The *endutxent()* function shall close the user accounting database.

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be thread-safe.

#### RETURN VALUE

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent()* and *setutxent()* functions shall not return a value.

#### ERRORS

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

The *pututxline()* function may fail if:

[EPERM]           The process does not have appropriate privileges.

29199 **EXAMPLES**

29200 None.

29201 **APPLICATION USAGE**29202 The sizes of the arrays in the structure can be found using the *sizeof* operator.29203 **RATIONALE**

29204 None.

29205 **FUTURE DIRECTIONS**

29206 None.

29207 **SEE ALSO**29208 XBD [<utmpx.h>](#)29209 **CHANGE HISTORY**

29210 First released in Issue 4, Version 2.

29211 **Issue 5**

29212 Moved from X/OPEN UNIX extension to BASE.

29213 Normative text previously in the APPLICATION USAGE section is moved to the  
29214 DESCRIPTION.

29215 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

29216 **Issue 6**

29217 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

29218 **Issue 7**

29219 Austin Group Interpretation 1003.1-2001 #156 is applied.

29220 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0090 [213,428] and  
29221 XSH/TC1-2008/0091 [213] are applied.

29222 **NAME**29223            **environ** — array of character pointers to the environment strings29224 **SYNOPSIS**29225            extern char \*\***environ**;29226 **DESCRIPTION**29227            Refer to *exec* and XBD [Chapter 8](#) (on page 167).

29228 **NAME**

29229 erand48 — generate uniformly distributed pseudo-random numbers

29230 **SYNOPSIS**29231 XSI `#include <stdlib.h>`29232 `double erand48(unsigned short xsubi[3]);`29233 **DESCRIPTION**29234 Refer to *drand48()*.

29235 **NAME**

29236 erf, erff, erfl — error functions

29237 **SYNOPSIS**

```
29238 #include <math.h>
29239 double erf(double x);
29240 float erff(float x);
29241 long double erfl(long double x);
```

29242 **DESCRIPTION**

29243 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29244 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29245 volume of POSIX.1-2024 defers to the ISO C standard.

29246 These functions shall compute the error function of their argument  $x$ , defined as:

$$29247 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

29248 An application wishing to check for error situations should set *errno* to zero and call  
 29249 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 29250 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 29251 zero, an error has occurred.

29252 **RETURN VALUE**

29253 Upon successful completion, these functions shall return the value of the error function.

29254 MX If  $x$  is NaN, a NaN shall be returned.

29255 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

29256 If  $x$  is  $\pm \text{Inf}$ ,  $\pm 1$  shall be returned.

29257 If the correct value would cause underflow, a range error may occur, and *erf()*, *erff()*, and *erfl()*  
 29258 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 29259 MXX FLT\_MIN, and LDBL\_MIN, respectively. If the IEC 60559 Floating-Point option is supported,  
 29260  $2 * x / \text{sqrt}(\pi)$  should be returned.

29261 **ERRORS**

29262 These functions may fail if:

29263 MX **Range Error** The result underflows.

29264 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 29265 then *errno* shall be set to [ERANGE]. If the integer expression  
 29266 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 29267 floating-point exception shall be raised.

29268 **EXAMPLES**29269 **Computing the Probability for a Normal Variate**

29270 This example shows how to use *erf()* to compute the probability that a normal variate assumes a  
29271 value in the range  $[x_1, x_2]$  with  $x_1 \leq x_2$ .

29272 This example uses the constant `M_SQRT1_2` which is part of the XSI option.

```
29273 #include <math.h>
29274 double
29275 Phi(const double x1, const double x2)
29276 {
29277     return ( erf(x2*M_SQRT1_2) - erf(x1*M_SQRT1_2) ) / 2;
29278 }
```

29279 **APPLICATION USAGE**

29280 Underflow occurs when  $|x| < \text{DBL\_MIN} * (\text{sqrt}(\pi)/2)$ .

29281 On error, the expressions (*math\_errhandling* & `MATH_ERRNO`) and (*math\_errhandling* &  
29282 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

29283 **RATIONALE**

29284 None.

29285 **FUTURE DIRECTIONS**

29286 None.

29287 **SEE ALSO**

29290 **CHANGE HISTORY**

29291 First released in Issue 1. Derived from Issue 1 of the SVID.

29292 **Issue 5**

29293 The DESCRIPTION is updated to indicate how an application should check for an error. This  
29294 text was previously published in the APPLICATION USAGE section.

29295 **Issue 6**

29296 The *erf()* function is no longer marked as an extension.

29297 The *erfc()* function is split out onto its own reference page.

29298 The *erfff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

29299 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
29300 revised to align with the ISO/IEC 9899:1999 standard.

29301 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
29302 marked.

29303 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the  
29304 EXAMPLES section.

29305 **Issue 7**

29306 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0092 [68] is applied.

29307 **Issue 8**  
29308

Austin Group Defect 1178 is applied, joining two paragraphs in the RETURN VALUE section.

29309 **NAME**

29310 erfc, erfcf, erfcl — complementary error functions

29311 **SYNOPSIS**

```
29312 #include <math.h>
29313 double erfc(double x);
29314 float erfcf(float x);
29315 long double erfcl(long double x);
```

29316 **DESCRIPTION**

29317 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29318 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29319 volume of POSIX.1-2024 defers to the ISO C standard.

29320 These functions shall compute the complementary error function  $1.0 - \text{erf}(x)$ .

29321 An application wishing to check for error situations should set *errno* to zero and call  
 29322 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 29323 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 29324 zero, an error has occurred.

29325 **RETURN VALUE**

29326 Upon successful completion, these functions shall return the value of the complementary error  
 29327 function.

29328 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 29329 MXX and *erfc()*, *erfcf()*, and *erfcl()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 29330 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 29331 FLT\_MIN, and LDBL\_MIN, respectively.

29332 MX If *x* is NaN, a NaN shall be returned.

29333 If *x* is  $\pm 0$ , +1 shall be returned.

29334 If *x* is  $-\text{Inf}$ , +2 shall be returned.

29335 If *x* is  $+\text{Inf}$ , +0 shall be returned.

29336 MXX If the correct value would cause underflow and is representable, a range error may occur and  
 29337 the correct value shall be returned.

29338 **ERRORS**

29339 These functions may fail if:

29340 Range Error The result underflows.

29341 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 29342 then *errno* shall be set to [ERANGE]. If the integer expression  
 29343 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 29344 floating-point exception shall be raised.

29345 **EXAMPLES**

29346 None.

29347 **APPLICATION USAGE**

29348 The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called  
29349 for large *x* and the result subtracted from 1.0.

29350 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
29351 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

29352 **RATIONALE**

29353 None.

29354 **FUTURE DIRECTIONS**

29355 None.

29356 **SEE ALSO**29357 *erf()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

29358 XBD Section 4.23 (on page 109), &lt;math.h&gt;

29359 **CHANGE HISTORY**

29360 First released in Issue 1. Derived from Issue 1 of the SVID.

29361 **Issue 5**

29362 The DESCRIPTION is updated to indicate how an application should check for an error. This  
29363 text was previously published in the APPLICATION USAGE section.

29364 **Issue 6**29365 The *erfc()* function is no longer marked as an extension.29366 These functions are split out from the *erf()* reference page.

29367 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
29368 revised to align with the ISO/IEC 9899:1999 standard.

29369 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
29370 marked.

29371 **Issue 7**

29372 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0093 [68] and XSH/TC1-2008/0094  
29373 [68] are applied.

29374 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0096 [630] is applied.

29375 **NAME**29376 `erff, erfl` — error functions29377 **SYNOPSIS**29378 `#include <math.h>`29379 `float erff(float x);`29380 `long double erfl(long double x);`29381 **DESCRIPTION**29382 Refer to *erf()*.

29383 **NAME**

29384           errno — error return value

29385 **SYNOPSIS**

29386           #include &lt;errno.h&gt;

29387 **DESCRIPTION**29388           The lvalue to which the macro *errno* expands is used by many functions to return error values.

29389           Many functions provide an error number in *errno*, which has type **int** and is defined in  
29390           <**errno.h**>. The value of *errno* in the initial thread shall be zero at program startup (the initial  
29391           value of *errno* in other threads is an indeterminate value) and shall otherwise be defined only  
29392           after a call to a function for which it is explicitly stated to be set and until it is changed by the  
29393           next function call or if the application assigns it a value. The value of *errno* should only be  
29394           examined when it is indicated to be valid by a function's return value. Applications shall obtain  
29395           the definition of *errno* by the inclusion of <**errno.h**>. No function in this volume of  
29396           POSIX.1-2024 shall set *errno* to 0. The setting of *errno* after a successful call to a function is  
29397           unspecified unless the description of that function specifies that *errno* shall not be modified.

29398           If the macro definition is suppressed in order to access an actual object, or a program defines an  
29399           identifier with the name *errno*, the behavior is undefined.

29400           The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant  
29401           pages.

29402 **RETURN VALUE**

29403           None.

29404 **ERRORS**

29405           None.

29406 **EXAMPLES**

29407           None.

29408 **APPLICATION USAGE**

29409           Previously both POSIX and X/Open documents were more restrictive than the ISO C standard  
29410           in that they required *errno* to be defined as an external variable, whereas the ISO C standard  
29411           required only that *errno* be defined as a modifiable lvalue with type **int**.

29412           An application that needs to examine the value of *errno* to determine the error should set it to 0  
29413           before a function call, then inspect it before a subsequent function call.

29414 **RATIONALE**

29415           None.

29416 **FUTURE DIRECTIONS**

29417           None.

29418 **SEE ALSO**29419           [Section 2.3](#)29420           XBD <**errno.h**>29421 **CHANGE HISTORY**

29422           First released in Issue 1. Derived from Issue 1 of the SVID.

29423 **Issue 5**

29424           The following sentence is deleted from the DESCRIPTION: “The value of *errno* is 0 at program  
29425           start-up, but is never set to 0 by any XSI function”.

29426 The DESCRIPTION also no longer states that conforming implementations may support the  
29427 declaration:

```
29428 extern int errno;
```

29429 **Issue 6**

29430 Obsolescent text regarding defining *errno* as:

```
29431 extern int errno
```

29432 is removed.

29433 Text regarding no function setting *errno* to zero to indicate an error is changed to no function  
29434 shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

29435 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the  
29436 DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified  
29437 unless the description of the function requires that it will not be modified.

29438 **Issue 8**

29439 Austin Group Defect 1302 is applied, aligning this macro with the ISO/IEC 9899:2018 standard.

29440 **NAME**

29441 environ, execl, execl, execlp, execv, execve, execvp, fexecve — execute a file

29442 **SYNOPSIS**

```

29443 #include <unistd.h>
29444 extern char **environ;
29445 int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
29446 int execl(const char *path, const char *arg0, ... /*,
29447         (char *)0, char *const envp[]*/);
29448 int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
29449 int execv(const char *path, char *const argv[]);
29450 int execve(const char *path, char *const argv[], char *const envp[]);
29451 int execvp(const char *file, char *const argv[]);
29452 int fexecve(int fd, char *const argv[], char *const envp[]);

```

29453 **DESCRIPTION**

29454 The *exec* family of functions shall replace the current process image with a new process image.  
 29455 The new image shall be constructed from a regular, executable file called the *new process image*  
 29456 *file*. There shall be no return from a successful *exec*, because the calling process image is overlaid  
 29457 by the new process image.

29458 The *fexecve()* function shall be equivalent to the *execve()* function except that the file to be  
 29459 executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is  
 29460 ignored.

29461 When a C-language program is executed as a result of a call to one of the *exec* family of  
 29462 functions, it shall be entered as a C-language function call as follows:

```
29463 int main (int argc, char *argv[]);
```

29464 where *argc* is the argument count and *argv* is an array of character pointers to the arguments  
 29465 themselves. In addition, the following variable, which needs to be declared by the user if it is to  
 29466 be used directly:

```
29467 extern char **environ;
```

29468 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*  
 29469 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*  
 29470 array is not counted in *argc*.

29471 Applications can change the entire environment in a single operation by assigning the *environ*  
 29472 variable to point to an array of character pointers to the new environment strings. After  
 29473 assigning a new value to *environ*, applications should not rely on the new environment strings  
 29474 XSI remaining part of the environment, as a call to *getenv()*, *secure\_getenv()*, *putenv()*, *setenv()*,  
 29475 *unsetenv()*, or any function that is dependent on an environment variable may, on noticing that  
 29476 *environ* has changed, copy the environment strings to a new array and assign *environ* to point to  
 29477 it.

29478 Any application that directly modifies the pointers to which the *environ* variable points has  
 29479 undefined behavior.

29480 Conforming multi-threaded applications shall not use the *environ* variable to access or modify  
 29481 any environment variable while any other thread is concurrently modifying any environment  
 29482 variable. A call to any function dependent on any environment variable shall be considered a  
 29483 use of the *environ* variable to access that environment variable.

29484 The arguments specified by a program with one of the *exec* functions shall be passed on to the  
 29485 new process image in the corresponding *main()* arguments.

29486 For the *execl()*, *execle()*, *execv()*, and *execve()* functions, the argument *path* points to a pathname  
29487 that identifies the new process image file.

29488 For the *execlp()* and *execvp()* functions, the argument *file* is used to construct a pathname that  
29489 identifies the new process image file. If the *file* argument contains a <slash> character, the *file*  
29490 argument shall be used as the pathname for this file. Otherwise, the path prefix for this file is  
29491 obtained by a search of the directories passed as the environment variable *PATH* (see XBD  
29492 Chapter 8, on page 167). If this environment variable is not present, the results of the search are  
29493 implementation-defined.

29494 There are two distinct ways in which the contents of the process image file may cause the  
29495 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the  
29496 ERRORS section). In the cases where the other members of the *exec* family of functions would  
29497 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command  
29498 interpreter and the environment of the executed command shall be as if the process invoked the  
29499 *sh* utility using *execl()* as follows:

```
29500 execl(<shell path>, <name>, file, <args>, (char *)0);
```

29501 where <shell path> is an unspecified pathname for the *sh* utility, <name> is an unspecified string,  
29502 *file* is the process image file, and where <args> is zero or more parameters corresponding to any  
29503 initial non-null arguments passed after *argv0* for *execlp()* or to any initial non-null members of  
29504 *argv* starting at *argv[1]* for *execvp()*.

29505 The arguments represented by *argv0,...* are pointers to null-terminated character strings. These  
29506 strings shall constitute the argument list available to the new process image. The list is  
29507 terminated by a null pointer. The argument *argv0* should point to a filename string that is  
29508 associated with the process being started by one of the *exec* functions.

29509 The argument *argv* is an array of character pointers to null-terminated strings. The application  
29510 shall ensure that the last member of this array is a null pointer. These strings shall constitute the  
29511 argument list available to the new process image. The value in *argv[0]* should point to a filename  
29512 string that is associated with the process being started by one of the *exec* functions.

29513 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
29514 shall constitute the environment for the new process image. The *envp* array is terminated by a  
29515 null pointer.

29516 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the  
29517 environment for the new process image shall be taken from the external variable *environ* in the  
29518 calling process.

29519 The number of bytes available for the new process' combined argument and environment lists is  
29520 {ARG\_MAX}. It is implementation-defined whether null terminators, pointers, and/or any  
29521 alignment bytes are included in this total.

29522 File descriptors open in the calling process image shall remain open in the new process image,  
29523 except for those whose close-on-exec flag FD\_CLOEXEC is set. For those file descriptors that  
29524 remain open, all attributes of the open file description shall remain unchanged and the  
29525 FD\_CLOFORK file descriptor flag, if set, shall remain set. For any file descriptor that is closed  
29526 for this reason, process-owned file locks that the calling process owns on the file associated with  
29527 the file descriptor shall be unlocked as a result of the close, as described in *close()*. File locks that  
29528 are not unlocked by closing of file descriptors remain unchanged.

29529 If file descriptor 0, 1, or 2 would otherwise be closed after a successful call to one of the *exec*  
29530 family of functions, implementations may open an unspecified file for the file descriptor in the  
29531 new process image. If a standard utility or a conforming application is executed with file

- 29532 descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the  
29533 environment in which the utility or application is executed shall be deemed non-conforming,  
29534 and consequently the utility or application might not behave as described in this standard.
- 29535 Directory streams open in the calling process image shall be closed in the new process image.
- 29536 The state of the floating-point environment in the initial thread of the new process image shall  
29537 be set to the default.
- 29538 The state of conversion descriptors and message catalog descriptors in the new process image is  
29539 undefined.
- 29540 For the new process image, the equivalent of:
- 29541 `setlocale(LC_ALL, "C")`
- 29542 shall be executed at start-up.
- 29543 Signals set to the default action (SIG\_DFL) in the calling process image shall be set to the default  
29544 action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG\_IGN) by  
29545 the calling process image shall be set to be ignored by the new process image. Signals set to be  
29546 caught by the calling process image shall be set to the default action in the new process image  
29547 (see <signal.h>).
- 29548 If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether  
29549 the SIGCHLD signal is set to be ignored or to the default action in the new process image.
- 29550 XSI After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and  
29551 the SA\_ONSTACK flag shall be cleared for all signals.
- 29552 After a successful call to any of the *exec* functions, any functions previously registered by the  
29553 *atexit()*, *at\_quick\_exit()*, or *pthread\_atfork()* functions are no longer registered.
- 29554 XSI If the ST\_NOSUID bit is set for the file system containing the new process image file, then the  
29555 effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged  
29556 in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is  
29557 set, the effective user ID of the new process image shall be set to the user ID of the new process  
29558 image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the  
29559 effective group ID of the new process image shall be set to the group ID of the new process  
29560 image file. The real user ID, real group ID, and supplementary group IDs of the new process  
29561 image shall remain the same as those of the calling process image. The effective user ID and  
29562 effective group ID of the new process image shall be saved (as the saved set-user-ID and the  
29563 saved set-group-ID) for use by *setuid()*.
- 29564 XSI Any shared memory segments attached to the calling process image shall not be attached to the  
29565 new process image.
- 29566 Any named semaphores open in the calling process shall be closed as if by appropriate calls to  
29567 *sem\_close()*. Any unnamed semaphores open in the calling process shall be destroyed as if by  
29568 calls to *sem\_destroy()*.
- 29569 TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if  
29570 *munmap()* was implicitly called to unmap them.
- 29571 ML Memory locks established by the calling process via calls to *mlockall()* or *mlock()* shall be  
29572 removed. If locked pages in the address space of the calling process are also mapped into the  
29573 address spaces of other processes and are locked by those processes, the locks established by the  
29574 other processes shall be unaffected by the call by this process to the *exec* function. If the *exec*  
29575 function fails, the effect on memory locks is unspecified.

29576		Memory mappings created in the process are unmapped before the address space is rebuilt for the new process image.
29577		
29578	SS	When the calling process image does not use the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the scheduling policy and parameters of the new process image and the initial thread in that new process image are implementation-defined.
29579		
29580		
29581	PS	When the calling process image uses the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the process policy and scheduling parameter settings shall not be changed by a call to an <i>exec</i> function. The initial thread in the new process image shall inherit the process scheduling policy and parameters. It shall have the default system contention scope, but shall inherit its allocation domain from the calling process image.
29582		
29583	TPS	
29584		
29585		
29586		Per-process timers created by the calling process shall be deleted before replacing the current process image with the new process image.
29587		
29588	MSG	All open message queue descriptors in the calling process shall be closed, as described in <i>mq_close()</i> .
29589		
29590		Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the <i>exec</i> function had not yet occurred, but any associated signal notifications shall be suppressed. It is unspecified whether the <i>exec</i> function itself blocks awaiting such I/O completion. In no event, however, shall the new process image created by the <i>exec</i> function be affected by the presence of outstanding asynchronous I/O operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O may be canceled upon <i>exec</i> , is implementation-defined.
29591		
29592		
29593		
29594		
29595		
29596		
29597	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the process executing the <i>exec</i> function itself.
29598		
29599		
29600		
29601	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set to zero.
29602		
29603		The thread ID of the initial thread in the new process image is unspecified.
29604		The size and location of the stack on which the initial thread in the new process image runs is unspecified.
29605		
29606		The initial thread in the new process image shall have its cancellation type set to PTHREAD_CANCEL_DEFERRED and its cancellation state set to PTHREAD_CANCEL_ENABLED.
29607		
29608		
29609		The initial thread in the new process image shall have all thread-specific data values set to NULL and all thread-specific data keys shall be removed by the call to <i>exec</i> without running destructors.
29610		
29611		
29612		The initial thread in the new process image shall be joinable, as if created with the <i>detachstate</i> attribute set to PTHREAD_CREATE_JOINABLE.
29613		
29614		The new process shall inherit at least the following attributes from the calling process image:
29615	XSI	• Nice value (see <i>nice()</i> )
29616	XSI	• <i>semadj</i> values (see <i>semop()</i> )
29617		• Process ID

- 29618 • Parent process ID
- 29619 • Process group ID
- 29620 • Session membership
- 29621 • Real user ID
- 29622 • Real group ID
- 29623 • Supplementary group IDs
- 29624 • Time left until an alarm clock signal (see *alarm()*)
- 29625 • Current working directory
- 29626 • Root directory
- 29627 • File mode creation mask (see *umask()*)
- 29628 • File size limit (see *getrlimit()* and *setrlimit()*)
- 29629 • Process signal mask (see *pthread\_sigmask()*)
- 29630 • Pending signal (see *sigpending()*)
- 29631 • *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* (see *times()*)
- 29632 • Resource limits
- 29633 • Controlling terminal

29634 The initial thread of the new process shall inherit at least the following attributes from the  
 29635 calling thread:

- 29636 • Signal mask (see *sigprocmask()* and *pthread\_sigmask()*)
- 29637 • Pending signals (see *sigpending()*)

29638 All other process attributes defined in this volume of POSIX.1-2024 shall be inherited in the new  
 29639 process image from the old process image. All other thread attributes defined in this volume of  
 29640 POSIX.1-2024 shall be inherited in the initial thread in the new process image from the calling  
 29641 thread in the old process image. The inheritance of process or thread attributes not defined by  
 29642 this volume of POSIX.1-2024 is implementation-defined.

29643 A call to any *exec* function from a process with more than one thread shall result in all threads  
 29644 being terminated and the new executable image being loaded and executed. No destructor  
 29645 functions or cleanup handlers shall be called.

29646 Upon successful completion, the *exec* functions shall mark for update the last data access  
 29647 timestamp of the file. If an *exec* function failed but was able to locate the process image file,  
 29648 whether the last data access timestamp is marked for update is unspecified. Should the *exec*  
 29649 function succeed, the process image file shall be considered to have been opened with *open()*.  
 29650 The corresponding *close()* shall be considered to occur at a time after this open, but before  
 29651 process termination or successful completion of a subsequent call to one of the *exec* functions,  
 29652 *posix\_spawn()*, or *posix\_spawnnp()*. The *argv[]* and *envp[]* arrays of pointers and the strings to  
 29653 which those arrays point shall not be modified by a call to one of the *exec* functions, except as a  
 29654 consequence of replacing the process image.

29655 The saved resource limits in the new process image are set to be a copy of the process'  
 29656 corresponding hard and soft limits.

29657 **RETURN VALUE**

29658 If one of the *exec* functions returns to the calling process image, an error has occurred; the return  
 29659 value shall be  $-1$ , and *errno* shall be set to indicate the error.

29660 **ERRORS**

29661 The *exec* functions shall fail if:

29662 [E2BIG] The number of bytes used by the new process image's argument list and  
 29663 environment list is greater than the system-imposed limit of {ARG\_MAX}  
 29664 bytes.

29665 [EACCES] The new process image file is not a regular file and the implementation does  
 29666 not support execution of files of its type.

29667 [EINVAL] The new process image file has appropriate privileges and has a recognized  
 29668 executable binary format, but the system does not support execution of a file  
 29669 with this format.

29670 The *exec* functions, except for *fexecve()*, shall fail if:

29671 [EACCES] Search permission is denied for a directory listed in the new process image  
 29672 file's path prefix, or the new process image file denies execution permission.

29673 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*  
 29674 argument.

29675 [ENAMETOOLONG]  
 29676 The length of a component of a pathname is longer than {NAME\_MAX}.

29677 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an  
 29678 empty string.

29679 [ENOTDIR] A component of the new process image file's path prefix names an existing file  
 29680 that is neither a directory nor a symbolic link to a directory, or the new process  
 29681 image file's pathname contains at least one non- $\langle$ slash $\rangle$  character and ends  
 29682 with one or more trailing  $\langle$ slash $\rangle$  characters and the last pathname  
 29683 component names an existing file that is neither a directory nor a symbolic  
 29684 link to a directory.

29685 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:

29686 [ENOEXEC] The new process image file has the appropriate access permission but has an  
 29687 unrecognized format.

29688 The *fexecve()* function shall fail if:

29689 [EBADF] The *fd* argument is not a valid file descriptor open for executing.

29690 The *exec* functions may fail if:

29691 [ENOMEM] The new process image requires more memory than is allowed by the  
 29692 hardware or system-imposed memory management constraints.

29693 The *exec* functions, except for *fexecve()*, may fail if:

29694 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 29695 resolution of the *path* or *file* argument.

29696 [ENAMETOOLONG]  
 29697 The length of the *path* argument or the length of the pathname constructed  
 29698 from the *file* argument exceeds {PATH\_MAX}, or pathname resolution of a

29699 symbolic link produced an intermediate result with a length that exceeds  
29700 {PATH\_MAX}.

29701 [ETXTBSY] The new process image file is a pure procedure (shared text) file that is  
29702 currently open for writing by some process.

## 29703 EXAMPLES

### 29704 Using `execl()`

29705 The following example executes the `ls` command, specifying the pathname of the executable  
29706 (`/bin/ls`) and using arguments supplied directly to the command to produce single-column  
29707 output.

```
29708 #include <unistd.h>
29709 int ret;
29710 ...
29711 ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

### 29712 Using `execle()`

29713 The following example is similar to [Using `execl\(\)`](#). In addition, it specifies the environment for  
29714 the new process image using the `env` argument.

```
29715 #include <unistd.h>
29716 int ret;
29717 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
29718 ...
29719 ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

### 29720 Using `execlp()`

29721 The following example searches for the location of the `ls` command among the directories  
29722 specified by the `PATH` environment variable.

```
29723 #include <unistd.h>
29724 int ret;
29725 ...
29726 ret = execlp ("ls", "ls", "-l", (char *)0);
```

### 29727 Using `execv()`

29728 The following example passes arguments to the `ls` command in the `cmd` array.

```
29729 #include <unistd.h>
29730 int ret;
29731 char *cmd[] = { "ls", "-l", (char *)0 };
29732 ...
29733 ret = execv ("/bin/ls", cmd);
```

29734 **Using `execve()`**

29735 The following example passes arguments to the `ls` command in the `cmd` array, and specifies the  
29736 environment for the new process image using the `env` argument.

```
29737 #include <unistd.h>
29738
29738 int ret;
29739 char *cmd[] = { "ls", "-l", (char *)0 };
29740 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
29741 ...
29742 ret = execve ("/bin/ls", cmd, env);
```

29743 **Using `execvp()`**

29744 The following example searches for the location of the `ls` command among the directories  
29745 specified by the `PATH` environment variable, and passes arguments to the `ls` command in the  
29746 `cmd` array.

```
29747 #include <unistd.h>
29748
29748 int ret;
29749 char *cmd[] = { "ls", "-l", (char *)0 };
29750 ...
29751 ret = execvp ("ls", cmd);
```

29752 **APPLICATION USAGE**

29753 As the state of conversion descriptors and message catalog descriptors in the new process image  
29754 is undefined, conforming applications should not rely on their use and should close them prior  
29755 to calling one of the `exec` functions.

29756 Applications that require other than the default POSIX locale as the global locale in the new  
29757 process image should call `setlocale()` with the appropriate parameters.

29758 When assigning a new value to the `environ` variable, applications should ensure that the  
29759 environment to which it will point contains at least the following:

- 29760 1. Any implementation-defined variables required by the implementation to provide a  
29761 conforming environment. See the `_CS_V8_ENV` entry in `<unistd.h>` and `confstr()` for  
29762 details.
- 29763 2. A value for `PATH` which finds conforming versions of all standard utilities before any  
29764 other versions.

29765 The same constraint applies to the `envp` array passed to `execle()` or `execve()`, in order to ensure  
29766 that the new process image is invoked in a conforming environment.

29767 Applications should not execute programs with file descriptor 0 not open for reading or with file  
29768 descriptor 1 or 2 not open for writing, as this might cause the executed program to misbehave.  
29769 In order not to pass on these file descriptors to an executed program, applications should not  
29770 just close them but should reopen them on, for example, `/dev/null`. Some implementations may  
29771 reopen them automatically, but applications should not rely on this being done.

29772 If an application wants to perform an integrity test of the file being executed before executing it,  
29773 the file will need to be opened with read permission to perform the integrity test.

29774 Since execute permission is checked by `fexecve()`, the file description `fd` need not have been  
29775 opened with the `O_EXEC` flag. However, if the file to be executed denies read and write  
29776 permission for the process preparing to do the `exec`, the only way to provide the `fd` to `fexecve()`

29777 will be to use the O\_EXEC flag when opening *fd*. In this case, the application will not be able to  
 29778 perform an integrity test since it will not be able to read the contents of the file.

29779 Note that when a file descriptor is opened with O\_RDONLY, O\_RDWR, or O\_WRONLY mode,  
 29780 the file descriptor can be used to read, read and write, or write the file, respectively, even if the  
 29781 mode of the file changes after the file was opened. Using the O\_EXEC open mode is different;  
 29782 *fexecve()* will ignore the mode that was used when the file descriptor was opened and the *exec*  
 29783 will fail if the mode of the file associated with *fd* does not grant execute permission to the calling  
 29784 process at the time *fexecve()* is called.

#### 29785 RATIONALE

29786 Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was  
 29787 driven by the same requirement in drafts of the ISO C standard. In fact, historical  
 29788 implementations have passed a value of zero when no arguments are supplied to the caller of  
 29789 the *exec* functions. This requirement was removed from the ISO C standard and subsequently  
 29790 removed from this volume of POSIX.1-2024 as well. The wording, in particular the use of the  
 29791 word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to  
 29792 the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an  
 29793 application. In fact, this is good practice, since many existing applications reference *argv[0]*  
 29794 without first checking the value of *argc*.

29795 The requirement on a Strictly Conforming POSIX Application also states that the value passed as  
 29796 the first argument be a filename string associated with the process being started. Although some  
 29797 existing applications pass a pathname rather than a filename string in some circumstances, a  
 29798 filename string is more generally useful, since the common usage of *argv[0]* is in printing  
 29799 diagnostics. In some cases the filename passed is not the actual filename of the file; for example,  
 29800 many implementations of the *login* utility use a convention of prefixing a <hyphen-minus>  
 29801 ('-') to the actual filename, which indicates to the command interpreter being invoked that it is  
 29802 a “login shell”.

29803 Also, note that the *test* and *[* utilities require specific strings for the *argv[0]* argument to have  
 29804 deterministic behavior across all implementations.

29805 Historically, there have been two ways that implementations can *exec* shell scripts.

29806 One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()*  
 29807 functions return an [ENOEXEC] error for any file not recognizable as executable, including a  
 29808 shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file  
 29809 to be a shell script and invoke a known command interpreter to interpret such files. This is now  
 29810 required by POSIX.1-2024. These implementations of *execvp()* and *execlp()* only give the  
 29811 [ENOEXEC] error in the rare case of a problem with the command interpreter’s executable file.  
 29812 Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp()* or  
 29813 *execvp()*, although implementations can still give it.

29814 Another way that some historical implementations handle shell scripts is by recognizing the first  
 29815 two bytes of the file as the character string “#!” and using the remainder of the first line of the  
 29816 file as the name of the command interpreter to execute.

29817 One potential source of confusion noted by the standard developers is over how the contents of  
 29818 a process image file affect the behavior of the *exec* family of functions. The following is a  
 29819 description of the actions taken:

- 29820 1. If the process image file is a valid executable (in a format that is executable and valid and  
 29821 having appropriate privileges) for this system, then the system executes the file.

- 29822 2. If the process image file has appropriate privileges and is in a format that is executable  
 29823 but not valid for this system (such as a recognized binary for another architecture), then  
 29824 this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
- 29825 3. If the process image file has appropriate privileges but is not otherwise recognized:
- 29826 a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter  
 29827 assuming that the process image file is a shell script.
- 29828 b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to  
 29829 [ENOEXEC].

29830 Applications that do not require to access their arguments may use the form:

29831 `main(void)`

29832 as specified in the ISO C standard. However, the implementation will always provide the two  
 29833 arguments *argc* and *argv*, even if they are not used.

29834 Some implementations provide a third argument to *main()* called *envp*. This is defined as a  
 29835 pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments,  
 29836 so implementations are required to support applications written this way. Since this volume of  
 29837 POSIX.1-2024 defines the global variable *environ*, which is also provided by historical  
 29838 implementations and can be used anywhere that *envp* could be used, there is no functional need  
 29839 for the *envp* argument. Applications should use the *getenv()* function rather than accessing the  
 29840 environment directly via either *envp* or *environ*. Implementations are required to support the  
 29841 two-argument calling sequence, but this does not prohibit an implementation from supporting  
 29842 *envp* as an optional third argument.

29843 This volume of POSIX.1-2024 specifies that signals set to SIG\_IGN remain set to SIG\_IGN, and  
 29844 that the new process image inherits the signal mask of the thread that called *exec* in the old  
 29845 process image. This is consistent with historical implementations, and it permits some useful  
 29846 functionality, such as the *nohup* command. However, it should be noted that many existing  
 29847 applications wrongly assume that they start with certain signals set to the default action and/or  
 29848 unblocked. In particular, applications written with a simpler signal model that does not include  
 29849 blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked  
 29850 with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without  
 29851 explicit reason to do so, and especially not to block signals across *execs* of arbitrary (not closely  
 29852 cooperating) programs.

29853 The *exec* functions always save the value of the effective user ID and effective group ID of the  
 29854 process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of  
 29855 the process image file is set.

29856 The statement about *argv[]* and *envp[]* being constants is included to make explicit to future  
 29857 writers of language bindings that these objects are completely constant. Due to a limitation of  
 29858 the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of  
 29859 *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the  
 29860 natural choice, given that these functions do not modify either the array of pointers or the  
 29861 characters to which the function points, but this would disallow existing correct code. Instead,  
 29862 only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src*  
 29863 derived from the ISO C standard summarizes the compatibility:

	<i>dst:</i>	<b>char *[]</b>	<b>const char *[]</b>	<b>char *const[]</b>	<b>const char *const[]</b>
29864	<i>src:</i>				
29865	<b>char *[]</b>	VALID	—	VALID	—
29866	<b>const char *[]</b>	—	VALID	—	VALID
29867	<b>char * const []</b>	—	—	VALID	—
29868	<b>const char *const[]</b>	—	—	—	VALID

29870 Since all existing code has a source type matching the first row, the column that gives the most  
 29871 valid combinations is the third column. The only other possibility is the fourth column, but  
 29872 using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth  
 29873 column cannot be used, because the declaration a non-expert would naturally use would be that  
 29874 in the second row.

29875 The ISO C standard and this volume of POSIX.1-2024 do not conflict on the use of *environ*, but  
 29876 some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in  
 29877 the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can  
 29878 contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no  
 29879 problem ensues. The situation is similar for *environ*: the definition in this volume of  
 29880 POSIX.1-2024 is to be used if there is no user-provided *environ* to take precedence. At least three  
 29881 implementations are known to exist that solve this problem.

29882 [E2BIG] The limit {ARG\_MAX} applies not just to the size of the argument list, but to  
 29883 the sum of that and the size of the environment list.

29884 [EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the  
 29885 new process image file is corrupted. They are non-conforming.

29886 [EINVAL] This error condition was added to POSIX.1-2024 to allow an implementation  
 29887 to detect executable files generated for different architectures, and indicate this  
 29888 situation to the application. Historical implementations of shells, *execvp()*, and  
 29889 *execlp()* that encounter an [ENOEXEC] error will execute a shell on the  
 29890 assumption that the file is a shell script. This will not produce the desired  
 29891 effect when the file is a valid executable for a different architecture. An  
 29892 implementation may now choose to avoid this problem by returning  
 29893 [EINVAL] when a valid executable for a different architecture is encountered.  
 29894 Some historical implementations return [EINVAL] to indicate that the *path*  
 29895 argument contains a character with the high order bit set. The standard  
 29896 developers chose to deviate from historical practice for the following reasons:

- 29897 1. The new utilization of [EINVAL] will provide some measure of utility  
 29898 to the user community.
- 29899 2. Historical use of [EINVAL] is not acceptable in an internationalized  
 29900 operating environment.

29901 [ENAMETOOLONG] Since the file pathname may be constructed by taking elements in the *PATH*  
 29902 variable and putting them together with the filename, the  
 29903 [ENAMETOOLONG] error condition could also be reached this way.  
 29904

29905 [ETXTBSY] System V returns this error when the executable file is currently open for  
 29906 writing by some process. This volume of POSIX.1-2024 neither requires nor  
 29907 prohibits this behavior.

29908 Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this  
 29909 volume of POSIX.1-2024, but implementations may have a window between the call to *exec* and

29910 the time that a signal could cause one of the *exec* calls to return with [EINTR].

29911 An explicit statement regarding the floating-point environment (as defined in the `<fenv.h>`  
29912 header) was added to make it clear that the floating-point environment is set to its default when  
29913 a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the  
29914 default for other process and thread start-up functions is covered by more generic statements in  
29915 their descriptions and can be summarized as follows:

29916 *posix\_spawn()* Set to default.

29917 *fork()* Inherit.

29918 *pthread\_create()* Inherit.

29919 The purpose of the *fexecve()* function is to enable executing a file which has been verified to be  
29920 the intended file. It is possible to actively check the file by reading from the file descriptor and be  
29921 sure that the file is not exchanged for another between the reading and the execution.  
29922 Alternatively, a function like *openat()* can be used to open a file which has been found by  
29923 reading the content of a directory using *readdir()*.

29924 When *execlp()* or *execvp()* fall back to invoking *sh* because of an [ENOEXEC] condition, the  
29925 standard leaves the process name (what becomes *argv[0]* in the resulting *sh* process) unspecified.  
29926 Existing implementations vary on whether they pass a variation of "sh", or preserve the  
29927 original *arg0*. There are existing implementations of *sh* that behave differently depending on the  
29928 contents of *argv[0]*, such that blindly passing the original *arg0* on to the fallback execution can  
29929 fail to invoke a compliant shell environment. Because of the requirements on how *sh* handles its  
29930 command line arguments, the shell script will see \$0 containing the pathname of the script  
29931 being executed, regardless of the value of *argv[0]*.

#### 29941 CHANGE HISTORY

29942 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 29943 Issue 5

29944 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
29945 Threads Extension.

29946 Large File Summit extensions are added.

29947 **Issue 6**

29948 The following new requirements on POSIX implementations derive from alignment with the  
29949 Single UNIX Specification:

- 29950 • In the DESCRIPTION, behavior is defined for when the process image file is not a valid  
29951 executable.
- 29952 • In this version, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective  
29953 group ID of the new process image shall be saved (as the saved set-user-ID and the saved  
29954 set-group-ID) for use by the `setuid()` function.
- 29955 • The [ELOOP] mandatory error condition is added.
- 29956 • A second [ENAMETOOLONG] is added as an optional error condition.
- 29957 • The [ETXTBSY] optional error condition is added.

29958 The following changes were made to align with the IEEE P1003.1a draft standard:

- 29959 • The [EINVAL] mandatory error condition is added.
- 29960 • The [ELOOP] optional error condition is added.

29961 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

29962 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
29963 for typed memory.

29964 The normative text is updated to avoid use of the term “must” for application requirements.

29965 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

29966 IEEE PASC Interpretation 1003.1 #132 is applied.

29967 The DESCRIPTION is updated to make it explicit that the floating-point environment in the new  
29968 process image is set to the default.

29969 The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents  
29970 of a process image file affect the behavior of the *exec* functions.

29971 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to  
29972 the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change  
29973 addresses a security concern, where implementations may want to reopen file descriptors 0, 1,  
29974 and 2 for programs with the set-user-id or set-group-id file mode bits calling the *exec* family of  
29975 functions.

29976 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the  
29977 DESCRIPTION, addressing which attributes are inherited by threads, and behavioral  
29978 requirements for threads attributes.

29979 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the  
29980 RATIONALE from “the process signal mask be unchanged across an *exec*” to “the new process  
29981 image inherits the signal mask of the thread that called *exec* in the old process image”.

29982 **Issue 7**

29983 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of `_CS_V7_ENV`  
29984 to the APPLICATION USAGE.

29985 Austin Group Interpretation 1003.1-2001 #143 is applied.

29986 The *fexecve()* function is added from The Open Group Technical Standard, 2006, Extended API  
29987 Set Part 2.

- 29988            Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads,  
29989            and Timers options is moved to the Base.
- 29990            Changes are made related to support for finegrained timestamps.
- 29991            POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0095 [386], XSH/TC1-2008/0096 [167],  
29992            XSH/TC1-2008/0097 [291], XSH/TC1-2008/0098 [173], XSH/TC1-2008/0099 [296],  
29993            XSH/TC1-2008/00100 [324], XSH/TC1-2008/00101 [296], XSH/TC1-2008/00102 [302],  
29994            XSH/TC1-2008/00103 [167], XSH/TC1-2008/00104 [173], and XSH/TC1-2008/00105 [291,429]  
29995            are applied.
- 29996            POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0097 [584], XSH/TC2-2008/0098 [898],  
29997            and XSH/TC2-2008/0099 [734] are applied.
- 29998    **Issue 8**
- 29999            Austin Group Defects 51 and 1669 are applied, moving the *getrlimit()* and *setrlimit()* functions  
30000            from the XSI option to the Base.
- 30001            Austin Group Defect 368 is applied, adding a requirement for unnamed semaphores to be  
30002            destroyed.
- 30003            Austin Group Defect 768 is applied, adding OFD-owned file locks.
- 30004            Austin Group Defect 922 is applied, adding the *secure\_getenv()* function.
- 30005            Austin Group Defect 1284 is applied, changing “checksum test” to “integrity test” in the  
30006            APPLICATION USAGE section.
- 30007            Austin Group Defect 1318 is applied, adding FD\_CLOFORK.
- 30008            Austin Group Defect 1330 is applied, removing obsolescent interfaces and changing “\_V7\_” to  
30009            “\_V8\_”.
- 30010            Austin Group Defect 1435 is applied, adding function lists to the descriptions of the *path* and *file*  
30011            arguments.
- 30012            Austin Group Defect 1645 is applied, making it unspecified what string is passed to the shell in  
30013            *argv[0]* when executed by *execlp()* or *execvp()*.
- 30014            Austin Group Defect 1646 is applied, adding *at\_quick\_exit()* to the list of registration functions  
30015            whose registrations are not inherited across *exec*.

30016 **NAME**

30017 exit — terminate a process

30018 **SYNOPSIS**

30019 #include &lt;stdlib.h&gt;

30020 void exit(int status);

30021 **DESCRIPTION**

30022 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30023 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30024 volume of POSIX.1-2024 defers to the ISO C standard.

30025 The *exit()* function shall cause normal process termination to occur. No functions registered by  
 30026 the *at\_quick\_exit()* function shall be called. If a process calls the *exit()* function more than once,  
 30027 or calls the *quick\_exit()* function in addition to the *exit()* function, the behavior is undefined.

30028 CX The value of *status* can be 0, EXIT\_SUCCESS, EXIT\_FAILURE, or any other value, though only  
 30029 the least significant 8 bits (that is, *status* & 0377) shall be available from *wait()* and *waitpid()*; the  
 30030 full value shall be available from *waitid()* and in the **siginfo\_t** passed to a signal handler for  
 30031 SIGCHLD.

30032 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their  
 30033 registration, except that a function is called after any previously registered functions that had  
 30034 already been called at the time it was registered. Each function is called as many times as it was  
 30035 registered. If, during the call to any such function, a call to the *longjmp()* function is made that  
 30036 would terminate the call to the registered function, the behavior is undefined.

30037 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall  
 30038 not be called and the rest of the *exit()* processing shall not be completed.

30039 CX The *exit()* function shall then flush all open streams with unwritten buffered data. For each  
 30040 stream which is the active handle to its underlying file descriptor, and for which the file is not  
 30041 already at EOF and is capable of seeking, the file offset of the underlying open file description  
 30042 shall be set to the file position of the stream. For each open stream, the *exit()* function shall  
 30043 perform the equivalent of a *close()* on the file descriptor that is associated with the stream.

30044 CX Finally, the process shall be terminated with the same consequences as described in  
 30045 [Consequences of Process Termination](#) (on page 568).

30046 **RETURN VALUE**30047 The *exit()* function does not return.30048 **ERRORS**

30049 No errors are defined.

30050 **EXAMPLES**

30051 See APPLICATION USAGE.

30052 **APPLICATION USAGE**

30053 When a stream that has unwritten buffered data is flushed by *exit()* there is no way for the  
 30054 calling process to discover whether or not *exit()* successfully wrote the data to the underlying  
 30055 file descriptor. Therefore, it is strongly recommended that applications always ensure there is no  
 30056 unwritten buffered data in any stream when calling *exit()*, or returning from the initial call to  
 30057 *main()*, with a *status* value that indicates no errors occurred.

30058 For example, the following code demonstrates one way to ensure that *stdout* has already been  
 30059 successfully flushed before calling *exit()* with status 0. If the flush fails, the file descriptor  
 30060 underlying *stdout* is closed so that *exit()* will not try to repeat the failed write operation. If the  
 30061 flush succeeds, a final check with *ferror()* is performed to ensure that there were no write errors

```

30062         during earlier flush operations (that were not handled at the time).
30063         int status = 0;
30064         if (fflush(stdout) != 0) {
30065             perror("appname: standard output");
30066             close(fileno(stdout));
30067             status = 1;
30068         }
30069         else if (ferror(stdout)) {
30070             fputs("appname: write error on standard output\n", stderr);
30071             status = 1;
30072         }
30073         exit(status);
30074         See also _Exit().

```

**30075 RATIONALE**

30076 See *\_Exit()*.

**30077 FUTURE DIRECTIONS**

30078 None.

**30079 SEE ALSO**

30080 *\_Exit()*, *at\_quick\_exit()*, *atexit()*, *exec*, *fflush()*, *longjmp()*, *quick\_exit()*, *tmpfile()*, *wait()*, *waitid()*

30081 XBD <stdlib.h>

**30082 CHANGE HISTORY****30083 Issue 7**

30084 Austin Group Interpretation 1003.1-2001 #031 is applied, separating the *\_Exit()* and *\_exit()*  
30085 functions from the *exit()* function.

30086 Austin Group Interpretation 1003.1-2001 #085 is applied.

30087 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0100 [594] is applied.

**30088 Issue 8**

30089 Austin Group Defect 610 is applied, clarifying the effects of *exit()* on open streams.

30090 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
30091 standard.

30092 Austin Group Defect 1490 is applied, changing the EXAMPLES and APPLICATION USAGE  
30093 sections.

30094 Austin Group Defect 1629 is applied, changing the APPLICATION USAGE section.

30095 **NAME**30096 `exp`, `expf`, `expl` — exponential function30097 **SYNOPSIS**

```
30098 #include <math.h>
30099 double exp(double x);
30100 float expf(float x);
30101 long double expl(long double x);
```

30102 **DESCRIPTION**

30103 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30104 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30105 volume of POSIX.1-2024 defers to the ISO C standard.

30106 These functions shall compute the base-*e* exponential of *x*.

30107 An application wishing to check for error situations should set *errno* to zero and call  
 30108 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 30109 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 30110 zero, an error has occurred.

30111 **RETURN VALUE**

30112 Upon successful completion, these functions shall return the exponential value of *x*.

30113 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*  
 30114 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

30115 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 30116 MXX and *exp()*, *expf()*, and *expl()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 30117 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 30118 FLT\_MIN, and LDBL\_MIN, respectively.

30119 MX If *x* is NaN, a NaN shall be returned.

30120 If *x* is  $\pm 0$ , 1 shall be returned.

30121 If *x* is  $-\text{Inf}$ , +0 shall be returned.

30122 If *x* is  $+\text{Inf}$ , *x* shall be returned.

30123 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 30124 the correct value shall be returned.

30125 **ERRORS**

30126 These functions shall fail if:

30127 Range Error The result overflows.

30128 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30129 then *errno* shall be set to [ERANGE]. If the integer expression  
 30130 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 30131 floating-point exception shall be raised.

30132 These functions may fail if:

30133 Range Error The result underflows.

30134 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30135 then *errno* shall be set to [ERANGE]. If the integer expression  
 30136 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 30137 floating-point exception shall be raised.

30138 **EXAMPLES**30139 **Computing the Density of the Standard Normal Distribution**

30140 This function shows an implementation for the density of the standard normal distribution  
 30141 using `exp()`. This example uses the constant `M_PI` which is part of the XSI option.

```
30142 #include <math.h>
30143
30144 double
30145 normal_density (double x)
30146 {
30147     return exp(-x*x/2) / sqrt (2*M_PI);
30148 }
```

30148 **APPLICATION USAGE**

30149 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`  
 30150 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

30151 **RATIONALE**

30152 None.

30153 **FUTURE DIRECTIONS**

30154 None.

30155 **SEE ALSO**

30156 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#), [log\(\)](#)

30157 XBD [Section 4.23](#) (on page 109), [<math.h>](#)

30158 **CHANGE HISTORY**

30159 First released in Issue 1. Derived from Issue 1 of the SVID.

30160 **Issue 5**

30161 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 30162 text was previously published in the APPLICATION USAGE section.

30163 **Issue 6**

30164 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

30165 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 30166 revised to align with the ISO/IEC 9899:1999 standard.

30167 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 30168 marked.

30169 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the  
 30170 EXAMPLES section.

30171 **Issue 7**

30172 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0106 [68] and XSH/TC1-2008/0107  
 30173 [68] are applied.

30174 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0101 [630] is applied.

30175 **NAME**

30176 exp2, exp2f, exp2l — exponential base 2 functions

30177 **SYNOPSIS**

```
30178 #include <math.h>
30179 double exp2(double x);
30180 float exp2f(float x);
30181 long double exp2l(long double x);
```

30182 **DESCRIPTION**

30183 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30184 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30185 volume of POSIX.1-2024 defers to the ISO C standard.

30186 These functions shall compute the base-2 exponential of  $x$ .

30187 An application wishing to check for error situations should set *errno* to zero and call  
 30188 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 30189 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 30190 zero, an error has occurred.

30191 **RETURN VALUE**

30192 Upon successful completion, these functions shall return  $2^x$ .

30193 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and  
 30194 *exp2l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 30195 respectively.

30196 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 30197 MXX and *exp2()*, *exp2f()*, and *exp2l()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 30198 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 30199 FLT\_MIN, and LDBL\_MIN, respectively.

30200 MX If  $x$  is NaN, a NaN shall be returned.

30201 If  $x$  is  $\pm 0$ , 1 shall be returned.

30202 If  $x$  is  $-\text{Inf}$ , +0 shall be returned.

30203 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

30204 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 30205 the correct value shall be returned.

30206 **ERRORS**

30207 These functions shall fail if:

30208 Range Error The result overflows.

30209 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30210 then *errno* shall be set to [ERANGE]. If the integer expression  
 30211 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 30212 floating-point exception shall be raised.

30213 These functions may fail if:

30214 Range Error The result underflows.

30215 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30216 then *errno* shall be set to [ERANGE]. If the integer expression  
 30217 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

30218 floating-point exception shall be raised.

30219 **EXAMPLES**

30220 None.

30221 **APPLICATION USAGE**

30222 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
30223 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

30224 **RATIONALE**

30225 None.

30226 **FUTURE DIRECTIONS**

30227 None.

30228 **SEE ALSO**

30229 *exp()*, *feclearexcept()*, *fetetestexcept()*, *isnan()*, *log()*

30230 XBD Section 4.23 (on page 109), <math.h>

30231 **CHANGE HISTORY**

30232 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

30233 **Issue 7**

30234 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0108 [68] and XSH/TC1-2008/0109  
30235 [68] are applied.

30236 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0102 [630] is applied.

30237 **NAME**

30238 expm1, expm1f, expm1l — compute exponential functions

30239 **SYNOPSIS**

```
30240 #include <math.h>
30241 double expm1(double x);
30242 float expm1f(float x);
30243 long double expm1l(long double x);
```

30244 **DESCRIPTION**

30245 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30246 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30247 volume of POSIX.1-2024 defers to the ISO C standard.

30248 These functions shall compute  $e^x - 1.0$ .

30249 An application wishing to check for error situations should set *errno* to zero and call  
 30250 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 30251 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 30252 zero, an error has occurred.

30253 **RETURN VALUE**30254 Upon successful completion, these functions return  $e^x - 1.0$ .

30255 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and  
 30256 *expm1l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 30257 respectively.

30258 MX If  $x$  is NaN, a NaN shall be returned.30259 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.30260 If  $x$  is  $-\text{Inf}$ ,  $-1$  shall be returned.30261 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.30262 MXX If  $x$  is subnormal,  $x$  should be returned.

30263 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *expm1()*, *expm1f()*, and  
 30264 *expm1l()* shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 30265 FLT\_MIN, and LDBL\_MIN, respectively.

30266 **ERRORS**

30267 These functions shall fail if:

30268 Range Error The result overflows.

30269 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30270 then *errno* shall be set to [ERANGE]. If the integer expression  
 30271 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 30272 floating-point exception shall be raised.

30273 These functions may fail if:

30274 MX Range Error The value of  $x$  is subnormal.

30275 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 30276 then *errno* shall be set to [ERANGE]. If the integer expression  
 30277 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 30278 floating-point exception shall be raised.

30279 **EXAMPLES**

30280 None.

30281 **APPLICATION USAGE**30282 The value of  $\text{expm1}(x)$  may be more accurate than  $\text{exp}(x)-1.0$  for small values of  $x$ .30283 The  $\text{expm1}()$  and  $\text{log1p}()$  functions are useful for financial calculations of  $((1+x)^n-1)/x$ , namely:30284  $\text{expm1}(n * \text{log1p}(x)) / x$ 30285 when  $x$  is very small (for example, when calculating small daily interest rates). These functions  
30286 also simplify writing accurate inverse hyperbolic functions.30287 On error, the expressions ( $\text{math_errhandling}$  & MATH\_ERRNO) and ( $\text{math_errhandling}$  &  
30288 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.30289 **RATIONALE**

30290 None.

30291 **FUTURE DIRECTIONS**

30292 None.

30293 **SEE ALSO**30294 [exp\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [ilogb\(\)](#), [log1p\(\)](#)30295 XBD Section 4.23 (on page 109), [<math.h>](#)30296 **CHANGE HISTORY**

30297 First released in Issue 4, Version 2.

30298 **Issue 5**

30299 Moved from X/OPEN UNIX extension to BASE.

30300 **Issue 6**30301 The  $\text{expm1f}()$  and  $\text{expm1l}()$  functions are added for alignment with the ISO/IEC 9899:1999  
30302 standard.30303 The  $\text{expm1}()$  function is no longer marked as an extension.30304 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
30305 revised to align with the ISO/IEC 9899:1999 standard.30306 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
30307 marked.30308 **Issue 7**

30309 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0110 [68] is applied.

30310 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0103 [630] is applied.

30311 **Issue 8**30312 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when  $x$  is  
30313 subnormal to avoid the need for two shading changes.

30314 **NAME**

30315           fabs, fabsf, fabsl — absolute value function

30316 **SYNOPSIS**

```
30317       #include <math.h>
30318       double fabs(double x);
30319       float fabsf(float x);
30320       long double fabsl(long double x);
```

30321 **DESCRIPTION**

30322 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 30323 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30324 volume of POSIX.1-2024 defers to the ISO C standard.

30325       These functions shall compute the absolute value of their argument  $x$ ,  $|x|$ .30326 **RETURN VALUE**30327       Upon successful completion, these functions shall return the absolute value of  $x$ .

30328 MX       The returned value shall be exact and shall be independent of the current rounding direction  
 30329 mode.

30330       If  $x$  is NaN, a NaN shall be returned.30331       If  $x$  is  $\pm 0$ ,  $+0$  shall be returned.30332       If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.30333 **ERRORS**

30334       No errors are defined.

30335 **EXAMPLES**30336       **Computing the 1-Norm of a Floating-Point Vector**30337       This example shows the use of *fabs()* to compute the 1-norm of a vector defined as follows:30338        $\text{norm1}(v) = |v[0]| + |v[1]| + \dots + |v[n-1]|$ 

30339       where  $|x|$  denotes the absolute value of  $x$ ,  $n$  denotes the vector's dimension  $v[i]$  denotes the  $i$ -th  
 30340 component of  $v$  ( $0 \leq i < n$ ).

```
30341       #include <math.h>
30342       double
30343       norm1(const double v[], const int n)
30344       {
30345           int        i;
30346           double    n1_v; /* 1-norm of v */
30347           n1_v = 0;
30348           for (i=0; i<n; i++) {
30349               n1_v += fabs (v[i]);
30350           }
30351           return n1_v;
30352       }
```

30353 **APPLICATION USAGE**

30354 None.

30361 XBD &lt;math.h&gt;

30362 **CHANGE HISTORY**

30363 First released in Issue 1. Derived from Issue 1 of the SVID.

30364 **Issue 5**30365 The DESCRIPTION is updated to indicate how an application should check for an error. This  
30366 text was previously published in the APPLICATION USAGE section.30367 **Issue 6**30368 The *fabsf()* and *fabsl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.30369 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
30370 revised to align with the ISO/IEC 9899:1999 standard.30371 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
30372 marked.30373 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/27 is applied, adding the example to the  
30374 EXAMPLES section.30375 **Issue 8**30376 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
30377 standard.

30378 **NAME**30379        `faccessat` — determine accessibility of a file relative to directory file descriptor30380 **SYNOPSIS**30381        `#include <unistd.h>`30382        `int faccessat(int fd, const char *path, int amode, int flag);`30383 **DESCRIPTION**30384        Refer to [\*access\(\)\*](#).

30385 **NAME**

30386 fchdir — change working directory

30387 **SYNOPSIS**

30388 #include &lt;unistd.h&gt;

30389 int fchdir(int *fildev*);30390 **DESCRIPTION**30391 The *fchdir()* function shall be equivalent to *chdir()* except that the directory that is to be the new  
30392 current working directory is specified by the file descriptor *fildev*.30393 A conforming application can obtain a file descriptor for a file of type directory using *open()*,  
30394 provided that the file status flags and access modes do not contain *O\_WRONLY* or *O\_RDWR*.30395 **RETURN VALUE**30396 Upon successful completion, *fchdir()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
30397 indicate the error. On failure the current working directory shall remain unchanged.30398 **ERRORS**30399 The *fchdir()* function shall fail if:30400 [EACCES] Search permission is denied for the directory referenced by *fildev*.30401 [EBADF] The *fildev* argument is not an open file descriptor.30402 [ENOTDIR] The open file descriptor *fildev* does not refer to a directory.30403 The *fchdir()* may fail if:30404 [EINTR] A signal was caught during the execution of *fchdir()*.

30405 [EIO] An I/O error occurred while reading from or writing to the file system.

30406 **EXAMPLES**

30407 None.

30408 **APPLICATION USAGE**

30409 None.

30410 **RATIONALE**

30411 None.

30412 **FUTURE DIRECTIONS**

30413 None.

30414 **SEE ALSO**30415 [chdir\(\)](#), [dirfd\(\)](#)30416 XBD [<unistd.h>](#)30417 **CHANGE HISTORY**

30418 First released in Issue 4, Version 2.

30419 **Issue 5**

30420 Moved from X/OPEN UNIX extension to BASE.

30421 **Issue 7**30422 The *fchdir()* function is moved from the XSI option to the Base.

30423 **NAME**

30424 fchmod — change mode of a file

30425 **SYNOPSIS**

```
30426 #include <sys/stat.h>
30427 int fchmod(int fildev, mode_t mode);
```

30428 **DESCRIPTION**

30429 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are  
 30430 changed is specified by the file descriptor *fildev*.

30431 SHM If *fildev* references a shared memory object, the *fchmod()* function need only affect the S\_IRUSR,  
 30432 S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits.

30433 TYM If *fildev* references a typed memory object, the behavior of *fchmod()* is unspecified.

30434 If *fildev* refers to a socket, the behavior of *fchmod()* is unspecified.

30435 **RETURN VALUE**

30436 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return  $-1$  and set *errno* to  
 30437 indicate the error.

30438 **ERRORS**

30439 The *fchmod()* function shall fail if:

30440 [EBADF] The *fildev* argument is not an open file descriptor.

30441 [EPERM] The effective user ID does not match the owner of the file and the process does  
 30442 not have appropriate privileges.

30443 [EROFS] The file referred to by *fildev* resides on a read-only file system.

30444 The *fchmod()* function may fail if:

30445 XSI [EINTR] The *fchmod()* function was interrupted by a signal.

30446 XSI [EINVAL] The value of the *mode* argument is invalid.

30447 [EINVAL] The *fildev* argument refers to a pipe and the implementation disallows  
 30448 execution of *fchmod()* on a pipe.

30449 **EXAMPLES**30450 **Changing the Current Permissions for a File**

30451 The following example shows how to change the permissions for a file named `/home/cnd/mod1`  
 30452 so that the owner and group have read/write/execute permissions, but the world only has  
 30453 read/write permissions.

```
30454 #include <sys/stat.h>
30455 #include <fcntl.h>
30456 mode_t mode;
30457 int fildev;
30458 ...
30459 fildev = open("/home/cnd/mod1", O_RDWR);
30460 fchmod(fildev, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);
```

**30461 APPLICATION USAGE**

30462 None.

**30463 RATIONALE**

30464 None.

**30465 FUTURE DIRECTIONS**

30466 None.

**30467 SEE ALSO**

30468 *chmod()*, *chown()*, *creat()*, *fcntl()*, *fstatat()*, *fstatofs()*, *mknod()*, *open()*, *read()*, *write()*

30469 XBD <sys/stat.h>

**30470 CHANGE HISTORY**

30471 First released in Issue 4, Version 2.

**30472 Issue 5**

30473 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX  
30474 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a  
30475 second instance of [EINVAL] is defined in the list of optional errors.

**30476 Issue 6**

30477 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*  
30478 behavior is unspecified for typed memory objects.

**30479 Issue 8**

30480 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

30481 **NAME**

30482 fchmodat — change mode of a file relative to directory file descriptor

30483 **SYNOPSIS**

30484 #include <sys/stat.h>

30485 int fchmodat(int *fd*, const char \**path*, mode\_t *mode*, int *flag*);

30486 **DESCRIPTION**

30487 Refer to *chmod()*.

30488 **NAME**

30489 fchown — change owner and group of a file

30490 **SYNOPSIS**

30491 #include &lt;unistd.h&gt;

30492 int fchown(int *fildev*, uid\_t *owner*, gid\_t *group*);30493 **DESCRIPTION**30494 The *fchown()* function shall be equivalent to *chown()* except that the file whose owner and group  
30495 are changed is specified by the file descriptor *fildev*.30496 **RETURN VALUE**30497 Upon successful completion, *fchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
30498 indicate the error.30499 **ERRORS**30500 The *fchown()* function shall fail if:30501 [EBADF] The *fildev* argument is not an open file descriptor.30502 [EPERM] The effective user ID does not match the owner of the file or the process does  
30503 not have appropriate privileges and `_POSIX_CHOWN_RESTRICTED`  
30504 indicates that such privilege is required.30505 [EROFS] The file referred to by *fildev* resides on a read-only file system.30506 The *fchown()* function may fail if:30507 [EINVAL] The owner or group ID is not a value supported by the implementation. The  
30508 *fildev* argument refers to a pipe or socket and the implementation disallows  
30509 execution of *fchown()* on a pipe.

30510 [EIO] A physical I/O error has occurred.

30511 [EINTR] The *fchown()* function was interrupted by a signal which was caught.30512 **EXAMPLES**30513 **Changing the Current Owner of a File**30514 The following example shows how to change the owner of a file named `/home/cnd/mod1` to  
30515 `“jones”` and the group to `“cnd”`.30516 The numeric value for the user ID is obtained by extracting the user ID from the user database  
30517 entry associated with `“jones”`. Similarly, the numeric value for the group ID is obtained by  
30518 extracting the group ID from the group database entry associated with `“cnd”`. This example  
30519 assumes the calling program has appropriate privileges.

```

30520 #include <sys/types.h>
30521 #include <unistd.h>
30522 #include <fcntl.h>
30523 #include <pwd.h>
30524 #include <grp.h>
30525
30526 struct passwd *pwd;
30527 struct group *grp;
30528 int
30529     fildev;
30530
30531 ...
30532 fildev = open("/home/cnd/mod1", O_RDWR);
30533 pwd = getpwnam("jones");

```

```
30531     grp = getgrnam("cnd");
30532     fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

## 30533 APPLICATION USAGE

## 30542 CHANGE HISTORY

30543 First released in Issue 4, Version 2.

### 30544 Issue 5

30545 Moved from X/OPEN UNIX extension to BASE.

### 30546 Issue 6

30547 The following changes were made to align with the IEEE P1003.1a draft standard:

- 30548 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

30549 The *fchown()* function is defined as mandatory.

### 30550 Issue 7

30551 Functionality relating to XSI STREAMS is marked obsolescent.

### 30552 Issue 8

30553 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

30554 **NAME**

30555 fchownat — change owner and group of a file relative to directory file descriptor

30556 **SYNOPSIS**

30557 #include &lt;unistd.h&gt;

30558 int fchownat(int *fd*, const char \**path*, uid\_t *owner*, gid\_t *group*,  
30559 int *flag*);30560 **DESCRIPTION**30561 Refer to *chown()*.

30562 **NAME**

30563           fclose — close a stream

30564 **SYNOPSIS**

30565           #include <stdio.h>

30566           int fclose(FILE \*stream);

30567 **DESCRIPTION**

30568 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
30569 conflict between the requirements described here and the ISO C standard is unintentional. This  
30570 volume of POSIX.1-2024 defers to the ISO C standard.

30571       The *fclose()* function shall cause the stream pointed to by *stream* to be flushed and the associated  
30572 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any  
30573 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be  
30574 disassociated from the file and any buffer set by the *setbuf()* or *setvbuf()* function shall be  
30575 disassociated from the stream. If the associated buffer was automatically allocated, it shall be  
30576 deallocated.

30577 CX       If the file is not already at EOF, and the file is one capable of seeking, the file offset of the  
30578 underlying open file description shall be set to the file position of the stream if the stream is the  
30579 active handle to the underlying file description.

30580       The *fclose()* function shall mark for update the last data modification and last file status change  
30581 timestamps of the underlying file, if the stream was writable, and if buffered data remains that  
30582 has not yet been written to the file. The *fclose()* function shall perform the equivalent of a *close()*  
30583 on the file descriptor that is associated with the stream pointed to by *stream*.

30584       After the call to *fclose()*, any use of *stream* results in undefined behavior.

30585 **RETURN VALUE**

30586 CX       Upon successful completion, *fclose()* shall return 0; otherwise, it shall return EOF and set *errno*  
30587 to indicate the error.

30588 **ERRORS**

30589       The *fclose()* function shall fail if:

30590 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
30591                           the thread would be delayed in the write operation.

30592 CX       [EBADF]       The file descriptor underlying stream is not valid.

30593 CX       [EFBIG]       An attempt was made to write a file that exceeds the maximum file size.

30594 CX       [EFBIG]       An attempt was made to write a file that exceeds the file size limit of the  
30595 process.

30596 XSI       A SIGXFSZ signal shall also be generated for the thread.

30597 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
30598 offset maximum associated with the corresponding stream.

30599 CX       [EINTR]       The *fclose()* function was interrupted by a signal.

30600 CX       [EIO]         The process is a member of a background process group attempting to write to  
30601 its controlling terminal, TOSTOP is set, the calling thread is not blocking  
30602 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the  
30603 process is orphaned. This error may also be returned under implementation-  
30604 defined conditions.

30605 CX [ENOMEM] The underlying stream was created by *open\_memstream()* or  
 30606 *open\_wmemstream()* and insufficient memory is available.

30607 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
 30608 buffer used by the *fmemopen()* function.

30609 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 30610 any process. A SIGPIPE signal shall also be sent to the thread.

30611 The *fclose()* function may fail if:

30612 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 30613 capabilities of the device.

#### 30614 EXAMPLES

30615 None.

#### 30616 APPLICATION USAGE

30617 Since after the call to *fclose()* any use of *stream* results in undefined behavior, *fclose()* should not  
 30618 be used on *stdin*, *stdout*, or *stderr* except immediately before process termination (see XBD  
 30619 Section 3.287, on page 73), so as to avoid triggering undefined behavior in other standard  
 30620 interfaces that rely on these streams. If there are any *atexit()* handlers registered by the  
 30621 application, such a call to *fclose()* should not occur until the last handler is finishing. Once  
 30622 *fclose()* has been used to close *stdin*, *stdout*, or *stderr*, there is no standard way to reopen any of  
 30623 these streams.

30624 Use of *freopen()* to change *stdin*, *stdout*, or *stderr* instead of closing them avoids the danger of a  
 30625 file unexpectedly being opened as one of the special file descriptors `STDIN_FILENO`,  
 30626 `STDOUT_FILENO`, or `STDERR_FILENO` at a later time in the application.

#### 30627 RATIONALE

30628 None.

#### 30629 FUTURE DIRECTIONS

30630 None.

#### 30631 SEE ALSO

30632 Section 2.5 (on page 521), *atexit()*, *close()*, *fmemopen()*, *fopen()*, *freopen()*, *getrlimit()*,

#### 30635 CHANGE HISTORY

30636 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 30637 Issue 5

30638 Large File Summit extensions are added.

#### 30639 Issue 6

30640 Extensions beyond the ISO C standard are marked.

30641 The following new requirements on POSIX implementations derive from alignment with the  
 30642 Single UNIX Specification:

- 30643 • The [EFBIG] error is added as part of the large file support extensions.
- 30644 • The [ENXIO] optional error condition is added.

30645 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether  
 30646 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

30647 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN]

30648 error in the ERRORS section from “the process would be delayed” to “the thread would be  
30649 delayed”.

30650 **Issue 7**

30651 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
30652 descriptors and streams.

30653 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
30654 Group Technical Standard, 2006, Extended API Set Part 1.

30655 Changes are made related to support for finegrained timestamps.

30656 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0113 [87], XSH/TC1-2008/0114 [79],  
30657 and XSH/TC1-2008/0115 [14] are applied.

30658 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0104 [555] is applied.

30659 **Issue 8**

30660 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

30661 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
30662 relating to the file size limit for the process.

30663 **NAME**

30664           fcntl — file control

30665 **SYNOPSIS**

30666           #include &lt;fcntl.h&gt;

30667           int fcntl(int *fildev*, int *cmd*, ...);30668 **DESCRIPTION**30669           The *fcntl()* function shall perform the operations described below on open files. The *fildev*  
30670           argument is a file descriptor.30671           The available values for *cmd* are defined in <fcntl.h> and are as follows:

30672           **F\_DUPFD**           Return a new file descriptor which shall be allocated as described in  
30673                                Section 2.6 (on page 525), except that it shall be the lowest numbered  
30674                                available file descriptor greater than or equal to the third argument, *arg*,  
30675                                taken as an integer of type **int**. The new file descriptor shall refer to the  
30676                                same open file description as the original file descriptor, and shall share  
30677                                any locks. The FD\_CLOEXEC and FD\_CLOFORK flags associated with  
30678                                the new file descriptor shall be cleared.

30679           **F\_DUPFD\_CLOEXEC**30680                                Like F\_DUPFD, but the FD\_CLOEXEC flag associated with the new file  
30681                                descriptor shall be set.30682           **F\_DUPFD\_CLOFORK**30683                                Like F\_DUPFD, but the FD\_CLOFORK flag associated with the new file  
30684                                descriptor shall be set.30685           **F\_GETFD**30686                                Get the file descriptor flags defined in <fcntl.h> that are associated with  
30687                                the file descriptor *fildev*. File descriptor flags are associated with a single  
30688                                file descriptor and do not affect other file descriptors that refer to the  
30689                                same file.30689           **F\_SETFD**30690                                Set the file descriptor flags defined in <fcntl.h>, that are associated with  
30691                                *fildev*, to the third argument, *arg*, taken as type **int**. If the FD\_CLOEXEC  
30692                                flag in the third argument is set, the file descriptor shall be closed upon  
30693                                successful execution of an *exec* family function and in the new process  
30694                                image created by *posix\_spawn()* or *posix\_spawnnp()*; otherwise, the file  
30695                                descriptor shall remain open. If the FD\_CLOFORK flag in the third  
30696                                argument is set, the file descriptor shall not be inherited by any child  
30697                                process created from a process that has the file descriptor open;  
30698                                otherwise, the file descriptor shall be inherited.30698           **F\_GETFL**30699                                Get the file status flags and file access modes, defined in <fcntl.h>, for the  
30700                                file description associated with *fildev*. The file access modes can be  
30701                                extracted from the return value using the mask O\_ACCMODE, which is  
30702                                defined in <fcntl.h>. File status flags and file access modes are associated  
30703                                with the file description and do not affect other file descriptors that refer  
30704                                to the same file with different open file descriptions. The flags returned  
30705                                may include non-standard file status flags which the application did not  
30706                                set, provided that these additional flags do not alter the behavior of a  
30707                                conforming application.30707           **F\_SETFL**30708                                Set the file status flags, defined in <fcntl.h>, for the file description  
30709                                associated with *fildev* from the corresponding bits in the third argument,  
30709                                *arg*, taken as type **int**. Bits corresponding to the file access mode and the

30710		file creation flags, as defined in <code>&lt;fcntl.h&gt;</code> , that are set in <i>arg</i> shall be
30711		ignored. If any bits in <i>arg</i> other than those mentioned here are changed by
30712		the application, the result is unspecified. If <i>fildev</i> does not support non-
30713		blocking operations, it is unspecified whether the <code>O_NONBLOCK</code> flag
30714		will be ignored.
30715	F_GETOWN	If <i>fildev</i> refers to a socket, get the process ID or process group ID specified
30716		to receive SIGURG signals when out-of-band data is available. Positive
30717		values shall indicate a process ID; negative values, other than <code>-1</code> , shall
30718		indicate a process group ID; the value zero shall indicate that no SIGURG
30719		signals are to be sent. If <i>fildev</i> does not refer to a socket, the results are
30720		unspecified.
30721	F_SETOWN	If <i>fildev</i> refers to a socket, atomically set the process ID or process group
30722		ID specified to receive SIGURG signals when out-of-band data is
30723		available, using the value of the third argument, <i>arg</i> , taken as type <code>int</code> .
30724		Positive values shall indicate a process ID; negative values, other than <code>-1</code> ,
30725		shall indicate a process group ID; the value zero shall indicate that no
30726		SIGURG signals are to be sent. If <i>fildev</i> does not refer to a socket, the
30727		results are unspecified.
30728	F_GETOWN_EX	If <i>fildev</i> refers to a socket, get the process ID or process group ID specified
30729		to receive SIGURG signals when out-of-band data is available, by setting
30730		the <i>type</i> and <i>pid</i> members of the <code>f_owner_ex</code> structure pointed to by the
30731		third argument, <i>arg</i> . The value of <i>type</i> shall be <code>F_OWNER_PID</code> or
30732		<code>F_OWNER_PGRP</code> to indicate that <i>pid</i> contains a process ID or a process
30733		group ID, respectively. The value of <i>pid</i> shall be zero if no SIGURG signals
30734		are to be sent. If <i>fildev</i> does not refer to a socket, the results are
30735		unspecified.
30736	F_SETOWN_EX	If <i>fildev</i> refers to a socket, set the process ID or process group ID specified
30737		to receive SIGURG signals when out-of-band data is available, using the
30738		value of the third argument, <i>arg</i> , taken as type pointer to <code>struct</code>
30739		<code>f_owner_ex</code> . The <i>type</i> and <i>pid</i> members of this structure shall be used as
30740		follows:
30741		• A <i>pid</i> value of zero shall indicate that no SIGURG signals are to be
30742		sent.
30743		• A <i>type</i> value of <code>F_OWNER_PID</code> and a positive <i>pid</i> value shall
30744		indicate that SIGURG signals are to be sent to the process ID
30745		specified in <i>pid</i> .
30746		• A <i>type</i> value of <code>F_OWNER_PGRP</code> and a positive <i>pid</i> value shall
30747		indicate that SIGURG signals are to be sent to the process group ID
30748		specified in <i>pid</i> .
30749		If <i>fildev</i> does not refer to a socket, the results are unspecified.
30750		For <code>F_SETOWN</code> and <code>F_SETOWN_EX</code> , each time a SIGURG signal is sent to the specified process
30751		or process group, permission checks equivalent to those performed by <code>kill()</code> shall be performed,
30752		as if <code>kill()</code> were called by a process with the same real user ID, effective user ID, and privileges
30753		that the process calling <code>fcntl()</code> has at the time of the call; if the <code>kill()</code> call would fail, no signal
30754		shall be sent. These permission checks may also be performed by the <code>fcntl()</code> call. If the process
30755		specified by <i>arg</i> later terminates, or the process group specified by <i>arg</i> later becomes empty,
30756		while still being specified to receive SIGURG signals when out-of-band data is available from

30757		<i>files</i> , then no signals shall be sent to any subsequently created process that has the same process
30758		ID or process group ID, regardless of permission; it is unspecified whether this is achieved by
30759		the equivalent of a <i>fcntl(files, F_SETOWN, 0)</i> call at the time the process terminates or is waited
30760		for or the process group becomes empty, or by other means.
30761		The following values for <i>cmd</i> are available for advisory record locking. Record locking shall be
30762		supported for regular files, and may be supported for other files.
30763	F_GETLK	Get any lock which blocks the process-owned file lock description
30764		pointed to by the third argument, <i>arg</i> , taken as a pointer to type <b>struct</b>
30765		<b>lock</b> , defined in <b>&lt;fcntl.h&gt;</b> . The information retrieved shall overwrite the
30766		information passed to <i>fcntl()</i> in the structure <b>lock</b> . If no lock is found
30767		that would prevent this lock from being created, then the structure shall
30768		be left unchanged except for the lock type in <i>l_type</i> which shall be set to
30769		F_UNLCK.
30770	F_SETLK	Set or clear a process-owned file lock according to the lock description
30771		pointed to by the third argument, <i>arg</i> , taken as a pointer to type <b>struct</b>
30772		<b>lock</b> , defined in <b>&lt;fcntl.h&gt;</b> . F_SETLK can establish shared (or read) locks
30773		(F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as remove
30774		either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are
30775		defined in <b>&lt;fcntl.h&gt;</b> . If a shared or exclusive lock cannot be set, <i>fcntl()</i>
30776		shall return immediately with a return value of -1.
30777	F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or
30778		exclusive lock is blocked by other locks, the thread shall wait until the
30779		request can be satisfied. If a signal that is to be caught is received while
30780		<i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return
30781		from the signal handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to [EINTR],
30782		and the lock operation shall not be done.
30783	F_OFD_GETLK	Get any lock which blocks the OFD-owned file lock description pointed to
30784		by the third argument, <i>arg</i> , taken as a pointer to type <b>struct lock</b> , defined
30785		in <b>&lt;fcntl.h&gt;</b> ; the application shall ensure that the <i>l_pid</i> member of the
30786		structure pointed to by <i>arg</i> is set to 0 on input. The information retrieved
30787		shall overwrite the information passed to <i>fcntl()</i> in the structure <b>lock</b> . If
30788		no lock is found that would prevent this lock from being created, then the
30789		structure shall be left unchanged except for the lock type in <i>l_type</i> which
30790		shall be set to F_UNLCK.
30791	F_OFD_SETLK	Set or clear an OFD-owned file lock according to the lock description
30792		pointed to by the third argument, <i>arg</i> , taken as a pointer to type <b>struct</b>
30793		<b>lock</b> , defined in <b>&lt;fcntl.h&gt;</b> ; the application shall ensure that the <i>l_pid</i>
30794		member of the structure pointed to by <i>arg</i> is set to 0 on input.
30795		F_OFD_SETLK can establish shared (or read) locks (F_RDLCK) or
30796		exclusive (or write) locks (F_WRLCK), as well as remove either type of
30797		lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in
30798		<b>&lt;fcntl.h&gt;</b> . If a shared or exclusive lock cannot be set, <i>fcntl()</i> shall return
30799		immediately with a return value of -1.
30800	F_OFD_SETLKW	This command shall be equivalent to F_OFD_SETLK except that if a
30801		shared or exclusive lock is blocked by other locks, the thread shall wait
30802		until the request can be satisfied. If a signal that is to be caught is received
30803		while <i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon
30804		return from the signal handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to

30805 [EINTR], and the lock operation shall not be done.

30806 Additional implementation-defined values for *cmd* may be defined in `<fcntl.h>`. Their names  
30807 shall start with `F_`.

30808 When a shared lock is set on a segment of a file, other processes can set shared process-owned  
30809 locks, and other open file descriptions can be used to set shared OFD-owned locks, on that  
30810 segment or a portion of it. A shared process-owned lock shall prevent any other process from  
30811 setting an exclusive process-owned lock, and shall prevent any exclusive OFD-owned lock from  
30812 being set, on any portion of the protected area. A shared OFD-owned lock shall prevent any  
30813 other open file description from being used to set an exclusive OFD-owned lock, and shall  
30814 prevent any exclusive process-owned lock from being set, on any portion of the protected area.  
30815 A request for a shared lock shall fail if the file descriptor is not open for reading.

30816 An exclusive process-owned lock shall prevent any other process from setting a shared or  
30817 exclusive process-owned lock, and shall prevent any shared or exclusive OFD-owned lock from  
30818 being set, on any portion of the protected area. An exclusive OFD-owned lock shall prevent any  
30819 other open file description from being used to set a shared or exclusive OFD-owned lock, and  
30820 shall prevent any shared or exclusive process-owned lock from being set, on any portion of the  
30821 protected area. A request for an exclusive lock shall fail if the file descriptor is not open for  
30822 writing.

30823 The structure **flock** describes the type (*l\_type*), starting offset (*l\_whence*), relative offset (*l\_start*),  
30824 size (*l\_len*), and process ID (*l\_pid*) of the segment of the file to be affected.

30825 The value of *l\_whence* is `SEEK_SET`, `SEEK_CUR`, or `SEEK_END`, to indicate that the relative  
30826 offset *l\_start* bytes shall be measured from the start of the file, current position, or end of the file,  
30827 respectively. The value of *l\_len* is the number of consecutive bytes to be locked. The value of *l\_len*  
30828 may be negative (where the definition of **off\_t** permits negative values of *l\_len*). On input, the  
30829 *l\_pid* field shall be ignored for `F_GETLK`, `F_SETLK` and `F_SETLKW`; the application shall ensure  
30830 that it is set to zero for `F_OFD_GETLK`, `F_OFD_SETLK` and `F_OFD_SETLKW`. It is set by  
30831 `F_GETLK` and `F_OFD_GETLK` when identifying a blocking lock. After a successful `F_GETLK` or  
30832 `F_OFD_GETLK` request, when a blocking lock is found, the values returned in the **flock**  
30833 structure shall be as follows:

30834	<i>l_type</i>	Type of blocking lock found.
30835	<i>l_whence</i>	<code>SEEK_SET</code> .
30836	<i>l_start</i>	Start of the blocking lock.
30837	<i>l_len</i>	Length of the blocking lock.
30838	<i>l_pid</i>	Process ID of the process that holds the blocking lock if the blocking lock is a 30839 process-owned file lock, or <code>(pid_t)-1</code> if the blocking lock is an OFD-owned file 30840 lock.

30841 If the command is `F_SETLKW` or `F_OFD_SETLKW` and the thread needs to wait for a blocking  
30842 lock to be released, then the range of bytes to be locked shall be determined before the `fcntl()`  
30843 function blocks. If the file size or file descriptor seek offset change while `fcntl()` is blocked, this  
30844 shall not affect the range of bytes locked.

30845 If *l\_len* is positive, the area affected shall start at *l\_start* and end at *l\_start+l\_len-1*. If *l\_len* is  
30846 negative, the area affected shall start at *l\_start+l\_len* and end at *l\_start-1*. Locks may start and  
30847 extend beyond the current end of a file, but shall not extend before the beginning of the file. A  
30848 lock shall be set to extend to the largest possible value of the file offset for that file by setting  
30849 *l\_len* to 0. If such a lock also has *l\_start* set to 0 and *l\_whence* is set to `SEEK_SET`, the whole file  
30850 shall be locked.

30851		Each byte in the file can be locked either with one or more shared locks (F_RDLCK) or with one
30852		exclusive lock (F_WRLCK).
30853		Before a successful return from an F_SETLK or an F_SETLKW request when the calling process
30854		has previously existing process-owned locks on bytes in the region specified by the request, the
30855		previous shared or exclusive lock for each byte in the specified region shall be replaced by the
30856		new shared or exclusive lock. An F_SETLK or an F_SETLKW request (respectively) shall fail or
30857		block when another process has existing process-owned locks, or any open file description
30858		(including the one associated with <i>fildes</i> ) has existing OFD-owned locks, on bytes in the specified
30859		region and any of those locks conflicts with the requested lock.
30860		Before a successful return from an F_OFD_SETLK or an F_OFD_SETLKW request when the
30861		open file description associated with <i>fildes</i> has previously existing OFD-owned locks on bytes in
30862		the region specified by the request, the previous shared or exclusive lock for each byte in the
30863		specified region shall be replaced by the new shared or exclusive lock. An F_OFD_SETLK or an
30864		F_OFD_SETLKW request (respectively) shall fail or block when another open file description
30865		has existing OFD-owned locks, or any process (including the calling process) has existing
30866		process-owned locks, on bytes in the specified region and any of those locks conflicts with the
30867		requested lock.
30868		All process-owned locks associated with a file for a given process shall be removed when any
30869		file descriptor for that file is closed by that process (even if via a different open file description)
30870		or the process holding that file descriptor terminates. Process-owned locks shall not be inherited
30871		by a child process.
30872		All OFD-owned locks associated with a given open file description shall be removed when all
30873		file descriptors associated with that open file description have been closed (either directly or as a
30874		side-effect of, for example, process termination or FD_CLOEXEC). OFD-owned locks shall be
30875		shared across all file descriptors that are associated with the owning open file description,
30876		regardless of which process holds the file descriptor.
30877		A potential for deadlock occurs if a process or thread controlling a locked region is put to sleep
30878		by attempting to lock a region that has an existing conflicting lock. If the system detects that
30879		sleeping until a locked region is unlocked would cause a deadlock, <i>fcntl()</i> shall fail with an
30880		[EDEADLK] error. Deadlock detection may differ between process-owned locks and OFD-
30881		owned locks.
30882	XSI	The interaction between <i>fcntl()</i> and <i>lockf()</i> locks is unspecified.
30883		An unlock (F_UNLCK) request in which <i>l_len</i> is non-zero and the offset of the last byte of the
30884		requested segment is the maximum value for an object of type <b>off_t</b> , when the process (for
30885		F_SETLK and F_SETLKW) or open file description (for F_OFD_SETLK and F_OFD_SETLKW)
30886		has an existing lock in which <i>l_len</i> is 0 and which includes the last byte of the requested
30887		segment, shall be treated as a request to unlock from the start of the requested segment with an
30888		<i>l_len</i> equal to 0. Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the
30889		requested segment.
30890	SHM	When the file descriptor <i>fildes</i> refers to a shared memory object, the behavior of <i>fcntl()</i> shall be
30891		the same as for a regular file except the effect of the following values for the argument <i>cmd</i> is
30892		unspecified: F_SETFL, F_GETLK, F_SETLK, F_SETLKW, F_OFD_GETLK, F_OFD_SETLK, and
30893		F_OFD_SETLKW.
30894	TYM	If <i>fildes</i> refers to a typed memory object, the result of the <i>fcntl()</i> function is unspecified.

30895 **RETURN VALUE**30896 Upon successful completion, the value returned shall depend on *cmd* as follows:

30897 F\_DUPFD A new file descriptor.

30898 F\_DUPFD\_CLOEXEC

30899 A new file descriptor.

30900 F\_DUPFD\_CLOFORK

30901 A new file descriptor.

30902 F\_GETFD Value of flags defined in **<fcntl.h>**. The return value shall not be negative.30903 F\_SETFD Value other than  $-1$ .30904 F\_GETFL Value of file status flags and access modes. The return value shall not be  
30905 negative.30906 F\_SETFL Value other than  $-1$ .30907 F\_GETLK Value other than  $-1$ .30908 F\_SETLK Value other than  $-1$ .30909 F\_SETLKW Value other than  $-1$ .30910 F\_OFD\_GETLK Value other than  $-1$ .30911 F\_OFD\_SETLK Value other than  $-1$ .

30912 F\_OFD\_SETLKW

30913 Value other than  $-1$ .30914 F\_GETOWN Value of the socket owner process or process group; this shall not be  $-1$ .30915 F\_SETOWN Value other than  $-1$ .30916 F\_GETOWN\_EX Value other than  $-1$ .30917 F\_SETOWN\_EX Value other than  $-1$ .30918 Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.30919 **ERRORS**30920 The *fcntl()* function shall fail if:

30921 [EACCES] or [EAGAIN]

30922 The *cmd* argument is F\_SETLK, the type of lock (*l\_type*) is a shared (F\_RDLCK)  
30923 or exclusive (F\_WRLCK) lock, and the requested lock cannot be set because it  
30924 is blocked by an existing lock on the file.30925 [EAGAIN] The *cmd* argument is F\_OFD\_SETLK, the type of lock (*l\_type*) is a shared  
30926 (F\_RDLCK) or exclusive (F\_WRLCK) lock, and the requested lock cannot be  
30927 set because it is blocked by an existing lock on the file.30928 [EBADF] The *fildev* argument is not a valid open file descriptor; or the argument *cmd* is  
30929 F\_SETLK, F\_SETLKW, F\_OFD\_SETLK, or F\_OFD\_SETLKW, the type of lock,  
30930 *l\_type*, is a shared lock (F\_RDLCK), and *fildev* is not a valid file descriptor open  
30931 for reading, or the type of lock, *l\_type*, is an exclusive lock (F\_WRLCK), and  
30932 *fildev* is not a valid file descriptor open for writing.

30933	[EINTR]	The <i>cmd</i> argument is F_SETLKW or F_OFD_SETLKW and the function was interrupted by a signal.
30934		
30935	[EINVAL]	The <i>cmd</i> argument is invalid; or the <i>cmd</i> argument is F_DUPFD, F_DUPFD_CLOEXEC, or F_DUPFD_CLOFORK and <i>arg</i> is negative or is greater than or equal to {OPEN_MAX}; or the <i>cmd</i> argument is F_SETOWN_EX and the <i>type</i> member of the <b>f_owner_ex</b> structure pointed to by <i>arg</i> is invalid, or the <i>pid</i> member is negative and the <i>type</i> member is F_OWNER_PID or F_OWNER_PGRP; or the <i>cmd</i> argument is F_GETLK, F_SETLK, F_SETLKW, F_OFD_GETLK, F_OFD_SETLK, or F_OFD_SETLKW and the data pointed to by <i>arg</i> is not valid, or <i>fildev</i> refers to a file that does not support locking.
30936		
30937		
30938		
30939		
30940		
30941		
30942		
30943		
30944	[EMFILE]	The argument <i>cmd</i> is F_DUPFD, F_DUPFD_CLOEXEC, or F_DUPFD_CLOFORK and all file descriptors available to the process are currently open, or no file descriptors greater than or equal to <i>arg</i> are available.
30945		
30946		
30947	[ENOLCK]	The argument <i>cmd</i> is F_SETLK, F_SETLKW, F_OFD_SETLK, or F_OFD_SETLKW and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.
30948		
30949		
30950	[EOVERFLOW]	One of the values to be returned cannot be represented correctly.
30951	[EOVERFLOW]	The <i>cmd</i> argument is F_GETLK, F_SETLK, F_SETLKW, F_OFD_GETLK, F_OFD_SETLK, or F_OFD_SETLKW and the smallest or, if <i>l_len</i> is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type <b>off_t</b> .
30952		
30953		
30954		
30955	[ESRCH]	The <i>cmd</i> argument is F_SETOWN or F_SETOWN_EX and no process or process group can be found corresponding to that specified by <i>arg</i> .
30956		
30957		The <i>fcntl()</i> function may fail if:
30958	[EDEADLK]	The <i>cmd</i> argument is F_SETLKW or F_OFD_SETLKW, the type of lock ( <i>l_type</i> ) is a shared (F_RDLCK) or exclusive (F_WRLCK) lock, the requested lock is blocked by an existing lock on the file, and the system determines that waiting for that lock to be released would cause a deadlock.
30959		
30960		
30961		
30962	[EINVAL]	The <i>cmd</i> argument is F_SETOWN and the value of <i>arg</i> is positive and is not valid as a process ID or the value of <i>arg</i> is negative and its absolute value is not valid as a process group ID; or the <i>cmd</i> argument is F_SETOWN_EX, the value of the <i>type</i> member of the <b>f_owner_ex</b> structure pointed to by <i>arg</i> is F_OWNER_PID, and the value of the <i>pid</i> member is not valid as a process ID; or the <i>cmd</i> argument is F_SETOWN_EX, the value of the <i>type</i> member of the <b>f_owner_ex</b> structure pointed to by <i>arg</i> is F_OWNER_PGRP, and the value of the <i>pid</i> member is not valid as a process group ID.
30963		
30964		
30965		
30966		
30967		
30968		
30969		
30970	[EPERM]	The <i>cmd</i> argument is F_SETOWN or F_SETOWN_EX and the calling process does not have permission to send a SIGURG signal to any process specified by <i>arg</i> .
30971		
30972		

## 30973 EXAMPLES

## 30974 Locking and Unlocking a File

30975 The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then  
 30976 later remove it. F\_SETLK is used to perform a non-blocking lock request so that the process does  
 30977 not have to wait if an incompatible lock is held by another process; instead the process can take  
 30978 some other action.

```

30979 #include <stdlib.h>
30980 #include <unistd.h>
30981 #include <fcntl.h>
30982 #include <errno.h>
30983 #include <stdio.h>

30984 int
30985 main(int argc, char *argv[])
30986 {
30987     int fd;
30988     struct flock fl;

30989     fd = open("testfile", O_RDWR);
30990     if (fd == -1)
30991         /* Handle error */;

30992     /* Make a non-blocking request to place a write lock
30993        on bytes 100-109 of testfile */

30994     fl.l_type = F_WRLCK;
30995     fl.l_whence = SEEK_SET;
30996     fl.l_start = 100;
30997     fl.l_len = 10;

30998     if (fcntl(fd, F_SETLK, &fl) == -1) {
30999         if (errno == EACCES || errno == EAGAIN) {
31000             printf("Already locked by another process\n");
31001             /* We cannot get the lock at the moment */
31002         } else {
31003             /* Handle unexpected error */;
31004         }
31005     } else { /* Lock was granted... */

31006         /* Perform I/O on bytes 100 to 109 of file */

31007         /* Unlock the locked bytes */

31008         fl.l_type = F_UNLCK;
31009         fl.l_whence = SEEK_SET;
31010         fl.l_start = 100;
31011         fl.l_len = 10;
31012         if (fcntl(fd, F_SETLK, &fl) == -1)
31013             /* Handle error */;
31014     }
31015     exit(EXIT_SUCCESS);
31016 } /* main */

```

31017 **Setting the Close-on-Exec Flag**31018 The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```

31019 #include <unistd.h>
31020 #include <fcntl.h>
31021 ...
31022     int flags;
31023
31024     flags = fcntl(fd, F_GETFD);
31025     if (flags == -1)
31026         /* Handle error */;
31027     flags |= FD_CLOEXEC;
31028     if (fcntl(fd, F_SETFD, flags) == -1)
31029         /* Handle error */;

```

31029 **APPLICATION USAGE**

31030 The *arg* values to `F_GETFD`, `F_SETFD`, `F_GETFL`, and `F_SETFL` all represent flag values to allow  
 31031 for future growth. Applications using these functions should do a read-modify-write operation  
 31032 on them, rather than assuming that only the values defined by this volume of POSIX.1-2024 are  
 31033 valid. It is a common error to forget this, particularly in the case of `F_SETFD`. Some  
 31034 implementations set additional file status flags to advise the application of default behavior,  
 31035 even though the application did not request these flags.

31036 In order to set both `FD_CLOEXEC` and `FD_CLOFORK` when duplicating a file descriptor,  
 31037 applications should use `F_DUPFD_CLOFORK` to obtain the new file descriptor with  
 31038 `FD_CLOFORK` already set, and then use `F_SETFD` to set the `FD_CLOEXEC` flag on the new  
 31039 descriptor. (The alternative of first using `F_DUPFD_CLOEXEC` and then setting `FD_CLOFORK`  
 31040 with `F_SETFD` has a timing window where another thread could create a child process which  
 31041 inherits the new descriptor because `FD_CLOFORK` has not yet been set.)

31042 The `FD_CLOFORK` flag takes effect for all child processes, not just those created using `fork()` or  
 31043 `_Fork()`.

31044 On implementations where process IDs can be greater than `{INT_MAX}`, `F_SETOWN` cannot be  
 31045 used with process IDs greater than `{INT_MAX}` or process group IDs greater than `{INT_MAX}+1`  
 31046 because the value is passed to `fcntl()` in an argument of type `int`. In this situation,  
 31047 `F_SETOWN_EX` should be used instead.

31048 Similarly, if a process ID greater than `{INT_MAX}` or a process group ID greater than  
 31049 `{INT_MAX}+1` has been set to receive SIGURG signals (using `F_SETOWN_EX`), `F_GETOWN`  
 31050 cannot be used to obtain the value because `fcntl()` returns the value as type `int` and will thus  
 31051 give an `[EOVERFLOW]` error for such values. `F_GETOWN_EX` should be used instead.

31052 Note that the convention of negating a process group ID is only used with `F_SETOWN` and  
 31053 `F_GETOWN`; the `pid` member of the `f_owner_ex` structure used with `F_SETOWN_EX` and  
 31054 `F_GETOWN_EX` is not negated when it specifies a process group ID.

31055 On systems which do not perform permission checks at the time of an `fcntl()` call with  
 31056 `F_SETOWN` or `F_SETOWN_EX`, if the permission checks performed at the time the signal is sent  
 31057 disallow sending the signal to any process, the process that called `fcntl()` has no way of  
 31058 discovering that this has happened. A call to `kill()` with signal 0 can be used as a prior check of  
 31059 permissions, although this is no guarantee that permission will be granted at the time a signal is  
 31060 sent, since the target process(es) could change user IDs or privileges in the meantime.

31061 Record-locking should not be used in combination with buffered standard I/O streams (see  
 31062 [Section 2.5](#), on page 521). Instead, non-buffered I/O should be used. Unexpected results may

31063 occur in processes that do buffering in the user address space. The process may later read/write  
 31064 data which is/was locked. Functions that operate on standard I/O streams are the most  
 31065 common source of such buffering.

#### 31066 RATIONALE

31067 The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number  
 31068 of arguments. It is used because System V uses pointers for the implementation of file locking  
 31069 functions.

31070 This volume of POSIX.1-2024 permits concurrent read and write access to file data using the  
 31071 *fcntl()* function; this is a change from the 1984 /usr/group standard and early proposals.  
 31072 Without concurrency controls, this feature may not be fully utilized without occasional loss of  
 31073 data.

31074 Data losses occur in several ways. One case occurs when several processes try to update the  
 31075 same record, without sequencing controls; several updates may occur in parallel and the last  
 31076 writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing  
 31077 reorganization. Without exclusive use to the tree segment by the updating process, other reading  
 31078 processes chance getting lost in the database when the index blocks are split, condensed,  
 31079 inserted, or deleted. While *fcntl()* is useful for many applications, it is not intended to be overly  
 31080 general and does not handle the bit-tree example well.

31081 This facility is only required for regular files because it is not appropriate for many devices such  
 31082 as terminals and network connections.

31083 Since *fcntl()* works with “any file descriptor associated with that file, however it is obtained”,  
 31084 the file descriptor may have been inherited through a *fork()* or *exec* operation and thus may  
 31085 affect a file that another process also has open.

31086 The use of the open file description to identify what to lock requires extra calls and presents  
 31087 problems if several processes are sharing an open file description, but there are too many  
 31088 implementations of the existing mechanism for this volume of POSIX.1-2024 to use different  
 31089 specifications.

31090 Another consequence of this model is that closing any file descriptor for a given file (whether or  
 31091 not it is the same open file description that created the lock) causes the locks on that file to be  
 31092 relinquished for that process. Equivalently, any close for any file/process pair relinquishes the  
 31093 locks owned on that file for that process. But note that while an open file description may be  
 31094 shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through  
 31095 one of the *exec* functions.

31096 The identification of a machine in a network environment is outside the scope of this volume of  
 31097 POSIX.1-2024. Thus, an *l\_sysid* member, such as found in System V, is not included in the locking  
 31098 structure.

31099 Changing of lock types can result in a previously locked region being split into smaller regions.

31100 Mandatory locking was a major feature of the 1984 /usr/group standard.

31101 For advisory file record locking to be effective, all processes that have access to a file must  
 31102 cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode  
 31103 record locking is important when it cannot be assumed that all processes are cooperating. For  
 31104 example, if one user uses an editor to update a file at the same time that a second user executes  
 31105 another process that updates the same file and if only one of the two processes is using advisory  
 31106 locking, the processes are not cooperating. Enforcement-mode record locking would protect  
 31107 against accidental collisions.

31108 Secondly, advisory record locking requires a process using locking to bracket each I/O operation

31109 with lock (or test) and unlock operations. With enforcement-mode file and record locking, a  
 31110 process can lock the file once and unlock when all I/O operations have been completed.  
 31111 Enforcement-mode record locking provides a base that can be enhanced; for example, with  
 31112 sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so  
 31113 other processes could read it, but none of them could write it.

31114 Mandatory locks were omitted for several reasons:

- 31115 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most  
 31116 implementations; this was confusing, at best.
- 31117 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
- 31118 3. Any publicly readable file could be locked by anyone. Many historical implementations  
 31119 keep the password database in a publicly readable file. A malicious user could thus  
 31120 prohibit logins. Another possibility would be to hold open a long-distance telephone line.
- 31121 4. Some demand-paged historical implementations offer memory mapped files, and  
 31122 enforcement cannot be done on that type of file.

31123 Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a  
 31124 timeout facility in applications requiring it. This is useful in deadlock detection. Since  
 31125 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was  
 31126 made optional.

31127 The F\_SETOWN\_EX and F\_GETOWN\_EX values for *cmd* and the associated **f\_owner\_ex**  
 31128 structure were adopted from the GNU C library. In addition to the values F\_OWNER\_PID and  
 31129 F\_OWNER\_PGRP for the *type* member, this also has F\_OWNER\_TID to specify that the *pid*  
 31130 member contains a thread ID. However, this relies on thread IDs being representable in a **pid\_t**  
 31131 and so was not included in POSIX.1-2024. The aim of adding F\_SETOWN\_EX and  
 31132 F\_GETOWN\_EX was to address the inability of F\_SETOWN and F\_GETOWN to handle process  
 31133 IDs greater than {INT\_MAX} and process group IDs greater than {INT\_MAX}+1, and this need is  
 31134 satisfied without including F\_OWNER\_TID.

### 31135 FUTURE DIRECTIONS

31136 None.

### 31137 SEE ALSO

31138 *alarm()*, *close()*, *exec*, *kill()*, *open()*, *sigaction()*

31139 XBD <fcntl.h>, <signal.h>

### 31140 CHANGE HISTORY

31141 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 31142 Issue 5

31143 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 31144 Threads Extension.

31145 Large File Summit extensions are added.

#### 31146 Issue 6

31147 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

31148 The following new requirements on POSIX implementations derive from alignment with the  
 31149 Single UNIX Specification:

- 31150 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 31151 required for conforming implementations of previous POSIX specifications, it was not  
 31152 required for UNIX applications.

31153 • In the DESCRIPTION, sentences describing behavior when *l\_len* is negative are now  
 31154 mandated, and the description of unlock (F\_UNLOCK) when *l\_len* is non-negative is  
 31155 mandated.

31156 • In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd*  
 31157 is invalid, and two [EOVERFLOW] error conditions are added.

31158 The F\_GETOWN and F\_SETOWN values are added for sockets.

31159 The following changes were made to align with the IEEE P1003.1a draft standard:

31160 • Clarification is added that the extent of the bytes locked is determined prior to the  
 31161 blocking action.

31162 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 31163 *fcntl()* results are unspecified for typed memory objects.

31164 The normative text is updated to avoid use of the term “must” for application requirements.

31165 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the  
 31166 EXAMPLES section.

#### 31167 Issue 7

31168 Austin Group Interpretation 1003.1-2001 #150 is applied, clarifying the file status flags returned  
 31169 when *cmd* is F\_GETFL.

31170 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
 31171 FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.

31172 The optional `<unistd.h>` header is removed from this function, since `<fcntl.h>` now defines  
 31173 SEEK\_SET, SEEK\_CUR, and SEEK\_END as part of the Base.

31174 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0116 [141] is applied.

31175 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0105 [835], XSH/TC2-2008/0106 [677],  
 31176 XSH/TC2-2008/0107 [484], XSH/TC2-2008/0108 [675], and XSH/TC2-2008/0109 [675,677] are  
 31177 applied.

#### 31178 Issue 8

31179 Austin Group Defect 695 is applied, adding an atomicity requirement to the F\_SETOWN  
 31180 operation.

31181 Austin Group Defects 768 and 1671 are applied, adding OFD-owned file locks.

31182 Austin Group Defect 1203 is applied, changing some wording in the RETURN VALUE section to  
 31183 use “shall”.

31184 Austin Group Defects 1274 and 1670 are applied, adding F\_GETOWN\_EX and F\_SETOWN\_EX.

31185 Austin Group Defect 1318 is applied, adding FD\_CLOFORK and F\_DUPFD\_CLOFORK.

31186 **NAME**31187 `fdatasync` — synchronize the data of a file (**REALTIME**)31188 **SYNOPSIS**

```
31189 SIO #include <unistd.h>
31190 int fdatasync(int fildes);
```

31191 **DESCRIPTION**

31192 The `fdatasync()` function shall force all currently queued I/O operations associated with the file  
 31193 indicated by file descriptor `fildes` to the synchronized I/O completion state.

31194 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`  
 31195 defined, with the exception that all I/O operations shall be completed as defined for  
 31196 synchronized I/O data integrity completion.

31197 **RETURN VALUE**

31198 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return  
 31199 the value `-1` and set `errno` to indicate the error. If the `fdatasync()` function fails, outstanding I/O  
 31200 operations are not guaranteed to have been completed.

31201 **ERRORS**

31202 The `fdatasync()` function shall fail if:

31203 [EBADF] The `fildes` argument is not a valid file descriptor.

31204 [EINVAL] This implementation does not support synchronized I/O for this file.

31205 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error  
 31206 conditions defined for `read()` and `write()`.

31207 **EXAMPLES**

31208 None.

31209 **APPLICATION USAGE**

31210 Note that even if the file descriptor is not open for writing, if there are any pending write  
 31211 requests on the underlying file, then that I/O will be completed prior to the return of `fdatasync()`.

31212 An application that modifies a directory, for example, by creating a file in the directory, can  
 31213 invoke `fdatasync()` on the directory to ensure that the directory's entries are synchronized,  
 31214 although for most applications this should not be necessary (see XBD Section 4.11, on page 98).

31215 **RATIONALE**

31216 None.

31217 **FUTURE DIRECTIONS**

31218 None.

31219 **SEE ALSO**

31220 `aio_fsync()`, `fcntl()`, `fsync()`, `open()`, `read()`, `write()`

31221 XBD `<unistd.h>`

31222 **CHANGE HISTORY**

31223 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

31224 **Issue 6**

31225 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 31226 implementation does not support the Synchronized Input and Output option.

31227 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

31228 **Issue 7**

31229 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0110 [501] is applied.

31230 **Issue 8**

31231 Austin Group Defect 672 is applied, changing the APPLICATION USAGE section.

31232 **NAME**

31233 fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

31234 **SYNOPSIS**

```
31235 #include <math.h>
31236 double fdim(double x, double y);
31237 float fdimf(float x, float y);
31238 long double fdiml(long double x, long double y);
```

31239 **DESCRIPTION**

31240 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31241 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31242 volume of POSIX.1-2024 defers to the ISO C standard.

31243 These functions shall determine the positive difference between their arguments. If  $x$  is greater  
 31244 than  $y$ ,  $x-y$  is returned. If  $x$  is less than or equal to  $y$ ,  $+0$  is returned.

31245 An application wishing to check for error situations should set *errno* to zero and call  
 31246 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 31247 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 31248 zero, an error has occurred.

31249 **RETURN VALUE**

31250 Upon successful completion, these functions shall return the positive difference value.

31251 If  $x-y$  is positive and overflows, a range error shall occur and *fdim()*, *fdimf()*, and *fdiml()* shall  
 31252 return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

31253 If the correct value would cause underflow, a range error may occur, and *fdim()*, *fdimf()*, and  
 31254 MXX *fdiml()* shall return the correct value, or (if the IEC 60559 Floating-Point option is not  
 31255 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 31256 FLT\_MIN, and LDBL\_MIN, respectively.

31257 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

31258 **ERRORS**31259 The *fdim()* function shall fail if:

31260 Range Error The result overflows.

31261 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 31262 then *errno* shall be set to [ERANGE]. If the integer expression  
 31263 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 31264 floating-point exception shall be raised.

31265 The *fdim()* function may fail if:

31266 Range Error The result underflows.

31267 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 31268 then *errno* shall be set to [ERANGE]. If the integer expression  
 31269 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 31270 floating-point exception shall be raised.

31271 **EXAMPLES**

31272 None.

31273 **APPLICATION USAGE**

31274 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
31275 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

31276 **RATIONALE**

31277 None.

31278 **FUTURE DIRECTIONS**

31279 None.

31280 **SEE ALSO**31281 [fclearexcept\(\)](#), [fetestexcept\(\)](#), [fmax\(\)](#), [fmin\(\)](#)31282 [Section 4.23](#) (on page 109), [<math.h>](#)31283 **CHANGE HISTORY**

31284 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31285 **Issue 7**

31286 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0119 [68,428] and  
31287 XSH/TC1-2008/0120 [68,428] are applied.

31288 **NAME**

31289 fdopen — associate a stream with a file descriptor

31290 **SYNOPSIS**

```
31291 CX #include <stdio.h>
31292 FILE *fdopen(int fildev, const char *mode);
```

31293 **DESCRIPTION**31294 The *fdopen()* function shall associate a stream with a file descriptor.

31295 The *mode* argument points to a character string that is valid for *fopen()*. If the string begins with  
 31296 one of the following characters, then the stream shall be associated with *fildev* as specified.  
 31297 Otherwise, the behavior is undefined.

31298 'r' If *mode* includes '+', the associated stream shall be open for update (reading and  
 31299 writing); otherwise, the stream shall be open for reading only. If the open file description  
 31300 referenced by *fildev* has O\_APPEND set, it shall remain set.

31301 'w' If *mode* includes '+', the associated stream shall be open for update (reading and  
 31302 writing); otherwise, the stream shall be open for writing only. The file shall not be  
 31303 truncated by the *fdopen()* call. If the open file description referenced by *fildev* has  
 31304 O\_APPEND set, it shall remain set.

31305 'a' If *mode* includes '+', the associated stream shall be open for update (reading and  
 31306 writing); otherwise, the stream shall be open for writing only. If the open file description  
 31307 referenced by *fildev* has O\_APPEND clear, it is unspecified whether O\_APPEND is set by  
 31308 the *fdopen()* call or remains clear.

31309 The presence of 'x' in *mode* shall have no effect. The FD\_CLOEXEC flag of *fildev* shall be  
 31310 unchanged if 'e' is not present, and shall be set by the *fdopen()* call if 'e' is present.

31311 Additional values for the *mode* argument may be supported by an implementation.

31312 The application shall ensure that the mode of the stream as expressed by the *mode* argument is  
 31313 allowed by the file access mode of the open file description to which *fildev* refers. The file  
 31314 position indicator associated with the new stream is set to the position indicated by the file offset  
 31315 associated with the file descriptor.

31316 The error and end-of-file indicators for the stream shall be cleared. The *fdopen()* function may  
 31317 cause the last data access timestamp of the underlying file to be marked for update.

31318 SHM If *fildev* refers to a shared memory object, the result of the *fdopen()* function is unspecified.31319 TYM If *fildev* refers to a typed memory object, the result of the *fdopen()* function is unspecified.

31320 The *fdopen()* function shall preserve the offset maximum previously set for the open file  
 31321 description corresponding to *fildev*.

31322 **RETURN VALUE**

31323 Upon successful completion, *fdopen()* shall return a pointer to a stream; otherwise, a null pointer  
 31324 shall be returned and *errno* set to indicate the error.

31325 **ERRORS**31326 The *fdopen()* function shall fail if:

31327 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

31328 The *fdopen()* function may fail if:

- 31329 [EBADF] The *fildev* argument is not a valid file descriptor.
- 31330 [EINVAL] The *mode* argument is not a valid mode.
- 31331 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.
- 31332 [ENOMEM] Insufficient space to allocate a buffer.

**31333 EXAMPLES**

31334 None.

**31335 APPLICATION USAGE**

31336 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but  
31337 do not return streams.

**31338 RATIONALE**

31339 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, *fcntl()*, or *socket()*;  
31340 inherited through *fork()*, *posix\_spawn()*, or *exec*; or perhaps obtained by other means.

31341 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, write ('w')  
31342 mode cannot create or truncate a file, and append ('a') mode cannot create a file. Inclusion of a  
31343 'b' in the *mode* argument is allowed for consistency with *fopen()*; the 'b' has no effect on the  
31344 resulting stream. Implementations differ as to whether specifying append ('a') mode causes  
31345 the O\_APPEND flag to be set if it was clear, but they are encouraged to do so. Since *fdopen()*  
31346 does not create a file, the 'x' mode modifier is silently ignored. The 'e' mode modifier is not  
31347 strictly necessary for *fdopen()*, since FD\_CLOEXEC must not be changed when it is absent;  
31348 however, it is standardized here since that modifier is necessary to avoid a data race in multi-  
31349 threaded applications using *freopen()*, and consistency dictates that all functions accepting *mode*  
31350 strings should allow the same set of strings.

**31351 FUTURE DIRECTIONS**

31352 None.

**31353 SEE ALSO**

31354 [Section 2.5.1](#) (on page 522), *fclose()*, *fmemopen()*, *fopen()*, *open()*, *open\_memstream()*,

31356 XBD <stdio.h>

**31357 CHANGE HISTORY**

31358 First released in Issue 1. Derived from Issue 1 of the SVID.

**31359 Issue 5**

31360 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

31361 Large File Summit extensions are added.

**31362 Issue 6**

31363 The following new requirements on POSIX implementations derive from alignment with the  
31364 Single UNIX Specification:

- 31365 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include  
31366 binary streams.
- 31367 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset  
31368 maximum in the open file description.
- 31369 • All errors identified in the ERRORS section are added.

31370 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st\_atime* to be  
31371 updated.

31372 The following changes were made to align with the IEEE P1003.1a draft standard:

31373 • Clarification is added that it is the responsibility of the application to ensure that the mode  
31374 is compatible with the open file descriptor.

31375 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
31376 *fdopen()* results are unspecified for typed memory objects.

31377 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the  
31378 RATIONALE.

31379 **Issue 7**

31380 SD5-XSH-ERN-149 is applied, adding the {STREAM\_MAX} [EMFILE] error condition.

31381 Changes are made related to support for finegrained timestamps.

31382 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0121 [409] is applied.

31383 **Issue 8**

31384 Austin Group Defects 411 and 1526 are applied, changing the requirements for the *mode*  
31385 argument.

31386 **NAME**

31387 fdopendir, opendir — open directory associated with file descriptor

31388 **SYNOPSIS**

```
31389 #include <dirent.h>
31390 DIR *fdopendir(int fd);
31391 DIR *opendir(const char *dirname);
```

31392 **DESCRIPTION**

31393 The *fdopendir()* function shall be equivalent to the *opendir()* function except that the directory is  
 31394 specified by a file descriptor rather than by a name. The file offset associated with the file  
 31395 descriptor at the time of the call determines which entries are returned.

31396 Upon successful return from *fdopendir()*, the file descriptor is under the control of the system,  
 31397 and if any attempt is made to close the file descriptor, or to modify the state of the associated  
 31398 XSI description, other than by means of *closedir()*, *readdir()*, *readdir\_r()*, *rewinddir()*, or *seekdir()*, the  
 31399 behavior is undefined. Upon calling *closedir()* the file descriptor shall be closed.

31400 It is unspecified whether the FD\_CLOEXEC flag will be set on the file descriptor by a successful  
 31401 call to *fdopendir()* if it was not previously set. However, the flag shall not be cleared if it was  
 31402 previously set.

31403 The *opendir()* function shall open a directory stream corresponding to the directory named by  
 31404 the *dirname* argument. The directory stream shall be positioned at the first entry. If *opendir()*  
 31405 opens a file descriptor for *dirname* to associate with the returned stream:

- 31406 • The descriptor shall be allocated as if the O\_DIRECTORY and O\_CLOEXEC flags were  
 31407 passed to *open()*.
- 31408 • The descriptor shall be subject to the limit of {OPEN\_MAX} file descriptors available to the  
 31409 process.

31410 **RETURN VALUE**

31411 Upon successful completion, these functions shall return a pointer to an object of type **DIR**.  
 31412 Otherwise, these functions shall return a null pointer and set *errno* to indicate the error.

31413 **ERRORS**

31414 The *fdopendir()* function shall fail if:

- 31415 [EBADF] The *fd* argument is not a valid file descriptor open for reading.
- 31416 [ENOTDIR] The descriptor *fd* is not associated with a directory.

31417 The *opendir()* function shall fail if:

- 31418 [EACCES] Search permission is denied for the component of the path prefix of *dirname* or  
 31419 read permission is denied for *dirname*.
- 31420 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname*  
 31421 argument.
- 31422 [ENAMETOOLONG]  
 31423 The length of a component of a pathname is longer than {NAME\_MAX}.
- 31424 [ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an  
 31425 empty string.
- 31426 [ENOTDIR] A component of *dirname* names an existing file that is neither a directory nor a  
 31427 symbolic link to a directory.

- 31428 The *opendir()* function may fail if:
- 31429 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
31430 resolution of the *dirname* argument.
- 31431 [EMFILE] All file descriptors available to the process are currently open.
- 31432 [ENAMETOOLONG]  
31433 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
31434 symbolic link produced an intermediate result with a length that exceeds  
31435 {PATH\_MAX}.
- 31436 [ENFILE] Too many files are currently open in the system.

31437 **EXAMPLES**31438 **Open a Directory Stream**

31439 The following program fragment demonstrates how the *opendir()* function is used.

```
31440 #include <dirent.h>
31441 ...
31442     DIR *dir;
31443     struct dirent *dp;
31444 ...
31445     if ((dir = opendir(".")) == NULL) {
31446         perror("Cannot open .");
31447         exit(1);
31448     }
31449     while ((dp = readdir(dir)) != NULL) {
31450         ...
```

31451 **Find And Open a File**

31452 The following program searches through a given directory looking for files whose name does  
31453 not begin with a dot and whose size is larger than 1 MiB.

```
31454 #include <stdio.h>
31455 #include <dirent.h>
31456 #include <fcntl.h>
31457 #include <sys/stat.h>
31458 #include <stdint.h>
31459 #include <stdlib.h>
31460 #include <unistd.h>
31461 int
31462 main(int argc, char *argv[])
31463 {
31464     struct stat statbuf;
31465     DIR *d;
31466     struct dirent *dp;
31467     int dfd, ffd;
31468     if ((d = fdopendir((dfd = open("./tmp", O_RDONLY)))) == NULL) {
31469         fprintf(stderr, "Cannot open ./tmp directory\n");
31470         exit(1);
31471     }
31472     while ((dp = readdir(d)) != NULL) {
```

```

31473         if (dp->d_name[0] == '.')
31474             continue;
31475         /* there is a possible race condition here as the file
31476          * could be renamed between the readdir and the open */
31477         if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {
31478             perror(dp->d_name);
31479             continue;
31480         }
31481         if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {
31482             /* found it ... */
31483             printf("%s: %jdK\n", dp->d_name,
31484                 (intmax_t)(statbuf.st_size / 1024));
31485         }
31486         close(ffd);
31487     }
31488     closedir(d); // note this implicitly closes dfd
31489     return 0;
31490 }

```

### APPLICATION USAGE

The `opendir()` function should be used in conjunction with `readdir()`, `closedir()`, and `rewinddir()` to examine the contents of the directory (see the EXAMPLES section in `readdir()`). This method is recommended for portability.

### RATIONALE

The purpose of the `fdopendir()` function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to `opendir()`, resulting in unspecified behavior.

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of POSIX.1-2024 does not mandate that `opendir()` opens a file descriptor to associate with the stream; this may instead be done by the first call to `dirfd()`, thus avoiding the need to allocate a file descriptor if `dirfd()` is never called. Once a file descriptor has been associated with the stream, it is mandatory that `closedir()` deallocate the file descriptor. If `opendir()` opens a file descriptor to associate with the stream, it behaves as if the `O_CLOEXEC` flag for `open()` had been used, so that the `FD_CLOEXEC` flag is set for the file descriptor. If `fdopendir()` is used to create a directory stream, it is unspecified whether the `FD_CLOEXEC` flag on the file descriptor specified by the `fd` argument is set or left unchanged.

The directory entries for dot and dot-dot are optional. This volume of POSIX.1-2024 does not provide a way to test *a priori* for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a “normal” entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of POSIX.1-2024 imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a `dirp` value or a `dirent` structure value after a directory stream has been closed or after a `fork()` or one of the `exec` function calls.

31521 **FUTURE DIRECTIONS**

31522 None.

31523 **SEE ALSO**31524 *closedir()*, *dirfd()*, *fstatat()*, *open()*, *posix\_getdents()*, *readdir()*, *rewinddir()*, *symlink()*31525 XBD <*dirent.h*>, <*fcntl.h*>, <*sys/types.h*>31526 **CHANGE HISTORY**

31527 First released in Issue 2.

31528 **Issue 6**31529 In the SYNOPSIS, the optional include of the <*sys/types.h*> header is removed.31530 The following new requirements on POSIX implementations derive from alignment with the  
31531 Single UNIX Specification:31532 • The requirement to include <*sys/types.h*> has been removed. Although <*sys/types.h*> was  
31533 required for conforming implementations of previous POSIX specifications, it was not  
31534 required for UNIX applications.

31535 • The [ELOOP] mandatory error condition is added.

31536 • A second [ENAMETOOLONG] is added as an optional error condition.

31537 The following changes were made to align with the IEEE P1003.1a draft standard:

31538 • The [ELOOP] optional error condition is added.

31539 **Issue 7**

31540 Austin Group Interpretation 1003.1-2001 #143 is applied.

31541 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

31542 The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API  
31543 Set Part 2.

31544 An additional example is added.

31545 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0122 [422] and XSH/TC1-2008/0123  
31546 [324] are applied.31547 **Issue 8**31548 Austin Group Defect 368 is applied, adding a requirement for FD\_CLOEXEC to be set by  
31549 *opendir()* if it associates a file descriptor with the returned stream.31550 Austin Group Defect 411 is applied, clarifying that FD\_CLOEXEC is not cleared by *fdopendir()* if  
31551 it was previously set.31552 Austin Group Defect 697 is applied, adding *posix\_getdents()* to the SEE ALSO section.31553 Austin Group Defect 1360 is applied, clarifying that type **DIR** always has the ability to store a  
31554 file descriptor; what is optional is whether one is opened by *opendir()*.

31555 **NAME**

31556           feclearexcept — clear floating-point exception

31557 **SYNOPSIS**

31558           #include &lt;fenv.h&gt;

31559           int feclearexcept(int *excepts*);31560 **DESCRIPTION**

31561 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
31562       conflict between the requirements described here and the ISO C standard is unintentional. This  
31563       volume of POSIX.1-2024 defers to the ISO C standard.

31564       The *feclearexcept()* function shall attempt to clear the supported floating-point exceptions  
31565       represented by *excepts*.

31566 **RETURN VALUE**

31567       If the argument is zero or if all the specified exceptions were successfully cleared, *feclearexcept()*  
31568       shall return zero. Otherwise, it shall return a non-zero value.

31569 **ERRORS**

31570       No errors are defined.

31571 **EXAMPLES**

31572       None.

31573 **APPLICATION USAGE**

31574       None.

31575 **RATIONALE**

31576       None.

31577 **FUTURE DIRECTIONS**

31578       None.

31579 **SEE ALSO**31580       *fegetexceptflag()*, *feraiseexcept()*, *fetestexcept()*

31581       XBD &lt;fenv.h&gt;

31582 **CHANGE HISTORY**

31583       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31584       ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

31585 **NAME**

31586 fegetenv, fesetenv — get and set current floating-point environment

31587 **SYNOPSIS**

```
31588 #include <fenv.h>
31589 int fegetenv(fenv_t *envp);
31590 int fesetenv(const fenv_t *envp);
```

31591 **DESCRIPTION**

31592 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31593 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31594 volume of POSIX.1-2024 defers to the ISO C standard.

31595 The *fegetenv()* function shall attempt to store the current floating-point environment in the object  
 31596 pointed to by *envp*.

31597 The *fesetenv()* function shall attempt to establish the floating-point environment represented by  
 31598 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to  
 31599 *fegetenv()* or *fehldexcept()*, or equal a floating-point environment macro. The *fesetenv()* function  
 31600 does not raise floating-point exceptions, but only installs the state of the floating-point status  
 31601 flags represented through its argument.

31602 **RETURN VALUE**

31603 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall  
 31604 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return  
 31605 zero. Otherwise, it shall return a non-zero value.

31606 **ERRORS**

31607 No errors are defined.

31608 **EXAMPLES**

31609 None.

31610 **APPLICATION USAGE**

31611 None.

31612 **RATIONALE**

31613 None.

31614 **FUTURE DIRECTIONS**

31615 None.

31616 **SEE ALSO**31617 *fehldexcept()*, *feupdateenv()*31618 XBD **<fenv.h>**31619 **CHANGE HISTORY**

31620 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31621 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

31622 **NAME**

31623 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

31624 **SYNOPSIS**

31625 #include &lt;fenv.h&gt;

31626 int fegetexceptflag(fexcept\_t \*flagp, int excepts);

31627 int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

31628 **DESCRIPTION**31629 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31630 conflict between the requirements described here and the ISO C standard is unintentional. This  
31631 volume of POSIX.1-2024 defers to the ISO C standard.31632 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of  
31633 the states of the floating-point status flags indicated by the argument *excepts* in the object  
31634 pointed to by the argument *flagp*.31635 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the  
31636 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by  
31637 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument  
31638 represented at least those floating-point exceptions represented by the argument *excepts*. This  
31639 function does not raise floating-point exceptions, but only sets the state of the flags.31640 **RETURN VALUE**31641 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it  
31642 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions  
31643 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero  
31644 value.31645 **ERRORS**

31646 No errors are defined.

31647 **EXAMPLES**

31648 None.

31649 **APPLICATION USAGE**

31650 None.

31651 **RATIONALE**

31652 None.

31653 **FUTURE DIRECTIONS**

31654 None.

31655 **SEE ALSO**31656 [feclearexcept\(\)](#), [feraiseexcept\(\)](#), [fetestexcept\(\)](#)31657 XBD [<fenv.h>](#)31658 **CHANGE HISTORY**

31659 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31660 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

31661 **NAME**

31662 fegetround, fesetround — get and set current rounding direction

31663 **SYNOPSIS**

```
31664 #include <fenv.h>
31665 int fegetround(void);
31666 int fesetround(int round);
```

31667 **DESCRIPTION**

31668 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31669 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31670 volume of POSIX.1-2024 defers to the ISO C standard.

31671 The *fegetround()* function shall get the current rounding direction.

31672 The *fesetround()* function shall establish the rounding direction represented by its argument  
 31673 *round*. If the argument is not equal to the value of a rounding direction macro, the rounding  
 31674 direction is not changed.

31675 **RETURN VALUE**

31676 The *fegetround()* function shall return the value of the rounding direction macro representing the  
 31677 current rounding direction or a negative value if there is no such rounding direction macro or  
 31678 the current rounding direction is not determinable.

31679 The *fesetround()* function shall return a zero value if and only if the requested rounding direction  
 31680 was established.

31681 **ERRORS**

31682 No errors are defined.

31683 **EXAMPLES**

31684 The following example saves, sets, and restores the rounding direction, reporting an error and  
 31685 aborting if setting the rounding direction fails:

```
31686 #include <fenv.h>
31687 #include <assert.h>
31688 void f(int round_dir)
31689 {
31690     #pragma STDC FENV_ACCESS ON
31691     int save_round;
31692     int setround_ok;
31693     save_round = fegetround();
31694     setround_ok = fesetround(round_dir);
31695     assert(setround_ok == 0);
31696     /* ... */
31697     fesetround(save_round);
31698     /* ... */
31699 }
```

31700 **APPLICATION USAGE**

31701 None.

31702 **RATIONALE**

31703 None.

31704 **FUTURE DIRECTIONS**

31705 None.

31706 **SEE ALSO**

31707 XBD [<fenv.h>](#)

31708 **CHANGE HISTORY**

31709 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31710 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

31711 **NAME**

31712 feholdexcept — save current floating-point environment

31713 **SYNOPSIS**

31714 #include &lt;fenv.h&gt;

31715 int feholdexcept(fenv\_t \*envp);

31716 **DESCRIPTION**

31717 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31718 conflict between the requirements described here and the ISO C standard is unintentional. This  
31719 volume of POSIX.1-2024 defers to the ISO C standard.

31720 The *feholdexcept()* function shall save the current floating-point environment in the object  
31721 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on  
31722 floating-point exceptions) mode, if available, for all floating-point exceptions.

31723 **RETURN VALUE**

31724 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception  
31725 handling was successfully installed.

31726 **ERRORS**

31727 No errors are defined.

31728 **EXAMPLES**

31729 None.

31730 **APPLICATION USAGE**

31731 None.

31732 **RATIONALE**

31733 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard  
31734 implementations which have the default non-stop mode and at least one other mode for trap  
31735 handling or aborting. If the implementation provides only the non-stop mode, then installing the  
31736 non-stop mode is trivial.

31737 **FUTURE DIRECTIONS**

31738 None.

31739 **SEE ALSO**31740 *fegetenv()*, *feupdateenv()*

31741 XBD &lt;fenv.h&gt;

31742 **CHANGE HISTORY**

31743 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31744 **NAME**

31745 feof — test end-of-file indicator on a stream

31746 **SYNOPSIS**

31747 #include &lt;stdio.h&gt;

31748 int feof(FILE \*stream);

31749 **DESCRIPTION**

31750 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31751 conflict between the requirements described here and the ISO C standard is unintentional. This  
31752 volume of POSIX.1-2024 defers to the ISO C standard.

31753 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.31754 CX The *feof()* function shall not change the setting of *errno* if *stream* is valid.31755 **RETURN VALUE**31756 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.31757 **ERRORS**

31758 No errors are defined.

31759 **EXAMPLES**

31760 None.

31761 **APPLICATION USAGE**

31762 None.

31763 **RATIONALE**

31764 None.

31765 **FUTURE DIRECTIONS**

31766 None.

31767 **SEE ALSO**31768 [\*clearerr\(\)\*](#), [\*ferror\(\)\*](#), [\*fopen\(\)\*](#)31769 XBD [\*\*<stdio.h>\*\*](#)31770 **CHANGE HISTORY**

31771 First released in Issue 1. Derived from Issue 1 of the SVID.

31772 **Issue 7**

31773 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0124 [401] is applied.

31774 **NAME**

31775           feraiseexcept — raise floating-point exception

31776 **SYNOPSIS**

31777           #include &lt;fenv.h&gt;

31778           int feraiseexcept(int *excepts*);31779 **DESCRIPTION**

31780 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
31781       conflict between the requirements described here and the ISO C standard is unintentional. This  
31782       volume of POSIX.1-2024 defers to the ISO C standard.

31783       The *feraiseexcept()* function shall attempt to raise the supported floating-point exceptions  
31784       represented by the *excepts* argument. The order in which these floating-point exceptions are  
31785 MX       raised is unspecified, except that if the *excepts* argument represents IEC 60559 valid coincident  
31786       floating-point exceptions for atomic operations (namely overflow and inexact, or underflow and  
31787       inexact), then overflow or underflow shall be raised before inexact. Whether the *feraiseexcept()*  
31788       function additionally raises the inexact floating-point exception whenever it raises the overflow  
31789       or underflow floating-point exception is implementation-defined.

31790 **RETURN VALUE**

31791       If the argument is zero or if all the specified exceptions were successfully raised, *feraiseexcept()*  
31792       shall return zero. Otherwise, it shall return a non-zero value.

31793 **ERRORS**

31794       No errors are defined.

31795 **EXAMPLES**

31796       None.

31797 **APPLICATION USAGE**

31798       The effect is intended to be similar to that of floating-point exceptions raised by arithmetic  
31799       operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

31800 **RATIONALE**

31801       Raising overflow or underflow is allowed to also raise inexact because on some architectures the  
31802       only practical way to raise an exception is to execute an instruction that has the exception as a  
31803       side-effect. The function is not restricted to accept only valid coincident expressions for atomic  
31804       operations, so the function can be used to raise exceptions accrued over several operations.

31805 **FUTURE DIRECTIONS**

31806       None.

31807 **SEE ALSO**31808       [\*feclearexcept\(\)\*](#), [\*feketexceptflag\(\)\*](#), [\*fetestexcept\(\)\*](#)31809       XBD <[\*\*fenv.h\*\*](#)>31810 **CHANGE HISTORY**

31811       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31841 **CHANGE HISTORY**

31842 First released in Issue 1. Derived from Issue 1 of the SVID.

31843 **Issue 7**

31844 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0125 [401] is applied.

31845 **NAME**

31846       fesetenv — set current floating-point environment

31847 **SYNOPSIS**

31848       #include &lt;fenv.h&gt;

31849       int fesetenv(const fenv\_t \*envp);

31850 **DESCRIPTION**31851       Refer to *fegetenv()*.

31852 **NAME**

31853       fesetexceptflag — set floating-point status flags

31854 **SYNOPSIS**

31855       #include <fenv.h>

31856       int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

31857 **DESCRIPTION**

31858       Refer to *fegetexceptflag()*.

31859 **NAME**

31860           fesetround — set current rounding direction

31861 **SYNOPSIS**

31862           #include <fenv.h>

31863           int fesetround(int *round*);

31864 **DESCRIPTION**

31865           Refer to *fegetround()*.

31866 **NAME**

31867 fetestexcept — test floating-point exception flags

31868 **SYNOPSIS**

```
31869 #include <fenv.h>
31870 int fetestexcept(int excepts);
```

31871 **DESCRIPTION**

31872 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31873 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31874 volume of POSIX.1-2024 defers to the ISO C standard.

31875 The *fetestexcept()* function shall determine which of a specified subset of the floating-point  
 31876 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to  
 31877 be queried.

31878 **RETURN VALUE**

31879 The *fetestexcept()* function shall return the value of the bitwise-inclusive OR of the floating-point  
 31880 exception macros corresponding to the currently set floating-point exceptions included in  
 31881 *excepts*.

31882 **ERRORS**

31883 No errors are defined.

31884 **EXAMPLES**

31885 The following example calls function *f()* if an invalid exception is set, and then function *g()* if an  
 31886 overflow exception is set:

```
31887 #include <fenv.h>
31888 /* ... */
31889 {
31890     #pragma STDC FENV_ACCESS ON
31891     int set_excepts;
31892     feclearexcept (FE_INVALID | FE_OVERFLOW);
31893     // maybe raise exceptions
31894     set_excepts = fetestexcept (FE_INVALID | FE_OVERFLOW);
31895     if (set_excepts & FE_INVALID) f();
31896     if (set_excepts & FE_OVERFLOW) g();
31897     /* ... */
31898 }
```

31899 **APPLICATION USAGE**

31900 None.

31901 **RATIONALE**

31902 None.

31903 **FUTURE DIRECTIONS**

31904 None.

31905 **SEE ALSO**31906 [feclearexcept\(\)](#), [fegetexceptflag\(\)](#), [feraiseexcept\(\)](#)31907 XBD [<fenv.h>](#)

31908 **CHANGE HISTORY**

31909 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

31910 **NAME**

31911 feupdateenv — update floating-point environment

31912 **SYNOPSIS**

31913 #include &lt;fenv.h&gt;

31914 int feupdateenv(const fenv\_t \*envp);

31915 **DESCRIPTION**

31916 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31917 conflict between the requirements described here and the ISO C standard is unintentional. This  
31918 volume of POSIX.1-2024 defers to the ISO C standard.

31919 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in  
31920 its automatic storage, attempt to install the floating-point environment represented by the object  
31921 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument  
31922 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point  
31923 environment macro.

31924 **RETURN VALUE**

31925 The *feupdateenv()* function shall return a zero value if and only if all the required actions were  
31926 successfully carried out.

31927 **ERRORS**

31928 No errors are defined.

31929 **EXAMPLES**

31930 The following example shows sample code to hide spurious underflow floating-point  
31931 exceptions:

```
31932 #include <fenv.h>
31933 double f(double x)
31934 {
31935     #pragma STDC FENV_ACCESS ON
31936     double result;
31937     fenv_t save_env;
31938     feholdexcept(&save_env);
31939     // compute result
31940     if (/* test spurious underflow */)
31941         feclearexcept(FE_UNDERFLOW);
31942     feupdateenv(&save_env);
31943     return result;
31944 }
```

31945 **APPLICATION USAGE**

31946 None.

31947 **RATIONALE**

31948 None.

31949 **FUTURE DIRECTIONS**

31950 None.

31951 **SEE ALSO**31952 *fegetenv()*, *feholdexcept()*

31953 XBD &lt;fenv.h&gt;

31954 **CHANGE HISTORY**

- 31955 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.
- 31956 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

31957 **NAME**

31958           fexecve — execute a file

31959 **SYNOPSIS**

31960           #include &lt;unistd.h&gt;

31961           int fexecve(int *fd*, char \*const *argv*[], char \*const *envp*[]);31962 **DESCRIPTION**31963           Refer to *exec*.

31964 **NAME**

31965 fflush — flush a stream

31966 **SYNOPSIS**

31967 #include &lt;stdio.h&gt;

31968 int fflush(FILE \*stream);

31969 **DESCRIPTION**

31970 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31971 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31972 volume of POSIX.1-2024 defers to the ISO C standard.

31973 If *stream* points to an output stream or an update stream in which the most recent operation was  
 31974 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the  
 31975 last data modification and last file status change timestamps of the underlying file shall be  
 31976 marked for update.

31977 For a stream open for reading with an underlying file description, if the file is not already at  
 31978 EOF, and the file is one capable of seeking, the file offset of the underlying open file description  
 31979 shall be set to the file position of the stream, and any characters pushed back onto the stream by  
 31980 *ungetc()* or *ungetwc()* that have not subsequently been read from the stream shall be discarded  
 31981 (without further changing the file offset).

31982 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the  
 31983 behavior is defined above.

31984 **RETURN VALUE**

31985 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for  
 31986 CX the stream, return EOF, and set *errno* to indicate the error.

31987 **ERRORS**31988 The *fflush()* function shall fail if:

31989 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 31990 the thread would be delayed in the write operation.

31991 CX [EBADF] The file descriptor underlying *stream* is not valid.

31992 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

31993 CX [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 31994 process.

31995 XSI A SIGXFSZ signal shall also be generated for the thread.

31996 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 31997 offset maximum associated with the corresponding stream.

31998 CX [EINTR] The *fflush()* function was interrupted by a signal.

31999 CX [EIO] The process is a member of a background process group attempting to write to  
 32000 its controlling terminal, TOSTOP is set, the calling thread is not blocking  
 32001 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the  
 32002 process is orphaned. This error may also be returned under implementation-  
 32003 defined conditions.

32004 CX [ENOMEM] The underlying stream was created by *open\_memstream()* or  
 32005 *open\_wmemstream()* and insufficient memory is available.

32006 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
32007 buffer used by the *fmemopen()* function.

32008 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
32009 any process. A SIGPIPE signal shall also be sent to the thread.

32010 The *fflush()* function may fail if:

32011 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
32012 capabilities of the device.

## 32013 EXAMPLES

### 32014 Sending Prompts to Standard Output

32015 The following example uses *printf()* calls to print a series of prompts for information the user  
32016 must enter from standard input. The *fflush()* calls force the output to standard output. The  
32017 *fflush()* function is used because standard output is usually buffered and the prompt may not  
32018 immediately be printed on the output or terminal. The *getline()* function calls read strings from  
32019 standard input and place the results in variables, for use later in the program.

```
32020 char *user;
32021 char *oldpasswd;
32022 char *newpasswd;
32023 ssize_t llen;
32024 size_t blen;
32025 struct termios term;
32026 tcflag_t saveflag;

32027 printf("User name: ");
32028 fflush(stdout);
32029 blen = 0;
32030 llen = getline(&user, &blen, stdin);
32031 user[llen-1] = 0;
32032 tcgetattr(fileno(stdin), &term);
32033 saveflag = term.c_lflag;
32034 term.c_lflag &= ~ECHO;
32035 tcsetattr(fileno(stdin), TCSANOW, &term);
32036 printf("Old password: ");
32037 fflush(stdout);
32038 blen = 0;
32039 llen = getline(&oldpasswd, &blen, stdin);
32040 oldpasswd[llen-1] = 0;

32041 printf("\nNew password: ");
32042 fflush(stdout);
32043 blen = 0;
32044 llen = getline(&newpasswd, &blen, stdin);
32045 newpasswd[llen-1] = 0;
32046 term.c_lflag = saveflag;
32047 tcsetattr(fileno(stdin), TCSANOW, &term);
32048 free(user);
32049 free(oldpasswd);
32050 free(newpasswd);
```

32051 **APPLICATION USAGE**

32052 None.

32053 **RATIONALE**

32054 Data buffered by the system may make determining the validity of the position of the current  
 32055 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*  
 32056 on streams open for *read()* is not mandated by POSIX.1-2024.

32057 **FUTURE DIRECTIONS**

32058 None.

32059 **SEE ALSO**32060 [Section 2.5](#) (on page 521), *fmemopen()*, *getrlimit()*, *open\_memstream()*32061 XBD [<stdio.h>](#)32062 **CHANGE HISTORY**

32063 First released in Issue 1. Derived from Issue 1 of the SVID.

32064 **Issue 5**

32065 Large File Summit extensions are added.

32066 **Issue 6**

32067 Extensions beyond the ISO C standard are marked.

32068 The following new requirements on POSIX implementations derive from alignment with the  
 32069 Single UNIX Specification:

- 32070 • The [EFBIG] error is added as part of the large file support extensions.
- 32071 • The [ENXIO] optional error condition is added.

32072 The RETURN VALUE section is updated to note that the error indicator shall be set for the  
 32073 stream. This is for alignment with the ISO/IEC 9899:1999 standard.

32074 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN]  
 32075 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 32076 delayed”.

32077 **Issue 7**

32078 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
 32079 descriptors and streams.

32080 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
 32081 Group Technical Standard, 2006, Extended API Set Part 1.

32082 The EXAMPLES section is revised.

32083 Changes are made related to support for finegrained timestamps.

32084 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0126 [87], XSH/TC1-2008/0127 [79],  
 32085 and XSH/TC1-2008/0128 [14] are applied.

32086 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0112 [816] and XSH/TC2-2008/0113  
 32087 [626] are applied.

32088 **Issue 8**

32089 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

32090  
32091

Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error relating to the file size limit for the process.

32092 **NAME**

32093           ffs, ffs1, ffs11 — find first set bit

32094 **SYNOPSIS**

```
32095 XSI       #include <strings.h>
32096           int ffs(int i);
32097           int ffs1(long i);
32098           int ffs11(long long i);
```

32099 **DESCRIPTION**

32100       The *ffs()*, *ffs1()*, and *ffs11()* functions shall find the first bit set (beginning with the least significant bit) in *i*, and return the index of that bit. Bits are numbered starting at one (the least significant bit).

32103 **RETURN VALUE**

32104       The *ffs()*, *ffs1()*, and *ffs11()* functions shall return the index of the first bit set. If *i* is 0, then these functions shall return 0.

32106 **ERRORS**

32107       No errors are defined.

32108 **EXAMPLES**

32109       None.

32110 **APPLICATION USAGE**

32111       None.

32112 **RATIONALE**

32113       None.

32114 **FUTURE DIRECTIONS**

32115       None.

32116 **SEE ALSO**32117       XBD <[strings.h](#)>32118 **CHANGE HISTORY**

32119       First released in Issue 4, Version 2.

32120 **Issue 5**

32121       Moved from X/OPEN UNIX extension to BASE.

32122 **Issue 8**32123       Austin Group Defect 617 is applied, adding *ffs1()* and *ffs11()*.

32124 **NAME**

32125 fgetc — get a byte from a stream

32126 **SYNOPSIS**

32127 #include &lt;stdio.h&gt;

32128 int fgetc(FILE \*stream);

32129 **DESCRIPTION**

32130 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32131 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32132 volume of POSIX.1-2024 defers to the ISO C standard.

32133 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is  
 32134 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,  
 32135 from the input stream pointed to by *stream*, and advance the associated file position indicator for  
 32136 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple  
 32137 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

32138 CX The *fgetc()* function may mark the last data access timestamp of the file associated with *stream*  
 32139 for update. The last data access timestamp shall be marked for update by the first successful  
 32140 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, or *scanf()* using  
 32141 *stream* that returns data not supplied by a prior call to *ungetc()*.

32142 **RETURN VALUE**

32143 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to  
 32144 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the  
 32145 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If an error occurs, the  
 32146 CX error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to indicate  
 32147 the error.

32148 **ERRORS**32149 The *fgetc()* function shall fail if data needs to be read and:

32150 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 32151 the thread would be delayed in the *fgetc()* operation.

32152 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
 32153 reading.

32154 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 32155 was transferred.

32156 CX [EIO] A physical I/O error has occurred, or the process is in a background process  
 32157 group attempting to read from its controlling terminal, and either the calling  
 32158 thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process  
 32159 group of the process is orphaned. This error may also be generated for  
 32160 implementation-defined reasons.

32161 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
 32162 offset maximum associated with the corresponding stream.

32163 The *fgetc()* function may fail if:

32164 CX [ENOMEM] Insufficient storage space is available.

32165 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 32166 capabilities of the device.

32167 **EXAMPLES**

32168 None.

32169 **APPLICATION USAGE**

32170 If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared  
 32171 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
 32172 a variable of type **char** on widening to integer is implementation-defined.

32173 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
 32174 end-of-file condition.

32175 **RATIONALE**

32176 None.

32177 **FUTURE DIRECTIONS**

32178 None.

32179 **SEE ALSO**32180 [Section 2.5](#) (on page 521), *feof()*, *ferror()*, *fgets()*, *fread()*, *fscanf()*, *getchar()*, *getc()*, *ungetc()*32181 XBD [<stdio.h>](#)32182 **CHANGE HISTORY**

32183 First released in Issue 1. Derived from Issue 1 of the SVID.

32184 **Issue 5**

32185 Large File Summit extensions are added.

32186 **Issue 6**

32187 Extensions beyond the ISO C standard are marked.

32188 The following new requirements on POSIX implementations derive from alignment with the  
 32189 Single UNIX Specification:

- 32190 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 32191 • The [ENOMEM] and [ENXIO] optional error conditions are added.

32192 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 32193 • The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the  
 32194 input stream is not set.
- 32195 • The RETURN VALUE section is updated to note that the error indicator shall be set for the  
 32196 stream.

32197 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN]  
 32198 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 32199 delayed”.

32200 **Issue 7**

32201 Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark  
 32202 the last data access timestamp for update.

32203 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0129 [79] and XSH/TC1-2008/0130  
 32204 [14] are applied.

32205 **Issue 8**

32206 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

32207 Austin Group Defect 1624 is applied, changing the RETURN VALUE section.

32208 **NAME**

32209 fgetpos — get current file position information

32210 **SYNOPSIS**

32211 #include &lt;stdio.h&gt;

32212 int fgetpos(FILE \*restrict stream, fpos\_t \*restrict pos);

32213 **DESCRIPTION**

32214 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32215 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32216 volume of POSIX.1-2024 defers to the ISO C standard.

32217 The *fgetpos()* function shall store the current values of the parse state (if any) and file position  
 32218 indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored  
 32219 contains unspecified information usable by *fsetpos()* for repositioning the stream to its position  
 32220 at the time of the call to *fgetpos()*.

32221 The *fgetpos()* function shall not change the setting of *errno* if successful.

32222 **RETURN VALUE**

32223 Upon successful completion, *fgetpos()* shall return 0; otherwise, it shall return a non-zero value  
 32224 and set *errno* to indicate the error.

32225 **ERRORS**

32226 The *fgetpos()* function shall fail if:

32227 CX [EBADF] The file descriptor underlying *stream* is not valid.

32228 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an  
 32229 object of type **fpos\_t**.

32230 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

32231 **EXAMPLES**

32232 None.

32233 **APPLICATION USAGE**

32234 None.

32235 **RATIONALE**

32236 None.

32237 **FUTURE DIRECTIONS**

32238 None.

32239 **SEE ALSO**

32240 [Section 2.5](#) (on page 521), *fopen()*, *ftell()*, *rewind()*, *ungetc()*

32241 XBD [<stdio.h>](#)

32242 **CHANGE HISTORY**

32243 First released in Issue 4. Derived from the ISO C standard.

32244 **Issue 5**

32245 Large File Summit extensions are added.

32246 **Issue 6**

32247 Extensions beyond the ISO C standard are marked.

32248 The following new requirements on POSIX implementations derive from alignment with the  
32249 Single UNIX Specification:

32250 • The [EBADF] and [ESPIPE] optional error conditions are added.

32251 An additional [ESPIPE] error condition is added for sockets.

32252 The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

32253 **Issue 7**

32254 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0131 [105], XSH/TC1-2008/0132 [122],  
32255 and XSH/TC1-2008/0133 [14] are applied.

32256 **NAME**

32257 fgets — get a string from a stream

32258 **SYNOPSIS**

32259 #include &lt;stdio.h&gt;

32260 char \*fgets(char \*restrict s, int n, FILE \*restrict stream);

32261 **DESCRIPTION**

32262 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32263 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32264 volume of POSIX.1-2024 defers to the ISO C standard.

32265 The `fgets()` function shall read bytes from *stream* into the array pointed to by *s* until *n*−1 bytes are  
 32266 read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered. A  
 32267 null byte shall be written immediately after the last byte read into the array. If the end-of-file  
 32268 condition is encountered before any bytes are read, the contents of the array pointed to by *s* shall  
 32269 not be changed.

32270 CX The `fgets()` function may mark the last data access timestamp of the file associated with *stream*  
 32271 for update. The last data access timestamp shall be marked for update by the first successful  
 32272 execution of `fgetc()`, `fgets()`, `fread()`, `fscanf()`, `getc()`, `getchar()`, `getdelim()`, `getline()`, or `scanf()` using  
 32273 *stream* that returns data not supplied by a prior call to `ungetc()`.

32274 **RETURN VALUE**

32275 Upon successful completion, `fgets()` shall return *s*. If the stream is at end-of-file, the end-of-file  
 32276 indicator for the stream shall be set and `fgets()` shall return a null pointer. If an error occurs, the  
 32277 CX error indicator for the stream shall be set, `fgets()` shall return a null pointer, and shall set `errno` to  
 32278 indicate the error.

32279 **ERRORS**32280 Refer to `fgetc()`.32281 **EXAMPLES**32282 **Reading Input**

32283 The following example uses `fgets()` to read lines of input. It assumes that the file it is reading is a  
 32284 text file and that lines in this text file are no longer than 16384 (or `{LINE_MAX}` if it is less than  
 32285 16384 on the implementation where it is running) bytes long. (Note that the standard utilities  
 32286 have no line length limit if `sysconf(_SC_LINE_MAX)` returns −1 without setting `errno`. This  
 32287 example assumes that `sysconf(_SC_LINE_MAX)` will not fail.)

```

32288 #include <limits.h>
32289 #include <stdio.h>
32290 #include <unistd.h>
32291 #define MYLIMIT 16384

32292 char *line;
32293 int line_max;
32294 if (LINE_MAX >= MYLIMIT) {
32295     // Use maximum line size of MYLIMIT. If LINE_MAX is
32296     // bigger than our limit, sysconf() cannot report a
32297     // smaller limit.
32298     line_max = MYLIMIT;
32299 } else {
32300     long limit = sysconf(_SC_LINE_MAX);
32301     line_max = (limit < 0 || limit > MYLIMIT) ? MYLIMIT : (int)limit;

```

```

32302     }
32303     // line_max + 1 leaves room for the null byte added by fgets().
32304     line = malloc(line_max + 1);
32305     if (line == NULL) {
32306         // out of space
32307         ...
32308         return error;
32309     }
32310     while (fgets(line, line_max + 1, fp) != NULL) {
32311         // Verify that a full line has been read ...
32312         // If not, report an error or prepare to treat the
32313         // next time through the loop as a read of a
32314         // continuation of the current line.
32315         ...
32316         // Process line ...
32317         ...
32318     }
32319     free(line);
32320     ...

```

32321 **APPLICATION USAGE**  
32322 None.

32323 **RATIONALE**  
32324 None.

32344 **NAME**

32345 fgetwc — get a wide-character code from a stream

32346 **SYNOPSIS**

32347 #include &lt;stdio.h&gt;

32348 #include &lt;wchar.h&gt;

32349 wint\_t fgetwc(FILE \*stream);

32350 **DESCRIPTION**

32351 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32352 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32353 volume of POSIX.1-2024 defers to the ISO C standard.

32354 The *fgetwc()* function shall obtain the next character (if present) from the input stream pointed to  
 32355 by *stream*, convert that to the corresponding wide-character code, and advance the associated file  
 32356 position indicator for the stream (if defined).

32357 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

32358 CX The *fgetwc()* function may mark the last data access timestamp of the file associated with *stream*  
 32359 for update. The last data access timestamp shall be marked for update by the first successful  
 32360 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vwscanf()*, or *wscanf()*  
 32361 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

32362 The *fgetwc()* function shall not change the setting of *errno* if successful.

32363 **RETURN VALUE**

32364 Upon successful completion, the *fgetwc()* function shall return the wide-character code of the  
 32365 character read from the input stream pointed to by *stream* converted to a type **wint\_t**. If the end-  
 32366 of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for  
 32367 the stream shall be set and *fgetwc()* shall return WEOF. If an error other than an encoding error  
 32368 CX occurs, the error indicator for the stream shall be set, and *fgetwc()* shall return WEOF and shall  
 32369 CX set *errno* to indicate the error. If an encoding error occurs, the error indicator for the stream shall  
 32370 be set, and *fgetwc()* shall return WEOF and shall set *errno* to indicate the error.

32371 **ERRORS**

32372 The *fgetwc()* function shall fail if data needs to be read and:

32373 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 32374 the thread would be delayed in the *fgetwc()* operation.

32375 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
 32376 reading.

32377 [EILSEQ] The data obtained from the input stream does not form a valid character.

32378 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 32379 was transferred.

32380 CX [EIO] A physical I/O error has occurred, or the process is in a background process  
 32381 group attempting to read from its controlling terminal, and either the calling  
 32382 thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process  
 32383 group of the process is orphaned. This error may also be generated for  
 32384 implementation-defined reasons.

32385 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
 32386 offset maximum associated with the corresponding stream.

32387 The *fgetwc()* function may fail if:

32388 CX [ENOMEM] Insufficient storage space is available.

32389 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
32390 capabilities of the device.

### 32391 EXAMPLES

32392 None.

### 32393 APPLICATION USAGE

32394 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
32395 end-of-file condition.

### 32396 RATIONALE

32397 The requirement to set the error indicator when an encoding error occurs is shaded CX because  
32398 this is not required by the ISO C standard. However, the next revision of the ISO C standard is  
32399 expected to add this requirement.

### 32400 FUTURE DIRECTIONS

32401 None.

### 32402 SEE ALSO

32403 [Section 2.5](#) (on page 521), *feof()*, *ferror()*, *fopen()*

### 32405 CHANGE HISTORY

32406 First released in Issue 4. Derived from the MSE working draft.

#### 32407 Issue 5

32408 The Optional Header (OH) marking is removed from [<stdio.h>](#).

32409 Large File Summit extensions are added.

#### 32410 Issue 6

32411 Extensions beyond the ISO C standard are marked.

32412 The following new requirements on POSIX implementations derive from alignment with the  
32413 Single UNIX Specification:

- 32414 • The [EIO] and [Eoverflow] mandatory error conditions are added.
- 32415 • The [ENOMEM] and [ENXIO] optional error conditions are added.

32416 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/33 is applied, updating the [EAGAIN]  
32417 error in the ERRORS section from “the process would be delayed” to “the thread would be  
32418 delayed”.

#### 32419 Issue 7

32420 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

32421 Changes are made related to support for finegrained timestamps.

32422 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0136 [105], XSH/TC1-2008/0137 [79],  
32423 and XSH/TC1-2008/0138 [14] are applied.

#### 32424 Issue 8

32425 Austin Group Defect 1624 is applied, changing the RETURN VALUE and RATIONALE sections.

32426 **NAME**

32427 fgetws — get a wide-character string from a stream

32428 **SYNOPSIS**

32429 #include &lt;stdio.h&gt;

32430 #include &lt;wchar.h&gt;

32431 wchar\_t \*fgetws(wchar\_t \*restrict ws, int n,

32432 FILE \*restrict stream);

32433 **DESCRIPTION**

32434 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32435 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32436 volume of POSIX.1-2024 defers to the ISO C standard.

32437 The *fgetws()* function shall read characters from the *stream*, convert these to the corresponding  
 32438 wide-character codes, place them in the **wchar\_t** array pointed to by *ws*, until *n*−1 characters are  
 32439 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is  
 32440 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character  
 32441 code.

32442 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

32443 CX The *fgetws()* function may mark the last data access timestamp of the file associated with *stream*  
 32444 for update. The last data access timestamp shall be marked for update by the first successful  
 32445 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vwsscanf()*, or *wscanf()*  
 32446 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

32447 **RETURN VALUE**

32448 Upon successful completion, *fgetws()* shall return *ws*. If the end-of-file indicator for the stream is  
 32449 set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and  
 32450 *fgetws()* shall return a null pointer. If an error occurs, the error indicator for the stream shall be  
 32451 CX set, and *fgetws()* shall return a null pointer and shall set *errno* to indicate the error.

32452 **ERRORS**32453 Refer to *fgetwc()*.32454 **EXAMPLES**

32455 None.

32456 **APPLICATION USAGE**

32457 None.

32458 **RATIONALE**

32459 None.

32460 **FUTURE DIRECTIONS**

32461 None.

32462 **SEE ALSO**32463 [Section 2.5](#) (on page 521), *fopen()*, *fread()*32464 XBD [<stdio.h>](#), [<wchar.h>](#)32465 **CHANGE HISTORY**

32466 First released in Issue 4. Derived from the MSE working draft.

- 32467 **Issue 5**  
32468 The Optional Header (OH) marking is removed from `<stdio.h>`.
- 32469 **Issue 6**  
32470 Extensions beyond the ISO C standard are marked.  
32471 The prototype for `fgetws()` is changed for alignment with the ISO/IEC 9899:1999 standard.
- 32472 **Issue 7**  
32473 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.  
32474 Changes are made related to support for finegrained timestamps.  
32475 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0139 [14] is applied.

32477 Austin Group Defect 1624 is applied, changing the RETURN VALUE section.

32478 **NAME**

32479 fileno — map a stream pointer to a file descriptor

32480 **SYNOPSIS**

```
32481 CX #include <stdio.h>
32482 int fileno(FILE *stream);
```

32483 **DESCRIPTION**

32484 The *fileno()* function shall return the integer file descriptor associated with the stream pointed to  
 32485 by *stream*.

32486 **RETURN VALUE**

32487 Upon successful completion, *fileno()* shall return the integer value of the file descriptor  
 32488 associated with *stream*. Otherwise, the value  $-1$  shall be returned and *errno* set to indicate the  
 32489 error.

32490 **ERRORS**

32491 The *fileno()* function shall fail if:

32492 [EBADF] The stream is not associated with a file.

32493 The *fileno()* function may fail if:

32494 [EBADF] The file descriptor underlying *stream* is not a valid file descriptor.

32495 **EXAMPLES**

32496 None.

32497 **APPLICATION USAGE**

32498 None.

32499 **RATIONALE**

32500 Without some specification of which file descriptors are associated with these streams, it is  
 32501 impossible for an application to set up the streams for another application it starts with *fork()*  
 32502 and *exec*. In particular, it would not be possible to write a portable version of the *sh* command  
 32503 interpreter (although there may be other constraints that would prevent that portability).

32504 **FUTURE DIRECTIONS**

32505 None.

32506 **SEE ALSO**

32507 [Section 2.5.1](#) (on page 522), *dirfd()*, *fdopen()*, *fopen()*, *stdin*

32508 XBD [<stdio.h>](#)

32509 **CHANGE HISTORY**

32510 First released in Issue 1. Derived from Issue 1 of the SVID.

32511 **Issue 6**

32512 The following new requirements on POSIX implementations derive from alignment with the  
 32513 Single UNIX Specification:

- 32514 • The [EBADF] optional error condition is added.

32515 **Issue 7**

32516 SD5-XBD-ERN-99 is applied, changing the definition of the [EBADF] error.

32517 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0115 [589] is applied.

32518 **NAME**

32519 flockfile, ftrylockfile, funlockfile — stdio locking functions

32520 **SYNOPSIS**

```
32521 CX #include <stdio.h>
32522 void flockfile(FILE *file);
32523 int ftrylockfile(FILE *file);
32524 void funlockfile(FILE *file);
```

32525 **DESCRIPTION**

32526 These functions shall provide for explicit application-level locking of the locks associated with  
 32527 standard I/O streams (see [Section 2.5](#), on page 521). These functions can be used by a thread to  
 32528 delineate a sequence of I/O statements that are executed as a unit.

32529 The *flockfile()* function shall acquire for a thread ownership of a (**FILE \***) object.

32530 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE \***) object if the object is  
 32531 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

32532 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is  
 32533 undefined if a thread other than the current owner calls the *funlockfile()* function.

32534 The functions shall behave as if there is a lock count associated with each (**FILE \***) object. This  
 32535 count is implicitly initialized to zero when the (**FILE \***) object is created. The (**FILE \***) object is  
 32536 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE \***)  
 32537 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and  
 32538 the caller owns the (**FILE \***) object, the count shall be incremented. Otherwise, the calling thread  
 32539 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall  
 32540 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)  
 32541 and *funlockfile()* to be nested.

32542 **RETURN VALUE**

32543 None for *flockfile()* and *funlockfile()*.

32544 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock  
 32545 cannot be acquired.

32546 **ERRORS**

32547 No errors are defined.

32548 **EXAMPLES**

32549 None.

32550 **APPLICATION USAGE**

32551 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 32552 [Section 3.275](#) (on page 72).

32553 A call to *exit()* can block until locked streams are unlocked because a thread having ownership  
 32554 of a (**FILE\***) object blocks all function calls that reference that (**FILE\***) object (except those with  
 32555 names ending in *\_unlocked*) from other threads, including calls to *exit()*.

32556 Note: a **FILE** lock is not a file lock (see XBD [Section 3.143](#), on page 51).

32557 **RATIONALE**

32558 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each  
 32559 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a **FILE** lock,  
 32560 analogous to *pthread\_mutex\_trylock()*.

32561 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.

32562 This both provides thread-safety of these functions without requiring a second level of internal  
32563 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

32564 Application developers and implementors should be aware that there are potential deadlock  
32565 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested  
32566 via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of  
32567 implementation-defined line-buffered output streams to be flushed. If two threads each hold the  
32568 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring  
32569 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can  
32570 typically be avoided by acquiring locks on input streams before locks on output streams if a  
32571 thread would be acquiring both.

32572 In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()*  
32573 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where  
32574 the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the  
32575 `*_unlocked` functions/macros. This moves the cost/performance tradeoff to the optimal point.

#### 32576 **FUTURE DIRECTIONS**

32577 None.

#### 32578 **SEE ALSO**

32579 [\*exit\(\)\*](#), [\*getc\\_unlocked\(\)\*](#)

32580 XBD Section 3.275 (on page 72), [`<stdio.h>`](#)

#### 32581 **CHANGE HISTORY**

32582 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 32583 **Issue 6**

32584 These functions are marked as part of the Thread-Safe Functions option.

#### 32585 **Issue 7**

32586 The *flockfile()*, *ftrylockfile()*, and *funlockfile()* functions are moved from the Thread-Safe Functions  
32587 option to the Base.

32588 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0140 [118] is applied.

32589 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0116 [611] is applied.

#### 32590 **Issue 8**

32591 Austin Group Defect 1118 is applied, clarifying that a **FILE** lock is not a file lock.

32592 Austin Group Defect 1302 is applied, replacing parts of the text with a reference to [Section 2.5](#)  
32593 (on page 521).

32594 **NAME**

32595 floor, floorf, floorl — floor function

32596 **SYNOPSIS**

```
32597 #include <math.h>
32598 double floor(double x);
32599 float floorf(float x);
32600 long double floorl(long double x);
```

32601 **DESCRIPTION**

32602 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32603 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32604 volume of POSIX.1-2024 defers to the ISO C standard.

32605 These functions shall compute the largest integral value not greater than  $x$ .

32606 MX These functions may raise the inexact floating-point exception for finite non-integer arguments.

32607 **RETURN VALUE**

32608 MX The returned value shall be independent of the current rounding direction mode and shall have  
 32609 the same sign as  $x$ .

32610 Upon successful completion, these functions shall return the largest integral value not greater  
 32611 than  $x$ , expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the  
 32612 function.

32613 MX If  $x$  is NaN, a NaN shall be returned.

32614 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

32615 **ERRORS**

32616 No errors are defined.

32617 **EXAMPLES**

32618 None.

32619 **APPLICATION USAGE**

32620 The integral value returned by these functions might not be expressible as an **intmax\_t**. The  
 32621 return value should be tested before assigning it to an integer type to avoid the undefined  
 32622 results of an integer overflow.

32623 **RATIONALE**

32624 None.

32625 **FUTURE DIRECTIONS**

32626 None.

32627 **SEE ALSO**

32628 [ceil\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#)

32630 **CHANGE HISTORY**

32631 First released in Issue 1. Derived from Issue 1 of the SVID.

32632 **Issue 5**

32633 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 32634 text was previously published in the APPLICATION USAGE section.

32635 **Issue 6**32636 The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.32637 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
32638 revised to align with the ISO/IEC 9899:1999 standard.32639 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
32640 marked.32641 **Issue 7**

32642 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0141 [346] is applied.

32643 **Issue 8**32644 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
32645 standard.

32646 **NAME**32647 `fma, fmaf, fmal` — floating-point multiply-add32648 **SYNOPSIS**32649 `#include <math.h>`32650 `double fma(double x, double y, double z);`32651 `float fmaf(float x, float y, float z);`32652 `long double fmal(long double x, long double y, long double z);`32653 **DESCRIPTION**32654 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
32655 conflict between the requirements described here and the ISO C standard is unintentional. This  
32656 volume of POSIX.1-2024 defers to the ISO C standard.32657 These functions shall compute  $(x * y) + z$ , rounded as one ternary operation: they shall compute  
32658 the value (as if) to infinite precision and round once to the result format, according to the  
32659 rounding mode characterized by the value of `FLT_ROUNDS`.32660 An application wishing to check for error situations should set `errno` to zero and call  
32661 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
32662 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
32663 zero, an error has occurred.32664 **RETURN VALUE**32665 Upon successful completion, these functions shall return  $(x * y) + z$ , rounded as one ternary  
32666 operation.32667 **MX** If the result overflows or underflows, a range error may occur. On systems that support the IEC  
32668 60559 Floating-Point option, if the result overflows a range error shall occur.32669 If  $x$  or  $y$  are NaN, a NaN shall be returned.32670 If  $x$  multiplied by  $y$  is an exact infinity and  $z$  is also an infinity but with the opposite sign, a  
32671 domain error shall occur, and either a NaN (if supported), or an implementation-defined value  
32672 shall be returned.32673 If one of  $x$  and  $y$  is infinite, the other is zero, and  $z$  is not a NaN, a domain error shall occur, and  
32674 either a NaN (if supported), or an implementation-defined value shall be returned.32675 If one of  $x$  and  $y$  is infinite, the other is zero, and  $z$  is a NaN, a NaN shall be returned and a  
32676 domain error may occur.32677 If  $x*y$  is not  $0*\text{Inf}$  nor  $\text{Inf}*0$  and  $z$  is a NaN, a NaN shall be returned.32678 **ERRORS**

32679 These functions shall fail if:

32680 **MX** **Domain Error** The value of  $x*y+z$  is invalid, or the value  $x*y$  is invalid and  $z$  is not a NaN.32681 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
32682 then `errno` shall be set to [EDOM]. If the integer expression `(math_errhandling`  
32683 `& MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception  
32684 shall be raised.32685 **MX** **Range Error** The result overflows.32686 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
32687 then `errno` shall be set to [ERANGE]. If the integer expression  
32688 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the overflow  
32689 floating-point exception shall be raised.

32690 These functions may fail if:

32691	MX	<b>Domain Error</b>	The value $x*y$ is invalid and $z$ is a NaN.
32692			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
32693			then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i>
32694			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
32695			shall be raised.
32696		<b>Range Error</b>	The result underflows.
32697			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
32698			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
32699			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
32700			floating-point exception shall be raised.
32701		<b>Range Error</b>	The result overflows.
32702			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
32703			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
32704			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
32705			floating-point exception shall be raised.

#### 32706 EXAMPLES

32707 None.

#### 32708 APPLICATION USAGE

32709 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
32710 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 32711 RATIONALE

32712 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its  
32713 unexpected use by the compiler can undermine carefully written code. The FP\_CONTRACT  
32714 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees  
32715 its use where desired. Many current machines provide hardware floating multiply-add  
32716 instructions; software implementation can be used for others.

#### 32717 FUTURE DIRECTIONS

32718 None.

32761 **CHANGE HISTORY**

32762 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

32763 **Issue 7**

32764 Austin Group Interpretation 1003.1-2001 #007 is applied.

32765 **Issue 8**32766 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
32767 standard.

32768 **NAME**

32769 fmemopen — open a memory buffer stream

32770 **SYNOPSIS**

```
32771 CX #include <stdio.h>
32772 FILE *fmemopen(void *restrict buf, size_t max_size,
32773               const char *restrict mode);
```

32774 **DESCRIPTION**

32775 The *fmemopen()* function shall associate the buffer given by the *buf* and *max\_size* arguments with  
 32776 a stream. The *buf* argument shall be either a null pointer or point to a buffer that is at least  
 32777 *max\_size* bytes long.

32778 The *mode* argument points to a string. If the string is one of the following, the stream shall be  
 32779 opened in the indicated mode. Otherwise, the behavior is undefined.

32780	<i>r</i> or <i>rb</i>	Open the stream for reading.
32781	<i>w</i> or <i>wb</i>	Open the stream for writing.
32782	<i>a</i> or <i>ab</i>	Append; open the stream for writing.
32783	<i>r+</i> or <i>rb+</i> or <i>r+b</i>	Open the stream for update (reading and writing).
32784	<i>w+</i> or <i>wb+</i> or <i>w+b</i>	Open the stream for update (reading and writing).
32785	<i>a+</i> or <i>ab+</i> or <i>a+b</i>	Append; open the stream for update (reading and writing).

32786 If the *mode* argument begins with 'w' and *max\_size* is not zero, the buffer contents shall be  
 32787 truncated by writing a null byte at the beginning. If the *mode* argument includes 'b', the results  
 32788 are implementation-defined.

32789 If a null pointer is specified as the *buf* argument, *fmemopen()* shall allocate *max\_size* bytes of  
 32790 memory as if by a call to *malloc()*. This buffer shall be automatically freed when the stream is  
 32791 closed. Because this feature is only useful when the stream is opened for updating (because  
 32792 there is no way to get a pointer to the buffer) the *fmemopen()* call may fail if the *mode* argument  
 32793 does not include a '+'.  
 32794

32794 When a stream is opened for reading only and *buf* is not a null pointer, the buffer pointed to by  
 32795 *buf* shall not be modified by any operation performed on the stream.

32796 The stream shall maintain a current position in the buffer. This position shall be initially set to  
 32797 either the beginning of the buffer (for *r* and *w* modes) or to the first null byte in the buffer (for *a*  
 32798 modes). If no null byte is found in append mode, the initial position shall be set to one byte after  
 32799 the end of the buffer.

32800 If *buf* is a null pointer, the initial position shall always be set to the beginning of the buffer.

32801 The stream shall also maintain the end position of the current buffer contents; use of *fseek()* or  
 32802 *fseeko()* on the stream with *SEEK\_END* shall seek relative to this end position. If *mode* starts  
 32803 with 'r', the end position shall be set to the value given by the *max\_size* argument and shall not  
 32804 change. Otherwise, the stream is writable and the end position shall be variable; for modes *w*  
 32805 and *w+* the initial end position shall be zero and for modes *a* and *a+* the initial end position shall  
 32806 be:

- 32807 • Zero, if *buf* is a null pointer

- 32808           • The position of the first null byte in the buffer, if one is found
- 32809           • The value of the *max\_size* argument, if *buf* is not a null pointer and no null byte is found

32810           A read operation on the stream shall not advance the current buffer position beyond the current  
 32811           buffer end position. Reaching the buffer end position in a read operation shall count as “end-of-  
 32812           file”. Null bytes in the buffer shall have no special meaning for reads. The read operation shall  
 32813           start at the current buffer position of the stream.

32814           A write operation shall start either at the current position of the stream (if *mode* has not specified  
 32815           'a' as the first character) or at the current end position of the stream (if *mode* had 'a' as the  
 32816           first character). If the current position at the end of the write is larger than the current buffer end  
 32817           position, the current buffer end position shall be set to the current position. A write operation on  
 32818           the stream shall not advance the current buffer end position beyond the size given in the  
 32819           *max\_size* argument.

32820           When a stream open for update (the *mode* argument includes '+') or for writing only is  
 32821           successfully written and the write advances the current buffer end position, a null byte shall be  
 32822           written at the new buffer end position if it fits.

32823           An attempt to seek a memory buffer stream to a negative position or to a position larger than the  
 32824           buffer size given in the *max\_size* argument shall fail.

#### 32825 RETURN VALUE

32826           Upon successful completion, *fmemopen()* shall return a pointer to the object controlling the  
 32827           stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

#### 32828 ERRORS

32829           The *fmemopen()* function shall fail if:

32830           [EMFILE]           {STREAM\_MAX} streams are currently open in the calling process.

32831           The *fmemopen()* function may fail if:

32832           [EINVAL]           The value of the *mode* argument is not valid.

32833           [EINVAL]           The *buf* argument is a null pointer and the *mode* argument does not include a  
 32834           '+' character.

32835           [EINVAL]           The *max\_size* argument specifies a buffer size of zero and the implementation  
 32836           does not support this.

32837           [ENOMEM]          The *buf* argument is a null pointer and the allocation of a buffer of length  
 32838           *max\_size* has failed.

32839           [EMFILE]           {FOPEN\_MAX} streams are currently open in the calling process.

#### 32840 EXAMPLES

```

32841           #include <stdio.h>
32842           #include <string.h>
32843           static char buffer[] = "foobar";
32844           int
32845           main (void)
32846           {
32847               int ch;
32848               FILE *stream;
32849               stream = fmemopen(buffer, strlen (buffer), "r");

```

```

32850         if (stream == NULL)
32851             /* handle error */;
32852         while ((ch = fgetc(stream)) != EOF)
32853             printf("Got %c\n", ch);
32854         fclose(stream);
32855         return (0);
32856     }

```

32857 This program produces the following output:

```

32858     Got f
32859     Got o
32860     Got o
32861     Got b
32862     Got a
32863     Got r

```

### 32864 APPLICATION USAGE

32865 Implementations differ as regards how a 'b' in the *mode* argument affects the behavior. For  
32866 some the 'b' has no effect, as is required for *fopen()*; others distinguish between text and binary  
32867 modes.

32868 Note that *buf* will not be null terminated if *max\_size* bytes are written to the memory stream.  
32869 Applications wanting to guarantee that the buffer will be null terminated need to call  
32870 *fmemopen()* with *max\_size* set to one byte smaller than the actual size of *buf* and set *buf[max\_size]*  
32871 to a null byte.

32872 This standard intentionally leaves the behavior of 'e' and 'x' in the *mode* argument undefined;  
32873 implementations might silently ignore them so that *fmemopen()* may accept the same mode  
32874 strings as *fopen()*, or may reject them as invalid.

### 32875 RATIONALE

32876 This interface has been introduced to eliminate many of the errors encountered in the  
32877 construction of strings, notably overflowing of strings. This interface prevents overflow.

### 32878 FUTURE DIRECTIONS

32879 A future version of this standard may require support of zero-length buffer streams explicitly.

32929 XBD &lt;math.h&gt;

32930 **CHANGE HISTORY**

32931 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

32932 **Issue 7**

32933 Austin Group Interpretation 1003.1-2001 #008 is applied.

32934 **Issue 8**32935 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
32936 standard.

32937 **NAME**

32938 fmod, fmodf, fmodl — floating-point remainder value function

32939 **SYNOPSIS**

32940 #include &lt;math.h&gt;

32941 double fmod(double *x*, double *y*);32942 float fmodf(float *x*, float *y*);32943 long double fmodl(long double *x*, long double *y*);32944 **DESCRIPTION**32945 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
32946 conflict between the requirements described here and the ISO C standard is unintentional. This  
32947 volume of POSIX.1-2024 defers to the ISO C standard.32948 These functions shall return the floating-point remainder of the division of *x* by *y*.32949 An application wishing to check for error situations should set *errno* to zero and call  
32950 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
32951 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
32952 zero, an error has occurred.32953 **RETURN VALUE**32954 These functions shall return the value  $x - i * y$ , for some integer *i* such that, if *y* is non-zero, the  
32955 result has the same sign as *x* and magnitude less than the magnitude of *y*.32956 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
32957 MXX and *fmod*(), *modf*(), and *fmodl*() shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
32958 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
32959 FLT\_MIN, and LDBL\_MIN, respectively.32960 MX If *x* or *y* is NaN, a NaN shall be returned, and none of the conditions below shall be considered.32961 If *y* is zero, a domain error shall occur, and a NaN shall be returned.32962 If *x* is infinite, a domain error shall occur, and a NaN shall be returned.32963 If *x* is  $\pm 0$  and *y* is not zero,  $\pm 0$  shall be returned.32964 If *x* is not infinite and *y* is  $\pm \text{Inf}$ , *x* shall be returned.32965 When subnormal results are supported, the returned value shall be exact and shall be  
32966 independent of the current rounding direction mode.32967 **ERRORS**

32968 These functions shall fail if:

32969 MX **Domain Error** The *x* argument is infinite or *y* is zero.32970 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
32971 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
32972 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
32973 shall be raised.

32974 These functions may fail if:

32975 **Range Error** The result underflows.32976 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
32977 then *errno* shall be set to [ERANGE]. If the integer expression  
32978 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
32979 floating-point exception shall be raised.

**32980 EXAMPLES**

32981 None.

**32982 APPLICATION USAGE**

32983 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
32984 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**32985 RATIONALE**

32986 None.

**32992 CHANGE HISTORY**

32993 First released in Issue 1. Derived from Issue 1 of the SVID.

**32994 Issue 5**

32995 The DESCRIPTION is updated to indicate how an application should check for an error. This  
32996 text was previously published in the APPLICATION USAGE section.

**32997 Issue 6**

32998 The behavior for when the *y* argument is zero is now defined.

32999 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999  
33000 standard.

33001 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
33002 revised to align with the ISO/IEC 9899:1999 standard.

33003 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
33004 marked.

**33005 Issue 7**

33006 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0151 [68], XSH/TC1-2008/0152 [320],  
33007 and XSH/TC1-2008/0153 [68] are applied.

33008 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0120 [605] is applied.

**33009 Issue 8**

33010 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
33011 standard.

33012 **NAME**33013 `fmtmsg` — display a message in the specified format on standard error and/or a system console33014 **SYNOPSIS**

```
33015 XSI      #include <fmtmsg.h>
33016
33016      int fmtmsg(long classification, const char *label, int severity,
33017                const char *text, const char *action, const char *tag);
```

33018 **DESCRIPTION**33019 The `fmtmsg()` function shall display messages in a specified format instead of the traditional  
33020 `printf()` function.33021 Based on a message's classification component, `fmtmsg()` shall write a formatted message either  
33022 to standard error, to the console, or to both.33023 A formatted message consists of up to five components as defined below. The component  
33024 *classification* is not part of a message displayed to the user, but defines the source of the message  
33025 and directs the display of the formatted message.

33026 *classification*      Contains the sum of identifying values constructed from the constants defined  
33027 below. Any one identifier from a subclass may be used in combination with a  
33028 single identifier from a different subclass. Two or more identifiers from the  
33029 same subclass should not be used together, with the exception of identifiers  
33030 from the display subclass. (Both display subclass identifiers may be used so  
33031 that messages can be displayed to both standard error and the system  
33032 console.)

33033 **Major Classifications**33034 Identifies the source of the condition. Identifiers are: MM\_HARD  
33035 (hardware), MM\_SOFT (software), and MM\_FIRM (firmware).33036 **Message Source Subclassifications**33037 Identifies the type of software in which the problem is detected.  
33038 Identifiers are: MM\_APPL (application), MM\_UTIL (utility), and  
33039 MM OPSYS (operating system).33040 **Display Subclassifications**33041 Indicates where the message is to be displayed. Identifiers are:  
33042 MM\_PRINT to display the message on the standard error stream,  
33043 MM\_CONSOLE to display the message on the system console. One or  
33044 both identifiers may be used.33045 **Status Subclassifications**33046 Indicates whether the application can recover from the condition.  
33047 Identifiers are: MM\_RECOVER (recoverable) and MM\_NRECOV (non-  
33048 recoverable).33049 An additional identifier, MM\_NULLMC, indicates that no classification  
33050 component is supplied for the message.33051 *label*                Identifies the source of the message. The format is two fields separated by a  
33052 <colon>. The first field is up to 10 bytes, the second is up to 14 bytes.33053 *severity*             Indicates the seriousness of the condition. Identifiers for the levels of *severity*  
33054 are:

33055		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
33056			
33057		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
33058			
33059		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
33060			
33061			
33062		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
33063			
33064		MM_NOSEV	Indicates that no severity level is supplied for the message.
33065	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
33066			
33067			
33068	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
33069			
33070			
33071	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
33072			
33073			

33074 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*  
 33075 which message components it is to select when writing messages to standard error. The value of  
 33076 *MSGVERB* shall be a <colon>-separated list of optional keywords. Valid keywords are: *label*,  
 33077 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the  
 33078 component's value is not the component's null value, *fmtmsg()* shall include that component in  
 33079 the message when writing the message to standard error. If *MSGVERB* does not include a  
 33080 keyword for a message component, that component shall not be included in the display of the  
 33081 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the  
 33082 null string, if its value is not of the correct format, or if it contains keywords other than the valid  
 33083 ones listed above, *fmtmsg()* shall select all components.

33084 *MSGVERB* shall determine which components are selected for display to standard error. All  
 33085 message components shall be included in console messages.

#### 33086 RETURN VALUE

33087 The *fmtmsg()* function shall return one of the following values:

33088	MM_OK	The function succeeded.
33089	MM_NOTOK	The function failed completely.
33090	MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
33091		
33092	MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.
33093		

#### 33094 ERRORS

33095 None.

33096 **EXAMPLES**33097 1. The following example of *fmtmsg()*:33098 `fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",`  
33099 `"refer to cat in user's reference manual", "XSI:cat:001")`

33100 produces a complete message in the specified message format:

33101 `XSI:cat: ERROR: illegal option`33102 `TO FIX: refer to cat in user's reference manual XSI:cat:001`33103 2. When the environment variable *MSGVERB* is set as follows:33104 `MSGVERB=severity:text:action`33105 and Example 1 is used, *fmtmsg()* produces:33106 `ERROR: illegal option`33107 `TO FIX: refer to cat in user's reference manual`33108 **APPLICATION USAGE**33109 One or more message components may be systematically omitted from messages generated by  
33110 an application by using the null value of the argument for that component.33111 **RATIONALE**

33112 None.

33113 **FUTURE DIRECTIONS**

33114 None.

33115 **SEE ALSO**33116 [\*fprintf\(\)\*](#)33117 XBD <[fmtmsg.h](#)>33118 **CHANGE HISTORY**

33119 First released in Issue 4, Version 2.

33120 **Issue 5**

33121 Moved from X/OPEN UNIX extension to BASE.

33122 **NAME**

33123 fnmatch — match a filename string or a pathname

33124 **SYNOPSIS**

33125 #include &lt;fnmatch.h&gt;

33126 int fnmatch(const char \*pattern, const char \*string, int flags);

33127 **DESCRIPTION**

33128 The *fnmatch()* function shall match patterns as described in XCU [Section 2.14.1](#) (on page 2523)  
 33129 and [Section 2.14.2](#) (on page 2524). It checks the string specified by the *string* argument to see if it  
 33130 matches the pattern specified by the *pattern* argument.

33131 The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-  
 33132 inclusive OR of zero or more of the flags defined in <fnmatch.h>. If the FNM\_PATHNAME flag  
 33133 is set in *flags*, then a <slash> character (' / ') in *string* shall be explicitly matched by a <slash> in  
 33134 *pattern*; it shall not be matched by either the <asterisk> or <question-mark> special characters,  
 33135 nor by a bracket expression. If the FNM\_PATHNAME flag is not set, the <slash> character shall  
 33136 be treated as an ordinary character.

33137 If FNM\_NOESCAPE is not set in *flags*, a <backslash> character can be used as an escape  
 33138 character as described in XCU [Section 2.14.1](#) (on page 2523). If *pattern* ends with an unescaped  
 33139 <backslash>, the behavior is unspecified. If FNM\_NOESCAPE is set, a <backslash> character  
 33140 shall be treated as an ordinary character.

33141 If FNM\_PERIOD is set in *flags*, then a leading <period> (' . ') in *string* shall match a <period> in  
 33142 *pattern*; as described by rule 2 in XCU [Section 2.14.3](#) (on page 2525) where the location of  
 33143 “leading” is indicated by the value of FNM\_PATHNAME:

- 33144 • If FNM\_PATHNAME is set, a <period> is “leading” if it is the first character in *string* or if  
 33145 it immediately follows a <slash>.
- 33146 • If FNM\_PATHNAME is not set, a <period> is “leading” only if it is the first character of  
 33147 *string*.

33148 If FNM\_PERIOD is not set, then no special restrictions are placed on matching a period.

33149 If FNM\_CASEFOLD or FNM\_IGNORECASE is set, *string* and *pattern* shall be compared in a  
 33150 case-insensitive manner. See XBD [Section 4.1](#) (on page 95).

33151 **RETURN VALUE**

33152 If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no  
 33153 match, *fnmatch()* shall return FNM\_NOMATCH, which is defined in <fnmatch.h>. If an error  
 33154 occurs, *fnmatch()* shall return another non-zero value.

33155 **ERRORS**

33156 No errors are defined.

33157 **EXAMPLES**

33158 None.

33159 **APPLICATION USAGE**

33160 The *fnmatch()* function has two major uses. It could be used by an application or utility that  
 33161 needs to read a directory and apply a pattern against each entry. The *find* utility is an example of  
 33162 this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that  
 33163 need to match strings in a similar manner.

33164 The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The  
 33165 default action of this function is to match filename strings, rather than pathnames, since it gives  
 33166 no special significance to the <slash> character. With the FNM\_PATHNAME flag, *fnmatch()* does

33167 match pathnames, but without tilde expansion, parameter expansion, or special treatment for a  
33168 <period> at the beginning of a filename.

#### 33169 RATIONALE

33170 This function replaced the REG\_FILENAME flag of *regcomp()* in early proposals of this volume  
33171 of POSIX.1-2024. It provides virtually the same functionality as the *regcomp()* and *regexec()*  
33172 functions using the REG\_FILENAME and REG\_FSLASH flags (the REG\_FSLASH flag was  
33173 proposed for *regcomp()*, and would have had the opposite effect from FNM\_PATHNAME), but  
33174 with a simpler function and less system overhead.

#### 33175 FUTURE DIRECTIONS

33176 None.

#### 33177 SEE ALSO

33178 *glob()*, *wordexp()*

33179 XBD <fnmatch.h>

#### 33180 CHANGE HISTORY

33181 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 33182 Issue 5

33183 Moved from POSIX2 C-language Binding to BASE.

#### 33184 Issue 7

33185 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0154 [291] and XSH/TC1-2008/0155  
33186 [291] are applied.

33187 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0121 [806] is applied.

#### 33188 Issue 8

33189 Austin Group Defect 1031 is applied, adding FNM\_CASEFOLD and FNM\_IGNORECASE.

33190 Austin Group Defect 1287 is applied, changing the description of how <backslash> is handled (if  
33191 FNM\_NOESCAPE is not set) to refer to XCU [Section 2.14.1](#) (on page 2523).

33192 Austin Group Defect 1444 is applied, correcting cross-references to *wordexp()*.

33193 **NAME**

33194 fopen — open a stream

33195 **SYNOPSIS**

33196 #include &lt;stdio.h&gt;

33197 FILE \*fopen(const char \*restrict pathname, const char \*restrict mode);

33198 **DESCRIPTION**

33199 CX Except for the “exclusive access” requirement (see below), the functionality described on this  
 33200 reference page is aligned with the ISO C standard. Any other conflict between the requirements  
 33201 described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to  
 33202 the ISO C standard for all *fopen()* functionality except in relation to “exclusive access”.

33203 The *fopen()* function shall open the file whose pathname is the string pointed to by *pathname*,  
 33204 and associates a stream with it.

33205 The *mode* argument points to a character string. The behavior is unspecified if any character  
 33206 occurs more than once in the string. If the string begins with one of the following characters,  
 33207 then the file shall be opened in the indicated mode. Otherwise, the behavior is undefined.

33208 'r' Open file for reading.

33209 'w' Truncate to zero length or create file for writing.

33210 'a' Append; open or create file for writing at end-of-file.

33211 CX The remainder of the string can contain any of the following characters, in any order, and  
 33212 further affect how the file is opened:

33213 CX 'b' This character shall have no effect, but is allowed for ISO C standard conformance.

33214 CX 'e' The underlying file descriptor shall have the FD\_CLOEXEC flag atomically set.

33215 CX 'x' If the first character of *mode* is 'w' or 'a', then the function shall fail if the file already  
 33216 exists, or cannot be created; if the file does not exist and can be created, it shall be created  
 33217 CX with an implementation-defined form of exclusive (also known as non-shared) access,  
 33218 CX if supported by the underlying file system, provided the resulting file permissions are the  
 33219 same as they would be without the 'x' modifier. If the first character of *mode* is 'r', the  
 33220 effect is implementation-defined.

33221 **Note:** The ISO C standard requires exclusive access “to the extent that the underlying file  
 33222 system supports exclusive access”, but does not define what it means by this. Taken at  
 33223 face value—that systems must do whatever they are capable of, at the file system level,  
 33224 in order to exclude access by others—this would require POSIX.1 systems to set the file  
 33225 permissions in a way that prevents access by other users and groups. Consequently, this  
 33226 volume of POSIX.1-2024 does not defer to the ISO C standard as regards the “exclusive  
 33227 access” requirement.

33228 ' +' The file shall be opened for update (both reading and writing), rather than just reading or  
 33229 just writing.

33230 Opening a file with read mode ('r' as the first character in the *mode* argument) shall fail if the  
 33231 file does not exist or cannot be read.

33232 Opening a file with append mode ('a' as the first character in the *mode* argument) shall cause  
 33233 all subsequent writes to the file to be forced to the then current end-of-file, regardless of  
 33234 intervening calls to *fseek()*.

33235 When a file is opened with update mode ('+' in the *mode* argument), both input and output can  
 33236 be performed on the associated stream. However, the application shall ensure that output is not  
 33237 directly followed by input without an intervening call to *fflush()* or to a file positioning function

33238 (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly followed by output without an  
33239 intervening call to a file positioning function, unless the input operation encounters end-of-file.

33240 When opened, a stream is fully buffered if and only if it can be determined not to refer to an  
33241 interactive device. The error and end-of-file indicators for the stream shall be cleared.

33242 CX If the first character in *mode* is 'w' or 'a' and the file did not previously exist, upon successful  
33243 completion, *fopen()* shall mark for update the last data access, last data modification, and last file  
33244 status change timestamps of the file and the last file status change and last data modification  
33245 timestamps of the parent directory.

33246 If the first character in *mode* is 'w' or 'a' and the file did not previously exist, the *fopen()*  
33247 function shall create a file as if it called the *open()* function with a value appropriate for the *path*  
33248 argument interpreted from *pathname*, a value for the *oflag* argument as specified below, and a  
33249 value of S\_IRUSR | S\_IWUSR | S\_IRGRP | S\_IWGRP | S\_IROTH | S\_IWOTH for the third  
33250 argument.

33251 If the first character in *mode* is 'w' and the file did previously exist, upon successful completion,  
33252 *fopen()* shall mark for update the last data modification and last file status change timestamps of  
33253 the file.

33254 XSI After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the  
33255 encoding rule shall be cleared, and the associated *mbstate\_t* object shall be set to describe an  
33256 initial conversion state.

33257 CX The file descriptor associated with the opened stream shall be allocated and opened as if by a  
33258 call to *open()* using the following flags:

<i>fopen()</i> Mode First Character	<i>fopen()</i> Mode Includes '+'	Initial <i>open()</i> Flags
'r'	no	O_RDONLY
'w'	no	O_WRONLY   O_CREAT   O_TRUNC
'a'	no	O_WRONLY   O_CREAT   O_APPEND
'r'	yes	O_RDWR
'w'	yes	O_RDWR   O_CREAT   O_TRUNC
'a'	yes	O_RDWR   O_CREAT   O_APPEND

33267 If, and only if, the 'e' *mode* string character is specified, the O\_CLOEXEC flag shall be OR'ed  
33268 into the initial *open()* flags specified in the above table.

33269 If, and only if, the 'x' *mode* string character is specified together with either 'w' or 'a', the  
33270 O\_EXCL flag shall be OR'ed into the initial *open()* flags specified in the above table.

33271 If *mode* includes 'x' and the underlying file system supports exclusive access (see above)  
33272 enabled by the use of implementation-specific flags to *open()*, then the behavior shall be as if  
33273 those flags are also included.

33274 When using *mode* strings specified by this standard, the implementation shall behave as if no  
33275 other flags had been passed to *open()*.

#### 33276 RETURN VALUE

33277 Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream.

33278 CX Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

33279 **ERRORS**33280 The *fopen()* function shall fail if:

33281	CX	[EACCES]	Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by <i>mode</i> are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.
33282			
33283			
33284			
33285	CX	[EEXIST]	The <i>mode</i> argument begins with <i>w</i> or <i>a</i> and includes <i>x</i> , but the file already exists.
33286			
33287	CX	[EILSEQ]	The <i>mode</i> argument begins with <i>w</i> or <i>a</i> , the file did not previously exist, and the last pathname component is not a portable filename and cannot be created in the target directory.
33288			
33289			
33290	CX	[EINTR]	A signal was caught during <i>fopen()</i> .
33291	CX	[EISDIR]	The named file is a directory and <i>mode</i> requires write access.
33292	CX	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>pathname</i> argument.
33293			
33294	CX	[EMFILE]	All file descriptors available to the process are currently open.
33295	CX	[EMFILE]	{STREAM_MAX} streams are currently open in the calling process.
33296	CX	[ENAMETOOLONG]	
33297			The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
33298			
33299			
33300	CX	[ENFILE]	The maximum allowable number of files is currently open in the system.
33301	CX	[ENOENT]	The <i>mode</i> string begins with 'r' and a component of <i>pathname</i> does not name an existing file, or <i>mode</i> begins with 'w' or 'a' and a component of the path prefix of <i>pathname</i> does not name an existing file, or <i>pathname</i> is an empty string.
33302			
33303			
33304			
33305	CX	[ENOENT] or [ENOTDIR]	
33306			The <i>pathname</i> argument contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters. If <i>pathname</i> without the trailing <i>&lt;slash&gt;</i> characters would name an existing file, an [ENOENT] error shall not occur.
33307			
33308			
33309			
33310	CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and the file was to be created.
33311			
33312	CX	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>pathname</i> argument contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
33313			
33314			
33315			
33316			
33317	CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
33318			
33319	CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <b>off_t</b> .
33320			

33321 CX [EROFS] The named file resides on a read-only file system and *mode* requires write  
33322 access.

33323 The *fopen()* function may fail if:

33324 CX [EINVAL] The value of the *mode* argument is not valid.

33325 CX [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
33326 resolution of the *pathname* argument.

33327 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

33328 CX [ENAMETOOLONG]

33329 The length of a component of a pathname is longer than {NAME\_MAX}.

33330 CX [ENOMEM] Insufficient storage space is available.

33331 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*  
33332 requires write access.

### 33333 EXAMPLES

#### 33334 Opening a File

33335 The following example tries to open the file named **file** for reading. The *fopen()* function returns  
33336 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the  
33337 file, it just ignores it.

```
33338 #include <stdio.h>
33339 ...
33340 FILE *fp;
33341 ...
33342 void rgrep(const char *file)
33343 {
33344     ...
33345     if ((fp = fopen(file, "r")) == NULL)
33346         return;
33347     ...
33348 }
```

### 33349 APPLICATION USAGE

33350 If an application needs to create a file in a way that fails if the file already exists, and either  
33351 requires that it does not have exclusive access to the file or does not need exclusive access, it  
33352 should use *open()* with the O\_CREAT and O\_EXCL flags instead of using *fopen()* with an 'x'  
33353 in the mode. A stream can then be created, if needed, by calling *fdopen()* on the file descriptor  
33354 returned by *open()*.

### 33355 RATIONALE

33356 The 'e' mode character is provided as a convenience to avoid a data race in multi-threaded  
33357 applications. Without it, a file descriptor is leaked into a child process created by one thread in  
33358 the window between another thread creating a file descriptor with *fopen()* and then using  
33359 *fileno()* and *fcntl()* to set the FD\_CLOEXEC flag. It is also possible to avoid the race by using  
33360 *open()* with O\_CLOEXEC followed by *fdopen()*, however, there is no safe alternative for the  
33361 *freopen()* function, and consistency dictates that the 'e' modifier should be standardized for all  
33362 functions that accept *mode* strings.

33363 The ISO C standard only recognizes the '+', 'b', and 'x' characters in certain positions of the  
33364 *mode* string, leaving other arrangements as unspecified, and only permits 'x' in *mode* strings

33365 beginning with 'w'. This standard specifically requires support for all characters other than the  
 33366 first in the *mode* string to be recognized in any order. Thus, "wxe" and "wex" behave the same,  
 33367 and while "wx+" is unspecified in the ISO C standard, this standard requires it to have the same  
 33368 behavior as "w+x". This standard also requires that 'x' work for *mode* strings beginning with  
 33369 'a', as well as having implementation-defined behavior for *mode* strings beginning with 'r'.  
 33370 Therefore, while *open()* has undefined behavior if O\_EXCL is specified without O\_CREAT, the  
 33371 same is not true of *fopen()*.

33372 When 'x' is in mode, the ISO C standard requires that the file is created with exclusive access to  
 33373 the extent that the underlying system supports exclusive access. Although POSIX.1 does not  
 33374 specify any method of enabling exclusive access, it allows for the existence of an  
 33375 implementation-specific flag, or flags, that enable it. Note that they should be file creation flags  
 33376 if a file is being created, not file access mode flags (that is, ones that are included in  
 33377 O\_ACCMODE) or file status flags, so that they do not affect the value returned by *fcntl()* with  
 33378 F\_GETFL. On implementations that have such flags, if support for them is file system dependent  
 33379 and exclusive access is requested when using *fopen()* to create a file on a file system that does  
 33380 not support it, the flags must not be used if they would cause *fopen()* to fail.

33381 Some implementations support mandatory file locking as a means of enabling exclusive access  
 33382 to a file. Locks are set in the normal way, but instead of only preventing others from setting  
 33383 conflicting locks they prevent others from accessing the contents of the locked part of the file in a  
 33384 way that conflicts with the lock. However, unless the implementation has a way of setting a  
 33385 whole-file write lock on file creation, this does not satisfy the requirement in the ISO C standard  
 33386 that the file is "created with exclusive access to the extent that the underlying system supports  
 33387 exclusive access". (Having *fopen()* create the file and set a lock on the file as two separate  
 33388 operations is not the same, and it would introduce a race condition whereby another process  
 33389 could open the file and write to it (or set a lock) in between the two operations.) However, on all  
 33390 implementations that support mandatory file locking, its use is discouraged; therefore, it is  
 33391 recommended that implementations which support mandatory file locking do not add a means  
 33392 of creating a file with a whole-file exclusive lock set, so that *fopen()* is not required to enable  
 33393 mandatory file locking in order to conform to the ISO C standard. An implementation that has a  
 33394 means of creating a file with a whole-file exclusive lock set would need to provide a way to  
 33395 change the behavior of *fopen()* depending on whether the calling process is executing in a  
 33396 POSIX.1 conforming environment or an ISO C conforming environment.

33397 The typical implementation-defined behavior for mode "rx" is to ignore the 'x', but the  
 33398 standard developers did not wish to mandate this behavior. For example, an implementation  
 33399 could allow shared access for reading; that is, disallow a file that has been opened this way from  
 33400 also being opened for writing.

33401 Implementations are encouraged to have *fopen()* and *freopen()* report an [EILSEQ] error if *mode*  
 33402 begins with 'w' or 'a', the file did not previously exist, and the last component of *pathname*  
 33403 contains any bytes that have the encoded value of a <newline> character.

#### 33404 FUTURE DIRECTIONS

33405 None.

33409 **CHANGE HISTORY**

33410 First released in Issue 1. Derived from Issue 1 of the SVID.

33411 **Issue 5**

33412 Large File Summit extensions are added.

33413 **Issue 6**

33414 Extensions beyond the ISO C standard are marked.

33415 The following new requirements on POSIX implementations derive from alignment with the  
33416 Single UNIX Specification:

- 33417 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
33418 file description. This change is to support large files.
- 33419 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
33420 large files.
- 33421 • The [ELOOP] mandatory error condition is added.
- 33422 • The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional  
33423 error conditions are added.

33424 The normative text is updated to avoid use of the term “must” for application requirements.

33425 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 33426 • The prototype for *fopen()* is updated.
- 33427 • The DESCRIPTION is updated to note that if the argument *mode* points to a string other  
33428 than those listed, then the behavior is undefined.

33429 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
33430 [ELOOP] error condition is added.33431 **Issue 7**

33432 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode.

33433 Austin Group Interpretation 1003.1-2001 #143 is applied.

33434 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set  
33435 on the open file description.

33436 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

33437 SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a  
33438 “may fail” to a “shall fail”.

33439 Changes are made related to support for finegrained timestamps.

33440 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0156 [291,433], XSH/TC1-2008/0157  
33441 [146,433], XSH/TC1-2008/0158 [324], and XSH/TC1-2008/0159 [14] are applied.

33442 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0122 [822] is applied.

33443 **Issue 8**33444 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
33445 filenames containing any bytes that have the encoded value of a <newline> character.

33446 Austin Group Defect 293 is applied, adding the [EILSEQ] error.

33447 Austin Group Defects 411 and 1524 are applied, adding the 'e' and 'x' *mode* string characters.

33448 Austin Group Defect 1200 is applied, correcting the argument name in the [ELOOP] errors.

33449  
33450

Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018 standard.

33451 **NAME**

33452 fork — create a new process

33453 **SYNOPSIS**

```
33454 #include <unistd.h>
33455 pid_t fork(void);
33456 pid_t _Fork(void);
```

33457 **DESCRIPTION**

33458 The `fork()` function shall create a new process. The new process (child process) shall be an exact  
 33459 copy of the calling process (parent process) except as detailed below:

- 33460 • The child process shall have a unique process ID.
- 33461 • The child process ID also shall not match any active process group ID.
- 33462 • The child process shall have a different parent process ID, which shall be the process ID of  
 33463 the calling process.
- 33464 • The child process shall have its own copy of the parent's file descriptors, except for those  
 33465 whose `FD_CLOFORK` flag is set (see `fcntl()`). Each of the child's file descriptors shall refer  
 33466 to the same open file description with the corresponding file descriptor of the parent.
- 33467 • The child process shall have its own copy of the parent's open directory streams. Each  
 33468 open directory stream in the child process may share directory stream positioning with the  
 33469 corresponding directory stream of the parent.
- 33470 • The child process shall have its own copy of the parent's message catalog descriptors.
- 33471 • The child process values of `tms_utime`, `tms_stime`, `tms_cutime`, and `tms_cstime` shall be set to  
 33472 0.
- 33473 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be  
 33474 canceled; see `alarm()`.
- 33475 XSI • All `semadj` values shall be cleared.
- 33476 • Process-owned file locks set by the parent process shall not be inherited by the child  
 33477 process.
- 33478 • The set of signals pending for the child process shall be initialized to the empty set.
- 33479 XSI • Interval timers shall be reset in the child process.
- 33480 • Any semaphores that are open in the parent process shall also be open in the child process.
- 33481 ML • The child process shall not inherit any address space memory locks established by the  
 33482 parent process via calls to `mlockall()` or `mlock()`.
- 33483 • Memory mappings created in the parent shall be retained in the child process.  
 33484 `MAP_PRIVATE` mappings inherited from the parent shall also be `MAP_PRIVATE`  
 33485 mappings in the child, and any modifications to the data in these mappings made by the  
 33486 parent prior to calling `fork()` shall be visible to the child. Any modifications to the data in  
 33487 `MAP_PRIVATE` mappings made by the parent after `fork()` returns shall be visible only to  
 33488 the parent. Modifications to the data in `MAP_PRIVATE` mappings made by the child shall  
 33489 be visible only to the child.
- 33490 PS • For the `SCHED_FIFO` and `SCHED_RR` scheduling policies, the child process shall inherit  
 33491 the policy and priority settings of the parent process during a `fork()` function. For other  
 33492 scheduling policies, the policy and priority settings on `fork()` are implementation-defined.

- 33493 • Per-process timers created by the parent shall not be inherited by the child process.
- 33494 MSG • The child process shall have its own copy of the message queue descriptors of the parent.  
33495 Each of the message descriptors of the child shall refer to the same open message queue  
33496 description as the corresponding message descriptor of the parent.
- 33497 • No asynchronous input or asynchronous output operations shall be inherited by the child  
33498 process. Any use of asynchronous control blocks created by the parent produces undefined  
33499 behavior.
- 33500 • A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the  
33501 new process shall contain a replica of the calling thread and its entire address space,  
33502 possibly including the states of mutexes and other resources. Consequently, the application  
33503 shall ensure that the child process only executes async-signal-safe operations until such  
33504 time as one of the *exec* functions is successful.
- 33505 • Any locks held by any thread in the calling process that have been set to be process-shared  
33506 shall not be held by the child process. For locks held by any thread in the calling process  
33507 that have not been set to be process-shared, any attempt by the child process to perform  
33508 any operation on the lock results in undefined behavior (regardless of whether the calling  
33509 process is single-threaded or multi-threaded).
- 33510 CPT • The initial value of the CPU-time clock of the child process shall be set to zero.
- 33511 TCT • The initial value of the CPU-time clock of the single thread of the child process shall be set  
33512 to zero.

33513 All other process characteristics defined by POSIX.1-2024 shall be the same in the parent and  
33514 child processes. The inheritance of process characteristics not defined by POSIX.1-2024 is  
33515 unspecified by POSIX.1-2024.

33516 After *fork()*, both the parent and the child processes shall be capable of executing independently  
33517 before either one terminates.

33518 The *\_Fork()* function shall be equivalent to *fork()*, except that fork handlers established by means  
33519 of the *pthread\_atfork()* function shall not be called and *\_Fork()* shall be async-signal-safe.

#### 33520 RETURN VALUE

33521 Upon successful completion, *fork()* shall return 0 to the child process and shall return the  
33522 process ID of the child process to the parent process. Both processes shall continue to execute  
33523 from the *fork()* function. Otherwise, *-1* shall be returned to the parent process, no child process  
33524 shall be created, and *errno* shall be set to indicate the error.

#### 33525 ERRORS

33526 These functions shall fail if:

33527 [EAGAIN] The system lacked the necessary resources to create another process, or the  
33528 system-imposed limit on the total number of processes under execution  
33529 system-wide or by a single user {CHILD\_MAX} would be exceeded.

33530 These functions may fail if:

33531 [ENOMEM] Insufficient storage space is available.

33532 **EXAMPLES**

33533 None.

33534 **APPLICATION USAGE**

33535 When a multi-threaded process calls *fork()* or *\_Fork()*, there is no guarantee that thread-specific  
 33536 memory, such as stacks or thread-local storage, associated with threads in the parent other than  
 33537 the calling thread will still be available in the child. This is because threads in the parent other  
 33538 than the calling thread do not exist in the child. Consequently, the implementation of *fork()* or  
 33539 *\_Fork()* could remove that memory from the address space in the child, or reuse it for other  
 33540 purposes before returning or (in the case of *fork()*) calling any of the fork handlers registered by  
 33541 *pthread\_atfork()*. Therefore, applications should avoid using any pointers to thread-specific  
 33542 memory in the child that were passed to the calling thread from other threads in the parent.

33543 **RATIONALE**

33544 Many historical implementations have timing windows where a signal sent to a process group  
 33545 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the  
 33546 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of  
 33547 pending signals. This volume of POSIX.1-2024 does not require, or even permit, this behavior.  
 33548 However, it is pragmatic to expect that problems of this nature may continue to exist in  
 33549 implementations that appear to conform to this volume of POSIX.1-2024 and pass available  
 33550 verification suites. This behavior is only a consequence of the implementation failing to make  
 33551 the interval between signal generation and delivery totally invisible. From the application's  
 33552 perspective, a *fork()* call should appear atomic. A signal that is generated prior to the *fork()*  
 33553 should be delivered prior to the *fork()*. A signal sent to the process group after the *fork()* should  
 33554 be delivered to both parent and child. The implementation may actually initialize internal data  
 33555 structures corresponding to the child's set of pending signals to include signals sent to the  
 33556 process group during the *fork()*. Since the *fork()* call can be considered as atomic from the  
 33557 application's perspective, the set would be initialized as empty and such signals would have  
 33558 arrived after the *fork()*; see also **<signal.h>**.

33559 One approach that has been suggested to address the problem of signal inheritance across *fork()*  
 33560 is to add an [EINTR] error, which would be returned when a signal is detected during the call.  
 33561 While this is preferable to losing signals, it was not considered an optimal solution. Although it  
 33562 is not recommended for this purpose, such an error would be an allowable extension for an  
 33563 implementation.

33564 The [ENOMEM] error value is reserved for those implementations that detect and distinguish  
 33565 such a condition. This condition occurs when an implementation detects that there is not enough  
 33566 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate  
 33567 because there can never be enough memory (either primary or secondary storage) to perform  
 33568 the operation. Since *fork()* duplicates an existing process, this must be a condition where there is  
 33569 sufficient memory for one such process, but not for two. Many historical implementations  
 33570 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally  
 33571 distinct from [EAGAIN] from the perspective of a conforming application.

33572 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it  
 33573 and it should be reserved for the error condition specified there. The condition is not applicable  
 33574 on many implementations.

33575 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.  
 33576 A system that single-threads processes was clearly not intended and is considered an  
 33577 unacceptable "toy implementation" of this volume of POSIX.1-2024. The only objection  
 33578 anticipated to the phrase "executing independently" is testability, but this assertion should be  
 33579 testable. Such tests require that both the parent and child can block on a detectable action of the  
 33580 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be

33581 possible for the system to conform to the intent of this volume of POSIX.1-2024.

33582 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it  
 33583 occurs or not is not in any practical sense under the control of the application because the  
 33584 condition is usually a consequence of the user's use of the system, not of the application's code.  
 33585 Thus, no application can or should rely upon its occurrence under any circumstances, nor  
 33586 should the exact semantics of what concept of "user" is used be of concern to the application  
 33587 developer. Validation writers should be cognizant of this limitation.

33588 There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread  
 33589 of control within the same program (which was originally only possible in POSIX by creating a  
 33590 new process); the other is to create a new process running a different program. In the latter case,  
 33591 the call to *fork()* is soon followed by a call to one of the *exec* functions.

33592 The general problem with making *fork()* work in a multi-threaded world is what to do with all  
 33593 of the threads. There are two alternatives. One is to copy all of the threads into the new process.  
 33594 This causes the programmer or implementation to deal with threads that are suspended on  
 33595 system calls or that might be about to execute system calls that should not be executed in the  
 33596 new process. The other alternative is to copy only the thread that calls *fork()*. This creates the  
 33597 difficulty that the state of process-local resources is usually held in process memory. If a thread  
 33598 that is not calling *fork()* holds a resource, that resource is never released in the child process  
 33599 because the thread whose job it is to release the resource does not exist in the child process.

33600 When a programmer is writing a multi-threaded program, the first described use of *fork()*,  
 33601 creating new threads in the same program, is provided by the *pthread\_create()* function. The  
 33602 *fork()* function is thus used only to run new programs, and the effects of calling functions that  
 33603 require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

33604 The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()*  
 33605 function lets all the threads in the parent be duplicated in the child. This essentially duplicates  
 33606 the state of the parent in the child. This allows threads in the child to continue processing and  
 33607 allows locks and the state to be preserved without explicit *pthread\_atfork()* code. The calling  
 33608 process has to ensure that the threads processing state that is shared between the parent and  
 33609 child (that is, file descriptors or MAP\_SHARED memory) behaves properly after *forkall()*. For  
 33610 example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two  
 33611 threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*.  
 33612 If this is not desired behavior, the parent process has to synchronize with such threads before  
 33613 calling *forkall()*.

33614 When *forkall()* is called, threads, other than the calling thread, that are in functions that can  
 33615 return with an [EINTR] error may have those functions return [EINTR] if the implementation  
 33616 cannot ensure that the function behaves correctly in the parent and child. In particular,  
 33617 *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, and *pthread\_cond\_wait()* need to return in  
 33618 order to ensure that the condition has not changed. These functions can be awakened by a  
 33619 spurious condition wakeup rather than returning [EINTR].

33620 **FUTURE DIRECTIONS**

33621 None.

33624 XBD Section 4.15.2 (on page 104), <sys/types.h>, <unistd.h>

33625 **CHANGE HISTORY**

33626 First released in Issue 1. Derived from Issue 1 of the SVID.

33627 **Issue 5**33628 The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX  
33629 Threads Extension.33630 **Issue 6**33631 The following new requirements on POSIX implementations derive from alignment with the  
33632 Single UNIX Specification:

- 33633 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
33634 required for conforming implementations of previous POSIX specifications, it was not  
33635 required for UNIX applications.

33636 The following changes were made to align with the IEEE P1003.1a draft standard:

- 33637 • The effect of `fork()` on a pending alarm call in the child process is clarified.

33638 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

33639 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

33640 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the  
33641 DESCRIPTION and RATIONALE relating to fork handlers registered by the `pthread_atfork()`  
33642 function and async-signal safety.33643 **Issue 7**33644 Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous  
33645 input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.33646 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers,  
33647 and Threads options is moved to the Base.

33648 Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

33649 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0123 [858] is applied.

33650 **Issue 8**33651 Austin Group Defects 62, 1361, and 1383 are applied, adding the `_Fork()` function and removing  
33652 the requirement for `fork()` to be async-signal-safe.

33653 Austin Group Defect 768 is applied, adding OFD-owned file locks.

33654 Austin Group Defect 1112 is applied, clarifying the requirements for a child of a multi-threaded  
33655 process and for process-shared and non-process-shared locks held by any thread in the calling  
33656 process.

33657 Austin Group Defect 1114 is applied, changing the APPLICATION USAGE section.

33658 Austin Group Defect 1216 is applied, adding `pthread_cond_clockwait()`.33659 Austin Group Defect 1318 is applied, adding `FD_CLOFORK`.

33660 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

33661 **NAME**

33662 `fpathconf`, `pathconf` — get configurable pathname variables

33663 **SYNOPSIS**

```
33664 #include <unistd.h>
33665 long fpathconf(int fildes, int name);
33666 long pathconf(const char *path, int name);
```

33667 **DESCRIPTION**

33668 The `fpathconf()` and `pathconf()` functions shall determine the current value of a configurable limit  
33669 or option (*variable*) that is associated with a file or directory.

33670 For `pathconf()`, the *path* argument points to the pathname of a file or directory.

33671 For `fpathconf()`, the *filde*s argument is an open file descriptor.

33672 The *name* argument represents the variable to be queried relative to that file or directory.  
33673 Implementations shall support all of the variables listed in the following table and may support  
33674 others. The variables in the following table come from `<limits.h>` or `<unistd.h>` and the  
33675 symbolic constants, defined in `<unistd.h>`, are the corresponding values used for *name*.

33676	Variable	Value of <i>name</i>	Requirements
33677	{FILESIZEBITS}	_PC_FILESIZEBITS	4,7
33678	{LINK_MAX}	_PC_LINK_MAX	1
33679	{MAX_CANON}	_PC_MAX_CANON	2
33680	{MAX_INPUT}	_PC_MAX_INPUT	2
33681	{NAME_MAX}	_PC_NAME_MAX	3,4
33682	{PATH_MAX}	_PC_PATH_MAX	4,5
33683	{PIPE_BUF}	_PC_PIPE_BUF	6
33684	{POSIX2_SYMLINKS}	_PC_2_SYMLINKS	4
33685	{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	10
33686	{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	10
33687	{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	10
33688	{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	10
33689	{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	10
33690	{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
33691	{TEXTDOMAIN_MAX}	_PC_TEXTDOMAIN_MAX	3,4
33692	_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
33693	_POSIX_NO_TRUNC	_PC_NO_TRUNC	3,4
33694	_POSIX_VDISABLE	_PC_VDISABLE	2
33695	_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
33696	_POSIX_FALLOC	_PC_FALLOC	8
33697	_POSIX_PRIO_IO	_PC_PRIO_IO	8
33698	_POSIX_SYNC_IO	_PC_SYNC_IO	8
33699	_POSIX_TIMESTAMP_RESOLUTION	_PC_TIMESTAMP_RESOLUTION	1

33700 **Requirements**

- 33701 1. If *path* or *fildev* refers to a directory, the value returned shall apply to the directory itself.
- 33702 2. If *path* or *fildev* does not refer to a terminal file, it is unspecified whether an  
33703 implementation supports an association of the variable name with the specified file.
- 33704 3. If *path* or *fildev* refers to a directory, the value returned shall apply to filenames within the  
33705 directory.
- 33706 4. If *path* or *fildev* does not refer to a directory, it is unspecified whether an implementation  
33707 supports an association of the variable name with the specified file.
- 33708 5. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of a  
33709 relative pathname that would not cross any mount points when the specified directory is  
33710 the working directory.
- 33711 6. If *path* refers to a FIFO, or *fildev* refers to a pipe or FIFO, the value returned shall apply to  
33712 the referenced object. If *path* or *fildev* refers to a directory, the value returned shall apply to  
33713 any FIFO that exists or can be created within the directory. If *path* or *fildev* refers to any  
33714 other type of file, it is unspecified whether an implementation supports an association of  
33715 the variable name with the specified file.
- 33716 7. If *path* or *fildev* refers to a directory, the value returned shall apply to any files, other than  
33717 directories, that exist or can be created within the directory.
- 33718 8. If *path* or *fildev* refers to a directory, it is unspecified whether an implementation supports  
33719 an association of the variable name with the specified file.
- 33720 9. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of the  
33721 string that a symbolic link in that directory can contain.
- 33722 10. If *path* or *fildev* does not refer to a regular file, it is unspecified whether an  
33723 implementation supports an association of the variable name with the specified file. If an  
33724 implementation supports such an association for other than a regular file, the value  
33725 returned is unspecified.

33726 **RETURN VALUE**

33727 If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return  $-1$  and set *errno* to  
33728 indicate the error.

33729 If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum  
33730 value and the variable has no limit for the path or file descriptor, both *pathconf()* and *fpathconf()*  
33731 shall return  $-1$  without changing *errno*. Note that indefinite limits do not imply infinite limits;  
33732 see **<limits.h>**.

33733 If the implementation needs to use *path* to determine the value of *name* and the implementation  
33734 does not support the association of *name* with the file specified by *path*, or if the process did not  
33735 have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf()*  
33736 shall return  $-1$  and set *errno* to indicate the error.

33737 If the implementation needs to use *fildev* to determine the value of *name* and the implementation  
33738 does not support the association of *name* with the file specified by *fildev*, or if *fildev* is an invalid  
33739 file descriptor, *fpathconf()* shall return  $-1$  and set *errno* to indicate the error.

33740 Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or  
33741 directory without changing *errno*. The value returned shall not be more restrictive than the  
33742 corresponding value available to the application when it was compiled with the  
33743 implementation's **<limits.h>** or **<unistd.h>**.

33744 If the variable corresponding to *name* is dependent on an unsupported option, the results are  
33745 unspecified.

### 33746 ERRORS

33747 The *pathconf()* function shall fail if:

33748 [EINVAL] The value of *name* is not valid.

33749 [EOVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is  
33750 larger than `{LONG_MAX}`.

33751 The *pathconf()* function may fail if:

33752 [EACCES] Search permission is denied for a component of the path prefix.

33753 [EINVAL] The implementation does not support an association of the variable *name* with  
33754 the specified file.

33755 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
33756 argument.

33757 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during  
33758 resolution of the *path* argument.

33759 [ENAMETOOLONG]

33760 The length of a component of a pathname is longer than `{NAME_MAX}`.

33761 [ENAMETOOLONG]

33762 The length of a pathname exceeds `{PATH_MAX}`, or pathname resolution of a  
33763 symbolic link produced an intermediate result with a length that exceeds  
33764 `{PATH_MAX}`.

33765 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

33766 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
33767 directory nor a symbolic link to a directory, or the *path* argument contains at  
33768 least one non-`<slash>` character and ends with one or more trailing `<slash>`  
33769 characters and the last pathname component names an existing file that is  
33770 neither a directory nor a symbolic link to a directory.

33771 The *fpathconf()* function shall fail if:

33772 [EINVAL] The value of *name* is not valid.

33773 [EOVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is  
33774 larger than `{LONG_MAX}`.

33775 The *fpathconf()* function may fail if:

33776 [EBADF] The *fdes* argument is not a valid file descriptor.

33777 [EINVAL] The implementation does not support an association of the variable *name* with  
33778 the specified file.

33779 **EXAMPLES**

33780 None.

33781 **APPLICATION USAGE**

33782 Application developers should check whether an option, such as `_POSIX_ADVISORY_INFO`, is  
 33783 supported prior to obtaining and using values for related variables such as  
 33784 `{POSIX_ALLOC_SIZE_MIN}`.

33785 **RATIONALE**

33786 The `fpathconf()` function was proposed immediately after the `sysconf()` function when it was  
 33787 realized that some configurable values may differ across file system, directory, or device  
 33788 boundaries.

33789 For example, `{NAME_MAX}` frequently changes between System V and BSD-based file systems;  
 33790 System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file  
 33791 systems, an application would be forced to limit all pathname components to 14 bytes, as this  
 33792 would be the value specified in `<limits.h>` on such a system.

33793 Therefore, various useful values can be queried on any pathname or file descriptor, assuming  
 33794 that appropriate privileges are in place.

33795 The value returned for the variable `{PATH_MAX}` indicates the longest relative pathname that  
 33796 could be given if the specified directory is the current working directory of the process. A  
 33797 process may not always be able to generate a name that long and use it if a subdirectory in the  
 33798 pathname crosses into a more restrictive file system. Note that implementations are allowed to  
 33799 accept pathnames longer than `{PATH_MAX}` bytes long, but are not allowed to return  
 33800 pathnames longer than this unless the user specifies a larger buffer using a function that  
 33801 provides a buffer size argument.

33802 The value returned for the variable `_POSIX_CHOWN_RESTRICTED` also applies to directories  
 33803 that do not have file systems mounted on them. The value may change when crossing a mount  
 33804 point, so applications that need to know should check for each directory. (An even easier check  
 33805 is to try the `chown()` function and look for an error in case it happens.)

33806 Unlike the values returned by `sysconf()`, the pathname-oriented variables are potentially more  
 33807 volatile and are not guaranteed to remain constant throughout the lifetime of the process. For  
 33808 example, in between two calls to `fpathconf()`, the file system in question may have been  
 33809 unmounted and remounted with different characteristics.

33810 Also note that most of the errors are optional. If one of the variables always has the same value  
 33811 on an implementation, the implementation need not look at `path` or `fildev` to return that value and  
 33812 is, therefore, not required to detect any of the errors except the meaning of `[EINVAL]` that  
 33813 indicates that the value of `name` is not valid for that variable, and the `[EOVERFLOW]` error that  
 33814 indicates the value to be returned is larger than `{LONG_MAX}`.

33815 If the value of any of the limits is unspecified (logically infinite), they will not be defined in  
 33816 `<limits.h>` and the `fpathconf()` and `fpathconf()` functions return `-1` without changing `errno`. This  
 33817 can be distinguished from the case of giving an unrecognized `name` argument because `errno` is set  
 33818 to `[EINVAL]` in this case.

33819 Since `-1` is a valid return value for the `fpathconf()` and `fpathconf()` functions, applications should  
 33820 set `errno` to zero before calling them and check `errno` only if the return value is `-1`.

33821 For the case of `{SYMLINK_MAX}`, since both `fpathconf()` and `open()` follow symbolic links, there  
 33822 is no way that `path` or `fildev` could refer to a symbolic link.

33823 It was the intention of IEEE Std 1003.1d-1999 that the following variables:

33824 {POSIX\_ALLOC\_SIZE\_MIN}  
 33825 {POSIX\_REC\_INCR\_XFER\_SIZE}  
 33826 {POSIX\_REC\_MAX\_XFER\_SIZE}  
 33827 {POSIX\_REC\_MIN\_XFER\_SIZE}  
 33828 {POSIX\_REC\_XFER\_ALIGN}

33829 only applied to regular files, but Note 10 also permits implementation of the advisory semantics  
 33830 on other file types unique to an implementation (for example, a character special device).

33831 The [EOVERFLOW] error for \_PC\_TIMESTAMP\_RESOLUTION cannot occur on POSIX-  
 33832 compliant file systems because POSIX requires a timestamp resolution no larger than one  
 33833 second. Even on 32-bit systems, this can be represented without overflow.

#### 33834 FUTURE DIRECTIONS

#### 33840 CHANGE HISTORY

33841 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 33842 Issue 5

33843 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

33844 Large File Summit extensions are added.

#### 33845 Issue 6

33846 The following new requirements on POSIX implementations derive from alignment with the  
 33847 Single UNIX Specification:

- 33848 • The DESCRIPTION is updated to include {FILESIZEBITS}.
- 33849 • The [ELOOP] mandatory error condition is added.
- 33850 • A second [ENAMETOOLONG] is added as an optional error condition.

33851 The following changes were made to align with the IEEE P1003.1a draft standard:

- 33852 • The \_PC\_SYMLINK\_MAX entry is added to the table in the DESCRIPTION.

33853 The following *pathconf()* variables and their associated names are added for alignment with  
 33854 IEEE Std 1003.1d-1999:

33855 {POSIX\_ALLOC\_SIZE\_MIN}  
 33856 {POSIX\_REC\_INCR\_XFER\_SIZE}  
 33857 {POSIX\_REC\_MAX\_XFER\_SIZE}  
 33858 {POSIX\_REC\_MIN\_XFER\_SIZE}  
 33859 {POSIX\_REC\_XFER\_ALIGN}

33860 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth  
 33861 paragraph of the DESCRIPTION and removing shading and margin markers from the table.  
 33862 This change is needed since implementations are required to support all of these symbols.

33863 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for  
 33864 POSIX2\_SYMLINKS in the DESCRIPTION.

33865 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the  
33866 DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

33867 {POSIX\_ALLOC\_SIZE\_MIN}  
33868 {POSIX\_REC\_INCR\_XFER\_SIZE}  
33869 {POSIX\_REC\_MAX\_XFER\_SIZE}  
33870 {POSIX\_REC\_MIN\_XFER\_SIZE}  
33871 {POSIX\_REC\_XFER\_ALIGN}

33872 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN  
33873 VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable  
33874 is dependent on an unsupported option, and advising application developers to check for  
33875 supported options prior to obtaining and using such values.

33876 **Issue 7**

33877 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

33878 Changes are made related to support for finegrained timestamps.

33879 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
33880 pathname exists but is not a directory or a symbolic link to a directory.

33881 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0160 [256,428], XSH/TC1-2008/0161  
33882 [256,428], and XSH/TC1-2008/0162 [324] are applied.

33883 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0124 [651] and XSH/TC2-2008/0125  
33884 [651] are applied.

33885 **Issue 8**

33886 Austin Group Defect 687 is applied, adding \_POSIX\_FALLOC and \_PC\_FALLOC.

33887 Austin Group Defect 1122 is applied, adding {TEXTDOMAIN\_MAX}.

33888 **NAME**

33889 fpclassify — classify real floating type

33890 **SYNOPSIS**

33891 #include &lt;math.h&gt;

33892 int fpclassify(real-floating x);

33893 **DESCRIPTION**

33894 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
33895 conflict between the requirements described here and the ISO C standard is unintentional. This  
33896 volume of POSIX.1-2024 defers to the ISO C standard.

33897 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,  
33898 zero, or into another implementation-defined category. First, an argument represented in a  
33899 format wider than its semantic type is converted to its semantic type. Then classification is based  
33900 on the type of the argument.

33901 **RETURN VALUE**

33902 The *fpclassify()* macro shall return the value of the number classification macro appropriate to  
33903 the value of its argument.

33904 **ERRORS**

33905 No errors are defined.

33906 **EXAMPLES**

33907 None.

33908 **APPLICATION USAGE**

33909 None.

33910 **RATIONALE**

33911 None.

33912 **FUTURE DIRECTIONS**

33913 None.

33916 XBD &lt;math.h&gt;

33917 **CHANGE HISTORY**

33918 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

33919 **NAME**

33920 asprintf, dprintf, fprintf, printf, snprintf, sprintf — print formatted output

33921 **SYNOPSIS**

33922 #include &lt;stdio.h&gt;

```

33923 CX int asprintf(char **restrict ptr, const char *restrict format, ...);
33924 int dprintf(int fildes, const char *restrict format, ...);
33925 int fprintf(FILE *restrict stream, const char *restrict format, ...);
33926 int printf(const char *restrict format, ...);
33927 int snprintf(char *restrict s, size_t n,
33928             const char *restrict format, ...);
33929 int sprintf(char *restrict s, const char *restrict format, ...);

```

33930 **DESCRIPTION**

33931 CX Except for *asprintf()*, *dprintf()*, and the behavior of the %lc conversion when passed a null wide  
 33932 character, the functionality described on this reference page is aligned with the ISO C standard.  
 33933 Any other conflict between the requirements described here and the ISO C standard is  
 33934 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard for all *fprintf()*,  
 33935 *printf()*, *snprintf()*, and *sprintf()* functionality except in relation to the %lc conversion when  
 33936 passed a null wide character.

33937 The *fprintf()* function shall place output on the named output *stream*. The *printf()* function shall  
 33938 place output on the standard output stream *stdout*. The *sprintf()* function shall place output  
 33939 followed by the null byte, '\0', in consecutive bytes starting at *\*s*; it is the user's responsibility  
 33940 to ensure that enough space is available.

33941 CX The *asprintf()* function shall be equivalent to *sprintf()*, except that the output string shall be  
 33942 written to dynamically allocated memory, allocated as if by a call to *malloc()*, of sufficient length  
 33943 to hold the resulting string, including a terminating null byte. If the call to *asprintf()* is  
 33944 successful, the address of this dynamically allocated string shall be stored in the location  
 33945 referenced by *ptr*.

33946 The *dprintf()* function shall be equivalent to the *fprintf()* function, except that *dprintf()* shall  
 33947 write output to the file associated with the file descriptor specified by the *fildes* argument rather  
 33948 than place output on a stream.

33949 The *snprintf()* function shall be equivalent to *sprintf()*, with the addition of the *n* argument  
 33950 which limits the number of bytes written to the buffer referred to by *s*. If *n* is zero, nothing shall  
 33951 be written and *s* may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be  
 33952 discarded instead of being written to the array, and a null byte is written at the end of the bytes  
 33953 actually written into the array.

33954 If copying takes place between objects that overlap as a result of a call to *sprintf()* or *snprintf()*,  
 33955 the results are undefined.

33956 Each of these functions converts, formats, and prints its arguments under control of the *format*.  
 33957 The application shall ensure that the format is a character string, beginning and ending in its  
 33958 initial shift state, if any. The format is composed of zero or more directives: *ordinary characters*,  
 33959 which are simply copied to the output stream, and *conversion specifications*, each of which shall  
 33960 result in the fetching of zero or more arguments. The results are undefined if there are  
 33961 insufficient arguments for the format. If the format is exhausted while arguments remain, the  
 33962 excess arguments shall be evaluated but are otherwise ignored.

33963 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 33964 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 33965 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}],

33966 giving the position of the argument in the argument list. This feature provides for the definition  
 33967 of format strings that select arguments in an order appropriate to specific languages (see the  
 33968 EXAMPLES section).

33969 The *format* can contain either numbered argument conversion specifications (that is, those  
 33970 introduced by "%n\$" and optionally containing the "\*m\$" forms of field width and precision),  
 33971 or unnumbered argument conversion specifications (that is, those introduced by the % character  
 33972 and optionally containing the \* form of field width and precision), but not both. The only  
 33973 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered  
 33974 and unnumbered argument specifications in a format string are undefined. When numbered  
 33975 argument specifications are used, specifying the Nth argument requires that all the leading  
 33976 arguments, from the first to the (N-1)th, are specified in the format string.

33977 In format strings containing the "%n\$" form of conversion specification, numbered arguments  
 33978 in the argument list can be referenced from the format string as many times as required.

33979 In format strings containing the % form of conversion specification, each conversion specification  
 33980 uses the first unused argument in the argument list.

33981 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix  
 33982 character in the output string. The radix character is defined in the current locale (category  
 33983 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
 33984 radix character shall default to a <period> ('.').

33985 CX Each conversion specification is introduced by the '%' character or by the character sequence  
 33986 "%n\$", after which the following appear in sequence:

- 33987 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
 33988 specification.
- 33989 • An optional minimum *field width*. If the converted value has fewer bytes than the field  
 33990 width, it shall be padded with <space> characters by default on the left; it shall be padded  
 33991 on the right if the left-adjustment flag ('-'), described below, is given to the field width.  
 33992 CX The field width takes the form of an <asterisk> ('\*'), or in conversion specifications  
 33993 introduced by "%n\$" the "\*m\$" string, described below, or a decimal integer.
- 33994 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,  
 33995 x, and X conversion specifiers; the number of digits to appear after the radix character for  
 33996 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for  
 33997 the g and G conversion specifiers; or the maximum number of bytes to be printed from a  
 33998 XSI string in the s and S conversion specifiers. The precision takes the form of a <period>  
 33999 CX ('.') followed either by an <asterisk> ('\*'), or in conversion specifications introduced  
 34000 by "%n\$" the "\*m\$" string, described below, or an optional decimal digit string, where a  
 34001 null digit string is treated as zero. If a precision appears with any other conversion  
 34002 specifier, the behavior is undefined.
- 34003 • An optional length modifier that specifies the size of the argument.
- 34004 • A *conversion specifier* character that indicates the type of conversion to be applied.

34005 A field width, or precision, or both, may be indicated by an <asterisk> ('\*'). In this case an  
 34006 argument of type **int** supplies the field width or precision. Applications shall ensure that  
 34007 arguments specifying field width, or precision, or both appear in that order before the argument,  
 34008 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field  
 34009 CX width. A negative precision is taken as if the precision were omitted. In format strings  
 34010 containing conversion specifications introduced by "%n\$", in addition to being indicated by the  
 34011 decimal digit string, a field width may be indicated by the sequence "\*m\$" and precision by the

```

34012 sequence ".*m$", where m is a decimal integer in the range [1,{NL_ARGMAX}] giving the
34013 position in the argument list (after the format argument) of an integer argument containing the
34014 field width or precision, for example:
34015 printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);

```

34016 The flag characters and their meanings are:

- 34017 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,  
34018 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For  
34019 other conversions the behavior is undefined. The non-monetary grouping character is  
34020 used.
- 34021 - The result of the conversion shall be left-justified within the field. The conversion is  
34022 right-justified if this flag is not specified.
- 34023 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The  
34024 conversion shall begin with a sign only when a negative value is converted if this flag is  
34025 not specified.
- 34026 <space> If the first character of a signed conversion is not a sign or if a signed conversion results  
34027 in no characters, a <space> shall be prefixed to the result. This means that if the  
34028 <space> and '+' flags both appear, the <space> flag shall be ignored.
- 34029 # Specifies that the value is to be converted to an alternative form. For o conversion, it  
34030 shall increase the precision, if and only if necessary, to force the first digit of the result  
34031 to be a zero (if the value and precision are both 0, a single 0 is printed). For x or X  
34032 conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,  
34033 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,  
34034 even if no digits follow the radix character. Without this flag, a radix character appears  
34035 in the result of these conversions only if a digit follows it. For g and G conversion  
34036 specifiers, trailing zeros shall *not* be removed from the result as they normally are. For  
34037 other conversion specifiers, the behavior is undefined.
- 34038 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros  
34039 (following any indication of sign or base) are used to pad to the field width rather than  
34040 performing space padding, except when converting an infinity or NaN. If the '0' and  
34041 '-' flags both appear, the '0' flag is ignored. For d, i, o, u, x, and X conversion  
34042 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and  
34043 <apostrophe> flags both appear, the grouping characters are inserted before zero  
34044 padding. For other conversions, the behavior is undefined.

34045 The length modifiers and their meanings are:

- 34046 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**  
34047 or **unsigned char** argument (the argument will have been promoted according to the  
34048 integer promotions, but its value shall be converted to **signed char** or **unsigned char**  
34049 before printing); or that a following n conversion specifier applies to a pointer to a  
34050 **signed char** argument.
- 34051 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or  
34052 **unsigned short** argument (the argument will have been promoted according to the  
34053 integer promotions, but its value shall be converted to **short** or **unsigned short** before  
34054 printing); or that a following n conversion specifier applies to a pointer to a **short**  
34055 argument.

- 34056 1 (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or  
 34057 **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to  
 34058 a **long** argument; that a following `c` conversion specifier applies to a **wint\_t** argument;  
 34059 that a following `s` conversion specifier applies to a pointer to a **wchar\_t** argument; or  
 34060 has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.
- 34061 1.1 (ell-ell)  
 34062 Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long**  
 34063 or **unsigned long long** argument; or that a following `n` conversion specifier applies to a  
 34064 pointer to a **long long** argument.
- 34065 `j` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax\_t**  
 34066 or **uintmax\_t** argument; or that a following `n` conversion specifier applies to a pointer  
 34067 to an **intmax\_t** argument.
- 34068 `z` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size\_t** or the  
 34069 corresponding signed integer type argument; or that a following `n` conversion specifier  
 34070 applies to a pointer to a signed integer type corresponding to a **size\_t** argument.
- 34071 `t` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff\_t** or  
 34072 the corresponding **unsigned** type argument; or that a following `n` conversion specifier  
 34073 applies to a pointer to a **ptrdiff\_t** argument.
- 34074 `L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long**  
 34075 **double** argument.
- 34076 If a length modifier appears with any conversion specifier other than as specified above, the  
 34077 behavior is undefined.
- 34078 The conversion specifiers and their meanings are:
- 34079 `d`, `i` The **int** argument shall be converted to a signed decimal in the style "`[-] dddd`". The  
 34080 precision specifies the minimum number of digits to appear; if the value being  
 34081 converted can be represented in fewer digits, it shall be expanded with leading zeros.  
 34082 The default precision is 1. The result of converting zero with an explicit precision of  
 34083 zero shall be no characters.
- 34084 `o` The **unsigned** argument shall be converted to unsigned octal format in the style  
 34085 "`ddd`". The precision specifies the minimum number of digits to appear; if the value  
 34086 being converted can be represented in fewer digits, it shall be expanded with leading  
 34087 zeros. The default precision is 1. The result of converting zero with an explicit precision  
 34088 of zero shall be no characters.
- 34089 `u` The **unsigned** argument shall be converted to unsigned decimal format in the style  
 34090 "`ddd`". The precision specifies the minimum number of digits to appear; if the value  
 34091 being converted can be represented in fewer digits, it shall be expanded with leading  
 34092 zeros. The default precision is 1. The result of converting zero with an explicit precision  
 34093 of zero shall be no characters.
- 34094 `x` The **unsigned** argument shall be converted to unsigned hexadecimal format in the style  
 34095 "`ddd`"; the letters "`abcdef`" are used. The precision specifies the minimum number  
 34096 of digits to appear; if the value being converted can be represented in fewer digits, it  
 34097 shall be expanded with leading zeros. The default precision is 1. The result of  
 34098 converting zero with an explicit precision of zero shall be no characters.
- 34099 `X` Equivalent to the `x` conversion specifier, except that letters "`ABCDEF`" are used instead  
 34100 of "`abcdef`".

34101	f, F	The <b>double</b> argument shall be converted to decimal notation in the style	
34102		" <code>[-]ddd.ddd</code> ", where the number of digits after the radix character is equal to the	
34103		precision specification. If the precision is missing, it shall be taken as 6; if the precision	
34104		is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix	
34105		character appears, at least one digit appears before it. The low-order digit shall be	
34106		rounded in an implementation-defined manner.	
34107		A <b>double</b> argument representing an infinity shall be converted in one of the styles	
34108		" <code>[-]inf</code> " or " <code>[-]infinity</code> "; which style is implementation-defined. A <b>double</b>	
34109		argument representing a NaN shall be converted in one of the styles " <code>[-]nan(<i>n-char-sequence</i>)</code> "	
34110		or " <code>[-]nan</code> "; which style, and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F	
34111		conversion specifier produces "INF",	
34112		"INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.	
34113	e, E	The <b>double</b> argument shall be converted in the style " <code>[-]d.ddde±dd</code> ", where there is	
34114		one digit before the radix character (which is non-zero if the argument is non-zero) and	
34115		the number of digits after it is equal to the precision; if the precision is missing, it shall	
34116		be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall	
34117		appear. The low-order digit shall be rounded in an implementation-defined manner.	
34118		The E conversion specifier shall produce a number with 'E' instead of 'e' introducing the exponent. The exponent shall always contain at least two digits. If the	
34119	value is zero, the exponent shall be zero.		
34120		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of	
34121		an f or F conversion specifier.	
34122			
34123		g, G	The <b>double</b> argument representing a floating-point number shall be converted in the
34124			style f or e (or in the style F or E in the case of a G conversion specifier), depending on
34125			the value converted and the precision. Let P equal the precision if non-zero, 6 if the
34126	precision is omitted, or 1 if the precision is zero. Then, if a conversion with style E		
34127	would have an exponent of X:		
34128	— If $P > X \geq -4$ , the conversion shall be with style f (or F) and precision $P - (X + 1)$ .		
34129	— Otherwise, the conversion shall be with style e (or E) and precision $P - 1$ .		
34130		Finally, unless the '#' flag is used, any trailing zeros shall be removed from the	
34131		fractional portion of the result and the decimal-point character shall be removed if there	
34132		is no fractional portion remaining.	
34133		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of	
34134		an f or F conversion specifier.	
34135	a, A	A <b>double</b> argument representing a floating-point number shall be converted in the	
34136		style " <code>[-]0xh.hhhhp±d</code> ", where there is one hexadecimal digit (which shall be non-	
34137		zero if the argument is a normalized floating-point number and is otherwise	
34138		unspecified) before the decimal-point character and the number of hexadecimal digits	
34139		after it is equal to the precision; if the precision is missing and FLT_RADIX is a power	
34140		of 2, then the precision shall be sufficient for an exact representation of the value; if the	
34141		precision is missing and FLT_RADIX is not a power of 2, then the precision shall be	
34142		sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be	
34143		omitted; if the precision is zero and the '#' flag is not specified, no decimal-point	
34144		character shall appear. The letters "abcdef" shall be used for a conversion and the	
34145		letters "ABCDEF" for A conversion. The A conversion specifier produces a number with	
34146		'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one	
34147		digit, and only as many more digits as necessary to represent the decimal exponent of	

34148		2. If the value is zero, the exponent shall be zero.
34149		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
34150		
34151	c	The <b>int</b> argument shall be converted to an <b>unsigned char</b> , and the resulting byte shall be written.
34152		
34153	CX	If an <code>l</code> (ell) qualifier is present, the <b>wint_t</b> argument shall be converted to a multi-byte sequence as if by a call to <code>wcrtomb()</code> with a pointer to storage of at least <code>MB_CUR_MAX</code> bytes, the <b>wint_t</b> argument converted to <b>wchar_t</b> , and an initial shift state, and the resulting byte(s) written.
34154		
34155		
34156		
34157	s	The argument shall be a pointer to an array of <b>char</b> . Bytes from the array shall be written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.
34158		
34159		
34160		
34161		
34162		If an <code>l</code> (ell) qualifier is present, the argument shall be a pointer to an array of type <b>wchar_t</b> . Wide characters from the array shall be converted to characters (each as if by a call to the <code>wcrtomb()</code> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character be written.
34163		
34164		
34165		
34166		
34167		
34168		
34169		
34170		
34171		
34172		
34173		
34174	p	The argument shall be a pointer to <b>void</b> . The value of the pointer is converted to a sequence of printable characters, in an implementation-defined manner.
34175		
34176	n	The argument shall be a pointer to an integer into which is written the number of bytes written to the output so far by this call to one of the <code>fprintf()</code> functions. No argument is converted.
34177		
34178		
34179	XSI	<b>C</b> Equivalent to <code>lc</code> .
34180	XSI	<b>S</b> Equivalent to <code>ls</code> .
34181	%	Write a <code>'%'</code> character; no argument shall be converted. The application shall ensure that the complete conversion specification is <code>%%</code> .
34182		
34183		If a conversion specification does not match one of the above forms, the behavior is undefined. If any argument is not the correct type for the corresponding conversion specification, the behavior is undefined.
34184		
34185		
34186		In no case shall a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by <code>fprintf()</code> and <code>printf()</code> are printed as if <code>fputc()</code> had been called.
34187		
34188		
34189		For the <code>a</code> and <code>A</code> conversion specifiers, if <code>FLT_RADIX</code> is a power of 2, the value shall be correctly rounded to a hexadecimal floating number with the given precision.
34190		
34191		For <code>a</code> and <code>A</code> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in
34192		

34193 hexadecimal floating style with the given precision, with the extra stipulation that the error  
34194 should have a correct sign for the current rounding direction.

34195 For the *e*, *E*, *f*, *F*, *g*, and *G* conversion specifiers, if the number of significant decimal digits is at  
34196 most `DECIMAL_DIG`, then the result should be correctly rounded. If the number of significant  
34197 decimal digits is more than `DECIMAL_DIG` but the source value is exactly representable with  
34198 `DECIMAL_DIG` digits, then the result should be an exact representation with trailing zeros.  
34199 Otherwise, the source value is bounded by two adjacent decimal strings  $L < U$ , both having  
34200 `DECIMAL_DIG` significant digits; the value of the resultant decimal string  $D$  should satisfy  $L \leq$   
34201  $D \leq U$ , with the extra stipulation that the error should have a correct sign for the current  
34202 rounding direction.

34203 CX The last data modification and last file status change timestamps of the file shall be marked for  
34204 update:

- 34205 1. Between the call to a successful execution of `fprintf()` or `printf()` and the next successful  
34206 completion of a call to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`
- 34207 2. Upon successful completion of a call to `dprintf()`

### 34208 RETURN VALUE

34209 CX Upon successful completion, the `dprintf()`, `fprintf()`, and `printf()` functions shall return the  
34210 number of bytes transmitted.

34211 CX Upon successful completion, the `asprintf()` function shall return the number of bytes written to  
34212 the allocated string stored in the location referenced by `ptr`, excluding the terminating null byte.

34213 Upon successful completion, the `sprintf()` function shall return the number of bytes written to `s`,  
34214 excluding the terminating null byte.

34215 Upon successful completion, the `snprintf()` function shall return the number of bytes that would  
34216 be written to `s` had `n` been sufficiently large excluding the terminating null byte.

34217 CX If an error was encountered, these functions shall return a negative value and set `errno` to  
34218 indicate the error. For `asprintf()`, if memory allocation was not possible, or if some other error  
34219 occurs, the function shall return a negative value, and the contents of the location referenced by  
34220 `ptr` are undefined, but shall not refer to allocated memory.

34221 If the value of `n` is zero on a call to `snprintf()`, nothing shall be written, the number of bytes that  
34222 would have been written had `n` been sufficiently large excluding the terminating null shall be  
34223 returned, and `s` may be a null pointer.

### 34224 ERRORS

34225 CX For the conditions under which `dprintf()`, `fprintf()`, and `printf()` fail and may fail, refer to `fputc()`  
34226 or `fputwc()`.

34227 In addition, all forms of `fprintf()` shall fail if:

34228 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
34229 detected.

34230 CX [EOVERFLOW] The value to be returned is greater than `{INT_MAX}`.

34231 CX The `asprintf()` function shall fail if:

34232 [ENOMEM] Insufficient storage space is available.

34233 The `dprintf()` function may fail if:

34234 [EBADF] The *fildest* argument is not a valid file descriptor.

34235 CX The *dprintf()*, *fprintf()*, and *printf()* functions may fail if:

34236 CX [ENOMEM] Insufficient storage space is available.

### 34237 EXAMPLES

#### 34238 Printing Language-Independent Date and Time

34239 The following statement can be used to print date and time using a language-independent  
34240 format:

```
34241 printf(format, weekday, month, day, hour, min);
```

34242 For American usage, *format* could be a pointer to the following string:

```
34243 "%s, %s %d, %d:%.2d\n"
```

34244 This example would produce the following message:

```
34245 Sunday, July 3, 10:02
```

34246 For German usage, *format* could be a pointer to the following string:

```
34247 "%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

34248 This definition of *format* would produce the following message:

```
34249 Sonntag, 3. Juli, 10:02
```

#### 34250 Printing File Information

34251 The following example prints information about the type, permissions, and number of links of a  
34252 specific file in a directory.

34253 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined  
34254 *strperm()* function shall return a string similar to the one at the beginning of the output for the  
34255 following command:

```
34256 ls -l
```

34257 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*  
34258 function shall return a **passwd** structure from which the name of the user is extracted. If the user  
34259 name is not found, the program instead prints out the numeric value of the user ID.

34260 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar  
34261 to *getpwuid()* except that it shall return group information based on the group number. Once  
34262 again, if the group is not found, the program prints the numeric value of the group for the entry.

34263 The final call to *printf()* prints the size of the file.

```
34264 #include <stdio.h>
34265 #include <sys/types.h>
34266 #include <pwd.h>
34267 #include <grp.h>

34268 char *strperm (mode_t);
34269 ...
34270 struct stat statbuf;
34271 struct passwd *pwd;
```

```

34272     struct group *grp;
34273     ...
34274     printf("%10.10s", strperm (statbuf.st_mode));
34275     printf("%4d", statbuf.st_nlink);

34276     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
34277         printf(" %-8.8s", pwd->pw_name);
34278     else
34279         printf(" %-8ld", (long) statbuf.st_uid);

34280     if ((grp = getgrgid(statbuf.st_gid)) != NULL)
34281         printf(" %-8.8s", grp->gr_name);
34282     else
34283         printf(" %-8ld", (long) statbuf.st_gid);

34284     printf("%9jd", (intmax_t) statbuf.st_size);
34285     ...

```

### 34286 **Printing a Localized Date String**

34287 The following example gets a localized date string. The *nl\_langinfo()* function shall return the  
34288 localized date string, which specifies the order and layout of the date. The *strftime()* function  
34289 takes this information and, using the **tm** structure for values, places the date and time  
34290 information into *datestring*. The *printf()* function then outputs *datestring* and the name of the  
34291 entry.

```

34292     #include <stdio.h>
34293     #include <time.h>
34294     #include <langinfo.h>
34295     ...
34296     struct dirent *dp;
34297     struct tm *tm;
34298     char datestring[256];
34299     ...
34300     strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);

34301     printf(" %s %s\n", datestring, dp->d_name);
34302     ...

```

### 34303 **Printing Error Information**

34304 The following example uses *fprintf()* to write error information to standard error.

34305 In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If  
34306 the file already exists, this is an error, as indicated by the **O\_EXCL** flag on the *open()* function. If  
34307 the call fails, the program assumes that someone else is updating the password file, and the  
34308 program exits.

34309 The next group of calls saves a new password file as the current password file by creating a link  
34310 between **LOCKFILE** and the new password file **PASSWDFILE**.

```

34311     #include <sys/types.h>
34312     #include <sys/stat.h>
34313     #include <fcntl.h>
34314     #include <stdio.h>
34315     #include <stdlib.h>

```

```

34316     #include <unistd.h>
34317     #include <string.h>
34318     #include <errno.h>

34319     #define LOCKFILE "/etc/ptmp"
34320     #define PASSWDFILE "/etc/passwd"
34321     ...
34322     int pfd;
34323     ...
34324     if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
34325         S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
34326     {
34327         fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
34328         exit(1);
34329     }
34330     ...
34331     if (link(LOCKFILE, PASSWDFILE) == -1) {
34332         fprintf(stderr, "Link error: %s\n", strerror(errno));
34333         exit(1);
34334     }
34335     ...

```

### 34336 Printing Usage Information

34337 The following example checks to make sure the program has the necessary arguments, and uses  
34338 *fprintf()* to print usage information if the expected number of arguments is not present.

```

34339     #include <stdio.h>
34340     #include <stdlib.h>
34341     ...
34342     char *Options = "hdbt1";
34343     ...
34344     if (argc < 2) {
34345         fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
34346     }
34347     ...

```

### 34348 Formatting a Decimal String

34349 The following example prints a key and data pair on *stdout*. Note use of the <asterisk> ('\*') in  
34350 the format string; this ensures the correct number of decimal places for the element based on the  
34351 number of elements requested.

```

34352     #include <stdio.h>
34353     ...
34354     long i;
34355     char *keyst;
34356     int elementlen, len;
34357     ...
34358     while (len < elementlen) {
34359         ...
34360         printf("%s Element%0*ld\n", keyst, elementlen, i);
34361         ...

```

```
34362     }
```

### 34363 **Creating a Pathname**

34364 The following example creates a pathname using information from a previous *getpwnam()*  
34365 function that returned the password database entry of the user.

```
34366     #include <stdint.h>
34367     #include <stdio.h>
34368     #include <stdlib.h>
34369     #include <string.h>
34370     #include <sys/types.h>
34371     #include <unistd.h>
34372     ...
34373     char *pathname;
34374     struct passwd *pw;
34375     size_t len;
34376     ...
34377     // digits required for pid_t is number of bits times
34378     // log2(10) = approx 10/33
34379     len = strlen(pw->pw_dir) + 1 + 1+(sizeof(pid_t)*80+32)/33 +
34380         sizeof ".out";
34381     pathname = malloc(len);
34382     if (pathname != NULL)
34383     {
34384         snprintf(pathname, len, "%s/%jd.out", pw->pw_dir,
34385             (intmax_t) getpid());
34386         ...
34387     }
```

### 34388 **Reporting an Event**

34389 The following example loops until an event has timed out. The *pause()* function waits forever  
34390 unless it receives a signal. The *fprintf()* statement should never occur due to the possible return  
34391 values of *pause()*.

```
34392     #include <stdio.h>
34393     #include <unistd.h>
34394     #include <string.h>
34395     #include <errno.h>
34396     ...
34397     while (!event_complete) {
34398         ...
34399         if (pause() != -1 || errno != EINTR)
34400             fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
34401     }
34402     ...
```

34403 **Printing Monetary Information**

34404 The following example uses *strfmon()* to convert a number and store it as a formatted monetary  
 34405 string named *convbuf*. If the first number is printed, the program prints the format and the  
 34406 description; otherwise, it just prints the number.

```

34407 #include <monetary.h>
34408 #include <stdio.h>
34409 ...
34410 struct tblfmt {
34411     char *format;
34412     char *description;
34413 };
34414
34415 struct tblfmt table[] = {
34416     { "%n", "default formatting" },
34417     { "%11n", "right align within an 11 character field" },
34418     { "%#5n", "aligned columns for values up to 99999" },
34419     { "%=*#5n", "specify a fill character" },
34420     { "%=0#5n", "fill characters do not use grouping" },
34421     { "%^#5n", "disable the grouping separator" },
34422     { "%^#5.0n", "round off to whole units" },
34423     { "%^#5.4n", "increase the precision" },
34424     { "%(#5n", "use an alternative pos/neg style" },
34425     { "%!(#5n", "disable the currency symbol" },
34426 };
34427 ...
34428 float input[3];
34429 int i, j;
34430 char convbuf[100];
34431 ...
34432 strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
34433
34434 if (j == 0) {
34435     printf("%s%s%s\n", table[i].format,
34436           convbuf, table[i].description);
34437 }
34438 else {
34439     printf("%s\n", convbuf);
34440 }
34441 ...
  
```

34440 **Printing Wide Characters**

34441 The following example prints a series of wide characters. Suppose that "L`@`" expands to three  
 34442 bytes:

```

34443 wchar_t wz [3] = L"@@";           // Zero-terminated
34444 wchar_t wn [3] = L"@@";           // Unterminated
34445
34446 fprintf (stdout, "%ls", wz);       // Outputs 6 bytes
34447 fprintf (stdout, "%ls", wn);       // Undefined because wn has no terminator
34448 fprintf (stdout, "%4ls", wz);       // Outputs 3 bytes
34449 fprintf (stdout, "%4ls", wn);       // Outputs 3 bytes; no terminator needed
34450 fprintf (stdout, "%9ls", wz);       // Outputs 6 bytes
  
```

```

34450 fprintf (stdout, "%9ls", wn); // Outputs 9 bytes; no terminator needed
34451 fprintf (stdout, "%10ls", wz); // Outputs 6 bytes
34452 fprintf (stdout, "%10ls", wn); // Undefined because wn has no terminator

```

34453 In the last line of the example, after processing three characters, nine bytes have been output.  
 34454 The fourth character must then be examined to determine whether it converts to one byte or  
 34455 more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth  
 34456 character in the array, the behavior is undefined.

#### 34457 APPLICATION USAGE

34458 If the application calling *fprintf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
 34459 the **<wchar.h>** header to have these objects defined.

34460 The space allocated by a successful call to *asprintf()* should be subsequently freed by a call to  
 34461 *free()*.

#### 34462 RATIONALE

34463 If an implementation detects that there are insufficient arguments for the format, it is  
 34464 recommended that the function should fail and report an [EINVAL] error.

34465 The behavior specified for the `%lc` conversion differs slightly from the specification in the ISO C  
 34466 standard, in that printing the null wide character produces a null byte instead of 0 bytes of  
 34467 output as would be required by a strict reading of the ISO C standard's direction to behave as if  
 34468 applying the `%ls` specifier to a **wchar\_t** array whose first element is the null wide character.  
 34469 Requiring a multi-byte output for every possible wide character, including the null character,  
 34470 matches historical practice, and provides consistency with `%c` in *fprintf()* and with both `%c` and  
 34471 `%lc` in *fwprintf()*. It is anticipated that a future edition of the ISO C standard will change to  
 34472 match the behavior specified here.

#### 34473 FUTURE DIRECTIONS

34474 None.

#### 34478 CHANGE HISTORY

34479 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 34480 Issue 5

34481 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier can  
 34482 now be used with `c` and `s` conversion specifiers.

34483 The *snprintf()* function is new in Issue 5.

#### 34484 Issue 6

34485 Extensions beyond the ISO C standard are marked.

34486 The normative text is updated to avoid use of the term “must” for application requirements.

34487 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 34488 • The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI  
 34489 shading is removed from *snprintf()*.

- 34490 • The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes  
 34491 the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed  
 34492 the behavior from Issue 5.

- 34493           • The DESCRIPTION is updated.
- 34494           The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.
- 34495
- 34496           ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
- 34497           An example of printing wide characters is added.
- 34498   **Issue 7**
- 34499           Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.
- 34500
- 34501           Austin Group Interpretation 1003.1-2001 #170 is applied.
- 34502           ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of g and G.
- 34503
- 34504           SD5-XSH-ERN-174 is applied.
- 34505           The *dprintf()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.
- 34506
- 34507           Functionality relating to the %n\$ form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.
- 34508
- 34509           Changes are made related to support for finegrained timestamps.
- 34510           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0163 [302], XSH/TC1-2008/0164 [316], XSH/TC1-2008/0165 [316], XSH/TC1-2008/0166 [451,291], and XSH/TC1-2008/0167 [14] are applied.
- 34511
- 34512
- 34513           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0126 [894], XSH/TC2-2008/0127 [557], and XSH/TC2-2008/0128 [936] are applied.
- 34514
- 34515   **Issue 8**
- 34516           Austin Group Defect 986 is applied, adding *strlcat()* and *wcslcat()* to the SEE ALSO section.
- 34517           Austin Group Defect 1020 is applied, clarifying that the *snprintf()* argument *n* limits the number of bytes written to *s*; it is not necessarily the same as the size of *s*.
- 34518
- 34519           Austin Group Defect 1021 is applied, changing “output error” to “error” in the RETURN VALUE section.
- 34520
- 34521           Austin Group Defect 1137 is applied, clarifying the use of “%n\$” and “\*m\$” in conversion specifications.
- 34522
- 34523           Austin Group Defect 1205 is applied, changing the description of the % conversion specifier.
- 34524           Austin Group Defect 1219 is applied, removing the *snprintf()*-specific [Eoverflow] error.
- 34525           Austin Group Defect 1496 is applied, adding the *asprintf()* function.
- 34526           Austin Group Defect 1562 is applied, clarifying that it is the application’s responsibility to ensure that the format is a character string, beginning and ending in its initial shift state, if any.
- 34527
- 34528           Austin Group Defect 1647 is applied, changing the description of the c conversion specifier and updating the statement that this volume of POSIX.1-2024 defers to the ISO C standard so that it excludes the %lc conversion when passed a null wide character.
- 34529
- 34530

34531 **NAME**

34532           fputc — put a byte on a stream

34533 **SYNOPSIS**

34534           #include &lt;stdio.h&gt;

34535           int fputc(int *c*, FILE \**stream*);34536 **DESCRIPTION**34537 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
34538 conflict between the requirements described here and the ISO C standard is unintentional. This  
34539 volume of POSIX.1-2024 defers to the ISO C standard.34540       The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the  
34541 output stream pointed to by *stream*, at the position indicated by the associated file-position  
34542 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file  
34543 cannot support positioning requests, or if the stream was opened with append mode, the byte  
34544 shall be appended to the output stream.34545 CX       The last data modification and last file status change timestamps of the file shall be marked for  
34546 update between the successful execution of *fputc()* and the next successful completion of a call  
34547 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.34548 **RETURN VALUE**34549       Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall  
34550 CX       return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the  
34551 error.34552 **ERRORS**34553       The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be  
34554 flushed, and:34555 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
34556                       the thread would be delayed in the write operation.34557 CX       [EBADF]       The file descriptor underlying *stream* is not a valid file descriptor open for  
34558                       writing.

34559 CX       [EFBIG]       An attempt was made to write to a file that exceeds the maximum file size.

34560 CX       [EFBIG]       An attempt was made to write to a file that exceeds the file size limit of the  
34561                       process.  
34562 XSI       A SIGXFSZ signal shall also be generated for the thread.34563 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
34564                       offset maximum.34565 CX       [EINTR]       The write operation was terminated due to the receipt of a signal, and no data  
34566                       was transferred.34567 CX       [EIO]        A physical I/O error has occurred, or the process is a member of a background  
34568                       process group attempting to write to its controlling terminal, TOSTOP is set,  
34569                       the calling thread is not blocking SIGTTOU, the process is not ignoring  
34570                       SIGTTOU, and the process group of the process is orphaned. This error may  
34571                       also be returned under implementation-defined conditions.

34572 CX       [ENOSPC]       There was no free space remaining on the device containing the file.

34573 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 34574 any process. A SIGPIPE signal shall also be sent to the thread.

34575 The *fputc()* function may fail if:

34576 CX [ENOMEM] Insufficient storage space is available.

34577 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 34578 capabilities of the device.

#### 34579 EXAMPLES

34580 None.

#### 34581 APPLICATION USAGE

34582 None.

#### 34583 RATIONALE

34584 None.

#### 34585 FUTURE DIRECTIONS

34586 None.

#### 34590 CHANGE HISTORY

34591 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 34592 Issue 5

34593 Large File Summit extensions are added.

#### 34594 Issue 6

34595 Extensions beyond the ISO C standard are marked.

34596 The following new requirements on POSIX implementations derive from alignment with the  
 34597 Single UNIX Specification:

- 34598 • The [EIO] and [EFBIG] mandatory error conditions are added.
- 34599 • The [ENOMEM] and [ENXIO] optional error conditions are added.

34600 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN]  
 34601 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 34602 delayed”.

#### 34603 Issue 7

34604 Changes are made related to support for finegrained timestamps.

34605 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0168 [79] and XSH/TC1-2008/0169  
 34606 [14] are applied.

#### 34607 Issue 8

34608 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

34609 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
 34610 relating to the file size limit for the process.

34611 **NAME**

34612 fputs — put a string on a stream

34613 **SYNOPSIS**

34614 #include &lt;stdio.h&gt;

34615 int fputs(const char \*restrict s, FILE \*restrict stream);

34616 **DESCRIPTION**

34617 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 34618 conflict between the requirements described here and the ISO C standard is unintentional. This  
 34619 volume of POSIX.1-2024 defers to the ISO C standard.

34620 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed  
 34621 to by *stream*. The terminating null byte shall not be written.

34622 CX The last data modification and last file status change timestamps of the file shall be marked for  
 34623 update between the successful execution of *fputs()* and the next successful completion of a call  
 34624 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

34625 **RETURN VALUE**

34626 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall  
 34627 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

34628 **ERRORS**34629 Refer to *fputc()*.34630 **EXAMPLES**34631 **Printing to Standard Output**

34632 The following example gets the current time, converts it to a string using *localtime()* and  
 34633 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 34634 an event for which it is waiting.

```
34635 #include <time.h>
34636 #include <stdio.h>
34637 ...
34638 time_t now;
34639 int minutes_to_event;
34640 ...
34641 time(&now);
34642 printf("The time is ");
34643 fputs(asctime(localtime(&now)), stdout);
34644 printf("There are still %d minutes to the event.\n",
34645     minutes_to_event);
34646 ...
```

34647 **APPLICATION USAGE**34648 The *puts()* function appends a <newline> while *fputs()* does not.

34649 This volume of POSIX.1-2024 requires that successful completion simply return a non-negative  
 34650 integer. There are at least three known different implementation conventions for this  
 34651 requirement:

- 34652 • Return a constant value.

- 34653 • Return the last character written.
- 34654 • Return the number of bytes written. Note that this implementation convention cannot be
- 34655 adhered to for strings longer than {INT\_MAX} bytes as the value would not be
- 34656 representable in the return type of the function. For backwards-compatibility,
- 34657 implementations can return the number of bytes for strings of up to {INT\_MAX} bytes, and
- 34658 return {INT\_MAX} for all longer strings.

#### 34659 RATIONALE

34660 The *fputs()* function is one whose source code was specified in the referenced *The C Programming*  
34661 *Language*. In the original edition, the function had no defined return value, yet many practical  
34662 implementations would, as a side-effect, return the value of the last character written as that was  
34663 the value remaining in the accumulator used as a return value. In the second edition of the book,  
34664 either the fixed value 0 or EOF would be returned depending upon the return value of *ferror()*;  
34665 however, for compatibility with extant implementations, several implementations would, upon  
34666 success, return a positive value representing the last byte written.

#### 34667 FUTURE DIRECTIONS

34668 None.

#### 34672 CHANGE HISTORY

34673 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 34674 Issue 6

34675 Extensions beyond the ISO C standard are marked.

34676 The *fputs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

#### 34677 Issue 7

34678 Changes are made related to support for finegrained timestamps.

34679 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0170 [174,412], XSH/TC1-2008/0171  
34680 [412], and XSH/TC1-2008/0172 [14] are applied.

34681 **NAME**34682 `fputwc` — put a wide-character code on a stream34683 **SYNOPSIS**34684 `#include <stdio.h>`34685 `#include <wchar.h>`34686 `wint_t fputwc(wchar_t wc, FILE *stream);`34687 **DESCRIPTION**

34688 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 34689 conflict between the requirements described here and the ISO C standard is unintentional. This  
 34690 volume of POSIX.1-2024 defers to the ISO C standard.

34691 The `fputwc()` function shall write the character corresponding to the wide-character code `wc` to  
 34692 the output stream pointed to by `stream`, at the position indicated by the associated file-position  
 34693 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot  
 34694 support positioning requests, or if the stream was opened with append mode, the character is  
 34695 appended to the output stream. If an error occurs while writing the character, the shift state of  
 34696 the output file is left in an undefined state.

34697 CX The last data modification and last file status change timestamps of the file shall be marked for  
 34698 update between the successful execution of `fputwc()` and the next successful completion of a call  
 34699 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

34700 The `fputwc()` function shall not change the setting of `errno` if successful.

34701 **RETURN VALUE**

34702 CX Upon successful completion, `fputwc()` shall return `wc`. Otherwise, it shall return WEOF, `errno`  
 34703 shall be set to indicate the error, and for errors other than [EILSEQ] the error indicator for the  
 34704 stream shall be set; the error indicator for the stream shall also be set for [EILSEQ] errors.

34705 **ERRORS**

34706 The `fputwc()` function shall fail if either the stream is unbuffered or data in the `stream`'s buffer  
 34707 needs to be written, and:

34708 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying `stream` and  
 34709 the thread would be delayed in the write operation.

34710 CX [EBADF] The file descriptor underlying `stream` is not a valid file descriptor open for  
 34711 writing.

34712 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size.

34713 CX [EFBIG] An attempt was made to write to a file that exceeds the file size limit of the  
 34714 process.

34715 XSI A SIGXFSZ signal shall also be generated for the thread.

34716 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 34717 offset maximum associated with the corresponding stream.

34718 [EILSEQ] The wide-character code `wc` does not correspond to a valid character.

34719 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
 34720 was transferred.

34721 CX [EIO] A physical I/O error has occurred, or the process is a member of a background  
 34722 process group attempting to write to its controlling terminal, TOSTOP is set,  
 34723 the calling thread is not blocking SIGTTOU, the process is not ignoring  
 34724 SIGTTOU, and the process group of the process is orphaned. This error may

34725 also be returned under implementation-defined conditions.

34726 CX [ENOSPC] There was no free space remaining on the device containing the file.

34727 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
34728 any process. A SIGPIPE signal shall also be sent to the thread.

34729 The *fputc()* function may fail if:

34730 CX [ENOMEM] Insufficient storage space is available.

34731 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
34732 capabilities of the device.

**34733 EXAMPLES**

34734 None.

**34735 APPLICATION USAGE**

34736 None.

**34737 RATIONALE**

34738 The requirement to set the error indicator for the stream on [EILSEQ] errors is CX shaded  
34739 because the ISO C standard does not require it to be set for *fputc()* encoding errors, although it  
34740 does for *fgetc()*. The next revision of the ISO C standard is expected to address this  
34741 inconsistency by requiring the error indicator for the stream to be set for *fputc()* encoding  
34742 errors.

**34743 FUTURE DIRECTIONS**

34744 None.

**34745 SEE ALSO**

34746 [Section 2.5](#) (on page 521), *ferror()*, *fopen()*, *getrlimit()*, *setbuf()*

**34748 CHANGE HISTORY**

34749 First released in Issue 4. Derived from the MSE working draft.

**34750 Issue 5**

34751 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
34752 is changed from **wint\_t** to **wchar\_t**.

34753 The Optional Header (OH) marking is removed from [<stdio.h>](#).

34754 Large File Summit extensions are added.

**34755 Issue 6**

34756 Extensions beyond the ISO C standard are marked.

34757 The following new requirements on POSIX implementations derive from alignment with the  
34758 Single UNIX Specification:

- 34759 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 34760 • The [ENOMEM] and [ENXIO] optional error conditions are added.

34761 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN]  
34762 error in the ERRORS section from “the process would be delayed” to “the thread would be  
34763 delayed”.

**34764 Issue 7**

34765 Changes are made related to support for finegrained timestamps.

34766 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0173 [105], XSH/TC1-2008/0174 [79],  
34767 and XSH/TC1-2008/0175 [14] are applied.

**34768 Issue 8**

34769 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

34770 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
34771 relating to the file size limit for the process.

34772 Austin Group Defect 1769 is applied, changing the CX shading in the RETURN VALUE section.

34773 **NAME**34774 `fputws` — put a wide-character string on a stream34775 **SYNOPSIS**34776 `#include <stdio.h>`34777 `#include <wchar.h>`34778 `int fputws(const wchar_t *restrict ws, FILE *restrict stream);`34779 **DESCRIPTION**34780 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
34781 conflict between the requirements described here and the ISO C standard is unintentional. This  
34782 volume of POSIX.1-2024 defers to the ISO C standard.34783 The `fputws()` function shall write a character string corresponding to the (null-terminated) wide-  
34784 character string pointed to by `ws` to the stream pointed to by `stream`. No character corresponding  
34785 to the terminating null wide-character code shall be written.34786 CX The last data modification and last file status change timestamps of the file shall be marked for  
34787 update between the successful execution of `fputws()` and the next successful completion of a call  
34788 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.34789 **RETURN VALUE**34790 Upon successful completion, `fputws()` shall return a non-negative number. Otherwise, it shall  
34791 CX return `-1`, set an error indicator for the stream, and set `errno` to indicate the error.34792 **ERRORS**34793 Refer to `fputwc()`.34794 **EXAMPLES**

34795 None.

34796 **APPLICATION USAGE**34797 The `fputws()` function does not append a `<newline>`.34798 This volume of POSIX.1-2024 requires that successful completion simply return a non-negative  
34799 integer. There are at least three known different implementation conventions for this  
34800 requirement:

- 34801
- Return a constant value.
  - Return the last character written.
  - Return the number of bytes written. Note that this implementation convention cannot be  
34804 adhered to for strings longer than `{INT_MAX}` bytes as the value would not be  
34805 representable in the return type of the function. For backwards-compatibility,  
34806 implementations can return the number of bytes for strings of up to `{INT_MAX}` bytes, and  
34807 return `{INT_MAX}` for all longer strings.

34808 **RATIONALE**

34809 None.

34810 **FUTURE DIRECTIONS**

34811 None.

34812 **SEE ALSO**34813 [Section 2.5](#) (on page 521), `fopen()`34814 XBD `<stdio.h>`, `<wchar.h>`

34815 **CHANGE HISTORY**

34816 First released in Issue 4. Derived from the MSE working draft.

34817 **Issue 5**

34818 The Optional Header (OH) marking is removed from `<stdio.h>`.

34819 **Issue 6**

34820 Extensions beyond the ISO C standard are marked.

34821 The `fputws()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

34822 **Issue 7**

34823 Changes are made related to support for finegrained timestamps.

34824 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0176 [412] and XSH/TC1-2008/0177  
34825 [14] are applied.

34826 **NAME**

34827 fread — binary input

34828 **SYNOPSIS**

```
34829 #include <stdio.h>
34830 size_t fread(void *restrict ptr, size_t size, size_t nitems,
34831 FILE *restrict stream);
```

34832 **DESCRIPTION**

34833 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 34834 conflict between the requirements described here and the ISO C standard is unintentional. This  
 34835 volume of POSIX.1-2024 defers to the ISO C standard.

34836 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size  
 34837 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall  
 34838 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**  
 34839 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be  
 34840 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the  
 34841 file position indicator for the stream is unspecified. If a partial element is read, its value is  
 34842 unspecified.

34843 CX The *fread()* function may mark the last data access timestamp of the file associated with *stream*  
 34844 for update. The last data access timestamp shall be marked for update by the first successful  
 34845 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, or *scanf()* using  
 34846 *stream* that returns data not supplied by a prior call to *ungetc()*.

34847 **RETURN VALUE**

34848 The *fread()* function shall return the number of elements successfully read, which shall be less  
 34849 than *nitems* only if an error or end-of-file is encountered, or *size* is zero. If *size* or *nitems* is 0,  
 34850 *fread()* shall return 0 and the contents of the array and the state of the stream shall remain  
 34851 CX unchanged. Otherwise, if an error occurs, the error indicator for the stream shall be set, and  
 34852 *errno* shall be set to indicate the error.

34853 **ERRORS**34854 Refer to *fgetc()*.34855 **EXAMPLES**34856 **Reading from a Stream**

34857 The following example transfers a single 100-byte fixed length record from the *fp* stream into the  
 34858 array pointed to by *buf*.

```
34859 #include <stdio.h>
34860 ...
34861 size_t elements_read;
34862 char buf[100];
34863 FILE *fp;
34864 ...
34865 elements_read = fread(buf, sizeof(buf), 1, fp);
34866 ...
```

34867 If a read error occurs, *elements\_read* will be zero but the number of bytes read from the stream  
 34868 could be anything from zero to *sizeof(buf)*-1.

34869 The following example reads multiple single-byte elements from the *fp* stream into the array  
 34870 pointed to by *buf*.

```

34871     #include <stdio.h>
34872     ...
34873     size_t bytes_read;
34874     char buf[100];
34875     FILE *fp;
34876     ...
34877     bytes_read = fread(buf, 1, sizeof(buf), fp);
34878     ...

```

34879 If a read error occurs, *bytes\_read* will contain the number of bytes read from the stream.

#### 34880 APPLICATION USAGE

34881 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
 34882 end-of-file condition.

34883 Because of possible differences in element length and byte ordering, files written using *fwrite()*  
 34884 are application-dependent, and possibly cannot be read using *fread()* by a different application  
 34885 or by the same application on a different processor.

#### 34886 RATIONALE

34887 None.

#### 34888 FUTURE DIRECTIONS

34889 None.

#### 34890 SEE ALSO

34891 [Section 2.5](#) (on page 521), *feof()*, *ferror()*, *fgetc()*, *fopen()*, *fscanf()*, *getc()*

#### 34893 CHANGE HISTORY

34894 First released in Issue 1. Derived from Issue 1 of the SVID.

##### 34895 Issue 6

34896 Extensions beyond the ISO C standard are marked.

34897 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 34898 • The *fread()* prototype is updated.
- 34899 • The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

##### 34900 Issue 7

34901 Changes are made related to support for finegrained timestamps.

34902 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0178 [232] and XSH/TC1-2008/0179  
 34903 [14] are applied.

34904 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0129 [926] is applied.

##### 34905 Issue 8

34906 Austin Group Defect 1196 is applied, clarifying the RETURN VALUE section.

34907 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

34908 Austin Group Defect 1624 is applied, changing the RETURN VALUE section.

34909 **NAME**

34910 free — free allocated memory

34911 **SYNOPSIS**

34912 #include &lt;stdlib.h&gt;

34913 void free(void \*ptr);

34914 **DESCRIPTION**

34915 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 34916 conflict between the requirements described here and the ISO C standard is unintentional. This  
 34917 volume of POSIX.1-2024 defers to the ISO C standard.

34918 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made  
 34919 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the  
 34920 argument does not match a pointer earlier returned by *aligned\_alloc()*, *calloc()*, *malloc()*,  
 34921 ADV *posix\_memalign()*, *realloc()*,  
 34922 CX *reallocarray()*, or a function in POSIX.1-2024 that allocates memory as if by *malloc()*, or if the  
 34923 CX space has been deallocated by a call to *free()*, *reallocarray()*, or *realloc()*, the behavior is  
 34924 undefined.

34925 Any use of a pointer that refers to freed space results in undefined behavior.

34926 CX The *free()* function shall not modify *errno* if *ptr* is a null pointer or a pointer previously returned  
 34927 as if by *malloc()* and not yet deallocated.

34928 For purposes of determining the existence of a data race, *free()* shall behave as though it  
 34929 accessed only memory locations accessible through its argument and not other static duration  
 34930 storage. The function may, however, visibly modify the storage that it deallocates. Calls to  
 34931 ADV *aligned\_alloc()*, *calloc()*, *free()*, *malloc()*, *posix\_memalign()*,  
 34932 CX *reallocarray()*, and *realloc()* that allocate or deallocate a particular region of memory shall occur  
 34933 in a single total order (see XBD Section 4.15.1, on page 100), and each such deallocation call shall  
 34934 synchronize with the next allocation (if any) in this order.

34935 **RETURN VALUE**34936 The *free()* function shall not return a value.34937 **ERRORS**

34938 No errors are defined.

34939 **EXAMPLES**

34940 None.

34941 **APPLICATION USAGE**

34942 There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

34943 Because the *free()* function does not modify *errno* for valid pointers, it is safe to use it in cleanup  
 34944 code without corrupting earlier errors, such as in this example code:

```
34945 // buf was obtained by malloc(buflen)
34946 ret = write(fd, buf, buflen);
34947 if (ret < 0) {
34948     free(buf);
34949     return ret;
34950 }
```

34951 However, earlier versions of this standard did not require this, and the same example had to be  
 34952 written as:

```
34953 // buf was obtained by malloc(buflen)
```

```
34954         ret = write(fd, buf, buflen);
34955         if (ret < 0) {
34956             int save = errno;
34957             free(buf);
34958             errno = save;
34959             return ret;
34960         }
```

**34961 RATIONALE**

34962 None.

**34963 FUTURE DIRECTIONS**

34964 None.

**34965 SEE ALSO**

34966 [\*aligned\\_alloc\(\)\*](#), [\*calloc\(\)\*](#), [\*malloc\(\)\*](#), [\*posix\\_memalign\(\)\*](#), [\*realloc\(\)\*](#)

34967 XBD <[\*stdlib.h\*](#)>

**34968 CHANGE HISTORY**

34969 First released in Issue 1. Derived from Issue 1 of the SVID.

**34970 Issue 6**

34971 Reference to the *valloc()* function is removed.

**34972 Issue 7**

34973 The DESCRIPTION is updated to clarify that if the pointer returned is not by a function that  
34974 allocates memory as if by *malloc()*, then the behavior is undefined.

**34975 Issue 8**

34976 Austin Group Defect 385 is applied, adding a requirement that *free()* does not modify *errno*  
34977 when passed a pointer to an object than can be freed.

34978 Austin Group Defect 1218 is applied, adding *reallocarray()*.

34979 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
34980 standard.

34981 **NAME**

34982 freeaddrinfo, getaddrinfo — get address information

34983 **SYNOPSIS**

```

34984 #include <sys/socket.h>
34985 #include <netdb.h>

34986 void freeaddrinfo(struct addrinfo *ai);
34987 int getaddrinfo(const char *restrict nodename,
34988               const char *restrict servname,
34989               const struct addrinfo *restrict hints,
34990               struct addrinfo **restrict res);

```

34991 **DESCRIPTION**

34992 The `freeaddrinfo()` function shall free one or more **addrinfo** structures returned by `getaddrinfo()`,  
 34993 along with any additional storage associated with those structures. If the `ai_next` field of the  
 34994 structure is not null, the entire list of structures shall be freed. The `freeaddrinfo()` function shall  
 34995 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by `getaddrinfo()`.  
 34996 The `freeaddrinfo()` function shall not modify `errno` if `ai` is a sublist previously returned by  
 34997 `getaddrinfo()` and not yet freed.

34998 The `getaddrinfo()` function shall translate the name of a service location (for example, a host  
 34999 name) and/or a service name and shall return a set of socket addresses and associated  
 35000 information to be used in creating a socket with which to address the specified service.

35001 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,  
 35002 RFC 1035, and RFC 3596.

35003 The `freeaddrinfo()` and `getaddrinfo()` functions shall be thread-safe.

35004 The `nodename` and `servname` arguments are either null pointers or pointers to null-terminated  
 35005 strings. One or both of these two arguments shall be supplied by the application as a non-null  
 35006 pointer.

35007 The format of a valid name depends on the address family or families. If a specific family is not  
 35008 given and the name could be interpreted as valid within multiple supported families, the  
 35009 implementation shall attempt to resolve the name in all supported families and, in absence of  
 35010 errors, one or more results shall be returned.

35011 If the `nodename` argument is not null, it can be a descriptive name or can be an address string. If  
 35012 IP6 the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names  
 35013 include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings  
 35014 using Internet standard dot notation as specified in `inet_ntop()` are valid.

35015 IP6 If the specified address family is AF\_INET6 or AF\_UNSPEC, standard IPv6 text forms described  
 35016 in `inet_ntop()` are valid.

35017 If `nodename` is not null, the requested service location is named by `nodename`; otherwise, the  
 35018 requested service location is local to the caller.

35019 If `servname` is null, the call shall return network-level addresses for the specified `nodename`. If  
 35020 `servname` is not null, it is a null-terminated character string identifying the requested service.  
 35021 This can be either a descriptive name or a numeric representation suitable for use with the  
 35022 IP6 address family or families. If the specified address family is AF\_INET, AF\_INET6, or  
 35023 AF\_UNSPEC, the service can be specified as a string specifying a decimal port number.

35024 If the `hints` argument is not null, it refers to a structure containing input values that directs the  
 35025 operation by providing options and by limiting the returned information to a specific socket  
 35026 type, address family, and/or protocol, as described below. The application shall ensure that each

35027 of the *ai\_addrlen*, *ai\_addr*, *ai\_canonname*, and *ai\_next* members, as well as each of the non-standard  
 35028 additional members, if any, of this *hints* structure is initialized. If any of these members has a  
 35029 value other than the value that would result from default initialization, the behavior is  
 35030 implementation-defined. A value of AF\_UNSPEC for *ai\_family* means that the caller shall accept  
 35031 any address family. A value of zero for *ai\_socktype* means that the caller shall accept any socket  
 35032 type. A value of zero for *ai\_protocol* means that the caller shall accept any protocol. If *hints* is a  
 35033 null pointer, the behavior shall be as if it referred to a structure containing the value zero for the  
 35034 *ai\_flags*, *ai\_socktype*, and *ai\_protocol* fields, and AF\_UNSPEC for the *ai\_family* field.

35035 The *ai\_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-  
 35036 inclusive OR of one or more of the values AI\_PASSIVE, AI\_CANONNAME,  
 35037 AI\_NUMERICHOST, AI\_NUMERICSERV, AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG.

35038 If the AI\_PASSIVE flag is specified, the returned address information shall be suitable for use in  
 35039 binding a socket for accepting incoming connections for the specified service. In this case, if the  
 35040 *nodename* argument is null, then the IP address portion of the socket address structure shall be  
 35041 set to INADDR\_ANY for an IPv4 address or IN6ADDR\_ANY\_INIT for an IPv6 address. If the  
 35042 AI\_PASSIVE flag is not specified, the returned address information shall be suitable for a call to  
 35043 *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a  
 35044 connectionless protocol). In this case, if the *nodename* argument is null, then the IP address  
 35045 portion of the socket address structure shall be set to the loopback address. The AI\_PASSIVE  
 35046 flag shall be ignored if the *nodename* argument is not null.

35047 If the AI\_CANONNAME flag is specified and the *nodename* argument is not null, the function  
 35048 shall attempt to determine the canonical name corresponding to *nodename* (for example, if  
 35049 *nodename* is an alias or shorthand notation for a complete name).

35050 **Note:** Since different implementations use different conceptual models, the terms “canonical name”  
 35051 and “alias” cannot be precisely defined for the general case. However, Domain Name System  
 35052 implementations are expected to interpret them as they are used in RFC 1034.

35053 A numeric host address string is not a “name”, and thus does not have a “canonical name”  
 35054 form; no address to host name translation is performed. See below for handling of the case  
 35055 where a canonical name cannot be obtained.

35056 If the AI\_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a  
 35057 numeric host address string. Otherwise, an [EAI\_NONAME] error is returned. This flag shall  
 35058 prevent any type of name resolution service (for example, the DNS) from being invoked.

35059 If the AI\_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a  
 35060 numeric port string. Otherwise, an [EAI\_NONAME] error shall be returned. This flag shall  
 35061 prevent any type of name resolution service (for example, NIS+) from being invoked.

35062 IP6 By default, with an *ai\_family* of AF\_INET6, *getaddrinfo()* shall return only IPv6 addresses. If the  
 35063 AI\_V4MAPPED flag is specified along with an *ai\_family* of AF\_INET6, then *getaddrinfo()* shall  
 35064 return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses. The  
 35065 AI\_V4MAPPED flag shall be ignored unless *ai\_family* equals AF\_INET6. If the AI\_ALL flag is  
 35066 used with the AI\_V4MAPPED flag, then *getaddrinfo()* shall return all matching IPv6 and IPv4  
 35067 addresses. The AI\_ALL flag without the AI\_V4MAPPED flag shall be ignored.

35068 If the AI\_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4  
 35069 IP6 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6  
 35070 address is configured on the local system.

35071 The *ai\_socktype* field to which argument *hints* points specifies the socket type for the service, as  
 35072 defined in Section 2.10.6 (on page 550). If a specific socket type is not given (for example, a  
 35073 value of zero) and the service name could be interpreted as valid with multiple supported socket

35074 types, the implementation shall attempt to resolve the service name for all supported socket  
 35075 types and, in the absence of errors, all possible results shall be returned. A non-zero socket type  
 35076 value shall limit the returned information to values with the specified socket type.

35077 If the *ai\_family* field to which *hints* points has the value AF\_UNSPEC, addresses shall be  
 35078 returned for use with any address family that can be used with the specified *nodename* and/or  
 35079 *servname*. Otherwise, addresses shall be returned for use only with the specified address family.  
 35080 If *ai\_family* is not AF\_UNSPEC and *ai\_protocol* is not zero, then addresses shall be returned for  
 35081 use only with the specified address family and protocol; the value of *ai\_protocol* shall be  
 35082 interpreted as in a call to the *socket()* function with the corresponding values of *ai\_family* and  
 35083 *ai\_protocol*.

#### 35084 RETURN VALUE

35085 A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value  
 35086 indicates failure. The possible values for the failures are listed in the ERRORS section.

35087 Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list  
 35088 of **addrinfo** structures, each of which shall specify a socket address and information for use in  
 35089 creating a socket with which to use that socket address. The list shall include at least one  
 35090 **addrinfo** structure. The *ai\_next* field of each structure contains a pointer to the next structure on  
 35091 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall  
 35092 include values for use with a call to the *socket()* function, and a socket address for use with the  
 35093 *connect()* function or, if the AI\_PASSIVE flag was specified, for use with the *bind()* function. The  
 35094 fields *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be usable as the arguments to the *socket()*  
 35095 function to create a socket suitable for use with the returned address. The fields *ai\_addr* and  
 35096 *ai\_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket,  
 35097 according to the AI\_PASSIVE flag.

35098 If *nodename* is not null, and if requested by the AI\_CANONNAME flag, the *ai\_canonname* field of  
 35099 the first returned **addrinfo** structure shall point to a null-terminated string containing the  
 35100 canonical name corresponding to the input *nodename*; if the canonical name is not available, then  
 35101 *ai\_canonname* shall refer to the *nodename* argument or a string with the same contents. The  
 35102 contents of the *ai\_flags* field of the returned structures are undefined.

35103 All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an  
 35104 explicit argument (for example, *sin6\_flowinfo*) shall be set to zero.

35105 **Note:** This makes it easier to compare socket address structures.

#### 35106 ERRORS

35107 The *getaddrinfo()* function shall fail and return the corresponding error value if:

35108 [EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

35109 [EAI\_BADFLAGS]

35110 The *flags* parameter had an invalid value.

35111 [EAI\_FAIL] A non-recoverable error occurred when attempting to resolve the name.

35112 [EAI\_FAMILY] The address family was not recognized.

35113 [EAI\_MEMORY] There was a memory allocation failure when trying to allocate storage for the  
 35114 return value.

35115 [EAI\_NONAME] The name does not resolve for the supplied parameters.

35116 Neither *nodename* nor *servname* were supplied. At least one of these shall be  
 35117 supplied.

35118 [EAI\_SERVICE] The service passed was not recognized for the specified socket type.

35119 [EAI\_SOCKTYPE]

35120 The intended socket type was not recognized.

35121 [EAI\_SYSTEM] A system error occurred; the error code can be found in *errno*.

### 35122 EXAMPLES

35123 The following (incomplete) program demonstrates the use of *getaddrinfo()* to obtain the socket  
35124 address structure(s) for the service named in the program's command-line argument. The  
35125 program then loops through each of the address structures attempting to create and bind a  
35126 socket to the address, until it performs a successful *bind()*.

```

35127 #include <stdio.h>
35128 #include <stdlib.h>
35129 #include <unistd.h>
35130 #include <string.h>
35131 #include <sys/socket.h>
35132 #include <netdb.h>

35133 int
35134 main(int argc, char *argv[])
35135 {
35136     struct addrinfo *result, *rp;
35137     int sfd, s;

35138     if (argc != 2) {
35139         fprintf(stderr, "Usage: %s port\n", argv[0]);
35140         exit(EXIT_FAILURE);
35141     }

35142     struct addrinfo hints = {0};
35143     hints.ai_family = AF_UNSPEC;
35144     hints.ai_socktype = SOCK_DGRAM;
35145     hints.ai_flags = AI_PASSIVE;
35146     hints.ai_protocol = 0;

35147     s = getaddrinfo(NULL, argv[1], &hints, &result);
35148     if (s != 0) {
35149         fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
35150         exit(EXIT_FAILURE);
35151     }

35152     /* getaddrinfo() returns a list of address structures.
35153     Try each address until a successful bind().
35154     If socket(2) (or bind(2)) fails, close the socket
35155     and try the next address. */

35156     for (rp = result; rp != NULL; rp = rp->ai_next) {
35157         sfd = socket(rp->ai_family, rp->ai_socktype,
35158                   rp->ai_protocol);
35159         if (sfd == -1)
35160             continue;

35161         if (bind(sfd, rp->ai_addr, rp->ai_addrlen) == 0)
35162             break;          /* Success */

35163         close(sfd);

```

```

35164     }
35165     if (rp == NULL) {           /* No address succeeded */
35166         fprintf(stderr, "Could not bind\n");
35167         exit(EXIT_FAILURE);
35168     }
35169     freeaddrinfo(result);      /* No longer needed */
35170                               /* ... use socket bound to sfd ... */
35171 }

```

### 35172 APPLICATION USAGE

35173 If the caller handles only TCP and not UDP, for example, then the *ai\_protocol* member of the *hints*  
 35174 structure should be set to IPPROTO\_TCP when *getaddrinfo()* is called.

35175 If the caller handles only IPv4 and not IPv6, then the *ai\_family* member of the *hints* structure  
 35176 should be set to AF\_INET when *getaddrinfo()* is called.

35177 The *hints* structure can be initialized using `memset(&hints, 0, sizeof hints)` or by  
 35178 default initialization (see the APPLICATION USAGE for XBD <[netdb.h](#)>).

35179 The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181).  
 35180 It should be noted that the canonical name is a result of alias processing, and not necessarily a  
 35181 unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this  
 35182 in the Domain Name System context.

35183 The *ai\_socktype* field pointed to by *hints* is just the socket type; not the socket type and flags that  
 35184 can be specified when the socket is created. Passing in socket creation flags will cause a failure  
 35185 with [EAI\_SOCKTYPE].

### 35186 RATIONALE

35187 None.

### 35188 FUTURE DIRECTIONS

35189 None.

### 35193 CHANGE HISTORY

35194 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35195 The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the  
 35196 ISO/IEC 9899:1999 standard.

35197 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the  
 35198 DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical  
 35199 name”. A reference to RFC 2181 is also added to the Informative References.

35200 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for  
 35201 alignment with IPv6. These include the following:

- 35202 • Adding AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG to the allowed values for the  
 35203 *ai\_flags* field
- 35204 • Adding a description of AI\_ADDRCONFIG

- 35205           • Adding a description of the consequences of ignoring the AI\_PASSIVE flag.
- 35206           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing “corresponding  
35207           value” to “corresponding error value” in the ERRORS section.
- 35208   **Issue 7**
- 35209           Austin Group Interpretation 1003.1-2001 #013 is applied.
- 35210           Austin Group Interpretation 1003.1-2001 #146 is applied, updating the DESCRIPTION.
- 35211           An example is added.
- 35212           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0130 [939], XSH/TC2-2008/0131 [979],  
35213           XSH/TC2-2008/0132 [918], and XSH/TC2-2008/0133 [934] are applied.
- 35214   **Issue 8**
- 35215           Austin Group Defect 385 is applied, adding a requirement that *freeaddrinfo()* does not modify  
35216           *errno* when passed a sublist that can be freed.
- 35217           Austin Group Defect 411 is applied, changing the “socket type” reference and adding a  
35218           paragraph about *hints->ai\_socktype* to the APPLICATION USAGE section.
- 35219           Austin Group Defect 940 is applied, changing text in the APPLICATION USAGE section relating  
35220           to initialization of the *hints* structure.
- 35221           Austin Group Defect 1102 is applied, replacing a reference to the *inet\_addr()* page with one to the  
35222           *inet\_ntop()* page.
- 35223           Austin Group Defect 1685 is applied, updating RFC references.

35224 **NAME**

35225           freelocale — free resources allocated for a locale object

35226 **SYNOPSIS**

```
35227 CX       #include <locale.h>
35228       void freelocale(locale_t locobj);
```

35229 **DESCRIPTION**

35230       The *freelocale()* function shall cause the resources allocated for a locale object returned by a call  
35231       to the *newlocale()* or *duplocale()* functions to be released. The *freelocale()* function shall not  
35232       modify *errno* if *locobj* is a locale object previously returned by *newlocale()* or *duplocale()* and not  
35233       yet released by *freelocale()* or *newlocale()*.

35234       The behavior is undefined if the *locobj* argument is the special locale object  
35235       LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

35236       Any use of a locale object that has been freed results in undefined behavior.

35237 **RETURN VALUE**

35238       None.

35239 **ERRORS**

35240       None.

35241 **EXAMPLES**35242       **Freeing Up a Locale Object**

35243       The following example shows a code fragment to free a locale object created by *newlocale()*:

```
35244       #include <locale.h>
35245       ...
35246       /* Every locale object allocated with newlocale() should be
35247        * freed using freelocale():
35248        */
35249       locale_t loc;
35250       /* Get the locale. */
35251       loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
35252       /* ... Use the locale object ... */
35253       ...
35254       /* Free the locale object resources. */
35255       freelocale (loc);
```

35256 **APPLICATION USAGE**

35257       None.

35258 **RATIONALE**

35259       None.

35260 **FUTURE DIRECTIONS**

35261       None.

35262 **SEE ALSO**35263 *duplocale()*, *getlocalename\_l()*, *newlocale()*, *uselocale()*

35264 XBD &lt;locale.h&gt;

35265 **CHANGE HISTORY**

35266 First released in Issue 7.

35267 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0180 [283] is applied.

35268 **Issue 8**35269 Austin Group Defect 385 is applied, adding a requirement that *freelocale()* does not modify *errno*  
35270 when passed a locale object than can be freed.35271 Austin Group Defect 1220 is applied, adding *getlocalename\_l()* to the SEE ALSO section.

## 35272 NAME

35273 freopen — open a stream

## 35274 SYNOPSIS

35275 #include &lt;stdio.h&gt;

```
35276 FILE *freopen(const char *restrict pathname, const char *restrict mode,
35277 FILE *restrict stream);
```

## 35278 DESCRIPTION

35279 CX Except for the “exclusive access” requirement (see *fopen()*), the functionality described on this  
 35280 reference page is aligned with the ISO C standard. Any other conflict between the requirements  
 35281 described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to  
 35282 the ISO C standard for all *freopen()* functionality except in relation to “exclusive access”.

35283 The *freopen()* function shall first attempt to flush the stream associated with *stream* as if by a call  
 35284 to *fflush(stream)*. Failure to flush the stream successfully shall be ignored. If *pathname* is not a  
 35285 null pointer, *freopen()* shall close any file descriptor associated with *stream*. Failure to close the  
 35286 file descriptor successfully shall be ignored. The error and end-of-file indicators for the stream  
 35287 shall be cleared.

35288 The *freopen()* function shall open the file whose pathname is the string pointed to by *pathname*  
 35289 and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in  
 35290 *fopen()*.

35291 The original stream shall be closed regardless of whether the subsequent open succeeds.

35292 If *pathname* is a null pointer, the *freopen()* function shall attempt to change the mode of the  
 35293 stream to that specified by *mode*, as if the name of the file currently associated with the stream  
 35294 had been used. In this case, the file descriptor associated with the stream need not be closed if  
 35295 the call to *freopen()* succeeds. It is implementation-defined which changes of mode are permitted  
 35296 (if any), and under what circumstances.

35297 XSI After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the  
 35298 encoding rule shall be cleared, and the associated *mbstate\_t* object shall be set to describe an  
 35299 initial conversion state.

35300 CX If *pathname* is not a null pointer, or if *pathname* is a null pointer and the specified mode change  
 35301 necessitates the file descriptor associated with the stream to be closed and reopened, the file  
 35302 descriptor associated with the reopened stream shall be allocated and opened as if by a call to  
 35303 *open()* with the flags specified for *fopen()* with the same *mode* argument.

## 35304 RETURN VALUE

35305 Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer  
 35306 CX shall be returned, and *errno* shall be set to indicate the error.

## 35307 ERRORS

35308 The *freopen()* function shall fail if:

35309 CX [EACCES] Search permission is denied on a component of the path prefix, or the file  
 35310 exists and the permissions specified by *mode* are denied, or the file does not  
 35311 exist and write permission is denied for the parent directory of the file to be  
 35312 created.

35313 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when  
 35314 *pathname* is a null pointer.

35315	CX	[EILSEQ]	The <i>mode</i> argument begins with <i>w</i> or <i>a</i> , the file did not previously exist, and the last pathname component is not a portable filename and cannot be created in the target directory.
35316			
35317			
35318	CX	[EEXIST]	The <i>mode</i> argument begins with <i>w</i> or <i>a</i> and includes <i>x</i> , but the file already exists.
35319			
35320	CX	[EINTR]	A signal was caught during <i>freopen()</i> .
35321	CX	[EISDIR]	The named file is a directory and <i>mode</i> requires write access.
35322	CX	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>pathname</i> argument.
35323			
35324	CX	[EMFILE]	All file descriptors available to the process are currently open.
35325	CX	[ENAMETOOLONG]	
35326			The length of a component of a pathname is longer than {NAME_MAX}.
35327	CX	[ENFILE]	The maximum allowable number of files is currently open in the system.
35328	CX	[ENOENT]	The <i>mode</i> string begins with 'r' and a component of <i>pathname</i> does not name an existing file, or <i>mode</i> begins with 'w' or 'a' and a component of the path prefix of <i>pathname</i> does not name an existing file, or <i>pathname</i> is an empty string.
35329			
35330			
35331			
35332	CX	[ENOENT] or [ENOTDIR]	
35333			The <i>pathname</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters. If <i>pathname</i> without the trailing <code>&lt;slash&gt;</code> characters would name an existing file, an [ENOENT] error shall not occur.
35334			
35335			
35336			
35337	CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.
35338			
35339	CX	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>pathname</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
35340			
35341			
35342			
35343			
35344	CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
35345			
35346	CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> .
35347			
35348	CX	[EROFS]	The named file resides on a read-only file system and <i>mode</i> requires write access.
35349			
35350			The <i>freopen()</i> function may fail if:
35351	CX	[EBADF]	The mode with which the file descriptor underlying the stream was opened does not support the requested mode when <i>pathname</i> is a null pointer.
35352			
35353	CX	[EINVAL]	The value of the <i>mode</i> argument is not valid.
35354	CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>pathname</i> argument.
35355			

35356	CX	[ENAMETOOLONG]	
35357			The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
35358			symbolic link produced an intermediate result with a length that exceeds
35359			{PATH_MAX}.
35360	CX	[ENOMEM]	Insufficient storage space is available.
35361	CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the
35362			capabilities of the device.
35363	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i>
35364			requires write access.

### 35365 EXAMPLES

#### 35366 Directing Standard Output to a File

35367 The following example logs all standard output to the `/tmp/logfile` file.

```
35368 #include <stdio.h>
35369 ...
35370 FILE *fp;
35371 ...
35372 fp = freopen ("/tmp/logfile", "a+", stdout);
35373 ...
```

### 35374 APPLICATION USAGE

35375 The `freopen()` function is typically used to attach the pre-opened *streams* associated with *stdin*,

35376 *stdout*, and *stderr* to other files.

35377 Since implementations are not required to support any stream mode changes when the *pathname*

35378 argument is NULL, portable applications cannot rely on the use of `freopen()` to change the stream

35379 mode, and use of this feature is discouraged. The feature was originally added to the ISO C

35380 standard in order to facilitate changing *stdin* and *stdout* to binary mode. Since a 'b' character in

35381 the mode has no effect on POSIX systems, this use of the feature is unnecessary in POSIX

35382 applications. However, even though the 'b' is ignored, a successful call to `freopen(NULL, "wb",`

35383 `stdout)` does have an effect. In particular, for regular files it truncates the file and sets the file-

35384 position indicator for the stream to the start of the file. It is possible that these side-effects are an

35385 unintended consequence of the way the feature was specified in the ISO/IEC 9899:1999

35386 standard (and still is in the current standard), but unless or until the ISO C standard is changed,

35387 applications which successfully call `freopen(NULL, "wb", stdout)` will behave in unexpected ways

35388 on conforming systems in situations such as:

```
35389 { appl file1; appl file2; } > file3
```

35390 which will result in `file3` containing only the output from the second invocation of `appl`.

35391 See also the APPLICATION USAGE for `fopen()`.

### 35392 RATIONALE

35393 See the RATIONALE for `fopen()`.

### 35394 FUTURE DIRECTIONS

35395 None.

35400 **CHANGE HISTORY**

35401 First released in Issue 1. Derived from Issue 1 of the SVID.

35402 **Issue 5**

35403 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the  
 35404 conversion state of the stream is set to an initial conversion state by a successful call to the  
 35405 *freopen()* function.

35406 Large File Summit extensions are added.

35407 **Issue 6**

35408 Extensions beyond the ISO C standard are marked.

35409 The following new requirements on POSIX implementations derive from alignment with the  
 35410 Single UNIX Specification:

35411 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
 35412 file description. This change is to support large files.

35413 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
 35414 large files.

35415 • The [ELOOP] mandatory error condition is added.

35416 • A second [ENAMETOOLONG] is added as an optional error condition.

35417 • The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

35418 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

35419 • The *freopen()* prototype is updated.

35420 • The DESCRIPTION is updated.

35421 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 35422 [ELOOP] error condition is added.

35423 The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

35424 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following  
 35425 sentence to the DESCRIPTION: “In this case, the file descriptor associated with the stream need  
 35426 not be closed if the call to *freopen()* succeeds.”.

35427 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory  
 35428 [EBADF] error, and an optional [EBADF] error to the ERRORS section.

35429 **Issue 7**

35430 Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the *freopen()* function  
 35431 allocates a file descriptor as per *open()*.

35432 Austin Group Interpretation 1003.1-2001 #143 is applied.

35433 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set  
 35434 on the open file description.

35435 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

- 35436 SD5-XSH-ERN-150 and SD5-XSH-ERN-219 are applied.
- 35437 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0181 [291,433], XSH/TC1-2008/0182  
35438 [146,433], XSH/TC1-2008/0183 [324], and XSH/TC1-2008/0184 [14] are applied.
- 35439 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0134 [822] is applied.
- 35440 **Issue 8**
- 35441 Austin Group Defect 293 is applied, adding the [EILSEQ] error.
- 35442 Austin Group Defect 411 is applied, adding the *e* and *x* mode string characters.
- 35443 Austin Group Defect 1200 is applied, correcting the argument name in the [ELOOP] errors.
- 35444 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
35445 standard.

35446 **NAME**

35447 frexp, frexpf, frexpl — extract significand and exponent from a double precision number

35448 **SYNOPSIS**

35449 #include &lt;math.h&gt;

35450 double frexp(double *num*, int \**exp*);35451 float frexpf(float *num*, int \**exp*);35452 long double frexpl(long double *num*, int \**exp*);35453 **DESCRIPTION**

35454 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 35455 conflict between the requirements described here and the ISO C standard is unintentional. This  
 35456 volume of POSIX.1-2024 defers to the ISO C standard.

35457 These functions shall break a floating-point number *num* into a normalized fraction and an  
 35458 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*; if the  
 35459 integer exponent is outside the range of **int**, the results are unspecified.

35460 **RETURN VALUE**

35461 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the  
 35462 interval  $[\frac{1}{2}, 1)$  or 0, and *num* equals *x* times 2 raised to the power \**exp*.

35463 MX When the radix of the argument is a power of 2, the returned value shall be exact and shall be  
 35464 independent of the current rounding direction mode.

35465 If *num* is NaN, a NaN shall be returned, and the value of \**exp* is unspecified.

35466 If *num* is  $\pm 0$ ,  $\pm 0$  shall be returned, and the value of \**exp* shall be 0.

35467 If *num* is  $\pm\text{Inf}$ , *num* shall be returned, and the value of \**exp* is unspecified.

35468 **ERRORS**

35469 No errors are defined.

35470 **EXAMPLES**

35471 None.

35472 **APPLICATION USAGE**

35473 None.

35474 **RATIONALE**

35475 None.

35476 **FUTURE DIRECTIONS**

35477 None.

35478 **SEE ALSO**35479 [isnan\(\)](#), [ldexp\(\)](#), [modf\(\)](#)35480 XBD [<math.h>](#)35481 **CHANGE HISTORY**

35482 First released in Issue 1. Derived from Issue 1 of the SVID.

35483 **Issue 5**

35484 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 35485 text was previously published in the APPLICATION USAGE section.

35486 **Issue 6**

35487 The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
35488 standard.

35489 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
35490 revised to align with the ISO/IEC 9899:1999 standard.

35491 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
35492 marked.

35493 **Issue 8**

35494 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
35495 standard.

35496 Austin Group Defect 1753 is applied, changing the NAME section.

35497 **NAME**

35498 fscanf, scanf, sscanf — convert formatted input

35499 **SYNOPSIS**

```
35500 #include <stdio.h>
35501 int fscanf(FILE *restrict stream, const char *restrict format, ...);
35502 int scanf(const char *restrict format, ...);
35503 int sscanf(const char *restrict s, const char *restrict format, ...);
```

35504 **DESCRIPTION**

35505 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 35506 conflict between the requirements described here and the ISO C standard is unintentional. This  
 35507 volume of POSIX.1-2024 defers to the ISO C standard.

35508 The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read  
 35509 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each  
 35510 function reads bytes, interprets them according to a format, and stores the results in its  
 35511 arguments. Each expects, as arguments, a control string *format* described below, and a set of  
 35512 *pointer* arguments indicating where the converted input should be stored. The result is  
 35513 undefined if there are insufficient arguments for the format. If the format is exhausted while  
 35514 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

35515 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 35516 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 35517 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}].  
 35518 This feature provides for the definition of format strings that select arguments in an order  
 35519 appropriate to specific languages. In format strings containing the "%n\$" form of conversion  
 35520 specifications, it is unspecified whether numbered arguments in the argument list can be  
 35521 referenced from the format string more than once.

35522 The format can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 35523 two forms cannot be mixed within a single format string. The only exception to this is that %% or  
 35524 %\* can be mixed with the "%n\$" form. When numbered argument specifications are used,  
 35525 specifying the *N*th argument requires that all the leading arguments, from the first to the  
 35526 (*N*−1)th, are pointers.

35527 The *fscanf()* function in all its forms shall allow detection of a language-dependent radix  
 35528 character in the input string. The radix character is defined in the current locale (category  
 35529 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
 35530 radix character shall default to a <period> ('.').

35531 The application shall ensure that the format is a character string, beginning and ending in its  
 35532 initial shift state, if any, composed of zero or more directives. Each directive is composed of one  
 35533 of the following: one or more white-space bytes; an ordinary character (neither '%' nor a white-  
 35534 space byte); or a conversion specification. Each conversion specification is introduced by the  
 35535 CX character '%' or the character sequence "%n\$", after which the following appear in sequence:

- 35536 • An optional assignment-suppressing character '\*'.
- 35537 • An optional non-zero decimal integer that specifies the maximum field width.
- 35538 CX • An optional assignment-allocation character 'm'.
- 35539 • An option length modifier that specifies the size of the receiving object.
- 35540 • A *conversion specifier* character that specifies the type of conversion to be applied. The valid  
 35541 conversion specifiers are described below.

35542 The *fscanf()* functions shall execute each directive of the format in turn. When all directives have  
 35543 been executed, or if a directive fails (as detailed below), the function shall return. Failures are  
 35544 described as input failures (due to the unavailability of input bytes) or matching failures (due to  
 35545 inappropriate input).

35546 A directive composed of one or more white-space bytes shall be executed by reading input up to  
 35547 the first non-white-space byte, which shall remain unread, or until no more bytes can be read.  
 35548 The directive shall never fail.

35549 A directive that is an ordinary character shall be executed as follows: the next byte shall be read  
 35550 from the input and compared with the byte that comprises the directive; if the comparison  
 35551 shows that they are not equivalent, the directive shall fail, and the differing and subsequent  
 35552 bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a  
 35553 character from being read, the directive shall fail.

35554 A directive that is a conversion specification defines a set of matching input sequences, as  
 35555 described below for each conversion character. A conversion specification shall be executed in  
 35556 the following steps.

35557 Input white-space bytes shall be skipped, unless the conversion specification includes a `[`, `c`, `C`,  
 35558 or `n` conversion specifier.

35559 An item shall be read from the input, unless the conversion specification includes an `n`  
 35560 conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to  
 35561 any specified maximum field width, which may be measured in characters or bytes dependent  
 35562 on the conversion specifier) which is an initial subsequence of a matching sequence. The first  
 35563 byte, if any, after the input item shall remain unread. If the length of the input item is 0, the  
 35564 execution of the conversion specification shall fail; this condition is a matching failure, unless  
 35565 end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is  
 35566 an input failure.

35567 Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion  
 35568 specification, the count of input bytes) shall be converted to a type appropriate to the conversion  
 35569 character. If the input item is not a matching sequence, the execution of the conversion  
 35570 specification fails; this condition is a matching failure. Unless assignment suppression was  
 35571 indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the  
 35572 first argument following the *format* argument that has not already received a conversion result if  
 35573 the conversion specification is introduced by `%`, or in the *n*th argument if introduced by the  
 35574 character sequence `"%n$"`. If this object does not have an appropriate type, or if the result of the  
 35575 conversion cannot be represented in the space provided, the behavior is undefined.

35576 CX The `c`, `s`, and `[` conversion specifiers shall accept an optional assignment-allocation character  
 35577 `'m'`, which shall cause a memory buffer to be allocated to hold the conversion results. If the  
 35578 conversion specifier is `s` or `[`, the allocated buffer shall include space for a terminating null  
 35579 character (or wide character). In such a case, the argument corresponding to the conversion  
 35580 specifier should be a reference to a pointer variable that will receive a pointer to the allocated  
 35581 buffer. The system shall allocate a buffer as if *malloc()* had been called. The application shall be  
 35582 responsible for freeing the memory after usage. If there is insufficient memory to allocate a  
 35583 buffer, the function shall set *errno* to `[ENOMEM]` and a conversion error shall result. If the  
 35584 function returns EOF, any memory successfully allocated for parameters using assignment-  
 35585 allocation character `'m'` by this call shall be freed before the function returns.

- 35586 The length modifiers and their meanings are:
- 35587 hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35588 argument with type pointer to **signed char** or **unsigned char**.
- 35589 h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35590 argument with type pointer to **short** or **unsigned short**.
- 35591 l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35592 argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F,  
35593 g, or G conversion specifier applies to an argument with type pointer to **double**; or that  
35594 a following c, s, or [ conversion specifier applies to an argument with type pointer to  
35595 CX **wchar\_t**. If the 'm' assignment-allocation character is specified, the conversion  
35596 applies to an argument with the type pointer to a pointer to **wchar\_t**.
- 35597 ll (ell-ell)  
35598 Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35599 argument with type pointer to **long long** or **unsigned long long**.
- 35600 j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35601 argument with type pointer to **intmax\_t** or **uintmax\_t**.
- 35602 z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35603 argument with type pointer to **size\_t** or the corresponding signed integer type.
- 35604 t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
35605 argument with type pointer to **ptrdiff\_t** or the corresponding **unsigned** type.
- 35606 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an  
35607 argument with type pointer to **long double**.
- 35608 If a length modifier appears with any conversion specifier other than as specified above, the  
35609 behavior is undefined.
- 35610 The following conversion specifiers are valid:
- 35611 d Matches an optionally signed decimal integer, whose format is the same as expected for  
35612 the subject sequence of *strtol()* with the value 10 for the *base* argument. In the absence  
35613 of a size modifier, the application shall ensure that the corresponding argument is a  
35614 pointer to **int**.
- 35615 i Matches an optionally signed integer, whose format is the same as expected for the  
35616 subject sequence of *strtol()* with 0 for the *base* argument. In the absence of a size  
35617 modifier, the application shall ensure that the corresponding argument is a pointer to  
35618 **int**.
- 35619 o Matches an optionally signed octal integer, whose format is the same as expected for  
35620 the subject sequence of *strtoul()* with the value 8 for the *base* argument. In the absence  
35621 of a size modifier, the application shall ensure that the corresponding argument is a  
35622 pointer to **unsigned**.
- 35623 u Matches an optionally signed decimal integer, whose format is the same as expected for  
35624 the subject sequence of *strtoul()* with the value 10 for the *base* argument. In the absence  
35625 of a size modifier, the application shall ensure that the corresponding argument is a  
35626 pointer to **unsigned**.
- 35627 x Matches an optionally signed hexadecimal integer, whose format is the same as  
35628 expected for the subject sequence of *strtoul()* with the value 16 for the *base* argument. In  
35629 the absence of a size modifier, the application shall ensure that the corresponding

35630 argument is a pointer to **unsigned**.

35631 a, e, f, g

35632 Matches an optionally signed floating-point number, infinity, or NaN, whose format is

35633 the same as expected for the subject sequence of *strtod*(). In the absence of a size

35634 modifier, the application shall ensure that the corresponding argument is a pointer to

35635 **float**.

35636 If the *fprintf*() family of functions generates character string representations for infinity

35637 and NaN (a symbolic entity encoded in floating-point format) to support

35638 IEEE Std 754-1985, the *fscanf*() family of functions shall recognize them as input.

35639 s

35640 Matches a sequence of bytes that are not white-space bytes. If the 'm' assignment-

35641 allocation character is not specified, the application shall ensure that the corresponding

35642 argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned**

35643 **char** large enough to accept the sequence and a terminating null character code, which

35644 **CX** shall be added automatically. Otherwise, the application shall ensure that the

corresponding argument is a pointer to a pointer to a **char**.

35645 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the

35646 initial shift state. Each character shall be converted to a wide character as if by a call to

35647 the *mbrtowc*() function, with the conversion state described by an **mbstate\_t** object

35648 initialized to zero before the first character is converted. If the 'm' assignment-

35649 allocation character is not specified, the application shall ensure that the corresponding

35650 argument is a pointer to an array of **wchar\_t** large enough to accept the sequence and

35651 **CX** the terminating null wide character, which shall be added automatically. Otherwise,

35652 the application shall ensure that the corresponding argument is a pointer to a pointer to

35653 a **wchar\_t**.

35654 [

35655 Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The

35656 normal skip over white-space bytes shall be suppressed in this case. If the 'm'

35657 assignment-allocation character is not specified, the application shall ensure that the

35658 corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**,

35659 **CX** or **unsigned char** large enough to accept the sequence and a terminating null byte,

35660 which shall be added automatically. Otherwise, the application shall ensure that the

corresponding argument is a pointer to a pointer to a **char**.

35661 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the

35662 initial shift state. Each character in the sequence shall be converted to a wide character

35663 as if by a call to the *mbrtowc*() function, with the conversion state described by an

35664 **mbstate\_t** object initialized to zero before the first character is converted. If the 'm'

35665 assignment-allocation character is not specified, the application shall ensure that the

35666 corresponding argument is a pointer to an array of **wchar\_t** large enough to accept the

35667 sequence and the terminating null wide character, which shall be added automatically.

35668 **CX** Otherwise, the application shall ensure that the corresponding argument is a pointer to

35669 a pointer to a **wchar\_t**.

35670 The conversion specification includes all subsequent bytes in the format string up to

35671 and including the matching <right-square-bracket> (' ] '). The bytes between the

35672 square brackets (the *scanlist*) comprise the *scanset*, unless the byte after the <left-

35673 square-bracket> is a <circumflex> (' ^ '), in which case the *scanset* contains all bytes

35674 that do not appear in the *scanlist* between the <circumflex> and the <right-square-

35675 bracket>. If the conversion specification begins with "[ ]" or "[ ^ ]", the <right-

35676 square-bracket> is included in the *scanlist* and the next <right-square-bracket> is the

35677 matching <right-square-bracket> that ends the conversion specification; otherwise, the

35678		first <right-square-bracket> is the one that ends the conversion specification. If a '-' is in the scanlist and is not the first character, nor the second where the first character is a '^', nor the last character, the behavior is implementation-defined.
35679		
35680		
35681	c	Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). No null byte is added. The normal skip over white-space bytes shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .
35682		
35683		
35684		
35685		
35686	CX	
35687		
35688		If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. No null wide character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the resulting sequence of wide characters. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
35689		
35690		
35691		
35692		
35693		
35694	CX	
35695		
35696		
35697	p	Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding <i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion specification is undefined.
35698		
35699		
35700		
35701		
35702		
35703		
35704	n	No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which shall be written the number of bytes read from the input so far by this call to the <i>fscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.
35705		
35706		
35707		
35708		
35709		
35710		
35711	XSI	<b>C</b> Equivalent to <b>lc</b> .
35712	XSI	<b>S</b> Equivalent to <b>ls</b> .
35713	%	Matches a single '%' character; no conversion or assignment occurs. The complete conversion specification shall be %%.
35714		
35715		If a conversion specification is invalid, the behavior is undefined.
35716		The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to a, e, f, g, and x, respectively.
35717		
35718		If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs before any bytes matching the current conversion specification (except for %n) have been read (other than leading white-space bytes, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.
35719		
35720		
35721		
35722		
35723		

35724 Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for  
35725 *fscanf()*.

35726 If conversion terminates on a conflicting input, the offending input is left unread in the input.  
35727 Any trailing white-space bytes (including <newline> characters) shall be left unread unless  
35728 matched by a conversion specification. The success of literal matches and suppressed  
35729 assignments is only directly determinable via the %n conversion specification.

35730 CX The *fscanf()* and *scanf()* functions may mark the last data access timestamp of the file associated  
35731 with *stream* for update. The last data access timestamp shall be marked for update by the first  
35732 successful execution of *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *fscanf()*, or  
35733 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

#### 35734 RETURN VALUE

35735 Upon successful completion, these functions shall return the number of successfully matched  
35736 and assigned input items; this number can be zero in the event of an early matching failure. If  
35737 the input ends before the first conversion (if any) has completed, and without a matching failure  
35738 having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has  
35739 CX completed, and without a matching failure having occurred, EOF shall be returned and *errno*  
35740 shall be set to indicate the error. If an error occurs, the error indicator for the stream shall be set.

#### 35741 ERRORS

35742 For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or  
35743 *fgetwc()*.

35744 In addition, the *fscanf()* function shall fail if:

35745 CX [EILSEQ] Input byte sequence does not form a valid character.

35746 [ENOMEM] Insufficient storage space is available.

35747 In addition, the *fscanf()* function may fail if:

35748 CX [EINVAL] There are insufficient arguments.

#### 35749 EXAMPLES

35750 The call:

```
35751 int i, n; float x; char name[50];
35752 n = scanf("%d%f%s", &i, &x, name);
```

35753 with the input line:

```
35754 25 54.32E-1 Hamster
```

35755 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
35756 "Hamster".

35757 The call:

```
35758 int i; float x; char name[50];
35759 (void) scanf("%2d%f*d %[0123456789]", &i, &x, name);
```

35760 with input:

```
35761 56789 0123 56a72
```

35762 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
35763 *getchar()* shall return the character 'a'.

35764 **Reading Data into an Array**

35765 The following call uses *fscanf()* to read three floating-point numbers from standard input into  
 35766 the *input* array.

```
35767 float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

35768 **APPLICATION USAGE**

35769 If the application calling *fscanf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
 35770 the **<wchar.h>** header to have these objects defined.

35771 For functions that allocate memory as if by *malloc()*, the application should release such memory  
 35772 when it is no longer required by a call to *free()*. For *fscanf()*, this is memory allocated via use of  
 35773 the 'm' assignment-allocation character.

35774 **RATIONALE**

35775 The set of characters allowed in a scanset is limited to single-byte characters. In other similar  
 35776 places, multi-byte characters have been permitted, but for alignment with the ISO C standard, it  
 35777 has not been done here. Applications needing this could use the corresponding wide-character  
 35778 functions to achieve the desired results.

35779 **FUTURE DIRECTIONS**

35780 None.

35781 **SEE ALSO**

35782 [Section 2.5](#) (on page 521), *fprintf()*, *getc()*, *setlocale()*, *strtod()*, *strtol()*, *strtoul()*, *wcrtomb()*

35783 [XBD Chapter 7](#) (on page 127), **<inttypes.h>**, **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**

35784 **CHANGE HISTORY**

35785 First released in Issue 1. Derived from Issue 1 of the SVID.

35786 **Issue 5**

35787 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier is  
 35788 now defined for the **c**, **s**, and **[** conversion specifiers.

35789 The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the  
 35790 *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

35791 **Issue 6**

35792 The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several  
 35793 occurrences of “characters” in the text which have been replaced with the term “bytes”.

35794 The normative text is updated to avoid use of the term “must” for application requirements.

35795 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 35796 • The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.
- 35797 • The DESCRIPTION is updated.
- 35798 • The **hh**, **ll**, **j**, **t**, and **z** length modifiers are added.
- 35799 • The **a**, **A**, and **F** conversion characters are added.

35800 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
 35801 specification” consistently.

35802 **Issue 7**

- 35803 Austin Group Interpretation 1003.1-2001 #170 is applied.
- 35804 SD5-XSH-ERN-9 is applied, correcting *fscanf()* to *scanf()* in the DESCRIPTION.
- 35805 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.
- 35806 Functionality relating to the %n\$ form of conversion specification is moved from the XSI option  
35807 to the Base.
- 35808 Changes are made related to support for finegrained timestamps.
- 35809 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
35810 *malloc()*.
- 35811 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0185 [302], XSH/TC1-2008/0186 [90],  
35812 and XSH/TC1-2008/0187 [14] are applied. XSH/TC1-2008/0186 [90] changes the second  
35813 sentence in the RETURN VALUE section to align with expected wording changes in the next  
35814 revision of the ISO C standard.
- 35815 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0135 [936] is applied.

35816 **Issue 8**

- 35817 Austin Group Defect 1163 is applied, clarifying the handling of white space in the format string.
- 35818 Austin Group Defect 1173 is applied, clarifying the description of the assignment-allocation  
35819 character 'm'.
- 35820 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
35821 standard.
- 35822 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 35823 Austin Group Defect 1375 is applied, changing “terminating null character” to “terminating null  
35824 character (or wide character)”.
- 35825 Austin Group Defect 1562 is applied, clarifying that it is the application’s responsibility to  
35826 ensure that the format is a character string, beginning and ending in its initial shift state, if any.
- 35827 Austin Group Defect 1624 is applied, changing the RETURN VALUE section.

35828 **NAME**35829 `fseek, fseeko` — reposition a file-position indicator in a stream35830 **SYNOPSIS**35831 `#include <stdio.h>`35832 `int fseek(FILE *stream, long offset, int whence);`35833 CX `int fseeko(FILE *stream, off_t offset, int whence);`35834 **DESCRIPTION**35835 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
35836 conflict between the requirements described here and the ISO C standard is unintentional. This  
35837 volume of POSIX.1-2024 defers to the ISO C standard.35838 The `fseek()` function shall set the file-position indicator for the stream pointed to by `stream`. If a  
35839 read or write error occurs, the error indicator for the stream shall be set and `fseek()` fails.35840 CX The new position, measured in bytes from the beginning of the file, except in the case of streams  
35841 opened with `open_wmemstream()` for which the position shall be measured in wide characters,  
35842 shall be obtained by adding `offset` to the position specified by `whence`. The specified point is the  
35843 beginning of the file for `SEEK_SET`, the current value of the file-position indicator for  
35844 `SEEK_CUR`, or end-of-file for `SEEK_END`.35845 If the stream is to be used with wide-character input/output functions, the application shall  
35846 ensure that `offset` is either 0 or a value returned by an earlier call to `ftell()` on the same stream and  
35847 `whence` is `SEEK_SET`.35848 A successful call to `fseek()` shall clear the end-of-file indicator for the stream and undo any effects  
35849 of `ungetc()` and `ungetwc()` on the same stream. After an `fseek()` call, the next operation on an  
35850 update stream may be either input or output.35851 CX If the most recent operation, other than `ftell()`, on a given stream is `fflush()`, the file offset in the  
35852 underlying open file description shall be adjusted to reflect the location specified by `fseek()`.35853 The `fseek()` function shall allow the file-position indicator to be set beyond the end of existing  
35854 data in the file. If data is later written at this point, subsequent reads of data in the gap shall  
35855 return bytes with the value 0 until data is actually written into the gap.35856 The behavior of `fseek()` on devices which are incapable of seeking is implementation-defined.  
35857 The value of the file offset associated with such a device is undefined.35858 If the stream has an underlying file description and is writable, and buffered data had not been  
35859 written to the underlying file, `fseek()` shall cause the unwritten data to be written to the file and  
35860 shall mark the last data modification and last file status change timestamps of the file for update.35861 If the stream was created by `fmemopen()`, `open_memstream()`, or `open_wmemstream()` and the  
35862 stream is writable, and if the stream is buffered and data in the stream's buffer has not been  
35863 written to the underlying memory buffer, `fseek()` shall cause the unwritten data to be written to  
35864 the underlying memory buffer.35865 In a locale with state-dependent encoding, whether `fseek()` restores the stream's shift state is  
35866 implementation-defined.35867 The `fseeko()` function shall be equivalent to the `fseek()` function except that the `offset` argument is  
35868 of type `off_t`.

35869 **RETURN VALUE**

35870 CX The `fseek()` and `fseeko()` functions shall return 0 if they succeed.

35871 CX Otherwise, they shall return `-1` and set `errno` to indicate the error.

35872 **ERRORS**

35873 CX The `fseek()` and `fseeko()` functions shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to be flushed, and the call to `fseek()` or `fseeko()` causes an underlying `lseek()` or `write()` to be invoked, and:

35876 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor and the thread would be delayed in the write operation.

35878 CX **[EBADF]** The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.

35880 CX **[EFBIG]** An attempt was made to write a file that exceeds the maximum file size.

35881 CX **[EFBIG]** An attempt was made to write a file that exceeds the file size limit of the process.

35882  
35883 XSI A `SIGXFSZ` signal shall also be generated for the thread.

35884 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

35886 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data was transferred.

35888 CX **[EINVAL]** The *whence* argument is invalid, the resulting file-position indicator would be set to a negative value, or the stream was created by `fmemopen()` and the resulting file-position indicator would be beyond the end of the underlying memory buffer.

35892 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a `write()` to its controlling terminal, `TOSTOP` is set, the calling thread is not blocking `SIGTTOU`, the process is not ignoring `SIGTTOU`, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

35897 CX **[ENOMEM]** The stream was created by `open_memstream()` or `open_wmemstream()` and insufficient memory is available.

35899 CX **[ENOSPC]** There was no free space remaining on the device containing the file or in the buffer used by the `fmemopen()` function.

35901 CX **[EOVERFLOW]** For `fseek()`, the resulting file offset would be a value which cannot be represented correctly in an object of type **long**.

35903 CX **[EOVERFLOW]** For `fseeko()`, the resulting file offset would be a value which cannot be represented correctly in an object of type **off\_t**.

35905 CX **[EPIPE]** An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a `SIGPIPE` signal shall also be sent to the thread.

35907 CX **[ESPIPE]** The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

35908 CX The `fseek()` and `fseeko()` functions may fail if:

35909 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 35910 capabilities of the device.

### 35911 EXAMPLES

35912 None.

### 35913 APPLICATION USAGE

35914 None.

### 35915 RATIONALE

35916 When the stream was created by *fmemopen()*, *fseek()* fails if an attempt is made to seek beyond  
 35917 the end of the underlying memory buffer. This is different than *fseek()* on a file when a file size  
 35918 limit is in effect because the size specified to *fmemopen()* is a fixed, absolute limit whereas a file  
 35919 size limit is artificial and can be changed. With a file size limit, it is possible to seek past the  
 35920 limit, then raise the limit and successfully write at the new position; there is no equivalent  
 35921 possibility with the buffer size specified to *fmemopen()*.

35922 See also the rationale for *ftell()*.

### 35923 FUTURE DIRECTIONS

35924 None.

### 35925 SEE ALSO

35926 Section 2.5 (on page 521), *fopen()*, *fmemopen()*, *fsetpos()*, *ftell()*, *getrlimit()*, *lseek()*,  
 35927 *open\_memstream()*, *rewind()*, *ungetc()*, *write()*

35928 XBD <stdio.h>

### 35929 CHANGE HISTORY

35930 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 35931 Issue 5

35932 Normative text previously in the APPLICATION USAGE section is moved to the  
 35933 DESCRIPTION.

35934 Large File Summit extensions are added.

#### 35935 Issue 6

35936 Extensions beyond the ISO C standard are marked.

35937 The following new requirements on POSIX implementations derive from alignment with the  
 35938 Single UNIX Specification:

- 35939 • The *fseeko()* function is added.
- 35940 • The [EFBIG], [Eoverflow], and [ENXIO] mandatory error conditions are added.

35941 The following change is incorporated for alignment with the FIPS requirements:

- 35942 • The [EINTR] error is no longer an indication that the implementation does not report  
 35943 partial transfers.

35944 The normative text is updated to avoid use of the term “must” for application requirements.

35945 The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and  
 35946 then on error the error indicator is set and *fseek()* fails. This is for alignment with the  
 35947 ISO/IEC 9899:1999 standard.

35948 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN]  
 35949 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 35950 delayed”.

35951 **Issue 7**

35952 Changes are made related to support for finegrained timestamps.

35953 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0188 [79], XSH/TC1-2008/0189 [122],  
35954 XSH/TC1-2008/0190 [225], and XSH/TC1-2008/0191 [14] are applied.

35955 **Issue 8**

35956 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

35957 Austin Group Defect 1027 is applied, specifying that for streams opened with  
35958 *open\_wmemstream()* the position is measured in wide characters, not bytes.

35959 Austin Group Defect 1225 is applied, clarifying the behavior for memory streams.

35960 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
35961 relating to the file size limit for the process.

35962 **NAME**

35963 fsetpos — set current file position

35964 **SYNOPSIS**

35965 #include &lt;stdio.h&gt;

35966 int fsetpos(FILE \*stream, const fpos\_t \*pos);

35967 **DESCRIPTION**

35968 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 35969 conflict between the requirements described here and the ISO C standard is unintentional. This  
 35970 volume of POSIX.1-2024 defers to the ISO C standard.

35971 The *fsetpos()* function shall set the **mbstate\_t** object (if any) and file position indicator for the  
 35972 stream pointed to by *stream* according to the value of the object pointed to by *pos*, which the  
 35973 application shall ensure is a value obtained from an earlier call to *fgetpos()* on the same stream. If  
 35974 a read or write error occurs, the error indicator for the stream shall be set and *fsetpos()* fails.

35975 A successful call to the *fsetpos()* function shall undo any effects of the *ungetc()* function on the  
 35976 stream, clear the end-of-file indicator for the stream, and then establish the new parse state and  
 35977 position. After a successful *fsetpos()* call, the next operation on an update stream can be either  
 35978 input or output.

35979 CX The behavior of *fsetpos()* on devices which are incapable of seeking is implementation-defined.  
 35980 The value of the file offset associated with such a device is undefined.

35981 If the stream has an underlying file description and is writable, and buffered data has not been  
 35982 written to the underlying file, *fsetpos()* shall cause the unwritten data to be written to the file and  
 35983 shall mark the last data modification and last file status change timestamps of the file for update.

35984 If the stream was created by *fmemopen()*, *open\_memstream()*, or *open\_wmemstream()* and the  
 35985 stream is writable, and if the stream is buffered and data in the stream's buffer has not been  
 35986 written to the underlying memory buffer, *fsetpos()* shall cause the unwritten data to be written to  
 35987 the underlying memory buffer.

35988 The *fsetpos()* function shall not change the setting of *errno* if successful.

35989 **RETURN VALUE**

35990 The *fsetpos()* function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and  
 35991 set *errno* to indicate the error.

35992 **ERRORS**

35993 CX The *fsetpos()* function shall fail if, either the *stream* is unbuffered or the *stream's* buffer needed to  
 35994 be flushed, and the call to *fsetpos()* causes an underlying *lseek()* or *write()* to be invoked, and:

35995 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be  
 35996 delayed in the write operation.

35997 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the  
 35998 stream's buffer needed to be flushed and the file is not open.

35999 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

36000 CX [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 36001 process.

36002 XSI A SIGXFSZ signal shall also be generated for the thread.

36003 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 36004 offset maximum associated with the corresponding stream.

36005	CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
36006			
36007	CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a <i>write()</i> to its controlling terminal, TOSTOP is set, the calling thread is not blocking SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
36008			
36009			
36010			
36011			
36012	CX	[ENOMEM]	The stream was created by <i>open_memstream()</i> or <i>open_wmemstream()</i> and insufficient memory is available.
36013			
36014	CX	[ENOSPC]	There was no free space remaining on the device containing the file or in the buffer used by the <i>fmemopen()</i> function.
36015			
36016	CX	[EPIPE]	An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.
36017			
36018	CX	[ESPIPE]	The file descriptor underlying <i>stream</i> is associated with a pipe, FIFO, or socket.
36019			The <i>fsetpos()</i> function may fail if:
36020	CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
36021			

**36022 EXAMPLES**

36023 None.

**36024 APPLICATION USAGE**

36025 None.

**36026 RATIONALE**

36027 The ERRORS section does not include an [EINVAL] error equivalent to the one for *fseek()*  
 36028 because applications are required to obtain the **fpos\_t** value using *fgetpos()*, in which case the  
 36029 file position to be set will always be valid. Directly manipulating the **fpos\_t** object to set a  
 36030 position results in undefined behavior. However, if an implementation detects that the  
 36031 requested file position would be a negative value, or would be beyond the end of the underlying  
 36032 memory buffer of a stream that was created by *fmemopen()*, it is recommended that *fsetpos()*  
 36033 returns a non-zero value and sets *errno* to [EINVAL].

**36034 FUTURE DIRECTIONS**

36035 None.

**36036 SEE ALSO**

36037 [Section 2.5](#) (on page 521), *fopen()*, *fmemopen()*, *ftell()*, *lseek()*, *open\_memstream()*, *rewind()*,  
 36038 *ungetc()*, *write()*

36039 XBD [<stdio.h>](#)

**36040 CHANGE HISTORY**

36041 First released in Issue 4. Derived from the ISO C standard.

**36042 Issue 6**

36043 Extensions beyond the ISO C standard are marked.

36044 The normative text is updated to avoid use of the term “must” for application requirements.

36045 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or  
 36046 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

36047 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous  
36048 [EINVAL] error case from the ERRORS section.

36049 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN]  
36050 error in the ERRORS section from ``the process would be delayed'' to ``the thread would be  
36051 delayed''.

36052 **Issue 7**

36053 SD5-XSH-ERN-220 is applied.

36054 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0192 [105], XSH/TC1-2008/0193 [79],  
36055 XSH/TC1-2008/0194 [225], XSH/TC1-2008/0195 [450], XSH/TC1-2008/0196 [450], and  
36056 XSH/TC1-2008/0197 [14] are applied.

36057 **Issue 8**

36058 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

36059 Austin Group Defect 1225 is applied, aligning the CX requirements with *fseek()*.

36060 Austin Group Defect 1249 is applied, correcting some text mismatches with the ISO C standard.

36061 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
36062 relating to the file size limit for the process.

36063 **NAME**36064 `fstat` — get file status36065 **SYNOPSIS**36066 `#include <sys/stat.h>`36067 `int fstat(int fildev, struct stat *buf);`36068 **DESCRIPTION**36069 The `fstat()` function shall obtain information about an open file associated with the file  
36070 descriptor *fildev*, and shall write it to the area pointed to by *buf*.36071 SHM If *fildev* references a shared memory object, the implementation shall update in the **stat** structure  
36072 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
36073 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
36074 valid. The implementation may update other fields and flags.36075 TYM If *fildev* references a typed memory object, the implementation shall update in the **stat** structure  
36076 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
36077 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
36078 valid. The implementation may update other fields and flags.36079 The *buf* argument is a pointer to a **stat** structure, as defined in `<sys/stat.h>`, into which  
36080 information is placed concerning the file.36081 For all other file types defined in this volume of POSIX.1-2024, the structure members *st\_mode*,  
36082 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
36083 value of the *st\_nlink* member shall be set to the number of links to the file.36084 An implementation that provides additional or alternative file access control mechanisms may,  
36085 under implementation-defined conditions, cause `fstat()` to fail.36086 The `fstat()` function shall update any time-related fields (as described in XBD [Section 4.12](#), on  
36087 page 98), before writing into the **stat** structure.36088 **RETURN VALUE**36089 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
36090 indicate the error.36091 **ERRORS**36092 The `fstat()` function shall fail if:36093 [EBADF] The *fildev* argument is not a valid file descriptor.

36094 [EIO] An I/O error occurred while reading from the file system.

36095 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
36096 serial number cannot be represented correctly in the structure pointed to by  
36097 *buf*.36098 The `fstat()` function may fail if:36099 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf*  
36100 argument.

36101 **EXAMPLES**36102 **Obtaining File Status Information**

36103 The following example shows how to obtain file status information for a file named  
 36104 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The  
 36105 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file  
 36106 descriptor *fildev*.

```
36107 #include <sys/types.h>
36108 #include <sys/stat.h>
36109 #include <fcntl.h>

36110 struct stat buffer;
36111 int      status;
36112 ...
36113 fildev = open("/home/cnd/mod1", O_RDWR);
36114 status = fstat(fildev, &buffer);
```

36115 **APPLICATION USAGE**

36116 None.

36117 **RATIONALE**

36118 None.

36119 **FUTURE DIRECTIONS**

36120 None.

36121 **SEE ALSO**

36123 XBD Section 4.12 (on page 98), [<sys/stat.h>](#), [<sys/types.h>](#)

36124 **CHANGE HISTORY**

36125 First released in Issue 1. Derived from Issue 1 of the SVID.

36126 **Issue 5**

36127 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

36128 Large File Summit extensions are added.

36129 **Issue 6**

36130 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

36131 The following new requirements on POSIX implementations derive from alignment with the  
 36132 Single UNIX Specification:

- 36133 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 36134 required for conforming implementations of previous POSIX specifications, it was not  
 36135 required for UNIX applications.
- 36136 • The [EIO] mandatory error condition is added.
- 36137 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 36138 files.
- 36139 • The [EOVERFLOW] optional error condition is added.

36140 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 36141 shared memory object semantics apply to typed memory objects.

36142 **Issue 7**

36143 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
36144 applies.

36145 Changes are made related to support for finegrained timestamps.

36146 **NAME**

36147 fstatat, lstat, stat — get file status

36148 **SYNOPSIS**

36149 OH #include &lt;fcntl.h&gt;

36150 #include &lt;sys/stat.h&gt;

36151 int fstatat(int fd, const char \*restrict path,

36152 struct stat \*restrict buf, int flag);

36153 int lstat(const char \*restrict path, struct stat \*restrict buf);

36154 int stat(const char \*restrict path, struct stat \*restrict buf);

36155 **DESCRIPTION**

36156 The *stat()* function shall obtain information about the named file and write it to the area pointed  
 36157 to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or  
 36158 execute permission of the named file is not required. An implementation that provides  
 36159 additional or alternate file access control mechanisms may, under implementation-defined  
 36160 conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file  
 36161 specified by *path*.

36162 If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using  
 36163 the contents of the symbolic link, and shall return information pertaining to the resulting file if  
 36164 the file exists.

36165 The *buf* argument is a pointer to a **stat** structure, as defined in the <sys/stat.h> header, into  
 36166 which information is placed concerning the file.

36167 The *stat()* function shall update any time-related fields (as described in XBD Section 4.12, on  
 36168 page 98), before writing into the **stat** structure.

36169 SHM If the named file is a shared memory object, the implementation shall update in the **stat** structure  
 36170 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 36171 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 36172 valid. The implementation may update other fields and flags.

36173 TYM If the named file is a typed memory object, the implementation shall update in the **stat** structure  
 36174 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 36175 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 36176 valid. The implementation may update other fields and flags.

36177 For all other file types defined in this volume of POSIX.1-2024, the structure members *st\_mode*,  
 36178 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
 36179 value of the member *st\_nlink* shall be set to the number of hard links to the file.

36180 The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In  
 36181 that case *lstat()* shall return information about the link, while *stat()* shall return information  
 36182 about the file the link references.

36183 For symbolic links, the *st\_mode* member shall contain meaningful information when used with  
 36184 the file type macros. The file mode bits in *st\_mode* are unspecified. The structure members *st\_ino*,  
 36185 *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the value of  
 36186 the *st\_nlink* member shall be set to the number of hard links to the symbolic link. The value of  
 36187 the *st\_size* member shall be set to the length of the pathname contained in the symbolic link not  
 36188 including any terminating null byte.

36189 The *fstatat()* function shall be equivalent to the *stat()* or *lstat()* function, depending on the value  
 36190 of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status  
 36191 shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead

36192 of the current working directory. If the access mode of the open file description associated with  
 36193 the file descriptor is not O\_SEARCH, the function shall check whether directory searches are  
 36194 permitted using the current permissions of the directory underlying the file descriptor. If the  
 36195 access mode is O\_SEARCH, the function shall not perform the check.

36196 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 36197 in **<fcntl.h>**:

36198 AT\_SYMLINK\_NOFOLLOW

36199 If *path* names a symbolic link, the status of the symbolic link is returned.

36200 If *fstatat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 36201 directory shall be used and the behavior shall be identical to a call to *stat()* or *lstat()* respectively,  
 36202 depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in *flag*.

### 36203 RETURN VALUE

36204 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 36205 return -1 and set *errno* to indicate the error.

### 36206 ERRORS

36207 These functions shall fail if:

36208 [EACCES] Search permission is denied for a component of the path prefix.

36209 [EIO] An error occurred while reading from the file system.

36210 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 36211 argument.

36212 [ENAMETOOLONG]

36213 The length of a component of a pathname is longer than {NAME\_MAX}.

36214 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

36215 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 36216 directory nor a symbolic link to a directory, or the *path* argument contains at  
 36217 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
 36218 characters and the last pathname component names an existing file that is  
 36219 neither a directory nor a symbolic link to a directory.

36220 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
 36221 serial number cannot be represented correctly in the structure pointed to by  
 36222 *buf*.

36223 The *fstatat()* function shall fail if:

36224 [EACCES] The access mode of the open file description associated with *fd* is not  
 36225 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
 36226 directory searches.

36227 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 36228 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

36229 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
 36230 with a non-directory file.

36231 These functions may fail if:

36232 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 36233 resolution of the *path* argument.

- 36234 [ENAMETOOLONG]  
 36235           The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 36236           symbolic link produced an intermediate result with a length that exceeds  
 36237           {PATH\_MAX}.
- 36238 [EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.  
 36239 The *fstatat()* function may fail if:
- 36240 [EINVAL]       The value of the *flag* argument is not valid.

## 36241 EXAMPLES

### 36242 Obtaining File Status Information

36243 The following example shows how to obtain file status information for a file named  
 36244 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
36245 #include <sys/types.h>
36246 #include <sys/stat.h>
36247 #include <fcntl.h>
36248
36249 struct stat buffer;
36249 int      status;
36250 ...
36251 status = stat("/home/cnd/mod1", &buffer);
```

### 36252 Getting Directory Information

36253 The following example fragment gets status information for each entry in a directory. The call to  
 36254 the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines  
 36255 that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the  
 36256 program.

```
36257 #include <sys/types.h>
36258 #include <sys/stat.h>
36259 #include <dirent.h>
36260 #include <pwd.h>
36261 #include <grp.h>
36262 #include <time.h>
36263 #include <locale.h>
36264 #include <langinfo.h>
36265 #include <stdio.h>
36266 #include <stdint.h>
36267
36268 struct dirent *dp;
36268 struct stat  statbuf;
36269 struct passwd *pwd;
36270 struct group  *grp;
36271 struct tm     *tm;
36272 char          datestring[256];
36273 ...
36274 /* Loop through directory entries. */
36275 while ((dp = readdir(dir)) != NULL) {
36276
36276     /* Get entry's information. */
36277     if (stat(dp->d_name, &statbuf) == -1)
```

```

36278         continue;
36279         /* Print out type, permissions, and number of links. */
36280         printf("%10.10s", mode_string(statbuf.st_mode));
36281         printf(" %4ju", (uintmax_t)statbuf.st_nlink);
36282         /* Print out owner's name if it is found using getpwuid(). */
36283         if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
36284             printf(" %-8.8s", pwd->pw_name);
36285         else
36286             printf(" %-8ju", (uintmax_t)statbuf.st_uid);
36287         /* Print out group name if it is found using getgrgid(). */
36288         if ((grp = getgrgid(statbuf.st_gid)) != NULL)
36289             printf(" %-8.8s", grp->gr_name);
36290         else
36291             printf(" %-8ju", (uintmax_t)statbuf.st_gid);
36292         /* Print size of file. */
36293         printf(" %9jd", (intmax_t)statbuf.st_size);
36294         tm = localtime(&statbuf.st_mtime);
36295         /* Get localized date string. */
36296         strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
36297         printf(" %s %s\n", datestring, dp->d_name);
36298     }

```

### 36299 Obtaining Symbolic Link Status Information

36300 The following example shows how to obtain status information for a symbolic link named  
36301 **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path*  
36302 argument specified the pathname for the file pointed to by the symbolic link (**/home/cnd/mod1**),  
36303 the results of calling the function would be the same as those returned by a call to the *stat()*  
36304 function.

```

36305 #include <sys/stat.h>
36306 struct stat buffer;
36307 int status;
36308 ...
36309 status = lstat("/modules/pass1", &buffer);

```

### 36310 APPLICATION USAGE

36311 None.

### 36312 RATIONALE

36313 The intent of the paragraph describing “additional or alternate file access control mechanisms”  
36314 is to allow a secure implementation where a process with a label that does not dominate the  
36315 file’s label cannot perform a *stat()* function. This is not related to read permission; a process with  
36316 a label that dominates the file’s label does not need read permission. An implementation that  
36317 supports write-up operations could fail *fstat()* function calls even though it has a valid file  
36318 descriptor open for writing.

36319 The purpose of the *fstatat()* function is to obtain the status of files in directories other than the  
36320 current working directory without exposure to race conditions. Any part of the path of a file  
36321 could be changed in parallel to a call to *stat()*, resulting in unspecified behavior. By opening a

36322 file descriptor for the target directory and using the *fstatat()* function it can be guaranteed that  
 36323 the file for which status is returned is located relative to the desired directory.

#### 36324 FUTURE DIRECTIONS

36325 None.

#### 36326 SEE ALSO

36327 *access()*, *chmod()*, *fdopendir()*, *fstat()*, *mknod()*, *readlink()*, *symlink()*

36328 XBD Section 4.12 (on page 98), [<fcntl.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#)

#### 36329 CHANGE HISTORY

36330 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 36331 Issue 5

36332 Large File Summit extensions are added.

#### 36333 Issue 6

36334 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

36335 The following new requirements on POSIX implementations derive from alignment with the  
 36336 Single UNIX Specification:

- 36337 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 36338 required for conforming implementations of previous POSIX specifications, it was not  
 36339 required for UNIX applications.
- 36340 • The [EIO] mandatory error condition is added.
- 36341 • The [ELOOP] mandatory error condition is added.
- 36342 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 36343 files.
- 36344 • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are  
 36345 added.

36346 The following changes were made to align with the IEEE P1003.1a draft standard:

- 36347 • Details are added regarding the treatment of symbolic links.
- 36348 • The [ELOOP] optional error condition is added.

36349 The normative text is updated to avoid use of the term “must” for application requirements.

36350 The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999  
 36351 standard.

#### 36352 Issue 7

36353 Austin Group Interpretation 1003.1-2001 #143 is applied.

36354 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
 36355 applies.

36356 The *fstatat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 36357 Set Part 2.

36358 Changes are made related to support for finegrained timestamps.

36359 The *lstat()* function is now required to return meaningful data for symbolic links in all **stat**  
 36360 structure fields, except for the permission bits of *st\_mode*.

36361 Changes are made to allow a directory to be opened for searching.

36362 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
36363 pathname exists but is not a directory or a symbolic link to a directory.

36364 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0198 [461], XSH/TC1-2008/0199 [324],  
36365 XSH/TC1-2008/0200 [278], XSH/TC1-2008/0201 [278], and XSH/TC1-2008/0202 [291] are  
36366 applied.

36367 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0136 [591], XSH/TC2-2008/0137 [817],  
36368 XSH/TC2-2008/0138 [817], and XSH/TC2-2008/0139 [889] are applied.

36369 **Issue 8**

36370 Austin Group Defect 1380 is applied, changing text using the term “link” in line with its  
36371 updated definition.

36372 Austin Group Defect 1409 is applied, changing the EXAMPLES section.

36373 **NAME**

36374 fstatvfs, statvfs — get file system information

36375 **SYNOPSIS**

36376 #include &lt;sys/statvfs.h&gt;

36377 int fstatvfs(int *fildev*, struct statvfs \**buf*);36378 int statvfs(const char \*restrict *path*, struct statvfs \*restrict *buf*);36379 **DESCRIPTION**36380 The *fstatvfs()* function shall obtain information about the file system containing the file  
36381 referenced by *fildev*.36382 The *statvfs()* function shall obtain information about the file system containing the file named by  
36383 *path*.36384 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,  
36385 write, or execute permission of the named file is not required.36386 The following flags can be returned in the *f\_flag* member:

36387 ST\_RDONLY Read-only file system.

36388 ST\_NOSUID Setuid/setgid bits ignored by *exec*.36389 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file  
36390 systems.36391 **RETURN VALUE**36392 Upon successful completion, *statvfs()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
36393 indicate the error.36394 **ERRORS**36395 The *fstatvfs()* and *statvfs()* functions shall fail if:

36396 [EIO] An I/O error occurred while reading the file system.

36397 [EINTR] A signal was caught during execution of the function.

36398 [EOVERFLOW] One of the values to be returned cannot be represented correctly in the  
36399 structure pointed to by *buf*.36400 The *fstatvfs()* function shall fail if:36401 [EBADF] The *fildev* argument is not an open file descriptor.36402 The *statvfs()* function shall fail if:

36403 [EACCES] Search permission is denied on a component of the path prefix.

36404 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
36405 argument.

36406 [ENAMETOOLONG]

36407 The length of a component of a pathname is longer than {NAME\_MAX}.

36408 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.36409 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
36410 directory nor a symbolic link to a directory, or the *path* argument contains at  
36411 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
36412 characters and the last pathname component names an existing file that is  
36413 neither a directory nor a symbolic link to a directory.

36414 The *statvfs()* function may fail if:

36415 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
36416 resolution of the *path* argument.

36417 [ENAMETOOLONG]  
36418 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
36419 symbolic link produced an intermediate result with a length that exceeds  
36420 {PATH\_MAX}.

## 36421 EXAMPLES

### 36422 Obtaining File System Information Using *fstatvfs()*

36423 The following example shows how to obtain file system information for the file system upon  
36424 which the file named */home/cnd/mod1* resides, using the *fstatvfs()* function. The  
36425 */home/cnd/mod1* file is opened with read/write privileges and the open file descriptor is passed  
36426 to the *fstatvfs()* function.

```
36427 #include <sys/statvfs.h>
36428 #include <fcntl.h>

36429 struct statvfs buffer;
36430 int status;
36431 ...
36432 fildes = open("/home/cnd/mod1", O_RDWR);
36433 status = fstatvfs(fildes, &buffer);
```

### 36434 Obtaining File System Information Using *statvfs()*

36435 The following example shows how to obtain file system information for the file system upon  
36436 which the file named */home/cnd/mod1* resides, using the *statvfs()* function.

```
36437 #include <sys/statvfs.h>

36438 struct statvfs buffer;
36439 int status;
36440 ...
36441 status = statvfs("/home/cnd/mod1", &buffer);
```

## 36442 APPLICATION USAGE

36443 None.

## 36444 RATIONALE

36445 None.

## 36446 FUTURE DIRECTIONS

36447 None.

## 36448 SEE ALSO

36449 *chmod()*, *chown()*, *creat()*, *dup()*, *exec*, *fcntl()*, *futimens()*, *link()*, *mknod()*, *open()*, *pipe()*, *read()*,

36451 XBD [<sys/statvfs.h>](#)

36452 **CHANGE HISTORY**

36453 First released in Issue 4, Version 2.

36454 **Issue 5**

36455 Moved from X/OPEN UNIX extension to BASE.

36456 Large File Summit extensions are added.

36457 **Issue 6**

36458 The normative text is updated to avoid use of the term “must” for application requirements.

36459 The **restrict** keyword is added to the *statvfs()* prototype for alignment with the  
36460 ISO/IEC 9899:1999 standard.

36461 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
36462 [ELOOP] error condition is added.

36463 **Issue 7**

36464 Austin Group Interpretation 1003.1-2001 #143 is applied.

36465 SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

36466 The *fstatvfs()* and *statvfs()* functions are moved from the XSI option to the Base.

36467 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
36468 pathname exists but is not a directory or a symbolic link to a directory.

36469 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0203 [324] is applied.

36470 **NAME**

36471 fsync — synchronize changes to a file

36472 **SYNOPSIS**

```
36473 #include <unistd.h>
36474 int fsync(int fildev);
```

36475 **DESCRIPTION**

36476 The *fsync()* function shall request that all data for the open file descriptor named by *fildev* is to be  
 36477 transferred to the storage device associated with the file described by *fildev*. The nature of the  
 36478 transfer is implementation-defined. The *fsync()* function shall not return until the system has  
 36479 completed that action or until an error is detected.

36480 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued  
 36481 I/O operations associated with the file indicated by file descriptor *fildev* to the synchronized I/O  
 36482 completion state. All I/O operations shall be completed as defined for synchronized I/O file  
 36483 integrity completion.

36484 **RETURN VALUE**

36485 Upon successful completion, *fsync()* shall return 0. Otherwise, `-1` shall be returned and *errno* set  
 36486 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed  
 36487 to have been completed.

36488 **ERRORS**36489 The *fsync()* function shall fail if:

- 36490 [EBADF] The *fildev* argument is not a valid descriptor.
- 36491 [EINTR] The *fsync()* function was interrupted by a signal.
- 36492 [EINVAL] The *fildev* argument does not refer to a file on which this operation is possible.
- 36493 [EIO] An I/O error occurred while reading from or writing to the file system.

36494 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions  
 36495 defined for *read()* and *write()*.

36496 **EXAMPLES**

36497 None.

36498 **APPLICATION USAGE**

36499 The *fsync()* function should be used by programs which require modifications to a file to be  
 36500 completed before continuing; for example, a program which contains a simple transaction  
 36501 facility might use it to ensure that all modifications to a file or files caused by a transaction are  
 36502 recorded.

36503 An application that modifies a directory, for example, by creating a file in the directory, can  
 36504 invoke *fsync()* on the directory to ensure that the directory's entries and file attributes are  
 36505 synchronized. For most applications, synchronizing the directory's entries should not be  
 36506 necessary (see XBD [Section 4.11](#), on page 98).

36507 **RATIONALE**

36508 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to  
 36509 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is  
 36510 recorded on the disk. Since the concepts of "buffer cache", "system crash", "physical write", and  
 36511 "non-volatile storage" are not defined here, the wording has to be more abstract.

36512 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance

36513 document to tell the user what can be expected from the system. It is explicitly intended that a  
36514 null implementation is permitted. This could be valid in the case where the system cannot assure  
36515 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the  
36516 functionality is not required. In the middle ground between these extremes, *fsync()* might or  
36517 might not actually cause data to be written where it is safe from a power failure. The  
36518 conformance document should identify at least that one configuration exists (and how to obtain  
36519 that configuration) where this can be assured for at least some files that the user can select to use  
36520 for critical data. It is not intended that an exhaustive list is required, but rather sufficient  
36521 information is provided so that if critical data needs to be saved, the user can determine how the  
36522 system is to be configured to allow the data to be written to non-volatile storage.

36523 It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite.  
36524 That does not make the function any less valuable, just more difficult to test. A formal  
36525 conformance test should probably force a system crash (power shutdown) during the test for  
36526 this condition, but it needs to be done in such a way that automated testing does not require this  
36527 to be done except when a formal record of the results is being made. It would also not be  
36528 unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation  
36529 issue.

#### 36530 **FUTURE DIRECTIONS**

36531 None.

#### 36532 **SEE ALSO**

36533 [\*sync\(\)\*](#)

36534 XBD <[unistd.h](#)>

#### 36535 **CHANGE HISTORY**

36536 First released in Issue 3.

#### 36537 **Issue 5**

36538 Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and  
36539 RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate  
36540 that *fsync()* can return the error conditions defined for *read()* and *write()*.

#### 36541 **Issue 6**

36542 This function is marked as part of the File Synchronization option.

36543 The following new requirements on POSIX implementations derive from alignment with the  
36544 Single UNIX Specification:

- 36545 • The [EINVAL] and [EIO] mandatory error conditions are added.

36546 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial  
36547 rewording of the DESCRIPTION. No change in meaning is intended.

#### 36548 **Issue 8**

36549 Austin Group Defect 672 is applied, changing the APPLICATION USAGE section.

36550 **NAME**

36551 ftell, ftello — return a file offset in a stream

36552 **SYNOPSIS**

```
36553 #include <stdio.h>
36554 long ftell(FILE *stream);
36555 CX off_t ftello(FILE *stream);
```

36556 **DESCRIPTION**

36557 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 36558 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36559 volume of POSIX.1-2024 defers to the ISO C standard.

36560 The *ftell()* function shall obtain the current value of the file-position indicator for the stream  
 36561 pointed to by *stream*.

36562 The *ftell()* function shall not change the setting of *errno* if successful.

36563 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type **off\_t** and  
 36564 the *ftello()* function may change the setting of *errno* if successful.

36565 **RETURN VALUE**

36566 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position  
 36567 CX indicator for the stream measured in bytes from the beginning of the file, except in the case of  
 36568 streams opened with *open\_wmemstream()* for which the position shall be measured in wide  
 36569 characters.

36570 Otherwise, *ftell()* and *ftello()* shall return  $-1$ , and set *errno* to indicate the error.

36571 **ERRORS**

36572 CX The *ftell()* and *ftello()* functions shall fail if:

36573 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

36574 CX [EOVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of  
 36575 type **long**.

36576 CX [EOVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object  
 36577 of type **off\_t**.

36578 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

36579 **EXAMPLES**

36580 None.

36581 **APPLICATION USAGE**

36582 None.

36583 **RATIONALE**

36584 For all streams other than those opened by *open\_wmemstream()*, *ftell()* and *fseek()* operate on  
 36585 byte offsets. The behavior with *open\_wmemstream()* streams is intentionally different—*ftell()* and  
 36586 *fseek()* operate on wide character offsets. This is because those streams are unique in that the  
 36587 backing storage is not a multibyte representation but a wide character array, and it is useful to be  
 36588 able to use the output of *ftell()* to index into that array.

**36589 FUTURE DIRECTIONS**

36590 None.

**36591 SEE ALSO**

36592 [Section 2.5](#) (on page 521), [fgetpos\(\)](#), [fopen\(\)](#), [fseek\(\)](#), [lseek\(\)](#), [open\\_memstream\(\)](#)

36593 XBD [<stdio.h>](#)

**36594 CHANGE HISTORY**

36595 First released in Issue 1. Derived from Issue 1 of the SVID.

**36596 Issue 5**

36597 Large File Summit extensions are added.

**36598 Issue 6**

36599 Extensions beyond the ISO C standard are marked.

36600 The following new requirements on POSIX implementations derive from alignment with the  
36601 Single UNIX Specification:

- 36602 • The *ftello()* function is added.
- 36603 • The [Eoverflow] error conditions are added.

36604 An additional [ESPIPE] error condition is added for sockets.

**36605 Issue 7**

36606 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0204 [105], XSH/TC1-2008/0205 [421],  
36607 XSH/TC1-2008/0206 [122], XSH/TC1-2008/0207 [122], and XSH/TC1-2008/0208 [14] are  
36608 applied.

**36609 Issue 8**

36610 Austin Group Defect 1027 is applied, specifying that for streams opened with  
36611 *open\_wmemstream()* the position is measured in wide characters, not bytes.

36612 **NAME**

36613 ftok — generate an IPC key

36614 **SYNOPSIS**

```
36615 XSI #include <sys/ipc.h>
36616 key_t ftok(const char *path, int id);
```

36617 **DESCRIPTION**

36618 The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to  
 36619 *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the  
 36620 pathname of an existing file that the process is able to *stat()*, with the exception that if *stat()*  
 36621 would fail with [EOVERFLOW] due to file size, *ftok()* shall still succeed.

36622 The *ftok()* function shall return the same key value for all paths that name the same file, when  
 36623 called with the same *id* value, and should return different key values when called with different  
 36624 *id* values or with paths that name different files existing on the same file system at the same  
 36625 time. It is unspecified whether *ftok()* shall return the same key value when called again after the  
 36626 file named by *path* is removed and recreated with the same name.

36627 Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits  
 36628 are 0.

36629 **RETURN VALUE**

36630 Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return (**key\_t**)-1  
 36631 and set *errno* to indicate the error.

36632 **ERRORS**

36633 The *ftok()* function shall fail if:

- |       |                |   |
|-------|----------------|---|
| 36634 | [EACCES]       | Search permission is denied for a component of the path prefix.   |
| 36635 | [EIO]          | An error occurred while reading from the file system.   |
| 36636 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i><br>36637 argument.   |
| 36638 | [ENAMETOOLONG] | 36639 The length of a component of a pathname is longer than {NAME_MAX}.  |
| 36640 | [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.  |
| 36641 | [ENOTDIR]      | A component of the path prefix names an existing file that is neither a<br>36642 directory nor a symbolic link to a directory, or the <i>path</i> argument contains at<br>36643 least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i><br>36644 characters and the last pathname component names an existing file that is<br>36645 neither a directory nor a symbolic link to a directory. |

36646 The *ftok()* function may fail if:

- |       |                |   |
|-------|----------------|---|
| 36647 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during<br>36648 resolution of the <i>path</i> argument.   |
| 36649 | [ENAMETOOLONG] | 36650 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a<br>36651 symbolic link produced an intermediate result with a length that exceeds<br>36652 {PATH_MAX}. |

36653 **EXAMPLES**36654 **Getting an IPC Key**

36655 The following example gets a key based on the pathname `/tmp` and the ID value `a`. It also  
 36656 assigns the value of the resulting key to the `semkey` variable so that it will be available to a later  
 36657 call to `semget()`, `msgget()`, or `shmget()`.

```
36658 #include <sys/ipc.h>
36659 ...
36660 key_t semkey;
36661 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
36662     perror("IPC error: ftok"); exit(1);
36663 }
```

36664 **APPLICATION USAGE**

36665 For maximum portability, `id` should be a single-byte character.

36666 Applications should not assume that the resulting key value is unique.

36667 **RATIONALE**

36668 None.

36669 **FUTURE DIRECTIONS**

36670 Future versions of this standard may add new interfaces to provide unique keys.

36671 **SEE ALSO**

36672 [\*msgget\(\)\*](#), [\*semget\(\)\*](#), [\*shmget\(\)\*](#)

36673 XBD [\*<sys/ipc.h>\*](#)

36674 **CHANGE HISTORY**

36675 First released in Issue 4, Version 2.

36676 **Issue 5**

36677 Moved from X/OPEN UNIX extension to BASE.

36678 **Issue 6**

36679 The normative text is updated to avoid use of the term “must” for application requirements.

36680 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 36681 [ELOOP] error condition is added.

36682 **Issue 7**

36683 Austin Group Interpretation 1003.1-2001 #143 is applied.

36684 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 36685 pathname exists but is not a directory or a symbolic link to a directory.

36686 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0209 [343], XSH/TC1-2008/0210 [366],  
 36687 XSH/TC1-2008/0211 [343], XSH/TC1-2008/0212 [324], XSH/TC1-2008/0213 [366],  
 36688 XSH/TC1-2008/0214 [366], XSH/TC1-2008/0215 [366], and XSH/TC1-2008/0216 [366] are  
 36689 applied.

36690 **NAME**

36691 ftruncate — truncate a file to a specified length

36692 **SYNOPSIS**

36693 #include &lt;unistd.h&gt;

36694 int ftruncate(int *fildev*, off\_t *length*);36695 **DESCRIPTION**36696 If *fildev* is not a valid file descriptor open for writing, the *ftruncate()* function shall fail.

36697 If *fildev* refers to a regular file, the *ftruncate()* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate()* shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate()*.

36703 Upon successful completion, if *fildev* refers to a regular file, *ftruncate()* shall mark for update the last data modification and last file status change timestamps of the file and the S\_ISUID and S\_ISGID bits of the file mode may be cleared. If the *ftruncate()* function is unsuccessful, the file is unaffected.

36707 If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate a SIGXFSZ signal for the thread.

36709 If *fildev* is a file descriptor open for writing and refers to a file that is neither a regular file nor a shared memory object, the result is unspecified.

36711 SHM If *fildev* refers to a shared memory object, *ftruncate()* shall set the size of the shared memory object to *length*.

36713 SHM If the effect of *ftruncate()* is to decrease the size of a memory mapped file or a shared memory object and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

36716 References to discarded pages shall result in the generation of a SIGBUS signal.

36717 If the effect of *ftruncate()* is to increase the size of a memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

36720 **RETURN VALUE**

36721 Upon successful completion, *ftruncate()* shall return 0; otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

36723 **ERRORS**

36724 The *ftruncate()* function shall fail if:

36725 [EBADF] or [EINVAL]

36726 The *fildev* argument is not a file descriptor open for writing.

36727 [EFBIG] or [EINVAL]

36728 The *length* argument is greater than the maximum file size.

36729 XSI [EFBIG] The *length* argument exceeds the file size limit of the process. A SIGXFSZ signal shall also be generated for the thread.

36731 [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildev*.

36733	[EINTR]	A signal was caught during execution.
36734	[EINVAL]	The <i>length</i> argument is less than 0 or the <i>files</i> argument refers to a file on which this operation is not possible (for example, a pipe, FIFO or socket).
36735		
36736	[EIO]	An I/O error occurred while reading from or writing to a file system.

36748	<b>CHANGE HISTORY</b>	
36749	First released in Issue 4, Version 2.	
36750	<b>Issue 5</b>	
36751	Moved from X/OPEN UNIX extension to BASE and aligned with <i>ftruncate()</i> in the POSIX	
36752	Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is	
36753	added to the list of mandatory errors that can be returned by <i>ftruncate()</i> .	
36754	Large File Summit extensions are added.	
36755	<b>Issue 6</b>	
36756	The <i>truncate()</i> function is split out into a separate reference page.	
36757	The following new requirements on POSIX implementations derive from alignment with the	
36758	Single UNIX Specification:	
36759	• The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a	
36760	regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.	
36761	The following changes were made to align with the IEEE P1003.1a draft standard:	
36762	• The DESCRIPTION text is updated.	
36763	XSI-conformant systems are required to increase the size of the file if the file was previously	
36764	smaller than the size requested.	
36765	<b>Issue 7</b>	
36766	Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although	
36767	the [EINVAL] “may fail” error was subsequently removed during review of the XSI option).	
36768	Functionality relating to the Memory Protection and Memory Mapped Files options is moved to	
36769	the Base.	
36770	The DESCRIPTION is updated so that a call to <i>ftruncate()</i> when the file is smaller than the size	
36771	requested will increase the size of the file. Previously, non-XSI-conforming implementations	
36772	were allowed to increase the size of the file or fail.	
36773	Changes are made related to support for finegrained timestamps.	

36774 **Issue 8**

36775 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

36776 Austin Group Defect 1169 is applied, removing a redundant statement that *ftruncate()* fails if  
36777 *files* refers to a directory.

36778 Austin Group Defect 1381 is applied, adding a second condition to the [EINVAL] error and  
36779 rearranging the ERRORS section into alphabetical order.

36780 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
36781 relating to the file size limit for the process.

36782 **NAME**

36783 ftrylockfile — stdio locking functions

36784 **SYNOPSIS**

```
36785 CX #include <stdio.h>  
36786 int ftrylockfile(FILE *file);
```

36787 **DESCRIPTION**36788 Refer to *flockfile()*.

36789 **NAME**

36790 funlockfile — stdio locking functions

36791 **SYNOPSIS**

```
36792 CX #include <stdio.h>  
36793 void funlockfile(FILE *file);
```

36794 **DESCRIPTION**

36795 Refer to *flockfile()*.

36796 **NAME**

36797 futimens, utimensat, utimes — set file access and modification times

36798 **SYNOPSIS**

36799 #include &lt;sys/stat.h&gt;

36800 int futimens(int *fd*, const struct timespec *times*[2]);

36801 OH #include &lt;fcntl.h&gt;

36802 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2],  
36803 int *flag*);

36804 XSI #include &lt;sys/time.h&gt;

36805 int utimes(const char \**path*, const struct timeval *times*[2]);36806 **DESCRIPTION**

36807 The *futimens()* and *utimensat()* functions shall set the access and modification times of a file to  
 36808 the values of the *times* argument. The *futimens()* function changes the times of the file associated  
 36809 with the file descriptor *fd*. The *utimensat()* function changes the times of the file pointed to by  
 36810 the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions  
 36811 allow time specifications accurate to the nanosecond.

36812 For *futimens()* and *utimensat()*, the *times* argument is an array of two **timespec** structures. The  
 36813 first array member represents the date and time of last access, and the second member  
 36814 represents the date and time of last modification. The times in the **timespec** structure are  
 36815 measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set  
 36816 to the greatest value supported by the file system that is not greater than the specified time.

36817 If the *tv\_nsec* field of a **timespec** structure has the special value **UTIME\_NOW**, the file's relevant  
 36818 timestamp shall be set to the greatest value supported by the file system that is not greater than  
 36819 the current time. If the *tv\_nsec* field has the special value **UTIME\_OMIT**, the file's relevant  
 36820 timestamp shall not be changed. In either case, the *tv\_sec* field shall be ignored.

36821 If the *times* argument is a null pointer, both the access and modification timestamps shall be set  
 36822 to the greatest value supported by the file system that is not greater than the current time. If  
 36823 *utimensat()* is passed a relative path in the *path* argument, the file to be used shall be relative to  
 36824 the directory associated with the file descriptor *fd* instead of the current working directory. If the  
 36825 access mode of the open file description associated with the file descriptor is not **O\_SEARCH**,  
 36826 the function shall check whether directory searches are permitted using the current permissions  
 36827 of the directory underlying the file descriptor. If the access mode is **O\_SEARCH**, the function  
 36828 shall not perform the check.

36829 If *utimensat()* is passed the special value **AT\_FDCWD** in the *fd* parameter, the current working  
 36830 directory shall be used.

36831 Only a process with the effective user ID equal to the user ID of the file, or with write access to  
 36832 the file, or with appropriate privileges may use *futimens()* or *utimensat()* with a null pointer as  
 36833 the *times* argument or with both *tv\_nsec* fields set to the special value **UTIME\_NOW**. Only a  
 36834 process with the effective user ID equal to the user ID of the file or with appropriate privileges  
 36835 may use *futimens()* or *utimensat()* with a non-null *times* argument that does not have both  
 36836 *tv\_nsec* fields set to **UTIME\_NOW** and does not have both *tv\_nsec* fields set to **UTIME\_OMIT**. If  
 36837 both *tv\_nsec* fields are set to **UTIME\_OMIT**, no ownership or permissions check shall be  
 36838 performed for the file, but other error conditions may still be detected (including **[EACCES]**  
 36839 errors related to the path prefix).

36840 Values for the *flag* argument of *utimensat()* are constructed by a bitwise-inclusive OR of flags

36841 from the following list, defined in `<fcntl.h>`:

36842 `AT_SYMLINK_NOFOLLOW`

36843 If *path* names a symbolic link, then the access and modification times of the symbolic link  
36844 are changed.

36845 Upon successful completion, *futimens()* and *utimensat()* shall mark the last file status change  
36846 timestamp for update, with the exception that if both *tv\_nsec* fields are set to `UTIME_OMIT`, the  
36847 file status change timestamp need not be marked for update.

36848 The *utimes()* function shall be equivalent to the *utimensat()* function with the special value  
36849 `AT_FDCWD` as the *fd* argument and the *flag* argument set to zero, except that the *times* argument  
36850 is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond,  
36851 not nanosecond, and rounding towards the nearest second may occur.

#### 36852 RETURN VALUE

36853 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
36854 return `-1` and set *errno* to indicate the error. If `-1` is returned, the file times shall not be affected.

#### 36855 ERRORS

36856 The *utimes()* function shall fail, the *futimens()* and *utimensat()* functions shall fail in the case that  
36857 the *times* argument does not have both *tv\_nsec* fields set to `UTIME_OMIT`, and the *futimens()* and  
36858 *utimensat()* functions may fail in the case that the *times* argument has both *tv\_nsec* fields set to  
36859 `UTIME_OMIT`, if:

36860 [EACCES] The *times* argument is a null pointer, or both *tv\_nsec* values are `UTIME_NOW`,  
36861 and the effective user ID of the process does not match the owner of the file  
36862 and write access is denied.

36863 [EINVAL] Either of the *times* argument structures specified a *tv\_nsec* value that was  
36864 neither `UTIME_NOW` nor `UTIME_OMIT`, and was a value less than zero or  
36865 greater than or equal to 1 000 million.

36866 [EINVAL] A new file timestamp would be a value whose *tv\_sec* component is not a value  
36867 supported by the file system.

36868 [EPERM] The *times* argument is not a null pointer, does not have both *tv\_nsec* fields set  
36869 to `UTIME_NOW`, does not have both *tv\_nsec* fields set to `UTIME_OMIT`, the  
36870 calling process' effective user ID does not match the owner of the file, and the  
36871 calling process does not have appropriate privileges.

36872 [EROFS] The file system containing the file is read-only.

36873 The *futimens()* function shall fail in the case that the *times* argument does not have both *tv\_nsec*  
36874 fields set to `UTIME_OMIT`, and may fail in the case that the *times* argument has both *tv\_nsec*  
36875 fields set to `UTIME_OMIT`, if:

36876 [EBADF] The *fd* argument is not a valid file descriptor.

36877 The *utimensat()* function shall fail in the case that the *times* argument does not have both *tv\_nsec*  
36878 fields set to `UTIME_OMIT`, and may fail in the case that the *times* argument has both *tv\_nsec*  
36879 fields set to `UTIME_OMIT`, if:

36880 [EACCES] The access mode of the open file description associated with *fd* is not  
36881 `O_SEARCH` and the permissions of the directory underlying *fd* do not permit  
36882 directory searches.

- 36883 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
36884 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.
- 36885 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
36886 with a non-directory file.
- 36887 The *utimes()* function shall fail, the *utimensat()* function shall fail in the case that the *times*  
36888 argument does not have both *tv\_nsec* fields set to *UTIME\_OMIT*, and the *utimensat()* function  
36889 may fail in the case that the *times* argument has both *tv\_nsec* fields set to *UTIME\_OMIT*, if:
- 36890 [EACCES] Search permission is denied by a component of the path prefix.
- 36891 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
36892 argument.
- 36893 [ENAMETOOLONG]  
36894 The length of a component of a pathname is longer than {*NAME\_MAX*}.
- 36895 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 36896 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
36897 directory nor a symbolic link to a directory, or the *path* argument contains at  
36898 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
36899 characters and the last pathname component names an existing file that is  
36900 neither a directory nor a symbolic link to a directory.
- 36901 The *utimensat()* and *utimes()* functions may fail if:
- 36902 [ELOOP] More than {*SYMLOOP\_MAX*} symbolic links were encountered during  
36903 resolution of the *path* argument.
- 36904 [ENAMETOOLONG]  
36905 The length of a pathname exceeds {*PATH\_MAX*}, or pathname resolution of a  
36906 symbolic link produced an intermediate result with a length that exceeds  
36907 {*PATH\_MAX*}.
- 36908 The *utimensat()* function may fail if:
- 36909 [EINVAL] The value of the *flag* argument is not valid.

**36910 EXAMPLES**

36911 None.

**36912 APPLICATION USAGE**

36913 None.

**36914 RATIONALE**

36915 The purpose of the *utimensat()* function is to set the access and modification time of files in  
36916 directories other than the current working directory without exposure to race conditions. Any  
36917 part of the path of a file could be changed in parallel to a call to *utimes()*, resulting in unspecified  
36918 behavior. By opening a file descriptor for the target directory and using the *utimensat()* function  
36919 it can be guaranteed that the changed file is located relative to the desired directory.

36920 The standard developers considered including a special case for the permissions required by  
36921 *utimensat()* when one *tv\_nsec* field is *UTIME\_NOW* and the other is *UTIME\_OMIT*. One  
36922 possibility would be to include this case in with the cases where *times* is a null pointer or both  
36923 fields are *UTIME\_NOW*, where the call is allowed if the process has write permission for the file.  
36924 However, associating write permission with an update to just the last data access timestamp  
36925 (which is normally updated by *read()*) did not seem appropriate. The other possibility would be  
36926 to specify that this one case is allowed if the process has read permission, but this was felt to be

36927 too great a departure from the *utime()* and *utimes()* functions on which *utimensat()* is based. If  
36928 an application needs to set the last data access timestamp to the current time for a file on which  
36929 it has read permission but is not the owner, it can do so by opening the file, reading one or more  
36930 bytes (or reading a directory entry, if the file is a directory), and then closing it.

#### 36931 FUTURE DIRECTIONS

36932 None.

#### 36933 SEE ALSO

36934 *read()*

36935 XBD [<fcntl.h>](#), [<sys/stat.h>](#), [<sys/time.h>](#)

#### 36936 CHANGE HISTORY

36937 First released in Issue 4, Version 2.

#### 36938 Issue 5

36939 Moved from X/OPEN UNIX extension to BASE.

#### 36940 Issue 6

36941 This function is marked LEGACY.

36942 The normative text is updated to avoid use of the term “must” for application requirements.

36943 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
36944 [ELOOP] error condition is added.

#### 36945 Issue 7

36946 Austin Group Interpretation 1003.1-2001 #143 is applied.

36947 The LEGACY marking is removed.

36948 The *utimensat()* function (renamed from *futimesat()*) is added from The Open Group Technical  
36949 Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by  
36950 adding a *flag* argument.

36951 The *futimens()* function is added.

36952 Changes are made related to support for finegrained timestamps.

36953 Changes are made to allow a directory to be opened for searching.

36954 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
36955 pathname exists but is not a directory or a symbolic link to a directory.

36956 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0220 [63,428], XSH/TC1-2008/0221  
36957 [278], XSH/TC1-2008/0222 [324], XSH/TC1-2008/0223 [306], and XSH/TC1-2008/0224 [278] are  
36958 applied.

36959 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0140 [591], XSH/TC2-2008/0141 [817],  
36960 XSH/TC2-2008/0142 [485], and XSH/TC2-2008/0143 [817] are applied.

#### 36961 Issue 8

36962 Austin Group Defect 1280 is applied, changing the ERRORS section.

36963 **NAME**

36964 fwide — set stream orientation

36965 **SYNOPSIS**

36966 #include &lt;stdio.h&gt;

36967 #include &lt;wchar.h&gt;

36968 int fwide(FILE \**stream*, int *mode*);36969 **DESCRIPTION**

36970 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
36971 conflict between the requirements described here and the ISO C standard is unintentional. This  
36972 volume of POSIX.1-2024 defers to the ISO C standard.

36973 The *fwide()* function shall determine the orientation of the stream pointed to by *stream*. If *mode* is  
36974 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less  
36975 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero  
36976 and the function does not alter the orientation of the stream.

36977 If the orientation of the stream has already been determined, *fwide()* shall not change it.

36978 CX The *fwide()* function shall not change the setting of *errno* if successful.

36979 Since no return value is reserved to indicate an error, an application wishing to check for error  
36980 situations should set *errno* to 0, then call *fwide()*, then check *errno*, and if it is non-zero, assume  
36981 an error has occurred.

36982 **RETURN VALUE**

36983 The *fwide()* function shall return a value greater than zero if, after the call, the stream has wide-  
36984 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no  
36985 orientation.

36986 **ERRORS**

36987 The *fwide()* function may fail if:

36988 CX [EBADF] The *stream* argument is not a valid stream.

36989 **EXAMPLES**

36990 None.

36991 **APPLICATION USAGE**

36992 A call to *fwide()* with *mode* set to zero can be used to determine the current orientation of a  
36993 stream.

36994 **RATIONALE**

36995 None.

36996 **FUTURE DIRECTIONS**

36997 None.

36998 **SEE ALSO**

36999 XBD <stdio.h>, <wchar.h>

37000 **CHANGE HISTORY**

37001 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
37002 (E).

37003 **Issue 6**

37004 Extensions beyond the ISO C standard are marked.

37005 **Issue 7**

37006 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0225 [272] is applied.

37007 **NAME**37008 `fwprintf`, `swprintf`, `wprintf` — print formatted wide-character output37009 **SYNOPSIS**

```

37010 #include <stdio.h>
37011 #include <wchar.h>
37012 int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
37013 int swprintf(wchar_t *restrict ws, size_t n,
37014             const wchar_t *restrict format, ...);
37015 int wprintf(const wchar_t *restrict format, ...);

```

37016 **DESCRIPTION**

37017 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 37018 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37019 volume of POSIX.1-2024 defers to the ISO C standard.

37020 The `fwprintf()` function shall place output on the named output *stream*. The `wprintf()` function  
 37021 shall place output on the standard output stream *stdout*. The `swprintf()` function shall place  
 37022 output followed by the null wide character in consecutive wide characters starting at *\*ws*; no  
 37023 more than *n* wide characters shall be written, including a terminating null wide character, which  
 37024 is always added (unless *n* is zero).

37025 Each of these functions shall convert, format, and print its arguments under control of the *format*  
 37026 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*,  
 37027 which are simply copied to the output stream, and *conversion specifications*, each of which results  
 37028 in the fetching of zero or more arguments. The results are undefined if there are insufficient  
 37029 arguments for the *format*. If the *format* is exhausted while arguments remain, the excess  
 37030 arguments are evaluated but are otherwise ignored.

37031 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 37032 to the next unused argument. In this case, the conversion specifier wide character `%` (see below)  
 37033 is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range  
 37034 `[1,{NL_ARGMAX}]`, giving the position of the argument in the argument list. This feature  
 37035 provides for the definition of *format* wide-character strings that select arguments in an order  
 37036 appropriate to specific languages (see the EXAMPLES section).

37037 The *format* can contain either numbered argument conversion specifications (that is, those  
 37038 introduced by `"%n$"` and optionally containing the `"*m$"` forms of field width and precision),  
 37039 or unnumbered argument conversion specifications (that is, those introduced by the `%` character  
 37040 and optionally containing the `*` form of field width and precision), but not both. The only  
 37041 exception to this is that `%%` can be mixed with the `"%n$"` form. The results of mixing numbered  
 37042 and unnumbered argument specifications in a *format* wide-character string are undefined. When  
 37043 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 37044 leading arguments, from the first to the (*N*−1)th, are specified in the *format* wide-character string.

37045 In *format* wide-character strings containing the `"%n$"` form of conversion specification,  
 37046 numbered arguments in the argument list can be referenced from the *format* wide-character  
 37047 string as many times as required.

37048 In *format* wide-character strings containing the `%` form of conversion specification, each  
 37049 argument in the argument list shall be used exactly once. It is unspecified whether an encoding  
 37050 error occurs if the format string contains `wchar_t` values that do not correspond to members of  
 37051 the character set of the current locale and the specified semantics do not require that value to be  
 37052 processed by `wcrtomb()`.

37053 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character  
 37054 in the output string, output as a wide-character value. The radix character is defined in the  
 37055 current locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix  
 37056 character is not defined, the radix character shall default to a <period> ('.').

37057 CX Each conversion specification is introduced by the '%' wide character or by the wide-character  
 37058 sequence "%n\$", after which the following appear in sequence:

- 37059 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
 37060 specification.

- 37061 • An optional minimum *field width*. If the converted value has fewer wide characters than  
 37062 the field width, it shall be padded with <space> characters by default on the left; it shall be  
 37063 padded on the right, if the left-adjustment flag ('-'), described below, is given to the field  
 37064 CX width. The field width takes the form of an <asterisk> ('\*'), or in conversion  
 37065 specifications introduced by "%n\$" the "\*m\$" string, described below, or a decimal  
 37066 integer.

- 37067 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,  
 37068 x, and X conversion specifiers; the number of digits to appear after the radix character for  
 37069 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for  
 37070 the g and G conversion specifiers; or the maximum number of wide characters to be  
 37071 printed from a string in the s conversion specifiers. The precision takes the form of a  
 37072 CX <period> ('.') followed either by an <asterisk> ('\*'), or in conversion specifications  
 37073 introduced by "%n\$" the "\*m\$" string, described below, or an optional decimal digit  
 37074 string, where a null digit string is treated as 0. If a precision appears with any other  
 37075 conversion wide character, the behavior is undefined.

- 37076 • An optional length modifier that specifies the size of the argument.

- 37077 • A *conversion specifier* wide character that indicates the type of conversion to be applied.

37078 A field width, or precision, or both, may be indicated by an <asterisk> ('\*'). In this case an  
 37079 argument of type **int** supplies the field width or precision. Applications shall ensure that  
 37080 arguments specifying field width, or precision, or both appear in that order before the argument,  
 37081 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field  
 37082 CX width. A negative precision is taken as if the precision were omitted. In *format* wide-character  
 37083 strings containing conversion specifications introduced by "%n\$", in addition to being indicated  
 37084 by the decimal digit string, a field width may be indicated by the sequence "\*m\$" and precision  
 37085 by the sequence ".\*m\$", where *m* is a decimal integer in the range [1,{NL\_ARGMAX}] giving  
 37086 the position in the argument list (after the *format* argument) of an integer argument containing  
 37087 the field width or precision, for example:

```
37088 wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

37089 The flag wide characters and their meanings are:

- 37090 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,  
 37091 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping wide characters. For  
 37092 other conversions, the behavior is undefined. The numeric grouping wide character is  
 37093 used.

- 37094 - The result of the conversion shall be left-justified within the field. The conversion shall  
 37095 be right-justified if this flag is not specified.

- 37096 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The  
 37097 conversion shall begin with a sign only when a negative value is converted if this flag is  
 37098 not specified.

- 37099 <space> If the first wide character of a signed conversion is not a sign, or if a signed conversion  
 37100 results in no wide characters, a <space> shall be prefixed to the result. This means that  
 37101 if the <space> and '+' flags both appear, the <space> flag shall be ignored.
- 37102 # Specifies that the value is to be converted to an alternative form. For o conversion, it  
 37103 shall increase the precision, if and only if necessary, to force the first digit of the result  
 37104 to be zero (if the value and precision are both 0, a single 0 is printed). For x or X  
 37105 conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,  
 37106 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,  
 37107 even if no digits follow it. Without this flag, a radix character appears in the result of  
 37108 these conversions only if a digit follows it. For g and G conversion specifiers, trailing  
 37109 zeros shall *not* be removed from the result as they normally are. For other conversion  
 37110 specifiers, the behavior is undefined.
- 37111 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros  
 37112 (following any indication of sign or base) are used to pad to the field width rather than  
 37113 performing space padding, except when converting an infinity or NaN. If the '0' and  
 37114 '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion  
 37115 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and  
 37116 <apostrophe> flags both appear, the grouping wide characters are inserted before zero  
 37117 padding. For other conversions, the behavior is undefined.
- 37118 The length modifiers and their meanings are:
- 37119 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**  
 37120 or **unsigned char** argument (the argument will have been promoted according to the  
 37121 integer promotions, but its value shall be converted to **signed char** or **unsigned char**  
 37122 before printing); or that a following n conversion specifier applies to a pointer to a  
 37123 **signed char** argument.
- 37124 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or  
 37125 **unsigned short** argument (the argument will have been promoted according to the  
 37126 integer promotions, but its value shall be converted to **short** or **unsigned short** before  
 37127 printing); or that a following n conversion specifier applies to a pointer to a **short**  
 37128 argument.
- 37129 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or  
 37130 **unsigned long** argument; that a following n conversion specifier applies to a pointer to  
 37131 a **long** argument; that a following c conversion specifier applies to a **wint\_t** argument;  
 37132 that a following s conversion specifier applies to a pointer to a **wchar\_t** argument; or  
 37133 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.
- 37134 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**  
 37135 or **unsigned long long** argument; or that a following n conversion specifier applies to a  
 37136 pointer to a **long long** argument.
- 37138 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax\_t**  
 37139 or **uintmax\_t** argument; or that a following n conversion specifier applies to a pointer  
 37140 to an **intmax\_t** argument.
- 37141 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size\_t** or the  
 37142 corresponding signed integer type argument; or that a following n conversion specifier  
 37143 applies to a pointer to a signed integer type corresponding to a **size\_t** argument.

37144	t	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type argument; or that a following n conversion specifier applies to a pointer to a <b>ptrdiff_t</b> argument.
37145		
37146		
37147	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a <b>long double</b> argument.
37148		
37149		If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.
37150		
37151		The conversion specifiers and their meanings are:
37152	d, i	The <b>int</b> argument shall be converted to a signed decimal in the style "[−] dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
37153		
37154		
37155		
37156		
37157	o	The <b>unsigned</b> argument shall be converted to unsigned octal format in the style "dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
37158		
37159		
37160		
37161		
37162	u	The <b>unsigned</b> argument shall be converted to unsigned decimal format in the style "dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
37163		
37164		
37165		
37166		
37167	x	The <b>unsigned</b> argument shall be converted to unsigned hexadecimal format in the style "dddd"; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
37168		
37169		
37170		
37171		
37172	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead of "abcdef".
37173		
37174	f, F	The <b>double</b> argument shall be converted to decimal notation in the style "[−] ddd.ddd", where the number of digits after the radix character shall be equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix character appears, at least one digit shall appear before it. The value shall be rounded in an implementation-defined manner to the appropriate number of digits.
37175		
37176		
37177		
37178		
37179		
37180		A <b>double</b> argument representing an infinity shall be converted in one of the styles "[−]inf" or "[−]infinity"; which style is implementation-defined. A <b>double</b> argument representing a NaN shall be converted in one of the styles "[−]nan" or "[−]nan (n-char-sequence)"; which style, and the meaning of any n-char-sequence, is implementation-defined. The F conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.
37181		
37182		
37183		
37184		
37185		
37186	e, E	The <b>double</b> argument shall be converted in the style "[−] d.ddde±dd", where there shall be one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it shall be equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no
37187		
37188		
37189		

37190		radix character shall appear. The value shall be rounded in an implementation-defined manner to the appropriate number of digits. The E conversion wide character shall produce a number with 'E' instead of 'e' introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.
37191		
37192		
37193		
37194		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
37195		
37196	g, G	The <b>double</b> argument representing a floating-point number shall be converted in the style <code>f</code> or <code>e</code> (or in the style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), depending on the value converted and the precision. Let <code>P</code> equal the precision if non-zero, 6 if the precision is omitted, or 1 if the precision is zero. Then, if a conversion with style <code>E</code> would have an exponent of <code>X</code> :
37197		
37198		
37199		
37200		
37201		— If $P > X \geq -4$ , the conversion shall be with style <code>f</code> (or <code>F</code> ) and precision $P - (X + 1)$ .
37202		— Otherwise, the conversion shall be with style <code>e</code> (or <code>E</code> ) and precision $P - 1$ .
37203		Finally, unless the '#' flag is used, any trailing zeros shall be removed from the fractional portion of the result and the decimal-point character shall be removed if there is no fractional portion remaining.
37204		
37205		
37206		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
37207		
37208	a, A	A <b>double</b> argument representing a floating-point number shall be converted in the style " <code>[-]0xh.hhhhp±d</code> ", where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point wide character shall appear. The letters "abcdef" are used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.
37209		
37210		
37211		
37212		
37213		
37214		
37215		
37216		
37217		
37218		
37219		
37220		
37221		
37222		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
37223		
37224	c	If no <code>l</code> (ell) qualifier is present, the <b>int</b> argument shall be converted to a wide character as if by calling the <code>btowc()</code> function and the resulting wide character shall be written. Otherwise, the <b>wint_t</b> argument shall be converted to <b>wchar_t</b> , and written.
37225		
37226		
37227	s	If no <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <code>mbrtowc()</code> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.
37228		
37229		
37230		
37231		
37232		
37233		
37234		
37235		

37236			If an <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type <code>wchar_t</code> . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.
37237			
37238			
37239			
37240			
37241			
37242		<code>p</code>	The application shall ensure that the argument is a pointer to <code>void</code> . The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.
37243			
37244			
37245		<code>n</code>	The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the <code>fwprintf()</code> functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.
37246			
37247			
37248			
37249			
37250	XSI	<code>C</code>	Equivalent to <code>lc</code> .
37251	XSI	<code>S</code>	Equivalent to <code>ls</code> .
37252		<code>%</code>	Write a <code>'%'</code> wide character; no argument shall be converted. The application shall ensure that the complete conversion specification is <code>%%</code> .
37253			
37254			If a conversion specification does not match one of the above forms, the behavior is undefined.
37255			In no case does a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by <code>fwprintf()</code> and <code>wprintf()</code> shall be printed as if <code>fputwc()</code> had been called.
37256			
37257			
37258			
37259			For <code>a</code> and <code>A</code> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.
37260			
37261			
37262			
37263			For <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, if the number of significant decimal digits is at most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with <code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having <code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string $D$ should satisfy $L \leq D \leq U$ , with the extra stipulation that the error should have a correct sign for the current rounding direction.
37264			
37265			
37266			
37267			
37268			
37269			
37270			
37271	CX		The last data modification and last file status change timestamps of the file shall be marked for update between the call to a successful execution of <code>fwprintf()</code> or <code>wprintf()</code> and the next successful completion of a call to <code>fflush()</code> or <code>fclose()</code> on the same stream, or a call to <code>exit()</code> or <code>abort()</code> .
37272			
37273			
37274			
37275			<b>RETURN VALUE</b>
37276			Upon successful completion, these functions shall return the number of wide characters transmitted, excluding the terminating null wide character in the case of <code>swprintf()</code> , or a negative value if an error was encountered, and set <code>errno</code> to indicate the error.
37277			
37278	CX		
37279			If <code>n</code> or more wide characters were requested to be written, <code>swprintf()</code> shall return a negative value, and set <code>errno</code> to indicate the error.
37280	CX		

**37281 ERRORS**

37282 For the conditions under which *fwprintf()* and *wprintf()* fail and may fail, refer to *fputwc()*.

37283 In addition, all forms of *fwprintf()* shall fail if:

37284 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
37285 detected.

37286 CX [EOVERFLOW] The value to be returned is greater than {INT\_MAX}.

37287 In addition, *fwprintf()* and *wprintf()* may fail if:

37288 CX [ENOMEM] Insufficient storage space is available.

37289 The *swprintf()* shall fail if:

37290 CX [EOVERFLOW] The number of wide characters requested to be written was *n* or more.

**37291 EXAMPLES**

37292 To print the language-independent date and time format, the following statement could be used:

37293 `wprintf(format, weekday, month, day, hour, min);`

37294 For American usage, *format* could be a pointer to the wide-character string:

37295 `L"%s, %s %d, %d:%.2d\n"`

37296 producing the message:

37297 `Sunday, July 3, 10:02`

37298 whereas for German usage, *format* could be a pointer to the wide-character string:

37299 `L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"`

37300 producing the message:

37301 `Sonntag, 3. Juli, 10:02`

**37302 APPLICATION USAGE**

37303 None.

**37304 RATIONALE**

37305 If an implementation detects that there are insufficient arguments for the format, it is  
37306 recommended that the function should fail and report an [EINVAL] error.

**37307 FUTURE DIRECTIONS**

37308 None.

**37312 CHANGE HISTORY**

37313 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
37314 (E).

**37315 Issue 6**

37316 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing  
37317 the case if *n* or more wide characters are requested to be written using *swprintf()*.

37318 The normative text is updated to avoid use of the term “must” for application requirements.

37319 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 37320           • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 37321           • The DESCRIPTION is updated.
- 37322           • The hh, ll, j, t, and z length modifiers are added.
- 37323           • The a, A, and F conversion characters are added.
- 37324           • XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.
- 37325
- 37326           The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.
- 37327
- 37328           ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
- 37329   **Issue 7**
- 37330           Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.
- 37331
- 37332           Austin Group Interpretation 1003.1-2001 #170 is applied.
- 37333           ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of g and G.
- 37334
- 37335           Functionality relating to the "%n\$" form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.
- 37336
- 37337           The [Eoverflow] error is added for *swprintf()*.
- 37338           Changes are made related to support for finegrained timestamps.
- 37339           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0226 [302] and XSH/TC1-2008/0227 [14] are applied.
- 37340
- 37341           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0144 [73], XSH/TC2-2008/0145 [894], XSH/TC2-2008/0146 [557], and XSH/TC2-2008/0147 [936] are applied.
- 37342
- 37343   **Issue 8**
- 37344           Austin Group Defect 1021 is applied, changing “output error” to “error” in the RETURN VALUE section and changing the requirements for [Eoverflow].
- 37345
- 37346           Austin Group Defect 1137 is applied, clarifying the use of "%n\$" and "%m\$" in conversion specifications.
- 37347
- 37348           Austin Group Defect 1205 is applied, changing the description of the % conversion specifier.
- 37349           Austin Group Defect 1219 is applied, changing the *swprintf()*-specific [Eoverflow] error.

37350 **NAME**

37351 fwrite — binary output

37352 **SYNOPSIS**

37353 #include &lt;stdio.h&gt;

```
37354     size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
37355                 FILE *restrict stream);
```

37356 **DESCRIPTION**

37357 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 37358 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37359 volume of POSIX.1-2024 defers to the ISO C standard.

37360 The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose  
 37361 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be  
 37362 made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly  
 37363 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by  
 37364 the number of bytes successfully written. If an error occurs, the resulting value of the file-  
 37365 position indicator for the stream is unspecified.

37366 CX The last data modification and last file status change timestamps of the file shall be marked for  
 37367 update between the successful execution of *fwrite()* and the next successful completion of a call  
 37368 to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.

37369 **RETURN VALUE**

37370 The *fwrite()* function shall return the number of elements successfully written, which shall be  
 37371 less than *nitems* only if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0  
 37372 and the state of the stream remains unchanged. Otherwise, if a write error occurs, the error  
 37373 CX indicator for the stream shall be set, and *errno* shall be set to indicate the error.

37374 **ERRORS**37375 Refer to *fputc()*.37376 **EXAMPLES**

37377 None.

37378 **APPLICATION USAGE**

37379 Because of possible differences in element length and byte ordering, files written using *fwrite()*  
 37380 are application-dependent, and possibly cannot be read using *fread()* by a different application  
 37381 or by the same application on a different processor.

37382 **RATIONALE**

37383 None.

37384 **FUTURE DIRECTIONS**

37385 None.

37386 **SEE ALSO**37387 [Section 2.5](#) (on page 521), *ferror()*, *fopen()*, *fprintf()*, *putc()*, *puts()*, *write()*37388 XBD [<stdio.h>](#)37389 **CHANGE HISTORY**

37390 First released in Issue 1. Derived from Issue 1 of the SVID.

37391 **Issue 6**

37392 Extensions beyond the ISO C standard are marked.

37393 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

37394 • The *fwrite()* prototype is updated.37395 • The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.37396 **Issue 7**

37397 Changes are made related to support for finegrained timestamps.

37398 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0228 [14] is applied.

37399 **Issue 8**

37400 Austin Group Defect 1196 is applied, clarifying the RETURN VALUE section.

37401 **NAME**

37402 fwscanf, swscanf, wscanf — convert formatted wide-character input

37403 **SYNOPSIS**

37404 #include &lt;stdio.h&gt;

37405 #include &lt;wchar.h&gt;

37406 int fwscanf(FILE \*restrict stream, const wchar\_t \*restrict format, ...);

37407 int swscanf(const wchar\_t \*restrict ws,

37408 const wchar\_t \*restrict format, ...);

37409 int wscanf(const wchar\_t \*restrict format, ...);

37410 **DESCRIPTION**

37411 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 37412 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37413 volume of POSIX.1-2024 defers to the ISO C standard.

37414 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read  
 37415 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character  
 37416 string *ws*. Each function reads wide characters, interprets them according to a format, and stores  
 37417 the results in its arguments. Each expects, as arguments, a control wide-character string *format*  
 37418 described below, and a set of *pointer* arguments indicating where the converted input should be  
 37419 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is  
 37420 exhausted while arguments remain, the excess arguments are evaluated but are otherwise  
 37421 ignored.

37422 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 37423 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 37424 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 37425 [1,{NL\_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that  
 37426 select arguments in an order appropriate to specific languages. In *format* wide-character strings  
 37427 containing the "%n\$" form of conversion specifications, it is unspecified whether numbered  
 37428 arguments in the argument list can be referenced from the *format* wide-character string more  
 37429 than once.

37430 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 37431 two forms cannot normally be mixed within a single *format* wide-character string. The only  
 37432 exception to this is that %% or %\* can be mixed with the "%n\$" form. When numbered argument  
 37433 specifications are used, specifying the *N*th argument requires that all the leading arguments,  
 37434 from the first to the (*N*−1)th, are pointers.

37435 The *fwscanf()* function in all its forms allows for detection of a language-dependent radix  
 37436 character in the input string, encoded as a wide-character value. The radix character is defined  
 37437 in the current locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the  
 37438 radix character is not defined, the radix character shall default to a <period> ('.').

37439 The *format* is a wide-character string composed of zero or more directives. Each directive is  
 37440 composed of one of the following: one or more white-space wide characters; an ordinary wide  
 37441 character (neither '%' nor a white-space wide character); or a conversion specification. It is  
 37442 unspecified whether an encoding error occurs if the format string contains **wchar\_t** values that  
 37443 do not correspond to members of the character set of the current locale and the specified  
 37444 semantics do not require that value to be processed by *wcrtomb()*.

37445 CX Each conversion specification is introduced by the '%' or by the character sequence "%n\$",  
 37446 after which the following appear in sequence:

- 37447 • An optional assignment-suppressing character ' \* '.
- 37448 • An optional non-zero decimal integer that specifies the maximum field width.
- 37449 CX • An optional assignment-allocation character ' m '.
- 37450 • An optional length modifier that specifies the size of the receiving object.
- 37451 • A conversion specifier wide character that specifies the type of conversion to be applied.
- 37452 The valid conversion specifiers are described below.

37453 The *fwscanf()* functions shall execute each directive of the format in turn. When all directives  
 37454 have been executed, or if a directive fails (as detailed below), the function shall return. Failures  
 37455 are described as input failures (due to the unavailability of input bytes) or matching failures  
 37456 (due to inappropriate input).

37457 A directive composed of one or more white-space wide characters shall be executed by reading  
 37458 input up to the first wide character that is not a white-space wide character, which shall remain  
 37459 unread, or until no more wide characters can be read. The directive shall never fail.

37460 A directive that is an ordinary wide character shall be executed as follows. The next wide  
 37461 character is read from the input and compared with the wide character that comprises the  
 37462 directive; if the comparison shows that they are not equivalent, the directive shall fail, and the  
 37463 differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding  
 37464 error, or a read error prevents a wide character from being read, the directive shall fail.

37465 A directive that is a conversion specification defines a set of matching input sequences, as  
 37466 described below for each conversion wide character. A conversion specification is executed in  
 37467 the following steps.

37468 Input white-space wide characters shall be skipped, unless the conversion specification includes  
 37469 a [ , c, or n conversion specifier.

37470 An item shall be read from the input, unless the conversion specification includes an n  
 37471 conversion specifier wide character. An input item is defined as the longest sequence of input  
 37472 wide characters, not exceeding any specified field width, which is an initial subsequence of a  
 37473 matching sequence. The first wide character, if any, after the input item shall remain unread. If  
 37474 the length of the input item is zero, the execution of the conversion specification shall fail; this  
 37475 condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented  
 37476 input from the stream, in which case it is an input failure.

37477 Except in the case of a % conversion specifier, the input item (or, in the case of a %n conversion  
 37478 specification, the count of input wide characters) shall be converted to a type appropriate to the  
 37479 conversion wide character. If the input item is not a matching sequence, the execution of the  
 37480 conversion specification shall fail; this condition is a matching failure. Unless assignment  
 37481 suppression was indicated by a ' \* ' , the result of the conversion shall be placed in the object  
 37482 pointed to by the first argument following the *format* argument that has not already received a  
 37483 CX conversion result if the conversion specification is introduced by %, or in the *n*th argument if  
 37484 introduced by the wide-character sequence "%n\$". If this object does not have an appropriate  
 37485 type, or if the result of the conversion cannot be represented in the space provided, the behavior  
 37486 is undefined.

37487 CX The c, s, and [ conversion specifiers shall accept an optional assignment-allocation character  
 37488 ' m ' , which shall cause a memory buffer to be allocated to hold the conversion results. If the  
 37489 conversion specifier is s or [ , the allocated buffer shall include space for a terminating null  
 37490 character (or wide character). In such a case, the argument corresponding to the conversion  
 37491 specifier should be a reference to a pointer value that will receive a pointer to the allocated  
 37492 buffer. The system shall allocate a buffer as if *malloc()* had been called. The application shall be

37493 responsible for freeing the memory after usage. If there is insufficient memory to allocate a  
 37494 buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. If the  
 37495 function returns EOF, any memory successfully allocated for parameters using assignment-  
 37496 allocation character 'm' by this call shall be freed before the function returns.

37497 The length modifiers and their meanings are:

37498 hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37499 argument with type pointer to **signed char** or **unsigned char**.

37500 h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37501 argument with type pointer to **short** or **unsigned short**.

37502 l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37503 argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F,  
 37504 g, or G conversion specifier applies to an argument with type pointer to **double**; or that  
 37505 a following c, s, or [ conversion specifier applies to an argument with type pointer to  
 37506 CX **wchar\_t**. If the 'm' assignment-allocation character is specified, the conversion  
 37507 applies to an argument with the type pointer to a pointer to **wchar\_t**.

37508 ll (ell-ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37509 argument with type pointer to **long long** or **unsigned long long**.

37511 j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37512 argument with type pointer to **intmax\_t** or **uintmax\_t**.

37513 z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37514 argument with type pointer to **size\_t** or the corresponding signed integer type.

37515 t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
 37516 argument with type pointer to **ptrdiff\_t** or the corresponding **unsigned** type.

37517 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an  
 37518 argument with type pointer to **long double**.

37519 If a length modifier appears with any conversion specifier other than as specified above, the  
 37520 behavior is undefined.

37521 The following conversion specifier wide characters are valid:

37522 d Matches an optionally signed decimal integer, whose format is the same as expected for  
 37523 the subject sequence of *wcstol()* with the value 10 for the *base* argument. In the absence  
 37524 of a size modifier, the application shall ensure that the corresponding argument is a  
 37525 pointer to **int**.

37526 i Matches an optionally signed integer, whose format is the same as expected for the  
 37527 subject sequence of *wcstol()* with 0 for the *base* argument. In the absence of a size  
 37528 modifier, the application shall ensure that the corresponding argument is a pointer to  
 37529 **int**.

37530 o Matches an optionally signed octal integer, whose format is the same as expected for  
 37531 the subject sequence of *wcstoul()* with the value 8 for the *base* argument. In the absence  
 37532 of a size modifier, the application shall ensure that the corresponding argument is a  
 37533 pointer to **unsigned**.

37534 u Matches an optionally signed decimal integer, whose format is the same as expected for  
 37535 the subject sequence of *wcstoul()* with the value 10 for the *base* argument. In the absence  
 37536 of a size modifier, the application shall ensure that the corresponding argument is a

37537		pointer to <b>unsigned</b> .
37538	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.
37539		In the absence of a size modifier, the application shall ensure that the corresponding
37540		argument is a pointer to <b>unsigned</b> .
37541		
37542	a, e, f, g	
37543		Matches an optionally signed floating-point number, infinity, or NaN whose format is
37544		the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size
37545		modifier, the application shall ensure that the corresponding argument is a pointer to
37546		<b>float</b> .
37547		If the <i>fwprintf()</i> family of functions generates character string representations for
37548		infinity and NaN (a symbolic entity encoded in floating-point format) to support
37549		IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.
37550	s	Matches a sequence of non-white-space wide characters. If no l (ell) qualifier is present,
37551		characters from the input field shall be converted as if by repeated calls to the
37552		<i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object
37553		initialized to zero before the first wide character is converted. If the 'm' assignment-
37554		allocation character is not specified, the application shall ensure that the corresponding
37555		argument is a pointer to a character array large enough to accept the sequence and the
37556	CX	terminating null character, which shall be added automatically. Otherwise, the
37557		application shall ensure that the corresponding argument is a pointer to a pointer to a
37558		<b>char</b> .
37559		If the l (ell) qualifier is present and the 'm' assignment-allocation character is not
37560		specified, the application shall ensure that the corresponding argument is a pointer to
37561		an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide
37562	CX	character, which shall be added automatically. If the l (ell) qualifier is present and the
37563		'm' assignment-allocation character is present, the application shall ensure that the
37564		corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
37565	[	Matches a non-empty sequence of wide characters from a set of expected wide
37566		characters (the <i>scanset</i> ). If no l (ell) qualifier is present, wide characters from the input
37567		field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the
37568		conversion state described by an <b>mbstate_t</b> object initialized to zero before the first
37569		wide character is converted. If the 'm' assignment-allocation character is not specified,
37570		the application shall ensure that the corresponding argument is a pointer to a character
37571		array large enough to accept the sequence and the terminating null character, which
37572	CX	shall be added automatically. Otherwise, the application shall ensure that the
37573		corresponding argument is a pointer to a pointer to a <b>char</b> .
37574		If an l (ell) qualifier is present and the 'm' assignment-allocation character is not
37575		specified, the application shall ensure that the corresponding argument is a pointer to
37576		an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide
37577	CX	character. If an l (ell) qualifier is present and the 'm' assignment-allocation character
37578		is specified, the application shall ensure that the corresponding argument is a pointer to
37579		a pointer to a <b>wchar_t</b> .
37580		The conversion specification includes all subsequent wide characters in the <i>format</i>
37581		string up to and including the matching <right-square-bracket> (']'). The wide
37582		characters between the square brackets (the <i>scanlist</i> ) comprise the <i>scanset</i> , unless the
37583		wide character after the <left-square-bracket> is a <circumflex> ('^'), in which case
37584		the <i>scanset</i> contains all wide characters that do not appear in the <i>scanlist</i> between the

37585		<circumflex> and the <right-square-bracket>. If the conversion specification begins with "[ ]" or "[^]", the <right-square-bracket> is included in the scanlist and the next <right-square-bracket> is the matching <right-square-bracket> that ends the conversion specification; otherwise, the first <right-square-bracket> is the one that ends the conversion specification. If a '-' is in the scanlist and is not the first wide character, nor the second where the first wide character is a '^', nor the last wide character, the behavior is implementation-defined.
37586		
37587		
37588		
37589		
37590		
37591		
37592	c	Matches a sequence of wide characters of exactly the number specified by the field width (1 if no field width is present in the conversion specification).
37593		
37594		If no l (ell) length modifier is present, characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. No null character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial element of a character array large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .
37595		
37596		
37597		
37598		
37599	CX	
37600		
37601		
37602		No null wide character is added. If an l (ell) length modifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument shall be a pointer to the initial element of an array of <b>wchar_t</b> large enough to accept the sequence. If an l (ell) qualifier is present and the 'm' assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
37603		
37604		
37605	CX	
37606		
37607		
37608	p	Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding <i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion is undefined.
37609		
37610		
37611		
37612		
37613		
37614		
37615	n	No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined.
37616		
37617		
37618		
37619		
37620		
37621		
37622	XSI	<b>C</b> Equivalent to <b>lc</b> .
37623	XSI	<b>S</b> Equivalent to <b>ls</b> .
37624	%	Matches a single '%' wide character; no conversion or assignment shall occur. The complete conversion specification shall be %%.
37625		
37626		If a conversion specification is invalid, the behavior is undefined.
37627		The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively, a, e, f, g, and x.
37628		
37629		If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before any wide characters matching the current conversion specification (except for %n) have been
37630		

37631 read (other than leading white-space wide characters, where permitted), execution of the current  
 37632 conversion specification shall terminate with an input failure. Otherwise, unless execution of  
 37633 the current conversion specification is terminated with a matching failure, execution of the  
 37634 following conversion specification (if any) shall be terminated with an input failure.

37635 Reaching the end of the string in *swscanf()* shall be equivalent to encountering end-of-file for  
 37636 *fwscanf()*.

37637 If conversion terminates on a conflicting input, the offending input shall be left unread in the  
 37638 input. Any trailing white-space wide characters (including <newline>) shall be left unread  
 37639 unless matched by a conversion specification. The success of literal matches and suppressed  
 37640 assignments is only directly determinable via the %n conversion specification.

37641 CX The *fwscanf()* and *wscanf()* functions may mark the last data access timestamp of the file  
 37642 associated with *stream* for update. The last data access timestamp shall be marked for update by  
 37643 the first successful execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*,  
 37644 *vscanf()*, or *wscanf()* using *stream* that returns data not supplied by a prior call to *ungetwc()*.

### 37645 RETURN VALUE

37646 Upon successful completion, these functions shall return the number of successfully matched  
 37647 and assigned input items; this number can be zero in the event of an early matching failure. If  
 37648 the input ends before the first conversion (if any) has completed, and without a matching failure  
 37649 having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has  
 37650 CX completed, and without a matching failure having occurred, EOF shall be returned and *errno*  
 37651 shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be  
 37652 set.

### 37653 ERRORS

37654 For the conditions under which the *fwscanf()* functions shall fail and may fail, refer to *fgetwc()*.

37655 In addition, the *fwscanf()* function shall fail if:

37656 CX [EILSEQ] Input byte sequence does not form a valid character.

37657 [ENOMEM] Insufficient storage space is available.

37658 In addition, the *fwscanf()* function may fail if:

37659 CX [EINVAL] There are insufficient arguments.

### 37660 EXAMPLES

37661 The call:

```
37662 int i, n; float x; char name[50];
37663 n = wscanf(L"%d%f%s", &i, &x, name);
```

37664 with the input line:

```
37665 25 54.32E-1 Hamster
```

37666 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
 37667 "Hamster".

37668 The call:

```
37669 int i; float x; char name[50];
37670 (void) wscanf(L"%2d%f*d %[0123456789]", &i, &x, name);
```

37671 with input:

```
37672 56789 0123 56a72
```

37673 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
 37674 *getchar()* shall return the character 'a'.

#### 37675 APPLICATION USAGE

37676 In format strings containing the '%' form of conversion specifications, each argument in the  
 37677 argument list is used exactly once.

37678 For functions that allocate memory as if by *malloc()*, the application should release such memory  
 37679 when it is no longer required by a call to *free()*. For *fwscanf()*, this is memory allocated via use of  
 37680 the 'm' assignment-allocation character.

#### 37681 RATIONALE

37682 None.

#### 37688 CHANGE HISTORY

37689 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 37690 (E).

#### 37691 Issue 6

37692 The normative text is updated to avoid use of the term "must" for application requirements.

37693 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 37694 • The prototypes for *fwscanf()* and *swscanf()* are updated.
- 37695 • The DESCRIPTION is updated.
- 37696 • The hh, ll, j, t, and z length modifiers are added.
- 37697 • The a, A, and F conversion characters are added.

37698 The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion  
 37699 specification" consistently.

#### 37700 Issue 7

37701 Austin Group Interpretation 1003.1-2001 #170 is applied.

37702 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.

37703 Functionality relating to the "%n\$" form of conversion specification is moved from the XSI  
 37704 option to the Base.

37705 Changes are made related to support for finegrained timestamps.

37706 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
 37707 *malloc()*.

37708 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0229 [302] and XSH/TC1-2008/0230  
 37709 [14] are applied.

37710 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0148 [73], XSH/TC2-2008/0149 [823],  
 37711 and XSH/TC2-2008/0150 [936] are applied.

37712 **Issue 8**

37713 Austin Group Defect 1163 is applied, clarifying the handling of white space in the format string.

37714 Austin Group Defect 1173 is applied, clarifying the description of the assignment-allocation  
37715 character 'm'.

37716 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
37717 standard.

37718 Austin Group Defect 1375 is applied, changing “terminating null wide character” to  
37719 “terminating null character (or wide character)” and changing the first occurrence of **wchar\_t** in  
37720 the descriptions of the `s` and `[` conversion specifiers to **char**.

37721 **NAME**

37722        gai\_strerror — address and name information error description

37723 **SYNOPSIS**

37724        #include &lt;netdb.h&gt;

37725        const char \*gai\_strerror(int *ecode*);37726 **DESCRIPTION**37727        The *gai\_strerror()* function shall return a text string describing an error value for the *getaddrinfo()*  
37728        and *getnameinfo()* functions listed in the <netdb.h> header.37729        When the *ecode* argument is one of the following values listed in the <netdb.h> header:

37730        [EAI_AGAIN]	[EAI_NONAME]
37731        [EAI_BADFLAGS]	[EAI_OVERFLOW]
37732        [EAI_FAIL]	[EAI_SERVICE]
37733        [EAI_FAMILY]	[EAI_SOCKTYPE]
37734        [EAI_MEMORY]	[EAI_SYSTEM]

37735        the function return value shall point to a string describing the error. If the argument is not one  
37736        of those values, the function shall return a pointer to a string whose contents indicate an  
37737        unknown error.37738 **RETURN VALUE**37739        Upon successful completion, *gai\_strerror()* shall return a pointer to an implementation-defined  
37740        string.37741 **ERRORS**

37742        No errors are defined.

37743 **EXAMPLES**

37744        None.

37745 **APPLICATION USAGE**

37746        None.

37747 **RATIONALE**

37748        None.

37749 **FUTURE DIRECTIONS**

37750        None.

37751 **SEE ALSO**37752        [\*freeaddrinfo\(\)\*](#)

37753        XBD &lt;netdb.h&gt;

37754 **CHANGE HISTORY**

37755        First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37756        The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from  
37757        **char \*** to **const char \***. This is for coordination with the IPnG Working Group.37758        IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the  
37759        [EAI\_OVERFLOW] error code.

37760 **NAME**

37761           getaddrinfo — get address information

37762 **SYNOPSIS**

37763           #include <sys/socket.h>

37764           #include <netdb.h>

37765           int getaddrinfo(const char \*restrict *nodename*,

37766                           const char \*restrict *servname*,

37767                           const struct addrinfo \*restrict *hints*,

37768                           struct addrinfo \*\*restrict *res*);

37769 **DESCRIPTION**

37770           Refer to [freeaddrinfo\(\)](#).

37771 **NAME**

37772        getc — get a byte from a stream

37773 **SYNOPSIS**

37774        #include &lt;stdio.h&gt;

37775        int getc(FILE \*stream);

37776 **DESCRIPTION**

37777 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
37778        conflict between the requirements described here and the ISO C standard is unintentional. This  
37779        volume of POSIX.1-2024 defers to the ISO C standard.

37780        The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it  
37781        may evaluate *stream* more than once, so the argument should never be an expression with side-  
37782        effects.

37783 **RETURN VALUE**37784        Refer to *fgetc()*.37785 **ERRORS**37786        Refer to *fgetc()*.37787 **EXAMPLES**

37788        None.

37789 **APPLICATION USAGE**

37790        If the integer value returned by *getc()* is stored into a variable of type **char** and then compared  
37791        against the integer constant EOF, the comparison may never succeed, because sign-extension of  
37792        a variable of type **char** on widening to integer is implementation-defined.

37793        Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with  
37794        side-effects. In particular, *getc(\*f++)* does not necessarily work as expected. Therefore, use of this  
37795        function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.

37796 **RATIONALE**

37797        None.

37798 **FUTURE DIRECTIONS**

37799        None.

37800 **SEE ALSO**37801        [Section 2.5](#) (on page 521), *fgetc()*

37802        XBD &lt;stdio.h&gt;

37803 **CHANGE HISTORY**

37804        First released in Issue 1. Derived from Issue 1 of the SVID.

37805 **Issue 7**

37806        POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0231 [14] is applied.

37807 **NAME**

37808        getc\_unlocked, getchar\_unlocked, putc\_unlocked, putchar\_unlocked — stdio with explicit client  
37809        locking

37810 **SYNOPSIS**

```
37811 CX       #include <stdio.h>
37812       int getc_unlocked(FILE *stream);
37813       int getchar_unlocked(void);
37814       int putc_unlocked(int c, FILE *stream);
37815       int putchar_unlocked(int c);
```

37816 **DESCRIPTION**

37817        Versions of the functions *getc()*, *getchar()*, *putc()*, and *putchar()* respectively named  
37818        *getc\_unlocked()*, *getchar\_unlocked()*, *putc\_unlocked()*, and *putchar\_unlocked()* shall be provided  
37819        which are functionally equivalent to the original versions, with the exception that they are not  
37820        required to be implemented in a fully thread-safe manner. They shall be thread-safe when used  
37821        within a scope protected by *flockfile()* (or *ftrylockfile()*) and *funlockfile()*. These functions can  
37822        safely be used in a multi-threaded program if and only if they are called while the invoking  
37823        thread owns the (**FILE \***) object, as is the case after a successful call to the *flockfile()* or  
37824        *ftrylockfile()* functions.

37825        If *getc\_unlocked()* or *putc\_unlocked()* are implemented as macros they may evaluate *stream* more  
37826        than once, so the *stream* argument should never be an expression with side-effects.

37827 **RETURN VALUE**

37828        See *getc()*, *getchar()*, *putc()*, and *putchar()*.

37829 **ERRORS**

37830        See *getc()*, *getchar()*, *putc()*, and *putchar()*.

37831 **EXAMPLES**

37832        None.

37833 **APPLICATION USAGE**

37834        Since they may be implemented as macros, *getc\_unlocked()* and *putc\_unlocked()* may treat  
37835        incorrectly a *stream* argument with side-effects. In particular, *getc\_unlocked(\*f++)* and  
37836        *putc\_unlocked(c,\*f++)* do not necessarily work as expected. Therefore, use of these functions in  
37837        such situations should be preceded by the following statement as appropriate:

```
37838        #undef getc_unlocked
37839        #undef putc_unlocked
```

37840 **RATIONALE**

37841        Some I/O functions are typically implemented as macros for performance reasons (for example,  
37842        *putc()* and *getc()*). For safety, they need to be synchronized, but it is often too expensive to  
37843        synchronize on every character. Nevertheless, it was felt that the safety concerns were more  
37844        important; consequently, the *getc()*, *getchar()*, *putc()*, and *putchar()* functions are required to be  
37845        thread-safe. However, unlocked versions are also provided with names that clearly indicate the  
37846        unsafe nature of their operation but can be used to exploit their higher performance. These  
37847        unlocked versions can be safely used only within explicitly locked program regions, using  
37848        exported locking primitives. In particular, a sequence such as:

```
37849        flockfile(fileptr);
37850        putc_unlocked('1', fileptr);
37851        putc_unlocked('\n', fileptr);
37852        fprintf(fileptr, "Line 2\n");
```

37853 `funlockfile(fileptr);`

37854 is permissible, and results in the text sequence:

37855 1

37856 Line 2

37857 being printed without being interspersed with output from other threads.

37858 It would be wrong to have the standard names such as `getc()`, `putc()`, and so on, map to the  
 37859 “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still  
 37860 want to inspect all uses of `getc()`, `putc()`, and so on, by hand when converting existing code.  
 37861 Choosing the safe bindings as the default, at least, results in correct code and maintains the  
 37862 “atomicity at the function” invariant. To do otherwise would introduce gratuitous  
 37863 synchronization errors into converted code. Other routines that modify the `stdio (FILE *)`  
 37864 structures or buffers are also safely synchronized.

37865 Note that there is no need for functions of the form `getc_locked()`, `putc_locked()`, and so on, since  
 37866 this is the functionality of `getc()`, `putc()`, *et al.* It would be inappropriate to use a feature test  
 37867 macro to switch a macro definition of `getc()` between `getc_locked()` and `getc_unlocked()`, since the  
 37868 ISO C standard requires an actual function to exist, a function whose behavior could not be  
 37869 changed by the feature test macro. Also, providing both the `xxx_locked()` and `xxx_unlocked()`  
 37870 forms leads to the confusion of whether the suffix describes the behavior of the function or the  
 37871 circumstances under which it should be used.

37872 Three additional routines, `flockfile()`, `ftrylockfile()`, and `funlockfile()` (which may be macros), are  
 37873 provided to allow the user to delineate a sequence of I/O statements that are executed  
 37874 synchronously.

37875 The `ungetc()` function is infrequently called relative to the other functions/macros so no  
 37876 unlocked variation is needed.

#### 37877 FUTURE DIRECTIONS

37878 None.

#### 37879 SEE ALSO

37880 [Section 2.5](#) (on page 521), `flockfile()`, `getc()`, `getchar()`, `putc()`, `putchar()`

37881 XBD [<stdio.h>](#)

#### 37882 CHANGE HISTORY

37883 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 37884 Issue 6

37885 These functions are marked as part of the Thread-Safe Functions option.

37886 The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing  
 37887 how applications should be written to avoid the case when the functions are implemented as  
 37888 macros.

#### 37889 Issue 7

37890 The `getc_unlocked()`, `getchar_unlocked()`, `putc_unlocked()`, and `putchar_unlocked()` functions are  
 37891 moved from the Thread-Safe Functions option to the Base.

37892 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0232 [395], XSH/TC1-2008/0233 [395],  
 37893 XSH/TC1-2008/0234 [395], and XSH/TC1-2008/0235 [14] are applied.

37894 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0151 [826] is applied.

37895 **NAME**37896            getchar — get a byte from a *stdin* stream37897 **SYNOPSIS**

37898            #include &lt;stdio.h&gt;

37899            int getchar(void);

37900 **DESCRIPTION**

37901 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
37902 conflict between the requirements described here and the ISO C standard is unintentional. This  
37903 volume of POSIX.1-2024 defers to the ISO C standard.

37904            The *getchar()* function shall be equivalent to *getc(stdin)*.37905 **RETURN VALUE**37906            Refer to *fgetc()*.37907 **ERRORS**37908            Refer to *fgetc()*.37909 **EXAMPLES**

37910            None.

37911 **APPLICATION USAGE**

37912            If the integer value returned by *getchar()* is stored into a variable of type **char** and then  
37913 compared against the integer constant EOF, the comparison may never succeed, because sign-  
37914 extension of a variable of type **char** on widening to integer is implementation-defined.

37915 **RATIONALE**

37916            None.

37917 **FUTURE DIRECTIONS**

37918            None.

37919 **SEE ALSO**37920            [Section 2.5](#) (on page 521), *getc()*

37921            XBD &lt;stdio.h&gt;

37922 **CHANGE HISTORY**

37923            First released in Issue 1. Derived from Issue 1 of the SVID.

37924 **Issue 7**

37925            POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0236 [14] is applied.

37926 **NAME**

37927        getchar\_unlocked — stdio with explicit client locking

37928 **SYNOPSIS**

37929 CX        #include &lt;stdio.h&gt;

37930        int getchar\_unlocked(void);

37931 **DESCRIPTION**37932        Refer to *getc\_unlocked()*.

37933 **NAME**

37934           getcwd — get the pathname of the current working directory

37935 **SYNOPSIS**

37936           #include &lt;unistd.h&gt;

37937           char \*getcwd(char \*buf, size\_t size);

37938 **DESCRIPTION**

37939           The *getcwd()* function shall place an absolute pathname of the current working directory in the  
 37940           array pointed to by *buf*, and return *buf*. The pathname shall contain no components that are dot  
 37941           or dot-dot, or are symbolic links.

37942           If there are multiple pathnames that *getcwd()* could place in the array pointed to by *buf*, one  
 37943           beginning with a single <slash> character and one or more beginning with two <slash>  
 37944           characters, then *getcwd()* shall place the pathname beginning with a single <slash> character in  
 37945           the array. The pathname shall not contain any unnecessary <slash> characters after the leading  
 37946           one or two <slash> characters.

37947           The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf*  
 37948           is a null pointer, the behavior of *getcwd()* is unspecified.

37949 **RETURN VALUE**

37950           Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall  
 37951           return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by  
 37952           *buf* are then undefined.

37953 **ERRORS**37954           The *getcwd()* function shall fail if:37955           [EINVAL]           The *size* argument is 0.37956           [ERANGE]           The *size* argument is greater than 0, but is smaller than the length of the string  
37957           +1.37958           The *getcwd()* function may fail if:37959           [EACCES]           Search permission was denied for the current directory, or read or search  
37960           permission was denied for a directory above the current directory in the file  
37961           hierarchy.

37962           [ENOMEM]           Insufficient storage space is available.

37963 **EXAMPLES**

37964           The following example uses {PATH\_MAX} as the initial buffer size (unless it is indeterminate or  
 37965           very large), and calls *getcwd()* with progressively larger buffers until it does not give an  
 37966           [ERANGE] error.

37967           #include &lt;stdlib.h&gt;

37968           #include &lt;errno.h&gt;

37969           #include &lt;unistd.h&gt;

37970           ...

37971           long path\_max;

37972           size\_t size;

37973           char \*buf;

37974           char \*ptr;

37975           path\_max = pathconf(".", \_PC\_PATH\_MAX);

37976           if (path\_max == -1)

```

37977         size = 1024;
37978     else if (path_max > 10240)
37979         size = 10240;
37980     else
37981         size = path_max;
37982     for (buf = ptr = NULL; ptr == NULL; size *= 2)
37983     {
37984         if ((buf = realloc(buf, size)) == NULL)
37985         {
37986             ... handle error ...
37987         }
37988         ptr = getcwd(buf, size);
37989         if (ptr == NULL && errno != ERANGE)
37990         {
37991             ... handle error ...
37992         }
37993     }
37994     ...
37995     free (buf);

```

#### 37996 APPLICATION USAGE

37997 If the pathname obtained from *getcwd()* is longer than {PATH\_MAX} bytes, it could produce an  
37998 [ENAMETOOLONG] error if passed to *chdir()*. Therefore, in order to return to that directory it  
37999 may be necessary to break the pathname into sections shorter than {PATH\_MAX} bytes and call  
38000 *chdir()* on each section in turn (the first section being an absolute pathname and subsequent  
38001 sections being relative pathnames). A simpler way to handle saving and restoring the working  
38002 directory when it may be deeper than {PATH\_MAX} bytes in the file hierarchy is to use a file  
38003 descriptor and *fchdir()*, rather than *getcwd()* and *chdir()*. However, the two methods do have  
38004 some differences. The *fchdir()* approach causes the program to restore a working directory even  
38005 if it has been renamed in the meantime, whereas the *chdir()* approach restores to a directory with  
38006 the same name as the original, even if the directories were renamed in the meantime. Since the  
38007 *fchdir()* approach does not access parent directories, it can succeed when *getcwd()* would fail  
38008 due to permissions problems. In applications conforming to earlier versions of this standard, it  
38009 was not possible to use the *fchdir()* approach when the working directory is searchable but not  
38010 readable, as the only way to open a directory was with O\_RDONLY, whereas the *getcwd()*  
38011 approach can succeed in this case.

#### 38012 RATIONALE

38013 Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for  
38014 the returned argument was considered. The advantage is that *getcwd()* knows how big the  
38015 working directory pathname is and can allocate an appropriate amount of space. But the  
38016 programmer would have to use the *free()* function to free the resulting object, or each use of  
38017 *getcwd()* would further reduce the available memory. Finally, *getcwd()* is taken from the SVID  
38018 where it has the two arguments used in this volume of POSIX.1-2024.

38019 The older function *getwd()* was rejected for use in this context because it had only a buffer  
38020 argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except  
38021 to depend on the programmer to provide a large enough buffer.

38022 On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory  
38023 using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a  
38024 subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in  
38025 conforming applications.

38026 Earlier implementations of `getcwd()` sometimes generated pathnames like  
38027 `"../../../../subdirname"` internally, using them to explore the path of ancestor directories  
38028 back to the root. If one of these internal pathnames exceeded `{PATH_MAX}` in length, the  
38029 implementation could fail with *errno* set to `[ENAMETOOLONG]`. This is no longer allowed.

38030 If a program is operating in a directory where some (grand)parent directory does not permit  
38031 reading, `getcwd()` may fail, as in most implementations it must read the directory to determine  
38032 the name of the file. This can occur if search, but not read, permission is granted in an  
38033 intermediate directory, or if the program is placed in that directory by some more privileged  
38034 process (for example, login). Including the `[EACCES]` error condition makes the reporting of the  
38035 error consistent and warns the application developer that `getcwd()` can fail for reasons beyond  
38036 the control of the application developer or user. Some implementations can avoid this  
38037 occurrence (for example, by implementing `getcwd()` using `pwd`, where `pwd` is a set-user-root  
38038 process), thus the error was made optional. Since this volume of POSIX.1-2024 permits the  
38039 addition of other errors, this would be a common addition and yet one that applications could  
38040 not be expected to deal with without this addition.

#### 38041 FUTURE DIRECTIONS

38042 None.

#### 38043 SEE ALSO

#### 38046 CHANGE HISTORY

38047 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 38048 Issue 6

38049 The following new requirements on POSIX implementations derive from alignment with the  
38050 Single UNIX Specification:

- 38051 • The `[ENOMEM]` optional error condition is added.

#### 38052 Issue 7

38053 Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with  
38054 the `pwd` utility, adding text to address the case where the current directory is deeper in the file  
38055 hierarchy than `{PATH_MAX}` bytes, and adding the requirements relating to pathnames  
38056 beginning with two `<slash>` characters.

38057 **NAME**

38058 getdate — convert user format date and time

38059 **SYNOPSIS**

```
38060 XSI      #include <time.h>
38061      struct tm *getdate(const char *string);
```

38062 **DESCRIPTION**

38063 The *getdate()* function shall convert a string representation of a date or time into a broken-down  
38064 time.

38065 The external variable or macro *getdate\_err*, which has type **int**, is used by *getdate()* to return error  
38066 values. It is unspecified whether *getdate\_err* is a macro or an identifier declared with external  
38067 linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order  
38068 to access an actual object, or a program defines an identifier with the name *getdate\_err*, the  
38069 behavior is undefined.

38070 Templates are used to parse and interpret the input string. The templates are contained in a text  
38071 file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to  
38072 indicate the full pathname of the file that contains the templates. The first line in the template  
38073 that matches the input specification is used for interpretation and conversion into the internal  
38074 time format.

38075 The following conversion specifications shall be supported:

38076	%%	Equivalent to %.
38077	%a	Abbreviated weekday name.
38078	%A	Full weekday name.
38079	%b	Abbreviated month name.
38080	%B	Full month name.
38081	%c	Locale's appropriate date and time representation.
38082	%C	Century number [00,99]; leading zeros are permitted but not required.
38083	%d	Day of month [01,31]; the leading 0 is optional.
38084	%D	Date as %m/%d/%y.
38085	%e	Equivalent to %d.
38086	%h	Abbreviated month name.
38087	%H	Hour [00,23].
38088	%I	Hour [01,12].
38089	%m	Month number [01,12].
38090	%M	Minute [00,59].
38091	%n	Equivalent to <newline>.
38092	%p	Locale's equivalent of either AM or PM.
38093	%r	The locale's appropriate representation of time in 12-hour clock notation, if the 12-hour 38094 format is supported in the locale (see XBD <a href="#">Section 7.3.5</a> , on page 152). In the POSIX 38095 locale, this shall be equivalent to %I:%M:%S %p.

38096	%R	Time as %H:%M.
38097	%S	Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap second data has to come from some external source.
38098		
38099		
38100	%t	Equivalent to <tab>.
38101	%T	Time as %H:%M:%S.
38102	%w	Weekday number (Sunday = [0,6]).
38103	%x	Locale's appropriate date representation.
38104	%X	Locale's appropriate time representation.
38105	%y	Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.
38106		
38107		
38108		<b>Note:</b> It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
38109		
38110		
38111	%Y	Year as "ccyy" (for example, 2001).
38112	%Z	Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month).
38113		
38114		
38115		
38116		The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.
38117		
38118		The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i> ).
38119		
38120		
38121		Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra white space in either the template file or in <i>string</i> shall be ignored.
38122		
38123		
38124		The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.
38125		
38126		The following rules apply for converting the input specification into the internal format:
38127		• If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.
38128		
38129		
38130		• If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.
38131		
38132		• If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.
38133		
38134		
38135		• If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.
38136		

- 38137           • If no date is given, the hour chosen shall be the hour, starting with the current hour and  
38138           moving into the future, which first matches the named hour.

38139           If a conversion specification in the DATEMSK file does not correspond to one of the conversion  
38140           specifications above, the behavior is unspecified.

38141           The *getdate()* function need not be thread-safe.

#### 38142 RETURN VALUE

38143           Upon successful completion, *getdate()* shall return a pointer to a **struct tm**. Otherwise, it shall  
38144           return a null pointer and set *getdate\_err* to indicate the error.

#### 38145 ERRORS

38146           The *getdate()* function shall fail in the following cases, setting *getdate\_err* to the value shown in  
38147           the list below. Any changes to *errno* are unspecified.

- 38148           1. The *DATEMSK* environment variable is null or undefined.
- 38149           2. The template file cannot be opened for reading.
- 38150           3. Failed to get file status information.
- 38151           4. The template file is not a regular file.
- 38152           5. An I/O error is encountered while reading the template file.
- 38153           6. Memory allocation failed (not enough memory available).
- 38154           7. There is no line in the template that matches the input.
- 38155           8. Invalid input specification. For example, February 31; or a time is specified that cannot be  
38156           represented in a **time\_t** (representing the time in seconds since the Epoch).

#### 38157 EXAMPLES

- 38158           1. The following example shows the possible contents of a template:

```
38159           %m
38160           %A %B %d, %Y, %H:%M:%S
38161           %A
38162           %B
38163           %m/%d/%y %I %p
38164           %d, %m, %Y %H:%M
38165           at %A the %dst of %B in %Y
38166           run job at %I %p, %B %dnd
38167           %A den %d. %B %Y %H.%M Uhr
```

- 38168           2. The following are examples of valid input specifications for the template in Example 1:

```
38169           getdate("10/1/87 4 PM");
38170           getdate("Friday");
38171           getdate("Friday September 18, 1987, 10:30:30");
38172           getdate("24,9,1986 10:30");
38173           getdate("at monday the 1st of december in 1986");
38174           getdate("run job at 3 PM, december 2nd");
```

38175           If the *LC\_TIME* category is set to a German locale that includes *freitag* as a weekday name  
38176           and *oktober* as a month name, the following would be valid:

```
38177           getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

38178 3. The following example shows how local date and time specification can be defined in the  
38179 template:

Invocation	Line in Template
getdate("11/27/86")	%m/%d/%y
getdate("27.11.86")	%d.%m.%y
getdate("86-11-27")	%y-%m-%d
getdate("Friday 12:00:00")	%A %H:%M:%S

38185 4. The following examples help to illustrate the above rules assuming that the current date  
38186 is Mon Sep 22 12:19:47 EDT 1986 and the *LC\_TIME* category is set to the default C or  
38187 POSIX locale:

Input	Line in Template	Date
Mon	%a	Mon Sep 22 12:19:47 EDT 1986
Sun	%a	Sun Sep 28 12:19:47 EDT 1986
Fri	%a	Fri Sep 26 12:19:47 EDT 1986
September	%B	Mon Sep 1 12:19:47 EDT 1986
January	%B	Thu Jan 1 12:19:47 EST 1987
December	%B	Mon Dec 1 12:19:47 EST 1986
Sep Mon	%b %a	Mon Sep 1 12:19:47 EDT 1986
Jan Fri	%b %a	Fri Jan 2 12:19:47 EST 1987
Dec Mon	%b %a	Mon Dec 1 12:19:47 EST 1986
Jan Wed 1989	%b %a %Y	Wed Jan 4 12:19:47 EST 1989
Fri 9	%a %H	Fri Sep 26 09:00:00 EDT 1986
Feb 10:30	%b %H:%S	Sun Feb 1 10:00:30 EST 1987
10:30	%H:%M	Tue Sep 23 10:30:00 EDT 1986
13:30	%H:%M	Mon Sep 22 13:30:00 EDT 1986

### 38203 APPLICATION USAGE

38204 Although historical versions of *getdate()* did not require that **<time.h>** declare the external  
38205 variable *getdate\_err*, this volume of POSIX.1-2024 does require it. The standard developers  
38206 encourage applications to remove declarations of *getdate\_err* and instead incorporate the  
38207 declaration by including **<time.h>**.

38208 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

### 38209 RATIONALE

38210 In standard locales, the conversion specifications %c, %x, and %X do not include unsupported  
38211 conversion specifiers and so the text regarding results being undefined is not a problem in that  
38212 case.

### 38213 FUTURE DIRECTIONS

38214 None.

### 38215 SEE ALSO

38216 *ctime()*, *localtime()*, *setlocale()*, *strftime()*, *times()*

38217 XBD **<time.h>**

### 38218 CHANGE HISTORY

38219 First released in Issue 4, Version 2.

**Issue 5**

- 38220 Moved from X/OPEN UNIX extension to BASE.
- 38221
- 38222 The last paragraph of the DESCRIPTION is added.
- 38223 The %C conversion specification is added, and the exact meaning of the %y conversion  
38224 specification is clarified in the DESCRIPTION.
- 38225 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 38226 The %R conversion specification is changed to follow historical practice.

**Issue 6**

- 38227 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since  
38228 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*  
38229 functions.
- 38230
- 38231 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 38232 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors  
38233 for consistency with other functions.

**Issue 7**

- 38234 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 38235
- 38236 The description of the *getdate\_err* value is expanded.
- 38237 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0152 [796] is applied.

**Issue 8**

- 38238 Austin Group Defect 1307 is applied, changing the %r conversion in relation to locales that do  
38239 not support the 12-hour clock format.
- 38240

38241 **NAME**38242 getdelim, getline — read a delimited record from *stream*38243 **SYNOPSIS**

```
38244 CX #include <stdio.h>
38245     ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
38246                   int delimiter, FILE *restrict stream);
38247     ssize_t getline(char **restrict lineptr, size_t *restrict n,
38248                   FILE *restrict stream);
```

38249 **DESCRIPTION**

38250 The *getdelim()* function shall read from *stream* until it encounters a character matching the  
 38251 *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall  
 38252 ensure is a character representable as an **unsigned char** of equal value that terminates the read  
 38253 process. If the *delimiter* argument has any other value, the behavior is undefined.

38254 The application shall ensure that *\*lineptr* is a valid argument that could be passed to the *free()*  
 38255 function. If *\*n* is non-zero, the application shall ensure that *\*lineptr* either points to an object of  
 38256 size at least *\*n* bytes, or is a null pointer.

38257 If *\*lineptr* is a null pointer or if the object pointed to by *\*lineptr* is of insufficient size, an object  
 38258 shall be allocated as if by *malloc()* or the object shall be reallocated as if by *realloc()*, respectively,  
 38259 such that the object is large enough to hold the characters to be written to it, including the  
 38260 terminating NUL, and *\*n* shall be set to the new size. If the object was allocated, or if the  
 38261 reallocation operation moved the object, *\*lineptr* shall be updated to point to the new object or  
 38262 new location. The characters read, including any delimiter, shall be stored in the object, and a  
 38263 terminating NUL added when the delimiter or end-of-file is encountered.

38264 The *getline()* function shall be equivalent to the *getdelim()* function with the *delimiter* character  
 38265 equal to the <newline> character.

38266 The *getdelim()* and *getline()* functions may mark the last data access timestamp of the file  
 38267 associated with *stream* for update. The last data access timestamp shall be marked for update by  
 38268 the first successful execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*,  
 38269 *getline()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

38270 **RETURN VALUE**

38271 Upon successful completion, the *getline()* and *getdelim()* functions shall return the number of  
 38272 bytes written into the buffer, including the delimiter character if one was encountered before  
 38273 EOF, but excluding the terminating NUL character. If the end-of-file indicator for the stream is  
 38274 set, or if no characters were read and the stream is at end-of-file, the end-of-file indicator for the  
 38275 stream shall be set and the function shall return  $-1$ . If an error occurs, the error indicator for the  
 38276 stream shall be set, and the function shall return  $-1$  and set *errno* to indicate the error.

38277 **ERRORS**

38278 For the conditions under which the *getdelim()* and *getline()* functions shall fail and may fail, refer  
 38279 to *fgetc()*.

38280 In addition, these functions shall fail if:

38281 [EINVAL] *lineptr* or *n* is a null pointer.

38282 [ENOMEM] Insufficient memory is available.

38283 These functions may fail if:

38284 [EOVERFLOW] The number of bytes to be written into the buffer, including the delimiter  
38285 character (if encountered), would exceed {SSIZE\_MAX}.

### 38286 EXAMPLES

```
38287 #include <stdio.h>
38288 #include <stdlib.h>
38289 int main(void)
38290 {
38291     FILE *fp;
38292     char *line = NULL;
38293     size_t len = 0;
38294     ssize_t read;
38295     fp = fopen("/etc/motd", "r");
38296     if (fp == NULL)
38297         exit(1);
38298     while ((read = getline(&line, &len, fp)) != -1) {
38299         printf("Retrieved line of length %zu :\n", read);
38300         printf("%s", line);
38301     }
38302     if (ferror(fp)) {
38303         /* handle error */
38304     }
38305     free(line);
38306     fclose(fp);
38307     return 0;
38308 }
```

### 38309 APPLICATION USAGE

38310 Setting *\*lineptr* to a null pointer and *\*n* to zero are allowed and a recommended way to start  
38311 parsing a file.

38312 The *ferror()* or *feof()* functions should be used to distinguish between an error condition and an  
38313 end-of-file condition.

38314 Although a null terminator is always supplied after the line, note that *strlen(\*lineptr)* will be  
38315 smaller than the return value if the line contains embedded NUL characters.

### 38316 RATIONALE

38317 These functions are widely used to solve the problem that the *fgets()* function has with long  
38318 lines. The functions automatically enlarge the target buffers if needed. These are especially  
38319 useful since they reduce code needed for applications.

### 38320 FUTURE DIRECTIONS

38321 None.

### 38322 SEE ALSO

38323 [Section 2.5](#) (on page 521), *fgetc()*, *fgets()*, *free()*, *malloc()*, *realloc()*

38324 XBD [<stdio.h>](#)

### 38325 CHANGE HISTORY

38326 First released in Issue 7.

38327 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0237 [14] is applied.

38328 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0153 [569], XSH/TC2-2008/0154 [571],  
38329 and XSH/TC2-2008/0155 [570] are applied.

38330 **Issue 8**

38331 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

38332 Austin Group Defect 1621 is applied, changing ``NUL terminator'' to ``null terminator''.

**38333 NAME**

38334 getegid — get the effective group ID

**38335 SYNOPSIS**

38336 #include <unistd.h>  
38337 gid\_t getegid(void);

**38338 DESCRIPTION**

38339 The *getegid()* function shall return the effective group ID of the calling process. The *getegid()*  
38340 function shall not modify *errno*.

**38341 RETURN VALUE**

38342 The *getegid()* function shall always be successful and no return value is reserved to indicate an  
38343 error.

**38344 ERRORS**

38345 No errors are defined.

**38346 EXAMPLES**

38347 None.

**38348 APPLICATION USAGE**

38349 None.

**38350 RATIONALE**

38351 In a conforming environment, *getegid()* will always succeed. It is possible for implementations to  
38352 provide an extension where a process in a non-conforming environment will not be associated  
38353 with a user or group ID. It is recommended that such implementations return (**gid\_t**)-1 and set  
38354 *errno* to indicate such an environment; doing so does not violate this standard, since such an  
38355 environment is already an extension.

**38356 FUTURE DIRECTIONS**

38357 None.

**38358 SEE ALSO**

38359 *geteuid()*, *getgid()*, *getresgid()*, *getresuid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*,  
38360 *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*

38361 XBD <[sys/types.h](#)>, <[unistd.h](#)>

**38362 CHANGE HISTORY**

38363 First released in Issue 1. Derived from Issue 1 of the SVID.

**38364 Issue 6**

38365 In the SYNOPSIS, the optional include of the <[sys/types.h](#)> header is removed.

38366 The following new requirements on POSIX implementations derive from alignment with the  
38367 Single UNIX Specification:

- 38368 • The requirement to include <[sys/types.h](#)> has been removed. Although <[sys/types.h](#)> was  
38369 required for conforming implementations of previous POSIX specifications, it was not  
38370 required for UNIX applications.

**38371 Issue 7**

38372 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0156 [511] is applied.

38373 **Issue 8**

38374

38375

Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to SEE ALSO.

38376 **NAME**38377 `getentropy` — fill a buffer with random bytes38378 **SYNOPSIS**38379 `#include <unistd.h>`38380 `int getentropy(void *buffer, size_t length);`38381 **DESCRIPTION**

38382 The `getentropy()` function shall write *length* bytes of data starting at the location pointed to by  
38383 *buffer*. The output shall be unpredictable high quality random data, generated by a  
38384 cryptographically secure pseudo-random number generator. The maximum permitted value for  
38385 the *length* argument is given by the {GETENTROPY\_MAX} symbolic constant defined in  
38386 `<limits.h>`.

38387 A successful call to `getentropy()` shall always provide the requested number of bytes of entropy.

38388 **RETURN VALUE**

38389 Upon successful completion, `getentropy()` shall return 0; otherwise, `-1` shall be returned and  
38390 *errno* set to indicate the error.

38391 **ERRORS**

38392 The `getentropy()` function shall fail if:

38393 [EINVAL] The value of *length* is greater than {GETENTROPY\_MAX}.

38394 The `getentropy()` function may fail if:

38395 [ENOSYS] The system does not provide the necessary source of entropy.

38396 **EXAMPLES**

38397 None.

38398 **APPLICATION USAGE**

38399 The intended use of this function is to create a seed for other pseudo-random number  
38400 generators.

38401 **RATIONALE**

38402 The `getentropy()` function is not a cancellation point. (See [Section 2.9.5.2](#) (on page 543).)

38403 **FUTURE DIRECTIONS**

38404 None.

38405 **SEE ALSO**

38406 `drand48()`, `initstate()`, `rand()`

38407 XBD `<limits.h>`, `<unistd.h>`

38408 **CHANGE HISTORY**

38409 First released in Issue 8.

38410 **NAME**

38411            getenv, secure\_getenv — get value of an environment variable

38412 **SYNOPSIS**

38413            #include &lt;stdlib.h&gt;

38414            char \*getenv(const char \*name);

38415 CX         char \*secure\_getenv(const char \*name);

38416 **DESCRIPTION**38417 CX         The functionality described on this reference page is aligned with the ISO C standard. Any  
38418 conflict between the requirements described here and the ISO C standard is unintentional. This  
38419 volume of POSIX.1-2024 defers to the ISO C standard.38420         The *getenv()* function shall search the environment of the calling process (see XBD [Chapter 8](#), on  
38421 page 167) for the environment variable *name* if it exists and return a pointer to the value of the  
38422 environment variable. If the specified environment variable cannot be found, a null pointer shall  
38423 be returned. The application shall ensure that it does not modify the string pointed to by the  
38424 CX         *getenv()* function, unless it is part of a modifiable object previously placed in the environment  
38425 by assigning a new value to *environ*  
38426 XSI         or by using *putenv()*.38427 CX         The pointer returned by *getenv()* shall point to a string within the environment data pointed to  
38428 by *environ*.38429         **Note:**         This requirement is an extension to the ISO C standard, which allows *getenv()* to copy the data  
38430 to an internal buffer.38431         The *secure\_getenv()* function shall be equivalent to *getenv()*, except that it shall return a null  
38432 pointer if the calling process does not meet all of the following security criteria:

- 38433            1. The effective user ID and real user ID of the calling process were equal during program
- 
- 38434 startup.
- 
- 38435            2. The effective group ID and real group ID of the calling process were equal during
- 
- 38436 program startup.
- 
- 38437            3. Additional implementation-defined security criteria.

38438 **RETURN VALUE**38439         Upon successful completion, *getenv()* shall return a pointer to a string containing the value for  
38440 the specified *name*. If the specified *name* cannot be found in the environment of the calling  
38441 process, a null pointer shall be returned.38442 CX         Upon successful completion, *secure\_getenv()* shall return a pointer to a string containing the  
38443 value for the specified *name*. If the specified *name* cannot be found in the environment of the  
38444 calling process, or the calling process does not meet the security criteria listed in DESCRIPTION,  
38445 a null pointer shall be returned.38446 **ERRORS**

38447         No errors are defined.

38448 **EXAMPLES**38449 **Getting the Value of an Environment Variable**

38450 The following example gets the value of the *HOME* environment variable.

```
38451 #include <stdlib.h>
38452 ...
38453 const char *name = "HOME";
38454 char *value;
38455 value = getenv(name);
```

38456 **APPLICATION USAGE**

38457 None.

38458 **RATIONALE**

38459 The *clearenv()* function was considered but rejected. The *putenv()* function has now been  
38460 included for alignment with the Single UNIX Specification.

38461 Some earlier versions of this standard did not require *getenv()* to be thread-safe because it was  
38462 allowed to return a value pointing to an internal buffer. However, this behavior allowed by the  
38463 ISO C standard is no longer allowed by POSIX.1. POSIX.1 requires the environment data to be  
38464 available through *environ[]*, so there is no reason why *getenv()* can't return a pointer to the actual  
38465 data instead of a copy. Therefore *getenv()* is now required to be thread-safe (except when  
38466 another thread modifies the environment).

38467 Conforming applications are required not to directly modify the pointers to which *environ*  
38468 points, but to use only the *setenv()*, *unsetenv()*, and *putenv()* functions, or assignment to *environ*  
38469 itself, to manipulate the process environment. This constraint allows the implementation to  
38470 properly manage the memory it allocates. This enables the implementation to free any space it  
38471 has allocated to strings (and perhaps the pointers to them) stored in *environ* when *unsetenv()* is  
38472 called. A C runtime start-up procedure (that which invokes *main()* and perhaps initializes  
38473 *environ*) can also initialize a flag indicating that none of the environment has yet been copied to  
38474 allocated storage, or that the separate table has not yet been initialized. If the application  
38475 switches to a complete new environment by assigning a new value to *environ*, this can be  
38476 detected by *getenv()*, *setenv()*, *unsetenv()*, or *putenv()* and the implementation can at that point  
38477 reinitialize based on the new environment. (This may include copying the environment strings  
38478 into a new array and assigning *environ* to point to it.)

38479 In fact, for higher performance of *getenv()*, implementations that do not provide *putenv()* could  
38480 also maintain a separate copy of the environment in a data structure that could be searched  
38481 much more quickly (such as an indexed hash table, or a binary tree), and update both it and the  
38482 linear list at *environ* when *setenv()* or *unsetenv()* is invoked. On implementations that do provide  
38483 *putenv()*, such a copy might still be worthwhile but would need to allow for the fact that  
38484 applications can directly modify the content of environment strings added with *putenv()*. For  
38485 example, if an environment string found by searching the copy is one that was added using  
38486 *putenv()*, the implementation would need to check that the string in *environ* still has the same  
38487 name (and value, if the copy includes values), and whenever searching the copy produces no  
38488 match the implementation would then need to search each environment string in *environ* that  
38489 was added using *putenv()* in case any of them have changed their names and now match. Thus,  
38490 each use of *putenv()* to add to the environment would reduce the speed advantage of having the  
38491 copy.

38492 Performance of *getenv()* can be important for applications which have large numbers of  
38493 environment variables. Typically, applications like this use the environment as a resource

38494 database of user-configurable parameters. The fact that these variables are in the user's shell  
38495 environment usually means that any other program that uses environment variables (such as *ls*,  
38496 which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC\_ALL*, and so on) is  
38497 similarly slowed down by the linear search through the variables.

38498 An implementation that maintains separate data structures, or even one that manages the  
38499 memory it consumes, is not currently required as it was thought it would reduce consensus  
38500 among implementors who do not want to change their historical implementations.

#### 38501 **FUTURE DIRECTIONS**

38502 None.

#### 38503 **SEE ALSO**

38504 *exec*, *putenv()*, *setenv()*, *unsetenv()*

38505 XBD Chapter 8 (on page 167), `<stdlib.h>`

#### 38506 **CHANGE HISTORY**

38507 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 38508 **Issue 5**

38509 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
38510 VALUE section.

38511 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

#### 38512 **Issue 6**

38513 The following changes were made to align with the IEEE P1003.1a draft standard:

- 38514 • References added to the new *setenv()* and *unsetenv()* functions.

38515 The normative text is updated to avoid use of the term "must" for application requirements.

#### 38516 **Issue 7**

38517 Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv()* may  
38518 also cause the string to be overwritten.

38519 Austin Group Interpretation 1003.1-2001 #148 is applied, adding the FUTURE DIRECTIONS.

38520 Austin Group Interpretation 1003.1-2001 #156 is applied.

38521 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0238 [75,428], XSH/TC1-2008/0239  
38522 [167], and XSH/TC1-2008/0240 [167] are applied.

38523 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0157 [656] is applied.

#### 38524 **Issue 8**

38525 Austin Group Defects 188 and 1394 are applied, changing *getenv()* to be thread-safe.

38526 Austin Group Defect 922 is applied, adding the *secure\_getenv()* function.

38527 **NAME**

38528           geteuid — get the effective user ID

38529 **SYNOPSIS**

38530           #include <unistd.h>

38531           uid\_t geteuid(void);

38532 **DESCRIPTION**

38533           The *geteuid()* function shall return the effective user ID of the calling process. The *geteuid()*  
38534           function shall not modify *errno*.

38535 **RETURN VALUE**

38536           The *geteuid()* function shall always be successful and no return value is reserved to indicate an  
38537           error.

38538 **ERRORS**

38539           No errors are defined.

38540 **EXAMPLES**

38541           None.

38542 **APPLICATION USAGE**

38543           None.

38544 **RATIONALE**

38545           In a conforming environment, *geteuid()* will always succeed. It is possible for implementations  
38546           to provide an extension where a process in a non-conforming environment will not be associated  
38547           with a user or group ID. It is recommended that such implementations return **(uid\_t)-1** and set  
38548           *errno* to indicate such an environment; doing so does not violate this standard, since such an  
38549           environment is already an extension.

38550 **FUTURE DIRECTIONS**

38551           None.

38552 **SEE ALSO**

38553           *getegid()*, *getgid()*, *getresgid()*, *getresuid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*,  
38554           *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*

38555           XBD <[sys/types.h](#)>, <[unistd.h](#)>

38556 **CHANGE HISTORY**

38557           First released in Issue 1. Derived from Issue 1 of the SVID.

38558 **Issue 6**

38559           In the SYNOPSIS, the optional include of the <[sys/types.h](#)> header is removed.

38560           The following new requirements on POSIX implementations derive from alignment with the  
38561           Single UNIX Specification:

- 38562           • The requirement to include <[sys/types.h](#)> has been removed. Although <[sys/types.h](#)> was  
38563           required for conforming implementations of previous POSIX specifications, it was not  
38564           required for UNIX applications.

38565 **Issue 7**

38566           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0158 [511] is applied.

38567 **Issue 8**

38568

38569

Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to SEE ALSO.

38570 **NAME**

38571 getgid — get the real group ID

38572 **SYNOPSIS**

38573 #include &lt;unistd.h&gt;

38574 gid\_t getgid(void);

38575 **DESCRIPTION**38576 The *getgid()* function shall return the real group ID of the calling process. The *getgid()* function  
38577 shall not modify *errno*.38578 **RETURN VALUE**38579 The *getgid()* function shall always be successful and no return value is reserved to indicate an  
38580 error.38581 **ERRORS**

38582 No errors are defined.

38583 **EXAMPLES**

38584 None.

38585 **APPLICATION USAGE**

38586 None.

38587 **RATIONALE**38588 In a conforming environment, *getgid()* will always succeed. It is possible for implementations to  
38589 provide an extension where a process in a non-conforming environment will not be associated  
38590 with a user or group ID. It is recommended that such implementations return (**gid\_t**)-1 and set  
38591 *errno* to indicate such an environment; doing so does not violate this standard, since such an  
38592 environment is already an extension.38593 **FUTURE DIRECTIONS**

38594 None.

38597 *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*38598 XBD <[sys/types.h](#)>, <[unistd.h](#)>38599 **CHANGE HISTORY**

38600 First released in Issue 1. Derived from Issue 1 of the SVID.

38601 **Issue 6**38602 In the SYNOPSIS, the optional include of the <[sys/types.h](#)> header is removed.38603 The following new requirements on POSIX implementations derive from alignment with the  
38604 Single UNIX Specification:

- 38605
- The requirement to include <[sys/types.h](#)> has been removed. Although <[sys/types.h](#)> was  
38606 required for conforming implementations of previous POSIX specifications, it was not  
38607 required for UNIX applications.

38608 **Issue 7**

38609 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0159 [511] is applied.

38610 **Issue 8**

38611

38612

Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to SEE ALSO.

38613 **NAME**

38614       getgrent — get the group database entry

38615 **SYNOPSIS**

```
38616 XSI       #include <grp.h>  
38617       struct group *getgrent(void);
```

38618 **DESCRIPTION**38619       Refer to *endgrent()*.

38620 **NAME**

38621 getgrgid, getgrgid\_r — get group database entry for a group ID

38622 **SYNOPSIS**

```
38623 #include <grp.h>
38624 struct group *getgrgid(gid_t gid);
38625 int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
38626               size_t bufsize, struct group **result);
```

38627 **DESCRIPTION**38628 The *getgrgid()* function shall search the group database for an entry with a matching *gid*.38629 The *getgrgid()* function need not be thread-safe.38630 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*.  
38631 If *getgrgid()* returns a null pointer and *errno* is set to non-zero, an error occurred.

38632 The *getgrgid\_r()* function shall update the **group** structure pointed to by *grp* and store a pointer  
38633 to that structure at the location pointed to by *result*. The structure shall contain an entry from  
38634 the group database with a matching *gid*. Storage referenced by the group structure is allocated  
38635 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to  
38636 *sysconf(\_SC\_GETGR\_R\_SIZE\_MAX)* returns either  $-1$  without changing *errno* or an initial value  
38637 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to  
38638 by *result* on error or if the requested entry is not found.

38639 **RETURN VALUE**

38640 Upon successful completion, *getgrgid()* shall return a pointer to a **struct group** with the structure  
38641 defined in **<grp.h>** with a matching entry if one is found. The *getgrgid()* function shall return a  
38642 null pointer if either the requested entry was not found, or an error occurred. If the requested  
38643 entry was not found, *errno* shall not be changed. On error, *errno* shall be set to indicate the error.

38644 The application shall not modify the structure to which the return value points, nor any storage  
38645 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
38646 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
38647 subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*. The returned pointer, and pointers  
38648 within the structure, might also be invalidated if the calling thread is terminated.

38649 If successful, the *getgrgid\_r()* function shall return zero; otherwise, an error number shall be  
38650 returned to indicate the error.38651 **ERRORS**38652 The *getgrgid()* and *getgrgid\_r()* functions may fail if:

- |       |          |  |
|-------|----------|--|
| 38653 | [EIO]    | An I/O error has occurred.   |
| 38654 | [EINTR]  | A signal was caught during <i>getgrgid()</i> .                         |
| 38655 | [EMFILE] | All file descriptors available to the process are currently open.      |
| 38656 | [ENFILE] | The maximum allowable number of files is currently open in the system. |

38657 The *getgrgid\_r()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 38658 | [ERANGE] | Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be<br>38659 referenced by the resulting <b>group</b> structure. |
|-------|----------|---|

38660 **EXAMPLES**

38661 Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size  
 38662 of the buffer needed to store all the groups returned. This example shows how an application  
 38663 can allocate a buffer of sufficient size to work with `getgr_r()`.

```

38664 long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
38665 size_t len;
38666 if (initlen == -1)
38667     /* Default initial length. */
38668     len = 1024;
38669 else
38670     len = (size_t) initlen;
38671 struct group result;
38672 struct group *resultp;
38673 char *buffer = malloc(len);
38674 if (buffer == NULL)
38675     ...handle error...
38676 int e;
38677 while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
38678     {
38679     size_t newlen = 2 * len;
38680     if (newlen < len)
38681         ...handle error...
38682     len = newlen;
38683     char *newbuffer = realloc(buffer, len);
38684     if (newbuffer == NULL)
38685         ...handle error...
38686     buffer = newbuffer;
38687     }
38688 if (e != 0)
38689     ...handle error...
38690 free (buffer);

```

38691 **Finding an Entry in the Group Database**

38692 The following example uses `getgrgid()` to search the group database for a group ID that was  
 38693 previously stored in a `stat` structure, then prints out the group name if it is found. If the group is  
 38694 not found, the program prints the numeric value of the group for the entry.

```

38695 #include <sys/types.h>
38696 #include <grp.h>
38697 #include <stdio.h>
38698 ...
38699 struct stat statbuf;
38700 struct group *grp;
38701 ...
38702 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
38703     printf(" %-8.8s", grp->gr_name);
38704 else
38705     printf(" %-8d", statbuf.st_gid);
38706 ...

```

38707 **APPLICATION USAGE**

38708 The `getgrgid_r()` function is thread-safe and shall return values in a user-supplied buffer instead  
 38709 of possibly using a static data area that may be overwritten by each call.

38710 Portable applications should take into account that it is usual for an implementation to return `-1`  
 38711 from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

38712 **RATIONALE**

38713 None.

38714 **FUTURE DIRECTIONS**

38715 None.

38716 **SEE ALSO**

38717 `endgrent()`, `getgrnam()`, `sysconf()`

38718 XBD `<grp.h>`, `<sys/types.h>`

38719 **CHANGE HISTORY**

38720 First released in Issue 1. Derived from System V Release 2.0.

38721 **Issue 5**

38722 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 38723 VALUE section.

38724 The `getgrgid_r()` function is included for alignment with the POSIX Threads Extension.

38725 A note indicating that the `getgrgid()` function need not be reentrant is added to the  
 38726 DESCRIPTION.

38727 **Issue 6**

38728 The `getgrgid_r()` function is marked as part of the Thread-Safe Functions option.

38729 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
 38730 describing matching the `gid`.

38731 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

38732 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

38733 The following new requirements on POSIX implementations derive from alignment with the  
 38734 Single UNIX Specification:

38735 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 38736 required for conforming implementations of previous POSIX specifications, it was not  
 38737 required for UNIX applications.

38738 • In the RETURN VALUE section, the requirement to set `errno` on error is added.

38739 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

38740 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 38741 its avoidance of possibly using a static data area.

38742 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
 38743 buffer from `bufsize` characters to bytes.

38744 **Issue 7**

38745 Austin Group Interpretation 1003.1-2001 #156 is applied.

38746 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

38747 SD5-XSH-ERN-166 is applied.

- 38748 The `getgrgid_r()` function is moved from the Thread-Safe Functions option to the Base.
- 38749 A minor addition is made to the EXAMPLES section, reminding the application developer to  
38750 free memory allocated as if by `malloc()`.
- 38751 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0241 [75] is applied.
- 38752 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0160 [808], XSH/TC2-2008/0161 [808],  
38753 XSH/TC2-2008/0162 [656], and XSH/TC2-2008/0163 [808] are applied.
- 38754 **Issue 8**
- 38755 Austin Group Defect 398 is applied, changing the [ERANGE] error from “may fail” to “shall  
38756 fail”.
- 38757 Austin Group Defect 1570 is applied, removing extra spacing in “==”.

38758 **NAME**

38759 getgrnam, getgrnam\_r — search group database for a name

38760 **SYNOPSIS**

```
38761 #include <grp.h>
38762 struct group *getgrnam(const char *name);
38763 int getgrnam_r(const char *name, struct group *grp, char *buffer,
38764 size_t bufsize, struct group **result);
```

38765 **DESCRIPTION**38766 The *getgrnam()* function shall search the group database for an entry with a matching *name*.38767 The *getgrnam()* function need not be thread-safe.38768 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam()*.  
38769 If *getgrnam()* returns a null pointer and *errno* is set to non-zero, an error occurred.

38770 The *getgrnam\_r()* function shall update the **group** structure pointed to by *grp* and store a pointer  
38771 to that structure at the location pointed to by *result*. The structure shall contain an entry from  
38772 the group database with a matching *name*. Storage referenced by the **group** structure is allocated  
38773 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to  
38774 *sysconf(\_SC\_GETGR\_R\_SIZE\_MAX)* returns either  $-1$  without changing *errno* or an initial value  
38775 suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result*  
38776 on error or if the requested entry is not found.

38777 **RETURN VALUE**

38778 The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in  
38779 **<grp.h>** with a matching entry if one is found. The *getgrnam\_r()* function shall return a null  
38780 pointer if either the requested entry was not found, or an error occurred. If the requested entry  
38781 was not found, *errno* shall not be changed. On error, *errno* shall be set to indicate the error.

38782 The application shall not modify the structure to which the return value points, nor any storage  
38783 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
38784 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
38785 subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*. The returned pointer, and pointers  
38786 within the structure, might also be invalidated if the calling thread is terminated.

38787 The *getgrnam\_r()* function shall return zero on success or if the requested entry was not found  
38788 and no error has occurred. If any error has occurred, an error number shall be returned to  
38789 indicate the error.

38790 **ERRORS**38791 The *getgrnam()* and *getgrnam\_r()* functions may fail if:

- |       |          |  |
|-------|----------|--|
| 38792 | [EIO]    | An I/O error has occurred.   |
| 38793 | [EINTR]  | A signal was caught during <i>getgrnam()</i> .                         |
| 38794 | [EMFILE] | All file descriptors available to the process are currently open.      |
| 38795 | [ENFILE] | The maximum allowable number of files is currently open in the system. |

38796 The *getgrnam\_r()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 38797 | [ERANGE] | Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be<br>38798 referenced by the resulting <b>group</b> structure. |
|-------|----------|---|

**EXAMPLES**

38799 Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size  
 38800 of the buffer needed to store all the groups returned. This example shows how an application  
 38801 can allocate a buffer of sufficient size to work with `getgrnam_r()`.  
 38802

```

38803 long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
38804 size_t len;
38805 if (initlen == -1)
38806     /* Default initial length. */
38807     len = 1024;
38808 else
38809     len = (size_t) initlen;
38810 struct group result;
38811 struct group *resultp;
38812 char *buffer = malloc(len);
38813 if (buffer == NULL)
38814     ...handle error...
38815 int e;
38816 while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
38817     == ERANGE)
38818     {
38819         size_t newlen = 2 * len;
38820         if (newlen < len)
38821             ...handle error...
38822         len = newlen;
38823         char *newbuffer = realloc(buffer, len);
38824         if (newbuffer == NULL)
38825             ...handle error...
38826         buffer = newbuffer;
38827     }
38828 if (e != 0)
38829     ...handle error...
38830 free (buffer);

```

**APPLICATION USAGE**

38831 The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead  
 38832 of possibly using a static data area that may be overwritten by each call.  
 38833

38834 Portable applications should take into account that it is usual for an implementation to return `-1`  
 38835 from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

**RATIONALE**

38836 None.  
 38837

**FUTURE DIRECTIONS**

38838 None.  
 38839

**SEE ALSO**

38843 **CHANGE HISTORY**

38844 First released in Issue 1. Derived from System V Release 2.0.

38845 **Issue 5**38846 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
38847 VALUE section.38848 The `getgrnam_r()` function is included for alignment with the POSIX Threads Extension.38849 A note indicating that the `getgrnam()` function need not be reentrant is added to the  
38850 DESCRIPTION.38851 **Issue 6**38852 The `getgrnam_r()` function is marked as part of the Thread-Safe Functions option.

38853 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

38854 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.38855 The following new requirements on POSIX implementations derive from alignment with the  
38856 Single UNIX Specification:38857 

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
38858 required for conforming implementations of previous POSIX specifications, it was not  
38859 required for UNIX applications.

38860 

- In the RETURN VALUE section, the requirement to set `errno` on error is added.

38861 

- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

38862 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
38863 its avoidance of possibly using a static data area.38864 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
38865 buffer from `bufsize` characters to bytes.38866 **Issue 7**

38867 Austin Group Interpretation 1003.1-2001 #081 is applied, clarifying the RETURN VALUE section.

38868 Austin Group Interpretation 1003.1-2001 #156 is applied.

38869 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

38870 SD5-XSH-ERN-166 is applied.

38871 The `getgrnam_r()` function is moved from the Thread-Safe Functions option to the Base.38872 A minor addition is made to the EXAMPLES section, reminding the application developer to  
38873 free memory allocated as if by `malloc()`.

38874 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0242 [75] is applied.

38875 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0164 [808], XSH/TC2-2008/0165 [808],  
38876 XSH/TC2-2008/0166 [656], and XSH/TC2-2008/0167 [808] are applied.38877 **Issue 8**38878 Austin Group Defect 398 is applied, changing the [ERANGE] error from “may fail” to “shall  
38879 fail”.

38880 Austin Group Defect 1570 is applied, removing extra spacing in “==”.

38881 **NAME**

38882 getgroups — get supplementary group IDs

38883 **SYNOPSIS**

38884 #include &lt;unistd.h&gt;

38885 int getgroups(int *gidsetsize*, gid\_t *grouplist*[]);38886 **DESCRIPTION**

38887 The *getgroups()* function shall fill in the array *grouplist* with the current supplementary group  
 38888 IDs of the calling process. It is implementation-defined whether *getgroups()* also returns the  
 38889 effective group ID in the *grouplist* array.

38890 The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual  
 38891 number of group IDs stored in the array shall be returned. The values of array entries with  
 38892 indices greater than or equal to the value returned are undefined.

38893 If *gidsetsize* is 0, *getgroups()* shall return the number of group IDs that it would otherwise return  
 38894 without modifying the array pointed to by *grouplist*.

38895 If the effective group ID of the process is returned with the supplementary group IDs, the value  
 38896 returned shall always be greater than or equal to one and less than or equal to the value of  
 38897 {NGROUPS\_MAX}+1.

38898 **RETURN VALUE**

38899 Upon successful completion, the number of supplementary group IDs shall be returned. A  
 38900 return value of -1 indicates failure and *errno* shall be set to indicate the error.

38901 **ERRORS**38902 The *getgroups()* function shall fail if:

38903 [EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs  
 38904 that would have been returned.

38905 **EXAMPLES**38906 **Getting the Supplementary Group IDs of the Calling Process**

38907 The following example places the current supplementary group IDs of the calling process into  
 38908 the *group* array.

```
38909 #include <sys/types.h>
38910 #include <unistd.h>
38911 ...
38912 gid_t *group;
38913 int ngroups;
38914 long ngroups_max;

38915 ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
38916 group = (gid_t *)malloc(ngroups_max *sizeof(gid_t));

38917 ngroups = getgroups(ngroups_max, group);
```

38918 **APPLICATION USAGE**

38919 None.

38920 **RATIONALE**

38921 The related function *setgroups()* is a privileged operation and therefore is not covered by this  
 38922 volume of POSIX.1-2024.

38923 As implied by the definition of supplementary groups, the effective group ID may appear in the

38924 array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but  
38925 the application needs to call *getegid()* to be sure of getting all of the information. Various  
38926 implementation variations and administrative sequences cause the set of groups appearing in  
38927 the result of *getgroups()* to vary in order and as to whether the effective group ID is included,  
38928 even when the set of groups is the same (in the mathematical sense of “set”). (The history of a  
38929 process and its parents could affect the details of the result.)

38930 Application developers should note that {NGROUPS\_MAX} is not necessarily a constant on all  
38931 implementations.

#### 38932 FUTURE DIRECTIONS

38933 None.

#### 38934 SEE ALSO

38935 *getegid()*, *setgid()*

38936 XBD <sys/types.h>, <unistd.h>

#### 38937 CHANGE HISTORY

38938 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 38939 Issue 5

38940 Normative text previously in the APPLICATION USAGE section is moved to the  
38941 DESCRIPTION.

#### 38942 Issue 6

38943 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

38944 The following new requirements on POSIX implementations derive from alignment with the  
38945 Single UNIX Specification:

38946 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
38947 required for conforming implementations of previous POSIX specifications, it was not  
38948 required for UNIX applications.

38949 • A return value of 0 is not permitted, because {NGROUPS\_MAX} cannot be 0. This is a FIPS  
38950 requirement.

38951 The following changes were made to align with the IEEE P1003.1a draft standard:

38952 • An explanation is added that the effective group ID may be included in the supplementary  
38953 group list.

#### 38954 Issue 8

38955 Austin Group Defect 1400 is applied, changing the EXAMPLES section.

38956 **NAME**  
38957       gethostent — network host database functions

38958 **SYNOPSIS**  
38959       #include <netdb.h>  
38960       struct hostent \*gethostent(void);

38961 **DESCRIPTION**  
38962       Refer to *endhostent()*.

38963 **NAME**  
38964       gethostid — get an identifier for the current host

38965 **SYNOPSIS**

```
38966 XSI       #include <unistd.h>  
38967       long gethostid(void);
```

38968 **DESCRIPTION**

38969       The *gethostid()* function shall retrieve a 32-bit identifier for the current host.

38970 **RETURN VALUE**

38971       Upon successful completion, *gethostid()* shall return an identifier for the current host.

38972 **ERRORS**

38973       No errors are defined.

38974 **EXAMPLES**

38975       None.

38976 **APPLICATION USAGE**

38977       This volume of POSIX.1-2024 does not define the domain in which the return value is unique.

38978 **RATIONALE**

38979       None.

38980 **FUTURE DIRECTIONS**

38981       None.

38985 **CHANGE HISTORY**

38986       First released in Issue 4, Version 2.

38987 **Issue 5**

38988       Moved from X/OPEN UNIX extension to BASE.

**38989 NAME**

38990           gethostname — get name of current host

**38991 SYNOPSIS**

38992           #include <unistd.h>

38993           int gethostname(char \*name, size\_t namelen);

**38994 DESCRIPTION**

38995           The *gethostname()* function shall return the standard host name for the current machine. The  
38996           *namelen* argument shall specify the size of the array pointed to by the *name* argument. The  
38997           returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold  
38998           the host name, then the returned name shall be truncated and it is unspecified whether the  
38999           returned name is null-terminated.

39000           Host names are limited to {HOST\_NAME\_MAX} bytes.

**39001 RETURN VALUE**

39002           Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned.

**39003 ERRORS**

39004           No errors are defined.

**39005 EXAMPLES**

39006           None.

**39007 APPLICATION USAGE**

39008           None.

**39009 RATIONALE**

39010           None.

**39011 FUTURE DIRECTIONS**

39012           None.

**39013 SEE ALSO**

39014           [\*gethostid\(\)\*](#), [\*uname\(\)\*](#)

39015           XBD [\*\*<unistd.h>\*\*](#)

**39016 CHANGE HISTORY**

39017           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39018           The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from  
39019           **socklen\_t** to **size\_t**.

39020 **NAME**

39021            getline — read a delimited record from *stream*

39022 **SYNOPSIS**

```
39023 CX        #include <stdio.h>
39024            ssize_t getline(char **restrict lineptr, size_t *restrict n,
39025            FILE *restrict stream);
```

39026 **DESCRIPTION**

39027            Refer to *getdelim()*.

39028 **NAME**

39029 getlocalename\_l — get a locale name from a locale object

39030 **SYNOPSIS**

```
39031 CX #include <locale.h>
39032 const char *getlocalename_l(int category, locale_t locobj);
```

39033 **DESCRIPTION**

39034 If *category* is not LC\_ALL, the *getlocalename\_l()* function shall return the locale name for the  
 39035 given locale category of the locale object *locobj*, or of the global locale if *locobj* is the special locale  
 39036 object LC\_GLOBAL\_LOCALE.

39037 If *category* is LC\_ALL, the *getlocalename\_l()* function shall return a string that encodes the locale  
 39038 settings for all locale categories of the locale object *locobj*, or of the global locale if *locobj* is the  
 39039 special locale object LC\_GLOBAL\_LOCALE, in the same form as is returned by *setlocale()*. The  
 39040 string returned is such that a subsequent call to *setlocale()*, from the same process, with a pointer  
 39041 to that string as *locale* and the LC\_ALL *category* shall set the global locale to the same locale for  
 39042 each category as was present in the queried object.

39043 If the value of the *category* argument is neither LC\_ALL nor a supported locale category value  
 39044 (see *setlocale()*), *getlocalename\_l()* shall fail.

39045 The behavior is undefined if the *locobj* argument is neither the special locale object  
 39046 LC\_GLOBAL\_LOCALE nor a valid locale object handle.

39047 **RETURN VALUE**

39048 Upon successful completion, *getlocalename\_l()* shall return a pointer to a string; otherwise, a null  
 39049 pointer shall be returned.

39050 If *locobj* is LC\_GLOBAL\_LOCALE, the returned string pointer might be invalidated or the string  
 39051 content might be overwritten by a subsequent call in the same thread to *getlocalename\_l()* with  
 39052 LC\_GLOBAL\_LOCALE; the returned string pointer might also be invalidated if the calling  
 39053 thread is terminated. Otherwise, the returned string pointer and content shall remain valid until  
 39054 the locale object *locobj* is used in a call to *freelocale()* or as the *base* argument in a successful call to  
 39055 *newlocale()*.

39056 **ERRORS**

39057 No errors are defined.

39058 **EXAMPLES**39059 **Determining the locale name for a category of the current locale**

39060 The following example shows how to obtain the locale name for the LC\_NUMERIC category of  
 39061 the current thread-local locale, or of the global locale if no thread-local locale is in use.

```
39062 #include <locale.h>
39063 ...
39064 const char *name;
39065 locale_t loc = uselocale(NULL);
39066 name = getlocalename_l(LC_NUMERIC, loc);
```

39067 **APPLICATION USAGE**

39068 In addition to the caveats regarding validity of the returned string pointer in RETURN VALUE,  
 39069 the content of the string returned when *category* is LC\_ALL is only required to be valid for the  
 39070 life of the process, so is not intended for storage or sharing between processes. As the internal  
 39071 format of the string is implementation-specific, there is nothing preventing a subsequent run of

39072 an application from being presented a different format, for example if the implementation is  
39073 updated.

39074 **RATIONALE**

39075 Historical versions of *getlocalename\_l()* did not handle the special locale object  
39076 LC\_GLOBAL\_LOCALE, requiring that applications used *setlocale(category, NULL)* to query the  
39077 global locale if *uselocale(NULL)* returned LC\_GLOBAL\_LOCALE. However, since *setlocale()* is  
39078 not required to be thread-safe (even when the only concurrent calls are ones that query the  
39079 locale), this method was problematic for multi-threaded processes. This standard requires that  
39080 *getlocalename\_l(category, LC\_GLOBAL\_LOCALE)* queries the global locale in a thread-safe  
39081 manner, for example by returning a pointer to a thread-local internal buffer instead of a process-  
39082 wide internal buffer.

39083 **FUTURE DIRECTIONS**

39084 None.

39085 **SEE ALSO**

39086 *freelocale()*, *newlocale()*, *setlocale()*, *uselocale()*

39087 XBD Chapter 7 (on page 127), `<locale.h>`

39088 **CHANGE HISTORY**

39089 First released in Issue 8.

39090 **NAME**

39091 getlogin, getlogin\_r — get login name

39092 **SYNOPSIS**

39093 #include &lt;unistd.h&gt;

39094 char \*getlogin(void);

39095 int getlogin\_r(char \*name, size\_t namesize);

39096 **DESCRIPTION**

39097 The *getlogin()* function shall return a pointer to a string containing the user name associated by  
 39098 the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-  
 39099 null pointer, then that pointer points to the name that the user logged in under, even if there are  
 39100 several login names with the same user ID.

39101 The *getlogin()* function need not be thread-safe.

39102 The *getlogin\_r()* function shall put the name associated by the login activity with the controlling  
 39103 terminal of the current process in the character array pointed to by *name*. The array is *namesize*  
 39104 characters long and should have space for the name and the terminating null character. The  
 39105 maximum size of the login name is {LOGIN\_NAME\_MAX}.

39106 If *getlogin\_r()* is successful, *name* points to the name the user used at login, even if there are  
 39107 several login names with the same user ID.

39108 The *getlogin()* and *getlogin\_r()* functions may make use of file descriptors 0, 1, and 2 to find the  
 39109 controlling terminal of the current process, examining each in turn until the terminal is found. If  
 39110 in this case none of these three file descriptors is open to the controlling terminal, these functions  
 39111 may fail. The method used to find the terminal associated with a file descriptor may depend on  
 39112 the file descriptor being open to the actual terminal device, not */dev/tty*.

39113 **RETURN VALUE**

39114 Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer  
 39115 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to  
 39116 indicate the error.

39117 The application shall not modify the string returned. The returned pointer might be invalidated  
 39118 or the string content might be overwritten by a subsequent call to *getlogin()*. The returned  
 39119 pointer and the string content might also be invalidated if the calling thread is terminated.

39120 If successful, the *getlogin\_r()* function shall return zero; otherwise, an error number shall be  
 39121 returned to indicate the error.

39122 **ERRORS**

39123 These functions may fail if:

39124 [EMFILE] All file descriptors available to the process are currently open.

39125 [ENFILE] The maximum allowable number of files is currently open in the system.

39126 [ENOTTY] None of the file descriptors 0, 1, or 2 is open to the controlling terminal of the  
 39127 current process.

39128 [ENXIO] The calling process has no controlling terminal.

39129 The *getlogin\_r()* function shall fail if:

39130 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned  
 39131 including the terminating null character.

39132 **EXAMPLES**39133 **Getting the User Login Name**

39134 The following example calls the *getlogin()* function to obtain the name of the user associated  
 39135 with the calling process, and passes this information to the *getpwnam()* function to get the  
 39136 associated user database information.

```

39137 #include <unistd.h>
39138 #include <sys/types.h>
39139 #include <pwd.h>
39140 #include <stdio.h>
39141 ...
39142 char *lgn;
39143 struct passwd *pw;
39144 ...
39145 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
39146     fprintf(stderr, "Get of user information failed.\n"); exit(1);
39147 }

```

39148 **APPLICATION USAGE**

39149 Three names associated with the current process can be determined: *getpwuid(geteuid())* shall  
 39150 return the name associated with the effective user ID of the process; *getlogin()* shall return the  
 39151 name associated with the current login activity; and *getpwuid(getuid())* shall return the name  
 39152 associated with the real user ID of the process.

39153 The *getlogin\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 39154 possibly using a static data area that may be overwritten by each call.

39155 **RATIONALE**

39156 The *getlogin()* function returns a pointer to the user's login name. The same user ID may be  
 39157 shared by several login names. If it is desired to get the user database entry that is used during  
 39158 login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()*  
 39159 function. (This might be used to determine the user's login shell, particularly where a single user  
 39160 has multiple login shells with distinct login names, but the same user ID.)

39161 The information provided by the *cuserid()* function, which was originally defined in the  
 39162 POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
39163 getpwuid(geteuid())
```

39164 while the information provided by historical implementations of *cuserid()* can be obtained by:

```
39165 getpwuid(getuid())
```

39166 The thread-safe version of this function places the user name in a user-supplied buffer and  
 39167 returns a non-zero value if it fails. The non-thread-safe version may return the name in a static  
 39168 data area that may be overwritten by each call.

39169 **FUTURE DIRECTIONS**

39170 None.

39171 **SEE ALSO**

39172 *getpwnam()*, *getpwuid()*, *geteuid()*, *getuid()*

**39174 CHANGE HISTORY**

39175 First released in Issue 1. Derived from System V Release 2.0.

**39176 Issue 5**

39177 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
39178 VALUE section.

39179 The *getlogin\_r()* function is included for alignment with the POSIX Threads Extension.

39180 A note indicating that the *getlogin()* function need not be reentrant is added to the  
39181 DESCRIPTION.

**39182 Issue 6**

39183 The *getlogin\_r()* function is marked as part of the Thread-Safe Functions option.

39184 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

39185 The following new requirements on POSIX implementations derive from alignment with the  
39186 Single UNIX Specification:

- 39187 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 39188 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

39189 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
39190 its avoidance of possibly using a static data area.

**39191 Issue 7**

39192 Austin Group Interpretation 1003.1-2001 #156 is applied.

39193 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

39194 The *getlogin\_r()* function is moved from the Thread-Safe Functions option to the Base.

39195 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0243 [172], XSH/TC1-2008/0244 [75],  
39196 and XSH/TC1-2008/0245 [172] are applied.

39197 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0168 [656] is applied.

**39198 Issue 8**

39199 Austin Group Defect 398 is applied, changing the [ERANGE] error from “may fail” to “shall  
39200 fail”.

39201 **NAME**

39202 getnameinfo — get name information

39203 **SYNOPSIS**

39204 #include &lt;sys/socket.h&gt;

39205 #include &lt;netdb.h&gt;

```
39206 int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
39207 char *restrict node, socklen_t nodelen, char *restrict service,
39208 socklen_t servicelen, int flags);
```

39209 **DESCRIPTION**

39210 The *getnameinfo()* function shall translate a socket address to a node name and service location,  
 39211 all of which are defined as in *freeaddrinfo()*.

39212 The *sa* argument points to a socket address structure to be translated. The *salen* argument  
 39213 contains the length of the address pointed to by *sa*.

39214 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible  
 39215 IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node  
 39216 name for that IPv4 address.

39217 If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the  
 39218 behavior shall be the same as when the node's name cannot be located.

39219 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument  
 39220 points to a buffer able to contain up to *nodelen* bytes that receives the node name as a null-  
 39221 terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name  
 39222 shall not be returned. If the node's name cannot be located, the numeric form of the address  
 39223 contained in the socket address structure pointed to by the *sa* argument is returned instead of its  
 39224 name.

39225 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service*  
 39226 argument points to a buffer able to contain up to *servicelen* bytes that receives the service name  
 39227 as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero,  
 39228 the service name shall not be returned. If the service's name cannot be located, the numeric form  
 39229 of the service address (for example, its port number) shall be returned instead of its name.

39230 The *flags* argument is a flag that changes the default actions of the function. By default the fully-  
 39231 qualified domain name (FQDN) for the host shall be returned, but:

- 39232 • If the flag bit NI\_NOFQDN is set, only the node name portion of the FQDN shall be  
 39233 returned for local hosts.
- 39234 • If the flag bit NI\_NUMERICHOST is set, the numeric form of the address contained in the  
 39235 socket address structure pointed to by the *sa* argument shall be returned instead of its  
 39236 name.
- 39237 • If the flag bit NI\_NAMEREQD is set, an error shall be returned if the host's name cannot  
 39238 be located.
- 39239 • If the flag bit NI\_NUMERICSERV is set, the numeric form of the service address shall be  
 39240 returned (for example, its port number) instead of its name.
- 39241 • If the flag bit NI\_NUMERICSCOPE is set, the numeric form of the scope identifier shall be  
 39242 returned (for example, interface index) instead of its name. This flag shall be ignored if the  
 39243 *sa* argument is not an IPv6 address.

- 39244           • If the flag bit NI\_DGRAM is set, this indicates that the service is a datagram service  
 39245           (SOCK\_DGRAM). The default behavior shall assume that the service is a stream service  
 39246           (SOCK\_STREAM).

39247           **Notes:**

- 39248                     1. The two NI\_NUMERICxxx flags are required to support the `-n` flag that many  
 39249                     commands provide.
- 39250                     2. The NI\_DGRAM flag is required for the few AF\_INET and AF\_INET6 port numbers (for  
 39251                     example, [512,514]) that represent different services for UDP and TCP.

39252           The `getnameinfo()` function shall be thread-safe.

39253           **RETURN VALUE**

39254           A zero return value for `getnameinfo()` indicates successful completion; a non-zero return value  
 39255           indicates failure. The possible values for the failures are listed in the ERRORS section.

39256           Upon successful completion, `getnameinfo()` shall return the *node* and *service* names, if requested,  
 39257           in the buffers provided. The returned names are always null-terminated strings.

39258           **ERRORS**

39259           The `getnameinfo()` function shall fail and return the corresponding value if:

39260           [EAI\_AGAIN]   The name could not be resolved at this time. Future attempts may succeed.

39261           [EAI\_BADFLAGS]  
 39262                     The *flags* had an invalid value.

39263           [EAI\_FAIL]     A non-recoverable error occurred.

39264           [EAI\_FAMILY]   The address family was not recognized or the address length was invalid for  
 39265           the specified family.

39266           [EAI\_MEMORY]   There was a memory allocation failure.

39267           [EAI\_NONAME]   The name does not resolve for the supplied parameters.

39268                     NI\_NAMEREQD is set and the host's name cannot be located, or both  
 39269                     *nodename* and *servname* were null.

39270           [EAI\_OVERFLOW]  
 39271                     An argument buffer overflowed. The buffer pointed to by the *node* argument  
 39272                     or the *service* argument was too small.

39273           [EAI\_SYSTEM]   A system error occurred. The error code can be found in *errno*.

39274           **EXAMPLES**

39275           None.

39276           **APPLICATION USAGE**

39277           If the returned values are to be used as part of any further name resolution (for example, passed  
 39278           to `getaddrinfo()`), applications should provide buffers large enough to store any result possible on  
 39279           the system.

39280           Given the IPv4-mapped IPv6 address "`::ffff:1.2.3.4`", the implementation performs a  
 39281           lookup as if the socket address structure contains the IPv4 address "`1.2.3.4`".

39282           The IPv6 unspecified address ("`:::`") and the IPv6 loopback address ("`:::1`") are not  
 39283           IPv4-compatible addresses.

39284 **RATIONALE**

39285 None.

39286 **FUTURE DIRECTIONS**

39287 None.

39288 **SEE ALSO**39289 *endservent()*, *freeaddrinfo()*, *gai\_strerror()*, *inet\_ntop()*, *socket()*

39290 XBD &lt;netdb.h&gt;, &lt;sys/socket.h&gt;

39291 **CHANGE HISTORY**

39292 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39293 The **restrict** keyword is added to the *getnameinfo()* prototype for alignment with the  
39294 ISO/IEC 9899:1999 standard.39295 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in  
39296 the SYNOPSIS and DESCRIPTION for alignment with IPv6.39297 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the  
39298 [EAI\_OVERFLOW] error to the ERRORS section.39299 **Issue 7**39300 SD5-XSH-ERN-127 is applied, clarifying the behavior if the address is the IPv6 unspecified  
39301 address.39302 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0246 [284] and XSH/TC1-2008/0247  
39303 [285] are applied.

39304 **NAME**

39305           getnetbyaddr, getnetbyname, getnetent — network database functions

39306 **SYNOPSIS**

39307           #include &lt;netdb.h&gt;

39308           struct netent \*getnetbyaddr(uint32\_t net, int type);

39309           struct netent \*getnetbyname(const char \*name);

39310           struct netent \*getnetent(void);

39311 **DESCRIPTION**39312           Refer to *endnetent()*.

39313 **NAME**

39314            getopt, optarg, opterr, optind, optopt — command option parsing

39315 **SYNOPSIS**

39316            #include &lt;unistd.h&gt;

39317            int getopt(int argc, char \* const argv[], const char \*optstring);

39318            extern char \*optarg;

39319            extern int opterr, optind, optopt;

39320 **DESCRIPTION**39321            The *getopt()* function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,  
39322            6, 7, 9, and 10 in XBD [Section 12.2](#) (on page 215).39323            The parameters *argc* and *argv* are the argument count and argument array as passed to *main()*  
39324            (see *exec()*). The argument *optstring* is a string of recognized option characters; if a character is  
39325            followed by a <colon>, the option takes an argument. All option characters allowed by Utility  
39326            Syntax Guideline 3 are allowed in *optstring*. The *optstring* argument can optionally start with a  
39327            <plus-sign> ('+'), which shall have no effect on behavior in a conforming environment. If a  
39328            <plus-sign> occurs anywhere besides the first character of *optstring*, the behavior is unspecified.  
39329            The implementation may accept other characters as an extension.39330            The variable *optind* is the index of the next element of the *argv[]* vector to be processed. It shall  
39331            be initialized to 1 by the system, and *getopt()* shall update it when it finishes with each element  
39332            of *argv[]*. If the application sets *optind* to zero before calling *getopt()*, the behavior is unspecified.  
39333            When an element of *argv[]* contains multiple option characters, it is unspecified how *getopt()*  
39334            determines which options have already been processed.39335            The *getopt()* function shall return the next option character (if one is found) from *argv* that  
39336            matches a character in *optstring* (excluding an optional leading <plus-sign>), if there is one that  
39337            matches. If the option takes an argument, *getopt()* shall set the variable *optarg* to point to the  
39338            option-argument as follows:

- 39339            1. If the option was the last character in the string pointed to by an element of
- argv*
- , then
- 
- 39340
- optarg*
- shall contain the next element of
- argv*
- , and
- optind*
- shall be incremented by 2. If the
- 
- 39341            resulting value of
- optind*
- is greater than
- argc*
- , this indicates a missing option-argument,
- 
- 39342            and
- getopt()*
- shall return an error indication.
- 
- 39343            2. Otherwise,
- optarg*
- shall point to the string following the option character in that element
- 
- 39344            of
- argv*
- , and
- optind*
- shall be incremented by 1.

39345            If, when *getopt()* is called, any of the following is true:39346            *argv[optind]* is a null pointer  
39347            \**argv[optind]* is not the character '-'  
39348            *argv[optind]* points to the string "--"39349            *getopt()* shall return -1 without changing *optind*. If:39350            *argv[optind]* points to the string "--"39351            *getopt()* shall return -1 after incrementing *optind*.39352            If *getopt()* encounters a <colon> as an option character, or an option character that is not  
39353            contained in *optstring* after an optional leading <plus-sign>, it shall return the <question-mark>  
39354            ('?') character. If it detects a missing option-argument, it shall return the <colon> character  
39355            (':') if the first character of *optstring* after an optional <plus-sign> was a <colon>, or a  
39356            <question-mark> character('?') otherwise. In either case, *getopt()* shall set the variable *optopt* to  
39357            the option character that caused the error. If the application has not set the variable *opterr* to 0,

39358 and the first character of *optstring* after an optional <plus-sign> is not a <colon>, *getopt()* shall  
 39359 also print a diagnostic message to *stderr* in the format specified for the *getopts* utility, unless the  
 39360 *stderr* stream has wide orientation, in which case the behavior is undefined.

39361 The *getopt()* function need not be thread-safe.

### 39362 RETURN VALUE

39363 The *getopt()* function shall return the next option character specified on the command line.

39364 A <colon> (':') shall be returned if *getopt()* detects a missing argument and the first character  
 39365 of *optstring* after an optional <plus-sign> was a <colon> (':').

39366 A <question-mark> ('?') shall be returned if *getopt()* encounters a <colon> as an option  
 39367 character, encounters an option character not in *optstring*, or detects a missing argument and the  
 39368 first character of *optstring* after an optional <plus-sign> was not a <colon> (':').

39369 Otherwise, *getopt()* shall return -1 when all command line options are parsed.

### 39370 ERRORS

39371 If the application has not set the variable *opterr* to 0, the first character of *optstring* is not a  
 39372 <colon>, and a write error occurs while *getopt()* is printing a diagnostic message to *stderr*, then  
 39373 the error indicator for *stderr* shall be set; but *getopt()* shall still succeed and the value of *errno*  
 39374 after *getopt()* is unspecified.

### 39375 EXAMPLES

#### 39376 Parsing Command Line Options

39377 The following code fragment shows how you might process the arguments for a utility that can  
 39378 take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require  
 39379 arguments:

```

39380 #include <stdio.h>
39381 #include <stdlib.h>
39382 #include <unistd.h>

39383 int
39384 main(int argc, char *argv[ ])
39385 {
39386     int c;
39387     int bflg = 0, aflg = 0, errflg = 0;
39388     char *ifile;
39389     char *ofile;
39390     . . .
39391     while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
39392         switch(c) {
39393             case 'a':
39394                 if (bflg)
39395                     errflg++;
39396                 else
39397                     aflg++;
39398                 break;
39399             case 'b':
39400                 if (aflg)
39401                     errflg++;
39402                 else
39403                     bflg++;

```

```

39404         break;
39405     case 'f':
39406         ifile = optarg;
39407         break;
39408     case 'o':
39409         ofile = optarg;
39410         break;
39411     case ':': /* -f or -o without operand */
39412         fprintf(stderr,
39413             "Option -%c requires an operand\n", optopt);
39414         errflg++;
39415         break;
39416     case '?':
39417         fprintf(stderr,
39418             "Unrecognized option: '-%c'\n", optopt);
39419         errflg++;
39420     }
39421 }
39422 if (errflg) {
39423     fprintf(stderr, "usage: . . . ");
39424     exit(2);
39425 }
39426 for ( ; optind < argc; optind++) {
39427     if (access(argv[optind], R_OK)) {
39428         . . .
39429     }
39430 }
39431 }

```

39432 This code accepts any of the following as equivalent:

```

39433 cmd -ao arg path path
39434 cmd -a -o arg path path
39435 cmd -o arg -a path path
39436 cmd -a -o arg -- path path
39437 cmd -a -oarg path path
39438 cmd -aoarg path path

```

### 39439 **Selecting Options from the Command Line**

39440 The following example selects the type of database routines the user wants to use based on the  
39441 *Options* argument.

```

39442 #include <unistd.h>
39443 #include <string.h>
39444 ...
39445 const char *Options = "hdbt1";
39446 ...
39447 int dbtype, c;
39448 char *st;
39449 ...
39450 dbtype = 0;
39451 while ((c = getopt(argc, argv, Options)) != -1) {
39452     if ((st = strchr(Options, c)) != NULL) {

```

```

39453         dbtype = st - Options;
39454         break;
39455     }
39456 }

```

### 39457 APPLICATION USAGE

39458 The `getopt()` function is only required to support option characters included in Utility Syntax  
 39459 Guideline 3. Many historical implementations of `getopt()` support other characters as options.  
 39460 This is an allowed extension, but applications that use extensions are not maximally portable.  
 39461 Note that support for multi-byte option characters is only possible when such characters can be  
 39462 represented as type **int**.

39463 Applications which use wide-character output functions with `stderr` should ensure that any calls  
 39464 to `getopt()` do not write to `stderr`, either by setting `opterr` to 0 or by ensuring the first character of  
 39465 `optstring` is always a `<colon>`.

39466 While `ferror(stderr)` may be used to detect failures to write a diagnostic to `stderr` when `getopt()`  
 39467 returns `'?'`, the value of `errno` is unspecified in such a condition. Applications desiring more  
 39468 control over handling write failures should set `opterr` to 0 and independently perform output to  
 39469 `stderr`, rather than relying on `getopt()` to do the output.

### 39470 RATIONALE

39471 The `optopt` variable represents historical practice and allows the application to obtain the identity  
 39472 of the invalid option.

39473 The description has been written to make it clear that `getopt()`, like the `getopts` utility, deals with  
 39474 option-arguments whether separated from the option by `<blank>` characters or not. Note that  
 39475 the requirements on `getopt()` and `getopts` are more stringent than the Utility Syntax Guidelines.

39476 The `getopt()` function shall return `-1`, rather than EOF, so that `<stdio.h>` is not required.

39477 The special significance of a `<colon>` as the first character of `optstring` makes `getopt()` consistent  
 39478 with the `getopts` utility. It allows an application to make a distinction between a missing  
 39479 argument and an incorrect option letter without having to examine the option letter. It is true  
 39480 that a missing argument can only be detected in one case, but that is a case that has to be  
 39481 considered.

39482 In some non-conforming environments, the use of a leading `<plus-sign>` in `optstring` forces  
 39483 `getopt()` to behave in a conforming way, when it would otherwise have non-conforming  
 39484 behavior. Its use has been standardized to allow applications to be written that can guarantee  
 39485 behavior consistent with this specification even in an otherwise non-conforming environment. If  
 39486 both `<plus-sign>` and `<colon>` are used at the beginning of `optstring`, the `<plus-sign>` must be  
 39487 first.

39488 Note that the use of a leading `<plus-sign>` in `optstring` is only standardized for `getopt()`. Use of a  
 39489 `<plus-sign>` is intentionally left unspecified for the `getopts` utility, where historical  
 39490 implementations did not require a leading `<plus-sign>` for conforming behavior, and because  
 39491 some historical `getopts` implementations used a leading `<plus-sign>` for a different extension.

### 39492 FUTURE DIRECTIONS

39493 None.

39498 **CHANGE HISTORY**

39499 First released in Issue 1. Derived from Issue 1 of the SVID.

39500 **Issue 5**

39501 A note indicating that the *getopt()* function need not be reentrant is added to the DESCRIPTION.

39502 **Issue 6**

39503 IEEE PASC Interpretation 1003.2 #150 is applied.

39504 Austin Group Interpretation 1003.1-2001 #156 is applied.

39505 **Issue 7**

39506 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0248 [318], XSH/TC1-2008/0249 [460],  
39507 XSH/TC1-2008/0250 [189], XSH/TC1-2008/0251 [189], XSH/TC1-2008/0252 [189], and  
39508 XSH/TC1-2008/0253 [460] are applied.

39509 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0169 [608] is applied.

39510 **Issue 8**

39511 Austin Group Defect 191 is applied, allowing a leading <plus-sign> in *optstring*.

39512 Austin Group Defect 1179 is applied, adding some missing '}' characters at the end of the  
39513 example code.

39514 Austin Group Defect 1523 is applied, clarifying the conditions under which *getopt()* returns -1  
39515 without changing *optind*.

39516 **NAME**

39517 getpeername — get the name of the peer socket

39518 **SYNOPSIS**

```
39519 #include <sys/socket.h>
39520 int getpeername(int socket, struct sockaddr *restrict address,
39521 socklen_t *restrict address_len);
```

39522 **DESCRIPTION**

39523 The *getpeername()* function shall retrieve the peer address of the specified socket, store this  
 39524 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this  
 39525 address in the object pointed to by the *address\_len* argument.

39526 The *address\_len* argument points to a **socklen\_t** object which on input specifies the length of the  
 39527 supplied **sockaddr** structure, and on output specifies the length of the peer address. If the actual  
 39528 length of the address is greater than the length of the supplied **sockaddr** structure, the stored  
 39529 address shall be truncated.

39530 If the protocol permits connections by unbound clients, and the peer is not bound, then the  
 39531 value stored in the object pointed to by *address* is unspecified.

39532 **RETURN VALUE**

39533 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 39534 indicate the error.

39535 **ERRORS**

39536 The *getpeername()* function shall fail if:

- 39537 [EBADF] The *socket* argument is not a valid file descriptor.
- 39538 [EINVAL] The socket has been shut down.
- 39539 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.
- 39540 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 39541 [EOPNOTSUPP] The operation is not supported for the socket protocol.

39542 The *getpeername()* function may fail if:

- 39543 [ENOBUFS] Insufficient resources were available in the system to complete the call.

39544 **EXAMPLES**

39545 None.

39546 **APPLICATION USAGE**

39547 For AF\_UNIX sockets, it is recommended that *address* points to a buffer of length greater than  
 39548 `sizeof(struct sockaddr_un)` which has been initialized with null bytes. That way, even if  
 39549 the implementation supports the use of all bytes of *sun\_path* without a terminating null byte, the  
 39550 larger buffer guarantees that the *sun\_path* member can then be passed to other interfaces that  
 39551 expect a null-terminated string. If no truncation occurred based on the input value of *address\_len*,  
 39552 it is unspecified whether the returned *address\_len* will be `sizeof(struct sockaddr_un)`, or  
 39553 merely a value at least as large as `offsetof(struct sockaddr_un, sun_path)` plus the  
 39554 number of non-null bytes stored in *sun\_path*.

39555 **RATIONALE**

39556 None.

39557 **FUTURE DIRECTIONS**

39558 None.

39559 **SEE ALSO**39560 *accept()*, *bind()*, *getsockname()*, *socket()*39561 XBD <[sys/socket.h](#)>39562 **CHANGE HISTORY**

39563 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39564 The **restrict** keyword is added to the *getpeername()* prototype for alignment with the  
39565 ISO/IEC 9899:1999 standard.39566 **Issue 7**

39567 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0254 [464] is applied.

39568 **Issue 8**39569 Austin Group Defect 561 is applied, adding a paragraph about *sun\_path* to APPLICATION  
39570 USAGE.39571 Austin Group Defect 1565 is applied, changing the description of *address\_len*.

39572 **NAME**

39573 getpgid — get the process group ID for a process

39574 **SYNOPSIS**

39575 #include &lt;unistd.h&gt;

39576 pid\_t getpgid(pid\_t pid);

39577 **DESCRIPTION**39578 The *getpgid()* function shall return the process group ID of the process whose process ID is equal  
39579 to *pid*. If *pid* is equal to 0, *getpgid()* shall return the process group ID of the calling process.39580 **RETURN VALUE**39581 Upon successful completion, *getpgid()* shall return a process group ID. Otherwise, it shall return  
39582 (**pid\_t**)-1 and set *errno* to indicate the error.39583 **ERRORS**39584 The *getpgid()* function shall fail if:39585 [EPERM] The process whose process ID is equal to *pid* is not in the same session as the  
39586 calling process, and the implementation does not allow access to the process  
39587 group ID of that process from the calling process.39588 [ESRCH] There is no process with a process ID equal to *pid*.39589 The *getpgid()* function may fail if:39590 [EINVAL] The value of the *pid* argument is invalid.39591 **EXAMPLES**

39592 None.

39593 **APPLICATION USAGE**

39594 None.

39595 **RATIONALE**

39596 None.

39597 **FUTURE DIRECTIONS**

39598 None.

39599 **SEE ALSO**39600 *exec*, *fork()*, *getpgrp()*, *getpid()*, *getsid()*, *setpgid()*, *setsid()*39601 XBD <**unistd.h**>39602 **CHANGE HISTORY**

39603 First released in Issue 4, Version 2.

39604 **Issue 5**

39605 Moved from X/OPEN UNIX extension to BASE.

39606 **Issue 7**39607 The *getpgid()* function is moved from the XSI option to the Base.

39608 **NAME**

39609 getpgrp — get the process group ID of the calling process

39610 **SYNOPSIS**

39611 #include &lt;unistd.h&gt;

39612 pid\_t getpgrp(void);

39613 **DESCRIPTION**39614 The *getpgrp()* function shall return the process group ID of the calling process.39615 **RETURN VALUE**39616 The *getpgrp()* function shall always be successful and no return value is reserved to indicate an  
39617 error.39618 **ERRORS**

39619 No errors are defined.

39620 **EXAMPLES**

39621 None.

39622 **APPLICATION USAGE**

39623 None.

39624 **RATIONALE**39625 4.3 BSD provides a *getpgrp()* function that returns the process group ID for a specified process.  
39626 Although this function supports job control, all known job control shells always specify the  
39627 calling process with this function. Thus, the simpler System V *getpgrp()* suffices, and the added  
39628 complexity of the 4.3 BSD *getpgrp()* is provided by the *getpgid()* function.39629 **FUTURE DIRECTIONS**

39630 None.

39631 **SEE ALSO**39632 *exec*, *fork()*, *getpgid()*, *getpid()*, *getppid()*, *kill()*, *setpgid()*, *setsid()*39633 XBD <[sys/types.h](#)>, <[unistd.h](#)>39634 **CHANGE HISTORY**

39635 First released in Issue 1. Derived from Issue 1 of the SVID.

39636 **Issue 6**39637 In the SYNOPSIS, the optional include of the <[sys/types.h](#)> header is removed.39638 The following new requirements on POSIX implementations derive from alignment with the  
39639 Single UNIX Specification:

- 39640
- The requirement to include <[sys/types.h](#)> has been removed. Although <[sys/types.h](#)> was  
39641 required for conforming implementations of previous POSIX specifications, it was not  
39642 required for UNIX applications.

39643 **Issue 8**

39644 Austin Group Defect 1245 is applied, changing the RATIONALE section.

39645 **NAME**39646            **getpid** — get the process ID39647 **SYNOPSIS**

39648            #include &lt;unistd.h&gt;

39649            pid\_t getpid(void);

39704           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 39705
- 
- 39706
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 39707
- 
- 39708

39709 **NAME**

39710 getpriority, setpriority — get and set the nice value

39711 **SYNOPSIS**

```
39712 XSI      #include <sys/resource.h>
39713         int getpriority(int which, id_t who);
39714         int setpriority(int which, id_t who, int value);
```

39715 **DESCRIPTION**

39716 The *getpriority()* function shall obtain the nice value of a process, process group, or user. The  
 39717 *setpriority()* function shall set the nice value of a process, process group, or user to  
 39718 *value*+{NZERO}.

39719 Target processes are specified by the values of the *which* and *who* arguments. The *which*  
 39720 argument may be one of the following values: PRIO\_PROCESS, PRIO\_PGRP, or PRIO\_USER,  
 39721 indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an  
 39722 effective user ID, respectively. A 0 value for the *who* argument specifies the current process,  
 39723 process group, or user.

39724 The nice value set with *setpriority()* shall be applied to the process. If the process is multi-  
 39725 threaded, the nice value shall affect all system scope threads in the process.

39726 If more than one process is specified, *getpriority()* shall return value {NZERO} less than the  
 39727 lowest nice value pertaining to any of the specified processes, and *setpriority()* shall set the nice  
 39728 values of all of the specified processes to *value*+{NZERO}.

39729 The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling.  
 39730 While the range of valid nice values is [0,{NZERO}\*2-1], implementations may enforce more  
 39731 restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value,  
 39732 *setpriority()* shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater  
 39733 than the system's highest supported nice value, *setpriority()* shall set the nice value to the  
 39734 highest supported value.

39735 Only a process with appropriate privileges can lower its nice value.

39736 PS|TPS Any processes or threads using SCHED\_FIFO or SCHED\_RR shall be unaffected by a call to  
 39737 *setpriority()*. This is not considered an error. A process which subsequently reverts to  
 39738 SCHED\_OTHER need not have its priority affected by such a *setpriority()* call.

39739 The effect of changing the nice value may vary depending on the process-scheduling algorithm  
 39740 in effect.

39741 Since *getpriority()* can return the value -1 upon successful completion, it is necessary to set *errno*  
 39742 to 0 prior to a call to *getpriority()*. If *getpriority()* returns the value -1, then *errno* can be checked  
 39743 to see if an error occurred or if the value is a legitimate nice value.

39744 **RETURN VALUE**

39745 Upon successful completion, *getpriority()* shall return an integer in the range -{NZERO} to  
 39746 {NZERO}-1. Otherwise, -1 shall be returned and *errno* set to indicate the error.

39747 Upon successful completion, *setpriority()* shall return 0; otherwise, -1 shall be returned and *errno*  
 39748 set to indicate the error.

39749 **ERRORS**

39750 The *getpriority()* and *setpriority()* functions shall fail if:

39751 [ESRCH] No process could be located using the *which* and *who* argument values  
39752 specified.

39753 [EINVAL] The value of the *which* argument was not recognized, or the value of the *who*  
39754 argument is not a valid process ID, process group ID, or user ID.

39755 In addition, *setpriority()* may fail if:

39756 [EPERM] A process was located, but neither the real nor effective user ID of the  
39757 executing process match the effective user ID of the process whose nice value  
39758 is being changed.

39759 [EACCES] A request was made to change the nice value to a lower numeric value and the  
39760 current process does not have appropriate privileges.

39761 **EXAMPLES**39762 **Using *getpriority()***

39763 The following example returns the current scheduling priority for the process ID returned by the  
39764 call to *getpid()*.

```
39765 #include <sys/resource.h>
39766 ...
39767 int which = PRIO_PROCESS;
39768 id_t pid;
39769 int ret;

39770 pid = getpid();
39771 ret = getpriority(which, pid);
```

39772 **Using *setpriority()***

39773 The following example sets the priority for the current process ID to -20.

```
39774 #include <sys/resource.h>
39775 ...
39776 int which = PRIO_PROCESS;
39777 id_t pid;
39778 int priority = -20;
39779 int ret;

39780 pid = getpid();
39781 ret = setpriority(which, pid, priority);
```

39782 **APPLICATION USAGE**

39783 The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value  
39784  $-\{\text{NZERO}\}$ ). The nice value is in the range  $[0, 2 * \{\text{NZERO}\} - 1]$ , while the return value for  
39785 *getpriority()* and the third parameter for *setpriority()* are in the range  $[-\{\text{NZERO}\}, \{\text{NZERO}\} - 1]$ .

39786 **RATIONALE**

39787 None.

39788 **FUTURE DIRECTIONS**

39789 None.

39790 **SEE ALSO**39791 *nice()*, *sched\_get\_priority\_max()*, *sched\_setscheduler()*39792 XBD <[sys/resource.h](#)>39793 **CHANGE HISTORY**

39794 First released in Issue 4, Version 2.

39795 **Issue 5**

39796 Moved from X/OPEN UNIX extension to BASE.

39797 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion  
39798 with functionality in the POSIX Realtime Extension.

39799 **NAME**

39800 getprotobyname, getprotobynumber, getprotoent — network protocol database functions

39801 **SYNOPSIS**

39802 #include <netdb.h>

39803 struct protoent \*getprotobyname(const char \*name);

39804 struct protoent \*getprotobynumber(int proto);

39805 struct protoent \*getprotoent(void);

39806 **DESCRIPTION**

39807 Refer to *endprotoent()*.

39808 **NAME**

39809       getpwent — get user database entry

39810 **SYNOPSIS**

```
39811 XSI       #include <pwd.h>  
39812       struct passwd *getpwent(void);
```

39813 **DESCRIPTION**39814       Refer to *endpwent()*.

39815 **NAME**

39816 getpwnam, getpwnam\_r — search user database for a name

39817 **SYNOPSIS**

```
39818 #include <pwd.h>
39819 struct passwd *getpwnam(const char *name);
39820 int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
39821 size_t bufsize, struct passwd **result);
```

39822 **DESCRIPTION**39823 The *getpwnam()* function shall search the user database for an entry with a matching *name*.39824 The *getpwnam()* function need not be thread-safe.39825 Applications wishing to check for error situations should set *errno* to 0 before calling  
39826 *getpwnam()*. If *getpwnam()* returns a null pointer and *errno* is non-zero, an error occurred.

39827 The *getpwnam\_r()* function shall update the **passwd** structure pointed to by *pwd* and store a  
39828 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry  
39829 from the user database with a matching *name*. Storage referenced by the structure is allocated  
39830 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to  
39831 *sysconf(\_SC\_GETPW\_R\_SIZE\_MAX)* returns either  $-1$  without changing *errno* or an initial value  
39832 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to  
39833 by *result* on error or if the requested entry is not found.

39834 **RETURN VALUE**

39835 The *getpwnam()* function shall return a pointer to a **struct passwd** with the structure as defined  
39836 in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested  
39837 entry is not found, or an error occurs. If the requested entry was not found, *errno* shall not be  
39838 changed. On error, *errno* shall be set to indicate the error.

39839 The application shall not modify the structure to which the return value points, nor any storage  
39840 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
39841 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
39842 subsequent call to *getpwent()*, *getpwnam()*, or *getpwuid()*. The returned pointer, and pointers  
39843 within the structure, might also be invalidated if the calling thread is terminated.

39844 The *getpwnam\_r()* function shall return zero on success or if the requested entry was not found  
39845 and no error has occurred. If an error has occurred, an error number shall be returned to indicate  
39846 the error.

39847 **ERRORS**

39848 These functions may fail if:

- 39849 [EIO] An I/O error has occurred.
- 39850 [EINTR] A signal was caught during *getpwnam()*.
- 39851 [EMFILE] All file descriptors available to the process are currently open.
- 39852 [ENFILE] The maximum allowable number of files is currently open in the system.

39853 The *getpwnam\_r()* function shall fail if:

- 39854 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be  
39855 referenced by the resulting **passwd** structure.

39856 **EXAMPLES**

39857 Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size  
 39858 of the buffer needed to store all the groups returned. This example shows how an application  
 39859 can allocate a buffer of sufficient size to work with `getpwnam_r()`.

```

39860 long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
39861 size_t len;
39862 if (initlen == -1)
39863     /* Default initial length. */
39864     len = 1024;
39865 else
39866     len = (size_t) initlen;
39867 struct passwd result;
39868 struct passwd *resultp;
39869 char *buffer = malloc(len);
39870 if (buffer == NULL)
39871     ...handle error...
39872 int e;
39873 while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
39874        == ERANGE)
39875     {
39876     size_t newlen = 2 * len;
39877     if (newlen < len)
39878         ...handle error...
39879     len = newlen;
39880     char *newbuffer = realloc(buffer, len);
39881     if (newbuffer == NULL)
39882         ...handle error...
39883     buffer = newbuffer;
39884     }
39885 if (e != 0)
39886     ...handle error...
39887 free (buffer);

```

39888 **Getting an Entry for the Login Name**

39889 The following example uses the `getlogin()` function to return the name of the user who logged in;  
 39890 this information is passed to the `getpwnam()` function to get the user database entry for that user.

```

39891 #include <sys/types.h>
39892 #include <pwd.h>
39893 #include <unistd.h>
39894 #include <stdio.h>
39895 #include <stdlib.h>
39896 ...
39897 char *lgn;
39898 struct passwd *pw;
39899 ...
39900 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
39901     fprintf(stderr, "Get of user information failed.\n"); exit(1);
39902 }
39903 ...

```

39904 **APPLICATION USAGE**

39905 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns  
 39906 the name associated with the effective user ID of the process; *getlogin()* returns the name  
 39907 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
 39908 with the real user ID of the process.

39909 The *getpwnam\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 39910 possibly using a static data area that may be overwritten by each call.

39911 Portable applications should take into account that it is usual for an implementation to return `-1`  
 39912 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

39913 **RATIONALE**

39914 None.

39915 **FUTURE DIRECTIONS**

39916 None.

39920 **CHANGE HISTORY**

39921 First released in Issue 1. Derived from System V Release 2.0.

39922 **Issue 5**

39923 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 39924 VALUE section.

39925 The *getpwnam\_r()* function is included for alignment with the POSIX Threads Extension.

39926 A note indicating that the *getpwnam()* function need not be reentrant is added to the  
 39927 DESCRIPTION.

39928 **Issue 6**

39929 The *getpwnam\_r()* function is marked as part of the Thread-Safe Functions option.

39930 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
 39931 describing matching the *name*.

39932 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

39933 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

39934 The following new requirements on POSIX implementations derive from alignment with the  
 39935 Single UNIX Specification:

- 39936 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 39937 required for conforming implementations of previous POSIX specifications, it was not  
 39938 required for UNIX applications.
- 39939 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 39940 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

39941 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 39942 its avoidance of possibly using a static data area.

39943 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
 39944 buffer from *bufsize* characters to bytes.

39945 **Issue 7**

- 39946 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 39947 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 39948 SD5-XSH-ERN-166 is applied.
- 39949 The *getpwnam\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 39950 A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc()*.
- 39951
- 39952 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0255 [75,428] is applied.
- 39953 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0170 [808] and XSH/TC2-2008/0171
- 39954 [656] are applied.

39955 **Issue 8**

- 39956 Austin Group Defect 398 is applied, changing the [ERANGE] error from “may fail” to “shall fail”.
- 39957
- 39958 Austin Group Defect 1570 is applied, removing extra spacing in “==”.

39959 **NAME**39960 `getpwuid, getpwuid_r` — search user database for a user ID39961 **SYNOPSIS**

```
39962 #include <pwd.h>
39963 struct passwd *getpwuid(uid_t uid);
39964 int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
39965 size_t bufsize, struct passwd **result);
```

39966 **DESCRIPTION**39967 The `getpwuid()` function shall search the user database for an entry with a matching `uid`.39968 The `getpwuid()` function need not be thread-safe.39969 Applications wishing to check for error situations should set `errno` to 0 before calling `getpwuid()`.  
39970 If `getpwuid()` returns a null pointer and `errno` is set to non-zero, an error occurred.

39971 The `getpwuid_r()` function shall update the **passwd** structure pointed to by `pwd` and store a  
39972 pointer to that structure at the location pointed to by `result`. The structure shall contain an entry  
39973 from the user database with a matching `uid`. Storage referenced by the structure is allocated  
39974 from the memory provided with the `buffer` parameter, which is `bufsize` bytes in size. A call to  
39975 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either `-1` without changing `errno` or an initial value  
39976 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to  
39977 by `result` on error or if the requested entry is not found.

39978 **RETURN VALUE**

39979 The `getpwuid()` function shall return a pointer to a **struct passwd** with the structure as defined in  
39980 `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested entry  
39981 is not found, or an error occurs. If the requested entry was not found, `errno` shall not be changed.  
39982 On error, `errno` shall be set to indicate the error.

39983 The application shall not modify the structure to which the return value points, nor any storage  
39984 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
39985 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
39986 subsequent call to `getpwent()`, `getpwnam()`, or `getpwuid()`. The returned pointer, and pointers  
39987 within the structure, might also be invalidated if the calling thread is terminated.

39988 If successful, the `getpwuid_r()` function shall return zero; otherwise, an error number shall be  
39989 returned to indicate the error.39990 **ERRORS**

39991 These functions may fail if:

- 39992 [EIO] An I/O error has occurred.
- 39993 [EINTR] A signal was caught during `getpwuid()`.
- 39994 [EMFILE] All file descriptors available to the process are currently open.
- 39995 [ENFILE] The maximum allowable number of files is currently open in the system.

39996 The `getpwuid_r()` function shall fail if:

- 39997 [ERANGE] Insufficient storage was supplied via `buffer` and `bufsize` to contain the data to be  
39998 referenced by the resulting **passwd** structure.

39999 **EXAMPLES**

40000 Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size  
 40001 of the buffer needed to store all the groups returned. This example shows how an application  
 40002 can allocate a buffer of sufficient size to work with `getpwuid_r()`.

```

40003 long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
40004 size_t len;
40005 if (initlen == -1)
40006     /* Default initial length. */
40007     len = 1024;
40008 else
40009     len = (size_t) initlen;
40010 struct passwd result;
40011 struct passwd *resultp;
40012 char *buffer = malloc(len);
40013 if (buffer == NULL)
40014     ...handle error...
40015 int e;
40016 while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
40017     {
40018     size_t newlen = 2 * len;
40019     if (newlen < len)
40020         ...handle error...
40021     len = newlen;
40022     char *newbuffer = realloc(buffer, len);
40023     if (newbuffer == NULL)
40024         ...handle error...
40025     buffer = newbuffer;
40026     }
40027 if (e != 0)
40028     ...handle error...
40029 free (buffer);

```

40030 **Getting an Entry for the Root User**

40031 The following example gets the user database entry for the user with user ID 0 (root).

```

40032 #include <sys/types.h>
40033 #include <pwd.h>
40034 ...
40035 uid_t id = 0;
40036 struct passwd *pwd;
40037 pwd = getpwuid(id);

```

40038 **Finding the Name for the Effective User ID**

40039 The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to  
 40040 store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function  
 40041 shall return the effective user ID of the calling process; this is used as the search criteria for the  
 40042 *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that  
 40043 user ID value.

```
40044 #include <unistd.h>
40045 #include <sys/types.h>
40046 #include <pwd.h>
40047 ...
40048 struct passwd *pws;
40049 pws = getpwuid(geteuid());
```

40050 **Finding an Entry in the User Database**

40051 The following example uses *getpwuid()* to search the user database for a user ID that was  
 40052 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not  
 40053 found, the program prints the numeric value of the user ID for the entry.

```
40054 #include <sys/types.h>
40055 #include <pwd.h>
40056 #include <stdio.h>
40057 ...
40058 struct stat statbuf;
40059 struct passwd *pwd;
40060 ...
40061 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
40062     printf(" %-8.8s", pwd->pw_name);
40063 else
40064     printf(" %-8d", statbuf.st_uid);
```

40065 **APPLICATION USAGE**

40066 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns  
 40067 the name associated with the effective user ID of the process; *getlogin()* returns the name  
 40068 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
 40069 with the real user ID of the process.

40070 The *getpwuid\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 40071 possibly using a static data area that may be overwritten by each call.

40072 Portable applications should take into account that it is usual for an implementation to return  $-1$   
 40073 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

40176 First released in Issue 8.

40177 **NAME**

40178 getrlimit, setrlimit — control maximum resource consumption

40179 **SYNOPSIS**

```
40180 #include <sys/resource.h>
40181 int getrlimit(int resource, struct rlimit *rlp);
40182 int setrlimit(int resource, const struct rlimit *rlp);
```

40183 **DESCRIPTION**

40184 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption  
40185 of a variety of resources.

40186 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as  
40187 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim\_cur*  
40188 member specifies the current or soft limit and the *rlim\_max* member specifies the maximum or  
40189 hard limit. Soft limits can be changed by a process to any value that is less than or equal to the  
40190 hard limit. A process can (irreversibly) lower its hard limit to any value that is greater than or  
40191 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both  
40192 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints  
40193 described above.

40194 The value RLIM\_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than  
40195 any other limit value. If a call to *getrlimit()* returns RLIM\_INFINITY for a resource, it means the  
40196 implementation shall not enforce limits on that resource. Specifying RLIM\_INFINITY as any  
40197 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource  
40198 limit.

40199 The following resources are defined:

40200 **RLIMIT\_CORE** This is the maximum size of a file containing a core image, in bytes, that  
40201 can be created by a process. A limit of 0 shall prevent the creation of such  
40202 a file. If this limit is exceeded, the writing of a file containing a core image  
40203 shall terminate at this size. Note that the production of such a file may be  
40204 one of the implementation-defined actions for abnormal termination.

40205 XSI **RLIMIT\_CPU** This is the maximum amount of CPU time, in seconds, used by a process.  
40206 If this limit is exceeded, SIGXCPU shall be generated for the process. If  
40207 the process is catching or ignoring SIGXCPU, or all threads belonging to  
40208 that process are blocking SIGXCPU, the behavior is unspecified.

40209 **RLIMIT\_DATA** This is the maximum size of a data segment of the process, in bytes. If  
40210 this limit is exceeded, the *malloc()* function shall fail with *errno* set to  
40211 [ENOMEM].

40212 **RLIMIT\_FSIZE** This is the maximum size of a file, in bytes, that can be created by a  
40213 process. If a write or truncate operation would cause this limit to be  
40214 XSI exceeded, a SIGXFSZ shall be generated for the thread; if the thread is  
40215 blocking, or the process is catching or ignoring SIGXFSZ, the operation  
40216 shall fail with an [EFBIG] error.

40217 **RLIMIT\_NOFILE** This is a number one greater than the maximum value that the system  
40218 shall assign to a newly-created descriptor. If this limit is exceeded,  
40219 functions that allocate a file descriptor shall fail with *errno* set to  
40220 [EMFILE]. This limit constrains the number of file descriptors that a  
40221 process can allocate.

40222 RLIMIT\_STACK This is the maximum size of the initial thread's stack, in bytes. The  
 40223 implementation does not automatically grow the stack beyond this limit.  
 40224 If this limit is exceeded, SIGSEGV shall be generated for the thread. If the  
 40225 thread is blocking SIGSEGV, or the process is ignoring or catching  
 40226 SIGSEGV and has not made arrangements to use an alternate stack, the  
 40227 disposition of SIGSEGV shall be set to SIG\_DFL before it is generated.

40228 RLIMIT\_AS This is the maximum size of total available memory of the process, in  
 40229 bytes. If this limit is exceeded, the *malloc()* and *mmap()* functions shall fail  
 40230 with *errno* set to [ENOMEM]. In addition, the automatic stack growth  
 40231 fails with the effects outlined above.

40232 When using the *getrlimit()* function, if a resource limit can be represented correctly in an object  
 40233 of type **rlim\_t**, then its representation is returned; otherwise, if the value of the resource limit is  
 40234 equal to that of the corresponding saved hard limit, the value returned shall be  
 40235 RLIM\_SAVED\_MAX; otherwise, the value returned shall be RLIM\_SAVED\_CUR.

40236 When using the *setrlimit()* function, if the requested new limit is RLIM\_INFINITY, the new limit  
 40237 shall be "no limit"; otherwise, if the requested new limit is RLIM\_SAVED\_MAX, the new limit  
 40238 shall be the corresponding saved hard limit; otherwise, if the requested new limit is  
 40239 RLIM\_SAVED\_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the  
 40240 new limit shall be the requested value. In addition, if the corresponding saved limit can be  
 40241 represented correctly in an object of type **rlim\_t** then it shall be overwritten with the new limit.

40242 The result of setting a limit to RLIM\_SAVED\_MAX or RLIM\_SAVED\_CUR is unspecified unless  
 40243 a previous call to *getrlimit()* returned that value as the soft or hard limit for the corresponding  
 40244 resource limit.

40245 The determination of whether a limit can be correctly represented in an object of type **rlim\_t** is  
 40246 implementation-defined. For example, some implementations permit a limit whose value is  
 40247 greater than RLIM\_INFINITY and others do not.

40248 The *exec* family of functions shall cause resource limits to be saved.

#### 40249 RETURN VALUE

40250 Upon successful completion, *getrlimit()* and *setrlimit()* shall return 0. Otherwise, these functions  
 40251 shall return -1 and set *errno* to indicate the error.

#### 40252 ERRORS

40253 The *getrlimit()* and *setrlimit()* functions shall fail if:

40254 [EINVAL] An invalid *resource* was specified; or in a *setrlimit()* call, the new *rlim\_cur*  
 40255 exceeds the new *rlim\_max*.

40256 [EPERM] The limit specified to *setrlimit()* would have raised the maximum limit value,  
 40257 and the calling process does not have appropriate privileges.

40258 The *setrlimit()* function may fail if:

40259 [EINVAL] The limit specified cannot be lowered because current usage is already higher  
 40260 than the limit.

**40261 EXAMPLES**

40262 None.

**40263 APPLICATION USAGE**

40264 If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the value  
40265 of {\_POSIX\_OPEN\_MAX} from <limits.h>, unexpected behavior may occur.

40266 If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the  
40267 highest currently open file descriptor +1, unexpected behavior may occur.

**40268 RATIONALE**

40269 These functions were previously part of the XSI option and have been moved to the Base so that  
40270 portable shells, and other utilities that need to relay the wait status of a child process to a parent,  
40271 can terminate themselves with the same signal that terminated the child but without  
40272 overwriting a core image created by the child (through setting RLIMIT\_CORE to zero, which  
40273 disables core image creation). The RLIMIT\_CPU and RLIMIT\_FSIZE limits remain in the XSI  
40274 option because they relate to other XSI functionality (SIGXCPU and SIGXFSZ).

40275 It should be noted that RLIMIT\_STACK applies “at least” to the stack of the initial thread in the  
40276 process, and not to the sum of all the stacks in the process, as that would be very limiting unless  
40277 the value is so big as to provide no value at all with a single thread.

**40278 FUTURE DIRECTIONS**

40279 None.

**40280 SEE ALSO**

40283 XCU *ulimit*

**40284 CHANGE HISTORY**

40285 First released in Issue 4, Version 2.

**40286 Issue 5**

40287 Moved from X/OPEN UNIX extension to BASE.

40288 An APPLICATION USAGE section is added.

40289 Large File Summit extensions are added.

**40290 Issue 6**

40291 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for  
40292 RLIMIT\_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing  
40293 with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of  
40294 a process attempting to set the hard or soft limit for RLIMIT\_NOFILE less than the highest  
40295 currently open file descriptor +1.

40296 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of  
40297 RLIMIT\_STACK in the DESCRIPTION from “the maximum size of a process stack” to “the  
40298 maximum size of the initial thread’s stack”. Text is added to the RATIONALE section.

**40299 Issue 8**

40300 Austin Group Defects 51 and 1669 are applied, moving the *getrlimit()* and *setrlimit()* functions,  
40301 excluding the RLIMIT\_CPU limit, from the XSI option to the Base.

40302 Austin Group Defect 1141 is applied, changing the description of RLIMIT\_CORE.

40303 Austin Group Defect 1416 is applied, changing some uses of “may” to “can” and one to “shall”.

40304

Austin Group Defect 1418 is applied, changing the SEE ALSO section.

40305 **NAME**

40306 getrusage — get information about resource utilization

40307 **SYNOPSIS**

```
40308 XSI      #include <sys/resource.h>
40309      int getrusage(int who, struct rusage *r_usage);
```

40310 **DESCRIPTION**

40311 The *getrusage()* function shall provide measures of the resources used by the current process or  
 40312 its terminated and waited-for child processes. If the value of the *who* argument is  
 40313 RUSAGE\_SELF, information shall be returned about resources used by the current process. If the  
 40314 value of the *who* argument is RUSAGE\_CHILDREN, information shall be returned about  
 40315 resources used by the children of the current process that have terminated and been waited-for  
 40316 and their children that have terminated and been waited-for, recursively. If the child is never  
 40317 waited for (for example, if the parent has SA\_NOCLDWAIT set or sets SIGCHLD to SIG\_IGN),  
 40318 the resource information for the child process is discarded and not included in the resource  
 40319 information provided by *getrusage()*.

40320 The *r\_usage* argument is a pointer to an object of type **struct rusage** in which the returned  
 40321 information is stored.

40322 **RETURN VALUE**

40323 Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*  
 40324 set to indicate the error.

40325 **ERRORS**

40326 The *getrusage()* function shall fail if:

40327 [EINVAL] The value of the *who* argument is not valid.

40328 **EXAMPLES**40329 **Using getrusage()**

40330 The following example returns information about the resources used by the current process.

```
40331 #include <sys/resource.h>
40332 ...
40333 int who = RUSAGE_SELF;
40334 struct rusage usage;
40335 int ret;
40336
40337 ret = getrusage(who, &usage);
```

40337 **APPLICATION USAGE**

40338 None.

40339 **RATIONALE**

40340 None.

40346 **CHANGE HISTORY**

40347 First released in Issue 4, Version 2.

40348 **Issue 5**

40349 Moved from X/OPEN UNIX extension to BASE.

40350 **Issue 8**

40351 Austin Group Defect 1336 is applied, clarifying the requirements when the *who* argument is  
40352 RUSAGE\_CHILDREN.

40353 **NAME**

40354        getservbyname, getservbyport, getservent — network services database functions

40355 **SYNOPSIS**

40356        #include <netdb.h>

40357        struct servent \*getservbyname(const char \*name, const char \*proto);

40358        struct servent \*getservbyport(int port, const char \*proto);

40359        struct servent \*getservent(void);

40360 **DESCRIPTION**

40361        Refer to *endservent()*.

40362 **NAME**

40363 getsid — get the process group ID of a session leader

40364 **SYNOPSIS**

40365 #include &lt;unistd.h&gt;

40366 pid\_t getsid(pid\_t pid);

40367 **DESCRIPTION**40368 The *getsid()* function shall obtain the process group ID of the process that is the session leader of  
40369 the process specified by *pid*. If *pid* is (**pid\_t**)0, it specifies the calling process.40370 **RETURN VALUE**40371 Upon successful completion, *getsid()* shall return the process group ID of the session leader of  
40372 the specified process. Otherwise, it shall return  $-1$  and set *errno* to indicate the error.40373 **ERRORS**40374 The *getsid()* function shall fail if:40375 [EPERM] The process specified by *pid* is not in the same session as the calling process,  
40376 and the implementation does not allow access to the process group ID of the  
40377 session leader of that process from the calling process.40378 [ESRCH] There is no process with a process ID equal to *pid*.40379 **EXAMPLES**

40380 None.

40381 **APPLICATION USAGE**

40382 None.

40383 **RATIONALE**

40384 None.

40390 **CHANGE HISTORY**

40391 First released in Issue 4, Version 2.

40392 **Issue 5**

40393 Moved from X/OPEN UNIX extension to BASE.

40394 **Issue 7**40395 The *getsid()* function is moved from the XSI option to the Base.

40396 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0258 [421] is applied.

40397 **NAME**

40398       getsockname — get the socket name

40399 **SYNOPSIS**

40400       #include &lt;sys/socket.h&gt;

40401       int getsockname(int *socket*, struct sockaddr \*restrict *address*,  
40402                   socklen\_t \*restrict *address\_len*);40403 **DESCRIPTION**40404       The *getsockname()* function shall retrieve the locally-bound name of the specified socket, store  
40405       this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of  
40406       this address in the object pointed to by the *address\_len* argument.40407       The *address\_len* argument points to a **socklen\_t** object which on input specifies the length of the  
40408       supplied **sockaddr** structure, and on output specifies the length of the socket address. If the  
40409       actual length of the address is greater than the length of the supplied **sockaddr** structure, the  
40410       stored address shall be truncated.40411       If the socket has not been bound to a local name, the value stored in the object pointed to by  
40412       *address* is unspecified.40413 **RETURN VALUE**40414       Upon successful completion, 0 shall be returned, the *address* argument shall point to the address  
40415       of the socket, and the *address\_len* argument shall point to the length of the address. Otherwise, -1  
40416       shall be returned and *errno* set to indicate the error.40417 **ERRORS**40418       The *getsockname()* function shall fail if:40419       [EBADF]        The *socket* argument is not a valid file descriptor.40420       [ENOTSOCK]    The *socket* argument does not refer to a socket.

40421       [EOPNOTSUPP]  The operation is not supported for this socket's protocol.

40422       The *getsockname()* function may fail if:

40423       [EINVAL]       The socket has been shut down.

40424       [ENOBUFS]     Insufficient resources were available in the system to complete the function.

40425 **EXAMPLES**

40426       None.

40427 **APPLICATION USAGE**40428       For AF\_UNIX sockets, it is recommended that *address* points to a buffer of length greater than  
40429       sizeof(struct sockaddr\_un) which has been initialized with null bytes. That way, even if  
40430       the implementation supports the use of all bytes of *sun\_path* without a terminating null byte, the  
40431       larger buffer guarantees that the *sun\_path* member can then be passed to other interfaces that  
40432       expect a null-terminated string. If no truncation occurred based on the input value of *address\_len*,  
40433       it is unspecified whether the returned *address\_len* will be sizeof(struct sockaddr\_un), or  
40434       merely a value at least as large as offsetof(struct sockaddr\_un, sun\_path) plus the  
40435       number of non-null bytes stored in *sun\_path*.40436 **RATIONALE**

40437       None.

40438 **FUTURE DIRECTIONS**

40439 None.

40440 **SEE ALSO**40441 *accept()*, *bind()*, *getpeername()*, *socket()*40442 XBD <[sys/socket.h](#)>40443 **CHANGE HISTORY**

40444 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

40445 The **restrict** keyword is added to the *getsockname()* prototype for alignment with the  
40446 ISO/IEC 9899:1999 standard.40447 **Issue 7**

40448 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0259 [464] is applied.

40449 **Issue 8**40450 Austin Group Defect 561 is applied, adding a paragraph about *sun\_path* to APPLICATION  
40451 USAGE.40452 Austin Group Defect 1565 is applied, changing the description of *address\_len*.

40453 **NAME**

40454 getsockopt — get the socket options

40455 **SYNOPSIS**

```
40456 #include <sys/socket.h>
40457 int getsockopt(int socket, int level, int option_name,
40458 void *restrict option_value, socklen_t *restrict option_len);
```

40459 **DESCRIPTION**40460 The *getsockopt()* function manipulates options associated with a socket.

40461 The *getsockopt()* function shall retrieve the value for the option specified by the *option\_name*  
40462 argument for the socket specified by the *socket* argument. If the size of the option value is greater  
40463 than *option\_len*, the value stored in the object pointed to by the *option\_value* argument shall be  
40464 silently truncated. Otherwise, the object pointed to by the *option\_len* argument shall be modified  
40465 to indicate the actual length of the value.

40466 The *level* argument specifies the protocol level at which the option resides. To retrieve options at  
40467 the socket level, specify the *level* argument as SOL\_SOCKET. To retrieve options at other levels,  
40468 supply the appropriate level identifier for the protocol controlling the option. For example, to  
40469 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to  
40470 IPPROTO\_TCP as defined in the **<netinet/in.h>** header.

40471 The socket in use may require the process to have appropriate privileges to use the *getsockopt()*  
40472 function.

40473 The *option\_name* argument specifies a single option to be retrieved. It can be one of the socket-  
40474 level options defined in **<sys/socket.h>** and described in [Section 2.10.16](#) (on page 554).

40475 **RETURN VALUE**

40476 Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno*  
40477 set to indicate the error.

40478 **ERRORS**40479 The *getsockopt()* function shall fail if:

40480 [EBADF] The *socket* argument is not a valid file descriptor.

40481 [EINVAL] The specified option is invalid at the specified socket level.

40482 [ENOPROTOOPT]  
40483 The option is not supported by the protocol.

40484 [ENOTSOCK] The *socket* argument does not refer to a socket.

40485 The *getsockopt()* function may fail if:

40486 [EACCES] The calling process does not have appropriate privileges.

40487 [EINVAL] The socket has been shut down.

40488 [ENOBUFS] Insufficient resources are available in the system to complete the function.

40489 **EXAMPLES**

40490 None.

40491 **APPLICATION USAGE**

40492 None.

40493 **RATIONALE**

40494 None.

40495 **FUTURE DIRECTIONS**

40496 None.

40497 **SEE ALSO**40498 [Section 2.10.16](#) (on page 554), [bind\(\)](#), [close\(\)](#), [endprotoent\(\)](#), [setsockopt\(\)](#), [socket\(\)](#)40499 XBD [<sys/socket.h>](#), [<netinet/in.h>](#)40500 **CHANGE HISTORY**

40501 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

40502 The **restrict** keyword is added to the `getsockopt()` prototype for alignment with the  
40503 ISO/IEC 9899:1999 standard.40504 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of  
40505 SO\_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.40506 **Issue 7**40507 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options  
40508 that is now in [Section 2.10.16](#) (on page 554).

40509 **NAME**

40510 getsubopt — parse suboption arguments from a string

40511 **SYNOPSIS**

```
40512 CX #include <stdlib.h>
40513 int getsubopt(char **restrict optionp,
40514 char * const *restrict keylistp, char **restrict valuep);
```

40515 **DESCRIPTION**

40516 The *getsubopt()* function shall parse suboption arguments in a flag argument. Such options often  
 40517 result from the use of *getopt()*.

40518 The *getsubopt()* argument *optionp* is a pointer to a pointer to the option argument string. The  
 40519 suboption arguments shall be separated by <comma> characters and each may consist of either  
 40520 a single token, or a token-value pair separated by an <equals-sign>.

40521 The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified  
 40522 by a null pointer. Each entry in the vector is one of the possible tokens that might be found in  
 40523 *\*optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not  
 40524 appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates  
 40525 a token from its value, the application should not include an <equals-sign> in any of the strings  
 40526 pointed to by *keylistp*. The *getsubopt()* function shall not modify the *keylistp* vector.

40527 The *valuep* argument is the address of a value string pointer.

40528 If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma>  
 40529 characters have been processed, if there are one or more <equals-sign> characters in a suboption  
 40530 string, the first <equals-sign> in any suboption string shall be interpreted as a separator between  
 40531 a token and a value. Subsequent <equals-sign> characters in a suboption string shall be  
 40532 interpreted as part of the value.

40533 If the string at *\*optionp* contains only one suboption argument (equivalently, no <comma>  
 40534 characters), *getsubopt()* shall update *\*optionp* to point to the null character at the end of the  
 40535 string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator  
 40536 with a null character, and shall update *\*optionp* to point to the start of the next suboption  
 40537 argument. If the suboption argument has an associated value (equivalently, contains an <equals-  
 40538 sign>), *getsubopt()* shall update *\*valuep* to point to the value's first character. Otherwise, it shall  
 40539 set *\*valuep* to a null pointer. The calling application may use this information to determine  
 40540 whether the presence or absence of a value for the suboption is an error.

40541 Additionally, when *getsubopt()* fails to match the suboption argument with a token in the *keylistp*  
 40542 array, the calling application should decide if this is an error, or if the unrecognized option  
 40543 should be processed in another way.

40544 **RETURN VALUE**

40545 The *getsubopt()* function shall return the index of the matched token string, or -1 if no token  
 40546 strings were matched.

40547 **ERRORS**

40548 No errors are defined.

40549 **EXAMPLES**40550 **Parsing Suboptions**

40551 The following example uses the `getsubopt()` function to parse a *value* argument in the *optarg*  
 40552 external variable returned by a call to `getopt()`.

```

40553 #include <stdio.h>
40554 #include <stdlib.h>
40555 #include <unistd.h>

40556 int do_all;
40557 const char *type;
40558 int read_size;
40559 int write_size;
40560 int read_only;

40561 enum
40562 {
40563     RO_OPTION = 0,
40564     RW_OPTION,
40565     READ_SIZE_OPTION,
40566     WRITE_SIZE_OPTION
40567 };

40568 const char *mount_opts[] =
40569 {
40570     [RO_OPTION] = "ro",
40571     [RW_OPTION] = "rw",
40572     [READ_SIZE_OPTION] = "rsize",
40573     [WRITE_SIZE_OPTION] = "wsize",
40574     NULL
40575 };

40576 int
40577 main(int argc, char *argv[])
40578 {
40579     char *subopts, *value;
40580     int opt;

40581     while ((opt = getopt(argc, argv, "at:o:")) != -1)
40582         switch(opt)
40583         {
40584             case 'a':
40585                 do_all = 1;
40586                 break;
40587             case 't':
40588                 type = optarg;
40589                 break;
40590             case 'o':
40591                 subopts = optarg;
40592                 while (*subopts != ' ')
40593                     {
40594                         char *saved = subopts;
40595                         switch(getsubopt (&subopts, (char **)mount_opts,
```

```

40596         &value))
40597     {
40598     case RO_OPTION:
40599         read_only = 1;
40600         break;
40601     case RW_OPTION:
40602         read_only = 0;
40603         break;
40604     case READ_SIZE_OPTION:
40605         if (value == NULL)
40606             abort();
40607         read_size = atoi(value);
40608         break;
40609     case WRITE_SIZE_OPTION:
40610         if (value == NULL)
40611             abort();
40612         write_size = atoi(value);
40613         break;
40614     default:
40615         /* Unknown suboption. */
40616         printf("Unknown suboption `%s'\n", saved);
40617         abort();
40618     }
40619     }
40620     break;
40621     default:
40622         abort();
40623     }
40624     /* Do the real work. */
40625     return 0;
40626 }

```

40627 If the above example is invoked with:

```
40628 program -o ro,rsize=512
```

40629 then after option parsing, the variable *do\_all* will be 0, *type* will be a null pointer, *read\_size* will be  
 40630 512, *write\_size* will be 0, and *read\_only* will be 1. If it is invoked with:

```
40631 program -o oops
```

40632 it will print:

```
40633 "Unknown suboption `oops'"
```

40634 before aborting.

#### 40635 APPLICATION USAGE

40636 The value of *\*valuep* when *getsubopt()* returns  $-1$  is unspecified. Historical implementations  
 40637 provide various incompatible extensions to allow an application to access the suboption text that  
 40638 was not found in the *keylistp* array.

40639 **RATIONALE**

40640 The *keylistp* argument of *getsubopt()* is typed as **char \* const \*** to match historical practice.  
40641 However, the standard is clear that implementations will not modify either the array or the  
40642 strings contained in the array, as if the argument had been typed **const char \* const \***.

40643 **FUTURE DIRECTIONS**

40644 None.

40645 **SEE ALSO**

40648 **CHANGE HISTORY**

40649 First released in Issue 4, Version 2.

40650 **Issue 5**

40651 Moved from X/OPEN UNIX extension to BASE.

40652 **Issue 6**

40653 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/26 is applied, correcting an editorial error  
40654 in the SYNOPSIS.

40655 **Issue 7**

40656 The *getsubopt()* function is moved from the XSI option to the Base.

40657 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0260 [196], XSH/TC1-2008/0261 [196],  
40658 XSH/TC1-2008/0262 [196], XSH/TC1-2008/0263 [196], XSH/TC1-2008/0264 [196],  
40659 XSH/TC1-2008/0265 [196], XSH/TC1-2008/0266 [196], XSH/TC1-2008/0267 [196],  
40660 XSH/TC1-2008/0268 [196], and XSH/TC1-2008/0269 [196] are applied.

40661 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0174 [791] is applied.

40662 **Issue 8**

40663 Austin Group Defect 444 is applied, adding the **restrict** keyword to the *getsubopt()* prototype.

40664 **NAME**

40665 `dgettext`, `dgettext_l`, `dcgettext`, `dcgettext_l`, `gettext`, `gettext_l`, `ngettext`, `ngettext_l`, `dngettext`,  
 40666 `dngettext_l`, `dcngettext`, `dcngettext_l` — message handling functions

40667 **SYNOPSIS**

```
40668 #include <libintl.h>
40669 char *dgettext(const char *domainname, const char *msgid);
40670 char *dgettext_l(const char *domainname, const char *msgid,
40671 locale_t locale);
40672 char *dcgettext(const char *domainname, const char *msgid,
40673 int category);
40674 char *dcgettext_l(const char *domainname, const char *msgid,
40675 int category, locale_t locale);
40676 char *dngettext(const char *domainname, const char *msgid,
40677 const char *msgid_plural, unsigned long int n);
40678 char *dngettext_l(const char *domainname, const char *msgid,
40679 const char *msgid_plural, unsigned long int n,
40680 locale_t locale);
40681 char *dcngettext(const char *domainname, const char *msgid,
40682 const char *msgid_plural, unsigned long int n,
40683 int category);
40684 char *dcngettext_l(const char *domainname, const char *msgid,
40685 const char *msgid_plural, unsigned long int n,
40686 int category, locale_t locale);
40687 char *gettext(const char *msgid);
40688 char *gettext_l(const char *msgid, locale_t locale);
40689 char *ngettext(const char *msgid, const char *msgid_plural,
40690 unsigned long int n);
40691 char *ngettext_l(const char *msgid, const char *msgid_plural,
40692 unsigned long int n, locale_t locale);
```

40693 **DESCRIPTION**

40694 The `gettext()` function shall:

- 40695 • attempt to locate a suitable messages object (described in detail below) for the  
 40696 `LC_MESSAGES` category in the current locale, and for the current text domain (see  
 40697 `bindtextdomain()`), containing the string identified by `msgid`,
- 40698 • retrieve the string identified by `msgid` from the messages object,
- 40699 • convert the string to the output codeset if necessary (described in detail below), and
- 40700 • return the result.

40701 If the locale name in effect is "POSIX" or "C" (i.e. the name associated with the `LC_MESSAGES`  
 40702 locale category in the current locale), or if no suitable messages object exists, or if no string  
 40703 identified by `msgid` exists in the messages object, or if an error occurs, `msgid` shall be returned.

40704 The `dgettext()` function shall be equivalent to `gettext()`, except `domainname` shall be used instead  
 40705 of the current text domain to locate the messages object.

40706 The `dcgettext()` function shall be equivalent to `dgettext()`, except the locale category identified by  
 40707 `category` shall be used instead of `LC_MESSAGES`.

40708 The `ngettext()` function shall be equivalent to `gettext()`, except:

- 40709           • The string to retrieve shall be identified by a combination of *msgid* and *n* (see *msgfmt*).
- 40710           • If the locale name in effect is "POSIX" or "C", or if no suitable messages object exists, or if
- 40711           no string identified by the combination of *msgid* and *n* exists in the messages object, or if an
- 40712           error occurs, the return value shall be *msgid* if *n* is 1, otherwise *msgid\_plural*.

40713           The *dngettext()* function shall be equivalent to *ngettext()*, except *domainname* shall be used

40714           instead of the current text domain to locate the messages object.

40715           The *dcngettext()* function shall be equivalent to *dngettext()*, except the locale category identified

40716           by *category* shall be used instead of *LC\_MESSAGES*.

40717           The *\*\_l()* functions shall be equivalent to their counterparts without the *\_l* suffix, except *locale*

40718           shall be used instead of the current locale. If *locale* is the special locale object

40719           LC\_GLOBAL\_LOCALE or is not a valid locale object handle, the behavior is undefined.

40720           The application shall ensure that the *msgid* and *msgid\_plural* arguments are strings. If either

40721           *msgid* or *msgid\_plural* is an empty string, or contains characters not in the portable character set,

40722           the results are unspecified. If the *category* argument is *LC\_ALL*, the results are unspecified.

40723           The location of the messages object shall be determined according to the following criteria,

40724           stopping when the first messages object is found:

- 40725 XSI           1. If the *NLSPATH* environment variable is set to a non-empty string, an *NLSPATH* search
- 40726           shall be performed as described in XBD Section 8.2 (on page 169). If *NLSPATH* identifies
- 40727           more than one template to use, each template in turn shall be used until a valid messages
- 40728           object is found.
- 40729           2. If the *LANGUAGE* environment variable is set to a non-empty string, a *LANGUAGE*
- 40730           search shall be performed as described below. If *LANGUAGE* identifies more than one
- 40731           directory to search, each directory shall be searched until a valid messages object is found.
- 40732           3. A single-locale search shall be performed as described below.

40733 XSI           For the *NLSPATH* search and the single-locale search, the single locale name used to locate the

40734           messages object shall be the locale name associated with the selected locale category from the

40735           current locale, or the provided locale object if calling one of the *\*\_l()* functions; additional

40736           searches of locale names without *.codeset* (if present), without *\_territory* (if present), and without

40737           *@modifier* (if present) may be performed.

40738           For the *LANGUAGE* search, the value of the *LANGUAGE* environment variable shall be a list of

40739           one or more locale names separated by a <colon> (' : ') character. Each locale name shall be

40740           tried in the specified order. If a messages object for the locale does not exist, or cannot be

40741           opened, or is unsuitable for implementation-defined reasons (such as security), the next locale

40742           name (if any) shall be tried. If:

- 40743           • a messages object for the locale can be opened but cannot be processed without error, or
- 40744           • the messages object does not contain a string identified by *msgid*, or *msgid* and *n* for the
- 40745           *ngettext* functions,

40746           it is unspecified whether the next locale name (if any) is tried. In all other cases, the messages

40747           object for the locale shall be used.

40748           For each locale name in *LANGUAGE*, or if *LANGUAGE* is not set or is empty, or no suitable

40749           messages object is found in processing *LANGUAGE*, the pathname used to locate the messages

40750           object shall be *dirname/localename/categoryname/textdomainname.mo*, where:

- 40751 • The *dirname* part is the *dirname* argument of the most recent successful call to  
40752 *bindtextdomain()* that had *textdomainname* as the *domainname* argument; any trailing <slash>  
40753 characters in *dirname* shall be discarded. If a successful call to *bindtextdomain()* has not  
40754 been made for *textdomainname*, an implementation-defined default directory shall be used.
- 40755 • For the *LANGUAGE* search, the *localename* part is each locale name from *LANGUAGE* in  
40756 turn; if a locale name has the format *language[\_territory][.codeset][@modifier]*, additional  
40757 searches of locale names without *.codeset* (if present), without *\_territory* (if present), and  
40758 without *@modifier* (if present) may be performed; if *.codeset* is not present, additional  
40759 searches of locale names with an added *.codeset* may be performed. For the single-locale  
40760 search, the *localename* part is the name of the current locale, or the locale specified in an  
40761 *\*\_l()* function call, for the category named by *categoryname*. Spellings of codeset names are  
40762 not standardized, and implementations may attempt to use different commonly known  
40763 spellings, for example "utf8" and "UTF-8".
- 40764 • The *categoryname* part is the string "LC\_MESSAGES" if *gettext()*, *dgettext()*, *ngettext()*, or  
40765 *dngettext()* is called, or the locale category name corresponding to the *category* argument to  
40766 *dcgettext()* or *dcngettext()*. Likewise for the *\*\_l()* variants of all these functions.
- 40767 • For *gettext()*, *gettext\_l()*, *ngettext()*, and *ngettext\_l()*, the *textdomainname* part is the text  
40768 domain set by the last successful call to *textdomain()*. For *dgettext()*, *dcgettext()*,  
40769 *dngettext()*, *dcngettext()*, and the *\*\_l()* variants of these functions, *textdomainname* is the text  
40770 domain specified by the *domainname* argument. The *domainname* argument shall be  
40771 equivalent in syntax and meaning to the *domainname* argument to *textdomain()*, except that  
40772 the selection of the text domain shall affect only the *dgettext()*, *dcgettext()*, *dngettext()*, and  
40773 *dcngettext()* function calls and their *\*\_l()* variants. If the *domainname* argument is a null  
40774 pointer, the text domain set by the last successful call to *textdomain()* shall be used. For all  
40775 of these functions, if a successful call to *textdomain()* has not been made the default text  
40776 domain "messages" shall be used.

40777 Resolution of the messages object pathname shall be performed the first time one of the *gettext*  
40778 family of functions is called for a given combination of *dirname*, *localename*, *categoryname*, and  
40779 *textdomainname*. It is unspecified whether the pathname is re-resolved if the combination has  
40780 been used before in a call to one of the *gettext* family of functions. If *bindtextdomain()* performs  
40781 pathname resolution of its *dirname* argument, only the part of the messages object pathname  
40782 after *dirname* shall be resolved by the *gettext* family of functions.

40783 When one of the *gettext* family of functions returns a message string that was found in a  
40784 messages object, it shall convert the codeset of the message string to the output codeset if a  
40785 codeset is specified in the messages object (see *msgfmt*) and the output codeset is not the same as  
40786 that codeset. If a successful call to *bind\_textdomain\_codeset()* has been made with the text domain  
40787 of the messages object as the *domainname* argument and a non-null *codeset* argument, the output  
40788 codeset shall be the *codeset* argument from the most recent such call. Otherwise, the output  
40789 codeset shall be the codeset of characters in the current locale, or the provided locale object if  
40790 calling one of the *\*\_l()* functions, as specified by the *LC\_CTYPE* category of the locale. The  
40791 conversion shall be performed as if by a call to *iconv()* using a conversion descriptor returned by  
40792 *iconv\_open(<output codeset>, <messages object codeset>)*, except that if the return value of *iconv()*  
40793 would be greater than zero, the non-identical conversions performed by the *gettext* family of  
40794 functions need not be the same as those that such an *iconv()* call would perform. If an error  
40795 prevents the codeset conversion from being performed, the *gettext* family of functions shall  
40796 behave as if no message string was found in the messages object. If at least one non-identical  
40797 conversion is performed that results in a fallback character (one that does not provide any  
40798 information about the character it was converted from, for example, a <question-mark> or  
40799 ``replacement-character''), the *gettext* family of functions may behave as if no message string was

40800 found in the messages object.

#### 40801 RETURN VALUE

40802 The `gettext()`, `gettext_l()`, `dgettext()`, `dgettext_l()`, `dcgettext()`, and `dcgettext_l()` functions shall  
40803 return the message string described in DESCRIPTION if successful. Otherwise, they shall return  
40804 `msgid`.

40805 The `ngettext()`, `ngettext_l()`, `dngettext()`, `dngettext_l()`, `dcngettext()`, and `dcngettext_l()` functions  
40806 shall return the message string described in DESCRIPTION if successful. Otherwise, `msgid` shall  
40807 be returned if `n` is equal to 1, or `msgid_plural` if `n` is not equal to 1.

40808 The application shall ensure that it does not modify the returned string. A subsequent call to a  
40809 `gettext` family function shall not overwrite or invalidate the returned string. The returned string  
40810 may be invalidated by a subsequent call to `bind_textdomain_codeset()`, `bindtextdomain()`,  
40811 `setlocale()`, or `textdomain()` in the same process, except for calls that only query values. The  
40812 returned string shall not be invalidated by a subsequent call to `uselocale()`.

#### 40813 ERRORS

40814 The `gettext` family of functions shall not modify `errno`. If an error occurs these functions shall  
40815 return a string as described in RETURN VALUE.

#### 40816 EXAMPLES

40817 The example code below assumes the following:

- 40818 • The implementation-defined default directory is `/system/gettextlib`.
- 40819 • The following locales are available on the target system: `en_US`, `en_GB`, `de_DE`. The  
40820 codeset used for all of these locales is UTF-8.
- 40821 • The `en_AU` locale is not available on the target system.
- 40822 • The target system supports conversion from ISO/IEC 8859-1 to UTF-8.
- 40823 • The codeset used for the POSIX locale is ASCII.
- 40824 • The target system does not support conversion from ISO/IEC 8859-1 to ASCII.

40825 Furthermore, the following `.mo` files (and only the following `.mo` files) are installed:

- 40826 • `/system/gettextlib/en_US/LC_MESSAGES/mail.mo`
- 40827 • `/messagecatalogs/example/en_US/LC_MESSAGES/mail.mo`

40828 These are compiled from a portable messages object source file (dot-po file) with the following  
40829 ISO/IEC 8859-1 encoded contents (see the EXTENDED DESCRIPTION of the `msgfmt` utility for a  
40830 description of the dot-po file format):

```
40831 msgid ""
40832 msgstr ""
40833 "Content-Type: text/plain; charset=ISO_8859-1\n"
40834 "Plural-Forms: nplurals=4; plural= n==1?0: (n>1&&n<10)?1: (n==0)?2:3;\n"
40835 msgid "recipient"
40836 msgid_plural "recipients"
40837 msgstr[0] "1 recipient"
40838 msgstr[1] "2 to 9 recipients"
40839 msgstr[2] "no recipients"
40840 msgstr[3] "more than 9 recipients"
```

40841 `/system/gettextlib/de_DE/LC_MESSAGES/mail.mo` is compiled from a dot-po file with the  
40842 following ISO/IEC 8859-1 encoded contents:

```

40843     msgid ""
40844     msgstr ""
40845     "Content-Type: text/plain; charset=ISO_8859-1\n"
40846     "Plural-Forms: nplurals=4; plural= n==1?0: (n>1&&n<5)?1: (n==0)?2:3;\n"
40847     msgid "recipient"
40848     msgid_plural "recipients"
40849     msgstr[0] "1 Empfänger"
40850     msgstr[1] "2 bis 4 Empfänger"
40851     msgstr[2] "keine Empfänger"
40852     msgstr[3] "mehr als 4 Empfänger"

40853     /messagecatalogs/example/en_GB/LC_MESSAGES/mail.mo is compiled from a dot-po file
40854     with the following ISO/IEC 8859-1 encoded contents:

40855     msgid ""
40856     msgstr ""
40857     "Content-Type: text/plain; charset=ISO_8859-1\n"
40858     "Plural-Forms: nplurals=4; plural= n==1?0: (n>1&&n<5)?1: (n==0)?2:3;\n"
40859     msgid "recipient"
40860     msgid_plural "recipients"
40861     msgstr[0] "1 recipient"
40862     msgstr[1] "2 to 4 recipients"
40863     msgstr[2] "no recipients"
40864     msgstr[3] "5 or more recipients"

40865     /messagecatalogs/example2/en_US/LC_MESSAGES/othermail.mo is not a suitable messages
40866     object file or is a suitable messages object file that does not contain the msgid "recipient".

40867     The following example demonstrates the interactions between bindtextdomain(),
40868     bind_textdomain_codeset(), textdomain(), and the gettext family of functions.

40869     unsigned long n_recipients;
40870     // strdup() is used to prevent default_domain from being invalidated by
40871     // a future call to bindtextdomain()
40872     const char *default_domain = strdup(bindtextdomain("mail", NULL));
40873     setlocale(LC_MESSAGES, "POSIX");
40874     setlocale(LC_CTYPE, "POSIX");

40875     n_recipients = 1;
40876     // The following outputs "recipient" with the same encoding as the
40877     // "recipient" argument to ngettext():
40878     printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40879     n_recipients = 3;
40880     // The following outputs "recipients" with the same encoding as the
40881     // "recipients" argument to ngettext():
40882     printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40883     setlocale(LC_MESSAGES, "en_US");
40884     setlocale(LC_CTYPE, "en_US");
40885     textdomain("mail");

40886     n_recipients = 1;
40887     // The following outputs "1 recipient", encoded in UTF-8:
40888     printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40889     n_recipients = 3;

```

```
40890 // The following outputs "2 to 9 recipients", encoded in UTF-8:
40891 printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40892 setlocale(LC_MESSAGES, "en_GB");
40893 setlocale(LC_CTYPE, "en_GB");
40894 bindtextdomain("mail", "/messagecatalogs/example/");

40895 n_recipients = 3;
40896 // The following outputs "2 to 4 recipients", encoded in UTF-8:
40897 printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40898 setlocale(LC_MESSAGES, "en_US");
40899 setlocale(LC_CTYPE, "en_US");
40900 textdomain("othermail");
40901 bindtextdomain("othermail", "/messagecatalogs/example2/");

40902 n_recipients = 3;
40903 // The following outputs "recipients" with the same encoding as the
40904 // "recipients" argument to ngettext():
40905 printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40906 // Because there is no locale named en_AU on the system, en_US is used:
40907 setenv("LANGUAGE", "en_AU:en_US:en_GB", 1);
40908 setlocale(LC_MESSAGES, "");
40909 setlocale(LC_CTYPE, "");
40910 bindtextdomain("mail", default_domain);

40911 // The following outputs "2 to 9 recipients", encoded in UTF-8:
40912 printf("%s\n", dngettext("mail", "recipient", "recipients", 3));

40913 textdomain("mail");
40914 bind_textdomain_codeset("mail", "UTF-8");
40915 setlocale(LC_MESSAGES, "de_DE");
40916 setlocale(LC_CTYPE, "de_DE");
40917 // Clear the LANGUAGE environment variable, otherwise it would take
40918 // precedence over the locale set above, and en_US would continue to
40919 // be used.
40920 setenv("LANGUAGE", "", 1);

40921 n_recipients = 1;
40922 // The following outputs "1 Empfänger", encoded in UTF-8:
40923 printf("%s\n", ngettext("recipient", "recipients", n_recipients));

40924 bind_textdomain_codeset("mail", "ASCII");
40925 setlocale(LC_CTYPE, "POSIX");

40926 n_recipients = 1;
40927 // The following outputs "recipient" with the same encoding as the
40928 // "recipient" argument to ngettext() - remember, the system is assumed
40929 // to not support conversion from ISO/IEC 8859-1 to ASCII:
40930 printf("%s\n", ngettext("recipient", "recipients", n_recipients));
40931 free(default_domain);
```

## 40932 APPLICATION USAGE

40933 These functions do not impose a limit on message length. Note that translated strings typically  
 40934 have a different length than the input strings, possibly much longer, and applications using  
 40935 these translations in formatted text (for example, aligned columns for a table) should take that  
 40936 into account.

40937 The *dcgettext()*, *dcgettext\_l()*, *dcngettext()*, and *dcngettext\_l()* functions are useful to retrieve  
 40938 locale-specific strings for a category other than *LC\_MESSAGES*. For example, they can be used  
 40939 to obtain a time format string from the *LC\_TIME* category; because the locale setting of *LC\_TIME*  
 40940 and *LC\_MESSAGES* can be different, using the other *gettext* family functions in such a case  
 40941 might cause an undesired result. All of the functions in the *gettext* family of functions, except  
 40942 *dcgettext()*, *dcgettext\_l()*, *dcngettext()*, and *dcngettext\_l()*, search for messages objects only in the  
 40943 *LC\_MESSAGES* category.

40944 Implementations typically, but are not required to, *mmap()* the messages object file the first time  
 40945 one of the *gettext* family of functions is called, and keep that map in place until it is no longer  
 40946 expected to be used. For example, a successful call to *bindtextdomain()* will typically cause the  
 40947 next call to one of the *gettext* family of functions to *munmap()* the previous file and *mmap()* the  
 40948 new file. Applications should not rely on this behavior, however: the implementation is allowed  
 40949 to cache previously used maps, or not use *mmap()* at all and reopen the file each time one of the  
 40950 *gettext* family of functions is called.

40951 The *msgid* and *msgid\_plural* arguments are typically in (US) English. The arguments are always  
 40952 used in the POSIX or C locale, and when a *gettext* family function encounters an error, so they  
 40953 should not be abstract message identifiers (for example, "message 123") and they should only  
 40954 use characters in the portable character set (to avoid outputting byte sequences that are not valid  
 40955 characters in the current output codeset). If the *xgettext* utility is used to extract the *msgid* and  
 40956 *msgid\_plural* arguments from C source files into a template dot-po file, the arguments must be  
 40957 string literals in order for the resulting file to be useful to translators.

40958 The strings returned by the *gettext* family of functions are not guaranteed to contain only  
 40959 characters that are valid in the current output codeset. In particular, byte sequences that do not  
 40960 form valid characters can occur when:

- 40961 • The *msgid* or *msgid\_plural* arguments use characters outside the portable character set.
- 40962 • The messages object file does not specify a character set and uses characters outside the  
 40963 portable character set.

40964 The strings returned by the *gettext* family of functions are guaranteed to remain valid until  
 40965 invalidated as described in the RETURN VALUE section. This includes strings that are created  
 40966 by codeset conversion; those strings are freed by the implementation, not the application. Thus,  
 40967 it is safe to call *gettext* family functions multiple times in situations such as:

```
40968 printf("%s %s\n", gettext("foo"), gettext("bar"));
```

## 40969 RATIONALE

40970 Although the return type of these functions ought to be **const char \***, it is **char \*** to match  
 40971 historical practice.

40972 The *gettext* family of functions is frequently used in reporting errors. In fact, it is possible to have  
 40973 an application that attempts to create an error message that combines a translated string via  
 40974 *gettext()* with an error string provided by *strerror()*. The standard requires that the *gettext* family  
 40975 of functions does not modify *errno*, so that an application need not worry about complications of  
 40976 providing sequencing points to capture a stable value of *errno* prior to the translation of the error  
 40977 message, and so that the user will still get a somewhat useful string (even if it is the untranslated  
 40978 original string) on any failure.

40979 There are no wide character equivalents for these functions; historically no implementation is  
40980 known to exist, and the multi-byte message returned from these functions can, in most instances,  
40981 be converted to wide characters by the application if desired.

40982 Some historical *gettext* implementations returned the translated string from the messages object  
40983 without codeset conversion if *iconv\_open()* fails. This is considered to be a bug in those  
40984 implementations.

#### 40985 **FUTURE DIRECTIONS**

40986 None.

#### 40987 **SEE ALSO**

40988 *bindtextdomain()*, *catopen()*, *iconv()*, *setlocale()*, *uselocale()*

#### 40991 **CHANGE HISTORY**

40992 First released in Issue 8.

40993 **NAME**

40994       getuid — get a real user ID

40995 **SYNOPSIS**

40996       #include &lt;unistd.h&gt;

40997       uid\_t getuid(void);

40998 **DESCRIPTION**40999       The *getuid()* function shall return the real user ID of the calling process. The *getuid()* function  
41000       shall not modify *errno*.41001 **RETURN VALUE**41002       The *getuid()* function shall always be successful and no return value is reserved to indicate the  
41003       error.41004 **ERRORS**

41005       No errors are defined.

41006 **EXAMPLES**41007       **Setting the Effective User ID to the Real User ID**

41008       The following example sets the effective user ID of the calling process to the real user ID.

41009       #include &lt;unistd.h&gt;

41010       ...

41011       seteuid(getuid());

41012 **APPLICATION USAGE**

41013       None.

41014 **RATIONALE**41015       In a conforming environment, *getuid()* will always succeed. It is possible for implementations to  
41016       provide an extension where a process in a non-conforming environment will not be associated  
41017       with a user or group ID. It is recommended that such implementations return **(uid\_t)-1** and set  
41018       *errno* to indicate such an environment; doing so does not violate this standard, since such an  
41019       environment is already an extension.41020 **FUTURE DIRECTIONS**

41021       None.

41022 **SEE ALSO**41023       *getegid()*, *geteuid()*, *getgid()*, *getresgid()*, *getresuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*,  
41024       *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*41025       XBD <[sys/types.h](#)>, <[unistd.h](#)>41026 **CHANGE HISTORY**

41027       First released in Issue 1. Derived from Issue 1 of the SVID.

41028 **Issue 6**41029       In the SYNOPSIS, the optional include of the <[sys/types.h](#)> header is removed.41030       The following new requirements on POSIX implementations derive from alignment with the  
41031       Single UNIX Specification:

- 41032
- The requirement to include <[sys/types.h](#)> has been removed. Although <[sys/types.h](#)> was  
41033       required for conforming implementations of previous POSIX specifications, it was not  
41034       required for UNIX applications.

41035 **Issue 7**

41036 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0175 [511] and XSH/TC2-2008/0176  
41037 [897] are applied.

41038 **Issue 8**

41039 Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
41040 SEE ALSO.

41041 **NAME**

41042           getutxent, getutxid, getutxline — get user accounting database entries

41043 **SYNOPSIS**

```
41044 XSI       #include <utmpx.h>
41045           struct utmpx *getutxent(void);
41046           struct utmpx *getutxid(const struct utmpx *id);
41047           struct utmpx *getutxline(const struct utmpx *line);
```

41048 **DESCRIPTION**

41049           Refer to *endutxent()*.

41050 **NAME**

41051 getwc — get a wide character from a stream

41052 **SYNOPSIS**

41053 #include &lt;stdio.h&gt;

41054 #include &lt;wchar.h&gt;

41055 wint\_t getwc(FILE \*stream);

41056 **DESCRIPTION**

41057 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
41058 conflict between the requirements described here and the ISO C standard is unintentional. This  
41059 volume of POSIX.1-2024 defers to the ISO C standard.

41060 The *getwc()* function shall be equivalent to *fgetwc()*, except that if it is implemented as a macro it  
41061 may evaluate *stream* more than once, so the argument should never be an expression with side-  
41062 effects.

41063 **RETURN VALUE**41064 Refer to *fgetwc()*.41065 **ERRORS**41066 Refer to *fgetwc()*.41067 **EXAMPLES**

41068 None.

41069 **APPLICATION USAGE**

41070 Since it may be implemented as a macro, *getwc()* may treat incorrectly a *stream* argument with  
41071 side-effects. In particular, *getwc(\*f++)* does not necessarily work as expected. Therefore, use of  
41072 this function is not recommended; *fgetwc()* should be used instead.

41073 **RATIONALE**

41074 None.

41075 **FUTURE DIRECTIONS**

41076 None.

41077 **SEE ALSO**41078 [Section 2.5](#) (on page 521), *fgetwc()*41079 XBD [<stdio.h>](#), [<wchar.h>](#)41080 **CHANGE HISTORY**

41081 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
41082 draft.

41083 **Issue 5**41084 The Optional Header (OH) marking is removed from [<stdio.h>](#).41085 **Issue 7**

41086 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0270 [14] is applied.

41087 **NAME**41088           getwchar — get a wide character from a *stdin* stream41089 **SYNOPSIS**

41090           #include &lt;wchar.h&gt;

41091           wint\_t getwchar(void);

41092 **DESCRIPTION**

41093 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
41094       conflict between the requirements described here and the ISO C standard is unintentional. This  
41095       volume of POSIX.1-2024 defers to the ISO C standard.

41096       The *getwchar()* function shall be equivalent to *getwc(stdin)*.41097 **RETURN VALUE**41098       Refer to *fgetwc()*.41099 **ERRORS**41100       Refer to *fgetwc()*.41101 **EXAMPLES**

41102       None.

41103 **APPLICATION USAGE**

41104       If the **wint\_t** value returned by *getwchar()* is stored into a variable of type **wchar\_t** and then  
41105       compared against the **wint\_t** macro WEOF, the result may be incorrect. Only the **wint\_t** type is  
41106       guaranteed to be able to represent any wide character and WEOF.

41107 **RATIONALE**

41108       None.

41109 **FUTURE DIRECTIONS**

41110       None.

41111 **SEE ALSO**41112       Section 2.5 (on page 521), *fgetwc()*, *getwc()*41113       XBD <**wchar.h**>41114 **CHANGE HISTORY**

41115       First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
41116       draft.

41117 **Issue 7**

41118       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0271 [14] is applied.

41119 **NAME**

41120 glob, globfree — generate pathnames matching a pattern

41121 **SYNOPSIS**

```
41122 #include <glob.h>
41123 int glob(const char *restrict pattern, int flags,
41124         int(*errfunc)(const char *epath, int eerrno),
41125         glob_t *restrict pglob);
41126 void globfree(glob_t *pglob);
```

41127 **DESCRIPTION**

41128 The *glob()* function is a pathname generator that shall implement the rules defined in XCU  
 41129 [Section 2.14](#) (on page 2523), with optional support for rule 3 in XCU [Section 2.14.3](#) (on page  
 41130 2525).

41131 The structure type **glob\_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	<i>gl_pathc</i>	Count of paths matched by <i>pattern</i> .
char **	<i>gl_pathv</i>	Pointer to a list of matched pathnames.
size_t	<i>gl_offs</i>	Slots to reserve at the beginning of <i>gl_pathv</i> .

41137 The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function  
 41138 shall match all accessible pathnames against this pattern and develop a list of all pathnames that  
 41139 match. In order to have access to a pathname, *glob()* requires search permission on every  
 41140 component of a path except the last, and read permission on each directory of any filename  
 41141 component of *pattern* that contains any of the following special characters: '\*', '?', and '['.

41142 The *glob()* function shall store the number of matched pathnames into *pglob->gl\_pathc* and a  
 41143 pointer to a list of pointers to pathnames into *pglob->gl\_pathv*. The pathnames shall be in sort  
 41144 order as defined by the current setting of the *LC\_COLLATE* category; see XBD [Section 7.3.2](#) (on  
 41145 page 139). The first pointer after the last pathname shall be a null pointer. If the pattern does not  
 41146 match any pathnames, the returned number of matched paths is set to 0, and the contents of  
 41147 *pglob->gl\_pathv* are implementation-defined.

41148 It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function  
 41149 shall allocate other space as needed, including the memory pointed to by *gl\_pathv*. The *globfree()*  
 41150 function shall free any space associated with *pglob* from a previous call to *glob()*. The *globfree()*  
 41151 function shall not modify *errno* if *pglob* was previously used by *glob()* and not yet freed.

41152 The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-  
 41153 inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

41154	<b>GLOB_APPEND</b>	Append pathnames generated to the ones from a previous call to <i>glob()</i> .
41155	<b>GLOB_DOOFFS</b>	Make use of <i>pglob-&gt;gl_offs</i> . If this flag is set, <i>pglob-&gt;gl_offs</i> is used to 41156 specify how many null pointers to add to the beginning of 41157 <i>pglob-&gt;gl_pathv</i> . In other words, <i>pglob-&gt;gl_pathv</i> shall point to 41158 <i>pglob-&gt;gl_offs</i> null pointers, followed by <i>pglob-&gt;gl_pathc</i> pathname 41159 pointers, followed by a null pointer.
41160	<b>GLOB_ERR</b>	Cause <i>glob()</i> to return when an attempt to open or search a pathname as a 41161 directory, or an attempt to read an opened directory, fails because of an 41162 error condition that is related to file system contents and prevents <i>glob()</i> 41163 from expanding the pattern. If this flag is not set, <i>glob()</i> shall not treat 41164 such conditions as an error, and shall continue to look for matches. Other

41165 error conditions may also be treated the same way as error conditions that  
41166 are related to file system contents.

41167 GLOB\_MARK For each pathname that matches *pattern* and is determined to be a  
41168 directory after pathname resolution, process the pathname so the result is  
41169 as if the following steps are applied in order:

- 41170 1. If the pathname is <slash>, do not modify the pathname and skip  
41171 the remaining steps.
- 41172 2. If the pathname is <slash><slash> and the implementation handles  
41173 pathname resolution of a pathname starting with exactly two  
41174 successive <slash> characters differently than it handles a  
41175 pathname starting with only a single <slash>, do not modify the  
41176 pathname and skip the remaining steps.
- 41177 3. If the pathname does not end with a <slash>, append a <slash> to  
41178 the pathname and skip the remaining steps.
- 41179 4. A <slash> may be appended to the pathname.
- 41180 5. If there are multiple <slash> characters at the end of the pathname,  
41181 all but one of those trailing <slash> characters may be removed  
41182 from the pathname.

41183 GLOB\_NOCHECK Supports rule 3 in XCU [Section 2.14.3](#) (on page 2525). If *pattern* does not  
41184 match any pathname, then *glob()* shall return a list consisting of only  
41185 *pattern*, and the number of matched pathnames is 1.

41186 GLOB\_NOESCAPE Disable backslash escaping.

41187 GLOB\_NOSORT Ordinarily, *glob()* sorts the matching pathnames according to the current  
41188 setting of the *LC\_COLLATE* category; see XBD [Section 7.3.2](#) (on page 139).  
41189 When this flag is used, the order of pathnames returned is unspecified.

41190 The GLOB\_APPEND flag can be used to append a new set of pathnames to those found in a  
41191 previous call to *glob()*. The following rules apply to applications when two or more calls to  
41192 *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

- 41193 1. The first such call shall not set GLOB\_APPEND. All subsequent calls shall set it.
- 41194 2. All the calls shall set GLOB\_DOOFFS, or all shall not set it.
- 41195 3. After the second call, *pglob->gl\_pathv* points to a list containing the following:
  - 41196 a. Zero or more null pointers, as specified by GLOB\_DOOFFS and *pglob->gl\_offs*.
  - 41197 b. Pointers to the pathnames that were in the *pglob->gl\_pathv* list before the call, in  
41198 the same order as before.
  - 41199 c. Pointers to the new pathnames generated by the second call, in the specified order.
- 41200 4. The count returned in *pglob->gl\_pathc* shall be the total number of pathnames from the  
41201 two calls.
- 41202 5. The application can change any of the fields after a call to *glob()*. If it does, the  
41203 application shall reset them to the original value before a subsequent call, using the same  
41204 *pglob* value, to *globfree()* or *glob()* with the GLOB\_APPEND flag.

41205 If *errfunc* is not a null pointer and, during the search, an attempt to open or search a pathname as  
41206 a directory, or an attempt to read an opened directory, fails because of an error condition that

41207 prevents *glob()* from expanding the pattern, *glob()* calls (*\*errfunc()*) with two arguments:

- 41208 1. The *epath* argument is a pointer to the path that failed.
- 41209 2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or
- 41210 *stat()*. (Other values may be used to report other errors not explicitly documented for
- 41211 those functions.)

41212 If (*\*errfunc()*) is called and returns non-zero, or, optionally, if *errfunc* is a null pointer and the

41213 attempt failed because of an error condition that is not related to file system contents, or if the

41214 GLOB\_ERR flag is set in *flags*, *glob()* shall stop the scan and return GLOB\_ABORTED after

41215 setting *gl\_pathc* and *gl\_pathv* in *pglob* to reflect the paths already scanned. If GLOB\_ERR is not set

41216 and either *errfunc* is a null pointer or (*\*errfunc()*) returns 0, the error shall be ignored.

41217 The set of error conditions that are considered to prevent *glob()* from expanding the pattern shall

41218 include [EACCES], [ENAMETOOLONG], and [ELOOP]. It is implementation-defined what

41219 other error conditions are included in the set.

41220 The *glob()* function shall not fail because of large files.

#### 41221 RETURN VALUE

41222 Upon successful completion, *glob()* shall return 0. The argument *pglob->gl\_pathc* shall return the

41223 number of matched pathnames and the argument *pglob->gl\_pathv* shall contain a pointer to a

41224 null-terminated list of matched and sorted pathnames. However, if *pglob->gl\_pathc* is 0, the

41225 content of *pglob->gl\_pathv* is undefined.

41226 The *globfree()* function shall not return a value.

41227 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in

41228 **<glob.h>**. The arguments *pglob->gl\_pathc* and *pglob->gl\_pathv* are still set as defined above.

#### 41229 ERRORS

41230 The *glob()* function shall fail and return the corresponding value if:

41231 GLOB\_ABORTED The scan was stopped because (*\*errfunc()*) was called and returned non-

41232 zero, or, optionally, *errfunc* was a null pointer and an attempt to open,

41233 read, or search a directory failed because of an error condition that is not

41234 related to file system contents, or GLOB\_ERR was set.

41235 GLOB\_NOMATCH The pattern does not match any existing pathname, and

41236 GLOB\_NOCHECK was not set in *flags*.

41237 GLOB\_NOSPACE An attempt to allocate memory failed.

#### 41238 EXAMPLES

41239 One use of the GLOB\_DOOFFS flag is by applications that build an argument list for use with

41240 *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the

41241 equivalent of:

```
41242 ls -ld -- *.c
```

41243 but for some reason:

```
41244 system("ls -ld -- *.c")
```

41245 is not acceptable. The application could obtain the same result (except for error handling,

41246 omitted here for simplicity) using the sequence:

```
41247 globbuf.gl_offs = 3;
41248 glob("*.c", GLOB_DOOFFS|GLOB_NOCHECK, NULL, &globbuf);
41249 globbuf.gl_pathv[0] = "ls"; // to establish the initial arguments
```

```

41250     globbuf.gl_pathv[1] = "-ld"; // that sh -c "ls -ld --" would
41251     globbuf.gl_pathv[2] = "--"; // produce for both examples
41252     execvp("ls", &globbuf.gl_pathv[0]);

```

41253 Using the same example:

```

41254     ls -ld -- *.c *.h

```

41255 could be simulated using GLOB\_APPEND as follows:

```

41256     globbuf.gl_offs = 3;
41257     glob("*.c", GLOB_DOOFFS|GLOB_NOCHECK, NULL, &globbuf);
41258     glob("*.h", GLOB_DOOFFS|GLOB_NOCHECK|GLOB_APPEND, NULL, &globbuf);
41259     ...

```

## 41260 APPLICATION USAGE

41261 This function is not provided for the purpose of enabling utilities to perform pathname  
 41262 expansion on their arguments, as this operation is performed by the shell, and utilities are  
 41263 explicitly not expected to redo this. Instead, it is provided for applications that need to do  
 41264 pathname expansion on strings obtained from other sources, such as a pattern typed by a user or  
 41265 read from a file.

41266 If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

41267 Note that *gl\_pathc* and *gl\_pathv* have meaning even if *glob()* fails. This allows *glob()* to report  
 41268 partial results in the event of an error. However, if *gl\_pathc* is 0, *gl\_pathv* is unspecified even if  
 41269 *glob()* did not return an error.

41270 The GLOB\_NOCHECK option could be used when an application wants to expand a pathname  
 41271 if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility  
 41272 might use this for option-arguments, for example.

41273 The new pathnames generated by a subsequent call with GLOB\_APPEND are not sorted  
 41274 together with the previous pathnames. This mirrors the way that the shell handles pathname  
 41275 expansion when multiple expansions are done on a command line.

41276 It is recommended that (*\*errfunc()*) should always return a non-zero value if the *eerrno*  
 41277 parameter indicates an error condition that is not related to file system contents. See XRAT  
 41278 [Section C.2.14.3](#) (on page 3911) for information about which error conditions are related to file  
 41279 system contents.

41280 Applications that need tilde and parameter expansion should use *wordexp()*.

## 41281 RATIONALE

41282 It was claimed that the GLOB\_DOOFFS flag is unnecessary because it could be simulated using:

```

41283     new = (char **)malloc((n + pglob->gl_pathc + 1)
41284         * sizeof(char *));
41285     (void) memcpy(new+n, pglob->gl_pathv,
41286         pglob->gl_pathc * sizeof(char *));
41287     (void) memset(new, 0, n * sizeof(char *));
41288     free(pglob->gl_pathv);
41289     pglob->gl_pathv = new;

```

41290 However, this assumes that the memory pointed to by *gl\_pathv* is a block that was separately  
 41291 created using *malloc()*. This is not necessarily the case. An application should make no  
 41292 assumptions about how the memory referenced by fields in *pglob* was allocated. It might have  
 41293 been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have  
 41294 been created using a different memory allocator. It is not the intent of the standard developers to

41295 specify or imply how the memory used by *glob()* is managed.

41296 The GLOB\_APPEND flag would be used when an application wants to expand several different  
41297 patterns into a single list.

41298 Earlier versions of this standard defined the behavior associated with the flag GLOB\_MARK as:  
41299 ``Each pathname that is a directory that matches *pattern* shall have a <slash> appended.'' This  
41300 was undesirable if the matched pathname was <slash> or if the matched pathname was  
41301 <slash><slash> and the implementation treats a leading <slash><slash> differently than it treats  
41302 a pathname with a single leading <slash>. Only a few implementations were known to conform  
41303 to this requirement (maybe only one) and there was a lot of variation in the way other  
41304 implementations behaved. The current wording allows many of the alternative behaviors that  
41305 were observed, except that the pathnames "/" and "/" (if it is treated differently than "/")  
41306 must not be modified.

41307 Implementations should consider the following much simpler requirement (which is allowed by  
41308 the current standard) when processing the GLOB\_MARK flag: ``Each pathname that matches  
41309 *pattern*, is determined to be a directory after pathname resolution, and does not end with a  
41310 <slash> shall have a <slash> appended.''

41311 Implementations differ as to which error conditions they consider prevent *glob()* from  
41312 expanding the pattern. The standard requires that [EACCES], [ENAMETOOLONG], and  
41313 [ELOOP] are included because in these cases the expansion could succeed if performed with a  
41314 different effective user or group ID, or with an alternative pathname (shorter than  
41315 {PATH\_MAX}, or traversing fewer symbolic links).

41316 Implementations are encouraged to call (*\*errfunc()*) for all error conditions that are related to file  
41317 system contents which occur when attempting to open or search a pathname as a directory or  
41318 attempting to read an opened directory. The appropriate way to handle such errors varies  
41319 according to the provenance of the pattern and what the application will do with the resulting  
41320 pathnames, and should therefore be for the application to decide. For example, given the pattern  
41321 "non-existing/\*", some applications may want *glob()* to succeed and return an empty list  
41322 because there are no existing files that match the pattern, but for others that would not be  
41323 appropriate, such as if an application asks the user to name a directory containing files to be  
41324 processed and the user makes a typing mistake when responding; the application will want to  
41325 alert the user to the mistake instead of behaving as if the user had named an empty directory. If  
41326 (*\*errfunc()*) is called for [ENOENT] errors, the first application can ignore them in that function,  
41327 but if (*\*errfunc()*) is not called, the second application cannot achieve what it wants using *glob()*.  
41328 Similar reasoning applies for the pattern "regular\_file/\*" and [ENOTDIR] errors.

#### 41329 FUTURE DIRECTIONS

41330 A future version of this standard may require that (*\*errfunc()*) is called for all error conditions  
41331 that are related to file system contents which occur when attempting to open or search a  
41332 pathname as a directory or attempting to read an opened directory.

#### 41336 CHANGE HISTORY

41337 First released in Issue 4. Derived from the ISO POSIX-2 standard.

41338 **Issue 5**

41339 Moved from POSIX2 C-language Binding to BASE.

41340 **Issue 6**

41341 The normative text is updated to avoid use of the term “must” for application requirements.

41342 The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999  
41343 standard.

41344 **Issue 8**

41345 Austin Group Defect 385 is applied, adding a requirement that *globfree()* does not modify *errno*  
41346 when passed a pointer to a **glob\_t** that can be freed.

41347 Austin Group Defect 1255 is applied, changing the EXAMPLES section.

41348 Austin Group Defects 1273 and 1275 are applied, clarifying how errors are treated when  
41349 attempting to open or search a pathname as a directory or attempting to read an opened  
41350 directory.

41351 Austin Group Defect 1300 is applied, changing the description of GLOB\_MARK.

41352 Austin Group Defect 1444 is applied, correcting cross-references to *wordexp()*.

41353 **NAME**

41354 gmtime, gmtime\_r — convert a time value to a broken-down UTC time

41355 **SYNOPSIS**

```
41356 #include <time.h>
41357 struct tm *gmtime(const time_t *timer);
41358 CX struct tm *gmtime_r(const time_t *restrict timer,
41359 struct tm *restrict result);
```

41360 **DESCRIPTION**

41361 CX For `gmtime()`: The functionality described on this reference page is aligned with the ISO C  
 41362 standard. Any conflict between the requirements described here and the ISO C standard is  
 41363 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

41364 The `gmtime()` function shall convert the time in seconds since the Epoch pointed to by `timer` into  
 41365 a broken-down time, expressed as Coordinated Universal Time (UTC).

41366 CX The relationship between a time in seconds since the Epoch used as an argument to `gmtime()`  
 41367 and the `tm` structure (defined in the `<time.h>` header) is that the result shall be as specified in  
 41368 the expression given in the definition of seconds since the Epoch (see XBD Section 4.19, on page  
 41369 107), where the names in the structure and in the expression correspond.

41370 The same relationship shall apply for `gmtime_r()`.

41371 The `gmtime()` function need not be thread-safe; however, `gmtime()` shall avoid data races with all  
 41372 functions other than itself, `asctime()`, `ctime()`, and `localtime()`.

41373 The `asctime()`, `ctime()`, `gmtime()`, and `localtime()` functions shall return values in one of two static  
 41374 objects: a broken-down time structure and an array of type `char`. Execution of any of the  
 41375 functions that return a pointer to one of these object types may overwrite the information in any  
 41376 object of the same type pointed to by the value returned from any previous call to any of them.

41377 CX The `gmtime_r()` function shall convert the time in seconds since the Epoch pointed to by `timer`  
 41378 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down  
 41379 time is stored in the structure referred to by `result`. The `gmtime_r()` function shall also return the  
 41380 address of the same structure.

41381 **RETURN VALUE**

41382 Upon successful completion, the `gmtime()` function shall return a pointer to a `struct tm`. If an  
 41383 CX error is detected, `gmtime()` shall return a null pointer and set `errno` to indicate the error.

41384 Upon successful completion, `gmtime_r()` shall return the address of the structure pointed to by  
 41385 the argument `result`. The structure's `tm_zone` member shall be set to a pointer to the string  
 41386 "UTC", which shall have static storage duration. If an error is detected, `gmtime_r()` shall return a  
 41387 null pointer and set `errno` to indicate the error.

41388 **ERRORS**

41389 CX The `gmtime()` and `gmtime_r()` functions shall fail if:

41390 CX [EOVERFLOW] The result cannot be represented.

41391 **EXAMPLES**

41392 None.

41393 **APPLICATION USAGE**

41394 The *gmtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
41395 possibly using a static data area that may be overwritten by each call.

41396 **RATIONALE**

41397 None.

41398 **FUTURE DIRECTIONS**

41399 None.

41400 **SEE ALSO**41401 [asctime\(\)](#), [clock\(\)](#), [ctime\(\)](#), [difftime\(\)](#), [futimens\(\)](#), [localtime\(\)](#), [mktime\(\)](#), [strftime\(\)](#), [strptime\(\)](#), [time\(\)](#)41402 XBD Section 4.19 (on page 107), [<time.h>](#)41403 **CHANGE HISTORY**

41404 First released in Issue 1. Derived from Issue 1 of the SVID.

41405 **Issue 5**

41406 A note indicating that the *gmtime()* function need not be reentrant is added to the  
41407 DESCRIPTION.

41408 The *gmtime\_r()* function is included for alignment with the POSIX Threads Extension.41409 **Issue 6**41410 The *gmtime\_r()* function is marked as part of the Thread-Safe Functions option.

41411 Extensions beyond the ISO C standard are marked.

41412 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
41413 its avoidance of possibly using a static data area.

41414 The **restrict** keyword is added to the *gmtime\_r()* prototype for alignment with the  
41415 ISO/IEC 9899:1999 standard.

41416 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [Eoverflow]  
41417 error.

41418 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling  
41419 for *gmtime\_r()*.

41420 **Issue 7**

41421 Austin Group Interpretation 1003.1-2001 #156 is applied.

41422 The *gmtime\_r()* function is moved from the Thread-Safe Functions option to the Base.41423 **Issue 8**

41424 Austin Group Defect 1302 is applied, aligning the *gmtime()* function with the  
41425 ISO/IEC 9899:2018 standard.

41426 Austin Group Defect 1376 is applied, removing CX shading from some text derived from the  
41427 ISO C standard and updating it to match the ISO C standard.

41428 Austin Group Defect 1533 is applied, adding *tm\_gmtoff* and *tm\_zone* to the **tm** structure.

41429 **NAME**

41430 grantpt — grant access to the subsidiary pseudo-terminal device

41431 **SYNOPSIS**

```
41432 XSI #include <stdlib.h>  
41433 int grantpt(int fildev);
```

41434 **DESCRIPTION**

41435 The *grantpt()* function shall change the mode and ownership of the subsidiary pseudo-terminal  
41436 device associated with its manager pseudo-terminal counterpart. The *fildev* argument is a file  
41437 descriptor that refers to a manager pseudo-terminal device. The user ID of the subsidiary shall  
41438 be set to the real UID of the calling process and the group ID shall be set to an unspecified group  
41439 ID. The permission mode of the subsidiary pseudo-terminal shall be set to readable and writable  
41440 by the owner, and writable by the group.

41441 The behavior of the *grantpt()* function is unspecified if the application has installed a signal  
41442 handler to catch SIGCHLD signals.

41443 **RETURN VALUE**

41444 Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to  
41445 indicate the error.

41446 **ERRORS**

41447 The *grantpt()* function may fail if:

41448 [EACCES] The corresponding subsidiary pseudo-terminal device could not be accessed.

41449 [EBADF] The *fildev* argument is not a valid open file descriptor.

41450 [EINVAL] The *fildev* argument is not associated with a manager pseudo-terminal device.

41451 **EXAMPLES**

41452 None.

41453 **APPLICATION USAGE**

41454 None.

41455 **RATIONALE**

41456 See the RATIONALE section for *posix\_openpt()*.

41457 **FUTURE DIRECTIONS**

41458 None.

41459 **SEE ALSO**

41460 *open()*, *posix\_openpt()*, *ptsname()*, *unlockpt()*

41461 XBD <stdlib.h>

41462 **CHANGE HISTORY**

41463 First released in Issue 4, Version 2.

41464 **Issue 5**

41465 Moved from X/OPEN UNIX extension to BASE.

41466 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

41467 **Issue 7**

41468 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0272 [96] is applied.

41469 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0177 [506] is applied.

41470 **Issue 8**41471 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
41472 devices.

41473 **NAME**

41474 hcreate, hdestroy, hsearch — manage hash search table

41475 **SYNOPSIS**

```
41476 XSI #include <search.h>
41477 int hcreate(size_t nel);
41478 void hdestroy(void);
41479 ENTRY *hsearch(ENTRY item, ACTION action);
```

41480 **DESCRIPTION**41481 The *hcreate()*, *hdestroy()*, and *hsearch()* functions shall manage hash search tables.

41482 The *hcreate()* function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch()* is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

41486 The *hdestroy()* function shall dispose of the search table, and may be followed by another call to *hcreate()*. After the call to *hdestroy()*, the data can no longer be considered accessible.

41488 The *hsearch()* function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the **<search.h>** header) containing two pointers: *item.key* points to the comparison key (a **char \***), and *item.data* (a **void \***) points to any other data to be associated with that key. The comparison function used by *hsearch()* is *strcmp()*. The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

41497 These functions need not be thread-safe.

41498 **RETURN VALUE**41499 The *hcreate()* function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.41501 The *hdestroy()* function shall not return a value.41502 The *hsearch()* function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.41504 **ERRORS**41505 The *hcreate()* and *hsearch()* functions may fail if:

41506 [ENOMEM] Insufficient storage space is available.

41507 **EXAMPLES**

41508 The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
41511 #include <stdio.h>
41512 #include <search.h>
41513 #include <string.h>
41514 struct info { /* This is the info stored in the table */
41515     int age, room; /* other than the key. */
41516 };
```

```

41517     #define NUM_EMPL      5000    /* # of elements in search table. */
41518     int main(void)
41519     {
41520         char string_space[NUM_EMPL*20]; /* Space to store strings. */
41521         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
41522         char *str_ptr = string_space; /* Next space in string_space. */
41523         struct info *info_ptr = info_space;
41524                                     /* Next space in info_space. */
41525         ENTRY item;
41526         ENTRY *found_item; /* Name to look for in table. */
41527         char name_to_find[30];
41528
41529         int i = 0;
41529         /* Create table; no error checking is performed. */
41530         (void) hcreate(NUM_EMPL);
41531         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
41532                    &info_ptr->room) != EOF && i++ < NUM_EMPL) {
41533             /* Put information in structure, and structure in item. */
41534             item.key = str_ptr;
41535             item.data = info_ptr;
41536             str_ptr += strlen(str_ptr) + 1;
41537             info_ptr++;
41538
41539             /* Put item into table. */
41539             (void) hsearch(item, ENTER);
41540         }
41541
41541         /* Access table. */
41542         item.key = name_to_find;
41543         while (scanf("%s", item.key) != EOF) {
41544             if ((found_item = hsearch(item, FIND)) != NULL) {
41545                 /* If item is in the table. */
41546                 (void)printf("found %s, age = %d, room = %d\n",
41547                             found_item->key,
41548                             ((struct info *)found_item->data)->age,
41549                             ((struct info *)found_item->data)->room);
41550             } else
41551                 (void)printf("no such employee %s\n", name_to_find);
41552         }
41553         return 0;
41554     }

```

**APPLICATION USAGE**

The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

41586 **SYNOPSIS**

```
41587 #include <arpa/inet.h>
41588 uint32_t htonl(uint32_t hostlong);
41589 uint16_t htons(uint16_t hostshort);
41590 uint32_t ntohl(uint32_t netlong);
41591 uint16_t ntohs(uint16_t netshort);
```

41592 **DESCRIPTION**

41593 These functions shall convert 16-bit and 32-bit quantities between network byte order and host  
41594 byte order.

41595 On some implementations, these functions are defined as macros.

41596 The `uint32_t` and `uint16_t` types are defined in `<inttypes.h>`.

41597 **RETURN VALUE**

41598 The `htonl()` and `htons()` functions shall return the argument value converted from host to  
41599 network byte order.

41600 The `ntohl()` and `ntohs()` functions shall return the argument value converted from network to  
41601 host byte order.

41602 **ERRORS**

41603 No errors are defined.

41604 **EXAMPLES**

41605 None.

41606 **APPLICATION USAGE**

41607 These functions are most often used in conjunction with IPv4 addresses and ports as returned by  
41608 `gethostent()` and `getservent()`.

41609 **RATIONALE**

41610 None.

41611 **FUTURE DIRECTIONS**

41612 None.

41613 **SEE ALSO**

41614 [be16toh\(\)](#), [endhostent\(\)](#), [endservent\(\)](#)  
41615 XBD [<arpa/inet.h>](#), [<endian.h>](#), [<inttypes.h>](#)

41616 **CHANGE HISTORY**

41617 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41618 **Issue 8**

41619 Austin Group Defect 162 is applied, adding `be16toh()` and `<endian.h>` to the SEE ALSO section.

41620 **NAME**

41621 hypot, hypotf, hypotl — Euclidean distance function

41622 **SYNOPSIS**

41623 #include &lt;math.h&gt;

41624 double hypot(double *x*, double *y*);41625 float hypotf(float *x*, float *y*);41626 long double hypotl(long double *x*, long double *y*);41627 **DESCRIPTION**

41628 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41629 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41630 volume of POSIX.1-2024 defers to the ISO C standard.

41631 These functions shall compute the value of the square root of  $x^2+y^2$  without undue overflow or  
 41632 underflow.

41633 An application wishing to check for error situations should set *errno* to zero and call  
 41634 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41635 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41636 zero, an error has occurred.

41637 **RETURN VALUE**

41638 Upon successful completion, these functions shall return the length of the hypotenuse of a right-  
 41639 angled triangle with sides of length *x* and *y*.

41640 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and  
 41641 *hypotl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 41642 respectively.

41643 MX If *x* or *y* is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned (even if one of *x* or *y* is NaN).

41644 If *x* or *y* is NaN, and the other is not  $\pm\text{Inf}$ , a NaN shall be returned.

41645 MXX If both arguments are subnormal and the correct result is subnormal, a range error may occur  
 41646 and the correct result shall be returned.

41647 **ERRORS**

41648 These functions shall fail if:

41649 Range Error The result overflows.

41650 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41651 then *errno* shall be set to [ERANGE]. If the integer expression  
 41652 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 41653 floating-point exception shall be raised.

41654 These functions may fail if:

41655 MX Range Error The result underflows.

41656 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41657 then *errno* shall be set to [ERANGE]. If the integer expression  
 41658 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 41659 floating-point exception shall be raised.

41660 **EXAMPLES**41661 See the EXAMPLES section in *atan2()*.41662 **APPLICATION USAGE**41663 *hypot(x,y)*, *hypot(y,x)*, and *hypot(x,-y)* are equivalent.41664 *hypot(x, ±0)* is equivalent to *fabs(x)*.41665 Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

41667 These functions take precautions against overflow during intermediate steps of the computation.

41668 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41670 **RATIONALE**

41671 None.

41672 **FUTURE DIRECTIONS**

41673 None.

41674 **SEE ALSO**41675 *atan2()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sqrt()*

41677 **CHANGE HISTORY**

41678 First released in Issue 1. Derived from Issue 1 of the SVID.

41679 **Issue 5**

41680 The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

41682 **Issue 6**41683 The *hypot()* function is no longer marked as an extension.41684 The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

41686 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

41688 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

41690 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

41692 **Issue 7**

41693 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0273 [68] is applied.

41694 **NAME**

41695 iconv — codeset conversion function

41696 **SYNOPSIS**

```
41697 #include <iconv.h>
41698 size_t iconv(iconv_t cd, char **restrict inbuf,
41699             size_t *restrict inbytesleft, char **restrict outbuf,
41700             size_t *restrict outbytesleft);
```

41701 **DESCRIPTION**

41702 The *iconv()* function shall convert the sequence of characters from one codeset, in the array  
 41703 specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array  
 41704 specified by *outbuf*. The codesets are those specified in the *iconv\_open()* call that returned the  
 41705 conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first  
 41706 character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer  
 41707 to be converted. The *outbuf* argument points to a variable that points to the first available byte in  
 41708 the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the  
 41709 buffer.

41710 For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by  
 41711 a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()* is  
 41712 called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft*  
 41713 points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change  
 41714 the output buffer to its initial shift state. If the output buffer is not large enough to hold the  
 41715 entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as  
 41716 other than a null pointer or a pointer to a null pointer cause the conversion to take place from  
 41717 the current state of the conversion descriptor.

41718 If a sequence of input bytes does not form a valid character or shift sequence in the input  
 41719 codeset:

- 41720 • If the //IGNORE indicator suffix was specified when the conversion descriptor *cd* was  
 41721 opened and the byte sequence is immediately followed by a valid character or shift  
 41722 sequence, the sequence of bytes shall be discarded and conversion shall continue from the  
 41723 immediately following valid character or shift sequence. This shall not be treated as an  
 41724 error.
- 41725 • If the //IGNORE indicator suffix was not specified when the conversion descriptor *cd* was  
 41726 opened, conversion shall stop after the previous successfully converted character or shift  
 41727 sequence.

41728 If the input buffer ends with an incomplete character or shift sequence, conversion shall stop  
 41729 after the previous successfully converted bytes. If the output buffer is not large enough to hold  
 41730 the entire converted input, conversion shall stop just prior to the input bytes that would cause  
 41731 the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the  
 41732 byte following the last byte successfully used in the conversion. The value pointed to by  
 41733 *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input  
 41734 buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last  
 41735 byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to  
 41736 reflect the number of bytes still available in the output buffer. For state-dependent encodings,  
 41737 the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last  
 41738 successfully converted byte sequence.

41739 If *iconv()* encounters a character in the input buffer that is valid, but for which an identical  
 41740 character does not exist in the output codeset:

- 41741 • If either the `//IGNORE` or the `//NON_IDENTICAL_DISCARD` indicator suffix was
- 41742 specified when the conversion descriptor `cd` was opened, the character shall be discarded
- 41743 but shall still be counted in the return value of the `iconv()` call.
  
- 41744 • If the `//TRANSLIT` indicator suffix was specified when the conversion descriptor `cd` was
- 41745 opened, an implementation-defined transliteration shall be performed, if possible, to
- 41746 convert the character into one or more characters of the output codeset that best resemble
- 41747 the input character. The character shall be counted as one character in the return value of
- 41748 the `iconv()` call, regardless of the number of output characters.
  
- 41749 • If no indicator suffix was specified when the conversion descriptor `cd` was opened, or the
- 41750 `//TRANSLIT` indicator suffix was specified but no transliteration of the character is
- 41751 possible, `iconv()` shall perform an implementation-defined conversion on the character and
- 41752 it shall be counted in the return value of the `iconv()` call.

#### 41753 RETURN VALUE

41754 The `iconv()` function shall update the variables pointed to by the arguments to reflect the extent  
 41755 of the conversion and shall return the number of input characters that could not be converted to  
 41756 an identical output character. If the entire string in the input buffer is converted, except for any  
 41757 byte sequences discarded as a result of the `//IGNORE` indicator suffix, the value pointed to by  
 41758 `inbytesleft` shall be 0. If the input conversion is stopped due to any conditions mentioned above,  
 41759 the value pointed to by `inbytesleft` shall be non-zero and `errno` shall be set to indicate the  
 41760 condition. If an error occurs, `iconv()` shall return `(size_t)-1` and set `errno` to indicate the error.

#### 41761 ERRORS

41762 The `iconv()` function shall fail if:

- |       |          |  |
|-------|----------|--|
| 41763 | [EILSEQ] | Input conversion stopped due to an input byte that does not belong to the    |
| 41764 |          | input codeset.   |
| 41765 | [E2BIG]  | Input conversion stopped due to lack of space in the output buffer.          |
| 41766 | [EINVAL] | Input conversion stopped due to an incomplete character or shift sequence at |
| 41767 |          | the end of the input buffer.   |

41768 The `iconv()` function may fail if:

- |       |         |   |
|-------|---------|---|
| 41769 | [EBADF] | The <code>cd</code> argument is not a valid open conversion descriptor. |
|-------|---------|---|

#### 41770 EXAMPLES

41771 None.

#### 41772 APPLICATION USAGE

41773 The `inbuf` argument indirectly points to the memory area which contains the conversion input  
 41774 data. The `outbuf` argument indirectly points to the memory area which is to contain the result of  
 41775 the conversion. The objects indirectly pointed to by `inbuf` and `outbuf` are not restricted to  
 41776 containing data that is directly representable in the ISO C standard language `char` data type. The  
 41777 type of `inbuf` and `outbuf`, `char **`, does not imply that the objects pointed to are interpreted as  
 41778 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that  
 41779 represents a character in a given character set encoding scheme is done internally within the  
 41780 codeset converters. For example, the area pointed to indirectly by `inbuf` and/or `outbuf` can  
 41781 contain all zero octets that are not interpreted as string terminators but as coded character data  
 41782 according to the respective codeset encoding scheme. The type of the data (`char`, `short`, `long`, and  
 41783 so on) read or stored in the objects is not specified, but may be inferred for both the input and  
 41784 output data by the converters determined by the `fromcode` and `toencode` arguments of `iconv_open()`.

41785 Regardless of the data type inferred by the converter, the size of the remaining space in both  
 41786 input and output objects (the `inbytesleft` and `outbytesleft` arguments) is always measured in bytes.

41787 For implementations that support the conversion of state-dependent encodings, the conversion  
 41788 descriptor must be able to accurately reflect the shift-state in effect at the end of the last  
 41789 successful conversion. It is not required that the conversion descriptor itself be updated, which  
 41790 would require it to be a pointer type. Thus, implementations are free to implement the  
 41791 descriptor as a handle (other than a pointer type) by which the conversion information can be  
 41792 accessed and updated.

41793 It is the responsibility of the application to ensure that, if the output codeset has a locking-shift  
 41794 encoding, the output buffer is returned to its initial shift state when conversion is completed.  
 41795 This can be accomplished by calling *iconv()* with *inbuf* as a null pointer, or with *inbuf* pointing to  
 41796 a null pointer, before calling *iconv\_close()*. Since the standard does not provide a way to query  
 41797 whether a codeset has a locking-shift encoding, it is recommended that applications always call  
 41798 *iconv()* in this way before calling *iconv\_close()*.

41799 When the //IGNORE indicator suffix was used to open the conversion descriptor, *iconv()* does  
 41800 not provide any indication of whether any invalid input byte sequences were discarded.  
 41801 Applications which need to detect the discarding of invalid input byte sequences can open the  
 41802 conversion descriptor without using //IGNORE and then call *iconv()* in a loop such that if it  
 41803 returns an [EILSEQ] error, the application increments the variable pointed to by *inbuf* and  
 41804 decrements the variable pointed to by *inbytesleft* before the next call. This technique can also be  
 41805 used by applications which need to use //TRANSLIT but also discard invalid input byte  
 41806 sequences.

#### 41807 RATIONALE

41808 None.

#### 41809 FUTURE DIRECTIONS

41810 None.

#### 41811 SEE ALSO

41812 [\*iconv\\_open\(\)\*](#), [\*iconv\\_close\(\)\*](#), [\*mbsrtowcs\(\)\*](#)

41813 XBD [\*\*<iconv.h>\*\*](#)

#### 41814 CHANGE HISTORY

41815 First released in Issue 4. Derived from the HP-UX Manual.

#### 41816 Issue 6

41817 The SYNOPSIS has been corrected to align with the [\*\*<iconv.h>\*\*](#) reference page.

41818 The **restrict** keyword is added to the *iconv()* prototype for alignment with the  
 41819 ISO/IEC 9899:1999 standard.

#### 41820 Issue 7

41821 The *iconv()* function is moved from the XSI option to the Base.

#### 41822 Issue 8

41823 Austin Group Defect 1007 is applied, adding support for indicator suffixes in the *to*  
 41824 *code* argument to *iconv\_open()*.

41825 Austin Group Defect 1008 is applied, adding a paragraph about locking-shift encodings to the  
 41826 APPLICATION USAGE section.

41827 Austin Group Defect 1438 is applied, changing “valid character in the specified codeset” to  
 41828 “valid character in the specified input codeset”.

41829 **NAME**

41830 iconv\_close — codeset conversion deallocation function

41831 **SYNOPSIS**

41832 #include &lt;iconv.h&gt;

41833 int iconv\_close(iconv\_t *cd*);41834 **DESCRIPTION**41835 The *iconv\_close()* function shall deallocate the conversion descriptor *cd* and all other associated  
41836 resources allocated by *iconv\_open()*.41837 If a file descriptor is used to implement the type **iconv\_t**, that file descriptor shall be closed.41838 **RETURN VALUE**41839 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
41840 indicate the error.41841 **ERRORS**41842 The *iconv\_close()* function may fail if:

41843 [EBADF] The conversion descriptor is invalid.

41844 **EXAMPLES**

41845 None.

41846 **APPLICATION USAGE**

41847 None.

41848 **RATIONALE**

41849 None.

41850 **FUTURE DIRECTIONS**

41851 None.

41852 **SEE ALSO**41853 *iconv()*, *iconv\_open()*41854 XBD <**iconv.h**>41855 **CHANGE HISTORY**

41856 First released in Issue 4. Derived from the HP-UX Manual.

41857 **Issue 7**41858 The *iconv\_close()* function is moved from the XSI option to the Base.

41859 **NAME**

41860 iconv\_open — codeset conversion allocation function

41861 **SYNOPSIS**

41862 #include &lt;iconv.h&gt;

41863 iconv\_t iconv\_open(const char \*tocode, const char \*fromcode);

41864 **DESCRIPTION**

41865 The *iconv\_open()* function shall return a conversion descriptor that describes a conversion from  
 41866 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified  
 41867 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion  
 41868 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with  
 41869 *iconv()*.

41870 The codeset names that can be specified in *fromcode* and *tocode* and their permitted combinations  
 41871 are implementation-defined. Any one of the following indicator suffixes can be appended to the  
 41872 codeset name in *tocode*:

41873 //IGNORE Discard input bytes that do not form a valid character or shift sequence, and  
 41874 discard input characters for which an identical character does not exist in the  
 41875 output codeset.

41876 //NON\_IDENTICAL\_DISCARD  
 41877 Discard input characters for which an identical character does not exist in the  
 41878 output codeset.

41879 //TRANSLIT Transliterate input characters for which an identical character does not exist in  
 41880 the output codeset into one or more characters of the output codeset that best  
 41881 resemble the input character.

41882 See the description of *iconv()* for details of how these indicator suffixes alter the conversion  
 41883 performed by *iconv()*. Additional implementation-defined indicator suffixes may be supported.

41884 A conversion descriptor shall remain valid until it is closed by *iconv\_close()* or an implicit close.

41885 If a file descriptor is used to implement conversion descriptors, the FD\_CLOEXEC flag shall be  
 41886 set; see <fcntl.h>.

41887 **RETURN VALUE**

41888 Upon successful completion, *iconv\_open()* shall return a conversion descriptor for use on  
 41889 subsequent calls to *iconv()*. Otherwise, *iconv\_open()* shall return (**iconv\_t**)-1 and set *errno* to  
 41890 indicate the error.

41891 **ERRORS**

41892 The *iconv\_open()* function may fail if:

41893 [EMFILE] All file descriptors available to the process are currently open.

41894 [ENFILE] Too many files are currently open in the system.

41895 [ENOMEM] Insufficient storage space is available.

41896 [EINVAL] Conversion from the codeset specified in *fromcode* to the codeset specified in  
 41897 *tocode* is not supported by the implementation, or the codeset name in *tocode* is  
 41898 followed by an indicator suffix that is unrecognized or not supported.

**41899 EXAMPLES**

41900 None.

**41901 APPLICATION USAGE**

41902 Some implementations of *iconv\_open()* use *malloc()* to allocate space for internal buffer areas.  
41903 The *iconv\_open()* function may fail if there is insufficient storage space to accommodate these  
41904 buffers.

41905 Conforming applications must assume that conversion descriptors are not valid after a call to  
41906 one of the *exec* functions.

41907 Application developers should consult the system documentation to determine the supported  
41908 codesets and their naming schemes.

41909 Some implementations of *iconv\_open()* allow appending multiple indicator suffixes to the  
41910 codeset name in *toctype*, and some allow appending an indicator suffix (or suffixes) in both  
41911 *fromcode* and *toctype*. Portable applications should append at most one indicator suffix, and  
41912 append it only in *toctype*.

**41913 RATIONALE**

41914 None.

41955 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41956 **Issue 8**

41957 Austin Group Defect 385 is applied, adding a requirement that *if\_freenameindex()* does not  
41958 modify *errno* when passed a pointer to an **if\_nameindex** structure than can be freed.

**41959 NAME**

41960 if\_indextoname — map a network interface index to its corresponding name

**41961 SYNOPSIS**

41962 #include <net/if.h>

41963 char \*if\_indextoname(unsigned *ifindex*, char \**ifname*);

**41964 DESCRIPTION**

41965 The *if\_indextoname()* function shall map an interface index to its corresponding name.

41966 When this function is called, *ifname* shall point to a buffer of at least {IF\_NAMESIZE} bytes. The  
41967 function shall place in this buffer the name of the interface with index *ifindex*.

**41968 RETURN VALUE**

41969 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which  
41970 points to a buffer now containing the interface name. Otherwise, the function shall return a null  
41971 pointer and set *errno* to indicate the error.

**41972 ERRORS**

41973 The *if\_indextoname()* function shall fail if:

41974 [ENXIO] The interface does not exist.

**41975 EXAMPLES**

41976 None.

**41977 APPLICATION USAGE**

41978 None.

**41979 RATIONALE**

41980 None.

**41981 FUTURE DIRECTIONS**

41982 None.

**41983 SEE ALSO**

41984 [getsockopt\(\)](#), [if\\_freenameindex\(\)](#), [if\\_nameindex\(\)](#), [if\\_nametoindex\(\)](#), [setsockopt\(\)](#)

41985 XBD [<net/if.h>](#)

**41986 CHANGE HISTORY**

41987 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41988 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to  
41989 {IF\_NAMESIZ} in the DESCRIPTION.

41990 **NAME**

41991 if\_nameindex — return all network interface names and indexes

41992 **SYNOPSIS**

41993 #include <net/if.h>

41994 struct if\_nameindex \*if\_nameindex(void);

41995 **DESCRIPTION**

41996 The *if\_nameindex()* function shall return an array of *if\_nameindex* structures, one structure per  
41997 interface. The end of the array is indicated by a structure with an *if\_index* field of zero and an  
41998 *if\_name* field of NULL.

41999 Applications should call *if\_freenameindex()* to release the memory that may be dynamically  
42000 allocated by this function, after they have finished using it.

42001 **RETURN VALUE**

42002 An array of structures identifying local interfaces. A null pointer is returned upon an error, with  
42003 *errno* set to indicate the error.

42004 **ERRORS**

42005 The *if\_nameindex()* function may fail if:

42006 [ENOBUFFS] Insufficient resources are available to complete the function.

42007 **EXAMPLES**

42008 None.

42009 **APPLICATION USAGE**

42010 None.

42011 **RATIONALE**

42012 None.

42013 **FUTURE DIRECTIONS**

42014 None.

42015 **SEE ALSO**

42018 **CHANGE HISTORY**

42019 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

42020 **NAME**

42021 if\_nametoindex — map a network interface name to its corresponding index

42022 **SYNOPSIS**

42023 #include <net/if.h>

42024 unsigned if\_nametoindex(const char \*ifname);

42025 **DESCRIPTION**

42026 The *if\_nametoindex()* function shall return the interface index corresponding to name *ifname*.

42027 **RETURN VALUE**

42028 The corresponding index if *ifname* is the name of an interface; otherwise, zero.

42029 **ERRORS**

42030 No errors are defined.

42031 **EXAMPLES**

42032 None.

42033 **APPLICATION USAGE**

42034 None.

42035 **RATIONALE**

42036 None.

42037 **FUTURE DIRECTIONS**

42038 None.

42039 **SEE ALSO**

42041 XBD <net/if.h>

42042 **CHANGE HISTORY**

42043 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

42044 **NAME**

42045           ilogb, ilogbf, ilogbl — return an unbiased exponent

42046 **SYNOPSIS**

```
42047     #include <math.h>
42048     int ilogb(double x);
42049     int ilogbf(float x);
42050     int ilogbl(long double x);
```

42051 **DESCRIPTION**

42052 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 42053 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42054 volume of POSIX.1-2024 defers to the ISO C standard.

42055       These functions shall return the exponent part of their argument  $x$ . Formally, the return value is  
 42056 the integral part of  $\log_r |x|$  as a signed integral value, for non-zero  $x$ , where  $r$  is the radix of the  
 42057 machine's floating-point arithmetic, which is the value of `FLT_RADIX` defined in `<float.h>`.

42058       An application wishing to check for error situations should set `errno` to zero and call  
 42059 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 42060 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 42061 zero, an error has occurred.

42062 **RETURN VALUE**

42063       Upon successful completion, these functions shall return the exponent part of  $x$  as a signed  
 42064 integer value. They are equivalent to calling the corresponding `logb()` function and casting the  
 42065 returned value to type `int`.

42066 MX       When the correct result is representable in the range of the return type, the returned value shall  
 42067 be exact and shall be independent of the current rounding direction mode.

42068 XSI|MX   If  $x$  is 0, the value `FP_ILOGB0` shall be returned. On XSI-conformant systems and on systems  
 42069 that support the IEC 60559 Floating-Point option, a domain error shall occur; otherwise, a  
 42070 CX       domain error may occur.

42071 XSI|MX   If  $x$  is  $\pm\text{Inf}$ , the value `{INT_MAX}` shall be returned. On XSI-conformant systems and on  
 42072 systems that support the IEC 60559 Floating-Point option, a domain error shall occur; otherwise,  
 42073 CX       a domain error may occur.

42074 XSI|MX   If  $x$  is a NaN, the value `FP_ILOGBNAN` shall be returned. On XSI-conformant systems and on  
 42075 systems that support the IEC 60559 Floating-Point option, a domain error shall occur; otherwise,  
 42076 CX       a domain error may occur.

42077       If the correct value is greater than `{INT_MAX}` or less than `{INT_MIN}`, an unspecified value  
 42078 XSI       shall be returned. On XSI-conformant systems, a domain error shall occur and `{INT_MAX}` or  
 42079 `{INT_MIN}`, respectively, shall be returned;

42080 MX       if the IEC 60559 Floating-Point option is supported, a domain error shall occur; otherwise, a  
 42081 domain error or range error may occur.

42082 **ERRORS**

42083       These functions shall fail if:

42084 XSI|MX   **Domain Error**   The correct value is not representable as an integer.

42085           The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

42086           If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 42087 then `errno` shall be set to `[EDOM]`. If the integer expression `(math_errhandling`  
 42088 `& MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception

42089 shall be raised.

42090 These functions may fail if:

42091 Domain Error The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

42092 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
42093 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
42094 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
42095 shall be raised.

#### 42096 EXAMPLES

42097 None.

#### 42098 APPLICATION USAGE

42099 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
42100 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 42101 RATIONALE

42102 The errors come from taking the expected floating-point value and converting it to **int**, which is  
42103 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not  
42104 representable in a type **int**), so should be a domain error.

42105 There are no known implementations that overflow. For overflow to happen, {INT\_MAX} must  
42106 be less than  $\text{LDBL\_MAX\_EXP} * \log_2(\text{FLT\_RADIX})$  or {INT\_MIN} must be greater than  
42107  $\text{LDBL\_MIN\_EXP} * \log_2(\text{FLT\_RADIX})$  if subnormals are not supported, or {INT\_MIN} must be  
42108 greater than  $(\text{LDBL\_MIN\_EXP} - \text{LDBL\_MANT\_DIG}) * \log_2(\text{FLT\_RADIX})$  if subnormals are  
42109 supported.

#### 42110 FUTURE DIRECTIONS

42111 None.

#### 42112 SEE ALSO

42113 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [logb\(\)](#), [scalbln\(\)](#)

42114 XBD Section 4.23 (on page 109), [<float.h>](#), [<math.h>](#)

#### 42115 CHANGE HISTORY

42116 First released in Issue 4, Version 2.

#### 42117 Issue 5

42118 Moved from X/OPEN UNIX extension to BASE.

#### 42119 Issue 6

42120 The *ilogb()* function is no longer marked as an extension.

42121 The *ilogbf()* and *ilogbl()* functions are added for alignment with the ISO/IEC 9899:1999  
42122 standard.

42123 The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

42124 Functionality relating to the XSI option is marked.

#### 42125 Issue 7

42126 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #48 (SD5-XSH-ERN-71), #49, and #79  
42127 (SD5-XSH-ERN-72) are applied.

42128 **Issue 8**

42129 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
42130 standard.

42131 **NAME**

42132 imaxabs — return absolute value

42133 **SYNOPSIS**

42134 #include &lt;inttypes.h&gt;

42135 intmax\_t imaxabs(intmax\_t j);

42136 **DESCRIPTION**

42137 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
42138 conflict between the requirements described here and the ISO C standard is unintentional. This  
42139 volume of POSIX.1-2024 defers to the ISO C standard.

42140 The *imaxabs()* function shall compute the absolute value of an integer *j*. If the result cannot be  
42141 represented, the behavior is undefined.

42142 **RETURN VALUE**42143 The *imaxabs()* function shall return the absolute value.42144 **ERRORS**

42145 No errors are defined.

42146 **EXAMPLES**

42147 None.

42148 **APPLICATION USAGE**

42149 Since POSIX.1 requires a two's complement representation of **intmax\_t**, the absolute value of the  
42150 negative integer with the largest magnitude {INTMAX\_MIN} is not representable, thus  
42151 *imaxabs*(INTMAX\_MIN) is undefined.

42152 **RATIONALE**

42153 None.

42154 **FUTURE DIRECTIONS**

42155 None.

42156 **SEE ALSO**42157 [\*imaxdiv\(\)\*](#)42158 XBD [<inttypes.h>](#)42159 **CHANGE HISTORY**

42160 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42161 **Issue 8**

42162 Austin Group Defect 1108 is applied, changing the APPLICATION USAGE section.

42163 **NAME**

42164 imaxdiv — return quotient and remainder

42165 **SYNOPSIS**

42166 #include &lt;inttypes.h&gt;

42167 imaxdiv\_t imaxdiv(intmax\_t numer, intmax\_t denom);

42168 **DESCRIPTION**

42169 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
42170 conflict between the requirements described here and the ISO C standard is unintentional. This  
42171 volume of POSIX.1-2024 defers to the ISO C standard.

42172 The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.42173 **RETURN VALUE**

42174 The *imaxdiv()* function shall return a structure of type **imaxdiv\_t**, comprising both the quotient  
42175 and the remainder. The structure shall contain (in either order) the members *quot* (the quotient)  
42176 and *rem* (the remainder), each of which has type **intmax\_t**.

42177 If either part of the result cannot be represented, the behavior is undefined.

42178 **ERRORS**

42179 No errors are defined.

42180 **EXAMPLES**

42181 None.

42182 **APPLICATION USAGE**

42183 None.

42184 **RATIONALE**

42185 None.

42186 **FUTURE DIRECTIONS**

42187 None.

42188 **SEE ALSO**42189 [imaxabs\(\)](#)42190 XBD [<inttypes.h>](#)42191 **CHANGE HISTORY**

42192 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**42193 NAME**

42194 in6addr\_any, in6addr\_loopback — IPv6 address variables

**42195 SYNOPSIS**

```
42196 IP6 #include <netinet/in.h>
42197     const struct in6_addr in6addr_any;
42198     const struct in6_addr in6addr_loopback;
```

**42199 DESCRIPTION**

42200 The *in6addr\_any* variable is initialized by the system to contain the wildcard IPv6 address (:::).

42201 The *in6addr\_loopback* variable is initialized by the system to contain the loopback IPv6 address  
42202 (:::1).

**42203 RETURN VALUE**

42204 None.

**42205 ERRORS**

42206 No errors are defined.

**42207 EXAMPLES**

42208 None.

**42209 APPLICATION USAGE**

42210 None.

**42211 RATIONALE**

42212 These variables were only described on the XBD <netinet/in.h> page in earlier versions of this  
42213 standard.

**42214 FUTURE DIRECTIONS**

42215 None.

**42216 SEE ALSO**

42217 [bind\(\)](#), [connect\(\)](#)

42218 XBD <netinet/in.h>

**42219 CHANGE HISTORY**

42220 First released in Issue 8. Derived from Issue 7 XBD <netinet/in.h>.

42221 **NAME**

42222 inet\_addr, inet\_ntoa — IPv4 address manipulation

42223 **SYNOPSIS**

```
42224 OB #include <arpa/inet.h>
42225 in_addr_t inet_addr(const char *cp);
42226 char *inet_ntoa(struct in_addr in);
```

42227 **DESCRIPTION**

42228 The *inet\_addr()* function shall convert the string pointed to by *cp*, in the standard IPv4 dotted  
42229 decimal notation, to an integer value suitable for use as an Internet address.

42230 The *inet\_ntoa()* function shall convert the Internet host address specified by *in* to a string in the  
42231 Internet standard dot notation.

42232 The *inet\_ntoa()* function need not be thread-safe.

42233 All Internet addresses shall be returned in network order (bytes ordered from left to right).

42234 Values specified using IPv4 dotted decimal notation take one of the following forms:

42235 a.b.c.d When four parts are specified, each shall be interpreted as a byte of data and  
42236 assigned, from left to right, to the four bytes of an Internet address.

42237 a.b.c When a three-part address is specified, the last part shall be interpreted as a 16-bit  
42238 quantity and placed in the rightmost two bytes of the network address. This makes  
42239 the three-part address format convenient for specifying Class B network addresses  
42240 as "128.net.host".

42241 a.b When a two-part address is supplied, the last part shall be interpreted as a 24-bit  
42242 quantity and placed in the rightmost three bytes of the network address. This  
42243 makes the two-part address format convenient for specifying Class A network  
42244 addresses as "net.host".

42245 a When only one part is given, the value shall be stored directly in the network  
42246 address without any byte rearrangement.

42247 All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or  
42248 hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;  
42249 otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).

42250 **RETURN VALUE**

42251 Upon successful completion, *inet\_addr()* shall return the Internet address. Otherwise, it shall  
42252 return (**in\_addr\_t**)(-1).

42253 The *inet\_ntoa()* function shall return a pointer to the network address in Internet standard dot  
42254 notation.

42255 **ERRORS**

42256 No errors are defined.

42257 **EXAMPLES**

42258 None.

42259 **APPLICATION USAGE**42260 The return value of *inet\_ntoa()* may point to static data that may be overwritten by subsequent  
42261 calls to *inet\_ntoa()*.42262 Applications should prefer *inet\_pton()* over *inet\_addr()* for the following reasons:

- 42263
- The return value from *inet\_addr()* when converting 255.255.255.255 is indistinguishable  
42264 from an error.
  - The *inet\_pton()* function supports multiple address families.
  - The alternative textual representations supported by *inet\_addr()* (but not by *inet\_pton()*)  
42266 are often used maliciously to confuse or mislead users (e.g., for phishing).  
42267

42268 Applications should prefer *inet\_ntop()* over *inet\_ntoa()* as it supports multiple address families  
42269 and is thread-safe.42270 **RATIONALE**

42271 None.

42272 **FUTURE DIRECTIONS**42273 These functions are included only for compatibility with older implementations and may be  
42274 removed in a future version.42275 **SEE ALSO**42276 [\*endhostent\(\)\*, \*endnetent\(\)\*, \*inet\\_ntop\(\)\*](#)42277 XBD <[arpa/inet.h](#)>42278 **CHANGE HISTORY**

42279 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

42280 **Issue 7**

42281 Austin Group Interpretation 1003.1-2001 #156 is applied.

42282 **Issue 8**42283 Austin Group Defects 1101 and 1102 are applied, marking *inet\_addr()* and *inet\_ntoa()* as  
42284 obsolescent.

42285 **NAME**

42286 inet\_ntop, inet\_pton — convert IPv4 and IPv6 addresses between binary and text form

42287 **SYNOPSIS**

42288 #include &lt;arpa/inet.h&gt;

42289 const char \*inet\_ntop(int af, const void \*restrict src,  
42290 char \*restrict dst, socklen\_t size);

42291 int inet\_pton(int af, const char \*restrict src, void \*restrict dst);

42292 **DESCRIPTION**

42293 The *inet\_ntop()* function shall convert a numeric address into a text string suitable for  
 42294 IP6 presentation. The *af* argument shall specify the family of the address. This can be AF\_INET or  
 42295 AF\_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is  
 42296 IP6 AF\_INET, or an IPv6 address if the *af* argument is AF\_INET6; the address needs to be in  
 42297 network byte order. The *dst* argument points to a buffer where the function stores the resulting  
 42298 text string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall  
 42299 IP6 be large enough to hold the text string (INET\_ADDRSTRLEN characters for IPv4,  
 42300 INET6\_ADDRSTRLEN characters for IPv6).

42301 The *inet\_pton()* function shall convert an address in its standard text presentation form into its  
 42302 IP6 numeric binary form. The *af* argument shall specify the family of the address. The AF\_INET and  
 42303 AF\_INET6 address families shall be supported. The *src* argument points to the string being  
 42304 passed in. The *dst* argument points to a buffer into which the function stores the numeric  
 42305 IP6 address; this shall be large enough to hold the numeric address (32 bits for AF\_INET, 128 bits  
 42306 for AF\_INET6).

42307 If the *af* argument of *inet\_pton()* is AF\_INET, the *src* string shall be in the standard IPv4 dotted-  
 42308 decimal form:

42309 ddd.ddd.ddd.ddd

42310 where "ddd" is a one to three digit decimal number between 0 and 255. Leading zeros shall be  
 42311 allowed. The *inet\_pton()* function does not accept other formats (such as the octal numbers,  
 42312 hexadecimal numbers, and fewer than four numbers that *inet\_addr()* accepts).

42313 IP6 If the *af* argument of *inet\_pton()* is AF\_INET6, the *src* string shall be in one of the following  
 42314 standard IPv6 text forms:

- 42315 1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values  
 42316 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be  
 42317 omitted, but there shall be one to four hexadecimal digits in every field.
- 42318 2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::"  
 42319 can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may  
 42320 be represented simply as "::".
- 42321 3. A third form that is sometimes more convenient when dealing with a mixed environment  
 42322 of IPv4 and IPv6 nodes is "x:x:x:x:x:x.d.d.d.d", where the 'x's are the  
 42323 hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the  
 42324 decimal values of the four low-order 8-bit pieces of the address (standard IPv4  
 42325 representation).

42326 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in  
 42327 RFC 4291.

42328 **RETURN VALUE**

42329 The *inet\_ntop()* function shall return a pointer to the buffer containing the text string if the  
 42330 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

42331 The *inet\_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by  
 42332 IP6 *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string  
 42333 or a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is  
 42334 unknown.

42335 **ERRORS**

42336 The *inet\_ntop()* and *inet\_pton()* functions shall fail if:

42337 [EAFNOSUPPORT]

42338 The *af* argument is invalid.

42339 [ENOSPC] The size of the *inet\_ntop()* result buffer is inadequate.

42340 **EXAMPLES**

42341 None.

42342 **APPLICATION USAGE**

42343 None.

42344 **RATIONALE**

42345 None.

42350 XBD <[arpa/inet.h](#)>

42351 **CHANGE HISTORY**

42352 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

42353 IPv6 extensions are marked.

42354 The **restrict** keyword is added to the *inet\_ntop()* and *inet\_pton()* prototypes for alignment with  
 42355 the ISO/IEC 9899:1999 standard.

42356 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must  
 42357 be in network byte order” to the end of the fourth sentence of the first paragraph in the  
 42358 DESCRIPTION.

42359 **Issue 7**

42360 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0178 [777] is applied.

42361 **Issue 8**

42362 Austin Group Defect 1102 is applied, removing a reference to the [\*inet\\_addr\(\)\*](#) page from the  
 42363 DESCRIPTION.

42364 Austin Group Defect 1573 is applied, clarifying that leading zeros are allowed in the IPv4  
 42365 dotted-decimal form accepted by *inet\_pton()*.

42366 Austin Group Defect 1685 is applied, updating RFC references.

42367 **NAME**

42368           initstate, random, setstate, srandom — pseudo-random number functions

42369 **SYNOPSIS**

```
42370 XSI       #include <stdlib.h>
42371       char *initstate(unsigned seed, char *state, size_t size);
42372       long random(void);
42373       char *setstate(char *state);
42374       void srandom(unsigned seed);
```

42375 **DESCRIPTION**

42376       The *random()* function shall use a non-linear additive feedback random-number generator  
 42377       employing a default state array size of 31 **long** integers to return successive pseudo-random  
 42378       numbers in the range from 0 to  $2^{31}-1$ . The period of this random-number generator is  
 42379       approximately  $16 \times (2^{31}-1)$ . The size of the state array determines the period of the random-  
 42380       number generator. Increasing the state array size shall increase the period.

42381       With 256 bytes of state information, the period of the random-number generator shall be greater  
 42382       than  $2^{69}$ .

42383       Like *rand()*, *random()* shall produce by default a sequence of numbers that can be duplicated by  
 42384       calling *srandom()* with 1 as the seed.

42385       The *srandom()* function shall initialize the current state array using the value of *seed*.

42386       The *initstate()* and *setstate()* functions handle restarting and changing random-number  
 42387       generators. The *initstate()* function allows a state array, pointed to by the *state* argument, to be  
 42388       initialized for future use. The *size* argument, which specifies the size in bytes of the state array,  
 42389       shall be used by *initstate()* to decide what type of random-number generator to use; the larger  
 42390       the state array, the more random the numbers. Values for the amount of state information are 8,  
 42391       32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one  
 42392       of these values. If *initstate()* is called with  $8 \leq \text{size} < 32$ , then *random()* shall use a simple linear  
 42393       congruential random number generator. The *seed* argument specifies a starting point for the  
 42394       random-number sequence and provides for restarting at the same point. The *initstate()* function  
 42395       shall return a pointer to the previous state information array.

42396       If *initstate()* has not been called, then *random()* shall behave as though *initstate()* had been called  
 42397       with *seed*=1 and *size*=128.

42398       Once a state has been initialized, *setstate()* allows switching between state arrays. The array  
 42399       defined by the *state* argument shall be used for further random-number generation until  
 42400       *initstate()* is called or *setstate()* is called again. The *setstate()* function shall return a pointer to the  
 42401       previous state array.

42402 **RETURN VALUE**

42403       If *initstate()* is called with *size* less than 8, it shall return NULL.

42404       The *random()* function shall return the generated pseudo-random number.

42405       The *srandom()* function shall not return a value.

42406       Upon successful completion, *initstate()* and *setstate()* shall return a pointer to the previous state  
 42407       array; otherwise, a null pointer shall be returned.

42408 **ERRORS**

42409 No errors are defined.

42410 **EXAMPLES**

42411 None.

42412 **APPLICATION USAGE**

42413 After initialization, a state array can be restarted at a different point in one of two ways:

- 42414 1. The *initstate()* function can be used, with the desired seed, state array, and size of the
- 42415 array.
- 42416 2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with
- 42417 the desired seed. The advantage of using both of these functions is that the size of the
- 42418 state array does not have to be saved once it is initialized.

42419 Although some implementations of *random()* have written messages to standard error, such

42420 implementations do not conform to POSIX.1-2024.

42421 Issue 5 restored the historical behavior of this function.

42422 Threaded applications should use *erand48()*, *nrand48()*, or *jrand48()* instead of *random()* when

42423 an independent random number sequence in multiple threads is required.

42424 These functions should be avoided whenever non-trivial requirements (including safety) have to

42425 be fulfilled, unless seeded using *getentropy()*.

42426 **RATIONALE**

42427 None.

42428 **FUTURE DIRECTIONS**

42429 None.

42430 **SEE ALSO**42431 *drand48()*, *getentropy()*, *rand()*

42432 XBD &lt;stdlib.h&gt;

42433 **CHANGE HISTORY**

42434 First released in Issue 4, Version 2.

42435 **Issue 5**

42436 Moved from X/OPEN UNIX extension to BASE.

42437 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than

42438 or equal to 8, or less than 32”, “size<8” is replaced with “8≤size <32”, and a new first paragraph

42439 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE

42440 indicating that these changes restore the historical behavior of the function.

42441 **Issue 6**

42442 In the DESCRIPTION, duplicate text “For values greater than or equal to 8 . . .” is removed.

42443 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand\_r()* from the

42444 list of suggested functions in the APPLICATION USAGE section.

42445 **Issue 7**42446 The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.

42447 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0179 [743] is applied.

42448 **Issue 8**  
42449

Austin Group Defect 1134 is applied, adding *getentropy()*.

42450 **NAME**

42451 insque, remque — insert or remove an element in a queue

42452 **SYNOPSIS**

```
42453 XSI      #include <search.h>
42454         void insque(void *element, void *pred);
42455         void remque(void *element);
```

42456 **DESCRIPTION**

42457 The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The  
 42458 queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it  
 42459 defines a structure in which the first two members of the structure are pointers to the same type  
 42460 of structure, and any further members are application-specific. The first member of the structure  
 42461 is a forward pointer to the next entry in the queue. The second member is a backward pointer to  
 42462 the previous entry in the queue. If the queue is linear, the queue is terminated with null  
 42463 pointers. The names of the structure and of the pointer members are not subject to any special  
 42464 restriction.

42465 The *insque()* function shall insert the element pointed to by *element* into a queue immediately  
 42466 after the element pointed to by *pred*.

42467 The *remque()* function shall remove the element pointed to by *element* from a queue.

42468 If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the  
 42469 initial element of the queue, shall initialize the forward and backward pointers of *element* to null  
 42470 pointers.

42471 If the queue is to be used as a circular list, the application shall ensure it initializes the forward  
 42472 pointer and the backward pointer of the initial element of the queue to the element's own  
 42473 address.

42474 **RETURN VALUE**42475 The *insque()* and *remque()* functions do not return a value.42476 **ERRORS**

42477 No errors are defined.

42478 **EXAMPLES**42479 **Creating a Linear Linked List**

42480 The following example creates a linear linked list.

```
42481 #include <search.h>
42482 ...
42483 struct myque element1;
42484 struct myque element2;
42485
42486 char *data1 = "DATA1";
42487 char *data2 = "DATA2";
42488 ...
42489 element1.data = data1;
42490 element2.data = data2;
42491
42492 insque (&element1, NULL);
42493 insque (&element2, &element1);
```

42492 **Creating a Circular Linked List**

42493 The following example creates a circular linked list.

```

42494 #include <search.h>
42495 ...
42496 struct myque element1;
42497 struct myque element2;
42498
42499 char *data1 = "DATA1";
42500 char *data2 = "DATA2";
42501 ...
42502 element1.data = data1;
42503 element2.data = data2;
42504
42505 element1.fwd = &element1;
42506 element1.bck = &element1;
42507
42508 insque (&element2, &element1);

```

42506 **Removing an Element**42507 The following example removes the element pointed to by *element1*.

```

42508 #include <search.h>
42509 ...
42510 struct myque element1;
42511 ...
42512 remque (&element1);

```

42513 **APPLICATION USAGE**

42514 The historical implementations of these functions described the arguments as being of type  
 42515 **struct qelem \*** rather than as being of type **void \*** as defined here. In those implementations,  
 42516 **struct qelem** was commonly defined in **<search.h>** as:

```

42517 struct qelem {
42518     struct qelem *q_forw;
42519     struct qelem *q_back;
42520 };

```

42521 Applications using these functions, however, were never able to use this structure directly since  
 42522 it provided no room for the actual data contained in the elements. Most applications defined  
 42523 structures that contained the two pointers as the initial elements and also provided space for, or  
 42524 pointers to, the object's data. Applications that used these functions to update more than one  
 42525 type of table also had the problem of specifying two or more different structures with the same  
 42526 name, if they literally used **struct qelem** as specified.

42527 As described here, the implementations were actually expecting a structure type where the first  
 42528 two members were forward and backward pointers to structures. With C compilers that didn't  
 42529 provide function prototypes, applications used structures as specified in the DESCRIPTION  
 42530 above and the compiler did what the application expected.

42531 If this method had been carried forward with an ISO C standard compiler and the historical  
 42532 function prototype, most applications would have to be modified to cast pointers to the  
 42533 structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By  
 42534 specifying **void \*** as the argument type, applications do not need to change (unless they  
 42535 specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

42536 **RATIONALE**

42537 None.

42538 **FUTURE DIRECTIONS**

42539 None.

42540 **SEE ALSO**

42541 XBD [<search.h>](#)

42542 **CHANGE HISTORY**

42543 First released in Issue 4, Version 2.

42544 **Issue 5**

42545 Moved from X/OPEN UNIX extension to BASE.

42546 **Issue 6**

42547 The normative text is updated to avoid use of the term “must” for application requirements.

42548 **NAME**

42549 isalnum, isalnum\_l — test for an alphanumeric character

42550 **SYNOPSIS**

```
42551 #include <ctype.h>
42552 int isalnum(int c);
42553 CX int isalnum_l(int c, locale_t locale);
```

42554 **DESCRIPTION**

42555 CX For *isalnum()*: The functionality described on this reference page is aligned with the ISO C  
 42556 standard. Any conflict between the requirements described here and the ISO C standard is  
 42557 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

42558 CX The *isalnum()* and *isalnum\_l()* functions shall test whether *c* is a character of class **alpha** or  
 42559 CX **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7  
 42560 (on page 127).

42561 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
 42562 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
 42563 behavior is undefined.

42564 CX The behavior is undefined if the *locale* argument to *isalnum\_l()* is the special locale object  
 42565 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

42566 **RETURN VALUE**

42567 CX The *isalnum()* and *isalnum\_l()* functions shall return non-zero if *c* is an alphanumeric character;  
 42568 otherwise, they shall return 0.

42569 **ERRORS**

42570 No errors are defined.

42571 **EXAMPLES**

42572 None.

42573 **APPLICATION USAGE**

42574 To ensure applications portability, especially across natural languages, only these functions and  
 42575 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 42576 classification.

42577 **RATIONALE**

42578 None.

42579 **FUTURE DIRECTIONS**

42580 None.

42587 **Issue 6**

42588 The normative text is updated to avoid use of the term “must” for application requirements.

42589 **Issue 7**

42590 The *isalnum\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
42591 API Set Part 4.

42592 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0274 [302], XSH/TC1-2008/0275 [283],  
42593 and XSH/TC1-2008/0276 [283] are applied.

42594 **NAME**

42595 isalpha, isalpha\_l — test for an alphabetic character

42596 **SYNOPSIS**

42597 #include &lt;ctype.h&gt;

42598 int isalpha(int c);

42599 CX int isalpha\_l(int c, locale\_t locale);

42600 **DESCRIPTION**42601 CX For *isalpha()*: The functionality described on this reference page is aligned with the ISO C  
42602 standard. Any conflict between the requirements described here and the ISO C standard is  
42603 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.42604 CX The *isalpha()* and *isalpha\_l()* functions shall test whether *c* is a character of class **alpha** in the  
42605 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
42606 127).42607 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
42608 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
42609 behavior is undefined.42610 CX The behavior is undefined if the *locale* argument to *isalpha\_l()* is the special locale object  
42611 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.42612 **RETURN VALUE**42613 CX The *isalpha()* and *isalpha\_l()* functions shall return non-zero if *c* is an alphabetic character;  
42614 otherwise, they shall return 0.42615 **ERRORS**

42616 No errors are defined.

42617 **EXAMPLES**

42618 None.

42619 **APPLICATION USAGE**42620 To ensure applications portability, especially across natural languages, only these functions and  
42621 the functions in the reference pages listed in the SEE ALSO section should be used for character  
42622 classification.42623 **RATIONALE**

42624 None.

42625 **FUTURE DIRECTIONS**

42626 None.

42627 **SEE ALSO**42628 *isalnum()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

42667 **CHANGE HISTORY**

42668 First released in Issue 1. Derived from Issue 1 of the SVID.

42669 **Issue 6**42670 The following new requirements on POSIX implementations derive from alignment with the  
42671 Single UNIX Specification:

- 42672
- The optional setting of *errno* to indicate an error is added.
  - The [EBADF] and [ENOTTY] optional error conditions are added.

42674 **Issue 7**

42675 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

42676 **NAME**

42677 isblank, isblank\_l — test for a blank character

42678 **SYNOPSIS**

42679 #include &lt;ctype.h&gt;

42680 int isblank(int c);

42681 CX int isblank\_l(int c, locale\_t locale);

42682 **DESCRIPTION**42683 CX For *isblank()*: The functionality described on this reference page is aligned with the ISO C  
42684 standard. Any conflict between the requirements described here and the ISO C standard is  
42685 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.42686 CX The *isblank()* and *isblank\_l()* functions shall test whether *c* is a character of class **blank** in the  
42687 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
42688 127).42689 The *c* argument is a type **int**, the value of which the application shall ensure is a character  
42690 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
42691 any other value, the behavior is undefined.42692 CX The behavior is undefined if the *locale* argument to *isblank\_l()* is the special locale object  
42693 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.42694 **RETURN VALUE**42695 CX The *isblank()* and *isblank\_l()* functions shall return non-zero if *c* is a <blank>; otherwise, they  
42696 shall return 0.42697 **ERRORS**

42698 No errors are defined.

42699 **EXAMPLES**

42700 None.

42701 **APPLICATION USAGE**42702 To ensure applications portability, especially across natural languages, only these functions and  
42703 the functions in the reference pages listed in the SEE ALSO section should be used for character  
42704 classification.42705 **RATIONALE**

42706 None.

42707 **FUTURE DIRECTIONS**

42712 XBD Chapter 7 (on page 127), &lt;ctype.h&gt;, &lt;locale.h&gt;

42713 **CHANGE HISTORY**

42714 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42715 **Issue 7**42716 The *isblank\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
42717 Set Part 4.

42718  
42719

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0280 [302], XSH/TC1-2008/0281 [283], and XSH/TC1-2008/0282 [283] are applied.

42720 **NAME**

42721           iscntrl, iscntrl\_l — test for a control character

42722 **SYNOPSIS**

42723           #include &lt;ctype.h&gt;

42724           int iscntrl(int c);

42725 CX        int iscntrl\_l(int c, locale\_t locale);

42726 **DESCRIPTION**42727 CX        For *iscntrl()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.42730 CX        The *iscntrl()* and *iscntrl\_l()* functions shall test whether *c* is a character of class **cntrl** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 127).42733           The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.42736 CX        The behavior is undefined if the *locale* argument to *iscntrl\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.42738 **RETURN VALUE**42739 CX        The *iscntrl()* and *iscntrl\_l()* functions shall return non-zero if *c* is a control character; otherwise, they shall return 0.42741 **ERRORS**

42742           No errors are defined.

42743 **EXAMPLES**

42744           None.

42745 **APPLICATION USAGE**

42746           To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

42749 **RATIONALE**

42750           None.

42751 **FUTURE DIRECTIONS**

42752           None.

42753 **SEE ALSO**42754           *isalnum()*, *isalpha()*, *isblank()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*, *setlocale()*, *uselocale()*

42757 **CHANGE HISTORY**

42758           First released in Issue 1. Derived from Issue 1 of the SVID.

42759 **Issue 6**

42760           The normative text is updated to avoid use of the term “must” for application requirements.

42761 **Issue 7**

42762 The *iscntrl\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
42763 Set Part 4.

42764 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0283 [302], XSH/TC1-2008/0284 [283],  
42765 and XSH/TC1-2008/0285 [283] are applied.

42766 **NAME**

42767        isdigit, isdigit\_l — test for a decimal digit

42768 **SYNOPSIS**

42769        #include &lt;ctype.h&gt;

42770        int isdigit(int c);

42771 CX     int isdigit\_l(int c, locale\_t locale);

42772 **DESCRIPTION**42773 CX     For *isdigit()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.42776 CX     The *isdigit()* and *isdigit\_l()* functions shall test whether *c* is a character of class **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 127).42779        The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.42782 CX     The behavior is undefined if the *locale* argument to *isdigit\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.42784 **RETURN VALUE**42785 CX     The *isdigit()* and *isdigit\_l()* functions shall return non-zero if *c* is a decimal digit; otherwise, they shall return 0.42787 **ERRORS**

42788        No errors are defined.

42789 **EXAMPLES**

42790        None.

42791 **APPLICATION USAGE**

42792        To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

42795 **RATIONALE**

42796        None.

42797 **FUTURE DIRECTIONS**

42798        None.

42799 **SEE ALSO**42800        *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*

42803 **CHANGE HISTORY**

42804        First released in Issue 1. Derived from Issue 1 of the SVID.

42805 **Issue 6**

42806        The normative text is updated to avoid use of the term “must” for application requirements.

42807 **Issue 7**42808  
42809

The *isdigit\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

42810  
42811

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0286 [302], XSH/TC1-2008/0287 [283], and XSH/TC1-2008/0288 [283] are applied.

42812 **NAME**

42813 isfinite — test for finite value

42814 **SYNOPSIS**

42815 #include &lt;math.h&gt;

42816 int isfinite(real-floating x);

42817 **DESCRIPTION**

42818 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
42819 conflict between the requirements described here and the ISO C standard is unintentional. This  
42820 volume of POSIX.1-2024 defers to the ISO C standard.

42821 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or  
42822 normal, and not infinite or NaN). First, an argument represented in a format wider than its  
42823 semantic type is converted to its semantic type. Then determination is based on the type of the  
42824 argument.

42825 **RETURN VALUE**42826 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.42827 **ERRORS**

42828 No errors are defined.

42829 **EXAMPLES**

42830 None.

42831 **APPLICATION USAGE**

42832 None.

42833 **RATIONALE**

42834 None.

42835 **FUTURE DIRECTIONS**

42836 None.

42837 **SEE ALSO**42838 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

42839 XBD &lt;math.h&gt;

42840 **CHANGE HISTORY**

42841 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42842 **NAME**

42843 isgraph, isgraph\_l — test for a visible character

42844 **SYNOPSIS**

```
42845 #include <ctype.h>
42846 int isgraph(int c);
42847 CX int isgraph_l(int c, locale_t locale);
```

42848 **DESCRIPTION**

42849 CX For *isgraph()*: The functionality described on this reference page is aligned with the ISO C  
 42850 standard. Any conflict between the requirements described here and the ISO C standard is  
 42851 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

42852 CX The *isgraph()* and *isgraph\_l()* functions shall test whether *c* is a character of class **graph** in the  
 42853 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 42854 127).

42855 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 42856 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 42857 any other value, the behavior is undefined.

42858 CX The behavior is undefined if the *locale* argument to *isgraph\_l()* is the special locale object  
 42859 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

42860 **RETURN VALUE**

42861 CX The *isgraph()* and *isgraph\_l()* functions shall return non-zero if *c* is a character with a visible  
 42862 representation; otherwise, they shall return 0.

42863 **ERRORS**

42864 No errors are defined.

42865 **EXAMPLES**

42866 None.

42867 **APPLICATION USAGE**

42868 To ensure applications portability, especially across natural languages, only these functions and  
 42869 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 42870 classification.

42871 **RATIONALE**

42872 None.

42873 **FUTURE DIRECTIONS**

42874 None.

42875 **SEE ALSO**

42876 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
 42877 *isxdigit()*, *setlocale()*, *uselocale()*

42878 XBD Chapter 7 (on page 127), [<ctype.h>](#), [<locale.h>](#)42879 **CHANGE HISTORY**

42880 First released in Issue 1. Derived from Issue 1 of the SVID.

42881 **Issue 6**

42882 The normative text is updated to avoid use of the term “must” for application requirements.

42883 **Issue 7**

42884

42885

The *isgraph\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

42886

42887

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0289 [302], XSH/TC1-2008/0290 [283], and XSH/TC1-2008/0291 [283] are applied.

42888 **NAME**

42889 isgreater, isgreaterequal, isless, islessequal, islessgreater — real-floating relational tests

42890 **SYNOPSIS**

```
42891 #include <math.h>
42892 int isgreater(real-floating x, real-floating y);
42893 int isgreaterequal(real-floating x, real-floating y);
42894 int isless(real-floating x, real-floating y);
42895 int islessequal(real-floating x, real-floating y);
42896 int islessgreater(real-floating x, real-floating y);
```

42897 **DESCRIPTION**

42898 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42899 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42900 volume of POSIX.1-2024 defers to the ISO C standard.

42901 The *isgreater()* macro shall determine whether its first argument is greater than its second  
 42902 argument. The value of *isgreater(x, y)* shall be equal to  $(x) > (y)$ ; however, unlike  $(x) > (y)$ ,  
 42903 *isgreater(x, y)* shall not raise the invalid floating-point exception when  $x$  and  $y$  are unordered.

42904 The *isgreaterequal()* macro shall determine whether its first argument is greater than or equal to  
 42905 its second argument. The value of *isgreaterequal(x, y)* shall be equal to  $(x) \geq (y)$ ; however, unlike  
 42906  $(x) \geq (y)$ , *isgreaterequal(x, y)* shall not raise the invalid floating-point exception when  $x$  and  $y$  are  
 42907 unordered.

42908 The *isless()* macro shall determine whether its first argument is less than its second argument.  
 42909 The value of *isless(x, y)* shall be equal to  $(x) < (y)$ ; however, unlike  $(x) < (y)$ , *isless(x, y)* shall not  
 42910 raise the invalid floating-point exception when  $x$  and  $y$  are unordered.

42911 The *islessequal()* macro shall determine whether its first argument is less than or equal to its  
 42912 second argument. The value of *islessequal(x, y)* shall be equal to  $(x) \leq (y)$ ; however, unlike  
 42913  $(x) \leq (y)$ , *islessequal(x, y)* shall not raise the invalid floating-point exception when  $x$  and  $y$  are  
 42914 unordered.

42915 The *islessgreater()* macro shall determine whether its first argument is less than or greater than  
 42916 its second argument. The *islessgreater(x, y)* macro is similar to  $(x) < (y) \mid \mid (x) > (y)$ ; however,  
 42917 *islessgreater(x, y)* shall not raise the invalid floating-point exception when  $x$  and  $y$  are unordered  
 42918 (nor shall it evaluate  $x$  and  $y$  twice).

42919 MX Relational operators and their corresponding comparison macros shall produce equivalent result  
 42920 values, even if argument values are represented in wider formats. Thus, comparison macro  
 42921 arguments represented in formats wider than their semantic types shall not be converted to the  
 42922 semantic types, unless the wide evaluation method converts operands of relational operators to  
 42923 their semantic types. The standard wide evaluation methods characterized by  
 42924 FLT\_EVAL\_METHOD equal to 1 or 2 (see [<float.h>](#)) do not convert operands of relational  
 42925 operators to their semantic types.

42926 **RETURN VALUE**

42927 Upon successful completion, the *isgreater()* macro shall return the value of  $(x) > (y)$ .

42928 Upon successful completion, the *isgreaterequal()* macro shall return the value of  $(x) \geq (y)$ .

42929 Upon successful completion, the *isless()* macro shall return the value of  $(x) < (y)$ .

42930 Upon successful completion, the *islessequal()* macro shall return the value of  $(x) \leq (y)$ .

42931 Upon successful completion, the *islessgreater()* macro shall return the value of  
 42932  $(x) < (y) \mid \mid (x) > (y)$ .

42933 If  $x$  or  $y$  is NaN, these functions shall return 0.

42934 **ERRORS**

42935 No errors are defined.

42936 **EXAMPLES**

42937 None.

42938 **APPLICATION USAGE**

42939 The relational and equality operators support the usual mathematical relationships between  
42940 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
42941 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
42942 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
42943 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
42944 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
42945 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
42946 indicates that the argument shall be an expression of **real-floating** type.

42947 **RATIONALE**

42948 None.

42949 **FUTURE DIRECTIONS**

42950 None.

42951 **SEE ALSO**

42952 [\*isunordered\(\)\*](#)

42953 XBD [`<float.h>`](#), [`<math.h>`](#)

42954 **CHANGE HISTORY**

42955 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42956 **Issue 8**

42957 The individual pages for these functions have been merged to form a single page, to reduce  
42958 duplication.

42959 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
42960 standard.

42961 **NAME**

42962           isinf — test for infinity

42963 **SYNOPSIS**

42964           #include &lt;math.h&gt;

42965           int isinf(real-floating x);

42966 **DESCRIPTION**

42967 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
42968       conflict between the requirements described here and the ISO C standard is unintentional. This  
42969       volume of POSIX.1-2024 defers to the ISO C standard.

42970       The *isinf()* macro shall determine whether its argument value is an infinity (positive or  
42971       negative). First, an argument represented in a format wider than its semantic type is converted  
42972       to its semantic type. Then determination is based on the type of the argument.

42973 **RETURN VALUE**42974       The *isinf()* macro shall return a non-zero value if and only if its argument has an infinite value.42975 **ERRORS**

42976       No errors are defined.

42977 **EXAMPLES**

42978       None.

42979 **APPLICATION USAGE**

42980       None.

42981 **RATIONALE**

42982       None.

42983 **FUTURE DIRECTIONS**

42984       None.

42985 **SEE ALSO**42986       [\*fpclassify\(\)\*](#), [\*isfinite\(\)\*](#), [\*isnan\(\)\*](#), [\*isnormal\(\)\*](#), [\*signbit\(\)\*](#)42987       XBD <[\*\*math.h\*\*](#)>42988 **CHANGE HISTORY**

42989       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42990 **NAME**

42991 isless, islessequal, islessgreater — real-floating relational tests

42992 **SYNOPSIS**

42993 #include &lt;math.h&gt;

42994 int isless(real-floating *x*, real-floating *y*);42995 int islessequal(real-floating *x*, real-floating *y*);42996 int islessgreater(real-floating *x*, real-floating *y*);42997 **DESCRIPTION**42998 Refer to *isgreater()*.

42999 **NAME**

43000 islower, islower\_l — test for a lowercase letter

43001 **SYNOPSIS**

```
43002     #include <ctype.h>
43003     int islower(int c);
43004 CX    int islower_l(int c, locale_t locale);
```

43005 **DESCRIPTION**

43006 CX For *islower()*: The functionality described on this reference page is aligned with the ISO C  
 43007 standard. Any conflict between the requirements described here and the ISO C standard is  
 43008 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43009 CX The *islower()* and *islower\_l()* functions shall test whether *c* is a character of class **lower** in the  
 43010 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 43011 127).

43012 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 43013 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 43014 any other value, the behavior is undefined.

43015 CX The behavior is undefined if the *locale* argument to *islower\_l()* is the special locale object  
 43016 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

43017 **RETURN VALUE**

43018 CX The *islower()* and *islower\_l()* functions shall return non-zero if *c* is a lowercase letter; otherwise,  
 43019 they shall return 0.

43020 **ERRORS**

43021 No errors are defined.

43022 **EXAMPLES**43023 **Testing for a Lowercase Letter**

43024 Two examples follow, the first using *islower()*, the second using multiple concurrent locales and  
 43025 *islower\_l()*.

43026 The examples test whether the value is a lowercase letter, based on the current locale, then use it  
 43027 as part of a key value.

```
43028     /* Example 1 -- using islower() */
43029     #include <ctype.h>
43030     #include <stdlib.h>
43031     #include <locale.h>
43032     ...
43033     char *keystr;
43034     int elementlen, len;
43035     unsigned char c;
43036     ...
43037     setlocale(LC_ALL, "");
43038     ...
43039     len = 0;
43040     while (len < elementlen) {
43041         c = (unsigned char) (rand() % 256);
43042         ...
```

```

43043         if (islower(c))
43044             keystr[len++] = c;
43045         }
43046     ...
43047     /* Example 2 -- using islower_l() */
43048     #include <ctype.h>
43049     #include <stdlib.h>
43050     #include <locale.h>
43051     ...
43052     char *keystr;
43053     int elementlen, len;
43054     unsigned char c;
43055     ...
43056     locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
43057     ...
43058     len = 0;
43059     while (len < elementlen) {
43060         c = (unsigned char) (rand() % 256);
43061         ...
43062         if (islower_l(c, loc))
43063             keystr[len++] = c;
43064     }
43065     ...

```

#### 43066 APPLICATION USAGE

43067 To ensure applications portability, especially across natural languages, only these functions and  
 43068 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 43069 classification.

#### 43070 RATIONALE

43071 None.

#### 43072 FUTURE DIRECTIONS

43087  
43088

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0292 [302], XSH/TC1-2008/0293 [283], XSH/TC1-2008/0294 [283], XSH/TC1-2008/0295 [302], and XSH/TC1-2008/0296 [304] are applied.

43089 **NAME**

43090           isnan — test for a NaN

43091 **SYNOPSIS**

43092           #include &lt;math.h&gt;

43093           int isnan(real-floating x);

43094 **DESCRIPTION**

43095 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
43096       conflict between the requirements described here and the ISO C standard is unintentional. This  
43097       volume of POSIX.1-2024 defers to the ISO C standard.

43098       The *isnan()* macro shall determine whether its argument value is a NaN. First, an argument  
43099       represented in a format wider than its semantic type is converted to its semantic type. Then  
43100       determination is based on the type of the argument.

43101 **RETURN VALUE**43102       The *isnan()* macro shall return a non-zero value if and only if its argument has a NaN value.43103 **ERRORS**

43104       No errors are defined.

43105 **EXAMPLES**

43106       None.

43107 **APPLICATION USAGE**

43108       None.

43109 **RATIONALE**

43110       None.

43111 **FUTURE DIRECTIONS**

43112       None.

43113 **SEE ALSO**43114       [\*fpclassify\(\)\*](#), [\*isfinite\(\)\*](#), [\*isinf\(\)\*](#), [\*isnormal\(\)\*](#), [\*signbit\(\)\*](#)43115       XBD [\*\*<math.h>\*\*](#)43116 **CHANGE HISTORY**

43117       First released in Issue 3.

43118 **Issue 5**

43119       The DESCRIPTION is updated to indicate the return value when NaN is not supported. This  
43120       text was previously published in the APPLICATION USAGE section.

43121 **Issue 6**

43122       Re-written for alignment with the ISO/IEC 9899:1999 standard.

43123 **NAME**

43124           isnormal — test for a normal value

43125 **SYNOPSIS**

43126           #include &lt;math.h&gt;

43127           int isnormal(real-floating x);

43128 **DESCRIPTION**

43129 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
43130 conflict between the requirements described here and the ISO C standard is unintentional. This  
43131 volume of POSIX.1-2024 defers to the ISO C standard.

43132       The *isnormal()* macro shall determine whether its argument value is normal (neither zero,  
43133 subnormal, infinite, nor NaN). First, an argument represented in a format wider than its  
43134 semantic type is converted to its semantic type. Then determination is based on the type of the  
43135 argument.

43136 **RETURN VALUE**

43137       The *isnormal()* macro shall return a non-zero value if and only if its argument has a normal  
43138 value.

43139 **ERRORS**

43140       No errors are defined.

43141 **EXAMPLES**

43142       None.

43143 **APPLICATION USAGE**

43144       None.

43145 **RATIONALE**

43146       None.

43147 **FUTURE DIRECTIONS**

43148       None.

43149 **SEE ALSO**43150       *fpclassify()*, *isfinite()*, *isinf()*, *isnan()*, *signbit()*

43151       XBD &lt;math.h&gt;

43152 **CHANGE HISTORY**

43153       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

43154 **NAME**

43155 isprint, isprint\_l — test for a printable character

43156 **SYNOPSIS**

```
43157 #include <ctype.h>
43158 int isprint(int c);
43159 CX int isprint_l(int c, locale_t locale);
```

43160 **DESCRIPTION**

43161 CX For *isprint()*: The functionality described on this reference page is aligned with the ISO C  
 43162 standard. Any conflict between the requirements described here and the ISO C standard is  
 43163 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43164 CX The *isprint()* and *isprint\_l()* functions shall test whether *c* is a character of class **print** in the  
 43165 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 43166 127).

43167 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 43168 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 43169 any other value, the behavior is undefined.

43170 CX The behavior is undefined if the *locale* argument to *isprint\_l()* is the special locale object  
 43171 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

43172 **RETURN VALUE**

43173 CX The *isprint()* and *isprint\_l()* functions shall return non-zero if *c* is a printable character;  
 43174 otherwise, they shall return 0.

43175 **ERRORS**

43176 No errors are defined.

43177 **EXAMPLES**

43178 None.

43179 **APPLICATION USAGE**

43180 To ensure applications portability, especially across natural languages, only these functions and  
 43181 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 43182 classification.

43183 **RATIONALE**

43184 None.

43185 **FUTURE DIRECTIONS**

43186 None.

43187 **SEE ALSO**

43188 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *ispunct()*, *isspace()*, *isupper()*,  
 43189 *isxdigit()*, *setlocale()*, *uselocale()*

43190 XBD Chapter 7 (on page 127), [<ctype.h>](#), [<locale.h>](#)43191 **CHANGE HISTORY**

43192 First released in Issue 1. Derived from Issue 1 of the SVID.

43193 **Issue 6**

43194 The normative text is updated to avoid use of the term “must” for application requirements.

43195 **Issue 7**

43196 The *isprint\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
43197 Set Part 4.

43198 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0297 [302], XSH/TC1-2008/0298 [283],  
43199 and XSH/TC1-2008/0299 [283] are applied.

43200 **NAME**

43201           ispunct, ispunct\_l — test for a punctuation character

43202 **SYNOPSIS**

43203           #include &lt;ctype.h&gt;

43204           int ispunct(int c);

43205 CX        int ispunct\_l(int c, locale\_t locale);

43206 **DESCRIPTION**43207 CX        For *ispunct()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43210 CX        The *ispunct()* and *ispunct\_l()* functions shall test whether *c* is a character of class **punct** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 127).43213           The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.43216 CX        The behavior is undefined if the *locale* argument to *ispunct\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43218 **RETURN VALUE**43219 CX        The *ispunct()* and *ispunct\_l()* functions shall return non-zero if *c* is a punctuation character; otherwise, they shall return 0.43221 **ERRORS**

43222           No errors are defined.

43223 **EXAMPLES**

43224           None.

43225 **APPLICATION USAGE**

43226           To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

43229 **RATIONALE**

43230           None.

43231 **FUTURE DIRECTIONS**

43232           None.

43233 **SEE ALSO**43234           *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *isspace()*, *isupper()*, *isxdigit()*, *setlocale()*, *uselocale()*

43286        The normative text is updated to avoid use of the term “must” for application requirements.

43287 **Issue 7**

43288  
43289

The *isspace\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

43290  
43291

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0303 [302], XSH/TC1-2008/0304 [283], and XSH/TC1-2008/0305 [283] are applied.

43292 **NAME**

43293 isunordered — test if arguments are unordered

43294 **SYNOPSIS**

43295 #include &lt;math.h&gt;

43296 int isunordered(real-floating *x*, real-floating *y*);43297 **DESCRIPTION**

43298 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
43299 conflict between the requirements described here and the ISO C standard is unintentional. This  
43300 volume of POSIX.1-2024 defers to the ISO C standard.

43301 The *isunordered()* macro shall determine whether its arguments are unordered.43302 **RETURN VALUE**43303 Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are  
43304 unordered, and 0 otherwise.43305 If *x* or *y* is NaN, 1 shall be returned.43306 **ERRORS**

43307 No errors are defined.

43308 **EXAMPLES**

43309 None.

43310 **APPLICATION USAGE**

43311 The relational and equality operators support the usual mathematical relationships between  
43312 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
43313 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
43314 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
43315 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
43316 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
43317 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
43318 indicates that the argument shall be an expression of **real-floating** type.

43319 **RATIONALE**

43320 None.

43321 **FUTURE DIRECTIONS**

43322 None.

43323 **SEE ALSO**43324 [isgreater\(\)](#)43325 XBD [<math.h>](#)43326 **CHANGE HISTORY**

43327 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

43328 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/50 is applied, correcting the RETURN  
43329 VALUE section when *x* or *y* is NaN.

43330 **NAME**

43331 isupper, isupper\_l — test for an uppercase letter

43332 **SYNOPSIS**

```
43333 #include <ctype.h>
43334 int isupper(int c);
43335 CX int isupper_l(int c, locale_t locale);
```

43336 **DESCRIPTION**

43337 CX For *isupper()*: The functionality described on this reference page is aligned with the ISO C  
43338 standard. Any conflict between the requirements described here and the ISO C standard is  
43339 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43340 CX The *isupper()* and *isupper\_l()* functions shall test whether *c* is a character of class **upper** in the  
43341 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
43342 127).

43343 The *c* argument is an **int**, the value of which the application shall ensure is a character  
43344 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
43345 any other value, the behavior is undefined.

43346 CX The behavior is undefined if the *locale* argument to *isupper\_l()* is the special locale object  
43347 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

43348 **RETURN VALUE**

43349 CX The *isupper()* and *isupper\_l()* functions shall return non-zero if *c* is an uppercase letter;  
43350 otherwise, they shall return 0.

43351 **ERRORS**

43352 No errors are defined.

43353 **EXAMPLES**

43354 None.

43355 **APPLICATION USAGE**

43356 To ensure applications portability, especially across natural languages, only these functions and  
43357 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43358 classification.

43359 **RATIONALE**

43360 None.

43361 **FUTURE DIRECTIONS**

43362 None.

43363 **SEE ALSO**

43364 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,  
43365 *isxdigit()*, *setlocale()*, *uselocale()*

43366 XBD Chapter 7 (on page 127), [<ctype.h>](#), [<locale.h>](#)43367 **CHANGE HISTORY**

43368 First released in Issue 1. Derived from Issue 1 of the SVID.

43369 **Issue 6**

43370 The normative text is updated to avoid use of the term “must” for application requirements.

43371 **Issue 7**43372  
43373

The *isupper\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

43374  
43375

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0306 [302], XSH/TC1-2008/0307 [283], and XSH/TC1-2008/0308 [283] are applied.

43376 **NAME**

43377 iswalnum, iswalnum\_l — test for an alphanumeric wide-character code

43378 **SYNOPSIS**

43379 #include &lt;wctype.h&gt;

43380 int iswalnum(wint\_t wc);

43381 CX int iswalnum\_l(wint\_t wc, locale\_t locale);

43382 **DESCRIPTION**43383 CX For *iswalnum()*: The functionality described on this reference page is aligned with the ISO C  
43384 standard. Any conflict between the requirements described here and the ISO C standard is  
43385 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43386 CX The *iswalnum()* and *iswalnum\_l()* functions shall test whether *wc* is a wide-character code  
43387 CX representing a character of class **alpha** or **digit** in the current locale, or in the locale represented  
43388 by *locale*, respectively; see XBD Chapter 7 (on page 127).43389 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43390 code corresponding to a valid character in the locale used by the function, or equal to the value  
43391 of the macro WEOF. If the argument has any other value, the behavior is undefined.43392 CX The behavior is undefined if the *locale* argument to *iswalnum\_l()* is the special locale object  
43393 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43394 **RETURN VALUE**43395 CX The *iswalnum()* and *iswalnum\_l()* functions shall return non-zero if *wc* is an alphanumeric  
43396 wide-character code; otherwise, they shall return 0.43397 **ERRORS**

43398 No errors are defined.

43399 **EXAMPLES**

43400 None.

43401 **APPLICATION USAGE**43402 To ensure applications portability, especially across natural languages, only these functions and  
43403 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43404 classification.43405 **RATIONALE**

43406 None.

43407 **FUTURE DIRECTIONS**

43408 None.

43413 **CHANGE HISTORY**

43414 First released as a World-wide Portability Interface in Issue 4.

43415 **Issue 5**43416 The following change has been made in this version for alignment with  
43417 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43418 • The SYNOPSIS has been changed to indicate that this function and associated data types  
43419 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

**Issue 6**

43420 The normative text is updated to avoid use of the term “must” for application requirements.  
43421

**Issue 7**

43422 The `iswalnum_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43423 API Set Part 4.  
43424

43425 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0309 [302], XSH/TC1-2008/0310 [283],  
43426 and XSH/TC1-2008/0311 [283] are applied.

43427 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0180 [685] is applied.

43428 **NAME**

43429 iswalpha, iswalpha\_l — test for an alphabetic wide-character code

43430 **SYNOPSIS**

```
43431 #include <wctype.h>
43432 int iswalpha(wint_t wc);
43433 CX int iswalpha_l(wint_t wc, locale_t locale);
```

43434 **DESCRIPTION**

43435 CX For *iswalpha()*: The functionality described on this reference page is aligned with the ISO C  
 43436 standard. Any conflict between the requirements described here and the ISO C standard is  
 43437 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43438 CX The *iswalpha()* and *iswalpha\_l()* functions shall test whether *wc* is a wide-character code  
 43439 CX representing a character of class **alpha** in the current locale, or in the locale represented by *locale*,  
 43440 respectively; see XBD Chapter 7 (on page 127).

43441 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 43442 code corresponding to a valid character in the locale used by the function, or equal to the value  
 43443 of the macro WEOF. If the argument has any other value, the behavior is undefined.

43444 CX The behavior is undefined if the *locale* argument to *iswalpha\_l()* is the special locale object  
 43445 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

43446 **RETURN VALUE**

43447 CX The *iswalpha()* and *iswalpha\_l()* functions shall return non-zero if *wc* is an alphabetic wide-  
 43448 character code; otherwise, they shall return 0.

43449 **ERRORS**

43450 No errors are defined.

43451 **EXAMPLES**

43452 None.

43453 **APPLICATION USAGE**

43454 To ensure applications portability, especially across natural languages, only these functions and  
 43455 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 43456 classification.

43457 **RATIONALE**

43458 None.

43459 **FUTURE DIRECTIONS**

43460 None.

43461 **SEE ALSO**

43462 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 43463 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43464 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43465 **CHANGE HISTORY**

43466 First released in Issue 4.

43467 **Issue 5**

43468 The following change has been made in this version for alignment with  
 43469 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43470                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43471                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43472 **Issue 6**

43473                   The normative text is updated to avoid use of the term “must” for application requirements.

43474 **Issue 7**

43475                   The `iswalpha_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43476                   API Set Part 4.

43477                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0312 [302], XSH/TC1-2008/0313 [283],  
43478                   and XSH/TC1-2008/0314 [283] are applied.

43479                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0181 [685] is applied.

43480 **NAME**

43481 iswblank, iswblank\_l — test for a blank wide-character code

43482 **SYNOPSIS**

43483 #include &lt;wctype.h&gt;

43484 int iswblank(wint\_t wc);

43485 CX int iswblank\_l(wint\_t wc, locale\_t locale);

43486 **DESCRIPTION**43487 CX For *iswblank()*: The functionality described on this reference page is aligned with the ISO C  
43488 standard. Any conflict between the requirements described here and the ISO C standard is  
43489 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43490 CX The *iswblank()* and *iswblank\_l()* functions shall test whether *wc* is a wide-character code  
43491 CX representing a character of class **blank** in the current locale, or in the locale represented by  
43492 *locale*, respectively; see XBD Chapter 7 (on page 127).43493 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43494 code corresponding to a valid character in the locale used by the function, or equal to the value  
43495 of the macro WEOF. If the argument has any other value, the behavior is undefined.43496 CX The behavior is undefined if the *locale* argument to *iswblank\_l()* is the special locale object  
43497 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43498 **RETURN VALUE**43499 CX The *iswblank()* and *iswblank\_l()* functions shall return non-zero if *wc* is a blank wide-character  
43500 code; otherwise, they shall return 0.43501 **ERRORS**

43502 No errors are defined.

43503 **EXAMPLES**

43504 None.

43505 **APPLICATION USAGE**43506 To ensure applications portability, especially across natural languages, only these functions and  
43507 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43508 classification.43509 **RATIONALE**

43510 None.

43511 **FUTURE DIRECTIONS**

43512 None.

43513 **SEE ALSO**43514 *iswalnum()*, *iswalphalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
43515 *iswpunct()*, *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43516 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43517 **CHANGE HISTORY**

43518 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

43519 **Issue 7**43520 The *iswblank\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
43521 API Set Part 4.

43522 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0315 [302], XSH/TC1-2008/0316 [283],  
43523 and XSH/TC1-2008/0317 [283] are applied.

43524 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0182 [685] is applied.

43525 **Issue 8**

43526 Austin Group Defect 1770 is applied, changing “*iswblank()* and *iswblank()* functions” to  
43527 “*iswblank()* and *iswblank\_l()* functions”.

43528 **NAME**

43529 iswcntrl, iswcntrl\_l — test for a control wide-character code

43530 **SYNOPSIS**

43531 #include &lt;wctype.h&gt;

43532 int iswcntrl(wint\_t wc);

43533 CX int iswcntrl\_l(wint\_t wc, locale\_t locale);

43534 **DESCRIPTION**43535 CX For *iswcntrl()*: The functionality described on this reference page is aligned with the ISO C  
43536 standard. Any conflict between the requirements described here and the ISO C standard is  
43537 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43538 CX The *iswcntrl()* and *iswcntrl\_l()* functions shall test whether *wc* is a wide-character code  
43539 CX representing a character of class **cntrl** in the current locale, or in the locale represented by *locale*,  
43540 respectively; see XBD Chapter 7 (on page 127).43541 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43542 code corresponding to a valid character in the locale used by the function, or equal to the value  
43543 of the macro WEOF. If the argument has any other value, the behavior is undefined.43544 CX The behavior is undefined if the *locale* argument to *iswcntrl\_l()* is the special locale object  
43545 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43546 **RETURN VALUE**43547 CX The *iswcntrl()* and *iswcntrl\_l()* functions shall return non-zero if *wc* is a control wide-character  
43548 code; otherwise, they shall return 0.43549 **ERRORS**

43550 No errors are defined.

43551 **EXAMPLES**

43552 None.

43553 **APPLICATION USAGE**43554 To ensure applications portability, especially across natural languages, only these functions and  
43555 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43556 classification.43557 **RATIONALE**

43558 None.

43559 **FUTURE DIRECTIONS**

43560 None.

43561 **SEE ALSO**43562 *iswalnum()*, *iswalphabeta()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
43563 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43564 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43565 **CHANGE HISTORY**

43566 First released in Issue 4.

43567 **Issue 5**43568 The following change has been made in this version for alignment with  
43569 ISO/IEC 9899:1990/Amendment 1:1995 (E):

43570 • The SYNOPSIS has been changed to indicate that this function and associated data types  
43571 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43572 **Issue 6**

43573 The normative text is updated to avoid use of the term “must” for application requirements.

43574 **Issue 7**

43575 The `iswcntrl_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43576 API Set Part 4.

43577 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0318 [302], XSH/TC1-2008/0319 [283],  
43578 and XSH/TC1-2008/0320 [283] are applied.

43579 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0183 [685] is applied.

43580 **NAME**

43581 iswctype, iswctype\_l — test character for a specified class

43582 **SYNOPSIS**

```
43583 #include <wctype.h>
43584 int iswctype(wint_t wc, wctype_t charclass);
43585 CX int iswctype_l(wint_t wc, wctype_t charclass,
43586 locale_t locale);
```

43587 **DESCRIPTION**

43588 CX For *iswctype()*: The functionality described on this reference page is aligned with the ISO C  
 43589 standard. Any conflict between the requirements described here and the ISO C standard is  
 43590 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43591 CX The *iswctype()* and *iswctype\_l()* functions shall determine whether the wide-character code *wc*  
 43592 CX has the character class *charclass*, returning true or false. The *iswctype()* and *iswctype\_l()*  
 43593 functions are defined on WEOF and wide-character codes corresponding to the valid character  
 43594 CX encodings in the current locale, or in the locale represented by *locale*, respectively. If the *wc*  
 43595 argument is not in the domain of the function, the result is undefined. If the value of *charclass* is  
 43596 invalid (that is, not obtained by a call to *wctype()* or *charclass* is invalidated by a subsequent call  
 43597 to *setlocale()* that has affected category *LC\_CTYPE*) the result is unspecified.

43598 CX The behavior is undefined if the *locale* argument to *iswctype\_l()* is the special locale object  
 43599 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

43600 **RETURN VALUE**

43601 CX The *iswctype()* and *iswctype\_l()* functions shall return non-zero (true) if and only if *wc* has the  
 43602 CX property described by *charclass*. If *charclass* is *(wctype\_t)0*, the *iswctype()* and *iswctype\_l()*  
 43603 functions shall return 0.

43604 **ERRORS**

43605 No errors are defined.

43606 **EXAMPLES**43607 **Testing for a Valid Character**

```
43608 #include <wctype.h>
43609 ...
43610 int yes_or_no;
43611 wint_t wc;
43612 wctype_t valid_class;
43613 ...
43614 if ((valid_class=wctype("vowel")) == (wctype_t)0)
43615     /* Invalid character class. */
43616     yes_or_no=iswctype(wc,valid_class);
```

43617 **APPLICATION USAGE**

43618 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",  
 43619 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard  
 43620 character classes. In the table below, the functions in the left column are equivalent to the  
 43621 functions in the right column.

43622	<i>iswalnum(wc)</i>	<i>iswctype(wc, wctype("alnum"))</i>
43623	<i>iswalnum_l(wc, locale)</i>	<i>iswctype_l(wc, wctype("alnum"), locale)</i>
43624	<i>iswalpha(wc)</i>	<i>iswctype(wc, wctype("alpha"))</i>

```

43625     iswalpha_l(wc, locale)  iswctype_l(wc, wctype("alpha"), locale)
43626     iswblank(wc)           iswctype(wc, wctype("blank"))
43627     iswblank_l(wc, locale) iswctype_l(wc, wctype("blank"), locale)
43628     iswcntrl(wc)          iswctype(wc, wctype("cntrl"))
43629     iswcntrl_l(wc, locale) iswctype_l(wc, wctype("cntrl"), locale)
43630     iswdigit(wc)         iswctype(wc, wctype("digit"))
43631     iswdigit_l(wc, locale) iswctype_l(wc, wctype("digit"), locale)
43632     iswgraph(wc)        iswctype(wc, wctype("graph"))
43633     iswgraph_l(wc, locale) iswctype_l(wc, wctype("graph"), locale)
43634     iswlower(wc)       iswctype(wc, wctype("lower"))
43635     iswlower_l(wc, locale) iswctype_l(wc, wctype("lower"), locale)
43636     iswprint(wc)       iswctype(wc, wctype("print"))
43637     iswprint_l(wc, locale) iswctype_l(wc, wctype("print"), locale)
43638     iswpunct(wc)       iswctype(wc, wctype("punct"))
43639     iswpunct_l(wc, locale) iswctype_l(wc, wctype("punct"), locale)
43640     iswspace(wc)      iswctype(wc, wctype("space"))
43641     iswspace_l(wc, locale) iswctype_l(wc, wctype("space"), locale)
43642     iswupper(wc)      iswctype(wc, wctype("upper"))
43643     iswupper_l(wc, locale) iswctype_l(wc, wctype("upper"), locale)
43644     iswxdigit(wc)     iswctype(wc, wctype("xdigit"))
43645     iswxdigit_l(wc, locale) iswctype_l(wc, wctype("xdigit"), locale)

```

**43646 RATIONALE**

43647 None.

**43648 FUTURE DIRECTIONS**

43649 None.

**43654 CHANGE HISTORY**

43655 First released as World-wide Portability Interfaces in Issue 4.

**43656 Issue 5**

43657 The following change has been made in this version for alignment with  
43658 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43659 • The SYNOPSIS has been changed to indicate that this function and associated data types  
43660 are now made visible by inclusion of the [<wctype.h>](#) header rather than [<wchar.h>](#).

**43661 Issue 6**

43662 The behavior of `charclass = (wctype_t)0` is now described.

43663 An example is added.

43664 A new function, [iswblank\(\)](#), is added to the list in the APPLICATION USAGE.

**43665 Issue 7**

43666 The [iswctype\\_l\(\)](#) function is added from The Open Group Technical Standard, 2006, Extended  
43667 API Set Part 4.

43668 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0321 [283] and XSH/TC1-2008/0322  
43669 [283] are applied.

43670 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0184 [799] and XSH/TC2-2008/0185  
43671 [799] are applied.

43672 **Issue 8**

43673 Austin Group Defect 1302 is applied, aligning the *iswctype()* function with the  
43674 ISO/IEC 9899:2018 standard.

43675 **NAME**

43676 iswdigit, iswdigit\_l — test for a decimal digit wide-character code

43677 **SYNOPSIS**

43678 #include &lt;wctype.h&gt;

43679 int iswdigit(wint\_t wc);

43680 CX int iswdigit\_l(wint\_t wc, locale\_t locale);

43681 **DESCRIPTION**43682 CX For *iswdigit()*: The functionality described on this reference page is aligned with the ISO C  
43683 standard. Any conflict between the requirements described here and the ISO C standard is  
43684 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43685 CX The *iswdigit()* and *iswdigit\_l()* functions shall test whether *wc* is a wide-character code  
43686 CX representing a character of class **digit** in the current locale, or in the locale represented by *locale*,  
43687 respectively; see XBD Chapter 7 (on page 127).43688 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43689 code corresponding to a valid character in the locale used by the function, or equal to the value  
43690 of the macro WEOF. If the argument has any other value, the behavior is undefined.43691 CX The behavior is undefined if the *locale* argument to *iswdigit\_l()* is the special locale object  
43692 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43693 **RETURN VALUE**43694 CX The *iswdigit()* and *iswdigit\_l()* functions shall return non-zero if *wc* is a decimal digit wide-  
43695 character code; otherwise, they shall return 0.43696 **ERRORS**

43697 No errors are defined.

43698 **EXAMPLES**

43699 None.

43700 **APPLICATION USAGE**43701 To ensure applications portability, especially across natural languages, only these functions and  
43702 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43703 classification.43704 **RATIONALE**

43705 None.

43706 **FUTURE DIRECTIONS**

43707 None.

43708 **SEE ALSO**43709 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
43710 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43711 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43712 **CHANGE HISTORY**

43713 First released in Issue 4.

43714 **Issue 5**43715 The following change has been made in this version for alignment with  
43716 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43717                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43718                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43719 **Issue 6**

43720                   The normative text is updated to avoid use of the term “must” for application requirements.

43721 **Issue 7**

43722                   The `iswdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43723                   API Set Part 4.

43724                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0323 [302], XSH/TC1-2008/0324 [283],  
43725                   and XSH/TC1-2008/0325 [283] are applied.

43726                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0186 [685] is applied.

43727 **NAME**

43728 iswgraph, iswgraph\_l — test for a visible wide-character code

43729 **SYNOPSIS**

43730 #include &lt;wctype.h&gt;

43731 int iswgraph(wint\_t wc);

43732 CX int iswgraph\_l(wint\_t wc, locale\_t locale);

43733 **DESCRIPTION**43734 CX For *iswgraph()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43737 CX The *iswgraph()* and *iswgraph\_l()* functions shall test whether *wc* is a wide-character code representing a character of class **graph** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 127).43740 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.43743 CX The behavior is undefined if the *locale* argument to *iswgraph\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43745 **RETURN VALUE**43746 CX The *iswgraph()* and *iswgraph\_l()* functions shall return non-zero if *wc* is a wide-character code with a visible representation; otherwise, they shall return 0.43748 **ERRORS**

43749 No errors are defined.

43750 **EXAMPLES**

43751 None.

43752 **APPLICATION USAGE**

43753 To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

43756 **RATIONALE**

43757 None.

43758 **FUTURE DIRECTIONS**

43759 None.

43760 **SEE ALSO**43761 *iswalnum()*, *iswalphalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswlower()*, *iswprint()*, *iswpunct()*, *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43763 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43764 **CHANGE HISTORY**

43765 First released in Issue 4.

43766 **Issue 5**43767 The following change has been made in this version for alignment with  
43768 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43769                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43770                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43771 **Issue 6**

43772                   The normative text is updated to avoid use of the term “must” for application requirements.

43773 **Issue 7**

43774                   The `iswgraph_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43775                   API Set Part 4.

43776                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0326 [302], XSH/TC1-2008/0327 [283],  
43777                   and XSH/TC1-2008/0328 [283] are applied.

43778                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0187 [685] is applied.

43779 **NAME**

43780 iswlower, iswlower\_l — test for a lowercase letter wide-character code

43781 **SYNOPSIS**

43782 #include &lt;wctype.h&gt;

43783 int iswlower(wint\_t wc);

43784 CX int iswlower\_l(wint\_t wc, locale\_t locale);

43785 **DESCRIPTION**43786 CX For *iswlower()*: The functionality described on this reference page is aligned with the ISO C  
43787 standard. Any conflict between the requirements described here and the ISO C standard is  
43788 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43789 CX The *iswlower()* and *iswlower\_l()* functions shall test whether *wc* is a wide-character code  
43790 CX representing a character of class **lower** in the current locale, or in the locale represented by  
43791 *locale*, respectively; see XBD Chapter 7 (on page 127).43792 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43793 code corresponding to a valid character in the locale used by the function, or equal to the value  
43794 of the macro WEOF. If the argument has any other value, the behavior is undefined.43795 CX The behavior is undefined if the *locale* argument to *iswlower\_l()* is the special locale object  
43796 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43797 **RETURN VALUE**43798 CX The *iswlower()* and *iswlower\_l()* functions shall return non-zero if *wc* is a lowercase letter wide-  
43799 character code; otherwise, they shall return 0.43800 **ERRORS**

43801 No errors are defined.

43802 **EXAMPLES**

43803 None.

43804 **APPLICATION USAGE**43805 To ensure applications portability, especially across natural languages, only these functions and  
43806 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43807 classification.43808 **RATIONALE**

43809 None.

43810 **FUTURE DIRECTIONS**

43811 None.

43816 **CHANGE HISTORY**

43817 First released in Issue 4.

43818 **Issue 5**43819 The following change has been made in this version for alignment with  
43820 ISO/IEC 9899:1990/Amendment 1:1995 (E):

43821                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43822                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43823 **Issue 6**

43824                   The normative text is updated to avoid use of the term “must” for application requirements.

43825 **Issue 7**

43826                   The `iswlower_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43827                   API Set Part 4.

43828                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0329 [302], XSH/TC1-2008/0330 [283],  
43829                   and XSH/TC1-2008/0331 [283] are applied.

43830                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0188 [685] is applied.

43831 **NAME**

43832 iswprint, iswprint\_l — test for a printable wide-character code

43833 **SYNOPSIS**

43834 #include &lt;wctype.h&gt;

43835 int iswprint(wint\_t wc);

43836 CX int iswprint\_l(wint\_t wc, locale\_t locale);

43837 **DESCRIPTION**43838 CX For *iswprint()*: The functionality described on this reference page is aligned with the ISO C  
43839 standard. Any conflict between the requirements described here and the ISO C standard is  
43840 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43841 CX The *iswprint()* and *iswprint\_l()* functions shall test whether *wc* is a wide-character code  
43842 CX representing a character of class **print** in the current locale, or in the locale represented by *locale*,  
43843 respectively; see XBD Chapter 7 (on page 127).43844 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43845 code corresponding to a valid character in the locale used by the function, or equal to the value  
43846 of the macro WEOF. If the argument has any other value, the behavior is undefined.43847 CX The behavior is undefined if the *locale* argument to *iswprint\_l()* is the special locale object  
43848 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43849 **RETURN VALUE**43850 CX The *iswprint()* and *iswprint\_l()* functions shall return non-zero if *wc* is a printable wide-  
43851 character code; otherwise, they shall return 0.43852 **ERRORS**

43853 No errors are defined.

43854 **EXAMPLES**

43855 None.

43856 **APPLICATION USAGE**43857 To ensure applications portability, especially across natural languages, only these functions and  
43858 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43859 classification.43860 **RATIONALE**

43861 None.

43862 **FUTURE DIRECTIONS**

43863 None.

43864 **SEE ALSO**43865 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswpunct()*,  
43866 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43867 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43868 **CHANGE HISTORY**

43869 First released in Issue 4.

43870 **Issue 5**43871 The following change has been made in this version for alignment with  
43872 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43873                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43874                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43875 **Issue 6**

43876                   The normative text is updated to avoid use of the term “must” for application requirements.

43877 **Issue 7**

43878                   The `iswprint_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43879                   API Set Part 4.

43880                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0332 [302], XSH/TC1-2008/0333 [283],  
43881                   and XSH/TC1-2008/0334 [283] are applied.

43882                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0189 [685] is applied.

43883 **NAME**

43884 iswpunct, iswpunct\_l — test for a punctuation wide-character code

43885 **SYNOPSIS**

```
43886 #include <wctype.h>
43887 int iswpunct(wint_t wc);
43888 CX int iswpunct_l(wint_t wc, locale_t locale);
```

43889 **DESCRIPTION**

43890 CX For *iswpunct()*: The functionality described on this reference page is aligned with the ISO C  
 43891 standard. Any conflict between the requirements described here and the ISO C standard is  
 43892 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

43893 CX The *iswpunct()* and *iswpunct\_l()* functions shall test whether *wc* is a wide-character code  
 43894 CX representing a character of class **punct** in the current locale, or in the locale represented by  
 43895 *locale*, respectively; see XBD Chapter 7 (on page 127).

43896 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 43897 code corresponding to a valid character in the locale used by the function, or equal to the value  
 43898 of the macro WEOF. If the argument has any other value, the behavior is undefined.

43899 CX The behavior is undefined if the *locale* argument to *iswpunct\_l()* is the special locale object  
 43900 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

43901 **RETURN VALUE**

43902 CX The *iswpunct()* and *iswpunct\_l()* functions shall return non-zero if *wc* is a punctuation wide-  
 43903 character code; otherwise, they shall return 0.

43904 **ERRORS**

43905 No errors are defined.

43906 **EXAMPLES**

43907 None.

43908 **APPLICATION USAGE**

43909 To ensure applications portability, especially across natural languages, only these functions and  
 43910 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 43911 classification.

43912 **RATIONALE**

43913 None.

43914 **FUTURE DIRECTIONS**

43915 None.

43916 **SEE ALSO**

43917 *iswalnum()*, *iswalphalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
 43918 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43919 XBD Chapter 7 (on page 127), [<locale.h>](#), [<wctype.h>](#)

43920 **CHANGE HISTORY**

43921 First released in Issue 4.

43922 **Issue 5**

43923 The following change has been made in this version for alignment with  
 43924 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43925                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43926                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43927 **Issue 6**

43928                   The normative text is updated to avoid use of the term “must” for application requirements.

43929 **Issue 7**

43930                   The `iswpunct_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43931                   API Set Part 4.

43932                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0335 [302], XSH/TC1-2008/0336 [283],  
43933                   and XSH/TC1-2008/0337 [283] are applied.

43934                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0190 [685] is applied.

43935 **NAME**

43936 iswspace, iswspace\_l — test for a white-space wide-character code

43937 **SYNOPSIS**

43938 #include &lt;wctype.h&gt;

43939 int iswspace(wint\_t wc);

43940 CX int iswspace\_l(wint\_t wc, locale\_t locale);

43941 **DESCRIPTION**43942 CX For *iswspace()*: The functionality described on this reference page is aligned with the ISO C  
43943 standard. Any conflict between the requirements described here and the ISO C standard is  
43944 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43945 CX The *iswspace()* and *iswspace\_l()* functions shall test whether *wc* is a wide-character code  
43946 CX representing a character of class **space** in the current locale, or in the locale represented by *locale*,  
43947 respectively; see XBD Chapter 7 (on page 127).43948 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
43949 code corresponding to a valid character in the locale used by the function, or equal to the value  
43950 of the macro WEOF. If the argument has any other value, the behavior is undefined.43951 CX The behavior is undefined if the *locale* argument to *iswspace\_l()* is the special locale object  
43952 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.43953 **RETURN VALUE**43954 CX The *iswspace()* and *iswspace\_l()* functions shall return non-zero if *wc* is a white-space wide-  
43955 character code; otherwise, they shall return 0.43956 **ERRORS**

43957 No errors are defined.

43958 **EXAMPLES**

43959 None.

43960 **APPLICATION USAGE**43961 To ensure applications portability, especially across natural languages, only these functions and  
43962 the functions in the reference pages listed in the SEE ALSO section should be used for character  
43963 classification.43964 **RATIONALE**

43965 None.

43966 **FUTURE DIRECTIONS**

43967 None.

43968 **SEE ALSO**43969 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,  
43970 *iswpunct()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

43971 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

43972 **CHANGE HISTORY**

43973 First released in Issue 4.

43974 **Issue 5**43975 The following change has been made in this version for alignment with  
43976 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 43977                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
43978                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

43979 **Issue 6**

43980                   The normative text is updated to avoid use of the term “must” for application requirements.

43981 **Issue 7**

43982                   The `iswspace_l()` function is added from The Open Group Technical Standard, 2006, Extended  
43983                   API Set Part 4.

43984                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0338 [302], XSH/TC1-2008/0339 [283],  
43985                   and XSH/TC1-2008/0340 [283] are applied.

43986                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0191 [685] is applied.

43987 **NAME**

43988 iswupper, iswupper\_l — test for an uppercase letter wide-character code

43989 **SYNOPSIS**

43990 #include &lt;wctype.h&gt;

43991 int iswupper(wint\_t wc);

43992 CX int iswupper\_l(wint\_t wc, locale\_t locale);

43993 **DESCRIPTION**43994 CX For *iswupper()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.43997 CX The *iswupper()* and *iswupper\_l()* functions shall test whether *wc* is a wide-character code representing a character of class **upper** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 127).44000 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the locale used by the function, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.44003 CX The behavior is undefined if the *locale* argument to *iswupper\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.44005 **RETURN VALUE**44006 CX The *iswupper()* and *iswupper\_l()* functions shall return non-zero if *wc* is an uppercase letter wide-character code; otherwise, they shall return 0.44008 **ERRORS**

44009 No errors are defined.

44010 **EXAMPLES**

44011 None.

44012 **APPLICATION USAGE**

44013 To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

44016 **RATIONALE**

44017 None.

44018 **FUTURE DIRECTIONS**

44019 None.

44020 **SEE ALSO**44021 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*, *iswspace()*, *iswxdigit()*, *setlocale()*, *uselocale()*

44023 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

44024 **CHANGE HISTORY**

44025 First released in Issue 4.

44026 **Issue 5**44027 The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):  
44028

- 44029                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
44030                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

44031 **Issue 6**

44032                   The normative text is updated to avoid use of the term “must” for application requirements.

44033 **Issue 7**

44034                   The `iswupper_l()` function is added from The Open Group Technical Standard, 2006, Extended  
44035                   API Set Part 4.

44036                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0341 [302], XSH/TC1-2008/0342 [283],  
44037                   and XSH/TC1-2008/0343 [283] are applied.

44038                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0192 [685] is applied.

44039 **NAME**

44040 iswxdigit, iswxdigit\_l — test for a hexadecimal digit wide-character code

44041 **SYNOPSIS**

44042 #include &lt;wctype.h&gt;

44043 int iswxdigit(wint\_t wc);

44044 CX int iswxdigit\_l(wint\_t wc, locale\_t locale);

44045 **DESCRIPTION**44046 CX For *iswxdigit()*: The functionality described on this reference page is aligned with the ISO C  
44047 standard. Any conflict between the requirements described here and the ISO C standard is  
44048 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.44049 CX The *iswxdigit()* and *iswxdigit\_l()* functions shall test whether *wc* is a wide-character code  
44050 CX representing a character of class **xdigit** in the current locale, or in the locale represented by  
44051 *locale*, respectively; see XBD Chapter 7 (on page 127).44052 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
44053 code corresponding to a valid character in the locale used by the function, or equal to the value  
44054 of the macro WEOF. If the argument has any other value, the behavior is undefined.44055 CX The behavior is undefined if the *locale* argument to *iswxdigit\_l()* is the special locale object  
44056 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.44057 **RETURN VALUE**44058 CX The *iswxdigit()* and *iswxdigit\_l()* functions shall return non-zero if *wc* is a hexadecimal digit  
44059 wide-character code; otherwise, they shall return 0.44060 **ERRORS**

44061 No errors are defined.

44062 **EXAMPLES**

44063 None.

44064 **APPLICATION USAGE**44065 To ensure applications portability, especially across natural languages, only these functions and  
44066 the functions in the reference pages listed in the SEE ALSO section should be used for character  
44067 classification.44068 **RATIONALE**

44069 None.

44070 **FUTURE DIRECTIONS**

44071 None.

44072 **SEE ALSO**44073 *iswalnum()*, *iswalphalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

44075 XBD Chapter 7 (on page 127), &lt;locale.h&gt;, &lt;wctype.h&gt;

44076 **CHANGE HISTORY**

44077 First released in Issue 4.

44078 **Issue 5**44079 The following change has been made in this version for alignment with  
44080 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 44081                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
44082                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

44083 **Issue 6**

44084                   The normative text is updated to avoid use of the term “must” for application requirements.

44085 **Issue 7**

44086                   The `iswxdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended  
44087                   API Set Part 4.

44088                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0344 [302], XSH/TC1-2008/0345 [283],  
44089                   and XSH/TC1-2008/0346 [283] are applied.

44090                   POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0193 [685] is applied.

44091 **NAME**

44092 isxdigit, isxdigit\_l — test for a hexadecimal digit

44093 **SYNOPSIS**

```
44094 #include <ctype.h>
44095 int isxdigit(int c);
44096 CX int isxdigit_l(int c, locale_t locale);
```

44097 **DESCRIPTION**

44098 CX For *isxdigit()*: The functionality described on this reference page is aligned with the ISO C  
 44099 standard. Any conflict between the requirements described here and the ISO C standard is  
 44100 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

44101 CX The *isxdigit()* and *isxdigit\_l()* functions shall test whether *c* is a character of class **xdigit** in the  
 44102 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 44103 127).

44104 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 44105 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 44106 any other value, the behavior is undefined.

44107 CX The behavior is undefined if the *locale* argument to *isxdigit\_l()* is the special locale object  
 44108 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

44109 **RETURN VALUE**

44110 CX The *isxdigit()* and *isxdigit\_l()* functions shall return non-zero if *c* is a hexadecimal digit;  
 44111 otherwise, they shall return 0.

44112 **ERRORS**

44113 No errors are defined.

44114 **EXAMPLES**

44115 None.

44116 **APPLICATION USAGE**

44117 To ensure applications portability, especially across natural languages, only these functions and  
 44118 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 44119 classification.

44120 **RATIONALE**

44121 None.

44122 **FUTURE DIRECTIONS**

44123 None.

44124 **SEE ALSO**

44125 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,  
 44126 *isupper()*

44127 XBD Chapter 7 (on page 127), **<ctype.h>**

44128 **CHANGE HISTORY**

44129 First released in Issue 1. Derived from Issue 1 of the SVID.

44130 **Issue 6**

44131 The normative text is updated to avoid use of the term “must” for application requirements.

44132 **Issue 7**

44133

44134

The *isxdigit\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

44135

44136

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0347 [302], XSH/TC1-2008/0348 [283], and XSH/TC1-2008/0349 [283] are applied.

44137 **NAME**

44138           j0, j1, jn — Bessel functions of the first kind

44139 **SYNOPSIS**

```
44140 XSI      #include <math.h>
44141          double j0(double x);
44142          double j1(double x);
44143          double jn(int n, double x);
```

44144 **DESCRIPTION**

44145           The *j0()*, *j1()*, and *jn()* functions shall compute Bessel functions of *x* of the first kind of orders 0,  
44146           1, and *n*, respectively.

44147           An application wishing to check for error situations should set *errno* to zero and call  
44148           *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
44149           *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
44150           zero, an error has occurred.

44151 **RETURN VALUE**

44152           Upon successful completion, these functions shall return the relevant Bessel value of *x* of the  
44153           first kind.

44154           If the *x* argument is finite and too large in magnitude, or the correct result would cause  
44155 MXX       underflow and is not representable, a range error may occur, and the function shall return 0.0,  
44156           or (if the IEC 60559 Floating-Point option is not supported) an implementation-defined value no  
44157           greater in magnitude than DBL\_MIN.

44158 MXX       If the correct result would cause underflow, and is representable, a range error may occur and  
44159           the correct value shall be returned.

44160 MXX       If *x* is +Inf, +0 shall be returned.

44161 MXX       If *x* is NaN, a NaN shall be returned.

44162 **ERRORS**

44163           These functions may fail if:

44164           Range Error       The value of *x* was too large in magnitude, or an underflow occurred.

44165                               If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
44166                               then *errno* shall be set to [ERANGE]. If the integer expression  
44167                               (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
44168                               floating-point exception shall be raised.

44169           No other errors shall occur.

44170 **EXAMPLES**

44171           None.

44172 **APPLICATION USAGE**

44173           On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
44174           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

44175 **RATIONALE**

44176           None.

44177 **FUTURE DIRECTIONS**

44178 None.

44179 **SEE ALSO**44180 *feclearexcept()*, *fetetestexcept()*, *isnan()*, *y0()*

44181 XBD Section 4.23 (on page 109), &lt;math.h&gt;

44182 **CHANGE HISTORY**

44183 First released in Issue 1. Derived from Issue 1 of the SVID.

44184 **Issue 5**44185 The DESCRIPTION is updated to indicate how an application should check for an error. This  
44186 text was previously published in the APPLICATION USAGE section.44187 **Issue 6**

44188 The may fail [EDOM] error is removed for the case for NaN.

44189 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling  
44190 with the ISO/IEC 9899:1999 standard.44191 **Issue 7**

44192 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0350 [68] is applied.

44193 **Issue 8**44194 Austin Group Defect 714 is applied, changing the behavior of these functions for special cases to  
44195 be a better match for their mathematical behavior.

44196 **NAME**

44197       jrand48 — generate a uniformly distributed pseudo-random long signed integer

44198 **SYNOPSIS**

```
44199 XSI       #include <stdlib.h>  
44200       long jrand48(unsigned short xsubi[3]);
```

44201 **DESCRIPTION**44202       Refer to *drand48()*.

44203 **NAME**

44204 kill — send a signal to a process or a group of processes

44205 **SYNOPSIS**

```
44206 CX #include <signal.h>
44207 int kill(pid_t pid, int sig);
```

44208 **DESCRIPTION**

44209 The *kill()* function shall send a signal to a process or a group of processes specified by *pid*. The  
 44210 signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is  
 44211 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can  
 44212 be used to check the validity of *pid*.

44213 For a process to have permission to send a signal to a process designated by *pid*, unless the  
 44214 sending process has appropriate privileges, the real or effective user ID of the sending process  
 44215 shall match the real or saved set-user-ID of the receiving process.

44216 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

44217 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)  
 44218 whose process group ID is equal to the process group ID of the sender, and for which the process  
 44219 has permission to send a signal.

44220 If *pid* is -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for  
 44221 which the process has permission to send that signal.

44222 If *pid* is negative, but not -1, *sig* shall be sent to all processes (excluding an unspecified set of  
 44223 system processes) whose process group ID is equal to the absolute value of *pid*, and for which  
 44224 the process has permission to send a signal.

44225 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for  
 44226 the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait()* function  
 44227 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending  
 44228 thread before *kill()* returns.

44229 The user ID tests described above shall not be applied when sending SIGCONT to a process that  
 44230 is a member of the same session as the sending process.

44231 An implementation that provides extended security controls may impose further  
 44232 implementation-defined restrictions on the sending of signals, including the null signal. In  
 44233 particular, the system may deny the existence of some or all of the processes specified by *pid*.

44234 The *kill()* function is successful if the process has permission to send *sig* to any of the processes  
 44235 specified by *pid*. If *kill()* fails, no signal shall be sent.

44236 **RETURN VALUE**

44237 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 44238 indicate the error.

44239 **ERRORS**

44240 The *kill()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 44241 | [EINVAL] | The value of the <i>sig</i> argument is an invalid or unsupported signal number.  |
| 44242 | [EPERM]  | The process does not have permission to send the signal to any receiving process. |
| 44243 |          |   |

44244 [ESRCH] No process or process group can be found corresponding to that specified by  
44245 *pid*.

#### 44246 EXAMPLES

44247 None.

#### 44248 APPLICATION USAGE

44249 None.

#### 44250 RATIONALE

44251 The semantics for permission checking for *kill()* differed between System V and most other  
44252 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of  
44253 POSIX.1-2024 agree with System V. Specifically, a set-user-ID process cannot protect itself  
44254 against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice  
44255 allows the user who starts an application to send it signals even if it changes its effective user ID.  
44256 The other semantics give more power to an application that wants to protect itself from the user  
44257 who ran it.

44258 Some implementations provide semantic extensions to the *kill()* function when the absolute  
44259 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a  
44260 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not  
44261 included in this volume of POSIX.1-2024, although a conforming implementation could provide  
44262 such an extension.

44263 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

44264 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the  
44265 calling process and that signal is not blocked, that signal would be delivered before *kill()*  
44266 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.  
44267 However, historical implementations that provide only the *signal()* function make only the  
44268 weaker guarantee in this volume of POSIX.1-2024, because they only deliver one signal each  
44269 time a process enters the kernel. Modifications to such implementations to support the  
44270 *sigaction()* function generally require entry to the kernel following return from a signal-catching  
44271 function, in order to restore the signal mask. Such modifications have the effect of satisfying the  
44272 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.  
44273 The standard developers considered making the stronger requirement except when *signal()* is  
44274 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the  
44275 stronger requirement whenever possible. In practice, the weaker requirement is the same, except  
44276 in the rare case when two signals arrive during a very short window. This reasoning also applies  
44277 to a similar requirement for *sigprocmask()*.

44278 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID  
44279 security checks. This allows a job control shell to continue a job even if processes in the job have  
44280 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of  
44281 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any  
44282 process in the same session regardless of user ID security checks. This is less restrictive than BSD  
44283 in the sense that ancestor processes (in the same session) can now be the recipient. It is more  
44284 restrictive than BSD in the sense that descendant processes that form new sessions are now  
44285 subject to the user ID checks. A similar relaxation of security is not necessary for the other job  
44286 control signals since those signals are typically sent by the terminal driver in recognition of  
44287 special characters being typed; the terminal driver bypasses all security checks.

44288 In secure implementations, a process may be restricted from sending a signal to a process having  
44289 a different security label. In order to prevent the existence or nonexistence of a process from  
44290 being used as a covert channel, such processes should appear nonexistent to the sender; that is,  
44291 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

44292 Historical implementations varied on the result of a *kill()* with *pid* indicating a zombie process.  
 44293 Some indicated success on such a call (subject to permission checking), while others gave an  
 44294 error of [ESRCH]. Since the definition of process lifetime in this volume of POSIX.1-2024 covers  
 44295 zombie processes, the [ESRCH] error as described is inappropriate in this case and  
 44296 implementations that give this error do not conform. This means that an application cannot have  
 44297 a parent process check for termination of a particular child by sending it the null signal with  
 44298 *kill()*, but must instead use *waitpid()* or *waitid()*.

44299 There is some belief that the name *kill()* is misleading, since the function is not always intended  
 44300 to cause process termination. However, the name is common to all historical implementations,  
 44301 and any change would be in conflict with the goal of minimal changes to existing application  
 44302 code.

#### 44303 FUTURE DIRECTIONS

44304 None.

44307 XBD [<signal.h>](#), [<sys/types.h>](#)

#### 44308 CHANGE HISTORY

44309 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 44310 Issue 5

44311 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 44312 Issue 6

44313 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

44314 The following new requirements on POSIX implementations derive from alignment with the  
 44315 Single UNIX Specification:

- 44316 • In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-  
 44317 user-ID of the calling process is checked in place of its effective user ID. This is a FIPS  
 44318 requirement.
- 44319 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 44320 required for conforming implementations of previous POSIX specifications, it was not  
 44321 required for UNIX applications.
- 44322 • The behavior when *pid* is  $-1$  is now specified. It was previously explicitly unspecified in  
 44323 the POSIX.1-1988 standard.

44324 The normative text is updated to avoid use of the term “must” for application requirements.

44325 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE  
 44326 section.

#### 44327 Issue 7

44328 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0194 [765] is applied.

#### 44329 Issue 8

44330 Austin Group Defect 1138 is applied, adding *sig2str()* to the SEE ALSO section.

44331 **NAME**

44332 kill\_dependency — terminate a dependency chain

44333 **SYNOPSIS**

44334 #include &lt;stdatomic.h&gt;

44335 type kill\_dependency(type \*y);

44336 **DESCRIPTION**

44337 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
44338 conflict between the requirements described here and the ISO C standard is unintentional. This  
44339 volume of POSIX.1-2024 defers to the ISO C standard.

44340 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
44341 `<stdatomic.h>` header nor support the `kill_dependency()` macro.

44342 The `kill_dependency()` macro shall terminate a dependency chain (see XBD [Section 4.15.1](#), on page  
44343 100). The argument shall not carry a dependency to the return value.

44344 **RETURN VALUE**44345 The `kill_dependency()` macro shall return the value of *y*.44346 **ERRORS**

44347 No errors are defined.

44348 **EXAMPLES**

44349 None.

44350 **APPLICATION USAGE**

44351 None.

44352 **RATIONALE**

44353 None.

44354 **FUTURE DIRECTIONS**

44355 None.

44356 **SEE ALSO**44357 XBD [Section 4.15.1](#), `<stdatomic.h>`44358 **CHANGE HISTORY**

44359 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

44360 **NAME**

44361 killpg — send a signal to a process group

44362 **SYNOPSIS**

```
44363 XSI #include <signal.h>
44364 int killpg(pid_t pgrp, int sig);
```

44365 **DESCRIPTION**44366 The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.

44367 If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or  
 44368 equal to 1, the behavior of *killpg()* is undefined.

44369 **RETURN VALUE**44370 Refer to *kill()*.44371 **ERRORS**44372 Refer to *kill()*.44373 **EXAMPLES**44374 **Sending a Signal to All Other Members of a Process Group**

44375 The following example shows how the calling process could send a signal to all other members  
 44376 of its process group. To prevent itself from receiving the signal it first makes itself immune to the  
 44377 signal by ignoring it.

```
44378 #include <signal.h>
44379 #include <unistd.h>
44380 ...
44381     if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
44382         /* Handle error */;
44383     if (killpg(getpgrp(), SIGUSR1) == -1)
44384         /* Handle error */;
```

44385 **APPLICATION USAGE**

44386 None.

44387 **RATIONALE**

44388 None.

44389 **FUTURE DIRECTIONS**

44390 None.

44391 **SEE ALSO**44392 *getpgid()*, *getpid()*, *kill()*, *raise()*44393 XBD [<signal.h>](#)44394 **CHANGE HISTORY**

44395 First released in Issue 4, Version 2.

44396 **Issue 5**

44397 Moved from X/OPEN UNIX extension to BASE.

44398 **Issue 6**

44399 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/52 is applied, adding the example to the  
44400 EXAMPLES section.

44401 **NAME**

44402       l64a — convert a 32-bit integer to a radix-64 ASCII string

44403 **SYNOPSIS**

```
44404 XSI       #include <stdlib.h>  
44405       char *l64a(long value);
```

44406 **DESCRIPTION**

44407       Refer to [a64l\(\)](#).

44408 **NAME**

44409 labs, llabs — return a long integer absolute value

44410 **SYNOPSIS**

44411 #include &lt;stdlib.h&gt;

44412 long labs(long i);

44413 long long llabs(long long i);

44414 **DESCRIPTION**

44415 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
44416 conflict between the requirements described here and the ISO C standard is unintentional. This  
44417 volume of POSIX.1-2024 defers to the ISO C standard.

44418 The *labs()* function shall compute the absolute value of the **long** integer operand *i*. The *llabs()*  
44419 function shall compute the absolute value of the **long long** integer operand *i*. If the result  
44420 cannot be represented, the behavior is undefined.

44421 **RETURN VALUE**44422 The *labs()* function shall return the absolute value of the **long** integer operand.44423 The *llabs()* function shall return the absolute value of the **long long** integer operand.44424 **ERRORS**

44425 No errors are defined.

44426 **EXAMPLES**

44427 None.

44428 **APPLICATION USAGE**

44429 Since POSIX.1 requires a two's complement representation of **long** and **long long**, the absolute  
44430 value of the negative integers with the largest magnitude {LONG\_MIN} and {LLONG\_MIN} are  
44431 not representable, thus *labs*(LONG\_MIN) and *llabs*(LLONG\_MIN) are undefined.

44432 **RATIONALE**

44433 None.

44434 **FUTURE DIRECTIONS**

44435 None.

44436 **SEE ALSO**44437 [abs\(\)](#)44438 XBD [<stdlib.h>](#)44439 **CHANGE HISTORY**

44440 First released in Issue 4. Derived from the ISO C standard.

44441 **Issue 6**44442 The *llabs()* function is added for alignment with the ISO/IEC 9899:1999 standard.44443 **Issue 7**

44444 SD5-XSH-ERN-152 is applied, correcting the RETURN VALUE section.

44445 **Issue 8**

44446 Austin Group Defect 1108 is applied, changing the APPLICATION USAGE section.

44447 **NAME**

44448 lchown — change the owner and group of a symbolic link

44449 **SYNOPSIS**

44450 #include &lt;unistd.h&gt;

44451 int lchown(const char \*path, uid\_t owner, gid\_t group);

44452 **DESCRIPTION**

44453 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a  
 44454 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,  
 44455 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

44456 **RETURN VALUE**

44457 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
 44458 indicate an error.

44459 **ERRORS**44460 The *lchown()* function shall fail if:

- 44461 [EACCES] Search permission is denied on a component of the path prefix of *path*.
- 44462 [EINVAL] The owner or group ID is not a value supported by the implementation.
- 44463 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 44464 argument.
- 44465 [ENAMETOOLONG]  
 44466 The length of a component of a pathname is longer than {NAME\_MAX}.
- 44467 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 44468 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 44469 directory nor a symbolic link to a directory, or the *path* argument contains at  
 44470 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
 44471 characters and the last pathname component names an existing file that is  
 44472 neither a directory nor a symbolic link to a directory.
- 44473 [EPERM] The effective user ID does not match the owner of the file and the process does  
 44474 not have appropriate privileges.
- 44475 [EROFS] The file resides on a read-only file system.
- 44476 The *lchown()* function may fail if:
- 44477 [EIO] An I/O error occurred while reading or writing to the file system.
- 44478 [EINTR] A signal was caught during execution of the function.
- 44479 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 44480 resolution of the *path* argument.
- 44481 [ENAMETOOLONG]  
 44482 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 44483 symbolic link produced an intermediate result with a length that exceeds  
 44484 {PATH\_MAX}.

44485 **EXAMPLES**44486 **Changing the Current Owner of a File**

44487 The following example shows how to change the ownership of the symbolic link named  
44488 **/modules/pass1** to the user ID associated with ```jones``` and the group ID associated with ```cnd```.

44489 The numeric value for the user ID is obtained by using the `getpwnam()` function. The numeric  
44490 value for the group ID is obtained by using the `getgrnam()` function.

```
44491 #include <sys/types.h>
44492 #include <unistd.h>
44493 #include <pwd.h>
44494 #include <grp.h>

44495 struct passwd *pwd;
44496 struct group *grp;
44497 char          *path = "/modules/pass1";
44498 ...
44499 pwd = getpwnam("jones");
44500 grp = getgrnam("cnd");
44501 lchown(path, pwd->pw_uid, grp->gr_gid);
```

44502 **APPLICATION USAGE**

44503 On implementations which support symbolic links as directory entries rather than files, `lchown()`  
44504 may fail.

44505 **RATIONALE**

44506 None.

44507 **FUTURE DIRECTIONS**

44508 None.

44510 [\*chown\(\)\*](#), [\*symlink\(\)\*](#)

44511 XBD [\*\*<unistd.h>\*\*](#)

44512 **CHANGE HISTORY**

44513 First released in Issue 4, Version 2.

44514 **Issue 5**

44515 Moved from X/OPEN UNIX extension to BASE.

44516 **Issue 6**

44517 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
44518 [ELOOP] error condition is added.

44519 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the  
44520 APPLICATION USAGE.

44521 **Issue 7**

44522 Austin Group Interpretation 1003.1-2001 #143 is applied.

44523 The `lchown()` function is moved from the XSI option to the Base.

44524 The [EOPNOTSUPP] error is removed.

44525 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
44526 pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0351 [324] is applied.

44528 **NAME**

44529 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

44530 **SYNOPSIS**

```
44531 XSI #include <stdlib.h>  
44532 void lcong48(unsigned short param[7]);
```

44533 **DESCRIPTION**44534 Refer to *drand48()*.

44535 **NAME**

44536 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

44537 **SYNOPSIS**

```
44538 #include <math.h>
44539 double ldexp(double x, int exp);
44540 float ldexpf(float x, int exp);
44541 long double ldexpl(long double x, int exp);
```

44542 **DESCRIPTION**

44543 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44544 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44545 volume of POSIX.1-2024 defers to the ISO C standard.

44546 These functions shall compute the quantity  $x * 2^{exp}$ .

44547 An application wishing to check for error situations should set *errno* to zero and call  
 44548 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 44549 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 44550 zero, an error has occurred.

44551 **RETURN VALUE**44552 Upon successful completion, these functions shall return  $x$  multiplied by 2, raised to the power  
44553 *exp*.

44554 If these functions would cause overflow, a range error shall occur and *ldexp*(*x*), *ldexpf*(*x*), and  
 44555 *ldexpl*(*x*) shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (according to the sign of  
 44556 *x*), respectively.

44557 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 44558 MXX and *ldexp*(*x*), *ldexpf*(*x*), and *ldexpl*(*x*) shall return 0.0, or (if IEC 60559 Floating-Point is not  
 44559 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 44560 FLT\_MIN, and LDBL\_MIN, respectively.

44561 MX If *x* is NaN, a NaN shall be returned.44562 If *x* is  $\pm 0$  or  $\pm$ Inf, *x* shall be returned.44563 If *exp* is 0, *x* shall be returned.

44564 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 44565 the correct value shall be returned.

44566 **ERRORS**

44567 These functions shall fail if:

44568 Range Error The result overflows.

44569 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 44570 then *errno* shall be set to [ERANGE]. If the integer expression  
 44571 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 44572 floating-point exception shall be raised.

44573 These functions may fail if:

44574 Range Error The result underflows.

44575 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 44576 then *errno* shall be set to [ERANGE]. If the integer expression  
 44577 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

44578 floating-point exception shall be raised.

44579 **EXAMPLES**  
44580 None.

44581 **APPLICATION USAGE**  
44582 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
44583 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

44584 **RATIONALE**  
44585 None.

44586 **FUTURE DIRECTIONS**  
44587 None.

44588 **SEE ALSO**

44591 **CHANGE HISTORY**  
44592 First released in Issue 1. Derived from Issue 1 of the SVID.

44593 **Issue 5**  
44594 The DESCRIPTION is updated to indicate how an application should check for an error. This  
44595 text was previously published in the APPLICATION USAGE section.

44596 **Issue 6**  
44597 The *ldexpf()* and *ldexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
44598 standard.  
44599 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
44600 revised to align with the ISO/IEC 9899:1999 standard.  
44601 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
44602 marked.

44603 **Issue 7**  
44604 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0352 [68] and XSH/TC1-2008/0353  
44605 [68] are applied.

44606 **NAME**

44607 ldiv, lldiv — compute quotient and remainder of a long division

44608 **SYNOPSIS**

44609 #include &lt;stdlib.h&gt;

44610 ldiv\_t ldiv(long numer, long denom);

44611 lldiv\_t lldiv(long long numer, long long denom);

44612 **DESCRIPTION**

44613 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44614 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44615 volume of POSIX.1-2024 defers to the ISO C standard.

44616 These functions shall compute the quotient and remainder of the division of the numerator  
 44617 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**  
 44618 integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude  
 44619 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is  
 44620 undefined; otherwise,  $quot * denom + rem$  shall equal *numer*.

44621 **RETURN VALUE**

44622 The *ldiv()* function shall return a structure of type **ldiv\_t**, comprising both the quotient and the  
 44623 remainder. The structure shall include the following members, in any order:

```
44624 long    quot;    /* Quotient */
44625 long    rem;     /* Remainder */
```

44626 The *lldiv()* function shall return a structure of type **lldiv\_t**, comprising both the quotient and the  
 44627 remainder. The structure shall include the following members, in any order:

```
44628 long long quot;  /* Quotient */
44629 long long rem;   /* Remainder */
```

44630 **ERRORS**

44631 No errors are defined.

44632 **EXAMPLES**

44633 None.

44634 **APPLICATION USAGE**

44635 None.

44636 **RATIONALE**

44637 None.

44638 **FUTURE DIRECTIONS**

44639 None.

44640 **SEE ALSO**44641 [div\(\)](#)44642 XBD [<stdlib.h>](#)44643 **CHANGE HISTORY**

44644 First released in Issue 4. Derived from the ISO C standard.

44645 **Issue 6**44646 The *lldiv()* function is added for alignment with the ISO/IEC 9899:1999 standard.

44647 **NAME**

44648 le16toh, le32toh, le64toh — convert values between host and specified byte order

44649 **SYNOPSIS**

44650 #include &lt;endian.h&gt;

44651 uint16\_t le16toh(uint16\_t *little\_endian\_16bits*);44652 uint32\_t le32toh(uint32\_t *little\_endian\_32bits*);44653 uint64\_t le64toh(uint64\_t *little\_endian\_64bits*);44654 **DESCRIPTION**44655 Refer to *be16toh()*.

44656 **NAME**

44657 lfind — find entry in a linear search table

44658 **SYNOPSIS**

```
44659 XSI #include <search.h>
44660 void *lfind(const void *key, const void *base, size_t *nel,
44661           size_t width, int (*compar)(const void *, const void *));
```

44662 **DESCRIPTION**

44663 Refer to [lsearch\(\)](#).

44664 **NAME**

44665 lgamma, lgammaf, lgammal, signgam — log gamma function

44666 **SYNOPSIS**

```
44667 #include <math.h>
44668 double lgamma(double x);
44669 float lgammaf(float x);
44670 long double lgammal(long double x);
44671 XSI extern int signgam;
```

44672 **DESCRIPTION**

44673 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44674 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44675 volume of POSIX.1-2024 defers to the ISO C standard.

44676 These functions shall compute  $\log_e |\Gamma(x)|$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ . The argument  $x$   
 44677 need not be a non-positive integer ( $\Gamma(x)$  is defined over the reals, except the non-positive  
 44678 integers).

44679 XSI The sign of  $\Gamma(x)$  shall be returned in the external integer *signgam*. If  $x$  is NaN,  $-\text{Inf}$ , or a negative  
 44680 integer, the value of *signgam* is unspecified.

44681 If concurrent calls are made to these functions, the value of *signgam* is indeterminate.

44682 An application wishing to check for error situations should set *errno* to zero and call  
 44683 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 44684 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 44685 zero, an error has occurred.

44686 **RETURN VALUE**

44687 Upon successful completion, these functions shall return the logarithmic gamma of  $x$ .

44688 If  $x$  is a non-positive integer, a pole error shall occur and *lgamma()*, *lgammaf()*, and *lgammal()*  
 44689 shall return +HUGE\_VAL, +HUGE\_VALF, and +HUGE\_VALL, respectively.

44690 If the correct value would cause overflow, a range error shall occur and *lgamma()*, *lgammaf()*,  
 44691 and *lgammal()* shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (having the same  
 44692 sign as the correct value), respectively.

44693 MX If  $x$  is NaN, a NaN shall be returned.

44694 If  $x$  is 1 or 2, +0 shall be returned.

44695 If  $x$  is  $\pm\text{Inf}$ , +Inf shall be returned.

44696 **ERRORS**

44697 These functions shall fail if:

44698 Pole Error The  $x$  argument is a negative integer or zero.

44699 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 44700 then *errno* shall be set to [ERANGE]. If the integer expression  
 44701 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 44702 floating-point exception shall be raised.

44703 Range Error The result overflows.  
 44704  
 44705 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 44706 then *errno* shall be set to [ERANGE]. If the integer expression  
 44707 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 floating-point exception shall be raised.

**EXAMPLES**

44708  
 44709 None.

**APPLICATION USAGE**

44711 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 44712 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

44713 If the value of *signgam* will be obtained after a call to *lgamma()*, *lgammaf()*, or *lgammal()*, in order  
 44714 to ensure that the value will not be altered by another call in a different thread, applications  
 44715 should either restrict calls to these functions to be from a single thread or use a lock such as a  
 44716 mutex or spin lock to protect a critical section starting before the function call and ending after  
 44717 the value of *signgam* has been obtained.

**RATIONALE**

44718 Earlier versions of this standard did not require *lgamma()*, *lgammaf()*, and *lgammal()* to be  
 44719 thread-safe because *signgam* was a global variable. They are now required to be thread-safe to  
 44720 align with the ISO C standard (which, since the introduction of threads in 2011, requires that  
 44721 they avoid data races), with the exception that they need not avoid data races when storing a  
 44722 value in the *signgam* variable. Since *signgam* is not specified by the ISO C standard, this  
 44723 exception is not a conflict with that standard.  
 44724

**FUTURE DIRECTIONS**

44725  
 44726 None.

**SEE ALSO**

44728 [exp\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#)

44729 XBD Section 4.23 (on page 109), [<math.h>](#)

**CHANGE HISTORY**

44730  
 44731 First released in Issue 3.

**Issue 5**

44732 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 44733 text was previously published in the APPLICATION USAGE section.  
 44734

44735 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

44736 The *lgamma()* function is no longer marked as an extension.  
 44737

44738 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999  
 44739 standard.

44740 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 44741 revised to align with the ISO/IEC 9899:1999 standard.

44742 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 44743 marked.

44744 Functionality relating to the XSI option is marked.

44745 **Issue 7**

44746 Austin Group Interpretation 1003.1-2001 #156 is applied.

44747 The DESCRIPTION is clarified regarding the value of *signgam* when  $x$  is Nan,  $-\text{Inf}$ , or a negative  
44748 integer.

44749 **Issue 8**

44750 Austin Group Defect 1002 is applied, reinstating the requirement for the sign of  $\Gamma(x)$  to be  
44751 returned in *signgam*, which had been accidentally removed in Issue 7.

44752 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
44753 standard.

44754 **NAME**

44755 link, linkat — hard link one file to another file

44756 **SYNOPSIS**

44757 #include &lt;unistd.h&gt;

44758 int link(const char \*path1, const char \*path2);

44759 OH #include &lt;fcntl.h&gt;

44760 int linkat(int fd1, const char \*path1, int fd2,

44761 const char \*path2, int flag);

44762 **DESCRIPTION**44763 The *link()* function shall create a new hard link (directory entry) for the existing file, *path1*.

44764 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to  
 44765 a pathname naming the new directory entry to be created. The *link()* function shall atomically  
 44766 create a new hard link for the existing file and the link count of the file shall be incremented by  
 44767 one.

44768 If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the  
 44769 implementation supports using *link()* on directories.

44770 If *path1* names a symbolic link, it is implementation-defined whether *link()* follows the symbolic  
 44771 link, or creates a new hard link to the symbolic link itself.

44772 Upon successful completion, *link()* shall mark for update the last file status change timestamp of  
 44773 the file. Also, the last data modification and last file status change timestamps of the directory  
 44774 that contains the new entry shall be marked for update.

44775 If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.

44776 The implementation may require that the calling process has permission to access the existing  
 44777 file.

44778 The *linkat()* function shall be equivalent to the *link()* function except that symbolic links shall be  
 44779 handled as specified by the value of *flag* (see below) and except in the case where either *path1* or  
 44780 *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to the  
 44781 directory associated with the file descriptor *fd1* instead of the current working directory and  
 44782 similarly for *path2* and the file descriptor *fd2*. If the access mode of the open file description  
 44783 associated with the file descriptor is not O\_SEARCH, the function shall check whether directory  
 44784 searches are permitted using the current permissions of the directory underlying the file  
 44785 descriptor. If the access mode is O\_SEARCH, the function shall not perform the check.

44786 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 44787 in <fcntl.h>:

44788 AT\_SYMLINK\_FOLLOW

44789 If *path1* names a symbolic link, a new hard link for the target of the symbolic link is created.

44790 If *linkat()* is passed the special value AT\_FDCWD in the *fd1* or *fd2* parameter, the current  
 44791 working directory shall be used for the respective *path* argument. If both *fd1* and *fd2* have value  
 44792 AT\_FDCWD, the behavior shall be identical to a call to *link()*, except that symbolic links shall be  
 44793 handled as specified by the value of *flag*.

44794 If the AT\_SYMLINK\_FOLLOW flag is clear in the *flag* argument and the *path1* argument names a  
 44795 symbolic link, a new hard link is created for the symbolic link *path1* and not its target.

44796 **RETURN VALUE**

44797       Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
44798       return  $-1$  and set *errno* to indicate the error.

44799 **ERRORS**

44800       These functions shall fail if:

44801       [EACCES]       A component of either path prefix denies search permission, or the requested  
44802       link requires writing in a directory that denies write permission, or the calling  
44803       process does not have permission to access the existing file and this is required  
44804       by the implementation.

44805       [EEXIST]       The *path2* argument resolves to an existing directory entry or refers to a  
44806       symbolic link.

44807       [EILSEQ]       The last pathname component of *path2* is not a portable filename, and cannot  
44808       be created in the target directory.

44809       [ELOOP]       A loop exists in symbolic links encountered during resolution of the *path1* or  
44810       *path2* argument.

44811       [EMLINK]       The number of hard links to the file named by *path1* would exceed  
44812       {LINK\_MAX}.

44813       [ENAMETOOLONG]

44814       The length of a component of a pathname is longer than {NAME\_MAX}.

44815       [ENOENT]       A component of either path prefix does not exist; the file named by *path1* does  
44816       not exist; or *path1* or *path2* points to an empty string.

44817       [ENOENT] or [ENOTDIR]

44818       The *path1* argument names an existing non-directory file, and the *path2*  
44819       argument contains at least one non-`<slash>` character and ends with one or  
44820       more trailing `<slash>` characters. If *path2* without the trailing `<slash>`  
44821       characters would name an existing file, an [ENOENT] error shall not occur.

44822       [ENOSPC]       The directory to contain the link cannot be extended.

44823       [ENOTDIR]

44824       A component of either path prefix names an existing file that is neither a  
44825       directory nor a symbolic link to a directory, or the *path1* argument contains at  
44826       least one non-`<slash>` character and ends with one or more trailing `<slash>`  
44827       characters and the last pathname component names an existing file that is  
44828       neither a directory nor a symbolic link to a directory, or the *path1* argument  
44829       names an existing non-directory file and the *path2* argument names a  
44830       nonexistent file, contains at least one non-`<slash>` character, and ends with  
44830       one or more trailing `<slash>` characters.

44831       [EPERM]       The file named by *path1* is a directory and either the calling process does not  
44832       have appropriate privileges or the implementation prohibits using *link()* on  
44833       directories.

44834       [EROFS]       The requested link requires writing in a directory on a read-only file system.

44835       [EXDEV]       The file named by *path1* and the directory in which the directory entry named  
44836       by *path2* is to be created are on different file systems and the implementation  
44837       does not support hard links between file systems.

44838       The *linkat()* function shall fail if:

44839 [EACCES] The access mode of the open file description associated with *fd1* or *fd2* is not  
 44840 O\_SEARCH and the permissions of the directory underlying *fd1* or *fd2*,  
 44841 respectively, do not permit directory searches.

44842 [EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or  
 44843 *fd2* argument, respectively, is neither AT\_FDCWD nor a valid file descriptor  
 44844 open for reading or searching.

44845 [ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*,  
 44846 respectively, is a file descriptor associated with a non-directory file.

44847 These functions may fail if:

44848 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 44849 resolution of the *path1* or *path2* argument.

44850 [ENAMETOOLONG]  
 44851 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 44852 symbolic link produced an intermediate result with a length that exceeds  
 44853 {PATH\_MAX}.

44854 The *linkat()* function may fail if:

44855 [EINVAL] The value of the *flag* argument is not valid.

## 44856 EXAMPLES

### 44857 Creating a Hard Link to a File

44858 The following example shows how to create an additional hard link to a file named  
 44859 **/home/cnd/mod1** by creating a new directory entry named **/modules/pass1**.

```
44860 #include <unistd.h>
44861 char *path1 = "/home/cnd/mod1";
44862 char *path2 = "/modules/pass1";
44863 int status;
44864 ...
44865 status = link (path1, path2);
```

### 44866 Creating a Hard Link to a File Within a Program

44867 In the following program example, the *link()* function hard links the **/etc/passwd** file (defined as  
 44868 **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the  
 44869 current password file. Then, after removing the current password file (defined as  
 44870 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*  
 44871 function again.

```
44872 #include <unistd.h>
44873 #define LOCKFILE "/etc/ptmp"
44874 #define PASSWDFILE "/etc/passwd"
44875 #define SAVEFILE "/etc/opasswd"
44876 ...
44877 /* Save current password file */
44878 link (PASSWDFILE, SAVEFILE);
44879 /* Remove current password file. */
44880 unlink (PASSWDFILE);
```

```
44881      /* Save new password file as current password file. */
44882      link (LOCKFILE,PASSWDFILE);
```

#### 44883 APPLICATION USAGE

44884 Some implementations do allow hard links between file systems.

44885 If *path1* refers to a symbolic link, application developers should use *linkat()* with appropriate  
44886 flags to select whether or not the symbolic link should be resolved.

#### 44887 RATIONALE

44888 Creating additional hard links to a directory is restricted to the superuser in most historical  
44889 implementations because this capability may produce loops in the file hierarchy or otherwise  
44890 corrupt the file system. This volume of POSIX.1-2024 continues that philosophy by prohibiting  
44891 *link()* and *unlink()* from doing this. Other functions could do it if the implementor designed  
44892 such an extension.

44893 Some historical implementations allow hard linking of files on different file systems. Wording  
44894 was added to explicitly allow this optional behavior.

44895 The exception for cross-file system hard links is intended to apply only to links that are  
44896 programmatically indistinguishable from traditional hard links.

44897 The purpose of the *linkat()* function is to link files in directories other than the current working  
44898 directory without exposure to race conditions. Any part of the path of a file could be changed in  
44899 parallel to a call to *link()*, resulting in unspecified behavior. By opening a file descriptor for the  
44900 directory of both the existing file and the target location and using the *linkat()* function it can be  
44901 guaranteed that the both filenames are in the desired directories.

44902 Earlier versions of this standard specified only the *link()* function, and required it to behave like  
44903 *linkat()* with the `AT_SYMLINK_FOLLOW` flag. However, historical practice from SVR4 and  
44904 Linux kernels had *link()* behaving like *linkat()* with no flags, and many systems that attempted  
44905 to provide a conforming *link()* function did so in a way that was rarely used, and when it was  
44906 used did not conform to the standard (e.g., by not being atomic, or by dereferencing the  
44907 symbolic link incorrectly). Since applications could not rely on *link()* following symbolic links in  
44908 practice, the *linkat()* function was added taking a flag to specify the desired behavior for the  
44909 application.

44910 Implementations are encouraged to have *link()* and *linkat()* report an [EILSEQ] error if the file  
44911 named by *path2* did not previously exist, and the last component of that pathname contains any  
44912 bytes that have the encoded value of a <newline> character.

#### 44913 FUTURE DIRECTIONS

44914 None.

#### 44918 CHANGE HISTORY

44919 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 44920 Issue 6

44921 The following new requirements on POSIX implementations derive from alignment with the  
44922 Single UNIX Specification:

- 44923 • The [ELOOP] mandatory error condition is added.

- 44924           • A second [ENAMETOOLONG] is added as an optional error condition.
- 44925           The following changes were made to align with the IEEE P1003.1a draft standard:
- 44926           • An explanation is added of the action when *path2* refers to a symbolic link.
- 44927           • The [ELOOP] optional error condition is added.
- 44928   **Issue 7**
- 44929           Austin Group Interpretation 1003.1-2001 #143 is applied.
- 44930           SD5-XSH-ERN-93 is applied, adding RATIONALE.
- 44931           The *linkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
- 44932
- 44933           Functionality relating to XSI STREAMS is marked obsolescent.
- 44934           Changes are made related to support for finegrained timestamps.
- 44935           The [EOPNOTSUPP] error is removed.
- 44936           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0354 [326], XSH/TC1-2008/0355 [461],
- 44937           XSH/TC1-2008/0356 [326], XSH/TC1-2008/0357 [324], XSH/TC1-2008/0358 [147,429],
- 44938           XSH/TC1-2008/0359 [277], XSH/TC1-2008/0360 [278], and XSH/TC1-2008/0361 [278] are
- 44939           applied.
- 44940           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0195 [873], XSH/TC2-2008/0196 [591],
- 44941           XSH/TC2-2008/0197 [817], XSH/TC2-2008/0198 [822], and XSH/TC2-2008/0199 [817] are
- 44942           applied.
- 44943   **Issue 8**
- 44944           Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of
- 44945           filenames containing any bytes that have the encoded value of a <newline> character.
- 44946           Austin Group Defect 293 is applied, adding the [EILSEQ] error.
- 44947           Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 44948           Austin Group Defect 1380 is applied, changing text using the term “link” in line with its
- 44949           updated definition and removing a paragraph from the RATIONALE section.

44950 **NAME**

44951       lio\_listio — list directed I/O

44952 **SYNOPSIS**

44953       #include &lt;aio.h&gt;

44954       int lio\_listio(int mode, struct aiocb \*restrict const list[restrict],  
44955                   int nent, struct sigevent \*restrict sig);44956 **DESCRIPTION**44957       The *lio\_listio()* function shall initiate a list of I/O requests with a single function call.44958       The *mode* argument takes one of the values LIO\_WAIT or LIO\_NOWAIT declared in <aio.h> and  
44959       determines whether the function returns when the I/O operations have been completed, or as  
44960       soon as the operations have been queued. If the *mode* argument is LIO\_WAIT, the function shall  
44961       wait until all I/O is complete and the *sig* argument shall be ignored.44962       If the *mode* argument is LIO\_NOWAIT, the function shall return immediately, and asynchronous  
44963       notification shall occur, according to the *sig* argument, when all the I/O operations complete. If  
44964       *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous  
44965       notification occurs as specified in [Section 2.4.1](#) (on page 513) when all the requests in *list* have  
44966       completed.44967       The I/O requests enumerated by *list* are submitted in an unspecified order.44968       The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.  
44969       The array may contain NULL elements, which shall be ignored.44970       If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list*  
44971       become illegal addresses before all asynchronous I/O completed and, if necessary, the  
44972       notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio\_buf*  
44973       member of the **aiocb** structure pointed to by the elements of the array *list* become illegal  
44974       addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed,  
44975       the behavior is undefined.44976       The *aio\_lio\_opcode* field of each **aiocb** structure specifies the operation to be performed. The  
44977       supported operations are LIO\_READ, LIO\_WRITE, and LIO\_NOP; these symbols are defined in  
44978       <aio.h>. The LIO\_NOP operation causes the list entry to be ignored. If the *aio\_lio\_opcode*  
44979       element is equal to LIO\_READ, then an I/O operation is submitted as if by a call to *aio\_read()*  
44980       with the *aio\_cbp* equal to the address of the **aiocb** structure. If the *aio\_lio\_opcode* element is equal to  
44981       LIO\_WRITE, then an I/O operation is submitted as if by a call to *aio\_write()* with the *aio\_cbp*  
44982       equal to the address of the **aiocb** structure.44983       The *aio\_fildes* member specifies the file descriptor on which the operation is to be performed.44984       The *aio\_buf* member specifies the address of the buffer to or from which the data is transferred.44985       The *aio\_nbytes* member specifies the number of bytes of data to be transferred.44986       The members of the **aiocb** structure further describe the I/O operation to be performed, in a  
44987       manner identical to that of the corresponding **aiocb** structure when used by the *aio\_read()* and  
44988       *aio\_write()* functions.44989       The *nent* argument specifies how many elements are members of the list; that is, the length of the  
44990       array.44991       The behavior of this function is altered according to the definitions of synchronized I/O data  
44992       integrity completion and synchronized I/O file integrity completion if synchronized I/O is  
44993       enabled on the file associated with *aio\_fildes*.

44994 For regular files, no data transfer shall occur past the offset maximum established in the open  
44995 file description associated with *aiocbp*→*aio\_fildes*.

44996 If *sig*→*sigev\_notify* is SIGEV\_THREAD and *sig*→*sigev\_notify\_attributes* is a non-null pointer and  
44997 the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O  
44998 being completed, then the behavior is undefined.

#### 44999 RETURN VALUE

45000 If the *mode* argument has the value LIO\_NOWAIT, the *lio\_listio()* function shall return the value  
45001 zero if the I/O operations are successfully queued; otherwise, the function shall return the value  
45002 -1 and set *errno* to indicate the error.

45003 If the *mode* argument has the value LIO\_WAIT, the *lio\_listio()* function shall return the value zero  
45004 when all the indicated I/O has completed successfully. Otherwise, *lio\_listio()* shall return a value  
45005 of -1 and set *errno* to indicate the error.

45006 In either case, the return value only indicates the success or failure of the *lio\_listio()* call itself,  
45007 not the status of the individual I/O requests. In some cases one or more of the I/O requests  
45008 contained in the list may fail. Failure of an individual request does not prevent completion of  
45009 any other individual request. To determine the outcome of each I/O request, the application  
45010 shall examine the error status associated with each **aiocb** control block. The error statuses so  
45011 returned are identical to those returned as the result of an *aio\_read()* or *aio\_write()* function.

#### 45012 ERRORS

45013 The *lio\_listio()* function shall fail if:

45014 [EAGAIN] The resources necessary to queue all the I/O requests were not available. The  
45015 application may check the error status for each **aiocb** to determine the  
45016 individual request(s) that failed.

45017 [EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit  
45018 {AIO\_MAX} to be exceeded.

45019 [EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than  
45020 {AIO\_LISTIO\_MAX}.

45021 [EINTR] A signal was delivered while waiting for all I/O requests to complete during  
45022 an LIO\_WAIT operation. Note that, since each I/O operation invoked by  
45023 *lio\_listio()* may possibly provoke a signal when it completes, this error return  
45024 may be caused by the completion of one (or more) of the very I/O operations  
45025 being awaited. Outstanding I/O requests are not canceled, and the application  
45026 shall examine each list element to determine whether the request was  
45027 initiated, canceled, or completed.

45028 [EIO] One or more of the individual I/O operations failed. The application may  
45029 check the error status for each **aiocb** structure to determine the individual  
45030 request(s) that failed.

45031 If the *lio\_listio()* function succeeds or fails with errors of [EAGAIN], [EINTR], or [EIO], then  
45032 some of the I/O specified by the list may have been initiated. If the *lio\_listio()* function fails with  
45033 an error code other than [EAGAIN], [EINTR], or [EIO], no operations from the list shall have  
45034 been initiated. The I/O operation indicated by each list element can encounter errors specific to  
45035 the individual read or write function being performed. In this event, the error status for each  
45036 **aiocb** control block contains the associated error code. The error codes that can be set are the  
45037 same as would be set if the I/O operation had been initiated by an *aio\_read()* or *aio\_write()*  
45038 function, with the following additional error codes possible:

45039 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

45040 [EINPROGRESS] The requested I/O is in progress.

#### 45041 EXAMPLES

45042 None.

#### 45043 APPLICATION USAGE

45044 None.

#### 45045 RATIONALE

45046 Although it may appear that there are inconsistencies in the specified circumstances for error  
 45047 codes, the [EIO] error condition applies when any circumstance relating to an individual  
 45048 operation makes that operation fail. This might be due to a badly formulated request (for  
 45049 example, the *aio\_lio\_opcode* field is invalid, and *aio\_error()* returns [EINVAL]) or might arise from  
 45050 application behavior (for example, the file descriptor is closed before the operation is initiated,  
 45051 and *aio\_error()* returns [EBADF]).

45052 The limitation on the set of error codes returned when operations from the list shall have been  
 45053 initiated enables applications to know when operations have been started and whether  
 45054 *aio\_error()* is valid for a specific operation.

#### 45055 FUTURE DIRECTIONS

45056 None.

#### 45057 SEE ALSO

45058 *aio\_read()*, *aio\_write()*, *aio\_error()*, *aio\_return()*, *aio\_cancel()*, *close()*, *exec*, *exit()*, *fork()*, *lseek()*,  
 45059 *read()*

45060 XBD <[aio.h](#)>

#### 45061 CHANGE HISTORY

45062 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

45063 Large File Summit extensions are added.

#### 45064 Issue 6

45065 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 45066 implementation does not support the Asynchronous Input and Output option.

45067 The *lio\_listio()* function is marked as part of the Asynchronous Input and Output option.

45068 The following new requirements on POSIX implementations derive from alignment with the  
 45069 Single UNIX Specification:

- 45070 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
 45071 past the offset maximum established in the open file description associated with  
 45072 *aiocbp->aio\_fildes*. This change is to support large files.
- 45073 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support  
 45074 large files.

45075 The normative text is updated to avoid use of the term “must” for application requirements.

45076 The **restrict** keyword is added to the *lio\_listio()* prototype for alignment with the  
 45077 ISO/IEC 9899:1999 standard.

45078 **Issue 6**

45079 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for  
45080 symmetry with the *aio\_read()* and *aio\_write()* functions to the DESCRIPTION.

45081 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the  
45082 DESCRIPTION making it explicit that the user is required to keep the structure pointed to by  
45083 *sig->sigev\_notify\_attributes* valid until the last asynchronous operation finished and the  
45084 notification has been sent.

45085 **Issue 7**

45086 The *lio\_listio()* function is moved from the Asynchronous Input and Output option to the Base.

45087 **Issue 8**

45088 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

45089 **NAME**

45090 listen — listen for socket connections and limit the queue of incoming connections

45091 **SYNOPSIS**

```
45092 #include <sys/socket.h>
45093 int listen(int socket, int backlog);
```

45094 **DESCRIPTION**

45095 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as  
 45096 accepting connections.

45097 The *backlog* argument provides a hint to the implementation which the implementation shall use  
 45098 to limit the number of outstanding connections in the socket's listen queue. Implementations  
 45099 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*  
 45100 argument value shall result in a larger or equal length of the listen queue. Implementations shall  
 45101 support values of *backlog* up to SOMAXCONN, defined in **<sys/socket.h>**.

45102 The implementation may include incomplete connections in its listen queue. The limits on the  
 45103 number of incomplete connections and completed connections queued may be different.

45104 The implementation may have an upper limit on the length of the listen queue—either global or  
 45105 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

45106 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it  
 45107 had been called with a *backlog* argument value of 0.

45108 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of  
 45109 the listen queue may be set to an implementation-defined minimum value.

45110 The socket in use may require the process to have appropriate privileges to use the *listen()*  
 45111 function.

45112 **RETURN VALUE**

45113 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set  
 45114 to indicate the error.

45115 **ERRORS**

45116 The *listen()* function shall fail if:

45117 [EBADF] The *socket* argument is not a valid file descriptor.

45118 [EDESTADDRREQ]

45119 The socket is not bound to a local address, and the protocol does not support  
 45120 listening on an unbound socket.

45121 [EINVAL] The *socket* is already connected.

45122 [ENOTSOCK] The *socket* argument does not refer to a socket.

45123 [EOPNOTSUPP] The socket protocol does not support *listen()*.

45124 The *listen()* function may fail if:

45125 [EACCES] The calling process does not have appropriate privileges.

45126 [EINVAL] The *socket* has been shut down.

45127 [ENOBUFS] Insufficient resources are available in the system to complete the call.

45128 **EXAMPLES**

45129       None.

45130 **APPLICATION USAGE**

45131       None.

45132 **RATIONALE**

45133       None.

45134 **FUTURE DIRECTIONS**

45135       None.

45136 **SEE ALSO**

45137       [\*accept\(\)\*](#), [\*connect\(\)\*](#), [\*socket\(\)\*](#)

45138       XBD <[\*sys/socket.h\*](#)>

45139 **CHANGE HISTORY**

45140       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

45141       The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog*  
45142       argument.

45143 **NAME**

45144 llabs — return a long integer absolute value

45145 **SYNOPSIS**

45146 #include <stdlib.h>

45147 long long llabs(long long i);

45148 **DESCRIPTION**

45149 Refer to *labs()*.

45150 **NAME**

45151        `lldiv` — compute quotient and remainder of a long division

45152 **SYNOPSIS**

45153        `#include <stdlib.h>`

45154        `lldiv_t lldiv(long long numer, long long denom);`

45155 **DESCRIPTION**

45156        Refer to *ldiv()*.

45157 **NAME**

45158 llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

45159 **SYNOPSIS**

```
45160 #include <math.h>
45161 long long llrint(double x);
45162 long long llrintf(float x);
45163 long long llrintl(long double x);
```

45164 **DESCRIPTION**

45165 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45166 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45167 volume of POSIX.1-2024 defers to the ISO C standard.

45168 These functions shall round their argument to the nearest integer value, rounding according to  
 45169 the current rounding direction.

45170 An application wishing to check for error situations should set *errno* to zero and call  
 45171 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45172 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45173 zero, an error has occurred.

45174 **RETURN VALUE**

45175 Upon successful completion, these functions shall return the rounded integer value.

45176 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.45177 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.45178 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

45179 If the correct value is positive and too large to represent as a **long long**, an unspecified value  
 45180 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 45181 CX shall occur; otherwise, a domain error may occur.

45182 If the correct value is negative and too large to represent as a **long long**, an unspecified value  
 45183 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 45184 CX shall occur; otherwise, a domain error may occur.

45185 **ERRORS**

45186 These functions shall fail if:

45187 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 45188 integer.

45189 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45190 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45191 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45192 shall be raised.

45193 These functions may fail if:

45194 **Domain Error** The correct value is not representable as an integer.

45195 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45196 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45197 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45198 shall be raised.

45199 **EXAMPLES**

45200 None.

45201 **APPLICATION USAGE**

45202 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
45203 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45204 **RATIONALE**

45205 These functions provide floating-to-integer conversions. They round according to the current  
45206 rounding direction. If the rounded value is outside the range of the return type, the numeric  
45207 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
45208 floating-point exception and the result differs from the argument, they raise the inexact floating-  
45209 point exception.

45210 **FUTURE DIRECTIONS**

45211 None.

45212 **SEE ALSO**45213 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [lrint\(\)](#)45214 XBD Section 4.23 (on page 109), [<math.h>](#)45215 **CHANGE HISTORY**

45216 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

45217 **Issue 7**

45218 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 is applied.

45219 **NAME**

45220 llround, llroundf, llroundl — round to nearest integer value

45221 **SYNOPSIS**

```
45222 #include <math.h>
45223 long long llround(double x);
45224 long long llroundf(float x);
45225 long long llroundl(long double x);
```

45226 **DESCRIPTION**

45227 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45228 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45229 volume of POSIX.1-2024 defers to the ISO C standard.

45230 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 45231 away from zero, regardless of the current rounding direction.

45232 An application wishing to check for error situations should set *errno* to zero and call  
 45233 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45234 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45235 zero, an error has occurred.

45236 **RETURN VALUE**

45237 Upon successful completion, these functions shall return the rounded integer value.

45238 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.45239 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.45240 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

45241 If the correct value is positive and too large to represent as a **long long**, an unspecified value  
 45242 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 45243 CX shall occur; otherwise, a domain error may occur.

45244 If the correct value is negative and too large to represent as a **long long**, an unspecified value  
 45245 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 45246 CX shall occur; otherwise, a domain error may occur.

45247 **ERRORS**

45248 These functions shall fail if:

45249 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 45250 integer.

45251 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45252 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45253 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45254 shall be raised.

45255 These functions may fail if:

45256 **Domain Error** The correct value is not representable as an integer.

45257 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45258 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45259 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45260 shall be raised.

45261 **EXAMPLES**

45262           None.

45263 **APPLICATION USAGE**

45264           On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
45265           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45266 **RATIONALE**

45267           These functions differ from the *llrint()* functions in that the default rounding direction for the  
45268           *llround()* functions round halfway cases away from zero and need not raise the inexact floating-  
45269           point exception for non-integer arguments that round to within the range of the return type.

45270 **FUTURE DIRECTIONS**

45271           None.

45272 **SEE ALSO**

45273           *feclearexcept()*, *fetestexcept()*, *lround()*

45274           XBD Section 4.23 (on page 109), <[math.h](#)>

45275 **CHANGE HISTORY**

45276           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

45277 **Issue 7**

45278           ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-75) is applied.

45279 **NAME**

45280 localeconv — return locale-specific information

45281 **SYNOPSIS**

45282 #include &lt;locale.h&gt;

45283 struct lconv \*localeconv(void);

45284 **DESCRIPTION**

45285 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
45286 conflict between the requirements described here and the ISO C standard is unintentional. This  
45287 volume of POSIX.1-2024 defers to the ISO C standard.

45288 The *localeconv()* function shall set the components of an object with the type **struct lconv** with  
45289 the values appropriate for the formatting of numeric quantities (monetary and otherwise)  
45290 according to the rules of the current locale.

45291 The members of the structure with type **char \*** are pointers to strings, any of which (except  
45292 **decimal\_point**) can point to " ", to indicate that the value is not available in the current locale or  
45293 is of zero length. The members with type **char** are non-negative numbers, any of which can be  
45294 {CHAR\_MAX} to indicate that the value is not available in the current locale.

45295 The members include the following:

45296 **char \*decimal\_point**

45297 The radix character used to format non-monetary quantities.

45298 **char \*thousands\_sep**

45299 The character used to separate groups of digits before the decimal-point character in  
45300 formatted non-monetary quantities.

45301 **char \*grouping**

45302 A string whose elements taken as one-byte integer values indicate the size of each group of  
45303 digits in formatted non-monetary quantities.

45304 **char \*int\_curr\_symbol**

45305 The international currency symbol applicable to the current locale. The first three characters  
45306 contain the alphabetic international currency symbol in accordance with those specified in  
45307 the ISO 4217:2015 standard. The fourth character (immediately preceding the null byte) is  
45308 the character used to separate the international currency symbol from the monetary  
45309 quantity.

45310 **char \*currency\_symbol**

45311 The local currency symbol applicable to the current locale.

45312 **char \*mon\_decimal\_point**

45313 The radix character used to format monetary quantities.

45314 **char \*mon\_thousands\_sep**

45315 The separator for groups of digits before the decimal-point in formatted monetary  
45316 quantities.

45317 **char \*mon\_grouping**

45318 A string whose elements taken as one-byte integer values indicate the size of each group of  
45319 digits in formatted monetary quantities.

45320 **char \*positive\_sign**

45321 The string used to indicate a non-negative valued formatted monetary quantity.

- 45322        **char \*negative\_sign**  
45323            The string used to indicate a negative valued formatted monetary quantity.
- 45324        **char int\_frac\_digits**  
45325            The number of fractional digits (those after the decimal-point) to be displayed in an  
45326            internationally formatted monetary quantity.
- 45327        **char frac\_digits**  
45328            The number of fractional digits (those after the decimal-point) to be displayed in a  
45329            formatted monetary quantity.
- 45330        **char p\_cs\_precedes**  
45331            Set to 1 if the **currency\_symbol** precedes the value for a non-negative formatted monetary  
45332            quantity. Set to 0 if the symbol succeeds the value.
- 45333        **char p\_sep\_by\_space**  
45334            Set to a value indicating the separation of the **currency\_symbol**, the sign string, and the  
45335            value for a non-negative formatted monetary quantity.
- 45336        **char n\_cs\_precedes**  
45337            Set to 1 if the **currency\_symbol** precedes the value for a negative formatted monetary  
45338            quantity. Set to 0 if the symbol succeeds the value.
- 45339        **char n\_sep\_by\_space**  
45340            Set to a value indicating the separation of the **currency\_symbol**, the sign string, and the  
45341            value for a negative formatted monetary quantity.
- 45342        **char p\_sign\_posn**  
45343            Set to a value indicating the positioning of the **positive\_sign** for a non-negative formatted  
45344            monetary quantity.
- 45345        **char n\_sign\_posn**  
45346            Set to a value indicating the positioning of the **negative\_sign** for a negative formatted  
45347            monetary quantity.
- 45348        **char int\_p\_cs\_precedes**  
45349            Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a non-  
45350            negative internationally formatted monetary quantity.
- 45351        **char int\_n\_cs\_precedes**  
45352            Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a  
45353            negative internationally formatted monetary quantity.
- 45354        **char int\_p\_sep\_by\_space**  
45355            Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
45356            value for a non-negative internationally formatted monetary quantity.
- 45357        **char int\_n\_sep\_by\_space**  
45358            Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
45359            value for a negative internationally formatted monetary quantity.
- 45360        **char int\_p\_sign\_posn**  
45361            Set to a value indicating the positioning of the **positive\_sign** for a non-negative  
45362            internationally formatted monetary quantity.
- 45363        **char int\_n\_sign\_posn**  
45364            Set to a value indicating the positioning of the **negative\_sign** for a negative internationally  
45365            formatted monetary quantity.

- 45366 The elements of **grouping** and **mon\_grouping** are interpreted according to the following:
- 45367 {CHAR\_MAX} No further grouping is to be performed.
- 45368 0 The previous element is to be repeatedly used for the remainder of the digits.
- 45369 *other* The integer value is the number of digits that comprise the current group. The  
45370 next element is examined to determine the size of the next group of digits  
45371 before the current group.
- 45372 The values of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space**  
45373 are interpreted according to the following:
- 45374 0 No space separates the currency symbol and value.
- 45375 1 If the currency symbol and sign string are adjacent, a space separates them from the value;  
45376 otherwise, a space separates the currency symbol from the value.
- 45377 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a  
45378 space separates the sign string from the value.
- 45379 For **int\_p\_sep\_by\_space** and **int\_n\_sep\_by\_space**, the fourth character of **int\_curr\_symbol** is  
45380 used instead of a space.
- 45381 The values of **p\_sign\_posn**, **n\_sign\_posn**, **int\_p\_sign\_posn**, and **int\_n\_sign\_posn** are  
45382 interpreted according to the following:
- 45383 0 Parentheses surround the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 45384 1 The sign string precedes the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 45385 2 The sign string succeeds the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 45386 3 The sign string immediately precedes the **currency\_symbol** or **int\_curr\_symbol**.
- 45387 4 The sign string immediately succeeds the **currency\_symbol** or **int\_curr\_symbol**.
- 45388 The implementation shall behave as if no function in this volume of POSIX.1-2024 calls  
45389 *localeconv()*.
- 45390 The *localeconv()* function need not be thread-safe; however, *localeconv()* shall avoid data races  
45391 with all other functions.

#### 45392 RETURN VALUE

- 45393 The *localeconv()* function shall return a pointer to the filled-in object. The application shall not  
45394 CX modify the structure to which the return value points, nor any storage areas pointed to by  
45395 pointers within the structure. The returned pointer, and pointers within the structure, might be  
45396 CX invalidated or the structure or the storage areas might be overwritten by a subsequent call to  
45397 CX *localeconv()*. In addition, the returned pointer, and pointers within the structure, might be  
45398 CX invalidated or the structure or the storage areas might be overwritten by subsequent calls to  
45399 CX *setlocale()* with the categories LC\_ALL, LC\_MONETARY, or LC\_NUMERIC, or by calls to  
45400 *uselocale()* which change the categories LC\_MONETARY or LC\_NUMERIC. The returned  
45401 pointer, pointers within the structure, the structure, and the storage areas might also be  
45402 invalidated if the calling thread is terminated.

#### 45403 ERRORS

- 45404 No errors are defined.

45405 **EXAMPLES**

45406 None.

45407 **APPLICATION USAGE**

45408 The following table illustrates the rules which may be used by four countries to format  
 45409 monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	€1.230	-€1.230	EUR.1.230
Netherlands	€ 1.234,56	€ -1.234,56	EUR 1.234,56
Norway	kr1.234,56	kr1.234,56-	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

45415 For these four countries, the respective values for the monetary members of the structure  
 45416 returned by *localeconv()* are:

	Italy	Netherlands	Norway	Switzerland
int_curr_symbol	"EUR. "	"EUR "	"NOK "	"CHF "
currency_symbol	"€. "	"€"	"kr"	"SFrs. "
mon_decimal_point	" "	","	","	."
mon_thousands_sep	"."	"."	"."	","
mon_grouping	"\3"	"\3"	"\3"	"\3"
positive_sign	""	""	""	""
negative_sign	"-"	"-"	"-"	"C"
int_frac_digits	0	2	2	2
frac_digits	0	2	2	2
p_cs_precedes	1	1	1	1
p_sep_by_space	0	1	0	0
n_cs_precedes	1	1	1	1
n_sep_by_space	0	1	0	0
p_sign_posn	1	1	1	1
n_sign_posn	1	4	2	2
int_p_cs_precedes	1	1	1	1
int_n_cs_precedes	1	1	1	1
int_p_sep_by_space	0	0	0	0
int_n_sep_by_space	0	0	0	0
int_p_sign_posn	1	1	1	1
int_n_sign_posn	1	4	4	2

45439 **RATIONALE**

45440 None.

45441 **FUTURE DIRECTIONS**

45442 None.

45447 **CHANGE HISTORY**

45448 First released in Issue 4. Derived from the ANSI C standard.

45449 **Issue 6**

45450 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

45451 The RETURN VALUE section is rewritten to avoid use of the term “must”.

45452 This reference page is updated for alignment with the ISO/IEC 9899:1999 standard.

45453 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

45454 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to **int\_curr\_symbol** and updating the descriptions of **p\_sep\_by\_space** and **n\_sep\_by\_space**. These  
45455 changes are for alignment with the ISO C standard.  
45456

45457 **Issue 7**

45458 Austin Group Interpretation 1003.1-2001 #156 is applied.

45459 The definitions of **int\_curr\_symbol** and **currency\_symbol** are updated.

45460 The examples in the APPLICATION USAGE section are updated.

45461 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0362 [75] is applied.

45462 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0200 [656] is applied.

45463 **Issue 8**

45464 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
45465 standard.

45466 **NAME**

45467 localtime, localtime\_r — convert a time value to a broken-down local time

45468 **SYNOPSIS**

```
45469 #include <time.h>
45470 struct tm *localtime(const time_t *timer);
45471 CX struct tm *localtime_r(const time_t *restrict timer,
45472 struct tm *restrict result);
```

45473 **DESCRIPTION**

45474 CX For *localtime()*: The functionality described on this reference page is aligned with the ISO C  
 45475 standard. Any conflict between the requirements described here and the ISO C standard is  
 45476 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

45477 The *localtime()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 45478 into a broken-down time, expressed as a local time. The function corrects for the timezone and  
 45479 CX any seasonal time adjustments. Local timezone information shall be set as though *localtime()*  
 45480 calls *tzset()*.

45481 The relationship between a time in seconds since the Epoch used as an argument to *localtime()*  
 45482 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in  
 45483 the expression given in the definition of seconds since the Epoch (see XBD [Section 4.19](#), on page  
 45484 107) corrected for timezone and any seasonal time adjustments, where the names in the structure  
 45485 and in the expression correspond.

45486 The same relationship shall apply for *localtime\_r()*.

45487 The *localtime()* function need not be thread-safe; however, *localtime()* shall avoid data races with  
 45488 all functions other than itself, *asctime()*, *ctime()*, and *gmtime()*.

45489 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 45490 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 45491 functions that return a pointer to one of these object types may overwrite the information in any  
 45492 object of the same type pointed to by the value returned from any previous call to any of them.

45493 CX The *localtime\_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 45494 into a broken-down time stored in the structure to which *result* points. The *localtime\_r()* function  
 45495 shall also return a pointer to that same structure.

45496 Unlike *localtime()*, the *localtime\_r()* function is not required to set *tzname*. If *localtime\_r()* sets  
 45497 *tzname*, it shall also set *daylight* and *timezone*. If *localtime\_r()* does not set *tzname*, it shall not set  
 45498 *daylight* and shall not set *timezone*. If the **tm** structure member *tm\_zone* is accessed after the value  
 45499 of *TZ* is subsequently modified, the behaviour is undefined.

45500 **RETURN VALUE**

45501 Upon successful completion, the *localtime()* function shall return a pointer to the broken-down  
 45502 CX time structure. If an error is detected, *localtime()* shall return a null pointer and set *errno* to  
 45503 indicate the error.

45504 Upon successful completion, *localtime\_r()* shall return a pointer to the structure pointed to by the  
 45505 argument *result*. If an error is detected, *localtime\_r()* shall return a null pointer and set *errno* to  
 45506 indicate the error.

45507 **ERRORS**45508 CX The `localtime()` and `localtime_r()` functions shall fail if:45509 CX **[EOVERFLOW]** The result cannot be represented.45510 **EXAMPLES**45511 **Getting the Local Date and Time**

45512 The following example uses the `time()` function to calculate the time elapsed, in seconds, since  
 45513 January 1, 1970 0:00 UTC (the Epoch), `localtime()` to convert that value to a broken-down time,  
 45514 and `asctime()` to convert the broken-down time values into a printable string.

```
45515 #include <stdio.h>
45516 #include <time.h>
45517 int main(void)
45518 {
45519     time_t result;
45520
45521     result = time(NULL);
45522     printf("%s%ju secs since the Epoch\n",
45523           asctime(localtime(&result)),
45524           (uintmax_t)result);
45525     return(0);
45526 }
```

45526 This example writes the current time to `stdout` in a form like this:

```
45527 Wed Jun 26 10:32:15 1996
45528 835810335 secs since the Epoch
```

45529 **Getting the Modification Time for a File**

45530 The following example prints the last data modification timestamp in the local timezone for a  
 45531 given file.

```
45532 #include <stdio.h>
45533 #include <time.h>
45534 #include <sys/stat.h>
45535 int
45536 print_file_time(const char *pathname)
45537 {
45538     struct stat statbuf;
45539     struct tm *tm;
45540     char timestr[BUFSIZ];
45541
45542     if(stat(pathname, &statbuf) == -1)
45543         return -1;
45544     if((tm = localtime(&statbuf.st_mtime)) == NULL)
45545         return -1;
45546     if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
45547         return -1;
45548     printf("%s: %s.%09ld\n", pathname, timestr, statbuf.st_mtim.tv_nsec);
45549     return 0;
45550 }
```

45550 **Timing an Event**

45551 The following example gets the current time, converts it to a string using *localtime()* and  
 45552 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 45553 an event being timed.

```
45554 #include <time.h>
45555 #include <stdio.h>
45556 ...
45557 time_t now;
45558 int minutes_to_event;
45559 ...
45560 time(&now);
45561 printf("The time is ");
45562 fputs(asctime(localtime(&now)), stdout);
45563 printf("There are still %d minutes to the event.\n",
45564       minutes_to_event);
45565 ...
```

45566 **APPLICATION USAGE**

45567 The *localtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 45568 possibly using a static data area that may be overwritten by each call.

45569 **RATIONALE**

45570 None.

45571 **FUTURE DIRECTIONS**

45572 None.

45573 **SEE ALSO**

45574 [asctime\(\)](#), [clock\(\)](#), [ctime\(\)](#), [difftime\(\)](#), [futimens\(\)](#), [getdate\(\)](#), [gmtime\(\)](#), [mktime\(\)](#), [strptime\(\)](#),  
 45575 [strptime\(\)](#), [time\(\)](#), [tzset\(\)](#)

45577 **CHANGE HISTORY**

45578 First released in Issue 1. Derived from Issue 1 of the SVID.

45579 **Issue 5**

45580 A note indicating that the *localtime()* function need not be reentrant is added to the  
 45581 DESCRIPTION.

45582 The *localtime\_r()* function is included for alignment with the POSIX Threads Extension.

45583 **Issue 6**

45584 The *localtime\_r()* function is marked as part of the Thread-Safe Functions option.

45585 Extensions beyond the ISO C standard are marked.

45586 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 45587 its avoidance of possibly using a static data area.

45588 The **restrict** keyword is added to the *localtime\_r()* prototype for alignment with the  
 45589 ISO/IEC 9899:1999 standard.

45590 Examples are added.

45591 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the  
 45592 [EOverflow] error.

- 45593 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling  
45594 for *localtime\_r()*.
- 45595 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if  
45596 *localtime\_r()* does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On  
45597 systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide  
45598 information for the same timezone. This updates the description of *localtime\_r()* to mention  
45599 *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.
- 45600 **Issue 7**
- 45601 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 45602 The *localtime\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 45603 Changes are made to the EXAMPLES section related to support for finegrained timestamps.
- 45604 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0363 [291] is applied.
- 45605 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0201 [664] is applied.
- 45606 **Issue 8**
- 45607 Austin Group Defect 1125 is applied, changing “Local timezone information is used” to “Local  
45608 timezone information shall be set”.
- 45609 Austin Group Defect 1302 is applied, aligning the *localtime()* function with the  
45610 ISO/IEC 9899:2018 standard.
- 45611 Austin Group Defect 1376 is applied, removing CX shading from some text derived from the  
45612 ISO C standard and updating it to match the ISO C standard.
- 45613 Austin Group Defect 1533 is applied, adding *tm\_gmtoff* and *tm\_zone* to the **tm** structure.
- 45614 Austin Group Defect 1570 is applied, removing extra spacing in "==".

45615 **NAME**

45616 lockf — record locking on files

45617 **SYNOPSIS**

```
45618 XSI #include <unistd.h>
45619 int lockf(int fildev, int function, off_t size);
```

45620 **DESCRIPTION**

45621 The *lockf()* function shall lock sections of a file with advisory-mode process-owned file locks.  
 45622 Calls to *lockf()* from threads in other processes which attempt to lock the locked file section shall  
 45623 either return an error value or block until the section becomes unlocked. All the locks for a  
 45624 process are removed when the process terminates. Record locking with *lockf()* shall be  
 45625 supported for regular files and may be supported for other files.

45626 The *fildev* argument is an open file descriptor. To establish a lock with this function, the file  
 45627 descriptor shall be opened with write-only permission (O\_WRONLY) or with read/write  
 45628 permission (O\_RDWR).

45629 The *function* argument is a control value which specifies the action to be taken. The permissible  
 45630 values for *function* are defined in <unistd.h> as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

45636 F\_TEST shall detect if a lock by another process is present on the specified section.

45637 F\_LOCK and F\_TLOCK shall both lock a section of a file if the section is available.

45638 F\_ULOCK shall remove locks from a section of the file.

45639 The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be  
 45640 locked or unlocked starts at the current offset in the file and extends forward for a positive size  
 45641 or backward for a negative size (the preceding bytes up to but not including the current offset).  
 45642 If *size* is 0, the section from the current offset through the largest possible file offset shall be  
 45643 locked (that is, from the current offset through the present or any future end-of-file). An area  
 45644 need not be allocated to the file to be locked because locks may exist past the end-of-file.

45645 The sections locked with F\_LOCK or F\_TLOCK may, in whole or in part, contain or be contained  
 45646 by a previously locked section for the same process. When this occurs, or if adjacent locked  
 45647 sections would occur, the sections shall be combined into a single locked section. If the request  
 45648 would cause the number of locks to exceed a system-imposed limit, the request shall fail.

45649 F\_LOCK and F\_TLOCK requests differ only by the action taken if the section is not available.  
 45650 F\_LOCK shall block the calling thread until the section is available. F\_TLOCK shall cause the  
 45651 function to fail if the section is already locked by another process.

45652 Process-owned file locks shall be released on first close by the locking process of any file  
 45653 descriptor for the file.

45654 F\_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the  
 45655 process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or  
 45656 to the end-of-file if *size* is (off\_t)0. When all of a locked section is not released (that is, when the  
 45657 beginning or end of the area to be unlocked falls within a locked section), the remaining portions  
 45658 of that section shall remain locked by the process. Releasing the center portion of a locked

45659 section shall cause the remaining locked beginning and end portions to become two separate  
 45660 locked sections. If the request would cause the number of locks in the system to exceed a system-  
 45661 imposed limit, the request shall fail.

45662 A potential for deadlock occurs if the threads of a process controlling a locked section are  
 45663 blocked by accessing a locked section of another process. If the system detects that deadlock  
 45664 would occur, *lockf()* shall fail with an [EDEADLK] error.

45665 The interaction between *fcntl()* and *lockf()* locks is unspecified.

45666 Blocking on a section shall be interrupted by any signal.

45667 An F\_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested  
 45668 section is the maximum value for an object of type **off\_t**, when the process has an existing lock  
 45669 in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a  
 45670 request to unlock from the start of the requested section with a size equal to 0. Otherwise, an  
 45671 F\_ULOCK request shall attempt to unlock only the requested section.

45672 Attempting to lock a section of a file that is associated with a buffered stream produces  
 45673 unspecified results.

#### 45674 RETURN VALUE

45675 Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return  $-1$ , set *errno* to  
 45676 indicate an error, and existing locks shall not be changed.

#### 45677 ERRORS

45678 The *lockf()* function shall fail if:

45679 [EBADF] The *fildev* argument is not a valid open file descriptor; or *function* is F\_LOCK  
 45680 or F\_TLOCK and *fildev* is not a valid file descriptor open for writing.

45681 [EACCES] or [EAGAIN]  
 45682 The *function* argument is F\_TLOCK or F\_TEST and the section is already  
 45683 locked by another process.

45684 [EDEADLK] The *function* argument is F\_LOCK and a deadlock is detected.

45685 [EINTR] A signal was caught during execution of the function.

45686 [EINVAL] The *function* argument is not one of F\_LOCK, F\_TLOCK, F\_TEST, or  
 45687 F\_ULOCK; or *size* plus the current file offset is less than 0.

45688 [EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested  
 45689 section cannot be represented correctly in an object of type **off\_t**.

45690 The *lockf()* function may fail if:

45691 [EAGAIN] The *function* argument is F\_LOCK or F\_TLOCK and the file is mapped with  
 45692 *mmap()*.

45693 [EDEADLK] or [ENOLCK]  
 45694 The *function* argument is F\_LOCK, F\_TLOCK, or F\_ULOCK, and the request  
 45695 would cause the number of locks to exceed a system-imposed limit.

45696 [EOPNOTSUPP] or [EINVAL]  
 45697 The implementation does not support the locking of files of the type indicated  
 45698 by the *fildev* argument.

45699 **EXAMPLES**45700 **Locking a Portion of a File**

45701 In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that  
45702 use locking are prevented from changing it during this process. Only the first 10 000 bytes are  
45703 locked, and the lock call fails if another process has any part of this area locked already.

```
45704 #include <fcntl.h>  
45705 #include <unistd.h>  
  
45706 int fildes;  
45707 int status;  
45708 ...  
45709 fildes = open("/home/cnd/mod1", O_RDWR);  
45710 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

45711 **APPLICATION USAGE**

45712 Record-locking should not be used in combination with buffered standard I/O streams (see  
45713 [Section 2.5](#), on page 521). Instead, non-buffered I/O should be used. Unexpected results may  
45714 occur in processes that do buffering in the user address space. The process may later read/write  
45715 data which is/was locked. Functions that operate on standard I/O streams are the most  
45716 common source of such buffering.

45717 The `alarm()` function may be used to provide a timeout facility in applications requiring it.

45718 **RATIONALE**

45719 None.

45720 **FUTURE DIRECTIONS**

45721 None.

45722 **SEE ALSO**

45725 **CHANGE HISTORY**

45726 First released in Issue 4, Version 2.

45727 **Issue 5**

45728 Moved from X/OPEN UNIX extension to BASE.

45729 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified  
45730 and moved from optional to mandatory status.

45731 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a  
45732 file that is associated with a buffered stream.

45733 **Issue 6**

45734 The normative text is updated to avoid use of the term “must” for application requirements.

45735 **Issue 7**

45736 Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

45737 **Issue 8**

45738 Austin Group Defect 768 is applied, adding OFD-owned file locks.

45739 Austin Group Defect 1672 is applied, changing the APPLICATION USAGE section.

45740 **NAME**

45741 log, logf, logl — natural logarithm function

45742 **SYNOPSIS**

```
45743 #include <math.h>
45744 double log(double x);
45745 float logf(float x);
45746 long double logl(long double x);
```

45747 **DESCRIPTION**

45748 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45749 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45750 volume of POSIX.1-2024 defers to the ISO C standard.

45751 These functions shall compute the natural logarithm of their argument  $x$ ,  $\log_e(x)$ .

45752 An application wishing to check for error situations should set *errno* to zero and call  
 45753 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45754 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45755 zero, an error has occurred.

45756 **RETURN VALUE**

45757 Upon successful completion, these functions shall return the natural logarithm of  $x$ .

45758 If  $x$  is  $\pm 0$ , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return `-HUGE_VAL`,  
 45759 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

45760 MX For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 45761 NaN (if supported), or an implementation-defined value shall be returned.

45762 MX If  $x$  is NaN, a NaN shall be returned.

45763 If  $x$  is 1, `+0` shall be returned.

45764 If  $x$  is `+Inf`,  $x$  shall be returned.

45765 **ERRORS**

45766 These functions shall fail if:

45767 MX Domain Error The finite value of  $x$  is negative, or  $x$  is `-Inf`.

45768 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45769 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45770 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45771 shall be raised.

45772 Pole Error The value of  $x$  is zero.

45773 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45774 then *errno* shall be set to [ERANGE]. If the integer expression  
 45775 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 45776 floating-point exception shall be raised.

45777 **EXAMPLES**

45778 None.

45779 **APPLICATION USAGE**

45780 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
45781 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45782 **RATIONALE**

45783 None.

45784 **FUTURE DIRECTIONS**

45785 None.

45786 **SEE ALSO**45787 [exp\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#), [log10\(\)](#), [log1p\(\)](#)45788 XBD Section 4.23 (on page 109), [<math.h>](#)45789 **CHANGE HISTORY**

45790 First released in Issue 1. Derived from Issue 1 of the SVID.

45791 **Issue 5**

45792 The DESCRIPTION is updated to indicate how an application should check for an error. This  
45793 text was previously published in the APPLICATION USAGE section.

45794 **Issue 6**

45795 The normative text is updated to avoid use of the term “must” for application requirements.

45796 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

45797 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
45798 revised to align with the ISO/IEC 9899:1999 standard.

45799 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
45800 marked.

45801 **NAME**45802 `log10`, `log10f`, `log10l` — base 10 logarithm function45803 **SYNOPSIS**

```
45804 #include <math.h>
45805 double log10(double x);
45806 float log10f(float x);
45807 long double log10l(long double x);
```

45808 **DESCRIPTION**

45809 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45810 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45811 volume of POSIX.1-2024 defers to the ISO C standard.

45812 These functions shall compute the base 10 logarithm of their argument  $x$ ,  $\log_{10}(x)$ .

45813 An application wishing to check for error situations should set *errno* to zero and call  
 45814 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45815 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45816 zero, an error has occurred.

45817 **RETURN VALUE**

45818 Upon successful completion, these functions shall return the base 10 logarithm of  $x$ .

45819 If  $x$  is  $\pm 0$ , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return `-HUGE_VAL`,  
 45820 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

45821 MX For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 45822 NaN (if supported), or an implementation-defined value shall be returned.

45823 MX If  $x$  is NaN, a NaN shall be returned.

45824 If  $x$  is 1, `+0` shall be returned.

45825 If  $x$  is `+Inf`, `+Inf` shall be returned.

45826 **ERRORS**

45827 These functions shall fail if:

45828 MX Domain Error The finite value of  $x$  is negative, or  $x$  is `-Inf`.

45829 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45830 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45831 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45832 shall be raised.

45833 Pole Error The value of  $x$  is zero.

45834 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45835 then *errno* shall be set to [ERANGE]. If the integer expression  
 45836 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 45837 floating-point exception shall be raised.

45838 **EXAMPLES**

45839 None.

45840 **APPLICATION USAGE**

45841 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
45842 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45843 **RATIONALE**

45851 First released in Issue 1. Derived from Issue 1 of the SVID.

45852 **Issue 5**

45853 The DESCRIPTION is updated to indicate how an application should check for an error. This  
45854 text was previously published in the APPLICATION USAGE section.

45855 **Issue 6**

45856 The normative text is updated to avoid use of the term “must” for application requirements.

45857 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999  
45858 standard.

45859 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
45860 revised to align with the ISO/IEC 9899:1999 standard.

45861 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
45862 marked.

45863 **NAME**45864 `log1p`, `log1pf`, `log1pl` — compute a natural logarithm45865 **SYNOPSIS**

```
45866 #include <math.h>
45867 double log1p(double x);
45868 float log1pf(float x);
45869 long double log1pl(long double x);
```

45870 **DESCRIPTION**

45871 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45872 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45873 volume of POSIX.1-2024 defers to the ISO C standard.

45874 These functions shall compute  $\log_e(1.0 + x)$ .

45875 An application wishing to check for error situations should set *errno* to zero and call  
 45876 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45877 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45878 zero, an error has occurred.

45879 **RETURN VALUE**

45880 Upon successful completion, these functions shall return the natural logarithm of  $1.0 + x$ .

45881 If  $x$  is  $-1$ , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return `-HUGE_VAL`,  
 45882 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

45883 MX For finite values of  $x$  that are less than  $-1$ , or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 45884 NaN (if supported), or an implementation-defined value shall be returned.

45885 MX If  $x$  is NaN, a NaN shall be returned.

45886 If  $x$  is  $\pm 0$ , or  $+\text{Inf}$ ,  $x$  shall be returned.

45887 MXX If  $x$  is subnormal,  $x$  should be returned.

45888 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *log1p()*, *log1pf()*, and *log1pl()*  
 45889 shall return an implementation-defined value no greater in magnitude than `DBL_MIN`,  
 45890 `FLT_MIN`, and `LDBL_MIN`, respectively.

45891 **ERRORS**

45892 These functions shall fail if:

45893 MX Domain Error The finite value of  $x$  is less than  $-1$ , or  $x$  is  $-\text{Inf}$ .

45894 If the integer expression (*math\_errhandling* & `MATH_ERRNO`) is non-zero,  
 45895 then *errno* shall be set to `[EDOM]`. If the integer expression (*math\_errhandling*  
 45896 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception  
 45897 shall be raised.

45898 Pole Error The value of  $x$  is  $-1$ .

45899 If the integer expression (*math\_errhandling* & `MATH_ERRNO`) is non-zero,  
 45900 then *errno* shall be set to `[ERANGE]`. If the integer expression  
 45901 (*math\_errhandling* & `MATH_ERREXCEPT`) is non-zero, then the divide-by-zero  
 45902 floating-point exception shall be raised.

45903 These functions may fail if:

45904 MX **Range Error** The value of  $x$  is subnormal.

45905 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45906 then *errno* shall be set to [ERANGE]. If the integer expression  
 45907 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 45908 floating-point exception shall be raised.

#### 45909 **EXAMPLES**

45910 None.

#### 45911 **APPLICATION USAGE**

45912 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 45913 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 45914 **RATIONALE**

45915 None.

#### 45916 **FUTURE DIRECTIONS**

45917 None.

#### 45921 **CHANGE HISTORY**

45922 First released in Issue 4, Version 2.

#### 45923 **Issue 5**

45924 Moved from X/OPEN UNIX extension to BASE.

#### 45925 **Issue 6**

45926 The normative text is updated to avoid use of the term “must” for application requirements.

45927 The *log1p()* function is no longer marked as an extension.

45928 The *log1pf()* and *log1pl()* functions are added for alignment with the ISO/IEC 9899:1999  
 45929 standard.

45930 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 45931 revised to align with the ISO/IEC 9899:1999 standard.

45932 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 45933 marked.

#### 45934 **Issue 7**

45935 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0364 [68] is applied.

#### 45936 **Issue 8**

45937 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when  $x$  is  
 45938 subnormal to avoid the need for two shading changes.

45939 **NAME**45940 `log2, log2f, log2l` — compute base 2 logarithm functions45941 **SYNOPSIS**

```
45942 #include <math.h>
45943 double log2(double x);
45944 float log2f(float x);
45945 long double log2l(long double x);
```

45946 **DESCRIPTION**

45947 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45948 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45949 volume of POSIX.1-2024 defers to the ISO C standard.

45950 These functions shall compute the base 2 logarithm of their argument  $x$ ,  $\log_2(x)$ .

45951 An application wishing to check for error situations should set *errno* to zero and call  
 45952 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 45953 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 45954 zero, an error has occurred.

45955 **RETURN VALUE**

45956 Upon successful completion, these functions shall return the base 2 logarithm of  $x$ .

45957 If  $x$  is  $\pm 0$ , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return `-HUGE_VAL`,  
 45958 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

45959 MX For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 45960 NaN (if supported), or an implementation-defined value shall be returned.

45961 MX If  $x$  is NaN, a NaN shall be returned.

45962 If  $x$  is 1, `+0` shall be returned.

45963 If  $x$  is `+Inf`,  $x$  shall be returned.

45964 **ERRORS**

45965 These functions shall fail if:

45966 MX Domain Error The finite value of  $x$  is less than zero, or  $x$  is `-Inf`.

45967 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45968 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 45969 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 45970 shall be raised.

45971 Pole Error The value of  $x$  is zero.

45972 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 45973 then *errno* shall be set to [ERANGE]. If the integer expression  
 45974 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 45975 floating-point exception shall be raised.

45976 **EXAMPLES**

45977       None.

45978 **APPLICATION USAGE**

45979       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
45980       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

45981 **RATIONALE**

45982       None.

45983 **FUTURE DIRECTIONS**

45984       None.

45985 **SEE ALSO**

45986       *feclearexcept()*, *fetestexcept()*, *log()*

45987       XBD Section 4.23 (on page 109), <[math.h](#)>

45988 **CHANGE HISTORY**

45989       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

45990 **NAME**45991 `logb`, `logbf`, `logbl` — radix-independent exponent45992 **SYNOPSIS**

```
45993 #include <math.h>
45994 double logb(double x);
45995 float logbf(float x);
45996 long double logbl(long double x);
```

45997 **DESCRIPTION**

45998 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45999 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46000 volume of POSIX.1-2024 defers to the ISO C standard.

46001 These functions shall compute the exponent of  $x$ , which is the integral part of  $\log_r |x|$ , as a  
 46002 signed floating-point value, for non-zero  $x$ , where  $r$  is the radix of the machine's floating-point  
 46003 arithmetic, which is the value of `FLT_RADIX` defined in the `<float.h>` header.

46004 If  $x$  is subnormal it is treated as though it were normalized; thus for finite positive  $x$ :

46005 
$$1 \leq x * FLT\_RADIX^{-\text{logb}(x)} < FLT\_RADIX$$

46006 An application wishing to check for error situations should set `errno` to zero and call  
 46007 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 46008 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 46009 zero, an error has occurred.

46010 **RETURN VALUE**

46011 Upon successful completion, these functions shall return the exponent of  $x$ .

46012 MX The returned value shall be exact and shall be independent of the current rounding direction  
 46013 mode.

46014 If  $x$  is  $\pm 0$ , `logb()`, `logbf()`, and `logbl()` shall return `-HUGE_VAL`, `-HUGE_VALF`, and  
 46015 `-HUGE_VALL`, respectively.

46016 MX On systems that support the IEC 60559 Floating-Point option, a pole error shall occur;  
 46017 CX otherwise, a pole error may occur.

46018 MX If  $x$  is NaN, a NaN shall be returned.

46019 MX If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

46020 **ERRORS**

46021 These functions shall fail if:

46022 MX **Pole Error** The value of  $x$  is  $\pm 0$ .  
 46023 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 46024 then `errno` shall be set to `[ERANGE]`. If the integer expression  
 46025 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero  
 46026 floating-point exception shall be raised.

46027 These functions may fail if:

46028 **Pole Error** The value of  $x$  is 0.  
 46029 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 46030 then `errno` shall be set to `[ERANGE]`. If the integer expression  
 46031 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero  
 46032 floating-point exception shall be raised.

46033 **EXAMPLES**

46034 None.

46035 **APPLICATION USAGE**

46036 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
46037 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

46038 **RATIONALE**

46039 None.

46040 **FUTURE DIRECTIONS**

46041 None.

46042 **SEE ALSO**46043 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [ilogb\(\)](#), [scalbln\(\)](#)46044 XBD Section 4.23 (on page 109), [<float.h>](#), [<math.h>](#)46045 **CHANGE HISTORY**

46046 First released in Issue 4, Version 2.

46047 **Issue 5**

46048 Moved from X/OPEN UNIX extension to BASE.

46049 **Issue 6**46050 The *logb()* function is no longer marked as an extension.46051 The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

46052 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
46053 revised to align with the ISO/IEC 9899:1999 standard.

46054 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
46055 marked.

46056 **Issue 7**

46057 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #50 (SD5-XSH-ERN-76) is applied.

46058 **Issue 8**

46059 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
46060 standard.

46061 **NAME**

46062       logf, logl — natural logarithm function

46063 **SYNOPSIS**

46064       #include &lt;math.h&gt;

46065       float logf(float *x*);46066       long double logl(long double *x*);46067 **DESCRIPTION**46068       Refer to *log()*.

46069 **NAME**

46070 longjmp — non-local goto

46071 **SYNOPSIS**

46072 #include &lt;setjmp.h&gt;

46073 \_Noreturn void longjmp(jmp\_buf env, int val);

46074 **DESCRIPTION**

46075 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 46076 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46077 volume of POSIX.1-2024 defers to the ISO C standard.

46078 The *longjmp()* function shall restore the environment saved by the most recent invocation of  
 46079 *setjmp()* in the same process, with the corresponding **jmp\_buf** argument. If the most recent  
 46080 invocation of *setjmp()* with the corresponding **jmp\_buf** occurred in another thread, or if there is  
 46081 no such invocation, or if the function containing the invocation of *setjmp()* has terminated  
 46082 execution in the interim, or if the invocation of *setjmp()* was within the scope of an identifier  
 46083 with variably modified type and execution has left that scope in the interim, the behavior is  
 46084 CX undefined. It is unspecified whether *longjmp()* restores the signal mask, leaves the signal mask  
 46085 unchanged, or restores it to its value at the time *setjmp()* was called.

46086 All accessible objects have values, and all other components of the abstract machine have state  
 46087 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,  
 46088 except that the values of objects of automatic storage duration are unspecified if they meet all  
 46089 the following conditions:

- 46090 • They are local to the function containing the corresponding *setjmp()* invocation.
- 46091 • They do not have volatile-qualified type.
- 46092 • They are changed between the *setjmp()* invocation and *longjmp()* call.

46093 CX Although *longjmp()* is an async-signal-safe function, if it is invoked from a signal handler which  
 46094 interrupted a non-async-signal-safe function or equivalent (such as the processing equivalent to  
 46095 *exit()* performed after a return from the initial call to *main()*), the behavior of any subsequent  
 46096 call to a non-async-signal-safe function or equivalent is undefined.

46097 The effect of a call to *longjmp()* where initialization of the **jmp\_buf** structure was not performed  
 46098 in the calling thread is undefined.

46099 **RETURN VALUE**

46100 After *longjmp()* is completed, thread execution shall continue as if the corresponding invocation  
 46101 of *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause  
 46102 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

46103 **ERRORS**

46104 No errors are defined.

46105 **EXAMPLES**

46106 None.

46107 **APPLICATION USAGE**

46108 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*  
 46109 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the  
 46110 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under  
 46111 application control).

46112 It is recommended that applications do not call *longjmp()* or *siglongjmp()* from signal handlers.  
 46113 To avoid undefined behavior when calling these functions from a signal handler, the application

- 46114 needs to ensure one of the following two things:
- 46115 1. After the call to *longjmp()* or *siglongjmp()* the process only calls async-signal-safe  
46116 functions and does not return from the initial call to *main()*.
  - 46117 2. Any signal whose handler calls *longjmp()* or *siglongjmp()* is blocked during *every* call to a  
46118 non-async-signal-safe function, and no such calls are made after returning from the initial  
46119 call to *main()*.
- 46120 **RATIONALE**
- 46121 None.
- 46122 **FUTURE DIRECTIONS**
- 46123 None.
- 46124 **SEE ALSO**
- 46125 *setjmp()*, *sigaction()*, *siglongjmp()*, *sigsetjmp()*
- 46126 XBD <[setjmp.h](#)>
- 46127 **CHANGE HISTORY**
- 46128 First released in Issue 1. Derived from Issue 1 of the SVID.
- 46129 **Issue 5**
- 46130 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
- 46131 **Issue 6**
- 46132 Extensions beyond the ISO C standard are marked.
- 46133 The following new requirements on POSIX implementations derive from alignment with the  
46134 Single UNIX Specification:
- 46135 • The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask  
46136 unspecified.
- 46137 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.
- 46138 **Issue 7**
- 46139 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0365 [394] is applied.
- 46140 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0202 [516] is applied.
- 46141 **Issue 8**
- 46142 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
46143 standard.

46144 **NAME**

46145 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

46146 **SYNOPSIS**

```
46147 XSI #include <stdlib.h>  
46148 long lrand48(void);
```

46149 **DESCRIPTION**

46150 Refer to *drand48()*.

46151 **NAME**

46152 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

46153 **SYNOPSIS**

```
46154 #include <math.h>
46155 long lrint(double x);
46156 long lrintf(float x);
46157 long lrintl(long double x);
```

46158 **DESCRIPTION**

46159 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 46160 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46161 volume of POSIX.1-2024 defers to the ISO C standard.

46162 These functions shall round their argument to the nearest integer value, rounding according to  
 46163 the current rounding direction.

46164 An application wishing to check for error situations should set *errno* to zero and call  
 46165 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 46166 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 46167 zero, an error has occurred.

46168 **RETURN VALUE**

46169 Upon successful completion, these functions shall return the rounded integer value.

46170 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.46171 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.46172 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

46173 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 46174 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 46175 CX occur; otherwise, a domain error may occur.

46176 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 46177 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 46178 CX occur; otherwise, a domain error may occur.

46179 **ERRORS**

46180 These functions shall fail if:

46181 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 46182 integer.

46183 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 46184 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 46185 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 46186 shall be raised.

46187 These functions may fail if:

46188 **Domain Error** The correct value is not representable as an integer.

46189 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 46190 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 46191 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 46192 shall be raised.

46193 **EXAMPLES**

46194       None.

46195 **APPLICATION USAGE**46196       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
46197       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.46198 **RATIONALE**46199       These functions provide floating-to-integer conversions. They round according to the current  
46200       rounding direction. If the rounded value is outside the range of the return type, the numeric  
46201       result is unspecified and the invalid floating-point exception is raised. When they raise no other  
46202       floating-point exception and the result differs from the argument, they raise the inexact floating-  
46203       point exception.46204 **FUTURE DIRECTIONS**

46205       None.

46206 **SEE ALSO**46207       [feclearexcept\(\)](#), [fetestexcept\(\)](#), [llrint\(\)](#)46208       XBD Section 4.23 (on page 109), [<math.h>](#)46209 **CHANGE HISTORY**

46210       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

46211 **Issue 7**

46212       ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

46213 **NAME**

46214 lround, lroundf, lroundl — round to nearest integer value

46215 **SYNOPSIS**

```
46216 #include <math.h>
46217 long lround(double x);
46218 long lroundf(float x);
46219 long lroundl(long double x);
```

46220 **DESCRIPTION**

46221 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 46222 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46223 volume of POSIX.1-2024 defers to the ISO C standard.

46224 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 46225 away from zero, regardless of the current rounding direction.

46226 An application wishing to check for error situations should set *errno* to zero and call  
 46227 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 46228 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 46229 zero, an error has occurred.

46230 **RETURN VALUE**

46231 Upon successful completion, these functions shall return the rounded integer value.

46232 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

46233 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

46234 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

46235 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 46236 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 46237 CX otherwise, a domain error may occur.

46238 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 46239 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 46240 CX otherwise, a domain error may occur.

46241 **ERRORS**

46242 These functions shall fail if:

46243 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 46244 integer.

46245 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 46246 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 46247 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 46248 shall be raised.

46249 These functions may fail if:

46250 **Domain Error** The correct value is not representable as an integer.

46251 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 46252 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 46253 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 46254 shall be raised.

46255 **EXAMPLES**

46256 None.

46257 **APPLICATION USAGE**

46258 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
46259 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

46260 **RATIONALE**

46261 These functions differ from the *lrint()* functions in the default rounding direction, with the  
46262 *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact  
46263 floating-point exception for non-integer arguments that round to within the range of the return  
46264 type.

46265 **FUTURE DIRECTIONS**

46266 None.

46267 **SEE ALSO**

46268 [fclearexcept\(\)](#), [fetestexcept\(\)](#), [llround\(\)](#)

46269 XBD Section 4.23 (on page 109), [<math.h>](#)

46270 **CHANGE HISTORY**

46271 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

46272 **Issue 7**

46273 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

46274 **NAME**

46275 lsearch, lfind — linear search and update

46276 **SYNOPSIS**

```
46277 XSI #include <search.h>
46278 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
46279             int (*compar)(const void *, const void *));
46280 void *lfind(const void *key, const void *base, size_t *nel,
46281            size_t width, int (*compar)(const void *, const void *));
```

46282 **DESCRIPTION**

46283 The *lsearch()* function shall linearly search the table and return a pointer into the table for the  
 46284 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*  
 46285 argument points to the entry to be sought in the table. The *base* argument points to the first  
 46286 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument  
 46287 points to an integer containing the current number of elements in the table. The integer to which  
 46288 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to  
 46289 a comparison function which the application shall supply (for example, *strcmp()*). It is called  
 46290 with two arguments that point to the elements being compared. The application shall ensure  
 46291 that the function returns 0 if the elements are equal, and non-zero otherwise.

46292 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not  
 46293 added to the table. Instead, a null pointer is returned.

46294 **RETURN VALUE**

46295 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it.  
 46296 Otherwise, *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly  
 46297 added element.

46298 Both functions shall return a null pointer in case of error.

46299 **ERRORS**

46300 No errors are defined.

46301 **EXAMPLES**46302 **Storing Strings in a Table**

46303 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to  
 46304 ELSIZE and stores them in a table, eliminating duplicates.

```
46305 #include <stdio.h>
46306 #include <string.h>
46307 #include <search.h>
46308 #define TABSIZE 50
46309 #define ELSIZE 120
46310 ...
46311     char line[ELSIZE], tab[TABSIZE][ELSIZE];
46312     size_t nel = 0;
46313     ...
46314     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
46315         (void) lsearch(line, tab, &nel,
46316                       ELSIZE, (int (*)(const void *, const void *)) strcmp);
46317     ...
```

**46318 Finding a Matching Entry**

46319 The following example finds any line that reads "This is a test.".

```
46320 #include <search.h>
46321 #include <string.h>
46322 ...
46323 char line[ELSIZE], tab[TABSIZE][ELSIZE];
46324 size_t nel = 0;
46325 char *findline;
46326 void *entry;

46327 findline = "This is a test.\n";

46328 entry = lfind(findline, tab, &nel, ELSIZE, (
46329     int (*)(const void *, const void *)) strcmp);
```

**46330 APPLICATION USAGE**

46331 The comparison function need not compare every byte, so arbitrary data may be contained in  
46332 the elements in addition to the values being compared.

46333 Undefined results can occur if there is not enough room in the table to add a new item.

**46334 RATIONALE**

46335 None.

**46336 FUTURE DIRECTIONS**

46337 None.

**46338 SEE ALSO**

**46341 CHANGE HISTORY**

46342 First released in Issue 1. Derived from Issue 1 of the SVID.

**46343 Issue 6**

46344 The normative text is updated to avoid use of the term ``must'' for application requirements.

46345 **NAME**

46346 lseek — move the read/write file offset

46347 **SYNOPSIS**

46348 #include &lt;unistd.h&gt;

46349 off\_t lseek(int *filides*, off\_t *offset*, int *whence*);46350 **DESCRIPTION**46351 The *lseek()* function shall set the file offset for the open file description associated with the file  
46352 descriptor *filides*, as follows:

- 46353 • If *whence* is SEEK\_SET, the file offset shall be set to *offset* bytes.
- 46354 • If *whence* is SEEK\_CUR, the file offset shall be set to its current location plus *offset*.
- 46355 • If *whence* is SEEK\_END, the file offset shall be set to the size of the file plus *offset*.
- 46356 • If *whence* is SEEK\_HOLE, the file offset shall be set to the smallest location of a byte within  
46357 a hole and not less than *offset*, except that if *offset* falls beyond the last byte not within a  
46358 hole, then the file offset may be set to the file size instead. It shall be an error if *offset* is  
46359 greater than or equal to the size of the file.
- 46360 • If *whence* is SEEK\_DATA, the file offset shall be set to the smallest location of a byte not  
46361 within a hole and not less than *offset*. It shall be an error if no such byte exists.

46362 The symbolic constants SEEK\_SET, SEEK\_CUR, SEEK\_END, SEEK\_HOLE, and SEEK\_DATA are  
46363 defined in <unistd.h>.46364 A hole is a contiguous region of bytes within a file, all having the value of zero. Not all bytes  
46365 with the value zero need belong to a hole; however, all seekable files shall have a virtual hole  
46366 starting at the current size of the file, whether or not the file is sparse.46367 The behavior of *lseek()* on devices which are incapable of seeking is implementation-defined.  
46368 The value of the file offset associated with such a device is undefined.46369 The *lseek()* function shall allow the file offset to be set beyond the end of the existing data in the  
46370 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes  
46371 with the value 0 until data is actually written into the gap.46372 The *lseek()* function shall not, by itself, extend the size of a file.46373 SHM If *filides* refers to a shared memory object, the result of the *lseek()* function is unspecified.46374 TYM If *filides* refers to a typed memory object, the result of the *lseek()* function is unspecified.46375 **RETURN VALUE**46376 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the  
46377 file, shall be returned. Otherwise, -1 shall be returned, *errno* shall be set to indicate the error, and  
46378 the file offset shall remain unchanged.46379 **ERRORS**46380 The *lseek()* function shall fail if:

- 46381 [EBADF] The *filides* argument is not an open file descriptor.
- 46382 [EINVAL] The *whence* argument is not a proper value, or the resulting file offset would  
46383 be negative for a regular file, block special file, or directory.
- 46384 [ENXIO] The *whence* argument is SEEK\_HOLE or SEEK\_DATA, and *offset* is greater  
46385 than or equal to the file size; or the *whence* argument is SEEK\_DATA and the  
46386 offset falls beyond the last byte not within a hole.

46387 [EOVERFLOW] The resulting file offset would be a value which cannot be represented  
46388 correctly in an object of type `off_t`.

46389 [ESPIPE] The *fildes* argument is associated with a pipe, FIFO, or socket.

#### 46390 EXAMPLES

46391 None.

#### 46392 APPLICATION USAGE

46393 None.

#### 46394 RATIONALE

46395 The ISO C standard includes the functions *fgetpos()* and *fsetpos()*, which work on very large files  
46396 by use of a special positioning type.

46397 Although *lseek()* may position the file offset beyond the end of the file, this function does not  
46398 itself extend the size of the file. While the only function in POSIX.1-2024 that may directly extend  
46399 the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally derived from  
46400 the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing calls on *write()*).

46401 An invalid file offset that would cause [EINVAL] to be returned may be both implementation-  
46402 defined and device-dependent (for example, memory may have few invalid values). A negative  
46403 file offset may be valid for some devices in some implementations.

46404 The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset.  
46405 Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return  
46406 to determine whether a return value of `(off_t)-1` is a negative offset or an indication of an error  
46407 condition. The standard developers did not wish to require this action on the part of a  
46408 conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting  
46409 file offset would be negative for a regular file, block special file, or directory.

46410 Not all file systems support holes, and even where sparse files are supported, not all contiguous  
46411 blocks of zero bytes are required to be recognized as a hole. However, since all files are required  
46412 to have a virtual hole starting at the current file size, application writers can use SEEK\_HOLE  
46413 and SEEK\_DATA to optimize algorithms that can run faster when it is known that a block of  
46414 bytes is all zeros, because a non-sparse file will correctly report the entire file as a single non-  
46415 hole. A trivial recursive implementation for these two constants would be as follows, however,  
46416 for file systems that support sparse files, implementations are encouraged to do better.

```
46417 off_t lseek(int fildes, off_t offset, int whence)
46418 {
46419     off_t cur, end;
46420     switch (whence)
46421     {
46422     case SEEK_HOLE:
46423     case SEEK_DATA:
46424         cur = lseek(fildes, 0, SEEK_CUR);
46425         if (cur < 0)
46426             return cur;
46427         end = lseek(fildes, 0, SEEK_END);
46428         if (end < 0)
46429             return end;
46430         if (offset < end)
46431             return whence == SEEK_HOLE ?
46432                 end : lseek(fildes, offset, SEEK_SET);
46433         return lseek(fildes, cur, SEEK_SET);

```

```

46434         errno = ENXIO;
46435         return -1;
46436     default:
46437         ... /* Existing implementation */
46438     }
46439 }

```

46440 Note that although the above looks like user-space code, *lseek()* cannot be implemented with  
 46441 recursive calls in user space because this would not conform to the atomicity requirements in  
 46442 [Section 2.9.7](#) (on page 547).

#### 46443 FUTURE DIRECTIONS

46444 None.

#### 46445 SEE ALSO

46446 [open\(\)](#)

46447 XBD [<sys/types.h>](#), [<unistd.h>](#)

#### 46448 CHANGE HISTORY

46449 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 46450 Issue 5

46451 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

46452 Large File Summit extensions are added.

#### 46453 Issue 6

46454 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

46455 The following new requirements on POSIX implementations derive from alignment with the  
 46456 Single UNIX Specification:

- 46457 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 46458 required for conforming implementations of previous POSIX specifications, it was not  
 46459 required for UNIX applications.

- 46460 • The [EOVERFLOW] error condition is added. This change is to support large files.

46461 An additional [ESPIPE] error condition is added for sockets.

46462 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 46463 *lseek()* results are unspecified for typed memory objects.

#### 46464 Issue 7

46465 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0366 [421] is applied.

#### 46466 Issue 8

46467 Austin Group Defect 415 is applied, adding SEEK\_HOLE and SEEK\_DATA.

46468 **NAME**

46469        lstat — get file status

46470 **SYNOPSIS**

46471        #include <sys/stat.h>

46472        int lstat(const char \*restrict *path*, struct stat \*restrict *buf*);

46473 **DESCRIPTION**

46474        Refer to *fstatat()*.

46475 **NAME**

46476 malloc — a memory allocator

46477 **SYNOPSIS**

46478 #include &lt;stdlib.h&gt;

46479 void \*malloc(size\_t size);

46480 **DESCRIPTION**

46481 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 46482 conflict between the requirements described here and the ISO C standard is unintentional. This  
 46483 volume of POSIX.1-2024 defers to the ISO C standard.

46484 The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by  
 46485 *size* and whose value is unspecified.

46486 The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The  
 46487 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 46488 a pointer to any type of object with a fundamental alignment requirement and then used to  
 46489 access such an object in the space allocated (until the space is explicitly freed or reallocated).  
 46490 Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer  
 46491 returned points to the start (lowest byte address) of the allocated space. If the space cannot be  
 46492 allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is  
 46493 implementation-defined: either a null pointer shall be returned, or the behavior shall be as if the  
 46494 size were some non-zero value, except that the behavior is undefined if the returned pointer is  
 46495 used to access an object.

46496 For purposes of determining the existence of a data race, *malloc()* shall behave as though it  
 46497 accessed only memory locations accessible through its argument and not other static duration  
 46498 storage. The function may, however, visibly modify the storage that it allocates. Calls to  
 46499 ADV *aligned\_alloc()*, *calloc()*, *free()*, *malloc()*, *posix\_memalign()*,  
 46500 CX *reallocarray()*, and *realloc()* that allocate or deallocate a particular region of memory shall occur  
 46501 in a single total order (see Section 4.15.1, on page 100), and each such deallocation call shall  
 46502 synchronize with the next allocation (if any) in this order.

46503 **RETURN VALUE**

46504 Upon successful completion, *malloc()* shall return a pointer to the allocated space; if *size* is 0, the  
 46505 application shall ensure that the pointer is not used to access an object.

46506 CX Otherwise, it shall return a null pointer and set *errno* to indicate the error.

46507 **ERRORS**

46508 The *malloc()* function shall fail if:

46509 CX [ENOMEM] Insufficient storage space is available.

46510 The *malloc()* function may fail if:

46511 CX [EINVAL] *size* is 0 and the implementation does not support 0 sized allocations.

46512 **EXAMPLES**

46513 None.

46514 **APPLICATION USAGE**

46515 None.

46516 **RATIONALE**

46517 Some implementations set *errno* to [EAGAIN] to signal memory allocation failures that might  
46518 succeed if retried and [ENOMEM] for failures that are unlikely to ever succeed, for example due  
46519 to configured limits. Section 2.3 (on page 507) permits this behavior; when multiple error  
46520 conditions are simultaneously true there is no precedence between them.

46521 **FUTURE DIRECTIONS**

46522 None.

46523 **SEE ALSO**46524 *aligned\_alloc()*, *calloc()*, *free()*, *getrlimit()*, *posix\_memalign()*, *realloc()*

46525 XBD &lt;stdlib.h&gt;

46526 **CHANGE HISTORY**

46527 First released in Issue 1. Derived from Issue 1 of the SVID.

46528 **Issue 6**

46529 Extensions beyond the ISO C standard are marked.

46530 The following new requirements on POSIX implementations derive from alignment with the  
46531 Single UNIX Specification:

- 46532 • In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
- 46533 • The [ENOMEM] error condition is added.

46534 **Issue 7**

46535 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0203 [526] is applied.

46536 **Issue 8**

46537 Austin Group Defect 374 is applied, changing the RETURN VALUE and ERRORS sections in  
46538 relation to 0 sized allocations.

46539 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
46540 standard.

46541 Austin Group Defects 1387 and 1489 are applied, changing the RATIONALE section.

46542 **NAME**

46543           mblen — get number of bytes in a character

46544 **SYNOPSIS**

46545           #include &lt;stdlib.h&gt;

46546           int mblen(const char \*s, size\_t n);

46547 **DESCRIPTION**

46548 CX       Except for requirements relating to data races, the functionality described on this reference page  
 46549 is aligned with the ISO C standard. Any other conflict between the requirements described here  
 46550 and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C  
 46551 standard for all *mblen()* functionality except in relation to data races.

46552       If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character  
 46553 pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

46554       mbtowc((wchar\_t \*)0, (const char \*)0, 0);

46555       mbtowc((wchar\_t \*)0, s, n);

46556       The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 46557 *mblen()*.

46558       The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 46559 state-dependent encoding, this function shall be placed into its initial state at program startup  
 46560 and can be returned to that state by a call for which its character pointer argument, *s*, is a null  
 46561 pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the  
 46562 function to be altered as necessary. A call with *s* as a null pointer shall cause this function to  
 46563 return a non-zero value if encodings have state dependency, and 0 otherwise. If the  
 46564 implementation employs special bytes to change the shift state, these bytes shall not produce  
 46565 separate wide-character codes, but shall be grouped with an adjacent character. Changing the  
 46566 *LC\_CTYPE* category causes the shift state of this function to be unspecified.

46567 CX       The *mblen()* function need not be thread-safe; however, it shall avoid data races with all other  
 46568 functions.

46569 **RETURN VALUE**

46570       If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,  
 46571 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall  
 46572 either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 46573 character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a  
 46574 valid character) and may set *errno* to indicate the error. In no case shall the value returned be  
 46575 greater than *n* or the value of the {MB\_CUR\_MAX} macro.

46576 **ERRORS**46577       The *mblen()* function may fail if:

46578 CX       [EILSEQ]       An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 46579 error cannot occur since all byte values are valid characters.

**46580 EXAMPLES**

46581 None.

**46582 APPLICATION USAGE**

46583 None.

**46584 RATIONALE**

46585 When the ISO C standard introduced threads in C11, it required *mblen()* to avoid data races  
46586 (with itself as well as with other functions), whereas POSIX.1-2008 did not require it to be  
46587 thread-safe, and in many implementations it did not avoid data races with itself and still does  
46588 not. The ISO C committee intend to change the requirements in a future version of the ISO C  
46589 standard, but since POSIX.1 currently refers to C17 it is necessary for it not to defer to the ISO C  
46590 standard regarding data races in order to continue to allow this function not to avoid data races  
46591 with itself.

**46592 FUTURE DIRECTIONS**

46593 It is expected that a change in a future version of the ISO C standard will allow a future version  
46594 of this standard to remove the data race exception from the statement that it defers to the ISO C  
46595 standard.

**46599 CHANGE HISTORY**

46600 First released in Issue 4. Aligned with the ISO C standard.

**46601 Issue 7**

46602 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0367 [109] is applied.

46603 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0204 [663,674] is applied.

**46604 Issue 8**

46605 Austin Group Defects 708 and 1302 are applied, aligning this function with the  
46606 ISO/IEC 9899:2018 standard, except in relation to data races.

46607 **NAME**

46608 mbrlen — get number of bytes in a character (restartable)

46609 **SYNOPSIS**

46610 #include &lt;wchar.h&gt;

46611 size\_t mbrlen(const char \*restrict *s*, size\_t *n*,  
46612 mbstate\_t \*restrict *ps*);46613 **DESCRIPTION**46614 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
46615 conflict between the requirements described here and the ISO C standard is unintentional. This  
46616 volume of POSIX.1-2024 defers to the ISO C standard.46617 If *s* is not a null pointer, *mbrlen()* shall determine the number of bytes constituting the character  
46618 pointed to by *s*. It shall be equivalent to:46619 mbstate\_t internal;  
46620 mbrtowc(NULL, *s*, *n*, *ps* != NULL ? *ps* : &internal);46621 If *ps* is a null pointer, the *mbrlen()* function shall use its own internal **mbstate\_t** object, which is  
46622 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
46623 pointed to by *ps* shall be used to completely describe the current conversion state of the  
46624 associated character sequence. The implementation shall behave as if no function defined in this  
46625 volume of POSIX.1-2024 calls *mbrlen()*.46626 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.46627 If called with a null *ps* argument, the *mbrlen()* function need not be thread-safe; however, such  
46628 calls shall avoid data races with calls to *mbrlen()* with a non-null argument and with calls to all  
46629 other functions.46630 The *mbrlen()* function shall not change the setting of *errno* if successful.46631 **RETURN VALUE**46632 The *mbrlen()* function shall return the first of the following that applies:46633 0 If the next *n* or fewer bytes complete the character that corresponds to the null  
46634 wide character.46635 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall  
46636 be the number of bytes that complete the character.46637 **(size\_t)−2** If the next *n* bytes contribute to an incomplete but potentially valid character,  
46638 and all *n* bytes have been processed. When *n* has at least the value of the  
46639 {MB\_CUR\_MAX} macro, this case can only occur if *s* points at a sequence of  
46640 redundant shift sequences (for implementations with state-dependent  
46641 encodings).46642 **(size\_t)−1** If an encoding error occurs, in which case the next *n* or fewer bytes do not  
46643 contribute to a complete and valid character. In this case, [EILSEQ] shall be  
46644 stored in *errno* and the conversion state is undefined.46645 **ERRORS**46646 The *mbrlen()* function shall fail if:46647 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
46648 error cannot occur since all byte values are valid characters.

- 46649 The *mbrlen()* function may fail if:
- 46650 [EINVAL] *ps* points to an object that contains an invalid conversion state.

46674 **NAME**46675 `mbrtoc16`, `mbrtoc32` — convert a character to a Unicode character code (restartable)46676 **SYNOPSIS**46677 `#include <uchar.h>`46678 `size_t mbrtoc16(char16_t *restrict pc16, const char *restrict s,`  
46679 `size_t n, mbstate_t *restrict ps);`46680 `size_t mbrtoc32(char32_t *restrict pc32, const char *restrict s,`  
46681 `size_t n, mbstate_t *restrict ps);`46682 **DESCRIPTION**46683 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
46684 conflict between the requirements described here and the ISO C standard is unintentional. This  
46685 volume of POSIX.1-2024 defers to the ISO C standard.46686 If *s* is a null pointer, the `mbrtoc16()` function shall be equivalent to the call:46687 `mbrtoc16(NULL, "", 1, ps)`46688 In this case, the values of the parameters *pc16* and *n* are ignored.46689 If *s* is not a null pointer, the `mbrtoc16()` function shall inspect at most *n* bytes beginning with the  
46690 byte pointed to by *s* to determine the number of bytes needed to complete the next character  
46691 (including any shift sequences). If the function determines that the next character is complete  
46692 and valid, it shall determine the values of the corresponding wide characters and then, if *pc16* is  
46693 not a null pointer, shall store the value of the first (or only) such character in the object pointed  
46694 to by *pc16*. Subsequent calls shall store successive wide characters without consuming any  
46695 additional input until all the characters have been stored. If the corresponding wide character is  
46696 the null wide character, the resulting state described shall be the initial conversion state.46697 If *ps* is a null pointer, the `mbrtoc16()` function shall use its own internal `mbstate_t` object, which  
46698 shall be initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t`  
46699 object pointed to by *ps* shall be used to completely describe the current conversion state of the  
46700 associated character sequence.46701 The behavior of this function is affected by the `LC_CTYPE` category of the current locale.46702 The `mbrtoc16()` function shall not change the setting of `errno` if successful.46703 The `mbrtoc32()` function shall behave the same way as `mbrtoc16()` except that the first parameter  
46704 shall point to an object of type `char32_t` instead of `char16_t`. References to *pc16* in the above  
46705 description shall apply as if they were *pc32* when they are being read as describing `mbrtoc32()`.46706 If called with a null *ps* argument, the `mbrtoc16()` function need not be thread-safe; however, such  
46707 calls shall avoid data races with calls to `mbrtoc16()` with a non-null argument and with calls to  
46708 all other functions.46709 If called with a null *ps* argument, the `mbrtoc32()` function need not be thread-safe; however, such  
46710 calls shall avoid data races with calls to `mbrtoc32()` with a non-null argument and with calls to  
46711 all other functions.46712 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
46713 `mbrtoc16()` or `mbrtoc32()` with a null pointer for *ps*.46714 **RETURN VALUE**

46715 These functions shall return the first of the following that applies:

46716	0	If the next <i>n</i> or fewer bytes complete the character that corresponds to the null wide character (which is the value stored).
46717		
46718	between 1 and <i>n</i> inclusive	
46719		If the next <i>n</i> or fewer bytes complete a valid character (which is the value stored); the value returned shall be the number of bytes that complete the character.
46720		
46721		
46722	( <b>size_t</b> )−3	If the next character resulting from a previous call has been stored, in which case no bytes from the input shall be consumed by the call.
46723		
46724	( <b>size_t</b> )−2	If the next <i>n</i> bytes contribute to an incomplete but potentially valid character, and all <i>n</i> bytes have been processed (no value is stored). When <i>n</i> has at least the value of the {MB_CUR_MAX} macro, this case can only occur if <i>s</i> points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).
46725		
46726		
46727		
46728		
46729	( <b>size_t</b> )−1	If an encoding error occurs, in which case the next <i>n</i> or fewer bytes do not contribute to a complete and valid character (no value is stored). In this case, [EILSEQ] shall be stored in <i>errno</i> and the conversion state is undefined.
46730		
46731		

**46732 ERRORS**

46733 These functions shall fail if:

46734	CX	[EILSEQ]	An invalid character sequence is detected. In the POSIX locale an [EILSEQ] error cannot occur since all byte values are valid characters.
46735			

46736 These functions may fail if:

46737	CX	[EINVAL]	<i>ps</i> points to an object that contains an invalid conversion state.

46751 **NAME**

46752 mbrtowc — convert a character to a wide-character code (restartable)

46753 **SYNOPSIS**

46754 #include &lt;wchar.h&gt;

46755 size\_t mbrtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*,  
46756 size\_t *n*, mbstate\_t \*restrict *ps*);46757 **DESCRIPTION**46758 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
46759 conflict between the requirements described here and the ISO C standard is unintentional. This  
46760 volume of POSIX.1-2024 defers to the ISO C standard.46761 If *s* is a null pointer, the *mbrtowc()* function shall be equivalent to the call:46762 mbrtowc(NULL, "", 1, *ps*)46763 In this case, the values of the arguments *pwc* and *n* are ignored.46764 If *s* is not a null pointer, the *mbrtowc()* function shall inspect at most *n* bytes beginning at the  
46765 byte pointed to by *s* to determine the number of bytes needed to complete the next character  
46766 (including any shift sequences). If the function determines that the next character is completed,  
46767 it shall determine the value of the corresponding wide character and then, if *pwc* is not a null  
46768 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide  
46769 character is the null wide character, the resulting state described shall be the initial conversion  
46770 state.46771 If *ps* is a null pointer, the *mbrtowc()* function shall use its own internal **mbstate\_t** object, which  
46772 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t**  
46773 object pointed to by *ps* shall be used to completely describe the current conversion state of the  
46774 associated character sequence. The implementation shall behave as if no function defined in this  
46775 volume of POSIX.1-2024 calls *mbrtowc()*.46776 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.46777 If called with a null *ps* argument, the *mbrtowc()* function need not be thread-safe; however, such  
46778 calls shall avoid data races with calls to *mbrtowc()* with a non-null argument and with calls to all  
46779 other functions.46780 The *mbrtowc()* function shall not change the setting of *errno* if successful.46781 **RETURN VALUE**46782 The *mbrtowc()* function shall return the first of the following that applies:46783 0 If the next *n* or fewer bytes complete the character that corresponds to the null  
46784 wide character (which is the value stored).46785 between 1 and *n* inclusive46786 If the next *n* or fewer bytes complete a valid character (which is the value  
46787 stored); the value returned shall be the number of bytes that complete the  
46788 character.46789 (**size\_t**)−2 If the next *n* bytes contribute to an incomplete but potentially valid character,  
46790 and all *n* bytes have been processed (no value is stored). When *n* has at least  
46791 the value of the {*MB\_CUR\_MAX*} macro, this case can only occur if *s* points at  
46792 a sequence of redundant shift sequences (for implementations with state-  
46793 dependent encodings).

46794 (size\_t)-1 If an encoding error occurs, in which case the next *n* or fewer bytes do not  
 46795 contribute to a complete and valid character (no value is stored). In this case,  
 46796 [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

#### 46797 ERRORS

46798 The *mbrtowc()* function shall fail if:

46799 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 46800 error cannot occur since all byte values are valid characters.

46801 The *mbrtowc()* function may fail if:

46802 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

 46816 (E).

#### 46817 Issue 6

46818 The *mbrtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

46819 The following new requirements on POSIX implementations derive from alignment with the  
 46820 Single UNIX Specification:

- 46821 • The [EINVAL] error condition is added.

46822 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

#### 46823 Issue 7

46824 Austin Group Interpretation 1003.1-2001 #170 is applied.

46825 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0369 [109,105] is applied.

46826 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0204 [663,674] is applied.

#### 46827 Issue 8

46828 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
 46829 standard.

46830 **NAME**

46831 mbsinit — determine conversion object status

46832 **SYNOPSIS**

46833 #include &lt;wchar.h&gt;

46834 int mbsinit(const mbstate\_t \*ps);

46835 **DESCRIPTION**

46836 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
46837 conflict between the requirements described here and the ISO C standard is unintentional. This  
46838 volume of POSIX.1-2024 defers to the ISO C standard.

46839 If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by  
46840 *ps* describes an initial conversion state.

46841 **RETURN VALUE**

46842 The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object  
46843 describes an initial conversion state; otherwise, it shall return zero.

46844 If an **mbstate\_t** object is altered by any of the functions described as “restartable”, and is then  
46845 used with a different character sequence, or in the other conversion direction, or with a different  
46846 *LC\_CTYPE* category setting than on earlier function calls, the behavior is undefined.

46847 **ERRORS**

46848 No errors are defined.

46849 **EXAMPLES**

46850 None.

46851 **APPLICATION USAGE**

46852 The **mbstate\_t** object is used to describe the current conversion state from a particular character  
46853 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the  
46854 *LC\_CTYPE* category of the current locale.

46855 The initial conversion state corresponds, for a conversion in either direction, to the beginning of  
46856 a new character sequence in the initial shift state. A zero valued **mbstate\_t** object is at least one  
46857 way to describe an initial conversion state. A zero valued **mbstate\_t** object can be used to initiate  
46858 conversion involving any character sequence, in any *LC\_CTYPE* category setting.

46859 **RATIONALE**

46860 None.

46861 **FUTURE DIRECTIONS**

46862 None.

46863 **SEE ALSO**46864 [mbrlen\(\)](#), [mbrtowc\(\)](#), [mbsrtowcs\(\)](#), [wcrctomb\(\)](#), [wcsrtombs\(\)](#)46865 XBD [<wchar.h>](#)46866 **CHANGE HISTORY**

46868 (E).

46869 **NAME**46870 `mbsnrto wcs, mbsrtowcs` — convert a character string to a wide-character string (restartable)46871 **SYNOPSIS**46872 `#include <wchar.h>`

```
46873 CX size_t mbsnrto wcs(wchar_t *restrict dst, const char **restrict src,
46874 size_t nmc, size_t len, mbstate_t *restrict ps);
46875 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
46876 size_t len, mbstate_t *restrict ps);
```

46877 **DESCRIPTION**

46878 CX For `mbsrtowcs()`: The functionality described on this reference page is aligned with the ISO C  
 46879 standard. Any conflict between the requirements described here and the ISO C standard is  
 46880 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

46881 The `mbsrtowcs()` function shall convert a sequence of characters, beginning in the conversion  
 46882 state described by the object pointed to by `ps`, from the array indirectly pointed to by `src` into a  
 46883 sequence of corresponding wide characters. If `dst` is not a null pointer, the converted characters  
 46884 shall be stored into the array pointed to by `dst`. Conversion continues up to and including a  
 46885 terminating null character, which shall also be stored. Conversion shall stop early in either of the  
 46886 following cases:

- 46887 • A sequence of bytes is encountered that does not form a valid character.
- 46888 • `len` codes have been stored into the array pointed to by `dst` (and `dst` is not a null pointer).

46889 Each conversion shall take place as if by a call to the `mbrtowc()` function.

46890 If `dst` is not a null pointer, the pointer object pointed to by `src` shall be assigned either a null  
 46891 pointer (if conversion stopped due to reaching a terminating null character) or the address just  
 46892 past the last character converted (if any). If conversion stopped due to reaching a terminating  
 46893 null character, and if `dst` is not a null pointer, the resulting state described shall be the initial  
 46894 conversion state.

46895 If `ps` is a null pointer, the `mbsrtowcs()` function shall use its own internal `mbstate_t` object, which  
 46896 is initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object  
 46897 pointed to by `ps` shall be used to completely describe the current conversion state of the  
 46898 associated character sequence.

46899 CX The `mbsnrto wcs()` function shall be equivalent to the `mbsrtowcs()` function, except that the  
 46900 conversion of characters indirectly pointed to by `src` is limited to at most `nmc` bytes (the size of  
 46901 the input buffer), and under conditions where `mbsrtowcs()` would assign the address just past  
 46902 the last character converted (if any) to the pointer object pointed to by `src`, `mbsnrto wcs()` shall  
 46903 instead assign the address just past the last byte processed (if any) to that pointer object. If the  
 46904 input buffer ends with an incomplete character, conversion shall stop at the end of the input  
 46905 buffer; a subsequent call to `mbsnrto wcs()` with an input buffer that starts with the remainder of  
 46906 the incomplete character shall correctly complete the conversion of that character.

46907 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

46908 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 46909 these functions.

46910 CX If called with a null `ps` argument, the `mbsnrto wcs()` function need not be thread-safe; however,  
 46911 such calls shall avoid data races with calls to `mbsnrto wcs()` with a non-null argument and with  
 46912 calls to all other functions.

46913 If called with a null `ps` argument, the `mbsrtowcs()` function need not be thread-safe; however,

46914 such calls shall avoid data races with calls to *mbsrtowcs()* with a non-null argument and with  
 46915 calls to all other functions.

46916 The *mbsrtowcs()* function shall not change the setting of *errno* if successful.

#### 46917 RETURN VALUE

46918 If the input conversion encounters a sequence of bytes that do not form a valid character, an  
 46919 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in  
 46920 *errno* and shall return (*size\_t*)-1; the conversion state is undefined. Otherwise, these functions  
 46921 shall return the number of characters successfully converted, not including the terminating null  
 46922 (if any).

#### 46923 ERRORS

46924 These functions shall fail if:

46925 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 46926 error cannot occur since all byte values are valid characters.

46927 These functions may fail if:

46928 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

#### 46929 EXAMPLES

46930 None.

#### 46931 APPLICATION USAGE

46932 None.

#### 46933 RATIONALE

46934 None.

#### 46940 CHANGE HISTORY

46941 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 46942 (E).

#### 46943 Issue 6

46944 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

46945 The [EINVAL] error condition is marked CX.

#### 46946 Issue 7

46947 Austin Group Interpretation 1003.1-2001 #170 is applied.

46948 The *mbsnrtoowcs()* function is added from The Open Group Technical Standard, 2006, Extended  
 46949 API Set Part 1.

46950 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0370 [109,105] is applied.

46951 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0205 [601], XSH/TC2-2008/0206 [663],  
 46952 and XSH/TC2-2008/0207 [601] are applied.

46953 **Issue 8**

46954 Austin Group Defect 616 is applied, requiring that when the *mbsnr towcs()* input buffer ends  
46955 with an incomplete character, conversion stops at the end of the input buffer (not at the end of  
46956 the previous character, if any).

46957 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
46958 standard.

46959 **NAME**46960 `mbstowcs` — convert a character string to a wide-character string46961 **SYNOPSIS**46962 `#include <stdlib.h>`46963 `size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,`  
46964 `size_t n);`46965 **DESCRIPTION**46966 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
46967 conflict between the requirements described here and the ISO C standard is unintentional. This  
46968 volume of POSIX.1-2024 defers to the ISO C standard.46969 The `mbstowcs()` function shall convert a sequence of characters that begins in the initial shift  
46970 state from the array pointed to by `s` into a sequence of corresponding wide-character codes and  
46971 shall store not more than `n` wide-character codes into the array pointed to by `pwcs`. No  
46972 characters that follow a null byte (which is converted into a wide-character code with value 0)  
46973 shall be examined or converted. Each character shall be converted as if by a call to `mbtowc()`,  
46974 except that the shift state of `mbtowc()` is not affected.46975 No more than `n` elements shall be modified in the array pointed to by `pwcs`. If copying takes  
46976 place between objects that overlap, the behavior is undefined.46977 **XSI** The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.  
46978 If `pwcs` is a null pointer, `mbstowcs()` shall return the length required to convert the entire array  
46979 regardless of the value of `n`, but no values are stored.46980 **RETURN VALUE**46981 **CX** If an invalid character is encountered, `mbstowcs()` shall return `(size_t)-1` and shall set `errno` to  
46982 indicate the error.46983 **XSI** Otherwise, `mbstowcs()` shall return the number of the array elements modified (or required if  
46984 `pwcs` is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if  
46985 the value returned is `n`.46986 **ERRORS**46987 The `mbstowcs()` function shall fail if:46988 **CX** `[EILSEQ]` An invalid character sequence is detected. In the POSIX locale an `[EILSEQ]`  
46989 error cannot occur since all byte values are valid characters.46990 **EXAMPLES**

46991 None.

46992 **APPLICATION USAGE**

46993 None.

46994 **RATIONALE**

46995 None.

46996 **FUTURE DIRECTIONS**

46997 None.

46998 **SEE ALSO**46999 [`mblen\(\)`](#), [`mbtowc\(\)`](#), [`wctomb\(\)`](#), [`wcstombs\(\)`](#)47000 XBD [`<stdlib.h>`](#)

47001 **CHANGE HISTORY**

47002 First released in Issue 4. Aligned with the ISO C standard.

47003 **Issue 6**

47004 The *mbstowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

47005 Extensions beyond the ISO C standard are marked.

47006 **Issue 7**

47007 Austin Group Interpretation 1003.1-2001 #170 is applied.

47008 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0371 [195] is applied.

47009 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0208 [663,674] is applied.

47010 **NAME**

47011 mbtowc — convert a character to a wide-character code

47012 **SYNOPSIS**

47013 #include &lt;stdlib.h&gt;

47014 int mbtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*, size\_t *n*);47015 **DESCRIPTION**

47016 CX Except for requirements relating to data races, the functionality described on this reference page  
 47017 is aligned with the ISO C standard. Any other conflict between the requirements described here  
 47018 and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C  
 47019 standard for all *mbtowc()* functionality except in relation to data races.

47020 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the  
 47021 character pointed to by *s*. It shall then determine the wide-character code for the value of type  
 47022 **wchar\_t** that corresponds to that character. (The value of the wide-character code corresponding  
 47023 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store  
 47024 the wide-character code in the object pointed to by *pwc*.

47025 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 47026 state-dependent encoding, this function shall be placed into its initial state at program startup  
 47027 and can be returned to that state by a call for which its character pointer argument, *s*, is a null  
 47028 pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the  
 47029 function to be altered as necessary. A call with *s* as a null pointer shall cause this function to  
 47030 return a non-zero value if encodings have state dependency, and 0 otherwise. If the  
 47031 implementation employs special bytes to change the shift state, these bytes shall not produce  
 47032 separate wide-character codes, but shall be grouped with an adjacent character. Changing the  
 47033 *LC\_CTYPE* category causes the shift state of this function to be unspecified. At most *n* bytes of  
 47034 the array pointed to by *s* shall be examined.

47035 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 47036 *mbtowc()*.

47037 CX The *mbtowc()* function need not be thread-safe; however, it shall avoid data races with all other  
 47038 functions.

47039 **RETURN VALUE**

47040 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,  
 47041 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*  
 47042 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 47043 CX converted character (if the next *n* or fewer bytes form a valid character), or return -1 and shall  
 47044 set *errno* to indicate the error (if they do not form a valid character).

47045 In no case shall the value returned be greater than *n* or the value of the {MB\_CUR\_MAX} macro.

47046 **ERRORS**

47047 The *mbtowc()* function shall fail if:

47048 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 47049 error cannot occur since all byte values are valid characters.

**47050 EXAMPLES**

47051 None.

**47052 APPLICATION USAGE**

47053 None.

**47054 RATIONALE**

47055 When the ISO C standard introduced threads in C11, it required *mbtowc()* to avoid data races  
47056 (with itself as well as with other functions), whereas POSIX.1-2008 did not require it to be  
47057 thread-safe, and in many implementations it did not avoid data races with itself and still does  
47058 not. The ISO C committee intend to change the requirements in a future version of the ISO C  
47059 standard, but since POSIX.1 currently refers to C17 it is necessary for it not to defer to the ISO C  
47060 standard regarding data races in order to continue to allow this function not to avoid data races  
47061 with itself.

**47062 FUTURE DIRECTIONS**

47063 It is expected that a change in a future version of the ISO C standard will allow a future version  
47064 of this standard to remove the data race exception from the statement that it defers to the ISO C  
47065 standard.

**47069 CHANGE HISTORY**

47070 First released in Issue 4. Aligned with the ISO C standard.

**47071 Issue 6**

47072 The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

47073 Extensions beyond the ISO C standard are marked.

**47074 Issue 7**

47075 Austin Group Interpretation 1003.1-2001 #170 is applied.

47076 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0372 [109] and XSH/TC1-2008/0373  
47077 [195] are applied.

47078 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0209 [663,674] is applied.

**47079 Issue 8**

47080 Austin Group Defects 708 and 1302 are applied, aligning this function with the  
47081 ISO/IEC 9899:2018 standard, except in relation to data races.

47082 **NAME**

47083 memccpy — copy bytes in memory

47084 **SYNOPSIS**

```
47085 XSI #include <string.h>
47086 void *memccpy(void *restrict s1, const void *restrict s2,
47087               int c, size_t n);
```

47088 **DESCRIPTION**

47089 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first  
47090 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,  
47091 whichever comes first. If copying takes place between objects that overlap, the behavior is  
47092 undefined.

47093 The *memccpy()* function shall not change the setting of *errno* on valid input.

47094 **RETURN VALUE**

47095 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null  
47096 pointer if *c* was not found in the first *n* bytes of *s2*.

47097 **ERRORS**

47098 No errors are defined.

47099 **EXAMPLES**

47100 None.

47101 **APPLICATION USAGE**

47102 The *memccpy()* function does not check for the overflow of the receiving memory area.

47103 **RATIONALE**

47104 None.

47105 **FUTURE DIRECTIONS**

47106 None.

47107 **SEE ALSO**

47108 XBD [<string.h>](#)

47109 **CHANGE HISTORY**

47110 First released in Issue 1. Derived from Issue 1 of the SVID.

47111 **Issue 6**

47112 The **restrict** keyword is added to the *memccpy()* prototype for alignment with the  
47113 ISO/IEC 9899:1999 standard.

47114 **Issue 8**

47115 Austin Group Defect 448 is applied, adding a requirement that *memccpy()* does not change the  
47116 setting of *errno* on valid input.

47117 **NAME**

47118 memchr — find byte in memory

47119 **SYNOPSIS**

47120 #include &lt;string.h&gt;

47121 void \*memchr(const void \*s, int c, size\_t n);

47122 **DESCRIPTION**

47123 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
47124 conflict between the requirements described here and the ISO C standard is unintentional. This  
47125 volume of POSIX.1-2024 defers to the ISO C standard.

47126 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in  
47127 the initial *n* bytes (each interpreted as **unsigned char**) pointed to by *s*.

47128 The implementation shall behave as if it reads the bytes sequentially and stops as soon as a  
47129 matching byte is found.

47130 CX The *memchr()* function shall not change the setting of *errno* on valid input.

47131 **RETURN VALUE**

47132 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte is  
47133 not found.

47134 **ERRORS**

47135 No errors are defined.

47136 **EXAMPLES**

47137 None.

47138 **APPLICATION USAGE**

47139 None.

47140 **RATIONALE**

47141 None.

47142 **FUTURE DIRECTIONS**

47143 None.

47144 **SEE ALSO**47145 XBD <[string.h](#)>47146 **CHANGE HISTORY**

47147 First released in Issue 1. Derived from Issue 1 of the SVID.

47148 **Issue 7**

47149 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0374 [110] is applied.

47150 **Issue 8**

47151 Austin Group Defect 448 is applied, adding a requirement that *memchr()* does not change the  
47152 setting of *errno* on valid input.

47153 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
47154 standard.

47155 **NAME**

47156       memcmp — compare bytes in memory

47157 **SYNOPSIS**

47158       #include &lt;string.h&gt;

47159       int memcmp(const void \*s1, const void \*s2, size\_t n);

47160 **DESCRIPTION**47161 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
47162       conflict between the requirements described here and the ISO C standard is unintentional. This  
47163       volume of POSIX.1-2024 defers to the ISO C standard.47164       The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the  
47165       object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.47166       The sign of a non-zero return value shall be determined by the sign of the difference between the  
47167       values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects  
47168       being compared.47169 CX       The *memcmp()* function shall not change the setting of *errno* on valid input.47170 **RETURN VALUE**47171       The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object  
47172       pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.47173 **ERRORS**

47174       No errors are defined.

47175 **EXAMPLES**

47176       None.

47177 **APPLICATION USAGE**

47178       None.

47179 **RATIONALE**

47180       None.

47181 **FUTURE DIRECTIONS**

47182       None.

47183 **SEE ALSO**47184       XBD <[string.h](#)>47185 **CHANGE HISTORY**

47186       First released in Issue 1. Derived from Issue 1 of the SVID.

47187 **Issue 8**47188       Austin Group Defect 448 is applied, adding a requirement that *memcmp()* does not change the  
47189       setting of *errno* on valid input.

47190 **NAME**

47191       memcpy — copy bytes in memory

47192 **SYNOPSIS**

47193       #include &lt;string.h&gt;

47194       void \*memcpy(void \*restrict *s1*, const void \*restrict *s2*, size\_t *n*);47195 **DESCRIPTION**

47196 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
47197 conflict between the requirements described here and the ISO C standard is unintentional. This  
47198 volume of POSIX.1-2024 defers to the ISO C standard.

47199       The *memcpy()* function shall copy *n* bytes from the object pointed to by *s2* into the object pointed  
47200 to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

47201 CX       The *memcpy()* function shall not change the setting of *errno* on valid input.

47202 **RETURN VALUE**47203       The *memcpy()* function shall return *s1*; no return value is reserved to indicate an error.47204 **ERRORS**

47205       No errors are defined.

47206 **EXAMPLES**

47207       None.

47208 **APPLICATION USAGE**47209       The *memcpy()* function does not check for the overflow of the receiving memory area.47210 **RATIONALE**

47211       None.

47212 **FUTURE DIRECTIONS**

47213       None.

47214 **SEE ALSO**47215       XBD <[string.h](#)>47216 **CHANGE HISTORY**

47217       First released in Issue 1. Derived from Issue 1 of the SVID.

47218 **Issue 6**47219       The *memcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.47220 **Issue 8**47221       Austin Group Defect 448 is applied, adding a requirement that *memcpy()* does not change the  
47222 setting of *errno* on valid input.

47223 **NAME**

47224 memmem — find a byte subsequence in a byte sequence

47225 **SYNOPSIS**

```
47226 CX #include <string.h>
47227 void *memmem(const void *haystack, size_t haystacklen,
47228             const void *needle, size_t needlelen);
```

47229 **DESCRIPTION**

47230 The *memmem()* function shall locate the first occurrence of byte sequence *needle* of length  
47231 *needlelen* in byte sequence *haystack* of length *haystacklen*.

47232 **RETURN VALUE**

47233 Upon successful completion, *memmem()* shall return a pointer to the the first byte of the located  
47234 byte sequence in *haystack*, or a null pointer if the byte sequence is not found.

47235 If *needlelen* is zero, the function shall return *haystack*.

47236 If *haystacklen* is less than *needlelen*, the function shall return a null pointer.

47237 **ERRORS**

47238 No errors are defined.

47239 **EXAMPLES**

47240 None.

47241 **APPLICATION USAGE**

47242 None.

47243 **RATIONALE**

47244 This function is similar to *strstr()*, except that NUL bytes may be included in either *needle* or  
47245 *haystack*.

47246 **FUTURE DIRECTIONS**

47247 None.

47250 XBD [\*\*<string.h>\*\*](#)

47251 **CHANGE HISTORY**

47252 First released in Issue 8.

47253 **NAME**

47254 memmove — copy bytes in memory with overlapping areas

47255 **SYNOPSIS**

47256 #include &lt;string.h&gt;

47257 void \*memmove(void \*s1, const void \*s2, size\_t n);

47258 **DESCRIPTION**

47259 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
47260 conflict between the requirements described here and the ISO C standard is unintentional. This  
47261 volume of POSIX.1-2024 defers to the ISO C standard.

47262 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object  
47263 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first  
47264 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and  
47265 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

47266 CX The *memmove()* function shall not change the setting of *errno* on valid input.

47267 **RETURN VALUE**47268 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.47269 **ERRORS**

47270 No errors are defined.

47271 **EXAMPLES**

47272 None.

47273 **APPLICATION USAGE**

47274 None.

47275 **RATIONALE**

47276 None.

47277 **FUTURE DIRECTIONS**

47278 None.

47279 **SEE ALSO**47280 XBD <[string.h](#)>47281 **CHANGE HISTORY**

47282 First released in Issue 4. Derived from the ANSI C standard.

47283 **Issue 8**

47284 Austin Group Defect 448 is applied, adding a requirement that *memmove()* does not change the  
47285 setting of *errno* on valid input.

47286 **NAME**

47287       memset — set bytes in memory

47288 **SYNOPSIS**

47289       #include &lt;string.h&gt;

47290       void \*memset(void \*s, int c, size\_t n);

47291 **DESCRIPTION**47292 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
47293 conflict between the requirements described here and the ISO C standard is unintentional. This  
47294 volume of POSIX.1-2024 defers to the ISO C standard.47295       The `memset()` function shall copy `c` (converted to an **unsigned char**) into each of the first `n` bytes  
47296 of the object pointed to by `s`.47297 CX       The `memset()` function shall not change the setting of `errno` on valid input.47298 **RETURN VALUE**47299       The `memset()` function shall return `s`; no return value is reserved to indicate an error.47300 **ERRORS**

47301       No errors are defined.

47302 **EXAMPLES**

47303       None.

47304 **APPLICATION USAGE**

47305       None.

47306 **RATIONALE**

47307       None.

47308 **FUTURE DIRECTIONS**

47309       None.

47310 **SEE ALSO**47311       XBD <[string.h](#)>47312 **CHANGE HISTORY**

47313       First released in Issue 1. Derived from Issue 1 of the SVID.

47314 **Issue 8**47315       Austin Group Defect 448 is applied, adding a requirement that `memset()` does not change the  
47316 setting of `errno` on valid input.

47317 **NAME**

47318 mkdir, mkdirat — make a directory

47319 **SYNOPSIS**

47320 #include &lt;sys/stat.h&gt;

47321 int mkdir(const char \*path, mode\_t mode);

47322 OH #include &lt;fcntl.h&gt;

47323 int mkdirat(int fd, const char \*path, mode\_t mode);

47324 **DESCRIPTION**

47325 XSI The *mkdir()* function shall create a new directory with name *path*. The file permission bits and  
 47326 *S\_ISVTX* bit of the new directory shall be initialized from *mode*. The file permission bits of the  
 47327 *mode* argument shall be modified by the file creation mask of the process.

47328 XSI When bits in *mode* other than the file permission bits and *S\_ISVTX* are set, the meaning of these  
 47329 additional bits is implementation-defined.

47330 The directory's user ID shall be set to the process' effective user ID. The directory's group ID  
 47331 shall be set to the group ID of the parent directory or to the effective group ID of the process.  
 47332 Implementations shall provide a way to initialize the directory's group ID to the group ID of the  
 47333 parent directory. Implementations may, but need not, provide an implementation-defined way  
 47334 to initialize the directory's group ID to the effective group ID of the calling process.

47335 The newly created directory shall be an empty directory.

47336 If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

47337 Upon successful completion, *mkdir()* shall mark for update the last data access, last data  
 47338 modification, and last file status change timestamps of the directory. Also, the last data  
 47339 modification and last file status change timestamps of the directory that contains the new entry  
 47340 shall be marked for update.

47341 The *mkdirat()* function shall be equivalent to the *mkdir()* function except in the case where *path*  
 47342 specifies a relative path. In this case the newly created directory is created relative to the  
 47343 directory associated with the file descriptor *fd* instead of the current working directory. If  
 47344 the access mode of the open file description associated with the file descriptor is not O\_SEARCH,  
 47345 the function shall check whether directory searches are permitted using the current permissions  
 47346 of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function  
 47347 shall not perform the check.

47348 If *mkdirat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 47349 directory shall be used and the behavior shall be identical to a call to *mkdir()*.

47350 **RETURN VALUE**

47351 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 47352 return -1 and set *errno* to indicate the error. If -1 is returned, no directory shall be created.

47353 **ERRORS**

47354 These functions shall fail if:

47355 [EACCES] Search permission is denied on a component of the path prefix, or write  
 47356 permission is denied on the parent directory of the directory to be created.

47357 [EEXIST] The named file exists.

47358 [EILSEQ] The last pathname component of *path* is not a portable filename, and cannot be  
 47359 created in the target directory.

47360	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
47361		
47362	[EMLINK]	The link count of the parent directory would exceed {LINK_MAX}.
47363	[ENAMETOOLONG]	
47364		The length of a component of a pathname is longer than {NAME_MAX}.
47365	[ENOENT]	A component of the path prefix of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
47366		
47367	[ENOSPC]	The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.
47368		
47369	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.
47370		
47371	[EROFS]	The parent directory resides on a read-only file system.
47372		In addition, the <i>mkdirat()</i> function shall fail if:
47373	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
47374		
47375		
47376	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
47377		
47378	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
47379		
47380		These functions may fail if:
47381	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
47382		
47383	[ENAMETOOLONG]	
47384		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
47385		
47386		

## 47387 EXAMPLES

### 47388 Creating a Directory

47389 The following example shows how to create a directory named */home/cnd/mod1*, with  
 47390 read/write/search permissions for owner and group, and with read/search permissions for  
 47391 others.

```
47392 #include <sys/types.h>
47393 #include <sys/stat.h>
47394 int status;
47395 ...
47396 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

## 47397 APPLICATION USAGE

47398 None.

47399 **RATIONALE**

47400 The *mkdir()* function originated in 4.2 BSD and was added to System V in Release 3.0.

47401 4.3 BSD detects [ENAMETOOLONG].

47402 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the  
 47403 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2  
 47404 required that implementations provide a way to have the group ID be set to the group ID of the  
 47405 containing directory, but did not prohibit implementations also supporting a way to set the  
 47406 group ID to the effective group ID of the creating process. Conforming applications should not  
 47407 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 47408 group ID after the directory is created, or determine under what conditions the implementation  
 47409 will set the desired group ID.

47410 The purpose of the *mkdirat()* function is to create a directory in directories other than the current  
 47411 working directory without exposure to race conditions. Any part of the path of a file could be  
 47412 changed in parallel to the call to *mkdir()*, resulting in unspecified behavior. By opening a file  
 47413 descriptor for the target directory and using the *mkdirat()* function it can be guaranteed that the  
 47414 newly created directory is located relative to the desired directory.

47415 Implementations are encouraged to have *mkdir()* and *mkdirat()* report an [EILSEQ] error if the  
 47416 last component of *path* contains any bytes that have the encoded value of a <newline> character.

47417 **FUTURE DIRECTIONS**

47418 None.

47419 **SEE ALSO**

47421 XBD <fcntl.h>, <sys/stat.h>, <sys/types.h>

47422 **CHANGE HISTORY**

47423 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

47424 **Issue 6**

47425 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

47426 The following new requirements on POSIX implementations derive from alignment with the  
 47427 Single UNIX Specification:

47428 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 47429 required for conforming implementations of previous POSIX specifications, it was not  
 47430 required for UNIX applications.

47431 • The [ELOOP] mandatory error condition is added.

47432 • A second [ENAMETOOLONG] is added as an optional error condition.

47433 The following changes were made to align with the IEEE P1003.1a draft standard:

47434 • The [ELOOP] optional error condition is added.

47435 **Issue 7**

47436 Austin Group Interpretation 1003.1-2001 #143 is applied.

47437 The *mkdirat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 47438 Set Part 2.

47439 Changes are made related to support for finegrained timestamps.

47440 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0375 [461], XSH/TC1-2008/0376 [324],

47441 XSH/TC1-2008/0377 [277], XSH/TC1-2008/0378 [278], and XSH/TC1-2008/0379 [278] are  
47442 applied.

47443 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0210 [873], XSH/TC2-2008/0211 [591],  
47444 XSH/TC2-2008/0212 [817], XSH/TC2-2008/0213 [817], and XSH/TC2-2008/0214 [591] are  
47445 applied.

47446 **Issue 8**

47447 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
47448 filenames containing any bytes that have the encoded value of a <newline> character.

47449 Austin Group Defects 293 and 1734 are applied, adding the [EILSEQ] error.

47450 Austin Group Defect 1522 is applied, adding requirements relating to the S\_ISVTX bit.

47451 Austin Group Defect 1729 is applied, changing the description of the [ENOENT] error.

47452 **NAME**

47453 mkdtemp, mkostemp, mkstemp — create a unique directory or file

47454 **SYNOPSIS**

```
47455 CX #include <stdlib.h>
47456 char *mkdtemp(char *template);
47457 int mkostemp(char *template, int flag);
47458 int mkstemp(char *template);
```

47459 **DESCRIPTION**

47460 The *mkdtemp()* function shall create a directory with a unique name derived from *template*. The  
 47461 application shall ensure that the string provided in *template* is a pathname ending with at least  
 47462 six trailing 'X' characters. The *mkdtemp()* function shall modify the contents of *template* by  
 47463 replacing six or more 'X' characters at the end of the pathname with the same number of  
 47464 characters from the portable filename character set. The characters shall be chosen such that the  
 47465 resulting pathname does not duplicate the name of an existing file at the time of the call to  
 47466 *mkdtemp()*. The *mkdtemp()* function shall use the resulting pathname to create the new directory  
 47467 as if by a call to:

47468 `mkdir(pathname, S_IRWXU)`

47469 The *mkstemp()* function shall create a regular file with a unique name derived from *template* and  
 47470 return a file descriptor for the file open for reading and writing. The application shall ensure that  
 47471 the string provided in *template* is a pathname ending with at least six trailing 'X' characters. The  
 47472 *mkstemp()* function shall modify the contents of *template* by replacing six or more 'X' characters  
 47473 at the end of the pathname with the same number of characters from the portable filename  
 47474 character set. The characters shall be chosen such that the resulting pathname does not duplicate  
 47475 the name of an existing file at the time of the call to *mkstemp()*. The *mkstemp()* function shall use  
 47476 the resulting pathname to create the file, and obtain a file descriptor for it, as if by a call to:

47477 `open(pathname, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)`

47478 By behaving as if the `O_EXCL` flag for *open()* is set, the function prevents any possible race  
 47479 condition between testing whether the file exists and opening it for use.

47480 The *mkostemp()* function shall be equivalent to the *mkstemp()* function, except that the *flag*  
 47481 argument can contain additional flags to be used as if by *open()*. Behavior is unspecified if the  
 47482 *flag* argument contains more than the following flags:

47483 `O_APPEND` Set append mode.47484 `O_CLOEXEC` Set the `FD_CLOEXEC` file descriptor flag.47485 `O_CLOFORK` Set the `FD_CLOFORK` file descriptor flag.47486 SIO `O_DSYNC` Write according to the synchronized I/O data integrity completion.47487 SIO `O_RSYNC` Synchronized read I/O operations.47488 XSI|SIO `O_SYNC` Write according to synchronized I/O file integrity completion.47489 **RETURN VALUE**

47490 Upon successful completion, the *mkdtemp()* function shall return the value of *template*.  
 47491 Otherwise, it shall return a null pointer and shall set *errno* to indicate the error.

47492 Upon successful completion, the *mkstemp()* function shall return an open file descriptor.  
 47493 Otherwise, it shall return `-1` and shall set *errno* to indicate the error.

47494 **ERRORS**

47495 These functions shall fail if:

47496 [EINVAL] The string pointed to by *template* does not end in "XXXXXX".47497 The *mkostemp()* function may fail if:47498 [EINVAL] The value of the *flag* argument is invalid.47499 Additional error conditions for the *mkdtemp()* function are defined in *mkdir()*. Additional error  
47500 conditions for the *mkstemp()* and *mkostemp()* functions are defined in *open()*.47501 **EXAMPLES**47502 **Generating a Pathname**47503 The following example creates a file with a 10-character name beginning with the characters  
47504 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file  
47505 descriptor that identifies the file.

```

47506 #include <stdlib.h>
47507 ...
47508 char template[] = "/tmp/fileXXXXXX";
47509 int fd;
47510
47510 fd = mkstemp(template);

```

47511 **APPLICATION USAGE**

47512 It is possible to run out of letters.

47513 Portable applications should pass exactly six trailing 'X's in the template and no more;  
47514 implementations may treat any additional trailing 'X's as either a fixed or replaceable part of  
47515 the template. To be sure of only passing six, a fixed string of at least one non-'X' character  
47516 should precede the six 'X's.47517 Since 'X' is in the portable filename character set, some of the replacement characters can be  
47518 'X's, leaving part (or even all) of the template effectively unchanged.47519 **RATIONALE**47520 The O\_CLOEXEC and O\_CLOFORK flags of *mkostemp()* are necessary to avoid a data race in  
47521 multi-threaded applications. Without O\_CLOFORK, a file descriptor is leaked into a child  
47522 process created by one thread in the window between another thread creating a temporary file  
47523 descriptor with *mkstemp()* and then using *fcntl()* to set the FD\_CLOFORK flag. Without  
47524 O\_CLOEXEC, a temporary file descriptor intentionally inherited by child processes is similarly  
47525 leaked into an executed program if FD\_CLOEXEC is not set atomically.47526 Implementations are encouraged to have *mkdtemp()*, *mkostemp()*, and *mkstemp()* report an  
47527 [EILSEQ] error if the last component of the pathname in *template* contains any bytes that have  
47528 the encoded value of a <newline> character.47529 **FUTURE DIRECTIONS**

47530 None.

47531 **SEE ALSO**47532 *getpid()*, *mkdir()*, *open()*, *tmpfile()*, *tmpnam()*

47533 XBD &lt;stdlib.h&gt;

47534 **CHANGE HISTORY**

47535 First released in Issue 4, Version 2.

47536 **Issue 5**

47537 Moved from X/OPEN UNIX extension to BASE.

47538 **Issue 7**

47539 Austin Group Interpretation 1003.1-2001 #143 is applied.

47540 SD5-XSH-ERN-168 is applied, clarifying file permissions upon creation.

47541 The *mkstemp()* function is moved from the XSI option to the Base.47542 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

47544 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0380 [291], XSH/TC1-2008/0381 [324], and XSH/TC1-2008/0382 [291] are applied.

47546 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0215 [567,669] is applied.

47547 **Issue 8**

47548 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of filenames containing any bytes that have the encoded value of a &lt;newline&gt; character.

47550 Austin Group Defects 411, 1318, and 1350 are applied, adding *mkostemp()*.47551 Austin Group Defect 652 is applied, adding the [EINVAL] error for *mkstemp()*.47552 Austin Group Defect 1734 is applied, replacing the error conditions specified only for *mkdtemp()* with a reference to *mkdir()*.

47553

47554 **NAME**

47555 mkfifo, mkfifoat — make a FIFO special file

47556 **SYNOPSIS**

47557 #include &lt;sys/stat.h&gt;

47558 int mkfifo(const char \*path, mode\_t mode);

47559 OH #include &lt;fcntl.h&gt;

47560 int mkfifoat(int fd, const char \*path, mode\_t mode);

47561 **DESCRIPTION**

47562 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by  
 47563 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission  
 47564 bits of the *mode* argument shall be modified by the process' file creation mask.

47565 When bits in *mode* other than the file permission bits are set, the effect is implementation-  
 47566 defined.

47567 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

47568 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set  
 47569 to the group ID of the parent directory or to the effective group ID of the process.  
 47570 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the  
 47571 parent directory. Implementations may, but need not, provide an implementation-defined way  
 47572 to initialize the FIFO's group ID to the effective group ID of the calling process.

47573 Upon successful completion, *mkfifo()* shall mark for update the last data access, last data  
 47574 modification, and last file status change timestamps of the file. Also, the last data modification  
 47575 and last file status change timestamps of the directory that contains the new entry shall be  
 47576 marked for update.

47577 The *mkfifoat()* function shall be equivalent to the *mkfifo()* function except in the case where *path*  
 47578 specifies a relative path. In this case the newly created FIFO is created relative to the directory  
 47579 associated with the file descriptor *fd* instead of the current working directory. If the access mode  
 47580 of the open file description associated with the file descriptor is not O\_SEARCH, the function  
 47581 shall check whether directory searches are permitted using the current permissions of the  
 47582 directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not  
 47583 perform the check.

47584 If *mkfifoat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 47585 directory shall be used and the behavior shall be identical to a call to *mkfifo()*.

47586 **RETURN VALUE**

47587 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 47588 return -1 and set *errno* to indicate the error. If -1 is returned, no FIFO shall be created.

47589 **ERRORS**

47590 These functions shall fail if:

47591 [EACCES] A component of the path prefix denies search permission, or write permission  
 47592 is denied on the parent directory of the FIFO to be created.

47593 [EEXIST] The named file already exists.

47594 [EILSEQ] The last pathname component of *path* is not a portable filename, and cannot be  
 47595 created in the target directory.

47596	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
47597		
47598	[ENAMETOOLONG]	
47599		The length of a component of a pathname is longer than {NAME_MAX}.
47600	[ENOENT]	A component of the path prefix of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
47601		
47602	[ENOENT] or [ENOTDIR]	
47603		The <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters. If <i>path</i> without the trailing <code>&lt;slash&gt;</code> characters would name an existing file, an [ENOENT] error shall not occur.
47604		
47605		
47606	[ENOSPC]	The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.
47607		
47608	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.
47609		
47610	[EROFS]	The named file resides on a read-only file system.
47611		The <i>mkfifoat()</i> function shall fail if:
47612	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
47613		
47614		
47615	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
47616		
47617	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
47618		
47619		These functions may fail if:
47620	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
47621		
47622	[ENAMETOOLONG]	
47623		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
47624		
47625		

## 47626 EXAMPLES

### 47627 Creating a FIFO File

47628 The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with  
47629 read/write permissions for owner, and with read permissions for group and others.

```
47630 #include <sys/types.h>
47631 #include <sys/stat.h>
47632
47633 int status;
47634 ...
47635 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
47636             S_IRGRP | S_IROTH);
```

47636 **APPLICATION USAGE**

47637 None.

47638 **RATIONALE**

47639 The syntax of this function is intended to maintain compatibility with historical  
 47640 implementations of *mknod()*. The latter function was included in the 1984 /usr/group standard  
 47641 but only for use in creating FIFO special files. The *mknod()* function was originally excluded  
 47642 from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and  
 47643 *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX  
 47644 Specification.

47645 The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the  
 47646 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2  
 47647 required that implementations provide a way to have the group ID be set to the group ID of the  
 47648 containing directory, but did not prohibit implementations also supporting a way to set the  
 47649 group ID to the effective group ID of the creating process. Conforming applications should not  
 47650 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 47651 group ID after the FIFO is created, or determine under what conditions the implementation will  
 47652 set the desired group ID.

47653 The purpose of the *mkfifoat()* function is to create a FIFO special file in directories other than the  
 47654 current working directory without exposure to race conditions. Any part of the path of a file  
 47655 could be changed in parallel to a call to *mkfifo()*, resulting in unspecified behavior. By opening a  
 47656 file descriptor for the target directory and using the *mkfifoat()* function it can be guaranteed that  
 47657 the newly created FIFO is located relative to the desired directory.

47658 Implementations are encouraged to have *mkfifo()* and *mkfifoat()* report an [EILSEQ] error if the  
 47659 last component of *path* contains any bytes that have the encoded value of a <newline> character.

47660 **FUTURE DIRECTIONS**

47661 None.

47662 **SEE ALSO**47663 *chmod()*, *mknod()*, *umask()*

47664 XBD &lt;fcntl.h&gt;, &lt;sys/stat.h&gt;, &lt;sys/types.h&gt;

47665 **CHANGE HISTORY**

47666 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

47667 **Issue 6**

47668 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

47669 The following new requirements on POSIX implementations derive from alignment with the  
 47670 Single UNIX Specification:

47671 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 47672 required for conforming implementations of previous POSIX specifications, it was not  
 47673 required for UNIX applications.

47674 • The [ELOOP] mandatory error condition is added.

47675 • A second [ENAMETOOLONG] is added as an optional error condition.

47676 The following changes were made to align with the IEEE P1003.1a draft standard:

47677 • The [ELOOP] optional error condition is added.

47678 **Issue 7**

47679 Austin Group Interpretation 1003.1-2001 #143 is applied.

47680 The *mkfifoat()* function is added from The Open Group Technical Standard, 2006, Extended API  
47681 Set Part 2.

47682 Changes are made related to support for finegrained timestamps.

47683 Changes are made to allow a directory to be opened for searching.

47684 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0383 [461], XSH/TC1-2008/0384  
47685 [146,435], XSH/TC1-2008/0385 [324], XSH/TC1-2008/0386 [278], and XSH/TC1-2008/0387  
47686 [278] are applied.

47687 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0216 [873], XSH/TC2-2008/0217 [591],  
47688 XSH/TC2-2008/0218 [817], XSH/TC2-2008/0219 [822], XSH/TC2-2008/0220 [817], and  
47689 XSH/TC2-2008/0221 [591] are applied.

47690 **Issue 8**

47691 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
47692 filenames containing any bytes that have the encoded value of a <newline> character.

47693 Austin Group Defect 293 is applied, adding the [EILSEQ] error.

47694 **NAME**

47695 mknod, mknodat — make directory, special file, or regular file

47696 **SYNOPSIS**

```
47697 XSI #include <sys/stat.h>
47698 int mknod(const char *path, mode_t mode, dev_t dev);
```

```
47699 OH XSI #include <fcntl.h>
```

```
47700 XSI int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

47701 **DESCRIPTION**

47702 The *mknod()* function shall create a new file named by the pathname to which the argument *path*  
 47703 points.

47704 The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the  
 47705 following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

47712 The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S\_IFIFO or *dev* is  
 47713 not 0, the behavior of *mknod()* is unspecified.

47714 The permissions for the new file are OR'ed into the *mode* argument, and may be selected from  
 47715 any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

47732 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of  
 47733 the file shall be initialized to either the effective group ID of the process or the group ID of the  
 47734 parent directory. Implementations shall provide a way to initialize the file's group ID to the  
 47735 group ID of the parent directory. Implementations may, but need not, provide an  
 47736 implementation-defined way to initialize the file's group ID to the effective group ID of the

47737 calling process. The owner, group, and other permission bits of *mode* shall be modified by the file  
 47738 mode creation mask of the process. The *mknod()* function shall clear each bit whose  
 47739 corresponding bit in the file mode creation mask of the process is set.

47740 If *path* names a symbolic link, *mknod()* shall fail and set *errno* to [EEXIST].

47741 Upon successful completion, *mknod()* shall mark for update the last data access, last data  
 47742 modification, and last file status change timestamps of the file. Also, the last data modification  
 47743 and last file status change timestamps of the directory that contains the new entry shall be  
 47744 marked for update.

47745 Only a process with appropriate privileges may invoke *mknod()* for file types other than FIFO-  
 47746 special.

47747 The *mknodat()* function shall be equivalent to the *mknod()* function except in the case where *path*  
 47748 specifies a relative path. In this case the newly created directory, special file, or regular file is  
 47749 located relative to the directory associated with the file descriptor *fd* instead of the current  
 47750 working directory. If the access mode of the open file description associated with the file  
 47751 descriptor is not O\_SEARCH, the function shall check whether directory searches are permitted  
 47752 using the current permissions of the directory underlying the file descriptor. If the access mode  
 47753 is O\_SEARCH, the function shall not perform the check.

47754 If *mknodat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 47755 directory shall be used and the behavior shall be identical to a call to *mknod()*.

#### 47756 RETURN VALUE

47757 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 47758 return -1 and set *errno* to indicate the error. If -1 is returned, the new file shall not be created.

#### 47759 ERRORS

47760 These functions shall fail if:

47761 [EACCES] A component of the path prefix denies search permission, or write permission  
 47762 is denied on the parent directory.

47763 [EEXIST] The named file exists.

47764 [EILSEQ] The last pathname component of *path* is not a portable filename, and cannot be  
 47765 created in the target directory.

47766 [EINVAL] An invalid argument exists.

47767 [EIO] An I/O error occurred while accessing the file system.

47768 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 47769 argument.

47770 [ENAMETOOLONG]

47771 The length of a component of a pathname is longer than {NAME\_MAX}.

47772 [ENOENT] A component of the path prefix of *path* does not name an existing file or *path* is  
 47773 an empty string.

47774 [ENOENT] or [ENOTDIR]

47775 The *path* argument contains at least one non-*<slash>* character and ends with  
 47776 one or more trailing *<slash>* characters. If *path* without the trailing *<slash>*  
 47777 characters would name an existing file, an [ENOENT] error shall not occur.

47778	[ENOSPC]	The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.
47779		
47780	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.
47781		
47782	[EPERM]	The invoking process does not have appropriate privileges and the file type is not FIFO-special.
47783		
47784	[EROFS]	The directory in which the file is to be created is located on a read-only file system.
47785		
47786		The <i>mknodat()</i> function shall fail if:
47787	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
47788		
47789		
47790	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
47791		
47792	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
47793		
47794		These functions may fail if:
47795	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
47796		
47797	[ENAMETOOLONG]	The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
47798		
47799		
47800		

## EXAMPLES

### Creating a FIFO Special File

The following example shows how to create a FIFO special file named */home/cnd/mod\_done*, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

dev_t dev;
int status;
...
status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
              S_IRUSR | S_IRGRP | S_IROTH, dev);
```

## APPLICATION USAGE

The *mkfifo()* function is preferred over this function for making FIFO special files.

## RATIONALE

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the

47821 group ID after the file is created, or determine under what conditions the implementation will  
47822 set the desired group ID.

47823 The purpose of the *mknodat()* function is to create directories, special files, or regular files in  
47824 directories other than the current working directory without exposure to race conditions. Any  
47825 part of the path of a file could be changed in parallel to a call to *mknod()*, resulting in unspecified  
47826 behavior. By opening a file descriptor for the target directory and using the *mknodat()* function it  
47827 can be guaranteed that the newly created directory, special file, or regular file is located relative  
47828 to the desired directory.

47829 Implementations are encouraged to have *mknod()* and *mknodat()* report an [EILSEQ] error if the  
47830 last component of *path* contains any bytes that have the encoded value of a <newline> character.

#### 47831 **FUTURE DIRECTIONS**

47832 None.

#### 47833 **SEE ALSO**

47834 *chmod()*, *creat()*, *exec*, *fstatat()*, *mkdir()*, *mkfifo()*, *open()*, *umask()*

47835 XBD <fcntl.h>, <sys/stat.h>

#### 47836 **CHANGE HISTORY**

47837 First released in Issue 4, Version 2.

#### 47838 **Issue 5**

47839 Moved from X/OPEN UNIX extension to BASE.

#### 47840 **Issue 6**

47841 The normative text is updated to avoid use of the term “must” for application requirements.

47842 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
47843 [ELOOP] error condition is added.

#### 47844 **Issue 7**

47845 Austin Group Interpretation 1003.1-2001 #143 is applied.

47846 The *mknodat()* function is added from The Open Group Technical Standard, 2006, Extended API  
47847 Set Part 2.

47848 Changes are made related to support for finegrained timestamps.

47849 Changes are made to allow a directory to be opened for searching.

47850 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0388 [324], XSH/TC1-2008/0389 [461],  
47851 XSH/TC1-2008/0390 [146,435], XSH/TC1-2008/0391 [278], and XSH/TC1-2008/0392 [278] are  
47852 applied.

47853 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0222 [591], XSH/TC2-2008/0223 [817],  
47854 XSH/TC2-2008/0224 [822], XSH/TC2-2008/0225 [817], and XSH/TC2-2008/0226 [591] are  
47855 applied.

#### 47856 **Issue 8**

47857 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
47858 filenames containing any bytes that have the encoded value of a <newline> character.

47859 Austin Group Defect 293 is applied, adding the [EILSEQ] error.

47860 **NAME**

47861 mkostemp — create a unique file

47862 **SYNOPSIS**

```
47863 CX #include <stdlib.h>  
47864 int mkostemp(char *template, int flag);
```

47865 **DESCRIPTION**47866 Refer to *mkdtemp()*.

47867 **NAME**

47868 mkstemp — create a unique file

47869 **SYNOPSIS**

```
47870 CX #include <stdlib.h>  
47871 int mkstemp(char *template);
```

47872 **DESCRIPTION**

47873 Refer to *mkdtemp()*.

47874 **NAME**

47875 mktime — convert broken-down time into time since the Epoch

47876 **SYNOPSIS**

47877 #include &lt;time.h&gt;

47878 time\_t mktime(struct tm \*timeptr);

47879 **DESCRIPTION**

47880 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 47881 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47882 volume of POSIX.1-2024 defers to the ISO C standard.

47883 The *mktime()* function shall convert the broken-down time, expressed as local time, in some  
 47884 members of the structure pointed to by *timeptr*, into a time since the Epoch value with the same  
 47885 encoding as that of the values returned by *time()*. The *mktime()* function shall make use of only  
 47886 the *tm\_year*, *tm\_mon*, *tm\_mday*, *tm\_hour*, *tm\_min*, *tm\_sec*, and *tm\_isdst* members of the structure  
 47887 pointed to by *timeptr*; the values of these members shall not be restricted to the ranges described  
 47888 in <time.h>.

47889 CX Local timezone information shall be set as though *mktime()* called *tzset()*.

47890 The *mktime()* function shall calculate the time in seconds since the Epoch to be returned as if by  
 47891 manipulating the members of the **tm** structure according to the following steps.

- 47892 1. The *tm\_sec* member may, but should not, be brought into the range 0 to 60, inclusive. For  
 47893 each 60 seconds added to or subtracted from *tm\_sec*, a decrement or increment,  
 47894 respectively, of 1 minute shall be saved for later application.
- 47895 2. The *tm\_min* member shall be brought into the range 0 to 59, inclusive, and any saved  
 47896 decrement or increment of minutes shall then be applied, repeating the range adjustment  
 47897 afterwards if necessary. For each 60 minutes added to or subtracted from *tm\_min*, a  
 47898 decrement or increment, respectively, of 1 hour shall be saved for later application.
- 47899 3. The *tm\_hour* member shall be brought into the range 0 to 23, inclusive, and any saved  
 47900 decrement or increment of hours shall then be applied, repeating the range adjustment  
 47901 afterwards if necessary. For each 24 hours added to or subtracted from *tm\_hour*, a  
 47902 decrement or increment, respectively, of 1 day shall be saved for later application.
- 47903 4. The *tm\_mon* member shall be brought into the range 0 to 11, inclusive. For each 12 months  
 47904 added to or subtracted from *tm\_mon*, a decrement or increment, respectively, of 1 year  
 47905 shall be saved for later use.
- 47906 5. The *tm\_mday* member shall be brought into the range 1 to 31, inclusive, and any saved  
 47907 decrement or increment of days shall then be applied, repeating the range adjustment  
 47908 afterwards if necessary. Adjustments downwards shall be applied by subtracting the  
 47909 number of days (according to the Gregorian calendar) in month *tm\_mon+1* of the year  
 47910 obtained by adding/subtracting any saved increment/decrement of years to the value  
 47911 *tm\_year+1900*, and then incrementing *tm\_mon* by 1, repeated as necessary. Adjustments  
 47912 upwards shall be applied by adding the number of days in the month before month  
 47913 *tm\_mon+1* of the year obtained by adding/subtracting any saved increment/decrement of  
 47914 years to the value *tm\_year+1900*, and then decrementing *tm\_mon* by 1, repeated as  
 47915 necessary. During these adjustments, the *tm\_mon* value shall be kept within the range 0 to  
 47916 11, inclusive, by applying step 4 as necessary.
- 47917 6. If the *tm\_mday* member is greater than the number of days in month *tm\_mon+1* of the year  
 47918 obtained by adding/subtracting any saved increment/decrement of years to the value  
 47919 *tm\_year+1900*, that number of days shall be subtracted from *tm\_mday*, and *tm\_mon* shall

- 47920 be incremented by 1. If this results in *tm\_mon* having the value 12, step 4 shall be applied.
- 47921 7. The number of seconds since the Epoch in Coordinated Universal Time shall be  
 47922 calculated from the range-corrected values of the relevant **tm** structure members (or the  
 47923 original value where a member was not range corrected) as specified in the expression  
 47924 given in the definition of seconds since the Epoch (see XBD Section 4.19, on page 107),  
 47925 where the names other than *tm\_year* and *tm\_yday* in the structure and in the expression  
 47926 correspond, the *tm\_year* value used in the expression is the *tm\_year* in the structure  
 47927 plus/minus any saved increment/decrement of years, and the *tm\_yday* value used in the  
 47928 expression is the day of the year from 0 to 365 inclusive, calculated from the *tm\_mon* and  
 47929 *tm\_mday* members of the **tm** structure, for that year.
- 47930 8. The time since the Epoch shall be corrected for the offset of the local timezone's standard  
 47931 time from Coordinated Universal Time.
- 47932 9. The time since the Epoch shall be further corrected (if applicable—see below) for Daylight  
 47933 Saving Time.

47934 If the timezone is one that includes Daylight Saving Time (DST) adjustments, the value of  
 47935 *tm\_isdst* in the **tm** structure controls whether or not *mktime()* adjusts the calculated seconds since  
 47936 the Epoch value by the DST offset (after it has made the timezone adjustment), as follows:

- 47937 • If *tm\_isdst* is zero, *mktime()* shall not further adjust the seconds since the Epoch by the DST  
 47938 offset.
- 47939 • If *tm\_isdst* is positive, *mktime()* shall further adjust the seconds since the Epoch by the DST  
 47940 offset.
- 47941 • If *tm\_isdst* is negative, *mktime()* shall attempt to determine whether DST is in effect for the  
 47942 specified time; if it determines that DST is in effect it shall produce the same result as an  
 47943 equivalent call with a positive *tm\_isdst* value, otherwise it shall produce the same result as  
 47944 an equivalent call with a *tm\_isdst* value of zero. If the broken-down time specifies a time  
 47945 that is either skipped over or repeated when a transition to or from DST occurs, it is  
 47946 unspecified whether *mktime()* produces the same result as an equivalent call with a  
 47947 positive *tm\_isdst* value or as an equivalent call with a *tm\_isdst* value of zero.

47948 If the *TZ* environment variable specifies a geographical timezone for which the  
 47949 implementation's timezone database includes historical or future changes to the offset from  
 47950 Coordinated Universal Time of the timezone's standard time, and the broken-down time  
 47951 corresponds to a time that was (or will be) skipped over or repeated due to the occurrence of  
 47952 such a change, *mktime()* shall calculate the time since the Epoch value using either the offset in  
 47953 effect before the change or the offset in effect after the change.

47954 Upon successful completion, the members of the structure shall be set to the values that would  
 47955 be returned by a call to *localtime()* with the calculated time since the Epoch as its argument.

#### 47956 RETURN VALUE

47957 The *mktime()* function shall return the calculated time since the Epoch encoded as a value of  
 47958 type **time\_t**. If the time since the Epoch cannot be represented as a **time\_t** or the value to be  
 47959 returned in the *tm\_year* member of the structure pointed to by *timeptr* cannot be represented as  
 47960 an **int**, the function shall return the value (**time\_t**)−1 and set *errno* to [Eoverflow], and shall  
 47961 not change the value of the *tm\_wday* component of the structure.

47962 CX Since (**time\_t**)−1 is a valid return value for a successful call to *mktime()*, an application wishing  
 47963 to check for error situations should set *tm\_wday* to a value less than 0 or greater than 6 before  
 47964 calling *mktime()*. On return, if *tm\_wday* has not changed an error has occurred.

47965 **ERRORS**47966 The *mktime()* function shall fail if:

47967 CX [EOVERFLOW] The result cannot be represented.

47968 **EXAMPLES**

47969 What day of the week is July 4, 2001?

```

47970 #include <stdio.h>
47971 #include <time.h>
47972
47973 struct tm time_str;
47974
47975 char daybuf[20];
47976
47977 int main(void)
47978 {
47979     time_str.tm_year = 2001 - 1900;
47980     time_str.tm_mon = 7 - 1;
47981     time_str.tm_mday = 4;
47982     time_str.tm_hour = 0;
47983     time_str.tm_min = 0;
47984     time_str.tm_sec = 1;
47985     time_str.tm_isdst = -1;
47986     time_str.tm_wday = -1;
47987     if (mktime(&time_str) == (time_t)-1 && time_str.tm_wday == -1)
47988         (void)puts("-unknown-");
47989     else {
47990         (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
47991         (void)puts(daybuf);
47992     }
47993     return 0;
47994 }

```

47992 **APPLICATION USAGE**

47993 When using *mktime()* to add or subtract a fixed time period (one that always corresponds to a  
47994 fixed number of seconds) to or from a broken-down time in the local timezone, reliable results  
47995 for arbitrary TZ can only be assured by using *mktime()* to convert the original broken-down time  
47996 to a time since the Epoch, adding or subtracting the desired number of seconds to that value,  
47997 and then calling *localtime()* with the result. The alternative of adjusting the broken-down time  
47998 before calling *mktime()* may produce unexpected results if the original and updated times are on  
47999 different sides of a geographical timezone change. On implementations that follow the  
48000 recommendation of not range-correcting *tm\_sec* (see step 1 in the DESCRIPTION), reliable  
48001 results can also be assured by adding or subtracting the desired number of seconds to *tm\_sec*  
48002 (and not modifying any other members of the **tm** structure). In applications needing to be  
48003 portable to non-POSIX systems where the **time\_t** encoding is not a count of seconds, it is  
48004 recommended that conditional compilation is used such that the adjustment is performed on the  
48005 *mktime()* return value when possible, and otherwise on the *tm\_sec* member. For timezones that  
48006 are known not to have geographical timezone changes, such as TZ=UTC0, adjustments using just  
48007 *mktime()* do not have this problem.

48008 The way the *mktime()* function interprets out-of-range **tm** structure fields might not produce the  
48009 expected result when multiple adjustments are made at the same time. For example, if an  
48010 application tries to go back one day first and then one year by calling *localtime()*, decrementing  
48011 *tm\_mday* and *tm\_year*, and then calling *mktime()* this would not produce the expected result if it  
48012 was called on 2021-03-01 because *mktime()* would see the supplied year as 2020 (a leap year)

48013 and correct Mar 0 to Feb 29, whereas the intended result was Feb 28. Such issues can be avoided  
48014 by doing multiple adjustments one at a time when the order in which they are done matters.

48015 Examples of how *mktime()* handles some adjustments are:

- 48016 • If given Feb 29 in a non-leap year it treats that as the day after Feb 28 and gives back Mar 1.
- 48017 • If given Feb 0 it treats that as the day before Feb 1 and gives back Jan 31.
- 48018 • If given 21:65 it treats that as 6 minutes after 21:59 and gives back 22:05.
- 48019 • If given *tm\_isdst*=0 for a time when DST is in effect, it gives back a positive *tm\_isdst* and  
48020 alters the other fields appropriately.
- 48021 • If there is a DST transition where 02:00 standard time becomes 03:00 DST and *mktime()* is  
48022 given 02:30 (with negative *tm\_isdst*), it treats that as either 30 minutes after 02:00 standard  
48023 time or 30 minutes before 03:00 DST and gives back a zero or positive *tm\_isdst*,  
48024 respectively, with the *tm\_hour* field altered appropriately.
- 48025 • If a geographical timezone changes its UTC offset such that ``old 00:00`` becomes ``new  
48026 00:30`` and *mktime()* is given 00:20, it treats that as either 20 minutes after ``old 00:00`` or 10  
48027 minutes before ``new 00:30``, and gives back appropriately altered **struct tm** fields.

48028 If an application wants to check whether a given broken-down time is one that is skipped over, it  
48029 can do so by seeing whether the *tm\_mday*, *tm\_hour*, and *tm\_min* values it gets back from *mktime()*  
48030 are the same ones it fed in. Just checking *tm\_hour* and *tm\_min* might appear at first sight to  
48031 suffice, but *tm\_mday* could also change—without *tm\_hour* and *tm\_min* changing—if, for example,  
48032 *TZ* is set to "ABC12XYZ-12" (which might be used in a torture test) or if a geographical  
48033 timezone changes the offset from Coordinated Universal Time of its standard time by 24 hours.

#### 48034 RATIONALE

48035 In order to allow applications to distinguish between a successful return of **(time\_t)-1** and an  
48036 [EOverflow] error, *mktime()* is required not to change *tm\_wday* on error. This mechanism is  
48037 used rather than the convention used for other functions whereby the application sets *errno* to  
48038 zero before the call and the call does not change *errno* on error because the ISO C standard does  
48039 not require *mktime()* to set *errno* on error. The next revision of the ISO C standard is expected to  
48040 require that *mktime()* does not change *tm\_wday* when returning **(time\_t)-1** to indicate an error,  
48041 and that this return convention is used both for the case where the value to be returned by the  
48042 function cannot be represented as a **time\_t** and the case where the value to be returned in the  
48043 *tm\_year* member of the **tm** structure cannot be represented as an **int**.

48044 The DESCRIPTION section says that *mktime()* converts the specified broken-down time into  
48045 a time since the Epoch value. The use of the indefinite article here is necessary because, when  
48046 *tm\_isdst* is negative and the timezone has Daylight Saving Time transitions, there is not a one-to-  
48047 one correspondence between broken-down times and time since the Epoch values.

48048 The description of how the value of *tm\_isdst* affects the behavior of *mktime()* is shaded CX  
48049 because the requirements in the ISO C standard are unclear. The next revision of the ISO C  
48050 standard is expected to state the requirements using wording equivalent to the wording in this  
48051 standard.

48052 Implementations are encouraged not to range-correct *tm\_sec* (see step 1 in the DESCRIPTION) in  
48053 order for the results of making an adjustment to *tm\_sec* always to be equivalent to making the  
48054 same adjustment to the value returned by *mktime()*, even when the original and updated times  
48055 are on different sides of a geographical timezone change. This provides a way for applications to  
48056 do reliable fixed-period adjustment using only *mktime()*, as described in APPLICATION  
48057 USAGE.

48058 The described method for range-correcting the **tm** structure members uses separate variables to  
 48059 hold adjustment values to be applied later to other members, or (for the year adjustment) used  
 48060 in later calculations, because this is one way of avoiding intermediate member values that are  
 48061 not representable as an **int**. Implementations may use other methods; all that is required is that  
 48062 *tm\_year* is the only member for which an [EOverflow] error can occur.

48063 The described method for range-correcting *tm\_mday* would, if implemented that way, be highly  
 48064 inefficient for very large values. The efficiency can be improved by observing that any period of  
 48065 400 years always has the same number of days, so the month-by-month correction method need  
 48066 only be applied for a maximum of 4800 months.

#### 48067 FUTURE DIRECTIONS

48068 A future version of this standard may require that *mktime()* does not perform the optional range  
 48069 correction of the *tm\_sec* member of the **tm** structure described at step 1 in the DESCRIPTION.

48070 A future version of this standard is expected to add a *timegm()* function that is similar to  
 48071 *mktime()*, except that the **tm** structure pointed to by *timeptr* contains a broken-down time in  
 48072 Coordinated Universal Time (rather than the local timezone), where references to *localtime()* are  
 48073 replaced by references to *gmtime()*, and where there are no timezone offset or Daylight Saving  
 48074 Time adjustments. A combination of *gmtime()* and *timegm()* will be the expected way to perform  
 48075 arithmetic upon a **time\_t** value and remain compatible with the ISO C standard (where the  
 48076 internal structure of a **time\_t** is not specified), since attempting such manipulations using  
 48077 *localtime()* and *mktime()* can lead to unexpected results.

#### 48082 CHANGE HISTORY

48083 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C  
 48084 standard.

#### 48085 Issue 6

48086 Extensions beyond the ISO C standard are marked.

48087 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN  
 48088 VALUE and ERRORS sections to add the optional [EOverflow] error as a CX extension.

48089 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset()* function  
 48090 to the SEE ALSO section.

#### 48091 Issue 7

48092 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0393 [104] is applied.

48093 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0228 [724] is applied.

#### 48094 Issue 8

48095 Austin Group Defect 1253 is applied, changing “Daylight Savings” to “Daylight Saving”.

48096 Austin Group Defect 1613 is applied, changing the way the **tm** structure members used by  
 48097 *mktime()* are specified and clarifying that a successful call sets the members to the same values  
 48098 that would be returned by *localtime()*.

48099 Austin Group Defect 1614 is applied, clarifying how *tm\_isdst* is handled and the conditions  
 48100 under which (**time\_t**)-1 is returned.

48101 Austin Group Defect 1627 is applied, clarifying how *mktime()* calculates the time in seconds

48102

since the Epoch from the members of the **tm** structure.

48103 **NAME**48104 mlock, munlock — lock or unlock a range of process address space (**REALTIME**)48105 **SYNOPSIS**

```
48106 MLR #include <sys/mman.h>
48107 int mlock(const void *addr, size_t len);
48108 int munlock(const void *addr, size_t len);
```

48109 **DESCRIPTION**

48110 The *mlock()* function shall cause those whole pages containing any part of the address space of  
 48111 the process starting at address *addr* and continuing for *len* bytes to be memory-resident until  
 48112 unlocked or until the process exits or *execs* another process image. The implementation may  
 48113 require that *addr* be a multiple of {PAGESIZE}.

48114 The *munlock()* function shall unlock those whole pages containing any part of the address space  
 48115 of the process starting at address *addr* and continuing for *len* bytes, regardless of how many  
 48116 times *mlock()* has been called by the process for any of the pages in the specified range. The  
 48117 implementation may require that *addr* be a multiple of {PAGESIZE}.

48118 If any of the pages in the range specified to a call to *munlock()* are also mapped into the address  
 48119 spaces of other processes, any locks established on those pages by another process are  
 48120 unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a  
 48121 call to *munlock()* are also mapped into other portions of the address space of the calling process  
 48122 outside the range specified, any locks established on those pages via the other mappings are also  
 48123 unaffected by this call.

48124 Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-  
 48125 resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked  
 48126 with respect to the address space of the process. Memory residency of unlocked pages is  
 48127 unspecified.

48128 Appropriate privileges are required to lock process memory with *mlock()*.

48129 **RETURN VALUE**

48130 Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero.  
 48131 Otherwise, no change is made to any locks in the address space of the process, and the function  
 48132 shall return a value of -1 and set *errno* to indicate the error.

48133 **ERRORS**

48134 The *mlock()* and *munlock()* functions shall fail if:

48135 [ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does  
 48136 not correspond to valid mapped pages in the address space of the process.

48137 The *mlock()* function shall fail if:

48138 [EAGAIN] Some or all of the memory identified by the operation could not be locked  
 48139 when the call was made.

48140 The *mlock()* and *munlock()* functions may fail if:

48141 [EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

48142 The *mlock()* function may fail if:

48143 [ENOMEM] Locking the pages mapped by the specified range would exceed an  
 48144 implementation-defined limit on the amount of memory that the process may  
 48145 lock.

48146 [EPERM] The calling process does not have appropriate privileges to perform the  
48147 requested operation.

## 48159 CHANGE HISTORY

48160 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

### 48161 Issue 6

48162 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.

48163 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
48164 implementation does not support the Range Memory Locking option.

48165 **NAME**48166 mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)48167 **SYNOPSIS**

```
48168 ML #include <sys/mman.h>
48169 int mlockall(int flags);
48170 int munlockall(void);
```

48171 **DESCRIPTION**

48172 The *mlockall()* function shall cause all of the pages mapped by the address space of a process to  
 48173 be memory-resident until unlocked or until the process exits or *execs* another process image. The  
 48174 *flags* argument determines whether the pages to be locked are those currently mapped by the  
 48175 address space of the process, those that are mapped in the future, or both. The *flags* argument is  
 48176 constructed from the bitwise-inclusive OR of one or more of the following symbolic constants,  
 48177 defined in *<sys/mman.h>*:

48178 **MCL\_CURRENT** Lock all of the pages currently mapped into the address space of the process.

48179 **MCL\_FUTURE** Lock all of the pages that become mapped into the address space of the  
 48180 process in the future, when those mappings are established.

48181 If **MCL\_FUTURE** is specified, and the automatic locking of future mappings eventually causes  
 48182 the amount of locked memory to exceed the amount of available physical memory or any other  
 48183 implementation-defined limit, the behavior is implementation-defined. The manner in which the  
 48184 implementation informs the application of these situations is also implementation-defined.

48185 The *munlockall()* function shall unlock all currently mapped pages of the address space of the  
 48186 process. Any pages that become mapped into the address space of the process after a call to  
 48187 *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying  
 48188 **MCL\_FUTURE** or a subsequent call to *mlockall()* specifying **MCL\_CURRENT**. If pages mapped  
 48189 into the address space of the process are also mapped into the address spaces of other processes  
 48190 and are locked by those processes, the locks established by the other processes shall be  
 48191 unaffected by a call by this process to *munlockall()*.

48192 Upon successful return from the *mlockall()* function that specifies **MCL\_CURRENT**, all currently  
 48193 mapped pages of the address space of the process shall be memory-resident and locked. Upon  
 48194 return from the *munlockall()* function, all currently mapped pages of the address space of the  
 48195 process shall be unlocked with respect to the address space of the process. The memory  
 48196 residency of unlocked pages is unspecified.

48197 Appropriate privileges are required to lock process memory with *mlockall()*.

48198 **RETURN VALUE**

48199 Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no  
 48200 additional memory shall be locked, and the function shall return a value of  $-1$  and set *errno* to  
 48201 indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address  
 48202 space is unspecified.

48203 If it is supported by the implementation, the *munlockall()* function shall always return a value of  
 48204 zero. Otherwise, the function shall return a value of  $-1$  and set *errno* to indicate the error.

48205 **ERRORS**

48206 The *mlockall()* function shall fail if:

48207 **[EAGAIN]** Some or all of the memory identified by the operation could not be locked  
 48208 when the call was made.

48209	[EINVAL]	The <i>flags</i> argument is zero, or includes unimplemented flags.
48210		The <i>mlockall()</i> function may fail if:
48211	[ENOMEM]	Locking all of the pages currently mapped into the address space of the process would exceed an implementation-defined limit on the amount of memory that the process may lock.
48212		
48213		
48214	[EPERM]	The calling process does not have appropriate privileges to perform the requested operation.

48234 **NAME**

48235 mmap — map pages of memory

48236 **SYNOPSIS**

48237 #include &lt;sys/mman.h&gt;

48238 void \*mmap(void \*addr, size\_t len, int prot, int flags,  
48239 int fildes, off\_t off);48240 **DESCRIPTION**48241 The *mmap()* function shall establish a mapping between an address space of a process and a  
48242 memory object.48243 The *mmap()* function shall be supported for the following memory objects:

- 48244 • Regular files
- 48245 • Anonymous memory objects
- 48246 SHM • Shared memory objects
- 48247 TYM • Typed memory objects

48248 Support for any other type of file is unspecified.

48249 The format of the call is as follows:

48250 *pa*=mmap(*addr*, *len*, *prot*, *flags*, *fildes*, *off*);

48251 The *mmap()* function shall establish a mapping between the address space of the process at an  
48252 address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off*  
48253 for *len* bytes, or to an anonymous memory object of *len* bytes. The value of *pa* is an  
48254 implementation-defined function of the parameter *addr* and the values of *flags*, further described  
48255 below. A successful *mmap()* call shall return *pa* as its result. The address range starting at *pa* and  
48256 continuing for *len* bytes shall be legitimate for the possible (not necessarily current) address  
48257 space of the process. The range of bytes starting at *off* and continuing for *len* bytes shall be  
48258 legitimate for the possible (not necessarily current) offsets in the memory object represented by  
48259 *fildes*.

48260 TYM If *fildes* represents a typed memory object opened with either the  
48261 POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG  
48262 flag, the memory object to be mapped shall be that portion of the typed memory object allocated  
48263 by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap()*  
48264 is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling  
48265 process, *mmap()* shall fail.

48266 The mapping established by *mmap()* shall replace any previous mappings for those whole pages  
48267 containing any part of the address space of the process starting at *pa* and continuing for *len*  
48268 bytes.

48269 If the size of the mapped file changes after the call to *mmap()* as a result of some other operation  
48270 on the mapped file, the effect of references to portions of the mapped region that correspond to  
48271 added or removed portions of the file is unspecified.

48272 If *len* is zero, *mmap()* shall fail and no mapping shall be established.

48273 The parameter *prot* determines whether read, write, execute, or some combination of accesses  
48274 are permitted to the data being mapped. The *prot* shall be either PROT\_NONE or the bitwise-  
48275 inclusive OR of one or more of the other flags in the following table, defined in the  
48276 <sys/mman.h> header.

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap()* shall fail.

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT\_WRITE has not been set and shall not permit any access where PROT\_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-inclusive OR of PROT\_READ and PROT\_WRITE. The file descriptor *fildev* shall have been opened with read permission, regardless of the protection options specified. If PROT\_WRITE is specified, the application shall ensure that it has opened the file descriptor *fildev* with write permission unless MAP\_PRIVATE is specified in the *flags* parameter as described below.

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in `<sys/mman.h>`:

Symbolic Constant	Description
MAP_ANON	Synonym for MAP_ANONYMOUS.
MAP_ANONYMOUS	Map anonymous memory.
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

It is implementation-defined whether MAP\_FIXED shall be supported. MAP\_FIXED shall be supported on XSI-conformant systems.

MAP\_SHARED and MAP\_PRIVATE describe the disposition of write references to the memory object. If MAP\_SHARED is specified, write references shall change the underlying object. If MAP\_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP\_PRIVATE mapping is established are visible through the MAP\_PRIVATE mapping. Either MAP\_SHARED or MAP\_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP\_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

When *fildev* represents a typed memory object opened with either the POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fildev* represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fildev* represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fildev* represents a typed memory object opened with neither the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag nor the

48324 POSIX\_TYPED\_MEM\_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory  
 48325 object are mapped, exactly as when mapping a file or shared memory object. In this case, if two  
 48326 processes map an area of typed memory using the same *off* and *len* values and using file  
 48327 descriptors that refer to the same memory pool (either from the same port or from a different  
 48328 port), both processes shall map the same region of storage.

48329 When MAP\_FIXED is set in the *flags* argument, the implementation is informed that the value of  
 48330 *pa* shall be *addr*, exactly. If MAP\_FIXED is set, *mmap()* may return MAP\_FAILED and set *errno* to  
 48331 ML|MLR [EINVAL]. If a MAP\_FIXED request is successful, then any previous mappings or memory  
 48332 locks for those whole pages containing any part of the address range [*pa*,*pa+len*) shall be  
 48333 removed, as if by an appropriate call to *munmap()*, before the new mapping is established.

48334 When MAP\_FIXED is not set, the implementation uses *addr* in an implementation-defined  
 48335 manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the  
 48336 implementation deems suitable for a mapping of *len* bytes to the file. All implementations  
 48337 interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*,  
 48338 subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a  
 48339 process address near which the mapping should be placed. When the implementation selects a  
 48340 value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

48341 If MAP\_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off*  
 48342 parameter, modulo the page size as returned by *sysconf()* when passed *\_SC\_PAGESIZE* or  
 48343 *\_SC\_PAGE\_SIZE*. The implementation may require that *off* is a multiple of the page size. If  
 48344 MAP\_FIXED is specified, the implementation may require that *addr* is a multiple of the page  
 48345 size. The system performs mapping operations over whole pages. Thus, while the parameter *len*  
 48346 need not meet a size or alignment constraint, the system shall include, in any mapping  
 48347 operation, any partial page specified by the address range starting at *pa* and continuing for *len*  
 48348 bytes.

48349 If MAP\_ANONYMOUS (or its synonym MAP\_ANON) is specified, *fildev* is *-1*, and *off* is 0, then  
 48350 *mmap()* shall ignore *fildev* and instead establish a mapping to a new anonymous memory object  
 48351 of size *len*. The effect of specifying MAP\_ANONYMOUS (or MAP\_ANON) with other values of  
 48352 *fildev* or *off* is unspecified. Anonymous memory objects shall be initialized to all bits zero.

48353 The system shall always zero-fill any partial page at the end of an object. Further, the system  
 48354 shall never write out any modified portions of the last page of an object which are beyond its  
 48355 end. References within the address range starting at *pa* and continuing for *len* bytes to whole  
 48356 pages following the end of an object shall result in delivery of a SIGBUS signal.

48357 An implementation may generate SIGBUS signals when a reference would cause an error in the  
 48358 mapped object, such as out-of-space condition.

48359 The *mmap()* function shall add an extra reference to the file associated with the file descriptor  
 48360 *fildev* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be  
 48361 removed when there are no more mappings to the file.

48362 The last data access timestamp of the mapped file may be marked for update at any time  
 48363 between the *mmap()* call and the corresponding *munmap()* call. The initial read or write  
 48364 reference to a mapped region shall cause the file's last data access timestamp to be marked for  
 48365 update if it has not already been marked for update.

48366 The last data modification and last file status change timestamps of a file that is mapped with  
 48367 MAP\_SHARED and PROT\_WRITE shall be marked for update at some point in the interval  
 48368 between a write reference to the mapped region and the next call to *msync()* with MS\_ASYNC or  
 48369 MS\_SYNC for that portion of the file by any process. If there is no such call and if the  
 48370 underlying file is modified as a result of a write reference, then these timestamps shall be

- 48371 marked for update at some time after the write reference.
- 48372 There may be implementation-defined limits on the number of memory regions that can be  
48373 mapped (per process or per system).
- 48374 XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a  
48375 process is decreased by the use of *shmat()* is implementation-defined.
- 48376 If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the  
48377 mappings in the address range starting at *addr* and continuing for *len* bytes may have been  
48378 unmapped.
- 48379 **RETURN VALUE**
- 48380 Upon successful completion, the *mmap()* function shall return the address at which the mapping  
48381 was placed (*pa*); otherwise, it shall return a value of MAP\_FAILED and set *errno* to indicate the  
48382 error. The symbol MAP\_FAILED is defined in the `<sys/mman.h>` header. No successful return  
48383 from *mmap()* shall return the value MAP\_FAILED.
- 48384 **ERRORS**
- 48385 The *mmap()* function shall fail if:
- 48386 ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall()*, due to  
48387 a lack of resources.
- 48388 [EINVAL] The value of *len* is zero.
- 48389 [EINVAL] The value of *flags* is invalid (neither MAP\_PRIVATE nor MAP\_SHARED is  
48390 set).
- 48391 [EMFILE] The number of mapped regions would exceed an implementation-defined  
48392 limit (per process or per system).
- 48393 [ENOMEM] MAP\_FIXED was specified, and the range [*addr,addr+len*) exceeds that allowed  
48394 for the address space of a process; or, if MAP\_FIXED was not specified and  
48395 there is insufficient room in the address space to effect the mapping.
- 48396 ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall()*,  
48397 because it would require more space than the system is able to supply.
- 48398 TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory  
48399 object designated by *fildev* to allocate *len* bytes.
- 48400 [ENOTSUP] MAP\_FIXED or MAP\_PRIVATE was specified in the *flags* argument and the  
48401 implementation does not support this functionality.
- 48402 The implementation does not support the combination of accesses requested  
48403 in the *prot* argument.
- 48404 [ENXIO] MAP\_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is  
48405 invalid for the specified object.
- 48406 TYM [ENXIO] The *fildev* argument refers to a typed memory object that is not accessible from  
48407 the calling process.
- 48408 In addition, if MAP\_ANONYMOUS (or MAP\_ANON) is not set in *flags*, the *mmap()* function  
48409 shall fail if:
- 48410 [EACCES] The *fildev* argument is not open for read, regardless of the protection specified,  
48411 or *fildev* is not open for write and PROT\_WRITE was specified for a  
48412 MAP\_SHARED type mapping.

- 48413 [EBADF] The *fildes* argument is not a valid open file descriptor.
- 48414 [ENODEV] The *fildes* argument refers to a file whose type is not supported by *mmap()*.
- 48415 [EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset maximum established in the open file description associated with *fildes*.
- 48416
- 48417 [ENXIO] Addresses in the range [*off*,*off+len*) are invalid for the object specified by *fildes*.
- 48418 The *mmap()* function may fail if:
- 48419 [EINVAL] The *addr* argument (if MAP\_FIXED was specified) or *off* is not a multiple of the page size as returned by *sysconf()*, or is considered invalid by the implementation.
- 48420
- 48421

#### 48422 EXAMPLES

48423 None.

#### 48424 APPLICATION USAGE

48425 Use of *mmap()* may reduce the amount of memory available to other memory allocation functions.

48426

48427 Use of MAP\_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*. The use of MAP\_FIXED is discouraged, as it may prevent an implementation from making the most effective use of resources. Most implementations require that *off* and *addr* are multiples of the page size as returned by *sysconf()*.

48428

48429

48430

48431 The application must ensure correct synchronization when using *mmap()* in conjunction with any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

48432

48433 The *mmap()* function allows access to resources via address space manipulations, instead of *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the address to which the file was mapped. So, using pseudo-code to illustrate the way in which an existing program might be changed to use *mmap()*, the following:

48434

48435

48436

```
48437 fildes = open(...)
48438 lseek(fildes, some_offset)
48439 read(fildes, buf, len)
48440 /* Use data in buf. */
```

48441 becomes:

```
48442 fildes = open(...)
48443 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
48444 /* Use data at address. */
```

#### 48445 RATIONALE

48446 After considering several other alternatives, it was decided to adopt the *mmap()* definition found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is minimal, in that it describes only what has been built, and what appears to be necessary for a general and portable mapping facility.

48447

48448

48449

48450 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose mapping facility. It can be used to map any appropriate object, such as memory, files, devices, and so on, into the address space of a process.

48451

48452

48453 When a mapping is established, it is possible that the implementation may need to map more than is requested into the address space of the process because of hardware requirements. An application, however, cannot count on this behavior. Implementations that do not use a paged architecture may simply allocate a common memory region and return the address of it; such

48454

48455

48456

48457 implementations probably do not allocate any more than is necessary. References past the end of  
48458 the requested area are unspecified.

48459 If an application requests a mapping that overlaps existing mappings in the process, it might be  
48460 desirable that an implementation detect this and inform the application. However, if the  
48461 program specifies a fixed address mapping (which requires some implementation knowledge to  
48462 determine a suitable address, if the function is supported at all), then the program is presumed  
48463 to be successfully managing its own address space and should be trusted when it asks to map  
48464 over existing data structures. Furthermore, it is also desirable to make as few system calls as  
48465 possible, and it might be considered onerous to require an *munmap()* before an *mmap()* to the  
48466 same address range. This volume of POSIX.1-2024 specifies that the new mapping replaces any  
48467 existing mappings (implying an automatic *munmap()* on the address range), following existing  
48468 practice in this regard. The standard developers also considered whether there should be a way  
48469 for new mappings to overlay existing mappings, but found no existing practice for this.

48470 It is not expected that all hardware implementations are able to support all combinations of  
48471 permissions at all addresses. Implementations are required to disallow write access to mappings  
48472 without write permission and to disallow access to mappings without any access permission.  
48473 Other than these restrictions, implementations may allow access types other than those  
48474 requested by the application. For example, if the application requests only *PROT\_WRITE*, the  
48475 implementation may also allow read access. A call to *mmap()* fails if the implementation cannot  
48476 support allowing all the access requested by the application. For example, some  
48477 implementations cannot support a request for both write access and execute access  
48478 simultaneously. All implementations must support requests for no access, read access, write  
48479 access, and both read and write access. Strictly conforming code must only rely on the required  
48480 checks. These restrictions allow for portability across a wide range of hardware.

48481 The *MAP\_FIXED* address treatment is likely to fail for non-page-aligned values and for certain  
48482 architecture-dependent address ranges. Conforming implementations cannot count on being  
48483 able to choose address values for *MAP\_FIXED* without utilizing non-portable, implementation-  
48484 defined knowledge. Nonetheless, *MAP\_FIXED* is provided as a standard interface conforming  
48485 to existing practice for utilizing such knowledge when it is available.

48486 Similarly, in order to allow implementations that do not support virtual addresses, support for  
48487 directly specifying any mapping addresses via *MAP\_FIXED* is not required and thus a  
48488 conforming application may not count on it.

48489 The *MAP\_PRIVATE* function can be implemented efficiently when memory protection hardware  
48490 is available. When such hardware is not available, implementations can implement such  
48491 “mappings” by simply making a real copy of the relevant data into process private memory,  
48492 though this tends to behave similarly to *read()*.

48493 The function has been defined to allow for many different models of using shared memory.  
48494 However, all uses are not equally portable across all machine architectures. In particular, the  
48495 *mmap()* function allows the system as well as the application to specify the address at which to  
48496 map a specific region of a memory object. The most portable way to use the function is always to  
48497 let the system choose the address, specifying *NULL* as the value for the argument *addr* and not  
48498 to specify *MAP\_FIXED*.

48499 If it is intended that a particular region of a memory object be mapped at the same address in a  
48500 group of processes (on machines where this is even possible), then *MAP\_FIXED* can be used to  
48501 pass in the desired mapping address. The system can still be used to choose the desired address  
48502 if the first such mapping is made without specifying *MAP\_FIXED*, and then the resulting  
48503 mapping address can be passed to subsequent processes for them to pass in via *MAP\_FIXED*.  
48504 The availability of a specific address range cannot be guaranteed, in general.

48505 The `mmap()` function can be used to map a region of memory that is larger than the current size  
 48506 of the object. Memory access within the mapping but beyond the current end of the underlying  
 48507 objects may result in SIGBUS signals being sent to the process. The reason for this is that the size  
 48508 of the object can be manipulated by other processes and can change at any moment. The  
 48509 implementation should tell the application that a memory reference is outside the object where  
 48510 this can be detected; otherwise, written data may be lost and read data may not reflect actual  
 48511 data in the object.

48512 Note that references beyond the end of the object do not extend the object as the new end cannot  
 48513 be determined precisely by most virtual memory hardware. Instead, the size can be directly  
 48514 manipulated by `ftruncate()`.

48515 Process memory locking does apply to shared memory regions, and the `MCL_FUTURE`  
 48516 argument to `mlockall()` can be relied upon to cause new shared memory regions to be  
 48517 automatically locked.

48518 Existing implementations of `mmap()` return the value `-1` when unsuccessful. Since the casting of  
 48519 this value to type `void *` cannot be guaranteed by the ISO C standard to be distinct from a  
 48520 successful value, this volume of POSIX.1-2024 defines the symbol `MAP_FAILED`, which a  
 48521 conforming implementation does not return as the result of a successful call.

48522 Some historical implementations only supported `MAP_ANON`, some only supported  
 48523 `MAP_ANONYMOUS`, and some supported both spellings. This standard includes both  
 48524 spellings partly for application compatibility and partly because neither spelling was clearly  
 48525 more popular than the other at the time this feature was considered for standardization.

#### 48532 CHANGE HISTORY

48533 First released in Issue 4, Version 2.

#### 48534 Issue 5

48535 Moved from X/OPEN UNIX extension to BASE.

48536 Aligned with `mmap()` in the POSIX Realtime Extension as follows:

- 48537 • The DESCRIPTION is extensively reworded.
- 48538 • The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- 48539 • New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- 48540 • The value returned on failure is the value of the constant `MAP_FAILED`; this was  
 48541 previously defined as `-1`.

48542 Large File Summit extensions are added.

#### 48543 Issue 6

48544 The `mmap()` function is marked as part of the Memory Mapped Files option.

48545 The Open Group Corrigendum U028/6 is applied, changing `(void *)-1` to `MAP_FAILED`.

48546 The following new requirements on POSIX implementations derive from alignment with the  
 48547 Single UNIX Specification:

- 48548 • The DESCRIPTION is updated to describe the use of MAP\_FIXED.
- 48549 • The DESCRIPTION is updated to describe the addition of an extra reference to the file  
48550 associated with the file descriptor passed to *mmap()*.
- 48551 • The DESCRIPTION is updated to state that there may be implementation-defined limits on  
48552 the number of memory regions that can be mapped.
- 48553 • The DESCRIPTION is updated to describe constraints on the alignment and size of the *off*  
48554 argument.
- 48555 • The [EINVAL] and [EMFILE] error conditions are added.
- 48556 • The [EOVERFLOW] error condition is added. This change is to support large files.
- 48557 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:
- 48558 • The DESCRIPTION is updated to describe the cases when MAP\_PRIVATE and  
48559 MAP\_FIXED need not be supported.
- 48560 The following changes are made for alignment with IEEE Std 1003.1j-2000:
- 48561 • Semantics for typed memory objects are added to the DESCRIPTION.
- 48562 • New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- 48563 • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.
- 48564 The normative text is updated to avoid use of the term “must” for application requirements.
- 48565 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code  
48566 in the SYNOPSIS from MF | SHM to MC3 (notation for MF | SHM | TYM).
- 48567 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the  
48568 DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.
- 48569 **Issue 7**
- 48570 Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment  
48571 requirements and adding a note about the state of synchronization objects becoming undefined  
48572 when a shared region is unmapped.
- 48573 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
48574 the Base.
- 48575 Changes are made related to support for finegrained timestamps.
- 48576 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0229 [852] is applied.
- 48577 **Issue 8**
- 48578 Austin Group Defect 850 is applied, adding anonymous memory objects.

48579 **NAME**

48580 modf, modff, modfl — decompose a floating-point number

48581 **SYNOPSIS**

48582 #include &lt;math.h&gt;

48583 double modf(double *x*, double \**iptr*);48584 float modff(float *value*, float \**iptr*);48585 long double modfl(long double *value*, long double \**iptr*);48586 **DESCRIPTION**

48587 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 48588 conflict between the requirements described here and the ISO C standard is unintentional. This  
 48589 volume of POSIX.1-2024 defers to the ISO C standard.

48590 These functions shall break the argument *x* into integral and fractional parts, each of which has  
 48591 the same sign as the argument. It stores the integral part as a **double** (for the *modf()* function), a  
 48592 **float** (for the *modff()* function), or a **long double** (for the *modfl()* function), in the object pointed  
 48593 to by *iptr*.

48594 **RETURN VALUE**48595 Upon successful completion, these functions shall return the signed fractional part of *x*.

48596 MX The returned value shall be exact and shall be independent of the current rounding direction  
 48597 mode.

48598 If *x* is NaN, a NaN shall be returned, and \**iptr* shall be set to a NaN.48599 If *x* is  $\pm\text{Inf}$ ,  $\pm 0$  shall be returned, and \**iptr* shall be set to  $\pm\text{Inf}$ .48600 **ERRORS**

48601 No errors are defined.

48602 **EXAMPLES**

48603 None.

48604 **APPLICATION USAGE**48605 The *modf()* function computes the function result and \**iptr* such that:48606 `a = modf(x, iptr) ;`48607 `x == a+*iptr ;`

48608 allowing for the usual floating-point inaccuracies.

48609 **RATIONALE**

48610 None.

48611 **FUTURE DIRECTIONS**

48612 None.

48613 **SEE ALSO**48614 *frexp()*, *isnan()*, *ldexp()*

48615 XBD &lt;math.h&gt;

48616 **CHANGE HISTORY**

48617 First released in Issue 1. Derived from Issue 1 of the SVID.

48618 **Issue 5**

48619 The DESCRIPTION is updated to indicate how an application should check for an error. This  
48620 text was previously published in the APPLICATION USAGE section.

48621 **Issue 6**

48622 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999  
48623 standard.

48624 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
48625 revised to align with the ISO/IEC 9899:1999 standard.

48626 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
48627 marked.

48628 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example  
48629 in the APPLICATION USAGE section.

48630 **Issue 8**

48631 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
48632 standard.

48633 **NAME**

48634 mprotect — set protection of memory mapping

48635 **SYNOPSIS**

48636 #include &lt;sys/mman.h&gt;

48637 int mprotect(void \*addr, size\_t len, int prot);

48638 **DESCRIPTION**

48639 The *mprotect()* function shall change the access protections to be that specified by *prot* for those  
 48640 whole pages containing any part of the address space of the process starting at address *addr* and  
 48641 continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some  
 48642 combination of accesses are permitted to the data being mapped. The *prot* argument should be  
 48643 either PROT\_NONE or the bitwise-inclusive OR of one or more of PROT\_READ, PROT\_WRITE,  
 48644 and PROT\_EXEC.

48645 If an implementation cannot support the combination of access types specified by *prot*, the call to  
 48646 *mprotect()* shall fail.

48647 An implementation may permit accesses other than those specified by *prot*; however, no  
 48648 implementation shall permit a write to succeed where PROT\_WRITE has not been set or shall  
 48649 permit any access where PROT\_NONE alone has been set. Implementations shall support at  
 48650 least the following values of *prot*: PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-  
 48651 inclusive OR of PROT\_READ and PROT\_WRITE. If PROT\_WRITE is specified, the application  
 48652 shall ensure that it has opened the mapped objects in the specified address range with write  
 48653 permission, unless MAP\_PRIVATE was specified in the original mapping, regardless of whether  
 48654 the file descriptors used to map the objects have since been closed.

48655 The implementation may require that *addr* be a multiple of the page size as returned by  
 48656 *sysconf()*.

48657 The behavior of this function is unspecified if the mapping was not established by a call to  
 48658 *mmap()*.

48659 When *mprotect()* fails for reasons other than [EINVAL], the protections on some of the pages in  
 48660 the range [*addr,addr+len*) may have been changed.

48661 **RETURN VALUE**

48662 Upon successful completion, *mprotect()* shall return 0; otherwise, it shall return -1 and set *errno*  
 48663 to indicate the error.

48664 **ERRORS**

48665 The *mprotect()* function shall fail if:

48666 [EACCES] The *prot* argument specifies a protection that violates the access permission the  
 48667 process has to the underlying memory object.

48668 [EAGAIN] The *prot* argument specifies PROT\_WRITE over a MAP\_PRIVATE mapping  
 48669 and there are insufficient memory resources to reserve for locking the private  
 48670 page.

48671 [ENOMEM] Addresses in the range [*addr,addr+len*) are invalid for the address space of a  
 48672 process, or specify one or more pages which are not mapped.

48673 [ENOMEM] The *prot* argument specifies PROT\_WRITE on a MAP\_PRIVATE mapping, and  
 48674 it would require more space than the system is able to supply for locking the  
 48675 private pages, if required.

48676 [ENOTSUP] The implementation does not support the combination of accesses requested  
48677 in the *prot* argument.

48678 The *mprotect()* function may fail if:

48679 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

#### 48680 EXAMPLES

48681 None.

#### 48682 APPLICATION USAGE

48683 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

#### 48684 RATIONALE

48685 None.

#### 48686 FUTURE DIRECTIONS

#### 48688 SEE ALSO

48689 *mmap()*, *sysconf()*

48690 XBD <[sys/mman.h](#)>

#### 48691 CHANGE HISTORY

48692 First released in Issue 4, Version 2.

#### 48693 Issue 5

48694 Moved from X/OPEN UNIX extension to BASE.

48695 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 48696 • The DESCRIPTION is largely reworded.
- 48697 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 48698 • [EAGAIN] is moved from the optional to the mandatory error conditions.

#### 48699 Issue 6

48700 The *mprotect()* function is marked as part of the Memory Protection option.

48701 The following new requirements on POSIX implementations derive from alignment with the  
48702 Single UNIX Specification:

- 48703 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
48704 of the page size as returned by *sysconf()*.
- 48705 • The [EINVAL] error condition is added.

48706 The normative text is updated to avoid use of the term “must” for application requirements.

#### 48707 Issue 7

48708 SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.

48709 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
48710 requirements.

48711 The *mprotect()* function is moved from the Memory Protection option to the Base.

48712 **NAME**48713 mq\_close — close a message queue (**REALTIME**)48714 **SYNOPSIS**

```
48715 MSG #include <mqueue.h>
48716 int mq_close(mqd_t mqdes);
```

48717 **DESCRIPTION**

48718 The *mq\_close()* function shall remove the association between the message queue descriptor, *mqdes*, and its message queue. The results of using this message queue descriptor after successful return from this *mq\_close()*, and until the return of this message queue descriptor from a subsequent *mq\_open()*, are undefined.

48722 If a message queue descriptor is implemented using a file descriptor, *mq\_close()* shall close the file descriptor.

48724 If the process has successfully attached a notification request to the message queue via this *mqdes*, this attachment shall be removed, and the message queue is available for another process to attach for notification.

48727 **RETURN VALUE**

48728 Upon successful completion, the *mq\_close()* function shall return a value of zero; otherwise, the function shall return a value of  $-1$  and set *errno* to indicate the error.

48730 **ERRORS**

48731 The *mq\_close()* function shall fail if:

48732 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

48733 **EXAMPLES**

48734 None.

48735 **APPLICATION USAGE**

48736 None.

48737 **RATIONALE**

48738 None.

48739 **FUTURE DIRECTIONS**

48740 None.

48741 **SEE ALSO**

48744 **CHANGE HISTORY**

48745 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

48746 **Issue 6**

48747 The *mq\_close()* function is marked as part of the Message Passing option.

48748 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

48750 **Issue 8**

48751 Austin Group Defect 368 is applied, adding a requirement that if a message queue descriptor is implemented using a file descriptor, *mq\_close()* closes the file descriptor.

48753 **NAME**48754 mq\_getattr — get message queue attributes (**REALTIME**)48755 **SYNOPSIS**

```
48756 MSG #include <mqueue.h>
48757 int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

48758 **DESCRIPTION**48759 The *mq\_getattr()* function shall obtain status information and attributes of the message queue  
48760 and the open message queue description associated with the message queue descriptor.48761 The *mqdes* argument specifies a message queue descriptor.48762 The results shall be returned in the **mq\_attr** structure referenced by the *mqstat* argument.48763 Upon return, the following members shall have the values associated with the open message  
48764 queue description as set when the message queue was opened and as modified by subsequent  
48765 *mq\_setattr()* calls: *mq\_flags*.48766 The following attributes of the message queue shall be returned as set at message queue  
48767 creation: *mq\_maxmsg*, *mq\_msgsize*.48768 Upon return, the following members within the **mq\_attr** structure referenced by the *mqstat*  
48769 argument shall be set to the current state of the message queue:48770 *mq\_curmsgs* The number of messages currently on the queue.48771 **RETURN VALUE**48772 Upon successful completion, the *mq\_getattr()* function shall return zero. Otherwise, the function  
48773 shall return  $-1$  and set *errno* to indicate the error.48774 **ERRORS**48775 The *mq\_getattr()* function may fail if:48776 [EBADF] The *mqdes* argument is not a valid message queue descriptor.48777 **EXAMPLES**48778 See *mq\_notify()*.48779 **APPLICATION USAGE**

48780 None.

48781 **RATIONALE**

48782 None.

48783 **FUTURE DIRECTIONS**

48784 None.

48785 **SEE ALSO**48786 *mq\_notify()*, *mq\_open()*, *mq\_send()*, *mq\_setattr()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*48787 XBD <**mqueue.h**>48788 **CHANGE HISTORY**

48789 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

48790 **Issue 6**48791 The *mq\_getattr()* function is marked as part of the Message Passing option.48792 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
48793 implementation does not support the Message Passing option.

48794  
48795

The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

48796  
48797

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS section to change the [EBADF] error from mandatory to optional.

48798 **NAME**48799 mq\_notify — notify process that a message is available (**REALTIME**)48800 **SYNOPSIS**

```
48801 MSG #include <mqueue.h>
48802 int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

48803 **DESCRIPTION**

48804 If the argument *notification* is not NULL, this function shall register the calling process to be  
 48805 notified of message arrival at an empty message queue associated with the specified message  
 48806 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to  
 48807 the process when the message queue transitions from empty to non-empty. At any time, only  
 48808 one process may be registered for notification by a message queue. If the calling process or any  
 48809 other process has already registered for notification of message arrival at the specified message  
 48810 queue, subsequent attempts to register for that message queue shall fail.

48811 If *notification* is NULL and the process is currently registered for notification by the specified  
 48812 message queue, the existing registration shall be removed.

48813 When the notification is sent to the registered process, its registration shall be removed. The  
 48814 message queue shall then be available for registration.

48815 If a process has registered for notification of message arrival at a message queue and some  
 48816 thread is blocked in *mq\_receive()* or *mq\_timedreceive()* waiting to receive a message when a  
 48817 message arrives at the queue, the arriving message shall satisfy the appropriate *mq\_receive()* or  
 48818 *mq\_timedreceive()*, respectively. The resulting behavior is as if the message queue remains empty,  
 48819 and no notification shall be sent.

48820 **RETURN VALUE**

48821 Upon successful completion, the *mq\_notify()* function shall return a value of zero; otherwise, the  
 48822 function shall return a value of  $-1$  and set *errno* to indicate the error.

48823 **ERRORS**

48824 The *mq\_notify()* function shall fail if:

48825 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

48826 [EBUSY] A process is already registered for notification by the message queue.

48827 The *mq\_notify()* function may fail if:

48828 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

48829 **EXAMPLES**

48830 The following program registers a notification request for the message queue named in its  
 48831 command-line argument. Notification is performed by creating a thread. The thread executes a  
 48832 function which reads one message from the queue and then terminates the process.

```
48833 #include <pthread.h>
48834 #include <signal.h>
48835 #include <mqueue.h>
48836 #include <assert.h>
48837 #include <stdio.h>
48838 #include <stdlib.h>
48839 #include <unistd.h>

48840 static void /* Thread start function */
48841 tfunc(union sigval sv)
```

```

48842     {
48843         struct mq_attr attr;
48844         ssize_t nr;
48845         void *buf;
48846         mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
48847
48848         /* Determine maximum msg size; allocate buffer to receive msg */
48849         if (mq_getattr(mqdes, &attr) == -1) {
48850             perror("mq_getattr");
48851             exit(EXIT_FAILURE);
48852         }
48853         buf = malloc(attr.mq_msgsize);
48854
48855         if (buf == NULL) {
48856             perror("malloc");
48857             exit(EXIT_FAILURE);
48858         }
48859         nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
48860         if (nr == -1) {
48861             perror("mq_receive");
48862             exit(EXIT_FAILURE);
48863         }
48864         printf("Read %ld bytes from message queue\n", (long) nr);
48865         free(buf);
48866         exit(EXIT_SUCCESS);      /* Terminate the process */
48867     }
48868
48869     int
48870     main(int argc, char *argv[])
48871     {
48872         mqd_t mqdes;
48873         struct sigevent not;
48874
48875         assert(argc == 2);
48876
48877         mqdes = mq_open(argv[1], O_RDONLY);
48878         if (mqdes == (mqd_t) -1) {
48879             perror("mq_open");
48880             exit(EXIT_FAILURE);
48881         }
48882         not.sigev_notify = SIGEV_THREAD;
48883         not.sigev_notify_function = tfunc;
48884         not.sigev_notify_attributes = NULL;
48885         not.sigev_value.sival_ptr = &mqdes;    /* Arg. to thread func. */
48886         if (mq_notify(mqdes, &not) == -1) {
48887             perror("mq_notify");
48888             exit(EXIT_FAILURE);
48889         }
48890
48891         pause();    /* Process will be terminated by thread function */
48892     }

```

48887 **APPLICATION USAGE**

48888 Since the `<mqueue.h>` header is only required to declare the `sigevent` structure tag as naming  
48889 an incomplete structure type, in order to use `mq_notify()` and pass it a pointer to a `sigevent`  
48890 structure, applications need to include `<signal.h>` so that `sigevent` will be fully defined.

48891 **RATIONALE**

48892 None.

48893 **FUTURE DIRECTIONS**

48894 None.

48895 **SEE ALSO**

48898 **CHANGE HISTORY**

48899 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

48900 **Issue 6**

48901 The `mq_notify()` function is marked as part of the Message Passing option.

48902 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
48903 implementation does not support the Message Passing option.

48904 The `mq_timedsend()` function is added to the SEE ALSO section for alignment with IEEE Std  
48905 1003.1d-1999.

48906 **Issue 7**

48907 SD5-XSH-ERN-38 is applied, adding the `mq_timedreceive()` function to the DESCRIPTION.

48908 Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

48909 An example is added.

48910 **Issue 8**

48911 Austin Group Defect 1282 is applied, changing the EXAMPLES and APPLICATION USAGE  
48912 sections.

48913 **NAME**48914 mq\_open — open a message queue (**REALTIME**)48915 **SYNOPSIS**

```
48916 MSG #include <mqueue.h>
48917 mqd_t mq_open(const char *name, int oflag, ...);
```

48918 **DESCRIPTION**

48919 The *mq\_open()* function shall establish the connection between a process and a message queue  
 48920 with a message queue descriptor. It shall create an open message queue description that refers to  
 48921 the message queue, and a message queue descriptor that refers to that open message queue  
 48922 description. The message queue descriptor is used by other functions to refer to that message  
 48923 queue. The *name* argument points to a string naming a message queue. It is unspecified whether  
 48924 the name appears in the file system and is visible to other functions that take pathnames as  
 48925 arguments. The *name* argument conforms to the construction rules for a pathname, except that  
 48926 the interpretation of <slash> characters other than the leading <slash> character in *name* is  
 48927 implementation-defined, and that the length limits for the *name* argument are implementation-  
 48928 defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If  
 48929 *name* begins with the <slash> character, then processes calling *mq\_open()* with the same value of  
 48930 *name* shall refer to the same message queue object, as long as that name has not been removed. If  
 48931 *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name*  
 48932 argument is not the name of an existing message queue and creation is not requested, *mq\_open()*  
 48933 shall fail and return an error.

48934 A message queue descriptor may be implemented using a file descriptor, in which case  
 48935 applications can open up to at least {OPEN\_MAX} file and message queues.

48936 The *oflag* argument requests the desired receive and/or send access to the message queue. The  
 48937 requested access permission to receive messages or send messages shall be granted if the calling  
 48938 process would be granted read or write access, respectively, to an equivalently protected file.

48939 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications  
 48940 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

48941 **O\_RDONLY** Open the message queue for receiving messages. The process can use the  
 48942 returned message queue descriptor with *mq\_receive()*, but not *mq\_send()*. A  
 48943 message queue may be open multiple times in the same or different processes  
 48944 for receiving messages.

48945 **O\_WRONLY** Open the queue for sending messages. The process can use the returned  
 48946 message queue descriptor with *mq\_send()* but not *mq\_receive()*. A message  
 48947 queue may be open multiple times in the same or different processes for  
 48948 sending messages.

48949 **O\_RDWR** Open the queue for both receiving and sending messages. The process can use  
 48950 any of the functions allowed for **O\_RDONLY** and **O\_WRONLY**. A message  
 48951 queue may be open multiple times in the same or different processes for  
 48952 sending messages.

48953 Any combination of the remaining flags may be specified in the value of *oflag*:

48954 **O\_CREAT** Create a message queue. It requires two additional arguments: *mode*, which  
 48955 shall be of type **mode\_t**, and *attr*, which shall be a pointer to an **mq\_attr**  
 48956 structure. If the pathname *name* has already been used to create a message  
 48957 queue that still exists, then this flag shall have no effect, except as noted under  
 48958 **O\_EXCL**. Otherwise, a message queue shall be created without any messages

48959 in it. The user ID of the message queue shall be set to the effective user ID of  
 48960 the process. The group ID of the message queue shall be set to the effective  
 48961 group ID of the process; however, if the *name* argument is visible in the file  
 48962 system, the group ID may be set to the group ID of the containing directory.  
 48963 When bits in *mode* other than the file permission bits are specified, the effect is  
 48964 unspecified. If *attr* is NULL, the message queue shall be created with  
 48965 implementation-defined default message queue attributes. If *attr* is non-NULL  
 48966 and the calling process has appropriate privileges on *name*, the message queue  
 48967 *mq\_maxmsg* and *mq\_msgsize* attributes shall be set to the values of the  
 48968 corresponding members in the **mq\_attr** structure referred to by *attr*. The  
 48969 values of the *mq\_flags* and *mq\_curmsgs* members of the **mq\_attr** structure shall  
 48970 be ignored. If *attr* is non-NULL, but the calling process does not have  
 48971 appropriate privileges on *name*, the *mq\_open()* function shall fail and return an  
 48972 error without creating the message queue.

48973 **O\_EXCL** If O\_EXCL and O\_CREAT are set, *mq\_open()* shall fail if the message queue  
 48974 *name* exists. The check for the existence of the message queue and the creation  
 48975 of the message queue if it does not exist shall be atomic with respect to other  
 48976 threads executing *mq\_open()* naming the same *name* with O\_EXCL and  
 48977 O\_CREAT set. If O\_EXCL is set and O\_CREAT is not set, the result is  
 48978 undefined.

48979 **O\_NONBLOCK** Determines whether an *mq\_send()* or *mq\_receive()* waits for resources or  
 48980 messages that are not currently available, or fails with *errno* set to [EAGAIN];  
 48981 see *mq\_send()* and *mq\_receive()* for details.

48982 The *mq\_open()* function does not add or remove messages from the queue.

#### 48983 RETURN VALUE

48984 Upon successful completion, the function shall return a message queue descriptor; otherwise,  
 48985 the function shall return (**mqd\_t**)−1 and set *errno* to indicate the error.

#### 48986 ERRORS

48987 The *mq\_open()* function shall fail if:

48988 [EACCES] The message queue exists and the permissions specified by *oflag* are denied, or  
 48989 the message queue does not exist and permission to create the message queue  
 48990 is denied.

48991 [EEXIST] O\_CREAT and O\_EXCL are set and the named message queue already exists.

48992 [EINTR] The *mq\_open()* function was interrupted by a signal.

48993 [EINVAL] The *mq\_open()* function is not supported for the given name.

48994 [EINVAL] O\_CREAT was specified in *oflag*, the value of *attr* is not NULL, and either  
 48995 *mq\_maxmsg* or *mq\_msgsize* was less than or equal to zero.

48996 [EMFILE] Too many message queue descriptors or file descriptors are currently in use by  
 48997 this process.

48998 [ENFILE] Too many message queue descriptors or file descriptors are currently open in  
 48999 the system.

49000 [ENOENT] O\_CREAT is not set and the named message queue does not exist.

49001 [ENOSPC] There is insufficient space for the creation of the new message queue.

49002 If any of the following conditions occur, the *mq\_open()* function may return (**mqd\_t**)−1 and set  
 49003 *errno* to the corresponding value.

49004 [ENAMETOOLONG]

49005 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems  
 49006 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
 49007 systems, or has a pathname component that is longer than  
 49008 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
 49009 longer than `{_XOPEN_NAME_MAX}` on XSI systems.

#### 49010 EXAMPLES

49011 None.

#### 49012 APPLICATION USAGE

49013 None.

#### 49014 RATIONALE

49015 None.

#### 49016 FUTURE DIRECTIONS

49017 A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics  
 49018 similar to normal file system operations.

#### 49019 SEE ALSO

49020 *mq\_close()*, *mq\_getattr()*, *mq\_receive()*, *mq\_send()*, *mq\_setattr()*, *mq\_unlink()*, *msgctl()*, *msgget()*,  
 49021 *msgrcv()*, *msgsnd()*

49022 XBD <[mqqueue.h](#)>

#### 49023 CHANGE HISTORY

49024 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 49025 Issue 6

49026 The *mq\_open()* function is marked as part of the Message Passing option.

49027 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 49028 implementation does not support the Message Passing option.

49029 The *mq\_timedreceive()* and *mq\_timedsend()* functions are added to the SEE ALSO section for  
 49030 alignment with IEEE Std 1003.1d-1999.

49031 The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

49032 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of  
 49033 the permission bits in the DESCRIPTION. The change is made for consistency with the  
 49034 *shm\_open()* and *sem\_open()* functions.

#### 49035 Issue 7

49036 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
 49037 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

49038 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

49039 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
 49040 user ID and group ID of the message queue.

49041 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0394 [259] is applied.

49042 **Issue 8**  
49043

Austin Group Defect 368 is applied, changing the [ENFILE] error.

49044 **NAME**49045 mq\_receive, mq\_timedreceive — receive a message from a message queue (**REALTIME**)49046 **SYNOPSIS**

```
49047 MSG #include <queue.h>
49048 ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
49049 unsigned *msg_prio);
49050 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
49051 size_t msg_len, unsigned *restrict msg_prio,
49052 const struct timespec *restrict abstime);
```

49053 **DESCRIPTION**

49054 The *mq\_receive()* function shall receive the oldest of the highest priority message(s) from the  
 49055 message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg\_len*  
 49056 argument, is less than the *mq\_msgsize* attribute of the message queue, the function shall fail and  
 49057 return an error. Otherwise, the selected message shall be removed from the queue and copied to  
 49058 the buffer pointed to by the *msg\_ptr* argument.

49059 If the value of *msg\_len* is greater than {SSIZE\_MAX}, the result is implementation-defined.

49060 If the argument *msg\_prio* is not NULL, the priority of the selected message shall be stored in the  
 49061 location referenced by *msg\_prio*.

49062 If the specified message queue is empty and O\_NONBLOCK is not set in the message queue  
 49063 description associated with *mqdes*, *mq\_receive()* shall block until a message is enqueued on the  
 49064 message queue or until *mq\_receive()* is interrupted by a signal. If more than one thread is waiting  
 49065 to receive a message when a message arrives at an empty queue and the Priority Scheduling  
 49066 option is supported, then the thread of highest priority that has been waiting the longest shall be  
 49067 selected to receive the message. Otherwise, it is unspecified which waiting thread receives the  
 49068 message. If the specified message queue is empty and O\_NONBLOCK is set in the message  
 49069 queue description associated with *mqdes*, no message shall be removed from the queue, and  
 49070 *mq\_receive()* shall return an error.

49071 The *mq\_timedreceive()* function shall receive the oldest of the highest priority messages from the  
 49072 message queue specified by *mqdes* as described for the *mq\_receive()* function. However, if  
 49073 O\_NONBLOCK was not specified when the message queue was opened via the *mq\_open()*  
 49074 function, and no message exists on the queue to satisfy the receive, the wait for such a message  
 49075 shall be terminated when the specified timeout expires. If O\_NONBLOCK is set, this function is  
 49076 equivalent to *mq\_receive()*.

49077 The timeout expires when the absolute time specified by *abstime* passes, as measured by the  
 49078 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 49079 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 49080 call.

49081 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 49082 be the resolution of the clock on which it is based.

49083 Under no circumstance shall the operation fail with a timeout if a message can be removed from  
 49084 the message queue immediately. The validity of the *abstime* parameter need not be checked if a  
 49085 message can be removed from the message queue immediately.

49086 **RETURN VALUE**

49087 Upon successful completion, the `mq_receive()` and `mq_timedreceive()` functions shall return the  
 49088 length of the selected message in bytes and the message shall be removed from the queue.  
 49089 Otherwise, no message shall be removed from the queue, the functions shall return a value of `-1`,  
 49090 and set `errno` to indicate the error.

49091 **ERRORS**

49092 These functions shall fail if:

49093 [EAGAIN] `O_NONBLOCK` was set in the message description associated with `mqdes`, and  
 49094 the specified message queue is empty.

49095 [EBADF] The `mqdes` argument is not a valid message queue descriptor open for reading.

49096 [EMSGSIZE] The specified message buffer size, `msg_len`, is less than the message size  
 49097 attribute of the message queue.

49098 [EINTR] The `mq_receive()` or `mq_timedreceive()` operation was interrupted by a signal.

49099 [EINVAL] The process or thread would have blocked, and the `abstime` parameter  
 49100 specified a nanoseconds field value less than zero or greater than or equal to  
 49101 1 000 million.

49102 [ETIMEDOUT] The `O_NONBLOCK` flag was not set when the message queue was opened,  
 49103 but no message arrived on the queue before the specified timeout expired.

49104 These functions may fail if:

49105 [EBADMSG] The implementation has detected a data corruption problem with the  
 49106 message.

49107 **EXAMPLES**

49108 None.

49109 **APPLICATION USAGE**

49110 None.

49111 **RATIONALE**

49112 None.

49113 **FUTURE DIRECTIONS**

49114 None.

49118 **CHANGE HISTORY**

49119 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

49120 **Issue 6**

49121 The `mq_receive()` function is marked as part of the Message Passing option.

49122 The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to  
 49123 `msg_len` rather than `maxsize`.

49124 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 49125 implementation does not support the Message Passing option.

49126 The following new requirements on POSIX implementations derive from alignment with the  
 49127 Single UNIX Specification:

49128 • In this function it is possible for the return value to exceed the range of the type `ssize_t`  
49129 (since `size_t` has a larger range of positive values than `ssize_t`). A sentence restricting the  
49130 size of the `size_t` object is added to the description to resolve this conflict.

49131 The `mq_timedreceive()` function is added for alignment with IEEE Std 1003.1d-1999.

49132 The `restrict` keyword is added to the `mq_timedreceive()` prototype for alignment with the  
49133 ISO/IEC 9899:1999 standard.

49134 IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for `mq_timedreceive()`  
49135 from `int` to `ssize_t`.

49136 **Issue 7**

49137 The `mq_timedreceive()` function is moved from the Timeouts option to the Base.

49138 Functionality relating to the Timers option is moved to the Base.

49139 **Issue 8**

49140 Austin Group Defect 592 is applied, removing text relating to `<time.h>` from the SYNOPSIS and  
49141 DESCRIPTION sections.

49142 **NAME**49143 mq\_send, mq\_timedsend — send a message to a message queue (**REALTIME**)49144 **SYNOPSIS**

```
49145 MSG #include <queue.h>
49146 int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
49147             unsigned msg_prio);
49148 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
49149                 unsigned msg_prio, const struct timespec *abstime);
```

49150 **DESCRIPTION**

49151 The *mq\_send()* function shall add the message pointed to by the argument *msg\_ptr* to the  
 49152 message queue specified by *mqdes*. The *msg\_len* argument specifies the length of the message, in  
 49153 bytes, pointed to by *msg\_ptr*. The value of *msg\_len* shall be less than or equal to the *mq\_msgsize*  
 49154 attribute of the message queue, or *mq\_send()* shall fail.

49155 If the specified message queue is not full, *mq\_send()* shall behave as if the message is inserted  
 49156 into the message queue at the position indicated by the *msg\_prio* argument. A message with a  
 49157 larger numeric value of *msg\_prio* shall be inserted before messages with lower values of  
 49158 *msg\_prio*. A message shall be inserted after other messages in the queue, if any, with equal  
 49159 *msg\_prio*. The value of *msg\_prio* shall be less than {MQ\_PRIO\_MAX}.

49160 If the specified message queue is full and O\_NONBLOCK is not set in the message queue  
 49161 description associated with *mqdes*, *mq\_send()* shall block until space becomes available to  
 49162 enqueue the message, or until *mq\_send()* is interrupted by a signal. If more than one thread is  
 49163 waiting to send when space becomes available in the message queue and the Priority Scheduling  
 49164 option is supported, then the thread of the highest priority that has been waiting the longest  
 49165 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is  
 49166 unblocked. If the specified message queue is full and O\_NONBLOCK is set in the message  
 49167 queue description associated with *mqdes*, the message shall not be queued and *mq\_send()* shall  
 49168 return an error.

49169 The *mq\_timedsend()* function shall add a message to the message queue specified by *mqdes* in the  
 49170 manner defined for the *mq\_send()* function. However, if the specified message queue is full and  
 49171 O\_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for  
 49172 sufficient room in the queue shall be terminated when the specified timeout expires. If  
 49173 O\_NONBLOCK is set in the message queue description, this function shall be equivalent to  
 49174 *mq\_send()*.

49175 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 49176 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 49177 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 49178 call.

49179 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 49180 be the resolution of the clock on which it is based.

49181 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the  
 49182 queue to add the message immediately. The validity of the *abstime* parameter need not be  
 49183 checked when there is sufficient room in the queue.

49184 **RETURN VALUE**

49185 Upon successful completion, the *mq\_send()* and *mq\_timedsend()* functions shall return a value of  
 49186 zero. Otherwise, no message shall be enqueued, the functions shall return  $-1$ , and *errno* shall be  
 49187 set to indicate the error.

**49188 ERRORS**

49189 The *mq\_send()* and *mq\_timedsend()* functions shall fail if:

- 49190 [EAGAIN] The O\_NONBLOCK flag is set in the message queue description associated  
49191 with *mqdes*, and the specified message queue is full.
- 49192 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.
- 49193 [EINTR] A signal interrupted the call to *mq\_send()* or *mq\_timedsend()*.
- 49194 [EINVAL] The value of *msg\_prio* was outside the valid range.
- 49195 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
49196 specified a nanoseconds field value less than zero or greater than or equal to  
49197 1 000 million.
- 49198 [EMSGSIZE] The specified message length, *msg\_len*, exceeds the message size attribute of  
49199 the message queue.
- 49200 [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened,  
49201 but the timeout expired before the message could be added to the queue.

**49202 EXAMPLES**

49203 None.

**49204 APPLICATION USAGE**

49205 The value of the symbol {MQ\_PRIO\_MAX} limits the number of priority levels supported by the  
49206 application. Message priorities range from 0 to {MQ\_PRIO\_MAX}-1.

**49207 RATIONALE**

49208 None.

**49209 FUTURE DIRECTIONS**

49210 None.

**49214 CHANGE HISTORY**

49215 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**49216 Issue 6**

49217 The *mq\_send()* function is marked as part of the Message Passing option.

49218 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
49219 implementation does not support the Message Passing option.

49220 The *mq\_timedsend()* function is added for alignment with IEEE Std 1003.1d-1999.

**49221 Issue 7**

49222 The *mq\_timedsend()* function is moved from the Timeouts option to the Base.

49223 Functionality relating to the Timers option is moved to the Base.

**49224 Issue 8**

49225 Austin Group Defect 592 is applied, removing text relating to [<time.h>](#) from the SYNOPSIS and  
49226 DESCRIPTION sections.

49227 **NAME**49228 mq\_setattr — set message queue attributes (**REALTIME**)49229 **SYNOPSIS**

```
49230 MSG #include <mqqueue.h>
49231 int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
49232               struct mq_attr *restrict omqstat);
```

49233 **DESCRIPTION**

49234 The *mq\_setattr()* function shall set attributes associated with the open message queue  
 49235 description referenced by the message queue descriptor specified by *mqdes*.

49236 The message queue attributes corresponding to the following members defined in the **mq\_attr**  
 49237 structure shall be set to the specified values upon successful completion of *mq\_setattr()*:

49238 *mq\_flags* The value of this member is the bitwise-logical OR of zero or more of  
 49239 **O\_NONBLOCK** and any implementation-defined flags.

49240 The values of the *mq\_maxmsg*, *mq\_msgsize*, and *mq\_curmsgs* members of the **mq\_attr** structure  
 49241 shall be ignored by *mq\_setattr()*.

49242 If *omqstat* is non-NULL, the *mq\_setattr()* function shall store, in the location referenced by  
 49243 *omqstat*, the previous message queue attributes and the current queue status. These values shall  
 49244 be the same as would be returned by a call to *mq\_getattr()* at that point.

49245 **RETURN VALUE**

49246 Upon successful completion, the function shall return a value of zero and the attributes of the  
 49247 message queue shall have been changed as specified.

49248 Otherwise, the message queue attributes shall be unchanged, and the function shall return a  
 49249 value of  $-1$  and set *errno* to indicate the error.

49250 **ERRORS**

49251 The *mq\_setattr()* function shall fail if:

49252 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

49253 **EXAMPLES**

49254 None.

49255 **APPLICATION USAGE**

49256 None.

49257 **RATIONALE**

49258 None.

49259 **FUTURE DIRECTIONS**

49260 None.

49261 **SEE ALSO**

49262 *mq\_open()*, *mq\_send()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

49263 XBD **<mqqueue.h>**

49264 **CHANGE HISTORY**

49265 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

49266 **Issue 6**

49267 The *mq\_setattr()* function is marked as part of the Message Passing option.

49268 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
49269 implementation does not support the Message Passing option.

49270 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std  
49271 1003.1d-1999.

49272 The **restrict** keyword is added to the *mq\_setattr()* prototype for alignment with the  
49273 ISO/IEC 9899:1999 standard.

49274 **NAME**

49275 mq\_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)

49276 **SYNOPSIS**

```
49277 MSG #include <mqueue.h>
49278      ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
49279                          size_t msg_len, unsigned *restrict msg_prio,
49280                          const struct timespec *restrict abstime);
```

49281 **DESCRIPTION**

49282 Refer to [mq\\_receive\(\)](#).

49283 **NAME**49284 mq\_timedsend — send a message to a message queue (**ADVANCED REALTIME**)49285 **SYNOPSIS**

```
49286 MSG #include <mqueue.h>
49287 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
49288 unsigned msg_prio, const struct timespec *abstime);
```

49289 **DESCRIPTION**49290 Refer to [mq\\_send\(\)](#).

49291 **NAME**49292 mq\_unlink — remove a message queue (**REALTIME**)49293 **SYNOPSIS**

```
49294 MSG #include <mqueue.h>
49295 int mq_unlink(const char *name);
```

49296 **DESCRIPTION**

49297 The *mq\_unlink()* function shall remove the message queue named by the string *name*. If one or  
 49298 more processes have the message queue open when *mq\_unlink()* is called, destruction of the  
 49299 message queue shall be postponed until all references to the message queue have been closed.  
 49300 However, the *mq\_unlink()* call need not block until all references have been closed; it may return  
 49301 immediately.

49302 After a successful call to *mq\_unlink()*, reuse of the name shall subsequently cause *mq\_open()* to  
 49303 behave as if no message queue of this name exists (that is, *mq\_open()* shall fail if **O\_CREAT** is not  
 49304 set, or shall create a new message queue if **O\_CREAT** is set).

49305 **RETURN VALUE**

49306 Upon successful completion, the function shall return a value of zero. Otherwise, the named  
 49307 message queue shall be unchanged by this function call, and the function shall return a value of  
 49308  $-1$  and set *errno* to indicate the error.

49309 **ERRORS**49310 The *mq\_unlink()* function shall fail if:

49311 [EACCES] Permission is denied to unlink the named message queue.

49312 [EINTR] The call to *mq\_unlink()* blocked waiting for all references to the named  
49313 message queue to be closed and a signal interrupted the call.

49314 [ENOENT] The named message queue does not exist.

49315 The *mq\_unlink()* function may fail if:

49316 [ENAMETOOLONG]

49317 The length of the *name* argument exceeds  $\{\_POSIX\_PATH\_MAX\}$  on systems  
 49318 XSI that do not support the XSI option or exceeds  $\{\_XOPEN\_PATH\_MAX\}$  on XSI  
 49319 systems, or has a pathname component that is longer than  
 49320 XSI  $\{\_POSIX\_NAME\_MAX\}$  on systems that do not support the XSI option or  
 49321 longer than  $\{\_XOPEN\_NAME\_MAX\}$  on XSI systems. A call to *mq\_unlink()*  
 49322 with a *name* argument that contains the same message queue name as was  
 49323 previously used in a successful *mq\_open()* call shall not give an  
 49324 [ENAMETOOLONG] error.

49325 **EXAMPLES**

49326 None.

49327 **APPLICATION USAGE**

49328 None.

49329 **RATIONALE**

49330 None.

**49331 FUTURE DIRECTIONS**

49332 A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics  
49333 similar to normal file system operations.

**49334 SEE ALSO**

49335 *mq\_close()*, *mq\_open()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

49336 XBD <[mqqueue.h](#)>

**49337 CHANGE HISTORY**

49338 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**49339 Issue 6**

49340 The *mq\_unlink()* function is marked as part of the Message Passing option.

49341 The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion,  
49342 the named message queue is unchanged by this function.

49343 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
49344 implementation does not support the Message Passing option.

**49345 Issue 7**

49346 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
49347 ``shall fail'' to a ``may fail'' error .

49348 Austin Group Interpretation 1003.1-2001 #141 is applied.

49349 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0230 [504] is applied.

49350 **NAME**

49351 mrnd48 — generate uniformly distributed pseudo-random signed long integers

49352 **SYNOPSIS**

49353 XSI `#include <stdlib.h>`

49354 `long mrnd48(void);`

49355 **DESCRIPTION**

49356 Refer to *drand48()*.

49357 **NAME**

49358 msgctl — XSI message control operations

49359 **SYNOPSIS**

```
49360 XSI      #include <sys/msg.h>
49361      int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

49362 **DESCRIPTION**

49363 The *msgctl()* function operates on XSI message queues (see XBD [Section 3.206](#), on page 61). It is  
 49364 unspecified whether this function interoperates with the realtime interprocess communication  
 49365 facilities defined in [Section 2.8](#) (on page 527).

49366 The *msgctl()* function shall provide message control operations as specified by *cmd*. The  
 49367 following values for *cmd*, and the message control operations they specify, are:

49368 **IPC\_STAT** Place the current value of each member of the **msqid\_ds** data structure  
 49369 associated with *msqid* into the structure pointed to by *buf*. The contents of this  
 49370 structure are defined in **<sys/msg.h>**.

49371 **IPC\_SET** Set the value of the following members of the **msqid\_ds** data structure  
 49372 associated with *msqid* to the corresponding value found in the structure  
 49373 pointed to by *buf*:

```
49374      msg_perm.uid
49375      msg_perm.gid
49376      msg_perm.mode
49377      msg_qbytes
```

49378 Also, the *msg\_ctime* timestamp shall be set to the current time, as described in  
 49379 [Section 2.7.1](#) (on page 526).

49380 **IPC\_SET** can only be executed by a process with appropriate privileges or that  
 49381 has an effective user ID equal to the value of **msg\_perm.cuid** or  
 49382 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*. Only a  
 49383 process with appropriate privileges can raise the value of **msg\_qbytes**.

49384 **IPC\_RMID** Remove the message queue identifier specified by *msqid* from the system and  
 49385 destroy the message queue and **msqid\_ds** data structure associated with it.  
 49386 **IPC\_RMID** can only be executed by a process with appropriate privileges or  
 49387 one that has an effective user ID equal to the value of **msg\_perm.cuid** or  
 49388 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*.

49389 **RETURN VALUE**

49390 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 49391 indicate the error.

49392 **ERRORS**

49393 The *msgctl()* function shall fail if:

49394 **[EACCES]** The argument *cmd* is **IPC\_STAT** and the calling process does not have read  
 49395 permission; see [Section 2.7](#) (on page 526).

49396 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*  
 49397 is not a valid command.

49398 **[EPERM]** The argument *cmd* is **IPC\_RMID** or **IPC\_SET** and the effective user ID of the  
 49399 calling process is not equal to that of a process with appropriate privileges and  
 49400 it is not equal to the value of **msg\_perm.cuid** or **msg\_perm.uid** in the data

49401 structure associated with *msqid*.

49402 [EPERM] The argument *cmd* is `IPC_SET`, an attempt is being made to increase to the  
49403 value of `msg_qbytes`, and the effective user ID of the calling process does not  
49404 have appropriate privileges.

49405 **EXAMPLES**

49406 None.

49407 **APPLICATION USAGE**

49408 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
49409 (IPC). Application developers who need to use IPC should design their applications so that  
49410 modules using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to  
49411 use the alternative interfaces.

49412 **RATIONALE**

49413 None.

49414 **FUTURE DIRECTIONS**

49415 None.

49420 **CHANGE HISTORY**

49421 First released in Issue 2. Derived from Issue 2 of the SVID.

49422 **Issue 5**

49423 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
49424 DIRECTIONS to a new APPLICATION USAGE section.

49425 **Issue 7**

49426 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0395 [345] is applied.

49427 **NAME**

49428 msgget — get the XSI message queue identifier

49429 **SYNOPSIS**

```
49430 XSI #include <sys/msg.h>
49431 int msgget(key_t key, int msgflg);
```

49432 **DESCRIPTION**

49433 The `msgget()` function operates on XSI message queues (see XBD Section 3.206, on page 61). It is  
 49434 unspecified whether this function interoperates with the realtime interprocess communication  
 49435 facilities defined in Section 2.8 (on page 527).

49436 The `msgget()` function shall return the message queue identifier associated with the argument  
 49437 `key`.

49438 A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`),  
 49439 shall be created for the argument `key` if one of the following is true:

- 49440 • The argument `key` is equal to `IPC_PRIVATE`.
- 49441 • The argument `key` does not already have a message queue identifier associated with it, and  
 49442 (`msgflg & IPC_CREAT`) is non-zero.

49443 Upon creation, the data structure associated with the new message queue identifier shall be  
 49444 initialized as follows:

- 49445 • `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set to the  
 49446 effective user ID and effective group ID, respectively, of the calling process.
- 49447 • The low-order 9 bits of `msg_perm.mode` shall be set to the low-order 9 bits of `msgflg`.
- 49448 • `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set to 0.
- 49449 • `msg_ctime` shall be set to the current time, as described in Section 2.7.1 (on page 526).
- 49450 • `msg_qbytes` shall be set to the system limit.

49451 **RETURN VALUE**

49452 Upon successful completion, `msgget()` shall return a non-negative integer, namely a message  
 49453 queue identifier. Otherwise, it shall return `-1` and set `errno` to indicate the error.

49454 **ERRORS**

49455 The `msgget()` function shall fail if:

- |                         |          |   |
|-------------------------|----------|---|
| 49456<br>49457<br>49458 | [EACCES] | A message queue identifier exists for the argument <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>msgflg</code> would not be granted; see Section 2.7 (on page 526). |
| 49459<br>49460          | [EEXIST] | A message queue identifier exists for the argument <code>key</code> but <code>((msgflg &amp; IPC_CREAT) &amp;&amp; (msgflg &amp; IPC_EXCL))</code> is non-zero.   |
| 49461<br>49462          | [ENOENT] | A message queue identifier does not exist for the argument <code>key</code> and <code>(msgflg &amp; IPC_CREAT)</code> is 0.   |
| 49463<br>49464<br>49465 | [ENOSPC] | A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.  |

49466 **EXAMPLES**

49467 None.

49468 **APPLICATION USAGE**

49469 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
49470 (IPC). Application developers who need to use IPC should design their applications so that  
49471 modules using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to  
49472 use the alternative interfaces.

49473 **RATIONALE**

49474 None.

49475 **FUTURE DIRECTIONS**

49476 None.

49482 First released in Issue 2. Derived from Issue 2 of the SVID.

49483 **Issue 5**

49484 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
49485 DIRECTIONS to a new APPLICATION USAGE section.

49486 **Issue 7**

49487 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0396 [345] and XSH/TC1-2008/0397  
49488 [344] are applied.

49489 **NAME**

49490 msgrcv — XSI message receive operation

49491 **SYNOPSIS**

```
49492 XSI      #include <sys/msg.h>
49493
49493      ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
49494                  int msgflg);
```

49495 **DESCRIPTION**

49496 The `msgrcv()` function operates on XSI message queues (see XBD [Section 3.206](#), on page 61). It is  
 49497 unspecified whether this function interoperates with the realtime interprocess communication  
 49498 facilities defined in [Section 2.8](#) (on page 527).

49499 The `msgrcv()` function shall read a message from the queue associated with the message queue  
 49500 identifier specified by `msqid` and place it in the user-defined buffer pointed to by `msgp`.

49501 The application shall ensure that the argument `msgp` points to a user-defined buffer that contains  
 49502 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 49503 the data bytes of the message. The structure below is an example of what this user-defined  
 49504 buffer might look like:

```
49505 struct mymsg {
49506     long    mtype;      /* Message type. */
49507     char    mtext[1];  /* Message text. */
49508 }
```

49509 The structure member `mtype` is the received message's type as specified by the sending process.

49510 The structure member `mtext` is the text of the message.

49511 The argument `msgsz` specifies the size in bytes of `mtext`. The received message shall be truncated  
 49512 to `msgsz` bytes if it is larger than `msgsz` and `(msgflg & MSG_NOERROR)` is non-zero. The  
 49513 truncated part of the message shall be lost and no indication of the truncation shall be given to  
 49514 the calling process.

49515 If the value of `msgsz` is greater than `{SSIZE_MAX}`, the result is implementation-defined.

49516 The argument `msgtyp` specifies the type of message requested as follows:

- 49517 • If `msgtyp` is 0, the first message on the queue shall be received.
- 49518 • If `msgtyp` is greater than 0, the first message of type `msgtyp` shall be received.
- 49519 • If `msgtyp` is less than 0, the first message of the lowest type that is less than or equal to the  
 49520 absolute value of `msgtyp` shall be received.

49521 The argument `msgflg` specifies the action to be taken if a message of the desired type is not on the  
 49522 queue. These are as follows:

- 49523 • If `(msgflg & IPC_NOWAIT)` is non-zero, the calling thread shall return immediately with a  
 49524 return value of `-1` and `errno` set to `[ENOMSG]`.
- 49525 • If `(msgflg & IPC_NOWAIT)` is 0, the calling thread shall suspend execution until one of the  
 49526 following occurs:
  - 49527 — A message of the desired type is placed on the queue.
  - 49528 — The message queue identifier `msqid` is removed from the system; when this occurs,  
 49529 `errno` shall be set to `[EIDRM]` and `-1` shall be returned.

49530 — The calling thread receives a signal that is to be caught; in this case a message is not  
 49531 received and the calling thread resumes execution in the manner prescribed in  
 49532 *sigaction()*.

49533 Upon successful completion, the following actions are taken with respect to the data structure  
 49534 associated with *msqid*:

- 49535 • **msg\_qnum** shall be decremented by 1.
- 49536 • **msg\_lrp** shall be set to the process ID of the calling process.
- 49537 • **msg\_rtime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 526).

#### 49538 RETURN VALUE

49539 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually  
 49540 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return  $-1$ ,  
 49541 and *errno* shall be set to indicate the error.

#### 49542 ERRORS

49543 The *msgrcv()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 49544 | [E2BIG]  | The value of <i>mtext</i> is greater than <i>msgsz</i> and ( <i>msgflg</i> & MSG_NOERROR) is 0.         |
| 49545 | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 526).   |
| 49546 |          |   |
| 49547 | [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.                                   |
| 49548 | [EINTR]  | The <i>msgrcv()</i> function was interrupted by a signal.   |
| 49549 | [EINVAL] | <i>msqid</i> is not a valid message queue identifier.   |
| 49550 | [ENOMSG] | The queue does not contain a message of the desired type and ( <i>msgflg</i> & IPC_NOWAIT) is non-zero. |
| 49551 |          |   |

#### 49552 EXAMPLES

##### 49553 Receiving a Message

49554 The following example receives the first message on the queue (based on the value of the *msgtyp*  
 49555 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has  
 49556 previously been set). This call specifies that an error should be reported if no message is  
 49557 available, but not if the message is too large. The message size is calculated directly using the  
 49558 *sizeof* operator.

```

49559 #include <sys/msg.h>
49560 ...
49561 int result;
49562 int msqid;
49563 struct message {
49564     long type;
49565     char text[20];
49566 } msg;
49567 long msgtyp = 0;
49568 ...
49569 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
49570                msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

**49571 APPLICATION USAGE**

49572 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
49573 (IPC). Application developers who need to use IPC should design their applications so that  
49574 modules using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to  
49575 use the alternative interfaces.

**49576 RATIONALE**

49577 None.

**49578 FUTURE DIRECTIONS**

49579 None.

**49585 CHANGE HISTORY**

49586 First released in Issue 2. Derived from Issue 2 of the SVID.

**49587 Issue 5**

49588 The type of the return value is changed from **int** to **ssize\_t**, and a warning is added to the  
49589 DESCRIPTION about values of *msgsz* larger than {SSIZE\_MAX}.

49590 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
49591 DIRECTIONS to the APPLICATION USAGE section.

**49592 Issue 6**

49593 The normative text is updated to avoid use of the term “must” for application requirements.

**49594 Issue 7**

49595 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0398 [345] and XSH/TC1-2008/0399  
49596 [421] are applied.

49597 **NAME**

49598 msgsnd — XSI message send operation

49599 **SYNOPSIS**

```
49600 XSI #include <sys/msg.h>
49601 int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

49602 **DESCRIPTION**

49603 The `msgsnd()` function operates on XSI message queues (see XBD [Section 3.206](#), on page 61). It is  
 49604 unspecified whether this function interoperates with the realtime interprocess communication  
 49605 facilities defined in [Section 2.8](#) (on page 527).

49606 The `msgsnd()` function shall send a message to the queue associated with the message queue  
 49607 identifier specified by `msqid`.

49608 The application shall ensure that the argument `msgp` points to a user-defined buffer that contains  
 49609 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 49610 the data bytes of the message. The structure below is an example of what this user-defined  
 49611 buffer might look like:

```
49612 struct mymsg {
49613     long    mtype;        /* Message type. */
49614     char    mtext[1];    /* Message text. */
49615 }
```

49616 The structure member `mtype` is a non-zero positive type **long** that can be used by the receiving  
 49617 process for message selection.

49618 The structure member `mtext` is any text of length `msgsz` bytes. The argument `msgsz` can range  
 49619 from 0 to a system-imposed maximum.

49620 The argument `msgflg` specifies the action to be taken if one or more of the following is true:

- 49621 • The number of bytes already on the queue is equal to **msg\_qbytes**; see `<sys/msg.h>`.
- 49622 • The total number of messages on all queues system-wide is equal to the system-imposed  
 49623 limit.

49624 These actions are as follows:

- 49625 • If `(msgflg & IPC_NOWAIT)` is non-zero, the message shall not be sent and the calling  
 49626 thread shall return immediately.
- 49627 • If `(msgflg & IPC_NOWAIT)` is 0, the calling thread shall suspend execution until one of the  
 49628 following occurs:
  - 49629 — The condition responsible for the suspension no longer exists, in which case the  
 49630 message is sent.
  - 49631 — The message queue identifier `msqid` is removed from the system; when this occurs,  
 49632 `errno` shall be set to [EIDRM] and `-1` shall be returned.
  - 49633 — The calling thread receives a signal that is to be caught; in this case the message is not  
 49634 sent and the calling thread resumes execution in the manner prescribed in [sigaction\(\)](#).

49635 Upon successful completion, the following actions are taken with respect to the data structure  
 49636 associated with *msqid*; see `<sys/msg.h>`:

- 49637 • **msg\_qnum** shall be incremented by 1.
- 49638 • **msg\_lspid** shall be set to the process ID of the calling process.
- 49639 • **msg\_stime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 526).

#### 49640 RETURN VALUE

49641 Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent,  
 49642 *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

#### 49643 ERRORS

49644 The *msgsnd()* function shall fail if:

- |                         |          |   |
|-------------------------|----------|---|
| 49645<br>49646          | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 526).   |
| 49647<br>49648          | [EAGAIN] | The message cannot be sent for one of the reasons cited above and ( <i>msgflg</i> & <code>IPC_NOWAIT</code> ) is non-zero.  |
| 49649                   | [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.   |
| 49650                   | [EINTR]  | The <i>msgsnd()</i> function was interrupted by a signal.   |
| 49651<br>49652<br>49653 | [EINVAL] | The value of <i>msqid</i> is not a valid message queue identifier, or the value of <i>mtyp</i> e is less than 1; or the value of <i>msgsz</i> is greater than the system-imposed limit. |

#### 49654 EXAMPLES

##### 49655 Sending a Message

49656 The following example sends a message to the queue identified by the *msqid* argument  
 49657 (assuming that value has previously been set). This call specifies that an error should be  
 49658 reported if no message is available. The message size is calculated directly using the *sizeof*  
 49659 operator.

```

49660 #include <sys/msg.h>
49661 ...
49662 int result;
49663 int msqid;
49664 struct message {
49665     long type;
49666     char text[20];
49667 } msg;
49668 msg.type = 1;
49669 strcpy(msg.text, "This is message 1");
49670 ...
49671 result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
  
```

#### 49672 APPLICATION USAGE

49673 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 49674 (IPC). Application developers who need to use IPC should design their applications so that  
 49675 modules using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to  
 49676 use the alternative interfaces.

49677 **RATIONALE**

49678 None.

49679 **FUTURE DIRECTIONS**

49680 None.

49681 **SEE ALSO**49682 [Section 2.7](#) (on page 526), [Section 2.8](#) (on page 527), [mq\\_close\(\)](#), [mq\\_getattr\(\)](#), [mq\\_notify\(\)](#),

49684 [sigaction\(\)](#)49685 [XBD Section 3.206](#) (on page 61), [<sys/msg.h>](#)49686 **CHANGE HISTORY**

49687 First released in Issue 2. Derived from Issue 2 of the SVID.

49688 **Issue 5**49689 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
49690 DIRECTIONS to a new APPLICATION USAGE section.49691 **Issue 6**

49692 The normative text is updated to avoid use of the term “must” for application requirements.

49693 **Issue 7**49694 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0400 [345] and XSH/TC1-2008/0401  
49695 [359] are applied.

49696 **NAME**

49697       msync — synchronize memory with physical storage

49698 **SYNOPSIS**

```
49699 XSI|SIO #include <sys/mman.h>
49700 int msync(void *addr, size_t len, int flags);
```

49701 **DESCRIPTION**

49702 The *msync()* function shall write all modified data to permanent storage locations, if any, in  
 49703 those whole pages containing any part of the address space of the process starting at address  
 49704 *addr* and continuing for *len* bytes. If no such storage exists, *msync()* need not have any effect. If  
 49705 requested, the *msync()* function shall then invalidate cached copies of data.

49706 The implementation may require that *addr* be a multiple of the page size as returned by  
 49707 *sysconf()*.

49708 For mappings to files, the *msync()* function shall ensure that all write operations are completed  
 49709 as defined for synchronized I/O data integrity completion. It is unspecified whether the  
 49710 implementation also writes out other file attributes. When the *msync()* function is called on  
 49711 MAP\_PRIVATE mappings, any modified data shall not be written to the underlying object and  
 49712 shall not cause such data to be made visible to other processes. It is unspecified whether data in  
 49713 MAP\_PRIVATE mappings has any permanent storage locations. The effect of *msync()* on an  
 49714 SHM anonymous memory object, shared memory object, or  
 49715 TYM typed memory object is unspecified. The behavior of this function is unspecified if the mapping  
 49716 was not established by a call to *mmap()*.

49717 The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following  
 49718 flags defined in the `<sys/mman.h>` header:

49719	Symbolic Constant	Description
49720	MS_ASYNC	Perform asynchronous writes.
49721	MS_SYNC	Perform synchronous writes.
49722	MS_INVALIDATE	Invalidate cached data.

49723 When MS\_ASYNC is specified, *msync()* shall return immediately once all the write operations  
 49724 are initiated or queued for servicing; when MS\_SYNC is specified, *msync()* shall not return until  
 49725 all write operations are completed as defined for synchronized I/O data integrity completion.  
 49726 Either MS\_ASYNC or MS\_SYNC shall be specified, but not both.

49727 When MS\_INVALIDATE is specified, *msync()* shall invalidate all cached copies of mapped data  
 49728 that are inconsistent with the permanent storage locations such that subsequent references shall  
 49729 obtain data that was consistent with the permanent storage locations sometime between the call  
 49730 to *msync()* and the first subsequent memory reference to the data.

49731 If *msync()* causes any write to a file, the file's last data modification and last file status change  
 49732 timestamps shall be marked for update.

49733 **RETURN VALUE**

49734 Upon successful completion, *msync()* shall return 0; otherwise, it shall return `-1` and set *errno* to  
 49735 indicate the error.

49736 **ERRORS**

49737 The *msync()* function shall fail if:

- 49738 [EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len*  
49739 bytes are locked, and MS\_INVALIDATE is specified.
- 49740 [EINVAL] The value of *flags* is invalid.
- 49741 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are  
49742 outside the range allowed for the address space of a process or specify one or  
49743 more pages that are not mapped.
- 49744 The *msync()* function may fail if:
- 49745 [EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf()*.

**EXAMPLES**

49746 None.  
49747

**APPLICATION USAGE**

- 49748 The *msync()* function is only supported if the Synchronized Input and Output option is  
49749 supported, and thus need not be available on all implementations.  
49750
- 49751 The *msync()* function should be used by programs that require a memory object to be in a  
49752 known state; for example, in building transaction facilities.
- 49753 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees  
49754 that *msync()* is the only control over when pages are or are not written to disk.

**RATIONALE**

- 49755 The *msync()* function writes out data in a mapped region to the permanent storage for the  
49756 underlying object. The call to *msync()* ensures data integrity of the file.  
49757
- 49758 After the data is written out, any cached data may be invalidated if the MS\_INVALIDATE flag  
49759 was specified. This is useful on systems that do not support read/write consistency.

**FUTURE DIRECTIONS**

49760 None.  
49761

**SEE ALSO**

**CHANGE HISTORY**

49765 First released in Issue 4, Version 2.  
49766

**Issue 5**

- 49767 Moved from X/OPEN UNIX extension to BASE.  
49768
- 49769 Aligned with *msync()* in the POSIX Realtime Extension as follows:
- 49770 • The DESCRIPTION is extensively reworded.
  - 49771 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

**Issue 6**

- 49772 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input  
49773 and Output options.  
49774
- 49775 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:
- 49776 • The [EBUSY] mandatory error condition is added.
- 49777 The following new requirements on POSIX implementations derive from alignment with the  
49778 Single UNIX Specification:

49779 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
49780 of the page size.

49781 • The second [EINVAL] error condition is made mandatory.

49782 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to  
49783 typed memory objects.

49784 **Issue 7**

49785 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
49786 requirements.

49787 SD5-XSH-ERN-110 is applied.

49788 The *msync()* function is marked as part of the Synchronized Input and Output option or XSI  
49789 option as the Memory Mapped Files is moved to the Base.

49790 Changes are made related to support for finegrained timestamps.

49791 **Issue 8**

49792 Austin Group Defect 850 is applied, adding anonymous memory objects.

49793 **NAME**49794 `mtx_destroy`, `mtx_init` — destroy and initialize a mutex49795 **SYNOPSIS**

```
49796 #include <threads.h>
49797 void mtx_destroy(mtx_t *mtx);
49798 int  mtx_init(mtx_t *mtx, int type);
```

49799 **DESCRIPTION**

49800 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 49801 conflict between the requirements described here and the ISO C standard is unintentional. This  
 49802 volume of POSIX.1-2024 defers to the ISO C standard.

49803 The `mtx_destroy()` function shall release any resources used by the mutex pointed to by `mtx`. A  
 49804 destroyed mutex object can be reinitialized using `mtx_init()`; the results of otherwise referencing  
 49805 the object after it has been destroyed are undefined. It shall be safe to destroy an initialized  
 49806 mutex that is unlocked. Attempting to destroy a locked mutex, or a mutex that another thread is  
 49807 attempting to lock, or a mutex that is being used in a `cond_timedwait()` or `cond_wait()` call by  
 49808 another thread, results in undefined behavior. The behavior is undefined if the value specified  
 49809 by the `mtx` argument to `mtx_destroy()` does not refer to an initialized mutex.

49810 The `mtx_init()` function shall initialize a mutex object with properties indicated by `type`, whose  
 49811 valid values include:

49812	<code>mtx_plain</code>	for a simple non-recursive mutex,
49813	<code>mtx_timed</code>	for a non-recursive mutex that supports timeout,
49814	<code>mtx_plain</code>   <code>mtx_recursive</code>	for a simple recursive mutex, or
49815	<code>mtx_timed</code>   <code>mtx_recursive</code>	for a recursive mutex that supports timeout.

49816 If the `mtx_init()` function succeeds, it shall set the mutex pointed to by `mtx` to a value that  
 49817 uniquely identifies the newly initialized mutex. Upon successful initialization, the state of the  
 49818 mutex shall become initialized and unlocked. Attempting to initialize an already initialized  
 49819 mutex results in undefined behavior.

49820 CX See [Section 2.9.9](#) (on page 548) for further requirements.

49821 These functions shall not be affected if the calling thread executes a signal handler during the  
 49822 call.

49823 **RETURN VALUE**

49824 The `mtx_destroy()` function shall not return a value.

49825 The `mtx_init()` function shall return `thrd_success` on success or `thrd_error` if the request  
 49826 could not be honored.

49827 **ERRORS**

49828 No errors are defined.

49829 **EXAMPLES**

49830 None.

49831 **APPLICATION USAGE**

49832 A mutex can be destroyed immediately after it is unlocked. However, since attempting to  
49833 destroy a locked mutex, or a mutex that another thread is attempting to lock, or a mutex that is  
49834 being used in a *cond\_timedwait()* or *cond\_wait()* call by another thread results in undefined  
49835 behavior, care must be taken to ensure that no other thread may be referencing the mutex.

49836 **RATIONALE**

49837 These functions are not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#)  
49838 (on page 3742).

49839 **FUTURE DIRECTIONS**

49840 None.

49841 **SEE ALSO**49842 [cond\\_timedwait\(\)](#), [mtx\\_lock\(\)](#)49843 XBD [<threads.h>](#)49844 **CHANGE HISTORY**

49845 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

49846 **NAME**

49847       mtx\_lock, mtx\_timedlock, mtx\_trylock, mtx\_unlock — lock and unlock a mutex

49848 **SYNOPSIS**

```
49849       #include <threads.h>
49850       int mtx_lock(mtx_t *mtx);
49851       int mtx_timedlock(mtx_t *restrict mtx,
49852                        const struct timespec *restrict ts);
49853       int mtx_trylock(mtx_t *mtx);
49854       int mtx_unlock(mtx_t *mtx);
```

49855 **DESCRIPTION**

49856 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
49857 conflict between the requirements described here and the ISO C standard is unintentional. This  
49858 volume of POSIX.1-2024 defers to the ISO C standard.

49859       The *mtx\_lock()* function shall block until it locks the mutex pointed to by *mtx*. If the mutex is  
49860 non-recursive, the application shall ensure that it is not already locked by the calling thread.

49861       The *mtx\_timedlock()* function shall block until it locks the mutex pointed to by *mtx* or until after  
49862 the TIME\_UTC-based calendar time pointed to by *ts*. The application shall ensure that the  
49863 CX specified mutex supports timeout. Under no circumstance shall the function fail with a timeout  
49864 if the mutex can be locked immediately. The validity of the *ts* parameter need not be checked if  
49865 the mutex can be locked immediately.

49866       The *mtx\_trylock()* function shall endeavor to lock the mutex pointed to by *mtx*. If the mutex is  
49867 already locked (by any thread, including the current thread), the function shall return without  
49868 blocking. If the mutex is recursive and the mutex is currently owned by the calling thread, the  
49869 mutex lock count (see below) shall be incremented by one and the *mtx\_trylock()* function shall  
49870 immediately return success.

49871 CX       These functions shall not be affected if the calling thread executes a signal handler during the  
49872 call; if a signal is delivered to a thread waiting for a mutex, upon return from the signal handler  
49873 the thread shall resume waiting for the mutex as if it was not interrupted.

49874       If a call to *mtx\_lock()*, *mtx\_timedlock()* or *mtx\_trylock()* locks the mutex, prior calls to  
49875 *mtx\_unlock()* on the same mutex shall synchronize with this lock operation.

49876       The *mtx\_unlock()* function shall unlock the mutex pointed to by *mtx*. The application shall  
49877 CX ensure that the mutex pointed to by *mtx* is locked by the calling thread. If there are threads  
49878 blocked on the mutex object referenced by *mtx* when *mtx\_unlock()* is called, resulting in the  
49879 mutex becoming available, the scheduling policy shall determine which thread shall acquire the  
49880 mutex.

49881       A recursive mutex shall maintain the concept of a lock count. When a thread successfully  
49882 acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks  
49883 this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex,  
49884 the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall  
49885 become available for other threads to acquire.

49886       For purposes of determining the existence of a data race, mutex lock and unlock operations on  
49887 mutexes of type **mtx\_t** behave as atomic operations. All lock and unlock operations on a  
49888 particular mutex occur in some particular total order.

49889       If *mtx* does not refer to an initialized mutex object, the behavior of these functions is undefined.

**49890 RETURN VALUE**

49891 The *mtx\_lock()* and *mtx\_unlock()* functions shall return `thrd_success` on success, or  
49892 `thrd_error` if the request could not be honored.

49893 The *mtx\_timedlock()* function shall return `thrd_success` on success, or `thrd_timedout` if the  
49894 time specified was reached without acquiring the requested resource, or `thrd_error` if the  
49895 request could not be honored.

49896 The *mtx\_trylock()* function shall return `thrd_success` on success, or `thrd_busy` if the  
49897 resource requested is already in use, or `thrd_error` if the request could not be honored. The  
49898 *mtx\_trylock()* function can spuriously fail to lock an unused resource, in which case it shall  
49899 return `thrd_busy`.

**49900 ERRORS**

49901 See RETURN VALUE.

**49902 EXAMPLES**

49903 None.

**49904 APPLICATION USAGE**

49905 None.

**49906 RATIONALE**

49907 These functions are not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#)  
49908 (on page 3742).

49909 Since `<pthread.h>` has no equivalent of the `mtx_timed` mutex property, if the `<threads.h>`  
49910 interfaces are implemented as a thin wrapper around `<pthread.h>` interfaces (meaning `mtx_t`  
49911 and `pthread_mutex_t` are the same type), all mutexes support timeout and *mtx\_timedlock()* will  
49912 not fail for a mutex that was not initialized with `mtx_timed`. Alternatively, implementations  
49913 can use a less thin wrapper where `mtx_t` contains additional properties that are not held in  
49914 `pthread_mutex_t` in order to be able to return a failure indication from *mtx\_timedlock()* calls  
49915 where the mutex was not initialized with `mtx_timed`.

**49916 FUTURE DIRECTIONS**

49917 None.

**49918 SEE ALSO**

49920 XBD [`<threads.h>`](#)

**49921 CHANGE HISTORY**

49922 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

49923 **NAME**

49924           munlock — unlock a range of process address space

49925 **SYNOPSIS**

```
49926 MLR       #include <sys/mman.h>  
49927           int munlock(const void *addr, size_t len);
```

49928 **DESCRIPTION**

49929           Refer to *mlock()*.

49930 **NAME**

49931           munlockall — unlock the address space of a process

49932 **SYNOPSIS**

49933 ML        #include &lt;sys/mman.h&gt;

49934           int munlockall(void);

49935 **DESCRIPTION**49936           Refer to *mlockall()*.

49937 **NAME**

49938           munmap — unmap pages of memory

49939 **SYNOPSIS**

49940           #include &lt;sys/mman.h&gt;

49941           int munmap(void \*addr, size\_t len);

49942 **DESCRIPTION**

49943           The *munmap()* function shall remove any mappings for those entire pages containing any part of  
 49944           the address space of the process starting at *addr* and continuing for *len* bytes. Further references  
 49945           to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no  
 49946           mappings in the specified address range, then *munmap()* has no effect.

49947           The implementation may require that *addr* be a multiple of the page size as returned by  
 49948           *sysconf()*.

49949           If a mapping to be removed was private, any modifications made in this address range shall be  
 49950           discarded.

49951   ML|MLR   Any memory locks (see *mlock()* and *mlockall()*) associated with this address range shall be  
 49952           removed, as if by an appropriate call to *munlock()*.

49953   TYM       If a mapping removed from a typed memory object causes the corresponding address range of  
 49954           the memory pool to be inaccessible by any process in the system except through allocatable  
 49955           mappings (that is, mappings of typed memory objects opened with the  
 49956           POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag), then that range of the memory pool shall  
 49957           become deallocated and may become available to satisfy future typed memory allocation  
 49958           requests.

49959           A mapping removed from a typed memory object opened with the  
 49960           POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag shall not affect in any way the availability of  
 49961           that typed memory for allocation.

49962           The behavior of this function is unspecified if the mapping was not established by a call to  
 49963           *mmap()*.

49964 **RETURN VALUE**

49965           Upon successful completion, *munmap()* shall return 0; otherwise, it shall return -1 and set *errno*  
 49966           to indicate the error.

49967 **ERRORS**

49968           The *munmap()* function shall fail if:

49969           [EINVAL]       Addresses in the range [*addr*,*addr*+*len*) are outside the valid range for the  
 49970                           address space of a process.

49971           [EINVAL]       The *len* argument is 0.

49972           The *munmap()* function may fail if:

49973           [EINVAL]       The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

49974 **EXAMPLES**

49975 None.

49976 **APPLICATION USAGE**

49977 None.

49978 **RATIONALE**49979 The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

49980 It is possible that an application has applied process memory locking to a region that contains  
 49981 shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary,  
 49982 causes those locks to be removed.

49983 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.49984 **FUTURE DIRECTIONS**

49985 None.

49986 **SEE ALSO**49987 [mlock\(\)](#), [mlockall\(\)](#), [mmap\(\)](#), [posix\\_typed\\_mem\\_open\(\)](#), [sysconf\(\)](#)49988 XBD [<sys/mman.h>](#)49989 **CHANGE HISTORY**

49990 First released in Issue 4, Version 2.

49991 **Issue 5**

49992 Moved from X/OPEN UNIX extension to BASE.

49993 Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- 49994 • The DESCRIPTION is extensively reworded.
- 49995 • The SIGBUS error is no longer permitted to be generated.

49996 **Issue 6**

49997 The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory  
 49998 Objects option.

49999 The following new requirements on POSIX implementations derive from alignment with the  
 50000 Single UNIX Specification:

- 50001 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
 50002 of the page size.
- 50003 • The [EINVAL] error conditions are added.

50004 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 50005 • Semantics for typed memory objects are added to the DESCRIPTION.
- 50006 • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

50007 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code  
 50008 in the SYNOPSIS from MF | SHM to MC3 (notation for MF | SHM | TYM).

50009 **Issue 7**

50010 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
 50011 requirements.

50012 The *munmap()* function is moved from the Memory Mapped Files option to the Base.

50013 **NAME**

50014 nan, nanf, nanl — return quiet NaN

50015 **SYNOPSIS**

```
50016 #include <math.h>
50017 double nan(const char *tagp);
50018 float nanf(const char *tagp);
50019 long double nanl(const char *tagp);
```

50020 **DESCRIPTION**

50021 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 50022 conflict between the requirements described here and the ISO C standard is unintentional. This  
 50023 volume of POSIX.1-2024 defers to the ISO C standard.

50024 The function call *nan("n-char-sequence")* shall be equivalent to:

```
50025 strtod("NAN(n-char-sequence)", (char **) NULL);
```

50026 The function call *nan("")* shall be equivalent to:

```
50027 strtod("NAN()", (char **) NULL)
```

50028 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be  
 50029 equivalent to:

```
50030 strtod("NAN", (char **) NULL)
```

50031 Function calls to *nanf()* and *nanl()* are equivalent to the corresponding function calls to *strtof()*  
 50032 and *strtold()*.

50033 **RETURN VALUE**

50034 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

50035 MX The returned value shall be exact and shall be independent of the current rounding direction  
 50036 mode.

50037 If the implementation does not support quiet NaNs, these functions shall return zero.

50038 **ERRORS**

50039 No errors are defined.

50040 **EXAMPLES**

50041 None.

50042 **APPLICATION USAGE**

50043 None.

50044 **RATIONALE**

50045 None.

50046 **FUTURE DIRECTIONS**

50047 None.

50048 **SEE ALSO**

50049 [strtod\(\)](#)

50050 XBD [<math.h>](#)

50051 **CHANGE HISTORY**

50052 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

50053 **Issue 8**

50054 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
50055 standard.

50056 **NAME**

50057 nanosleep — high resolution sleep

50058 **SYNOPSIS**

```
50059 CX #include <time.h>
50060 int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

50061 **DESCRIPTION**

50062 The *nanosleep()* function shall cause the current thread to be suspended from execution until  
 50063 either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the  
 50064 calling thread, and its action is to invoke a signal-catching function or to terminate the process.  
 50065 The suspension time may be longer than requested because the argument value is rounded up to  
 50066 an integer multiple of the sleep resolution or because of the scheduling of other activity by the  
 50067 system. But, except for the case of being interrupted by a signal, the suspension time shall not be  
 50068 less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

50069 The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

50070 **RETURN VALUE**

50071 If the *nanosleep()* function returns because the requested time has elapsed, its return value shall  
 50072 be zero.

50073 If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a  
 50074 value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the  
 50075 **timespec** structure referenced by it is updated to contain the amount of time remaining in the  
 50076 interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments can  
 50077 point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

50078 If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.

50079 **ERRORS**

50080 The *nanosleep()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 50081 | [EINTR]  | The <i>nanosleep()</i> function was interrupted by a signal.  |
| 50082 | [EINVAL] | The <i>rqtp</i> argument specified a nanosecond value less than zero or greater than or equal to 1 000 million. |
| 50083 |          |   |

50084 **EXAMPLES**

50085 None.

50086 **APPLICATION USAGE**

50087 None.

50088 **RATIONALE**

50089 It is common to suspend execution of a thread for an interval in order to poll the status of a non-  
 50090 interrupting function. A large number of actual needs can be met with a simple extension to  
 50091 *sleep()* that provides finer resolution.

50092 In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the  
 50093 frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD,  
 50094 it is possible to write such a routine using no static storage and reserving no system facilities.  
 50095 Although it is possible to write a function with similar functionality to *sleep()* using the  
 50096 remainder of the *timer\_\**(*)* functions, such a function requires the use of signals and the  
 50097 reservation of some signal number. This volume of POSIX.1-2024 requires that *nanosleep()* be  
 50098 non-intrusive of the signals function.

50099 The *nanosleep()* function shall return a value of 0 on success and `-1` on failure or if interrupted.

50100 This latter case is different from *sleep()*. This was done because the remaining time is returned  
50101 via an argument structure pointer, *rmtpt*, instead of as the return value.

50102 **FUTURE DIRECTIONS**

50103 None.

50104 **SEE ALSO**

50105 *clock\_nanosleep()*, *sleep()*

50106 XBD <**time.h**>

50107 **CHANGE HISTORY**

50108 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

50109 **Issue 6**

50110 The *nanosleep()* function is marked as part of the Timers option.

50111 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
50112 implementation does not support the Timers option.

50113 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO  
50114 section to include the *clock\_nanosleep()* function.

50115 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the  
50116 RATIONALE section.

50117 **Issue 7**

50118 SD5-XBD-ERN-33 is applied.

50119 The *nanosleep()* function is moved from the Timers option to the Base.

50120 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0231 [909] is applied.

50121 **NAME**

50122 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

50123 **SYNOPSIS**

```
50124 #include <math.h>
50125 double nearbyint(double x);
50126 float nearbyintf(float x);
50127 long double nearbyintl(long double x);
```

50128 **DESCRIPTION**

50129 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 50130 conflict between the requirements described here and the ISO C standard is unintentional. This  
 50131 volume of POSIX.1-2024 defers to the ISO C standard.

50132 These functions shall round their argument to an integer value in floating-point format, using  
 50133 the current rounding direction and without raising the inexact floating-point exception.

50134 **RETURN VALUE**

50135 MX Upon successful completion, these functions shall return the rounded integer value. The result  
 50136 shall have the same sign as  $x$ .

50137 MX If  $x$  is NaN, a NaN shall be returned.

50138 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

50139 If  $x$  is  $\pm \text{Inf}$ ,  $x$  shall be returned.

50140 **ERRORS**

50141 No errors are defined.

50142 **EXAMPLES**

50143 None.

50144 **APPLICATION USAGE**

50145 The integral value returned by these functions need not be expressible as an `intmax_t`. The  
 50146 return value should be tested before assigning it to an integer type to avoid the undefined  
 50147 results of an integer overflow.

50148 **RATIONALE**

50149 None.

50150 **FUTURE DIRECTIONS**

50151 None.

50152 **SEE ALSO**

50153 [feclearexcept\(\)](#), [fetestexcept\(\)](#)

50154 XBD [Section 4.23](#) (on page 109), [<math.h>](#)

50155 **CHANGE HISTORY**

50156 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

50157 **Issue 7**

50158 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0402 [346,428] is applied.

50159 **NAME**

50160 newlocale — create or modify a locale object

50161 **SYNOPSIS**

```
50162 CX #include <locale.h>
50163 locale_t newlocale(int category_mask, const char *locale,
50164 locale_t base);
```

50165 **DESCRIPTION**

50166 The *newlocale()* function shall create a new locale object or modify an existing one. If the *base*  
 50167 argument is **(locale\_t)0**, a new locale object shall be created, otherwise the locale specified by  
 50168 *base* shall be modified. In the latter case it is unspecified whether the resulting locale object shall  
 50169 be that pointed to by *base* modified in place, or whether that object shall be freed after a new  
 50170 locale object is first created using some values from it.

50171 The *category\_mask* argument specifies the locale categories to be set or modified. Values for  
 50172 *category\_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants  
 50173 *LC\_CTYPE\_MASK*, *LC\_NUMERIC\_MASK*, *LC\_TIME\_MASK*, *LC\_COLLATE\_MASK*,  
 50174 *LC\_MONETARY\_MASK*, and *LC\_MESSAGES\_MASK*, or any of the implementation-defined  
 50175 mask values defined in **<locale.h>**.

50176 For each category with the corresponding bit set in *category\_mask* the data from the locale named  
 50177 by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale  
 50178 named by *locale* shall replace the existing data within the locale object. If a completely new locale  
 50179 object is created, the data for all sections not requested by *category\_mask* shall be taken from the  
 50180 POSIX locale.

50181 The following preset values of *locale* are defined for all settings of *category\_mask*:

50182 "POSIX" Specifies the minimal environment for C-language translation called the  
 50183 POSIX locale.

50184 "C" Equivalent to "POSIX".

50185 "" Specifies an implementation-defined native environment. This corresponds to  
 50186 the value of the associated environment variables, *LC\_\** and *LANG*; see XBD  
 50187 [Chapter 7](#) (on page 127) and [Chapter 8](#) (on page 167).

50188 If the *base* argument is not **(locale\_t)0** and the *newlocale()* function call succeeds, the contents of  
 50189 *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before  
 50190 calling *newlocale()*. If the function call fails and the *base* argument is not **(locale\_t)0**, the contents  
 50191 of *base* shall remain valid and unchanged.

50192 The behavior is undefined if the *base* argument is the special locale object  
 50193 *LC\_GLOBAL\_LOCALE*, or is not a valid locale object handle and is not **(locale\_t)0**.

50194 **RETURN VALUE**

50195 Upon successful completion, the *newlocale()* function shall return a handle which the caller may  
 50196 use on subsequent calls to *duplocale()*, *freelocale()*, and other functions taking a **locale\_t**  
 50197 argument.

50198 Upon failure, the *newlocale()* function shall return **(locale\_t)0** and set *errno* to indicate the error.

50199 **ERRORS**

50200 The *newlocale()* function shall fail if:

50201 [ENOMEM] There is not enough memory available to create the locale object or load the  
 50202 locale data.

50203 [EINVAL] The *category\_mask* contains a bit that does not correspond to a valid category.

50204 [ENOENT] For any of the categories in *category\_mask*, the locale data is not available.

50205 The *newlocale()* function may fail if:

50206 [EINVAL] The *locale* argument is not a valid string pointer.

## 50207 EXAMPLES

### 50208 Constructing a Locale Object from Different Locales

50209 The following example shows the construction of a locale where the *LC\_CTYPE* category data  
 50210 comes from a locale *loc1* and the *LC\_TIME* category data from a locale *loc2*:

```
50211 #include <locale.h>
50212 ...
50213 locale_t loc, new_loc;
50214 /* Get the "loc1" data. */
50215 loc = newlocale (LC_CTYPE_MASK, "loc1", (locale_t)0);
50216 if (loc == (locale_t) 0)
50217     abort ();
50218 /* Get the "loc2" data. */
50219 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
50220 if (new_loc != (locale_t) 0)
50221     /* We don't abort if this fails. In this case this
50222      * simply used to unchanged locale object. */
50223     loc = new_loc;
50224 ...
```

### 50225 Freeing up a Locale Object

50226 The following example shows a code fragment to free a locale object created by *newlocale()*:

```
50227 #include <locale.h>
50228 ...
50229 /* Every locale object allocated with newlocale() should be
50230  * freed using freelocale():
50231  */
50232 locale_t loc;
50233 /* Get the locale. */
50234 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", (locale_t)0);
50235 /* ... Use the locale object ... */
50236 ...
50237 /* Free the locale object resources. */
50238 freelocale (loc);
```

50239 **APPLICATION USAGE**

50240 Handles for locale objects created by the *newlocale()* function should either be released by a  
50241 corresponding call to *freelocale()*, or be used as a base locale to another *newlocale()* call.

50242 The special locale object LC\_GLOBAL\_LOCALE must not be passed for the *base* argument, even  
50243 when returned by the *uselocale()* function.

50244 **RATIONALE**

50245 None.

50246 **FUTURE DIRECTIONS**

50247 None.

50248 **SEE ALSO**

50249 *duplocale()*, *freelocale()*, *getlocalename\_1()*, *uselocale()*

50250 XBD Chapter 7 (on page 127), Chapter 8 (on page 167), <locale.h>

50251 **CHANGE HISTORY**

50252 First released in Issue 7.

50253 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0403 [227], XSH/TC1-2008/0404 [283],  
50254 XSH/TC1-2008/0405 [295], and XSH/TC1-2008/0406 [227] are applied.

50255 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0232 [781] and XSH/TC2-2008/0233  
50256 [673] are applied.

50257 **Issue 8**

50258 Austin Group Defect 1220 is applied, adding *getlocalename\_1()* to the SEE ALSO section.

50259 Austin Group Defect 1243 is applied, clarifying the handling of a non-zero *base* argument.

50260 Austin Group Defect 1264 is applied, changing “default locale” to “POSIX locale”.

50261 **NAME**

50262 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable  
50263 floating-point number

50264 **SYNOPSIS**

```
50265 #include <math.h>
50266 double nextafter(double x, double y);
50267 float nextafterf(float x, float y);
50268 long double nextafterl(long double x, long double y);
50269 double nexttoward(double x, long double y);
50270 float nexttowardf(float x, long double y);
50271 long double nexttowardl(long double x, long double y);
```

50272 **DESCRIPTION**

50273 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
50274 conflict between the requirements described here and the ISO C standard is unintentional. This  
50275 volume of POSIX.1-2024 defers to the ISO C standard.

50276 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable  
50277 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall  
50278 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,  
50279 and *nextafterl()* functions shall return *y* if *x* equals *y*.

50280 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the  
50281 corresponding *nextafter()* functions, except that the second parameter shall have type **long**  
50282 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

50283 An application wishing to check for error situations should set *errno* to zero and call  
50284 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
50285 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
50286 zero, an error has occurred.

50287 **RETURN VALUE**

50288 Upon successful completion, these functions shall return the next representable floating-point  
50289 value following *x* in the direction of *y*.

50290 If  $x=y$ , *y* (of the type *x*) shall be returned.

50291 MX Even though underflow or overflow can occur, the returned value shall be independent of the  
50292 current rounding direction mode.

50293 If *x* is finite and the correct function value would overflow, a range error shall occur and  
50294  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (with the same sign as *x*) shall be returned as  
50295 appropriate for the return type of the function.

50296 MX If *x* or *y* is NaN, a NaN shall be returned.

50297 MX If  $x \neq y$  and the correct function value is subnormal, zero, or underflows, a range error shall  
50298 occur, and

50299 MXX the correct function value (if representable) or

50300 MX 0.0 shall be returned.

50301 **ERRORS**

50302 These functions shall fail if:

50303 Range Error The correct value overflows.

50304 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
50305 then *errno* shall be set to [ERANGE]. If the integer expression

50306 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 50307 floating-point exception shall be raised.

50308 MX **Range Error** The correct value is subnormal or underflows.

50309 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 50310 then *errno* shall be set to [ERANGE]. If the integer expression  
 50311 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 50312 floating-point exception shall be raised.

#### 50313 **EXAMPLES**

50314 None.

#### 50315 **APPLICATION USAGE**

50316 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 50317 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

50318 When **<tgmath.h>** is included, note that the return type of *nextafter()* depends on the generic  
 50319 typing deduced from both arguments, while the return type of *nexttoward()* depends only on the  
 50320 generic typing of the first argument.

#### 50321 **RATIONALE**

50322 None.

#### 50323 **FUTURE DIRECTIONS**

50324 None.

#### 50325 **SEE ALSO**

50326 [\*feclearexcept\(\)\*](#), [\*fetestexcept\(\)\*](#)

50327 XBD Section 4.23 (on page 109), **<math.h>**, **<tgmath.h>**

#### 50328 **CHANGE HISTORY**

50329 First released in Issue 4, Version 2.

#### 50330 **Issue 5**

50331 Moved from X/OPEN UNIX extension to BASE.

#### 50332 **Issue 6**

50333 The *nextafter()* function is no longer marked as an extension.

50334 The *nextafterf()*, *nextafterl()*, *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions are added  
 50335 for alignment with the ISO/IEC 9899:1999 standard.

50336 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 50337 revised to align with the ISO/IEC 9899:1999 standard.

50338 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 50339 marked.

#### 50340 **Issue 7**

50341 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0407 [68] and XSH/TC1-2008/0408  
 50342 [357] are applied.

#### 50343 **Issue 8**

50344 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
 50345 standard.

50346 **NAME**

50347 nftw — walk a file tree

50348 **SYNOPSIS**

```
50349 XSI #include <ftw.h>
50350 int nftw(const char *path, int (*fn)(const char *,
50351 const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

50352 **DESCRIPTION**

50353 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The  
 50354 argument *flags* is a bitwise-inclusive OR of zero or more of the following flags:

50355 **FTW\_CHDIR** If set, *nftw()* shall change the current working directory to each directory as it  
 50356 reports files in that directory. If clear, *nftw()* shall not change the current  
 50357 working directory.

50358 **FTW\_DEPTH** If set, *nftw()* shall report all files in a directory before reporting the directory  
 50359 itself. If clear, *nftw()* shall report any directory before reporting the files in that  
 50360 directory.

50361 **FTW\_MOUNT** If set, *nftw()* shall only report files that have the same device ID (*st\_dev*) as  
 50362 *path* and shall not descend below directories that have a different device ID  
 50363 than *path*. If clear, *nftw()* shall report all files encountered during the walk,  
 50364 unless **FTW\_XDEV** is set.

50365 **FTW\_PHYS** If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

50366 **FTW\_XDEV** If set, *nftw()* shall not descend below directories that have a different device  
 50367 ID (*st\_dev*) than *path*; that is, when a directory with a different device ID is  
 50368 encountered, *nftw()* shall report the directory itself (unless **FTW\_MOUNT** is  
 50369 set) but shall not report any files below the directory. If clear, *nftw()* shall  
 50370 report all files encountered during the walk, unless **FTW\_MOUNT** is set.

50371 **Note:** If both **FTW\_MOUNT** and **FTW\_XDEV** are set, *nftw()* obeys both flags but the end result is the  
 50372 same as if **FTW\_XDEV** were clear.

50373 If **FTW\_PHYS** is clear and **FTW\_DEPTH** is set, *nftw()* shall follow links instead of reporting  
 50374 them, but shall not report any directory that would be a descendant of itself. If **FTW\_PHYS** is  
 50375 clear and **FTW\_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not  
 50376 report the contents of any directory that would be a descendant of itself.

50377 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 50378 • The first argument is the pathname of the object.
- 50379 • The second argument is a pointer to the **stat** buffer containing information on the object,  
 50380 filled in as if *fstatat()*, *stat()*, or *lstat()* had been called to retrieve the information.
- 50381 • The third argument is an integer giving additional information. Its value is one of the  
 50382 following:
  - 50383 **FTW\_D** The object is a directory.
  - 50384 **FTW\_DNR** The object is a directory that cannot be read. The *fn* function shall not be  
 50385 called for any of its descendants.
  - 50386 **FTW\_DP** The object is a directory and subdirectories have been visited. (This condition  
 50387 shall only occur if the **FTW\_DEPTH** flag is included in *flags*.)

- 50388 FTW\_F The object is a non-directory file.
- 50389 FTW\_NS The *stat()* function failed on the object because of lack of appropriate  
50390 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any  
50391 other reason is considered an error and *nftw()* shall return  $-1$ .
- 50392 FTW\_SL The object is a symbolic link. (This condition shall only occur if the  
50393 FTW\_PHYS flag is included in *flags*.)
- 50394 FTW\_SLN The object is a symbolic link that does not name an existing file. The **stat**  
50395 buffer passed to *fn* shall contain information on the symbolic link. (This  
50396 condition shall only occur if the FTW\_PHYS flag is not included in *flags*.)
- 50397 • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the
  - 50398 object's filename in the pathname passed as the first argument to *fn*. The value of **level**
  - 50399 indicates depth relative to the root of the walk, where the root level is 0.

50400 The results are unspecified if the application-supplied *fn* function does not preserve the current  
50401 working directory.

50402 The argument *fd\_limit* sets the maximum number of file descriptors that shall be used by *nftw()*  
50403 while traversing the file tree. At most one file descriptor shall be used for each directory level.  
50404 The FD\_CLOEXEC flag shall be set on any file descriptor opened by *nftw()* (see <fcntl.h>) not  
50405 including those opened by the user-supplied *fn* function. Every file descriptor opened by *nftw()*  
50406 not including those opened by the user-supplied *fn* function shall be closed before *nftw()*  
50407 returns.

50408 The *nftw()* function need not be thread-safe.

#### 50409 RETURN VALUE

50410 The *nftw()* function shall continue until the first of the following conditions occurs:

- 50411 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that  
50412 value.
- 50413 • The *nftw()* function detects an error other than [EACCES] (see FTW\_DNR and FTW\_NS  
50414 above), in which case *nftw()* shall return  $-1$  and set *errno* to indicate the error.
- 50415 • The tree is exhausted, in which case *nftw()* shall return 0.

#### 50416 ERRORS

50417 The *nftw()* function shall fail if:

- 50418 [EACCES] Search permission is denied for any component of *path* or read permission is  
50419 denied for *path*, or *fn* returns  $-1$  and does not reset *errno*.
- 50420 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
50421 argument.
- 50422 [ENAMETOOLONG]  
50423 The length of a component of a pathname is longer than {NAME\_MAX}.
- 50424 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 50425 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a  
50426 symbolic link to a directory.
- 50427 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
50428 programming environment for one or more files found in the file hierarchy.

50429 The *nftw()* function may fail if:

50430 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
50431 resolution of the *path* argument.

50432 [EMFILE] All file descriptors available to the process are currently open.

50433 [ENAMETOOLONG]  
50434 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
50435 symbolic link produced an intermediate result with a length that exceeds  
50436 {PATH\_MAX}.

50437 [ENFILE] Too many files are currently open in the system.

50438 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

**EXAMPLES**

50439 The following program traverses the directory tree under the path named in its first command-  
50440 line argument, or under the current directory if no argument is supplied. It displays various  
50441 information about each file. The second command-line argument can be used to specify  
50442 characters that control the value assigned to the *flags* argument when calling *nftw()*.  
50443

```
50444 #include <ftw.h>
50445 #include <stdio.h>
50446 #include <stdlib.h>
50447 #include <string.h>
50448 #include <stdint.h>

50449 static int
50450 display_info(const char *fpath, const struct stat *sb,
50451             int tflag, struct FTW *ftwbuf)
50452 {
50453     printf("%-3s %2d %7jd   %-40s %d %s\n",
50454           (tflag == FTW_D) ? "d" : (tflag == FTW_DNR) ? "dnr" :
50455           (tflag == FTW_DP) ? "dp" : (tflag == FTW_F) ?
50456           (S_ISBLK(sb->st_mode) ? "f b" :
50457           S_ISCHR(sb->st_mode) ? "f c" :
50458           S_ISFIFO(sb->st_mode) ? "f p" :
50459           S_ISREG(sb->st_mode) ? "f r" :
50460           S_ISSOCK(sb->st_mode) ? "f s" : "f ?") :
50461           (tflag == FTW_NS) ? "ns" : (tflag == FTW_SL) ? "sl" :
50462           (tflag == FTW_SLN) ? "sln" : "?", ftwbuf->level,
50463           (intmax_t) ((tflag == FTW_NS) ? -1 : sb->st_size),
50464           fpath, ftwbuf->base, fpath + ftwbuf->base);
50465     return 0; /* To tell nftw() to continue */
50466 }

50467 int
50468 main(int argc, char *argv[])
50469 {
50470     int flags = 0;

50471     if (argc > 2 && strchr(argv[2], 'd') != NULL)
50472         flags |= FTW_DEPTH;
50473     if (argc > 2 && strchr(argv[2], 'p') != NULL)
50474         flags |= FTW_PHYS;

50475     if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
50476     {
```

```

50477         perror("nftw");
50478         exit(EXIT_FAILURE);
50479     }
50480     exit(EXIT_SUCCESS);
50481 }

```

#### 50482 APPLICATION USAGE

50483 The *nftw()* function may allocate dynamic storage during its operation. If *nftw()* is forcibly  
50484 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
50485 or an interrupt routine, *nftw()* does not have a chance to free that storage, so it remains  
50486 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
50487 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
50488 invocation.

50489 When restricting the walk to files on one file system, it can sometimes be desirable for the  
50490 crossing points themselves to be reported and sometimes for them not to be reported. (Crossing  
50491 points are mount points and, if FTW\_PHYS is clear, symbolic links to directories on other file  
50492 systems.) With FTW\_XDEV *nftw()* reports them and with FTW\_MOUNT it does not. However,  
50493 with FTW\_MOUNT it also does not report symbolic links to non-directory files on other file  
50494 systems (if FTW\_PHYS is clear). If there is a need for an application to exclude crossing points  
50495 but include symbolic links to non-directory files on other file systems, this can be achieved by  
50496 using FTW\_XDEV and performing a check such as the following in the function pointed to by *fn*:

```

50497     if (tflag == FTW_D && sb->st_dev != saved_dev)
50498         return 0;

```

50499 (where *saved\_dev* is the *st\_dev* value for *path*).

#### 50500 RATIONALE

50501 Earlier versions of this standard did not make clear that, as well as not reporting them,  
50502 FTW\_MOUNT prevents descent below directories that have a different device ID than *path* if  
50503 they are encountered by following a symbolic link (rather than by being a mount point). This  
50504 meant that if such a directory contained any symbolic links to files with the same device ID as  
50505 *path*, *nftw()* with FTW\_PHYS clear was required to report them. However, this was not how  
50506 *nftw()* implementations behaved and the standard has been amended to match existing practice.

#### 50507 FUTURE DIRECTIONS

50508 None.

#### 50509 SEE ALSO

50510 [\*fdopendir\(\)\*](#), [\*fstatat\(\)\*](#), [\*readdir\(\)\*](#)

#### 50512 CHANGE HISTORY

50513 First released in Issue 4, Version 2.

#### 50514 Issue 5

50515 Moved from X/OPEN UNIX extension to BASE.

50516 In the DESCRIPTION, the definition of the *depth* argument is clarified.

#### 50517 Issue 6

50518 The Open Group Base Resolution bwg97-003 is applied.

50519 The ERRORS section is updated as follows:

- 50520
  - The wording of the mandatory [ELOOP] error condition is updated.
- 50521
  - A second optional [ELOOP] error condition is added.
- 50522
  - The [Eoverflow] mandatory error condition is added.
- 50523

Text is added to the DESCRIPTION to say that the *nftw()* function need not be reentrant and that
- 50524

the results are unspecified if the application-supplied *fn* function does not preserve the current
- 50525

working directory.
- 50526

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument
- 50527

*depth* to *fd\_limit* throughout and changing “to a maximum of 5 levels deep” to “using a
- 50528

maximum of 5 file descriptors” in the EXAMPLES section.
- 50529 **Issue 7**
- 50530

Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.
- 50531

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 50532

SD5-XBD-ERN-61 is applied.
- 50533

APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.
- 50534

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0409 [403], XSH/TC1-2008/0410 [324],
- 50535

and XSH/TC1-2008/0411 [403] are applied.
- 50536 **Issue 8**
- 50537

Austin Group Defect 368 is applied, adding a requirement for the FD\_CLOEXEC flag to be set.
- 50538

Austin Group Defect 1121 is applied, changing the description of FTW\_SLN and the handling of
- 50539

FTW\_NS in the EXAMPLES section.
- 50540

Austin Group Defect 1133 is applied, adding FTW\_XDEV.
- 50541

Austin Group Defect 1210 is applied, changing the description of FTW\_MOUNT and the
- 50542

RATIONALE section.
- 50543

Austin Group Defect 1330 is applied, removing obsolescent interfaces.

50544 **NAME**

50545       ngettext, ngettext\_l — message handling functions

50546 **SYNOPSIS**

50547       #include &lt;libintl.h&gt;

50548       char \*ngettext(const char \*msgid, const char \*msgid\_plural,  
50549                    unsigned long int n);50550       char \*ngettext\_l(const char \*msgid, const char \*msgid\_plural,  
50551                    unsigned long int n, locale\_t locale);50552 **DESCRIPTION**50553       Refer to *gettext*.

50554 **NAME**

50555 nice — change the nice value of a process

50556 **SYNOPSIS**

```
50557 XSI      #include <unistd.h>
50558      int nice(int incr);
```

50559 **DESCRIPTION**

50560 The *nice()* function shall add the value of *incr* to the nice value of the calling process. A nice  
 50561 value of a process is a non-negative number for which a more positive value shall result in less  
 50562 favorable scheduling.

50563 A maximum nice value of  $2^{\{NZERO\}}-1$  and a minimum nice value of 0 shall be imposed by the  
 50564 system. Requests for values above or below these limits shall result in the nice value being set to  
 50565 the corresponding limit. Only a process with appropriate privileges can lower the nice value.

50566 PS|TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy  
 50567 SCHED\_FIFO or SCHED\_RR. The effect on processes or threads with other scheduling policies  
 50568 is implementation-defined.

50569 The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the  
 50570 nice value shall affect all system scope threads in the process.

50571 As  $-1$  is a permissible return value in a successful situation, an application wishing to check for  
 50572 error situations should set *errno* to 0, then call *nice()*, and if it returns  $-1$ , check to see whether  
 50573 *errno* is non-zero.

50574 **RETURN VALUE**

50575 Upon successful completion, *nice()* shall return the new nice value  $-\{NZERO\}$ . Otherwise,  $-1$   
 50576 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to  
 50577 indicate the error.

50578 **ERRORS**

50579 The *nice()* function shall fail if:

50580 [EPERM] The *incr* argument is negative and the calling process does not have  
 50581 appropriate privileges.

50582 **EXAMPLES**50583 **Changing the Nice Value**

50584 The following example adds the value of the *incr* argument,  $-20$ , to the nice value of the calling  
 50585 process.

```
50586 #include <unistd.h>
50587 ...
50588 int incr = -20;
50589 int ret;

50590 ret = nice(incr);
```

50591 **APPLICATION USAGE**

50592 None.

50593 **RATIONALE**

50594 None.

50595 **FUTURE DIRECTIONS**

50596 None.

50597 **SEE ALSO**50598 *exec*, *getpriority()*

50599 XBD &lt;limits.h&gt;, &lt;unistd.h&gt;

50600 **CHANGE HISTORY**

50601 First released in Issue 1. Derived from Issue 1 of the SVID.

50602 **Issue 5**50603 A statement is added to the description indicating the effects of this function on the different  
50604 scheduling policies and multi-threaded processes.

50605 **NAME**

50606 nl\_langinfo, nl\_langinfo\_l — language information

50607 **SYNOPSIS**

50608 #include &lt;langinfo.h&gt;

50609 char \*nl\_langinfo(nl\_item item);

50610 char \*nl\_langinfo\_l(nl\_item item, locale\_t locale);

50611 **DESCRIPTION**

50612 The *nl\_langinfo()* and *nl\_langinfo\_l()* functions shall return a pointer to a string containing  
50613 information relevant to the particular language or cultural area defined in the current locale, or  
50614 in the locale represented by *locale*, respectively (see <langinfo.h>). The manifest constant names  
50615 and values of *item* are defined in <langinfo.h>. For example:

50616 nl\_langinfo(ABDAY\_1)

50617 would return a pointer to the string "Dom" if the identified language was Portuguese, and  
50618 "Sun" if the identified language was English.

50619 nl\_langinfo\_l(ABDAY\_1, loc)

50620 would return a pointer to the string "Dom" if the identified language of the locale represented by  
50621 *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was  
50622 English.

50623 The *nl\_langinfo()* function need not be thread-safe.

50624 The behavior is undefined if the *locale* argument to *nl\_langinfo\_l()* is the special locale object  
50625 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

50626 **RETURN VALUE**

50627 In a locale where *langinfo* data is not defined, these functions shall return a pointer to the  
50628 corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to  
50629 an empty string if *item* contains an invalid setting.

50630 The application shall not modify the string returned. The pointer returned by *nl\_langinfo()*  
50631 might be invalidated or the string content might be overwritten by a subsequent call to  
50632 *nl\_langinfo()* in any thread or to *nl\_langinfo\_l()* in the same thread or the initial thread, by  
50633 subsequent calls to *setlocale()* with a category corresponding to the category of *item* (see  
50634 <langinfo.h>) or the category LC\_ALL, or by subsequent calls to *uselocale()* which change the  
50635 category corresponding to the category of *item*. The pointer returned by *nl\_langinfo\_l()* might be  
50636 invalidated or the string content might be overwritten by a subsequent call to *nl\_langinfo\_l()* in  
50637 the same thread or to *nl\_langinfo()* in any thread, or by subsequent calls to *freelocale()* or  
50638 *newlocale()* which free or modify the locale object that was passed to *nl\_langinfo\_l()*. The  
50639 returned pointer and the string content might also be invalidated if the calling thread is  
50640 terminated.

50641 **ERRORS**

50642 No errors are defined.

50643 **EXAMPLES**50644 **Getting Date and Time Formatting Information**

50645 The following example returns a pointer to a string containing date and time formatting  
50646 information, as defined in the *LC\_TIME* category of the current locale.

```
50647 #include <time.h>
50648 #include <langinfo.h>
50649 ...
50650 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
50651 ...
```

50652 **APPLICATION USAGE**

50653 The array pointed to by the return value should not be modified by the program, but may be  
50654 modified by further calls to these functions.

50655 **RATIONALE**

50656 The possible interactions between internal data used by *nl\_langinfo()* and *nl\_langinfo\_l()* are  
50657 complicated by the fact that *nl\_langinfo\_l()* must be thread-safe but *nl\_langinfo()* need not be.  
50658 The various implementation choices are:

- 50659 1. *nl\_langinfo\_l()* and *nl\_langinfo()* use separate buffers, or at least one of them does not use  
50660 an internal string buffer. In this case there are no interactions.
- 50661 2. *nl\_langinfo\_l()* and *nl\_langinfo()* share an internal per-thread buffer. There can be  
50662 interactions, but only in the same thread.
- 50663 3. *nl\_langinfo\_l()* uses an internal per-thread buffer, and *nl\_langinfo()* uses (in all threads)  
50664 the same buffer that *nl\_langinfo\_l()* uses in the initial thread. There can be interactions,  
50665 but only when *nl\_langinfo\_l()* is called in the initial thread.

50666 **FUTURE DIRECTIONS**

50667 None.

50668 **SEE ALSO**

50671 **CHANGE HISTORY**

50672 First released in Issue 2.

50673 **Issue 5**

50674 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

50675 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

50676 **Issue 7**

50677 Austin Group Interpretation 1003.1-2001 #156 is applied.

50678 The *nl\_langinfo()* function is moved from the XSI option to the Base.

50679 The *nl\_langinfo\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
50680 API Set Part 4.

50681 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0412 [302], XSH/TC1-2008/0413 [75],  
50682 XSH/TC1-2008/0414 [283], XSH/TC1-2008/0415 [75,402], XSH/TC1-2008/0416 [283], and  
50683 XSH/TC1-2008/0417 [402] are applied.

50684

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0234 [656] is applied.

50685 **NAME**

50686 nrand48 — generate uniformly distributed pseudo-random non-negative long integers

50687 **SYNOPSIS**

```
50688 XSI #include <stdlib.h>  
50689 long nrand48(unsigned short xsubi[3]);
```

50690 **DESCRIPTION**50691 Refer to *drand48()*.

50692 **NAME**

50693           ntohl, ntohs — convert values between host and network byte order

50694 **SYNOPSIS**

50695           #include <arpa/inet.h>

50696           uint32\_t ntohl(uint32\_t *netlong*);

50697           uint16\_t ntohs(uint16\_t *netshort*);

50698 **DESCRIPTION**

50699           Refer to *htonl()*.

50700 **NAME**

50701 open, openat — open file

50702 **SYNOPSIS**50703 OH `#include <sys/stat.h>`50704 `#include <fcntl.h>`50705 `int open(const char *path, int oflag, ...);`50706 `int openat(int fd, const char *path, int oflag, ...);`50707 **DESCRIPTION**

50708 The `open()` function shall establish the connection between a file and a file descriptor. It shall  
 50709 create an open file description that refers to a file and a file descriptor that refers to that open file  
 50710 description. The file descriptor is used by other I/O functions to refer to that file. The `path`  
 50711 argument points to a pathname naming the file.

50712 The `open()` function shall return a file descriptor for the named file, allocated as described in  
 50713 [Section 2.6](#) (on page 525). The open file description is new, and therefore the file descriptor shall  
 50714 not share it with any other process in the system. The `FD_CLOEXEC` file descriptor flag  
 50715 associated with the new file descriptor shall be cleared unless the `O_CLOEXEC` flag is set in  
 50716 `oflag`. The `FD_CLOFORK` file descriptor flag associated with the new file descriptor shall be  
 50717 cleared unless the `O_CLOFORK` flag is set in `oflag`.

50718 The file offset used to mark the current position within the file shall be set to the beginning of  
 50719 the file.

50720 The file status flags and file access modes of the open file description shall be set according to  
 50721 the value of `oflag`.

50722 Values for `oflag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 50723 in `<fcntl.h>`. Applications shall specify exactly one of the first five values (file access modes)  
 50724 below in the value of `oflag`:

50725 `O_EXEC` Open for execute only (non-directory files). If `path` names a directory and  
 50726 `O_EXEC` is not the same value as `O_SEARCH`, `open()` shall fail.

50727 `O_RDONLY` Open for reading only.

50728 `O_RDWR` Open for reading and writing. If `path` names a FIFO, and the  
 50729 implementation does not support opening a FIFO for simultaneous read  
 50730 and write, then `open()` shall fail.

50731 `O_SEARCH` Open directory for search only. If `path` names a non-directory file and  
 50732 `O_SEARCH` is not the same value as `O_EXEC`, `open()` shall fail.

50733 `O_WRONLY` Open for writing only.

50734 Any combination of the following may be used:

50735 `O_APPEND` If set, the file offset shall be set to the end of the file prior to each write.

50736 `O_CLOEXEC` If set, the `FD_CLOEXEC` flag for the new file descriptor shall be set.

50737 `O_CLOFORK` If set, the `FD_CLOFORK` flag for the new file descriptor shall be set.

50738 `O_CREAT` If the file exists, this flag has no effect except as noted under `O_EXCL`  
 50739 below. Otherwise, if `O_DIRECTORY` is not set the file shall be created as a  
 50740 regular file; the user ID of the file shall be set to the effective user ID of the  
 50741 process; the group ID of the file shall be set to the group ID of the file's  
 50742 parent directory or to the effective group ID of the process; and the access  
 50743 permission bits (see `<sys/stat.h>`) of the file mode shall be set to the value

50744			of the argument following the <i>oflag</i> argument taken as type <b>mode_t</b>
50745			modified as follows: a bitwise AND is performed on the file-mode bits
50746			and the corresponding bits in the complement of the process' file mode
50747			creation mask. Thus, all bits in the file mode whose corresponding bit in
50748			the file mode creation mask is set are cleared. When bits other than the
50749			file permission bits are set, the effect is unspecified. The argument
50750			following the <i>oflag</i> argument does not affect whether the file is open for
50751			reading, writing, or for both. Implementations shall provide a way to
50752			initialize the file's group ID to the group ID of the parent directory.
50753			Implementations may, but need not, provide an implementation-defined
50754			way to initialize the file's group ID to the effective group ID of the calling
50755			process.
50756		O_DIRECTORY	If <i>path</i> resolves to a non-directory file, fail and set <i>errno</i> to [ENOTDIR].
50757	SIO	O_DSYNC	Write I/O operations on the file descriptor shall complete as defined by
50758			synchronized I/O data integrity completion.
50759		O_EXCL	If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The
50760			check for the existence of the file and the creation of the file if it does not
50761			exist shall be atomic with respect to other threads executing <i>open()</i>
50762			naming the same filename in the same directory with O_EXCL and
50763			O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a
50764			symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the
50765			contents of the symbolic link. If O_EXCL is set and O_CREAT is not set,
50766			the result is undefined.
50767		O_NOCTTY	If set and <i>path</i> identifies a terminal device, <i>open()</i> shall not cause the
50768			terminal device to become the controlling terminal for the process. If <i>path</i>
50769			does not identify a terminal device, O_NOCTTY shall be ignored.
50770		O_NOFOLLOW	If <i>path</i> names a symbolic link, fail and set <i>errno</i> to [ELOOP].
50771		O_NONBLOCK	When opening a FIFO with O_RDONLY or O_WRONLY set:
50772			• If O_NONBLOCK is set, an <i>open()</i> for reading-only shall return
50773			without delay. An <i>open()</i> for writing-only shall return an error if no
50774			process currently has the file open for reading.
50775			• If O_NONBLOCK is clear, an <i>open()</i> for reading-only shall block the
50776			calling thread until a thread opens the file for writing. An <i>open()</i> for
50777			writing-only shall block the calling thread until a thread opens the
50778			file for reading.
50779			When opening a block special or character special file that supports non-
50780			blocking opens:
50781			• If O_NONBLOCK is set, the <i>open()</i> function shall return without
50782			blocking for the device to be ready or available. Subsequent
50783			behavior of the device is device-specific.
50784			• If O_NONBLOCK is clear, the <i>open()</i> function shall block the calling
50785			thread until the device is ready or available before returning.
50786			Otherwise, the O_NONBLOCK flag shall not cause an error, but it is
50787			unspecified whether the file status flags will include the O_NONBLOCK
50788			flag.

50789	SIO	<b>O_RSYNC</b>	Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in <i>oflag</i> , all I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
50790			
50791			
50792			
50793			
50794			
50795			
50796	XSI SIO	<b>O_SYNC</b>	Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
50797			
50798	XSI		The O_SYNC flag shall be supported for regular files, even if the Synchronized Input and Output option is not supported.
50799			
50800		<b>O_TRUNC</b>	If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files or terminal device files. Its effect on other file types is implementation-defined. The result of using O_TRUNC without either O_RDWR or O_WRONLY is undefined.
50801			
50802			
50803			
50804			
50805			
50806		<b>O_TTY_INIT</b>	If <i>path</i> identifies a terminal device other than a pseudo-terminal, the device is not already open in any process, and either O_TTY_INIT is set in <i>oflag</i> or O_TTY_INIT has the value zero, <i>open()</i> shall set any non-standard <b>termios</b> structure terminal parameters to a state that provides conforming behavior (see XBD Section 11.2, on page 205) and initialize the <b>winsize</b> structure associated with the terminal to appropriate default settings. It is unspecified whether O_TTY_INIT has any effect if the device is already open in any process. If <i>path</i> identifies the subsidiary side of a pseudo-terminal that is not already open in any process, <i>open()</i> shall set any non-standard <b>termios</b> structure terminal parameters to a state that provides conforming behavior and initialize the <b>winsize</b> structure associated with the terminal to appropriate default settings, regardless of whether O_TTY_INIT is set. If <i>path</i> does not identify a terminal device, O_TTY_INIT shall be ignored.
50807			
50808			
50809			
50810			
50811			
50812			
50813			
50814			
50815			
50816			
50817			
50818			
50819			
50820			If O_CREAT and O_DIRECTORY are set and the requested access mode is neither O_WRONLY nor O_RDWR, the result is unspecified.
50821			
50822			If O_CREAT is set and the file did not previously exist, upon successful completion, <i>open()</i> shall mark for update the last data access, last data modification, and last file status change timestamps of the file and the last data modification and last file status change timestamps of the parent directory.
50823			
50824			
50825			
50826			If O_TRUNC is set and the file did previously exist, upon successful completion, <i>open()</i> shall mark for update the last data modification and last file status change timestamps of the file.
50827			
50828	SIO		If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.
50829			The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal device since system boot or since the device was closed by the process that last had it open. The application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If <i>path</i> names the manager side of a pseudo-terminal device, then it is unspecified whether <i>open()</i> locks the subsidiary side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i> before opening the subsidiary side.
50830			
50831	XSI		
50832			
50833			
50834			

50835 The largest value that can be represented correctly in an object of type `off_t` shall be established  
50836 as the offset maximum in the open file description.

50837 The `openat()` function shall be equivalent to the `open()` function except in the case where `path`  
50838 specifies a relative path. In this case the file to be opened is determined relative to the directory  
50839 associated with the file descriptor `fd` instead of the current working directory. If the access mode  
50840 of the open file description associated with the file descriptor is not `O_SEARCH`, the function  
50841 shall check whether directory searches are permitted using the current permissions of the  
50842 directory underlying the file descriptor. If the access mode is `O_SEARCH`, the function shall not  
50843 perform the check.

50844 The `oflag` parameter and the optional fourth parameter correspond exactly to the parameters of  
50845 `open()`.

50846 If `openat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working  
50847 directory shall be used and the behavior shall be identical to a call to `open()`.

#### 50848 RETURN VALUE

50849 Upon successful completion, these functions shall open the file and return a non-negative  
50850 integer representing the file descriptor. Otherwise, these functions shall return `-1` and set `errno`  
50851 to indicate the error. If `-1` is returned, no files shall be created or modified.

#### 50852 ERRORS

50853 These functions shall fail if:

50854 [EACCES] Search permission is denied on a component of the path prefix, or the file  
50855 exists and the permissions specified by `oflag` are denied, or the file does not  
50856 exist and write permission is denied for the parent directory of the file to be  
50857 created, or `O_TRUNC` is specified and write permission is denied.

50858 [EEXIST] `O_CREAT` and `O_EXCL` are set, and the named file exists.

50859 [EILSEQ] `O_CREAT` was specified, the file did not exist, and the last pathname  
50860 component of `path` is not a portable filename and cannot be created in the  
50861 target directory.

50862 [EINTR] A signal was caught during `open()`.

50863 [EINVAL] The `path` argument names a FIFO, `O_RDWR` was specified, and the  
50864 SIO implementation considers this an error; or synchronized I/O flags were  
50865 specified and the implementation does not support synchronized I/O for the  
50866 file.

50867 [EISDIR] The named file is a directory and `oflag` includes `O_WRONLY` or `O_RDWR`, or  
50868 includes `O_CREAT` without `O_DIRECTORY`, or includes `O_EXEC` when  
50869 `O_EXEC` is not the same value as `O_SEARCH`.

50870 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
50871 argument, or `O_NOFOLLOW` was specified and the `path` argument names a  
50872 symbolic link.

50873 [EMFILE] All file descriptors available to the process are currently open.

50874 [ENAMETOOLONG]  
50875 The length of a component of a pathname is longer than `{NAME_MAX}`.

50876 [ENFILE] The maximum allowable number of files is currently open in the system.

50877	[ENOENT]	O_CREAT is not set and a component of <i>path</i> does not name an existing file, or
50878		O_CREAT is set and a component of the path prefix of <i>path</i> does not name an
50879		existing file, or <i>path</i> points to an empty string.
50880	[ENOENT] or [ENOTDIR]	
50881		O_CREAT is set, and the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code>
50882		character and ends with one or more trailing <code>&lt;slash&gt;</code> characters. If <i>path</i>
50883		without the trailing <code>&lt;slash&gt;</code> characters would name an existing file, an
50884		[ENOENT] error shall not occur.
50885	[ENOSPC]	The directory or file system that would contain the new file cannot be
50886		expanded, the file does not exist, and O_CREAT is specified.
50887	[ENOTDIR]	A component of the path prefix names an existing file that is neither a
50888		directory nor a symbolic link to a directory; or O_CREAT and O_EXCL are not
50889		specified, the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and
50890		ends with one or more trailing <code>&lt;slash&gt;</code> characters, and the last pathname
50891		component names an existing file that is neither a directory nor a symbolic
50892		link to a directory; or O_DIRECTORY was specified and the <i>path</i> argument
50893		names a non-directory file; or the <i>path</i> argument names a non-directory file
50894		and O_SEARCH was specified when O_SEARCH is not the same value as
50895		O_EXEC.
50896	[ENXIO]	O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no
50897		process has the file open for reading.
50898	[ENXIO]	The named file is a character special or block special file, and the device
50899		associated with this special file does not exist.
50900	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented
50901		correctly in an object of type <code>off_t</code> .
50902	[EROFS]	The named file resides on a read-only file system and either O_WRONLY,
50903		O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the <i>oflag</i>
50904		argument.
50905		The <i>openat()</i> function shall fail if:
50906	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not
50907		O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit
50908		directory searches.
50909	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is
50910		neither AT_FDCWD nor a valid file descriptor open for reading or searching.
50911	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated
50912		with a non-directory file.
50913		These functions may fail if:
50914	XSI [EAGAIN]	The <i>path</i> argument names the subsidiary side of a pseudo-terminal device that
50915		is locked.
50916	[EINVAL]	The value of the <i>oflag</i> argument is not valid.
50917	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
50918		resolution of the <i>path</i> argument.

50919	[ENAMETOOLONG]	
50920		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
50921		symbolic link produced an intermediate result with a length that exceeds
50922		{PATH_MAX}.
50923	[EOPNOTSUPP]	The <i>path</i> argument names a socket.
50924	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>oflag</i> is
50925		O_WRONLY or O_RDWR.

## 50926 EXAMPLES

### 50927 Opening a File for Writing by the Owner

50928 The following example opens the file `/tmp/file`, either by creating it (if it does not already exist),  
 50929 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,  
 50930 the access permission bits in the file mode of the file are set to permit reading and writing by the  
 50931 owner, and to permit reading only by group members and others.

50932 If the call to `open()` is successful, the file is opened for writing.

```
50933 #include <fcntl.h>
50934 ...
50935 int fd;
50936 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
50937 char *pathname = "/tmp/file";
50938 ...
50939 fd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC, mode);
50940 ...
```

### 50941 Opening a File Using an Existence Check

50942 The following example uses the `open()` function to try to create the `LOCKFILE` file and open it  
 50943 for writing. Since the `open()` function specifies the `O_EXCL` flag, the call fails if the file already  
 50944 exists. In that case, the program assumes that someone else is updating the password file and  
 50945 exits.

```
50946 #include <fcntl.h>
50947 #include <stdio.h>
50948 #include <stdlib.h>
50949 #define LOCKFILE "/etc/ptmp"
50950 ...
50951 int pfd; /* Integer for file descriptor returned by open() call. */
50952 ...
50953 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
50954               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
50955 {
50956     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
50957     exit(1);
50958 }
50959 ...
```

50960 **Opening a File for Writing**

50961 The following example opens a file for writing, creating the file if it does not already exist. If the  
50962 file does exist, the system truncates the file to zero bytes.

```
50963 #include <fcntl.h>
50964 #include <stdio.h>
50965 #include <stdlib.h>
50966 #define LOCKFILE "/etc/ptmp"
50967 ...
50968 int pfd;
50969 char pathname[PATH_MAX+1];
50970 ...
50971 if ((pfd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC,
50972               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
50973 {
50974     perror("Cannot open output file\n"); exit(1);
50975 }
50976 ...
```

50977 **APPLICATION USAGE**

50978 POSIX.1-2024 does not require that terminal parameters be automatically set to any state on first  
50979 open, nor that they be reset after the last close. It is possible for a non-conforming application to  
50980 leave a terminal device in a state where the next process to use that device finds it in a non-  
50981 conforming state, but has no way of determining this. To ensure that the device is set to a  
50982 conforming initial state, applications which perform a first open of a terminal (other than a  
50983 pseudo-terminal) should do so using the O\_TTY\_INIT flag to set the parameters associated with  
50984 the terminal to a conforming state.

50985 Except as specified in this volume of POSIX.1-2024, the flags allowed in *oflag* are not mutually-  
50986 exclusive and any number of them may be used simultaneously. Not all combinations of flags  
50987 make sense. For example, using O\_SEARCH | O\_CREAT will successfully open a pre-existing  
50988 directory for searching, but if there is no existing file by that name, then it is unspecified whether  
50989 a regular file will be created. Likewise, if a non-directory file descriptor is successfully returned,  
50990 it is unspecified whether that descriptor will have execute permissions as if by O\_EXEC (note  
50991 that it is unspecified whether O\_EXEC and O\_SEARCH have the same value).

50992 The O\_CLOEXEC and O\_CLOFORK flags of *open()* are necessary to avoid a data race in multi-  
50993 threaded applications. Without O\_CLOFORK, a file descriptor is leaked into a child process  
50994 created by one thread in the window between another thread creating a file descriptor with  
50995 *open()* and then using *fcntl()* to set the FD\_CLOFORK flag. Without O\_CLOEXEC, a file  
50996 descriptor intentionally inherited by child processes is similarly leaked into an executed  
50997 program if FD\_CLOEXEC is not set atomically.

50998 **RATIONALE**

50999 Some implementations permit opening FIFOs with O\_RDWR. Since FIFOs could be  
51000 implemented in other ways, and since two file descriptors can be used to the same effect, an  
51001 implementation is allowed to reject the use of O\_RDWR on a FIFO.

51002 See *getgroups()* about the group of a newly created file.

51003 The use of *open()* to create a regular file is preferable to the use of *creat()*, because the latter is  
51004 redundant and included only for historical reasons.

51005 The use of the O\_TRUNC flag on FIFOs and directories (pipes cannot be *open()*-ed) must be  
51006 permissible without unexpected side-effects (for example, *creat()* on a FIFO must not remove

51007 data). Since terminal special files might have type-ahead data stored in the buffer, O\_TRUNC  
 51008 should not affect their content, particularly if a program that normally opens a regular file  
 51009 should open the current controlling terminal instead. Other file types, particularly  
 51010 implementation-defined ones, are left implementation-defined.

51011 POSIX.1-2024 permits [EACCES] to be returned for conditions other than those explicitly listed.

51012 The O\_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a  
 51013 controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-2024 does  
 51014 not specify how a controlling terminal is acquired, but it allows an implementation to provide  
 51015 this on *open()* if the O\_NOCTTY flag is not set and other conditions specified in XBD [Chapter 11](#)  
 51016 (on page 199) are met.

51017 In historical implementations the value of O\_RDONLY is zero. Because of that, it is not possible  
 51018 to detect the presence of O\_RDONLY and another option. Future implementations should  
 51019 encode O\_RDONLY and O\_WRONLY as bit flags so that:

```
51020 O_RDONLY | O_WRONLY == O_RDWR
```

51021 O\_EXEC and O\_SEARCH are specified as two of the five file access modes. Since O\_EXEC does  
 51022 not apply to directories, and O\_SEARCH only applies to directories, their values need not be  
 51023 distinct. Although this standard requires *open()* to fail on an attempt to use O\_EXEC on a  
 51024 directory, or O\_SEARCH on a non-directory, this only applies in implementations where the two  
 51025 modes have distinct values. Since O\_RDONLY has historically had the value zero,  
 51026 implementations are not able to distinguish between O\_SEARCH and O\_SEARCH |  
 51027 O\_RDONLY, and similarly for O\_EXEC.

51028 In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However,  
 51029 the *open()* function, when called with O\_CREAT and O\_EXCL, is required to fail with [EEXIST]  
 51030 if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This  
 51031 behavior is required so that privileged applications can create a new file in a known location  
 51032 without the possibility that a symbolic link might cause the file to be created in a different  
 51033 location.

51034 For example, a privileged application that must create a file with a predictable name in a user-  
 51035 writable directory, such as the user's home directory, could be compromised if the user creates a  
 51036 symbolic link with that name that refers to a nonexistent file in a system directory. If the user can  
 51037 influence the contents of a file, the user could compromise the system by creating a new system  
 51038 configuration or spool file that would then be interpreted by the system. The test for a symbolic  
 51039 link which refers to a nonexisting file must be atomic with the creation of a new file.

51040 In addition, the *open()* function refuses to open non-directories if the O\_DIRECTORY flag is set.  
 51041 This avoids race conditions whereby a user might compromise the system by substituting a hard  
 51042 link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where  
 51043 opening a file even for read access might have undesirable side-effects.

51044 In addition, the *open()* function does not follow symbolic links if the O\_NOFOLLOW flag is set.  
 51045 This avoids race conditions whereby a user might compromise the system by substituting a  
 51046 symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where  
 51047 opening a file even for read access might have undesirable side-effects.

51048 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
 51049 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
 51050 that implementations provide a way to have the group ID be set to the group ID of the  
 51051 containing directory, but did not prohibit implementations also supporting a way to set the  
 51052 group ID to the effective group ID of the creating process. Conforming applications should not  
 51053 assume which group ID will be used. If it matters, an application can use *chown()* to set the

51054 group ID after the file is created, or determine under what conditions the implementation will  
51055 set the desired group ID.

51056 The purpose of the *openat()* function is to enable opening files in directories other than the  
51057 current working directory without exposure to race conditions. Any part of the path of a file  
51058 could be changed in parallel to a call to *open()*, resulting in unspecified behavior. By opening a  
51059 file descriptor for the target directory and using the *openat()* function it can be guaranteed that  
51060 the opened file is located relative to the desired directory. Some implementations use the  
51061 *openat()* function for other purposes as well. In some cases, if the *oflag* parameter has the  
51062 *O\_XATTR* bit set, the returned file descriptor provides access to extended attributes. This  
51063 functionality is not standardized here.

51064 Implementations are encouraged to have *open()* and *openat()* report an [EILSEQ] error if *oflag*  
51065 includes *O\_CREAT*, the file did not previously exist, and the last component of *path* contains any  
51066 bytes that have the encoded value of a <newline> character.

#### 51067 FUTURE DIRECTIONS

51068 A future version of this standard may add an *O\_NOCLOBBER* flag, specified as follows, for use  
51069 by shells when the *noclobber* option is set (see XRAT Section C.2.7.2, on page 3891):

51070 *O\_NOCLOBBER* If *O\_CREAT* and *O\_NOCLOBBER* are set, *open()* shall fail if the file exists  
51071 and is either a regular file or a symbolic link that resolves to a regular file.  
51072 The check for the existence and type of the file and the creation of the file  
51073 if it does not exist shall be atomic with respect to other threads executing  
51074 *open()* naming the same filename in the same directory with  
51075 *O\_NOCLOBBER* and *O\_CREAT* set or with *O\_EXCL* and *O\_CREAT* set.  
51076 If *O\_NOCLOBBER* and *O\_CREAT* are set, and the file exists and is either  
51077 a non-regular file or a symbolic link that resolves to a non-regular file, the  
51078 file shall be opened as if neither flag was set. If *O\_NOCLOBBER* and  
51079 *O\_CREAT* are set, and *path* names a symbolic link that does not resolve to  
51080 an existing file, an empty file shall be created such that *path* resolves to the  
51081 newly created file. If *O\_NOCLOBBER* is set and *O\_CREAT* is not set, the  
51082 result is undefined.

#### 51087 CHANGE HISTORY

51088 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 51089 Issue 5

51090 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
51091 Threads Extension.

51092 Large File Summit extensions are added.

#### 51093 Issue 6

51094 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

51095 The following new requirements on POSIX implementations derive from alignment with the  
51096 Single UNIX Specification:

- 51097 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
51098 required for conforming implementations of previous POSIX specifications, it was not  
51099 required for UNIX applications.

- 51100           • In the DESCRIPTION, O\_CREAT is amended to state that the group ID of the file is set to  
51101           the group ID of the file's parent directory or to the effective group ID of the process. This is  
51102           a FIPS requirement.
- 51103           • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
51104           file description. This change is to support large files.
- 51105           • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
51106           large files.
- 51107           • The [ENXIO] mandatory error condition is added.
- 51108           • The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.
- 51109           The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI  
51110           STREAMS Option Group are marked.
- 51111           The following changes were made to align with the IEEE P1003.1a draft standard:
- 51112           • An explanation is added of the effect of the O\_CREAT and O\_EXCL flags when the path  
51113           refers to a symbolic link.
- 51114           • The [ELOOP] optional error condition is added.
- 51115           The normative text is updated to avoid use of the term “must” for application requirements.
- 51116           The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.
- 51117   **Issue 7**
- 51118           Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.
- 51119           Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O\_TTY\_INIT flag.
- 51120           Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
51121           FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.
- 51122           SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 51123           This page is revised and the *openat()* function is added from The Open Group Technical  
51124           Standard, 2006, Extended API Set Part 2.
- 51125           Functionality relating to the XSI STREAMS option is marked obsolescent.
- 51126           Changes are made related to support for finegrained timestamps.
- 51127           Changes are made to allow a directory to be opened for searching.
- 51128           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0418 [292], XSH/TC1-2008/0419 [141],  
51129           XSH/TC1-2008/0420 [461], XSH/TC1-2008/0421 [390], XSH/TC1-2008/0422 [146],  
51130           XSH/TC1-2008/0423 [324], XSH/TC1-2008/0424 [292], XSH/TC1-2008/0425 [278],  
51131           XSH/TC1-2008/0426 [278], XSH/TC1-2008/0427 [291], and XSH/TC1-2008/0428 [307] are  
51132           applied.
- 51133           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0235 [873], XSH/TC2-2008/0236 [835],  
51134           XSH/TC2-2008/0237 [847], XSH/TC2-2008/0238 [817], XSH/TC2-2008/0239 [835],  
51135           XSH/TC2-2008/0240 [847], XSH/TC2-2008/0241 [822], XSH/TC2-2008/0242 [817], and  
51136           XSH/TC2-2008/0243 [943] are applied.
- 51137   **Issue 8**
- 51138           Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
51139           filenames containing any bytes that have the encoded value of a <newline> character.
- 51140           Austin Group Defect 293 is applied, adding the [EILSEQ] error.

- 51141 Austin Group Defects 658 and 1665 are applied, restricting the allowed behaviors when O\_EXEC  
51142 is used on a directory, or O\_SEARCH on a non-directory file, or O\_RDWR on a FIFO, so that the  
51143 requirements for O\_EXCL still apply.
- 51144 Austin Group Defect 1016 is applied, changing the FUTURE DIRECTIONS section.
- 51145 Austin Group Defect 1151 is applied, changing the description of O\_TTY\_INIT to include  
51146 requirements relating to the **winsize** structure.
- 51147 Austin Group Defect 1318 is applied, adding FD\_CLOFORK and O\_CLOFORK.
- 51148 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 51149 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
51150 devices.

51151 **NAME**

51152 open\_memstream, open\_wmemstream — open a dynamic memory buffer stream

51153 **SYNOPSIS**

```
51154 CX #include <stdio.h>
51155 FILE *open_memstream(char **bufp, size_t *sizep);
51156 #include <wchar.h>
51157 FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

51158 **DESCRIPTION**

51159 The *open\_memstream()* and *open\_wmemstream()* functions shall create an I/O stream associated  
 51160 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall  
 51161 be seekable.

51162 The stream associated with a call to *open\_memstream()* shall be byte-oriented.

51163 The stream associated with a call to *open\_wmemstream()* shall be wide-oriented.

51164 The stream shall maintain a current position in the allocated buffer and a current buffer length.  
 51165 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall  
 51166 start at the current position and move this position by the number of successfully written bytes  
 51167 for *open\_memstream()* or the number of successfully written wide characters for  
 51168 *open\_wmemstream()*. The length shall be initially set to zero. If a write moves the position to a  
 51169 value larger than the current length, the current length shall be set to this position. In this case a  
 51170 null character for *open\_memstream()* or a null wide character for *open\_wmemstream()* shall be  
 51171 appended to the current buffer. For both functions the terminating null is not included in the  
 51172 calculation of the buffer length.

51173 After a successful *fflush()* or *fclose()*, the pointer referenced by *bufp* shall contain the address of  
 51174 the buffer, and the variable pointed to by *sizep* shall contain the smaller of the current buffer  
 51175 length and the number of bytes for *open\_memstream()*, or the number of wide characters for  
 51176 *open\_wmemstream()*, between the beginning of the buffer and the current file position indicator.

51177 The *fseek()* and *fseeko()* functions can be used to set the file position beyond the current buffer  
 51178 length. It is implementation-defined whether this extends the buffer to the new length. If it  
 51179 extends the buffer, the added buffer contents shall be set to null bytes for *open\_memstream()*, or  
 51180 null wide characters for *open\_wmemstream()*; if it does not extend the buffer, then if data is later  
 51181 written at this point, the buffer contents in the gap shall be set to null bytes for  
 51182 *open\_memstream()*, or null wide characters for *open\_wmemstream()*. If *fseek()* or *fseeko()* is called  
 51183 with *SEEK\_END* as the *whence* argument, it is implementation-defined whether the file position  
 51184 is adjusted relative to the current buffer length or relative to the buffer size that would be set by  
 51185 an *fflush()* call made immediately before the *fseek()* or *fseeko()* call.

51186 After a successful *fflush()* the pointer referenced by *bufp* and the variable referenced by *sizep*  
 51187 remain valid only until the next write operation on the stream or a call to *fclose()*.

51188 After a successful *fclose()*, the pointer referenced by *bufp* can be passed to *free()*.

51189 **RETURN VALUE**

51190 Upon successful completion, these functions shall return a pointer to the object controlling the  
 51191 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

**51192 ERRORS**

51193 These functions shall fail if:

51194 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

51195 These functions may fail if:

51196 [EINVAL] *bufp* or *sizep* are NULL.

51197 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

51198 [ENOMEM] Memory for the stream or the buffer could not be allocated.

**51199 EXAMPLES**

```

51200 #include <stdio.h>
51201 #include <stdlib.h>

51202 int
51203 main (void)
51204 {
51205     FILE *stream;
51206     char *buf;
51207     size_t len;
51208     off_t eob;

51209     stream = open_memstream (&buf, &len);
51210     if (stream == NULL)
51211         /* handle error */ ;
51212     fprintf (stream, "hello my world");
51213     fflush (stream);
51214     printf ("buf=%s, len=%zu\n", buf, len);
51215     eob = ftello(stream);
51216     fseeko (stream, 0, SEEK_SET);
51217     fprintf (stream, "good-bye");
51218     fseeko (stream, eob, SEEK_SET);
51219     fclose (stream);
51220     printf ("buf=%s, len=%zu\n", buf, len);
51221     free (buf);
51222     return 0;
51223 }
```

51224 This program produces the following output:

51225 buf=hello my world, len=14

51226 buf=good-bye world, len=14

**51227 APPLICATION USAGE**

51228 The buffer created by these functions should be freed by the application after closing the stream,  
51229 by means of a call to *free()*.

**51230 RATIONALE**

51231 These functions are similar to *fmemopen()* except that the memory is always allocated  
51232 dynamically by the function, and the stream is opened only for output.

51233 **FUTURE DIRECTIONS**

51234 None.

51235 **SEE ALSO**51236 *fclose()*, *fdopen()*, *fflush()*, *fmemopen()*, *fopen()*, *free()*, *freopen()*51237 XBD `<stdio.h>`, `<wchar.h>`51238 **CHANGE HISTORY**

51239 First released in Issue 7.

51240 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0244 [588] and XSH/TC2-2008/0245  
51241 [586] are applied.51242 **Issue 8**51243 Austin Group Defect 1406 is applied, clarifying the behavior of *fseek()* and *fseeko()* on streams  
51244 created by *open\_memstream()* and *open\_wmemstream()*.

51245 **NAME**

51246           openat — open file relative to directory file descriptor

51247 **SYNOPSIS**

51248           #include &lt;fcntl.h&gt;

51249           int openat(int *fd*, const char \**path*, int *oflag*, ...);51250 **DESCRIPTION**51251           Refer to *open()*.

51252 **NAME**

51253            opendir — open directory associated with file descriptor

51254 **SYNOPSIS**

51255            #include <dirent.h>

51256            DIR \*opendir(const char \**dirname*);

51257 **DESCRIPTION**

51258            Refer to *fdopendir()*.

51259 **NAME**

51260           openlog — open a connection to the logging facility

51261 **SYNOPSIS**

51262 XSI        #include &lt;syslog.h&gt;

51263        void openlog(const char \*ident, int logopt, int facility);

51264 **DESCRIPTION**51265        Refer to *closelog()*.

51266 **NAME**

51267           optarg, opterr, optind, optopt — options parsing variables

51268 **SYNOPSIS**

51269           #include <unistd.h>

51270           extern char \*optarg;

51271           extern int opterr, optind, optopt;

51272 **DESCRIPTION**

51273           Refer to [getopt\(\)](#).

51274 **NAME**

51275 pathconf — get configurable pathname variables

51276 **SYNOPSIS**

51277 #include &lt;unistd.h&gt;

51278 long pathconf(const char \*path, int name);

51279 **DESCRIPTION**51280 Refer to *fpathconf()*.

51281 **NAME**

51282 pause — suspend the thread until a signal is received

51283 **SYNOPSIS**

51284 #include &lt;unistd.h&gt;

51285 int pause(void);

51286 **DESCRIPTION**51287 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is  
51288 either to execute a signal-catching function or to terminate the process.51289 If the action is to terminate the process, *pause()* shall not return.51290 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching  
51291 function returns.51292 **RETURN VALUE**51293 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no  
51294 successful completion return value. A value of  $-1$  shall be returned and *errno* set to indicate the  
51295 error.51296 **ERRORS**51297 The *pause()* function shall fail if:51298 [EINTR] A signal is caught by the calling process and control is returned from the  
51299 signal-catching function.51300 **EXAMPLES**

51301 None.

51302 **APPLICATION USAGE**51303 Many common uses of *pause()* have timing windows. The scenario involves checking a  
51304 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal  
51305 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The  
51306 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.51307 **RATIONALE**

51308 None.

51309 **FUTURE DIRECTIONS**

51310 None.

51311 **SEE ALSO**51312 [\*sigsuspend\(\)\*](#)51313 XBD <[unistd.h](#)>51314 **CHANGE HISTORY**

51315 First released in Issue 1. Derived from Issue 1 of the SVID.

51316 **Issue 5**

51317 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

51318 **Issue 6**

51319 The APPLICATION USAGE section is added.

51320 **NAME**

51321 pclose — close a pipe stream to or from a process

51322 **SYNOPSIS**

```
51323 CX #include <stdio.h>
51324 int pclose(FILE *stream);
```

51325 **DESCRIPTION**

51326 The *pclose()* function shall close a stream that was opened by *popen()*, wait for the command to  
 51327 terminate, and return the termination status of the process that was running the command  
 51328 language interpreter. However, if a call caused the termination status to be unavailable to  
 51329 *pclose()*, then *pclose()* shall return  $-1$  with *errno* set to [ECHILD] to report this situation. This can  
 51330 happen if the application calls one of the following functions:

- 51331 • *wait()*
- 51332 • *waitpid()* with a *pid* argument less than or equal to 0 or equal to the process ID of the  
 51333 command line interpreter
- 51334 • Any other function not defined in this volume of POSIX.1-2024 that could do one of the  
 51335 above

51336 In any case, *pclose()* shall not return before the child process created by *popen()* has terminated.

51337 If the command language interpreter cannot be executed, the child termination status returned  
 51338 by *pclose()* shall be as if the command language interpreter terminated using *exit(127)* or  
 51339 *\_exit(127)*.

51340 The *pclose()* function shall not affect the termination status of any child of the calling process  
 51341 other than the one created by *popen()* for the associated stream.

51342 If the argument *stream* to *pclose()* is not a pointer to a stream created by *popen()*, the result of  
 51343 *pclose()* is undefined.

51344 If a thread is canceled during execution of *pclose()*, the behavior is undefined.

51345 **RETURN VALUE**

51346 Upon successful return, *pclose()* shall return the termination status of the command language  
 51347 interpreter. Otherwise, *pclose()* shall return  $-1$  and set *errno* to indicate the error.

51348 **ERRORS**

51349 The *pclose()* function shall fail if:

51350 [ECHILD] The status of the child process could not be obtained, as described above.

51351 **EXAMPLES**

51352 None.

51353 **APPLICATION USAGE**

51354 None.

51355 **RATIONALE**

51356 There is a requirement that *pclose()* not return before the child process terminates. This is  
 51357 intended to disallow implementations that return [EINTR] if a signal is received while waiting.  
 51358 If *pclose()* returned before the child terminated, there would be no way for the application to  
 51359 discover which child used to be associated with the stream, and it could not do the cleanup  
 51360 itself.

51361 If the stream pointed to by *stream* was not created by *popen()*, historical implementations of

51362 *pclose()* return `-1` without setting *errno*. To avoid requiring *pclose()* to set *errno* in this case,  
51363 POSIX.1-2024 makes the behavior unspecified. An application should not use *pclose()* to close  
51364 any stream that was not created by *popen()*.

51365 Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT,  
51366 and SIGHUP while waiting for the child process to terminate. Since this behavior is not  
51367 described for the *pclose()* function in POSIX.1-2024, such implementations are not conforming.  
51368 Also, some historical implementations return [EINTR] if a signal is received, even though the  
51369 child process has not terminated. Such implementations are also considered non-conforming.

51370 Consider, for example, an application that uses:

```
51371 popen ("command", "r")
```

51372 to start *command*, which is part of the same application. The parent writes a prompt to its  
51373 standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child  
51374 reads the response from the user, does some transformation on the response (pathname  
51375 expansion, perhaps) and writes the result to its standard output. The parent process reads the  
51376 result from the pipe, does something with it, and prints another prompt. The cycle repeats.  
51377 Assuming that both processes do appropriate buffer flushing, this would be expected to work.

51378 To conform to POSIX.1-2024, *pclose()* must use *waitpid()*, or some similar function, instead of  
51379 *wait()*.

51380 See the RATIONALE for *popen()* for a sample implementation of *pclose()*.

#### 51386 **CHANGE HISTORY**

51387 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 51388 **Issue 7**

51389 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0246 [632] is applied.

#### 51390 **Issue 8**

51391 Austin Group Defect 411 is applied, changing the RATIONALE section.

51392 **NAME**

51393 perror — write error messages to standard error

51394 **SYNOPSIS**

```
51395 #include <stdio.h>
51396 void perror(const char *s);
```

51397 **DESCRIPTION**

51398 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 51399 conflict between the requirements described here and the ISO C standard is unintentional. This  
 51400 volume of POSIX.1-2024 defers to the ISO C standard.

51401 The *perror()* function shall map the error number accessed through the symbol *errno* to a  
 51402 language-dependent error message, which shall be written to the standard error stream as  
 51403 follows:

- 51404 • First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the  
 51405 string pointed to by *s* followed by a <colon> and a <space>.
- 51406 • Then an error message string followed by a <newline>.

51407 The contents of the error message strings shall be the same as those returned by *strerror()* with  
 51408 argument *errno*.

51409 CX The *perror()* function shall mark for update the last data modification and last file status change  
 51410 timestamps of the file associated with the standard error stream at some time between its  
 51411 successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

51412 The *perror()* function shall not change the orientation of the standard error stream.

51413 On error, *perror()* shall set the error indicator for the stream to which *stderr* points, and shall set  
 51414 *errno* to indicate the error.

51415 Since no value is returned, an application wishing to check for error situations should call  
 51416 *clearerr(stderr)* before calling *perror()*, then if *ferror(stderr)* returns non-zero, the value of *errno*  
 51417 indicates which error occurred.

51418 **RETURN VALUE**

51419 The *perror()* function shall not return a value.

51420 **ERRORS**

51421 CX Refer to *fputc()*.

51422 **EXAMPLES**51423 **Printing an Error Message for a Function**

51424 The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,  
 51425 the *perror()* function prints a message and the program exits.

```
51426 #include <stdio.h>
51427 #include <stdlib.h>
51428 ...
51429 char *bufptr;
51430 size_t szbuf;
51431 ...
51432 if ((bufptr = malloc(szbuf)) == NULL) {
51433     perror("malloc"); exit(2);
51434 }
```

51435 . . .

51436 **APPLICATION USAGE**

51437 Application writers may prefer to use alternative interfaces instead of *perror()*, such as

51438 *strerror\_r()* in combination with *fprintf()*.

51439 **RATIONALE**

51440 None.

51441 **FUTURE DIRECTIONS**

51442 None.

51443 **SEE ALSO**

51444 *fprintf()*, *fputc()*, *psiginfo()*, *strerror()*

51445 XBD <**stdio.h**>

51446 **CHANGE HISTORY**

51447 First released in Issue 1. Derived from Issue 1 of the SVID.

51448 **Issue 5**

51449 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the

51450 orientation of the standard error stream.

51451 **Issue 6**

51452 Extensions beyond the ISO C standard are marked.

51453 **Issue 7**

51454 SD5-XSH-ERN-95 is applied.

51455 Changes are made related to support for finegrained timestamps.

51456 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0429 [389,401], XSH/TC1-2008/0430

51457 [389], and XSH/TC1-2008/0431 [389,401] are applied.

51458 **NAME**

51459 pipe, pipe2 — create an interprocess channel

51460 **SYNOPSIS**

```
51461 #include <unistd.h>
51462 int pipe(int fildes[2]);
51463 int pipe2(int fildes[2], int flag);
```

51464 **DESCRIPTION**

51465 The *pipe()* function shall create a pipe and place two file descriptors, one each into the  
 51466 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write  
 51467 ends of the pipe, respectively. The file descriptors shall be allocated as described in [Section 2.6](#)  
 51468 (on page 525). The FD\_CLOEXEC and FD\_CLOFORK flags shall be clear on both file  
 51469 descriptors. The O\_NONBLOCK flag shall be clear on both open file descriptions. (The *fcntl()*  
 51470 function can be used to set this flag.)

51471 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A  
 51472 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a  
 51473 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether  
 51474 *fildes*[1] is also open for reading.

51475 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open  
 51476 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

51477 The pipe's user ID shall be set to the effective user ID of the calling process.

51478 The pipe's group ID shall be set to the effective group ID of the calling process.

51479 Upon successful completion, *pipe()* shall mark for update the last data access, last data  
 51480 modification, and last file status change timestamps of the pipe.

51481 The *pipe2()* function shall be equivalent to the *pipe()* function, except that the state of  
 51482 O\_NONBLOCK on the new file descriptions and FD\_CLOEXEC and FD\_CLOFORK on the new  
 51483 file descriptors shall be determined solely by the *flag* argument, which can be constructed from a  
 51484 bitwise-inclusive OR of flags from the following list (provided by **<fcntl.h>**):

51485 O\_CLOEXEC Atomically set the FD\_CLOEXEC flag on both new file descriptors.

51486 O\_CLOFORK Atomically set the FD\_CLOFORK flag on both new file descriptors.

51487 O\_NONBLOCK Set the O\_NONBLOCK file status flag on both new file descriptions.

51488 **RETURN VALUE**

51489 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 51490 indicate the error, no file descriptors shall be allocated and the contents of *fildes* shall be left  
 51491 unmodified.

51492 **ERRORS**

51493 The *pipe()* and *pipe2()* functions shall fail if:

51494 [EMFILE] All, or all but one, of the file descriptors available to the process are currently  
 51495 open.

51496 [ENFILE] The number of simultaneously open files in the system would exceed a  
 51497 system-imposed limit.

51498 The *pipe2()* function may fail if:

51499 [EINVAL] The value of the *flag* argument is invalid.

## 51500 EXAMPLES

### 51501 Using a Pipe to Pass Data Between a Parent Process and a Child Process

51502 The following example demonstrates the use of a pipe to transfer data between a parent process  
51503 and a child process. Error handling is excluded, but otherwise this code demonstrates good  
51504 practice when using pipes: after the *fork()* the two processes close the unused ends of the pipe  
51505 before they commence transferring data.

```
51506 #include <stdlib.h>
51507 #include <unistd.h>
51508 ...
51509 int fildes[2];
51510 const int BSIZE = 100;
51511 char buf[BSIZE];
51512 ssize_t nbytes;
51513 int status;
51514
51515 status = pipe(fildes);
51516 if (status == -1 ) {
51517     /* an error occurred */
51518     ...
51519 }
51520
51521 switch (fork()) {
51522 case -1: /* Handle error */
51523     break;
51524
51525 case 0: /* Child - reads from pipe */
51526     close(fildes[1]); /* Write end is unused */
51527     nbytes = read(fildes[0], buf, BSIZE); /* Get data from pipe */
51528     /* At this point, a further read would see end-of-file ... */
51529     close(fildes[0]); /* Finished with pipe */
51530     exit(EXIT_SUCCESS);
51531
51532 default: /* Parent - writes to pipe */
51533     close(fildes[0]); /* Read end is unused */
51534     write(fildes[1], "Hello world\n", 12); /* Write data on pipe */
51535     close(fildes[1]); /* Child will see EOF */
51536     exit(EXIT_SUCCESS);
51537 }
51538 }
```

### 51534 APPLICATION USAGE

51535 None.

### 51536 RATIONALE

51537 The wording carefully avoids using the verb “to open” in order to avoid any implication of use  
51538 of *open()*; see also *write()*.

51539 The *O\_CLOEXEC* and *O\_CLOFORK* flags of *pipe2()* are necessary to avoid a data race in multi-  
51540 threaded applications. Without *O\_CLOFORK*, a file descriptor is leaked into a child process  
51541 created by one thread in the window between another thread creating a file descriptor with  
51542 *pipe()* and then using *fcntl()* to set the *FD\_CLOFORK* flag. Without *O\_CLOEXEC*, a file  
51543 descriptor intentionally inherited by child processes is similarly leaked into an executed

- 51544 program if `FD_CLOEXEC` is not set atomically.
- 51545 Since pipes are often used for communication between a parent and child process, `O_CLOFORK`  
 51546 has to be used with care in order for the pipe to be usable. If the parent will be writing and the  
 51547 child will be reading, `O_CLOFORK` should be used when creating the pipe, and then `fcntl()`  
 51548 should be used to clear `FD_CLOFORK` for the read side of the pipe. This prevents the write side  
 51549 from leaking into other children, ensuring the child will get end-of-file when the parent closes  
 51550 the write side (although the read side can still be leaked). If the parent will be reading and the  
 51551 child will be writing, there is no way to prevent the write side being leaked (short of preventing  
 51552 other threads from creating child processes) in order to ensure the parent gets end-of-file when  
 51553 the child closes the write side, and so the two processes should use an alternative method of  
 51554 indicating the end of communications.
- 51555 Arranging for `FD_CLOEXEC` to be set appropriately is more straightforward. The parent should  
 51556 use `O_CLOEXEC` when creating the pipe and the child should clear `FD_CLOEXEC` on the side  
 51557 to be passed to the new program before calling an *exec* family function to execute it.
- 51558 The `O_NONBLOCK` flag is for convenience in avoiding additional `fcntl()` calls.
- 51559 **FUTURE DIRECTIONS**
- 51560 None.
- 51561 **SEE ALSO**

- 51565 First released in Issue 1. Derived from Issue 1 of the SVID.
- 51566 **Issue 6**
- 51567 The following new requirements on POSIX implementations derive from alignment with the  
 51568 Single UNIX Specification:
- 51569 • The DESCRIPTION is updated to indicate that certain dispositions of `fildes[0]` and `fildes[1]`  
 51570 are unspecified.
- 51571 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the  
 51572 EXAMPLES section.
- 51573 **Issue 7**
- 51574 SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user  
 51575 ID and group ID.
- 51576 Changes are made related to support for finegrained timestamps.
- 51577 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0247 [835] and XSH/TC2-2008/0248  
 51578 [467,835] are applied.
- 51579 **Issue 8**
- 51580 Austin Group Defects 411, 1318, and 1577 are applied, adding `pipe2()` and `FD_CLOFORK`.
- 51581 Austin Group Defect 1576 is applied, adding the word ``respectively''.

51582 **NAME**

51583 poll, ppoll — input/output multiplexing

51584 **SYNOPSIS**

```
51585 #include <poll.h>
51586 int poll(struct pollfd fds[], nfds_t nfds, int timeout);
51587 int ppoll(struct pollfd fds[], nfds_t nfds,
51588           const struct timespec *restrict timeout,
51589           const sigset_t *restrict sigmask);
```

51590 **DESCRIPTION**

51591 The *ppoll()* function provides applications with a mechanism for multiplexing input/output  
 51592 over a set of file descriptors. For each member of the array pointed to by *fds*, *ppoll()* shall  
 51593 examine the given file descriptor for the event(s) specified in *events*. The number of **pollfd**  
 51594 structures in the *fds* array is specified by *nfds*. The *ppoll()* function shall identify those file  
 51595 descriptors on which an application can make an attempt to read or write data without blocking,  
 51596 or on which certain events have occurred.

51597 The *poll()* function shall be equivalent to the *ppoll()* function, except as follows:

- 51598 • For the *poll()* function, the timeout period is given in milliseconds in an argument of type  
 51599 **int**, whereas for the *ppoll()* function the timeout period is given in seconds and  
 51600 nanoseconds via an argument of type pointer to **struct timespec**. A *timeout* of  $-1$  for *poll()*  
 51601 shall be equivalent to passing a null pointer for the *timeout* for *ppoll()*.
- 51602 • The *poll()* function has no *sigmask* argument; it shall behave as *ppoll()* does when *sigmask* is  
 51603 a null pointer.

51604 The *fds* argument specifies the file descriptors to be examined and the events of interest for each  
 51605 file descriptor. It is a pointer to an array with one member for each open file descriptor of  
 51606 interest. The array's members are **pollfd** structures within which *fd* specifies an open file  
 51607 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the  
 51608 following event flags:

51609	POLLIN	The file descriptor is ready for reading data other than high-priority data.
51610	POLLRDNORM	The file descriptor is ready for reading normal data.
51611	POLLRDBAND	The file descriptor is ready for reading priority data.
51612	POLLPRI	The file descriptor is ready for reading high-priority data.
51613	POLLOUT	The file descriptor is ready for writing normal data.
51614	POLLWRNORM	Equivalent to POLLOUT.
51615	POLLWRBAND	The file descriptor is ready for writing priority data.
51616	POLLERR	An error condition is present on the file descriptor. All error conditions that 51617 arise solely from the state of the object underlying the open file description 51618 and would be diagnosed by a return of $-1$ from a <i>read()</i> or <i>write()</i> call on the 51619 file descriptor shall be reported as a POLLERR event. This flag is only valid in 51620 the <i>revents</i> bitmask; it shall be ignored in the <i>events</i> member.
51621	POLLHUP	A device has been disconnected, or a pipe or FIFO has been closed by the last 51622 process that had it open for writing. Once set, the hangup state of a FIFO shall 51623 persist until some process opens the FIFO for writing or until all read-only file 51624 descriptors for the FIFO are closed. This event and POLLOUT are mutually- 51625 exclusive. However, this event and POLLIN, POLLRDNORM,

51626 POLLRDBAND, or POLLPRI are not mutually-exclusive. This flag is only  
51627 valid in the *revents* bitmask; it shall be ignored in the *events* member.

51628 POLLNVAL The specified *fd* value is not an open file descriptor. This flag is only valid in  
51629 the *revents* member; it shall be ignored in the *events* member.

51630 A file descriptor shall be considered ready for reading when a call to an input function with  
51631 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
51632 successfully. (The function might return data, an end-of-file indication, or an error other than  
51633 one indicating that it is blocked, and in each of these cases the descriptor is considered ready for  
51634 reading.) A file descriptor shall be considered ready for writing when a call to an output  
51635 function with O\_NONBLOCK clear would not block, whether or not the function would transfer  
51636 data successfully. How much data could be written without blocking depends upon the object  
51637 underlying the open file description and its current state.

51638 The significance and semantics of normal, priority, and high-priority data are file and device-  
51639 specific. The semantics of device disconnection are device-specific.

51640 If the value of *fd* is less than 0, *events* shall be ignored, and *revents* shall be set to 0 in that entry on  
51641 return from *poll()* or *ppoll()*.

51642 In each **pollfd** structure, *poll()* or *ppoll()* shall clear the *revents* member, except that where the  
51643 application requested a report on a condition by setting one of the bits of *events* listed above,  
51644 *poll()* or *ppoll()* shall set the corresponding bit in *revents* if the requested condition is true. In  
51645 addition, *poll()* or *ppoll()* shall set the POLLHUP, POLLERR, and POLLNVAL flag in *revents* if  
51646 the condition is true, even if the application did not set the corresponding bit in *events*.

51647 The *timeout* argument controls how long the *poll()* or *ppoll()* function shall wait before timing  
51648 out. If the *timeout* argument is positive for *poll()* or not a null pointer for *ppoll()*, it specifies a  
51649 maximum interval to wait for the poll to complete. If the specified time interval expires without  
51650 any of the defined events having occurred, the function shall return. If the *timeout* argument is  
51651 -1 for *poll()* or a null pointer for *ppoll()*, then the call shall block indefinitely until at least one  
51652 descriptor meets the specified criteria or until the call is interrupted. To effect a poll, the  
51653 application shall ensure that the *timeout* argument for *poll()* is 0, or for *ppoll()* is not a null  
51654 pointer and points to a zero-valued **timespec** structure.

51655 Implementations may place limitations on the maximum timeout interval supported. All  
51656 implementations shall support a maximum timeout interval of at least 31 days for *ppoll()*. If the  
51657 *timeout* argument specifies a timeout interval greater than the implementation-defined  
51658 maximum value, the maximum value shall be used as the actual timeout value. Implementations  
51659 may also place limitations on the granularity of timeout intervals. If the requested timeout  
51660 interval requires a finer granularity than the implementation supports, the actual timeout  
51661 interval shall be rounded up to the next supported value.

51662 The *poll()* and *ppoll()* functions shall not be affected by the O\_NONBLOCK flag.

51663 The *poll()* and *ppoll()* functions shall support regular files, terminal and pseudo-terminal  
51664 devices, FIFOs, pipes, and sockets. The behavior of *poll()* and *ppoll()* on elements of *fds* that refer  
51665 to other types of file is unspecified.

51666 Regular files shall always poll TRUE for reading and writing.

51667 A file descriptor for a socket that is listening for connections shall indicate that it is ready for  
51668 reading, once connections are available. A file descriptor for a socket that is connecting  
51669 asynchronously shall indicate that it is ready for writing, once a connection has been established.

51670 Provided the application does not perform any action that results in unspecified or undefined  
51671 behavior, the value of the *fd* and *events* members of each element of *fds* shall not be modified by

51672 *poll()* or *ppoll()*.

51673 If *sigmask* is not a null pointer, the *ppoll()* function shall replace the signal mask of the caller by  
 51674 the set of signals pointed to by *sigmask* before examining the descriptors, and shall restore the  
 51675 signal mask of the calling thread before returning. If a signal is unmasked as a result of the  
 51676 signal mask being altered by *ppoll()*, and a signal-catching function is called for that signal  
 51677 during the execution of the *ppoll()* function, and SA\_RESTART is clear for the interrupting  
 51678 signal, then

- 51679 • If none of the defined events have occurred on any selected file descriptor, *ppoll()* shall  
 51680 immediately fail with the [EINTR] error after the signal-catching function returns.
- 51681 • If one or more of the defined events have occurred, it is unspecified whether *ppoll()*  
 51682 behaves the same as if none of the events had occurred (failing with [EINTR] as above) or  
 51683 behaves the same as if it was not interrupted (returning the total number of **pollfd**  
 51684 structures that have selected events).

51685 If a thread is canceled during a *ppoll()* call, it is unspecified whether the signal mask in effect  
 51686 when executing the registered cleanup functions is the original signal mask or the signal mask  
 51687 installed as part of the *ppoll()* call.

#### 51688 RETURN VALUE

51689 Upon successful completion, a non-negative value shall be returned. A positive value shall  
 51690 indicate the total number of **pollfd** structures that have selected events (that is, those for which  
 51691 the *revents* member is non-zero). A value of 0 shall indicate that the call timed out and no file  
 51692 descriptors have been selected. Upon failure, -1 shall be returned and *errno* set to indicate the  
 51693 error.

#### 51694 ERRORS

51695 The *poll()* and *ppoll()* functions shall fail if:

- |       |          |  |
|-------|----------|--|
| 51696 | [EAGAIN] | The allocation of internal data structures failed but a subsequent request may<br>51697 succeed. |
| 51698 | [EINTR]  | A signal was caught during <i>poll()</i> or <i>ppoll()</i> .                                     |
| 51699 | [EINVAL] | The <i>nfds</i> argument is greater than {OPEN_MAX}.   |

51700 The *ppoll()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 51701 | [EINVAL] | An invalid timeout interval was specified. |
|-------|----------|--|

#### 51702 EXAMPLES

51703 None.

#### 51704 APPLICATION USAGE

51705 Other than the difference in the precision of the requested timeout, the following *ppoll()* call:

```
51706 ready = ppoll(&fds, nfds, tmo_p, &sigmask);
```

51707 is equivalent to atomically executing the following calls:

```
51708 sigset_t origmask;
```

```
51709 int timeout;
```

```
51710 timeout = (tmo_p == NULL) ? -1 :
```

```
51711 (tmo_p->tv_sec * 1000 + tmo_p->tv_nsec / 1000000);
```

```
51712 pthread_sigmask(SIG_SETMASK, &sigmask, &origmask);
```

```
51713 ready = poll(&fds, nfds, timeout);
```

```
51714 pthread_sigmask(SIG_SETMASK, &origmask, NULL);
```

51715 When a *poll()* or *ppoll()* call indicates a file descriptor is ready for reading, this means that if an  
 51716 attempt to read data had been made at the time that the status of the file descriptor was checked,  
 51717 it would have returned at least one byte of data, an end-of-file indication, or an error, without  
 51718 blocking (even if *O\_NONBLOCK* is clear). When a *poll()* or *ppoll()* call indicates that a file  
 51719 descriptor is ready for writing, this means that if an attempt to write one byte of data had been  
 51720 made at the time that the status of the file descriptor was checked, it would have written that  
 51721 byte or returned an error, without blocking. However, if an attempt to write more than one byte  
 51722 had been made, it might have blocked (if *O\_NONBLOCK* is clear). In both cases, by the time the  
 51723 call returns and a subsequent I/O operation is attempted, the state of the file descriptor might  
 51724 have changed (for example, because another thread read or wrote some data) and, if  
 51725 *O\_NONBLOCK* is clear, there is no guarantee that the operation will not block (unless it would  
 51726 not block for some other reason, such as setting *MIN=0* and *TIME=0* for a terminal in non-  
 51727 canonical mode). Therefore it is recommended that applications always set *O\_NONBLOCK* on  
 51728 file descriptors whose readiness for I/O they query with *poll()* or *ppoll()*.

51729 The error conditions specified for *read()* and *write()* that are reported as *POLLERR* events are  
 51730 only those that arise solely from the state of the object underlying the open file description.  
 51731 They do not include, for example, *[EAGAIN]* as this relates to the state of the open file  
 51732 description not (solely) the object underlying it.

51733 Application writers should note that repeating a *poll()* or *ppoll()* call which indicated that I/O  
 51734 was possible on one or more of the file descriptors given, without causing some change to the  
 51735 state, either by altering the *fds* array or causing appropriate input or output to occur on at least  
 51736 one file descriptor indicated as ready, will result in “busy waiting”—a subsequent call will  
 51737 always return immediately indicating the same (or perhaps more) events as the previous one.

#### 51738 RATIONALE

51739 The *POLLHUP* event does not occur for FIFOs just because the FIFO is not open for writing. It  
 51740 only occurs when the FIFO is closed by the last writer and persists until some process opens the  
 51741 FIFO for writing or until all read-only file descriptors for the FIFO are closed.

51742 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
 51743 can install an additional cancellation handler which resets the signal mask to the expected value:

```
51744 void cleanup(void *arg)
51745 {
51746     sigset_t *ss = (sigset_t *) arg;
51747     pthread_sigmask(SIG_SETMASK, ss, NULL);
51748 }
51749 int call_ppoll(struct pollfd fds[], nfds_t nfds,
51750               const struct timespec *restrict timeout,
51751               const sigset_t *restrict sigmask)
51752 {
51753     sigset_t oldmask;
51754     int result;
51755     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
51756     pthread_cleanup_push(cleanup, &oldmask);
51757     result = ppoll(fds, nfds, timeout, sigmask);
51758     pthread_cleanup_pop(0);
51759     return result;
51760 }
```

51766 **CHANGE HISTORY**

51767 First released in Issue 4, Version 2.

51768 **Issue 5**

51769 Moved from X/OPEN UNIX extension to BASE.

51770 The description of POLLWRBAND is updated.

51771 **Issue 6**

51772 Text referring to sockets is added to the DESCRIPTION.

51773 Functionality relating to the XSI STREAMS Option Group is marked.

51774 The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of  
51775 POLLWRBAND.51776 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in  
51777 the EXAMPLES section.51778 **Issue 7**

51779 Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

51780 The *poll()* function is moved from the XSI option to the Base.

51781 Functionality relating to the XSI STREAMS option is marked obsolescent.

51782 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0249 [623] and XSH/TC2-2008/0250  
51783 [683] are applied.51784 **Issue 8**51785 Austin Group Defect 1263 is applied, adding *ppoll()*.

51786 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

51787 Austin Group Defect 1448 is applied, aligning the wording relating to file descriptor readiness  
51788 with *pselect()* and changing the APPLICATION USAGE section.

51789 **NAME**

51790 popen — initiate pipe streams to or from a process

51791 **SYNOPSIS**

```
51792 CX #include <stdio.h>
51793 FILE *popen(const char *command, const char *mode);
```

51794 **DESCRIPTION**

51795 The `popen()` function shall execute the command specified by the string `command`. It shall create  
 51796 a pipe between the calling program and the executed command, and shall return a pointer to a  
 51797 stream that can be used to either read from or write to the pipe.

51798 The environment of the executed command shall be as if a child process were created within the  
 51799 `popen()` call using the `fork()` function, and the child invoked the `sh` utility using the call:

```
51800 execl(<shell path>, "sh", "-c", "--", command, (char *)0);
```

51801 where `<shell path>` is an unspecified pathname for the `sh` utility. It is implementation-defined  
 51802 whether the handlers registered with `pthread_atfork()` are called as part of the creation of the  
 51803 child process.

51804 The `popen()` function shall ensure that any streams from previous `popen()` calls that remain open  
 51805 in the parent process are closed in the new child process, regardless of the `FD_CLOEXEC` or  
 51806 `FD_CLOFORK` status of the file descriptor underlying those streams.

51807 The `mode` argument to `popen()` is a string that specifies I/O mode:

- 51808 1. If `mode` starts with 'r', when the child process is started, its file descriptor  
 51809 `STDOUT_FILENO` shall be the writable end of the pipe, and the file descriptor  
 51810 `fileno(stream)` in the calling process, where `stream` is the stream pointer returned by  
 51811 `popen()`, shall be the readable end of the pipe. The `FD_CLOFORK` flag shall be cleared on  
 51812 both the `STDOUT_FILENO` file descriptor passed to the child process and the file  
 51813 descriptor underlying the returned stream.
- 51814 2. If `mode` starts with 'w', when the child process is started its file descriptor  
 51815 `STDIN_FILENO` shall be the readable end of the pipe, and the file descriptor `fileno(stream)`  
 51816 in the calling process, where `stream` is the stream pointer returned by `popen()`, shall be the  
 51817 writable end of the pipe. The `FD_CLOFORK` flag shall be cleared on both the  
 51818 `STDOUT_FILENO` file descriptor passed to the child process and the file descriptor  
 51819 underlying the returned stream.
- 51820 3. If `mode` includes a second character of 'e', then the file descriptor underlying the stream  
 51821 returned to the calling process by `popen()` shall have the `FD_CLOEXEC` flag atomically  
 51822 set. Additionally, if the implementation creates the file descriptor for use by the child  
 51823 process from within the parent process, then that file descriptor shall have the  
 51824 `FD_CLOEXEC` flag atomically set within the parent process. If `mode` does not have a  
 51825 second character, the `FD_CLOEXEC` flag of the underlying file descriptor returned by  
 51826 `popen()` shall be clear.
- 51827 4. If `mode` is any other value, the result is unspecified.

51828 After `popen()`, both the parent and the child process shall be capable of executing independently  
 51829 before either terminates.

51830 Pipe streams are byte-oriented.

51831 **RETURN VALUE**

51832 Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to  
 51833 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate  
 51834 the error.

51835 **ERRORS**

51836 The *popen()* function shall fail if:

51837 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

51838 The *popen()* function may fail if:

51839 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

51840 [EINVAL] The *mode* argument is invalid.

51841 The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

51842 **EXAMPLES**51843 **Using popen() to Obtain a List of Files from the ls Utility**

51844 The following example demonstrates the use of *popen()* and *pclose()* to execute the command *ls\**  
 51845 in order to obtain a list of files in the current directory:

```
51846 #include <stdio.h>
51847 ...
51848 FILE *fp;
51849 int status;
51850 char path[PATH_MAX];
51851 fp = popen("ls *", "r");
51852 if (fp == NULL)
51853     /* Handle error */;
51854 while (fgets(path, PATH_MAX, fp) != NULL)
51855     printf("%s", path);
51856 status = pclose(fp);
51857 if (status == -1) {
51858     /* Error reported by pclose() */
51859     ...
51860 } else {
51861     /* Use macros described under wait() to inspect `status' in order
51862        to determine success/failure of command executed by popen() */
51863     ...
51864 }
```

51865 **APPLICATION USAGE**

51866 Since open files are shared, a mode 'r' command can be used as an input filter and a mode 'w'  
 51867 command as an output filter.

51868 Buffered reading before opening an input filter may leave the standard input of that filter  
 51869 mispositioned. Similar problems with an output filter may be prevented by careful buffer  
 51870 flushing; for example, with *fflush()*.

51871 A stream opened by *popen()* should be closed by *pclose()*.

51872 The behavior of *popen()* is specified for values of *mode* of "r", "w", "re", and "we". Other

51873 modes such as "rb" and "wb" might be supported by specific implementations, but these  
 51874 would not be portable features. Note that historical implementations of *popen()* only check to see  
 51875 if the first character of *mode* is 'r'. Thus, a *mode* of "robert the robot" would be treated as  
 51876 *mode* "r", and a *mode* of "anything else" would be treated as *mode* "w".

51877 If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a  
 51878 stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process  
 51879 started by *popen()*.

51880 To determine whether or not the environment specified in the Shell and Utilities volume of  
 51881 POSIX.1-2024 is present, use the function call:

```
51882 sysconf(_SC_2_VERSION)
```

51883 (See *sysconf()*).

#### 51884 RATIONALE

51885 The *popen()* function should not be used by programs that have set user (or group) ID privileges.  
 51886 The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead.  
 51887 This prevents any unforeseen manipulation of the environment of the user that could cause  
 51888 execution of commands not anticipated by the calling program.

51889 If the original and *popen()*ed processes both intend to read or write or read and write a common  
 51890 file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for  
 51891 sharing file handles must be observed (see [Section 2.5.1](#), on page 522).

51892 The 'e' mode modifier to *popen()* is necessary to avoid a data race in multi-threaded  
 51893 applications. Without it, the parent's file descriptor is leaked into a second child process created  
 51894 by one thread in the window between another thread creating the pipe via *popen()* then using  
 51895 *fileno()* and *fcntl()* on the result. Also, if the *popen()* implementation temporarily has the child's  
 51896 file descriptor open within the parent, then that file descriptor could also be leaked if it is not  
 51897 atomically FD\_CLOEXEC for the duration in which it is open in the parent.

51898 The standard only requires that the implementation atomically set FD\_CLOEXEC on file  
 51899 descriptors created in the parent process when the 'e' mode modifier is in effect;  
 51900 implementations may also do so when the 'e' modifier is not in use, provided that the  
 51901 FD\_CLOEXEC bit is eventually cleared before *popen()* completes, however, this is not required  
 51902 because any application worried about the potential file descriptor leak will already be using the  
 51903 'e' modifier.

51904 Implementations are encouraged to add support for a "wf" mode which creates the pipe as if by  
 51905 calling *pipe2()* with the O\_CLOFORK flag and then clearing FD\_CLOFORK for the read side of  
 51906 the pipe. This prevents the write side from leaking into child processes created by other threads,  
 51907 ensuring the child created by *popen()* will get end-of-file when the parent closes the write side  
 51908 (although the read side can still be leaked). Unfortunately there is no way (short of temporarily  
 51909 preventing other threads from creating child processes, or implementing an atomic create-pipe-  
 51910 and-fork system call) to implement an "rf" mode with the equivalent guarantee that the child  
 51911 created by *popen()* will be the only writer. Therefore multi-threaded applications that do not  
 51912 have complete control over process creation cannot rely on getting end-of-file on the stream and  
 51913 need to use an alternative method of indicating the end of communications.

51914 Although the standard is clear that a conforming application should not call *popen()* when file  
 51915 descriptor 0 or 1 is closed, implementations are encouraged to handle these cases correctly.

51916 The following two examples demonstrate possible implementations of *popen()* using other  
 51917 standard functions. These examples are designed to show FD\_CLOEXEC handling rather than  
 51918 all aspects of thread safety, and implementations are encouraged to improve the locking

mechanism around the state list to be more efficient, as well as to be more robust if file descriptor 0 or 1 is returned as either part of the pipe. Also, remember that other implementations are possible, including one that uses an implementation-specific means of creating a pipe between parent and child where the parent process never has access to the child's end of the pipe. Both of these examples make use of the following helper functions, documented but not implemented here, to do the bookkeeping necessary to properly close all file descriptors created by other *popen()* calls regardless of their `FD_CLOEXEC` or `FD_CLOFORK` status:

```

51926 /* Obtain mutual exclusion lock, so that no concurrent popen() or
51927      pclose() calls are simultaneously modifying the list of tracked
51928      children. */
51929 static void popen_lock(void);

51930 /* Release mutual exclusion lock, without changing errno. */
51931 static void popen_unlock(void);

51932 /* Add the pid and stream pair to the list of tracked children, prior
51933      to any code that can clear FD_CLOEXEC on the file descriptor
51934      associated with stream. To be used while holding the lock. */
51935 static void popen_add_pair(FILE *stream, pid_t pid);

51936 /* Given a stream, return the associated pid, or -1 with errno set if
51937      the stream was not created by popen(). To be used while holding
51938      the lock. */
51939 static pid_t popen_get_pid(FILE *stream);

51940 /* Remove stream and its corresponding pid from the list of tracked
51941      children. To be used while holding the lock. */
51942 static void popen_remove(FILE *stream);

51943 /* If stream is NULL, return the first tracked child; otherwise,
51944      return the next tracked child. Return NULL if all tracked children
51945      have been returned. To be used while holding the lock. */
51946 static FILE *popen_next(FILE *stream);

```

51947 The first example is based on *fork()*:

```

51948 #include <stdio.h>
51949 #include <errno.h>
51950 #include <fcntl.h>
51951 #include <sys/wait.h>
51952 #include <unistd.h>
51953 FILE *popen(const char *command, const char *mode)
51954 {
51955     int fds[2];
51956     pid_t pid;
51957     FILE *stream;
51958     int target = mode[0] == 'w'; /* index of fds used by parent */

51959     /* Validate mode */
51960     if ((mode[0] != 'w' && mode[0] != 'r') ||
51961         mode[1 + (mode[1] == 'e')]) {
51962         errno = EINVAL;
51963         return NULL;
51964     }

51965     /* Create pipe and stream with FD_CLOEXEC set */

```

```

51966     if (pipe2(fds, O_CLOEXEC) < 0)
51967         return NULL;
51968     stream = fdopen(fds[target], mode);
51969     if (!stream) {
51970         int saved = errno;
51971         close(fds[0]);
51972         close(fds[1]);
51973         errno = saved;
51974         return NULL;
51975     }

51976     /* Create child process */
51977     popen_lock();
51978     pid = fork();
51979     if (pid < 0) {
51980         int saved = errno;
51981         close(fds[!target]);
51982         fclose(stream);
51983         popen_unlock();
51984         errno = saved;
51985         return NULL;
51986     }

51987     /* Child process. */
51988     if (!pid) {
51989         FILE *tracked = popen_next(NULL);
51990         while (tracked) {
51991             int fd = fileno(tracked);
51992             if (fd < 0 || close(fd))
51993                 _exit(127);
51994             tracked = popen_next(tracked);
51995         }
51996         target = mode[0] == 'r'; /* Opposite fd in the child */
51997         /* Use dup2 or fcntl to clear FD_CLOEXEC on child's descriptor,
51998            FD_CLOEXEC will take care of the rest of fds[]. */
51999         if (fds[target] != target) {
52000             if (dup2(fds[target], target) != target)
52001                 _exit(127);
52002             } else {
52003                 int flags = fcntl(fds[target], F_GETFD);
52004                 if (flags < 0 ||
52005                     fcntl(fds[target], F_SETFD, flags & ~FD_CLOEXEC) < 0)
52006                     _exit(127);
52007             }
52008             execl("/bin/sh", "sh", "-c", "--", command, NULL);
52009             _exit(127);
52010         }

52011     /* Parent process. From here on out, the close and fcntl system
52012        calls are assumed to pass, since all inputs are valid and do not
52013        require allocating any fds or memory. Besides, excluding
52014        failures due to undefined behavior (such as another thread
52015        closing an fd it knows nothing about), cleanup from any defined

```

```

52016         failures would require stopping and reaping the child process,
52017         which may have worse consequences. */
52018     close(fds[!target]);  popen_add_pair(stream, pid);
52019     popen_unlock();
52020     if (mode[1] != 'e') {
52021         int flags = fcntl(fds[target], F_GETFD);
52022         if (flags >= 0)
52023             fcntl(fds[target], F_SETFD, flags & ~FD_CLOEXEC);
52024     }
52025     return stream;
52026 }

```

52027 The second example is based on *posix\_spawn()*:

```

52028 #include <stdio.h>
52029 #include <errno.h>
52030 #include <fcntl.h>
52031 #include <sys/wait.h>
52032 #include <unistd.h>
52033 #include <spawn.h>
52034 extern char **environ;
52035 FILE *popen(const char *command, const char *mode)
52036 {
52037     int fds[2];
52038     pid_t pid;
52039     FILE *stream;
52040     int target = mode[0] == 'w'; /* index of fds used by parent */
52041     const char *argv[] = { "sh", "-c", "--", command, NULL };
52042     posix_spawn_file_actions_t actions;
52043     int saved;
52044     FILE *tracked;
52045
52046     /* Validate mode */
52047     if ((mode[0] != 'w' && mode[0] != 'r') ||
52048         mode[1 + (mode[1] == 'e')]) {
52049         errno = EINVAL;
52050         return NULL;
52051     }
52052
52053     /* Create pipe and stream with FD_CLOEXEC set */
52054     if (pipe2(fds, O_CLOEXEC) < 0)
52055         return NULL;
52056     stream = fdopen(fds[target], mode);
52057     if (!stream) {
52058         saved = errno;
52059         close(fds[0]);
52060         close(fds[1]);
52061         errno = saved;
52062         return NULL;
52063     }
52064
52065     /* Create child process */
52066     if (posix_spawn_file_actions_init(&actions)) {
52067         saved = errno;

```

```

52065         goto spawnerr1;
52066     }
52067     popen_lock();
52068     tracked = popen_next(NULL);
52069     while (tracked) {
52070         int fd = fileno(tracked);
52071         if (fd < 0 || posix_spawn_file_actions_addclose(&actions, fd))
52072             goto spawnerr2;
52073         tracked = popen_next(tracked);
52074     }
52075     if (posix_spawn_file_actions_adddup2(&actions, fds[!target], !target))
52076         goto spawnerr2;
52077     if (posix_spawn(&pid, "/bin/sh", &actions, NULL, (char **)argv,
52078     environ)) {
52079     spawnerr2:
52080         saved = errno;
52081         posix_spawn_file_actions_destroy(&actions);
52082         popen_unlock();
52083     spawnerr1:
52084         close(fds[!target]);
52085         fclose(stream);
52086         errno = saved;
52087         return NULL;
52088     }
52089     /* From here on out, system calls are assumed to pass, since all
52090     inputs are valid and do not require allocating any fds or memory.
52091     Besides, excluding failures due to undefined behavior (such as
52092     another thread closing an fd it knows nothing about), cleanup
52093     from any defined failures would require stopping and reaping the
52094     child process, which may have worse consequences. */
52095     posix_spawn_file_actions_destroy(&actions);
52096     close(fds[!target]);
52097     popen_add_pair(stream, pid);
52098     popen_unlock();
52099     if (mode[1] != 'e') {
52100         int flags = fcntl(fds[target], F_GETFD);
52101         if (flags >= 0)
52102             fcntl(fds[target], F_SETFD, flags & ~FD_CLOEXEC);
52103     }
52104     return stream;
52105 }

```

52106 Both examples can share a common *pclose()* implementation.

```

52107 int pclose(FILE *stream)
52108 {
52109     int status;
52110     popen_lock();
52111     pid_t pid = popen_get_pid(stream);
52112     if (pid < 0) {
52113         popen_unlock();
52114         return -1;

```

```

52115     }
52116     popen_remove(stream);
52117     popen_unlock();
52118     fclose(stream); /* Ignore failure */
52119     while (waitpid(pid, &status, 0) == -1) {
52120         if (errno != EINTR) {
52121             status = -1;
52122             break;
52123         }
52124     }
52125     return status;
52126 }

```

52127 Note that, while a particular implementation of *popen()* (such as the two above) can assume a  
52128 particular path for the shell, such a path is not necessarily valid on another system. The above  
52129 examples are not portable, and are not intended to be.

52130 Earlier versions of this standard required the *command* string to be passed as the next argument  
52131 after "-c" (omitting "--"). This meant that portable applications needed to take care not to  
52132 pass a command string beginning with <hyphen-minus> ('-') or <plus-sign> ('+'), as it  
52133 would then be interpreted as containing options. Now that implementations are required to pass  
52134 the "--", applications no longer need to do this.

#### 52135 FUTURE DIRECTIONS

#### 52141 CHANGE HISTORY

52142 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 52143 Issue 5

52144 A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

#### 52145 Issue 6

52146 The following new requirements on POSIX implementations derive from alignment with the  
52147 Single UNIX Specification:

- 52148 • The optional [EMFILE] error condition is added.

52149 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the  
52150 EXAMPLES section.

#### 52151 Issue 7

52152 Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the  
52153 DESCRIPTION.

52154 SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a  
52155 “may fail” to a “shall fail”.

52156 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0432 [14] is applied.

52157 **Issue 8**

52158 Austin Group Defects 411 and 1318 are applied, adding the 'e' mode modifier and  
52159 FD\_CLOFORK, and adding example implementations of *popen()* and *pclose()* in the  
52160 RATIONALE section.

52161 Austin Group Defect 1317 is applied, making it implementation-defined whether the handlers  
52162 registered with *pthread\_atfork()* are called.

52163 Austin Group Defect 1440 is applied, adding a "--" argument to the specified *execl()* call.

52164 Austin Group Defect 1526 is applied, making typographic changes relating to *mode* values for  
52165 consistency with *fopen()*.

52166 **NAME**

52167        posix\_close — close a file descriptor

52168 **SYNOPSIS**

52169        #include <unistd.h>

52170        int posix\_close(int *fd*, int *flag*);

52171 **DESCRIPTION**

52172        Refer to *close()*.

52173 **NAME**

52174 posix\_devctl — device control

52175 **SYNOPSIS**

```
52176 DC      #include <devctl.h>
52177
52177      int posix_devctl(int fildev, int dcmd, void *restrict dev_data_ptr,
52178                      size_t nbyte, int *restrict dev_info_ptr);
```

52179 **DESCRIPTION**

52180 The *posix\_devctl()* function shall cause the device control command *dcmd* to be passed to the  
 52181 driver identified by *fildev*. Associated data shall be passed to and/or from the driver depending  
 52182 on direction information encoded in the *dcmd* argument or as implied in the *dcmd* argument by  
 52183 the design and implementation of the driver.

52184 If the *dev\_data\_ptr* argument is not a null pointer, it shall be a pointer to a buffer that is provided  
 52185 by the caller and that contains data bytes to be passed to the driver or provides space for  
 52186 receiving data bytes to be passed back from the driver, or both.

52187 If the data bytes are to be passed to the driver, at least *nbyte* bytes of associated data shall be  
 52188 made available to the driver; if the data bytes are to be passed from the driver, no more than  
 52189 *nbyte* bytes shall be passed.

52190 The driver may be executing in an address space different from the address space of the calling  
 52191 thread. Therefore, if the data bytes passed to the driver (i.e., the contents of the memory area  
 52192 starting at *dev\_data\_ptr* and continuing for *nbyte* bytes) contain pointers to memory in the  
 52193 address space of the calling thread and the driver uses these pointers to access that memory, the  
 52194 effects are unspecified.

52195 OB If *dev\_data\_ptr* is not a null pointer and *nbyte* is zero, the amount of data passed to and/or from  
 52196 the driver is unspecified. This feature is obsolescent and is only provided for compatibility with  
 52197 existing device drivers.

52198 If *dev\_data\_ptr* is a null pointer, there shall be no data bytes passed between the caller and the  
 52199 driver other than the data specified in the rest of the arguments to *posix\_devctl()* and in its return  
 52200 value.

52201 The *dev\_info\_ptr* argument provides the opportunity to return an integer number containing  
 52202 additional device information, instead of just a success/failure indication. For implementation-  
 52203 provided *dcmd* values, it is implementation-defined whether each such value causes the **int**  
 52204 pointed to by *dev\_info\_ptr* to be set and, if set, what value it is set to.

52205 For each supported device, the set of valid *dcmd* commands, the associated data interpretation,  
 52206 and the effects of the command on the device are all defined by the driver for the device  
 52207 identified by *fildev*, and are therefore implementation-defined for implementation-provided  
 52208 device drivers.

52209 **RETURN VALUE**

52210 Upon successful completion, *posix\_devctl()* shall return zero; otherwise an error number shall be  
 52211 returned to indicate the error. The value returned in the **int** value pointed to by *dev\_info\_ptr* is  
 52212 driver dependent.

52213 **ERRORS**

52214 The *posix\_devctl()* function shall fail if:

52215 [EBADF] The *fildev* argument is not a valid open file descriptor.

52216 The *posix\_devctl()* function may fail if:

- 52217 [EINTR] The *posix\_devctl()* function was interrupted by a signal.
- 52218 [EINVAL] The *nbyte* argument exceeds an implementation-defined maximum or is less than the minimum number of bytes required for this command.
- 52219
- 52220 [EINVAL] The *dcmd* argument is not valid for this device.
- 52221 [ENOTTY] The *fildev* argument is not associated with a character special file that accepts control functions.
- 52222
- 52223 [EPERM] The requesting process does not have the appropriate privilege to request the device to perform the specified command.
- 52224
- 52225 Driver code may detect other errors, but the error numbers returned are driver dependent. See
- 52226 “Recommended Practice for Driver-Detected Errors” in RATIONALE.
- 52227 If the *posix\_devctl()* function fails, the effect of this failed function on the device is driver
- 52228 dependent. Corresponding data might be transferred, partially transferred, or not transferred at
- 52229 all.

52230 **EXAMPLES**

52231 None.

52232 **APPLICATION USAGE**

52233 None.

52234 **RATIONALE**

52235 **Background**

52236 An interface to be included in the POSIX standard should improve source code portability of  
 52237 application programs. In traditional UNIX practice, *ioctl()* was used to handle special devices.  
 52238 Therefore, a general specification of its arguments cannot be written. Based on this fact, in the  
 52239 past many people claimed that *ioctl()*, or something close to it, had no place in the POSIX  
 52240 standards.

52241 Against this perception stood the widespread use of *ioctl()* to interface to all sorts of drivers for a  
 52242 vast variety of hardware used in all areas of general-purpose, realtime, and embedded  
 52243 computing, such as analog-digital converters, counters, and video graphic devices. These  
 52244 devices provide a set of services that cannot be represented or used in terms of *read()* or *write()*  
 52245 calls.

52246 The arguments in favor of *ioctl()* standardization can be summarized as follows:

52247 Even if *ioctl()* addresses very different hardware, many of these devices either are actually the  
 52248 same, interfaced to different computer systems with different implementations of operating  
 52249 systems, or belong to classes of devices with rather high commonality in their functions, e.g.,  
 52250 analog-digital converters or digital-analog converters. Growing standardization of the control  
 52251 and status register (CSR) space of these devices allows exploitation of a growing similarity of  
 52252 control codes and data for these devices. A general mechanism is needed to control these  
 52253 devices.

52254 In all these cases, a standardized interface from the application program to drivers for these  
 52255 devices will improve source code portability.

52256 Even if control codes and device data have to be changed when porting applications from one  
 52257 system to another, the definition of *ioctl()* largely improves readability of a program handling  
 52258 special devices. Changes are confined to more clearly labeled places.

52259 A driver for a specific device normally cannot be considered portable *per se*, but an application

52260 that uses this driver can be made portable if all interfaces needed are well defined and  
 52261 standardized. Users and integrators of realtime systems often add device drivers for specific  
 52262 devices, and a standard interface simplifies this process. Also, device drivers often follow their  
 52263 special hardware from system to system.

52264 In recognition of these reasons, The Open Group included *ioctl()* in the The Single UNIX  
 52265 Specification, Version 1, and the interface was later incorporated into POSIX.1 under the XSI  
 52266 STREAMS option (although that option was subsequently removed).

52267 The *posix\_devctl()* interface defined in this standard provides an alternative to the the various  
 52268 *ioctl()* implementations with a standard interface that captures the extensibility of *ioctl()*, but  
 52269 avoids several of its deficiencies, which is mentioned in “Relationship to *ioctl()* and the  
 52270 Perceived Needs for Improvement” below.

### 52271 Existing Practice

52272 The *ioctl()* interface is widely used. It has provided the generality mentioned above. Existing  
 52273 practice encodes into the second parameter information about data size and direction in some  
 52274 systems. An example of such an encoding is the use in BSD 4.3 of two bits of the command word  
 52275 as read/write bits. However, *ioctl()* has definite problems with the way that its sometimes  
 52276 optional third parameter can be interpreted.

52277 This practice is similar to the existing POSIX *fcntl()* function, in which the third parameter can  
 52278 be optional for the F\_GETFD and F\_GETFL commands, an **int** when used with the F\_DUPFD,  
 52279 F\_SETFD, or F\_SETFL commands, or a **struct flock** when used with the F\_GETLK, F\_SETLK, or  
 52280 F\_SETLKW commands. However, the *fcntl()* interface defines two distinct and known data  
 52281 types as possible for the third parameter. This is not the case in the *ioctl()* interface, where any  
 52282 number of device driver specific structures and commands are used.

### 52283 Relationship to *ioctl()* and the Perceived Needs for Improvement

52284 [Section A.11](#) (on page 3718) briefly mentions some of the perceived deficiencies in existing  
 52285 implementations of the *ioctl()* function, in the context of those *ioctl()* commands used to  
 52286 implement terminal control. The standard developers decided that, since the set of such control  
 52287 operations was fairly well defined, suitable encapsulations such as *tcsetattr()*, *tcsendbreak()*, and  
 52288 *tcdrain()* could be standardized. These interfaces, while successfully standardizing portable  
 52289 terminal control operations, are not extensible to arbitrary user-supplied devices.

52290 There are several perceived deficiencies with the *ioctl()* function that drove the development of  
 52291 the *posix\_devctl()* interface as an alternative:

- 52292 • The major problem with *ioctl()* is that the third argument (when one is passed) varies in  
 52293 both size and type according to the second (command) argument. It is not unprecedented  
 52294 in POSIX, or standards in general, for a function to accept a generic pointer; consider the  
 52295 ISO C function *fread()*, or the POSIX functions *read()* and *mmap()*. However, in all such  
 52296 instances, the generic pointer is accompanied by a size argument that specifies the size of  
 52297 the pointed-to object. Unlike the Ada language, it is, and has always been, the C  
 52298 programmer’s responsibility to ensure that these two arguments form a consistent  
 52299 specification of the passed object. But traditional *ioctl()* implementations do not allow the  
 52300 user to specify the size of the pointed-to object; that size is instead fixed implicitly by the  
 52301 specified command (passed as another argument). The *posix\_devctl()* interface improves  
 52302 upon *ioctl()* in that it allows the user to specify the object size, thereby restoring the  
 52303 familiar C paradigm for passing a generic object by pointer/size pair.

- 52304 • A secondary problem with *ioctl()* is that the third argument is sometimes permitted to be  
52305 interpreted as an integer (**int**). The *posix\_devctl()* interface clearly requires the *dev\_data\_ptr*  
52306 argument to be a pointer.
- 52307 • A related problem with *ioctl()* is that the direction(s) in which data are transferred to or  
52308 from the pointed-to object is neither specified explicitly as an argument (as with *mmap()*),  
52309 nor implied by the *ioctl()* function (as with *read()/write()*, *fread()/fwrite()*, or  
52310 *fgets()/fputs()*). Instead, the direction is implied by the command argument. In traditional  
52311 implementations, only the device driver knows the interpretation of the commands and  
52312 whether data bytes are to be transferred to or from the pointed-to object. But in networked  
52313 implementations, generic portions of the operating system may need to know the direction  
52314 to ensure that data bytes are passed properly between a client and a server, separately from  
52315 device driver concerns. Two implementation-specific solutions to this problem are to  
52316 always assume data bytes need to be transferred in both directions, or to encode the  
52317 implied direction into the command word along with the fixed data size. The *posix\_devctl()*  
52318 interface already provides the implementation with an explicit size parameter. Since the  
52319 direction is already known implicitly to both the application and the driver and since  
52320 workable methods exist for implementations to ascertain that direction if required, this  
52321 perceived problem is strictly an implementation issue and solvable without further impact  
52322 on the interface.
- 52323 • Finally, *posix\_devctl()* improves upon *ioctl()* by adopting the new style of error return,  
52324 avoiding all the problems *errno* brings to multi-threaded applications. Because the driver-  
52325 specific information carried by the non-error return values of *ioctl()* still potentially needs  
52326 to be passed to the application, *posix\_devctl()* adds the *dev\_info\_ptr* argument to specify  
52327 where this information should be stored.

#### 52328 Which Differences Between *posix\_devctl()* and *ioctl()* Are Acceptable?

52329 Any differences between the definitions of *posix\_devctl()* and *ioctl()* have to be perceived as  
52330 a clear improvement by the community of potential users. Drivers for normal peripherals are  
52331 typically written by highly specialized professionals. Drivers for the special devices are very  
52332 often written by the application developer or by the hardware designer. Any interface definition  
52333 that can be seen as overly complicated will simply not be accepted.

52334 Nevertheless, a few simple and useful improvements to *ioctl()* are possible, specifically the  
52335 improvement of type checking, and justify the definition of a new interface.

52336 The major difference between the two interfaces is the addition of the size of the device data. For  
52337 enhanced compatibility with existing *ioctl()* implementations, this size can be specified as zero;  
52338 in this case the amount of data passed is unspecified. (This allows a macro definition of *ioctl()*  
52339 that converts it into a *posix\_devctl()* call.) In any case, the data size argument does not contradict  
52340 the general goal of being able to implement *posix\_devctl()* using the existing *ioctl()* interfaces  
52341 provided in current UNIX systems and other POSIX implementations because the standard  
52342 allows but does not require checking the size of the device data. Although the third argument of  
52343 the *ioctl()* function does not specify a size, it is implicit in the specific combination of control  
52344 command and driver and, therefore, known to the driver implementation.

52345 The method of indicating error return values differs from traditional *ioctl()* implementations, but  
52346 it does not preclude the construction of *posix\_devctl()* as a macro built upon *ioctl()*, which was  
52347 one of the original design goals.

### 52348 **Rationale for the *dev\_info\_ptr* Argument**

52349 The POSIX.26 developers felt that it was important to preserve the current *ioctl()* functionality of  
 52350 allowing a device driver to return some arbitrary piece of information instead of just a  
 52351 success/failure indication. Such information might be, for example, the number of bytes  
 52352 received, the number of bytes that would not fit into the buffer pointed at by *dev\_data\_ptr*, the  
 52353 data type indication, or the device status. Current practice for device drivers and *ioctl()* usage  
 52354 allows such a device-dependent return value. Thus, the concept of an additional output  
 52355 argument, *dev\_info\_ptr*, was born.

### 52356 **Rationale for No *direction* Argument**

52357 The initial specification for *posix\_devctl()* contained an additional argument that specified the  
 52358 direction of data flow, i.e., to the driver and/or from the driver. This argument was later  
 52359 removed for the following reasons:

- 52360 • The argument was redundant. Most (if not all) existing implementations encode the  
 52361 direction data either explicitly or implicitly in the command word.
- 52362 • The argument increased the probability of programming errors, since it must be made to  
 52363 agree with the direction information already encoded or implied in the command word or  
 52364 an error would occur.
- 52365 • The only real use of the argument would be if new drivers were written that supported  
 52366 generic commands such as TRANSFER\_CONTROL\_DATA, which was modified by the  
 52367 direction argument to indicate in which direction the data should be transferred. This is  
 52368 contrary to current practice that uses command pairs such as GET\_CONTROL\_DATA and  
 52369 PUT\_CONTROL\_DATA.
- 52370 • The primary purpose of the direction argument was to allow higher levels of the system to  
 52371 identify the direction of data transfers, particularly in the case of remote devices, without  
 52372 having to understand all the commands of all the devices on the system. Implementations  
 52373 that need to ascertain the direction of data transfer from a command word will define a  
 52374 consistent convention for encoding the direction into each command word, and all device  
 52375 drivers supplied by the user must adhere to this convention.

52376 Thus, the data direction argument was removed.

### 52377 **Rationale for Not Defining the Direction Encoding in the *dcmd* Argument**

52378 The POSIX.26 developers gave consideration to defining the direction encoding in the *dcmd*  
 52379 argument, but decided against doing so. No particular benefit was seen to a predefined  
 52380 encoding, as long as the encoding was used consistently across the entire implementation and  
 52381 was well known to the implementation.

52382 In addition, although only one encoding (BSD's) employed for *ioctl()* was known among the  
 52383 members of the small working group, it could not be ruled out that other encodings already  
 52384 existed, and no reason for precluding these encodings was seen.

52385 Finally, system or architectural constraints might make a chosen standard encoding difficult to  
 52386 use on a given implementation.

52387 Thus, this standard does not define a direction encoding. Specifying a standard encoding is  
 52388 actually a small part of a larger and more contentious objective, that of specifying a complete set  
 52389 of interfaces for portable device drivers. If a future POSIX standard specifies such interfaces, the  
 52390 issue of device control direction encoding will necessarily be addressed as part of that  
 52391 specification.

52392 **Recommended Practice for Handling Data Size Errors**

52393 In the event that the amount of data from the device is too large to fit into the specified buffer, as  
 52394 much data as will fit should be transferred, and the error posted. The retained data will aid in  
 52395 debugging, even if some of the data is lost.

52396 **Recommended Practice for *nbyte* == 0**

52397 The feature that permits an unspecified amount of control data to be transferred if *nbyte* is zero  
 52398 exists only for compatibility with existing device driver usage of *ioctl()*,  
 52399 i.e., when *ioctl()* is implemented on top of *posix\_devctl()* and the device driver transfers an  
 52400 amount of data implied by the command.

52401 Implementations in which *posix\_devctl()* is built as a library routine on top of *ioctl()* may not be  
 52402 able to make checks on the *nbyte* argument. However, newly developed applications using  
 52403 *posix\_devctl()* should always use an appropriate value for the *nbyte* argument, for portability to  
 52404 implementations directly supporting *posix\_devctl()* in which the device drivers may be able to  
 52405 honor the application's *nbyte* argument or return the error [EINVAL] if the argument is an  
 52406 unacceptable value. Device drivers designed for those systems should interpret a zero value of  
 52407 *nbyte* as no data to be transferred.

52408 **Recommended Practice for Driver-Detected Errors**

52409 If the driver detects the following error conditions, it is recommended that the *posix\_devctl()*  
 52410 function fail and return the corresponding error number:

52411	[EBUSY]	The control operation could not complete successfully because the device was
52412		in use by another process, or the driver was unable to carry out the request
52413		due to an outstanding operation in progress.
52414	[EINVAL]	The arguments <i>dev_data_ptr</i> and <i>nbyte</i> define a buffer too small to hold the
52415		amount of data expected by or to be returned by this driver.
52416	[EIO]	The control operation could not complete successfully because the driver
52417		detected a hardware error.

52418 **FUTURE DIRECTIONS**

52419 None.

52420 **SEE ALSO**

52421 XBD [Section 4.21](#) (on page 108), [<devctl.h>](#)

52422 **CHANGE HISTORY**

52423 First released in Issue 8. Derived from POSIX.26.

52424 **NAME**52425 posix\_fadvise — file advisory information (**ADVANCED REALTIME**)52426 **SYNOPSIS**

```
52427 ADV #include <fcntl.h>
52428 int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

52429 **DESCRIPTION**

52430 The *posix\_fadvise()* function shall advise the implementation on the expected behavior of the  
 52431 application with respect to the data in the file associated with the open file descriptor, *fd*, starting  
 52432 at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len*  
 52433 is zero, all data from *offset* to the largest possible value of the file offset for that file shall be  
 52434 specified. The implementation may use this information to optimize handling of the specified  
 52435 data. The *posix\_fadvise()* function shall have no effect on the semantics of other operations on the  
 52436 specified data, although it may affect the performance of other operations.

52437 The advice to be applied to the data is specified by the *advice* parameter and may be one of the  
 52438 following values:

52439 **POSIX\_FADV\_NORMAL**

52440 Specifies that the application has no advice to give on its behavior with respect to the  
 52441 specified data. It is the default characteristic if no advice is given for an open file.

52442 **POSIX\_FADV\_SEQUENTIAL**

52443 Specifies that the application expects to access the specified data sequentially from lower  
 52444 offsets to higher offsets.

52445 **POSIX\_FADV\_RANDOM**

52446 Specifies that the application expects to access the specified data in a random order.

52447 **POSIX\_FADV\_WILLNEED**

52448 Specifies that the application expects to access the specified data in the near future.

52449 **POSIX\_FADV\_DONTNEED**

52450 Specifies that the application expects that it will not access the specified data in the near  
 52451 future.

52452 **POSIX\_FADV\_NOREUSE**

52453 Specifies that the application expects to access the specified data once and then not reuse it  
 52454 thereafter.

52455 These values are defined in **<fcntl.h>**.

52456 **RETURN VALUE**

52457 Upon successful completion, *posix\_fadvise()* shall return zero; otherwise, an error number shall  
 52458 be returned to indicate the error.

52459 **ERRORS**

52460 The *posix\_fadvise()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 52461 | [EBADF]  | The <i>fd</i> argument is not a valid file descriptor.                               |
| 52462 | [EINVAL] | The value of <i>advice</i> is invalid, or the value of <i>len</i> is less than zero. |

52476 **CHANGE HISTORY**

52477 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

52478 In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

52479 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function  
52480 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the  
52481 standard developers felt it acceptable to make this change before implementations of this  
52482 function become widespread.

52483 **Issue 7**

52484 Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the  
52485 [EINVAL] error.

52486 **Issue 8**52487 Austin Group Defect 1135 is applied, clarifying the requirements when *len* is zero.

52488 **NAME**52489 posix\_fallocate — file space control (**ADVANCED REALTIME**)52490 **SYNOPSIS**

```
52491 ADV #include <fcntl.h>
52492 int posix_fallocate(int fd, off_t offset, off_t len);
```

52493 **DESCRIPTION**

52494 The *posix\_fallocate()* function shall ensure that any required storage for regular file data starting  
 52495 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If  
 52496 *posix\_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail due  
 52497 to the lack of free space on the file system storage media.

52498 If the *offset+len* is beyond the current file size, then *posix\_fallocate()* shall adjust the file size to  
 52499 *offset+len*. Otherwise, the file size shall not be changed.

52500 It is implementation-defined whether a previous *posix\_fadvise()* call influences allocation  
 52501 strategy.

52502 Space allocated via *posix\_fallocate()* shall be freed by a successful call to *creat()* or *open()* that  
 52503 truncates the size of the file. Space allocated via *posix\_fallocate()* may be freed by a successful call  
 52504 to *truncate()* that reduces the file size to a size smaller than *offset+len*.

52505 **RETURN VALUE**

52506 Upon successful completion, *posix\_fallocate()* shall return zero; otherwise, an error number shall  
 52507 be returned to indicate the error.

52508 **ERRORS**

52509 The *posix\_fallocate()* function shall fail if:

- |           |           |   |
|-----------|-----------|---|
| 52510     | [EBADF]   | The <i>fd</i> argument is not a valid file descriptor.  |
| 52511     | [EBADF]   | The <i>fd</i> argument references a file that was opened without write permission.  |
| 52512     | [EFBIG]   | The value of <i>offset+len</i> is greater than the maximum file size.   |
| 52513 XSI | [EFBIG]   | The value of <i>offset+len</i> exceeds the file size limit of the process. A SIGXFSZ signal shall also be generated for the thread. |
| 52514     |           |   |
| 52515     | [EINTR]   | A signal was caught during execution.   |
| 52516     | [EINVAL]  | The <i>len</i> argument is less than zero, or the <i>offset</i> argument is less than zero.   |
| 52517     | [EIO]     | An I/O error occurred while reading from or writing to a file system.   |
| 52518     | [ENODEV]  | The <i>fd</i> argument does not refer to a regular file.  |
| 52519     | [ENOSPC]  | There is insufficient free space remaining on the file system storage media.  |
| 52520     | [ENOTSUP] | The underlying file system does not support this operation.   |
| 52521     | [ESPIPE]  | The <i>fd</i> argument is associated with a pipe or FIFO.   |
| 52522     |           | The <i>posix_fallocate()</i> function may fail if:  |
| 52523     | [EINVAL]  | The <i>len</i> argument is zero.  |

52524 **EXAMPLES**

52525 None.

52526 **APPLICATION USAGE**52527 The *posix\_fallocate()* function is part of the Advisory Information option and need not be  
52528 provided on all implementations.52529 Not all file systems are capable of supporting *posix\_fallocate()*, in which case the function will  
52530 return [ENOTSUP]. However, if a system supports the Advisory Information option, there must  
52531 be at least one file system that is capable of supporting this function and is available for use in  
52532 conforming environments. The *pathconf()* and *fpathconf()* functions can be used to determine  
52533 whether a file in a particular file system supports *posix\_fallocate()*.52534 **RATIONALE**

52535 None.

52536 **FUTURE DIRECTIONS**

52537 None.

52541 **CHANGE HISTORY**

52542 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

52543 In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

52544 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/69 is applied, changing the function  
52545 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the  
52546 standard developers felt it acceptable to make this change before implementations of this  
52547 function become widespread.52548 **Issue 7**52549 Austin Group Interpretations 1003.1-2001 #022, #024, and #162 are applied, changing the  
52550 definition of the [EINVAL] error.52551 **Issue 8**

52552 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

52553 Austin Group Defect 684 is applied, requiring an [ENOTSUP] error instead of [EINVAL] when  
52554 the underlying file system does not support *posix\_fallocate()*.

52555 Austin Group Defect 687 is applied, changing the APPLICATION USAGE section.

52556 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
52557 relating to the file size limit for the process.

52558 **NAME**

52559 posix\_getdents — read directory entries

52560 **SYNOPSIS**

52561 #include &lt;dirent.h&gt;

52562 ssize\_t posix\_getdents(int *fildes*, void \**buf*, size\_t *nbyte*, int *flags*);52563 **DESCRIPTION**

52564 The *posix\_getdents()* function shall attempt to read directory entries from the directory associated  
 52565 with the open file descriptor *fildes* and shall place information about the directory entries and the  
 52566 files they refer to in **posix\_dent** structures in the buffer pointed to by *buf*, up to a maximum of  
 52567 *nbyte* bytes. The number of **posix\_dent** structures populated in *buf* may be fewer than the  
 52568 number that will fit in *nbyte* bytes, but shall be at least one if *nbyte* is greater than the size of the  
 52569 **posix\_dent** structure plus [NAME\_MAX] and *fildes* is not currently at end-of-file.

52570 The application shall ensure that *buf* is aligned suitably to point to a **posix\_dent** structure. The  
 52571 alignment needed shall not be more restrictive than the alignment provided by *malloc()*. Strictly  
 52572 conforming applications shall ensure that the value of *flags* is zero; other applications can set it to  
 52573 a value constructed by a bitwise-inclusive OR of implementation-defined bitwise-distinct flag  
 52574 values.

52575 Each **posix\_dent** structure returned in *buf* shall be located at an address that satisfies the  
 52576 implementation's alignment requirements for the **posix\_dent** structure and shall be populated  
 52577 as follows:

- 52578 • The value of the *d\_ino* member shall be set to the file serial number of the file named by the  
 52579 *d\_name* member.
- 52580 • The value of the *d\_reclen* member shall be set to the number of bytes occupied by this entry  
 52581 in *buf*, including any padding bytes needed before the next entry, if any. If this is the last  
 52582 entry in *buf*, *d\_reclen* shall include any padding bytes needed to make the address of this  
 52583 entry plus *d\_reclen* bytes satisfy the alignment requirements for the **posix\_dent** structure.
- 52584 • The value of the *d\_type* member shall be set to indicate the file type of the named file, if the  
 52585 file type can be determined without needing to use the file serial number to obtain the  
 52586 file's metadata; otherwise it may be set to DT\_UNKNOWN. If the file type is determined  
 52587 and it is one of the file types defined in this standard, the value of *d\_type* shall be DT\_BLK,  
 52588 DT\_CHR, DT\_DIR, DT\_FIFO, DT\_LNK, DT\_REG, DT\_SOCK, DT\_MQ, DT\_SEM,  
 52589 DT\_SHM, or DT\_TMO (see <dirent.h>). If it is determined but is not a standard file type,  
 52590 the value of *d\_type* shall not equal any of those listed here.
- 52591 • The *d\_name* member shall be a filename string, and (if not dot or dot-dot) shall contain the  
 52592 same byte sequence as the last pathname component of the string used to create the  
 52593 directory entry, plus the terminating NUL byte.

52594 If the *d\_name* member names a symbolic link, the values of the *d\_ino* and *d\_type* members shall  
 52595 be set to the values for the symbolic link itself.

52596 The *posix\_getdents()* function shall start reading at the current file offset in the open file  
 52597 description associated with *fildes*. On successful return, the file offset shall be incremented to  
 52598 point to the directory entry immediately following the last entry whose information was  
 52599 returned in *buf*, or to point to end-of-file if there are no more directory entries. On failure, the  
 52600 value of the file offset is unspecified. The current file offset can be set and retrieved using *lseek()*  
 52601 on the open file description associated with *fildes*. The behavior is unspecified if *lseek()* is used  
 52602 to set the file offset to a value other than zero or a value returned by a previous call to *lseek()* on  
 52603 the same open file description.

52604 The *posix\_getdents()* function shall not return directory entries containing empty names. If  
 52605 entries for dot or dot-dot exist, a sequence of calls that reads from offset zero to end-of-file shall  
 52606 return one entry for dot and one entry for dot-dot; otherwise, they shall not be returned.

52607 Upon successful completion, *posix\_getdents()* shall mark for update the last data access  
 52608 timestamp of the directory.

52609 If *fildev* is a file descriptor associated with a directory stream opened using *fdopendir()* or  
 52610 *opendir()*, the behavior is unspecified.

52611 If *posix\_getdents()* is called concurrently with an operation that adds, deletes, or modifies a  
 52612 directory entry, the results from *posix\_getdents()* shall reflect either all of the effects of the  
 52613 concurrent operation or none of them. If a sequence of calls to *posix\_getdents()* is made that reads  
 52614 from offset zero to end-of-file and a file is removed from or added to the directory between the  
 52615 first and last of those calls, whether the sequence of calls returns an entry for that file is  
 52616 unspecified.

52617 **RETURN VALUE**

52618 Upon successful completion, either a non-negative integer shall be returned indicating the  
 52619 number of bytes occupied by the **posix\_dent** structures placed in *buf* or 0 shall be returned  
 52620 indicating the end of the directory was reached without any directory entries being placed in *buf*.  
 52621 Otherwise, -1 shall be returned and *errno* shall be set to indicate the error.

52622 **ERRORS**

52623 The *posix\_getdents()* function shall fail if:

- 52624 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.
- 52625 [EINVAL] The *nbyte* argument is not large enough to contain the information to be  
 52626 returned about the directory entry located at the current file offset.
- 52627 [ENOENT] The current file offset is not located at a valid directory entry.
- 52628 [ENOTDIR] The *fildev* argument is associated with a non-directory file.
- 52629 [EOVERFLOW] One of the values in a structure to be placed in *buf* cannot be represented  
 52630 correctly.

52631 The *posix\_getdents()* function may fail if:

- 52632 [EIO] A physical I/O error has occurred.
- 52633 [ENOMEM] Insufficient memory was available to fulfill the request.

52634 **EXAMPLES**

52635 This example function lists the files in a specified directory with their file serial number and file  
 52636 type. If the file type is not available from *posix\_getdents()*, it is obtained using *fstatat()*.

```
52637 #include <dirent.h>
52638 #include <fcntl.h>
52639 #include <stdio.h>
52640 #include <stdlib.h>
52641 #include <sys/stat.h>
52642 #include <unistd.h>
52643 #define ENTBUSIZ 10240
52644 int list_dir(const char *dirnam)
52645 {
52646     int fd = open(dirnam, O_RDONLY | O_DIRECTORY);
```

```

52647     if (fd == -1)
52648         return -1;

52649     char *buf = malloc(ENTBUFSIZ);
52650     if (buf == NULL)
52651     {
52652         close(fd);
52653         return -1;
52654     }

52655     ssize_t bytesinbuf;
52656     for(;;)
52657     {
52658         ssize_t nextent = 0;

52659         bytesinbuf = posix_getdents(fd, buf, ENTBUFSIZ, 0);
52660         if (bytesinbuf <= 0)
52661             break;

52662         do {
52663             const char *ftype;
52664             struct posix_dent *entp = (void *)&buf[nextent];
52665             if (entp->d_type == DT_UNKNOWN)
52666             {
52667                 struct stat stbuf;
52668                 if (fstatat(fd, entp->d_name, &stbuf,
52669                     AT_SYMLINK_NOFOLLOW) == -1)
52670                     ftype = "?";
52671                 else
52672                     ftype = S_ISBLK(stbuf.st_mode) ? "b" :
52673                         S_ISCHR(stbuf.st_mode) ? "c" :
52674                         S_ISDIR(stbuf.st_mode) ? "d" :
52675                         S_ISFIFO(stbuf.st_mode) ? "p" :

52681                         S_TYPEISSHM(&stbuf) ? "shm" :
52682             #ifdef S_TYPEISTMO
52683                 S_TYPEISTMO(&stbuf) ? "tmo" :
52684             #endif
52685                 "?";
52686             }
52687             else
52688             {
52689                 ftype = entp->d_type == DT_BLK ? "b" :
52690                     entp->d_type == DT_CHR ? "c" :
52691                     entp->d_type == DT_DIR ? "d" :
52692                     entp->d_type == DT_FIFO ? "p" :
52693                     entp->d_type == DT_LNK ? "l" :
52694                     entp->d_type == DT_REG ? "r" :
52695                     entp->d_type == DT_SOCKET ? "s" :
52696                     entp->d_type == DT_MQ ? "mq" :

```

```

52697             entp->d_type == DT_SEM ? "sem" :
52698             entp->d_type == DT_SHM ? "shm" :
52699     #ifdef DT_TMO
52700             entp->d_type == DT_TMO ? "tmo" :
52701     #endif
52702             "?";
52703     }
52704     printf("%ld\t%s\t%s\n", (long)entp->d_ino, ftype,
52705           entp->d_name);
52706     nextent += entp->d_reclen;
52707     } while (nextent < bytesinbuf);
52708 }
52709
52709     close(fd);
52710     free(buf);
52711     return bytesinbuf;
52712 }

```

### APPLICATION USAGE

If an array of **posix\_dent** structures (which is only possible on implementations where *d\_name* is not a flexible array member) is used to provide the storage for *buf* in order to satisfy the alignment requirement, it should be noted that the number of array elements used to size the array may bear little or no relation to the number of directory entries that can be stored in it. It is recommended that the number of elements is calculated from the desired size in bytes, for example:

```

52720 #define DESIREDSIZE 10240
52721 struct posix_dent buf[DESIREDSIZE / sizeof(struct posix_dent) + 1];
52722 size_t nbyte = sizeof buf;

```

When *posix\_getdents()* is called with a *buf* that is not type **char \***, it is important to note that *d\_reclen* is a byte count and therefore any pointer arithmetic involved in calculating the start of the next entry needs to use a **char \*** pointer.

On implementations where directory entries in a directory take up more space than the corresponding **posix\_dent** structures in *buf*, a call to *posix\_getdents()* may read *nbyte* bytes from the directory, resulting (in most cases) in the actual number of bytes placed in *buf* being less than *nbyte*.

One advantage of *posix\_getdents()* is that it provides the file type of each directory entry (if available), whereas *readdir()* only does so on implementations that have the file type as a non-standard additional member of the **dirent** structure. Knowing the file type can greatly reduce the number of *fstatat()* calls that need to be made when traversing the file hierarchy.

Whether or not a file's type can be determined without needing to use the file serial number to obtain the file's metadata may vary across the different file system types supported by an implementation. Therefore applications should not assume that if *d\_type* contains known file types (i.e. not DT\_UNKNOWN) for entries in a given directory then it will also contain known file types for entries in subdirectories of that directory or in its parent.

Since the *d\_reclen* value for the last entry in *buf* includes padding to satisfy alignment requirements, applications can grow the buffer and call *posix\_getdents()* again to append to it without needing to perform an alignment calculation.

52742 **RATIONALE**

52743 The `posix_getdents()` function was derived from existing `getdents()` functions but the name was  
52744 changed because the existing `getdents()` functions differed in various ways, in particular the type  
52745 of the second argument (structure pointer or `void *`), the members of the populated structures,  
52746 and the error numbers used for some conditions. The name change also provided an  
52747 opportunity to add a `flags` argument to provide for future extensibility.

52748 Implementations are encouraged to include support for a `DT_FORCE_TYPE` flag which, when  
52749 that bit is set in `flags`, causes `posix_getdents()` to look up the file type if it can not be obtained from  
52750 the directory entry. This will allow applications that need to know the file type of every directory  
52751 entry to keep the cost of these lookups to the minimum needed to obtain the type at the file  
52752 system level, without the additional overhead of making a call to `fstatat()` for every file (that has  
52753 `d_type` equal to `DT_UNKNOWN`).

52754 Some existing `getdents()` or similar functions return directory entry structures for deleted  
52755 directory entries in `buf`, marked with a special value of one of the structure members to  
52756 distinguish them from non-deleted entries. This behavior is not allowed for `posix_getdents()`,  
52757 although the data from a deleted directory entry may be present in `buf` in the form of extra  
52758 padding on the end of the previous entry.

52759 **FUTURE DIRECTIONS**

52760 A future version of this standard may add a `DT_FORCE_TYPE` flag as described in  
52761 RATIONALE.

52765 **CHANGE HISTORY**

52766 First released in Issue 8.

52767 **NAME**

52768 posix\_madvise — memory advisory information and alignment control (**ADVANCED**  
52769 **REALTIME**)

52770 **SYNOPSIS**

```
52771 ADV #include <sys/mman.h>
52772 int posix_madvise(void *addr, size_t len, int advice);
```

52773 **DESCRIPTION**

52774 The *posix\_madvise()* function shall advise the implementation on the expected behavior of the  
52775 application with respect to the data in the memory starting at address *addr*, and continuing for  
52776 *len* bytes. The implementation may use this information to optimize handling of the specified  
52777 data. The *posix\_madvise()* function shall have no effect on the semantics of access to memory in  
52778 the specified range, although it may affect the performance of access.

52779 The implementation may require that *addr* be a multiple of the page size, which is the value  
52780 returned by *sysconf()* when the name value `_SC_PAGESIZE` is used.

52781 The advice to be applied to the memory range is specified by the *advice* parameter and may be  
52782 one of the following values:

52783 `POSIX_MADV_NORMAL`

52784 Specifies that the application has no advice to give on its behavior with respect to the  
52785 specified range. It is the default characteristic if no advice is given for a range of memory.

52786 `POSIX_MADV_SEQUENTIAL`

52787 Specifies that the application expects to access the specified range sequentially from lower  
52788 addresses to higher addresses.

52789 `POSIX_MADV_RANDOM`

52790 Specifies that the application expects to access the specified range in a random order.

52791 `POSIX_MADV_WILLNEED`

52792 Specifies that the application expects to access the specified range in the near future.

52793 `POSIX_MADV_DONTNEED`

52794 Specifies that the application expects that it will not access the specified range in the near  
52795 future.

52796 These values are defined in the `<sys/mman.h>` header.

52797 **RETURN VALUE**

52798 Upon successful completion, *posix\_madvise()* shall return zero; otherwise, an error number shall  
52799 be returned to indicate the error.

52800 **ERRORS**

52801 The *posix\_madvise()* function shall fail if:

52802 [EINVAL] The value of *advice* is invalid.

52803 [ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly  
52804 or completely outside the range allowed for the address space of the calling  
52805 process.

- 52806 The *posix\_madvise()* function may fail if:
- 52807 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the  
52808 name value *\_SC\_PAGESIZE* is used.
- 52809 [EINVAL] The value of *len* is zero.
- 52810 **EXAMPLES**
- 52811 None.
- 52812 **APPLICATION USAGE**
- 52813 The *posix\_madvise()* function is part of the Advisory Information option and need not be  
52814 provided on all implementations.

52825 **NAME**

52826        posix\_mem\_offset — find offset and length of a mapped typed memory block (**ADVANCED**  
52827        **REALTIME**)

52828 **SYNOPSIS**

```
52829 TYM     #include <sys/mman.h>
52830     int posix_mem_offset(const void *restrict addr, size_t len,
52831         off_t *restrict off, size_t *restrict contig_len,
52832         int *restrict fildes);
```

52833 **DESCRIPTION**

52834        The *posix\_mem\_offset()* function shall return in the variable pointed to by *off* a value that  
52835        identifies the offset (or location), within a memory object, of the memory block currently  
52836        mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used  
52837        (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since  
52838        the mapping was established, the returned value of *fildes* shall be  $-1$ . The *len* argument specifies  
52839        the length of the block of the memory object the user wishes the offset for; upon return, the  
52840        value pointed to by *contig\_len* shall equal either *len*, or the length of the largest contiguous block  
52841        of the memory object that is currently mapped to the calling process starting at *addr*, whichever  
52842        is smaller.

52843        If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig\_len*  
52844        values obtained by calling *posix\_mem\_offset()* are used in a call to *mmap()* with a file descriptor  
52845        that refers to the same memory pool as *fildes* (either through the same port or through a different  
52846        port), and that was opened with neither the `POSIX_TYPED_MEM_ALLOCATE` nor the  
52847        `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag, the typed memory area that is mapped shall  
52848        be exactly the same area that was mapped at *addr* in the address space of the process that called  
52849        *posix\_mem\_offset()*.

52850        If the memory object specified by *fildes* is not a typed memory object, then the behavior of this  
52851        function is implementation-defined.

52852 **RETURN VALUE**

52853        Upon successful completion, the *posix\_mem\_offset()* function shall return zero; otherwise, the  
52854        corresponding error status value shall be returned.

52855 **ERRORS**

52856        The *posix\_mem\_offset()* function shall fail if:

52857        [EACCES]        The process has not mapped a memory object supported by this function at  
52858        the given address *addr*.

52859        This function shall not return an error code of [EINTR].

52860 **EXAMPLES**

52861        None.

52862 **APPLICATION USAGE**

52863        None.

52864 **RATIONALE**

52865        None.

52866 **FUTURE DIRECTIONS**

52867 None.

52868 **SEE ALSO**

52870 XBD <[sys/mman.h](#)>

52871 **CHANGE HISTORY**

52872 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

52873 **NAME**52874 posix\_memalign — aligned memory allocation (**ADVANCED REALTIME**)52875 **SYNOPSIS**

```
52876 ADV #include <stdlib.h>
52877 int posix_memalign(void **memptr, size_t alignment, size_t size);
```

52878 **DESCRIPTION**

52879 The *posix\_memalign()* function shall allocate *size* bytes aligned on a boundary specified by  
 52880 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*  
 52881 shall be a power of two multiple of *sizeof(void \*)*.

52882 Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

52883 If the size of the space requested is 0, the behavior is implementation-defined: either a null  
 52884 pointer shall be returned in *memptr*, or the behavior shall be as if the size were some non-zero  
 52885 value, except that the behavior is undefined if the the value returned in *memptr* is used to access  
 52886 an object.

52887 CX The *free()* function shall deallocate memory that has previously been allocated by  
 52888 *posix\_memalign()*.

52889 For purposes of determining the existence of a data race, *posix\_memalign()* shall behave as  
 52890 though it accessed only memory locations accessible through its argument and not other static  
 52891 duration storage. The function may, however, visibly modify the storage that it allocates. Calls  
 52892 to *aligned\_alloc()*, *calloc()*, *free()*, *malloc()*, *posix\_memalign()*, *reallocarray()*, and *realloc()* that  
 52893 allocate or deallocate a particular region of memory shall occur in a single total order (see  
 52894 [Section 4.15.1](#), on page 100), and each such deallocation call shall synchronize with the next  
 52895 allocation (if any) in this order.

52896 **RETURN VALUE**

52897 Upon successful completion, *posix\_memalign()* shall return zero; otherwise, an error number  
 52898 shall be returned to indicate the error and the contents of *memptr* shall either be left unmodified  
 52899 or be set to a null pointer.

52900 If *size* is 0, either:

- 52901 • *posix\_memalign()* shall not attempt to allocate any space, in which case either an  
 52902 implementation-defined error number shall be returned, or zero shall be returned with a  
 52903 null pointer returned in *memptr*, or
- 52904 • *posix\_memalign()* shall attempt to allocate some space and, if the allocation succeeds, zero  
 52905 shall be returned and a pointer to the allocated space shall be returned in *memptr*. The  
 52906 application shall ensure that the pointer is not used to access an object.

52907 **ERRORS**

52908 The *posix\_memalign()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 52909 | [EINVAL] | The value of the alignment parameter is not a power of two multiple of |
| 52910 |          | <i>sizeof(void *)</i> .  |
| 52911 | [ENOMEM] | There is insufficient memory available with the requested alignment.   |

**52912 EXAMPLES**

52913 The following example shows how applications can obtain consistent behavior on error by  
52914 setting *\*memptr* to be a null pointer before calling *posix\_memalign()*.

```
52915 void *ptr = NULL;
52916 ...
52917 //do some work, which might goto error
52918 if (posix_memalign(&ptr, align, size))
52919     goto error;
52920
52921 //do some more work, which might goto error
52922 ...
52923 error:
52924     free(ptr);
52925     //more cleanup;
```

**52925 APPLICATION USAGE**

52926 The *posix\_memalign()* function is part of the Advisory Information option and need not be  
52927 provided on all implementations.

**52928 RATIONALE**

52929 None.

**52930 FUTURE DIRECTIONS**

52931 None.

52934 XBD <[stdlib.h](#)>

**52935 CHANGE HISTORY**

52936 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

52937 In the SYNOPSIS, the inclusion of <[sys/types.h](#)> is no longer required.

**52938 Issue 7**

52939 Austin Group Interpretation 1003.1-2001 #058 is applied, clarifying the value of the *alignment*  
52940 argument in the DESCRIPTION.

52941 Austin Group Interpretation 1003.1-2001 #152 is applied, clarifying the behavior when the size of  
52942 the space requested is 0.

52943 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0251 [526] and XSH/TC2-2008/0252  
52944 [520,526] are applied.

**52945 Issue 8**

52946 Austin Group Defect 1302 is applied, aligning this function with the requirements of the  
52947 ISO/IEC 9899:2018 standard on other memory allocation functions.

52948 **NAME**

52949        posix\_openpt — open a pseudo-terminal device

52950 **SYNOPSIS**

```
52951 XSI      #include <stdlib.h>
52952         int posix_openpt(int oflag);
```

52953 **DESCRIPTION**

52954        The *posix\_openpt()* function shall establish a connection between a manager device for a pseudo-terminal and a file descriptor. The file descriptor shall be allocated as described in [Section 2.6](#) (on page 525) and can be used by other I/O functions that refer to that pseudo-terminal.

52957        The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

52959        Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list:

52960	O_RDWR	Open for reading and writing.
52961	O_CLOEXEC	Atomically set the FD_CLOEXEC flag on the file descriptor.
52962	O_CLOFORK	Atomically set the FD_CLOFORK flag on the file descriptor.
52963	O_NOCTTY	If set <i>posix_openpt()</i> shall not cause the terminal device to become the controlling terminal for the process.

52965        The behavior of other values for the *oflag* argument is unspecified.

52966 **RETURN VALUE**

52967        Upon successful completion, the *posix\_openpt()* function shall open a file descriptor for a manager pseudo-terminal device and return a non-negative integer representing the file descriptor. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

52970 **ERRORS**

52971        The *posix\_openpt()* function shall fail if:

52972	[EMFILE]	All file descriptors available to the process are currently open.
52973	[ENFILE]	The maximum allowable number of files is currently open in the system.

52974        The *posix\_openpt()* function may fail if:

52975	[EINVAL]	The value of <i>oflag</i> is not valid.
52976	[EAGAIN]	Out of pseudo-terminal resources.

52977 **EXAMPLES**

52978        **Opening a Pseudo-Terminal and Returning the Name of the Subsidiary Device and a File Descriptor**

```
52980     #include <fcntl.h>
52981     #include <stdio.h>
52982     #include <stdlib.h>
52983
52983     int managerfd, subsidiaryfd;
52984     char *subsidiarydevice;
52985
52985     managerfd = posix_openpt (O_RDWR | O_NOCTTY);
52986
52986     if (managerfd == -1
52987         || grantpt (managerfd) == -1
```

```

52988     || unlockpt (managerfd) == -1
52989     || (subsidiarydevice = ptsname (managerfd)) == NULL)
52990     return -1;

52991     printf("subsidiary device is: %s\n", subsidiarydevice);

52992     subsidiaryfd = open(subsidiarydevice, O_RDWR|O_NOCTTY);
52993     if (subsidiaryfd < 0)
52994         return -1;

```

#### 52995 APPLICATION USAGE

52996 This function is a method for portably obtaining a file descriptor of a manager terminal device  
52997 for a pseudo-terminal. The *grantpt()* function and the *ptsname()* and *ptsname\_r()* functions can  
52998 be used to manipulate mode and ownership permissions, and to obtain the name of the  
52999 subsidiary device, respectively.

#### 53000 RATIONALE

53001 The standard developers considered the matter of adding a special device for cloning manager  
53002 pseudo-terminal devices: the */dev/ptmx* device. However, consensus could not be reached, and  
53003 it was felt that adding a new function would permit other implementations. The *posix\_openpt()*  
53004 function is designed to complement the *grantpt()*, *ptsname()*, *ptsname\_r()*, and *unlockpt()*  
53005 functions.

53006 On implementations supporting the */dev/ptmx* clone device, opening the manager device of a  
53007 pseudo-terminal is simply:

```

53008 mfdp = open("/dev/ptmx", oflag );
53009 if (mfdp < 0)
53010     return -1;

```

53011 The *O\_CLOEXEC* and *O\_CLOFORK* flags are necessary to avoid a data race in multi-threaded  
53012 applications. Without *O\_CLOFORK*, a file descriptor is leaked into a child process created by  
53013 one thread in the window between another thread creating a file descriptor with *posix\_openpt()*  
53014 and then using *fcntl()* to set the *FD\_CLOFORK* flag. Without *O\_CLOEXEC*, a file descriptor  
53015 intentionally inherited by child processes is similarly leaked into an executed program if  
53016 *FD\_CLOEXEC* is not set atomically.

#### 53017 FUTURE DIRECTIONS

53018 None.

#### 53019 SEE ALSO

53020 [Section 2.6](#) (on page 525), *grantpt()*, *open()*, *ptsname()*, *unlockpt()*

#### 53022 CHANGE HISTORY

53023 First released in Issue 6.

#### 53024 Issue 7

53025 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

53026 SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

53027 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0253 [835] and XSH/TC2-2008/0254  
53028 [835] are applied.

53029 **Issue 8**

- 53030 Austin Group Defects 411 and 1318 are applied, adding O\_CLOEXEC and O\_CLOFORK.
- 53031 Austin Group Defect 508 is applied, changing the APPLICATION USAGE and RATIONALE  
53032 sections to refer to *ptsname\_r()* as well as *ptsname()*.
- 53033 Austin Group Defect 593 is applied, removing `#include <fcntl.h>` from the SYNOPSIS and  
53034 a reference to `<fcntl.h>` from the DESCRIPTION section.
- 53035 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 53036 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
53037 devices.

53038 **NAME**53039 posix\_spawn, posix\_spawnnp — spawn a process (**ADVANCED REALTIME**)53040 **SYNOPSIS**

```
53041 SPN      #include <spawn.h>
53042
53043 int posix_spawn(pid_t *restrict pid, const char *restrict path,
53044               const posix_spawn_file_actions_t *restrict file_actions,
53045               const posix_spawnattr_t *restrict attrp,
53046               char *const argv[restrict], char *const envp[restrict]);
53047 int posix_spawnnp(pid_t *restrict pid, const char *restrict file,
53048                  const posix_spawn_file_actions_t *restrict file_actions,
53049                  const posix_spawnattr_t *restrict attrp,
53050                  char *const argv[restrict], char *const envp[restrict]);
```

53050 **DESCRIPTION**

53051 The *posix\_spawn()* and *posix\_spawnnp()* functions shall create a new process (child process) from  
 53052 the specified process image. The new process image shall be constructed from a regular  
 53053 executable file called the new process image file.

53054 When a C program is executed as the result of this call, it shall be entered as a C-language  
 53055 function call as follows:

```
53056 int main(int argc, char *argv[]);
```

53057 where *argc* is the argument count and *argv* is an array of character pointers to the arguments  
 53058 themselves. In addition, the following variable:

```
53059 extern char **environ;
```

53060 shall be initialized as a pointer to an array of character pointers to the environment strings.

53061 The argument *argv* is an array of character pointers to null-terminated strings. The last member  
 53062 of this array shall be a null pointer and is not counted in *argc*. These strings constitute the  
 53063 argument list available to the new process image. The value in *argv*[0] should point to a filename  
 53064 string that is associated with the process image being started by the *posix\_spawn()* or  
 53065 *posix\_spawnnp()* function.

53066 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
 53067 constitute the environment for the new process image. The environment array is terminated by a  
 53068 null pointer.

53069 The number of bytes available for the combined argument and environment lists of the child  
 53070 process is {ARG\_MAX}. The implementation shall specify in the system documentation (see  
 53071 XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators,  
 53072 pointers, or alignment bytes, is included in this total.

53073 The *path* argument to *posix\_spawn()* is a pathname that identifies the new process image file to  
 53074 execute; if the pathname does not start with a <slash>, it shall be interpreted relative to the  
 53075 working directory of the child process after all *file\_actions* have been performed.

53076 The *file* parameter to *posix\_spawnnp()* shall be used to construct a pathname that identifies the  
 53077 new process image file. If the *file* parameter contains a <slash> character, the *file* parameter shall  
 53078 be used as the pathname for the new process image file. Otherwise, the path prefix for this file  
 53079 shall be obtained by a search of the directories passed as the environment variable *PATH* (see  
 53080 XBD Chapter 8, on page 167), using the working directory of the child process after all  
 53081 *file\_actions* have been performed. If this environment variable is not defined, the results of the  
 53082 search are implementation-defined. However, if at least one of the *exec* family of functions

53083 would fail with [ENOEXEC] because the process image contents are not executable, this shall  
 53084 cause *posix\_spawnnp()* to fail rather than attempting a fallback to invoking the process as a shell  
 53085 script passed to *sh*.

53086 If *file\_actions* is a null pointer, then file descriptors open in the calling process shall remain open  
 53087 in the child process, except for those whose FD\_CLOEXEC or FD\_CLOFORK flag is set (see  
 53088 *fcntl()*), and except for file descriptors that are closed by a fork handler (if fork handlers are  
 53089 called). For those file descriptors that remain open, the child process shall not inherit any  
 53090 process-owned file locks, but all remaining attributes of the corresponding open file descriptions  
 53091 (see *fcntl()*), shall remain unchanged. The current working directory of the child process shall be  
 53092 the same as it is in the parent process.

53093 If *file\_actions* is not a null pointer, then the file descriptors open in the child process shall be those  
 53094 open in the calling process as modified by FD\_CLOFORK file descriptor flags, fork handlers (if  
 53095 they are called), the spawn file actions object pointed to by *file\_actions*, and the FD\_CLOEXEC  
 53096 flag of each remaining open file descriptor after the spawn file actions have been processed. The  
 53097 effective order of processing the spawn file actions shall be:

- 53098 1. The set of open file descriptors for the child process shall initially be the same set as is  
 53099 open for the calling process, except for those that have the FD\_CLOFORK flag set and any  
 53100 that are closed by fork handlers (if they are called). The child process shall not inherit any  
 53101 file locks, but all remaining attributes of the corresponding open file descriptions (see  
 53102 *fcntl()*), shall remain unchanged.
- 53103 2. The signal mask, signal default actions, and the effective user and group IDs for the child  
 53104 process shall be changed as specified in the attributes object referenced by *attrp*.
- 53105 3. The file actions specified by the spawn file actions object shall be performed in the order  
 53106 in which they were added to the spawn file actions object, and relative pathnames in a  
 53107 given action shall be interpreted in relation to the tracked working directory. The tracked  
 53108 working directory shall begin with the current working directory of the parent process,  
 53109 and can be altered according to *chdir* or *fchdir* file actions; the current working directory of  
 53110 the child process shall be the final state of the tracked working directory after all file  
 53111 actions have been applied.
- 53112 4. Any file descriptor that has its FD\_CLOEXEC flag set shall be closed.

53113 If file descriptor 0, 1, or 2 would otherwise be closed in the new process image created by  
 53114 *posix\_spawn()* or *posix\_spawnnp()*, implementations may open an unspecified file for the file  
 53115 descriptor in the new process image. If a standard utility or a conforming application is executed  
 53116 with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the  
 53117 environment in which the utility or application is executed shall be deemed non-conforming,  
 53118 and consequently the utility or application might not behave as described in this standard.

53119 The **posix\_spawnattr\_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at  
 53120 least the attributes defined below.

53121 If the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced  
 53122 by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the child's process  
 53123 group shall be as specified in the *spawn-pgroup* attribute of the object referenced by *attrp*.

53124 As a special case, if the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn-flags* attribute of  
 53125 the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero,  
 53126 then the child shall be in a new process group with a process group ID equal to its process ID.

53127 If the POSIX\_SPAWN\_SETSID flag is set in the *spawn-flags* attribute of the object referenced by  
 53128 *attrp*, the child process shall be the session leader of a new session, shall be the process group

53129 leader of a new process group, and shall have no controlling terminal. The process group ID of  
 53130 the child process shall be set equal to the process ID of the child process. The child process shall  
 53131 be the only process in the new process group and the only process in the new session.

53132 If both the POSIX\_SPAWN\_SETPGROUP flag and the POSIX\_SPAWN\_SETSID flag are set in the  
 53133 *spawn-flags* attribute of the object referenced by *attrp*, the behavior is unspecified.

53134 If neither the POSIX\_SPAWN\_SETPGROUP flag nor the POSIX\_SPAWN\_SETSID flag is set in  
 53135 the *spawn-flags* attribute of the object referenced by *attrp*, the new child process shall inherit the  
 53136 parent's process group.

53137 PS If the POSIX\_SPAWN\_SETSCHEDPARAM flag is set in the *spawn-flags* attribute of the object  
 53138 referenced by *attrp*, but POSIX\_SPAWN\_SETSCHEDULER is not set, the new process image  
 53139 shall initially have the scheduling policy of the calling process with the scheduling parameters  
 53140 specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

53141 If the POSIX\_SPAWN\_SETSCHEDULER flag is set in the *spawn-flags* attribute of the object  
 53142 referenced by *attrp* (regardless of the setting of the POSIX\_SPAWN\_SETSCHEDPARAM flag),  
 53143 the new process image shall initially have the scheduling policy specified in the *spawn-*  
 53144 *schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in  
 53145 the *spawn-schedparam* attribute of the same object.

53146 The POSIX\_SPAWN\_RESETPID flag in the *spawn-flags* attribute of the object referenced by *attrp*  
 53147 governs the effective user ID of the child process. If this flag is not set, the child process shall  
 53148 inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the  
 53149 child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit  
 53150 of the new process image file is set, the effective user ID of the child process shall become that  
 53151 file's owner ID before the new process image begins execution.

53152 The POSIX\_SPAWN\_RESETPID flag in the *spawn-flags* attribute of the object referenced by *attrp*  
 53153 also governs the effective group ID of the child process. If this flag is not set, the child process  
 53154 shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID  
 53155 of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID  
 53156 mode bit of the new process image file is set, the effective group ID of the child process shall  
 53157 become that file's group ID before the new process image begins execution.

53158 If the POSIX\_SPAWN\_SETSIGMASK flag is set in the *spawn-flags* attribute of the object  
 53159 referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-*  
 53160 *sigmask* attribute of the object referenced by *attrp*.

53161 If the POSIX\_SPAWN\_SETSIGDEF flag is set in the *spawn-flags* attribute of the object referenced  
 53162 by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to  
 53163 their default actions in the child process. Signals set to the default action in the parent process  
 53164 shall be set to the default action in the child process.

53165 Signals set to be caught by the calling process shall be set to the default action in the child  
 53166 process.

53167 Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be  
 53168 ignored by the child process, unless otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag  
 53169 being set in the *spawn-flags* attribute of the object referenced by *attrp* and the signals being  
 53170 indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

53171 If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the  
 53172 SIGCHLD signal is set to be ignored or to the default action in the child process, unless  
 53173 otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag being set in the *spawn-flags*  
 53174 attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the

53175 *spawn\_sigdefault* attribute of the object referenced by *attrp*.

53176 If the value of the *attrp* pointer is a null pointer, then the default values are used.

53177 All process attributes, other than those influenced by the attributes set in the object referenced  
 53178 by *attrp* as specified above or by the file descriptor manipulations specified in *file\_actions*, shall  
 53179 appear in the new process image as though *fork()* had been called to create a child process and  
 53180 then a member of the *exec* family of functions had been called by the child process to execute the  
 53181 new process image.

53182 It is implementation-defined whether the fork handlers are run when *posix\_spawn()* or  
 53183 *posix\_spawnp()* is called.

53184 **RETURN VALUE**

53185 Upon successful completion, *posix\_spawn()* and *posix\_spawnp()* shall return the process ID of the  
 53186 child process to the parent process, in the variable pointed to by a non-null *pid* argument, and  
 53187 shall return zero as the function return value. Otherwise, no child process shall be created, the  
 53188 value stored into the variable pointed to by a non-null *pid* is unspecified, and an error number  
 53189 shall be returned as the function return value to indicate the error. If the *pid* argument is a null  
 53190 pointer, the process ID of the child is not returned to the caller.

53191 **ERRORS**

53192 These functions may fail if:

53193 [EINVAL] The value specified by *file\_actions* or *attrp* is invalid.

53194 If this error occurs after the calling process successfully returns from the *posix\_spawn()* or  
 53195 *posix\_spawnp()* function, the child process may exit with exit status 127.

53196 If *posix\_spawn()* or *posix\_spawnp()* fail for any of the reasons that would cause *fork()* or one of  
 53197 the *exec* family of functions to fail, including when the corresponding *exec* function would  
 53198 attempt a fallback to *sh* instead of failing with [ENOEXEC], an error value shall be returned as  
 53199 described by *fork()* and *exec*, respectively; or, if the error occurs after the calling process  
 53200 successfully returns, the child process shall exit with exit status 127.

53201 If POSIX\_SPAWN\_SETPGROUP is set in the *spawn\_flags* attribute of the object referenced by  
 53202 *attrp*, and *posix\_spawn()* or *posix\_spawnp()* fails while changing the child's process group, an  
 53203 error value shall be returned as described by *setpgid()*; or, if the error occurs after the calling  
 53204 process successfully returns, the child process shall exit with exit status 127.

53205 If POSIX\_SPAWN\_SETSID is set in the *spawn\_flags* attribute of the object referenced by *attrp*, and  
 53206 *posix\_spawn()* or *posix\_spawnp()* fails while creating the new session, changing the child's  
 53207 session ID, or changing the child's process group, an error value shall be returned as described  
 53208 by *setsid()*; or, if the error occurs after the calling process successfully returns, the child process  
 53209 shall exit with exit status 127.

53210 PS If POSIX\_SPAWN\_SETSCHEDPARAM is set and POSIX\_SPAWN\_SETSCHEDULER is not set in  
 53211 the *spawn\_flags* attribute of the object referenced by *attrp*, then if *posix\_spawn()* or *posix\_spawnp()*  
 53212 fails for any of the reasons that would cause *sched\_setparam()* to fail, an error value shall be  
 53213 returned as described by *sched\_setparam()*; or, if the error occurs after the calling process  
 53214 successfully returns, the child process shall exit with exit status 127.

53215 If POSIX\_SPAWN\_SETSCHEDULER is set in the *spawn\_flags* attribute of the object referenced by  
 53216 *attrp*, and if *posix\_spawn()* or *posix\_spawnp()* fails for any of the reasons that would cause  
 53217 *sched\_setscheduler()* to fail, an error value shall be returned as described by *sched\_setscheduler()*;  
 53218 or, if the error occurs after the calling process successfully returns, the child process shall exit  
 53219 with exit status 127.

53220 If the *file\_actions* argument is not a null pointer, and specifies any *chdir*, *close*, *dup2*, *fchdir*, or *open*  
 53221 actions to be performed, and if *posix\_spawn()* or *posix\_spawnnp()* fails for any of the reasons that  
 53222 would cause *chdir()*, *close()*, *dup2()*, *fchdir()*, or *open()* to fail, other than attempting a *close()* on  
 53223 a file descriptor that is in range but already closed, an error value shall be returned as described  
 53224 by *chdir()*, *close()*, *dup2()*, *fchdir()*, and *open()*, respectively; or, if the error occurs after the  
 53225 calling process successfully returns, the child process shall exit with exit status 127. An open file  
 53226 action may, by itself, result in any of the errors described by *close()* or *dup2()*, in addition to  
 53227 those described by *open()*.

#### 53228 EXAMPLES

53229 None.

#### 53230 APPLICATION USAGE

53231 These functions are part of the Spawn option and need not be provided on all implementations.

53232 See also the APPLICATION USAGE section for *exec*.

#### 53233 RATIONALE

53234 The *posix\_spawn()* function and its close relation *posix\_spawnnp()* have been introduced to  
 53235 overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or  
 53236 impossible to implement without swapping or dynamic address translation.

- 53237 • Swapping is generally too slow for a realtime environment.
- 53238 • Dynamic address translation is not available everywhere that POSIX might be useful.
- 53239 • Processes are too useful to simply option out of POSIX whenever it must run without  
 53240 address translation or other MMU services.

53241 Thus, POSIX needs process creation and file execution primitives that can be efficiently  
 53242 implemented without address translation or other MMU services.

53243 The *posix\_spawn()* function is implementable as a library routine, but both *posix\_spawn()* and  
 53244 *posix\_spawnnp()* are designed as kernel operations. Also, although they may be an efficient  
 53245 replacement for many *fork()/exec* pairs, their goal is to provide useful process creation  
 53246 primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for  
 53247 *fork()/exec*.

53248 This view of the role of *posix\_spawn()* and *posix\_spawnnp()* influenced the design of their API. It  
 53249 does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified  
 53250 operations of any sort are permitted between the creation of the child process and the execution  
 53251 of the new process image; any attempt to reach that level would need to provide a programming  
 53252 language as parameters. Instead, *posix\_spawn()* and *posix\_spawnnp()* are process creation  
 53253 primitives like the *Start\_Process* and *Start\_Process\_Search* Ada language bindings package  
 53254 *POSIX\_Process\_Primitives* and also like those in many operating systems that are not UNIX  
 53255 systems, but with some POSIX-specific additions.

53256 To achieve its coverage goals, *posix\_spawn()* and *posix\_spawnnp()* have control of seven types of  
 53257 inheritance: file descriptors, current working directory, process group ID, user and group ID,  
 53258 signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in  
 53259 the child, or be reset to its default action in the child.

53260 Control of file descriptors is required to allow an independently written child process image to  
 53261 access data streams opened by and even generated or read by the parent process without being  
 53262 specifically coded to know which parent files and file descriptors are to be used. Control of the  
 53263 current working directory is required because the parent process may want to constrain the  
 53264 resources that the child process can reach from its current working directory or affect how  
 53265 relative pathnames are interpreted, while recognizing that a multi-threaded parent process

53266 would require a lot of overhead to safely change its own working directory prior to creating the  
 53267 child process. Control of the process group ID is required to control how the job control of the  
 53268 child process relates to that of the parent.

53269 Control of the signal mask and signal defaulting is sufficient to support the implementation of  
 53270 *system()*. Although support for *system()* is not explicitly one of the goals for *posix\_spawn()* and  
 53271 *posix\_spawnnp()*, it is covered under the “at least 50%” coverage goal.

53272 The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of  
 53273 the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec*  
 53274 family of functions should fully specify open file inheritance. The implementation need make no  
 53275 decisions regarding the set of open file descriptors when the child process image begins  
 53276 execution, those decisions having already been made by the caller and expressed as the set of  
 53277 open file descriptors and their FD\_CLOEXEC and FD\_CLOFORK flags at the time of the call, the  
 53278 actions of fork handlers (if they are called), and the spawn file actions object specified in the call.  
 53279 We have been assured that in cases where the POSIX *Start\_Process* Ada primitives have been  
 53280 implemented in a library, this method of controlling file descriptor inheritance may be  
 53281 implemented very easily.

53282 We can identify several problems with *posix\_spawn()* and *posix\_spawnnp()*, but there does not  
 53283 appear to be a solution that introduces fewer problems. Environment modification for child  
 53284 process attributes not specifiable via the *attrp* or *file\_actions* arguments must be done in the  
 53285 parent process, and since the parent generally wants to save its context, it is more costly than  
 53286 similar functionality with *fork()/exec*. It is also complicated to modify the environment of a  
 53287 multi-threaded process temporarily, since all threads must agree when it is safe for the  
 53288 environment to be changed. However, this cost is only borne by those invocations of  
 53289 *posix\_spawn()* and *posix\_spawnnp()* that use the additional functionality. Since extensive  
 53290 modifications are not the usual case, and are particularly unlikely in time-critical code, keeping  
 53291 much of the environment control out of *posix\_spawn()* and *posix\_spawnnp()* is appropriate design.

53292 The *posix\_spawn()* and *posix\_spawnnp()* functions do not have all the power of *fork()/exec*. This is  
 53293 to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to  
 53294 duplicate its functionality in a simple, fast function with no special hardware requirements. It is  
 53295 worth noting that *posix\_spawn()* and *posix\_spawnnp()* are very similar to the process creation  
 53296 operations on many operating systems that are not UNIX systems.

## 53297 Requirements

53298 The requirements for *posix\_spawn()* and *posix\_spawnnp()* are:

- 53299 • They must be implementable without an MMU or unusual hardware.
- 53300 • They must be compatible with existing POSIX standards.

53301 Additional goals are:

- 53302 • They should be efficiently implementable.
- 53303 • They should be able to replace at least 50% of typical executions of *fork()*.
- 53304 • A system with *posix\_spawn()* and *posix\_spawnnp()* and without *fork()* should be useful, at  
 53305 least for realtime applications.
- 53306 • A system with *fork()* and the *exec* family should be able to implement *posix\_spawn()* and  
 53307 *posix\_spawnnp()* as library routines.

53308 **Two-Syntax**

53309 POSIX *exec* has several calling sequences with approximately the same functionality. These  
 53310 appear to be required for compatibility with existing practice. Since the existing practice for the  
 53311 *posix\_spawn\**(*)* functions is otherwise substantially unlike POSIX, we feel that simplicity  
 53312 outweighs compatibility. There are, therefore, only two names for the *posix\_spawn\**(*)* functions.

53313 The parameter list does not differ between *posix\_spawn()* and *posix\_spawnp()*; *posix\_spawnp()*  
 53314 interprets the second parameter more elaborately than *posix\_spawn()*.

53315 **Compatibility with POSIX.5 (Ada)**

53316 The *Start\_Process* and *Start\_Process\_Search* procedures from the *POSIX\_Process\_Primitives*  
 53317 package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a  
 53318 manner similar to that of *posix\_spawn()* and *posix\_spawnp()*. Originally, in keeping with our  
 53319 simplicity goal, the standard developers had limited the capabilities of *posix\_spawn()* and  
 53320 *posix\_spawnp()* to a subset of the capabilities of *Start\_Process* and *Start\_Process\_Search*; certain  
 53321 non-default capabilities were not supported. However, based on suggestions by the ballot group  
 53322 to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings  
 53323 working group member, the standard developers decided that *posix\_spawn()* and *posix\_spawnp()*  
 53324 should be sufficiently powerful to implement *Start\_Process* and *Start\_Process\_Search*. The  
 53325 rationale is that if the Ada language binding to such a primitive had already been approved as  
 53326 an IEEE standard, there can be little justification for not approving the functionally-equivalent  
 53327 parts of a C binding. The only three capabilities provided by *posix\_spawn()* and *posix\_spawnp()*  
 53328 that are not provided by *Start\_Process* and *Start\_Process\_Search* are optionally specifying the  
 53329 child's process group ID, the set of signals to be reset to default signal handling in the child  
 53330 process, and the child's scheduling policy and parameters.

53331 For the Ada language binding for *Start\_Process* to be implemented with *posix\_spawn()*, that  
 53332 binding would need to explicitly pass an empty signal mask and the parent's environment to  
 53333 *posix\_spawn()* whenever the caller of *Start\_Process* allowed these arguments to default, since  
 53334 *posix\_spawn()* does not provide such defaults. The ability of *Start\_Process* to mask user-specified  
 53335 signals during its execution is functionally unique to the Ada language binding and must be  
 53336 dealt with in the binding separately from the call to *posix\_spawn()*.

53337 **Process Group**

53338 The process group inheritance field can be used to join the child process with an existing process  
 53339 group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*,  
 53340 the *setpgid()* mechanism will place the child process in a new process group.

53341 **Threads**

53342 Without the *posix\_spawn()* and *posix\_spawnp()* functions, systems without address translation  
 53343 can still use threads to give an abstraction of concurrency. In many cases, thread creation  
 53344 suffices, but it is not always a good substitute. The *posix\_spawn()* and *posix\_spawnp()* functions  
 53345 are considerably "heavier" than thread creation. Processes have several important attributes that  
 53346 threads do not. Even without address translation, a process may have base-and-bound memory  
 53347 protection. Each process has a process environment including security attributes and file  
 53348 capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-  
 53349 uniform-memory-architecture multi-processors better than threads, and they are more  
 53350 convenient to use for activities that are not closely linked.

53351 The *posix\_spawn()* and *posix\_spawnp()* functions may not bring support for multiple processes to  
 53352 every configuration. Process creation is not the only piece of operating system support required

53353 to support multiple processes. The total cost of support for multiple processes may be quite high  
53354 in some circumstances. Existing practice shows that support for multiple processes is  
53355 uncommon and threads are common among “tiny kernels”. There should, therefore, probably  
53356 continue to be AEPs for operating systems with only one process.

#### 53357 **Asynchronous Error Notification**

53358 A library implementation of *posix\_spawn()* or *posix\_spawnp()* may not be able to detect all  
53359 possible errors before it forks the child process. POSIX.1-2024 provides for an error indication  
53360 returned from a child process which could not successfully complete the spawn operation via a  
53361 special exit status which may be detected using the status value returned by *wait()*, *waitid()*, and  
53362 *waitpid()*.

53363 The *stat\_val* interface and the macros used to interpret it are not well suited to the purpose of  
53364 returning API errors, but they are the only path available to a library implementation. Thus, an  
53365 implementation may cause the child process to exit with exit status 127 for any error detected  
53366 during the spawn process after the *posix\_spawn()* or *posix\_spawnp()* function has successfully  
53367 returned.

53368 The standard developers had proposed using two additional macros to interpret *stat\_val*. The  
53369 first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because  
53370 of an error detected during the *posix\_spawn()* or *posix\_spawnp()* operations rather than during  
53371 actual execution of the child process image; the second, WSPAWNERRNO, would have  
53372 extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group  
53373 strongly opposed this because it would make a library implementation of *posix\_spawn()* or  
53374 *posix\_spawnp()* dependent on kernel modifications to *waitpid()* to be able to embed special  
53375 information in *stat\_val* to indicate a spawn failure.

53376 The 8 bits of child process exit status that are guaranteed by POSIX.1-2024 to be accessible to the  
53377 waiting parent process are insufficient to disambiguate a spawn error from any other kind of  
53378 error that may be returned by an arbitrary process image. No other bits of the exit status are  
53379 required to be visible in *stat\_val*, so these macros could not be strictly implemented at the library  
53380 level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this  
53381 value by *system()* and *popen()* to signal failures in these operations that occur after the function  
53382 has returned but before a shell is able to execute. The exit status of 127 does not uniquely  
53383 identify this class of error, nor does it provide any detailed information on the nature of the  
53384 failure. Note that a kernel implementation of *posix\_spawn()* or *posix\_spawnp()* is permitted (and  
53385 encouraged) to return any possible error as the function value, thus providing more detailed  
53386 failure information to the parent process.

53387 Thus, no special macros are available to isolate asynchronous *posix\_spawn()* or *posix\_spawnp()*  
53388 errors. Instead, errors detected by the *posix\_spawn()* or *posix\_spawnp()* operations in the context  
53389 of the child process before the new process image executes are reported by setting the child’s exit  
53390 status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the  
53391 *stat\_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that  
53392 other status values with which the child process image may exit (before the parent can  
53393 conclusively determine that the child process image has begun execution) are distinct from exit  
53394 status 127.

53405 **CHANGE HISTORY**

53406 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53407 IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are  
 53408 changed as well as the signal mask in step 2.

53409 IEEE PASC Interpretation 1003.1 #132 is applied.

53410 **Issue 7**

53411 Functionality relating to the Threads option is moved to the Base.

53412 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0433 [291], XSH/TC1-2008/0434 [173],  
 53413 and XSH/TC1-2008/0435 [173] are applied.

53414 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0255 [824] is applied.

53415 **Issue 8**

53416 Austin Group Defect 370 is applied, requiring that attempting to close a file descriptor that is in  
 53417 range but already closed is not treated as an error.

53418 Austin Group Defect 768 is applied, adding OFD-owned file locks.

53419 Austin Group Defect 1044 is applied, adding POSIX\_SPAWN\_SETSID.

53420 Austin Group Defect 1208 is applied, adding *posix\_spawn\_file\_actions\_addchdir()* and  
 53421 *posix\_spawn\_file\_actions\_addfchdir()*.

53422 Austin Group Defect 1318 is applied, adding FD\_CLOFORK and clarifying that the inherited set  
 53423 of file descriptors is affected by the actions of fork handlers (if they are called).

53424 Austin Group Defect 1328 is applied, adding the **restrict** keyword to the third parameter of  
 53425 *posix\_spawn()* and *posix\_spawnnp()*.

53426 Austin Group Defect 1362 is applied, removing parentheses around some text intended to be  
 53427 normative.

53428 Austin Group Defect 1674 is applied, adding a requirement that *posix\_spawnnp()* does not fallback  
 53429 to executing *sh* when the corresponding *exec* function would do so instead of failing with  
 53430 [ENOEXEC].

53431 **NAME**

53432 posix\_spawn\_file\_actions\_addchdir, posix\_spawn\_file\_actions\_addfchdir — add chdir or fchdir  
53433 action to spawn file actions object (**ADVANCED REALTIME**)

53434 **SYNOPSIS**

```
53435 SPN #include <spawn.h>
53436 int posix_spawn_file_actions_addchdir(posix_spawn_file_actions_t
53437     *restrict file_actions, const char *restrict path);
53438 int posix_spawn_file_actions_addfchdir(posix_spawn_file_actions_t
53439     *file_actions, int fildes);
```

53440 **DESCRIPTION**

53441 The *posix\_spawn\_file\_actions\_addchdir()* function shall add a *chdir* action to the object referenced  
53442 by *file\_actions* that shall cause the working directory to be set to *path* (as if *chdir(path)* had been  
53443 called) when a new process is spawned using this file actions object. A relative *path* shall be  
53444 interpreted in relation to the working directory determined by any prior actions. The string  
53445 pointed to by *path* shall be copied by the *posix\_spawn\_file\_actions\_addchdir()* function.

53446 The *posix\_spawn\_file\_actions\_addfchdir()* function shall add an *fchdir* action to the object  
53447 referenced by *file\_actions* that shall cause the working directory to be set to *fildes* (as if  
53448 *fchdir(fildes)* had been called) when a new process is spawned using this file actions object.

53449 A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

53450 **RETURN VALUE**

53451 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
53452 be returned to indicate the error.

53453 **ERRORS**

53454 The *posix\_spawn\_file\_actions\_addfchdir()* function shall fail if:  
53455 [EBADF] The value specified by *fildes* is negative.

53456 These functions shall fail if:

53457 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

53458 These functions may fail if:

53459 [EINVAL] The value specified by *file\_actions* is invalid.

53460 It shall not be considered an error for the *path* or *fildes* argument passed to these functions to  
53461 specify a pathname or file descriptor for which the specified operation could not be performed  
53462 at the time of the call. Any such error shall be detected when the associated file actions object is  
53463 later used during a *posix\_spawn()* or *posix\_spawnnp()* operation.

53464 **EXAMPLES**

53465 None.

53466 **APPLICATION USAGE**

53467 The *posix\_spawn\_file\_actions\_addchdir()* and *posix\_spawn\_file\_actions\_addfchdir()* functions are  
53468 part of the Spawn option and need not be provided on all implementations.

53469 Changing the working directory of a child process can be useful when invoking utilities such as  
53470 *pax*. Furthermore, the ability to add *fchdir* actions to *posix\_spawn()* gives the caller as much  
53471 control over relative pathnames processed in the context of the child as it would otherwise have  
53472 using *openat()*, since all file actions are processed in sequence in the context of the child at a  
53473 point where the child process is still single-threaded. Without *chdir* or *fchdir* actions, changing  
53474 the working directory of the child would require a shim utility (some implementations provide

53475 `env -C /new/path program args...`

53476 as an extension, but the standard does not require this extension), or else temporarily changing  
53477 the working directory in the parent process prior to calling `posix_spawn()` (but this requires  
53478 locking in a multi-threaded process, to ensure that no other thread is impacted by the temporary  
53479 change to global state).

53480 File actions are performed in a new process created by `posix_spawn()` or `posix_spawnp()` in the  
53481 same order that they were added to the file actions object. Thus, the execution of an *open* action  
53482 that was created by a call to `posix_spawn_file_actions_addopen()` that specifies a relative path will  
53483 be affected by the execution of a *chdir* or *fchdir* action that was created by a previous call to  
53484 `posix_spawn_file_actions_addchdir()` or `posix_spawn_file_actions_addfchdir()`. Likewise, a relative  
53485 path passed to `posix_spawn()` will be affected by the last *chdir* or *fchdir* action in the file action  
53486 list.

#### 53487 RATIONALE

53488 Refer to the RATIONALE section in `posix_spawn_file_actions_addclose()`.

#### 53489 FUTURE DIRECTIONS

53490 None.

#### 53491 SEE ALSO

#### 53495 CHANGE HISTORY

53496 First released in Issue 8. Derived from Solaris `posix_spawn_file_actions_addchdir_np`.

53497 **NAME**

53498 posix\_spawn\_file\_actions\_addclose, posix\_spawn\_file\_actions\_addopen — add close or open  
53499 action to spawn file actions object (**ADVANCED REALTIME**)

53500 **SYNOPSIS**

```
53501 SPN #include <spawn.h>
53502 int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
53503     *file_actions, int fildes);
53504 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
53505     *restrict file_actions, int fildes,
53506     const char *restrict path, int oflag, mode_t mode);
```

53507 **DESCRIPTION**

53508 These functions shall add a *close* or *open* action to a spawn file actions object.

53509 A spawn file actions object is of type **posix\_spawn\_file\_actions\_t** (defined in **<spawn.h>**) and is  
53510 used to specify a series of actions to be performed by a *posix\_spawn()* or *posix\_spawnp()*  
53511 operation in order to arrive at the set of open file descriptors for the child process given the set  
53512 of open file descriptors of the parent. POSIX.1-2024 does not define comparison or assignment  
53513 operators for the type **posix\_spawn\_file\_actions\_t**.

53514 A spawn file actions object, when passed to *posix\_spawn()* or *posix\_spawnp()*, shall specify how  
53515 the set of open file descriptors in the calling process is transformed into a set of potentially open  
53516 file descriptors for the spawned process. This transformation shall be as if the specified sequence  
53517 of actions was performed exactly once, in the context of the spawned process (prior to execution  
53518 of the new process image), in the order in which the actions were added to the object;  
53519 additionally, when the new process image is executed, any file descriptor (from this new set)  
53520 which has its FD\_CLOEXEC flag set shall be closed (see *posix\_spawn()*).

53521 The *posix\_spawn\_file\_actions\_addclose()* function shall add a *close* action to the object referenced  
53522 by *file\_actions* that shall cause the file descriptor *fildes* to be closed (as if *close(fildes)* had been  
53523 called) when a new process is spawned using this file actions object, except that a non-negative  
53524 *fildes* less than {OPEN\_MAX} that is already closed at the time when the new process is spawned  
53525 shall be ignored rather than failing with [EBADF].

53526 The *posix\_spawn\_file\_actions\_addopen()* function shall add an *open* action to the object referenced  
53527 by *file\_actions* that shall cause the file named by *path* to be opened (as if *open(path, oflag, mode)*  
53528 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a  
53529 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,  
53530 it shall be closed before the new file is opened. A relative *path* shall be interpreted in relation to  
53531 the working directory determined by any prior actions.

53532 The string pointed to by *path* shall be copied by the *posix\_spawn\_file\_actions\_addopen()* function.

53533 **RETURN VALUE**

53534 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
53535 be returned to indicate the error.

53536 **ERRORS**

53537 The *posix\_spawn\_file\_actions\_addopen()* function shall fail if:

53538 [EBADF] The value specified by *fildes* is negative or greater than or equal to  
53539 {OPEN\_MAX}.

53540 The *posix\_spawn\_file\_actions\_addclose()* function shall fail if:

53541 [EBADF] The value specified by *fdes* is negative.

53542 These functions shall fail if:

53543 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

53544 These functions may fail if:

53545 [EINVAL] The value specified by *file\_actions* is invalid.

53546 It shall not be considered an error for the *fdes* argument passed to these functions to specify a  
 53547 file descriptor for which the specified operation could not be performed at the time of the call.  
 53548 Any such error shall be detected when the associated file actions object is later used during a  
 53549 *posix\_spawn()* or *posix\_spawnnp()* operation.

#### 53550 EXAMPLES

53551 None.

#### 53552 APPLICATION USAGE

53553 These functions are part of the Spawn option and need not be provided on all implementations.

53554 Implementations may use file descriptors that must be inherited into child processes for the  
 53555 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
 53556 an application that calls *posix\_spawn\_file\_actions\_addclose()* with an arbitrary integer risks non-  
 53557 conforming behavior, and this function can only portably be used to close file descriptor values  
 53558 that the application has obtained through explicit actions, or for the three file descriptors  
 53559 corresponding to the standard file streams. In order to avoid a race condition of leaking an  
 53560 unintended file descriptor into a child process or executed program, an application should  
 53561 consider opening all file descriptors with the FD\_CLOFORK or FD\_CLOEXEC flag, or both  
 53562 flags, set unless the file descriptor is intended to be inherited by child processes or executed  
 53563 programs, respectively.

#### 53564 RATIONALE

53565 A spawn file actions object may be initialized to contain an ordered sequence of *chdir()*, *close()*,  
 53566 *dup2()*, *fchdir()*, and *open()* operations to be used by *posix\_spawn()* or *posix\_spawnnp()* to arrive at  
 53567 the set of open file descriptors and current working directory inherited by the spawned process  
 53568 from the set of open file descriptors and current working directory in the parent at the time of  
 53569 the *posix\_spawn()* or *posix\_spawnnp()* call. It had been suggested that the *close()* and *dup2()*  
 53570 operations alone are sufficient to rearrange file descriptors, and that files which need to be  
 53571 opened for use by the spawned process can be handled either by having the calling process open  
 53572 them before the *posix\_spawn()* or *posix\_spawnnp()* call (and close them after), or by passing  
 53573 pathnames to the spawned process (in *argv*) so that it may open them itself. The standard  
 53574 developers recommend that applications use one of these two methods when practical, since  
 53575 detailed error status on a failed open operation is always available to the application this way.  
 53576 However, the standard developers feel that allowing a spawn file actions object to specify open  
 53577 operations is still appropriate because:

- 53578 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 53579 2. It supports the I/O redirection paradigm commonly employed by POSIX programs  
 53580 designed to be invoked from a shell. When such a program is the child process, it may not  
 53581 be designed to open files on its own.
- 53582 3. It allows file opens that might otherwise fail or violate file ownership/access rights if  
 53583 executed by the parent process.

53584 Regarding 2. above, note that the spawn open file action provides to *posix\_spawn()* and  
 53585 *posix\_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only

53586 without the intervening execution of a shell; for example:

53587 `system ("myprog <file1 3<file2");`

53588 Regarding 3. above, note that if the calling process needs to open one or more files for access by  
 53589 the spawned process, but has insufficient spare file descriptors, then the *open* action is necessary  
 53590 to allow the *open()* to occur in the context of the child process after other file descriptors have  
 53591 been closed (that must remain open in the parent).

53592 Additionally, if a parent is executed from a file having a "set-user-id" mode bit set and the  
 53593 POSIX\_SPAWN\_RESETEUIDS flag is set in the spawn attributes, a file created within the parent  
 53594 process will (possibly incorrectly) have the parent's effective user ID as its owner, whereas a file  
 53595 created via an *open()* action during *posix\_spawn()* or *posix\_spawnnp()* will have the parent's real  
 53596 ID as its owner; and an open by the parent process may successfully open a file to which the real  
 53597 user should not have access or fail to open a file to which the real user should have access.

53598 **File Descriptor Mapping**

53599 The standard developers had originally proposed using an array which specified the mapping of  
 53600 child file descriptors back to those of the parent. It was pointed out by the ballot group that it is  
 53601 not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix\_spawn()*  
 53602 or *posix\_spawnnp()* without provision for one or more spare file descriptor entries (which simply  
 53603 may not be available). Such an array requires that an implementation develop a complex  
 53604 strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor  
 53605 at the wrong time.

53606 It was noted by a member of the Ada Language Bindings working group that the approved Ada  
 53607 Language *Start\_Process* family of POSIX process primitives use a caller-specified set of file  
 53608 actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very  
 53609 flexible way, yet no such problems exist because the burden of determining how to achieve the  
 53610 final file descriptor mapping is completely on the application. Furthermore, although the file  
 53611 actions interface appears frightening at first glance, it is actually quite simple to implement in  
 53612 either a library or the kernel.

53613 The *posix\_spawn\_file\_actions\_addclose()* function is not required to check whether the file  
 53614 descriptor is less than {OPEN\_MAX} because on some implementations {OPEN\_MAX} reflects  
 53615 the RLIMIT\_NOFILE soft limit and therefore calling *setrlimit()* to reduce this limit can result in  
 53616 an {OPEN\_MAX} value less than or equal to an already open file descriptor. Applications need  
 53617 to be able to close such file descriptors on spawn. On implementations where {OPEN\_MAX}  
 53618 does not change, it is recommended that *posix\_spawn\_file\_actions\_addclose()* should return  
 53619 [EBADF] if *fd* is greater than or equal to {OPEN\_MAX}.

53620 **FUTURE DIRECTIONS**

53621 None.

53626 **CHANGE HISTORY**

53627 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53628 IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the  
 53629 string pointed to by *path* is copied by the *posix\_spawn\_file\_actions\_addopen()* function.

53630 **Issue 7**

53631 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0436 [418], XSH/TC1-2008/0437 [149],  
53632 XSH/TC1-2008/0438 [291], and XSH/TC1-2008/0439 [418] are applied.

53633 **Issue 8**

53634 Austin Group Defect 370 is applied, requiring that attempting to close a file descriptor that is in  
53635 range, but already closed at the time when the new process is spawned, is not treated as an error.

53636 Austin Group Defect 1208 is applied, adding *posix\_spawn\_file\_actions\_addchdir()* and  
53637 *posix\_spawn\_file\_actions\_addfchdir()*.

53638 Austin Group Defect 1318 is applied, adding FD\_CLOFORK.

53639 **NAME**

53640 posix\_spawn\_file\_actions\_adddup2 — add dup2 action to spawn file actions object  
53641 (ADVANCED REALTIME)

53642 **SYNOPSIS**

```
53643 SPN #include <spawn.h>
53644 int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
53645 *file_actions, int fildes, int newfildes);
```

53646 **DESCRIPTION**

53647 The *posix\_spawn\_file\_actions\_adddup2()* function shall add a *dup2()* action to the object  
53648 referenced by *file\_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as  
53649 if *dup2(fildes, newfildes)* had been called) when a new process is spawned using this file actions  
53650 object.

53651 If *fildes* and *newfildes* are equal, then the action shall ensure that *newfildes* is inherited by the new  
53652 process with *FD\_CLOEXEC* clear, even if the *FD\_CLOEXEC* flag of *fildes* is set at the time the  
53653 new process is spawned, and even though *dup2()* would not make such a change.

53654 A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

53655 **RETURN VALUE**

53656 Upon successful completion, the *posix\_spawn\_file\_actions\_adddup2()* function shall return zero;  
53657 otherwise, an error number shall be returned to indicate the error.

53658 **ERRORS**

53659 The *posix\_spawn\_file\_actions\_adddup2()* function shall fail if:

53660 [EBADF] The value specified by *fildes* or *newfildes* is negative or greater than or equal to  
53661 {OPEN\_MAX}.

53662 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

53663 The *posix\_spawn\_file\_actions\_adddup2()* function may fail if:

53664 [EINVAL] The value specified by *file\_actions* is invalid.

53665 It shall not be considered an error for the *fildes* argument passed to the  
53666 *posix\_spawn\_file\_actions\_adddup2()* function to specify a file descriptor for which the specified  
53667 operation could not be performed at the time of the call. Any such error shall be detected when  
53668 the associated file actions object is later used during a *posix\_spawn()* or *posix\_spawnnp()*  
53669 operation.

53670 **EXAMPLES**

53671 None.

53672 **APPLICATION USAGE**

53673 The *posix\_spawn\_file\_actions\_adddup2()* function is part of the Spawn option and need not be  
53674 provided on all implementations.

53675 Implementations may use file descriptors that must be inherited into child processes for the  
53676 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
53677 an application that calls *posix\_spawn\_file\_actions\_adddup2()* with an arbitrary integer for *newfildes*  
53678 risks non-conforming behavior, and this function can only portably be used to overwrite file  
53679 descriptor values that the application has obtained through explicit actions, or for the three file  
53680 descriptors corresponding to the standard file streams. In order to avoid a race condition of  
53681 leaking an unintended file descriptor into a child process or executed program, an application  
53682 should consider opening all file descriptors with the *FD\_CLOFORK* or *FD\_CLOEXEC* flag, or

53683 both flags, set unless the file descriptor is intended to be inherited by child processes or executed  
53684 programs, respectively.

#### 53685 RATIONALE

53686 Refer to the RATIONALE section in [posix\\_spawn\\_file\\_actions\\_addclose\(\)](#).

53687 Although `dup2()` is required to do nothing when `fildes` and `newfildes` are equal and `fildes` is an  
53688 open descriptor, the use of `posix_spawn_file_actions_adddup2()` is required to cause `fildes` to be  
53689 accessible in the child with `FD_CLOEXEC` clear. This is because there is no counterpart  
53690 `posix_spawn_file_actions_fcntl()` that could be used for clearing the flag as an independent file  
53691 action. It would also be possible to achieve this effect by using two calls to  
53692 `posix_spawn_file_actions_adddup2()` and a temporary `fildes` value known not to conflict with any  
53693 other file descriptors, coupled with a `posix_spawn_file_actions_close()` to avoid leaking the  
53694 temporary, but this approach is complex, and risks [EMFILE] or [ENFILE] failure that can be  
53695 avoided with the in-place removal of `FD_CLOEXEC`.

53696 There is no need for `posix_spawn_file_actions_adddup3()`, since it makes no sense to create a file  
53697 descriptor with `FD_CLOEXEC` set before spawning the child process, where that file descriptor  
53698 would immediately be closed again.

#### 53699 FUTURE DIRECTIONS

53700 None.

#### 53701 SEE ALSO

53702 [dup\(\)](#), [posix\\_spawn\(\)](#), [posix\\_spawn\\_file\\_actions\\_addclose\(\)](#), [posix\\_spawn\\_file\\_actions\\_destroy\(\)](#)

#### 53704 CHANGE HISTORY

53705 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53706 IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the  
53707 `newfildes` argument in addition to `fildes`.

#### 53708 Issue 7

53709 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0440 [149] is applied.

#### 53710 Issue 8

53711 Austin Group Defect 411 is applied, changing requirements relating to the `FD_CLOEXEC` flag  
53712 when `fildes` and `newfildes` are equal.

53713 Austin Group Defect 1318 is applied, adding `FD_CLOFORK`.

53714 **NAME**

53715         posix\_spawn\_file\_actions\_addfchdir — add fchdir action to spawn file actions object  
53716         (ADVANCED REALTIME)

53717 **SYNOPSIS**

```
53718 SPN         #include <spawn.h>  
53719         int posix_spawn_file_actions_addfchdir(posix_spawn_file_actions_t  
53720                 *file_actions, int fildes);
```

53721 **DESCRIPTION**

53722         Refer to [posix\\_spawn\\_file\\_actions\\_addchdir\(\)](#).

53723 **NAME**

53724        posix\_spawn\_file\_actions\_addopen — add open action to spawn file actions object  
53725        (ADVANCED REALTIME)

53726 **SYNOPSIS**

```
53727 SPN     #include <spawn.h>  
53728        int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t  
53729                    *restrict file_actions, int fildes,  
53730                    const char *restrict path, int oflag, mode_t mode);
```

53731 **DESCRIPTION**

53732        Refer to [posix\\_spawn\\_file\\_actions\\_addclose\(\)](#).

53733 **NAME**

53734 posix\_spawn\_file\_actions\_destroy, posix\_spawn\_file\_actions\_init — destroy and initialize  
53735 spawn file actions object (**ADVANCED REALTIME**)

53736 **SYNOPSIS**

```
53737 SPN #include <spawn.h>
53738
53738 int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
53739     *file_actions);
53740 int posix_spawn_file_actions_init(posix_spawn_file_actions_t
53741     *file_actions);
```

53742 **DESCRIPTION**

53743 The *posix\_spawn\_file\_actions\_destroy()* function shall destroy the object referenced by *file\_actions*;  
53744 the object becomes, in effect, uninitialized. An implementation may cause  
53745 *posix\_spawn\_file\_actions\_destroy()* to set the object referenced by *file\_actions* to an invalid value. A  
53746 destroyed spawn file actions object can be reinitialized using *posix\_spawn\_file\_actions\_init()*; the  
53747 results of otherwise referencing the object after it has been destroyed are undefined.

53748 The *posix\_spawn\_file\_actions\_init()* function shall initialize the object referenced by *file\_actions* to  
53749 contain no file actions for *posix\_spawn()* or *posix\_spawnnp()* to perform.

53750 A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

53751 The effect of initializing an already initialized spawn file actions object is undefined.

53752 **RETURN VALUE**

53753 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
53754 be returned to indicate the error.

53755 **ERRORS**

53756 The *posix\_spawn\_file\_actions\_init()* function shall fail if:

53757 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

53758 The *posix\_spawn\_file\_actions\_destroy()* function may fail if:

53759 [EINVAL] The value specified by *file\_actions* is invalid.

53760 **EXAMPLES**

53761 None.

53762 **APPLICATION USAGE**

53763 These functions are part of the Spawn option and need not be provided on all implementations.

53764 **RATIONALE**

53765 Refer to the RATIONALE section in *posix\_spawn\_file\_actions\_addclose()*.

53766 **FUTURE DIRECTIONS**

53767 None.

53768 **SEE ALSO**

53769 *posix\_spawn()*, *posix\_spawn\_file\_actions\_addclose()*

53770 XBD <spawn.h>

53771 **CHANGE HISTORY**

53772 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53773 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

53774 **NAME**

53775 posix\_spawnattr\_destroy, posix\_spawnattr\_init — destroy and initialize spawn attributes object  
 53776 (ADVANCED REALTIME)

53777 **SYNOPSIS**

```
53778 SPN #include <spawn.h>
53779
53779 int posix_spawnattr_destroy(posix_spawnattr_t *attr);
53780 int posix_spawnattr_init(posix_spawnattr_t *attr);
```

53781 **DESCRIPTION**

53782 The *posix\_spawnattr\_destroy()* function shall destroy a spawn attributes object. A destroyed *attr*  
 53783 attributes object can be reinitialized using *posix\_spawnattr\_init()*; the results of otherwise  
 53784 referencing the object after it has been destroyed are undefined. An implementation may cause  
 53785 *posix\_spawnattr\_destroy()* to set the object referenced by *attr* to an invalid value.

53786 The *posix\_spawnattr\_init()* function shall initialize a spawn attributes object *attr* with the default  
 53787 value for all of the individual attributes used by the implementation. Results are undefined if  
 53788 *posix\_spawnattr\_init()* is called specifying an already initialized *attr* attributes object.

53789 A spawn attributes object is of type **posix\_spawnattr\_t** (defined in **<spawn.h>**) and is used to  
 53790 specify the inheritance of process attributes across a spawn operation. POSIX.1-2024 does not  
 53791 define comparison or assignment operators for the type **posix\_spawnattr\_t**.

53792 Each implementation shall document the individual attributes it uses and their default values  
 53793 unless these values are defined by POSIX.1-2024. Attributes not defined by POSIX.1-2024, their  
 53794 default values, and the names of the associated functions to get and set those attribute values are  
 53795 implementation-defined.

53796 The resulting spawn attributes object (possibly modified by setting individual attribute values),  
 53797 is used to modify the behavior of *posix\_spawn()* or *posix\_spawnnp()*. After a spawn attributes  
 53798 object has been used to spawn a process by a call to a *posix\_spawn()* or *posix\_spawnnp()*, any  
 53799 function affecting the attributes object (including destruction) shall not affect any process that  
 53800 has been spawned in this way.

53801 **RETURN VALUE**

53802 Upon successful completion, *posix\_spawnattr\_destroy()* and *posix\_spawnattr\_init()* shall return  
 53803 zero; otherwise, an error number shall be returned to indicate the error.

53804 **ERRORS**

- 53805 The *posix\_spawnattr\_init()* function shall fail if:
- 53806 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.
- 53807 The *posix\_spawnattr\_destroy()* function may fail if:
- 53808 [EINVAL] The value specified by *attr* is invalid.

53809 **EXAMPLES**

53810 None.

53811 **APPLICATION USAGE**

53812 These functions are part of the Spawn option and need not be provided on all implementations.

53813 **RATIONALE**

53814 The original spawn interface proposed in POSIX.1-2024 defined the attributes that specify the  
 53815 inheritance of process attributes across a spawn operation as a structure. In order to be able to  
 53816 separate optional individual attributes under their appropriate options (that is, the *spawn-*  
 53817 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

53818 also for extensibility and consistency with the newer POSIX interfaces, the attributes interface  
53819 has been changed to an opaque data type. This interface now consists of the type  
53820 **posix\_spawnattr\_t**, representing a spawn attributes object, together with associated functions to  
53821 initialize or destroy the attributes object, and to set or get each individual attribute. Although the  
53822 new object-oriented interface is more verbose than the original structure, it is simple to use,  
53823 more extensible, and easy to implement.

#### 53824 **FUTURE DIRECTIONS**

53825 None.

53828 *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
53829 *posix\_spawnattr\_getsigmask()*

53830 XBD <spawn.h>

#### 53831 **CHANGE HISTORY**

53832 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53833 IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already  
53834 initialized spawn attributes option is undefined.

53835 **NAME**

53836 posix\_spawnattr\_getflags, posix\_spawnattr\_setflags — get and set the spawn-flags attribute of a  
53837 spawn attributes object (**ADVANCED REALTIME**)

53838 **SYNOPSIS**

```
53839 SPN #include <spawn.h>
53840 int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
53841 short *restrict flags);
53842 int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

53843 **DESCRIPTION**

53844 The *posix\_spawnattr\_getflags()* function shall obtain the value of the *spawn-flags* attribute from the  
53845 attributes object referenced by *attr*.

53846 The *posix\_spawnattr\_setflags()* function shall set the *spawn-flags* attribute in an initialized  
53847 attributes object referenced by *attr*.

53848 The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the  
53849 new process image when invoking *posix\_spawn()* or *posix\_spawnnp()*. It is the bitwise-inclusive  
53850 OR of zero or more of the following flags:

- 53851 POSIX\_SPAWN\_RESETIDS
- 53852 POSIX\_SPAWN\_SETPGROUP
- 53853 PS POSIX\_SPAWN\_SETSCHEDPARAM
- 53854 POSIX\_SPAWN\_SETSCHEDULER
- 53855 POSIX\_SPAWN\_SETSID
- 53856 POSIX\_SPAWN\_SETSIGDEF
- 53857 POSIX\_SPAWN\_SETSIGMASK

53858 These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags  
53859 were set.

53860 **RETURN VALUE**

53861 Upon successful completion, *posix\_spawnattr\_getflags()* shall return zero and store the value of  
53862 the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an  
53863 error number shall be returned to indicate the error.

53864 Upon successful completion, *posix\_spawnattr\_setflags()* shall return zero; otherwise, an error  
53865 number shall be returned to indicate the error.

53866 **ERRORS**

53867 These functions may fail if:

- 53868 [EINVAL] The value specified by *attr* is invalid.
- 53869 The *posix\_spawnattr\_setflags()* function may fail if:
  - 53870 [EINVAL] The value of the attribute being set is not valid.

53871 **EXAMPLES**

53872 None.

53873 **APPLICATION USAGE**

53874 These functions are part of the Spawn option and need not be provided on all implementations.

53875 **RATIONALE**

53876 None.

53877 **FUTURE DIRECTIONS**

53878 None.

53881 *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
53882 *posix\_spawnattr\_getsigmask()*

53883 XBD &lt;spawn.h&gt;

53884 **CHANGE HISTORY**

53885 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53886 **Issue 8**

53887 Austin Group Defect 1044 is applied, adding POSIX\_SPAWN\_SETSID.

53888 **NAME**

53889 posix\_spawnattr\_getpgroup, posix\_spawnattr\_setpgroup — get and set the spawn-pgroup  
53890 attribute of a spawn attributes object (**ADVANCED REALTIME**)

53891 **SYNOPSIS**

```
53892 SPN #include <spawn.h>
53893 int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
53894 pid_t *restrict pgroup);
53895 int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

53896 **DESCRIPTION**

53897 The *posix\_spawnattr\_getpgroup()* function shall obtain the value of the *spawn-pgroup* attribute  
53898 from the attributes object referenced by *attr*.

53899 The *posix\_spawnattr\_setpgroup()* function shall set the *spawn-pgroup* attribute in an initialized  
53900 attributes object referenced by *attr*.

53901 The *spawn-pgroup* attribute represents the process group to be joined by the new process image  
53902 in a spawn operation (if POSIX\_SPAWN\_SETPGROUP is set in the *spawn-flags* attribute). The  
53903 default value of this attribute shall be zero.

53904 **RETURN VALUE**

53905 Upon successful completion, *posix\_spawnattr\_getpgroup()* shall return zero and store the value of  
53906 the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise,  
53907 an error number shall be returned to indicate the error.

53908 Upon successful completion, *posix\_spawnattr\_setpgroup()* shall return zero; otherwise, an error  
53909 number shall be returned to indicate the error.

53910 **ERRORS**

53911 These functions may fail if:

53912 [EINVAL] The value specified by *attr* is invalid.

53913 The *posix\_spawnattr\_setpgroup()* function may fail if:

53914 [EINVAL] The value of the attribute being set is not valid.

53915 **EXAMPLES**

53916 None.

53917 **APPLICATION USAGE**

53918 These functions are part of the Spawn option and need not be provided on all implementations.

53919 **RATIONALE**

53928 **CHANGE HISTORY**

53929 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53930 **NAME**

53931 posix\_spawnattr\_getschedparam, posix\_spawnattr\_setschedparam — get and set the spawn-  
53932 schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

53933 **SYNOPSIS**

```
53934 SPN PS #include <spawn.h>
53935 #include <sched.h>

53936 int posix_spawnattr_getschedparam(const posix_spawnattr_t
53937     *restrict attr, struct sched_param *restrict schedparam);
53938 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
53939     const struct sched_param *restrict schedparam);
```

53940 **DESCRIPTION**

53941 The *posix\_spawnattr\_getschedparam()* function shall obtain the value of the *spawn-schedparam*  
53942 attribute from the attributes object referenced by *attr*.

53943 The *posix\_spawnattr\_setschedparam()* function shall set the *spawn-schedparam* attribute in an  
53944 initialized attributes object referenced by *attr*.

53945 The *spawn-schedparam* attribute represents the scheduling parameters to be assigned to the new  
53946 process image in a spawn operation (if POSIX\_SPAWN\_SETSCHEDULER or  
53947 POSIX\_SPAWN\_SETSCHEDPARAM is set in the *spawn-flags* attribute). The default value of this  
53948 attribute is unspecified.

53949 **RETURN VALUE**

53950 Upon successful completion, *posix\_spawnattr\_getschedparam()* shall return zero and store the  
53951 value of the *spawn-schedparam* attribute of *attr* into the object referenced by the *schedparam*  
53952 parameter; otherwise, an error number shall be returned to indicate the error.

53953 Upon successful completion, *posix\_spawnattr\_setschedparam()* shall return zero; otherwise, an  
53954 error number shall be returned to indicate the error.

53955 **ERRORS**

53956 These functions may fail if:

53957 [EINVAL] The value specified by *attr* is invalid.

53958 The *posix\_spawnattr\_setschedparam()* function may fail if:

53959 [EINVAL] The value of the attribute being set is not valid.

53960 **EXAMPLES**

53961 None.

53962 **APPLICATION USAGE**

53963 These functions are part of the Spawn and Process Scheduling options and need not be provided  
53964 on all implementations.

54019 **CHANGE HISTORY**

54020 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

54021 **NAME**

54022 posix\_spawnattr\_getsigdefault, posix\_spawnattr\_setsigdefault — get and set the spawn-  
54023 sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

54024 **SYNOPSIS**

```
54025 SPN #include <signal.h>
54026 #include <spawn.h>
54027 int posix_spawnattr_getsigdefault(const posix_spawnattr_t
54028     *restrict attr, sigset_t *restrict sigdefault);
54029 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
54030     const sigset_t *restrict sigdefault);
```

54031 **DESCRIPTION**

54032 The *posix\_spawnattr\_getsigdefault()* function shall obtain the value of the *spawn-sigdefault*  
54033 attribute from the attributes object referenced by *attr*.

54034 The *posix\_spawnattr\_setsigdefault()* function shall set the *spawn-sigdefault* attribute in an  
54035 initialized attributes object referenced by *attr*.

54036 The *spawn-sigdefault* attribute represents the set of signals to be forced to default signal handling  
54037 in the new process image (if POSIX\_SPAWN\_SETSIGDEF is set in the *spawn-flags* attribute) by a  
54038 spawn operation. The default value of this attribute shall be an empty signal set.

54039 **RETURN VALUE**

54040 Upon successful completion, *posix\_spawnattr\_getsigdefault()* shall return zero and store the value  
54041 of the *spawn-sigdefault* attribute of *attr* into the object referenced by the *sigdefault* parameter;  
54042 otherwise, an error number shall be returned to indicate the error.

54043 Upon successful completion, *posix\_spawnattr\_setsigdefault()* shall return zero; otherwise, an error  
54044 number shall be returned to indicate the error.

54062 **CHANGE HISTORY**

54063 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

54064 **NAME**

54065 posix\_spawnattr\_getsigmask, posix\_spawnattr\_setsigmask — get and set the spawn-sigmask  
54066 attribute of a spawn attributes object (**ADVANCED REALTIME**)

54067 **SYNOPSIS**

```
54068 SPN #include <signal.h>
54069 #include <spawn.h>
54070 int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
54071 sigset_t *restrict sigmask);
54072 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
54073 const sigset_t *restrict sigmask);
```

54074 **DESCRIPTION**

54075 The *posix\_spawnattr\_getsigmask()* function shall obtain the value of the *spawn-sigmask* attribute  
54076 from the attributes object referenced by *attr*.

54077 The *posix\_spawnattr\_setsigmask()* function shall set the *spawn-sigmask* attribute in an initialized  
54078 attributes object referenced by *attr*.

54079 The *spawn-sigmask* attribute represents the signal mask in effect in the new process image of a  
54080 spawn operation (if *POSIX\_SPAWN\_SETSIGMASK* is set in the *spawn-flags* attribute). The  
54081 default value of this attribute is unspecified.

54082 **RETURN VALUE**

54083 Upon successful completion, *posix\_spawnattr\_getsigmask()* shall return zero and store the value  
54084 of the *spawn-sigmask* attribute of *attr* into the object referenced by the *sigmask* parameter;  
54085 otherwise, an error number shall be returned to indicate the error.

54086 Upon successful completion, *posix\_spawnattr\_setsigmask()* shall return zero; otherwise, an error  
54087 number shall be returned to indicate the error.

54088 **ERRORS**

54089 These functions may fail if:

54090 [EINVAL] The value specified by *attr* is invalid.

54091 The *posix\_spawnattr\_setsigmask()* function may fail if:

54092 [EINVAL] The value of the attribute being set is not valid.

54093 **EXAMPLES**

54094 None.

54095 **APPLICATION USAGE**

54096 These functions are part of the Spawn option and need not be provided on all implementations.

54104 *posix\_spawnattr\_getschedpolicy()*

54105 XBD [<signal.h>](#), [<spawn.h>](#)

54106 **CHANGE HISTORY**

54107 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

54108 **NAME**

54109        posix\_spawnattr\_init — initialize the spawn attributes object (**ADVANCED REALTIME**)

54110 **SYNOPSIS**

```
54111 SPN    #include <spawn.h>
54112        int posix_spawnattr_init(posix_spawnattr_t *attr);
```

54113 **DESCRIPTION**

54114        Refer to [posix\\_spawnattr\\_destroy\(\)](#).

54115 **NAME**

54116        posix\_spawnattr\_setflags — set the spawn-flags attribute of a spawn attributes object  
54117        (ADVANCED REALTIME)

54118 **SYNOPSIS**

```
54119 SPN     #include <spawn.h>  
54120     int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

54121 **DESCRIPTION**

54122        Refer to *posix\_spawnattr\_getflags()*.

54123 **NAME**

54124        `posix_spawnattr_setpgroup` — set the spawn-pgroup attribute of a spawn attributes object  
54125        (**ADVANCED REALTIME**)

54126 **SYNOPSIS**

```
54127 SPN    #include <spawn.h>  
54128        int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

54129 **DESCRIPTION**

54130        Refer to *posix\_spawnattr\_getpgroup()*.

54131 **NAME**

54132        posix\_spawnattr\_setschedparam — set the spawn-schedparam attribute of a spawn attributes  
54133        object (**ADVANCED REALTIME**)

54134 **SYNOPSIS**

```
54135 SPN PS #include <sched.h>  
54136         #include <spawn.h>  
  
54137         int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
54138         const struct sched_param *restrict schedparam);
```

54139 **DESCRIPTION**

54140        Refer to [posix\\_spawnattr\\_getschedparam\(\)](#).

54141 **NAME**

54142        `posix_spawnattr_setschedpolicy` — set the spawn-schedpolicy attribute of a spawn attributes  
54143        object (**ADVANCED REALTIME**)

54144 **SYNOPSIS**

```
54145 SPN PS #include <sched.h>  
54146         #include <spawn.h>  
  
54147         int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
54148         int schedpolicy);
```

54149 **DESCRIPTION**

54150        Refer to [posix\\_spawnattr\\_getschedpolicy\(\)](#).

54151 **NAME**

54152        posix\_spawnattr\_setsigdefault — set the spawn-sigdefault attribute of a spawn attributes object  
54153        (ADVANCED REALTIME)

54154 **SYNOPSIS**

```
54155 SPN     #include <signal.h>  
54156           #include <spawn.h>  
  
54157     int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,  
54158                                    const sigset_t *restrict sigdefault);
```

54159 **DESCRIPTION**

54160        Refer to [posix\\_spawnattr\\_getsigdefault\(\)](#).

54161 **NAME**

54162        posix\_spawnattr\_setsigmask — set the spawn-sigmask attribute of a spawn attributes object  
54163        (ADVANCED REALTIME)

54164 **SYNOPSIS**

```
54165 SPN     #include <signal.h>  
54166         #include <spawn.h>  
  
54167         int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
54168                                        const sigset_t *restrict sigmask);
```

54169 **DESCRIPTION**

54170        Refer to [posix\\_spawnattr\\_getsigmask\(\)](#).

54171 **NAME**54172 posix\_spawn — spawn a process (**ADVANCED REALTIME**)54173 **SYNOPSIS**

```
54174 SPN #include <spawn.h>
54175 int posix_spawn(pid_t *restrict pid, const char *restrict file,
54176 const posix_spawn_file_actions_t *file_actions,
54177 const posix_spawnattr_t *restrict attrp,
54178 char *const argv[restrict], char *const envp[restrict]);
```

54179 **DESCRIPTION**54180 Refer to *posix\_spawn()*.

54181 **NAME**54182 posix\_typed\_mem\_get\_info — query typed memory information (**ADVANCED REALTIME**)54183 **SYNOPSIS**

```
54184 TYM #include <sys/mman.h>
54185 int posix_typed_mem_get_info(int fildev,
54186 struct posix_typed_mem_info *info);
```

54187 **DESCRIPTION**

54188 The *posix\_typed\_mem\_get\_info()* function shall return, in the *posix\_tmi\_length* field of the  
 54189 **posix\_typed\_mem\_info** structure pointed to by *info*, the maximum length which may be  
 54190 successfully allocated by the typed memory object designated by *fildev*. This maximum length  
 54191 shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or  
 54192 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object  
 54193 represented by *fildev* was opened. The maximum length is dynamic; therefore, the value  
 54194 returned is valid only while the current mapping of the corresponding typed memory pool  
 54195 remains unchanged.

54196 If *fildev* represents a typed memory object opened with neither the  
 54197 `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG`  
 54198 flag specified, the returned value of *info->posix\_tmi\_length* is unspecified.

54199 The *posix\_typed\_mem\_get\_info()* function may return additional implementation-defined  
 54200 information in other fields of the **posix\_typed\_mem\_info** structure pointed to by *info*.

54201 If the memory object specified by *fildev* is not a typed memory object, then the behavior of this  
 54202 function is undefined.

54203 **RETURN VALUE**

54204 Upon successful completion, the *posix\_typed\_mem\_get\_info()* function shall return zero;  
 54205 otherwise, the corresponding error status value shall be returned.

54206 **ERRORS**

54207 The *posix\_typed\_mem\_get\_info()* function shall fail if:

54208 [EBADF] The *fildev* argument is not a valid open file descriptor.

54209 [ENODEV] The *fildev* argument is not connected to a memory object supported by this  
 54210 function.

54211 This function shall not return an error code of [EINTR].

54212 **EXAMPLES**

54213 None.

54214 **APPLICATION USAGE**

54215 None.

54216 **RATIONALE**

54217 An application that needs to allocate a block of typed memory with length dependent upon the  
 54218 amount of memory currently available must either query the typed memory object to obtain the  
 54219 amount available, or repeatedly invoke *mmap()* attempting to guess an appropriate length.  
 54220 While the latter method is existing practice with *malloc()*, it is awkward and imprecise. The  
 54221 *posix\_typed\_mem\_get\_info()* function allows an application to immediately determine available  
 54222 memory. This is particularly important for typed memory objects that may in some cases be  
 54223 scarce resources. Note that when a typed memory pool is a shared resource, some form of  
 54224 mutual-exclusion or synchronization may be required while typed memory is being queried and

54225 allocated to prevent race conditions.

54226 The existing *fstat()* function is not suitable for this purpose. We realize that implementations  
54227 may wish to provide other attributes of typed memory objects (for example, alignment  
54228 requirements, page size, and so on). The *fstat()* function returns a structure which is not  
54229 extensible and, furthermore, contains substantial information that is inappropriate for typed  
54230 memory objects.

54231 **FUTURE DIRECTIONS**

54232 None.

54233 **SEE ALSO**

54234 *fstat()*, *mmap()*, *posix\_typed\_mem\_open()*

54235 XBD <sys/mman.h>

54236 **CHANGE HISTORY**

54237 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

54238 **NAME**54239 posix\_typed\_mem\_open — open a typed memory object (**ADVANCED REALTIME**)54240 **SYNOPSIS**

```
54241 TYM #include <sys/mman.h>
54242 int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

54243 **DESCRIPTION**

54244 The `posix_typed_mem_open()` function shall establish a connection between the typed memory  
 54245 object specified by the string pointed to by `name` and a file descriptor. It shall create an open file  
 54246 description that refers to the typed memory object and a file descriptor that refers to that open  
 54247 file description. The file descriptor shall be allocated as described in [Section 2.6](#) (on page 525)  
 54248 and can be used by other functions to refer to that typed memory object. It is unspecified  
 54249 whether the name appears in the file system and is visible to other functions that take  
 54250 pathnames as arguments. The `name` argument conforms to the construction rules for a pathname,  
 54251 except that the interpretation of `<slash>` characters other than the leading `<slash>` character in  
 54252 `name` is implementation-defined, and that the length limits for the `name` argument are  
 54253 implementation-defined and need not be the same as the pathname limits `{PATH_MAX}` and  
 54254 `{NAME_MAX}`. If `name` begins with the `<slash>` character, then processes calling  
 54255 `posix_typed_mem_open()` with the same value of `name` shall refer to the same typed memory  
 54256 object. If `name` does not begin with the `<slash>` character, the effect is implementation-defined.

54257 Each typed memory object supported in a system shall be identified by a name which specifies  
 54258 not only its associated typed memory pool, but also the path or port by which it is accessed. That  
 54259 is, the same typed memory pool accessed via several different ports shall have several different  
 54260 corresponding names. The binding between names and typed memory objects is established in  
 54261 an implementation-defined manner. Unlike shared memory objects, there is no way within  
 54262 POSIX.1-2024 for a program to create a typed memory object.

54263 The value of `tflag` shall determine how the typed memory object behaves when subsequently  
 54264 mapped by calls to `mmap()`. At most, one of the following flags defined in `<sys/mman.h>` may  
 54265 be specified:

54266 POSIX\_TYPED\_MEM\_ALLOCATE

54267 Allocate on `mmap()`.

54268 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG

54269 Allocate contiguously on `mmap()`.

54270 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE

54271 Map on `mmap()`, without affecting allocatability.

54272 If `tflag` has the flag `POSIX_TYPED_MEM_ALLOCATE` specified, any subsequent call to `mmap()`  
 54273 using the returned file descriptor shall result in allocation and mapping of typed memory from  
 54274 the specified typed memory pool. The allocated memory may be a contiguous previously  
 54275 unallocated area of the typed memory pool or several non-contiguous previously unallocated  
 54276 areas (mapped to a contiguous portion of the process address space). If `tflag` has the flag  
 54277 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified, any subsequent call to `mmap()` using the  
 54278 returned file descriptor shall result in allocation and mapping of a single contiguous previously  
 54279 unallocated area of the typed memory pool (also mapped to a contiguous portion of the process  
 54280 address space). If `tflag` has none of the flags `POSIX_TYPED_MEM_ALLOCATE` or  
 54281 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified, any subsequent call to `mmap()` using the  
 54282 returned file descriptor shall map an application-chosen area from the specified typed memory  
 54283 pool such that this mapped area becomes unavailable for allocation until unmapped by all  
 54284 processes. If `tflag` has the flag `POSIX_TYPED_MEM_MAP_ALLOCATABLE` specified, any

54285 subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen  
 54286 area from the specified typed memory pool without an effect on the availability of that area for  
 54287 allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it  
 54288 was unallocated prior to the mapping or allocated if it was allocated prior to the mapping.  
 54289 Appropriate privileges to specify the POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag are  
 54290 implementation-defined.

54291 If successful, *posix\_typed\_mem\_open()* shall return a file descriptor for the typed memory object.  
 54292 The open file description is new, and therefore the file descriptor shall not share it with any other  
 54293 processes. It is unspecified whether the file offset is set. The FD\_CLOEXEC file descriptor flag  
 54294 associated with the new file descriptor shall be cleared unless *oflag* includes O\_CLOEXEC. The  
 54295 FD\_CLOFORK file descriptor flag associated with the new file descriptor shall be cleared unless  
 54296 *oflag* includes O\_CLOFORK.

54297 The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*,  
 54298 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *fstat()*, *dup()*, *dup2()*, *dup3()*, and *close()*, is  
 54299 unspecified when passed a file descriptor connected to a typed memory object by this function.

54300 The file status flags of the open file description shall be set according to the value of *oflag*.  
 54301 Applications shall specify exactly one of the three access mode values described below as the  
 54302 value of *oflag*.

54303 O\_RDONLY Open for read access only.

54304 O\_WRONLY Open for write access only.

54305 O\_RDWR Open for read or write access.

54306 Additionally, the value of *oflag* can include the following flags:

54307 O\_CLOEXEC Set the FD\_CLOEXEC file descriptor flag.

54308 O\_CLOFORK Set the FD\_CLOFORK file descriptor flag.

#### 54309 RETURN VALUE

54310 Upon successful completion, the *posix\_typed\_mem\_open()* function shall return a non-negative  
 54311 integer representing the file descriptor. Otherwise, it shall return  $-1$  and set *errno* to indicate the  
 54312 error.

#### 54313 ERRORS

54314 The *posix\_typed\_mem\_open()* function shall fail if:

54315 [EACCES] The typed memory object exists and the permissions specified by *oflag* are  
 54316 denied.

54317 [EINTR] The *posix\_typed\_mem\_open()* operation was interrupted by a signal.

54318 [EINVAL] The flags specified in *tflag* are invalid (more than one of  
 54319 POSIX\_TYPED\_MEM\_ALLOCATE,  
 54320 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG, or  
 54321 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE is specified).

54322 [EMFILE] All file descriptors available to the process are currently open.

54323 [ENFILE] Too many file descriptors are currently open in the system.

54324 [ENOENT] The named typed memory object does not exist.

54325 [EPERM] The caller lacks appropriate privileges to specify the  
 54326 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag in the *tflag* argument.

54327 The *posix\_typed\_mem\_open()* function may fail if:  
 54328 [ENAMETOOLONG]  
 54329 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems  
 54330 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
 54331 systems, or has a pathname component that is longer than  
 54332 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
 54333 longer than `{_XOPEN_NAME_MAX}` on XSI systems.

54334 **EXAMPLES**  
 54335 None.

54336 **APPLICATION USAGE**  
 54337 None.

54338 **RATIONALE**  
 54339 The use of the `O_CLOEXEC` and `O_CLOFORK` flags to *posix\_typed\_mem\_open()* is necessary to  
 54340 avoid leaking typed memory file descriptors to child processes, since *fcntl()* has unspecified  
 54341 results on typed memory objects and therefore cannot be used to set `FD_CLOEXEC` or  
 54342 `FD_CLOFORK` after the file descriptor has been opened. The *exec* family of functions already  
 54343 unmaps all memory associated with a typed memory object, but does not close the file  
 54344 descriptor unless `FD_CLOEXEC` is also set.

54345 **FUTURE DIRECTIONS**  
 54346 None.

54347 **SEE ALSO**  
 54348 [Section 2.6](#) (on page 525), *close()*, *dup()*, *exec*, *fcntl()*, *fstat()*, *ftruncate()*, *mmap()*, *msync()*,  
 54349 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *umask()*

54351 **CHANGE HISTORY**  
 54352 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

54353 **Issue 7**  
 54354 Austin Group Interpretation 1003.1-2001 #143 is applied.  
 54355 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0442 [119,428] is applied.  
 54356 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0256 [835], XSH/TC2-2008/0257 [835],  
 54357 and XSH/TC2-2008/0258 [835] are applied.

54358 **Issue 8**  
 54359 Austin Group Defects 411 and 1318 are applied, adding `O_CLOEXEC`, `O_CLOFORK`, and  
 54360 *dup3()*.  
 54361 Austin Group Defect 593 is applied, removing a reference to [<fcntl.h>](#) from the DESCRIPTION  
 54362 section.

54363 **NAME**

54364 pow, powf, powl — power function

54365 **SYNOPSIS**

54366 #include &lt;math.h&gt;

54367 double pow(double x, double y);

54368 float powf(float x, float y);

54369 long double powl(long double x, long double y);

54370 **DESCRIPTION**

54371 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 54372 conflict between the requirements described here and the ISO C standard is unintentional. This  
 54373 volume of POSIX.1-2024 defers to the ISO C standard.

54374 These functions shall compute the value of  $x$  raised to the power  $y$ ,  $x^y$ . If  $x$  is negative, the  
 54375 application shall ensure that  $y$  is an integer value.

54376 An application wishing to check for error situations should set *errno* to zero and call  
 54377 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 54378 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 54379 zero, an error has occurred.

54380 **RETURN VALUE**54381 Upon successful completion, these functions shall return the value of  $x$  raised to the power  $y$ .

54382 MX For finite values of  $x < 0$ , and finite non-integer values of  $y$ , a domain error shall occur and  
 54383 either a NaN (if representable), or an implementation-defined value shall be returned.

54384 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and  
 54385 *powl()* shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively, with the  
 54386 same sign as the correct value of the function.

54387 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 54388 MXX and *pow()*, *powf()*, and *powl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported)  
 54389 an implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN, and  
 54390 LDBL\_MIN, respectively.

54391 CX For  $y < 0$ , if  $x$  is zero, a pole error may occur and *pow()*, *powf()*, and *powl()* shall return  
 54392 MX  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively. On systems that support the  
 54393 IEC 60559 Floating-Point option, if  $x$  is  $\pm 0$ :

- 54394 • If  $y$  is an odd integer, a pole error shall occur and *pow()*, *powf()*, and *powl()* shall return  
 54395  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively.
- 54396 • If  $y$  is finite and is not an odd integer, a pole error shall occur and *pow()*, *powf()*, and *powl()*  
 54397 shall return HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.
- 54398 • If  $y$  is  $-\text{Inf}$ , a pole error may occur and *pow()*, *powf()*, and *powl()* shall return HUGE\_VAL,  
 54399 HUGE\_VALF, and HUGE\_VALL, respectively.

54400 MX If  $x$  or  $y$  is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

54401 For any value of  $y$  (including NaN), if  $x$  is +1, 1.0 shall be returned.

54402 For any value of  $x$  (including NaN), if  $y$  is  $\pm 0$ , 1.0 shall be returned.

54403 For any odd integer value of  $y > 0$ , if  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

54404 For  $y > 0$  and not an odd integer, if  $x$  is  $\pm 0$ , +0 shall be returned.

54405 If  $x$  is  $-1$ , and  $y$  is  $\pm\text{Inf}$ ,  $1.0$  shall be returned.

54406 For  $|x| < 1$ , if  $y$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

54407 For  $|x| > 1$ , if  $y$  is  $-\text{Inf}$ ,  $+0$  shall be returned.

54408 For  $|x| < 1$ , if  $y$  is  $+\text{Inf}$ ,  $+0$  shall be returned.

54409 For  $|x| > 1$ , if  $y$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

54410 For  $y$  an odd integer  $< 0$ , if  $x$  is  $-\text{Inf}$ ,  $-0$  shall be returned.

54411 For  $y < 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ ,  $+0$  shall be returned.

54412 For  $y$  an odd integer  $> 0$ , if  $x$  is  $-\text{Inf}$ ,  $-\text{Inf}$  shall be returned.

54413 For  $y > 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

54414 For  $y < 0$ , if  $x$  is  $+\text{Inf}$ ,  $+0$  shall be returned.

54415 For  $y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

54416 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
54417 the correct value shall be returned.

#### 54418 ERRORS

54419 These functions shall fail if:

54420 Domain Error The value of  $x$  is negative and  $y$  is a finite non-integer.

54421 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
54422 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
54423 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
54424 shall be raised.

54425 MX Pole Error The value of  $x$  is zero and  $y$  is negative.

54426 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
54427 then *errno* shall be set to [ERANGE]. If the integer expression  
54428 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
54429 floating-point exception shall be raised.

54430 Range Error The result overflows.

54431 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
54432 then *errno* shall be set to [ERANGE]. If the integer expression  
54433 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
54434 floating-point exception shall be raised.

54435 These functions may fail if:

54436 Pole Error The value of  $x$  is zero and  $y$  is negative.

54437 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
54438 then *errno* shall be set to [ERANGE]. If the integer expression  
54439 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
54440 floating-point exception shall be raised.

54441 Range Error The result underflows.

54442 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
54443 then *errno* shall be set to [ERANGE]. If the integer expression  
54444 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

54445 floating-point exception shall be raised.

54446 **EXAMPLES**

54447 None.

54448 **APPLICATION USAGE**

54449 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
54450 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

54451 **RATIONALE**

54452 None.

54453 **FUTURE DIRECTIONS**

54454 None.

54455 **SEE ALSO**

54458 **CHANGE HISTORY**

54459 First released in Issue 1. Derived from Issue 1 of the SVID.

54460 **Issue 5**

54461 The DESCRIPTION is updated to indicate how an application should check for an error. This  
54462 text was previously published in the APPLICATION USAGE section.

54463 **Issue 6**

54464 The normative text is updated to avoid use of the term “must” for application requirements.

54465 The *powf()* and *powl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

54466 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
54467 revised to align with the ISO/IEC 9899:1999 standard.

54468 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
54469 marked.

54470 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third  
54471 paragraph in the RETURN VALUE section.

54472 **Issue 7**

54473 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

54474 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0443 [68], XSH/TC1-2008/0444 [148],  
54475 and XSH/TC1-2008/0445 [68] are applied.

54476 **Issue 8**

54477 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
54478 standard.

54479 **NAME**

54480 ppoll — input/output multiplexing

54481 **SYNOPSIS**

54482 #include <poll.h>

```
54483 int ppoll(struct pollfd fds[], nfd_t nfds,  
54484           const struct timespec *restrict timeout,  
54485           const sigset_t *restrict sigmask);
```

54486 **DESCRIPTION**

54487 Refer to *poll()*.

54488 **NAME**

54489        pread — read from a file

54490 **SYNOPSIS**

54491        #include &lt;unistd.h&gt;

54492        ssize\_t pread(int *fd*, void \**buf*, size\_t *nbyte*, off\_t *offset*);54493 **DESCRIPTION**54494        Refer to *read()*.

54495 **NAME**

54496           printf — print formatted output

54497 **SYNOPSIS**

54498           #include <stdio.h>

54499           int printf(const char \*restrict *format*, ...);

54500 **DESCRIPTION**

54501           Refer to *fprintf()*.

54502 **NAME**

54503 pselect, select — synchronous I/O multiplexing

54504 **SYNOPSIS**

```
54505 #include <sys/select.h>
54506 int pselect(int nfds, fd_set *restrict readfds,
54507             fd_set *restrict writefds, fd_set *restrict errorfds,
54508             const struct timespec *restrict timeout,
54509             const sigset_t *restrict sigmask);
54510 int select(int nfds, fd_set *restrict readfds,
54511            fd_set *restrict writefds, fd_set *restrict errorfds,
54512            struct timeval *restrict timeout);
54513 void FD_CLR(int fd, fd_set *fdset);
54514 int FD_ISSET(int fd, const fd_set *fdset);
54515 void FD_SET(int fd, fd_set *fdset);
54516 void FD_ZERO(fd_set *fdset);
```

54517 **DESCRIPTION**

54518 The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the  
 54519 *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for  
 54520 reading, are ready for writing, or have an exceptional condition pending, respectively.

54521 The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- 54522 • For the *select()* function, the timeout period is given in seconds and microseconds in an  
 54523 argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is  
 54524 given in seconds and nanoseconds in an argument of type **struct timespec**.
- 54525 • The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when  
 54526 *sigmask* is a null pointer.
- 54527 • Upon successful completion, the *select()* function may modify the object pointed to by the  
 54528 *timeout* argument.

54529 The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal  
 54530 devices, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()* on file descriptors that  
 54531 refer to other types of file is unspecified.

54532 The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall  
 54533 be checked in each set; that is, the descriptors from zero through *nfds*-1 in the descriptor sets  
 54534 shall be examined.

54535 If the *readfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 54536 specifies the file descriptors to be checked for being ready to read, and on output indicates  
 54537 which file descriptors are ready to read.

54538 If the *writefds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 54539 specifies the file descriptors to be checked for being ready to write, and on output indicates  
 54540 which file descriptors are ready to write.

54541 If the *errorfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 54542 specifies the file descriptors to be checked for error conditions pending, and on output indicates  
 54543 which file descriptors have error conditions pending.

54544 Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to  
 54545 by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for  
 54546 reading, ready for writing, or have an error condition pending, respectively, and shall return the  
 54547 total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

54548 corresponding bit shall be set upon successful completion if it was set on input and the  
54549 associated condition is true for that file descriptor.

54550 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*  
54551 function shall block until at least one of the requested operations becomes ready, until the  
54552 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the  
54553 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null  
54554 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified  
54555 time interval expires without any requested operation becoming ready, the function shall return.  
54556 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block  
54557 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*  
54558 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

54559 The use of a timeout does not affect any pending timers set up by *alarm()*.

54560 Implementations may place limitations on the maximum timeout interval supported. All  
54561 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*  
54562 argument specifies a timeout interval greater than the implementation-defined maximum value,  
54563 the maximum value shall be used as the actual timeout value. Implementations may also place  
54564 limitations on the granularity of timeout intervals. If the requested timeout interval requires a  
54565 finer granularity than the implementation supports, the actual timeout interval shall be rounded  
54566 up to the next supported value.

54567 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the  
54568 caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall  
54569 restore the signal mask of the calling thread before returning. If a signal is unmasked as a result  
54570 of the signal mask being altered by *pselect()*, and a signal-catching function is called for that  
54571 signal during the execution of the *pselect()* function, and SA\_RESTART is clear for the  
54572 interrupting signal, then

- 54573 • If none of the selected file descriptors are ready, *pselect()* shall immediately fail with the  
54574 [EINTR] error after the signal-catching function returns.
- 54575 • If one or more of the selected file descriptors are ready, it is unspecified whether *pselect()*  
54576 behaves the same as if none of the descriptors were ready (failing with [EINTR] as above)  
54577 or behaves the same as if it was not interrupted (returning the total number of ready  
54578 descriptors).

54579 A descriptor shall be considered ready for reading when a call to an input function with  
54580 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
54581 successfully. (The function might return data, an end-of-file indication, or an error other than  
54582 one indicating that it is blocked, and in each of these cases the descriptor shall be considered  
54583 ready for reading.)

54584 A descriptor shall be considered ready for writing when a call to an output function with  
54585 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
54586 successfully.

54587 If a socket has a pending error, it shall be considered to have an exceptional condition pending.  
54588 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for  
54589 use with a socket, it is protocol-specific except as noted below. For other file types it is  
54590 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or  
54591 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate  
54592 that the descriptor has no exceptional condition pending.

54593 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with  
54594 parameters requesting normal and ancillary data, such that the presence of either type shall

54595 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if  
 54596 the socket option SO\_OOBINLINE has been enabled, as out-of-band data is enqueued with  
 54597 normal data. If the socket is currently listening, then it shall be marked as readable if an  
 54598 incoming connection request has been received, and a call to the *accept()* or *accept4()* function  
 54599 shall complete without blocking.

54600 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying  
 54601 an amount of normal data equal to the current value of the SO\_SNDLOWAT option for the  
 54602 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the  
 54603 connection attempt has either succeeded or failed leaving a pending error, the socket shall be  
 54604 marked as writable.

54605 A socket shall be considered to have an exceptional condition pending if a receive operation  
 54606 with O\_NONBLOCK clear for the open file description and with the MSG\_OOB flag set would  
 54607 return out-of-band data without blocking. (It is protocol-specific whether the MSG\_OOB flag  
 54608 would be used to read out-of-band data.) A socket shall also be considered to have an  
 54609 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other  
 54610 circumstances under which a socket may be considered to have an exceptional condition  
 54611 pending are protocol-specific and implementation-defined.

54612 If the *readfds*, *writfds*, and *errorfds* arguments are all null pointers and the *timeout* argument is  
 54613 not a null pointer, the *pselect()* or *select()* function shall block for the time specified, or until  
 54614 interrupted by a signal. If the *readfds*, *writfds*, and *errorfds* arguments are all null pointers and  
 54615 the *timeout* argument is a null pointer, the *pselect()* or *select()* function shall block until  
 54616 interrupted by a signal.

54617 File descriptors associated with regular files shall always select true for ready to read, ready to  
 54618 write, and error conditions.

54619 On failure, the objects pointed to by the *readfds*, *writfds*, and *errorfds* arguments shall not be  
 54620 modified. If the timeout interval expires without the specified condition being true for any of the  
 54621 specified file descriptors, the objects pointed to by the *readfds*, *writfds*, and *errorfds* arguments  
 54622 shall have all bits set to 0.

54623 File descriptor masks of type **fd\_set** can be initialized and tested with *FD\_CLR()*, *FD\_ISSET()*,  
 54624 *FD\_SET()*, and *FD\_ZERO()*. It is unspecified whether each of these is a macro or a function. If a  
 54625 macro definition is suppressed in order to access an actual function, or a program defines an  
 54626 external identifier with any of these names, the behavior is undefined.

54627 *FD\_CLR(fd, fdsetp)* shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not  
 54628 a member of this set, there shall be no effect on the set, and this shall not be treated as an error.

54629 *FD\_ISSET(fd, fdsetp)* shall evaluate to non-zero if the file descriptor *fd* is a member of the set  
 54630 pointed to by *fdsetp*, and shall evaluate to zero otherwise.

54631 *FD\_SET(fd, fdsetp)* shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file  
 54632 descriptor *fd* is already in this set, there shall be no effect on the set, and this shall not be treated  
 54633 as an error.

54634 *FD\_ZERO(fdsetp)* shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is  
 54635 returned if the set is not empty at the time *FD\_ZERO()* is invoked.

54636 The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or  
 54637 equal to FD\_SETSIZE, or if *fd* is not a valid file descriptor, or if any of the arguments are  
 54638 expressions with side-effects.

54639 If a thread gets canceled during a *pselect()* call, the signal mask in effect when executing the  
 54640 registered cleanup functions is either the original signal mask or the signal mask installed as part

54641 of the *pselect()* call.

#### 54642 RETURN VALUE

54643 Upon successful completion, the *pselect()* and *select()* functions shall return the total number of  
54644 bits set in the bit masks. Otherwise,  $-1$  shall be returned, and *errno* shall be set to indicate the  
54645 error.

54646 *FD\_CLR()*, *FD\_SET()*, and *FD\_ZERO()* do not return a value. *FD\_ISSET()* shall return a non-  
54647 zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and  
54648 0 otherwise.

#### 54649 ERRORS

54650 Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

54651 [EBADF] One or more of the file descriptor sets specified a file descriptor that is not a  
54652 valid open file descriptor.

54653 [EINTR] The function was interrupted by a signal.

54654 If SA\_RESTART has been set for the interrupting signal, it is implementation-  
54655 defined whether the function restarts or returns with [EINTR].

54656 [EINVAL] An invalid timeout interval was specified.

54657 [EINVAL] The *nfds* argument is less than 0 or greater than FD\_SETSIZE.

#### 54658 EXAMPLES

54659 None.

#### 54660 APPLICATION USAGE

54661 The use of *select()* and *pselect()* requires that the application construct the set of file descriptors  
54662 to work on each time through a polling loop, and is inherently limited from operating on file  
54663 descriptors larger than FD\_SETSIZE. Also, the amount of work to perform scales as *nfds*  
54664 increases, even if the number of file descriptors selected within the larger set remains the same.  
54665 Thus, applications may wish to consider using *poll()* and *ppoll()* instead, for better scaling.

54666 When a *pselect()* or *select()* call indicates a file descriptor is ready for reading, this means that if  
54667 an attempt to read data had been made at the time that the status of the file descriptor was  
54668 checked, it would have returned at least one byte of data, an end-of-file indication, or an error,  
54669 without blocking (even if O\_NONBLOCK is clear). When a *pselect()* or *select()* call indicates that  
54670 a file descriptor is ready for writing, this means that if an attempt to write one byte of data had  
54671 been made at the time that the status of the file descriptor was checked, it would have written  
54672 that byte or returned an error, without blocking. However, if an attempt to write more than one  
54673 byte had been made, it might have blocked (if O\_NONBLOCK is clear). In both cases, by the  
54674 time the call returns and a subsequent I/O operation is attempted, the state of the file descriptor  
54675 might have changed (for example, because another thread read or wrote some data) and, if  
54676 O\_NONBLOCK is clear, there is no guarantee that the operation will not block (unless it would  
54677 not block for some other reason, such as setting MIN=0 and TIME=0 for a terminal in non-  
54678 canonical mode). Therefore it is recommended that applications always set O\_NONBLOCK on  
54679 file descriptors whose readiness for I/O they query with *pselect()* or *select()*.

#### 54680 RATIONALE

54681 In earlier versions of the Single UNIX Specification, the *select()* function was defined in the  
54682 `<sys/time.h>` header. This is now changed to `<sys/select.h>`. The rationale for this change was  
54683 as follows: the introduction of the *pselect()* function included the `<sys/select.h>` header and the  
54684 `<sys/select.h>` header defines all the related definitions for the *pselect()* and *select()* functions.  
54685 Backwards-compatibility to existing XSI implementations is handled by allowing `<sys/time.h>`  
54686 to include `<sys/select.h>`.

54687 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
 54688 can install an additional cancellation handler which resets the signal mask to the expected value.

```
54689 void cleanup(void *arg)
54690 {
54691     sigset_t *ss = (sigset_t *) arg;
54692     pthread_sigmask(SIG_SETMASK, ss, NULL);
54693 }
54694 int call_pselect(int nfd, fd_set *readfds, fd_set *writefds,
54695                fd_set errorfds, const struct timespec *timeout,
54696                const sigset_t *sigmask)
54697 {
54698     sigset_t oldmask;
54699     int result;
54700     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
54701     pthread_cleanup_push(cleanup, &oldmask);
54702     result = pselect(nfd, readfds, writefds, errorfds, timeout, sigmask);
54703     pthread_cleanup_pop(0);
54704     return result;
54705 }
```

#### 54706 FUTURE DIRECTIONS

54707 None.

#### 54711 CHANGE HISTORY

54712 First released in Issue 4, Version 2.

#### 54713 Issue 5

54714 Moved from X/OPEN UNIX extension to BASE.

54715 In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when  
 54716 *nfd*s is less than 0 or greater than FD\_SETSIZE. It previously stated less than 0, or greater than or  
 54717 equal to FD\_SETSIZE.

54718 Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

#### 54719 Issue 6

54720 The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs*  
 54721 in the *select()* DESCRIPTION to be *readfds* and *writefds*.

54722 Text referring to sockets is added to the DESCRIPTION.

54723 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
 54724 marked as part of the XSI STREAMS Option Group.

54725 The following new requirements on POSIX implementations derive from alignment with the  
 54726 Single UNIX Specification:

- 54727 • These functions are now mandatory.

54728 The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail  
 54729 related to sockets semantics is added to the DESCRIPTION.

54730 The *select()* function now requires inclusion of [<sys/select.h>](#).

- 54731 The **restrict** keyword is added to the *select()* prototype for alignment with the  
54732 ISO/IEC 9899:1999 standard.
- 54733 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the  
54734 DESCRIPTION to reference the signal mask in terms of the calling thread rather than the  
54735 process.
- 54736 **Issue 7**
- 54737 SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled  
54738 during a call to *pselect()*, and adding example code to the RATIONALE.
- 54739 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 54740 Functionality relating to the Threads option is moved to the Base.
- 54741 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0446 [372] is applied.
- 54742 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0259 [680] is applied.
- 54743 **Issue 8**
- 54744 Austin Group Defect 220 is applied, adding `const` to the second parameter of *FD\_ISSET()*.
- 54745 Austin Group Defect 411 is applied, adding *accept4()*.
- 54746 Austin Group Defect 1186 is applied, clarifying the behavior when the *pselect()* function is  
54747 interrupted by a signal.
- 54748 Austin Group Defect 1263 is applied, changing the APPLICATION USAGE section.
- 54749 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 54750 Austin Group Defect 1448 is applied, changing the APPLICATION USAGE section.

54751 **NAME**

54752 psiginfo, psignal — write signal information to standard error

54753 **SYNOPSIS**

```
54754 CX #include <signal.h>
54755 void psiginfo(const siginfo_t *pinfo, const char *message);
54756 void psignal(int signum, const char *message);
```

54757 **DESCRIPTION**

54758 The *psiginfo()* and *psignal()* functions shall write a language-dependent message associated with  
 54759 a signal number to the standard error stream as follows:

- 54760 • First, if *message* is not a null pointer and is not the empty string, the string pointed to by the  
 54761 *message* argument shall be written, followed by a <colon> and a <space>.
- 54762 • Then the signal description string associated with *signum* or with the signal indicated by  
 54763 *pinfo* shall be written, followed by a <newline>.

54764 For *psiginfo()*, the application shall ensure that the argument *pinfo* references a valid **siginfo\_t**  
 54765 structure. For *psignal()*, if *signum* is not a valid signal number, the behavior is implementation-  
 54766 defined.

54767 The *psiginfo()* and *psignal()* functions shall not change the orientation of the standard error  
 54768 stream.

54769 The *psiginfo()* and *psignal()* functions shall mark for update the last data modification and last  
 54770 file status change timestamps of the file associated with the standard error stream at some time  
 54771 between their successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()*  
 54772 on *stderr*.

54773 The *psiginfo()* and *psignal()* functions shall not change the setting of *errno* if successful.

54774 On error, the *psiginfo()* and *psignal()* functions shall set the error indicator for the stream to  
 54775 which *stderr* points, and shall set *errno* to indicate the error.

54776 Since no value is returned, an application wishing to check for error situations should set *errno*  
 54777 to 0, then call *psiginfo()* or *psignal()*, then check *errno*.

54778 **RETURN VALUE**

54779 These functions shall not return a value.

54780 **ERRORS**

54781 Refer to *fputc()*.

54782 **EXAMPLES**

54783 None.

54784 **APPLICATION USAGE**

54785 As an alternative to setting *errno* to zero before the call and checking if it is non-zero afterwards,  
 54786 applications can use *ferror()* to detect whether *psiginfo()* or *psignal()* encountered an error.

54787 An application wishing to use this method to check for error situations should call  
 54788 *clearerr(stderr)* before calling *psiginfo()* or *psignal()*, then if *ferror(stderr)* returns non-zero, the  
 54789 value of *errno* indicates which error occurred.

54790 **RATIONALE**

54791 System V historically has *psignal()* and *psiginfo()* in `<siginfo.h>`. However, the `<siginfo.h>`  
54792 header is not specified in the Base Definitions volume of POSIX.1-2024, and the type `siginfo_t` is  
54793 defined in `<signal.h>`.

54794 **FUTURE DIRECTIONS**

54795 None.

54796 **SEE ALSO**

54797 *fputc()*, *perror()*, *strsignal()*

54798 XBD `<signal.h>`

54799 **CHANGE HISTORY**

54800 First released in Issue 7.

54801 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0447 [399,428], XSH/TC1-2008/0448  
54802 [399], and XSH/TC1-2008/0449 [399,401] are applied.

54803 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0260 [629] is applied.

54804 **NAME**

54805 pthread\_atfork — register fork handlers

54806 **SYNOPSIS**

```
54807 OB #include <pthread.h>
54808 int pthread_atfork(void (*prepare)(void), void (*parent)(void),
54809 void (*child)(void));
```

54810 **DESCRIPTION**

54811 The *pthread\_atfork()* function shall declare fork handlers to be called before and after *fork()*, in  
 54812 the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()*  
 54813 processing commences. The *parent* fork handler shall be called after *fork()* processing completes  
 54814 in the parent process. The *child* fork handler shall be called after *fork()* processing completes in  
 54815 the child process. If no handling is desired at one or more of these three points, the  
 54816 corresponding fork handler address(es) may be set to NULL.

54817 If a *fork()* call in a multi-threaded process leads to a *child* fork handler calling any function that is  
 54818 not async-signal-safe, the behavior is undefined.

54819 The order of calls to *pthread\_atfork()* is significant. The *parent* and *child* fork handlers shall be  
 54820 called in the order in which they were established by calls to *pthread\_atfork()*. The *prepare* fork  
 54821 handlers shall be called in the opposite order.

54822 **RETURN VALUE**

54823 Upon successful completion, *pthread\_atfork()* shall return a value of zero; otherwise, an error  
 54824 number shall be returned to indicate the error.

54825 **ERRORS**

54826 The *pthread\_atfork()* function shall fail if:

54827 [ENOMEM] Insufficient table space exists to record the fork handler addresses.

54828 The *pthread\_atfork()* function shall not return an error code of [EINTR].

54829 **EXAMPLES**

54830 None.

54831 **APPLICATION USAGE**

54832 The original usage pattern envisaged for *pthread\_atfork()* was for the *prepare* fork handler to lock  
 54833 mutexes and other locks, and for the *parent* and *child* handlers to unlock them. However, since all  
 54834 of the relevant unlocking functions, except *sem\_post()*, are not async-signal-safe, this usage  
 54835 results in undefined behavior in the child process unless the only such unlocking function it calls  
 54836 is *sem\_post()*.

54837 **RATIONALE**

54838 There are at least two serious problems with the semantics of *fork()* in a multi-threaded  
 54839 program. One problem has to do with state (for example, memory) covered by mutexes.  
 54840 Consider the case where one thread has a mutex locked and the state covered by that mutex is  
 54841 inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state  
 54842 (locked by a nonexistent thread and thus can never be unlocked). Having the child simply  
 54843 reinitialize the mutex is unsatisfactory since this approach does not resolve the question about  
 54844 how to correct or otherwise deal with the inconsistent state in the child.

54845 It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the  
 54846 child process, thus resetting all states. In the meantime, only a short list of async-signal-safe  
 54847 library routines are promised to be available.

54848 Unfortunately, this solution does not address the needs of multi-threaded libraries. Application  
54849 programs may not be aware that a multi-threaded library is in use, and they feel free to call any  
54850 number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed,  
54851 they may be extant single-threaded programs and cannot, therefore, be expected to obey new  
54852 restrictions imposed by the threads library.

54853 On the other hand, the multi-threaded library needs a way to protect its internal state during  
54854 *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-  
54855 threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to  
54856 effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may  
54857 entail simply resetting the state in the child after the *fork()* processing completes.

54858 The *pthread\_atfork()* function was intended to provide multi-threaded libraries with a means to  
54859 protect themselves from innocent application programs that call *fork()*, and to provide multi-  
54860 threaded application programs with a standard mechanism for protecting themselves from  
54861 *fork()* calls in a library routine or the application itself.

54862 The expected usage was that the prepare handler would acquire all mutex locks and the other  
54863 two fork handlers would release them.

54864 For example, an application could have supplied a prepare routine that acquires the necessary  
54865 mutexes the library maintains and supplied child and parent routines that release those  
54866 mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the  
54867 library (and that no mutexes would have been left stranded). This is good in theory, but in  
54868 reality not practical. Each and every mutex and lock in the process must be located and locked.  
54869 Every component of a program including third-party components must participate and they  
54870 must agree who is responsible for which mutex or lock. This is especially problematic for  
54871 mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the  
54872 implementation must be locked, too. This possibly delays the thread calling *fork()* for a long  
54873 time or even indefinitely since uses of these synchronization objects may not be under control of  
54874 the application. A final problem to mention here is the problem of locking streams. At least the  
54875 streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the  
54876 stream with *flockfile()*. But the application itself could have done that, possibly in the same  
54877 thread calling *fork()*. In this case, the process will deadlock.

54878 Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes  
54879 the mutexes in the library and all associated states to some known value (for example, what it  
54880 was when the image was originally executed). This approach is not possible, though, because  
54881 implementations are allowed to fail *\*\_init()* and *\*\_destroy()* calls for mutexes and locks if the  
54882 mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes  
54883 and locks.

54884 When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization  
54885 variables remain in the same state in the child as they were in the parent at the time *fork()* was  
54886 called. Thus, for example, mutex locks may be held by threads that no longer exist in the child  
54887 process, and any associated states may be inconsistent. The intention was that the parent process  
54888 could have avoided this by explicit code that acquires and releases locks critical to the child via  
54889 *pthread\_atfork()*. In addition, any critical threads would have needed to be recreated and  
54890 reinitialized to the proper state in the child (also via *pthread\_atfork()*).

54891 A higher-level package may acquire locks on its own data structures before invoking lower-level  
54892 packages. Under this scenario, the order specified for fork handler calls allows a simple rule of  
54893 initialization for avoiding package deadlock: a package initializes all packages on which it  
54894 depends before it calls the *pthread\_atfork()* function for itself.

54895 As explained, there is no suitable solution for functionality which requires non-atomic

54896 operations to be protected through mutexes and locks. This is why the POSIX.1 standard since  
54897 the 1996 release requires that the child process after *fork()* in a multi-threaded process only calls  
54898 *async-signal-safe* interfaces.

54899 An additional problem arises when *pthread\_atfork()* is called to register a function in a library  
54900 that was loaded using *dlopen()*. If the library is unloaded using *dlclose()*, and the  
54901 implementation of *dlclose()* does not unregister the function, then when *fork()* tries to call it the  
54902 result will be undefined behavior. Some implementations of *dlclose()* do unregister  
54903 *pthread\_atfork()* handlers, but this cannot be relied upon by portable applications. The standard  
54904 provides no portable method for unregistering a function installed as a handler via  
54905 *pthread\_atfork()*.

#### 54906 **FUTURE DIRECTIONS**

54907 The *pthread\_atfork()* function may be removed in a future version of this standard.

54913 IEEE PASC Interpretation 1003.1c #4 is applied.

#### 54914 **Issue 6**

54915 The *pthread\_atfork()* function is marked as part of the Threads option.

54916 The [<pthread.h>](#) header is added to the SYNOPSIS.

#### 54917 **Issue 7**

54918 The *pthread\_atfork()* function is moved from the Threads option to the Base.

54919 SD5-XSH-ERN-145 is applied, updating the RATIONALE.

54920 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0261 [858] is applied.

#### 54921 **Issue 8**

54922 Austin Group Defect 851 is applied, marking *pthread\_atfork()* as obsolescent.

54923 **NAME**

54924 pthread\_attr\_destroy, pthread\_attr\_init — destroy and initialize the thread attributes object

54925 **SYNOPSIS**

54926 #include &lt;pthread.h&gt;

54927 int pthread\_attr\_destroy(pthread\_attr\_t \*attr);

54928 int pthread\_attr\_init(pthread\_attr\_t \*attr);

54929 **DESCRIPTION**

54930 The *pthread\_attr\_destroy()* function shall destroy a thread attributes object. An implementation  
54931 may cause *pthread\_attr\_destroy()* to set *attr* to an implementation-defined invalid value. A  
54932 destroyed *attr* attributes object can be reinitialized using *pthread\_attr\_init()*; the results of  
54933 otherwise referencing the object after it has been destroyed are undefined.

54934 The *pthread\_attr\_init()* function shall initialize a thread attributes object *attr* with the default  
54935 value for all of the individual attributes used by a given implementation.

54936 The resulting attributes object (possibly modified by setting individual attribute values) when  
54937 used by *pthread\_create()* defines the attributes of the thread created. A single attributes object can  
54938 be used in multiple simultaneous calls to *pthread\_create()*. Results are undefined if  
54939 *pthread\_attr\_init()* is called specifying an already initialized *attr* attributes object.

54940 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_destroy()*  
54941 does not refer to an initialized thread attributes object.

54942 **RETURN VALUE**

54943 Upon successful completion, *pthread\_attr\_destroy()* and *pthread\_attr\_init()* shall return a value of  
54944 0; otherwise, an error number shall be returned to indicate the error.

54945 **ERRORS**54946 The *pthread\_attr\_init()* function shall fail if:

54947 [ENOMEM] Insufficient memory exists to initialize the thread attributes object.

54948 These functions shall not return an error code of [EINTR].

54949 **EXAMPLES**

54950 None.

54951 **APPLICATION USAGE**

54952 None.

54953 **RATIONALE**

54954 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
54955 support probable future standardization in these areas without requiring that the function itself  
54956 be changed.

54957 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
54958 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
54959 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
54960 can help by allowing the changes to be isolated in a single place, rather than being spread across  
54961 every instance of thread creation.

54962 Attributes objects can be used to set up “classes” of threads with similar attributes; for example,  
54963 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
54964 can be defined in a single place and then referenced wherever threads need to be created.  
54965 Changes to “class” decisions become straightforward, and detailed analysis of each  
54966 *pthread\_create()* call is not required.

54967 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
54968 been specified as structures, adding new attributes would force recompilation of all multi-  
54969 threaded programs when the attributes objects are extended; this might not be possible if  
54970 different program components were supplied by different vendors.

54971 Additionally, opaque attributes objects present opportunities for improving performance.  
54972 Argument validity can be checked once when attributes are set, rather than each time a thread is  
54973 created. Implementations often need to cache kernel objects that are expensive to create.  
54974 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
54975 invalid due to attribute changes.

54976 Since assignment is not necessarily defined on a given opaque type, implementation-defined  
54977 default values cannot be defined in a portable way. The solution to this problem is to allow  
54978 attributes objects to be initialized dynamically by attributes object initialization functions, so that  
54979 default values can be supplied automatically by the implementation.

54980 The following proposal was provided as a suggested alternative to the supplied attributes:

- 54981 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
54982 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
54983 parameter containing the flags should be an opaque type for extensibility. If no flags are  
54984 set in the parameter, then the objects are created with default characteristics. An  
54985 implementation may specify implementation-defined flag values and associated  
54986 behavior.
- 54987 2. If further specialization of mutexes and condition variables is necessary, implementations  
54988 may specify additional procedures that operate on the **pthread\_mutex\_t** and  
54989 **pthread\_cond\_t** objects (instead of on attributes objects).

54990 The difficulties with this solution are:

- 54991 1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using  
54992 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,  
54993 application programmers need to know the location of each bit. If bits are set or read by  
54994 encapsulation (that is, *get* and *set* functions), then the bitmask is merely an  
54995 implementation of attributes objects as currently defined and should not be exposed to  
54996 the programmer.
- 54997 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
54998 policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking  
54999 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,  
55000 the bitmask can only reasonably control whether particular attributes are set or not, and it  
55001 cannot serve as the repository of the value itself. The value needs to be specified as a  
55002 function parameter (which is non-extensible), or by setting a structure field (which is non-  
55003 opaque), or by *get* and *set* functions (making the bitmask a redundant addition to the  
55004 attributes objects).

55005 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
55006 machine-dependent. Some implementations may not be able to change the size of the stack, for  
55007 example, and others may not need to because stack pages may be discontinuous and can be  
55008 allocated and released on demand.

55009 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
55010 to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-2024 has  
55011 to be done with care so as not to affect binary-compatibility.

55012 Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,

55013 may have their size fixed at compile time. This means, for example, a *pthread\_create()* in an  
55014 implementation with extensions to **pthread\_attr\_t** cannot look beyond the area that the binary  
55015 application assumes is valid. This suggests that implementations should maintain a size field in  
55016 the attributes object, as well as possibly version information, if extensions in different directions  
55017 (possibly by different vendors) are to be accommodated.

55018 If an implementation detects that the value specified by the *attr* argument to  
55019 *pthread\_attr\_destroy()* does not refer to an initialized thread attributes object, it is recommended  
55020 that the function should fail and report an [EINVAL] error.

55021 If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_init()*  
55022 refers to an already initialized thread attributes object, it is recommended that the function  
55023 should fail and report an [EBUSY] error.

#### 55024 FUTURE DIRECTIONS

55025 None.

#### 55026 SEE ALSO

55027 [\*pthread\\_attr\\_getstacksize\(\)\*](#), [\*pthread\\_attr\\_getdetachstate\(\)\*](#), [\*pthread\\_create\(\)\*](#)

#### 55029 CHANGE HISTORY

55030 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 55031 Issue 6

55032 The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are marked as part of the Threads  
55033 option.

55034 IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already  
55035 initialized thread attributes object is undefined.

55036 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS  
55037 section to add the optional [EINVAL] error for the *pthread\_attr\_destroy()* function, and the  
55038 optional [EBUSY] error for the *pthread\_attr\_init()* function.

#### 55039 Issue 7

55040 The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are moved from the Threads option  
55041 to the Base.

55042 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55043 results in undefined behavior.

55044 The [EBUSY] error for an already initialized thread attributes object is removed; this condition  
55045 results in undefined behavior.

55046 **NAME**

55047 pthread\_attr\_getdetachstate, pthread\_attr\_setdetachstate — get and set the detachstate attribute

55048 **SYNOPSIS**

```
55049 #include <pthread.h>
55050 int pthread_attr_getdetachstate(const pthread_attr_t *attr,
55051 int *detachstate);
55052 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

55053 **DESCRIPTION**

55054 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread  
 55055 is created detached, then use of the ID of the newly created thread by the *pthread\_detach()* or  
 55056 *pthread\_join()* function is an error.

55057 The *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* functions, respectively, shall get  
 55058 and set the *detachstate* attribute in the *attr* object.

55059 For *pthread\_attr\_getdetachstate()*, *detachstate* shall be set to either  
 55060 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

55061 For *pthread\_attr\_setdetachstate()*, the application shall set *detachstate* to either  
 55062 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

55063 A value of PTHREAD\_CREATE\_DETACHED shall cause all threads created with *attr* to be in  
 55064 the detached state, whereas using a value of PTHREAD\_CREATE\_JOINABLE shall cause all  
 55065 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute  
 55066 shall be PTHREAD\_CREATE\_JOINABLE.

55067 The behavior is undefined if the value specified by the *attr* argument to  
 55068 *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread  
 55069 attributes object.

55070 **RETURN VALUE**

55071 Upon successful completion, *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* shall  
 55072 return a value of 0; otherwise, an error number shall be returned to indicate the error.

55073 The *pthread\_attr\_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*  
 55074 if successful.

55075 **ERRORS**

55076 The *pthread\_attr\_setdetachstate()* function shall fail if:

55077 [EINVAL] The value of *detachstate* was not valid

55078 These functions shall not return an error code of [EINTR].

55079 **EXAMPLES**55080 **Retrieving the detachstate Attribute**

55081 This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
55082 #include <pthread.h>
55083 pthread_attr_t thread_attr;
55084 int detachstate;
55085 int rc;
55086 /* code initializing thread_attr */
55087 ...
```

```
55088     rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
55089     if (rc!=0) {
55090         /* handle error */
55091         ...
55092     }
55093     else {
55094         /* legal values for detachstate are:
55095          * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
55096          */
55097         ...
55098     }
```

**55099 APPLICATION USAGE**

55100 None.

**55101 RATIONALE**

55102 If an implementation detects that the value specified by the *attr* argument to  
55103 *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread  
55104 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**55105 FUTURE DIRECTIONS**

55106 None.

**55107 SEE ALSO**

55108 [pthread\\_attr\\_destroy\(\)](#), [pthread\\_attr\\_getstacksize\(\)](#), [pthread\\_create\(\)](#)

55109 XBD <[pthread.h](#)>

**55110 CHANGE HISTORY**

55111 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**55112 Issue 6**

55113 The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are marked as part of  
55114 the Threads option.

55115 The normative text is updated to avoid use of the term “must” for application requirements.

55116 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the  
55117 EXAMPLES section.

55118 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS  
55119 section to include the optional [EINVAL] error.

**55120 Issue 7**

55121 The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are moved from the  
55122 Threads option to the Base.

55123 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55124 results in undefined behavior.

55125 **NAME**

55126 pthread\_attr\_getguardsize, pthread\_attr\_setguardsize — get and set the thread guardsize  
55127 attribute

55128 **SYNOPSIS**

```
55129 #include <pthread.h>
55130 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
55131                               size_t *restrict guardsize);
55132 int pthread_attr_setguardsize(pthread_attr_t *attr,
55133                               size_t guardsize);
```

55134 **DESCRIPTION**

55135 The *pthread\_attr\_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This  
55136 attribute shall be returned in the *guardsize* parameter.

55137 The *pthread\_attr\_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new  
55138 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard  
55139 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard  
55140 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

55141 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The  
55142 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is  
55143 created with guard protection, the implementation allocates extra memory at the overflow end  
55144 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows  
55145 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

55146 A conforming implementation may round up the value contained in *guardsize* to a multiple of  
55147 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation  
55148 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread\_attr\_getguardsize()*  
55149 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous  
55150 *pthread\_attr\_setguardsize()* function call.

55151 The default value of the *guardsize* attribute is implementation-defined.

55152 If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread  
55153 stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the  
55154 implementation. It is the responsibility of the application to manage stack overflow along with  
55155 stack allocation and management in this case.

55156 The behavior is undefined if the value specified by the *attr* argument to  
55157 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
55158 attributes object.

55159 **RETURN VALUE**

55160 If successful, the *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions shall return  
55161 zero; otherwise, an error number shall be returned to indicate the error.

55162 **ERRORS**

55163 These functions shall fail if:

55164 [EINVAL] The parameter *guardsize* is invalid.

55165 These functions shall not return an error code of [EINTR].

55166 **EXAMPLES**55167 **Retrieving the guardsize Attribute**

55168 This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```
55169 #include <pthread.h>
55170 pthread_attr_t thread_attr;
55171 size_t guardsize;
55172 int rc;
55173 /* code initializing thread_attr */
55174 ...
55175 rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
55176 if (rc != 0) {
55177     /* handle error */
55178     ...
55179 }
55180 else {
55181     if (guardsize > 0) {
55182         /* a guard area of at least guardsize bytes is provided */
55183         ...
55184     }
55185     else {
55186         /* no guard area provided */
55187         ...
55188     }
55189 }
```

55190 **APPLICATION USAGE**

55191 None.

55192 **RATIONALE**

55193 The *guardsize* attribute is provided to the application for two reasons:

- 55194 1. Overflow protection can potentially result in wasted system resources. An application  
55195 that creates a large number of threads, and which knows its threads never overflow their  
55196 stack, can save system resources by turning off guard areas.
- 55197 2. When threads allocate large data structures on the stack, large guard areas may be needed  
55198 to detect stack overflow.

55199 The default size of the guard area is left implementation-defined since on systems supporting  
55200 very large page sizes, the overhead might be substantial if at least one guard page is required by  
55201 default.

55202 If an implementation detects that the value specified by the *attr* argument to  
55203 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
55204 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

55205 **FUTURE DIRECTIONS**

55206 None.

55207 **SEE ALSO**

55208 XBD &lt;pthread.h&gt;, &lt;sys/mman.h&gt;

55209 **CHANGE HISTORY**

55210 First released in Issue 5.

55211 **Issue 6**55212 In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the  
55213 second error condition.55214 The **restrict** keyword is added to the *pthread\_attr\_getguardsize()* prototype for alignment with the  
55215 ISO/IEC 9899:1999 standard.55216 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS  
55217 section to remove the [EINVAL] error ("The attribute *attr* is invalid."), and replacing it with the  
55218 optional [EINVAL] error.55219 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the  
55220 EXAMPLES section.55221 **Issue 7**55222 SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.55223 SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the  
55224 guard area is implementation-defined.55225 The *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions are moved from the XSI  
55226 option to the Base.55227 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55228 results in undefined behavior.

55229 **NAME**

55230 pthread\_attr\_getinheritsched, pthread\_attr\_setinheritsched — get and set the inheritsched  
55231 attribute (**REALTIME THREADS**)

55232 **SYNOPSIS**

```
55233 TPS #include <pthread.h>
55234 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
55235 int *restrict inheritsched);
55236 int pthread_attr_setinheritsched(pthread_attr_t *attr,
55237 int inheritsched);
```

55238 **DESCRIPTION**

55239 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions, respectively, shall  
55240 get and set the *inheritsched* attribute in the *attr* argument.

55241 When the attributes objects are used by *pthread\_create()*, the *inheritsched* attribute determines  
55242 how the other scheduling attributes of the created thread shall be set.

55243 The supported values of *inheritsched* shall be:

55244 **PTHREAD\_INHERIT\_SCHED**

55245 Specifies that the thread scheduling attributes shall be inherited from the creating thread,  
55246 and the scheduling attributes in this *attr* argument shall be ignored.

55247 **PTHREAD\_EXPLICIT\_SCHED**

55248 Specifies that the thread scheduling attributes shall be set to the corresponding values from  
55249 this attributes object.

55250 The symbols **PTHREAD\_INHERIT\_SCHED** and **PTHREAD\_EXPLICIT\_SCHED** are defined in  
55251 the **<pthread.h>** header.

55252 The following thread scheduling attributes defined by POSIX.1-2024 are affected by the  
55253 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and  
55254 scheduling contention scope (*contentionscope*).

55255 The behavior is undefined if the value specified by the *attr* argument to  
55256 *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized  
55257 thread attributes object.

55258 **RETURN VALUE**

55259 If successful, the *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions shall  
55260 return zero; otherwise, an error number shall be returned to indicate the error.

55261 **ERRORS**

55262 The *pthread\_attr\_setinheritsched()* function shall fail if:

55263 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

55264 The *pthread\_attr\_setinheritsched()* function may fail if:

55265 [EINVAL] The value of *inheritsched* is not valid.

55266 These functions shall not return an error code of [EINTR].

55267 **EXAMPLES**

55268 None.

55269 **APPLICATION USAGE**55270 After these attributes have been set, a thread can be created with the specified attributes using  
55271 *pthread\_create()*. Using these routines does not affect the current running thread.55272 See [Section 2.9.4](#) (on page 540) for further details on thread scheduling attributes and their  
55273 default settings.55274 **RATIONALE**55275 If an implementation detects that the value specified by the *attr* argument to  
55276 *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized  
55277 thread attributes object, it is recommended that the function should fail and report an [EINVAL]  
55278 error.55279 **FUTURE DIRECTIONS**

55280 None.

55281 **SEE ALSO**55282 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getschedpolicy()*,  
55283 *pthread\_attr\_getschedparam()*, *pthread\_create()*55284 XBD [<pthread.h>](#), [<sched.h>](#)55285 **CHANGE HISTORY**

55286 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55287 Marked as part of the Realtime Threads Feature Group.

55288 **Issue 6**55289 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked as part  
55290 of the Threads and Thread Execution Scheduling options.55291 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
55292 implementation does not support the Thread Execution Scheduling option.55293 The **restrict** keyword is added to the *pthread\_attr\_getinheritsched()* prototype for alignment with  
55294 the ISO/IEC 9899:1999 standard.55295 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of  
55296 *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS  
55297 section for checking when *attr* refers to an uninitialized thread attribute object.55298 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to  
55299 [Section 2.9.4](#) (on page 540) in the APPLICATION USAGE section.55300 **Issue 7**55301 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked only as  
55302 part of the Thread Execution Scheduling option as the Threads option is now part of the Base.55303 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55304 results in undefined behavior.

55305 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0450 [314] is applied.

55306 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0262 [757] is applied.

55307 **NAME**

55308 pthread\_attr\_getschedparam, pthread\_attr\_setschedparam — get and set the schedparam  
55309 attribute

55310 **SYNOPSIS**

```
55311 #include <pthread.h>
55312 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
55313     struct sched_param *restrict param);
55314 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
55315     const struct sched_param *restrict param);
```

55316 **DESCRIPTION**

55317 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions, respectively, shall  
55318 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*  
55319 structure are defined in the **<sched.h>** header. For the SCHED\_FIFO and SCHED\_RR policies,  
55320 the only required member of *param* is *sched\_priority*.

55321 TSP For the SCHED\_SPORADIC policy, the required members of the *param* structure are  
55322 *sched\_priority*, *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and  
55323 *sched\_ss\_max\_repl*. The specified *sched\_ss\_repl\_period* needs to be greater than or equal to the  
55324 specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.  
55325 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
55326 function to succeed; if not, the function shall fail. It is unspecified whether the  
55327 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
55328 rounded to align with the resolution of the clock being used.

55329 The behavior is undefined if the value specified by the *attr* argument to  
55330 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
55331 attributes object.

55332 **RETURN VALUE**

55333 If successful, the *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions shall  
55334 return zero; otherwise, an error number shall be returned to indicate the error.

55335 **ERRORS**

55336 The *pthread\_attr\_setschedparam()* function shall fail if:

55337 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

55338 The *pthread\_attr\_setschedparam()* function may fail if:

55339 [EINVAL] The value of *param* is not valid.

55340 These functions shall not return an error code of [EINTR].

55341 **EXAMPLES**

55342 None.

55343 **APPLICATION USAGE**

55344 After these attributes have been set, a thread can be created with the specified attributes using  
55345 *pthread\_create()*. Using these routines does not affect the current running thread.

55346 **RATIONALE**

55347 If an implementation detects that the value specified by the *attr* argument to  
55348 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
55349 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

55350 **FUTURE DIRECTIONS**

55351 None.

55352 **SEE ALSO**55353 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
55354 *pthread\_attr\_getschedpolicy()*, *pthread\_create()*

55356 **CHANGE HISTORY**

55357 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55358 **Issue 6**55359 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are marked as part  
55360 of the Threads option.

55361 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

55362 The **restrict** keyword is added to the *pthread\_attr\_getschedparam()* and  
55363 *pthread\_attr\_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.55364 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS  
55365 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
55366 object.55367 **Issue 7**55368 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are moved from the  
55369 Threads option to the Base.55370 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
55371 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.55372 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55373 results in undefined behavior.

55374 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0451 [314] is applied.

55375 **NAME**

55376 pthread\_attr\_getschedpolicy, pthread\_attr\_setschedpolicy — get and set the schedpolicy  
55377 attribute (**REALTIME THREADS**)

55378 **SYNOPSIS**

```
55379 TPS #include <pthread.h>
55380 int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
55381 int *restrict policy);
55382 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

55383 **DESCRIPTION**

55384 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions, respectively, shall  
55385 get and set the *schedpolicy* attribute in the *attr* argument.

55386 The supported values of *policy* shall include SCHED\_FIFO, SCHED\_RR, and SCHED\_OTHER,  
55387 which are defined in the **<sched.h>** header. When threads executing with the scheduling policy  
55388 TSP SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC are waiting on a mutex, they shall acquire  
55389 the mutex in priority order when the mutex is unlocked.

55390 The behavior is undefined if the value specified by the *attr* argument to  
55391 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
55392 attributes object.

55393 **RETURN VALUE**

55394 If successful, the *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions shall  
55395 return zero; otherwise, an error number shall be returned to indicate the error.

55396 **ERRORS**

55397 The *pthread\_attr\_setschedpolicy()* function shall fail if:

55398 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

55399 The *pthread\_attr\_setschedpolicy()* function may fail if:

55400 [EINVAL] The value of *policy* is not valid.

55401 These functions shall not return an error code of [EINTR].

55402 **EXAMPLES**

55403 None.

55404 **APPLICATION USAGE**

55405 After these attributes have been set, a thread can be created with the specified attributes using  
55406 *pthread\_create()*. Using these routines does not affect the current running thread.

55407 See [Section 2.9.4](#) (on page 540) for further details on thread scheduling attributes and their  
55408 default settings.

55409 **RATIONALE**

55410 If an implementation detects that the value specified by the *attr* argument to  
55411 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
55412 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

55413 **FUTURE DIRECTIONS**

55414 None.

55415 **SEE ALSO**

55416 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
55417 *pthread\_attr\_getschedparam()*, *pthread\_create()*

55419 **CHANGE HISTORY**

55420 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55421 Marked as part of the Realtime Threads Feature Group.

55422 **Issue 6**

55423 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked as part of  
55424 the Threads and Thread Execution Scheduling options.

55425 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
55426 implementation does not support the Thread Execution Scheduling option.

55427 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

55428 The **restrict** keyword is added to the *pthread\_attr\_getschedpolicy()* prototype for alignment with  
55429 the ISO/IEC 9899:1999 standard.

55430 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/79 is applied, adding a reference to  
55431 [Section 2.9.4](#) (on page 540) in the APPLICATION USAGE section.

55432 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/80 is applied, updating the ERRORS  
55433 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
55434 object.

55435 **Issue 7**

55436 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked only as  
55437 part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

55438 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55439 results in undefined behavior.

55440 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0452 [314] is applied.

55441 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0263 [757] is applied.

55442 **NAME**

55443 pthread\_attr\_getscope, pthread\_attr\_setscope — get and set the contentionscope attribute  
55444 (**REALTIME THREADS**)

55445 **SYNOPSIS**

```
55446 TPS #include <pthread.h>
55447
55447 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
55448                          int *restrict contentionscope);
55449
55449 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

55450 **DESCRIPTION**

55451 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions, respectively, shall get and set  
55452 the *contentionscope* attribute in the *attr* object.

55453 The *contentionscope* attribute may have the values `PTHREAD_SCOPE_SYSTEM`, signifying  
55454 system scheduling contention scope, or `PTHREAD_SCOPE_PROCESS`, signifying process  
55455 scheduling contention scope. The symbols `PTHREAD_SCOPE_SYSTEM` and  
55456 `PTHREAD_SCOPE_PROCESS` are defined in the `<pthread.h>` header.

55457 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getscope()* or  
55458 *pthread\_attr\_setscope()* does not refer to an initialized thread attributes object.

55459 **RETURN VALUE**

55460 If successful, the *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions shall return zero;  
55461 otherwise, an error number shall be returned to indicate the error.

55462 **ERRORS**

55463 The *pthread\_attr\_setscope()* function shall fail if:

55464 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

55465 The *pthread\_attr\_setscope()* function may fail if:

55466 [EINVAL] The value of *contentionscope* is not valid.

55467 These functions shall not return an error code of [EINTR].

55468 **EXAMPLES**

55469 None.

55470 **APPLICATION USAGE**

55471 After these attributes have been set, a thread can be created with the specified attributes using  
55472 *pthread\_create()*. Using these routines does not affect the current running thread.

55473 See [Section 2.9.4](#) (on page 540) for further details on thread scheduling attributes and their  
55474 default settings.

55475 **RATIONALE**

55476 If an implementation detects that the value specified by the *attr* argument to  
55477 *pthread\_attr\_getscope()* or *pthread\_attr\_setscope()* does not refer to an initialized thread attributes  
55478 object, it is recommended that the function should fail and report an [EINVAL] error.

55479 **FUTURE DIRECTIONS**

55480 None.

55481 **SEE ALSO**

55482 *pthread\_attr\_destroy()*, *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedpolicy()*,  
55483 *pthread\_attr\_getschedparam()*, *pthread\_create()*

55484 XBD <pthread.h>, <sched.h>

55485 **CHANGE HISTORY**

55486 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55487 Marked as part of the Realtime Threads Feature Group.

55488 **Issue 6**

55489 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked as part of the  
55490 Threads and Thread Execution Scheduling options.

55491 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
55492 implementation does not support the Thread Execution Scheduling option.

55493 The **restrict** keyword is added to the *pthread\_attr\_getscope()* prototype for alignment with the  
55494 ISO/IEC 9899:1999 standard.

55495 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/81 is applied, adding a reference to  
55496 [Section 2.9.4](#) (on page 540) in the APPLICATION USAGE section.

55497 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/82 is applied, updating the ERRORS  
55498 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
55499 object.

55500 **Issue 7**

55501 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked only as part of the  
55502 Thread Execution Scheduling option as the Threads option is now part of the Base.

55503 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55504 results in undefined behavior.

55505 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0453 [314] is applied.

55506 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0264 [757] is applied.

55507 **NAME**

55508 pthread\_attr\_getstack, pthread\_attr\_setstack — get and set stack attributes

55509 **SYNOPSIS**

```
55510 TSA TSS #include <pthread.h>
55511 int pthread_attr_getstack(const pthread_attr_t *restrict attr,
55512 void **restrict stackaddr, size_t *restrict stacksize);
55513 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
55514 size_t stacksize);
```

55515 **DESCRIPTION**55516 The *pthread\_attr\_getstack()* and *pthread\_attr\_setstack()* functions, respectively, shall get and set the  
55517 thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.55518 The stack attributes specify the area of storage to be used for the created thread's stack. The base  
55519 (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be  
55520 *stacksize* bytes. The *stacksize* shall be at least {PTHREAD\_STACK\_MIN}. The  
55521 *pthread\_attr\_setstack()* function may fail with [EINVAL] if *stackaddr* does not meet  
55522 implementation-defined alignment requirements. All pages within the stack described by  
55523 *stackaddr* and *stacksize* shall be both readable and writable by the thread.55524 If the *pthread\_attr\_getstack()* function is called before the *stackaddr* attribute has been set, the  
55525 behavior is unspecified.55526 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getstack()* or  
55527 *pthread\_attr\_setstack()* does not refer to an initialized thread attributes object.55528 **RETURN VALUE**55529 Upon successful completion, these functions shall return a value of 0; otherwise, an error  
55530 number shall be returned to indicate the error.55531 The *pthread\_attr\_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize*  
55532 if successful.55533 **ERRORS**55534 The *pthread\_attr\_setstack()* function shall fail if:55535 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds an  
55536 implementation-defined limit.55537 The *pthread\_attr\_setstack()* function may fail if:55538 [EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or  
55539 ((**char** \*)*stackaddr* + *stacksize*) lacks proper alignment.55540 [EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable  
55541 and writable by the thread.

55542 These functions shall not return an error code of [EINTR].

55543 **EXAMPLES**

55544 None.

55545 **APPLICATION USAGE**55546 These functions are appropriate for use by applications in an environment where the stack for a  
55547 thread must be placed in some particular region of memory.55548 While it might seem that an application could detect stack overflow by providing a protected  
55549 page outside the specified stack region, this cannot be done portably. Implementations are free  
55550 to place the thread's initial stack pointer anywhere within the specified region to accommodate  
55551 the machine's stack pointer behavior and allocation requirements. Furthermore, on some  
55552 architectures, such as the IA-64, "overflow" might mean that two separate stack pointers  
55553 allocated within the region will overlap somewhere in the middle of the region.55554 After a successful call to *pthread\_attr\_setstack()*, the storage area specified by the *stackaddr*  
55555 parameter is under the control of the implementation, as described in [Section 2.9.8](#) (on page 548).55556 The specification of the *stackaddr* attribute presents several ambiguities that make portable use of  
55557 these functions impossible. For example, the standard allows implementations to impose  
55558 arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer  
55559 obtained from *malloc()* is suitably aligned. Note that although the *stacksize* value passed to  
55560 *pthread\_attr\_setstack()* must satisfy alignment requirements, the same is not true for  
55561 *pthread\_attr\_setstacksize()* where the implementation must increase the specified size if necessary  
55562 to achieve the proper alignment.55563 **RATIONALE**55564 If an implementation detects that the value specified by the *attr* argument to  
55565 *pthread\_attr\_getstack()* or *pthread\_attr\_setstack()* does not refer to an initialized thread attributes  
55566 object, it is recommended that the function should fail and report an [EINVAL] error.55567 **FUTURE DIRECTIONS**

55568 None.

55569 **SEE ALSO**55570 [\*pthread\\_attr\\_destroy\(\)\*](#), [\*pthread\\_attr\\_getdetachstate\(\)\*](#), [\*pthread\\_attr\\_getstacksize\(\)\*](#), [\*pthread\\_create\(\)\*](#)55571 XBD [`<limits.h>`](#), [`<pthread.h>`](#)55572 **CHANGE HISTORY**55573 First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE  
55574 PASC Interpretation 1003.1 #101.55575 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the  
55576 APPLICATION USAGE section to refer to [Section 2.9.8](#) (on page 548).55577 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS  
55578 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
55579 object.55580 **Issue 7**55581 SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.55582 Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is  
55583 called before the *stackaddr* attribute is set.

55584 SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

55585 The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION  
55586 USAGE sections.

55587  
55588

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

55589 **NAME**

55590 pthread\_attr\_getstacksize, pthread\_attr\_setstacksize — get and set the stacksize attribute

55591 **SYNOPSIS**

```
55592 TSS #include <pthread.h>
55593 int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
55594 size_t *restrict stacksize);
55595 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

55596 **DESCRIPTION**55597 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions, respectively, shall get and  
55598 set the thread creation *stacksize* attribute in the *attr* object.55599 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created  
55600 threads stack.55601 The behavior is undefined if the value specified by the *attr* argument to  
55602 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
55603 attributes object.55604 **RETURN VALUE**55605 Upon successful completion, *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* shall  
55606 return a value of 0; otherwise, an error number shall be returned to indicate the error.55607 The *pthread\_attr\_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if  
55608 successful.55609 **ERRORS**55610 The *pthread\_attr\_setstacksize()* function shall fail if:55611 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds a  
55612 system-imposed limit.

55613 These functions shall not return an error code of [EINTR].

55614 **EXAMPLES**

55615 None.

55616 **APPLICATION USAGE**

55617 None.

55618 **RATIONALE**55619 If an implementation detects that the value specified by the *attr* argument to  
55620 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
55621 attributes object, it is recommended that the function should fail and report an [EINVAL] error.55622 **FUTURE DIRECTIONS**

55623 None.

55624 **SEE ALSO**55625 *pthread\_attr\_destroy()*, *pthread\_attr\_getdetachstate()*, *pthread\_create()*

55626 XBD &lt;limits.h&gt;, &lt;pthread.h&gt;

55627 **CHANGE HISTORY**

55628 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55629 **Issue 6**

55630 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked as part of the  
55631 Threads and Thread Stack Size Attribute options.

55632 The **restrict** keyword is added to the *pthread\_attr\_getstacksize()* prototype for alignment with the  
55633 ISO/IEC 9899:1999 standard.

55634 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code  
55635 in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack  
55636 Address Attribute” option to “Thread Stack Size Attribute” option.

55637 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS  
55638 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
55639 object.

55640 **Issue 7**

55641 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked only as part of  
55642 the Thread Stack Size Attribute option as the Threads option is now part of the Base.

55643 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
55644 results in undefined behavior.

55645 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0265 [757] is applied.

55646 **NAME**

55647 pthread\_attr\_init — initialize the thread attributes object

55648 **SYNOPSIS**

55649 #include &lt;pthread.h&gt;

55650 int pthread\_attr\_init(pthread\_attr\_t \*attr);

55651 **DESCRIPTION**55652 Refer to *pthread\_attr\_destroy()*.

55653 **NAME**

55654 pthread\_attr\_setdetachstate — set the detachstate attribute

55655 **SYNOPSIS**

55656 #include <pthread.h>

55657 int pthread\_attr\_setdetachstate(pthread\_attr\_t \*attr, int detachstate);

55658 **DESCRIPTION**

55659 Refer to [pthread\\_attr\\_getdetachstate\(\)](#).

55660 **NAME**

55661 pthread\_attr\_setguardsize — set the thread guardsize attribute

55662 **SYNOPSIS**

55663 #include &lt;pthread.h&gt;

55664 int pthread\_attr\_setguardsize(pthread\_attr\_t \*attr,  
55665 size\_t guardsize);55666 **DESCRIPTION**55667 Refer to *pthread\_attr\_getguardsize()*.

55668 **NAME**

55669 pthread\_attr\_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)

55670 **SYNOPSIS**

```
55671 TPS #include <pthread.h>
55672 int pthread_attr_setinheritsched(pthread_attr_t *attr,
55673 int inheritsched);
```

55674 **DESCRIPTION**

55675 Refer to *pthread\_attr\_getinheritsched()*.

55676 **NAME**

55677 pthread\_attr\_setschedparam — set the schedparam attribute

55678 **SYNOPSIS**

55679 #include <pthread.h>

55680 int pthread\_attr\_setschedparam(pthread\_attr\_t \*restrict attr,  
55681 const struct sched\_param \*restrict param);

55682 **DESCRIPTION**

55683 Refer to [pthread\\_attr\\_getschedparam\(\)](#).

55684 **NAME**

55685 pthread\_attr\_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)

55686 **SYNOPSIS**

```
55687 TPS #include <pthread.h>  
55688 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

55689 **DESCRIPTION**

55690 Refer to [pthread\\_attr\\_getschedpolicy\(\)](#).

55691 **NAME**

55692 pthread\_attr\_setscope — set the contentionscope attribute (**REALTIME THREADS**)

55693 **SYNOPSIS**

```
55694 TPS #include <pthread.h>  
55695 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

55696 **DESCRIPTION**

55697 Refer to *pthread\_attr\_getscope()*.

55698 **NAME**

55699 pthread\_attr\_setstack — set the stack attribute

55700 **SYNOPSIS**

```
55701 TSA TSS #include <pthread.h>
55702 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
55703 size_t stacksize);
```

55704 **DESCRIPTION**

55705 Refer to [pthread\\_attr\\_getstack\(\)](#).

55706 **NAME**

55707 pthread\_attr\_setstacksize — set the stacksize attribute

55708 **SYNOPSIS**

```
55709 TSS #include <pthread.h>  
55710 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

55711 **DESCRIPTION**55712 Refer to *pthread\_attr\_getstacksize()*.

55713 **NAME**

55714 pthread\_barrier\_destroy, pthread\_barrier\_init — destroy and initialize a barrier object

55715 **SYNOPSIS**

55716 #include &lt;pthread.h&gt;

```
55717 int pthread_barrier_destroy(pthread_barrier_t *barrier);
55718 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
55719     const pthread_barrierattr_t *restrict attr, unsigned count);
```

55720 **DESCRIPTION**

55721 The *pthread\_barrier\_destroy()* function shall destroy the barrier referenced by *barrier* and release  
55722 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until  
55723 the barrier is reinitialized by another call to *pthread\_barrier\_init()*. An implementation may use  
55724 this function to set *barrier* to an invalid value. The results are undefined if  
55725 *pthread\_barrier\_destroy()* is called when any thread is blocked on the barrier, or if this function is  
55726 called with an uninitialized barrier.

55727 The *pthread\_barrier\_init()* function shall allocate any resources required to use the barrier  
55728 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is  
55729 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of  
55730 a default barrier attributes object. The results are undefined if *pthread\_barrier\_init()* is called  
55731 when any thread is blocked on the barrier (that is, has not returned from the  
55732 *pthread\_barrier\_wait()* call). The results are undefined if a barrier is used without first being  
55733 initialized. The results are undefined if *pthread\_barrier\_init()* is called specifying an already  
55734 initialized barrier.

55735 The *count* argument specifies the number of threads that have to call *pthread\_barrier\_wait()*  
55736 before any of them successfully return from the call. The value specified by *count* needs to be  
55737 greater than zero.

55738 If the *pthread\_barrier\_init()* function fails, the barrier shall not be initialized and the contents of  
55739 *barrier* are undefined.

55740 See [Section 2.9.9](#) (on page 548) for further requirements.

55741 **RETURN VALUE**

55742 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
55743 be returned to indicate the error.

55744 **ERRORS**

55745 The *pthread\_barrier\_init()* function shall fail if:

55746 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

55747 [EINVAL] The value specified by *count* is equal to zero.

55748 [ENOMEM] Insufficient memory exists to initialize the barrier.

55749 These functions shall not return an error code of [EINTR].

55750 **EXAMPLES**

55751 None.

55752 **APPLICATION USAGE**

55753 None.

55754 **RATIONALE**

55755 If an implementation detects that the value specified by the *barrier* argument to  
55756 *pthread\_barrier\_destroy()* does not refer to an initialized barrier object, it is recommended that the  
55757 function should fail and report an [EINVAL] error.

55758 If an implementation detects that the value specified by the *attr* argument to  
55759 *pthread\_barrier\_init()* does not refer to an initialized barrier attributes object, it is recommended  
55760 that the function should fail and report an [EINVAL] error.

55761 If an implementation detects that the value specified by the *barrier* argument to  
55762 *pthread\_barrier\_destroy()* or *pthread\_barrier\_init()* refers to a barrier that is in use (for example, in  
55763 a *pthread\_barrier\_wait()* call) by another thread, or detects that the value specified by the *barrier*  
55764 argument to *pthread\_barrier\_init()* refers to an already initialized barrier object, it is  
55765 recommended that the function should fail and report an [EBUSY] error.

55766 **FUTURE DIRECTIONS**

55767 None.

55768 **SEE ALSO**55769 [\*pthread\\_barrier\\_wait\(\)\*](#)55770 XBD <[pthread.h](#)>55771 **CHANGE HISTORY**

55772 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

55773 **Issue 7**

55774 The *pthread\_barrier\_destroy()* and *pthread\_barrier\_init()* functions are moved from the Barriers  
55775 option to the Base.

55776 The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes  
55777 object is removed; this condition results in undefined behavior.

55778 The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed;  
55779 this condition results in undefined behavior.

55780 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0266 [972] is applied.

55781 **NAME**

55782 pthread\_barrier\_wait — synchronize at a barrier

55783 **SYNOPSIS**

55784 #include &lt;pthread.h&gt;

55785 int pthread\_barrier\_wait(pthread\_barrier\_t \*barrier);

55786 **DESCRIPTION**

55787 The *pthread\_barrier\_wait()* function shall synchronize participating threads at the barrier  
55788 referenced by *barrier*. The calling thread shall block until the required number of threads have  
55789 called *pthread\_barrier\_wait()* specifying the barrier.

55790 When the required number of threads have called *pthread\_barrier\_wait()* specifying the barrier,  
55791 the constant PTHREAD\_BARRIER\_SERIAL\_THREAD shall be returned to one unspecified  
55792 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall  
55793 be reset to the state it had as a result of the most recent *pthread\_barrier\_init()* function that  
55794 referenced it.

55795 The constant PTHREAD\_BARRIER\_SERIAL\_THREAD is defined in <pthread.h> and its value  
55796 shall be distinct from any other value returned by *pthread\_barrier\_wait()*.

55797 The results are undefined if this function is called with an uninitialized barrier.

55798 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the  
55799 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the  
55800 required number of threads have not arrived at the barrier during the execution of the signal  
55801 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until  
55802 the thread in the signal handler returns from it, it is unspecified whether other threads may  
55803 proceed past the barrier once they have all reached it.

55804 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to  
55805 use the same processing resources from eventually making forward progress in its execution.  
55806 Eligibility for processing resources shall be determined by the scheduling policy.

55807 **RETURN VALUE**

55808 Upon successful completion, the *pthread\_barrier\_wait()* function shall return  
55809 PTHREAD\_BARRIER\_SERIAL\_THREAD for a single (arbitrary) thread synchronized at the  
55810 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to  
55811 indicate the error.

55812 **ERRORS**

55813 This function shall not return an error code of [EINTR].

55814 **EXAMPLES**

55815 None.

55816 **APPLICATION USAGE**

55817 Applications using this function may be subject to priority inversion, as discussed in XBD  
55818 [Section 3.275](#) (on page 72).

55819 **RATIONALE**

55820 If an implementation detects that the value specified by the *barrier* argument to  
55821 *pthread\_barrier\_wait()* does not refer to an initialized barrier object, it is recommended that the  
55822 function should fail and report an [EINVAL] error.

55823 **FUTURE DIRECTIONS**

55824 None.

55825 **SEE ALSO**55826 [pthread\\_barrier\\_destroy\(\)](#)55827 XBD [Section 3.275](#) (on page 72), [Section 4.15.2](#) (on page 104), [<pthread.h>](#)55828 **CHANGE HISTORY**

55829 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

55830 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.55831 **Issue 7**55832 The [pthread\\_barrier\\_wait\(\)](#) function is moved from the Barriers option to the Base.55833 The [EINVAL] error for an uninitialized barrier object is removed; this condition results in  
55834 undefined behavior.

55835 **NAME**

55836 pthread\_barrierattr\_destroy, pthread\_barrierattr\_init — destroy and initialize the barrier  
55837 attributes object

55838 **SYNOPSIS**

```
55839 #include <pthread.h>
55840 int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
55841 int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

55842 **DESCRIPTION**

55843 The *pthread\_barrierattr\_destroy()* function shall destroy a barrier attributes object. A destroyed  
55844 *attr* attributes object can be reinitialized using *pthread\_barrierattr\_init()*; the results of otherwise  
55845 referencing the object after it has been destroyed are undefined. An implementation may cause  
55846 *pthread\_barrierattr\_destroy()* to set the object referenced by *attr* to an invalid value.

55847 The *pthread\_barrierattr\_init()* function shall initialize a barrier attributes object *attr* with the  
55848 default value for all of the attributes defined by the implementation.

55849 If *pthread\_barrierattr\_init()* is called specifying an already initialized *attr* attributes object, the  
55850 results are undefined.

55851 After a barrier attributes object has been used to initialize one or more barriers, any function  
55852 affecting the attributes object (including destruction) shall not affect any previously initialized  
55853 barrier.

55854 The behavior is undefined if the value specified by the *attr* argument to  
55855 *pthread\_barrierattr\_destroy()* does not refer to an initialized barrier attributes object.

55856 **RETURN VALUE**

55857 If successful, the *pthread\_barrierattr\_destroy()* and *pthread\_barrierattr\_init()* functions shall return  
55858 zero; otherwise, an error number shall be returned to indicate the error.

55859 **ERRORS**

55860 The *pthread\_barrierattr\_init()* function shall fail if:

55861 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

55862 These functions shall not return an error code of [EINTR].

55863 **EXAMPLES**

55864 None.

55865 **APPLICATION USAGE**

55866 None.

55867 **RATIONALE**

55868 If an implementation detects that the value specified by the *attr* argument to  
55869 *pthread\_barrierattr\_destroy()* does not refer to an initialized barrier attributes object, it is  
55870 recommended that the function should fail and report an [EINVAL] error.

55871 **FUTURE DIRECTIONS**

55872 None.

55873 **SEE ALSO**

55874 [pthread\\_barrierattr\\_getshared\(\)](#)

55875 XBD [<pthread.h>](#)

55876 **CHANGE HISTORY**

55877 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

55878 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

55879 **Issue 7**

55880 The `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions are moved from the Barriers option to the Base.

55882 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

55883

55884 **NAME**

55885 pthread\_barrierattr\_getpshared, pthread\_barrierattr\_setpshared — get and set the process-  
55886 shared attribute of the barrier attributes object

55887 **SYNOPSIS**

```
55888 TSH #include <pthread.h>
55889
55889 int pthread_barrierattr_getpshared(const pthread_barrierattr_t
55890     *restrict attr, int *restrict pshared);
55891 int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
55892     int pshared);
```

55893 **DESCRIPTION**

55894 The *pthread\_barrierattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
55895 from the attributes object referenced by *attr*. The *pthread\_barrierattr\_setpshared()* function shall  
55896 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

55897 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a barrier to be  
55898 operated upon by any thread that has access to the memory where the barrier is allocated. See  
55899 [Section 2.9.9](#) (on page 548) for further requirements. The default value of the attribute shall be  
55900 `PTHREAD_PROCESS_PRIVATE`. Both constants `PTHREAD_PROCESS_SHARED` and  
55901 `PTHREAD_PROCESS_PRIVATE` are defined in **<pthread.h>**.

55902 Additional attributes, their default values, and the names of the associated functions to get and  
55903 set those attribute values are implementation-defined.

55904 The behavior is undefined if the value specified by the *attr* argument to  
55905 *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
55906 barrier attributes object.

55907 **RETURN VALUE**

55908 If successful, the *pthread\_barrierattr\_getpshared()* function shall return zero and store the value of  
55909 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
55910 an error number shall be returned to indicate the error.

55911 If successful, the *pthread\_barrierattr\_setpshared()* function shall return zero; otherwise, an error  
55912 number shall be returned to indicate the error.

55913 **ERRORS**

55914 The *pthread\_barrierattr\_setpshared()* function may fail if:

55915 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal  
55916 values `PTHREAD_PROCESS_SHARED` or `PTHREAD_PROCESS_PRIVATE`.

55917 These functions shall not return an error code of [EINTR].

55918 **EXAMPLES**

55919 None.

55920 **APPLICATION USAGE**

55921 The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are part of the  
55922 Thread Process-Shared Synchronization option and need not be provided on all  
55923 implementations.

55924 **RATIONALE**

55925 If an implementation detects that the value specified by the *attr* argument to  
55926 *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
55927 barrier attributes object, it is recommended that the function should fail and report an [EINVAL]

55928 error.

55929 **FUTURE DIRECTIONS**

55930 None.

55931 **SEE ALSO**

55932 *pthread\_barrier\_destroy()*, *pthread\_barrierattr\_destroy()*

55933 XBD <pthread.h>

55934 **CHANGE HISTORY**

55935 First released in Issue 6. Derived from IEEE Std 1003.1j-2000

55936 **Issue 7**

55937 The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are marked  
55938 only as part of the Thread Process-Shared Synchronization option as the Threads option is now  
55939 part of the Base.

55940 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition  
55941 results in undefined behavior.

55942 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0266 [972] and XSH/TC2-2008/0267  
55943 [757] are applied.

55944 **NAME**

55945 pthread\_barrierattr\_init — initialize the barrier attributes object

55946 **SYNOPSIS**

55947 #include <pthread.h>

55948 int pthread\_barrierattr\_init(pthread\_barrierattr\_t \*attr);

55949 **DESCRIPTION**

55950 Refer to *pthread\_barrierattr\_destroy()*.

55951 **NAME**

55952 pthread\_barrierattr\_setpshared — set the process-shared attribute of the barrier attributes object

55953 **SYNOPSIS**

```
55954 TSH #include <pthread.h>
55955      int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
55956      int pshared);
```

55957 **DESCRIPTION**

55958 Refer to [pthread\\_barrierattr\\_getpshared\(\)](#).

55959 **NAME**

55960 pthread\_cancel — cancel execution of a thread

55961 **SYNOPSIS**

55962 #include &lt;pthread.h&gt;

55963 int pthread\_cancel(pthread\_t thread);

55964 **DESCRIPTION**

55965 The *pthread\_cancel()* function shall request that *thread* be canceled. The target thread's  
55966 cancelability state and type determines when the cancellation takes effect. When the cancellation  
55967 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last  
55968 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called  
55969 for *thread*. When the last destructor function returns, *thread* shall be terminated. It shall not be an  
55970 error to request cancellation of a zombie thread.

55971 The cancellation processing in the target thread shall run asynchronously with respect to the  
55972 calling thread returning from *pthread\_cancel()*.

55973 If *thread* refers to a thread that was created using *thr\_create()*, the behavior is undefined.

55974 **RETURN VALUE**

55975 If successful, the *pthread\_cancel()* function shall return zero; otherwise, an error number shall be  
55976 returned to indicate the error.

55977 **ERRORS**

55978 The *pthread\_cancel()* function shall not return an error code of [EINTR].

55979 **EXAMPLES**

55980 None.

55981 **APPLICATION USAGE**

55982 None.

55983 **RATIONALE**

55984 Two alternative functions were considered for sending the cancellation notification to a thread.  
55985 One would be to define a new SIGCANCEL signal that had the cancellation semantics when  
55986 delivered; the other was to define the new *pthread\_cancel()* function, which would trigger the  
55987 cancellation semantics.

55988 The advantage of a new signal was that so much of the delivery criteria were identical to that  
55989 used when trying to deliver a signal that making cancellation notification a signal was seen as  
55990 consistent. Indeed, many implementations implement cancellation using a special signal. On the  
55991 other hand, there would be no signal functions that could be used with this signal except  
55992 *pthread\_kill()*, and the behavior of the delivered cancellation signal would be unlike any  
55993 previously existing defined signal.

55994 The benefits of a special function include the recognition that this signal would be defined  
55995 because of the similar delivery criteria and that this is the only common behavior between a  
55996 cancellation request and a signal. In addition, the cancellation delivery mechanism does not  
55997 have to be implemented as a signal. There are also strong, if not stronger, parallels with  
55998 language exception mechanisms than with signals that are potentially obscured if the delivery  
55999 mechanism is visibly closer to signals.

56000 In the end, it was considered that as there were so many exceptions to the use of the new signal  
56001 with existing signals functions it would be misleading. A special function has resolved this  
56002 problem. This function was carefully defined so that an implementation wishing to provide the  
56003 cancellation functions on top of signals could do so. The special function also means that  
56004 implementations are not obliged to implement cancellation with signals.

56005 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
56006 that the function should fail and report an [ESRCH] error.

56007 Historical implementations varied on the result of a *pthread\_cancel()* with a thread ID indicating  
56008 a zombie thread. Some indicated success with nothing further to do because the thread had  
56009 already terminated, while others gave an error of [ESRCH]. Since the definition of thread  
56010 lifetime in this standard covers zombie threads, the [ESRCH] error as described is inappropriate  
56011 in this case and implementations that give this error do not conform.

56012 Use of *pthread\_cancel()* to cancel a thread that was created using *thrd\_create()* is undefined  
56013 because *thrd\_join()* has no way to indicate a thread was cancelled. The standard developers  
56014 considered adding a `thrd_canceled` enumeration constant that *thrd\_join()* would return in  
56015 this case. However, this return would be unexpected in code that is written to conform to the  
56016 ISO C standard, and it would also not solve the problem that threads which use only ISO C  
56017 `<threads.h>` interfaces (such as ones created by third party libraries written to conform to the  
56018 ISO C standard) have no way to handle being cancelled, as the ISO C standard does not provide  
56019 cancellation cleanup handlers.

#### 56020 FUTURE DIRECTIONS

56021 None.

#### 56022 SEE ALSO

56023 [\*pthread\\_exit\(\)\*](#), [\*pthread\\_cond\\_clockwait\(\)\*](#), [\*pthread\\_join\(\)\*](#), [\*pthread\\_setcancelstate\(\)\*](#)

56024 XBD `<pthread.h>`

#### 56025 CHANGE HISTORY

56026 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 56027 Issue 6

56028 The *pthread\_cancel()* function is marked as part of the Threads option.

#### 56029 Issue 7

56030 The *pthread\_cancel()* function is moved from the Threads option to the Base.

56031 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

#### 56032 Issue 8

56033 Austin Group Defect 792 is applied, adding a requirement that passing the thread ID of a zombie  
56034 thread to *pthread\_cancel()* is not treated as an error.

56035 Austin Group Defect 1302 is applied, updating the page to account for the addition of  
56036 `<threads.h>` interfaces.

56037 **NAME**

56038 pthread\_cleanup\_pop, pthread\_cleanup\_push — establish cancellation handlers

56039 **SYNOPSIS**

56040 #include &lt;pthread.h&gt;

56041 void pthread\_cleanup\_pop(int *execute*);56042 void pthread\_cleanup\_push(void (\**routine*)(void\*), void \**arg*);56043 **DESCRIPTION**56044 The *pthread\_cleanup\_pop()* function shall remove the routine at the top of the calling thread's  
56045 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).56046 The *pthread\_cleanup\_push()* function shall push the specified cancellation cleanup handler *routine*  
56047 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be  
56048 popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- 56049
- The thread exits (that is, calls *pthread\_exit()*).
  - The thread acts upon a cancellation request.
  - The thread calls *pthread\_cleanup\_pop()* with a non-zero *execute* argument.

56052 It is unspecified whether *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* are macros or  
56053 functions. If a macro definition is suppressed in order to access an actual function, or a program  
56054 defines an external identifier with any of these names, the behavior is undefined. The  
56055 application shall ensure that they appear as statements, and in pairs within the same lexical  
56056 scope (that is, the *pthread\_cleanup\_push()* macro may be thought to expand to a token list whose  
56057 first token is '{' with *pthread\_cleanup\_pop()* expanding to a token list whose last token is the  
56058 corresponding '}').56059 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to  
56060 *pthread\_cleanup\_push()* or *pthread\_cleanup\_pop()* made without the matching call since the jump  
56061 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation  
56062 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation  
56063 cleanup handler.56064 Invoking a cancellation cleanup handler may terminate the execution of any code block being  
56065 executed by the thread whose execution began after the corresponding invocation of  
56066 *pthread\_cleanup\_push()*.56067 The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block  
56068 described by a pair of *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions calls is  
56069 undefined.56070 **RETURN VALUE**56071 The *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions shall not return a value.56072 **ERRORS**

56073 No errors are defined.

56074 These functions shall not return an error code of [EINTR].

56075 **EXAMPLES**

56076 The following is an example using thread primitives to implement a cancelable, writers-priority  
56077 read-write lock:

```

56078 typedef struct {
56079     pthread_mutex_t lock;
56080     pthread_cond_t rcond,
56081     wcond;
56082     int lock_count; /* < 0 .. Held by writer. */
56083                   /* > 0 .. Held by lock_count readers. */
56084                   /* = 0 .. Held by nobody. */
56085     int waiting_writers; /* Count of waiting writers. */
56086 } rwlock;

56087 void
56088 waiting_reader_cleanup(void *arg)
56089 {
56090     rwlock *l;
56091
56092     l = (rwlock *) arg;
56093     pthread_mutex_unlock(&l->lock);
56094 }

56094 void
56095 lock_for_read(rwlock *l)
56096 {
56097     pthread_mutex_lock(&l->lock);
56098     pthread_cleanup_push(waiting_reader_cleanup, l);
56099     while ((l->lock_count < 0) || (l->waiting_writers != 0))
56100         pthread_cond_wait(&l->rcond, &l->lock);
56101     l->lock_count++;
56102     /*
56103      * Note the pthread_cleanup_pop executes
56104      * waiting_reader_cleanup.
56105      */
56106     pthread_cleanup_pop(1);
56107 }

56108 void
56109 release_read_lock(rwlock *l)
56110 {
56111     pthread_mutex_lock(&l->lock);
56112     if (--l->lock_count == 0)
56113         pthread_cond_signal(&l->wcond);
56114     pthread_mutex_unlock(&l->lock);
56115 }

56116 void
56117 waiting_writer_cleanup(void *arg)
56118 {
56119     rwlock *l;
56120
56121     l = (rwlock *) arg;
56122     if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
56123         /*

```

```
56123         * This only happens if we have been canceled. If the
56124         * lock is not held by a writer, there may be readers who
56125         * were blocked because waiting_writers was positive; they
56126         * can now be unblocked.
56127         */
56128         pthread_cond_broadcast (&l->rcond);
56129     }
56130     pthread_mutex_unlock (&l->lock);
56131 }

56132 void
56133 lock_for_write (rwlock *l)
56134 {
56135     pthread_mutex_lock (&l->lock);
56136     l->waiting_writers++;
56137     pthread_cleanup_push (waiting_writer_cleanup, l);
56138     while (l->lock_count != 0)
56139         pthread_cond_wait (&l->wcond, &l->lock);
56140     l->lock_count = -1;
56141     /*
56142     * Note the pthread_cleanup_pop executes
56143     * waiting_writer_cleanup.
56144     */
56145     pthread_cleanup_pop (1);
56146 }

56147 void
56148 release_write_lock (rwlock *l)
56149 {
56150     pthread_mutex_lock (&l->lock);
56151     l->lock_count = 0;
56152     if (l->waiting_writers == 0)
56153         pthread_cond_broadcast (&l->rcond);
56154     else
56155         pthread_cond_signal (&l->wcond);
56156     pthread_mutex_unlock (&l->lock);
56157 }

56158 /*
56159 * This function is called to initialize the read/write lock.
56160 */
56161 void
56162 initialize_rwlock (rwlock *l)
56163 {
56164     pthread_mutex_init (&l->lock, pthread_mutexattr_default);
56165     pthread_cond_init (&l->wcond, pthread_condattr_default);
56166     pthread_cond_init (&l->rcond, pthread_condattr_default);
56167     l->lock_count = 0;
56168     l->waiting_writers = 0;
56169 }

56170 reader_thread ()
56171 {
56172     lock_for_read (&lock);
```

```

56173     pthread_cleanup_push(release_read_lock, &lock);
56174     /*
56175     * Thread has read lock.
56176     */
56177     pthread_cleanup_pop(1);
56178 }

56179 writer_thread()
56180 {
56181     lock_for_write(&lock);
56182     pthread_cleanup_push(release_write_lock, &lock);
56183     /*
56184     * Thread has write lock.
56185     */
56186     pthread_cleanup_pop(1);
56187 }

```

### 56188 APPLICATION USAGE

56189 The two routines that push and pop cancellation cleanup handlers, *pthread\_cleanup\_push()* and  
56190 *pthread\_cleanup\_pop()*, can be thought of as left and right-parentheses. They always need to be  
56191 matched.

### 56192 RATIONALE

56193 The restriction that the two routines that push and pop cancellation cleanup handlers,  
56194 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()*, have to appear in the same lexical scope  
56195 allows for efficient macro or compiler implementations and efficient storage management. A  
56196 sample implementation of these routines as macros might look like this:

```

56197 #define pthread_cleanup_push(rtn, arg) { \
56198     struct _pthread_handler_rec __cleanup_handler, **__head; \
56199     __cleanup_handler.rtn = rtn; \
56200     __cleanup_handler.arg = arg; \
56201     (void) pthread_getspecific(_pthread_handler_key, &__head); \
56202     __cleanup_handler.next = *__head; \
56203     *__head = &__cleanup_handler;
56204
56205 #define pthread_cleanup_pop(ex) \
56206     *__head = __cleanup_handler.next; \
56207     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
56208 }

```

56208 A more ambitious implementation of these routines might do even better by allowing the  
56209 compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

56210 This volume of POSIX.1-2024 currently leaves unspecified the effect of calling *longjmp()* from a  
56211 signal handler executing in a POSIX System Interfaces function. If an implementation wants to  
56212 allow this and give the programmer reasonable behavior, the *longjmp()* function has to call all  
56213 cancellation cleanup handlers that have been pushed but not popped since the time *setjmp()* was  
56214 called.

56215 Consider a multi-threaded function called by a thread that uses signals. If a signal were  
56216 delivered to a signal handler during the operation of *qsort()* and that handler were to call  
56217 *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads  
56218 created by the *qsort()* function would not be canceled. Instead, they would continue to execute  
56219 and write into the argument array even though the array might have been popped off the stack.

56220 Note that the specified cleanup handling mechanism is especially tied to the C language and,  
56221 while the requirement for a uniform mechanism for expressing cleanup is language-  
56222 independent, the mechanism used in other languages may be quite different. In addition, this  
56223 mechanism is really only necessary due to the lack of a real exception mechanism in the C  
56224 language, which would be the ideal solution.

56225 There is no notion of a cancellation cleanup-safe function. If an application has no cancellation  
56226 points in its signal handlers, blocks any signal whose handler may have cancellation points  
56227 while calling async-unsafe functions, or disables cancellation while calling async-unsafe  
56228 functions, all functions may be safely called from cancellation cleanup routines.

#### 56236 Issue 6

56237 The [\*pthread\\_cleanup\\_pop\(\)\*](#) and [\*pthread\\_cleanup\\_push\(\)\*](#) functions are marked as part of the  
56238 Threads option.

56239 The APPLICATION USAGE section is added.

56240 The normative text is updated to avoid use of the term “must” for application requirements.

56241 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the  
56242 DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the  
56243 [\*pthread\\_cleanup\\_push\(\)\*](#) and [\*pthread\\_cleanup\\_pop\(\)\*](#) functions.

#### 56244 Issue 7

56245 The [\*pthread\\_cleanup\\_pop\(\)\*](#) and [\*pthread\\_cleanup\\_push\(\)\*](#) functions are moved from the Threads  
56246 option to the Base.

56247 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0454 [229] is applied.

56248 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0268 [624] is applied.

#### 56249 Issue 8

56250 Austin Group Defect 613 is applied, clarifying the relationship of automatic object lifetimes to  
56251 cancellation cleanup functions.

56252 **NAME**

56253 pthread\_cond\_broadcast, pthread\_cond\_signal — broadcast or signal a condition

56254 **SYNOPSIS**

56255 #include &lt;pthread.h&gt;

56256 int pthread\_cond\_broadcast(pthread\_cond\_t \*cond);

56257 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

56258 **DESCRIPTION**

56259 These functions shall unblock threads blocked on a condition variable.

56260 The *pthread\_cond\_broadcast()* function shall, as a single atomic operation, determine which threads, if any, are blocked on the specified condition variable *cond* and unblock all of these threads.

56263 The *pthread\_cond\_signal()* function shall, as a single atomic operation, determine which threads, if any, are blocked on the specified condition variable *cond* and unblock at least one of these threads.

56266 If more than one thread is blocked on a condition variable, the scheduling policy shall determine the order in which threads are unblocked. When each thread unblocked as a result of a *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* returns from its call to *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()*, the thread shall own the mutex with which it called *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()*. The thread(s) that are unblocked shall contend for the mutex according to the scheduling policy (if applicable), and as if each had called *pthread\_mutex\_lock()*.

56273 The *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* functions may be called by a thread whether or not it currently owns the mutex that threads calling *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* have associated with the condition variable during their waits; however, if predictable scheduling behavior is required, then that mutex shall be locked by the thread calling *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()*.

56278 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall have no effect if they determine that there are no threads blocked on *cond*.

56280 The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* does not refer to an initialized condition variable.

56282 **RETURN VALUE**

56283 If successful, the *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

56285 **ERRORS**

56286 These functions shall not return an error code of [EINTR].

56287 **EXAMPLES**

56288 None.

56289 **APPLICATION USAGE**

56290 The *pthread\_cond\_broadcast()* function is used whenever the shared-variable state has been changed in a way that more than one thread can proceed with its task. Consider a single producer/multiple consumer problem, where the producer can insert multiple items on a list that is accessed one item at a time by the consumers. By calling the *pthread\_cond\_broadcast()* function, the producer would notify all consumers that might be waiting, and thereby the application would receive more throughput on a multi-processor. In addition, *pthread\_cond\_broadcast()* makes it easier to implement a read-write lock. The *pthread\_cond\_broadcast()* function is needed in order to wake up all waiting readers when a

56298 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function  
56299 to notify all clients of an impending transaction commit.

56300 It is not safe to use the *pthread\_cond\_signal()* function in a signal handler that is invoked  
56301 asynchronously. Even if it were safe, there would still be a race between the test of the Boolean  
56302 *pthread\_cond\_wait()* that could not be efficiently eliminated.

56303 Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling  
56304 from code running in a signal handler.

#### 56305 RATIONALE

56306 If an implementation detects that the value specified by the *cond* argument to  
56307 *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* does not refer to an initialized condition  
56308 variable, it is recommended that the function should fail and report an [EINVAL] error.

#### 56309 Multiple Awakenings by Condition Signal

56310 On a multi-processor, it may be impossible for an implementation of *pthread\_cond\_signal()* to  
56311 avoid the unblocking of more than one thread blocked on a condition variable. For example,  
56312 consider the following partial implementation of *pthread\_cond\_wait()* and *pthread\_cond\_signal()*,  
56313 executed by two threads in the order given. One thread is trying to wait on the condition  
56314 variable, another is concurrently executing *pthread\_cond\_signal()*, while a third thread is already  
56315 waiting.

```
56316 pthread_cond_wait(mutex, cond):
56317     value = cond->value; /* 1 */
56318     pthread_mutex_unlock(mutex); /* 2 */
56319     pthread_mutex_lock(cond->mutex); /* 10 */
56320     if (value == cond->value) { /* 11 */
56321         me->next_cond = cond->waiter;
56322         cond->waiter = me;
56323         pthread_mutex_unlock(cond->mutex);
56324         unable_to_run(me);
56325     } else
56326         pthread_mutex_unlock(cond->mutex); /* 12 */
56327     pthread_mutex_lock(mutex); /* 13 */

56328 pthread_cond_signal(cond):
56329     pthread_mutex_lock(cond->mutex); /* 3 */
56330     cond->value++; /* 4 */
56331     if (cond->waiter) { /* 5 */
56332         sleeper = cond->waiter; /* 6 */
56333         cond->waiter = sleeper->next_cond; /* 7 */
56334         able_to_run(sleeper); /* 8 */
56335     }
56336     pthread_mutex_unlock(cond->mutex); /* 9 */
```

56337 The effect is that more than one thread can return from its call to *pthread\_cond\_clockwait()*,  
56338 *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* as a result of one call to *pthread\_cond\_signal()*.  
56339 This effect is called “spurious wakeup”. Note that the situation is self-correcting in that the  
56340 number of threads that are so awakened is finite; for example, the next thread to call  
56341 *pthread\_cond\_wait()* after the sequence of events above blocks.

56342 While this problem could be resolved, the loss of efficiency for a fringe condition that occurs  
56343 only rarely is unacceptable, especially given that one has to check the predicate associated with a  
56344 condition variable anyway. Correcting this problem would unnecessarily reduce the degree of

- 56345 concurrency in this basic building block for all higher-level synchronization operations.
- 56346 An added benefit of allowing spurious wakeups is that applications are forced to code a  
56347 predicate-testing-loop around the condition wait. This also makes the application tolerate  
56348 superfluous condition broadcasts or signals on the same condition variable that may be coded in  
56349 some other part of the application. The resulting applications are thus more robust. Therefore,  
56350 POSIX.1-2024 explicitly documents that spurious wakeups may occur.

56370 **NAME**

56371 pthread\_cond\_clockwait, pthread\_cond\_timedwait, pthread\_cond\_wait — wait on a condition

56372 **SYNOPSIS**

```
56373 #include <pthread.h>
56374 int pthread_cond_clockwait(pthread_cond_t *restrict cond,
56375 pthread_mutex_t *restrict mutex, clockid_t clock_id,
56376 const struct timespec *restrict abstime);
56377 int pthread_cond_timedwait(pthread_cond_t *restrict cond,
56378 pthread_mutex_t *restrict mutex,
56379 const struct timespec *restrict abstime);
56380 int pthread_cond_wait(pthread_cond_t *restrict cond,
56381 pthread_mutex_t *restrict mutex);
```

56382 **DESCRIPTION**

56383 The *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, and *pthread\_cond\_wait()* functions shall  
 56384 block on a condition variable. The application shall ensure that these functions are called with  
 56385 *mutex* locked by the calling thread; otherwise, an error (for PTHREAD\_MUTEX\_ERRORCHECK  
 56386 and robust mutexes) or undefined behavior (for other mutexes) results.

56387 These functions atomically release *mutex* and cause the calling thread to block on the condition  
 56388 variable *cond*; atomically here means “atomically with respect to access by another thread to the  
 56389 mutex and then the condition variable”. That is, if another thread is able to acquire the mutex  
 56390 after the about-to-block thread has released it, then a subsequent call to *pthread\_cond\_broadcast()*  
 56391 or *pthread\_cond\_signal()* in that thread shall behave as if it were issued after the about-to-block  
 56392 thread has blocked.

56393 Upon successful return, the mutex shall have been locked and shall be owned by the calling  
 56394 thread.

56395 If *mutex* is a robust mutex where an owner terminated while holding the lock and the state is  
 56396 recoverable, the mutex shall be acquired even though the function returns [EOWNERDEAD].

56397 When using condition variables there is always a Boolean predicate involving shared variables  
 56398 associated with each condition wait that is true if the thread should proceed. Spurious wakeups  
 56399 from the *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* functions  
 56400 may occur. Since the return from *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or  
 56401 *pthread\_cond\_wait()* does not imply anything about the value of this predicate, the predicate  
 56402 should be re-evaluated upon such return.

56403 When a thread waits on a condition variable, having specified a particular mutex to the  
 56404 *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* operation, a dynamic  
 56405 binding is formed between that mutex and condition variable that remains in effect as long as at  
 56406 least one thread is blocked on the condition variable. During this time, the effect of an attempt  
 56407 by any thread to wait on that condition variable using a different mutex is undefined. Once all  
 56408 waiting threads have been unblocked (as by the *pthread\_cond\_broadcast()* operation), the next  
 56409 wait operation on that condition variable shall form a new dynamic binding with the mutex  
 56410 specified by that wait operation. Even though the dynamic binding between condition variable  
 56411 and mutex may be removed or replaced between the time a thread is unblocked from a wait on  
 56412 the condition variable and the time that it returns to the caller or begins cancellation cleanup,  
 56413 the unblocked thread shall always re-acquire the mutex specified in the condition wait operation  
 56414 call from which it is returning.

56415 A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a  
 56416 thread is set to PTHREAD\_CANCEL\_DEFERRED, a side-effect of acting upon a cancellation  
 56417 request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first

56418 cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up  
 56419 to the point of returning from the call to *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or  
 56420 *pthread\_cond\_wait()*, but at that point notices the cancellation request and, instead of returning to  
 56421 the caller, starts the thread cancellation activities, which includes calling cancellation cleanup  
 56422 handlers.

56423 A thread that has been unblocked because it has been canceled while blocked in a call to  
 56424 *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* shall not consume any  
 56425 condition signal that may be directed concurrently at the condition variable if there are other  
 56426 threads blocked on the condition variable.

56427 The *pthread\_cond\_clockwait()* function shall be equivalent to *pthread\_cond\_wait()*, except that an  
 56428 error is returned if the absolute time specified by *abstime* as measured against the clock indicated  
 56429 by *clock\_id* passes (that is, the current time measured by that clock equals or exceeds *abstime*)  
 56430 before the condition *cond* is signaled or broadcasted, or if the absolute time specified by *abstime*  
 56431 has already been passed at the time of the call. Implementations shall support passing  
 56432 CLOCK\_REALTIME and CLOCK\_MONOTONIC to *pthread\_cond\_clockwait()* as the *clock\_id*  
 56433 argument. When such timeouts occur, *pthread\_cond\_clockwait()* shall nonetheless release and re-  
 56434 acquire the mutex referenced by *mutex*, and may consume a condition signal directed  
 56435 concurrently at the condition variable.

56436 The *pthread\_cond\_timedwait()* function shall be equivalent to *pthread\_cond\_clockwait()*, except that  
 56437 it lacks the *clock\_id* argument. The clock to measure *abstime* against shall instead come from the  
 56438 condition variable's clock attribute which can be set by *pthread\_condattr\_setclock()* prior to the  
 56439 condition variable's creation. If no clock attribute has been set, the default shall be  
 56440 CLOCK\_REALTIME.

56441 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal  
 56442 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it  
 56443 shall return zero due to spurious wakeup.

56444 The behavior is undefined if the value specified by the *cond* or *mutex* argument to these  
 56445 functions does not refer to an initialized condition variable or an initialized mutex object,  
 56446 respectively.

#### 56447 RETURN VALUE

56448 Except for [ETIMEDOUT], [ENOTRECOVERABLE], and [EOWNERDEAD], all these error  
 56449 checks shall act as if they were performed immediately at the beginning of processing for the  
 56450 function and shall cause an error return, in effect, prior to modifying the state of the mutex  
 56451 specified by *mutex* or the condition variable specified by *cond*.

56452 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall  
 56453 be returned to indicate the error.

#### 56454 ERRORS

56455 These functions shall fail if:

56456 [EAGAIN] The mutex is a robust mutex and the system resources available for robust  
 56457 mutexes owned would be exceeded.

56458 [ENOTRECOVERABLE]  
 56459 The state protected by the mutex is not recoverable.

56460 [EOWNERDEAD]  
 56461 The mutex is a robust mutex and the process containing the previous owning  
 56462 thread terminated while holding the mutex lock. The mutex lock shall be  
 56463 acquired by the calling thread and it is up to the new owner to make the state

56464 consistent.

56465 [EPERM] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or the mutex is a  
56466 robust mutex, and the current thread does not own the mutex.

56467 The `pthread_cond_clockwait()` and `pthread_cond_timedwait()` functions shall fail if:

56468 [ETIMEDOUT] The time specified by *abstime* has passed.

56469 [EINVAL] The *abstime* argument specified a nanosecond value less than zero or greater  
56470 than or equal to 1000 million, or the *clock\_id* argument passed to  
56471 `pthread_cond_clockwait()` is invalid or not supported.

56472 These functions may fail if:

56473 [EOWNERDEAD]  
56474 The mutex is a robust mutex and the previous owning thread terminated  
56475 while holding the mutex lock. The mutex lock shall be acquired by the calling  
56476 thread and it is up to the new owner to make the state consistent.

56477 These functions shall not return an error code of [EINTR].

**EXAMPLES**

56478 None.  
56479

**APPLICATION USAGE**

56481 Applications that have assumed that non-zero return values are errors will need updating for  
56482 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
56483 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
56484 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
56485 an application is supposed to work with normal and robust mutexes, it should check all return  
56486 values for error conditions and if necessary take appropriate action.

**RATIONALE**

56487 If an implementation detects that the value specified by the *cond* argument to  
56488 `pthread_cond_clockwait()`, `pthread_cond_timedwait()`, or `pthread_cond_wait()` does not refer to an  
56489 initialized condition variable, or detects that the value specified by the *mutex* argument does not  
56490 refer to an initialized mutex object, it is recommended that the function should fail and report an  
56491 [EINVAL] error.  
56492

**Condition Wait Semantics**

56493 It is important to note that when `pthread_cond_clockwait()`, `pthread_cond_timedwait()`, and  
56494 `pthread_cond_wait()` return without error, the associated predicate may still be false. Similarly,  
56495 when `pthread_cond_clockwait()` or `pthread_cond_timedwait()` returns with the timeout error, the  
56496 associated predicate may be true due to an unavoidable race between the expiration of the  
56497 timeout and the predicate state change.  
56498

56499 The application needs to recheck the predicate on any return because it cannot be sure there is  
56500 another thread waiting on the thread to handle the signal, and if there is not then the signal is  
56501 lost. The burden is on the application to check the predicate.

56502 Some implementations, particularly on a multi-processor, may sometimes cause multiple  
56503 threads to wake up when the condition variable is signaled simultaneously on different  
56504 processors.

56505 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate  
56506 associated with the condition wait to determine whether it can safely proceed, should wait  
56507 again, or should declare a timeout. A return from the wait does not imply that the associated

56508 predicate is either true or false.

56509 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”  
56510 that checks the predicate.

### 56511 **Timed Wait Semantics**

56512 An absolute time measure was chosen for specifying the timeout parameter for two reasons.  
56513 First, a relative time measure can be easily implemented on top of a function that specifies  
56514 absolute time, but there is a race condition associated with specifying an absolute timeout on top  
56515 of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns  
56516 the current time and `cond_relative_timed_wait()` uses relative timeouts:

```
56517 clock_gettime(CLOCK_REALTIME, &now)
56518 reltime = sleep_til_this_absolute_time -now;
56519 cond_relative_timed_wait(c, m, &reltime);
```

56520 If the thread is preempted between the first statement and the last statement, the thread blocks  
56521 for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout  
56522 also need not be recomputed if it is used multiple times in a loop, such as that enclosing a  
56523 condition wait.

56524 For cases when the system clock is advanced discontinuously by an operator, it is expected that  
56525 implementations process any timed wait expiring at an intervening time as if that time had  
56526 actually occurred.

### 56527 **Choice of Clock**

56528 Care should be taken to decide which clock is most appropriate when waiting with a timeout.  
56529 The system clock `CLOCK_REALTIME`, as used by default with `pthread_cond_timedwait()`, may be  
56530 subject to jumps forwards and backwards in order to correct it against actual time.  
56531 `CLOCK_MONOTONIC` is guaranteed not to jump backwards and must also advance in real  
56532 time, so using it via `pthread_cond_clockwait()` or `pthread_condattr_setclock()` may be more  
56533 appropriate.

### 56534 **Cancellation and Condition Wait**

56535 A condition wait, whether timed or not, is a cancellation point. That is, the functions  
56536 `pthread_cond_clockwait()`, `pthread_cond_timedwait()`, and `pthread_cond_wait()` are points where a  
56537 pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite  
56538 wait is possible at these points—whatever event is being waited for, even if the program is  
56539 totally correct, might never occur; for example, some input data being awaited might never be  
56540 sent. By making condition wait a cancellation point, the thread can be canceled and perform its  
56541 cancellation cleanup handler even though it may be stuck in some indefinite wait.

56542 A side-effect of acting on a cancellation request while a thread is blocked on a condition variable  
56543 is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in  
56544 order to ensure that the cancellation cleanup handler is executed in the same state as the critical  
56545 code that lies both before and after the call to the condition wait function. This rule is also  
56546 required when interfacing to POSIX threads from languages, such as Ada or C++, which may  
56547 choose to map cancellation onto a language exception; this rule ensures that each exception  
56548 handler guarding a critical section can always safely depend upon the fact that the associated  
56549 mutex has already been locked regardless of exactly where within the critical section the  
56550 exception was raised. Without this rule, there would not be a uniform rule that exception  
56551 handlers could follow regarding the lock, and so coding would become very cumbersome.

56552 Therefore, since *some* statement has to be made regarding the state of the lock when a  
56553 cancellation is delivered during a wait, a definition has been chosen that makes application  
56554 coding most convenient and error free.

56555 When acting on a cancellation request while a thread is blocked on a condition variable, the  
56556 implementation is required to ensure that the thread does not consume any condition signals  
56557 directed at that condition variable if there are any other threads waiting on that condition  
56558 variable. This rule is specified in order to avoid deadlock conditions that could occur if these  
56559 two independent requests (one acting on a thread and the other acting on the condition variable)  
56560 were not processed independently.

#### 56561 **Performance of Mutexes and Condition Variables**

56562 Mutexes are expected to be locked only for a few instructions. This practice is almost  
56563 automatically enforced by the desire of programmers to avoid long serial regions of execution  
56564 (which would reduce total effective parallelism).

56565 When using mutexes and condition variables, one tries to ensure that the usual case is to lock the  
56566 mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a  
56567 relatively rare situation. For example, when implementing a read-write lock, code that acquires a  
56568 read-lock typically needs only to increment the count of readers (under mutual-exclusion) and  
56569 return. The calling thread would actually wait on the condition variable only when there is  
56570 already an active writer. So the efficiency of a synchronization operation is bounded by the cost  
56571 of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context  
56572 switch.

56573 This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be  
56574 at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable  
56575 is important. The cost of waiting on a condition variable should be little more than the minimal  
56576 cost for a context switch plus the time to unlock and lock the mutex.

#### 56577 **Features of Mutexes and Condition Variables**

56578 It had been suggested that the mutex acquisition and release be decoupled from condition wait.  
56579 This was rejected because it is the combined nature of the operation that, in fact, facilitates  
56580 realtime implementations. Those implementations can atomically move a high-priority thread  
56581 between the condition variable and the mutex in a manner that is transparent to the caller. This  
56582 can prevent extra context switches and provide more deterministic acquisition of a mutex when  
56583 the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the  
56584 scheduling discipline. Furthermore, the current condition wait operation matches existing  
56585 practice.

#### 56586 **Scheduling Behavior of Mutexes and Condition Variables**

56587 Synchronization primitives that attempt to interfere with scheduling policy by specifying an  
56588 ordering rule are considered undesirable. Threads waiting on mutexes and condition variables  
56589 are selected to proceed in an order dependent upon the scheduling policy rather than in some  
56590 fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which  
56591 thread(s) are awakened and allowed to proceed.

56592 **Timed Condition Wait**

56593 The `pthread_cond_clockwait()` and `pthread_cond_timedwait()` functions allow an application to give  
56594 up waiting for a particular condition after a given amount of time. An example follows:

```
56595 (void) pthread_mutex_lock(&t.mn);
56596     t.waiters++;
56597     clock_gettime(CLOCK_MONOTONIC, &ts);
56598     ts.tv_sec += 5;
56599     rc = 0;
56600     while (! mypredicate(&t) && rc == 0)
56601         rc = pthread_cond_clockwait(&t.cond, &t.mn,
56602             CLOCK_MONOTONIC, &ts);
56603     t.waiters--;
56604     if (rc == 0 || mypredicate(&t))
56605         setmystate(&t);
56606 (void) pthread_mutex_unlock(&t.mn);
```

56607 By making the timeout parameter absolute, it does not need to be recomputed each time the  
56608 program checks its blocking predicate. If the timeout was relative, it would have to be  
56609 recomputed before each call. This would be especially difficult since such code would need to  
56610 take into account the possibility of extra wakeups that result from extra broadcasts or signals on  
56611 the condition variable that occur before either the predicate is true or the timeout is due. Using  
56612 `CLOCK_MONOTONIC` rather than `CLOCK_REALTIME` means that the timeout is not  
56613 influenced by the system clock being changed.

56614 **FUTURE DIRECTIONS**

56615 None.

56616 **SEE ALSO**

56617 [pthread\\_cond\\_broadcast\(\)](#)

56618 XBD Section 4.15.2 (on page 104), [<pthread.h>](#)

56619 **CHANGE HISTORY**

56620 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

56621 **Issue 6**

56622 The `pthread_cond_timedwait()` and `pthread_cond_wait()` functions are marked as part of the  
56623 Threads option.

56624 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
56625 `pthread_cond_wait()` function.

56626 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
56627 for the Clock Selection option.

56628 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC  
56629 Interpretation 1003.1c #28.

56630 The **restrict** keyword is added to the `pthread_cond_timedwait()` and `pthread_cond_wait()`  
56631 prototypes for alignment with the ISO/IEC 9899:1999 standard.

56632 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the  
56633 DESCRIPTION for consistency with the `pthread_cond_destroy()` function that states it is safe to  
56634 destroy an initialized condition variable upon which no threads are currently blocked.

56635 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the  
56636 DESCRIPTION from “the cancelability enable state” to “the cancelability type”.

56637 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS  
56638 section to remove the error case related to *abstime* from the *pthread\_cond\_wait()* function, and to  
56639 make the error case related to *abstime* mandatory for *pthread\_cond\_timedwait()* for consistency  
56640 with other functions.

56641 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to  
56642 the RATIONALE section stating that an application should check the predicate on any return  
56643 from this function.

#### 56644 Issue 7

56645 SD5-XSH-ERN-44 is applied, changing the definition of the “shall fail” case of the [EINVAL]  
56646 error.

56647 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

56648 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are moved from the Threads  
56649 option to the Base.

56650 The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is  
56651 removed; this condition results in undefined behavior”

56652 The [EPERM] error is revised and moved to the “shall fail” list of error conditions for the  
56653 *pthread\_cond\_timedwait()* function.

56654 The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.

56655 The ERRORS section is updated to include “shall fail” cases for  
56656 PTHREAD\_MUTEX\_ERRORCHECK mutexes.

56657 The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes  
56658 where the [EPERM] error is not mandated.

56659 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0456 [91,286,437] and  
56660 XSH/TC1-2008/0457 [239] are applied.

56661 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0271 [749] is applied.

#### 56662 Issue 8

56663 Austin Group Defect 354 is applied, adding the [EAGAIN] error.

56664 Austin Group Defect 1162 is applied, changing “an error code” to “[EOWNERDEAD]”.

56665 Austin Group Defects 1216 and 1485 are applied, adding *pthread\_cond\_clockwait()*.

56666 **NAME**

56667 pthread\_cond\_destroy, pthread\_cond\_init — destroy and initialize condition variables

56668 **SYNOPSIS**

```
56669 #include <pthread.h>
56670 int pthread_cond_destroy(pthread_cond_t *cond);
56671 int pthread_cond_init(pthread_cond_t *restrict cond,
56672     const pthread_condattr_t *restrict attr);
56673 pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

56674 **DESCRIPTION**

56675 The *pthread\_cond\_destroy()* function shall destroy the given condition variable specified by *cond*;  
 56676 the object becomes, in effect, uninitialized. An implementation may cause *pthread\_cond\_destroy()*  
 56677 to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can  
 56678 be reinitialized using *pthread\_cond\_init()*; the results of otherwise referencing the object after it  
 56679 has been destroyed are undefined.

56680 It shall be safe to destroy an initialized condition variable upon which no threads are currently  
 56681 blocked. Attempting to destroy a condition variable upon which other threads are currently  
 56682 blocked results in undefined behavior.

56683 The *pthread\_cond\_init()* function shall initialize the condition variable referenced by *cond* with  
 56684 attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be  
 56685 used; the effect is the same as passing the address of a default condition variable attributes  
 56686 object. Upon successful initialization, the state of the condition variable shall become initialized.

56687 See [Section 2.9.9](#) (on page 548) for further requirements.

56688 Attempting to initialize an already initialized condition variable results in undefined behavior.

56689 In cases where default condition variable attributes are appropriate, the macro  
 56690 PTHREAD\_COND\_INITIALIZER can be used to initialize condition variables. The effect shall  
 56691 be equivalent to dynamic initialization by a call to *pthread\_cond\_init()* with parameter *attr*  
 56692 specified as NULL, except that no error checks are performed.

56693 The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_destroy()*  
 56694 does not refer to an initialized condition variable.

56695 The behavior is undefined if the value specified by the *attr* argument to *pthread\_cond\_init()* does  
 56696 not refer to an initialized condition variable attributes object.

56697 **RETURN VALUE**

56698 If successful, the *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions shall return zero;  
 56699 otherwise, an error number shall be returned to indicate the error.

56700 **ERRORS**

56701 The *pthread\_cond\_init()* function shall fail if:

56702 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 56703 another condition variable.

56704 [ENOMEM] Insufficient memory exists to initialize the condition variable.

56705 These functions shall not return an error code of [EINTR].

56706 **EXAMPLES**

56707 A condition variable can be destroyed immediately after all the threads that are blocked on it are  
56708 awakened. For example, consider the following code:

```
56709 struct list {
56710     pthread_mutex_t lm;
56711     ...
56712 }

56713 struct elt {
56714     key k;
56715     int busy;
56716     pthread_cond_t notbusy;
56717     ...
56718 }

56719 /* Find a list element and reserve it. */
56720 struct elt *
56721 list_find(struct list *lp, key k)
56722 {
56723     struct elt *ep;

56724     pthread_mutex_lock(&lp->lm);
56725     while ((ep = find_elt(l, k) != NULL) && ep->busy)
56726         pthread_cond_wait(&ep->notbusy, &lp->lm);
56727     if (ep != NULL)
56728         ep->busy = 1;
56729     pthread_mutex_unlock(&lp->lm);
56730     return(ep);
56731 }
56732 delete_elt(struct list *lp, struct elt *ep)
56733 {
56734     pthread_mutex_lock(&lp->lm);
56735     assert(ep->busy);
56736     ... remove ep from list ...
56737     ep->busy = 0; /* Paranoid. */
56738 (A) pthread_cond_broadcast(&ep->notbusy);
56739     pthread_mutex_unlock(&lp->lm);
56740 (B) pthread_cond_destroy(&ep->notbusy);
56741     free(ep);
56742 }
```

56743 In this example, the condition variable and its list element may be freed (line B) immediately  
56744 after all threads waiting for it are awakened (line A), since the mutex and the code ensure that  
56745 no other thread can touch the element to be deleted.

56746 **APPLICATION USAGE**

56747 None.

56748 **RATIONALE**

56749 If an implementation detects that the value specified by the *cond* argument to  
56750 *pthread\_cond\_destroy()* does not refer to an initialized condition variable, it is recommended that  
56751 the function should fail and report an [EINVAL] error.

56752 If an implementation detects that the value specified by the *cond* argument to  
56753 *pthread\_cond\_destroy()* or *pthread\_cond\_init()* refers to a condition variable that is in use (for

56754 example, in a *pthread\_cond\_wait()* call) by another thread, or detects that the value specified by  
56755 the *cond* argument to *pthread\_cond\_init()* refers to an already initialized condition variable, it is  
56756 recommended that the function should fail and report an [EBUSY] error.

56757 If an implementation detects that the value specified by the *attr* argument to *pthread\_cond\_init()*  
56758 does not refer to an initialized condition variable attributes object, it is recommended that the  
56759 function should fail and report an [EINVAL] error.

56760 See also *pthread\_mutex\_destroy()*.

#### 56761 FUTURE DIRECTIONS

56762 None.

#### 56763 SEE ALSO

56764 *pthread\_cond\_broadcast()*, *pthread\_cond\_clockwait()*, *pthread\_mutex\_destroy()*

56765 XBD <pthread.h>

#### 56766 CHANGE HISTORY

56767 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 56768 Issue 6

56769 The *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions are marked as part of the Threads  
56770 option.

56771 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

56772 The **restrict** keyword is added to the *pthread\_cond\_init()* prototype for alignment with the  
56773 ISO/IEC 9899:1999 standard.

#### 56774 Issue 7

56775 The *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions are moved from the Threads option  
56776 to the Base.

56777 The [EINVAL] error for an uninitialized condition variable and an uninitialized condition  
56778 variable attributes object is removed; this condition results in undefined behavior.

56779 The [EBUSY] error for a condition variable already in use or an already initialized condition  
56780 variable is removed; this condition results in undefined behavior.

56781 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0455 [70] is applied.

56782 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0269 [972] and XSH/TC2-2008/0270  
56783 [910] are applied.

56784 **NAME**

56785 pthread\_cond\_signal — signal a condition

56786 **SYNOPSIS**

56787 #include <pthread.h>

56788 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

56789 **DESCRIPTION**

56790 Refer to [pthread\\_cond\\_broadcast\(\)](#).

56791 **NAME**

56792 pthread\_cond\_timedwait, pthread\_cond\_wait — wait on a condition

56793 **SYNOPSIS**

56794 #include &lt;pthread.h&gt;

56795 int pthread\_cond\_timedwait(pthread\_cond\_t \*restrict cond,

56796 pthread\_mutex\_t \*restrict mutex,

56797 const struct timespec \*restrict abstime);

56798 int pthread\_cond\_wait(pthread\_cond\_t \*restrict cond,

56799 pthread\_mutex\_t \*restrict mutex);

56800 **DESCRIPTION**56801 Refer to [pthread\\_cond\\_clockwait\(\)](#).

56802 **NAME**

56803 pthread\_condattr\_destroy, pthread\_condattr\_init — destroy and initialize the condition variable  
56804 attributes object

56805 **SYNOPSIS**

```
56806 #include <pthread.h>  
  
56807 int pthread_condattr_destroy(pthread_condattr_t *attr);  
56808 int pthread_condattr_init(pthread_condattr_t *attr);
```

56809 **DESCRIPTION**

56810 The *pthread\_condattr\_destroy()* function shall destroy a condition variable attributes object; the  
56811 object becomes, in effect, uninitialized. An implementation may cause *pthread\_condattr\_destroy()*  
56812 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be  
56813 reinitialized using *pthread\_condattr\_init()*; the results of otherwise referencing the object after it  
56814 has been destroyed are undefined.

56815 The *pthread\_condattr\_init()* function shall initialize a condition variable attributes object *attr* with  
56816 the default value for all of the attributes defined by the implementation.

56817 Results are undefined if *pthread\_condattr\_init()* is called specifying an already initialized *attr*  
56818 attributes object.

56819 After a condition variable attributes object has been used to initialize one or more condition  
56820 variables, any function affecting the attributes object (including destruction) shall not affect any  
56821 previously initialized condition variables.

56822 This volume of POSIX.1-2024 requires two attributes, the *clock* attribute and the *process-shared*  
56823 attribute.

56824 Additional attributes, their default values, and the names of the associated functions to get and  
56825 set those attribute values are implementation-defined.

56826 The behavior is undefined if the value specified by the *attr* argument to  
56827 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object.

56828 **RETURN VALUE**

56829 If successful, the *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions shall return  
56830 zero; otherwise, an error number shall be returned to indicate the error.

56831 **ERRORS**

56832 The *pthread\_condattr\_init()* function shall fail if:

56833 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

56834 These functions shall not return an error code of [EINTR].

56835 **EXAMPLES**

56836 None.

56837 **APPLICATION USAGE**

56838 None.

56839 **RATIONALE**

56840 A *process-shared* attribute has been defined for condition variables for the same reason it has been  
56841 defined for mutexes.

56842 If an implementation detects that the value specified by the *attr* argument to  
56843 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object, it is  
56844 recommended that the function should fail and report an [EINVAL] error.

56845 See also *pthread\_attr\_destroy()* and *pthread\_mutex\_destroy()*.

56846 **FUTURE DIRECTIONS**

56847 None.

56848 **SEE ALSO**

56849 *pthread\_attr\_destroy()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_getpshared()*, *pthread\_create()*,  
56850 *pthread\_mutex\_destroy()*

56851 XBD <pthread.h>

56852 **CHANGE HISTORY**

56853 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

56854 **Issue 6**

56855 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are marked as part of the  
56856 Threads option.

56857 **Issue 7**

56858 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are moved from the Threads  
56859 option to the Base.

56860 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
56861 condition results in undefined behavior.

56862 **NAME**

56863 pthread\_condattr\_getclock, pthread\_condattr\_setclock — get and set the clock selection  
56864 condition variable attribute

56865 **SYNOPSIS**

```
56866 #include <pthread.h>
56867 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
56868 clockid_t *restrict clock_id);
56869 int pthread_condattr_setclock(pthread_condattr_t *attr,
56870 clockid_t clock_id);
```

56871 **DESCRIPTION**

56872 The *pthread\_condattr\_getclock()* function shall obtain the value of the *clock* attribute from the  
56873 attributes object referenced by *attr*.

56874 The *pthread\_condattr\_setclock()* function shall set the *clock* attribute in an initialized attributes  
56875 object referenced by *attr*. If *pthread\_condattr\_setclock()* is called with a *clock\_id* argument that  
56876 refers to a CPU-time clock, the call shall fail.

56877 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of  
56878 *pthread\_cond\_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.  
56879 The *clock* attribute shall have no effect on the *pthread\_cond\_clockwait()* function.

56880 The behavior is undefined if the value specified by the *attr* argument to  
56881 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
56882 variable attributes object.

56883 **RETURN VALUE**

56884 If successful, the *pthread\_condattr\_getclock()* function shall return zero and store the value of the  
56885 clock attribute of *attr* into the object referenced by the *clock\_id* argument. Otherwise, an error  
56886 number shall be returned to indicate the error.

56887 If successful, the *pthread\_condattr\_setclock()* function shall return zero; otherwise, an error  
56888 number shall be returned to indicate the error.

56889 **ERRORS**

56890 The *pthread\_condattr\_setclock()* function may fail if:

56891 [EINVAL] The value specified by *clock\_id* does not refer to a known clock, or is a CPU-  
56892 time clock.

56893 These functions shall not return an error code of [EINTR].

56894 **EXAMPLES**

56895 None.

56896 **APPLICATION USAGE**

56897 None.

56898 **RATIONALE**

56899 If an implementation detects that the value specified by the *attr* argument to  
56900 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
56901 variable attributes object, it is recommended that the function should fail and report an  
56902 [EINVAL] error.

56903 **FUTURE DIRECTIONS**

56904 None.

56905 **SEE ALSO**56906 *pthread\_cond\_clockwait()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_destroy()*,  
56907 *pthread\_condattr\_getpshared()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

56908 XBD &lt;pthread.h&gt;

56909 **CHANGE HISTORY**

56910 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

56911 **Issue 7**56912 The *pthread\_condattr\_getclock()* and *pthread\_condattr\_setclock()* functions are moved from the  
56913 Clock Selection option to the Base.56914 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
56915 condition results in undefined behavior.56916 **Issue 8**56917 Austin Group Defect 1216 is applied, adding *pthread\_cond\_clockwait()*.

56918 **NAME**

56919 pthread\_condattr\_getpshared, pthread\_condattr\_setpshared — get and set the process-shared  
56920 condition variable attributes

56921 **SYNOPSIS**

```
56922 TSH #include <pthread.h>
56923
56923 int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
56924 int *restrict pshared);
56925 int pthread_condattr_setpshared(pthread_condattr_t *attr,
56926 int pshared);
```

56927 **DESCRIPTION**

56928 The `pthread_condattr_getpshared()` function shall obtain the value of the *process-shared* attribute  
56929 from the attributes object referenced by *attr*.

56930 The `pthread_condattr_setpshared()` function shall set the *process-shared* attribute in an initialized  
56931 attributes object referenced by *attr*.

56932 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a condition  
56933 variable to be operated upon by any thread that has access to the memory where the condition  
56934 variable is allocated, even if the condition variable is allocated in memory that is shared by  
56935 multiple processes. See [Section 2.9.9](#) (on page 548) for further requirements. The default value of  
56936 the attribute is `PTHREAD_PROCESS_PRIVATE`.

56937 The behavior is undefined if the value specified by the *attr* argument to  
56938 `pthread_condattr_getpshared()` or `pthread_condattr_setpshared()` does not refer to an initialized  
56939 condition variable attributes object.

56940 **RETURN VALUE**

56941 If successful, the `pthread_condattr_setpshared()` function shall return zero; otherwise, an error  
56942 number shall be returned to indicate the error.

56943 If successful, the `pthread_condattr_getpshared()` function shall return zero and store the value of  
56944 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
56945 an error number shall be returned to indicate the error.

56946 **ERRORS**

56947 The `pthread_condattr_setpshared()` function may fail if:

56948 [EINVAL] The new value specified for the attribute is outside the range of legal values  
56949 for that attribute.

56950 These functions shall not return an error code of [EINTR].

56951 **EXAMPLES**

56952 None.

56953 **APPLICATION USAGE**

56954 None.

56955 **RATIONALE**

56956 If an implementation detects that the value specified by the *attr* argument to  
56957 `pthread_condattr_getpshared()` or `pthread_condattr_setpshared()` does not refer to an initialized  
56958 condition variable attributes object, it is recommended that the function should fail and report  
56959 an [EINVAL] error.

56960 **FUTURE DIRECTIONS**

56961 None.

56962 **SEE ALSO**56963 *pthread\_create()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_destroy()*, *pthread\_mutex\_destroy()*

56964 XBD &lt;pthread.h&gt;

56965 **CHANGE HISTORY**

56966 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

56967 **Issue 6**56968 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are marked as part  
56969 of the Threads and Thread Process-Shared Synchronization options.56970 The **restrict** keyword is added to the *pthread\_condattr\_getpshared()* prototype for alignment with  
56971 the ISO/IEC 9899:1999 standard.56972 **Issue 7**56973 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are marked only as  
56974 part of the Thread Process-Shared Synchronization option as the Threads option is now part of  
56975 the Base.56976 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
56977 condition results in undefined behavior.56978 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0272 [972] and XSH/TC2-2008/0273  
56979 [757] are applied.

56980 **NAME**

56981 pthread\_condattr\_init — initialize the condition variable attributes object

56982 **SYNOPSIS**

56983 #include <pthread.h>

56984 int pthread\_condattr\_init(pthread\_condattr\_t \*attr);

56985 **DESCRIPTION**

56986 Refer to *pthread\_condattr\_destroy()*.

56987 **NAME**

56988 pthread\_condattr\_setclock — set the clock selection condition variable attribute

56989 **SYNOPSIS**

56990 #include &lt;pthread.h&gt;

56991 int pthread\_condattr\_setclock(pthread\_condattr\_t \*attr,  
56992 clockid\_t clock\_id);56993 **DESCRIPTION**56994 Refer to [pthread\\_condattr\\_getclock\(\)](#).

56995 **NAME**

56996 pthread\_condattr\_setpshared — set the process-shared condition variable attribute

56997 **SYNOPSIS**

```
56998 TSH #include <pthread.h>
56999 int pthread_condattr_setpshared(pthread_condattr_t *attr,
57000 int pshared);
```

57001 **DESCRIPTION**

57002 Refer to [pthread\\_condattr\\_getpshared\(\)](#).

57003 **NAME**

57004 pthread\_create — thread creation

57005 **SYNOPSIS**

57006 #include &lt;pthread.h&gt;

```
57007 int pthread_create(pthread_t *restrict thread,
57008                  const pthread_attr_t *restrict attr,
57009                  void *(*start_routine)(void*), void *restrict arg);
```

57010 **DESCRIPTION**

57011 The *pthread\_create()* function shall create a new thread, with attributes specified by *attr*, within a  
 57012 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are  
 57013 modified later, the thread's attributes shall not be affected. Upon successful completion,  
 57014 *pthread\_create()* shall store the ID of the created thread in the location referenced by *thread*.

57015 The thread is created executing *start\_routine* with *arg* as its sole argument. If the *start\_routine*  
 57016 returns, the effect shall be as if there was an implicit call to *pthread\_exit()* using the return value  
 57017 of *start\_routine* as the exit status. Note that the thread in which *main()* was originally invoked  
 57018 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call to  
 57019 *exit()* using the return value of *main()* as the exit status.

57020 The signal state of the new thread shall be initialized as follows:

- 57021 • The signal mask shall be inherited from the creating thread.
- 57022 • The set of signals pending for the new thread shall be empty.

57023 XSI The thread-local current locale and the alternate stack shall not be inherited.

57024 The floating-point environment shall be inherited from the creating thread.

57025 If *pthread\_create()* fails, no new thread is created and the contents of the location referenced by  
 57026 *thread* are undefined.

57027 TCT If `_POSIX_THREAD_CPUTIME` is defined, the new thread shall have a CPU-time clock  
 57028 accessible, and the initial value of this clock shall be set to zero.

57029 The behavior is undefined if the value specified by the *attr* argument to *pthread\_create()* does not  
 57030 refer to an initialized thread attributes object.

57031 **RETURN VALUE**

57032 If successful, the *pthread\_create()* function shall return zero; otherwise, an error number shall be  
 57033 returned to indicate the error.

57034 **ERRORS**

57035 The *pthread\_create()* function shall fail if:

57036 [EAGAIN] The system lacked the necessary resources to create another thread, or the  
 57037 system-imposed limit on the total number of threads in a process  
 57038 {PTHREAD\_THREADS\_MAX} would be exceeded.

57039 [EPERM] The caller does not have appropriate privileges to set the required scheduling  
 57040 parameters or scheduling policy.

57041 The *pthread\_create()* function shall not return an error code of [EINTR].

57042 **EXAMPLES**

57043 None.

57044 **APPLICATION USAGE**

57045 There is no requirement on the implementation that the ID of the created thread be available  
 57046 before the newly created thread starts executing. The calling thread can obtain the ID of the  
 57047 created thread through the *thread* argument of the *pthread\_create()* function, and the newly  
 57048 created thread can obtain its ID by a call to *pthread\_self()*.

57049 **RATIONALE**

57050 A suggested alternative to *pthread\_create()* would be to define two separate operations: create  
 57051 and start. Some applications would find such behavior more natural. Ada, in particular,  
 57052 separates the “creation” of a task from its “activation”.

57053 Splitting the operation was rejected by the standard developers for many reasons:

- 57054 • The number of calls required to start a thread would increase from one to two and thus  
 57055 place an additional burden on applications that do not require the additional  
 57056 synchronization. The second call, however, could be avoided by the additional  
 57057 complication of a start-up state attribute.
- 57058 • An extra state would be introduced: “created but not started”. This would require the  
 57059 standard to specify the behavior of the thread operations when the target has not yet  
 57060 started executing.
- 57061 • For those applications that require such behavior, it is possible to simulate the two separate  
 57062 steps with the facilities that are currently provided. The *start\_routine()* can synchronize by  
 57063 waiting on a condition variable that is signaled by the start operation.

57064 An Ada implementor can choose to create the thread at either of two points in the Ada program:  
 57065 when the task object is created, or when the task is activated (generally at a “begin”). If the first  
 57066 approach is adopted, the *start\_routine()* needs to wait on a condition variable to receive the order  
 57067 to begin “activation”. The second approach requires no such condition variable or extra  
 57068 synchronization. In either approach, a separate Ada task control block would need to be created  
 57069 when the task object is created to hold rendezvous queues, and so on.

57070 An extension of the preceding model would be to allow the state of the thread to be modified  
 57071 between the create and start. This would allow the thread attributes object to be eliminated. This  
 57072 has been rejected because:

- 57073 • All state in the thread attributes object has to be able to be set for the thread. This would  
 57074 require the definition of functions to modify thread attributes. There would be no  
 57075 reduction in the number of function calls required to set up the thread. In fact, for an  
 57076 application that creates all threads using identical attributes, the number of function calls  
 57077 required to set up the threads would be dramatically increased. Use of a thread attributes  
 57078 object permits the application to make one set of attribute setting function calls.  
 57079 Otherwise, the set of attribute setting function calls needs to be made for each thread  
 57080 creation.
- 57081 • Depending on the implementation architecture, functions to set thread state would require  
 57082 kernel calls, or for other implementation reasons would not be able to be implemented as  
 57083 macros, thereby increasing the cost of thread creation.
- 57084 • The ability for applications to segregate threads by class would be lost.

57085 Another suggested alternative uses a model similar to that for process creation, such as “thread  
 57086 fork”. The fork semantics would provide more flexibility and the “create” function can be  
 57087 implemented simply by doing a thread fork followed immediately by a call to the desired “start

- 57088 routine” for the thread. This alternative has these problems:
- 57089       • For many implementations, the entire stack of the calling thread would need to be
- 57090       duplicated, since in many architectures there is no way to determine the size of the calling
- 57091       frame.
- 57092       • Efficiency is reduced since at least some part of the stack has to be copied, even though in
- 57093       most cases the thread never needs the copied context, since it merely calls the desired start
- 57094       routine.

57095 If an implementation detects that the value specified by the *attr* argument to *pthread\_create()*

57096 does not refer to an initialized thread attributes object, it is recommended that the function

57097 should fail and report an [EINVAL] error.

#### 57098 FUTURE DIRECTIONS

57099 None.

#### 57100 SEE ALSO

57101 *fork()*, *pthread\_exit()*, *pthread\_join()*

57102 XBD Section 4.15.2 (on page 104), [<pthread.h>](#)

#### 57103 CHANGE HISTORY

57104 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57105 Issue 6

57106 The *pthread\_create()* function is marked as part of the Threads option.

57107 The following new requirements on POSIX implementations derive from alignment with the

57108 Single UNIX Specification:

- 57109       • The [EPERM] mandatory error condition is added.

57110 The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

57111 The **restrict** keyword is added to the *pthread\_create()* prototype for alignment with the

57112 ISO/IEC 9899:1999 standard.

57113 The DESCRIPTION is updated to make it explicit that the floating-point environment is

57114 inherited from the creating thread.

57115 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the

57116 alternate stack is not inherited.

57117 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS

57118 section to remove the mandatory [EINVAL] error (“The value specified by *attr* is invalid”), and

57119 adding the optional [EINVAL] error (“The attributes specified by *attr* are invalid”).

57120 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION

57121 USAGE section.

#### 57122 Issue 7

57123 The *pthread\_create()* function is moved from the Threads option to the Base.

57124 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition

57125 results in undefined behavior.

57126 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0458 [302] is applied.

57127 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0274 [849] is applied.

57128 **NAME**

57129 pthread\_detach — detach a thread

57130 **SYNOPSIS**

57131 #include &lt;pthread.h&gt;

57132 int pthread\_detach(pthread\_t thread);

57133 **DESCRIPTION**

57134 The *pthread\_detach()* function shall change the thread *thread* from joinable to detached, indicating  
57135 to the implementation that storage for the thread can be reclaimed when the thread terminates.  
57136 If *thread* has not terminated, *pthread\_detach()* shall not cause it to terminate, but shall prevent the  
57137 thread from becoming a zombie thread when it does terminate.

57138 The behavior is undefined if the value specified by the *thread* argument to *pthread\_detach()* does  
57139 not refer to a joinable thread.

57140 **RETURN VALUE**

57141 If the call succeeds, *pthread\_detach()* shall return 0; otherwise, an error number shall be returned  
57142 to indicate the error.

57143 **ERRORS**57144 The *pthread\_detach()* function shall not return an error code of [EINTR].57145 **EXAMPLES**

57146 None.

57147 **APPLICATION USAGE**

57148 None.

57149 **RATIONALE**

57150 The *pthread\_join()* or *pthread\_detach()* functions should eventually be called for every thread that  
57151 is created so that storage associated with the thread may be reclaimed.

57152 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation  
57153 attribute is sufficient, since a thread need never be dynamically detached. However, need arises  
57154 in at least two cases:

57155 1. In a cancellation handler for a *pthread\_join()* it is nearly essential to have a  
57156 *pthread\_detach()* function in order to detach the thread on which *pthread\_join()* was  
57157 waiting. Without it, it would be necessary to have the handler do another *pthread\_join()* to  
57158 attempt to detach the thread, which would both delay the cancellation processing for an  
57159 unbounded period and introduce a new call to *pthread\_join()*, which might itself need a  
57160 cancellation handler. A dynamic detach is nearly essential in this case.

57161 2. In order to detach the “initial thread” (as may be desirable in processes that set up server  
57162 threads).

57163 If an implementation detects that the value specified by the *thread* argument to *pthread\_detach()*  
57164 does not refer to a joinable thread, it is recommended that the function should fail and report an  
57165 [EINVAL] error.

57166 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
57167 that the function should fail and report an [ESRCH] error.

57168 **FUTURE DIRECTIONS**

57169 None.

57170 **SEE ALSO**57171 [pthread\\_join\(\)](#)

57172 XBD &lt;pthread.h&gt;

57173 **CHANGE HISTORY**

57174 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

57175 **Issue 6**57176 The *pthread\_detach()* function is marked as part of the Threads option.57177 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS  
57178 section so that the [EINVAL] and [ESRCH] error cases become optional.57179 **Issue 7**57180 The *pthread\_detach()* function is moved from the Threads option to the Base.

57181 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

57182 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
57183 behavior.57184 **Issue 8**57185 Austin Group Defect 792 is applied, clarifying that detaching a live thread prevents it becoming  
57186 a zombie thread when it terminates.57187 Austin Group Defect 1167 is applied, clarifying that a thread is no longer joinable after  
57188 *pthread\_detach()* has been called for it.

57189 **NAME**

57190 pthread\_equal — compare thread IDs

57191 **SYNOPSIS**

57192 #include &lt;pthread.h&gt;

57193 int pthread\_equal(pthread\_t t1, pthread\_t t2);

57194 **DESCRIPTION**57195 This function shall compare the thread IDs *t1* and *t2*.57196 **RETURN VALUE**57197 The *pthread\_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero  
57198 shall be returned.57199 If either *t1* or *t2* is not a valid thread ID and is not equal to PTHREAD\_NULL, the behavior is  
57200 undefined.57201 **ERRORS**

57202 No errors are defined.

57203 The *pthread\_equal()* function shall not return an error code of [EINTR].57204 **EXAMPLES**

57205 None.

57206 **APPLICATION USAGE**

57207 None.

57208 **RATIONALE**57209 Implementations may choose to define a thread ID as a structure. This allows additional  
57210 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence  
57211 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).  
57212 Since the C language does not support comparison on structure types, the *pthread\_equal()*  
57213 function is provided to compare thread IDs.57214 **FUTURE DIRECTIONS**

57215 None.

57216 **SEE ALSO**57217 *pthread\_create()*, *pthread\_self()*

57218 XBD &lt;pthread.h&gt;

57219 **CHANGE HISTORY**

57220 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

57221 **Issue 6**57222 The *pthread\_equal()* function is marked as part of the Threads option.57223 **Issue 7**57224 The *pthread\_equal()* function is moved from the Threads option to the Base.57225 **Issue 8**57226 Austin Group Defect 599 is applied, changing the RETURN VALUE section to mention  
57227 PTHREAD\_NULL.

57228 **NAME**

57229 pthread\_exit — thread termination

57230 **SYNOPSIS**

57231 #include &lt;pthread.h&gt;

57232 \_Noreturn void pthread\_exit(void \*value\_ptr);

57233 **DESCRIPTION**

57234 The *pthread\_exit()* function shall terminate the calling thread and make the value *value\_ptr*  
57235 available to any successful join with the terminating thread. Any cancellation cleanup handlers  
57236 that have been pushed and not yet popped shall be popped in the reverse order that they were  
57237 pushed and then executed. After all cancellation cleanup handlers have been executed, if the  
57238 thread has any thread-specific data (whether associated with key type *tss\_t* or *pthread\_key\_t*),  
57239 appropriate destructor functions shall be called in an unspecified order. Thread termination  
57240 does not release any application visible process resources, including, but not limited to, mutexes  
57241 and file descriptors, nor does it perform any process-level cleanup actions, including, but not  
57242 limited to, calling any *atexit()* routines that may exist.

57243 An implicit call to *pthread\_exit()* is made when a thread that was not created using *thrd\_create()*,  
57244 and is not the thread in which *main()* was first invoked, returns from the start routine that was  
57245 used to create it. The function's return value shall serve as the thread's exit status.

57246 The behavior of *pthread\_exit()* is undefined if called from a cancellation cleanup handler or  
57247 destructor function that was invoked as a result of either an implicit or explicit call to  
57248 *pthread\_exit()*.

57249 After a thread has terminated, the result of access to local (auto) variables of the thread is  
57250 undefined. Thus, references to local variables of the exiting thread should not be used for the  
57251 *pthread\_exit()* *value\_ptr* parameter value.

57252 The process shall exit with an exit status of 0 after the last thread has been terminated. The  
57253 behavior shall be as if the implementation called *exit()* with a zero argument at thread  
57254 termination time.

57255 **RETURN VALUE**57256 The *pthread\_exit()* function cannot return to its caller.57257 **ERRORS**

57258 No errors are defined.

57259 **EXAMPLES**

57260 None.

57261 **APPLICATION USAGE**

57262 Calls to *pthread\_exit()* should not be made from threads created using *thrd\_create()*, as their exit  
57263 status has a different type (**int** instead of **void \***). If *pthread\_exit()* is called from the initial thread  
57264 and it is not the last thread to terminate, other threads should not try to obtain its exit status  
57265 using *thrd\_join()*.

57266 **RATIONALE**

57267 The normal mechanism by which a thread that was started using *pthread\_create()* terminates is to  
57268 return from the routine that was specified in the *pthread\_create()* call that started it. The  
57269 *pthread\_exit()* function provides the capability for a thread to terminate without requiring a  
57270 return from the start routine of that thread, thereby providing a function analogous to *exit()*.

57271 Regardless of the method of thread termination, any cancellation cleanup handlers that have  
57272 been pushed and not yet popped are executed, and the destructors for any existing thread-  
57273 specific data are executed. This volume of POSIX.1-2024 requires that cancellation cleanup

57274 handlers be popped and called in order. After all cancellation cleanup handlers have been  
57275 executed, thread-specific data destructors are called, in an unspecified order, for each item of  
57276 thread-specific data that exists in the thread. This ordering is necessary because cancellation  
57277 cleanup handlers may rely on thread-specific data.

57278 As the meaning of the status is determined by the application (except when the thread has been  
57279 canceled, in which case it is PTHREAD\_CANCELED), the implementation has no idea what an  
57280 illegal status value is, which is why no address error checking is done.

#### 57281 **FUTURE DIRECTIONS**

57282 None.

#### 57283 **SEE ALSO**

#### 57286 **CHANGE HISTORY**

57287 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57288 **Issue 6**

57289 The *pthread\_exit()* function is marked as part of the Threads option.

#### 57290 **Issue 7**

57291 The *pthread\_exit()* function is moved from the Threads option to the Base.

#### 57292 **Issue 8**

57293 Austin Group Defect 1302 is applied, adding `_Noreturn` to the SYNOPSIS, and updating the  
57294 page to account for the addition of <threads.h> interfaces.

57295 **NAME**

57296 pthread\_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME**  
57297 **THREADS**)

57298 **SYNOPSIS**

```
57299 TCT #include <pthread.h>
57300 #include <time.h>
57301 int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

57302 **DESCRIPTION**

57303 The *pthread\_getcpuclockid()* function shall return in *clock\_id* the clock ID of the CPU-time clock of  
57304 the thread specified by *thread\_id*, if the thread specified by *thread\_id* exists.

57305 **RETURN VALUE**

57306 Upon successful completion, *pthread\_getcpuclockid()* shall return zero; otherwise, an error  
57307 number shall be returned to indicate the error.

57308 **ERRORS**

57309 No errors are defined.

57310 **EXAMPLES**

57311 None.

57312 **APPLICATION USAGE**

57313 The *pthread\_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not  
57314 be provided on all implementations.

57315 **RATIONALE**

57316 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
57317 that the function should fail and report an [ESRCH] error.

57318 **FUTURE DIRECTIONS**

57319 None.

57320 **SEE ALSO**

57321 *clock\_getcpuclockid()*, *clock\_getres()*, *timer\_create()*

57322 XBD [<pthread.h>](#), [<time.h>](#)

57323 **CHANGE HISTORY**

57324 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

57325 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

57326 **Issue 7**

57327 The *pthread\_getcpuclockid()* function is marked only as part of the Thread CPU-Time Clocks  
57328 option as the Threads option is now part of the Base.

57329 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

57330 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0275 [757] is applied.

## 57331 NAME

57332 pthread\_getschedparam, pthread\_setschedparam — dynamic thread scheduling parameters  
57333 access (REALTIME THREADS)

## 57334 SYNOPSIS

```
57335 TPS #include <pthread.h>
57336
57336 int pthread_getschedparam(pthread_t thread, int *restrict policy,
57337 struct sched_param *restrict param);
57338 int pthread_setschedparam(pthread_t thread, int policy,
57339 const struct sched_param *param);
```

## 57340 DESCRIPTION

57341 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall, respectively, get and set  
57342 the scheduling policy and parameters of individual threads within a multi-threaded process to  
57343 be retrieved and set. For SCHED\_FIFO and SCHED\_RR, the only required member of the  
57344 **sched\_param** structure is the priority *sched\_priority*. For SCHED\_OTHER, the affected  
57345 scheduling parameters are implementation-defined.

57346 The *pthread\_getschedparam()* function shall retrieve the scheduling policy and scheduling  
57347 parameters for the thread whose thread ID is given by *thread* and shall store those values in  
57348 *policy* and *param*, respectively. The priority value returned from *pthread\_getschedparam()* shall be  
57349 the value specified by the most recent *pthread\_setschedparam()*, *pthread\_setschedprio()*, or  
57350 *pthread\_create()* call affecting the target thread. It shall not reflect any temporary adjustments to  
57351 its priority as a result of any priority inheritance or ceiling functions. The *pthread\_setschedparam()*  
57352 function shall set the scheduling policy and associated scheduling parameters for the thread  
57353 whose thread ID is given by *thread* to the policy and associated parameters provided in *policy*  
57354 and *param*, respectively.

57355 The *policy* parameter may have the value SCHED\_OTHER, SCHED\_FIFO, or SCHED\_RR. The  
57356 scheduling parameters for the SCHED\_OTHER policy are implementation-defined. The  
57357 SCHED\_FIFO and SCHED\_RR policies shall have a single scheduling parameter, *priority*.

57358 TSP If \_POSIX\_THREAD\_SPORADIC\_SERVER is defined, then the *policy* argument may have the  
57359 value SCHED\_SPORADIC, with the exception for the *pthread\_setschedparam()* function that if the  
57360 scheduling policy was not SCHED\_SPORADIC at the time of the call, it is implementation-  
57361 defined whether the function is supported; in other words, the implementation need not allow  
57362 the application to dynamically change the scheduling policy to SCHED\_SPORADIC. The  
57363 sporadic server scheduling policy has the associated parameters *sched\_ss\_low\_priority*,  
57364 *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, *sched\_priority*, and *sched\_ss\_max\_repl*. The specified  
57365 *sched\_ss\_repl\_period* shall be greater than or equal to the specified *sched\_ss\_init\_budget* for the  
57366 function to succeed; if it is not, then the function shall fail. The value of *sched\_ss\_max\_repl* shall  
57367 be within the inclusive range [1,{SS\_REPL\_MAX}] for the function to succeed; if not, the function  
57368 shall fail. It is unspecified whether the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are  
57369 stored as provided by this function or are rounded to align with the resolution of the clock being  
57370 used.

57371 If the *pthread\_setschedparam()* function fails, the scheduling parameters shall not be changed for  
57372 the target thread.

## 57373 RETURN VALUE

57374 If successful, the *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall return zero;  
57375 otherwise, an error number shall be returned to indicate the error.

57376 **ERRORS**57377 The *pthread\_setschedparam()* function shall fail if:57378 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an  
57379 unsupported value.57380 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to  
57381 SCHED\_SPORADIC, and the implementation does not support this change.57382 The *pthread\_setschedparam()* function may fail if:57383 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated  
57384 with the scheduling policy *policy* is invalid.57385 [EPERM] The caller does not have appropriate privileges to set either the scheduling  
57386 parameters or the scheduling policy of the specified thread.57387 [EPERM] The implementation does not allow the application to modify one of the  
57388 parameters to the value specified.

57389 These functions shall not return an error code of [EINTR].

57390 **EXAMPLES**

57391 None.

57392 **APPLICATION USAGE**

57393 None.

57394 **RATIONALE**57395 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
57396 that the function should fail and report an [ESRCH] error.57397 **FUTURE DIRECTIONS**

57398 None.

57399 **SEE ALSO**57400 *pthread\_setschedprio()*, *sched\_getparam()*, *sched\_getscheduler()*

57401 XBD &lt;pthread.h&gt;, &lt;sched.h&gt;

57402 **CHANGE HISTORY**

57403 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

57404 **Issue 6**57405 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked as part of the  
57406 Threads and Thread Execution Scheduling options.57407 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
57408 implementation does not support the Thread Execution Scheduling option.57409 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the  
57410 *pthread\_setschedparam()* function so that its second argument is of type **int**.

57411 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

57412 The **restrict** keyword is added to the *pthread\_getschedparam()* prototype for alignment with the  
57413 ISO/IEC 9899:1999 standard.

57414 The Open Group Corrigendum U047/1 is applied.

57415 IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a  
57416 call to the *pthread\_setschedprio()* function.

57417 **Issue 7**

57418 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked only as part of the  
57419 Thread Execution Scheduling option as the Threads option is now part of the Base.

57420 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
57421 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

57422 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

57423 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0459 [314] is applied.

57424 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0276 [757] is applied.

57425 **NAME**

57426 pthread\_getspecific, pthread\_setspecific — thread-specific data management

57427 **SYNOPSIS**

57428 #include &lt;pthread.h&gt;

57429 void \*pthread\_getspecific(pthread\_key\_t key);

57430 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

57431 **DESCRIPTION**57432 The *pthread\_getspecific()* function shall return the value currently bound to the specified *key* on  
57433 behalf of the calling thread.57434 The *pthread\_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a  
57435 previous call to *pthread\_key\_create()*. Different threads may bind different values to the same  
57436 key. These values are typically pointers to blocks of dynamically allocated memory that have  
57437 been reserved for use by the calling thread.57438 The effect of calling *pthread\_getspecific()* or *pthread\_setspecific()* with a *key* value not obtained  
57439 from *pthread\_key\_create()* or after *key* has been deleted with *pthread\_key\_delete()* is undefined.57440 Both *pthread\_getspecific()* and *pthread\_setspecific()* may be called from a thread-specific data  
57441 destructor function. A call to *pthread\_getspecific()* for the thread-specific data key being  
57442 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)  
57443 by a call to *pthread\_setspecific()*. Calling *pthread\_setspecific()* from a thread-specific data  
57444 destructor routine may result either in lost storage (after at least  
57445 PTHREAD\_DESTRUCTOR\_ITERATIONS attempts at destruction) or in an infinite loop.

57446 Both functions may be implemented as macros.

57447 **RETURN VALUE**57448 The *pthread\_getspecific()* function shall return the thread-specific data value associated with the  
57449 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be  
57450 returned.57451 If successful, the *pthread\_setspecific()* function shall return zero; otherwise, an error number shall  
57452 be returned to indicate the error.57453 **ERRORS**57454 No errors are returned from *pthread\_getspecific()*.57455 The *pthread\_setspecific()* function shall fail if:

57456 [ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

57457 The *pthread\_setspecific()* function shall not return an error code of [EINTR].57458 **EXAMPLES**

57459 None.

57460 **APPLICATION USAGE**

57461 None.

57462 **RATIONALE**57463 Performance and ease-of-use of *pthread\_getspecific()* are critical for functions that rely on  
57464 maintaining state in thread-specific data. Since no errors are required to be detected by it, and  
57465 since the only error that could be detected is the use of an invalid key, the function to  
57466 *pthread\_getspecific()* has been designed to favor speed and simplicity over error reporting.57467 If an implementation detects that the value specified by the *key* argument to *pthread\_setspecific()*  
57468 does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been

57469 deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an  
57470 [EINVAL] error.

#### 57471 FUTURE DIRECTIONS

57472 None.

#### 57473 SEE ALSO

57474 *pthread\_key\_create()*

57475 XBD <pthread.h>

#### 57476 CHANGE HISTORY

57477 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57478 Issue 6

57479 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are marked as part of the Threads  
57480 option.

57481 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

57482 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS  
57483 section so that the [ENOMEM] error case is changed from ``to associate the value with the key''  
57484 to ``to associate the non-NULL value with the key''.

#### 57485 Issue 7

57486 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

57487 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are moved from the Threads option to  
57488 the Base.

57489 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
57490 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

57491 **NAME**

57492 pthread\_join — wait for thread termination

57493 **SYNOPSIS**

57494 #include &lt;pthread.h&gt;

57495 int pthread\_join(pthread\_t thread, void \*\*value\_ptr);

57496 **DESCRIPTION**

57497 The *pthread\_join()* function shall suspend execution of the calling thread until the target *thread*  
 57498 terminates, unless the target *thread* has already terminated. On return from a successful  
 57499 *pthread\_join()* call with a non-NULL *value\_ptr* argument, the value passed to *pthread\_exit()* by  
 57500 the terminating thread shall be made available in the location referenced by *value\_ptr*. When a  
 57501 *pthread\_join()* returns successfully, the target thread has been terminated. The results of multiple  
 57502 simultaneous calls to *pthread\_join()* specifying the same target thread are undefined. If the  
 57503 thread calling *pthread\_join()* is canceled, then the target thread shall not be detached.

57504 It is unspecified whether a zombie thread counts against {PTHREAD\_THREADS\_MAX}.

57505 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* does not  
 57506 refer to a joinable thread.

57507 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* refers to  
 57508 the calling thread.

57509 If *thread* refers to a thread that was created using *thrd\_create()* and the thread terminates, or has  
 57510 already terminated, by returning from its start routine, the behavior of *pthread\_join()* is  
 57511 undefined. If *thread* refers to a thread that terminates, or has already terminated, by calling  
 57512 *thrd\_exit()*, the behavior of *pthread\_join()* is undefined.

57513 **RETURN VALUE**

57514 If successful, the *pthread\_join()* function shall return zero; otherwise, an error number shall be  
 57515 returned to indicate the error.

57516 **ERRORS**

57517 The *pthread\_join()* function may fail if:

57518 [EDEADLK] A deadlock was detected.

57519 The *pthread\_join()* function shall not return an error code of [EINTR].

57520 **EXAMPLES**

57521 An example of thread creation and deletion follows:

```
57522 typedef struct {
57523     int *ar;
57524     long n;
57525 } subarray;

57526 void *
57527 incer(void *arg)
57528 {
57529     long i;

57530     for (i = 0; i < ((subarray *)arg)->n; i++)
57531         ((subarray *)arg)->ar[i]++;
57532 }

57533 int main(void)
57534 {
```

```

57535         int            ar[1000000];
57536         pthread_t    th1, th2;
57537         subarray     sb1, sb2;

57538         sb1.ar = &ar[0];
57539         sb1.n  = 500000;
57540         (void) pthread_create(&th1, NULL, incer, &sb1);

57541         sb2.ar = &ar[500000];
57542         sb2.n  = 500000;
57543         (void) pthread_create(&th2, NULL, incer, &sb2);

57544         (void) pthread_join(th1, NULL);
57545         (void) pthread_join(th2, NULL);
57546         return 0;
57547     }

```

#### APPLICATION USAGE

None.

#### RATIONALE

The *pthread\_join()* function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start\_routine()*. The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread\_join()* function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread\_join()* in this volume of POSIX.1-2024 was considered valuable.

The *pthread\_join()* function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread\_join()* returns, any application-provided stack storage could be reclaimed.

The *pthread\_join()* or *pthread\_detach()* function should eventually be called for every thread that is created with the *detachstate* attribute set to *PTHREAD\_CREATE\_JOINABLE* so that storage associated with the thread may be reclaimed.

The interaction between *pthread\_join()* and cancellation is well-defined for the following reasons:

- The *pthread\_join()* function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread\_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread\_join()* returns. There are no race conditions since *pthread\_join()* was called in the deferred cancelability state.

If an implementation detects that the value specified by the *thread* argument to *pthread\_join()* does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *thread* argument to *pthread\_join()*

57580 refers to the calling thread, it is recommended that the function should fail and report an  
57581 [EDEADLK] error.

57582 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
57583 that the function should fail and report an [ESRCH] error.

57584 The *pthread\_join()* function cannot be used to obtain the exit status of a thread that was created  
57585 using *thrd\_create()* and which terminates by returning from its start routine, or of a thread that  
57586 terminates by calling *thrd\_exit()*, because such threads have an **int** exit status, instead of the  
57587 **void \*** that *pthread\_join()* returns via its *value\_ptr* argument.

#### 57588 FUTURE DIRECTIONS

57589 None.

#### 57590 SEE ALSO

57591 *pthread\_create()*, *thrd\_create()*, *thrd\_exit()*, *wait()*

57592 XBD Section 4.15.2 (on page 104), [<pthread.h>](#)

#### 57593 CHANGE HISTORY

57594 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57595 Issue 6

57596 The *pthread\_join()* function is marked as part of the Threads option.

57597 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS  
57598 section so that the [EINVAL] error is made optional and the words “the implementation has  
57599 detected” are removed from it.

#### 57600 Issue 7

57601 The *pthread\_join()* function is moved from the Threads option to the Base.

57602 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

57603 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
57604 behavior.

57605 The [EDEADLK] error for the calling thread is removed; this condition results in undefined  
57606 behavior.

#### 57607 Issue 8

57608 Austin Group Defect 792 is applied, changing “a thread that has exited but remains unjoined” to  
57609 “a zombie thread”.

57610 Austin Group Defect 1302 is applied, updating the page to account for the addition of  
57611 [<threads.h>](#) interfaces.

57612 **NAME**

57613 pthread\_key\_create — thread-specific data key creation

57614 **SYNOPSIS**

57615 #include &lt;pthread.h&gt;

57616 int pthread\_key\_create(pthread\_key\_t \*key, void (\*destructor)(void\*));

57617 **DESCRIPTION**

57618 The *pthread\_key\_create()* function shall create a thread-specific data key visible to all threads in  
57619 the process. Key values provided by *pthread\_key\_create()* are opaque objects used to locate  
57620 thread-specific data. Although the same key value may be used by different threads, the values  
57621 bound to the key by *pthread\_setspecific()* are maintained on a per-thread basis and persist for the  
57622 life of the calling thread.

57623 Upon key creation, the value NULL shall be associated with the new key in all active threads.  
57624 Upon thread creation, the value NULL shall be associated with all defined keys in the new  
57625 thread.

57626 An optional destructor function may be associated with each key value. At thread exit, if a key  
57627 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with  
57628 that key, the value of the key is set to NULL, and then the function pointed to is called with the  
57629 previously associated value as its sole argument. The order of destructor calls is unspecified if  
57630 more than one destructor exists for a thread when it exits.

57631 If, after all the destructors have been called for all non-NULL values with associated destructors,  
57632 there are still some non-NULL values with associated destructors, then the process is repeated.  
57633 If, after at least {PTHREAD\_DESTRUCTOR\_ITERATIONS} iterations of destructor calls for  
57634 outstanding non-NULL values, there are still some non-NULL values with associated  
57635 destructors, implementations may stop calling destructors, or they may continue calling  
57636 destructors until no non-NULL values with associated destructors exist, even though this might  
57637 result in an infinite loop.

57638 **RETURN VALUE**

57639 If successful, the *pthread\_key\_create()* function shall store the newly created key value at *\*key* and  
57640 shall return zero. Otherwise, an error number shall be returned to indicate the error.

57641 **ERRORS**

57642 The *pthread\_key\_create()* function shall fail if:

57643 [EAGAIN] The system lacked the necessary resources to create another thread-specific  
57644 data key, or the system-imposed limit on the total number of keys per process  
57645 {PTHREAD\_KEYS\_MAX} has been exceeded.

57646 [ENOMEM] Insufficient memory exists to create the key.

57647 The *pthread\_key\_create()* function shall not return an error code of [EINTR].

57648 **EXAMPLES**

57649 The following example demonstrates a function that initializes a thread-specific data key when it  
57650 is first called, and associates a thread-specific object with each calling thread, initializing this  
57651 object when necessary.

```
57652 static pthread_key_t key;  
57653 static pthread_once_t key_once = PTHREAD_ONCE_INIT;  
  
57654 static void  
57655 make_key()  
57656 {
```

```

57657         (void) pthread_key_create (&key, NULL);
57658     }
57659     func ()
57660     {
57661         void *ptr;
57662
57663         (void) pthread_once (&key_once, make_key);
57664         if ((ptr = pthread_getspecific(key)) == NULL) {
57665             ptr = malloc(OBJECT_SIZE);
57666             ...
57667             (void) pthread_setspecific(key, ptr);
57668         }
57669     }

```

57670 Note that the key has to be initialized before *pthread\_getspecific()* or *pthread\_setspecific()* can be  
57671 used. The *pthread\_key\_create()* call could either be explicitly made in a module initialization  
57672 routine, or it can be done implicitly by the first call to a module as in this example. Any attempt  
57673 to use the key before it is initialized is a programming error, making the code below incorrect.

```

57674     static pthread_key_t key;
57675
57676     func ()
57677     {
57678         void *ptr;
57679
57680         /* KEY NOT INITIALIZED!!! THIS WILL NOT WORK!!! */
57681         if ((ptr = pthread_getspecific(key)) == NULL &&
57682             pthread_setspecific(key, NULL) != 0) {
57683             pthread_key_create (&key, NULL);
57684             ...
57685         }
57686     }

```

#### 57685 APPLICATION USAGE

57686 None.

#### 57687 RATIONALE

##### 57688 Destructor Functions

57689 Normally, the value bound to a key on behalf of a particular thread is a pointer to storage  
57690 allocated dynamically on behalf of the calling thread. The destructor functions specified with  
57691 *pthread\_key\_create()* are intended to be used to free this storage when the thread exits. Thread  
57692 cancellation cleanup handlers cannot be used for this purpose because thread-specific data may  
57693 persist outside the lexical scope in which the cancellation cleanup handlers operate.

57694 If the value associated with a key needs to be updated during the lifetime of the thread, it may  
57695 be necessary to release the storage associated with the old value before the new value is bound.  
57696 Although the *pthread\_setspecific()* function could do this automatically, this feature is not needed  
57697 often enough to justify the added complexity. Instead, the programmer is responsible for freeing  
57698 the stale storage:

```

57699     old = pthread_getspecific(key);
57700     new = allocate();
57701     destructor(old);

```

57702 pthread\_setspecific(key, new);

57703 **Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such  
57704 problems occur in the default cancellation state if no cancellation points occur between the get  
57705 and set.

57706 There is no notion of a destructor-safe function. If an application does not call *pthread\_exit()*  
57707 from a signal handler, or if it blocks any signal whose handler may call *pthread\_exit()* while  
57708 calling async-unsafe functions, all functions may be safely called from destructors.

#### 57709 Non-Idempotent Data Key Creation

57710 There were requests to make *pthread\_key\_create()* idempotent with respect to a given *key* address  
57711 parameter. This would allow applications to call *pthread\_key\_create()* multiple times for a given  
57712 *key* address and be guaranteed that only one key would be created. Doing so would require the  
57713 key value to be previously initialized (possibly at compile time) to a known null value and  
57714 would require that implicit mutual-exclusion be performed based on the address and contents of  
57715 the *key* parameter in order to guarantee that exactly one key would be created.

57716 Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread\_key\_create()*.  
57717 On many implementations, implicit mutual-exclusion would also have to be performed by  
57718 *pthread\_getspecific()* and *pthread\_setspecific()* in order to guard against using incompletely stored  
57719 or not-yet-visible key values. This could significantly increase the cost of important operations,  
57720 particularly *pthread\_getspecific()*.

57721 Thus, this proposal was rejected. The *pthread\_key\_create()* function performs no implicit  
57722 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once  
57723 per key before use of the key. Several straightforward mechanisms can already be used to  
57724 accomplish this, including calling explicit module initialization functions, using mutexes, and  
57725 using *pthread\_once()*. This places no significant burden on the programmer, introduces no  
57726 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows  
57727 commonly used thread-specific data operations to be more efficient.

#### 57728 FUTURE DIRECTIONS

57729 None.

#### 57733 CHANGE HISTORY

57734 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57735 Issue 6

57736 The *pthread\_key\_create()* function is marked as part of the Threads option.

57737 IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

#### 57738 Issue 7

57739 The *pthread\_key\_create()* function is moved from the Threads option to the Base.

#### 57740 Issue 8

57741 Austin Group Defect 1059 is applied, changing the example code in the RATIONALE section.

57742 **NAME**

57743 pthread\_key\_delete — thread-specific data key deletion

57744 **SYNOPSIS**

57745 #include &lt;pthread.h&gt;

57746 int pthread\_key\_delete(pthread\_key\_t key);

57747 **DESCRIPTION**

57748 The *pthread\_key\_delete()* function shall delete a thread-specific data key previously returned by  
57749 *pthread\_key\_create()*. The thread-specific data values associated with *key* need not be NULL at  
57750 the time *pthread\_key\_delete()* is called. It is the responsibility of the application to free any  
57751 application storage or perform any cleanup actions for data structures related to the deleted key  
57752 or associated thread-specific data in any threads; this cleanup can be done either before or after  
57753 *pthread\_key\_delete()* is called. Any attempt to use *key* following the call to *pthread\_key\_delete()*  
57754 results in undefined behavior.

57755 The *pthread\_key\_delete()* function shall be callable from within destructor functions. No  
57756 destructor functions shall be invoked by *pthread\_key\_delete()*. Any destructor function that may  
57757 have been associated with *key* shall no longer be called upon thread exit.

57758 **RETURN VALUE**

57759 If successful, the *pthread\_key\_delete()* function shall return zero; otherwise, an error number shall  
57760 be returned to indicate the error.

57761 **ERRORS**

57762 The *pthread\_key\_delete()* function shall not return an error code of [EINTR].

57763 **EXAMPLES**

57764 None.

57765 **APPLICATION USAGE**

57766 None.

57767 **RATIONALE**

57768 A thread-specific data key deletion function has been included in order to allow the resources  
57769 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys  
57770 can arise, among other scenarios, when a dynamically loaded module that allocated a key is  
57771 unloaded.

57772 Conforming applications are responsible for performing any cleanup actions needed for data  
57773 structures associated with the key to be deleted, including data referenced by thread-specific  
57774 data values. No such cleanup is done by *pthread\_key\_delete()*. In particular, destructor functions  
57775 are not called. There are several reasons for this division of responsibility:

- 57776 1. The associated destructor functions used to free thread-specific data at thread exit time  
57777 are only guaranteed to work correctly when called in the thread that allocated the thread-  
57778 specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot  
57779 be used to free thread-specific data in other threads at key deletion time. Attempting to  
57780 have them called by other threads at key deletion time would require other threads to be  
57781 asynchronously interrupted. But since interrupted threads could be in an arbitrary state,  
57782 including holding locks necessary for the destructor to run, this approach would fail. In  
57783 general, there is no safe mechanism whereby an implementation could free thread-  
57784 specific data at key deletion time.
- 57785 2. Even if there were a means of safely freeing thread-specific data associated with keys to  
57786 be deleted, doing so would require that implementations be able to enumerate the  
57787 threads with non-NULL data and potentially keep them from creating more thread-

57788 specific data while the key deletion is occurring. This special case could cause extra  
57789 synchronization in the normal case, which would otherwise be unnecessary.

57790 For an application to know that it is safe to delete a key, it has to know that all the threads that  
57791 might potentially ever use the key do not attempt to use it again. For example, it could know  
57792 this if all the client threads have called a cleanup procedure declaring that they are through with  
57793 the module that is being shut down, perhaps by setting a reference count to zero.

57794 If an implementation detects that the value specified by the *key* argument to *pthread\_key\_delete()*  
57795 does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been  
57796 deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an  
57797 [EINVAL] error.

#### 57798 FUTURE DIRECTIONS

57799 None.

#### 57800 SEE ALSO

57801 [\*pthread\\_key\\_create\(\)\*](#)

57802 XBD <[pthread.h](#)>

#### 57803 CHANGE HISTORY

57804 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 57805 Issue 6

57806 The *pthread\_key\_delete()* function is marked as part of the Threads option.

#### 57807 Issue 7

57808 The *pthread\_key\_delete()* function is moved from the Threads option to the Base.

57809 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
57810 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

57811 **NAME**

57812 pthread\_kill — send a signal to a thread

57813 **SYNOPSIS**

```
57814 CX #include <signal.h>
57815 int pthread_kill(pthread_t thread, int sig);
```

57816 **DESCRIPTION**

57817 The *pthread\_kill()* function shall request that a signal be delivered to the specified thread. It shall  
57818 not be an error if *thread* is a zombie thread.

57819 **RETURN VALUE**

57820 Upon successful completion, the function shall return a value of zero. Otherwise, the function  
57821 shall return an error number. If the *pthread\_kill()* function fails, no signal shall be sent.

57822 **ERRORS**

57823 The *pthread\_kill()* function may fail if:

57824 [EINVAL] The value of the *sig* argument is zero.

57825 The *pthread\_kill()* function shall fail if:

57826 [EINVAL] The value of the *sig* argument is non-zero and is an invalid or unsupported  
57827 signal number.

57828 The *pthread\_kill()* function shall not return an error code of [EINTR].

57829 **EXAMPLES**

57830 None.

57831 **APPLICATION USAGE**

57832 The *pthread\_kill()* function provides a mechanism for asynchronously directing a signal at a  
57833 thread in the calling process. This could be used, for example, by one thread to affect broadcast  
57834 delivery of a signal to a set of threads.

57835 Note that *pthread\_kill()* only causes the signal to be handled in the context of the given thread;  
57836 the signal action (termination or stopping) affects the process as a whole.

57837 **RATIONALE**

57838 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
57839 that the function should fail and report an [ESRCH] error.

57840 Historical implementations varied on the result of a *pthread\_kill()* with a thread ID indicating a  
57841 zombie thread. Some indicated success on such a call, while others gave an error of [ESRCH].  
57842 Since the definition of thread lifetime in this volume of POSIX.1-2024 covers zombie threads, the  
57843 [ESRCH] error as described is inappropriate in this case and implementations that give this error  
57844 do not conform. In particular, this means that an application cannot have one thread check for  
57845 termination of another by calling *pthread\_kill()* with a *sig* argument of zero, and implementations  
57846 may indicate that it is not possible by returning [EINVAL] when *sig* is zero.

57847 **FUTURE DIRECTIONS**

57848 None.

57849 **SEE ALSO**

57850 *kill()*, *pthread\_self()*, *raise()*

57851 XBD <signal.h>

## 57852 CHANGE HISTORY

57853 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

### 57854 Issue 6

57855 The *pthread\_kill()* function is marked as part of the Threads option.

57856 The APPLICATION USAGE section is added.

### 57857 Issue 7

57858 The *pthread\_kill()* function is moved from the Threads option to the Base.

57859 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

57860 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0277 [765] is applied.

### 57861 Issue 8

57862 Austin Group Defect 792 is applied, adding a requirement that passing the thread ID of a zombie thread to *pthread\_kill()* is not treated as an error.

57864 Austin Group Defect 1214 is applied, allowing *pthread\_kill()* to fail with [EINVAL] when the *sig* argument is zero.

57866 **NAME**

57867 pthread\_mutex\_clocklock, pthread\_mutex\_timedlock — lock a mutex

57868 **SYNOPSIS**

```
57869 #include <pthread.h>
57870 int pthread_mutex_clocklock(pthread_mutex_t *restrict mutex,
57871     clockid_t clock_id, const struct timespec *restrict abstime);
57872 int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
57873     const struct timespec *restrict abstime);
```

57874 **DESCRIPTION**

57875 The *pthread\_mutex\_clocklock()* and *pthread\_mutex\_timedlock()* functions shall lock the mutex  
 57876 object referenced by *mutex*. If the mutex is already locked, the calling thread shall block until the  
 57877 mutex becomes available as in the *pthread\_mutex\_lock()* function. If the mutex cannot be locked  
 57878 without waiting for another thread to unlock the mutex, this wait shall be terminated when the  
 57879 specified timeout expires.

57880 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 57881 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 57882 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 57883 call.

57884 For *pthread\_mutex\_timedlock()*, the timeout shall be based on the CLOCK\_REALTIME clock. For  
 57885 *pthread\_mutex\_clocklock()*, the timeout shall be based on the clock specified by the *clock\_id*  
 57886 argument. The resolution of the timeout shall be the resolution of the clock on which it is based.  
 57887 Implementations shall support passing CLOCK\_REALTIME and CLOCK\_MONOTONIC to  
 57888 *pthread\_mutex\_clocklock()* as the *clock\_id* argument.

57889 Under no circumstance shall the function fail with a timeout if the mutex can be locked  
 57890 immediately. The validity of the *abstime* parameter need not be checked if the mutex can be  
 57891 locked immediately.

57892 RPI|TPI As a consequence of the priority inheritance rules (for mutexes initialized with the  
 57893 PRIO\_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the  
 57894 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this  
 57895 thread is no longer among the threads waiting for the mutex.

57896 If *mutex* is a robust mutex and the process containing the owning thread terminated while  
 57897 holding the mutex lock, a call to *pthread\_mutex\_clocklock()* or *pthread\_mutex\_timedlock()* shall  
 57898 return the error value [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread  
 57899 terminated while holding the mutex lock, a call to *pthread\_mutex\_clocklock()* or  
 57900 *pthread\_mutex\_timedlock()* may return the error value [EOWNERDEAD] even if the process in  
 57901 which the owning thread resides has not terminated. In these cases, the mutex is locked by the  
 57902 thread but the state it protects is marked as inconsistent. The application should ensure that the  
 57903 state is made consistent for reuse and when that is complete call *pthread\_mutex\_consistent()*. If  
 57904 the application is unable to recover the state, it should unlock the mutex without a prior call to  
 57905 *pthread\_mutex\_consistent()*, after which the mutex is marked permanently unusable.

57906 If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

57907 **RETURN VALUE**

57908 If successful, the *pthread\_mutex\_clocklock()* and *pthread\_mutex\_timedlock()* functions shall return  
 57909 zero; otherwise, an error number shall be returned to indicate the error.

57910 **ERRORS**

- 57911 The *pthread\_mutex\_clocklock()* and *pthread\_mutex\_timedlock()* functions shall fail if:
- 57912 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
57913 locks for *mutex* has been exceeded.
- 57914 [EAGAIN] The mutex is a robust mutex and the system resources available for robust  
57915 mutexes owned would be exceeded.
- 57916 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
57917 thread already owns the mutex.
- 57918 [EINVAL] The mutex was created with the protocol attribute having the value  
57919 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
57920 the mutex' current priority ceiling.
- 57921 [EINVAL] The process or thread would have blocked, and either the *abstime* parameter  
57922 specified a nanoseconds field value less than zero or greater than or equal to  
57923 1 000 million, or the *pthread\_mutex\_clocklock()* function was passed an invalid  
57924 or unsupported *clock\_id* value.
- 57925 [ENOTRECOVERABLE]  
57926 The state protected by the mutex is not recoverable.
- 57927 [EOWNERDEAD]  
57928 The mutex is a robust mutex and the process containing the previous owning  
57929 thread terminated while holding the mutex lock. The mutex lock shall be  
57930 acquired by the calling thread and it is up to the new owner to make the state  
57931 consistent.
- 57932 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.  
57933 The *pthread\_mutex\_clocklock()* and *pthread\_mutex\_timedlock()* functions may fail if:
- 57934 [EDEADLK] A deadlock condition was detected.
- 57935 [EOWNERDEAD]  
57936 The mutex is a robust mutex and the previous owning thread terminated  
57937 while holding the mutex lock. The mutex lock shall be acquired by the calling  
57938 thread and it is up to the new owner to make the state consistent.
- 57939 These functions shall not return an error code of [EINTR].

57940 **EXAMPLES**

57941 None.

57942 **APPLICATION USAGE**

57943 Applications that have assumed that non-zero return values are errors will need updating for  
57944 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
57945 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
57946 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
57947 an application is supposed to work with normal and robust mutexes, it should check all return  
57948 values for error conditions and if necessary take appropriate action.

57949 **RATIONALE**57950 Refer to *pthread\_mutex\_lock()*.

57951 **FUTURE DIRECTIONS**

57952 None.

57953 **SEE ALSO**57954 *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*, *time()*57955 XBD Section 4.15.2 (on page 104), **<pthread.h>**, **<time.h>**57956 **CHANGE HISTORY**

57957 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

57958 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/99 is applied, marking the last paragraph  
57959 in the DESCRIPTION as part of the Thread Priority Inheritance option.57960 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/100 is applied, updating the ERRORS  
57961 section so that the [EDEADLK] error includes detection of a deadlock condition.57962 **Issue 7**

57963 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

57964 The *pthread\_mutex\_timedlock()* function is moved from the Timeouts option to the Base.

57965 Functionality relating to the Timers option is moved to the Base.

57966 The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized  
57967 mutex.

57968 The ERRORS section is updated to account properly for all of the various mutex types.

57969 **Issue 8**57970 Austin Group Defect 354 is applied, adding the [EAGAIN] error for exceeding system resources  
57971 available for robust mutexes owned.57972 Austin Group Defect 592 is applied, removing text relating to **<time.h>** from the SYNOPSIS and  
57973 DESCRIPTION sections.57974 Austin Group Defects 1216 and 1472 are applied, adding *pthread\_mutex\_clocklock()*.

57975 **NAME**

57976 pthread\_mutex\_consistent — mark state protected by robust mutex as consistent

57977 **SYNOPSIS**

57978 #include &lt;pthread.h&gt;

57979 int pthread\_mutex\_consistent(pthread\_mutex\_t \*mutex);

57980 **DESCRIPTION**57981 If *mutex* is a robust mutex in an inconsistent state, the *pthread\_mutex\_consistent()* function can be  
57982 used to mark the state protected by the mutex referenced by *mutex* as consistent again.57983 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes  
57984 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the  
57985 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again  
57986 until the state is marked consistent.57987 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates  
57988 before calling either *pthread\_mutex\_consistent()* or *pthread\_mutex\_unlock()*, the next thread that  
57989 acquires the mutex lock shall be notified about the state of the mutex by the return value  
57990 [EOWNERDEAD].57991 The behavior is undefined if the value specified by the *mutex* argument to  
57992 *pthread\_mutex\_consistent()* does not refer to an initialized mutex.57993 **RETURN VALUE**57994 Upon successful completion, the *pthread\_mutex\_consistent()* function shall return zero.  
57995 Otherwise, an error value shall be returned to indicate the error.57996 **ERRORS**57997 The *pthread\_mutex\_consistent()* function shall fail if:57998 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an  
57999 inconsistent state.

58000 These functions shall not return an error code of [EINTR].

58001 **EXAMPLES**

58002 None.

58003 **APPLICATION USAGE**58004 The *pthread\_mutex\_consistent()* function is only responsible for notifying the implementation that  
58005 the state protected by the mutex has been recovered and that normal operations with the mutex  
58006 can be resumed. It is the responsibility of the application to recover the state so it can be reused.  
58007 If the application is not able to perform the recovery, it can notify the implementation that the  
58008 situation is unrecoverable by a call to *pthread\_mutex\_unlock()* without a prior call to  
58009 *pthread\_mutex\_consistent()*, in which case subsequent threads that attempt to lock the mutex will  
58010 fail to acquire the lock and be returned [ENOTRECOVERABLE].58011 **RATIONALE**58012 If an implementation detects that the value specified by the *mutex* argument to  
58013 *pthread\_mutex\_consistent()* does not refer to an initialized mutex, it is recommended that the  
58014 function should fail and report an [EINVAL] error.58015 **FUTURE DIRECTIONS**

58016 None.

58020 **CHANGE HISTORY**

58021 First released in Issue 7.

58022 **NAME**

58023 pthread\_mutex\_destroy, pthread\_mutex\_init — destroy and initialize a mutex

58024 **SYNOPSIS**

```
58025 #include <pthread.h>
58026 int pthread_mutex_destroy(pthread_mutex_t *mutex);
58027 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
58028     const pthread_mutexattr_t *restrict attr);
58029 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

58030 **DESCRIPTION**

58031 The *pthread\_mutex\_destroy()* function shall destroy the mutex object referenced by *mutex*; the  
58032 mutex object becomes, in effect, uninitialized. An implementation may cause  
58033 *pthread\_mutex\_destroy()* to set the object referenced by *mutex* to an invalid value.

58034 A destroyed mutex object can be reinitialized using *pthread\_mutex\_init()*; the results of otherwise  
58035 referencing the object after it has been destroyed are undefined.

58036 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked  
58037 mutex, or a mutex that another thread is attempting to lock, or a mutex that is being used in a  
58038 *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* call by another thread,  
58039 results in undefined behavior.

58040 The *pthread\_mutex\_init()* function shall initialize the mutex referenced by *mutex* with attributes  
58041 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the  
58042 same as passing the address of a default mutex attributes object. Upon successful initialization,  
58043 the state of the mutex becomes initialized and unlocked.

58044 See [Section 2.9.9](#) (on page 548) for further requirements.

58045 Attempting to initialize an already initialized mutex results in undefined behavior.

58046 In cases where default mutex attributes are appropriate, the macro  
58047 PTHREAD\_MUTEX\_INITIALIZER can be used to initialize mutexes. The effect shall be  
58048 equivalent to dynamic initialization by a call to *pthread\_mutex\_init()* with parameter *attr*  
58049 specified as NULL, except that no error checks are performed.

58050 The behavior is undefined if the value specified by the *mutex* argument to  
58051 *pthread\_mutex\_destroy()* does not refer to an initialized mutex.

58052 The behavior is undefined if the value specified by the *attr* argument to *pthread\_mutex\_init()*  
58053 does not refer to an initialized mutex attributes object.

58054 **RETURN VALUE**

58055 If successful, the *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions shall return zero;  
58056 otherwise, an error number shall be returned to indicate the error.

58057 **ERRORS**

58058 The *pthread\_mutex\_init()* function shall fail if:

58059 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
58060 another mutex.

58061 [ENOMEM] Insufficient memory exists to initialize the mutex.

58062 [EPERM] The caller does not have the privilege to perform the operation.

58063 The *pthread\_mutex\_init()* function may fail if:  
 58064 [EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set  
 58065 without the process-shared attribute being set.  
 58066 These functions shall not return an error code of [EINTR].

**EXAMPLES**

58067 None.  
 58068

**APPLICATION USAGE**

58069 None.  
 58070

**RATIONALE**

58071 If an implementation detects that the value specified by the *mutex* argument to  
 58072 *pthread\_mutex\_destroy()* does not refer to an initialized mutex, it is recommended that the  
 58073 function should fail and report an [EINVAL] error.  
 58074

58075 If an implementation detects that the value specified by the *mutex* argument to  
 58076 *pthread\_mutex\_destroy()* or *pthread\_mutex\_init()* refers to a locked mutex or a mutex that is  
 58077 referenced (for example, while being used in a *pthread\_cond\_clockwait()*,  
 58078 *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* call) by another thread, or detects that the value  
 58079 specified by the *mutex* argument to *pthread\_mutex\_init()* refers to an already initialized mutex, it  
 58080 is recommended that the function should fail and report an [EBUSY] error.

58081 If an implementation detects that the value specified by the *attr* argument to  
 58082 *pthread\_mutex\_init()* does not refer to an initialized mutex attributes object, it is recommended  
 58083 that the function should fail and report an [EINVAL] error.

**Alternate Implementations Possible**

58084  
 58085 This volume of POSIX.1-2024 supports several alternative implementations of mutexes. An  
 58086 implementation may store the lock directly in the object of type **pthread\_mutex\_t**. Alternatively,  
 58087 an implementation may store the lock in the heap and merely store a pointer, handle, or unique  
 58088 ID in the mutex object. Either implementation has advantages or may be required on certain  
 58089 hardware configurations. So that portable code can be written that is invariant to this choice, this  
 58090 volume of POSIX.1-2024 does not define assignment or equality for this type, and it uses the  
 58091 term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the  
 58092 mutex object itself.

58093 Note that this precludes an over-specification of the type of the mutex or condition variable and  
 58094 motivates the opaqueness of the type.

58095 An implementation is permitted, but not required, to have *pthread\_mutex\_destroy()* store an  
 58096 illegal value into the mutex. This may help detect erroneous programs that try to lock (or  
 58097 otherwise reference) a mutex that has already been destroyed.

**Tradeoff Between Error Checks and Performance Supported**

58098  
 58099 Many error conditions that can occur are not required to be detected by the implementation in  
 58100 order to let implementations trade off performance *versus* degree of error checking according to  
 58101 the needs of their specific applications and execution environment. As a general rule, conditions  
 58102 caused by the system (such as insufficient memory) are required to be detected, but conditions  
 58103 caused by an erroneously coded application (such as failing to provide adequate  
 58104 synchronization to prevent a mutex from being deleted while in use) are specified to result in  
 58105 undefined behavior.

58106 A wide range of implementations is thus made possible. For example, an implementation

58107 intended for application debugging may implement all of the error checks, but an  
58108 implementation running a single, provably correct application under very tight performance  
58109 constraints in an embedded computer might implement minimal checks. An implementation  
58110 might even be provided in two versions, similar to the options that compilers provide: a full-  
58111 checking, but slower version; and a limited-checking, but faster version. To forbid this  
58112 optionality would be a disservice to users.

58113 By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly  
58114 coded) application might do, and by defining that resource-not-available errors are mandatory,  
58115 this volume of POSIX.1-2024 ensures that a fully-conforming application is portable across the  
58116 full range of implementations, while not forcing all implementations to add overhead to check  
58117 for numerous things that a correct program never does. When the behavior is undefined, no  
58118 error number is specified to be returned on implementations that do detect the condition. This is  
58119 because undefined behavior means *anything* can happen, which includes returning with any  
58120 value (which might happen to be a valid, but different, error number). However, since the error  
58121 number might be useful to application developers when diagnosing problems during  
58122 application development, a recommendation is made in rationale that implementors should  
58123 return a particular error number if their implementation does detect the condition.

#### 58124 **Why No Limits are Defined**

58125 Defining symbols for the maximum number of mutexes and condition variables was considered  
58126 but rejected because the number of these objects may change dynamically. Furthermore, many  
58127 implementations place these objects into application memory; thus, there is no explicit  
58128 maximum.

#### 58129 **Static Initializers for Mutexes and Condition Variables**

58130 Providing for static initialization of statically allocated synchronization objects allows modules  
58131 with private static synchronization variables to avoid runtime initialization tests and overhead.  
58132 Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in  
58133 C libraries, where for various reasons the design calls for self-initialization instead of requiring  
58134 an explicit module initialization function to be called. An example use of static initialization  
58135 follows.

58136 Without static initialization, a self-initializing routine *foo()* might look as follows:

```
58137 static pthread_once_t foo_once = PTHREAD_ONCE_INIT;  
58138 static pthread_mutex_t foo_mutex;  
  
58139 void foo_init()  
58140 {  
58141     pthread_mutex_init(&foo_mutex, NULL);  
58142 }  
  
58143 void foo()  
58144 {  
58145     pthread_once(&foo_once, foo_init);  
58146     pthread_mutex_lock(&foo_mutex);  
58147     /* Do work. */  
58148     pthread_mutex_unlock(&foo_mutex);  
58149 }
```

58150 With static initialization, the same routine could be coded as follows:

```
58151 static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```

58152     void foo()
58153     {
58154         pthread_mutex_lock(&foo_mutex);
58155         /* Do work. */
58156         pthread_mutex_unlock(&foo_mutex);
58157     }

```

58158 Note that the static initialization both eliminates the need for the initialization test inside  
58159 *pthread\_once()* and the fetch of *&foo\_mutex* to learn the address to be passed to  
58160 *pthread\_mutex\_lock()* or *pthread\_mutex\_unlock()*.

58161 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a  
58162 large class of systems; those where the (entire) synchronization object can be stored in  
58163 application memory.

58164 Yet the locking performance question is likely to be raised for machines that require mutexes to  
58165 be allocated out of special memory. Such machines actually have to have mutexes and possibly  
58166 condition variables contain pointers to the actual hardware locks. For static initialization to work  
58167 on such machines, *pthread\_mutex\_lock()* also has to test whether or not the pointer to the actual  
58168 lock has been allocated. If it has not, *pthread\_mutex\_lock()* has to initialize it before use. The  
58169 reservation of such resources can be made when the program is loaded, and hence return codes  
58170 have not been added to mutex locking and condition variable waiting to indicate failure to  
58171 complete initialization.

58172 This runtime test in *pthread\_mutex\_lock()* would at first seem to be extra work; an extra test is  
58173 required to see whether the pointer has been initialized. On most machines this would actually  
58174 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the  
58175 pointer if it has already been initialized. While the test might seem to add extra work, the extra  
58176 effort of testing a register is usually negligible since no extra memory references are actually  
58177 done. As more and more machines provide caches, the real expenses are memory references, not  
58178 instructions executed.

58179 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*  
58180 overhead in the most important case: on the lock operations that occur *after* the lock has been  
58181 initialized. This can be done by shifting more overhead to the less frequent operation:  
58182 initialization. Since out-of-line mutex allocation also means that an address has to be  
58183 dereferenced to find the actual lock, one technique that is widely applicable is to have static  
58184 initialization store a bogus value for that address; in particular, an address that causes a machine  
58185 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity  
58186 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent  
58187 lock operations incur no extra overhead since they do not “fault”. This is merely one technique  
58188 that can be used to support static initialization, while not adversely affecting the performance of  
58189 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

58190 The locking overhead for machines doing out-of-line mutex allocation is thus similar for  
58191 modules being implicitly initialized, where it is improved for those doing mutex allocation  
58192 entirely inline. The inline case is thus made much faster, and the out-of-line case is not  
58193 significantly worse.

58194 Besides the issue of locking performance for such machines, a concern is raised that it is possible  
58195 that threads would serialize contending for initialization locks when attempting to finish  
58196 initializing statically allocated mutexes. (Such finishing would typically involve taking an  
58197 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing  
58198 the internal lock.) First, many implementations would reduce such serialization by hashing on  
58199 the mutex address. Second, such serialization can only occur a bounded number of times. In

58200 particular, it can happen at most as many times as there are statically allocated synchronization  
 58201 objects. Dynamically allocated objects would still be initialized via *pthread\_mutex\_init()* or  
 58202 *pthread\_cond\_init()*.

58203 Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient  
 58204 performance for an application on some implementation, the application can avoid static  
 58205 initialization altogether by explicitly initializing all synchronization objects with the  
 58206 corresponding *pthread\_\*\_init()* functions, which are supported by all implementations. An  
 58207 implementation can also document the tradeoffs and advise which initialization technique is  
 58208 more efficient for that particular implementation.

### 58209 Destroying Mutexes

58210 A mutex can be destroyed immediately after it is unlocked. However, since attempting to  
 58211 destroy a locked mutex, or a mutex that another thread is attempting to lock, or a mutex that is  
 58212 being used in a *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* call by  
 58213 another thread, results in undefined behavior, care must be taken to ensure that no other thread  
 58214 may be referencing the mutex.

### 58215 Robust Mutexes

58216 Implementations are required to provide robust mutexes for mutexes with the process-shared  
 58217 attribute set to PTHREAD\_PROCESS\_SHARED. Implementations are allowed, but not required,  
 58218 to provide robust mutexes when the process-shared attribute is set to  
 58219 PTHREAD\_PROCESS\_PRIVATE.

### 58220 FUTURE DIRECTIONS

58221 None.

### 58222 SEE ALSO

58223 *pthread\_mutex\_getprioceiling()*, *pthread\_mutexattr\_getrobust()*, *pthread\_mutex\_clocklock()*,  
 58224 *pthread\_mutex\_lock()*, *pthread\_mutexattr\_getpshared()*

58225 XBD <pthread.h>

### 58226 CHANGE HISTORY

58227 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

### 58228 Issue 6

58229 The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are marked as part of the  
 58230 Threads option.

58231 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
 58232 IEEE Std 1003.1d-1999.

58233 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

58234 The **restrict** keyword is added to the *pthread\_mutex\_init()* prototype for alignment with the  
 58235 ISO/IEC 9899:1999 standard.

### 58236 Issue 7

58237 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

58238 The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are moved from the Threads  
 58239 option to the Base.

58240 The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is  
 58241 removed; this condition results in undefined behavior.

- 58242 The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex  
58243 is removed; this condition results in undefined behavior.
- 58244 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0460 [70,428] is applied.
- 58245 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0278 [811], XSH/TC2-2008/0279 [972],  
58246 and XSH/TC2-2008/0280 [811] are applied.
- 58247 **Issue 8**  
58248 Austin Group Defect 1216 is applied, adding *pthread\_cond\_clockwait()*.

58249 **NAME**

58250 pthread\_mutex\_getprioceiling, pthread\_mutex\_setprioceiling — get and set the priority ceiling  
58251 of a mutex (**REALTIME THREADS**)

58252 **SYNOPSIS**

```
58253 RPP|TPP #include <pthread.h>
58254 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
58255 int *restrict prioceiling);
58256 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
58257 int prioceiling, int *restrict old_ceiling);
```

58258 **DESCRIPTION**

58259 The *pthread\_mutex\_getprioceiling()* function shall return the current priority ceiling of the mutex.

58260 The *pthread\_mutex\_setprioceiling()* function shall attempt to lock the mutex as if by a call to  
58261 *pthread\_mutex\_lock()*, except that the process of locking the mutex need not adhere to the priority  
58262 protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then  
58263 release the mutex as if by a call to *pthread\_mutex\_unlock()*. When the change is successful, the  
58264 previous value of the priority ceiling shall be returned in *old\_ceiling*.

58265 If the *pthread\_mutex\_setprioceiling()* function fails, the mutex priority ceiling shall not be  
58266 changed.

58267 **RETURN VALUE**

58268 If successful, the *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions shall  
58269 return zero; otherwise, an error number shall be returned to indicate the error.

58270 **ERRORS**

58271 These functions shall fail if:

- 58272 [EINVAL] The protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.
- 58273 [EPERM] The implementation requires appropriate privileges to perform the operation  
58274 and the caller does not have appropriate privileges.

58275 The *pthread\_mutex\_setprioceiling()* function shall fail if:

- 58276 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
58277 locks for *mutex* has been exceeded.
- 58278 [EAGAIN] The mutex is a robust mutex and the system resources available for robust  
58279 mutexes owned would be exceeded.
- 58280 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
58281 thread already owns the mutex.
- 58282 [EINVAL] The mutex was created with the protocol attribute having the value  
58283 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
58284 the mutex's current priority ceiling, and the implementation adheres to the  
58285 priority protect protocol in the process of locking the mutex.
- 58286 [ENOTRECOVERABLE]  
58287 The mutex is a robust mutex and the state protected by the mutex is not  
58288 recoverable.
- 58289 [EOWNERDEAD]  
58290 The mutex is a robust mutex and the process containing the previous owning  
58291 thread terminated while holding the mutex lock. The mutex lock shall be

58292 acquired by the calling thread and it is up to the new owner to make the state  
58293 consistent (see *pthread\_mutex\_lock()*).

58294 The *pthread\_mutex\_setprioceiling()* function may fail if:

58295 [EDEADLK] A deadlock condition was detected.

58296 [EINVAL] The priority requested by *prioceiling* is out of range.

58297 [EOWNERDEAD]

58298 The mutex is a robust mutex and the previous owning thread terminated  
58299 while holding the mutex lock. The mutex lock shall be acquired by the calling  
58300 thread and it is up to the new owner to make the state consistent (see  
58301 *pthread\_mutex\_lock()*).

58302 These functions shall not return an error code of [EINTR].

58312 *pthread\_mutex\_clocklock()*, *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*

58313 XBD <pthread.h>

#### 58314 CHANGE HISTORY

58315 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

58316 Marked as part of the Realtime Threads Feature Group.

#### 58317 Issue 6

58318 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are marked as  
58319 part of the Threads and Thread Priority Protection options.

58320 The [ENOSYS] error conditions have been removed.

58321 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
58322 IEEE Std 1003.1d-1999.

58323 The **restrict** keyword is added to the *pthread\_mutex\_getprioceiling()* and  
58324 *pthread\_mutex\_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

#### 58325 Issue 7

58326 SD5-XSH-ERN-39 is applied.

58327 Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a ``may fail''  
58328 error.

58329 SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a ``shall fail'' error case  
58330 for when the protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.

58331 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are moved from  
58332 the Threads option to require support of either the Robust Mutex Priority Protection option or

58333 the Non-Robust Mutex Priority Protection option.

58334 The DESCRIPTION and ERRORS sections are updated to account properly for all of the various  
58335 mutex types.

58336 **Issue 8**

58337 Austin Group Defect 354 is applied, adding the [EAGAIN] error for exceeding system resources  
58338 available for robust mutexes owned.

58339 **NAME**

58340 pthread\_mutex\_init — destroy and initialize a mutex

58341 **SYNOPSIS**

58343 int pthread\_mutex\_init(pthread\_mutex\_t \*restrict mutex,

58344 const pthread\_mutexattr\_t \*restrict attr);

58345 pthread\_mutex\_t mutex = PTHREAD\_MUTEX\_INITIALIZER;

58346 **DESCRIPTION**58347 Refer to *pthread\_mutex\_destroy()*.

58348 **NAME**

58349 pthread\_mutex\_lock, pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a  
58350 mutex

58351 **SYNOPSIS**

```
58352 #include <pthread.h>
58353 int pthread_mutex_lock(pthread_mutex_t *mutex);
58354 int pthread_mutex_trylock(pthread_mutex_t *mutex);
58355 int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

58356 **DESCRIPTION**

58357 The mutex object referenced by *mutex* shall be locked by a call to *pthread\_mutex\_lock()* that  
58358 returns zero or [EOWNERDEAD]. If the mutex is already locked by another thread, the calling  
58359 thread shall block until the mutex becomes available. This operation shall return with the mutex  
58360 object referenced by *mutex* in the locked state with the calling thread as its owner. If a thread  
58361 attempts to relock a mutex that it has already locked, *pthread\_mutex\_lock()* shall behave as  
58362 described in the **Relock** column of the following table. If a thread attempts to unlock a mutex  
58363 that it has not locked or a mutex which is unlocked, *pthread\_mutex\_unlock()* shall behave as  
58364 described in the **Unlock When Not Owner** column of the following table.

Mutex Type	Robustness	Relock	Unlock When Not Owner
NORMAL	non-robust	deadlock	undefined behavior
NORMAL	robust	deadlock	error returned
ERRORCHECK	either	error returned	error returned
RECURSIVE	either	recursive (see below)	error returned
DEFAULT	non-robust	undefined behavior†	undefined behavior†
DEFAULT	robust	undefined behavior†	error returned

58375 † If the mutex type is PTHREAD\_MUTEX\_DEFAULT, the behavior of *pthread\_mutex\_lock()*  
58376 may correspond to one of the three other standard mutex types as described in the table  
58377 above. If it does not correspond to one of those three, the behavior is undefined for the cases  
58378 marked †.

58379 Where the table indicates recursive behavior, the mutex shall maintain the concept of a lock  
58380 count. When a thread successfully acquires a mutex for the first time, the lock count shall be set  
58381 to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each  
58382 time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock  
58383 count reaches zero, the mutex shall become available for other threads to acquire.

58384 The *pthread\_mutex\_trylock()* function shall be equivalent to *pthread\_mutex\_lock()*, except that if  
58385 the mutex object referenced by *mutex* is currently locked (by any thread, including the current  
58386 thread), the call shall return immediately. If the mutex type is PTHREAD\_MUTEX\_RECURSIVE  
58387 and the mutex is currently owned by the calling thread, the mutex lock count shall be  
58388 incremented by one and the *pthread\_mutex\_trylock()* function shall immediately return success.

58389 The *pthread\_mutex\_unlock()* function shall release the mutex object referenced by *mutex*. The  
58390 manner in which a mutex is released is dependent upon the mutex's type attribute. If there are  
58391 threads blocked on the mutex object referenced by *mutex* when *pthread\_mutex\_unlock()* is called,  
58392 resulting in the mutex becoming available, the scheduling policy shall determine which thread  
58393 shall acquire the mutex.

58394 (In the case of PTHREAD\_MUTEX\_RECURSIVE mutexes, the mutex shall become available  
58395 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

58396 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the  
58397 thread shall resume waiting for the mutex as if it was not interrupted.

58398 If *mutex* is a robust mutex and the process containing the owning thread terminated while  
58399 holding the mutex lock, a call to *pthread\_mutex\_lock()* shall return the error value  
58400 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding  
58401 the mutex lock, a call to *pthread\_mutex\_lock()* may return the error value [EOWNERDEAD] even  
58402 if the process in which the owning thread resides has not terminated. In these cases, the mutex  
58403 shall be locked by the calling thread but the state it protects is marked as inconsistent. The  
58404 application should ensure that the state is made consistent for reuse and when that is complete  
58405 call *pthread\_mutex\_consistent()*. If the application is unable to recover the state, it should unlock  
58406 the mutex without a prior call to *pthread\_mutex\_consistent()*, after which the mutex is marked  
58407 permanently unusable.

58408 If *mutex* does not refer to an initialized mutex object, the behavior of *pthread\_mutex\_lock()*,  
58409 *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* is undefined.

#### 58410 RETURN VALUE

58411 If successful, the *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()*  
58412 functions shall return zero; otherwise, an error number shall be returned to indicate the error.

#### 58413 ERRORS

58414 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions shall fail if:

58415 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
58416 locks for *mutex* has been exceeded.

58417 [EAGAIN] The mutex is a robust mutex and the system resources available for robust  
58418 mutexes owned would be exceeded.

58419 RPP|TPP [EINVAL] The *mutex* was created with the protocol attribute having the value  
58420 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
58421 the mutex's current priority ceiling.

58422 [ENOTRECOVERABLE]

58423 The state protected by the mutex is not recoverable.

58424 [EOWNERDEAD]

58425 The mutex is a robust mutex and the process containing the previous owning  
58426 thread terminated while holding the mutex lock. The mutex lock shall be  
58427 acquired by the calling thread and it is up to the new owner to make the state  
58428 consistent.

58429 The *pthread\_mutex\_lock()* function shall fail if:

58430 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
58431 thread already owns the mutex.

58432 The *pthread\_mutex\_trylock()* function shall fail if:

58433 [EBUSY] The *mutex* could not be acquired because it was already locked.

58434 The *pthread\_mutex\_unlock()* function shall fail if:

58435 [EPERM] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or  
58436 PTHREAD\_MUTEX\_RECURSIVE, or the mutex is a robust mutex, and the  
58437 current thread does not own the mutex.

58438 The `pthread_mutex_lock()` and `pthread_mutex_trylock()` functions may fail if:  
58439 [EOWNERDEAD]  
58440 The mutex is a robust mutex and the previous owning thread terminated  
58441 while holding the mutex lock. The mutex lock shall be acquired by the calling  
58442 thread and it is up to the new owner to make the state consistent.

58443 The `pthread_mutex_lock()` function may fail if:  
58444 [EDEADLK] A deadlock condition was detected.  
58445 These functions shall not return an error code of [EINTR].

#### 58446 EXAMPLES

58447 None.

#### 58448 APPLICATION USAGE

58449 Applications that have assumed that non-zero return values are errors will need updating for  
58450 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
58451 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
58452 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
58453 an application is supposed to work with normal and robust mutexes it should check all return  
58454 values for error conditions and if necessary take appropriate action.

#### 58455 RATIONALE

58456 Mutex objects are intended to serve as a low-level primitive from which other thread  
58457 synchronization functions can be built. As such, the implementation of mutexes should be as  
58458 efficient as possible, and this has ramifications on the features available at the interface.

58459 The mutex functions and the particular default settings of the mutex attributes have been  
58460 motivated by the desire to not preclude fast, inlined implementations of mutex locking and  
58461 unlocking.

58462 Since most attributes only need to be checked when a thread is going to be blocked, the use of  
58463 attributes does not slow the (common) mutex-locking case.

58464 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it  
58465 would require storing the current thread ID when each mutex is locked, and this could incur  
58466 unacceptable levels of overhead. Similar arguments apply to a `mutex_tryunlock` operation.

58467 For further rationale on the extended mutex types, see XRAT [Threads Extensions](#) (on page 3815).

58468 If an implementation detects that the value specified by the `mutex` argument does not refer to an  
58469 initialized mutex object, it is recommended that the function should fail and report an [EINVAL]  
58470 error.

#### 58471 FUTURE DIRECTIONS

58472 None.

#### 58477 CHANGE HISTORY

58478 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

58479 The `pthread_mutex_lock()`, `pthread_mutex_trylock()`, and `pthread_mutex_unlock()` functions are  
58480 marked as part of the Threads option.  
58481

58482 The following new requirements on POSIX implementations derive from alignment with the  
58483 Single UNIX Specification:

- 58484 • The behavior when attempting to relock a mutex is defined.

58485 The `pthread_mutex_timedlock()` function is added to the SEE ALSO section for alignment with  
58486 IEEE Std 1003.1d-1999.

58487 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS  
58488 section so that the [EDEADLK] error includes detection of a deadlock condition. The  
58489 RATIONALE section is also reworded to take into account non-XSI-conformant systems.

**Issue 7**

58490 SD5-XSH-ERN-43 is applied, marking the “shall fail” case of the [EINVAL] error as dependent  
58491 on the Thread Priority Protection option.  
58492

58493 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

58494 The `pthread_mutex_lock()`, `pthread_mutex_trylock()`, and `pthread_mutex_unlock()` functions are  
58495 moved from the Threads option to the Base.

58496 The following extended mutex types are moved from the XSI option to the Base:

```
58497     PTHREAD_MUTEX_NORMAL  
58498     PTHREAD_MUTEX_ERRORCHECK  
58499     PTHREAD_MUTEX_RECURSIVE  
58500     PTHREAD_MUTEX_DEFAULT
```

58501 The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized  
58502 mutex.

58503 The ERRORS section is updated to account properly for all of the various mutex types.

58504 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0461 [121], XSH/TC1-2008/0462  
58505 [92,428], and XSH/TC1-2008/0463 [121] are applied.

**Issue 8**

58506 Austin Group Defect 354 is applied, adding the [EAGAIN] error for exceeding system resources  
58507 available for robust mutexes owned.  
58508

58509 Austin Group Defect 1115 is applied, changing “the thread” to “the calling thread”.

58510 **NAME**

58511 pthread\_mutex\_setprioceiling — change the priority ceiling of a mutex (**REALTIME**  
58512 **THREADS**)

58513 **SYNOPSIS**

```
58514 RPP|TPP #include <pthread.h>
58515 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
58516 int prioceiling, int *restrict old_ceiling);
```

58517 **DESCRIPTION**

58518 Refer to [pthread\\_mutex\\_getprioceiling\(\)](#).

58519 **NAME**

58520 pthread\_mutex\_timedlock — lock a mutex

58521 **SYNOPSIS**

58522 #include &lt;pthread.h&gt;

58523 int pthread\_mutex\_timedlock(pthread\_mutex\_t \*restrict mutex,  
58524 const struct timespec \*restrict abstime);58525 **DESCRIPTION**58526 Refer to [pthread\\_mutex\\_clocklock\(\)](#).

58527 **NAME**

58528 pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a mutex

58529 **SYNOPSIS**

58530 #include <pthread.h>

58531 int pthread\_mutex\_trylock(pthread\_mutex\_t \*mutex);

58532 int pthread\_mutex\_unlock(pthread\_mutex\_t \*mutex);

58533 **DESCRIPTION**

58534 Refer to *pthread\_mutex\_lock()*.

58535 **NAME**

58536 pthread\_mutexattr\_destroy, pthread\_mutexattr\_init — destroy and initialize the mutex  
58537 attributes object

58538 **SYNOPSIS**

```
58539 #include <pthread.h>
58540 int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
58541 int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

58542 **DESCRIPTION**

58543 The *pthread\_mutexattr\_destroy()* function shall destroy a mutex attributes object; the object  
58544 becomes, in effect, uninitialized. An implementation may cause *pthread\_mutexattr\_destroy()* to  
58545 set the object referenced by *attr* to an invalid value.

58546 A destroyed *attr* attributes object can be reinitialized using *pthread\_mutexattr\_init()*; the results of  
58547 otherwise referencing the object after it has been destroyed are undefined.

58548 The *pthread\_mutexattr\_init()* function shall initialize a mutex attributes object *attr* with the  
58549 default value for all of the attributes defined by the implementation.

58550 Results are undefined if *pthread\_mutexattr\_init()* is called specifying an already initialized *attr*  
58551 attributes object.

58552 After a mutex attributes object has been used to initialize one or more mutexes, any function  
58553 affecting the attributes object (including destruction) shall not affect any previously initialized  
58554 mutexes.

58555 The behavior is undefined if the value specified by the *attr* argument to  
58556 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object.

58557 **RETURN VALUE**

58558 Upon successful completion, *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* shall  
58559 return zero; otherwise, an error number shall be returned to indicate the error.

58560 **ERRORS**

58561 The *pthread\_mutexattr\_init()* function shall fail if:

58562 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

58563 These functions shall not return an error code of [EINTR].

58564 **EXAMPLES**

58565 None.

58566 **APPLICATION USAGE**

58567 None.

58568 **RATIONALE**

58569 If an implementation detects that the value specified by the *attr* argument to  
58570 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object, it is  
58571 recommended that the function should fail and report an [EINVAL] error.

58572 See *pthread\_attr\_destroy()* for a general explanation of attributes. Attributes objects allow  
58573 implementations to experiment with useful extensions and permit extension of this volume of  
58574 POSIX.1-2024 without changing the existing functions. Thus, they provide for future  
58575 extensibility of this volume of POSIX.1-2024 and reduce the temptation to standardize  
58576 prematurely on semantics that are not yet widely implemented or understood.

58577 Examples of possible additional mutex attributes that have been discussed are *spin\_only*,  
58578 *limited\_spin*, *no\_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

58579 recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes  
 58580 would transparently keep records of queue length, wait time, and so on.) Since there is not yet  
 58581 wide agreement on the usefulness of these resulting from shared implementation and usage  
 58582 experience, they are not yet specified in this volume of POSIX.1-2024. Mutex attributes objects,  
 58583 however, make it possible to test out these concepts for possible standardization at a later time.

#### 58584 **Mutex Attributes and Performance**

58585 Care has been taken to ensure that the default values of the mutex attributes have been defined  
 58586 such that mutexes initialized with the defaults have simple enough semantics so that the locking  
 58587 and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few  
 58588 other basic instructions).

58589 There is at least one implementation method that can be used to reduce the cost of testing at  
 58590 lock-time if a mutex has non-default attributes. One such method that an implementation can  
 58591 employ (and this can be made fully transparent to fully conforming POSIX applications) is to  
 58592 secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to  
 58593 lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were  
 58594 unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-  
 58595 default mutex. The underlying unlock operation is more complicated since the implementation  
 58596 never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending  
 58597 on the hardware, there may be certain optimizations that can be used so that whatever mutex  
 58598 attributes are considered “most frequently used” can be processed most efficiently.

#### 58599 **Process Shared Memory and Synchronization**

58600 The existence of memory mapping functions in this volume of POSIX.1-2024 leads to the  
 58601 possibility that an application may allocate the synchronization objects from this section in  
 58602 memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

58603 In order to permit such usage, while at the same time keeping the usual case (that is, usage  
 58604 within a single process) efficient, a *process-shared* option has been defined.

58605 If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the  
 58606 *process-shared* attribute can be used to indicate that mutexes or condition variables may be  
 58607 accessed by threads of multiple processes.

58608 The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared*  
 58609 attribute so that the most efficient forms of these synchronization objects are created by default.

58610 Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-*  
 58611 *shared* attribute may only be operated on by threads in the process that initialized them.  
 58612 Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-*  
 58613 *shared* attribute may be operated on by any thread in any process that has access to it. In  
 58614 particular, these processes may exist beyond the lifetime of the initializing process. For example,  
 58615 the following code implements a simple counting semaphore in a mapped file that may be used  
 58616 by many processes.

```
58617 /* sem.h */
58618 struct semaphore {
58619     pthread_mutex_t lock;
58620     pthread_cond_t nonzero;
58621     unsigned count;
58622 };
58623 typedef struct semaphore semaphore_t;
```

```

58624 semaphore_t *semaphore_create(char *semaphore_name);
58625 semaphore_t *semaphore_open(char *semaphore_name);
58626 void semaphore_post(semaphore_t *semap);
58627 void semaphore_wait(semaphore_t *semap);
58628 void semaphore_close(semaphore_t *semap);

58629 /* sem.c */
58630 #include <sys/types.h>
58631 #include <sys/stat.h>
58632 #include <sys/mman.h>
58633 #include <fcntl.h>
58634 #include <pthread.h>
58635 #include "sem.h"

58636 semaphore_t *
58637 semaphore_create(char *semaphore_name)
58638 {
58639     int fd;
58640     semaphore_t *semap;
58641     pthread_mutexattr_t psharedm;
58642     pthread_condattr_t psharedc;

58643     fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
58644     if (fd < 0)
58645         return (NULL);
58646     (void) ftruncate(fd, sizeof(semaphore_t));
58647     (void) pthread_mutexattr_init(&psharedm);
58648     (void) pthread_mutexattr_setpshared(&psharedm,
58649         PTHREAD_PROCESS_SHARED);
58650     (void) pthread_condattr_init(&psharedc);
58651     (void) pthread_condattr_setpshared(&psharedc,
58652         PTHREAD_PROCESS_SHARED);
58653     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
58654         PROT_READ | PROT_WRITE, MAP_SHARED,
58655         fd, 0);
58656     close (fd);
58657     (void) pthread_mutex_init(&semap->lock, &psharedm);
58658     (void) pthread_cond_init(&semap->nonzero, &psharedc);
58659     semap->count = 0;
58660     return (semap);
58661 }

58662 semaphore_t *
58663 semaphore_open(char *semaphore_name)
58664 {
58665     int fd;
58666     semaphore_t *semap;

58667     fd = open(semaphore_name, O_RDWR, 0666);
58668     if (fd < 0)
58669         return (NULL);
58670     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
58671         PROT_READ | PROT_WRITE, MAP_SHARED,
58672         fd, 0);

```

```

58673         close (fd);
58674         return (semap);
58675     }

58676     void
58677     semaphore_post (semaphore_t *semap)
58678     {
58679         pthread_mutex_lock (&semap->lock);
58680         if (semap->count == 0)
58681             pthread_cond_signal (&semap->nonzero);
58682         semap->count++;
58683         pthread_mutex_unlock (&semap->lock);
58684     }

58685     void
58686     semaphore_wait (semaphore_t *semap)
58687     {
58688         pthread_mutex_lock (&semap->lock);
58689         while (semap->count == 0)
58690             pthread_cond_wait (&semap->nonzero, &semap->lock);
58691         semap->count--;
58692         pthread_mutex_unlock (&semap->lock);
58693     }

58694     void
58695     semaphore_close (semaphore_t *semap)
58696     {
58697         munmap ((void *) semap, sizeof (semaphore_t));
58698     }

```

58699 The following code is for three separate processes that create, post, and wait on a semaphore in  
58700 the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and  
58701 decrement the counting semaphore (waiting and waking as required) even though they did not  
58702 initialize the semaphore.

```

58703     /* create.c */
58704     #include "pthread.h"
58705     #include "sem.h"

58706     int
58707     main (void)
58708     {
58709         semaphore_t *semap;

58710         semap = semaphore_create ("/tmp/semaphore");
58711         if (semap == NULL)
58712             exit (1);
58713         semaphore_close (semap);
58714         return (0);
58715     }

58716     /* post.c */
58717     #include "pthread.h"
58718     #include "sem.h"

58719     int

```

```

58720     main(void)
58721     {
58722         semaphore_t *semaph;
58723
58724         semaph = semaphore_open("/tmp/semaphore");
58725         if (semaph == NULL)
58726             exit(1);
58727         semaphore_post(semaph);
58728         semaphore_close(semaph);
58729         return (0);
58730     }
58731
58732     /* wait.c */
58733     #include "pthread.h"
58734     #include "sem.h"
58735
58736     int
58737     main(void)
58738     {
58739         semaphore_t *semaph;
58740
58741         semaph = semaphore_open("/tmp/semaphore");
58742         if (semaph == NULL)
58743             exit(1);
58744         semaphore_wait(semaph);
58745         semaphore_close(semaph);
58746         return (0);
58747     }

```

**58744 FUTURE DIRECTIONS**

**58749 CHANGE HISTORY**

58750 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**58751 Issue 6**

58752 The [pthread\\_mutexattr\\_destroy\(\)](#) and [pthread\\_mutexattr\\_init\(\)](#) functions are marked as part of the  
58753 Threads option.

58754 IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

**58755 Issue 7**

58756 The [pthread\\_mutexattr\\_destroy\(\)](#) and [pthread\\_mutexattr\\_init\(\)](#) functions are moved from the  
58757 Threads option to the Base.

58758 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
58759 results in undefined behavior.

**58760 Issue 8**

58761 Austin Group Defect 1195 is applied, changing `main()` to `main(void)`.

58762 **NAME**

58763 pthread\_mutexattr\_getprioceiling, pthread\_mutexattr\_setprioceiling — get and set the  
58764 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

58765 **SYNOPSIS**

```
58766 RPP|TPP #include <pthread.h>
58767 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
58768     *restrict attr, int *restrict prioceiling);
58769 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
58770     int prioceiling);
```

58771 **DESCRIPTION**

58772 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions,  
58773 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to  
58774 by *attr* which was previously created by the function *pthread\_mutexattr\_init()*.

58775 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of  
58776 *prioceiling* are within the maximum range of priorities defined by **SCHED\_FIFO**.

58777 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum  
58778 priority level at which the critical section guarded by the mutex is executed. In order to avoid  
58779 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal  
58780 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are  
58781 within the maximum range of priorities defined under the **SCHED\_FIFO** scheduling policy.

58782 The behavior is undefined if the value specified by the *attr* argument to  
58783 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
58784 initialized mutex attributes object.

58785 **RETURN VALUE**

58786 Upon successful completion, the *pthread\_mutexattr\_getprioceiling()* and  
58787 *pthread\_mutexattr\_setprioceiling()* functions shall return zero; otherwise, an error number shall be  
58788 returned to indicate the error.

58789 **ERRORS**

58790 These functions may fail if:

58791 [EINVAL] The value specified by *prioceiling* is invalid.

58792 [EPERM] The caller does not have the privilege to perform the operation.

58793 These functions shall not return an error code of [EINTR].

58794 **EXAMPLES**

58795 None.

58796 **APPLICATION USAGE**

58797 None.

58798 **RATIONALE**

58799 If an implementation detects that the value specified by the *attr* argument to  
58800 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
58801 initialized mutex attributes object, it is recommended that the function should fail and report an  
58802 [EINVAL] error.

58803 **FUTURE DIRECTIONS**

58804 None.

58805 **SEE ALSO**58806 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

58807 XBD &lt;pthread.h&gt;

58808 **CHANGE HISTORY**

58809 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

58810 Marked as part of the Realtime Threads Feature Group.

58811 **Issue 6**58812 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are marked  
58813 as part of the Threads and Thread Priority Protection options.58814 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58815 implementation does not support the Thread Priority Protection option.58816 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*  
58817 argument.58818 The **restrict** keyword is added to the *pthread\_mutexattr\_getprioceiling()* prototype for alignment  
58819 with the ISO/IEC 9899:1999 standard.58820 **Issue 7**58821 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are moved  
58822 from the Threads option to require support of either the Robust Mutex Priority Protection option  
58823 or the Non-Robust Mutex Priority Protection option.58824 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
58825 results in undefined behavior.

58826 **NAME**

58827 pthread\_mutexattr\_getprotocol, pthread\_mutexattr\_setprotocol — get and set the protocol  
58828 attribute of the mutex attributes object (**REALTIME THREADS**)

58829 **SYNOPSIS**

```
58830 MC1 #include <pthread.h>
58831 int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
58832     *restrict attr, int *restrict protocol);
58833 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
58834     int protocol);
```

58835 **DESCRIPTION**

58836 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions, respectively,  
58837 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was  
58838 previously created by the function *pthread\_mutexattr\_init()*.

58839 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of  
58840 *protocol* may be one of:

```
58841 RPI|TPI PTHREAD_PRIO_INHERIT
58842 MC1 PTHREAD_PRIO_NONE
58843 RPP|TPP PTHREAD_PRIO_PROTECT
```

58844 which are defined in the **<pthread.h>** header. The default value of the attribute shall be  
58845 PTHREAD\_PRIO\_NONE.

58846 When a thread owns a mutex with the PTHREAD\_PRIO\_NONE *protocol* attribute, its priority  
58847 and scheduling shall not be affected by its mutex ownership.

58848 RPI When a thread is blocking higher priority threads because of owning one or more robust  
58849 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
58850 its priority or the priority of the highest priority thread waiting on any of the robust mutexes  
58851 owned by this thread and initialized with this protocol.

58852 TPI When a thread is blocking higher priority threads because of owning one or more non-robust  
58853 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
58854 its priority or the priority of the highest priority thread waiting on any of the non-robust  
58855 mutexes owned by this thread and initialized with this protocol.

58856 RPP When a thread owns one or more robust mutexes initialized with the  
58857 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
58858 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this  
58859 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

58860 TPP When a thread owns one or more non-robust mutexes initialized with the  
58861 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
58862 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with  
58863 this attribute, regardless of whether other threads are blocked on any of these non-robust  
58864 mutexes or not.

58865 If a thread simultaneously owns several mutexes initialized with different protocols, it shall  
58866 execute at the highest of the priorities that it would have obtained by each of these protocols.

58867 RPI|TPI When a thread makes a call to *pthread\_mutex\_lock()*, the mutex was initialized with the protocol attribute having the value `PTHREAD_PRIO_INHERIT`, when the calling thread is blocked because the mutex is owned by another thread, that owner thread shall inherit the priority level of the calling thread as long as it continues to own the mutex. The implementation shall update its execution priority to the maximum of its assigned priority and all its inherited priorities. Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol* attribute having the value `PTHREAD_PRIO_INHERIT`, the same priority inheritance effect shall be propagated to this other owner thread, in a recursive manner.

58875 The behavior is undefined if the value specified by the *attr* argument to *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized mutex attributes object.

#### 58878 RETURN VALUE

58879 Upon successful completion, the *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

#### 58882 ERRORS

58883 The *pthread\_mutexattr\_setprotocol()* function shall fail if:

58884 [ENOTSUP] The value specified by *protocol* is an unsupported value.

58885 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions may fail if:

58886 [EINVAL] The value specified by *protocol* is invalid.

58887 [EPERM] The caller does not have the privilege to perform the operation.

58888 These functions shall not return an error code of [EINTR].

#### 58889 EXAMPLES

58890 None.

#### 58891 APPLICATION USAGE

58892 None.

#### 58893 RATIONALE

58894 If an implementation detects that the value specified by the *attr* argument to *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

#### 58898 FUTURE DIRECTIONS

58899 None.

#### 58903 CHANGE HISTORY

58904 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

58905 Marked as part of the Realtime Threads Feature Group.

#### 58906 Issue 6

58907 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are marked as part of the Threads option and either the Thread Priority Protection or Thread Priority Inheritance options.

58910 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58911 implementation does not support the Thread Priority Protection or Thread Priority Inheritance  
58912 options.

58913 The **restrict** keyword is added to the *pthread\_mutexattr\_getprotocol()* prototype for alignment  
58914 with the ISO/IEC 9899:1999 standard.

58915 **Issue 7**

58916 SD5-XSH-ERN-135 is applied, updating the DESCRIPTION to define a default value for the  
58917 *protocol* attribute.

58918 SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

58919 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are moved from  
58920 the Threads option to require support of either the Non-Robust Mutex Priority Protection option  
58921 or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection  
58922 option or the Robust Mutex Priority Inheritance option.

58923 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
58924 results in undefined behavior.

58925 **Issue 8**

58926 Austin Group Defect 1610 is applied, moving text relating to the effects of  
58927 PTHREAD\_PRIO\_INHERIT and PTHREAD\_PRIO\_PROTECT on scheduling queues to  
58928 [Scheduling Policies](#) (on page 531).

58929 **NAME**

58930 pthread\_mutexattr\_getpshared, pthread\_mutexattr\_setpshared — get and set the process-shared  
58931 attribute

58932 **SYNOPSIS**

```
58933 TSH #include <pthread.h>
58934 int pthread_mutexattr_getpshared(const pthread_mutexattr_t
58935     *restrict attr, int *restrict pshared);
58936 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
58937     int pshared);
```

58938 **DESCRIPTION**

58939 The *pthread\_mutexattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
58940 from the attributes object referenced by *attr*.

58941 The *pthread\_mutexattr\_setpshared()* function shall set the *process-shared* attribute in an initialized  
58942 attributes object referenced by *attr*.

58943 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a mutex to be  
58944 operated upon by any thread that has access to the memory where the mutex is allocated, even if  
58945 the mutex is allocated in memory that is shared by multiple processes. See [Section 2.9.9](#) (on page  
58946 548) for further requirements. The default value of the attribute shall be  
58947 `PTHREAD_PROCESS_PRIVATE`.

58948 The behavior is undefined if the value specified by the *attr* argument to  
58949 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
58950 mutex attributes object.

58951 **RETURN VALUE**

58952 Upon successful completion, *pthread\_mutexattr\_setpshared()* shall return zero; otherwise, an error  
58953 number shall be returned to indicate the error.

58954 Upon successful completion, *pthread\_mutexattr\_getpshared()* shall return zero and store the value  
58955 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.  
58956 Otherwise, an error number shall be returned to indicate the error.

58957 **ERRORS**

58958 The *pthread\_mutexattr\_setpshared()* function may fail if:

58959 [EINVAL] The new value specified for the attribute is outside the range of legal values  
58960 for that attribute.

58961 These functions shall not return an error code of [EINTR].

58962 **EXAMPLES**

58963 None.

58964 **APPLICATION USAGE**

58965 None.

58966 **RATIONALE**

58967 If an implementation detects that the value specified by the *attr* argument to  
58968 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
58969 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
58970 error.

58971 **FUTURE DIRECTIONS**

58972 None.

58973 **SEE ALSO**58974 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, *pthread\_mutexattr\_destroy()*

58975 XBD &lt;pthread.h&gt;

58976 **CHANGE HISTORY**

58977 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

58978 **Issue 6**58979 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked as  
58980 part of the Threads and Thread Process-Shared Synchronization options.58981 The **restrict** keyword is added to the *pthread\_mutexattr\_getpshared()* prototype for alignment  
58982 with the ISO/IEC 9899:1999 standard.58983 **Issue 7**58984 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked only  
58985 as part of the Thread Process-Shared Synchronization option as the Threads option is now part  
58986 of the Base.58987 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
58988 results in undefined behavior.58989 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0281 [972] and XSH/TC2-2008/0282  
58990 [757] are applied.

58991 **NAME**

58992 pthread\_mutexattr\_getrobust, pthread\_mutexattr\_setrobust — get and set the mutex robust  
58993 attribute

58994 **SYNOPSIS**

```
58995 #include <pthread.h>
58996 int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
58997     attr, int *restrict robust);
58998 int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
58999     int robust);
```

59000 **DESCRIPTION**

59001 The *pthread\_mutexattr\_getrobust()* and *pthread\_mutexattr\_setrobust()* functions, respectively, shall  
59002 get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values  
59003 for *robust* include:

59004 **PTHREAD\_MUTEX\_STALLED**

59005 No special actions are taken if the owner of the mutex is terminated while holding the  
59006 mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.  
59007 This is the default value.

59008 **PTHREAD\_MUTEX\_ROBUST**

59009 If the process containing the owning thread of a robust mutex terminates while holding the  
59010 mutex lock, the next thread that acquires the mutex shall be notified about the termination  
59011 by the return value [EOWNERDEAD] from the locking function. If the owning thread of a  
59012 robust mutex terminates while holding the mutex lock, the next thread that attempts to  
59013 acquire the mutex may be notified about the termination by the return value  
59014 [EOWNERDEAD]. The notified thread can then attempt to make the state protected by the  
59015 mutex consistent again, and if successful can mark the mutex state as consistent by calling  
59016 *pthread\_mutex\_consistent()*. After a subsequent successful call to *pthread\_mutex\_unlock()*, the  
59017 mutex lock shall be released and can be used normally by other threads. If the mutex is  
59018 unlocked without a call to *pthread\_mutex\_consistent()*, it shall be in a permanently unusable  
59019 state and all attempts to lock the mutex shall fail with the error [ENOTRECOVERABLE].  
59020 The only permissible operation on such a mutex is *pthread\_mutex\_destroy()*.

59021 The behavior is undefined if the value specified by the *attr* argument to  
59022 *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized  
59023 mutex attributes object.

59024 **RETURN VALUE**

59025 Upon successful completion, the *pthread\_mutexattr\_getrobust()* function shall return zero and  
59026 store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter.  
59027 Otherwise, an error value shall be returned to indicate the error. If successful, the  
59028 *pthread\_mutexattr\_setrobust()* function shall return zero; otherwise, an error number shall be  
59029 returned to indicate the error.

59030 **ERRORS**

59031 The *pthread\_mutexattr\_setrobust()* function shall fail if:

59032 [EINVAL] The value of *robust* is invalid.

59033 These functions shall not return an error code of [EINTR].

59034 **EXAMPLES**

59035 None.

59036 **APPLICATION USAGE**

59037 The actions required to make the state protected by the mutex consistent again are solely  
59038 dependent on the application. If it is not possible to make the state of a mutex consistent, robust  
59039 mutexes can be used to notify this situation by calling *pthread\_mutex\_unlock()* without a prior  
59040 call to *pthread\_mutex\_consistent()*.

59041 If the state is declared inconsistent by calling *pthread\_mutex\_unlock()* without a prior call to  
59042 *pthread\_mutex\_consistent()*, a possible approach could be to destroy the mutex and then  
59043 reinitialize it. However, it should be noted that this is possible only in certain situations where  
59044 the state protected by the mutex has to be reinitialized and coordination achieved with other  
59045 threads blocked on the mutex, because otherwise a call to a locking function with a reference to a  
59046 mutex object invalidated by a call to *pthread\_mutex\_destroy()* results in undefined behavior.

59047 **RATIONALE**

59048 If an implementation detects that the value specified by the *attr* argument to  
59049 *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized  
59050 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
59051 error.

59052 **FUTURE DIRECTIONS**

59053 None.

59054 **SEE ALSO**59055 [\*pthread\\_mutex\\_consistent\(\)\*](#), [\*pthread\\_mutex\\_destroy\(\)\*](#), [\*pthread\\_mutex\\_lock\(\)\*](#)59056 XBD <[\*pthread.h\*](#)>59057 **CHANGE HISTORY**

59058 First released in Issue 7.

59059 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0283 [748] is applied.

59060 **NAME**

59061 pthread\_mutexattr\_gettype, pthread\_mutexattr\_settype — get and set the mutex type attribute

59062 **SYNOPSIS**

```
59063 #include <pthread.h>
59064 int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
59065 int *restrict type);
59066 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

59067 **DESCRIPTION**

59068 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions, respectively, shall get  
 59069 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The  
 59070 default value of the *type* attribute is PTHREAD\_MUTEX\_DEFAULT.

59071 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types  
 59072 include:

```
59073 PTHREAD_MUTEX_NORMAL
59074 PTHREAD_MUTEX_ERRORCHECK
59075 PTHREAD_MUTEX_RECURSIVE
59076 PTHREAD_MUTEX_DEFAULT
```

59077 The mutex type affects the behavior of calls which lock and unlock the mutex. See  
 59078 *pthread\_mutex\_lock()* for details. An implementation may map PTHREAD\_MUTEX\_DEFAULT  
 59079 to one of the other mutex types.

59080 The behavior is undefined if the value specified by the *attr* argument to  
 59081 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
 59082 attributes object.

59083 **RETURN VALUE**

59084 Upon successful completion, the *pthread\_mutexattr\_gettype()* function shall return zero and store  
 59085 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,  
 59086 an error shall be returned to indicate the error.

59087 If successful, the *pthread\_mutexattr\_settype()* function shall return zero; otherwise, an error  
 59088 number shall be returned to indicate the error.

59089 **ERRORS**

59090 The *pthread\_mutexattr\_settype()* function shall fail if:

59091 [EINVAL] The value *type* is invalid.

59092 These functions shall not return an error code of [EINTR].

59093 **EXAMPLES**

59094 None.

59095 **APPLICATION USAGE**

59096 It is advised that an application should not use a PTHREAD\_MUTEX\_RECURSIVE mutex with  
 59097 condition variables because the implicit unlock performed in a *pthread\_cond\_clockwait()*,  
 59098 *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* call may not actually release the mutex (if it had  
 59099 been locked multiple times). If this happens, no other thread can satisfy the condition of the  
 59100 predicate.

59101 **RATIONALE**

59102 If an implementation detects that the value specified by the *attr* argument to  
59103 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
59104 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

59105 **FUTURE DIRECTIONS**

59106 None.

59107 **SEE ALSO**

59108 *pthread\_cond\_clockwait()*, *pthread\_mutex\_lock()*

59109 XBD <pthread.h>

59110 **CHANGE HISTORY**

59111 First released in Issue 5.

59112 **Issue 6**

59113 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for  
59114 *pthread\_mutexattr\_gettype()* is updated so that the first argument is of type **const**  
59115 **pthread\_mutexattr\_t\***.

59116 The **restrict** keyword is added to the *pthread\_mutexattr\_gettype()* prototype for alignment with  
59117 the ISO/IEC 9899:1999 standard.

59118 **Issue 7**

59119 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions are moved from the  
59120 XSI option to the Base.

59121 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
59122 results in undefined behavior.

59123 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0464 [121] is applied.

59124 **Issue 8**

59125 Austin Group Defect 1216 is applied, adding *pthread\_cond\_clockwait()*.

59126 **NAME**

59127 pthread\_mutexattr\_init — initialize the mutex attributes object

59128 **SYNOPSIS**

59129 #include &lt;pthread.h&gt;

59130 int pthread\_mutexattr\_init(pthread\_mutexattr\_t \*attr);

59131 **DESCRIPTION**59132 Refer to *pthread\_mutexattr\_destroy()*.

59133 **NAME**

59134 pthread\_mutexattr\_setprioceiling — set the prioceiling attribute of the mutex attributes object  
59135 (**REALTIME THREADS**)

59136 **SYNOPSIS**

```
59137 RPP|TPP #include <pthread.h>  
59138 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,  
59139 int prioceiling);
```

59140 **DESCRIPTION**

59141 Refer to [pthread\\_mutexattr\\_getprioceiling\(\)](#).

59142 **NAME**

59143 pthread\_mutexattr\_setprotocol — set the protocol attribute of the mutex attributes object  
59144 (**REALTIME THREADS**)

59145 **SYNOPSIS**

```
59146 MC1 #include <pthread.h>  
59147 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,  
59148 int protocol);
```

59149 **DESCRIPTION**

59150 Refer to [pthread\\_mutexattr\\_getprotocol\(\)](#).

59151 **NAME**

59152 pthread\_mutexattr\_setpshared — set the process-shared attribute

59153 **SYNOPSIS**

```
59154 TSH #include <pthread.h>
59155 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
59156 int pshared);
```

59157 **DESCRIPTION**

59158 Refer to [pthread\\_mutexattr\\_getpshared\(\)](#).

59159 **NAME**

59160 pthread\_mutexattr\_setrobust — get and set the mutex robust attribute

59161 **SYNOPSIS**

59162 #include &lt;pthread.h&gt;

59163 int pthread\_mutexattr\_setrobust(pthread\_mutexattr\_t \*attr,  
59164 int robust);59165 **DESCRIPTION**59166 Refer to [pthread\\_mutexattr\\_getrobust\(\)](#).

59167 **NAME**

59168 pthread\_mutexattr\_settype — set the mutex type attribute

59169 **SYNOPSIS**

59170 #include <pthread.h>

59171 int pthread\_mutexattr\_settype(pthread\_mutexattr\_t \*attr, int type);

59172 **DESCRIPTION**

59173 Refer to *pthread\_mutexattr\_gettype()*.

59174 **NAME**

59175 pthread\_once — dynamic package initialization

59176 **SYNOPSIS**

```
59177 #include <pthread.h>
59178 int pthread_once(pthread_once_t *once_control,
59179                 void (*init_routine)(void));
59180 pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

59181 **DESCRIPTION**

59182 The first call to *pthread\_once()* by any thread in a process, with a given *once\_control*, shall call the  
 59183 *init\_routine* with no arguments. Subsequent calls of *pthread\_once()* with the same *once\_control*  
 59184 shall not call the *init\_routine*. On return from *pthread\_once()*, *init\_routine* shall have completed.  
 59185 The *once\_control* parameter shall determine whether the associated initialization routine has been  
 59186 called.

59187 The *pthread\_once()* function is not a cancellation point. However, if *init\_routine* is a cancellation  
 59188 point and is canceled, the effect on *once\_control* shall be as if *pthread\_once()* was never called.

59189 If the call to *init\_routine* is terminated by a call to *longjmp()* or *siglongjmp()*, the behavior is  
 59190 undefined.

59191 The constant PTHREAD\_ONCE\_INIT is defined in the **<pthread.h>** header.

59192 The behavior of *pthread\_once()* is undefined if *once\_control* has automatic storage duration or is  
 59193 not initialized by PTHREAD\_ONCE\_INIT.

59194 **RETURN VALUE**

59195 Upon successful completion, *pthread\_once()* shall return zero; otherwise, an error number shall  
 59196 be returned to indicate the error.

59197 **ERRORS**

59198 The *pthread\_once()* function shall not return an error code of [EINTR].

59199 **EXAMPLES**

59200 None.

59201 **APPLICATION USAGE**

59202 If *init\_routine* recursively calls *pthread\_once()* with the same *once\_control*, the recursive call will  
 59203 not call the specified *init\_routine*, and thus the specified *init\_routine* will not complete, and thus  
 59204 the recursive call to *pthread\_once()* will not return. Use of *longjmp()* or *siglongjmp()* within an  
 59205 *init\_routine* to jump to a point outside of *init\_routine* prevents *init\_routine* from returning.

59206 **RATIONALE**

59207 Some C libraries are designed for dynamic initialization. That is, the global initialization for the  
 59208 library is performed when the first procedure in the library is called. In a single-threaded  
 59209 program, this is normally implemented using a static variable whose value is checked on entry  
 59210 to a routine, as follows:

```
59211 static int random_is_initialized = 0;
59212 extern void initialize_random(void);
59213 int random_function()
59214 {
59215     if (random_is_initialized == 0) {
59216         initialize_random();
59217         random_is_initialized = 1;
59218     }
```

```

59219     ... /* Operations performed after initialization. */
59220     }

```

59221 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,  
 59222 library initialization has to be accomplished by an explicit call to a library-exported initialization  
 59223 function prior to any use of the library.

59224 For dynamic library initialization in a multi-threaded process, if an initialization flag is used the  
 59225 flag needs to be protected against modification by multiple threads simultaneously calling into  
 59226 the library. This can be done by using a mutex (initialized by assigning  
 59227 PTHREAD\_MUTEX\_INITIALIZER). However, the better solution is to use *pthread\_once()* which  
 59228 is designed for exactly this purpose, as follows:

```

59229 #include <pthread.h>
59230 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
59231 extern void initialize_random(void);

59232 int random_function()
59233 {
59234     (void) pthread_once(&random_is_initialized, initialize_random);
59235     ... /* Operations performed after initialization. */
59236 }

```

59237 If an implementation detects that the value specified by the *once\_control* argument to  
 59238 *pthread\_once()* does not refer to a **pthread\_once\_t** object initialized by PTHREAD\_ONCE\_INIT,  
 59239 it is recommended that the function should fail and report an [EINVAL] error.

#### 59240 FUTURE DIRECTIONS

59241 None.

#### 59242 SEE ALSO

59243 XBD [<pthread.h>](#)

#### 59244 CHANGE HISTORY

59245 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 59246 Issue 6

59247 The *pthread\_once()* function is marked as part of the Threads option.

59248 The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

#### 59249 Issue 7

59250 The *pthread\_once()* function is moved from the Threads option to the Base.

59251 The [EINVAL] error for an uninitialized **pthread\_once\_t** object is removed; this condition results  
 59252 in undefined behavior.

59253 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0284 [863], XSH/TC2-2008/0285 [874],  
 59254 XSH/TC2-2008/0286 [874], and XSH/TC2-2008/0287 [747] are applied.

#### 59255 Issue 8

59256 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

59257 **NAME**

59258 pthread\_rwlock\_clockrdlock, pthread\_rwlock\_timedrdlock — lock a read-write lock for reading

59259 **SYNOPSIS**

```
59260 #include <pthread.h>
59261 int pthread_rwlock_clockrdlock(pthread_rwlock_t *restrict rlock,
59262     clockid_t clock_id, const struct timespec *restrict abstime);
59263 int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rlock,
59264     const struct timespec *restrict abstime);
```

59265 **DESCRIPTION**

59266 The *pthread\_rwlock\_clockrdlock()* and *pthread\_rwlock\_timedrdlock()* functions shall apply a read  
59267 lock to the read-write lock referenced by *rlock* as in the *pthread\_rwlock\_rdlock()* function.  
59268 However, if the lock cannot be acquired without waiting for other threads to unlock the lock,  
59269 this wait shall be terminated when the specified timeout expires. The timeout shall expire when  
59270 the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are  
59271 based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time  
59272 specified by *abstime* has already been passed at the time of the call.

59273 For *pthread\_rwlock\_timedrdlock()*, the timeout shall be based on the CLOCK\_REALTIME clock.  
59274 For *pthread\_rwlock\_clockrdlock()*, the timeout shall be based on the clock specified by the *clock\_id*  
59275 argument. The resolution of the timeout shall be the resolution of the clock on which it is based.  
59276 Implementations shall support passing CLOCK\_REALTIME and CLOCK\_MONOTONIC to  
59277 *pthread\_rwlock\_clockrdlock()* as the *clock\_id* argument.

59278 Under no circumstances shall the function fail with a timeout if the lock can be acquired  
59279 immediately. The validity of the *abstime* parameter need not be checked if the lock can be  
59280 immediately acquired.

59281 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
59282 write lock via a call to *pthread\_rwlock\_clockrdlock()* or *pthread\_rwlock\_timedrdlock()*, upon return  
59283 from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

59284 The calling thread may deadlock if at the time the call is made it holds a write lock on *rlock*.  
59285 The results are undefined if these functions are called with an uninitialized read-write lock.

59286 **RETURN VALUE**

59287 The *pthread\_rwlock\_clockrdlock()* and *pthread\_rwlock\_timedrdlock()* functions shall return zero if  
59288 the lock for reading on the read-write lock object referenced by *rlock* is acquired. Otherwise, an  
59289 error number shall be returned to indicate the error.

59290 **ERRORS**

59291 The *pthread\_rwlock\_clockrdlock()* and *pthread\_rwlock\_timedrdlock()* functions shall fail if:

59292 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

59293 The *pthread\_rwlock\_clockrdlock()* and *pthread\_rwlock\_timedrdlock()* functions may fail if:

59294 [EAGAIN] The read lock could not be acquired because the maximum number of read  
59295 locks for lock would be exceeded.

59296 [EDEADLK] A deadlock condition was detected or the calling thread already holds a write  
59297 lock on *rlock*.

59298 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000  
59299 million, or the *pthread\_rwlock\_clockrdlock()* function was passed an invalid or  
59300 unsupported *clock\_id* value.

59301 These functions shall not return an error code of [EINTR].

59302 **EXAMPLES**

59303 None.

59304 **APPLICATION USAGE**59305 Applications using these functions may be subject to priority inversion, as discussed in XBD  
59306 [Section 3.275](#) (on page 72).59307 **RATIONALE**59308 If an implementation detects that the value specified by the *rwlock* argument to  
59309 *pthread\_rwlock\_clockrdlock()* or *pthread\_rwlock\_timedrdlock()* does not refer to an initialized read-  
59310 write lock object, it is recommended that the function should fail and report an [EINVAL] error.59311 **FUTURE DIRECTIONS**

59312 None.

59313 **SEE ALSO**59314 [pthread\\_rwlock\\_clockwrlock\(\)](#), [pthread\\_rwlock\\_destroy\(\)](#), [pthread\\_rwlock\\_rdlock\(\)](#),

59318 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

59319 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS  
59320 section so that the [EDEADLK] error includes detection of a deadlock condition.59321 **Issue 7**59322 The *pthread\_rwlock\_timedrdlock()* function is moved from the Timeouts option to the Base.59323 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
59324 in undefined behavior.59325 **Issue 8**59326 Austin Group Defect 592 is applied, removing text relating to [<time.h>](#) from the SYNOPSIS and  
59327 DESCRIPTION sections.59328 Austin Group Defects 1216 and 1472 are applied, adding *pthread\_rwlock\_clockrdlock()*.

59329 **NAME**

59330 pthread\_rwlock\_clockwrlock, pthread\_rwlock\_timedwrlock — lock a read-write lock for writing

59331 **SYNOPSIS**

```
59332 #include <pthread.h>
59333 int pthread_rwlock_clockwrlock(pthread_rwlock_t *restrict rlock,
59334     clockid_t clock_id, const struct timespec *restrict abstime);
59335 int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rlock,
59336     const struct timespec *restrict abstime);
```

59337 **DESCRIPTION**

59338 The *pthread\_rwlock\_clockwrlock()* and *pthread\_rwlock\_timedwrlock()* functions shall apply a write  
 59339 lock to the read-write lock referenced by *rlock* as in the *pthread\_rwlock\_wrlock()* function.  
 59340 However, if the lock cannot be acquired without waiting for other threads to unlock the lock,  
 59341 this wait shall be terminated when the specified timeout expires. The timeout shall expire when  
 59342 the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are  
 59343 based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time  
 59344 specified by *abstime* has already been passed at the time of the call.

59345 For *pthread\_rwlock\_timedwrlock()*, the timeout shall be based on the CLOCK\_REALTIME clock.  
 59346 For *pthread\_rwlock\_clockwrlock()*, the timeout shall be based on the clock specified by the *clock\_id*  
 59347 argument. The resolution of the timeout shall be the resolution of the clock on which it is based.  
 59348 Implementations shall support passing CLOCK\_REALTIME and CLOCK\_MONOTONIC to  
 59349 *pthread\_rwlock\_clockwrlock()* as the *clock\_id* argument.

59350 Under no circumstances shall the function fail with a timeout if the lock can be acquired  
 59351 immediately. The validity of the *abstime* parameter need not be checked if the lock can be  
 59352 immediately acquired.

59353 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
 59354 write lock via a call to *pthread\_rwlock\_clockwrlock()* or *pthread\_rwlock\_timedwrlock()*, upon return  
 59355 from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

59356 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The  
 59357 results are undefined if these functions are called with an uninitialized read-write lock.

59358 **RETURN VALUE**

59359 The *pthread\_rwlock\_clockwrlock()* and *pthread\_rwlock\_timedwrlock()* functions shall return zero if  
 59360 the lock for writing on the read-write lock object referenced by *rlock* is acquired. Otherwise, an  
 59361 error number shall be returned to indicate the error.

59362 **ERRORS**

59363 The *pthread\_rwlock\_clockwrlock()* and *pthread\_rwlock\_timedwrlock()* functions shall fail if:

59364 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

59365 The *pthread\_rwlock\_clockwrlock()* and *pthread\_rwlock\_timedwrlock()* functions may fail if:

59366 [EDEADLK] A deadlock condition was detected or the calling thread already holds the  
 59367 *rlock*.

59368 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000  
 59369 million, or the *pthread\_rwlock\_clockwrlock()* function was passed an invalid or  
 59370 unsupported *clock\_id* value.

59371 These functions shall not return an error code of [EINTR].

59372 **EXAMPLES**

59373 None.

59374 **APPLICATION USAGE**59375 Applications using these functions may be subject to priority inversion, as discussed in XBD  
59376 [Section 3.275](#) (on page 72).59377 **RATIONALE**59378 If an implementation detects that the value specified by the *rwlock* argument to  
59379 *pthread\_rwlock\_clockwrlock()* or *pthread\_rwlock\_timedwrlock()* does not refer to an initialized read-  
59380 write lock object, it is recommended that the function should fail and report an [EINVAL] error.59381 **FUTURE DIRECTIONS**

59382 None.

59383 **SEE ALSO**59384 [pthread\\_rwlock\\_clockrdlock\(\)](#), [pthread\\_rwlock\\_destroy\(\)](#), [pthread\\_rwlock\\_rdlock\(\)](#),

59388 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

59389 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS  
59390 section so that the [EDEADLK] error includes detection of a deadlock condition.59391 **Issue 7**59392 The *pthread\_rwlock\_timedwrlock()* function is moved from the Timeouts option to the Base.59393 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
59394 in undefined behavior.59395 **Issue 8**59396 Austin Group Defect 592 is applied, removing text relating to [<time.h>](#) from the SYNOPSIS and  
59397 DESCRIPTION sections.59398 Austin Group Defects 1216 and 1472 are applied, adding *pthread\_rwlock\_clockwrlock()*.

59399 **NAME**

59400 pthread\_rwlock\_destroy, pthread\_rwlock\_init — destroy and initialize a read-write lock object

59401 **SYNOPSIS**

```
59402 #include <pthread.h>
59403 int pthread_rwlock_destroy(pthread_rwlock_t *rwlck);
59404 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlck,
59405     const pthread_rwlockattr_t *restrict attr);
59406 pthread_rwlock_t rwlck = PTHREAD_RWLOCK_INITIALIZER;
```

59407 **DESCRIPTION**

59408 The *pthread\_rwlock\_destroy()* function shall destroy the read-write lock object referenced by  
 59409 *rwlck* and release any resources used by the lock. The effect of subsequent use of the lock is  
 59410 undefined until the lock is reinitialized by another call to *pthread\_rwlock\_init()*. An  
 59411 implementation may cause *pthread\_rwlock\_destroy()* to set the object referenced by *rwlck* to an  
 59412 invalid value. Results are undefined if *pthread\_rwlock\_destroy()* is called when any thread holds  
 59413 *rwlck*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

59414 The *pthread\_rwlock\_init()* function shall allocate any resources required to use the read-write lock  
 59415 referenced by *rwlck* and initializes the lock to an unlocked state with attributes referenced by  
 59416 *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as  
 59417 passing the address of a default read-write lock attributes object. Once initialized, the lock can be  
 59418 used any number of times without being reinitialized. Results are undefined if  
 59419 *pthread\_rwlock\_init()* is called specifying an already initialized read-write lock. Results are  
 59420 undefined if a read-write lock is used without first being initialized.

59421 If the *pthread\_rwlock\_init()* function fails, *rwlck* shall not be initialized and the contents of *rwlck*  
 59422 are undefined.

59423 See [Section 2.9.9](#) (on page 548) for further requirements.

59424 In cases where default read-write lock attributes are appropriate, the macro  
 59425 PTHREAD\_RWLOCK\_INITIALIZER can be used to initialize read-write locks. The effect shall  
 59426 be equivalent to dynamic initialization by a call to *pthread\_rwlock\_init()* with the *attr* parameter  
 59427 specified as NULL, except that no error checks are performed.

59428 The behavior is undefined if the value specified by the *attr* argument to *pthread\_rwlock\_init()*  
 59429 does not refer to an initialized read-write lock attributes object.

59430 **RETURN VALUE**

59431 If successful, the *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions shall return zero;  
 59432 otherwise, an error number shall be returned to indicate the error.

59433 **ERRORS**

59434 The *pthread\_rwlock\_init()* function shall fail if:

59435 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 59436 another read-write lock.

59437 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

59438 [EPERM] The caller does not have the privilege to perform the operation.

59439 These functions shall not return an error code of [EINTR].

59440 **EXAMPLES**

59441 None.

59442 **APPLICATION USAGE**59443 Applications using these and related read-write lock functions may be subject to priority  
59444 inversion, as discussed in XBD [Section 3.275](#) (on page 72).59445 **RATIONALE**59446 If an implementation detects that the value specified by the *rwlock* argument to  
59447 *pthread\_rwlock\_destroy()* does not refer to an initialized read-write lock object, it is recommended  
59448 that the function should fail and report an [EINVAL] error.59449 If an implementation detects that the value specified by the *attr* argument to  
59450 *pthread\_rwlock\_init()* does not refer to an initialized read-write lock attributes object, it is  
59451 recommended that the function should fail and report an [EINVAL] error.59452 If an implementation detects that the value specified by the *rwlock* argument to  
59453 *pthread\_rwlock\_destroy()* or *pthread\_rwlock\_init()* refers to a locked read-write lock object, or  
59454 detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_init()* refers to an  
59455 already initialized read-write lock object, it is recommended that the function should fail and  
59456 report an [EBUSY] error.59457 **FUTURE DIRECTIONS**

59458 None.

59459 **SEE ALSO**59460 [pthread\\_rwlock\\_clockrdlock\(\)](#), [pthread\\_rwlock\\_clockwrlock\(\)](#), [pthread\\_rwlock\\_rdlock\(\)](#),  
59461 [pthread\\_rwlock\\_trywrlock\(\)](#), [pthread\\_rwlock\\_unlock\(\)](#)59462 [XBD Section 3.275](#) (on page 72), [<pthread.h>](#)59463 **CHANGE HISTORY**

59464 First released in Issue 5.

59465 **Issue 6**

59466 The following changes are made for alignment with IEEE Std 1003.1j-2000:

59467 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
59468 now part of the Threads option (previously it was part of the Read-Write Locks option in  
59469 IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also  
59470 deleted from the SYNOPSIS.

59471 • The DESCRIPTION is updated as follows:

59472 — It explicitly notes allocation of resources upon initialization of a read-write lock  
59473 object.59474 — A paragraph is added specifying that copies of read-write lock objects may not be  
59475 used.59476 • An [EINVAL] error is added to the ERRORS section for *pthread\_rwlock\_init()*, indicating  
59477 that the *rwlock* value is invalid.

59478 • The SEE ALSO section is updated.

59479 The **restrict** keyword is added to the *pthread\_rwlock\_init()* prototype for alignment with the  
59480 ISO/IEC 9899:1999 standard.59481 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION  
59482 USAGE relating to priority inversion.

59483 **Issue 7**

59484 Austin Group Interpretation 1003.1-2001 #048 is applied, adding the  
59485 PTHREAD\_RWLOCK\_INITIALIZER macro.

59486 The *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions are moved from the Threads  
59487 option to the Base.

59488 The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes  
59489 object is removed; this condition results in undefined behavior.

59490 The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock  
59491 object is removed; this condition results in undefined behavior.

59492 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0465 [70] is applied.

59493 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0288 [972] and XSH/TC2-2008/0289  
59494 [758] are applied.

59495 **NAME**

59496 pthread\_rwlock\_rdlock, pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

59497 **SYNOPSIS**

59498 #include &lt;pthread.h&gt;

59499 int pthread\_rwlock\_rdlock(pthread\_rwlock\_t \*rwlock);

59500 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

59501 **DESCRIPTION**59502 The *pthread\_rwlock\_rdlock()* function shall apply a read lock to the read-write lock referenced by  
59503 *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are  
59504 no writers blocked on the lock.59505 TPS If the Thread Execution Scheduling option is supported, and the threads that hold or are blocked  
59506 on the lock are executing with the scheduling policies SCHED\_FIFO or SCHED\_RR, the calling  
59507 thread shall not acquire the lock if a writer holds the lock or if the calling thread does not  
59508 already hold a read lock and writers of higher or equal priority are blocked on the lock;  
59509 otherwise, the calling thread shall acquire the lock.59510 TPS TSP If the Thread Execution Scheduling option is supported, and the threads that hold or are blocked  
59511 on the lock are executing with the SCHED\_SPORADIC scheduling policy, the calling thread  
59512 shall not acquire the lock if a writer holds the lock or if the calling thread does not already hold a  
59513 read lock and writers of higher or equal priority are blocked on the lock; otherwise, the calling  
59514 thread shall acquire the lock.59515 If the Thread Execution Scheduling option is not supported, it is implementation-defined  
59516 whether the calling thread acquires the lock when a writer does not hold the lock and there are  
59517 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the  
59518 read lock.59519 Whether the Thread Execution Scheduling option is supported or not, if the read lock is not  
59520 acquired, the calling thread shall block until it can acquire the lock. The calling thread may  
59521 deadlock if at the time the call is made it holds a write lock.59522 A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the  
59523 *pthread\_rwlock\_rdlock()* function *n* times). If so, the application shall ensure that the thread  
59524 performs matching unlocks (that is, it calls the *pthread\_rwlock\_unlock()* function *n* times).59525 The maximum number of simultaneous read locks that an implementation guarantees can be  
59526 applied to a read-write lock shall be implementation-defined. The *pthread\_rwlock\_rdlock()*  
59527 function may fail if this maximum would be exceeded.59528 The *pthread\_rwlock\_tryrdlock()* function shall apply a read lock as in the *pthread\_rwlock\_rdlock()*  
59529 function, with the exception that the function shall fail if the equivalent *pthread\_rwlock\_rdlock()*  
59530 call would have blocked the calling thread. In no case shall the *pthread\_rwlock\_tryrdlock()*  
59531 function ever block; it always either acquires the lock or fails and returns immediately.

59532 Results are undefined if any of these functions are called with an uninitialized read-write lock.

59533 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the  
59534 signal handler the thread resumes waiting for the read-write lock for reading as if it was not  
59535 interrupted.59536 **RETURN VALUE**59537 If successful, the *pthread\_rwlock\_rdlock()* function shall return zero; otherwise, an error number  
59538 shall be returned to indicate the error.59539 The *pthread\_rwlock\_tryrdlock()* function shall return zero if the lock for reading on the read-write

59540 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
59541 indicate the error.

#### 59542 ERRORS

59543 The *pthread\_rwlock\_tryrdlock()* function shall fail if:

59544 [EBUSY] The read-write lock could not be acquired for reading because a writer holds  
59545 the lock or a writer with the appropriate priority was blocked on it.

59546 The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions may fail if:

59547 [EAGAIN] The read lock could not be acquired because the maximum number of read  
59548 locks for *rwlock* has been exceeded.

59549 The *pthread\_rwlock\_rdlock()* function may fail if:

59550 [EDEADLK] A deadlock condition was detected or the current thread already owns the  
59551 read-write lock for writing.

59552 These functions shall not return an error code of [EINTR].

#### 59553 EXAMPLES

59554 None.

#### 59555 APPLICATION USAGE

59556 Applications using these functions may be subject to priority inversion, as discussed in XBD  
59557 [Section 3.275](#) (on page 72).

#### 59558 RATIONALE

59559 If an implementation detects that the value specified by the *rwlock* argument to  
59560 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()* does not refer to an initialized read-write  
59561 lock object, it is recommended that the function should fail and report an [EINVAL] error.

#### 59562 FUTURE DIRECTIONS

59563 None.

#### 59564 SEE ALSO

59565 [pthread\\_rwlock\\_clockrdlock\(\)](#), [pthread\\_rwlock\\_clockwrlock\(\)](#), [pthread\\_rwlock\\_destroy\(\)](#),

#### 59568 CHANGE HISTORY

59569 First released in Issue 5.

#### 59570 Issue 6

59571 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 59572 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
59573 now part of the Threads option (previously it was part of the Read-Write Locks option in  
59574 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 59575 • The DESCRIPTION is updated as follows:
  - 59576 — Conditions under which writers have precedence over readers are specified.
  - 59577 — Failure of *pthread\_rwlock\_tryrdlock()* is clarified.
  - 59578 — A paragraph on the maximum number of read locks is added.

59579                   • In the ERRORS sections, [EBUSY] is modified to take into account write priority, and  
59580                   [EDEADLK] is deleted as a *pthread\_rwlock\_tryrdlock()* error.

59581                   • The SEE ALSO section is updated.

59582                   IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS  
59583                   section so that the [EDEADLK] error includes detection of a deadlock condition.

59584   **Issue 7**

59585                   The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions are moved from the Threads  
59586                   option to the Base.

59587                   The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
59588                   in undefined behavior.

59589   **Issue 8**

59590                   Austin Group Defect 1111 is applied, changing “threads involved in the lock” to “threads that  
59591                   hold or are blocked on the lock” and clarifying that a requirement when the read lock is not  
59592                   acquired applies regardless of whether or not the Thread Execution Scheduling option is  
59593                   supported.

59594 **NAME**

59595 pthread\_rwlock\_timedrdlock — lock a read-write lock for reading

59596 **SYNOPSIS**

59597 #include &lt;pthread.h&gt;

59598 int pthread\_rwlock\_timedrdlock(pthread\_rwlock\_t \*restrict *rwlock*,  
59599 const struct timespec \*restrict *abstime*);59600 **DESCRIPTION**59601 Refer to [pthread\\_rwlock\\_clockrdlock\(\)](#).

59602 **NAME**

59603 pthread\_rwlock\_timedwrlock — lock a read-write lock for writing

59604 **SYNOPSIS**

59605 #include <pthread.h>

59606 int pthread\_rwlock\_timedwrlock(pthread\_rwlock\_t \*restrict *rwlock*,  
59607 const struct timespec \*restrict *abstime*);

59608 **DESCRIPTION**

59609 Refer to [pthread\\_rwlock\\_clockwrlock\(\)](#).

59610 **NAME**

59611 pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

59612 **SYNOPSIS**

59613 #include &lt;pthread.h&gt;

59614 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

59615 **DESCRIPTION**59616 Refer to *pthread\_rwlock\_rdlock()*.

59617 **NAME**

59618 pthread\_rwlock\_trywrlock, pthread\_rwlock\_wrlock — lock a read-write lock object for writing

59619 **SYNOPSIS**

59620 #include <pthread.h>

59621 int pthread\_rwlock\_trywrlock(pthread\_rwlock\_t \*rlock);

59622 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rlock);

59623 **DESCRIPTION**

59624 The *pthread\_rwlock\_trywrlock()* function shall apply a write lock like the *pthread\_rwlock\_wrlock()*  
59625 function, with the exception that the function shall fail if any thread currently holds *rlock* (for  
59626 reading or writing).

59627 The *pthread\_rwlock\_wrlock()* function shall apply a write lock to the read-write lock referenced by  
59628 *rlock*. The calling thread shall acquire the write lock if no thread (reader or writer) holds the  
59629 read-write lock *rlock*. Otherwise, if another thread holds the read-write lock *rlock*, the calling  
59630 thread shall block until it can acquire the lock. If a deadlock condition occurs or the calling  
59631 thread already owns the read-write lock for writing or reading, the call shall either deadlock or  
59632 return [EDEADLK].

59633 Results are undefined if any of these functions are called with an uninitialized read-write lock.

59634 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the  
59635 signal handler the thread resumes waiting for the read-write lock for writing as if it was not  
59636 interrupted.

59637 **RETURN VALUE**

59638 The *pthread\_rwlock\_trywrlock()* function shall return zero if the lock for writing on the read-write  
59639 lock object referenced by *rlock* is acquired. Otherwise, an error number shall be returned to  
59640 indicate the error.

59641 If successful, the *pthread\_rwlock\_wrlock()* function shall return zero; otherwise, an error number  
59642 shall be returned to indicate the error.

59643 **ERRORS**

59644 The *pthread\_rwlock\_trywrlock()* function shall fail if:

59645 [EBUSY] The read-write lock could not be acquired for writing because it was already  
59646 locked for reading or writing.

59647 The *pthread\_rwlock\_wrlock()* function may fail if:

59648 [EDEADLK] A deadlock condition was detected or the current thread already owns the  
59649 read-write lock for writing or reading.

59650 These functions shall not return an error code of [EINTR].

59651 **EXAMPLES**

59652 None.

59653 **APPLICATION USAGE**

59654 Applications using these functions may be subject to priority inversion, as discussed in XBD  
59655 [Section 3.275](#) (on page 72).

59656 **RATIONALE**

59657 If an implementation detects that the value specified by the *rlock* argument to  
59658 *pthread\_rwlock\_trywrlock()* or *pthread\_rwlock\_wrlock()* does not refer to an initialized read-write  
59659 lock object, it is recommended that the function should fail and report an [EINVAL] error.

59660 **FUTURE DIRECTIONS**

59661 None.

59662 **SEE ALSO**59663 *pthread\_rwlock\_clockrdlock()*, *pthread\_rwlock\_clockwrlock()*, *pthread\_rwlock\_destroy()*,  
59664 *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_unlock()*

59665 XBD Section 3.275 (on page 72), Section 4.15.2 (on page 104), &lt;pthread.h&gt;

59666 **CHANGE HISTORY**

59667 First released in Issue 5.

59668 **Issue 6**

59669 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 59670
- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
59671 now part of the Threads option (previously it was part of the Read-Write Locks option in  
59672 IEEE Std 1003.1j-2000 and also part of the XSI extension).
  - The [EDEADLK] error is deleted as a *pthread\_rwlock\_trywrlock()* error.  
59673
  - The SEE ALSO section is updated.  
59674

59675 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS  
59676 section so that the [EDEADLK] error includes detection of a deadlock condition.59677 **Issue 7**59678 The *pthread\_rwlock\_trywrlock()* and *pthread\_rwlock\_wrlock()* functions are moved from the  
59679 Threads option to the Base.59680 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
59681 in undefined behavior.59682 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0290 [720] and XSH/TC2-2008/0291  
59683 [722] are applied.

59684 **NAME**

59685 pthread\_rwlock\_unlock — unlock a read-write lock object

59686 **SYNOPSIS**

59687 #include &lt;pthread.h&gt;

59688 int pthread\_rwlock\_unlock(pthread\_rwlock\_t \*rlock);

59689 **DESCRIPTION**

59690 The *pthread\_rwlock\_unlock()* function shall release a lock held on the read-write lock object  
59691 referenced by *rlock*. Results are undefined if the read-write lock *rlock* is not held by the  
59692 calling thread.

59693 If this function is called to release a read lock from the read-write lock object and there are other  
59694 read locks currently held on this read-write lock object, the read-write lock object remains in the  
59695 read locked state. If this function releases the last read lock for this read-write lock object, the  
59696 read-write lock object shall be put in the unlocked state with no owners.

59697 If this function is called to release a write lock for this read-write lock object, the read-write lock  
59698 object shall be put in the unlocked state.

59699 If there are threads blocked on the lock when it becomes available, the scheduling policy shall  
59700 TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is  
59701 supported, when threads executing with the scheduling policies SCHED\_FIFO, SCHED\_RR, or  
59702 SCHED\_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when  
59703 the lock becomes available. For equal priority threads, write locks shall take precedence over  
59704 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-  
59705 defined whether write locks take precedence over read locks.

59706 Results are undefined if this function is called with an uninitialized read-write lock.

59707 **RETURN VALUE**

59708 If successful, the *pthread\_rwlock\_unlock()* function shall return zero; otherwise, an error number  
59709 shall be returned to indicate the error.

59710 **ERRORS**

59711 The *pthread\_rwlock\_unlock()* function shall not return an error code of [EINTR].

59712 **EXAMPLES**

59713 None.

59714 **APPLICATION USAGE**

59715 None.

59716 **RATIONALE**

59717 If an implementation detects that the value specified by the *rlock* argument to  
59718 *pthread\_rwlock\_unlock()* does not refer to an initialized read-write lock object, it is recommended  
59719 that the function should fail and report an [EINVAL] error.

59720 If an implementation detects that the value specified by the *rlock* argument to  
59721 *pthread\_rwlock\_unlock()* refers to a read-write lock object for which the current thread does not  
59722 hold a lock, it is recommended that the function should fail and report an [EPERM] error.

59723 **FUTURE DIRECTIONS**

59724 None.

59725 **SEE ALSO**

59726 *pthread\_rwlock\_clockrdlock()*, *pthread\_rwlock\_clockwrlock()*, *pthread\_rwlock\_destroy()*,  
59727 *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_trywrlock()*

59728 XBD Section 4.15.2 (on page 104), **<pthread.h>**

59729 **CHANGE HISTORY**

59730 First released in Issue 5.

59731 **Issue 6**

59732 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 59733 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
59734 now part of the Threads option (previously it was part of the Read-Write Locks option in  
59735 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 59736 • The DESCRIPTION is updated as follows:
  - 59737 — The conditions under which writers have precedence over readers are specified.
  - 59738 — The concept of read-write lock owner is deleted.
- 59739 • The SEE ALSO section is updated.

59740 **Issue 7**

59741 SD5-XSH-ERN-183 is applied.

59742 The *pthread\_rwlock\_unlock()* function is moved from the Threads option to the Base.

59743 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
59744 in undefined behavior.

59745 The [EPERM] error for a read-write lock object for which the current thread does not hold a lock  
59746 is removed; this condition results in undefined behavior.

59747 **NAME**

59748 pthread\_rwlock\_wrlock — lock a read-write lock object for writing

59749 **SYNOPSIS**

59750 #include <pthread.h>

59751 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlock);

59752 **DESCRIPTION**

59753 Refer to *pthread\_rwlock\_trywrlock()*.

59754 **NAME**

59755 pthread\_rwlockattr\_destroy, pthread\_rwlockattr\_init — destroy and initialize the read-write  
59756 lock attributes object

59757 **SYNOPSIS**

```
59758 #include <pthread.h>
59759
59759 int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
59760 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

59761 **DESCRIPTION**

59762 The *pthread\_rwlockattr\_destroy()* function shall destroy a read-write lock attributes object. A  
59763 destroyed *attr* attributes object can be reinitialized using *pthread\_rwlockattr\_init()*; the results of  
59764 otherwise referencing the object after it has been destroyed are undefined. An implementation  
59765 may cause *pthread\_rwlockattr\_destroy()* to set the object referenced by *attr* to an invalid value.

59766 The *pthread\_rwlockattr\_init()* function shall initialize a read-write lock attributes object *attr* with  
59767 the default value for all of the attributes defined by the implementation.

59768 Results are undefined if *pthread\_rwlockattr\_init()* is called specifying an already initialized *attr*  
59769 attributes object.

59770 After a read-write lock attributes object has been used to initialize one or more read-write locks,  
59771 any function affecting the attributes object (including destruction) shall not affect any previously  
59772 initialized read-write locks.

59773 The behavior is undefined if the value specified by the *attr* argument to  
59774 *pthread\_rwlockattr\_destroy()* does not refer to an initialized read-write lock attributes object.

59775 **RETURN VALUE**

59776 If successful, the *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions shall return  
59777 zero; otherwise, an error number shall be returned to indicate the error.

59778 **ERRORS**

59779 The *pthread\_rwlockattr\_init()* function shall fail if:

59780 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

59781 These functions shall not return an error code of [EINTR].

59782 **EXAMPLES**

59783 None.

59784 **APPLICATION USAGE**

59785 None.

59786 **RATIONALE**

59787 If an implementation detects that the value specified by the *attr* argument to  
59788 *pthread\_rwlockattr\_destroy()* does not refer to an initialized read-write lock attributes object, it is  
59789 recommended that the function should fail and report an [EINVAL] error.

59790 **FUTURE DIRECTIONS**

59791 None.

59792 **SEE ALSO**

59795 **CHANGE HISTORY**

59796 First released in Issue 5.

59797 **Issue 6**

59798 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 59799 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 59800 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 59801 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 59802 • The SEE ALSO section is updated.

59803 **Issue 7**59804 The *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions are moved from the

59805 Threads option to the Base.

59806 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this

59807 condition results in undefined behavior.

59808 **NAME**

59809 pthread\_rwlockattr\_getpshared, pthread\_rwlockattr\_setpshared — get and set the process-  
 59810 shared attribute of the read-write lock attributes object

59811 **SYNOPSIS**

```
59812 TSH #include <pthread.h>
59813
59814 int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
59815 *restrict attr, int *restrict pshared);
59816 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
59817 int pshared);
```

59817 **DESCRIPTION**

59818 The *pthread\_rwlockattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 59819 from the initialized attributes object referenced by *attr*. The *pthread\_rwlockattr\_setpshared()*  
 59820 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

59821 The *process-shared* attribute shall be set to `PTHREAD_PROCESS_SHARED` to permit a read-write  
 59822 lock to be operated upon by any thread that has access to the memory where the read-write lock  
 59823 is allocated, even if the read-write lock is allocated in memory that is shared by multiple  
 59824 processes. See [Section 2.9.9](#) (on page 548) for further requirements. The default value of the  
 59825 *process-shared* attribute shall be `PTHREAD_PROCESS_PRIVATE`.

59826 Additional attributes, their default values, and the names of the associated functions to get and  
 59827 set those attribute values are implementation-defined.

59828 The behavior is undefined if the value specified by the *attr* argument to  
 59829 *pthread\_rwlockattr\_getpshared()* or *pthread\_rwlockattr\_setpshared()* does not refer to an initialized  
 59830 read-write lock attributes object.

59831 **RETURN VALUE**

59832 Upon successful completion, the *pthread\_rwlockattr\_getpshared()* function shall return zero and  
 59833 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*  
 59834 parameter. Otherwise, an error number shall be returned to indicate the error.

59835 If successful, the *pthread\_rwlockattr\_setpshared()* function shall return zero; otherwise, an error  
 59836 number shall be returned to indicate the error.

59837 **ERRORS**

59838 The *pthread\_rwlockattr\_setpshared()* function may fail if:

59839 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 59840 for that attribute.

59841 These functions shall not return an error code of [EINTR].

59842 **EXAMPLES**

59843 None.

59844 **APPLICATION USAGE**

59845 None.

59846 **RATIONALE**

59847 None.

59848 **FUTURE DIRECTIONS**

59849 None.

59850 **SEE ALSO**59851 *pthread\_rwlock\_destroy()*, *pthread\_rwlockattr\_destroy()*

59852 XBD &lt;pthread.h&gt;

59853 **CHANGE HISTORY**

59854 First released in Issue 5.

59855 **Issue 6**

59856 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 59857 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the
- 59858 functionality is now part of the Threads option (previously it was part of the Read-Write
- 59859 Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 59860 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 59861 • The SEE ALSO section is updated.
