriate privileges are required to set one of these mode bits, and the user restoring  
 110812 the files from the archive does not have appropriate privileges, the mode bits for which the user  
 110813 does not have appropriate privileges shall be ignored. Some of the mode bits in the archive  
 110814 format are not mentioned elsewhere in this volume of POSIX.1-2024. If the implementation does  
 110815 not support those bits, they may be ignored.

110816 The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

110817 The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type  
 110818 1 (a hard link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is

- 110819 set to specify a file of type 5 (directory), the *size* field shall be interpreted as described under the  
 110820 definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag*  
 110821 field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size*  
 110822 field is unspecified by this volume of POSIX.1-2024, and no data logical records shall be stored  
 110823 on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If the  
 110824 *typeflag* field is set to any other value, the number of logical records written following the header  
 110825 shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.
- 110826 The *mtime* field shall be the modification time of the file at the time it was archived. It is the  
 110827 ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained  
 110828 from the *stat()* function.
- 110829 The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of  
 110830 the simple sum of all octets in the header logical record. Each octet in the header shall be treated  
 110831 as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the  
 110832 precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is  
 110833 treated as if it were all <space> characters.
- 110834 The *typeflag* field specifies the type of file archived. If a particular implementation does not  
 110835 recognize the type, or the user does not have appropriate privileges to create that type, the file  
 110836 shall be extracted as if it were a regular file if the file type is defined to have a meaning for the  
 110837 *size* field that could cause data logical records to be written on the medium (see the previous  
 110838 description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error  
 110839 indicating that the conversion took place. All of the *typeflag* fields shall be coded in the  
 110840 ISO/IEC 646:1991 standard IRV:
- |        |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 110841 | 0    | Represents a regular file. For backwards-compatibility, a <i>typeflag</i> value of binary zero (' <code>\0</code> ') should be recognized as meaning a regular file when extracting files from the archive. Archives written with this version of the archive file format create regular files with a <i>typeflag</i> value of the ISO/IEC 646:1991 standard IRV ' <code>0</code> '.                                       |
| 110842 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110843 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110844 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110845 | 1    | Represents a file linked to another file, of any type, previously archived. Such files are identified by having the same device and file serial numbers, and pathnames that refer to different directory entries. All such files shall be archived as linked files. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length.                  |
| 110846 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110847 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110848 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110849 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110850 | 2    | Represents a symbolic link. The contents of the symbolic link shall be stored in the <i>linkname</i> field.                                                                                                                                                                                                                                                                                                                |
| 110851 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110852 | 3, 4 | Represent character special files and block special files respectively. In this case the <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format of which is unspecified by this volume of POSIX.1-2024. Implementations may map the device specifications to their own local specification or may ignore the entry.                                                          |
| 110853 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110854 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110855 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110856 | 5    | Specifies a directory or subdirectory. On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field. |
| 110857 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110858 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110859 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110860 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110861 | 6    | Specifies a FIFO special file. Note that the archiving of a FIFO file archives the existence of this file and not its contents.                                                                                                                                                                                                                                                                                            |
| 110862 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110863 | 7    | Reserved to represent a file to which an implementation has associated some high-performance attribute. Implementations without such extensions should treat this file as a regular file (type 0).                                                                                                                                                                                                                         |
| 110864 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 110865 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |

110866 A-Z The letters 'A' to 'Z', inclusive, are reserved for custom implementations. All other  
110867 values are reserved for future versions of this standard.

110868 It is unspecified whether files with pathnames that refer to the same directory entry are archived  
110869 as linked files or as separate files. If they are archived as linked files, this means that attempting  
110870 to extract both pathnames from the resulting archive always causes an error (unless the `-u`  
110871 option is used) because the link cannot be created.

110872 It is unspecified whether files with the same device and file serial numbers being appended to  
110873 an archive are treated as linked files to members that were in the archive before the append.

110874 Attempts to archive a socket shall produce a diagnostic message when **ustar** interchange format  
110875 is used, but may be allowed when **pax** interchange format is used. Handling of other file types is  
110876 implementation-defined.

110877 The *magic* field is the specification that this archive was output in this archive format. If this field  
110878 contains **ustar** (the five characters from the ISO/IEC 646:1991 standard IRV shown followed by  
110879 NUL), the *uname* and *gname* fields shall contain the ISO/IEC 646:1991 standard IRV  
110880 representation of the owner and group of the file, respectively (truncated to fit, if necessary).  
110881 When the file is restored by a privileged, protection-preserving version of the utility, the user  
110882 and group databases shall be scanned for these names. If found, the user and group IDs  
110883 contained within these files shall be used rather than the values contained within the *uid* and *gid*  
110884 fields.

#### 110885 **cpio Interchange Format**

110886 The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that  
110887 describes the file, the name of the file, and then the contents of the file.

110888 An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used  
110889 only to make physical I/O more efficient. The last group of blocks shall always be at the full  
110890 size.

110891 For the octet-oriented **cpio** archive format, the individual entry information shall be in the order  
110892 indicated and described by the following table; see also the **<cpio.h>** header.

110893

**Table 3-17** Octet-Oriented cpio Archive Entry

110894

| Header Field Name    | Length (in Octets) | Interpreted as  |
|----------------------|--------------------|-----------------|
| <i>c_magic</i>       | 6                  | Octal number    |
| <i>c_dev</i>         | 6                  | Octal number    |
| <i>c_ino</i>         | 6                  | Octal number    |
| <i>c_mode</i>        | 6                  | Octal number    |
| <i>c_uid</i>         | 6                  | Octal number    |
| <i>c_gid</i>         | 6                  | Octal number    |
| <i>c_nlink</i>       | 6                  | Octal number    |
| <i>c_rdev</i>        | 6                  | Octal number    |
| <i>c_mtime</i>       | 11                 | Octal number    |
| <i>c_namesize</i>    | 6                  | Octal number    |
| <i>c_filesize</i>    | 11                 | Octal number    |
| Filename Field Name  | Length             | Interpreted as  |
| <i>c_name</i>        | <i>c_namesize</i>  | Pathname string |
| File Data Field Name | Length             | Interpreted as  |
| <i>c_filedata</i>    | <i>c_filesize</i>  | Data            |

**cpio Header**

110911

110912

110913

110914

110915

110916

For each file in the archive, a header as defined previously shall be written. The information in the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted as octal numbers. The octal numbers shall be extended to the necessary length by appending the ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result is written to the most-significant digit of the stream of octets first. The fields shall be interpreted as follows:

110917

110918

*c\_magic* Identify the archive as being a transportable archive by containing the identifying value "070707".

110919

110920

110921

*c\_dev, c\_ino* Contains values that uniquely identify the file within the archive (that is, no files contain the same pair of *c\_dev* and *c\_ino* values unless they are links to the same file). The values shall be determined in an unspecified manner.

110922

*c\_mode* Contains the file type and access permissions as defined in the following table.

| File Permissions Name | Value    | Indicates              |
|-----------------------|----------|------------------------|
| C_IRUSR               | 000 400  | Read by owner          |
| C_IWUSR               | 000 200  | Write by owner         |
| C_IXUSR               | 000 100  | Execute by owner       |
| C_IRGRP               | 000 040  | Read by group          |
| C_IWGRP               | 000 020  | Write by group         |
| C_IXGRP               | 000 010  | Execute by group       |
| C_IROTH               | 000 004  | Read by others         |
| C_IWOTH               | 000 002  | Write by others        |
| C_IXOTH               | 000 001  | Execute by others      |
| C_ISUID               | 004 000  | Set <i>uid</i>         |
| C_ISGID               | 002 000  | Set <i>gid</i>         |
| C_ISVTX               | 001 000  | Reserved               |
| File Type Name        | Value    | Indicates              |
| C_ISDIR               | 040 000  | Directory              |
| C_ISFIFO              | 010 000  | FIFO                   |
| C_ISREG               | 0100 000 | Regular file           |
| C_ISLNK               | 0120 000 | Symbolic link          |
| C_ISBLK               | 060 000  | Block special file     |
| C_ISCHR               | 020 000  | Character special file |
| C_ISSOCK              | 0140 000 | Socket                 |
| C_ISCTG               | 0110 000 | Reserved               |

110946

110947

110948

110949

110950

Directories, FIFOs, symbolic links, and regular files shall be supported on a system conforming to this volume of POSIX.1-2024; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

110951

*c\_uid*

Contains the user ID of the owner.

110952

*c\_gid*

Contains the group ID of the group.

110953

*c\_nlink*

Contains a number greater than or equal to the number of links in the archive referencing the file. If the `-a` option is used to append to a *cpio* archive, then the *pax* utility need not account for the files in the existing part of the archive when calculating the *c\_nlink* values for the appended part of the archive, and need not alter the *c\_nlink* values in the existing part of the archive if additional files with the same *c\_dev* and *c\_ino* values are appended to the archive.

110954

110955

110956

110957

110958

110959

*c\_rdev*

Contains implementation-defined information for character or block special files.

110960

*c\_mtime*

Contains the latest time of modification of the file at the time the archive was created.

110961

110962

*c\_namesize*

Contains the length of the pathname, including the terminating NUL character.

110963

*c\_filesiz*

Contains the length in octets of the data section following the header structure.

110964 **cpio Filename**

110965 The *c\_name* field shall contain the pathname of the file. The length of this field in octets is the  
110966 value of *c\_namesize*.

110967 If a filename is found on the medium that would create an invalid pathname, it is  
110968 implementation-defined whether the data from the file is stored on the file hierarchy and under  
110969 what name it is stored.

110970 All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum  
110971 portability between implementations, names should be selected from characters represented by  
110972 the portable filename character set as octets with the most significant bit zero. If an  
110973 implementation supports the use of characters outside the portable filename character set in  
110974 names for files, users, and groups, one or more implementation-defined encodings of these  
110975 characters shall be provided for interchange purposes. However, the *pax* utility shall never create  
110976 filenames on the local system that cannot be accessed via the procedures described previously in  
110977 this volume of POSIX.1-2024. If a filename is found on the medium that would create an invalid  
110978 filename, it is implementation-defined whether the data from the file is stored on the local file  
110979 system and under what name it is stored. The *pax* utility may choose to ignore these files as long  
110980 as it produces an error indicating that the file is being ignored.

110981 **cpio File Data**

110982 Following *c\_name*, there shall be *c\_filesiz*e octets of data. Interpretation of such data occurs in a  
110983 manner dependent on the file. For regular files, the data shall consist of the contents of the file.  
110984 For symbolic links, the data shall consist of the contents of the symbolic link. If *c\_filesiz*e is zero,  
110985 no data shall be contained in *c\_filedata*.

110986 When restoring from an archive:

- 110987 • If the user does not have appropriate privileges to create a file of the specified type, *pax*  
110988 shall ignore the entry and write an error message to standard error.
- 110989 • Only regular files and symbolic links have data to be restored. Presuming a regular file  
110990 meets any selection criteria that might be imposed on the format-reading utility by the  
110991 user, such data shall be restored.
- 110992 • If a user does not have appropriate privileges to set a particular mode flag, the flag shall be  
110993 ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this  
110994 volume of POSIX.1-2024. If the implementation does not support those flags, they may be  
110995 ignored.

110996 **cpio Special Entries**

110997 FIFO special files, directories, and the trailer shall be recorded with *c\_filesiz*e equal to zero.  
110998 Symbolic links shall be recorded with *c\_filesiz*e equal to the length of the contents of the symbolic  
110999 link. For other special files, *c\_filesiz*e is unspecified by this volume of POSIX.1-2024. The header  
111000 for the next file entry in the archive shall be written directly after the last octet of the file entry  
111001 preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive;  
111002 the contents of octets in the last block of the archive following such a header are undefined.

111003 **EXIT STATUS**

111004 The following exit values shall be returned:

- 111005 0 All files were processed successfully.

111006 >0 An error occurred.

### 111007 CONSEQUENCES OF ERRORS

111008 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
 111009 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
 111010 diagnostic message shall be written to standard error and a non-zero exit status shall be  
 111011 returned, but processing shall continue. In the case where *pax* cannot create a hard link to a file,  
 111012 *pax* shall not, by default, create a second copy of the file.

111013 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
 111014 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
 111015 file of the same name as that specified by the user, but which is not the file the user wanted.  
 111016 Additionally, the file modes of extracted directories may have additional bits from the S\_IRWXU  
 111017 mask set as well as incorrect modification and access times.

### 111018 APPLICATION USAGE

111019 Caution is advised when using the **-a** option to append to a *cpio* format archive. If any of the  
 111020 files being appended happen to be given the same *c\_dev* and *c\_ino* values as a file in the existing  
 111021 part of the archive, then they may be treated as links to that file on extraction. Thus, it is risky to  
 111022 use **-a** with *cpio* format except when it is done on the same system that the original archive was  
 111023 created on, and with the same *pax* utility, and in the knowledge that there has been little or no  
 111024 file system activity since the original archive was created that could lead to any of the files  
 111025 appended being given the same *c\_dev* and *c\_ino* values as an unrelated file in the existing part of  
 111026 the archive. Also, when (intentionally) appending additional links to a file in the existing part of  
 111027 the archive, the *c\_nlink* values in the modified archive can be smaller than the number of links to  
 111028 the file in the archive, which may mean that the links are not preserved on extraction.

111029 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
 111030 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
 111031 option also provides a consistent means of extending the ways in which future file attributes can  
 111032 be addressed, such as for enhanced security systems or high-performance files. Although it may  
 111033 seem complex, there are really two modes that are most commonly used:

111034 **-p e** “Preserve everything”. This would be used by the historical superuser, someone with  
 111035 all appropriate privileges, to preserve all aspects of the files as they are recorded in the  
 111036 archive. The **e** flag is the sum of **o** and **p**, and other implementation-defined attributes.

111037 **-p p** “Preserve” the file mode bits. This would be used by the user with regular privileges  
 111038 who wished to preserve aspects of the file other than the ownership. The file times are  
 111039 preserved by default, but two other flags are offered to disable these and use the time of  
 111040 extraction.

111041 The one pathname per line format of standard input precludes pathnames containing <newline>  
 111042 characters. Although such pathnames violate the portable filename guidelines, they may exist  
 111043 and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from  
 111044 historical archive programs. The problem can be avoided by listing filename arguments on the  
 111045 command line instead of on standard input.

111046 It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this  
 111047 volume of POSIX.1-2024. Specifically, creating files of type block special or character special,  
 111048 restoring file access times unless the files are owned by the user (the **-t** option), or preserving file  
 111049 owner, group, and mode (the **-p** option) all probably require appropriate privileges.

111050 In **read** mode, implementations are permitted to overwrite files when the archive has multiple  
 111051 members with the same name. This may fail if permissions on the first version of the file do not  
 111052 permit it to be overwritten.

111053 The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ( $8 * 2^{30}$ ) in size.

111054 When archives containing binary header information are listed , the filenames printed may  
111055 cause strange behavior on some terminals.

111056 When all of the following are true:

- 111057 1. A file of type directory is being placed into an archive.
- 111058 2. The **ustar** archive format is being used.
- 111059 3. The pathname of the directory is less than or equal to 155 bytes long (it will fit in the *prefix*  
111060 field in the **ustar** header block).
- 111061 4. The last component of the pathname of the directory is longer than 100 bytes long (it will  
111062 not fit in the *name* field in the **ustar** header block).

111063 some implementations of the *pax* utility will place the entire directory pathname in the *prefix*  
111064 field, set the *name* field to an empty string, and place the directory in the archive. Other  
111065 implementations of the *pax* utility will give an error under these conditions because the *name*  
111066 field is not large enough to hold the last component of the directory name. This standard allows  
111067 either behavior. However, when extracting a directory from a **ustar** format archive, this standard  
111068 requires that all implementations be able to extract a directory even if the *name* field contains an  
111069 empty string as long as the *prefix* field does not also contain an empty string.

111070 When restricting file hierarchy traversal to one file system, it can sometimes be desirable for the  
111071 crossing points themselves to be processed (archived or copied) and sometimes for them not to  
111072 be processed. (Crossing points are mount points and, if the **-L** option is specified, symbolic links  
111073 to directories on other file systems.) With the **-X** option *pax* processes them, but there is no  
111074 standard way to have *pax* not process them. However, this can be achieved by using *find* to do  
111075 the hierarchy traversal and piping the output of *find* to *pax* (with the **-d** option); see the  
111076 APPLICATION USAGE for *find*.

#### 111077 EXAMPLES

111078 The following command:

```
111079 pax -w -f /dev/rmt/1m .
```

111080 copies the contents of the current directory to tape drive 1, medium density (assuming historical  
111081 System V device naming procedures—the historical BSD device name would be **/dev/rmt9**).

111082 The following commands:

```
111083 mkdir newdir
111084 pax -rw olddir newdir
```

111085 copy the *olddir* directory hierarchy to *newdir*.

```
111086 pax -r -s ',^//*usr//*,,' -f a.pax
```

111087 reads the archive **a.pax**, with all files rooted in **/usr** in the archive extracted relative to the current  
111088 directory.

111089 Using the option:

```
111090 -o listopt="%M %(atime)T %(size)D %(name)s"
```

111091 overrides the default output description in Standard Output and instead writes:

```
111092 -rw-rw--- Jan 12 15:53 2003 1492 /usr/foo/bar
```

111093 Using the options:

```
111094 -o listopt='%L\t%(size)D\n%.7' \
111095 -o listopt='(name)s\n%(atime)T\n%T'
```

111096 overrides the default output description in Standard Output and instead writes:

```
111097 /usr/foo/bar -> /tmp 1492
111098 /usr/fo
111099 Jan 12 15:53 1991
111100 Jan 31 15:53 2003
```

#### 111101 RATIONALE

111102 The *pax* utility was new for the ISO POSIX-2:1993 standard. It represents a peaceful compromise  
111103 between advocates of the historical *tar* and *cpio* utilities.

111104 A fundamental difference between *cpio* and *tar* was in the way directories were treated. The *cpio*  
111105 utility did not treat directories differently from other files, and to select a directory and its  
111106 contents required that each file in the hierarchy be explicitly specified. For *tar*, a directory  
111107 matched every file in the file hierarchy it rooted.

111108 The *pax* utility offers both interfaces; by default, directories map into the file hierarchy they root.  
111109 The `-d` option causes *pax* to skip any file not explicitly referenced, as *cpio* historically did. The *tar*  
111110 `-style` behavior was chosen as the default because it was believed that this was the more  
111111 common usage and because *tar* is the more commonly available interface, as it was historically  
111112 provided on both System V and BSD implementations.

111113 The data interchange format specification in this volume of POSIX.1-2024 requires that processes  
111114 with “appropriate privileges” shall always restore the ownership and permissions of extracted  
111115 files exactly as archived. If viewed from the historic equivalence between superuser and  
111116 “appropriate privileges”, there are two problems with this requirement. First, users running as  
111117 superusers may unknowingly set dangerous permissions on extracted files. Second, it is  
111118 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the  
111119 archive was created by the superuser. (It should be noted that restoration of ownerships and  
111120 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to  
111121 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the `-p`  
111122 option. Only a *pax* invocation with the privileges needed, and which has the `-p` option set using  
111123 the `e` specification character, has appropriate privileges to restore full ownership and permission  
111124 information.

111125 Note also that this volume of POSIX.1-2024 requires that the file ownership and access  
111126 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided  
111127 with the mode stored in the archive. This means that the file creation mask of the user is applied  
111128 to the file permissions.

111129 Users should note that directories may be created by *pax* while extracting files with permissions  
111130 that are different from those that existed at the time the archive was created. When extracting  
111131 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
111132 their file creation mask appropriately to protect these files during extraction.

111133 The table of contents output is written to standard output to facilitate pipeline processing.

111134 An early proposal had hard links displaying for all pathnames. This was removed because it  
111135 complicates the output of the case where `-v` is not specified and does not match historical *cpio*  
111136 usage. The hard-link information is available in the `-v` display.

111137 The description of the `-l` option allows implementations to make hard links to symbolic links.  
111138 Earlier versions of this standard did not specify any way to create a hard link to a symbolic link,  
111139 but many implementations provided this capability as an extension. If there are hard links to

111140 symbolic links when an archive is created, the implementation is required to archive the hard  
111141 link in the archive (unless **-H** or **-L** is specified). When in **read** mode and in **copy** mode,  
111142 implementations supporting hard links to symbolic links should use them when appropriate.

111143 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that have  
111144 been brought along from historical usage. For example, there are restrictions on the length of  
111145 pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory  
111146 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

111147 The default *blocksize* value of 5 120 bytes for *cpio* was selected because it is one of the standard  
111148 block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value  
111149 for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10 240  
111150 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The  
111151 maximum block size of 32 256 bytes ( $2^{15}$ -512 bytes) is the largest multiple of 512 bytes that fits  
111152 into a signed 16-bit tape controller transfer register. There are known limitations in some  
111153 historical systems that would prevent larger blocks from being accepted. Historical values were  
111154 chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate  
111155 archives. Also, default block sizes for any file type other than character special file has been  
111156 deleted from this volume of POSIX.1-2024 as unimportant and not likely to affect the structure of  
111157 the resulting archive.

111158 Implementations are permitted to modify the block-size value based on the archive format or the  
111159 device to which the archive is being written. This is to provide implementations with the  
111160 opportunity to take advantage of special types of devices, and it should not be used without a  
111161 great deal of consideration as it almost certainly decreases archive portability.

111162 The intended use of the **-n** option was to permit extraction of one or more files from the archive  
111163 without processing the entire archive. This was viewed by the standard developers as offering  
111164 significant performance advantages over historical implementations. The **-n** option in early  
111165 proposals had three effects; the first was to cause special characters in patterns to not be treated  
111166 specially. The second was to cause only the first file that matched a pattern to be extracted. The  
111167 third was to cause *pax* to write a diagnostic message to standard error when no file was found  
111168 matching a specified pattern. Only the second behavior is retained by this volume of  
111169 POSIX.1-2024, for many reasons. First, it is in general not acceptable for a single option to have  
111170 multiple effects. Second, the ability to make pattern matching characters act as normal characters  
111171 is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the  
111172 special characters is useful because users may wish to normalize only a single special character  
111173 in a single filename. Fourth, given a more general escape mechanism, the previous behavior of  
111174 the **-n** option can be easily obtained using the **-s** option or a *sed* script. Finally, writing a  
111175 diagnostic message when a pattern specified by the user is unmatched by any file is useful  
111176 behavior in all cases.

111177 In this version, the **-n** was removed from the **copy** mode synopsis of *pax*; it is inapplicable  
111178 because there are no pattern operands specified in this mode.

111179 There is another method than *pax* for copying subtrees in POSIX.1-2024 described as part of the  
111180 *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface,  
111181 while *pax* offers a finer granularity of control. Each provides additional functionality to the  
111182 other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is  
111183 the intention of the standard developers that the results be similar (using appropriate option  
111184 combinations in both utilities). The results are not required to be identical; there seemed  
111185 insufficient gain to applications to balance the difficulty of implementations having to guarantee  
111186 that the results would be exactly identical.

111187 A single archive may span more than one file. It is suggested that implementations provide

111188 informative messages to the user on standard error whenever the archive file is changed.

111189 The **-d** option (do not create intermediate directories not listed in the archive) found in early  
111190 proposals was originally provided as a complement to the historic **-d** option of *cpio*. It has been  
111191 deleted.

111192 The **-s** option in early proposals specified a subset of the substitution command from the *ed*  
111193 utility. As there was no reason for only a subset to be supported, the **-s** option is now compatible  
111194 with the current *ed* specification. Since the delimiter can be any non-null character, the following  
111195 usage with single <space> characters is valid:

```
111196 pax -s " foo bar " . . .
```

111197 The **-t** description is worded so as to note that this may cause the access time update caused by  
111198 some other activity (which occurs while the file is being read) to be overwritten.

111199 The default behavior of *pax* with regard to file modification times is the same as historical  
111200 implementations of *tar*. It is not the historical behavior of *cpio*.

111201 Because the **-i** option uses */dev/tty*, utilities without a controlling terminal are not able to use  
111202 this option.

111203 The **-y** option, found in early proposals, has been deleted because a line containing a single  
111204 <period> for the **-i** option has equivalent functionality. The special lines for the **-i** option (a  
111205 single <period> and the empty line) are historical practice in *cpio*.

111206 In early drafts, a **-echarmap** option was included to increase portability of files between systems  
111207 using different coded character sets. This option was omitted because it was apparent that  
111208 consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate  
111209 substitute.

111210 The ISO POSIX-2:1993 standard and ISO POSIX-1 standard requirements for *pax*, however,  
111211 made it very difficult to create a single archive containing files created using extended characters  
111212 provided by different locales. This version adds the **hdrcharset** keyword to make it possible to  
111213 archive files in these cases without dropping files due to translation errors.

111214 Translating filenames and other attributes from a locale's encoding to UTF-8 and then back again  
111215 can lose information, as the resulting filename might not be byte-for-byte equivalent to the  
111216 original. To avoid this problem, users can specify the **-o hdrcharset=binary** option, which will  
111217 cause the resulting archive to use binary format for all names and attributes. Such archives are  
111218 not portable among hosts that use different native encodings (e.g., EBCDIC *versus* ASCII-based  
111219 encodings), but they will allow interchange among the vast majority of POSIX file systems in  
111220 practical use. Also, the **-o hdrcharset=binary** option will cause *pax* in **copy** mode to behave  
111221 more like other standard utilities such as *cp*.

111222 If the values specified by the **-o exthdr.name=value**, **-o globexthdr.name=value**, or by  
111223 **\$TMPDIR** (if **-o globexthdr.name** is not specified) require a character encoding other than that  
111224 described in the ISO/IEC 646:1991 standard, a **path** extended header record will have to be  
111225 created for the file. If a **hdrcharset** extended header record is active for such headers, it will  
111226 determine the codeset used for the value field in these extended **path** header records. These **path**  
111227 extended header records always need to be created when writing an archive even if  
111228 **hdrcharset=binary** has been specified and would contain the same (binary) data that appears in  
111229 the **ustar** header record prefix and *name* fields. (In other words, an extended header **path** record  
111230 is always required to be generated if the *prefix* or *name* fields contain non-ASCII characters even  
111231 when **hdrcharset=binary** is also in effect for that file.)

111232 The **-k** option was added to address international concerns about the dangers involved in the  
111233 character set transformations of **-e** (if the target character set were different from the source, the

filenames might be transformed into names matching existing files) and also was made more general to protect files transferred between file systems with different {NAME\_MAX} values (truncating a filename on a smaller system might also inadvertently overwrite existing files). As stated, it prevents any overwriting, even if the target file is older than the source. This version adds more granularity of options to solve this problem by introducing the **-oinvalid=option**—specifically the **UTF-8** and **binary** actions. (Note that an existing file is still subject to overwriting in this case. The **-k** option closes that loophole.)

Some of the file characteristics referenced in this volume of POSIX.1-2024 might not be supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the file access time. For this reason, the **e** specification character has been provided, intended to cause all file characteristics specified in the archive to be retained.

It is required that extracted directories, by default, have their access and modification times and permissions set to the values specified in the archive. This has obvious problems in that the directories are almost certainly modified after being extracted and that directory permissions may not permit file creation. One possible solution is to create directories with the mode specified in the archive, as modified by the *umask* of the user, with sufficient permissions to allow file creation. After all files have been extracted, *pax* would then reset the access and modification times and permissions as necessary.

The list-mode formatting description borrows heavily from the one defined by the *printf* utility. However, since there is no separate operand list to get conversion arguments, the format was extended to allow specifying the name of the conversion argument as part of the conversion specification.

The **T** conversion specifier allows time fields to be displayed in any of the date formats. Unlike the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past. This makes parsing the output more predictable.

The **D** conversion specifier handles the ability to display the major/minor or file size, as with *ls*, by using **%-8(size)D**.

The **L** conversion specifier handles the *ls* display for symbolic links.

Conversion specifiers were added to generate existing known types used for *ls*.

### 111263 **pax Interchange Format**

The new POSIX data interchange format was developed primarily to satisfy international concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers realized that this new POSIX data interchange format should be very extensible because there were other requirements they foresaw in the near future:

- Support international character encodings and locale information
- Support security information (ACLs, and so on)
- Support future file types, such as realtime or contiguous files
- Include data areas for implementation use
- Support systems with words larger than 32 bits and timers with subsecond granularity

The following were not goals for this format because these are better handled by separate utilities or are inappropriate for a portable format:

- 111276 • Encryption
- 111277 • Compression
- 111278 • Data translation between locales and codesets
- 111279 • *inode* storage

111280 The format chosen to support the goals is an extension of the **ustar** format. Of the two formats  
111281 previously available, only the **ustar** format was selected for extensions because:

- 111282 • It was easier to extend in an upwards-compatible way. It offered version flags and header  
111283 block type fields with room for future standardization. The **cpio** format, while possessing a  
111284 more flexible file naming methodology, could not be extended without breaking some  
111285 theoretical implementation or using a dummy filename that could be a legitimate filename.
- 111286 • Industry experience since the original “*tar wars*” fought in developing the ISO POSIX-1  
111287 standard has clearly been in favor of the **ustar** format, which is generally the default  
111288 output format selected for *pax* implementations on new systems.

111289 The new format was designed with one additional goal in mind: reasonable behavior when an  
111290 older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated  
111291 that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this  
111292 allowed the format to include all the extended information in a pseudo-regular file that  
111293 preceded each real file. An option is given that allows the archive creator to set up reasonable  
111294 names for these files on the older systems. Also, the normative text suggests that reasonable file  
111295 access values be used for this **ustar** header block. Making these header files inaccessible for  
111296 convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are  
111297 suggested.

111298 The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format  
111299 rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous  
111300 version of *pax*), mandated the behavior of the format-reading utility when it encountered an  
111301 unknown *typeflag*, but was silent about the other two fields.

111302 Early proposals for the first version of this standard contained a proposed archive format that  
111303 was based on compatibility with the standard for tape files (ISO 1001, similar to the format used  
111304 historically on many mainframes and minicomputers). This format was overly complex and  
111305 required considerable overhead in volume and header records. Furthermore, the standard  
111306 developers felt that it would not be acceptable to the community of POSIX developers, so it was  
111307 later changed to be a format more closely related to historical practice on POSIX systems.

111308 The prefix and name split of pathnames in **ustar** was replaced by the single path extended  
111309 header record for simplicity.

111310 The concept of a global extended header (*typeflag***g**) was controversial. If this were applied to an  
111311 archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape  
111312 could be a serious problem; a utility attempting to extract as many files as possible from a  
111313 damaged archive could lose a large percentage of file header information in this case. However,  
111314 if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers  
111315 considerable potential size reductions by eliminating redundant information. Thus, the text  
111316 warns against using the global method for unreliable media and provides a method for  
111317 implanting global information in the extended header for each file, rather than in the *typeflag* **g**  
111318 records.

111319 No facility for data translation or filtering on a per-file basis is included because the standard  
111320 developers could not invent an interface that would allow this in an efficient manner. If a filter,  
111321 such as encryption or compression, is to be applied to all the files, it is more efficient to apply the

111322 filter to the entire archive as a single file. The standard developers considered interfaces that  
111323 would invoke a shell script for each file going into or out of the archive, but the system overhead  
111324 in this approach was considered to be too high.

111325 One such approach would be to have **filter=** records that give a pathname for an executable.  
111326 When the program is invoked, the file and archive would be open for standard input/output  
111327 and all the header fields would be available as environment variables or command-line  
111328 arguments. The standard developers did discuss such schemes, but they were omitted from  
111329 POSIX.1-2024 due to concerns about excessive overhead. Also, the program itself would need to  
111330 be in the archive if it were to be used portably.

111331 There is currently no portable means of identifying the character set(s) used for a file in the file  
111332 system. Therefore, *pax* has not been given a mechanism to generate charset records  
111333 automatically. The only portable means of doing this is for the user to write the archive using the  
111334 **-ocharset=string** command line option. This assumes that all of the files in the archive use the  
111335 same encoding. The “implementation-defined” text is included to allow for a system that can  
111336 identify the encodings used for each of its files.

111337 The table of standards that accompanies the charset record description is acknowledged to be  
111338 very limited. Only a limited number of character set standards is reasonable for maximal  
111339 interchange. Any character set is, of course, possible by prior agreement. It was suggested that  
111340 EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal  
111341 standards, and then only those with reasonably large followings, can be included here, simply as  
111342 a matter of practicality. The *<value>*s represent names of officially registered character sets in the  
111343 format required by the ISO 2375:1985 standard.

111344 The normal *<comma>* or *<blank>*-separated list rules are not followed in the case of keyword  
111345 options to allow ease of argument parsing for *getopts*.

111346 Further information on character encodings is in [pax Archive Character Set Encoding/Decoding](#)  
111347 (on page 3284).

111348 The standard developers have reserved keyword name space for vendor extensions. It is  
111349 suggested that the format to be used is:

111350 *VENDOR.keyword*

111351 where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further  
111352 suggested that the keyword following the *<period>* be named differently than any of the  
111353 standard keywords so that it could be used for future standardization, if appropriate, by  
111354 omitting the *VENDOR* prefix.

111355 The *<length>* field in the extended header record was included to make it simpler to step  
111356 through the records, even if a record contains an unknown format (to a particular *pax*) with  
111357 complex interactions of special characters. It also provides a minor integrity checkpoint within  
111358 the records to aid a program attempting to recover files from a damaged archive.

111359 There are no extended header versions of the *devmajor* and *devminor* fields because the  
111360 unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific  
111361 extended keywords (such as *VENDOR.devmajor*) should be used.

111362 Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly  
111363 on a symbolic name basis, as in **ustar**.

111364 Just as with the **ustar** format descriptions, the new format makes no special arrangements for  
111365 multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file  
111366 and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing  
111367 their labels, and mounting each in the proper sequence are considered to be implementation

- 111368 details that cannot be described portably.
- 111369 The **pax** format is intended for interchange, not only for backup on a single (family of) systems.  
111370 It is not as densely packed as might be possible for backup:
- 111371 • It contains information as coded characters that could be coded in binary.
  - 111372 • It identifies extended records with name fields that could be omitted in favor of a fixed-  
111373 field layout.
  - 111374 • It translates names into a portable character set and identifies locale-related information,  
111375 both of which are probably unnecessary for backup.
- 111376 The requirements on restoring from an archive are slightly different from the historical wording,  
111377 allowing for non-monolithic privilege to bring forward as much as possible. In particular,  
111378 attributes such as “high performance file” might be broadly but not universally granted while  
111379 set-user-ID or *chown()* might be much more restricted. There is no implication in POSIX.1-2024  
111380 that the security information be honored after it is restored to the file hierarchy, in spite of what  
111381 might be improperly inferred by the silence on that topic. That is a topic for another standard.
- 111382 Hard links are recorded in the fashion described here because a hard link can be to any file type.  
111383 It is desirable in general to be able to restore part of an archive selectively and restore all of those  
111384 files completely. If the data is not associated with each hard link, it is not possible to do this.  
111385 However, the data associated with a file can be large, and when selective restoration is not  
111386 needed, this can be a significant burden. The archive is structured so that files that have no  
111387 associated data can always be restored by the name of any link name of any hard link, and the  
111388 user can choose whether data is recorded with each instance of a file that contains data. The  
111389 format permits mixing of hard links with data and hard links without data in a single archive;  
111390 this can be done for special needs, and *pax* is expected to interpret such archives on input  
111391 properly, despite the fact that there is no *pax* option that would force this mixed case on output.  
111392 (When **-o linkdata** is used, the output must contain the duplicate data, but the implementation  
111393 is free to include it or omit it when **-o linkdata** is not used.)
- 111394 The time values are included as extended header records for those implementations needing  
111395 more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be  
111396 negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject  
111397 the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a  
111398 leading '-'. Even though some implementations can support finer file-time granularities than  
111399 seconds, the normative text requires support only for seconds since the Epoch because the  
111400 ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new  
111401 format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will  
111402 be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification  
111403 time) is described with appropriate privileges so that it can be ignored when writing to the file  
111404 system. POSIX does not provide a portable means to change file creation time. Nothing is  
111405 intended to prevent a non-portable implementation of *pax* from restoring the value.
- 111406 The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the  
111407 sizes specified in the regular *tar* header. New file system architectures are emerging that will  
111408 exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits  
111409 for user and group IDs, but the extended header values were included for completeness,  
111410 allowing overrides for all of the decimal values in the *tar* header.
- 111411 The standard developers intended to describe the effective results of *pax* with regard to file  
111412 ownerships and permissions; implementations are not restricted in timing or sequencing the  
111413 restoration of such, provided the results are as specified.
- 111414 Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The

111415 **copy** mode references are due to the normative text: “The effect of the copy shall be as if the  
111416 copied files were written to an archive file and then subsequently extracted ...”. There is  
111417 certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode,  
111418 but the effects must be as if it had.

#### 111419 **pax Archive Character Set Encoding/Decoding**

111420 There is a need to exchange archives of files between systems of different native codesets.  
111421 Filenames, group names, and user names must be preserved to the fullest extent possible when  
111422 an archive is read on the receiving platform. Translation of the contents of files is not within the  
111423 scope of the *pax* utility.

111424 There will also be the need to represent characters that are not available on the receiving  
111425 platform. These unsupported characters cannot be automatically folded to the local set of  
111426 characters due to the chance of collisions. This could result in overwriting previous extracted  
111427 files from the archive or pre-existing files on the system.

111428 For these reasons, the codeset used to represent characters within the extended header records of  
111429 the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields  
111430 requiring translation include, at a minimum, filenames, user names, group names, and link  
111431 pathnames. Implementations may wish to have localized extended keywords that use non-  
111432 portable characters.

111433 The standard developers considered the following options:

- 111434 • The archive creator specifies the well-defined name of the source codeset. The receiver  
111435 must then recognize the codeset name and perform the appropriate translations to the  
111436 destination codeset.
- 111437 • The archive creator includes within the archive the character mapping table for the source  
111438 codeset used to encode extended header records. The receiver must then read the  
111439 character mapping table and perform the appropriate translations to the destination  
111440 codeset.
- 111441 • The archive creator translates the extended header records in the source codeset into a  
111442 canonical form. The receiver must then perform the appropriate translations to the  
111443 destination codeset.

111444 The approach that incorporates the name of the source codeset poses the problem of codeset  
111445 name registration, and makes the archive useless to *pax* archive decoders that do not recognize  
111446 that codeset.

111447 Because parts of an archive may be corrupted, the standard developers felt that including the  
111448 character map of the source codeset was too fragile. The loss of this one key component could  
111449 result in making the entire archive useless. (The difference between this and the global extended  
111450 header decision was that the latter has a workaround—duplicating extended header records on  
111451 unreliable media—but this would be too burdensome for large character set maps.)

111452 Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the  
111453 cross-product of all source and destination codesets.

111454 To simplify the translation from the source codeset to the canonical form and from the canonical  
111455 form to the destination codeset, the standard developers decided that the internal representation  
111456 should be a stateless encoding. A stateless encoding is one where each codepoint has the same  
111457 meaning, without regard to the decoder being in a specific state. An example of a stateful  
111458 encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the  
111459 ISO/IEC 646: 1991 standard (equivalent to 7-bit ASCII).

111460 For these reasons, the standard developers decided to adopt a canonical format for the  
 111461 representation of file information strings. The obvious, well-endorsed candidate is the  
 111462 ISO/IEC 10646:2020 standard (based in part on Unicode), which can be used to represent the  
 111463 characters of virtually all standardized character sets. The standard developers initially agreed  
 111464 upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters  
 111465 provides a sufficiently rich set to represent all commonly-used codesets.

111466 However, the standard developers found that the 16-bit Unicode representation had some  
 111467 problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character  
 111468 made the extended header records twice as long for the case of strings coded entirely from  
 111469 historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the  
 111470 ISO/IEC 10646:2020 standard. This multi-byte representation encodes UCS2 or UCS4 characters  
 111471 reliably and deterministically, eliminating the need for a canonical byte ordering. In addition,  
 111472 NUL octets and other characters possibly confusing to POSIX file systems do not appear, except  
 111473 to represent themselves. It was realized that certain national codesets take up more space after  
 111474 the encoding, due to their placement within the UCS range; it was felt that the usefulness of the  
 111475 encoding of the names outweighs the disadvantage of size increase for file, user, and group  
 111476 names.

111477 The encoding of UTF-8 is as follows:

| 111478 | UCS4 Hex Encoding   | UTF-8 Binary Encoding                                 |
|--------|---------------------|-------------------------------------------------------|
| 111479 | 00000000–0000007F   | 0xxxxxxx                                              |
| 111480 | 00000080–000007FF   | 110xxxxx 10xxxxxx                                     |
| 111481 | 00000800–0000FFFF   | 1110xxxx 10xxxxxx 10xxxxxx                            |
| 111482 | 00010000–001FFFFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx                   |
| 111483 | 00200000–03FFFFFFF  | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 111484 | 04000000–7FFFFFFF   | 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

111485 where each 'x' represents a bit value from the character being translated.

### 111486 **ustar Interchange Format**

111487 The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of  
 111488 the historical *tar* utility. The goal of these changes was not only to provide the functional  
 111489 enhancements desired, but also to retain compatibility between new and old versions. This  
 111490 compatibility has been retained. Archives written using the old archive format are compatible  
 111491 with the new format.

111492 Implementors should be aware that the previous file format did not include a mechanism to  
 111493 archive directory type files. For this reason, the convention of using a filename ending with  
 111494 <slash> was adopted to specify a directory on the archive.

111495 The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for  
 111496 {PATH\_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname  
 111497 be stored there without the use of the *prefix* field. Although the name field is known to be too  
 111498 small to contain {PATH\_MAX} characters, the value was not changed in this version of the  
 111499 archive file format to retain backwards-compatibility, and instead the prefix was introduced.  
 111500 Also, because of the earlier version of the format, there is no way to remove the restriction on the  
 111501 *linkname* field being limited in size to just that of the *name* field.

111502 The *size* field is required to be meaningful in all implementation extensions, although it could be  
 111503 zero. This is required so that the data blocks can always be properly counted.

111504 It is suggested that if device special files need to be represented that cannot be represented in the  
 111505 standard format, that one of the extension types (A-Z) be used, and that the additional

111506 information for the special file be represented as data and be reflected in the *size* field.

111507 Attempting to restore a special file type, where it is converted to ordinary data and conflicts with  
 111508 an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax*  
 111509 should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is  
 111510 converted to another type or not). If run as a privileged user, it should be able to do so, and it  
 111511 would be considered a bug if it did not. The same is true of ordinary data files and similarly  
 111512 named special files; it is impossible to anticipate the needs of the user (who could really intend  
 111513 to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the  
 111514 protection system as required.

111515 The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a  
 111516 **ustar** archive. POSIX.1-2024 does not require the contiguous file extension, but does define a  
 111517 standard way of archiving such files so that all conforming systems can interpret these file types  
 111518 in a meaningful and consistent manner. On a system that does not support extended file types,  
 111519 the *pax* utility should do the best it can with the file and go on to the next.

111520 The file protection modes are those conventionally used by the *ls* utility. This is extended beyond  
 111521 the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is intended  
 111522 that the conformance document should not document anything beyond the existence of and  
 111523 support of such a mode. Further extensions are expected to these bits, particularly with  
 111524 overloading the set-user-ID and set-group-ID flags.

#### 111525 **cpio Interchange Format**

111526 The reference to appropriate privileges in the **cpio** format refers to an error on standard output;  
 111527 the **ustar** format does not make comparable statements.

111528 The model for this format was the historical System V *cpio-c* data interchange format. This  
 111529 model documents the portable version of the **cpio** format and not the binary version. It has the  
 111530 flexibility to transfer data of any type described within POSIX.1-2024, yet is extensible to transfer  
 111531 data types specific to extensions beyond POSIX.1-2024 (for example, contiguous files). Because it  
 111532 describes existing practice, there is no question of maintaining upwards-compatibility.

#### 111533 **cpio Header**

111534 There has been some concern that the size of the *c\_ino* field of the header is too small to handle  
 111535 those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used  
 111536 strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as  
 111537 the *inode* number of the file in the location from which that file is extracted.

111538 The name *c\_magic* is based on historical usage.

#### 111539 **cpio Filename**

111540 For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to  
 111541 describe the pathname without the addition of any other header fields (the NUL character  
 111542 would be included in this count). {PATH\_MAX} is the minimum value for pathname size,  
 111543 documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the  
 111544 exact length of the pathname. With the current description of the **<cpio.h>** header, this  
 111545 pathname size can be as large as a number that is described in six octal digits.

111546 Two values are documented under the *c\_mode* field values to provide for extensibility for known  
 111547 file types:

111548 **0110 000** Reserved for contiguous files. The implementation may treat the rest of the  
 111549 information for this archive like a regular file. If this file type is undefined, the  
 111550 implementation may create the file as a regular file.

111551 This provides for extensibility of the **cpio** format while allowing for the ability to read old  
 111552 archives. Files of an unknown type may be read as “regular files” on some implementations. On  
 111553 a system that does not support extended file types, the *pax* utility should do the best it can with  
 111554 the file and go on to the next.

#### 111555 **FUTURE DIRECTIONS**

111556 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 111557 value of a <newline> character when <newline> is a terminator or separator in the output  
 111558 format being used, implementations are encouraged to treat this as an error. A future version of  
 111559 this standard may require implementations to treat this as an error.

111560 If this utility is directed to create a new directory entry that contains any bytes that have the  
 111561 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 111562 error. A future version of this standard may require implementations to treat this as an error.

#### 111568 **CHANGE HISTORY**

111569 First released in Issue 4.

#### 111570 **Issue 5**

111571 A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only  
 111572 support files up to 8 gigabytes in size.

#### 111573 **Issue 6**

111574 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 111575 • Support has been added for symbolic links in the options and interchange formats.
- 111576 • A new format has been devised, based on extensions to **ustar**.
- 111577 • References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990  
 111578 standard have been changed to remove the “extended” adjective because this could cause  
 111579 confusion with the extended **tar** header added in this version. (All references to **tar** are  
 111580 actually to **ustar**.)

111581 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

111582 IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can  
 111583 ignore an [EEXIST] error when extracting an archive.

111584 IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when  
 111585 in **read** mode.

111586 IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

111587 IEEE PASC Interpretation 1003.2 #195 is applied.

111588 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,  
 111589 and **-I** options.

- 111590 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of  
 111591 the *pax* process into certain fields. This change provides a method for the implementation to  
 111592 ensure that different instances of *pax* extracting a file named */a/b/foo* will not collide when  
 111593 processing the extended header information associated with **foo**.
- 111594 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing `-x B` to `-x pax` in  
 111595 the OPTIONS section.
- 111596 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/20 is applied, updating the SYNOPSIS to  
 111597 be consistent with the normative text.
- 111598 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/21 is applied, updating the  
 111599 DESCRIPTION to describe the behavior when files to be linked are symbolic links and the  
 111600 system is not capable of making hard links to symbolic links.
- 111601 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/22 is applied, updating the OPTIONS  
 111602 section to describe the behavior for how multiple `-odelete=pattern` options are to be handled.
- 111603 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/23 is applied, updating the **write** option  
 111604 within the OPTIONS section.
- 111605 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/24 is applied, adding a paragraph into  
 111606 the OPTIONS section that states that specifying more than one of the mutually-exclusive options  
 111607 (`-H` and `-L`) is not considered an error and that the last option specified will determine the  
 111608 behavior of the utility.
- 111609 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/25 is applied, removing the *ctime*  
 111610 paragraph within the EXTENDED DESCRIPTION. There is a contradiction in the definition of  
 111611 the *ctime* keyword for the *pax* extended header, in that the *st\_ctime* member of the **stat**  
 111612 structure does not refer to a file creation time. No field in the standard **stat** structure from `<sys/stat.h>`  
 111613 includes a file creation time.
- 111614 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/26 is applied, making it clear that *typeflag*  
 111615 1 (**ustar** Interchange Format) applies not only to files that are hard-linked, but also to files that  
 111616 are aliased via symbolic links.
- 111617 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/27 is applied, clarifying the *cpio c\_nlink*  
 111618 field.
- 111619 **Issue 7**
- 111620 Austin Group Interpretations 1003.1-2001 #011, #036, #086, and #109 are applied.
- 111621 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
 111622 *LC\_MESSAGES* environment variable.
- 111623 SD5-XCU-ERN-2 is applied, making `-c` and `-n` mutually-exclusive in the SYNOPSIS.
- 111624 SD5-XCU-ERN-3 is applied, revising the default behavior of `-H` and `-L`.
- 111625 SD5-XCU-ERN-5, SD5-XCU-ERN-6, SD5-XCU-ERN-7, SD5-XCU-ERN-60 are applied.
- 111626 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 111627 The *pax* utility is no longer allowed to create separate identical symbolic links when extracting  
 111628 linked symbolic links from an archive.
- 111629 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0128 [260], XCU/TC1-2008/0129  
 111630 [261], XCU/TC1-2008/0130 [261], XCU/TC1-2008/0131 [313], and XCU/TC1-2008/0132 [233]  
 111631 are applied.
- 111632 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0152 [886], XCU/TC2-2008/0153

- 111633 [814], XCU/TC2-2008/0154 [886], and XCU/TC2-2008/0155 [707] are applied.
- 111634 **Issue 8**
- 111635 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:
- 111636 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
111637 have the encoded value of a <newline> character when <newline> is a terminator or  
111638 separator in the output format being used.
  - 111639 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
111640 <newline> character.
- 111641 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 111642 Austin Group Defect 1133 is applied, clarifying the *-X* option and adding a paragraph to the  
111643 APPLICATION USAGE section.
- 111644 Austin Group Defect 1270 is applied, removing the *-n* option from the copy mode SYNOPSIS  
111645 line.
- 111646 Austin Group Defect 1278 is applied, removing mention of the *-n* option in connection with  
111647 write mode.
- 111648 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 111649 Austin Group Defect 1331 is applied, changing ```st_atime``` to ```st_atim``` and ```st_mtime``` to  
111650 ```st_mtim```.
- 111651 Austin Group Defect 1379 is applied, changing the ENVIRONMENT VARIABLES section.
- 111652 Austin Group Defect 1380 is applied, changing text using the term ```link``` in line with its  
111653 updated definition and changing the description of the *-u* option.
- 111654 Austin Group Defect 1618 is applied, adding optional trailing 's' and 'S' characters to the  
111655 option-argument of the *-s* option.

111656 **NAME**

111657 pr — print files

111658 **SYNOPSIS**

```
111659 XSI pr [+page] [-column] [-adfFmprt] [-e[char][gap]] [-h header]
111660 [-i[char][gap]] [-l lines] [-n[char][width]] [-o offset] [-s[char]]
111661 [-w width] [file...]
```

111662 **DESCRIPTION**

111663 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 111664 read, formatted, and written to standard output. By default, the input shall be separated into  
 111665 66-line pages, each with:

- 111666 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 111667 • A 5-line trailer consisting of blank lines

111668 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 111669 *pr* utility has completed processing.

111670 When options specifying multi-column output are specified, output text columns shall be of  
 111671 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 111672 columns shall be separated with at least one <blank>.

111673 **OPTIONS**

111674 The *pr* utility shall conform to XBD [Section 12.2](#) (on page 215), except that: the *page* option has a  
 111675 '+' delimiter; *page* and *column* can be multi-digit numbers; some of the option-arguments are  
 111676 optional; and some of the option-arguments cannot be specified as separate arguments from the  
 111677 preceding option letter. In particular, the *-s* option does not allow the option letter to be  
 111678 separated from its argument, and the options *-e*, *-i*, and *-n* require that both arguments, if  
 111679 present, not be separated from the option letter.

111680 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 111681 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

- 111682 **+page** Begin output at page number *page* of the formatted input.
- 111683 **-column** Produce multi-column output that is arranged in *column* columns (the default shall  
 111684 be 1) and is written down each column in the order in which the text is received  
 111685 from the input file. This option should not be used with *-m*. The options *-e* and *-i*  
 111686 shall be assumed for multiple text-column output. Whether or not text columns are  
 111687 produced with identical vertical lengths is unspecified, but a text column shall  
 111688 never exceed the length of the page (see the *-l* option). When used with *-t*, use the  
 111689 minimum number of lines to write the output.
- 111690 **-a** Modify the effect of the *-column* option so that the columns are filled across the  
 111691 page in a round-robin order (for example, when *column* is 2, the first input line  
 111692 heads column 1, the second heads column 2, the third is the second line in column  
 111693 1, and so on).
- 111694 **-d** Produce output that is double-spaced; append an extra <newline> following every  
 111695 <newline> found in the input.
- 111696 **-e[char][gap]**  
 111697 Expand each input <tab> to the next greater column position specified by the  
 111698 formula  $n*gap+1$ , where *n* is an integer > 0. If *gap* is zero or is omitted, it shall  
 111699 default to 8. All <tab> characters in the input shall be expanded into the  
 111700 appropriate number of <space> characters. If any non-digit character, *char*, is  
 111701 specified, it shall be used as the input <tab>. If the first character of the *-e* option-

- 111702 argument is a digit, the entire option-argument shall be assumed to be *gap*.
- 111703 XSI **-f** Use a <form-feed> for new pages, instead of the default behavior that uses a  
111704 sequence of <newline> characters. Pause before beginning the first page if the  
111705 standard output is associated with a terminal.
- 111706 **-F** Use a <form-feed> for new pages, instead of the default behavior that uses a  
111707 sequence of <newline> characters.
- 111708 **-h header** Use the string *header* to replace the contents of the *file* operand in the page header.
- 111709 **-i[*char*][*gap*]** In output, replace <space> characters with <tab> characters wherever one or more  
111710 adjacent <space> characters reach column positions  $gap+1$ ,  $2 * gap+1$ ,  $3 * gap+1$ , and  
111711 so on. If *gap* is zero or is omitted, default tab settings at every eighth column  
111712 position shall be assumed. If any non-digit character, *char*, is specified, it shall be  
111713 used as the output <tab>. If the first character of the **-i** option-argument is a digit,  
111714 the entire option-argument shall be assumed to be *gap*.
- 111715 **-l lines** Override the 66-line default and reset the page length to *lines*. If *lines* is not greater  
111716 than the sum of both the header and trailer depths (in lines), the *pr* utility shall  
111717 suppress both the header and trailer, as if the **-t** option were in effect.
- 111718 **-m** Merge files. Standard output shall be formatted so the *pr* utility writes one line  
111719 from each file specified by a *file* operand, side by side into text columns of equal  
111720 fixed widths, in terms of the number of column positions. Implementations shall  
111721 support merging of at least nine *file* operands.
- 111722 **-n[*char*][*width*]**  
111723 Provide *width*-digit line numbering (default for *width* shall be 5). The number shall  
111724 occupy the first *width* column positions of each text column of default output or  
111725 each line of **-m** output. If *char* (any non-digit character) is given, it shall be  
111726 appended to the line number to separate it from whatever follows (default for *char*  
111727 is a <tab>).
- 111728 **-o offset** Each line of output shall be preceded by offset <space> characters. If the **-o** option  
111729 is not specified, the default offset shall be zero. The space taken is in addition to the  
111730 output line width (see the **-w** option below).
- 111731 **-p** Pause before beginning each page if the standard output is directed to a terminal;  
111732 *pr* shall write an <alert> to standard error and wait for a <newline> to be read on  
111733 **/dev/tty**.
- 111734 **-r** Write no diagnostic reports on failure to open files.
- 111735 **-s[*char*]** Separate text columns by the single character *char* instead of by the appropriate  
111736 number of <space> characters (default for *char* shall be <tab>).
- 111737 **-t** Write neither the five-line identifying header nor the five-line trailer usually  
111738 supplied for each page. Quit writing after the last line of each file without spacing  
111739 to the end of the page.
- 111740 **-w width** Set the width of the line to *width* column positions for multiple text-column output  
111741 only. If the **-w** option is not specified and the **-s** option is not specified, the default  
111742 width shall be 72. If the **-w** option is not specified and the **-s** option is specified,  
111743 the default width shall be 512.
- 111744 For single column output, input lines shall not be truncated.

111745 **OPERANDS**

111746 The following operand shall be supported:

111747 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*  
 111748 operand is '-', the standard input shall be used.

111749 **STDIN**

111750 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 111751 See the INPUT FILES section.

111752 **INPUT FILES**

111753 The input files shall be text files. If the **-m** option is not specified, an empty input file may, but  
 111754 should not, be treated as an error.

111755 The file **/dev/tty** shall be used to read responses required by the **-p** option.

111756 **ENVIRONMENT VARIABLES**

111757 The following environment variables shall affect the execution of *pr*:

111758 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 111759 (See XBD Section 8.2 (on page 169) the precedence of internationalization variables  
 111760 used to determine the values of locale categories.)

111761 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 111762 internationalization variables.

111763 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 111764 characters (for example, single-byte as opposed to multi-byte characters in  
 111765 arguments and input files) and which characters are defined as printable (character  
 111766 class **print**). Non-printable characters are still written to standard output, but are  
 111767 not counted for the purpose for column-width and line-length calculations.

111768 *LC\_MESSAGES*

111769 Determine the locale that should be used to affect the format and contents of  
 111770 diagnostic messages written to standard error.

111771 *LC\_TIME* Determine the format of the date and time for use in writing header lines.

111772 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

111773 *TZ* Determine the timezone used to calculate date and time strings written in header  
 111774 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.

111775 **ASYNCHRONOUS EVENTS**

111776 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
 111777 messages to the screen before terminating.

111778 **STDOUT**

111779 If the **-m** option is not specified, the *pr* utility output shall be as follows:

- 111780 • If an input file is empty and the implementation does not treat this as an error, no output  
 111781 shall be written for that file and this shall be considered to be successful completion of the  
 111782 processing for that file.

- 111783 • For each non-empty input file, the output shall be a paginated version of the original file.

111784 If the **-m** option is specified, the *pr* utility output shall be a paginated version of the merged file  
 111785 contents, as described in OPTIONS.

111786 In both cases, the pagination shall be accomplished using either <form-feed> characters or a

111787 XSI sequence of <newline> characters, as controlled by the **-F** or **-f** option. Page headers shall be  
 111788 generated unless the **-t** option is specified, the **-l** option is specified with too small a value (see  
 111789 OPTIONS), or the **-m** option is specified and all of the input files are empty. The page headers  
 111790 shall be of the form:

111791 "\n\n%s %s Page %d\n\n\n", <output of date>, <file>, <page number>

111792 In the POSIX locale, the <output of date> field shall be equivalent to the output of the following  
 111793 command:

111794 date "+%b %e %H:%M %Y"

111795 without the trailing <newline>, as it would appear if executed at the current time if the **-m**  
 111796 option is specified, or at the following time otherwise:

- 111797 • The current time on pages being written from standard input.
- 111798 • The modification time of the file named by the corresponding *file* operand on pages not  
 111799 being written from standard input.

111800 When the *LC\_TIME* locale category is not set to the POSIX locale, a different format and order of  
 111801 presentation of this field may be used.

111802 If the **-h** option is specified, the <file> field shall be replaced by the *header* argument. Otherwise:

- 111803 • If the **-m** option is specified, the <file> field shall be replaced by a null string on all pages.
- 111804 • If the **-m** option is not specified, the <file> field shall be replaced by a null string on pages  
 111805 containing output that was read from standard input.

#### 111806 **STDERR**

111807 The standard error shall be used for diagnostic messages and for alerting the terminal when **-p**  
 111808 is specified.

#### 111809 **OUTPUT FILES**

111810 None.

#### 111811 **EXTENDED DESCRIPTION**

111812 None.

#### 111813 **EXIT STATUS**

111814 The following exit values shall be returned:

- 111815 0 Successful completion.
- 111816 >0 An error occurred.

#### 111817 **CONSEQUENCES OF ERRORS**

111818 Default.

#### 111819 **APPLICATION USAGE**

111820 A conforming application must protect its first operand, if it starts with a <plus-sign>, by  
 111821 preceding it with the "--" argument that denotes the end of the options. For example, *pr+x*  
 111822 could be interpreted as an invalid page number or a *file* operand.

111823 If a *file* operand contains <newline>, <form-feed>, or <vertical-tab> characters, or is overly long,  
 111824 and the *pr* utility is instructed to include the pathname of that file in the header, pagination may  
 111825 not be handled correctly. Applications can guard against this by using the **-h** option (for  
 111826 example, passing a sanitized, truncated form of the pathname with **-h**).

111827 **EXAMPLES**

- 111828           1. Print a numbered list of all files in the current directory:
- 111829                 `ls -a | pr -n -h "Files in $(pwd) ."`
- 111830           2. Print **file1** and **file2** as a double-spaced, three-column listing headed by ```file list```:
- 111831                 `pr -3d -h "file list" file1 file2`
- 111832           3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:
- 111833                 `pr -e9 -t <file1 >file2`

111834 **RATIONALE**

111835           This utility is one of those that does not follow the Utility Syntax Guidelines because of its  
 111836           historical origins. The standard developers could have added new options that obeyed the  
 111837           guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are  
 111838           examples of both actions in this volume of POSIX.1-2024. Because of its widespread use by  
 111839           historical applications, the standard developers decided to exempt this version of *pr* from many  
 111840           of the guidelines.

111841           Implementations are required to accept option-arguments to the `-h`, `-l`, `-o`, and `-w` options  
 111842           whether presented as part of the same argument or as a separate argument to *pr*, as suggested by  
 111843           the Utility Syntax Guidelines. The `-n` and `-s` options, however, are specified as in historical  
 111844           practice because they are frequently specified without their optional arguments. If a `<blank>`  
 111845           were allowed before the option-argument in these cases, a *file* operand could mistakenly be  
 111846           interpreted as an option-argument in historical applications.

111847           The text about the minimum number of lines in multi-column output was included to ensure  
 111848           that a best effort is made in balancing the length of the columns. There are known historical  
 111849           implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines  
 111850           and a second of 4. Although this is not a problem when a full page with headers and trailers is  
 111851           produced, it would be relatively useless when used with `-t`.

111852           Historical implementations of the *pr* utility have differed in the action taken for the `-f` option.  
 111853           BSD uses it as described here for the `-F` option; System V uses it to change trailing `<newline>`  
 111854           characters on each page to a `<form-feed>` and, if standard output is a TTY device, sends an  
 111855           `<alert>` to standard error and reads a line from `/dev/tty` before the first page. There were strong  
 111856           arguments from both sides of this issue concerning historical practice and as a result the `-F`  
 111857           option was added. XSI-conformant systems support the System V historical actions for the `-f`  
 111858           option.

111859           The `<output of date>` field in the `-l` format is specified only for the POSIX locale. As noted, the  
 111860           format can be different in other locales. No mechanism for defining this is present in this volume  
 111861           of POSIX.1-2024, as the appropriate vehicle is a message catalog; that is, the format should be  
 111862           specified as a ```message```.

111863           Some implementations of *pr* treat an empty file as an error when `-m` is not specified, but not  
 111864           when `-m` is specified (even if there is only one input file). Implementations are encouraged to  
 111865           eliminate this inconsistency by never treating an empty file as an error.

111866 **FUTURE DIRECTIONS**

111867           A future version of this standard may require that an empty file is never treated as an error.

111868 **SEE ALSO**111869 *expand, lp*

111870 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

111871 **CHANGE HISTORY**

111872 First released in Issue 2.

111873 **Issue 6**111874 The following new requirements on POSIX implementations derive from alignment with the  
111875 Single UNIX Specification:

- 111876
- The `-p` option is added.

111877 The normative text is reworded to avoid use of the term “must” for application requirements.

111878 **Issue 7**

111879 PASC Interpretation 1003.2-92 #151 (SD5-XCU-ERN-44) is applied.

111880 Austin Group Interpretation 1003.1-2001 #093 is applied.

111881 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

111882 **Issue 8**111883 Austin Group Defect 251 is applied, adding a paragraph about problematic pathnames to the  
111884 APPLICATION USAGE section.111885 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.111886 Austin Group Defect 1433 is applied, changing `<carriage-return>` to `<newline>` in the  
111887 description of the `-p` option.111888 Austin Group Defect 1434 is applied, combining the two option groups in the SYNOPSIS into  
111889 one.111890 Austin Group Defect 1590 is applied, clarifying the requirements when an input file is empty  
111891 and changing the STDOUT section.

111892 **NAME**

111893 printf — write formatted output

111894 **SYNOPSIS**111895 `printf format [argument...]`111896 **DESCRIPTION**111897 The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
111898 shall be formatted under control of the *format* operand.111899 **OPTIONS**

111900 None.

111901 **OPERANDS**

111902 The following operands shall be supported:

111903 *format* A character string describing the format to use to write the remaining operands.  
111904 See the EXTENDED DESCRIPTION section.111905 *argument* The values to be written to standard output, under the control of *format*. See the  
111906 EXTENDED DESCRIPTION section.111907 **STDIN**

111908 Not used.

111909 **INPUT FILES**

111910 None.

111911 **ENVIRONMENT VARIABLES**111912 The following environment variables shall affect the execution of *printf*:111913 *LANG* Provide a default value for the internationalization variables that are unset or null.  
111914 (See XBD Section 8.2 (on page 169) the precedence of internationalization variables  
111915 used to determine the values of locale categories.)111916 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
111917 internationalization variables.111918 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
111919 characters (for example, single-byte as opposed to multi-byte characters in  
111920 arguments).111921 *LC\_MESSAGES*111922 Determine the locale that should be used to affect the format and contents of  
111923 diagnostic messages written to standard error.111924 *LC\_NUMERIC*111925 Determine the locale for numeric formatting. It shall affect the format of numbers  
111926 written using the *e*, *E*, *f*, *g*, and *G* conversion specifier characters (if supported).111927 *XSHELL* *NLSPATH* Determine the location of messages objects and message catalogs.111928 **ASYNCHRONOUS EVENTS**

111929 Default.

111930 **STDOUT**

111931 See the EXTENDED DESCRIPTION section.

111932 **STDERR**

111933 The standard error shall be used only for diagnostic messages.

111934 **OUTPUT FILES**

111935 None.

111936 **EXTENDED DESCRIPTION**

111937 The application shall ensure that the *format* operand is a character string, beginning and ending  
 111938 in its initial shift state, if any. The *format* operand shall be used as the format string described in  
 111939 XBD Chapter 5 (on page 113) with the following exceptions:

- 111940 1. A <space> in the format string, in any context other than a flag of a conversion  
 111941 specification, shall be treated as an ordinary character that is copied to the output.
- 111942 2. A ' $\Delta$ ' character in the format string shall be treated as a ' $\Delta$ ' character, not as a <space>.
- 111943 3. In addition to the escape sequences shown in XBD Chapter 5 (on page 113) ('\\', '\a',  
 111944 '\b', '\f', '\n', '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit  
 111945 octal number, shall be written as a byte with the numeric value specified by the octal  
 111946 number.
- 111947 4. The implementation shall not precede or follow output from the *d* or *u* conversion  
 111948 specifiers with <blank> characters not specified by the *format* operand.
- 111949 5. The implementation shall not precede output from the *o* conversion specifier with zeros  
 111950 not specified by the *format* operand.
- 111951 6. The *a*, *A*, *e*, *E*, *f*, *F*, *g*, and *G* conversion specifiers need not be supported.
- 111952 7. An additional conversion specifier character, *b*, shall be supported as follows. The  
 111953 argument shall be taken to be a string that can contain <backslash>-escape sequences.  
 111954 The following <backslash>-escape sequences shall be supported:
  - 111955 — The escape sequences listed in XBD Chapter 5 (on page 113) ('\\', '\a', '\b',  
 111956 '\f', '\n', '\r', '\t', '\v'), which shall be converted to the characters they  
 111957 represent.
  - 111958 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
 111959 converted to a byte with the numeric value specified by the octal number.
  - 111960 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
 111961 characters in the string operand containing it, any remaining string operands, and  
 111962 any additional characters in the *format* operand. If a precision is specified and the  
 111963 argument contains a '\c' after the point at which the number of bytes indicated by  
 111964 the precision specification have been written, it is unspecified whether the '\c'  
 111965 takes effect.
- 111966 The interpretation of a <backslash> followed by any other sequence of characters is  
 111967 unspecified.
- 111968 Bytes from the converted string shall be written until the end of the string or the number  
 111969 of bytes indicated by the precision specification is reached. If the precision is omitted, it  
 111970 shall be taken to be infinite, so all bytes up to the end of the converted string shall be  
 111971 written.
- 111972 8. Conversions can be applied to the *n*th *argument* operand rather than to the next *argument*  
 111973 operand. In this case, the conversion specifier character '%' is replaced by the sequence  
 111974 "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}], giving the *argument*  
 111975 operand number. This feature provides for the definition of format strings that select

- 111976 arguments in an order appropriate to specific languages.
- 111977 The format can contain either numbered argument conversion specifications (that is, ones  
111978 beginning with "%n\$"), or unnumbered argument conversion specifications, but not  
111979 both. The only exception to this is that "%%" can be mixed with the "%n\$" form. The  
111980 results of mixing numbered and unnumbered argument specifications that consume an  
111981 argument are unspecified.
- 111982 9. For each conversion specification that consumes an argument, an *argument* operand shall  
111983 be evaluated and converted to the appropriate type for the conversion as specified below.  
111984 The operand to be evaluated shall be determined as follows:
- 111985 • If the conversion specification begins with a "%n\$" sequence, the *nth argument*  
111986 operand shall be evaluated.
  - 111987 • Otherwise, the evaluated operand shall be the next *argument* operand after the one  
111988 evaluated by the previous conversion specification that consumed an argument; if  
111989 there is no such previous conversion specification the first *argument* operand shall  
111990 be evaluated.
- 111991 If the *format* operand contains no conversion specifications that consume an argument  
111992 and there are *argument* operands present, the results are unspecified.
- 111993 10. The *format* operand shall be reused as often as necessary to satisfy the *argument* operands.  
111994 If conversion specifications beginning with a "%n\$" sequence are used, on format reuse  
111995 the value of *n* shall refer to the *nth argument* operand following the highest numbered  
111996 *argument* operand consumed by the previous use of the *format* operand.
- 111997 11. If an *argument* operand to be consumed by a conversion specification does not exist:
- 111998 • If it is a numbered argument conversion specification, *printf* should write a  
111999 diagnostic message to standard error and exit with non-zero status, but may behave  
112000 as for an unnumbered argument conversion specification.
  - 112001 • If it is an unnumbered argument conversion specification, any extra *b*, *c*, or *s*  
112002 conversion specifiers shall be evaluated as if a null string argument were supplied  
112003 and any other extra conversion specifiers shall be evaluated as if a zero argument  
112004 were supplied.
- 112005 12. If a character sequence in the *format* operand begins with a '%' character, but does not  
112006 form a valid conversion specification, the behavior is unspecified.
- 112007 13. The argument to the *c* conversion specifier can be a string containing zero or more bytes.  
112008 If it contains one or more bytes, the first byte shall be written and any additional bytes  
112009 shall be ignored. If the argument is an empty string, it is unspecified whether nothing is  
112010 written or a null byte is written.
- 112011 The *argument* operands shall be treated as strings if the corresponding conversion specifier is *b*,  
112012 *c*, or *s*, and shall be evaluated as if by the *strtod()* function if the corresponding conversion  
112013 specifier is *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G*. Otherwise, they shall be evaluated as unsuffixed C integer  
112014 constants, as described by the ISO C standard, with the following extensions:
- 112015 • A leading <plus-sign> or <hyphen-minus> shall be allowed.
  - 112016 • If the leading character is a single-quote or double-quote, the value shall be the numeric  
112017 value in the underlying codeset of the character following the single-quote or double-  
112018 quote.

- 112019           • Suffixed integer constants may be allowed.
- 112020           If an *argument* operand cannot be completely converted into an internal value appropriate to the  
112021           corresponding conversion specification, a diagnostic message shall be written to standard error  
112022           and the utility shall not exit with a zero exit status, but shall continue processing any remaining  
112023           operands and shall write the value accumulated at the time the error was detected to standard  
112024           output.
- 112025           It shall not be considered an error if an *argument* operand is not completely used for a *b*, *c*, or *s*  
112026           conversion.
- 112027 **EXIT STATUS**
- 112028           The following exit values shall be returned:
- 112029           0 Successful completion.
  - 112030           >0 An error occurred.
- 112031 **CONSEQUENCES OF ERRORS**
- 112032           Default.
- 112033 **APPLICATION USAGE**
- 112034           The floating-point formatting conversion specifications of *printf()* are not required because all  
112035           arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations  
112036           and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-  
112037           point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility  
112038           cannot really be used to format *bc* output; it does not support arbitrary precision.)  
112039           Implementations are encouraged to support the floating-point conversions as an extension.
- 112040           Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of  
112041           POSIX.1-2024 on which it is based, makes no special provision for dealing with multi-byte  
112042           characters when using the *%c* conversion specification or when a precision is specified in a *%b* or  
112043           *%s* conversion specification. Applications should be extremely cautious using either of these  
112044           features when there are multi-byte characters in the character set.
- 112045           No provision is made in this volume of POSIX.1-2024 which allows field widths and precisions  
112046           to be specified as '\*' since the '\*' can be replaced directly in the *format* operand using shell  
112047           variable substitution. Implementations can also provide this feature as an extension if they so  
112048           choose.
- 112049           Hexadecimal character constants as defined in the ISO C standard are not recognized in the  
112050           *format* operand because there is no consistent way to detect the end of the constant. Octal  
112051           character constants are limited to, at most, three octal digits, but hexadecimal character constants  
112052           are only terminated by a non-hex-digit character. In the ISO C standard, string literal  
112053           concatenation can be used to terminate a constant and follow it with a hexadecimal character to  
112054           be written. In the shell, similar concatenation can be done using '\$'...' so that the shell  
112055           converts the hexadecimal sequence before it executes *printf*.
- 112056           The *%b* conversion specification is not part of the ISO C standard; it has been added here as a  
112057           portable way to process <backslash>-escapes expanded in string operands as provided by the  
112058           *echo* utility. See also the APPLICATION USAGE section of *echo* (on page 2811) for ways to use  
112059           *printf* as a replacement for all of the traditional versions of the *echo* utility.
- 112060           If an argument cannot be parsed correctly for the corresponding conversion specification, the  
112061           *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end  
112062           of an argument being used for a numeric conversion shall be reported as errors.
- 112063           Unlike the *printf()* function, when numbered conversion specifications are used, specifying the

112064 Nth argument does not require that all the leading arguments, from the first to the (N-1)th, are  
 112065 specified in the format string. For example, "%3\$s %1\$d\n" is an acceptable *format* operand  
 112066 which evaluates the first and third *argument* operands but not the second.

### 112067 EXAMPLES

112068 To alert the user and then print and read a series of prompts:

```
112069 printf "\aPlease fill in the following: \nName: "  
112070 read name  
112071 printf "Phone number: "  
112072 read phone
```

112073 To read out a list of right and wrong answers from a file, calculate the percentage correctly, and  
 112074 print them out. The numbers are right-justified and separated by a single <tab>. The percentage  
 112075 is written to one decimal place of accuracy:

```
112076 while read right wrong ; do  
112077     percent=$(echo "scale=1; ($right*100)/($right+$wrong)" | bc)  
112078     printf "%2d right\t%2d wrong\t(%s%%)\n" \  
112079         $right $wrong $percent  
112080 done < database_file
```

112081 The command:

```
112082 printf "%5d%4d\n" 1 21 321 4321 54321
```

112083 produces:

```
112084     1  21  
112085     3214321  
112086 54321  0
```

112087 Note that the *format* operand is used three times to print all of the given strings and that a '0'  
 112088 was supplied by *printf* to satisfy the last %4d conversion specification.

112089 The command:

```
112090 printf '%d\n' 10 010 0x10
```

112091 produces:

| Output Line | Explanation                                                                      |
|-------------|----------------------------------------------------------------------------------|
| 10          | Decimal representation of the numeric value of decimal integer constant 10       |
| 8           | Decimal representation of the numeric value of octal integer constant 010        |
| 16          | Decimal representation of the numeric value of hexadecimal integer constant 0x10 |

112098 If the implementation supports floating-point conversions, the command:

```
112099 LC_ALL=C printf "%.2f\n" 10 010 0x10 10.1e2 010.1e2 0x10.1p2
```

112100 produces:

| Output Line                          | Explanation                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 112101<br>112102<br>112103<br>112104 | 10.00<br>The string "10" interpreted as a decimal value, with 2 digits of precision                                   |
| 112105<br>112106                     | 10.00<br>The string "010" interpreted as a decimal (not octal) value, with 2 digits of precision                      |
| 112107<br>112108                     | 16.00<br>The string "0x10" interpreted as a hexadecimal value, with 2 digits of precision                             |
| 112109<br>112110                     | 1010.00<br>The string "10.1e2" interpreted as a decimal floating-point value, with 2 digits of precision              |
| 112111<br>112112                     | 1010.00<br>The string "010.1e2" interpreted as a decimal (not octal) floating-point value, with 2 digits of precision |
|                                      | 64.25<br>The string "0x10.1p2" interpreted as a hexadecimal floating-point value, with 2 digits of precision          |

112113 The *printf* utility is required to notify the user when conversion errors are detected while  
 112114 producing numeric output; thus, the following results would be expected on an implementation  
 112115 with 32-bit two's-complement integers when %d is specified as the *format* operand:

| Argument         | Standard Output | Diagnostic Output                                |
|------------------|-----------------|--------------------------------------------------|
| 112116<br>112117 | 5a              | 5                                                |
| 112118           | 9999999999      | <b>printf: "5a" not completely converted</b>     |
| 112119           | -9999999999     | <b>printf: "9999999999" arithmetic overflow</b>  |
| 112120           | ABC             | <b>printf: "-9999999999" arithmetic overflow</b> |
| 112121           |                 | <b>printf: "ABC" expected numeric value</b>      |

112122 The diagnostic message format is not specified, but these examples convey the type of  
 112123 information that should be reported. Note that the value shown on standard output is what  
 112124 would be expected as the return value from the *strtol()* function as defined in the System  
 112125 Interfaces volume of POSIX.1-2024. A similar correspondence exists between %u and *strtoul()*  
 112126 and %e, %f, and %g (if the implementation supports floating-point conversions) and *strtod()*.

112127 In a locale that uses a codeset based on the ISO/IEC 646:1991 standard, the command:

```
112128 printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

112129 produces:

| Output Line | Explanation |
|-------------|-------------|
| 112130      |             |
| 112131      | 3           |
| 112132      | 3           |
| 112133      | -3          |
| 112134      | 51          |
| 112135      | 43          |
| 112136      | 43          |
| 112137      | 45          |
| 112138      | 45          |
| 112139      |             |

112140 Since the last two arguments contain more characters than used for the conversion, a diagnostic  
 112141 message is generated and the exit status is non-zero. Note that in a locale with multi-byte  
 112142 characters, the value of a character is intended to be the value of the equivalent of the `wchar_t`  
 112143 representation of the character as described in the System Interfaces volume of POSIX.1-2024.

#### 112144 RATIONALE

112145 The *printf* utility was added to provide functionality that has historically been provided by *echo*.  
 112146 However, due to irreconcilable differences in the various versions of *echo* extant, the version has  
 112147 few special features, leaving those to this new *printf* utility, which is based on one in the Ninth  
 112148 Edition system.

112149 The format strings for the *printf* utility are handled differently than for the *printf()* function in  
 112150 several respects. Notable differences include:

- 112151 • Reuse of the format until all arguments have been consumed.
- 112152 • No provision for obtaining field width and precision from argument values.
- 112153 • No requirement to support floating-point conversion specifiers.
- 112154 • An additional `b` conversion specifier.
- 112155 • Special handling of leading single-quote or double-quote for integer conversion specifiers.
- 112156 • Hexadecimal character constants are not recognized in the format.
- 112157 • Formats that use numbered argument conversion specifications can have gaps in the  
 112158 argument numbers.

112159 Although *printf* implementations have no difficulty handling formats with mixed numbered and  
 112160 unnumbered conversion specifications (unlike the *printf()* function where it is undefined  
 112161 behavior), existing implementations differ in behavior. Given the format operand  
 112162 "`%2$d %d\n`", with some implementations the "`%d`" evaluates the first argument and with  
 112163 others it evaluates the third. Consequently this standard leaves the behavior unspecified (as  
 112164 opposed to undefined).

112165 Earlier versions of this standard specified that arguments for all conversions other than `b`, `c`, and  
 112166 `s` were evaluated in the same way (as C constants, but with stated exceptions). For  
 112167 implementations supporting the floating-point conversions it was not clear whether integer  
 112168 conversions need only accept integer constants and floating-point conversions need only accept  
 112169 floating-point constants, or whether both types of conversions should accept both types of  
 112170 constants. Also by not distinguishing between them, the requirement relating to a leading  
 112171 single-quote or double-quote applied to floating-point conversions even though this provided  
 112172 no useful functionality to applications that was not already available through the integer  
 112173 conversions. The current standard clarifies the situation by specifying that the arguments for  
 112174 floating-point conversions are evaluated as if by *strtod()*, and the arguments for integer  
 112175 conversions are evaluated as C integer constants, with the special treatment of leading single-

112176 quote and double-quote applying only to integer conversions.

#### 112177 FUTURE DIRECTIONS

112178 A future version of this standard may require that a missing *argument* operand to be consumed  
112179 by a numbered argument conversion specification is treated as an error.

112180 A future version of this standard is expected to add a %b conversion to the *printf()* function for  
112181 binary conversion of integers, in alignment with the next version of the ISO C standard. This  
112182 will result in an inconsistency between the *printf* utility and *printf()* function for format strings  
112183 containing %b. Implementors are encouraged to collaborate on a way to address this which  
112184 could then be adopted in a future version of this standard. For example, the *printf* utility could  
112185 add a -C option to make the format string behave in the same way, as far as possible, as the  
112186 *printf()* function.

112187 A future version of this standard may add a %q conversion to convert a string argument to a  
112188 quoted output format that can be reused as shell input.

#### 112193 CHANGE HISTORY

112194 First released in Issue 4.

#### 112195 Issue 7

112196 Austin Group Interpretations 1003.1-2001 #175 and #177 are applied.

112197 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112198 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0156 [727], XCU/TC2-2008/0157  
112199 [727,932], XCU/TC2-2008/0158 [584], and XCU/TC2-2008/0159 [727] are applied.

#### 112200 Issue 8

112201 Austin Group Defect 1108 is applied, changing ``twos'' to ``two's''.

112202 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

112203 Austin Group Defect 1202 is applied, changing the description of how '\c' is handled by the b  
112204 conversion specifier.

112205 Austin Group Defects 1209 and 1476 are applied, changing the EXAMPLES section.

112206 Austin Group Defect 1413 is applied, changing the APPLICATION USAGE section.

112207 Austin Group Defect 1562 is applied, clarifying that it is the application's responsibility to  
112208 ensure that the format is a character string, beginning and ending in its initial shift state, if any.

112209 Austin Group Defect 1592 is applied, adding support for numbered conversion specifications.

112210 Austin Group Defect 1771 is applied, changing the FUTURE DIRECTIONS section.

112211 **NAME**112212 prs — print an SCCS file (**DEVELOPMENT**)112213 **SYNOPSIS**112214 XSI prs [-a] [-d *dataspec*] [-r[*SID*]] *file...*112215 prs [-e|-l] -c *cutoff* [-d *dataspec*] *file...*112216 prs [-e|-l] -r[*SID*] [-d *dataspec*] *file...*112217 **DESCRIPTION**112218 The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
112219 format.112220 **OPTIONS**112221 The *prs* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the `-r` option has an  
112222 optional option-argument. This optional option-argument cannot be presented as a separate  
112223 argument. The following options shall be supported:112224 `-d dataspec` Specify the output data specification. The *dataspec* shall be a string consisting of  
112225 SCCS file *data keywords* (see [Data Keywords](#), on page 3305) interspersed with  
112226 optional user-supplied text.112227 `-r[SID]` Specify the SCCS identification string (SID) of a delta for which information is  
112228 desired. If no *SID* option-argument is specified, the SID of the most recently  
112229 created delta shall be assumed.112230 `-e` Request information for all deltas created earlier than and including the delta  
112231 designated via the `-r` option or the date-time given by the `-c` option.112232 `-l` Request information for all deltas created later than and including the delta  
112233 designated via the `-r` option or the date-time given by the `-c` option.112234 `-c cutoff` Indicate the *cutoff* date-time, in the form:112235 `YY[MM[DD[HH[MM[SS]]]]]`112236 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
112237 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.112238 **Note:** It is expected that in a future version of this standard the default century inferred  
112239 from a 2-digit year will change. (This would apply to all commands accepting a  
112240 2-digit year as input.)112241 No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
112242 date-time shall be included in the output. Units omitted from the date-time default  
112243 to their maximum possible values; for example, `-c 7502` is equivalent to  
112244 `-c 750228235959`.112245 `-a` Request writing of information for both removed—that is, *delta type=R* (see  
112246 [rmdel](#))—and existing—that is, *delta type=D<sub>r</sub>*—deltas. If the `-a` option is not  
112247 specified, information for existing deltas only shall be provided.112248 **OPERANDS**

112249 The following operand shall be supported:

112250 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*  
112251 utility shall behave as though each file in the directory were specified as a named  
112252 file, except that non-SCCS files (last component of the pathname does not begin  
112253 with **s**.) and unreadable files shall be silently ignored.

112254 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 112255 each line of the standard input shall be taken to be the name of an SCCS file to be  
 112256 processed. Non-SCCS files and unreadable files shall be silently ignored.

#### 112257 STDIN

112258 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 112259 line of the text file shall be interpreted as an SCCS pathname.

#### 112260 INPUT FILES

112261 Any SCCS files displayed are files of an unspecified format.

#### 112262 ENVIRONMENT VARIABLES

112263 The following environment variables shall affect the execution of *prs*:

112264 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 112265 (See XBD Section 8.2 (on page 169) the precedence of internationalization variables  
 112266 used to determine the values of locale categories.)

112267 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 112268 internationalization variables.

112269 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 112270 characters (for example, single-byte as opposed to multi-byte characters in  
 112271 arguments and input files).

112272 *LC\_MESSAGES*

112273 Determine the locale that should be used to affect the format and contents of  
 112274 diagnostic messages written to standard error.

112275 *NLSPATH* Determine the location of messages objects and message catalogs.

#### 112276 ASYNCHRONOUS EVENTS

112277 Default.

#### 112278 STDOUT

112279 The standard output shall be a text file whose format is dependent on the data keywords  
 112280 specified with the **-d** option.

#### 112281 Data Keywords

112282 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 112283 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 112284 times.

112285 The information written by *prs* shall consist of:

- 112286 1. The user-supplied text
- 112287 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 112288 keywords in the order of appearance in the *dataspec*

112289 The format of a data keyword value shall either be simple ('S'), in which keyword substitution  
 112290 is direct, or multi-line ('M').

112291 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be  
 112292 specified by '\t' and <newline> by '\n'. When the **-r** option is not specified, the default  
 112293 *dataspec* shall be:

112294 :PN::\n\n

112295 and the following *dataspec* shall be used for each selected delta:

112296 :Dt:\t:DL:\nMRs:\n:MR:COMMENTS:\n:C:

| 112382                  |                               | <code>prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file</code>                                                                                       |       |                            |
| 112383                  |                               | might write to standard output:                                                                                                                           |       |                            |
| 112384                  |                               | Delta for pgm main.c: 3.7 - 77/12/01 By cas                                                                                                               |       |                            |

112385 3. As a special case:  
 112386 prs s.file  
 112387 might write to standard output:  
 112388 s.file:  
 112389 <blank line>  
 112390 D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000  
 112391 MRs:  
 112392 b178-12345  
 112393 b179-54321  
 112394 COMMENTS:  
 112395 this is the comment line for s.file initial delta  
 112396 <blank line>

112397 for each delta table entry of the **D** type. The only option allowed to be used with this  
 112398 special case is the **-a** option.

#### 112399 RATIONALE

112400 None.

#### 112401 FUTURE DIRECTIONS

112402 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 112403 value of a <newline> character when <newline> is a terminator or separator in the output  
 112404 format being used, implementations are encouraged to treat this as an error. A future version of  
 112405 this standard may require implementations to treat this as an error.

#### 112406 SEE ALSO

112407 *admin, delta, get, what*

112408 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 112409 CHANGE HISTORY

112410 First released in Issue 2.

#### 112411 Issue 5

112412 The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end  
 112413 of the second paragraph of [Data Keywords](#) (on page 3305).

112414 The interpretation of the *YY* component of the **-c cutoff** argument is noted.

#### 112415 Issue 6

112416 The normative text is reworded to emphasize the term “shall” for implementation requirements.

112417 The Open Group Base Resolution bwg2001-007 is applied, updating the table in STDOUT with a  
 112418 note that line statistics are capped at 99 999 for the **:Li:**, **:Ld:**, **:Lu:**, and **:DL:** keywords.

112419 The Open Group Interpretation PIN4C.00009 is applied.

#### 112420 Issue 7

112421 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 112422 Issue 8

112423 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
 112424 directed to display a pathname that contains any bytes that have the encoded value of a  
 112425 <newline> character when <newline> is a terminator or separator in the output format being  
 112426 used.

112427 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

112428

Austin Group Defect 1452 is applied, deleting **:KV:** from the list of keywords.

112429

Austin Group Defect 1570 is applied, removing extra spacing in "==".

112430 **NAME**

112431 ps — report process status

112432 **SYNOPSIS**

```
112433 XSI ps [-aAw] [-defl] [-g grouplist] [-G grouplist]
112434 [-n namelist] [-o format]... [-p proclist] [-t termlist]
112435 [-u userlist] [-U userlist]
```

112436 **DESCRIPTION**

112437 The *ps* utility shall write information about processes, subject to having appropriate privileges to  
 112438 obtain information about those processes.

112439 By default, *ps* shall select all processes with the same effective user ID as the current user and the  
 112440 same controlling terminal as the invoker.

112441 **OPTIONS**

112442 The *ps* utility shall conform to XBD [Section 12.2](#) (on page 215).

112443 The following options shall be supported:

- 112444 **-a** Write information for all processes associated with terminals. Implementations  
 112445 may omit session leaders from this list.
- 112446 **-A** Write information for all processes.
- 112447 XSI **-d** Write information for all processes, except session leaders.
- 112448 XSI **-e** Write information for all processes. (Equivalent to **-A**.)
- 112449 XSI **-f** Generate a **full** listing. (See the **STDOUT** section for the contents of a **full** listing.)
- 112450 XSI **-g grouplist** Write information for processes whose session leaders are given in *grouplist*. The  
 112451 application shall ensure that the *grouplist* is a single argument in the form of a  
 112452 <blank> or <comma>-separated list.
- 112453 **-G grouplist** Write information for processes whose real group ID numbers are given in  
 112454 *grouplist*. The application shall ensure that the *grouplist* is a single argument in the  
 112455 form of a <blank> or <comma>-separated list.
- 112456 XSI **-l** Generate a **long** listing. (See **STDOUT** for the contents of a **long** listing.)
- 112457 XSI **-n namelist** Specify the name of an alternative system *namelist* file in place of the default. The  
 112458 name of the default file and the format of a *namelist* file are unspecified.
- 112459 **-o format** Write information according to the format specification given in *format*. This is  
 112460 fully described in the **STDOUT** section. Multiple **-o** options can be specified; the  
 112461 format specification shall be interpreted as the <space>-separated concatenation of  
 112462 all the *format* option-arguments.
- 112463 **-p proclist** Write information for processes whose process ID numbers are given in *proclist*.  
 112464 The application shall ensure that the *proclist* is a single argument in the form of a  
 112465 <blank> or <comma>-separated list.
- 112466 **-t termlist** Write information for processes associated with terminals given in *termlist*. The  
 112467 application shall ensure that the *termlist* is a single argument in the form of a  
 112468 <blank> or <comma>-separated list. Terminal identifiers shall be given in an  
 112469 XSI implementation-defined format. On XSI-conformant systems, they shall be given  
 112470 in one of two forms: the device's filename (for example, **tty04**) or, if the device's  
 112471 filename starts with **tty**, just the identifier following the characters **tty** (for example,  
 112472 **"04"**).

- 112473 XSI **-u *userlist*** Write information for processes whose user ID numbers or login names are given in *userlist*. The application shall ensure that the *userlist* is a single argument in the form of a <blank> or <comma>-separated list. In the listing, the numerical user ID shall be written unless the **-f** option is used, in which case the login name shall be written.
- 112474
- 112475
- 112476
- 112477
- 112478 **-U *userlist*** Write information for processes whose real user ID numbers or login names are given in *userlist*. The application shall ensure that the *userlist* is a single argument in the form of a <blank> or <comma>-separated list.
- 112479
- 112480
- 112481 **-w** Behave as if the *COLUMNS* environment variable had a value of at least 132. If the **-w** option is not specified or is specified exactly once, all output lines shall contain no more than the greater of {*LINE\_MAX*} and *COLUMNS* bytes provided that no format name is specified multiple times.
- 112482
- 112483
- 112484
- 112485 XSI With the exception of **-f**, **-l**, **-n *namelist***, and **-o *format***, all of the options shown are used to select processes. If any are specified, the default list shall be ignored and *ps* shall select the processes represented by the inclusive OR of all the selection-criteria options.
- 112486
- 112487
- 112488 **OPERANDS**
- 112489 None.
- 112490 **STDIN**
- 112491 Not used.
- 112492 **INPUT FILES**
- 112493 None.
- 112494 **ENVIRONMENT VARIABLES**
- 112495 The following environment variables shall affect the execution of *ps*:
- 112496 ***COLUMNS*** Override the system-selected horizontal display line size, used to determine the number of text columns to display. See XBD [Chapter 8](#) (on page 167) for valid values and results when it is unset or null.
- 112497
- 112498
- 112499 ***LANG*** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 169) the precedence of internationalization variables used to determine the values of locale categories.)
- 112500
- 112501
- 112502 ***LC\_ALL*** If set to a non-empty string value, override the values of all the other internationalization variables.
- 112503
- 112504 ***LC\_CTYPE*** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
- 112505
- 112506
- 112507 ***LC\_MESSAGES***
- 112508 Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
- 112509
- 112510
- 112511 ***LC\_TIME*** Determine the format and contents of the date and time strings displayed.
- 112512 XSI ***NLSPATH*** Determine the location of messages objects and message catalogs.
- 112513 ***TZ*** Determine the timezone used to calculate date and time strings displayed. If *TZ* is unset or null, an unspecified default timezone shall be used.
- 112514

112515 **ASYNCHRONOUS EVENTS**

112516 Default.

112517 **STDOUT**112518 When the **-o** option is not specified, the standard output format is unspecified.

112519 XSI On XSI-conformant systems, the output format shall be as follows. The column headings and descriptions of the columns in a *ps* listing are given below. The precise meanings of these fields are implementation-defined. The letters 'f' and 'l' (below) indicate the option (**full** or **long**) that shall cause the corresponding heading to appear; **all** means that the heading always appears. Note that these two options determine only what information is provided for a process; they do not determine which processes are listed.

|        |              |       |                                                                                                                                    |
|--------|--------------|-------|------------------------------------------------------------------------------------------------------------------------------------|
| 112525 | <b>F</b>     | (l)   | Flags (octal and additive) associated with the process.                                                                            |
| 112526 | <b>S</b>     | (l)   | The state of the process.                                                                                                          |
| 112527 | <b>UID</b>   | (f,l) | The user ID number of the process owner; the login name is printed under the <b>-f</b> option.                                     |
| 112528 |              |       |                                                                                                                                    |
| 112529 | <b>PID</b>   | (all) | The process ID of the process; it is possible to kill a process if this datum is known.                                            |
| 112530 |              |       |                                                                                                                                    |
| 112531 | <b>PPID</b>  | (f,l) | The process ID of the parent process.                                                                                              |
| 112532 | <b>C</b>     | (f,l) | Processor utilization for scheduling.                                                                                              |
| 112533 | <b>PRI</b>   | (l)   | The priority of the process; higher numbers mean lower priority.                                                                   |
| 112534 | <b>NI</b>    | (l)   | Nice value; used in priority computation.                                                                                          |
| 112535 | <b>ADDR</b>  | (l)   | The address of the process.                                                                                                        |
| 112536 | <b>SZ</b>    | (l)   | The size in pages of the total memory requirements of the process, including text, data, stack, mapped memory and other resources. |
| 112537 |              |       |                                                                                                                                    |
| 112538 | <b>WCHAN</b> | (l)   | The event for which the process is waiting or sleeping; if blank, the process is running.                                          |
| 112539 |              |       |                                                                                                                                    |
| 112540 | <b>STIME</b> | (f)   | Starting time of the process.                                                                                                      |
| 112541 | <b>TTY</b>   | (all) | The controlling terminal for the process.                                                                                          |
| 112542 | <b>TIME</b>  | (all) | The cumulative execution time for the process.                                                                                     |
| 112543 | <b>CMD</b>   | (all) | The command name; the full command name and its arguments are written under the <b>-f</b> option.                                  |
| 112544 |              |       |                                                                                                                                    |

112545 A process that has exited and has a parent, but has not yet been waited for by the parent, shall be marked **defunct**.

112546

112547 Under the option **-f**, *ps* tries to determine the command name and arguments given when the process was created by examining memory or the swap area. Failing this, the command name, as it would appear without the option **-f**, is written in square brackets.

112548

112549

112550 The **-o** option allows the output format to be specified under user control.

112551 The application shall ensure that the format specification is a list of names presented as a single argument, <blank> or <comma>-separated. Each variable has a default header. The default header can be overridden by appending an <equals-sign> and the new text of the header. The rest of the characters in the argument shall be used as the header text. The fields specified shall be written in the order specified on the command line, and should be arranged in columns in the output. The field widths shall be selected by the system to be at least as wide as the header text (default or overridden value). If the header text is null, such as **-o user=**, the field width shall be at least as wide as the default header text. If all header text fields are null, no header line shall be written.

112552 The following names are recognized in the POSIX locale:

112553

112554

112555

112556

112557

112558

112559

| 112587 | <b>comm</b>   | The name of the command being executed ( <i>argv</i> [0] value) as a string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 112588 | <b>args</b>   | The command with all its arguments as a string. The implementation may truncate this value to the field width; it is implementation-defined whether any further truncation occurs. It is unspecified whether the string represented is a version of the argument list as it was passed to the command when it started, or is a version of the arguments as they may have been modified by the application. Applications cannot depend on being able to modify their argument list and having that modification be reflected in the output of <i>ps</i> . |
| 112589 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 112590 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

112611

**112612 STDERR**

112613 The standard error shall be used only for diagnostic messages.

**112614 OUTPUT FILES**

112615 None.

**112616 EXTENDED DESCRIPTION**

112617 None.

**112618 EXIT STATUS**

112619 The following exit values shall be returned:

112620 0 Successful completion.

112621 >0 An error occurred.

**112622 CONSEQUENCES OF ERRORS**

112623 Default.

**112624 APPLICATION USAGE**

112625 Things can change while *ps* is running; the snapshot it gives is only true for an instant, and  
112626 might not be accurate by the time it is displayed.

112627 The **args** format specifier is allowed to produce a truncated version of the command arguments.  
112628 In some implementations, this information is no longer available when the *ps* utility is executed.

112629 If the field width is too narrow to display a textual ID, the system may use a numeric version.  
112630 Normally, the system would be expected to choose large enough field widths, but if a large  
112631 number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on  
112632 one line. One way to ensure adequate width for the textual IDs is to override the default header  
112633 for a field to make it larger than most or all user or group names.

112634 Portable applications should not set *COLUMNS* to a value greater than {*LINE\_MAX*} and should  
112635 not specify the **-w** option more than once if the output will be used as input for a utility that  
112636 requires a text file as input because lines containing more than {*LINE\_MAX*} bytes may cause  
112637 undefined behavior in some implementations of the utility.

112638 There is no special quoting mechanism for header text. The header text is the rest of the  
112639 argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
112640 ps -o "user=User Name" -o pid=Process\ ID
```

112641 On some implementations, especially multi-level secure systems, *ps* may be severely restricted  
112642 and produce information only about child processes owned by the user.

112643 **EXAMPLES**

112644 The command:

```
112645 ps -o user,pid,ppid=MOM -o args
```

112646 writes at least the following in the POSIX locale:

```
112647     USER    PID    MOM    COMMAND
112648 helene     34     12    ps -o user,pid,ppid=MOM -o args
```

112649 The contents of the **COMMAND** field need not be the same in all implementations, due to  
112650 possible truncation.

112651 **RATIONALE**

112652 There is very little commonality between BSD and System V implementations of *ps*. Many  
112653 options conflict or have subtly different usages. The standard developers attempted to select a  
112654 set of options for the base standard that were useful on a wide range of systems and selected  
112655 options that either can be implemented on both BSD and System V-based systems without  
112656 breaking the current implementations or where the options are sufficiently similar that any  
112657 changes would not be unduly problematic for users or implementors.

112658 It is recognized that on some implementations, especially multi-level secure systems, *ps* may be  
112659 nearly useless. The default output has therefore been chosen such that it does not break  
112660 historical implementations and also is likely to provide at least some useful information on most  
112661 systems.

112662 The major change is the addition of the format specification capability. The motivation for this  
112663 invention is to provide a mechanism for users to access a wider range of system information, if  
112664 the system permits it, in a portable manner. The fields chosen to appear in this volume of  
112665 POSIX.1-2024 were arrived at after considering what concepts were likely to be both reasonably  
112666 useful to the “average” user and had a reasonable chance of being implemented on a wide range  
112667 of systems. Again it is recognized that not all systems are able to provide all the information  
112668 and, conversely, some may wish to provide more. It is hoped that the approach adopted will be  
112669 sufficiently flexible and extensible to accommodate most systems. Implementations may be  
112670 expected to introduce new format specifiers.

112671 The default output should consist of a short listing containing the process ID, terminal name,  
112672 cumulative execution time, and command name of each process.

112673 The preference of the standard developers would have been to make the format specification an  
112674 operand of the *ps* command. Unfortunately, BSD usage precluded this.

112675 At one time a format was included to display the environment array of the process. This was  
112676 deleted because there is no portable way to display it.

112677 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a  
112678 mnemonic compromise was selected.

112679 The **-a** option is described with some optional behavior because the SVID omits session leaders,  
112680 but BSD does not.

112681 In an early proposal, format specifiers appeared for priority and start time. The former was not  
112682 defined adequately in this volume of POSIX.1-2024 and was removed in deference to the defined  
112683 nice value; the latter because elapsed time was considered to be more useful.

112684 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,  
112685 followed by additional format specifiers. This was not adopted because the default output is  
112686 implementation-defined. Nevertheless, this is a useful option that should be reserved for that  
112687 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of

112688 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their  
112689 desired format and add more fields to the end of the output in certain cases where that would be  
112690 useful.

112691 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
112692 require that they all use the same format.

112693 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.  
112694 This is because it is difficult to express an algorithm that is useful across all possible machine  
112695 architectures. Historical counterparts to this value have attempted to show percentage of use in  
112696 the recent past, such as the preceding minute. Frequently, these values for all processes did not  
112697 add up to 100%. Implementations are encouraged to provide data in this field to users that will  
112698 help them identify processes currently affecting the performance of the system.

#### 112699 **FUTURE DIRECTIONS**

112700 None.

#### 112701 **SEE ALSO**

112702 *kill*, *nice*, *renice*

112703 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 112704 **CHANGE HISTORY**

112705 First released in Issue 2.

#### 112706 **Issue 6**

112707 This utility is marked as part of the User Portability Utilities option.

112708 The normative text is reworded to avoid use of the term “must” for application requirements.

112709 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

#### 112710 **Issue 7**

112711 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112712 SD5-XCU-ERN-148 is applied, updating the OPTIONS section.

112713 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0160 [584] is applied.

#### 112714 **Issue 8**

112715 Austin Group Defect 905 is applied, adding the **-w** option.

112716 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

112717 Austin Group Defect 1141 is applied, changing the description of **SZ** in the STDOUT section.

112718 Austin Group Defect 1175 is applied, changing “uid” to “user” in the EXAMPLES section.

112719 **NAME**112720 `pwd` — return working directory name112721 **SYNOPSIS**112722 `pwd [-L|-P]`112723 **DESCRIPTION**112724 The *pwd* utility shall write to standard output an absolute pathname of the current working  
112725 directory, which does not contain the filenames dot or dot-dot.112726 **OPTIONS**112727 The *pwd* utility shall conform to XBD [Section 12.2](#) (on page 215).

112728 The following options shall be supported by the implementation:

112729 **-L** If the *PWD* environment variable contains an absolute pathname of the current  
112730 directory and the pathname does not contain any components that are dot or dot-  
112731 dot, *pwd* shall write this pathname to standard output, except that if the *PWD*  
112732 environment variable is longer than {PATH\_MAX} bytes including the terminating  
112733 null, it is unspecified whether *pwd* writes this pathname to standard output or  
112734 behaves as if the **-P** option had been specified. Otherwise, the **-L** option shall  
112735 behave as the **-P** option.

112736 **-P** The pathname written to standard output shall not contain any components that  
112737 refer to files of type symbolic link. If there are multiple pathnames that the *pwd*  
112738 utility could write to standard output, one beginning with a single <slash>  
112739 character and one or more beginning with two <slash> characters, then it shall  
112740 write the pathname beginning with a single <slash> character. The pathname shall  
112741 not contain any unnecessary <slash> characters after the leading one or two  
112742 <slash> characters.

112743 If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*  
112744 utility shall behave as if **-L** had been specified.

112745 **OPERANDS**

112746 None.

112747 **STDIN**

112748 Not used.

112749 **INPUT FILES**

112750 None.

112751 **ENVIRONMENT VARIABLES**112752 The following environment variables shall affect the execution of *pwd*:

112753 **LANG** Provide a default value for the internationalization variables that are unset or null.  
112754 (See XBD [Section 8.2](#) (on page 169) the precedence of internationalization variables  
112755 used to determine the values of locale categories.)

112756 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
112757 internationalization variables.

112758 **LC\_MESSAGES**

112759 Determine the locale that should be used to affect the format and contents of  
112760 diagnostic messages written to standard error.

112761 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.

112762 *PWD* An absolute pathname of the current working directory. If an application sets or  
112763 unsets the value of *PWD*, the behavior of *pwd* is unspecified.

#### 112764 **ASYNCHRONOUS EVENTS**

112765 Default.

#### 112766 **STDOUT**

112767 The *pwd* utility output is an absolute pathname of the current working directory:

112768 "%s\n", <directory pathname>

#### 112769 **STDERR**

112770 The standard error shall be used only for diagnostic messages.

#### 112771 **OUTPUT FILES**

112772 None.

#### 112773 **EXTENDED DESCRIPTION**

112774 None.

#### 112775 **EXIT STATUS**

112776 The following exit values shall be returned:

112777 0 Successful completion.

112778 >0 An error occurred.

#### 112779 **CONSEQUENCES OF ERRORS**

112780 If an error is detected other than a write error when writing to standard output, no output shall  
112781 be written to standard output, a diagnostic message shall be written to standard error, and the  
112782 exit status shall be non-zero.

#### 112783 **APPLICATION USAGE**

112784 If the pathname obtained from *pwd* is longer than {PATH\_MAX} bytes, it could produce an error  
112785 if passed to *cd*. Therefore, in order to return to that directory it may be necessary to break the  
112786 pathname into sections shorter than {PATH\_MAX} and call *cd* on each section in turn (the first  
112787 section being an absolute pathname and subsequent sections being relative pathnames).

#### 112788 **EXAMPLES**

112789 None.

#### 112790 **RATIONALE**

112791 Some implementations have historically provided *pwd* as a shell special built-in command.

112792 In most utilities, if an error occurs, partial output may be written to standard output. This does  
112793 not happen in historical implementations of *pwd* (unless an error condition causes a partial  
112794 write). Because *pwd* is frequently used in historical shell scripts without checking the exit status,  
112795 it is important that the historical behavior is required here; therefore, the CONSEQUENCES OF  
112796 ERRORS section specifically disallows any partial output being written to standard output,  
112797 except when a write error occurs when writing to standard output.

112798 An earlier version of this standard stated that the *PWD* environment variable was affected when  
112799 the *-P* option was in effect. This was incorrect; conforming implementations do not do this.

#### 112800 **FUTURE DIRECTIONS**

112801 If this utility is directed to display a pathname that contains any bytes that have the encoded  
112802 value of a <newline> character when <newline> is a terminator or separator in the output  
112803 format being used, implementations are encouraged to treat this as an error. A future version of  
112804 this standard may require implementations to treat this as an error.

112809 **CHANGE HISTORY**

- 112810 First released in Issue 2.
- 112811 **Issue 6**
- 112812 The **-P** and **-L** options are added to describe actions relating to symbolic links as specified in the
- 112813 IEEE P1003.2b draft standard.
- 112814 **Issue 7**
- 112815 Austin Group Interpretation 1003.1-2001 #097 is applied.
- 112816 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 112817 Changes to the *pwd* utility and *PWD* environment variable have been made to match the
- 112818 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.
- 112819 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0161 [471] is applied.
- 112820 **Issue 8**
- 112821 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is
- 112822 directed to display a pathname that contains any bytes that have the encoded value of a
- 112823 <newline> character when <newline> is a terminator or separator in the output format being
- 112824 used.
- 112825 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 112826 Austin Group Defect 1488 is applied, clarifying the behavior when a write error occurs when
- 112827 writing to standard output.

112828 **NAME**

112829 read — read from standard input into shell variables

112830 **SYNOPSIS**112831 read [-r] [-d *delim*] *var*...112832 **DESCRIPTION**112833 The *read* utility shall read a single logical line from standard input into one or more shell  
112834 variables.

112835 If the *-r* option is not specified, <backslash> shall act as an escape character. An unescaped  
112836 <backslash> shall preserve the literal value of a following <backslash> and shall prevent a  
112837 following byte (if any) from being used to split fields, with the exception of either <newline> or  
112838 the logical line delimiter specified with the *-d delim* option (if it is used and *delim* is not  
112839 <newline>); it is unspecified which. If this excepted character follows the <backslash>, the *read*  
112840 utility shall interpret this as line continuation. The <backslash> and the excepted character shall  
112841 be removed before splitting the input into fields. All other unescaped <backslash> characters  
112842 shall be removed after splitting the input into fields.

112843 If standard input is a terminal device and the invoking shell is interactive, *read* shall prompt for a  
112844 continuation line when it reads an input line ending with a <backslash> <newline>, unless the  
112845 *-r* option is specified.

112846 The terminating logical line delimiter (if any) shall be removed from the input. Then, if the shell  
112847 variable *IFS* (see [Section 2.5.3](#), on page 2481) is set, and its value is an empty string, the resulting  
112848 data shall be assigned to the variable named by the first *var* operand, and the variables named  
112849 by other *var* operands (if any) shall be set to the empty string. No other processing shall be  
112850 performed in this case.

112851 If *IFS* is unset, or is set to any non-empty value, then a modified version of the field splitting  
112852 algorithm specified in [Section 2.6.5](#) (on page 2491) shall be applied, with the modifications as  
112853 follows:

- 112854 1. The input to the algorithm shall be the logical line (minus terminating delimiter) that was  
112855 read from standard input, and shall be considered as a single initial field, all of which  
112856 resulted from expansions, with any escaped byte and the preceding <backslash> escape  
112857 character treated as if they were the result of a quoted expansion, and all other bytes  
112858 treated as if they were the results of unquoted expansions.
- 112859 2. The loop over the contents of that initial field shall cease when either the input is empty  
112860 or *n* output fields have been generated, where *n* is one less than the number of *var*  
112861 operands passed to the *read* utility. Any remaining input in the original field being  
112862 processed shall be returned to the *read* utility “unsplit”; that is, unmodified except that  
112863 any leading or trailing *IFS* white space, as defined in [Section 2.6.5](#) (on page 2491), shall be  
112864 removed.

112865 The specified *var* operands shall be processed in the order they appear on the command line,  
112866 and the output fields generated by the field splitting algorithm shall be used in the order they  
112867 were generated, by repeating the following checks until neither is true:

- 112868 • If more than one *var* operand is yet to be processed and one or more output fields are yet to  
112869 be used, the variable named by the first unprocessed *var* operand shall be assigned the  
112870 value of the first unused output field.
- 112871 • If exactly one *var* operand is yet to be processed and there was some remaining unsplit  
112872 input returned from the modified field splitting algorithm, the variable named by the  
112873 unprocessed *var* operand shall be assigned the unsplit input.

112874 If there are still one or more unprocessed *var* operands, each of the variables names by those  
112875 operands shall be assigned an empty string.

112876 Note that in the case where just one *var* operand is given on the *read* command line, the modified  
112877 field splitting algorithm ceases after producing zero output fields and simply returns the  
112878 original input field, with any leading and trailing *IFS* white space removed, as unsplit input.  
112879 This unsplit input is assigned to the variable named by the *var* operand.

112880 The setting of variables specified by the *var* operands shall affect the current shell execution  
112881 environment; see [Section 2.13](#) (on page 2522). An error in setting any variable (such as if a *var*  
112882 has previously been marked *readonly*) shall be considered an error of *read* processing, and shall  
112883 result in a return value greater than one. Variables named before the one generating the error  
112884 shall be set as described above; it is unspecified whether variables named later shall be set as  
112885 above, or *read* simply ceases processing when the error occurs, leaving later named variables  
112886 unaltered. If *read* is called in a subshell or separate utility execution environment, such as one of  
112887 the following:

```
112888 (read foo)
112889 nohup read ...
112890 find . -exec read ... \;
```

112891 it shall not affect the shell variables in the caller's environment.

112892 If end-of-file is detected before a terminating logical line delimiter is encountered, the variables  
112893 specified by the *var* operands shall be set as described above and the exit status shall be 1.

#### 112894 OPTIONS

112895 The *read* utility shall conform to XBD [Section 12.2](#) (on page 215).

112896 The following options shall be supported:

112897 **-d** *delim* If *delim* consists of one single-byte character, that byte shall be used as the logical  
112898 line delimiter. If *delim* is the null string, the logical line delimiter shall be the null  
112899 byte. Otherwise, the behavior is unspecified.

112900 **-r** Do not treat a <backslash> character in any special way. Consider each  
112901 <backslash> to be part of the input line.

#### 112902 OPERANDS

112903 The following operand shall be supported:

112904 *var* The name of an existing or nonexisting shell variable. If a *var* operand names the  
112905 variable *IFS*, the behavior is unspecified.

112906 If a *var* operand names one of the variables *LANG*, *LC\_CTYPE*, or *LC\_ALL* and the  
112907 new value assigned to the variable would change how the bytes in *IFS* form  
112908 characters, or which characters in *IFS* are considered to be *IFS* white space (see  
112909 [Section 2.6.5](#), on page 2491), it is unspecified what effects, if any, the change has on  
112910 how *read* performs field splitting.

#### 112911 STDIN

112912 If the **-d** *delim* option is not specified, or if it is specified and *delim* is not the null string, the  
112913 standard input shall contain zero or more bytes (which need not form valid characters) and shall  
112914 not contain any null bytes.

112915 If the **-d** *delim* option is specified and *delim* is the null string, the standard input shall contain  
112916 zero or more bytes (which need not form valid characters).

112917 **INPUT FILES**

112918 None.

112919 **ENVIRONMENT VARIABLES**112920 The following environment variables shall affect the execution of *read*:112921 *IFS* Determine the internal field separators used to delimit fields; see [Section 2.5.3](#) (on  
112922 page 2481).112923 *LANG* Provide a default value for the internationalization variables that are unset or null.  
112924 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
112925 variables used to determine the values of locale categories.)112926 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
112927 internationalization variables.112928 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
112929 characters (for example, single-byte as opposed to multi-byte characters in  
112930 arguments).112931 *LC\_MESSAGES*112932 Determine the locale that should be used to affect the format and contents of  
112933 diagnostic messages written to standard error.112934 XSI *NLSPATH* Determine the location of messages objects and message catalogs.112935 *PS2* Provide the prompt string that an interactive shell shall write to standard error  
112936 when a line ending with a <backslash> <newline> is read and the *-r* option was  
112937 not specified.112938 **ASYNCHRONOUS EVENTS**

112939 Default.

112940 **STDOUT**

112941 Not used.

112942 **STDERR**

112943 The standard error shall be used for diagnostic messages and prompts for continued input.

112944 **OUTPUT FILES**

112945 None.

112946 **EXTENDED DESCRIPTION**

112947 None.

112948 **EXIT STATUS**

112949 The following exit values shall be returned:

112950 0 Successful completion.

112951 1 End-of-file was detected.

112952 &gt;1 An error occurred.

112953 **CONSEQUENCES OF ERRORS**

112954 Default.

112955 **APPLICATION USAGE**

112956 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

112957 The `-r` option is included to enable `read` to subsume the purpose of the `line` utility, which is not  
112958 included in POSIX.1-2024.

112959 The `-d delim` option enables reading up to an arbitrary single-byte delimiter. When *delim* is the  
112960 null string, the delimiter is the null byte and this allows `read` to be used to process null-  
112961 terminated lists of pathnames (as produced by the `find -print0` primary), with correct handling  
112962 of pathnames that contain `<newline>` characters. Note that in order to specify the null string as  
112963 the delimiter, `-d` and *delim* need to be specified as two separate arguments. Implementations  
112964 differ in their handling of `<backslash>` for line continuation when `-d delim` is specified (and  
112965 *delim* is not `<newline>`); some treat `<backslash>delim` (or `<backslash><NUL>` if *delim* is the null  
112966 string) as a line continuation, whereas others still treat `<backslash><newline>` as a line  
112967 continuation. Consequently, portable applications need to specify `-r` whenever they specify `-d  
112968 delim` (and *delim* is not `<newline>`).

112969 When reading a pathname it is inadvisable to use the contents of the first *var* operand, if non-  
112970 empty, when the exit status of `read` is 1, as it is likely the result of the command used to generate  
112971 the list of pathnames (for example `find` with `-print` or `-print0`) being terminated after it has  
112972 written a partial pathname, and consequently using it could result in the wrong pathname being  
112973 processed.

112974 Since the *var* operands are processed in the order specified on the command line, if any variable  
112975 name is specified more than once as a *var* operand, the last assignment made is the one that is in  
112976 effect when `read` returns, including when an empty string is assigned because no field data was  
112977 available.

112978 **EXAMPLES**

112979 The following command:

```
112980 while read -r xx yy
112981 do
112982     printf "%s %s\n" "$yy" "$xx"
112983 done < input_file
```

112984 prints a file with the first field of each line moved to the end of the line.

112985 **RATIONALE**

112986 The `read` utility historically has been a shell built-in. It was separated off into its own utility to  
112987 take advantage of the richer description of functionality introduced by this volume of  
112988 POSIX.1-2024.

112989 Since `read` affects the current shell execution environment, it is required to be intrinsic. If it is  
112990 called in a subshell or separate utility execution environment, such as one of the following:

```
112991 (read foo)
112992 nohup read ...
112993 find . -exec read ... \;
```

112994 it does not affect the shell variables in the environment of the caller.

112995 Earlier versions of this standard required the standard input to be a text file, and therefore the  
112996 results were undefined if the input was not empty and end-of-file was detected before a  
112997 `<newline>` character was encountered. However, all of the most popular shell implementations  
112998 have been found to have consistent behavior in this case, and so the behavior is now specified  
112999 and the requirement for standard input to be a text file has been relaxed to allow non-empty  
113000 input that does not end with a `<newline>`.

113001 **FUTURE DIRECTIONS**

113002 None.

113003 **SEE ALSO**113004 [Chapter 2](#) (on page 2472)113005 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)113006 **CHANGE HISTORY**

113007 First released in Issue 2.

113008 **Issue 7**

113009 Austin Group Interpretation 1003.1-2001 #194 is applied, clarifying the handling of the &lt;backslash&gt; escape character.

113011 SD5-XCU-ERN-126 is applied, clarifying that input lines end with a &lt;newline&gt;.

113012 The description of here-documents is removed from the *read* reference page.

113013 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0162 [958] is applied.

113014 **Issue 8**113015 Austin Group Defect 243 is applied, adding the `-d` option and relaxing the requirement for standard input to be a text file.113017 Austin Group Defect 367 is applied, requiring that *read* distinguishes between detecting end-of-file and an error occurring, setting its exit status to one and greater than one, respectively.

113019 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that this utility is required to be intrinsic.

113021 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

113022 Austin Group Defect 1778 is applied, clarifying how field splitting is performed.

113023 Austin Group Defect 1779 is applied, clarifying how an error in setting any variable affects the processing of variables named before or after the one generating the error.

113024

113025 **NAME**

113026 readlink — display the contents of a symbolic link

113027 **SYNOPSIS**113028 readlink [-n] *file*113029 **DESCRIPTION**

113030 If the *file* operand names a symbolic link, the *readlink* utility shall not follow the symbolic link  
 113031 when resolving *file* and shall write the contents of the symbolic link to standard output. If the **-n**  
 113032 option is not specified, the output to standard output shall be followed by a <newline>  
 113033 character.

113034 If *file* does not name a symbolic link, *readlink* shall write a diagnostic message to standard error  
 113035 and exit with non-zero status.

113036 **OPTIONS**113037 The *readlink* utility shall conform to XBD [Section 12.2](#) (on page 215).

113038 The following option shall be supported:

113039 **-n** Do not output a trailing <newline> character.113040 **OPERANDS**

113041 The following operand shall be supported:

113042 *file* A pathname of a symbolic link to be read.113043 **STDIN**

113044 Not used.

113045 **INPUT FILES**

113046 None.

113047 **ENVIRONMENT VARIABLES**113048 The following environment variables shall affect the execution of *readlink*:

113049 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 113050 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 113051 variables used to determine the values of locale categories.)

113052 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 113053 internationalization variables.

113054 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 113055 characters (for example, single-byte as opposed to multi-byte characters in  
 113056 arguments and input files).

113057 **LC\_MESSAGES**

113058 Determine the locale that should be used to affect the format and contents of  
 113059 diagnostic messages written to standard error.

113060 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.113061 **ASYNCHRONOUS EVENTS**

113062 Default.

113063 **STDOUT**

113064 See DESCRIPTION.

- 113065 **STDERR**  
113066       The standard error shall be used only for diagnostic messages.
- 113067 **OUTPUT FILES**  
113068       None.
- 113069 **EXTENDED DESCRIPTION**  
113070       None.
- 113071 **EXIT STATUS**  
113072       The following exit values shall be returned:  
113073       0 Successful completion.  
113074       >0 An error occurred.
- 113075 **CONSEQUENCES OF ERRORS**  
113076       Default.
- 113077 **APPLICATION USAGE**  
113078       None.
- 113079 **EXAMPLES**  
113080       None.
- 113081 **RATIONALE**  
113082       The *readlink* utility was added because using *ls -l* to obtain the contents of a symbolic link is difficult if the output includes more than one occurrence of the string " -> ".  
113083  
113084       The *-f* option found in many implementations was not included, as the *realpath* utility provides equivalent functionality with a choice of behaviors.  
113085
- 113086 **FUTURE DIRECTIONS**  
113087       None.
- 113088 **SEE ALSO**  
113089       *ln, ls, realpath*  
113090       XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)  
113091       XSH [readlink\(\)](#)
- 113092 **CHANGE HISTORY**  
113093       First released in Issue 8.

113094 **NAME**113095        *realpath* — resolve a pathname113096 **SYNOPSIS**113097        *realpath* [-E|-e] *file*113098 **DESCRIPTION**113099        The *realpath* utility shall canonicalize the pathname specified by the *file* operand as follows:113100        If a call to the *realpath*() function with the specified pathname as its first argument would  
113101        succeed, the canonicalized pathname shall be the pathname that would be returned by that  
113102        *realpath*() call. Otherwise:

- 113103           • If the **-e** option is specified, the canonicalization shall fail.
- 113104           • If the **-E** option is specified, then if a call to the *realpath*() function with the specified  
113105           pathname as its first argument would encounter an error condition other than [ENOENT],  
113106           the canonicalization shall fail; if the call would encounter an [ENOENT] error, *realpath* shall  
113107           expand all symbolic links that would be encountered in an attempt to resolve the specified  
113108           pathname using the algorithm specified in XBD [Section 4.16](#) (on page 105), except that any  
113109           trailing <slash> characters that are not also leading <slash> characters shall be ignored. If  
113110           this expansion succeeds and the path prefix of the expanded pathname resolves to an  
113111           existing directory, the canonicalized pathname shall be the expanded pathname. In all  
113112           other cases, the canonicalization shall fail. If the expanded pathname is not empty, does not  
113113           begin with a <slash>, and has exactly one pathname component, it shall be treated as if it  
113114           had a path prefix of ". /".
- 113115           • If no options are specified, *realpath* shall canonicalize the specified pathname in an  
113116           unspecified manner such that the resulting absolute pathname does not contain any  
113117           components that refer to files of type symbolic link and does not contain any components  
113118           that are dot or dot-dot.

113119        Upon successful canonicalization, *realpath* shall write the canonicalized pathname, followed by a  
113120        <newline> character, to standard output.113121        If canonicalization fails, or the canonicalized pathname is empty, nothing shall be written to  
113122        standard output, a diagnostic message shall be written to standard error, and *realpath* shall exit  
113123        with non-zero status.113124 **OPTIONS**113125        The *realpath* utility shall conform to XBD [Section 12.2](#) (on page 215).

113126        The following options shall be supported:

113127        **-E**        Do not treat it as an error if attempting to resolve the last component of the  
113128        canonicalized form of the *file* operand results in an [ENOENT] error condition.113129        **-e**        Treat it as an error if attempting to resolve the last component of the canonicalized  
113130        form of the *file* operand results in an [ENOENT] error condition.113131        Specifying more than one of the mutually-exclusive options **-E** and **-e** shall not be considered an  
113132        error. The last option specified shall determine the behavior of the utility.113133 **OPERANDS**

113134        The following operand shall be supported:

113135        *file*        A pathname to be canonicalized.

113136 **STDIN**

113137 Not used.

113138 **INPUT FILES**

113139 None.

113140 **ENVIRONMENT VARIABLES**113141 The following environment variables shall affect the execution of *realpath*:

113142 *LANG* Provide a default value for the internationalization variables that are unset or null.  
113143 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
113144 variables used to determine the values of locale categories.)

113145 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
113146 internationalization variables.

113147 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
113148 characters (for example, single-byte as opposed to multi-byte characters in  
113149 arguments and input files).

113150 *LC\_MESSAGES*

113151 Determine the locale that should be used to affect the format and contents of  
113152 diagnostic messages written to standard error.

113153 *XSI NLSPATH* Determine the location of messages objects and message catalogs.

113154 **ASYNCHRONOUS EVENTS**

113155 Default.

113156 **STDOUT**

113157 See DESCRIPTION.

113158 **STDERR**

113159 The standard error shall be used only for diagnostic messages.

113160 **OUTPUT FILES**

113161 None.

113162 **EXTENDED DESCRIPTION**

113163 None.

113164 **EXIT STATUS**

113165 The following exit values shall be returned:

113166 0 Successful completion.

113167 &gt;0 An error occurred.

113168 **CONSEQUENCES OF ERRORS**

113169 Default.

113170 **APPLICATION USAGE**

113171 If neither the `-e` nor the `-E` option is specified, some implementations behave as if `-e` had been  
 113172 specified and others as if `-E` had been specified, but there are also implementations where the  
 113173 behavior differs from both of these. For example, the *mksh* shell has an internal implementation  
 113174 of *realpath* that canonicalizes `/dir/regular_file/..` to `/dir`, whereas the *realpath()* function would  
 113175 return an [ENOTDIR] error in this case. Portable applications should always specify either `-e` or  
 113176 `-E`.

113177 **EXAMPLES**

113178 None.

113179 **RATIONALE**

113180 The *realpath* utility was added in preference to a `-f` option found in some implementations of the  
 113181 *readlink* utility because it allows the application to specify whether or not a missing final  
 113182 component is to be treated as an error.

113183 The behavior with the `-E` option when *file* does not resolve (with symbolic links followed) to an  
 113184 existing file is not the same as simply calling *realpath()* with the path prefix of the *file* operand  
 113185 and writing the resulting pathname, a `<slash>`, and the last component of *file* to standard output.  
 113186 For example, if `/tmp/nofile` does not exist, and *file* is `A/B` where `A` is an existing directory and `B`  
 113187 is a symbolic link to `/tmp/nofile`, *realpath* with `-E` will output `/tmp/nofile`, but if `B` is a symbolic  
 113188 link to `/tmp/nofile/foo`, *realpath* with `-E` will treat this as an error. In both cases  
 113189 *realpath("A/B")* would fail with *errno* set to [ENOENT]. Even though *realpath("A")*  
 113190 would succeed, in neither case is anything ending `/B` the result.

113191 Trailing `<slash>` characters (that follow a non-`<slash>`) are handled differently with `-E` than with  
 113192 `-e`. With `-e` they are handled as for the *realpath()* function. With `-E` they are sometimes  
 113193 effectively ignored, and they are never included in the output. For example, if `/tmp/nofile` does  
 113194 not exist and `/tmp/regfile` is an existing regular file:

```
113195 $ realpath -E /tmp/nofile/  
113196 /tmp/nofile  
113197 $ realpath -E /tmp/regfile/  
113198 realpath: /tmp/regfile/: Not a directory
```

113199 **FUTURE DIRECTIONS**

113200 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 113201 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
 113202 format being used, implementations are encouraged to treat this as an error. A future version of  
 113203 this standard may require implementations to treat this as an error.

113208 **CHANGE HISTORY**

113209 First released in Issue 8.

113210 **NAME**

113211 renice — set nice values of running processes

113212 **SYNOPSIS**113213 renice [-g|-p|-u] -n *increment* *ID*...113214 **DESCRIPTION**

113215 The *renice* utility shall request that the nice values (see XBD [Section 3.225](#), on page 64) of one or  
 113216 more running processes be changed. By default, the applicable processes are specified by their  
 113217 process IDs. When a process group is specified (see **-g**), the request shall apply to all processes  
 113218 in the process group.

113219 The nice value shall be bounded in an implementation-defined manner. If the requested  
 113220 *increment* would raise or lower the nice value of the executed utility beyond implementation-  
 113221 defined limits, then the limit whose value was exceeded shall be used.

113222 When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the  
 113223 user ID corresponding to the user.

113224 Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values  
 113225 of any process unless the user requesting such a change has appropriate privileges to do so for  
 113226 the specified process. If the user lacks appropriate privileges to perform the requested action, the  
 113227 utility shall return an error status.

113228 The saved set-user-ID of the user's process shall be checked instead of its effective user ID when  
 113229 *renice* attempts to determine the user ID of the process in order to determine whether the user  
 113230 has appropriate privileges.

113231 **OPTIONS**113232 The *renice* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

113233 The following options shall be supported:

113234 **-g** Interpret the following operands as unsigned decimal integer process group IDs.

113235 **-n** *increment* Specify how the nice value of the specified process or processes is to be adjusted.  
 113236 The *increment* option-argument is a positive or negative decimal integer that shall  
 113237 be used to modify the nice value of the specified process or processes. Negative  
 113238 *increment* values may require appropriate privileges.

113239 **-p** Interpret the following operands as unsigned decimal integer process IDs. The **-p**  
 113240 option is the default if no options are specified.

113241 **-u** Interpret the following operands as users. If a user exists with a user name equal to  
 113242 the operand, then the user ID of that user is used in further processing. Otherwise,  
 113243 if the operand represents an unsigned decimal integer, it shall be used as the  
 113244 numeric user ID of the user.

113245 **OPERANDS**

113246 The following operands shall be supported:

113247 *ID* A process ID, process group ID, or user name/user ID, depending on the option  
 113248 selected.

113249 **STDIN**

113250 Not used.

113251 **INPUT FILES**

113252 None.

113253 **ENVIRONMENT VARIABLES**113254 The following environment variables shall affect the execution of *renice*:

113255 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 113256 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 113257 variables used to determine the values of locale categories.)

113258 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 113259 internationalization variables.

113260 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 113261 characters (for example, single-byte as opposed to multi-byte characters in  
 113262 arguments).

113263 *LC\_MESSAGES*

113264 Determine the locale that should be used to affect the format and contents of  
 113265 diagnostic messages written to standard error.

113266 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

113267 **ASYNCHRONOUS EVENTS**

113268 Default.

113269 **STDOUT**

113270 Not used.

113271 **STDERR**

113272 The standard error shall be used only for diagnostic messages.

113273 **OUTPUT FILES**

113274 None.

113275 **EXTENDED DESCRIPTION**

113276 None.

113277 **EXIT STATUS**

113278 The following exit values shall be returned:

113279 0 Successful completion.

113280 &gt;0 An error occurred.

113281 **CONSEQUENCES OF ERRORS**

113282 Default.

113283 **APPLICATION USAGE**

113284 None.

113285 **EXAMPLES**

113286 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

113287 `renice -n 5 -p 987 32`

113288 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
 113289 user has appropriate privileges to do so:

113290 `renice -n -4 -g 324 76`

113291 3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice  
113292 value:

```
113293 renice -n 4 -u 8 sas
```

113294 Useful nice value increments on historical systems include 19 or 20 (the affected processes run  
113295 only when nothing else in the system attempts to run) and any negative number (to make  
113296 processes run faster).

#### 113297 RATIONALE

113298 The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-  
113299 argument. However, for clarity, they have been included in the OPTIONS section, rather than  
113300 the OPERANDS section.

113301 The definition of nice value is not intended to suggest that all processes in a system have  
113302 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
113303 System Interfaces volume of POSIX.1-2024 make the notion of a single underlying priority for all  
113304 scheduling policies problematic. Some implementations may implement the *nice*-related features  
113305 to affect all processes on the system, others to affect just the general time-sharing activities  
113306 implied by this volume of POSIX.1-2024, and others may have no effect at all. Because of the use  
113307 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
113308 possible.

113309 Originally, this utility was written in the historical manner, using the term “nice value”. This  
113310 was always a point of concern with users because it was never intuitively obvious what this  
113311 meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was  
113312 hoped that novice users could better understand what this utility was meant to do. Also, it  
113313 would be easier to document what the utility was meant to do. Unfortunately, the addition of  
113314 the POSIX realtime scheduling capabilities introduced the concepts of process and thread  
113315 scheduling priorities that were totally unaffected by the *nice/renice* utilities or the  
113316 *nice()/setpriority()* functions. Continuing to use the term “system scheduling priority” would  
113317 have incorrectly suggested that these utilities and functions were indeed affecting these realtime  
113318 priorities. It was decided to revert to the historical term “nice value” to reference this unrelated  
113319 process attribute.

113320 Although this utility has use by system administrators (and in fact appears in the system  
113321 administration portion of the BSD documentation), the standard developers considered that it  
113322 was very useful for individual end users to control their own processes.

113323 Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
113324 renice nice_value[-p] pid...[-g gid...][-p pid...][-u user...]
```

```
113325 renice nice_value -g gid...[-g gid...]-p pid...[-u user...]
```

```
113326 renice nice_value -u user...[-g gid...]-p pid...[-u user...]
```

113327 These forms are no longer specified by POSIX.1-2024 but may be present in some  
113328 implementations.

#### 113329 FUTURE DIRECTIONS

113330 None.

#### 113331 SEE ALSO

113332 [nice](#)

113333 [XBD Section 3.225](#) (on page 64), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

113334 **CHANGE HISTORY**

113335 First released in Issue 4.

113336 **Issue 5**

113337 In the SYNOPSIS, an ellipsis is added to the `-u` option in all three obsolescent forms.

113338 **Issue 6**

113339 This utility is marked as part of the User Portability Utilities option.

113340 The APPLICATION USAGE section is added.

113341 The obsolescent forms of the SYNOPSIS are removed.

113342 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this version. This is a FIPS  
113343 requirement.

113344 **Issue 7**

113345 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
113346 Syntax Guidelines does not apply.

113347 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

113348 The *renice* utility is moved from the User Portability Utilities option to the Base. User Portability  
113349 Utilities is now an option for interactive utilities.

113350 **Issue 8**

113351 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

113352 Austin Group Defect 1286 is applied, changing the description of the `-n` option.

113353 **NAME**113354 `rm` — remove directory entries113355 **SYNOPSIS**113356 `rm [-diRrv] file...`113357 `rm -f [-diRrv] [file...]`113358 **DESCRIPTION**113359 The `rm` utility shall remove the directory entry specified by each *file* argument.

113360 If either of the files `dot` or `dot-dot` are specified as the basename portion of an operand (that is,  
113361 the final pathname component) or if an operand resolves to the root directory, `rm` shall write a  
113362 diagnostic message to standard error and do nothing more with such operands.

113363 For each *file* the following steps shall be taken:

- 113364 1. If the *file* does not exist:
  - 113365 a. If the `-f` option is not specified, `rm` shall write a diagnostic message to standard  
113366 error.
  - 113367 b. Go on to any remaining *files*.
- 113368 2. If *file* is of type directory, the following steps shall be taken:
  - 113369 a. If neither the `-R` option nor the `-r` option is specified, but `-d` is specified, `rm` shall  
113370 proceed with step 3 for the current file. If none of `-r`, `-R`, or `-d` is specified, `rm` shall  
113371 write a diagnostic message to standard error, do nothing more with *file*, and go on  
113372 to any remaining files.
  - 113373 b. If *file* is an empty directory, `rm` may skip to step 2d. If the `-f` option is not specified,  
113374 and either the permissions of *file* do not permit writing and the standard input is a  
113375 terminal or the `-i` option is specified, `rm` shall write a prompt to standard error and  
113376 read a line from the standard input. If the response is not affirmative, `rm` shall do  
113377 nothing more with the current file and go on to any remaining files.
  - 113378 c. For each entry contained in *file*, other than `dot` or `dot-dot`, the four steps listed here  
113379 (1 to 4) shall be taken with the entry as if it were a *file* operand. The `rm` utility shall  
113380 not traverse directories by following symbolic links into other parts of the  
113381 hierarchy, but shall remove the links themselves.
  - 113382 d. If the `-i` option is specified, `rm` shall write a prompt to standard error and read a  
113383 line from the standard input. If the response is not affirmative, `rm` shall do nothing  
113384 more with the current file, and go on to any remaining files.
  - 113385 e. `rm` shall proceed with step 4 for the current file.
- 113386 3. If the `-f` option is not specified, and either the permissions of *file* do not permit writing  
113387 and the standard input is a terminal or the `-i` option is specified, `rm` shall write a prompt  
113388 to the standard error and read a line from the standard input. If the response is not  
113389 affirmative, `rm` shall do nothing more with the current file and go on to any remaining  
113390 files.
- 113391 4. `rm` shall perform actions equivalent to the `remove()` function defined in the System  
113392 Interfaces volume of POSIX.1-2024 called with a pathname of the current file used as the  
113393 *path* argument.

113394 If `rm` successfully performed the above actions on the current file, and the `-v` option is  
113395 specified, `rm` shall write a message containing the pathname of the current file to the  
113396 standard output. If the actions fail for any reason, `rm` shall write a diagnostic message to

- 113397 standard error, do nothing more with the current file, and go on to any remaining files.
- 113398 The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail  
 113399 due to path length limitations (unless an operand specified by the user exceeds system  
 113400 limitations).
- 113401 **OPTIONS**
- 113402 The *rm* utility shall conform to XBD [Section 12.2](#) (on page 215).
- 113403 The following options shall be supported:
- 113404 **-d** Remove empty directories. See the DESCRIPTION.
- 113405 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the  
 113406 exit status in the case of no file operands, or in the case of operands that do not  
 113407 exist. Any previous occurrences of the **-i** option shall be ignored.
- 113408 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
 113409 **-f** option shall be ignored.
- 113410 **-R** Remove file hierarchies. See the DESCRIPTION.
- 113411 **-r** Equivalent to **-R**.
- 113412 **-v** After each file has been removed, write a message to standard output indicating  
 113413 that it has been removed.
- 113414 **OPERANDS**
- 113415 The following operand shall be supported:
- 113416 *file* A pathname of a directory entry to be removed.
- 113417 **STDIN**
- 113418 The standard input shall be used to read an input line in response to each prompt specified in  
 113419 the STDOUT section. Otherwise, the standard input shall not be used.
- 113420 **INPUT FILES**
- 113421 None.
- 113422 **ENVIRONMENT VARIABLES**
- 113423 The following environment variables shall affect the execution of *rm*:
- 113424 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 113425 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 113426 variables used to determine the values of locale categories.)
- 113427 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 113428 internationalization variables.
- 113429 **LC\_COLLATE**
- 113430 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 113431 character collating elements used in the extended regular expression defined for  
 113432 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.
- 113433 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 113434 characters (for example, single-byte as opposed to multi-byte characters in  
 113435 arguments) and the behavior of character classes within regular expressions used  
 113436 in the extended regular expression defined for the **yesexpr** locale keyword in the  
 113437 *LC\_MESSAGES* category.

- 113438 *LC\_MESSAGES*
- 113439 Determine the locale used to process affirmative responses, and the locale used to
- 113440 affect the format and contents of diagnostic messages and prompts written to
- 113441 standard error.
- 
- 113442 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 113443 **ASYNCHRONOUS EVENTS**
- 113444 Default.
- 113445 **STDOUT**
- 113446 If the `-v` option is specified, information about each removed file shall be written to standard
- 113447 output in an unspecified format.
- 113448 **STDERR**
- 113449 Prompts shall be written to standard error under the conditions specified in the **DESCRIPTION**
- 113450 and **OPTIONS** sections. The prompts shall contain the *file* pathname, but their format is
- 113451 otherwise unspecified. The standard error also shall be used for diagnostic messages.
- 113452 **OUTPUT FILES**
- 113453 None.
- 113454 **EXTENDED DESCRIPTION**
- 113455 None.
- 113456 **EXIT STATUS**
- 113457 The following exit values shall be returned:
- 113458 0 All requested directory entries (excluding directory entries where a non-affirmative
- 113459 response was given to a request for confirmation) were successfully deleted. In addition, if
- 113460 the `-v` option is specified, information about each removed directory entry was successfully
- 113461 written to standard output.
- 113462 >0 An error occurred.
- 113463 **CONSEQUENCES OF ERRORS**
- 113464 Default.
- 113465 **APPLICATION USAGE**
- 113466 The *rm* utility is forbidden to remove the names `dot` and `dot-dot` in order to avoid the
- 113467 consequences of inadvertently doing something like:
- 113468 `rm -r .*`
- 113469 Some implementations do not permit the removal of the last hard link to an executable binary
- 113470 file that is being executed; see the [EBUSY] error in the *unlink()* function defined in the System
- 113471 Interfaces volume of POSIX.1-2024. Thus, the *rm* utility can fail to remove such files.
- 113472 The `-i` option causes *rm* to prompt and read the standard input even if the standard input is not
- 113473 a terminal, but in the absence of `-i` the mode prompting is not done when the standard input is
- 113474 not a terminal.
- 113475 **EXAMPLES**
- 113476 1. The following command:
- 113477 `rm a.out core`
- 113478 removes the directory entries: **a.out** and **core**, or issues an error if either directory entry is
- 113479 itself a directory or does not exist.

- 113480           2. The following command:
- 113481            `rm -Rf junk`
- 113482           removes the directory **junk** and all its contents, without prompting.
- 113483           3. The following command:
- 113484            `rm -d name`
- 113485           behaves like
- 113486            `rmdir name`
- 113487           if **name** is a directory (including failing if **name** is not empty), as if by the `rmdir()`
- 113488           function; and behaves like
- 113489            `rm name`
- 113490           if **name** is not a directory, as if by the `unlink()` function.

#### 113491 RATIONALE

113492           For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior

113493           when prompting for confirmation, should be interpreted in the following manner:

```
113494           if ((NOT f_option) AND
113495            ((not_writable AND input_is_terminal) OR i_option))
```

113496           The exact format of the interactive prompts is unspecified. Only the general nature of the

113497           contents of prompts are specified because implementations may desire more descriptive

113498           prompts than those used on historical implementations. Therefore, an application not using the

113499           **-f** option, or using the **-i** option, relies on the system to provide the most suitable dialog directly

113500           with the user, based on the behavior specified.

113501           The **-r** option is historical practice on all known systems. The synonym **-R** option is provided

113502           for consistency with the other utilities in this volume of POSIX.1-2024 that provide options

113503           requesting recursive descent through the file hierarchy.

113504           The behavior of the **-f** option in historical versions of *rm* is inconsistent. In general, along with

113505           “forcing” the unlink without prompting for permission, it always causes diagnostic messages to

113506           be suppressed and the exit status to be unmodified for nonexistent operands and files that

113507           cannot be unlinked. In some versions, however, the **-f** option suppresses usage messages and

113508           system errors as well. Suppressing such messages is not a service to either shell scripts or users.

113509           It is less clear that error messages regarding files that cannot be unlinked (removed) should be

113510           suppressed. Although this is historical practice, this volume of POSIX.1-2024 does not permit the

113511           **-f** option to suppress such messages.

113512           When given the **-r** and **-i** options, historical versions of *rm* prompt the user twice for each

113513           directory, once before removing its contents and once before actually attempting to delete the

113514           directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical

113515           versions of *rm* were inconsistent in that some did not do the former prompt for directories

113516           named on the command line and others had obscure prompting behavior when the **-i** option

113517           was specified and the permissions of the file did not permit writing. The POSIX Shell and

113518           Utilities *rm* differs little from historic practice, but does require that prompts be consistent.

113519           Historical versions of *rm* were also inconsistent in that prompts were done to both standard

113520           output and standard error. This volume of POSIX.1-2024 requires that prompts be done to

113521           standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that

113522           provide an option to list deleted files on standard output.

113523 The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be  
113524 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its  
113525 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the  
113526 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted  
113527 to fail because of path length restrictions, unless an operand specified by the user is longer than  
113528 {PATH\_MAX}.

113529 The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of  
113530 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing  
113531 hierarchies with *-r* or *-R*, the prohibition on following symbolic links has to be made explicit.

113532 The addition of the *-d* option allows the use of *rm* to delete either a file or an empty directory  
113533 without the risk of recursion into a non-empty directory, and without the inherent race between  
113534 determining a file's type and deciding what action to attempt on that file. If either the *-r* or *-R*  
113535 option is specified, the use of recursion takes precedence.

113536 The addition of the *-v* option allows a user of *rm* to see which files have been deleted.

#### 113537 FUTURE DIRECTIONS

113538 If this utility is directed to display a pathname that contains any bytes that have the encoded  
113539 value of a <newline> character when <newline> is a terminator or separator in the output  
113540 format being used, implementations are encouraged to treat this as an error. A future version of  
113541 this standard may require implementations to treat this as an error.

#### 113546 CHANGE HISTORY

113547 First released in Issue 2.

#### 113548 Issue 5

113549 The FUTURE DIRECTIONS section is added.

#### 113550 Issue 6

113551 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft  
113552 standard.

#### 113553 Issue 7

113554 Austin Group Interpretations 1003.1-2001 #019 and #091 are applied.

113555 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
113556 *LC\_MESSAGES* environment variable.

113557 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0163 [542], XCU/TC2-2008/0164  
113558 [819], and XCU/TC2-2008/0165 [542] are applied.

#### 113559 Issue 8

113560 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
113561 directed to display a pathname that contains any bytes that have the encoded value of a  
113562 <newline> character when <newline> is a terminator or separator in the output format being  
113563 used.

113564 Austin Group Defect 802 is applied, adding the *-d* option.

113565 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

- 113566 Austin Group Defects 1154, 1365, and 1487 are applied, adding the `-v` option.
- 113567 Austin Group Defect 1380 is applied, changing ```last link``` to ```last hard link```.
- 113568 Austin Group Defect 1732 is applied, changing the EXIT STATUS section.

113569 **NAME**113570 rmdel — remove a delta from an SCCS file (**DEVELOPMENT**)113571 **SYNOPSIS**113572 XSI `rmdel -r SID file...`113573 **DESCRIPTION**

113574 The *rmdel* utility shall remove the delta specified by the *SID* from each named SCCS file. The  
 113575 delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 113576 SCCS file. In addition, the application shall ensure that the *SID* specified is not that of a version  
 113577 being edited for the purpose of making a delta; that is, if a *p-file* (see *get*) exists for the named  
 113578 SCCS file, the *SID* specified shall not appear in any entry of the *p-file*.

113579 Removal of a delta shall be restricted to:

- 113580 1. The user who made the delta
- 113581 2. The owner of the SCCS file
- 113582 3. The owner of the directory containing the SCCS file

113583 **OPTIONS**113584 The *rmdel* utility shall conform to XBD [Section 12.2](#) (on page 215).

113585 The following option shall be supported:

113586 **-r** *SID* Specify the SCCS identification string (*SID*) of the delta to be deleted.113587 **OPERANDS**

113588 The following operand shall be supported:

113589 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rmdel*  
 113590 utility shall behave as though each file in the directory were specified as a named  
 113591 file, except that non-SCCS files (last component of the pathname does not begin  
 113592 with **s**.) and unreadable files shall be silently ignored.

113593 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 113594 each line of the standard input is taken to be the name of an SCCS file to be  
 113595 processed. Non-SCCS files and unreadable files shall be silently ignored.

113596 **STDIN**

113597 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 113598 line of the text file shall be interpreted as an SCCS pathname.

113599 **INPUT FILES**

113600 The SCCS files shall be files of unspecified format.

113601 **ENVIRONMENT VARIABLES**113602 The following environment variables shall affect the execution of *rmdel*:

113603 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 113604 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 113605 variables used to determine the values of locale categories.)

113606 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 113607 internationalization variables.

113608 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 113609 characters (for example, single-byte as opposed to multi-byte characters in  
 113610 arguments and input files).

- 113611 **LC\_MESSAGES**
- 113612 Determine the locale that should be used to affect the format and contents of
- 113613 diagnostic messages written to standard error.
- 113614 **NLSPATH** Determine the location of messages objects and message catalogs.
- 113615 **ASYNCHRONOUS EVENTS**
- 113616 Default.
- 113617 **STDOUT**
