- 113618 Not used.
- 113619 **STDERR**
- 113620 The standard error shall be used only for diagnostic messages.
- 113621 **OUTPUT FILES**
- 113622 The SCCS files shall be files of unspecified format. During processing of a *file*, a temporary *x-file*,
- 113623 as described in *admin*, may be created and deleted; a locking *z-file*, as described in *get*, may be
- 113624 created and deleted.
- 113625 **EXTENDED DESCRIPTION**
- 113626 None.
- 113627 **EXIT STATUS**
- 113628 The following exit values shall be returned:
- 113629 0 Successful completion.
- 113630 >0 An error occurred.
- 113631 **CONSEQUENCES OF ERRORS**
- 113632 Default.
- 113633 **APPLICATION USAGE**
- 113634 None.
- 113635 **EXAMPLES**
- 113636 None.
- 113637 **RATIONALE**
- 113638 None.
- 113639 **FUTURE DIRECTIONS**
- 113640 If this utility is directed to create a new directory entry that contains any bytes that have the
- 113641 encoded value of a <newline> character, implementations are encouraged to treat this as an
- 113642 error. A future version of this standard may require implementations to treat this as an error.
- 113643 **SEE ALSO**
- 113644 *admin*, *delta*, *get*, *prs*
- 113645 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)
- 113646 **CHANGE HISTORY**
- 113647 First released in Issue 2.
- 113648 **Issue 6**
- 113649 The normative text is reworded to avoid use of the term “must” for application requirements.

113650 **Issue 8**

113651 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
113652 filenames containing any bytes that have the encoded value of a <newline> character.

113653 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

113654 **NAME**

113655           rmdir — remove directories

113656 **SYNOPSIS**113657           rmdir [-p] *dir*...113658 **DESCRIPTION**113659           The *rmdir* utility shall remove the directory entry specified by each *dir* operand.113660           For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function  
113661           called with the *dir* operand as its only argument.113662           Directories shall be processed in the order specified. If a directory and a subdirectory of that  
113663           directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
113664           subdirectory before the parent directory so that the parent directory is empty when the *rmdir*  
113665           utility tries to remove it.113666 **OPTIONS**113667           The *rmdir* utility shall conform to XBD [Section 12.2](#) (on page 215).

113668           The following option shall be supported:

113669           **-p**           Remove all directories in a pathname. For each *dir* operand:

- 113670                           1. The directory entry it names shall be removed.
- 
- 113671                           2. If the
- dir*
- operand includes more than one pathname component, effects
- 
- 113672                           equivalent to the following command shall occur:

113673                           rmdir -p \$(dirname *dir*)113674 **OPERANDS**

113675           The following operand shall be supported:

113676           *dir*           A pathname of an empty directory to be removed.113677 **STDIN**

113678           Not used.

113679 **INPUT FILES**

113680           None.

113681 **ENVIRONMENT VARIABLES**113682           The following environment variables shall affect the execution of *rmdir*:113683           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
113684                           (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
113685                           variables used to determine the values of locale categories.)113686           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
113687                           internationalization variables.113688           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
113689                           characters (for example, single-byte as opposed to multi-byte characters in  
113690                           arguments).113691           **LC\_MESSAGES**113692                           Determine the locale that should be used to affect the format and contents of  
113693                           diagnostic messages written to standard error.

- 113694 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 113695 **ASYNCHRONOUS EVENTS**
- 113696 Default.
- 113697 **STDOUT**
- 113698 Not used.
- 113699 **STDERR**
- 113700 The standard error shall be used only for diagnostic messages.
- 113701 **OUTPUT FILES**
- 113702 None.
- 113703 **EXTENDED DESCRIPTION**
- 113704 None.
- 113705 **EXIT STATUS**
- 113706 The following exit values shall be returned:
- 113707 0 Each directory entry specified by a *dir* operand was removed successfully.
- 113708 >0 An error occurred.
- 113709 **CONSEQUENCES OF ERRORS**
- 113710 Default.
- 113711 **APPLICATION USAGE**
- 113712 The definition of an empty directory is one that contains, at most, directory entries for dot and dot-dot.
- 113713
- 113714 **EXAMPLES**
- 113715 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty
- 113716 except it contains a directory **c**:
- 113717 `rmdir -p a/b/c`
- 113718 removes all three directories.
- 113719 **RATIONALE**
- 113720 On historical System V systems, the `-p` option also caused a message to be written to the
- 113721 standard output. The message indicated whether the whole path was removed or whether part
- 113722 of the path remained for some reason. The **STDERR** section requires this diagnostic when the
- 113723 entire path specified by a *dir* operand is not removed, but does not allow the status message
- 113724 reporting success to be written as a diagnostic.
- 113725 The *rmdir* utility on System V also included a `-s` option that suppressed the informational
- 113726 message output by the `-p` option. This option has been omitted because the informational
- 113727 message is not specified by this volume of POSIX.1-2024.
- 113728 **FUTURE DIRECTIONS**
- 113729 None.
- 113730 **SEE ALSO**
- 113731 *rm*
- 113732 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)
- 113733 XSH *remove()*, *rmdir()*, *unlink()*

113734 **CHANGE HISTORY**

113735 First released in Issue 2.

113736 **Issue 6**

113737 The normative text is reworded to avoid use of the term “must” for application requirements.

113738 **Issue 8**

113739 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

113740 **NAME**113741 sact — print current SCCS file-editing activity (**DEVELOPMENT**)113742 **SYNOPSIS**113743 XSI `sact file...`113744 **DESCRIPTION**

113745 The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 113746 list to standard output. This situation occurs when *get -e* has been executed previously without  
 113747 a subsequent execution of *delta*, *unget*, or *sccs unedit*.

113748 **OPTIONS**

113749 None.

113750 **OPERANDS**

113751 The following operand shall be supported:

113752 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*  
 113753 utility shall behave as though each file in the directory were specified as a named  
 113754 file, except that non-SCCS files (last component of the pathname does not begin  
 113755 with **s**.) and unreadable files shall be silently ignored.

113756 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 113757 each line of the standard input shall be taken to be the name of an SCCS file to be  
 113758 processed. Non-SCCS files and unreadable files shall be silently ignored.

113759 **STDIN**

113760 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 113761 line of the text file shall be interpreted as an SCCS pathname.

113762 **INPUT FILES**

113763 Any SCCS files interrogated are files of an unspecified format.

113764 **ENVIRONMENT VARIABLES**113765 The following environment variables shall affect the execution of *sact*:

113766 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 113767 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 113768 variables used to determine the values of locale categories.)

113769 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 113770 internationalization variables.

113771 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 113772 characters (for example, single-byte as opposed to multi-byte characters in  
 113773 arguments and input files).

113774 *LC\_MESSAGES*

113775 Determine the locale that should be used to affect the format and contents of  
 113776 diagnostic messages written to standard error.

113777 *NLSPATH* Determine the location of messages objects and message catalogs.

113778 **ASYNCHRONOUS EVENTS**

113779 Default.

**113780 STDOUT**

113781 The output for each named file shall consist of a line in the following format:

113782 "%sΔ%sΔ%sΔ%sΔ%s\n", <SID>, <new SID>, <login>, <date>, <time>

113783 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
113784 are made to make the new delta.

113785 <new SID> Specifies the SID for the new delta to be created.

113786 <login> Contains the login name of the user who makes the delta (that is, who executed a  
113787 *get* for editing).

113788 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
113789 keyword.

113790 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
113791 keyword.

113792 If there is more than one named file or if a directory or standard input is named, each pathname  
113793 shall be written before each of the preceding lines:

113794 "\n%s:\n", <pathname>

**113795 STDERR**

113796 The standard error shall be used only for optional informative messages concerning SCCS files  
113797 with no impending deltas, and for diagnostic messages.

**113798 OUTPUT FILES**

113799 None.

**113800 EXTENDED DESCRIPTION**

113801 None.

**113802 EXIT STATUS**

113803 The following exit values shall be returned:

113804 0 Successful completion.

113805 >0 An error occurred.

**113806 CONSEQUENCES OF ERRORS**

113807 Default.

**113808 APPLICATION USAGE**

113809 None.

**113810 EXAMPLES**

113811 None.

**113812 RATIONALE**

113813 None.

**113814 FUTURE DIRECTIONS**

113815 If this utility is directed to display a pathname that contains any bytes that have the encoded  
113816 value of a <newline> character when <newline> is a terminator or separator in the output  
113817 format being used, implementations are encouraged to treat this as an error. A future version of  
113818 this standard may require implementations to treat this as an error.

113819 **SEE ALSO**113820 *delta, get, sccs, unget*

113821 XBD Chapter 8 (on page 167)

113822 **CHANGE HISTORY**

113823 First released in Issue 2.

113824 **Issue 8**

113825 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
113826 directed to display a pathname that contains any bytes that have the encoded value of a  
113827 <newline> character when <newline> is a terminator or separator in the output format being  
113828 used.

113829 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

113830 **NAME**113831 `sccs` — front end for the SCCS subsystem (**DEVELOPMENT**)113832 **SYNOPSIS**113833 XSI `sccs [-r] [-d path] [-p path] command [options...] [operands...]`113834 **DESCRIPTION**113835 The `sccs` utility is a front end to the SCCS programs. It also includes the capability to run set-  
113836 user-id to another user to provide additional protection.113837 The `sccs` utility shall invoke the specified *command* with the specified *options* and *operands*. By  
113838 default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s.". 113839 The *command* can be the name of one of the SCCS utilities in this volume of POSIX.1-2024 (*admin*,  
113840 *delta*, *get*, *prs*, *rmDEL*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
113841 EXTENDED DESCRIPTION section.113842 **OPTIONS**113843 The `sccs` utility shall conform to XBD [Section 12.2](#) (on page 215), except that *options* operands are  
113844 actually options to be passed to the utility named by *command*. When the portion of the  
113845 command:113846 `command [options ... ] [operands ... ]`113847 is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
113848 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
113849 Guidelines to the extent indicated by their individual OPTIONS sections.113850 The following options shall be supported preceding the *command* operand:113851 **-d path** A pathname of a directory to be used as a root directory for the SCCS files. The  
113852 default shall be the current directory. The **-d** option shall take precedence over the  
113853 *PROJECTDIR* variable. See **-p**.113854 **-p path** A pathname of a directory in which the SCCS files are located. The default shall be  
113855 the **SCCS** directory.113856 The **-p** option differs from the **-d** option in that the **-d** option-argument shall be  
113857 prefixed to the entire pathname and the **-p** option-argument shall be inserted  
113858 before the final component of the pathname. For example:113859 `sccs -d /x -p y get a/b`

113860 converts to:

113861 `get /x/a/y/s.b`

113862 This allows the creation of aliases such as:

113863 `alias syssccs="sccs -d /usr/src"`

113864 which is used as:

113865 `syssccs get cmd/who.c`113866 **-r** Invoke *command* with the real user ID of the process, not any effective user ID that  
113867 the `sccs` utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmDEL*,  
113868 and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
113869 change the authorizations. These commands are always run as the real user.

113870 **OPERANDS**

113871 The following operands shall be supported:

113872 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
113873 EXTENDED DESCRIPTION section.

113874 *options* An option or option-argument to be passed to *command*.

113875 *operands* An operand to be passed to *command*.

113876 **STDIN**

113877 See the utility description for the specified *command*.

113878 **INPUT FILES**

113879 See the utility description for the specified *command*.

113880 **ENVIRONMENT VARIABLES**

113881 The following environment variables shall affect the execution of *sccs*:

113882 *LANG* Provide a default value for the internationalization variables that are unset or null.  
113883 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
113884 variables used to determine the values of locale categories.)

113885 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
113886 internationalization variables.

113887 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
113888 characters (for example, single-byte as opposed to multi-byte characters in  
113889 arguments and input files).

113890 *LC\_MESSAGES*

113891 Determine the locale that should be used to affect the format and contents of  
113892 diagnostic messages written to standard error.

113893 *NLSPATH* Determine the location of messages objects and message catalogs.

113894 *PROJECTDIR*

113895 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
113896 with a <slash>, it shall be considered an absolute pathname; otherwise, the value  
113897 of *PROJECTDIR* is treated as a user name and that user's initial working directory  
113898 shall be examined for a subdirectory *src* or *source*. If such a directory is found, it  
113899 shall be used. Otherwise, the value shall be used as a relative pathname.

113900 Additional environment variable effects may be found in the utility description for the specified  
113901 *command*.

113902 **ASYNCHRONOUS EVENTS**

113903 Default.

113904 **STDOUT**

113905 See the utility description for the specified *command*.

113906 **STDERR**

113907 See the utility description for the specified *command*.

113908 **OUTPUT FILES**

113909 See the utility description for the specified *command*.

## 113910 EXTENDED DESCRIPTION

- 113911 The following pseudo-utilities shall be supported as *command* operands. All options referred to  
113912 in the following list are values given in the *options* operands following *command*.
- 113913 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a  
113914 non-zero exit status shall be returned if anything is being edited. The intent is to have  
113915 this included in an ``install'' entry in a makefile to ensure that everything is included  
113916 into the SCCS file before a version is installed.
- 113917 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
113918 but do not remove any files being edited. If the **-b** option is given, branches shall be  
113919 ignored in the determination of whether they are being edited; this is dangerous if  
113920 branches are kept in the same directory.
- 113921 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
113922 options to *admin* are accepted. If the creation is successful, the original files shall be  
113923 renamed by prefixing the basenames with a comma. These renamed files should be  
113924 removed after it has been verified that the SCCS files have been created successfully.
- 113925 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall  
113926 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**  
113927 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be  
113928 passed to *get*.
- 113929 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option is  
113930 useful for making a checkpoint of the current editing phase. The same options shall be  
113931 passed to *delta* as described above, and all the options listed for *get* above except **-e**  
113932 shall be passed to **edit**.
- 113933 **diffs** Write a difference listing between the current version of the files checked out for editing  
113934 and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be passed to  
113935 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option shall be  
113936 passed to *diff* as **-c**.
- 113937 **edit** Equivalent to *get -e*.
- 113938 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
113939 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
113940 is followed by a **-r** *SID* option. Since **fix** does not leave audit trails, it should be used  
113941 carefully.
- 113942 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
113943 with two or fewer components) shall be ignored. If a **-u** *user* option is given, then only  
113944 files being edited by the named user shall be listed. A **-U** option shall be equivalent to  
113945 **-u**<*current user*>.
- 113946 **print** Write out verbose information about the named files, equivalent to *sccs prs*.
- 113947 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
113948 **-b**, **-u**, and **-U** options like **info** and **check**.
- 113949 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
113950 changes made since the *get* are lost.

113951 **EXIT STATUS**

113952 The following exit values shall be returned:

113953 0 Successful completion.

113954 &gt;0 An error occurred.

113955 **CONSEQUENCES OF ERRORS**

113956 Default.

113957 **APPLICATION USAGE**

113958 Many of the SCCS utilities take directory names as operands as well as specific filenames. The  
 113959 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 113960 prohibited from doing so.

113961 **EXAMPLES**

113962 1. To get a file for editing, edit it and produce a new delta:

113963 `sccs get -e file.c`113964 `ex file.c`113965 `sccs delta file.c`

113966 2. To get a file from another directory:

113967 `sccs -p /usr/src/sccs/s. get cc.c`

113968 or:

113969 `sccs get /usr/src/sccs/s.cc.c`

113970 3. To make a delta of a large number of files in the current directory:

113971 `sccs delta *.c`

113972 4. To get a list of files being edited that are not on branches:

113973 `sccs info -b`

113974 5. To delta everything being edited by the current user:

113975 `sccs delta $(sccs tell -U)`

113976 6. In a makefile, to get source files from an SCCS file if it does not already exist:

113977 `SRCS = <list of source files>`113978 `$(SRCS) :`113979 `sccs get $(REL) $@`113980 **RATIONALE**

113981 *sccs* and its associated utilities are part of the XSI Development Utilities option within the XSI  
 113982 option.

113983 SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement  
 113984 tracking tool. When a file is put under SCCS, the source code control system maintains the file  
 113985 and, when changes are made, identifies and stores them in the file with the original source code  
 113986 and/or documentation. As other changes are made, they too are identified and retained in the  
 113987 file.

113988 Retrieval of the original and any set of changes is possible. Any version of the file as it develops  
 113989 can be reconstructed for inspection or additional modification. History data can be stored with  
 113990 each version, documenting why the changes were made, who made them, and when they were  
 113991 made.

**113992 FUTURE DIRECTIONS**

113993 None.

**113994 SEE ALSO**

113996 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

**113997 CHANGE HISTORY**

113998 First released in Issue 4.

**113999 Issue 6**

114000 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
114001 ``otherwise, the home directory of a user of that name is examined'' to ``otherwise, the value of  
114002 *PROJECTDIR* is treated as a user name and that user's initial working directory is examined''.

114003 The normative text is reworded to avoid use of the term ``must'' for application requirements.

**114004 Issue 7**

114005 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**114006 Issue 8**

114007 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

114008 **NAME**

114009 sed — stream editor

114010 **SYNOPSIS**114011 sed [-En] *script* [*file...*]114012 sed [-En] -e *script* [-e *script*]... [-f *script\_file*]... [*file...*]114013 sed [-En] [-e *script*]... -f *script\_file* [-f *script\_file*]... [*file...*]114014 **DESCRIPTION**

114015 The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 114016 according to a script of editing commands, and write the results to standard output. The script  
 114017 shall be obtained from either the *script* operand string or a combination of the option-arguments  
 114018 from the -e *script* and -f *script\_file* options.

114019 **OPTIONS**

114020 The *sed* utility shall conform to XBD Section 12.2 (on page 215), except that the order of  
 114021 presentation of the -e and -f options is significant.

114022 The following options shall be supported:

114023 -E Match using extended regular expressions. Treat each pattern specified as an ERE,  
 114024 as described in XBD Section 9.4 (on page 187).

114025 -e *script* Add the editing commands specified by the *script* option-argument to the end of  
 114026 the script of editing commands.

114027 -f *script\_file* Add the editing commands in the file *script\_file* to the end of the script of editing  
 114028 commands.

114029 -n Suppress the default output (in which each line, after it is examined for editing, is  
 114030 written to standard output). Only lines explicitly selected for output are written.

114031 If any -e or -f options are specified, the script of editing commands shall initially be empty. The  
 114032 commands specified by each -e or -f option shall be added to the script in the order specified.  
 114033 When each addition is made, if the previous addition (if any) was from a -e option, a <newline>  
 114034 shall be inserted before the new addition. The resulting script shall have the same properties as  
 114035 the *script* operand, described in the OPERANDS section.

114036 **OPERANDS**

114037 The following operands shall be supported:

114038 *file* A pathname of a file whose contents are read and edited. If multiple *file* operands  
 114039 are specified, the named files shall be read in the order specified and the  
 114040 concatenation shall be edited. If no *file* operands are specified, the standard input  
 114041 shall be used.

114042 *script* A string to be used as the script of editing commands. The application shall not  
 114043 present a *script* that violates the restrictions of a text file except that the final  
 114044 character need not be a <newline>.

114045 **STDIN**

114046 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 114047 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 114048 the standard input shall not be used. See the INPUT FILES section.

114049 **INPUT FILES**

114050 The input files shall be text files. The *script\_files* named by the `-f` option shall consist of editing  
114051 commands.

114052 **ENVIRONMENT VARIABLES**

114053 The following environment variables shall affect the execution of *sed*:

114054 *LANG* Provide a default value for the internationalization variables that are unset or null.  
114055 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
114056 variables used to determine the values of locale categories.)

114057 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
114058 internationalization variables.

114059 *LC\_COLLATE*

114060 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
114061 character collating elements within regular expressions.

114062 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
114063 characters (for example, single-byte as opposed to multi-byte characters in  
114064 arguments and input files), and the behavior of character classes within regular  
114065 expressions.

114066 *LC\_MESSAGES*

114067 Determine the locale that should be used to affect the format and contents of  
114068 diagnostic messages written to standard error.

114069 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

114070 **ASYNCHRONOUS EVENTS**

114071 Default.

114072 **STDOUT**

114073 The input files shall be written to standard output, with the editing commands specified in the  
114074 script applied. If the `-n` option is specified, only those input lines selected by the script shall be  
114075 written to standard output.

114076 **STDERR**

114077 The standard error shall be used only for diagnostic and warning messages.

114078 **OUTPUT FILES**

114079 The output files shall be text files whose formats are dependent on the editing commands given.

114080 **EXTENDED DESCRIPTION**

114081 The *script* shall consist of editing commands of the following form:

114082 `[address[, address]] function`

114083 where *function* represents a single-character command verb from the list in [Editing Commands](#)  
114084 [in sed](#) (on page 3357), followed by any applicable arguments.

114085 The command can be preceded by <blank> characters and/or <semicolon> characters. The  
114086 function can be preceded by <blank> characters. These optional characters shall have no effect.

114087 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>  
114088 character, into the pattern space. Reading from input shall be skipped if a <newline> was in the  
114089 pattern space prior to a **D** command ending the previous cycle. The *sed* utility shall then apply in  
114090 sequence all commands whose addresses select that pattern space, until a command starts the  
114091 next cycle or quits. If no commands explicitly started a new cycle, then at the end of the script  
114092 the pattern space shall be copied to standard output (except when `-n` is specified) and the

114093 pattern space shall be deleted. Whenever the pattern space is written to standard output or a  
114094 named file, *sed* shall immediately follow it with a <newline>.

114095 Some of the editing commands use a hold space to save all or part of the pattern space for  
114096 subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

### 114097 **Addresses in sed**

114098 An address is either a decimal number that counts input lines cumulatively across files, a '\$'  
114099 character that addresses the last line of input, or a context address. A context address has either  
114100 the form "/RE/" or "\cREc", where RE is a regular expression as described in [Regular](#)  
114101 [Expressions in sed](#), and *c* is any character other than <backslash> or <newline>. In a *sed* context  
114102 address, the BRE and ERE syntax shall be extended to support escaping occurrences of the  
114103 <slash> or *c* delimiter within the RE by means of an escape sequence (see [XBD Section 9.1](#), on  
114104 page 179). For the "\cREc" form, if the character designated by *c* is not listed as a special BRE  
114105 character (if the -E option is not specified) or a special ERE character (if -E is specified) in [XBD](#)  
114106 [Section 9.3.3](#) (on page 182) or [XBD Section 9.4.3](#) (on page 188), respectively, the escape sequence  
114107 <backslash>*c* shall be treated as that literal character; otherwise, it is unspecified whether the  
114108 escape sequence <backslash>*c* is treated as the literal character or the special character. In either  
114109 case, the escape sequence <backslash>*c* shall not terminate the RE. For example, in the context  
114110 address "/abc/def/", the second <slash> stands for itself, so that the RE is "abc/def", and  
114111 in "\xabc\xdefx", the second 'x' stands for itself, so that the RE is "abcxdef".

114112 An editing command with no addresses shall select every pattern space.

114113 An editing command with one address shall select each pattern space that matches the address.

114114 An editing command with two addresses shall select the inclusive range from the first pattern  
114115 space that matches the first address through the next pattern space that matches the second. (If  
114116 the second address is a number less than or equal to the line number first selected, only one line  
114117 shall be selected.) Starting at the first line following the selected range, *sed* shall look again for  
114118 the first address. Thereafter, the process shall be repeated. Omitting either or both of the address  
114119 components in the following form produces undefined results:

114120 `[address[, address]]`

### 114121 **Regular Expressions in sed**

114122 The *sed* utility shall support the REs described in [XBD Chapter 9](#) (on page 179); by default it shall  
114123 use BREs as described in [XBD Section 9.3](#) (on page 181), but if the -E option is used, it shall use  
114124 EREs as described in [XBD Section 9.4](#) (on page 187). In *sed*, the BRE and ERE syntax shall be  
114125 extended as follows:

- 114126 • The delimiter character that precedes and follows the RE shall not terminate the RE when  
114127 it appears within a bracket expression, and shall have its normal meaning in the bracket  
114128 expression. For example, the context address "\% [%] %" is equivalent to "[ % ] /", and the  
114129 command "s-[0-9]--g" is equivalent to "s/[0-9]//g".
- 114130 • The escape sequence '\n' shall match a <newline> embedded in the pattern space. A  
114131 literal <newline> shall not be used in the RE of a context address or in the substitute  
114132 function.
- 114133 • If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in  
114134 the last command applied (either as an address or as part of a substitute command) was  
114135 specified.

114136 **Editing Commands in sed**

114137 In the following list of editing commands, the maximum number of permissible addresses for  
114138 each function is indicated by *[0addr]*, *[1addr]*, or *[2addr]*, representing zero, one, or two  
114139 addresses.

114140 The argument *text* shall consist of one or more lines. A <backslash> in the text can be escaped  
114141 with another <backslash>. The application shall ensure that each embedded <newline> (that is,  
114142 those other than the terminating <newline> of the last line) in the text is preceded by an  
114143 unescaped <backslash>. The behavior is unspecified if an unescaped <backslash> is  
114144 immediately followed by any character other than <backslash> or <newline>, or by the end of a  
114145 *script*.

114146 The **r** and **w** command verbs, and the *w* flag to the **s** command, take an *rfile* (or *wfile*) parameter,  
114147 separated from the command verb letter or flag by one or more <blank> characters;  
114148 implementations may allow zero separation as an extension.

114149 The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be  
114150 created before processing begins. Implementations shall support at least ten *wfile* arguments in  
114151 the script; the actual number (greater than or equal to 10) that is supported by the  
114152 implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially  
114153 created, if it does not exist, or shall replace the contents of an existing file.

114154 The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following  
114155 synopses indicate which arguments shall be separated from the command verbs by a single  
114156 <space>.

114157 The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and  
114158 the contents of the file specified for the **r** command, shall be written to standard output just  
114159 before the next attempt to fetch a line of input when executing the **c**, **D**, **d**, **N**, or **n** commands,  
114160 just before executing the **q** command, or when reaching the end of the script. If written when  
114161 reaching the end of the script, and the **-n** option was not specified, the text shall be written after  
114162 copying the pattern space to standard output. The contents of the file specified for the **r**  
114163 command shall be as of the time the output is written, not the time the **r** command is applied.  
114164 The text shall be output in the order in which the **a** and **r** commands were applied to the input.

114165 Editing commands other than **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a <semicolon>,  
114166 optional <blank> characters, and another editing command. However, when an **s** editing  
114167 command is used with the *w* flag, following it with another command in this manner produces  
114168 undefined results.

114169 A function can be preceded by a **!** character, in which case the function shall be applied if the  
114170 addresses do not select the pattern space. Zero or more <blank> characters shall be accepted  
114171 before the **!** character. It is unspecified whether <blank> characters can follow the **!**  
114172 character, and conforming applications shall not follow the **!** character with <blank>  
114173 characters.

114174 If a *label* argument (to a **b**, **t**, or **:** command) contains characters outside of the portable filename  
114175 character set, or if a *label* is longer than 8 bytes, the behavior is unspecified. The implementation  
114176 shall support *label* arguments recognized as unique up to at least 8 bytes; the actual length  
114177 (greater than or equal to 8) supported by the implementation is unspecified. It is unspecified  
114178 whether exceeding the maximum supported label length causes an error or a silent truncation.

114179 *[2addr] {editing command}*  
114180 *editing command*

|        |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 114181 | ...               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114182 | }                 | Execute a list of <i>sed</i> editing commands only when the pattern space is selected. The list of <i>sed</i> editing commands shall be surrounded by braces. The braces can be preceded or followed by <blank> characters. The <right-brace> shall be preceded by a <newline> or <semicolon> (before any optional <blank> characters preceding the <right-brace>).                                                                                                                    |
| 114183 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114184 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114185 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 114217 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114218 |                   | Long lines shall be folded, with the point of folding indicated by writing a <backslash> followed by a <newline>; the length at which folding occurs is unspecified, but should be appropriate for the output device. The end of each line shall be marked with a '\$'.                                                                                                                                                                                                                |
| 114219 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114220 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114221 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114222 | [2addr]n          | Write the pattern space to standard output if the default output has not been suppressed, and replace the pattern space with the next line of input, less its terminating <newline>.                                                                                                                                                                                                                                                                                                   |
| 114223 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 114224 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- 114225 If no next line of input is available, the **n** command verb shall branch to the end of  
114226 the script and quit without starting a new cycle.
- 114227 **[2addr]N** Append the next line of input, less its terminating <newline>, to the pattern space,  
114228 using an embedded <newline> to separate the appended material from the  
114229 original material. Note that the current line number changes.
- 114230 If no next line of input is available, the **N** command verb shall branch to the end of  
114231 the script and quit without starting a new cycle or copying the pattern space to  
114232 standard output.
- 114233 **[2addr]p** Write the pattern space to standard output.
- 114234 **[2addr]P** Write the pattern space, up to the first <newline>, to standard output.
- 114235 **[1addr]q** Branch to the end of the script and quit without starting a new cycle.
- 114236 **[1addr]r rfile** Copy the contents of *rfile* to standard output as described previously. If *rfile* does  
114237 not exist or cannot be read, it shall be treated as if it were an empty file, causing no  
114238 error condition.
- 114239 **[2addr]s/RE/replacement/flags**  
114240 Substitute the replacement string for instances of the RE in the pattern space. Any  
114241 character other than <backslash> or <newline> can be used instead of a <slash> to  
114242 delimit the RE and the replacement. Within the RE (as a *sed* extension to the BRE  
114243 and ERE syntax) and the replacement, the delimiter shall not terminate the RE or  
114244 replacement if it is the second character of an escape sequence (see XBD [Section](#)  
114245 [9.1](#), on page 179). If the delimiter character is not listed as a special BRE character  
114246 (if the **-E** option is not specified) or a special ERE character (if **-E** is specified) in  
114247 XBD [Section 9.3.3](#) (on page 182) or XBD [Section 9.4.3](#) (on page 188), respectively,  
114248 the escaped delimiter shall be treated as that literal character in the RE; otherwise,  
114249 it is unspecified whether the escaped delimiter is treated as the literal character or  
114250 the special character. Likewise, if the delimiter character is not <ampersand>  
114251 ('&'), the escaped delimiter shall be treated as that literal character in the  
114252 replacement; if it is <ampersand>, it is unspecified whether the escaped delimiter  
114253 is treated as the literal character or the special character (see below).
- 114254 The replacement string shall be scanned from beginning to end. An <ampersand>  
114255 ('&') appearing in the replacement shall be replaced by the string matching the  
114256 RE. The special meaning of '&' in this context can be suppressed by preceding it  
114257 by a <backslash>. The characters "*\n*", where *n* is a digit, shall be replaced by the  
114258 text matched by the corresponding back-reference expression. If the corresponding  
114259 back-reference expression does not match, then the characters "*\n*" shall be  
114260 replaced by the empty string. The special meaning of "*\n*" where *n* is a digit in  
114261 this context, can be suppressed by preceding it by a <backslash>. For each other  
114262 <backslash> encountered, the following character shall lose its special meaning (if  
114263 any).
- 114264 A line can be split by substituting a <newline> into it. The application shall escape  
114265 the <newline> in the replacement by preceding it by a <backslash>.
- 114266 The meaning of an unescaped <backslash> immediately followed by any character  
114267 other than '&', <backslash>, a digit, <newline>, or the delimiter character used for  
114268 this command, is unspecified.
- 114269 Any <backslash> used to alter the default meaning of a subsequent character shall  
114270 be discarded from the resulting replacement string. A substitution shall be

|        |                                                               |                                                                                                              |
|--------|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| 114271 |                                                               | considered to have been performed even if the resulting replacement string is                                |
| 114272 |                                                               | identical to the string that it replaces.                                                                    |
| 114273 |                                                               | The value of <i>flags</i> shall be zero or more of:                                                          |
| 114274 | <i>n</i>                                                      | Substitute for the <i>n</i> th occurrence only of the RE found within the                                    |
| 114275 |                                                               | pattern space.                                                                                               |
| 114276 | <b>g</b>                                                      | Globally substitute for all non-overlapping instances of the RE rather                                       |
| 114277 |                                                               | than just the first one. If both <b>g</b> and <i>n</i> are specified, the results are                        |
| 114278 |                                                               | unspecified.                                                                                                 |
| 114279 | <b>i</b>                                                      | Match the regular expression in a case-insensitive way.                                                      |
| 114280 | <b>p</b>                                                      | Write the pattern space to standard output if a replacement was                                              |
| 114281 |                                                               | made.                                                                                                        |
| 114282 | <b>w</b> <i>wfile</i>                                         | Write. Append the pattern space to <i>wfile</i> if a replacement was made.                                   |
| 114283 |                                                               | A conforming application shall precede the <i>wfile</i> argument with one                                    |
| 114284 |                                                               | or more <blank> characters. If the <b>w</b> flag is not the last flag value                                  |
| 114285 |                                                               | given in a concatenation of multiple flag values, the results are                                            |
| 114286 |                                                               | undefined.                                                                                                   |
| 114287 | [ <i>2addr</i> ] <b>t</b> [ <i>label</i> ]                    |                                                                                                              |
| 114288 |                                                               | Test. Branch to the <b>:</b> command verb bearing the <i>label</i> if any substitutions have been            |
| 114289 |                                                               | made since the most recent reading of an input line or execution of a <b>t</b> . If <i>label</i> is          |
| 114290 |                                                               | not specified, branch to the end of the script.                                                              |
| 114291 | [ <i>2addr</i> ] <b>w</b> <i>wfile</i>                        |                                                                                                              |
| 114292 |                                                               | Append (write) the pattern space to <i>wfile</i> .                                                           |
| 114293 | [ <i>2addr</i> ] <b>x</b>                                     | Exchange the contents of the pattern and hold spaces.                                                        |
| 114294 | [ <i>2addr</i> ] <b>y</b> / <i>string1</i> / <i>string2</i> / |                                                                                                              |
| 114295 |                                                               | Replace all occurrences of characters in <i>string1</i> with the corresponding characters                    |
| 114296 |                                                               | in <i>string2</i> . If a <backslash> followed by an 'n' appear in <i>string1</i> or <i>string2</i> , the two |
| 114297 |                                                               | characters shall be handled as a single <newline>. If (after resolving any escape                            |
| 114298 |                                                               | sequences) the numbers of characters in <i>string1</i> and <i>string2</i> are not equal, or if any           |
| 114299 |                                                               | of the characters in <i>string1</i> appear more than once, the results are undefined. Any                    |
| 114300 |                                                               | character other than <backslash> or <newline> can be used instead of <slash> to                              |
| 114301 |                                                               | delimit the strings. If the delimiter is not 'n', within <i>string1</i> and <i>string2</i> , the             |
| 114302 |                                                               | delimiter itself can be used as a literal character if it is preceded by an unescaped                        |
| 114303 |                                                               | <backslash>. If a <backslash> character is escaped by an immediately preceding                               |
| 114304 |                                                               | unescaped <backslash> character in <i>string1</i> or <i>string2</i> , the two <backslash>                    |
| 114305 |                                                               | characters shall be treated as a single literal <backslash> character. The meaning of                        |
| 114306 |                                                               | an unescaped <backslash> followed by any character that is not 'n', a                                        |
| 114307 |                                                               | <backslash>, or the delimiter character is undefined.                                                        |
| 114308 | [ <i>0addr</i> ]: <i>label</i>                                | Do nothing. This command bears a <i>label</i> to which the <b>b</b> and <b>t</b> commands branch.            |
| 114309 | [ <i>1addr</i> ]=                                             | Write the following to standard output:                                                                      |
| 114310 |                                                               | "%d\n", <current line number>                                                                                |
| 114311 | [ <i>0addr</i> ]                                              | Ignore this empty command.                                                                                   |
| 114312 | [ <i>0addr</i> ] <b>#</b>                                     | Ignore the '#' and the remainder of the line (treat them as a comment), with the                             |
| 114313 |                                                               | single exception that if the first two characters in the script are "#n", the default                        |
| 114314 |                                                               | output shall be suppressed; this shall be the equivalent of specifying <b>-n</b> on the                      |

114315 command line.

#### 114316 EXIT STATUS

114317 The following exit values shall be returned:

114318 0 Successful completion.

114319 >0 An error occurred.

#### 114320 CONSEQUENCES OF ERRORS

114321 Default.

#### 114322 APPLICATION USAGE

114323 Regular expressions match entire strings, not just individual lines, but a <newline> is matched  
114324 by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression  
114325 in POSIX.1-2024. Also note that '\n' cannot be used to match a <newline> at the end of an  
114326 arbitrary input line; <newline> characters appear in the pattern space as a result of the **N** editing  
114327 command.

114328 Applications that use a special RE character as a delimiter (for example, '.' or '\*') and need to  
114329 use the delimiter as a literal character in the RE should put it inside a bracket expression, as  
114330 implementations differ regarding whether escaping it with a <backslash> removes its special  
114331 meaning. For example, for the context address "/\.[0-9]/" to be written with '.' as  
114332 delimiter, the form "\.[.] [0-9]." needs to be used; "\.\.[0-9]." cannot be used portably  
114333 for this purpose, as it is unspecified whether this would be equivalent to "/\.[0-9]/" or  
114334 "/.[0-9]/". Portable applications cannot use a special RE character as a delimiter if that  
114335 character needs to have its special meaning in the RE, as escaping it may remove its special  
114336 meaning.

114337 When using *sed* to process pathnames, it is recommended that LC\_ALL, or at least LC\_CTYPE  
114338 and LC\_COLLATE, are set to POSIX or C in the environment, since pathnames can contain byte  
114339 sequences that do not form valid characters in some locales, in which case the utility's behavior  
114340 would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore  
114341 this problem is avoided.

114342 Note that some implementations of *sed* also support an **I** flag for the **s** command as an alias for  
114343 the lower case **i** flag.

114344 Some implementations of *sed*, when executed in a non-conforming environment, handle  
114345 <backslash> escapes in regular expressions in a similar way to how *awk* handles them in the  
114346 lexical token **ERE** (processing "\t" as a tab character, etc.). This is a compatible extension except  
114347 that it conflicts with the requirements of this standard when <backslash> appears inside a  
114348 bracket expression. A future version of this standard may allow this behavior, and therefore  
114349 applications should use two <backslash> characters in bracket expressions instead of one in  
114350 order to ensure future portability. On implementations conforming to the current standard, the  
114351 second <backslash> is redundant. In the future (and in current non-conforming environments)  
114352 the first <backslash> may escape the second.

#### 114353 EXAMPLES

114354 This *sed* script simulates the BSD *cat -s* command, squeezing excess empty lines from standard  
114355 input.

```
114356 sed -n '
114357 # Write non-empty lines.
114358 ./ {
114359     p
114360     d
```

```

114361     }
114362     # Write a single empty line, then look for more empty lines.
114363     /^$/ p
114364     # Get next line, discard the held <newline> (empty line),
114365     # and look for more empty lines.
114366     :Empty
114367     /^$/ {
114368         N
114369         s/././
114370         b Empty
114371     }
114372     # Write the non-empty line before going back to search
114373     # for the first in a set of empty lines.
114374     p
114375     '

```

114376 The following *sed* command is a much simpler method of squeezing empty lines, although it is  
 114377 not quite the same as *cat -s* since it removes any initial empty lines:

```
114378 sed -n '/./,/^$/p'
```

#### 114379 RATIONALE

114380 This volume of POSIX.1-2024 requires implementations to support at least ten distinct *wfiles*,  
 114381 matching historical practice on many implementations. Implementations are encouraged to  
 114382 support more, but conforming applications should not exceed this limit.

114383 The exit status codes specified here are different from those in System V. System V returns 2 for  
 114384 garbled *sed* commands, but returns zero with its usage message or if the input file could not be  
 114385 opened. The standard developers considered this to be a bug.

114386 The manner in which the *l* command writes non-printable characters was changed to avoid the  
 114387 historical backspace-overstrike method, and other requirements to achieve unambiguous output  
 114388 were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as  
 114389 that chosen for *sed*.

114390 This volume of POSIX.1-2024 requires implementations to provide pattern and hold spaces of at  
 114391 least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical implementations, but  
 114392 less than the 20 480 bytes limit used in an early proposal. Implementations are encouraged to  
 114393 allocate dynamically larger pattern and hold spaces as needed.

114394 The requirements for acceptance of <blank> and <space> characters in command lines has been  
 114395 made more explicit than in early proposals to describe clearly the historical practice and to  
 114396 remove confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is  
 114397 done on every script line” that appears in much of the historical documentation of the *sed* utility  
 114398 description of text. (Not all implementations are known to have stripped <blank> characters  
 114399 from text lines, although they all have allowed leading <blank> characters preceding the address  
 114400 on a command line.)

114401 The treatment of '#' comments differs from the SVID which only allows a comment as the first  
 114402 line of the script, but matches BSD-derived implementations. The comment character is treated  
 114403 as a command, and it has the same properties in terms of being accepted with leading <blank>  
 114404 characters; the BSD implementation has historically supported this.

114405 Early proposals required that a *script\_file* have at least one non-comment line. Some historical  
 114406 implementations have behaved in unexpected ways if this were not the case. The standard  
 114407 developers considered that this was incorrect behavior and that application developers should

114408 not have to avoid this feature. A correct implementation of this volume of POSIX.1-2024 shall  
114409 permit *script\_files* that consist only of comment lines.

114410 Early proposals indicated that if `-e` and `-f` options were intermixed, all `-e` options were  
114411 processed before any `-f` options. This has been changed to process them in the order presented  
114412 because it matches historical practice and is more intuitive.

114413 The characters `<backslash>` and `<newline>` cannot be used as RE delimiter characters, as they  
114414 can never be recognized as the ending delimiter:

- 114415 • `<backslash>` does not work, because if it appears unescaped later in the RE, it either  
114416 escapes the following character, which can then never be the ending delimiter, or it is part  
114417 of a bracket expression, inside which the ending delimiter for the RE cannot be located.
- 114418 • `<newline>` does not work, because if not escaped, it terminates the command, meaning it  
114419 cannot be the ending delimiter.

114420 Some historical *sed* implementations did not support escaping `'(, ')', '{', and '}'` when  
114421 used as a BRE delimiter, as the sequences `"\ ("` and so on were still treated as special, usually  
114422 resulting in an error. This standard requires that these sequences are treated as the literal  
114423 character. This is for consistency with extensions. For example, some implementations treat  
114424 `"\s"` in a BRE as matching white-space characters, as an extension. This cannot have its special  
114425 meaning when `'s'` is used as a BRE delimiter in order to ensure portability of *sed* commands  
114426 that have `'s'` as a delimiter and escape it. If `"\s"` were allowed to keep its special meaning,  
114427 then the potential for further extensions would mean portable applications would not be able to  
114428 escape any delimiter character other than `<slash>`.

114429 The treatment of the `p` flag to the `s` command differs between System V and BSD-based systems  
114430 when the default output is suppressed. In the two examples:

```
114431 echo a | sed 's/a/A/p'
114432 echo a | sed -n 's/a/A/p'
```

114433 this volume of POSIX.1-2024, BSD, System V documentation, and the SVID indicate that the first  
114434 example should write two lines with **A**, whereas the second should write one. Some System V  
114435 systems write the **A** only once in both examples because the `p` flag is ignored if the `-n` option is  
114436 not specified.

114437 This is a case of a diametrical difference between systems that could not be reconciled through  
114438 the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V  
114439 documentation behavior was adopted for this volume of POSIX.1-2024 because:

- 114440 • No known documentation for any historic system describes the interaction between the `p`  
114441 flag and the `-n` option.
- 114442 • The selected behavior is more correct as there is no technical justification for any  
114443 interaction between the `p` flag and the `-n` option. A relationship between `-n` and the `p` flag  
114444 might imply that they are only used together, but this ignores valid scripts that interrupt  
114445 the cyclical nature of the processing through the use of the `D`, `d`, `q`, or branching  
114446 commands. Such scripts rely on the `p` suffix to write the pattern space because they do not  
114447 make use of the default output at the ```bottom``` of the script.
- 114448 • Because the `-n` option makes the `p` flag unnecessary, any interaction would only be useful  
114449 if *sed* scripts were written to run both with and without the `-n` option. This is believed to  
114450 be unlikely. It is even more unlikely that programmers have coded the `p` flag expecting it to  
114451 be unnecessary. Because the interaction was not documented, the likelihood of a  
114452 programmer discovering the interaction and depending on it is further decreased.

- 114453           • Finally, scripts that break under the specified behavior produce too much output instead of  
114454           too little, which is easier to diagnose and correct.

114455           The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in  
114456           an early proposal. This limit has been removed because there is no reason an editor processing  
114457           lines of {LINE\_MAX} length should have this restriction. The command *s/a/A/2047* should be  
114458           able to substitute the 2 047th occurrence of **a** on a line.

114459           The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is  
114460           made of trailing white space. Historical implementations of *sed* assigned different locations to  
114461           the labels '**x**' and "**x**". This is not useful, and leads to subtle programming errors, but it is  
114462           historical practice, and changing it could theoretically break working scripts. Implementors are  
114463           encouraged to provide warning messages about labels that are never referenced by a **b** or **t**  
114464           command, jumps to labels that do not exist, and label arguments that are subject to truncation.

114465           Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
114466           but this has been modified in this version.

#### 114467 **FUTURE DIRECTIONS**

114468           A future version of this standard may allow *sed* to handle <backslash> escapes in regular  
114469           expressions in a similar way to how *awk* handles them in the lexical token **ERE**. ("Similar"  
114470           rather than "the same" because *sed* can use BREs or EREs whereas *awk* uses only EREs.)

#### 114471 **SEE ALSO**

114474           page 215)

#### 114475 **CHANGE HISTORY**

114476           First released in Issue 2.

#### 114477 **Issue 5**

114478           The FUTURE DIRECTIONS section is added.

#### 114479 **Issue 6**

114480           The following new requirements on POSIX implementations derive from alignment with the  
114481           Single UNIX Specification:

- 114482           • Implementations are required to support at least ten *wfile* arguments in an editing  
114483           command.

114484           The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

114485           IEEE PASC Interpretation 1003.2 #190 is applied.

114486           IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the  
114487           <backslash>-escape sequences in a replacement string for a BRE.

114488           IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/28 is applied, removing text describing  
114489           behavior on systems with bytes consisting of more than eight bits.

114490           IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/29 is applied, making an editorial  
114491           correction within the Editing Commands in *sed* section.

#### 114492 **Issue 7**

114493           Austin Group Interpretations 1003.1-2001 #006, #036, and #092 are applied.

114494           SD5-XCU-ERN-97 and SD5-XCU-ERN-123 are applied, updating the SYNOPSIS.

114495           A second example is added.

- 114496 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0133 [262], XCU/TC1-2008/0134  
114497 [282,431], XCU/TC1-2008/0135 [269], and XCU/TC1-2008/0136 [282,431] are applied.
- 114498 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0166 [945], XCU/TC2-2008/0167  
114499 [944], XCU/TC2-2008/0168 [945], XCU/TC2-2008/0169 [944], XCU/TC2-2008/0170 [945],  
114500 XCU/TC2-2008/0171 [533], XCU/TC2-2008/0172 [663], XCU/TC2-2008/0173 [945], and  
114501 XCU/TC2-2008/0174 [944] are applied.
- 114502 **Issue 8**
- 114503 Austin Group Defect 528 is applied, adding support for selecting the use of EREs instead of  
114504 BREs, by specifying the `-E` option.
- 114505 Austin Group Defect 779 is applied, adding the `i` flag to the `s` command.
- 114506 Austin Group Defect 961 is applied, requiring that `{...}` can be followed by a `<semicolon>`,  
114507 optional `<blank>` characters, and another editing command.
- 114508 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.
- 114509 Austin Group Defect 1231 is applied, clarifying the handling of `<backslash>` in `text` arguments.
- 114510 Austin Group Defect 1233 is applied, changing the APPLICATION USAGE and FUTURE  
114511 DIRECTIONS sections.
- 114512 Austin Group Defect 1319 is applied, changing when the text specified for the `a` command and  
114513 the contents of the file specified for the `r` command are written.
- 114514 Austin Group Defect 1550 is applied, clarifying requirements relating to delimiters in context  
114515 addresses and in `s` and `y` commands.
- 114516 Austin Group Defect 1578 is applied, clarifying the description of the `y` command.
- 114517 Austin Group Defect 1767 is applied, clarifying that a `c` command starts the next cycle on every  
114518 line that its address range matches.

114519 **NAME**

114520 sh — shell, the standard command language interpreter

114521 **SYNOPSIS**

114522 OB sh [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...  
 114523 [command\_file [argument...]]

114524 OB sh -c [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...  
 114525 command\_string [command\_name [argument...]]

114526 OB sh -s [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...  
 114527 [argument...]

114528 **DESCRIPTION**

114529 The *sh* utility is a command language interpreter that shall execute commands read from a  
 114530 command line string, the standard input, or a specified file. The application shall ensure that the  
 114531 commands to be executed are expressed in the language described in [Chapter 2](#) (on page 2472).

114532 Pathname expansion shall not fail due to the size of a file.

114533 Shell input and output redirections have an implementation-defined offset maximum that is  
 114534 established in the open file description.

114535 **OPTIONS**

114536 The *sh* utility shall conform to XBD [Section 12.2](#) (on page 215), with an extension for support of a  
 114537 leading <plus-sign> ('+') as noted below.

114538 The *-a*, *-b*, *-C*, *-e*, *-f*, *-h*, *-m*, *-n*, *-o option*, *-u*, *-v*, and *-x* options are described as part of the  
 114539 *set* utility in [Section 2.15](#) (on page 2526). The option letters derived from the *set* special built-in  
 114540 shall also be accepted with a leading <plus-sign> ('+') instead of a leading <hyphen-minus>  
 114541 (meaning the reverse case of the option as described in this volume of POSIX.1-2024). If the *-o*  
 114542 or *+o* option is specified without an option-argument, the behavior is unspecified.

114543 The following additional options shall be supported:

114544 *-c* Read commands from the *command\_string* operand. Set the value of special  
 114545 parameter 0 (see [Section 2.5.2](#), on page 2479) from the value of the *command\_name*  
 114546 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
 114547 remaining *argument* operands. No commands shall be read from the standard  
 114548 input.

114549 *-i* Specify that the shell is *interactive*; see below. An implementation may treat  
 114550 specifying the *-i* option as an error if the real user ID of the calling process does  
 114551 not equal the effective user ID or if the real group ID does not equal the effective  
 114552 group ID.

114553 *-s* Read commands from the standard input.

114554 If there are no operands and the *-c* option is not specified, the *-s* option shall be assumed.

114555 If the *-i* option is present, or if the shell reads commands from the standard input and the shell's  
 114556 standard input and standard error are attached to a terminal, the shell is considered to be  
 114557 *interactive*.

114558 **OPERANDS**

114559 The following operands shall be supported:

114560 *-* A single <hyphen-minus> shall be treated as the first operand and then ignored. If  
 114561 both '-' and "--" are given as arguments, or if other operands precede the single  
 114562 <hyphen-minus>, the results are undefined.

- 114563        *argument*     The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.
- 114564        *command\_file* The pathname of a file containing commands. If the pathname contains one or  
114565                    more <slash> characters, the implementation attempts to read that file; the file  
114566                    need not be executable. If the pathname does not contain a <slash> character:
- 114567                    • The implementation shall attempt to read that file from the current working  
114568                    directory; the file need not be executable.
  - 114569                    • If the file is not in the current working directory, the implementation may  
114570                    perform a search for an executable file using the value of *PATH*, as described  
114571                    in [Section 2.9.1.4](#) (on page 2502).
- 114572                    Special parameter 0 (see [Section 2.5.2](#), on page 2479) shall be set to the value of  
114573                    *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
114574                    parameter 0 shall be set to the value of the first argument passed to *sh* from its  
114575                    parent (for example, *argv*[0] for a C program), which is normally a pathname used  
114576                    to execute the *sh* utility.
- 114577        *command\_name*     A string assigned to special parameter 0 when executing the commands in  
114578                    *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
114579                    to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
114580                    for a C program), which is normally a pathname used to execute the *sh* utility.  
114581
- 114582        *command\_string*     A string that shall be interpreted by the shell as one or more commands, as if the  
114583                    string were the argument to the *system()* function defined in the System Interfaces  
114584                    volume of POSIX.1-2024. If the *command\_string* operand is an empty string, *sh* shall  
114585                    exit with a zero exit status.  
114586
- 114587        **STDIN**
- 114588                    The standard input shall be used only if one of the following is true:
- 114589                    • The *-s* option is specified.
  - 114590                    • The *-c* option is not specified and no operands are specified.
  - 114591                    • The script executes one or more commands that require input from standard input (such as  
114592                    a *read* command that does not redirect its input).
- 114593                    See the INPUT FILES section.
- 114594                    When the shell is using standard input and it invokes a command that also uses standard input,  
114595                    the shell shall ensure that the standard input file pointer points directly after the command it has  
114596                    read when the command begins execution. It shall not read ahead in such a manner that any  
114597                    characters intended to be read by the invoked command are consumed by the shell (whether  
114598                    interpreted by the shell or not) or that characters that are not read by the invoked command are  
114599                    not seen by the shell. When the command expecting to read standard input is started  
114600                    asynchronously by an interactive shell, it is unspecified whether characters are read by the  
114601                    command or interpreted by the shell.
- 114602                    If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
114603                    shall enable blocking reads on standard input. This shall remain in effect when the command  
114604                    completes.

114605 **INPUT FILES**

114606 The input file can be of any type, but the initial portion of the file intended to be parsed  
 114607 according to the shell grammar (see [Section 2.10.2](#), on page 2513) shall consist of characters and  
 114608 shall not contain the NUL character. The shell shall not enforce any line length limits. If the  
 114609 input file consists solely of zero or more blank lines and comments, *sh* shall exit with a zero exit  
 114610 status.

114611 **ENVIRONMENT VARIABLES**

114612 The following environment variables shall affect the execution of *sh*:

114613 UP **ENV** This variable, when and only when an interactive shell is invoked, shall be  
 114614 subjected to parameter expansion (see [Section 2.6.2](#), on page 2485) by the shell, and  
 114615 the resulting value shall be used as a pathname of a file containing shell  
 114616 commands to execute in the current environment. The file need not be executable.  
 114617 If the expanded value of *ENV* is not an absolute pathname, the results are  
 114618 unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
 114619 effective group IDs of the process are different. The file specified by *ENV* need not  
 114620 be processed if the file can be written by any user other than the user identified by  
 114621 the real (and effective) user ID of the shell process.

114622 UP **FCEDIT** This variable, when expanded by the shell, shall determine the default value for  
 114623 the `-e editor` option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 114624 used as the editor.

114625 UP **HISTFILE** Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 114626 not set, the shell may attempt to access or create a file `.sh_history` in the directory  
 114627 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 114628 and write access to, or create, the history file, it shall use an unspecified  
 114629 mechanism that allows the history to operate properly. (References to history  
 114630 "file" in this section shall be understood to mean this unspecified mechanism in  
 114631 such cases.) An implementation may choose to access this variable only when  
 114632 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 114633 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 114634 by the user, the file named by the *ENV* variable, or implementation-defined system  
 114635 start-up files. Implementations may choose to disable the history list mechanism  
 114636 for users with appropriate privileges who do not set *HISTFILE*; the specific  
 114637 circumstances under which this occurs are implementation-defined. If more than  
 114638 one instance of the shell is using the same history file, it is unspecified how  
 114639 updates to the history file from those shells interact. As entries are deleted from the  
 114640 history file, they shall be deleted oldest first. It is unspecified when history file  
 114641 entries are physically removed from the history file.

114642 UP **HISTSIZ** Determine a decimal number representing the limit to the number of previous  
 114643 commands that are accessible. If this variable is unset, an unspecified default  
 114644 greater than or equal to 128 shall be used. The maximum number of commands in  
 114645 the history list is unspecified, but shall be at least 128. An implementation may  
 114646 choose to access this variable only when initializing the history file, as described  
 114647 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZ*  
 114648 after the history file has been initialized are effective.

114649 **HOME** Determine the pathname of the user's home directory. The contents of *HOME* are  
 114650 used in tilde expansion as described in [Section 2.6.1](#) (on page 2485).

|        |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|-----|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 114651 |     | <i>LANG</i>        | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 114652 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 114653 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 114654 |     | <i>LC_ALL</i>      | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 114666 | UP  | <i>MAIL</i>        | Determine a pathname of the user's mailbox file for purposes of incoming mail notification. If this variable is set, the shell shall inform the user if the file named by the variable is created or if its modification time has changed. Informing the user shall be accomplished by writing a string of unspecified format to standard error prior to the writing of the next primary prompt string. Such check shall be performed only after the completion of the interval defined by the <i>MAILCHECK</i> variable after the last such check. The user shall be informed only if <i>MAIL</i> is set and <i>MAILPATH</i> is not set.                                    |
| 114667 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 114675 |     |                    | Establish a decimal integer value that specifies how often (in seconds) the shell shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i> variables. The default value shall be 600 seconds. If set to zero, the shell shall check before issuing each primary prompt.                                                                                                                                                                                                                                                                                                                                                              |

| 114679 | UP  | <i>MAILPATH</i>    | Provide a list of pathnames and optional messages separated by <colon> characters. If this variable is set, the shell shall inform the user if any of the files named by the variable are created or if any of their modification times change. (See the preceding entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each pathname can be followed by '%' and a string that shall be subjected to parameter expansion and written to standard error when the modification time changes. If a '%' character in the pathname is preceded by a <backslash>, it shall be treated as a literal '%' in the pathname. The default message is unspecified. |

| 114686 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 114687 |     |                    | The <i>MAILPATH</i> environment variable takes precedence over the <i>MAIL</i> variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 114688 | XSI | <i>NLSPATH</i>     | Determine the location of messages objects and message catalogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 114689 |     | <i>PATH</i>        | Establish a string formatted as described in XBD <a href="#">Chapter 8</a> (on page 167), used to effect command interpretation; see <a href="#">Section 2.9.1.4</a> (on page 2502).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 114690 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 114691 |     | <i>PWD</i>         | This variable shall represent an absolute pathname of the current working directory. Assignments to this variable may be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 114692 |     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

114693 **ASYNCHRONOUS EVENTS**

114694 The *sh* utility shall take the standard action for all signals (see [Section 1.4](#), on page 2462) with the  
 114695 following exceptions.

114696 If the shell is interactive, SIGINT signals received during command line editing shall be handled  
 114697 as described in the EXTENDED DESCRIPTION, and SIGINT signals received at other times  
 114698 shall be caught but no action performed.

114699 If the shell is interactive:

- 114700 • SIGQUIT and SIGTERM signals shall be ignored.
- 114701 • If the `-m` option is in effect, SIGTTIN, SIGTTOU, and SIGTSTP signals shall be ignored.
- 114702 • If the `-m` option is not in effect, it is unspecified whether SIGTTIN, SIGTTOU, and  
 114703 SIGTSTP signals are ignored, set to the default action, or caught. If they are caught, the  
 114704 shell shall, in the signal-catching function, set the signal to the default action and raise the  
 114705 signal (after taking any appropriate steps, such as restoring terminal settings).

114706 The standard actions, and the actions described above for interactive shells, can be overridden  
 114707 by use of the *trap* special built-in utility (see *trap* (on page 2565) and [Section 2.12](#), on page 2521).

114708 **STDOUT**

114709 See the STDERR section.

114710 **STDERR**

114711 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),  
 114712 standard error shall be used only for diagnostic messages.

114713 **OUTPUT FILES**

114714 None.

114715 **EXTENDED DESCRIPTION**

114716 UP See [Chapter 2](#). The functionality described in the rest of the EXTENDED DESCRIPTION section  
 114717 shall be provided on implementations that support the User Portability Utilities option (and the  
 114718 rest of this section is not further shaded for this option).

114719 **Command History List**

114720 When the *sh* utility is being used interactively, it shall maintain a list of commands previously  
 114721 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,  
 114722 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the  
 114723 file for a user, if file access permissions allow this; see the description of the *HISTFILE*  
 114724 environment variable.

114725 **Command Line Editing**

114726 When *sh* is being used interactively from a terminal, the current command and the command  
 114727 history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,  
 114728 described below, similar to a subset of those described in the *vi* utility. Implementations may  
 114729 offer other command line editing modes corresponding to other editing utilities.

114730 The command `set -o vi` shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see  
 114731 [Command Line Editing \(vi-mode\)](#), on page 3371). This command also shall disable any other  
 114732 editing mode that the implementation may provide. The command `set +o vi` disables *vi*-mode  
 114733 editing.

114734 Certain block-mode terminals may be unable to support shell command line editing. If a  
 114735 terminal is unable to provide either edit mode, it need not be possible to `set -o vi` when using the

114736 shell on this terminal.

114737 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the  
114738 *stty* utility.

### 114739 **Command Line Editing (vi-mode)**

114740 In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations  
114741 which modify a line affect the edit line. The edit line is always the newest line in the command  
114742 history buffer.

114743 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

114744 When in insert mode, an entered character shall be inserted into the command line, except as  
114745 noted in [vi Line Editing Insert Mode](#). Upon entering *sh* and after termination of the previous  
114746 command, *sh* shall be in insert mode.

114747 Typing an escape character shall switch *sh* into command mode (see [vi Line Editing Command](#)  
114748 [Mode](#), on page 3372). In command mode, an entered character shall either invoke a defined  
114749 operation, be used as part of a multi-character operation, or be treated as an error. A character  
114750 that is not recognized as part of an editing command shall terminate any specific editing  
114751 command and shall alert the terminal. If *sh* receives a SIGINT signal in command mode  
114752 (whether generated by typing the *interrupt* character or by other means), it shall terminate  
114753 command line editing on the current command line, reissue the prompt on the next line of the  
114754 terminal, and reset the command history (see *fc*) so that the most recently executed command is  
114755 the previous command (that is, the command that was being edited when it was interrupted is  
114756 not re-entered into the history).

114757 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean  
114758 “move the cursor to the first character of the current word” and the phrase “move the cursor to  
114759 the end of the word” shall mean “move the cursor to the last character of the current word”. The  
114760 phrase “beginning of the command line” indicates the point between the end of the prompt  
114761 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and  
114762 the first character of the command text.

### 114763 **vi Line Editing Insert Mode**

114764 While in insert mode, any character typed shall be inserted in the current command line, unless  
114765 it is from the following set.

114766 <newline> Execute the current command line. If the current command line is not empty, this  
114767 line shall be entered into the command history (see *fc*).

114768 *erase* Delete the character previous to the current cursor position and move the current  
114769 cursor position back one character. In insert mode, characters shall be erased from  
114770 both the screen and the buffer when backspacing.

114771 *interrupt* If *sh* receives a SIGINT signal in insert mode (whether generated by typing the  
114772 *interrupt* character or by other means), it shall terminate command line editing  
114773 with the same effects as described for interrupting command mode; see [Command](#)  
114774 [Line Editing \(vi-mode\)](#).

114775 *kill* Clear all the characters from the input line.

114776 <control>-V Insert the next character input, even if the character is otherwise a special insert  
114777 mode character.

- 114778 <control>-W Delete the characters from the one preceding the cursor to the preceding word  
114779 boundary. The word boundary in this case is the closer to the cursor of either the  
114780 beginning of the line or a character that is in neither the **blank** nor **punct** character  
114781 classification of the current locale.
- 114782 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
114783 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
114784 line, the results are unspecified.
- 114785 <ESC> Place *sh* into command mode.

## 114786 **vi Line Editing Command Mode**

114787 In command mode for the command line editing feature, decimal digits not beginning with 0  
114788 that precede a command letter shall be remembered. Some commands use these decimal digits  
114789 as a count number that affects the operation.

114790 The term *motion command* represents one of the commands:

114791 <space> 0 b F l W ^ \$ ; E f T w | , B e h t

114792 If the current line is not the edit line, any command that modifies the current line shall cause the  
114793 content of the current line to replace the content of the edit line, and the current line shall  
114794 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).  
114795 The modification requested shall then be performed to the edit line. When the current line is the  
114796 edit line, the modification shall be done directly to the edit line.

114797 Any command that is preceded by *count* shall take a count (the numeric value of any preceding  
114798 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat  
114799 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out  
114800 of range is considered an error condition and shall alert the terminal, but neither the cursor  
114801 position, nor the command line, shall change.

114802 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*  
114803 corresponds to the term *unnamed buffer* in *vi*.

114804 The following commands shall be recognized in command mode:

114805 <newline> Execute the current command line. If the current command line is not empty, this  
114806 line shall be entered into the command history (see *fc*).

114807 <control>-L Redraw the current command line. Position the cursor at the same location on the  
114808 redrawn line.

114809 # Insert the character '#' at the beginning of the current command line and treat the  
114810 resulting edit line as a comment. This line shall be entered into the command  
114811 history; see *fc*.

114812 = Display the possible shell word expansions (see [Section 2.6](#), on page 2483) of the  
114813 bigword at the current command line position.

114814 **Note:** This does not modify the content of the current line, and therefore does not cause  
114815 the current line to become the edit line.

114816 These expansions shall be displayed on subsequent terminal lines. If the bigword  
114817 contains none of the characters '?', '\*', or '[', an <asterisk> ('\*') shall be  
114818 implicitly assumed at the end. If any directories are matched, these expansions  
114819 shall have a '/' character appended. After the expansion, the line shall be  
114820 redrawn, the cursor repositioned at the current cursor position, and *sh* shall be  
114821 placed in command mode.

|--------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 114822 | \                                | Perform pathname expansion (see <a href="#">Section 2.6.6</a> , on page 2493) on the current bigword, up to the largest set of characters that can be matched uniquely. If the bigword contains none of the characters '?', '*', or '[', an <asterisk> ('*') shall be implicitly assumed at the end. This maximal expansion then shall replace the original bigword in the command line, and the cursor shall be placed after this expansion. If the resulting bigword completely and uniquely matches a directory, a '/' character shall be inserted directly after the bigword. If some other file is completely matched, a single <space> shall be inserted after the bigword. After this operation, <i>sh</i> shall be placed in insert mode. |
| 114823 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 114831 | *                                | Perform pathname expansion on the current bigword and insert all expansions into the command to replace the current bigword, with each expansion separated by a single <space>. If at the end of the line, the current cursor position shall be moved to the first column position following the expansions and <i>sh</i> shall be placed in insert mode. Otherwise, the current cursor position shall be the last column position of the first character after the expansions and <i>sh</i> shall be placed in insert mode. If the current bigword contains none of the characters '?', '*', or '[', before the operation, an <asterisk> ('*') shall be implicitly assumed at the end.                                                           |

| 114844 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 114845 | [count]~                         | Convert, if the current character is a lowercase letter, to the equivalent uppercase letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position then shall be advanced by one character. If the cursor was positioned on the last character of the line, the case conversion shall occur, but the cursor shall not advance. If the '~' command is preceded by a <i>count</i> , that number of characters shall be converted, and the cursor shall be advanced to the character position after the last character converted. If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line. |

| 114860 | [number]v                        | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the editor exits, the commands in the temporary file shall be executed and placed in the command history. If a <i>number</i> is included, it specifies the command number in the command history to be edited, rather than the current command line.                                                                                                                                                                                                                                                                                                                                                                                                       |

If the motion command would move the current cursor position toward the beginning of the command line, the character under the current cursor position shall not be deleted. If the motion command                                                                                    |
| 114959 |                       |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 114960 |                       |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 114961 |                       |                                                                                                                                                                                                                                                                                                                                                                                                               |

|        |                       |                                                                                                   |
|--------|-----------------------|---------------------------------------------------------------------------------------------------|
| 114962 |                       | would move the current cursor position toward the end of the command line, the                    |
| 114963 |                       | character under the current cursor position shall be deleted. If the <i>count</i> is larger       |
| 114964 |                       | than the number of characters between the current cursor position and the end of                  |
| 114965 |                       | the command line toward which the motion command would move the cursor, this                      |
| 114966 |                       | shall not be considered an error; all of the remaining characters in the                          |
| 114967 |                       | mentioned range shall be deleted and insert mode shall be entered. If the                         |
| 114968 |                       | motion command is invalid, the terminal shall be alerted, the cursor shall not be                 |
| 114969 |                       | moved, and no text shall be deleted.                                                              |
| 114970 | <b>C</b>              | Delete from the current character to the end of the line and enter insert mode at the             |
| 114971 |                       | new end-of-line.                                                                                  |
| 114972 | <b>S</b>              | Clear the entire edit line and enter insert mode.                                                 |
| 114973 | <b>[count]rc</b>      | Replace the current character with the character 'c'. With a number <i>count</i> ,                |
| 114974 |                       | replace the current and the following <i>count</i> -1 characters. After this command, the         |
| 114975 |                       | current cursor position shall be on the last character that was changed. If the <i>count</i>      |
| 114976 |                       | is larger than the number of characters after the cursor, this shall not be considered            |
| 114977 |                       | an error; all of the remaining characters shall be changed.                                       |
| 114978 | <b>[count]_</b>       | Append a <space> after the current character position and then append the last                    |
| 114979 |                       | bigword in the previous input line after the <space>. Then enter insert mode after                |
| 114980 |                       | the last character just appended. With a number <i>count</i> , append the <i>count</i> th bigword |
| 114981 |                       | in the previous line.                                                                             |
| 114982 | <b>[count]x</b>       | Delete the character at the current cursor position and place the deleted characters              |
| 114983 |                       | in the save buffer. If the cursor was positioned on the last character of the line, the           |
| 114984 |                       | character shall be deleted and the cursor position shall be moved to the previous                 |
| 114985 |                       | character (the new last character). If the <i>count</i> is larger than the number of              |
| 114986 |                       | characters after the cursor, this shall not be considered an error; all the characters            |
| 114987 |                       | from the cursor to the end of the line shall be deleted.                                          |
| 114988 | <b>[count]X</b>       | Delete the character before the current cursor position and place the deleted                     |
| 114989 |                       | characters in the save buffer. The character under the current cursor position shall              |
| 114990 |                       | not change. If the cursor was positioned on the first character of the line, the                  |
| 114991 |                       | terminal shall be alerted, and the X command shall have no effect. If the line                    |
| 114992 |                       | contained a single character, the X command shall have no effect. If the line                     |
| 114993 |                       | contained no characters, the terminal shall be alerted and the cursor shall not be                |
| 114994 |                       | moved. If the <i>count</i> is larger than the number of characters before the cursor, this        |
| 114995 |                       | shall not be considered an error; all the characters from before the cursor to the                |
| 114996 |                       | beginning of the line shall be deleted.                                                           |
| 114997 | <b>[count]dmotion</b> |                                                                                                   |
| 114998 |                       | Delete the characters between the current cursor position and the character                       |
| 114999 |                       | position that would result from the motion command. A number <i>count</i> repeats the             |
| 115000 |                       | motion command <i>count</i> times. If the motion command would move toward the                    |
| 115001 |                       | beginning of the command line, the character under the current cursor position                    |
| 115002 |                       | shall not be deleted. If the motion command is <b>d</b> , the entire current command line         |
| 115003 |                       | shall be cleared. If the <i>count</i> is larger than the number of characters between the         |
| 115004 |                       | current cursor position and the end of the command line toward which the motion                   |
| 115005 |                       | command would move the cursor, this shall not be considered an error; all of the                  |
| 115006 |                       | remaining characters in the aforementioned range shall be deleted. The deleted                    |
| 115007 |                       | characters shall be placed in the save buffer.                                                    |

|        |                       |                                                                                               |
|--------|-----------------------|-----------------------------------------------------------------------------------------------|
| 115008 | <b>D</b>              | Delete all characters from the current cursor position to the end of the line. The            |
| 115009 |                       | deleted characters shall be placed in the save buffer.                                        |
| 115010 | <b>[count]ymotion</b> |                                                                                               |
| 115011 |                       | Yank (that is, copy) the characters from the current cursor position to the position          |
| 115012 |                       | resulting from the motion command into the save buffer. A number <i>count</i> shall be        |
| 115013 |                       | applied to the motion command. If the motion command would move toward the                    |
| 115014 |                       | beginning of the command line, the character under the current cursor position                |
| 115015 |                       | shall not be included in the set of yanked characters. If the motion command is <b>y</b> ,    |
| 115016 |                       | the entire current command line shall be yanked into the save buffer. The current             |
| 115017 |                       | cursor position shall be unchanged. If the <i>count</i> is larger than the number of          |
| 115018 |                       | characters between the current cursor position and the end of the command line                |
| 115019 |                       | toward which the motion command would move the cursor, this shall not be                      |
| 115020 |                       | considered an error; all of the remaining characters in the aforementioned range              |
| 115021 |                       | shall be yanked.                                                                              |
| 115022 | <b>Y</b>              | Yank the characters from the current cursor position to the end of the line into the          |
| 115023 |                       | save buffer. The current character position shall be unchanged.                               |
| 115024 | <b>[count]p</b>       | Put a copy of the current contents of the save buffer after the current cursor                |
| 115025 |                       | position. The current cursor position shall be advanced to the last character put             |
| 115026 |                       | from the save buffer. A <i>count</i> shall indicate how many copies of the save buffer        |
| 115027 |                       | shall be put.                                                                                 |
| 115028 | <b>[count]P</b>       | Put a copy of the current contents of the save buffer before the current cursor               |
| 115029 |                       | position. The current cursor position shall be moved to the last character put from           |
| 115030 |                       | the save buffer. A <i>count</i> shall indicate how many copies of the save buffer shall be    |
| 115031 |                       | put.                                                                                          |
| 115032 | <b>u</b>              | Undo the last command that changed the edit line. This operation shall not undo               |
| 115033 |                       | the copy of any command line to the edit line.                                                |
| 115034 | <b>U</b>              | Undo all changes made to the edit line. This operation shall not undo the copy of             |
| 115035 |                       | any command line to the edit line.                                                            |
| 115036 | <b>[count]k</b>       |                                                                                               |
| 115037 | <b>[count]-</b>       | Set the current command line to be the <i>count</i> th previous command line in the shell     |
| 115038 |                       | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be |
| 115039 |                       | positioned on the first character of the new command. If a <b>k</b> or <b>-</b> command would |
| 115040 |                       | retreat past the maximum number of commands in effect for this shell (affected by             |
| 115041 |                       | the <i>HISTSIZE</i> environment variable), the terminal shall be alerted, and the             |
| 115042 |                       | command shall have no effect.                                                                 |
| 115043 | <b>[count]j</b>       |                                                                                               |
| 115044 | <b>[count]+</b>       | Set the current command line to be the <i>count</i> th next command line in the shell         |
| 115045 |                       | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be |
| 115046 |                       | positioned on the first character of the new command. If a <b>j</b> or <b>+</b> command       |
| 115047 |                       | advances past the edit line, the current command line shall be restored to the edit           |
| 115048 |                       | line and the terminal shall be alerted.                                                       |
| 115049 | <b>[number]G</b>      | Set the current command line to be the oldest command line stored in the shell                |
| 115050 |                       | command history. With a number <i>number</i> , set the current command line to be the         |
| 115051 |                       | command line <i>number</i> in the history. If command line <i>number</i> does not exist, the  |
| 115052 |                       | terminal shall be alerted and the command line shall not be changed.                          |

115053 */pattern<newline>*  
 115054 Move backwards through the command history, searching for the specified  
 115055 pattern, beginning with the previous command line. Patterns use the pattern  
 115056 matching notation described in [Section 2.14](#) (on page 2523), except that the '^'  
 115057 character shall have special meaning when it appears as the first character of  
 115058 *pattern*. In this case, the '^' is discarded and the characters after the '^' shall be  
 115059 matched only at the beginning of a line. Commands in the command history shall  
 115060 be treated as strings, not as filenames. If the pattern is not found, the current  
 115061 command line shall be unchanged and the terminal shall be alerted. If it is found in  
 115062 a previous line, the current command line shall be set to that line and the cursor  
 115063 shall be set to the first character of the new command line.

115064 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 115065 there is no previous non-empty pattern, the terminal shall be alerted and the  
 115066 current command line shall remain unchanged.

115067 *?pattern<newline>*  
 115068 Move forwards through the command history, searching for the specified pattern,  
 115069 beginning with the next command line. Patterns use the pattern matching notation  
 115070 described in [Section 2.14](#) (on page 2523), except that the '^' character shall have  
 115071 special meaning when it appears as the first character of *pattern*. In this case, the  
 115072 '^' is discarded and the characters after the '^' shall be matched only at the  
 115073 beginning of a line. Commands in the command history shall be treated as strings,  
 115074 not as filenames. If the pattern is not found, the current command line shall be  
 115075 unchanged and the terminal shall be alerted. If it is found in a following line, the  
 115076 current command line shall be set to that line and the cursor shall be set to the fist  
 115077 character of the new command line.

115078 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 115079 there is no previous non-empty pattern, the terminal shall be alerted and the  
 115080 current command line shall remain unchanged.

115081 **n** Repeat the most recent / or ? command. If there is no previous / or ?, the terminal  
 115082 shall be alerted and the current command line shall remain unchanged.

115083 **N** Repeat the most recent / or ? command, reversing the direction of the search. If  
 115084 there is no previous / or ?, the terminal shall be alerted and the current command  
 115085 line shall remain unchanged.

115086 **EXIT STATUS**  
 115087 The following exit values shall be returned:

115088 0 The script to be executed consisted solely of zero or more blank lines or comments, or  
 115089 both.

115090 1-125 A non-interactive shell detected an error other than *command\_file* not found,  
 115091 *command\_file* not executable, or an unrecoverable read error while reading commands  
 115092 (except from the *file* operand of the *dot* special built-in); including but not limited to  
 115093 syntax, redirection, or variable assignment errors.

115094 126 A specified *command\_file* could not be executed due to an [ENOEXEC] error (see [Section](#)  
 115095 [2.9.1.4](#) (on page 2502), item 2).

115096 127 A specified *command\_file* could not be found by a non-interactive shell.

115097           128   An unrecoverable read error was detected while reading commands, except from the  
115098                    *file* operand of the *dot* special built-in.

115099           Otherwise, the shell shall terminate in the same manner as for an *exit* command with no  
115100           operands, unless the last command the shell invoked was executed without forking, in which  
115101           case the wait status seen by the parent process of the shell shall be the wait status of the last  
115102           command the shell invoked. See the *exit* utility in [Section 2.15](#) (on page 2526).

#### 115103 CONSEQUENCES OF ERRORS

115104           See [Section 2.8.1](#) (on page 2497).

#### 115105 APPLICATION USAGE

115106           Standard input and standard error are the files that determine whether a shell is interactive  
115107           when *-i* is not specified. For example:

```
115108           sh > file
```

115109           and:

```
115110           sh 2> file
```

115111           create interactive and non-interactive shells, respectively. Although both accept terminal input,  
115112           the results of error conditions are different, as described in [Section 2.8.1](#) (on page 2497); in the  
115113           second example a redirection error encountered by a special built-in utility aborts the shell.

115114           *sh -n* can be used to check for many syntax errors without waiting for *complete\_commands* to be  
115115           executed, but may be fooled into declaring false positives or missing actual errors that would  
115116           occur when the shell actually evaluates *eval* commands present in the script, or if there are *alias*  
115117           (or *unalias*) commands in the script that would alter the syntax of commands that use the  
115118           affected aliases.

115119           A conforming application must protect its first operand, if it starts with a <plus-sign>, by  
115120           preceding it with the "--" argument that denotes the end of the options.

115121           Applications should note that the standard *PATH* to the shell cannot be assumed to be either  
115122           */bin/sh* or */usr/bin/sh*, and should be determined by interrogation of the *PATH* returned by  
115123           *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell  
115124           built-in.

115125           For example, to determine the location of the standard *sh* utility:

```
115126           command -v sh
```

115127           On some implementations this might return:

```
115128           /usr/xpg4/bin/sh
```

115129           Furthermore, on systems that support executable scripts (the "#!" construct), it is  
115130           recommended that applications using executable scripts install them using *getconf PATH* to  
115131           determine the shell pathname and update the "#!" script appropriately as it is being installed  
115132           (for example, with *sed*). For example:

```
115133           #  
115134           # Installation time script to install correct POSIX shell pathname  
115135           #  
115136           # Get list of paths to check  
115137           #  
115138           Sifs=$IFS  
115139           Sifs_set=${IFS+y}  
115140           IFS=:
```

```

115141     set -- $(getconf PATH)
115142     if [ "$Sifs_set" = y ]
115143     then
115144         IFS=$Sifs
115145     else
115146         unset IFS
115147     fi
115148     #
115149     # Check each path for 'sh'
115150     #
115151     for i
115152     do
115153         if [ -x "${i}/sh ]
115154         then
115155             Pshell=${i}/sh
115156         fi
115157     done
115158     #
115159     # This is the list of scripts to update. They should be of the
115160     # form '${name}.source' and will be transformed to '${name}'.
115161     # Each script should begin:
115162     #
115163     # #!INSTALLSHELLPATH
115164     #
115165     scripts="a b c"
115166     #
115167     # Transform each script
115168     #
115169     for i in ${scripts}
115170     do
115171         sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
115172     done

```

### 115173 EXAMPLES

- 115174 1. Execute a shell command from a string:
 

```
115175     sh -c "cat myfile"
```
- 115176 2. Execute a shell script from a file in the current directory:
 

```
115177     sh my_shell_cmds
```

### 115178 RATIONALE

115179 The *sh* utility and the *set* special built-in utility share a common set of options.

115180 The name *IFS* was originally an abbreviation of “Input Field Separators”; however, this name is  
 115181 misleading as the *IFS* characters are actually used as field terminators. One justification for  
 115182 ignoring the contents of *IFS* upon entry to the script, beyond security considerations, is to assist  
 115183 possible future shell compilers. Allowing *IFS* to be imported from the environment prevents  
 115184 many optimizations that might otherwise be performed via dataflow analysis of the script itself.

115185 The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been  
 115186 invoked, probably by a C-language program, with standard input that has been opened using  
 115187 the *O\_NONBLOCK* flag; see *open()* in the System Interfaces volume of POSIX.1-2024. If the shell  
 115188 did not reset this flag, it would immediately terminate because no input data would be available

115189 yet and that would be considered the same as end-of-file.

115190 The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were  
115191 excluded because the standard developers considered that the implied level of security could  
115192 not be achieved and they did not want to raise false expectations.

115193 On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
115194 name `-i`. When it is called by a sequence such as:

115195 `sh -`

115196 or by:

115197 `#! usr/bin/sh -`

115198 the historical systems have assumed that no option letters follow. Thus, this volume of  
115199 POSIX.1-2024 allows the single `<hyphen-minus>` to mark the end of the options, in addition to  
115200 the use of the regular `--` argument, because it was considered that the older practice was so  
115201 pervasive. An alternative approach is taken by the KornShell, where real and effective  
115202 user/group IDs must match for an interactive shell; this behavior is specifically allowed by this  
115203 volume of POSIX.1-2024.

115204 **Note:** There are other problems with set-user-ID scripts that the two approaches described here do not  
115205 resolve.

115206 The initialization process for the history file can be dependent on the system start-up files, in  
115207 that they may contain commands that effectively preempt the user's settings of *HISTFILE* and  
115208 *HISTSIZ*E. In some historical shells, the history file is initialized just after the *ENV* file has been  
115209 processed. Therefore, it is implementation-defined whether changes made to *HISTFILE* after the  
115210 history file has been initialized are effective.

115211 The default messages for the various *MAIL*-related messages are unspecified because they vary  
115212 across implementations. Typical messages are:

115213 `"you have mail\n"`

115214 or:

115215 `"you have new mail\n"`

115216 It is important that the descriptions of command line editing refer to the same shell as that in  
115217 POSIX.1-2024 so that interactive users can also be application programmers without having to  
115218 deal with programmatic differences in their two environments. It is also essential that the utility  
115219 name *sh* be specified because this explicit utility name is too firmly rooted in historical practice  
115220 of application programs for it to change.

115221 Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on  
115222 terminals that do not support command line editing. However, it is not historical practice for the  
115223 shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in  
115224 all cases. Implementations are encouraged to supply diagnostics in this case whenever possible,  
115225 rather than leaving the user in a state where editing commands work incorrectly.

115226 In early proposals, the KornShell-derived *emacs* mode of command line editing was included,  
115227 even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant  
115228 that the full *emacs* editor not be standardized because they were concerned that an attempt to  
115229 standardize this very powerful environment would encourage vendors to ship strictly  
115230 conforming versions lacking the extensibility required by the community. The author of the  
115231 original *emacs* program also expressed his desire to omit the program. Furthermore, there were a  
115232 number of historical systems that did not include *emacs*, or included it without supporting it, but  
115233 there were very few that did not include and support *vi*. The shell *emacs* command line editing

115234 mode was finally omitted because it became apparent that the KornShell version and the editor  
 115235 being distributed with the GNU system had diverged in some respects. The author of *emacs*  
 115236 requested that the POSIX *emacs* mode either be deleted or have a significant number of  
 115237 unspecified conditions. Although the KornShell author agreed to consider changes to bring the  
 115238 shell into alignment, the standard developers decided to defer specification at that time. At the  
 115239 time, it was assumed that convergence on an acceptable definition would occur for a subsequent  
 115240 draft, but that has not happened, and there appears to be no impetus to do so. In any case,  
 115241 implementations are free to offer additional command line editing modes based on the exact  
 115242 models of editors their users are most comfortable with.

115243 Early proposals had the following list entry in *vi* [Line Editing Insert Mode](#) (on page 3371):

115244 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
 115245 Otherwise, the <backslash> itself shall be inserted into the input line.

115246 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
 115247 historical terminal line drivers. Some conforming implementations continue to do this when the  
 115248 *stty ixten* flag is set.

115249 In interactive shells, SIGTERM is ignored so that `kill 0` does not kill the shell, and SIGINT is  
 115250 caught so that *wait* is interruptible. If the shell does not ignore SIGTTIN, SIGTTOU, and  
 115251 SIGTSTP signals when it is interactive and the `-m` option is not in effect, these signals suspend  
 115252 the shell if it is not a session leader. If it is a session leader, the signals are discarded if they  
 115253 would stop the process, as required by XSH [Section 2.4.3](#) (on page 516) for orphaned process  
 115254 groups.

115255 Earlier versions of this standard required that input files to the shell be text files except that line  
 115256 lengths were unlimited. However, that was overly restrictive in relation to the fact that shells can  
 115257 parse a script without a trailing newline, and in relation to a common practice of concatenating a  
 115258 shell script ending with an `exit` or `exec $command` with a binary data payload to form a  
 115259 single-file self-extracting archive.

#### 115260 FUTURE DIRECTIONS

115261 If this utility is directed to create a new directory entry that contains any bytes that have the  
 115262 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 115263 error. A future version of this standard may require implementations to treat this as an error.

#### 115269 CHANGE HISTORY

115270 First released in Issue 2.

#### 115271 Issue 5

115272 The FUTURE DIRECTIONS section is added.

115273 Text is added to the DESCRIPTION for the Large File Summit proposal.

#### 115274 Issue 6

115275 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

115276 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

115277 The following new requirements on POSIX implementations derive from alignment with the

- 115278 Single UNIX Specification:
- 115279 • The option letters derived from the *set* special built-in are also accepted with a leading  
115280 <plus-sign> ('+').
  - 115281 • Large file extensions are added:
    - 115282 — Pathname expansion does not fail due to the size of a file.
    - 115283 — Shell input and output redirections have an implementation-defined offset maximum  
115284 that is established in the open file description.
- 115285 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
115286 “directory referred to by the *HOME* environment variable”.
- 115287 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
115288 IEEE P1003.2b draft standard.
- 115289 The normative text is reworded to avoid use of the term “must” for application requirements.
- 115290 **Issue 7**
- 115291 Austin Group Interpretation 1003.1-2001 #098 is applied, changing the definition of *IFS*.
- 115292 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 115293 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
115294 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.
- 115295 Minor editorial changes are made to the User Portability Utilities option shading. No normative  
115296 changes are implied.
- 115297 Minor changes are made to the install script example in the APPLICATION USAGE section.
- 115298 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0137 [152], XCU/TC1-2008/0138  
115299 [347], XCU/TC1-2008/0139 [347], XCU/TC1-2008/0140 [347], XCU/TC1-2008/0141 [299], and  
115300 XCU/TC1-2008/0142 [347] are applied.
- 115301 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0175 [584], XCU/TC2-2008/0176  
115302 [584], XCU/TC2-2008/0177 [718], XCU/TC2-2008/0178 [884], XCU/TC2-2008/0179 [809],  
115303 XCU/TC2-2008/0180 [884], and XCU/TC2-2008/0181 [584] are applied.
- 115304 **Issue 8**
- 115305 Austin Group Defect 51 is applied, changing the EXIT STATUS section.
- 115306 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
115307 filenames containing any bytes that have the encoded value of a <newline> character.
- 115308 Austin Group Defect 981 is applied, removing a reference to the *set* **-o nolog** option from the  
115309 RATIONALE section.
- 115310 Austin Group Defect 1006 is applied, changing the description of the *ENV* environment variable.
- 115311 Austin Group Defect 1055 is applied, adding a paragraph about the **-n** option to the  
115312 APPLICATION USAGE section.
- 115313 Austin Group Defect 1063 is applied, adding OB shading to the **-h** option and adding it to the  
115314 list of options that are described as part of the *set* utility.
- 115315 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 115316 Austin Group Defect 1250 is applied, changing the INPUT FILES section.
- 115317 Austin Group Defect 1266 is applied, clarifying the circumstances under which the shell is

- 115318 considered to be interactive.
- 115319 Austin Group Defect 1267 is applied, changing the ENVIRONMENT VARIABLES section to  
115320 remove the UP shading from *HOME* and add it to *HISTSIZE*.
- 115321 Austin Group Defect 1519 is applied, making the behavior explicitly unspecified if the *-o* or *+o*  
115322 option is specified without an option-argument.
- 115323 Austin Group Defect 1629 is applied, changing the EXIT STATUS section.

115324 **NAME**

115325 sleep — suspend execution for an interval

115326 **SYNOPSIS**115327 sleep *time*115328 **DESCRIPTION**115329 The *sleep* utility shall suspend execution for at least the integral number of seconds specified by  
115330 the *time* operand.115331 **OPTIONS**

115332 None.

115333 **OPERANDS**

115334 The following operand shall be supported:

115335 *time* A non-negative decimal integer specifying the number of seconds for which to  
115336 suspend execution.115337 **STDIN**

115338 Not used.

115339 **INPUT FILES**

115340 None.

115341 **ENVIRONMENT VARIABLES**115342 The following environment variables shall affect the execution of *sleep*:115343 *LANG* Provide a default value for the internationalization variables that are unset or null.  
115344 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
115345 variables used to determine the values of locale categories.)115346 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
115347 internationalization variables.115348 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
115349 characters (for example, single-byte as opposed to multi-byte characters in  
115350 arguments).115351 *LC\_MESSAGES*115352 Determine the locale that should be used to affect the format and contents of  
115353 diagnostic messages written to standard error.115354 XSI *NLSPATH* Determine the location of messages objects and message catalogs.115355 **ASYNCHRONOUS EVENTS**115356 If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 115357 1. Terminate normally with a zero exit status.
- 
- 115358 2. Effectively ignore the signal.
- 
- 115359 3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS
- 
- 115360 section of
- [Section 1.4](#)
- (on page 2462). This could include terminating with a non-zero exit
- 
- 115361 status.

115362 The *sleep* utility shall take the standard action for all other signals.

115363 **STDOUT**

115364 Not used.

115365 **STDERR**

115366 The standard error shall be used only for diagnostic messages.

115367 **OUTPUT FILES**

115368 None.

115369 **EXTENDED DESCRIPTION**

115370 None.

115371 **EXIT STATUS**

115372 The following exit values shall be returned:

115373 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
115374 was received. See the ASYNCHRONOUS EVENTS section.

115375 &gt;0 An error occurred.

115376 **CONSEQUENCES OF ERRORS**

115377 Default.

115378 **APPLICATION USAGE**

115379 None.

115380 **EXAMPLES**115381 The *sleep* utility can be used to execute a command after a certain amount of time, as in:115382 `(sleep 105; command) &`

115383 or to execute a command every so often, as in:

115384 `while true`  
115385 `do`  
115386  `command`  
115387  `sleep 37`  
115388 `done`115389 **RATIONALE**115390 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
115391 most implementations of this utility rely on the arrival of that signal to notify them that the  
115392 requested finishing time has been successfully attained. Such implementations thus do not  
115393 distinguish this situation from the successful completion case. Other implementations are  
115394 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
115395 the normal signal termination procedures.115396 As with all other utilities that take integral operands and do not specify subranges of allowed  
115397 values, *sleep* is required by this volume of POSIX.1-2024 to deal with *time* requests of up to  
115398 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls to  
115399 the delay mechanism of the underlying operating system if its argument range is less than this.115400 **FUTURE DIRECTIONS**

115401 None.

115402 **SEE ALSO**115403 [\*wait\*](#)115404 [XBD Chapter 8](#) (on page 167)115405 [XSH \*alarm\(\)\*, \*sleep\(\)\*](#)

115406 **CHANGE HISTORY**

115407 First released in Issue 2.

115408 **Issue 8**

115409 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

115410 **NAME**

115411 sort — sort, merge, or sequence check text files

115412 **SYNOPSIS**115413 sort [-m] [-o *output*] [-bdfinru] [-t *char*] [-k *keydef*]... [*file*...]115414 sort [-c|-C] [-bdfinru] [-t *char*] [-k *keydef*] [*file*]115415 **DESCRIPTION**115416 The *sort* utility shall perform one of the following functions:

- 115417 1. Sort lines of all the named files together and write the result to the specified output.
- 115418 2. Merge lines of all the named (presorted) files together and write the result to the specified  
115419 output.
- 115420 3. Check that a single input file is correctly presorted.

115421 Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no  
115422 sort keys are specified, the entire line up to, but not including, the terminating <newline>), and  
115423 shall be performed using the collating sequence of the current locale. If this collating sequence  
115424 does not have a total ordering of all characters (see XBD Section 7.3.2, on page 139), any lines of  
115425 input that collate equally shall be further compared byte-by-byte using the collating sequence  
115426 for the POSIX locale.

115427 **OPTIONS**

115428 The *sort* utility shall conform to XBD Section 12.2 (on page 215), except for Guideline 9, and the  
115429 **-k** *keydef* option should follow the **-b**, **-d**, **-f**, **-i**, **-n**, and **-r** options. In addition, '+' may be  
115430 recognized as an option delimiter as well as '-'.

115431 The following options shall be supported:

- 115432 **-c** Check that the single input file is ordered as specified by the arguments and the  
115433 collating sequence of the current locale. Output shall not be sent to standard  
115434 output. The exit code shall indicate whether or not disorder was detected or an  
115435 error occurred. If disorder (or, with **-u**, a duplicate key) is detected, a warning  
115436 message shall be sent to standard error indicating where the disorder or duplicate  
115437 key was found.
- 115438 **-C** Same as **-c**, except that a warning message shall not be sent to standard error if  
115439 disorder or, with **-u**, a duplicate key is detected.
- 115440 **-m** Merge only; the input file shall be assumed to be already sorted.
- 115441 **-o** *output* Specify the name of an output file to be used instead of the standard output. This  
115442 file can be the same as one of the input *files*.
- 115443 **-u** Unique: suppress all but one in each set of lines having equal keys. If used with  
115444 the **-c** option, check that there are no lines with duplicate keys, in addition to  
115445 checking that the input file is sorted.

115446 The following options shall override the default ordering rules. When ordering options appear  
115447 independent of any key field specifications, the requested field ordering rules shall be applied  
115448 globally to all sort keys. When attached to a specific key (see **-k**), the specified ordering options  
115449 shall override all global ordering options for that key.

- 115450 **-d** Specify that only <blank> characters and alphanumeric characters, according to  
115451 the current setting of *LC\_CTYPE*, shall be significant in comparisons. The behavior  
115452 is undefined for a sort key to which **-i** or **-n** also applies.

- 115453        **-f**            Consider all lowercase characters that have uppercase equivalents, according to  
115454                    the current setting of *LC\_CTYPE*, to be the uppercase equivalent for the purposes  
115455                    of comparison.
- 115456        **-i**            Ignore all characters that are non-printable, according to the current setting of  
115457                    *LC\_CTYPE*. The behavior is undefined for a sort key for which **-n** also applies.
- 115458        **-n**            Restrict the sort key to an initial numeric string, consisting of optional <blank>  
115459                    characters, optional <hyphen-minus> character, and zero or more digits with an  
115460                    optional radix character and thousands separators (as defined in the current  
115461                    locale), which shall be sorted by arithmetic value. An empty digit string shall be  
115462                    treated as zero. Leading zeros and signs on zeros shall not affect ordering.
- 115463        **-r**            Reverse the sense of comparisons.
- 115464        The treatment of field separators can be altered using the options:
- 115465        **-b**            Ignore leading <blank> characters when determining the starting and ending  
115466                    positions of a restricted sort key. If the **-b** option is specified before the first **-k**  
115467                    option, it shall be applied to all **-k** options. Otherwise, the **-b** option can be  
115468                    attached independently to each **-k** *field\_start* or *field\_end* option-argument (see  
115469                    below).
- 115470        **-t char**        Use *char* as the field separator character; *char* shall not be considered to be part of a  
115471                    field (although it can be included in a sort key). Each occurrence of *char* shall be  
115472                    significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not  
115473                    specified, <blank> characters shall be used as default field separators; each  
115474                    maximal non-empty sequence of <blank> characters that follows a non-<blank>  
115475                    shall be a field separator.
- 115476        Sort keys can be specified using the options:
- 115477        **-k keydef**        The *keydef* argument is a restricted sort key field definition. The format of this  
115478                    definition is:
- 115479                    *field\_start*[*type*][,*field\_end*[*type*]]
- 115480                    where *field\_start* and *field\_end* define a key field restricted to a portion of the line  
115481                    (see the EXTENDED DESCRIPTION section), and *type* is one or more modifiers  
115482                    from the list of characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall  
115483                    behave like the **-b** option, but shall apply only to the *field\_start* or *field\_end* to  
115484                    which it is attached. The other modifiers shall behave like the corresponding  
115485                    options, but shall apply only to the key field to which they are attached; they shall  
115486                    have this effect if specified with *field\_start*, *field\_end*, or both. If any modifier is  
115487                    attached to a *field\_start* or to a *field\_end*, no option shall apply to either.  
115488                    Implementations shall support at least nine occurrences of the **-k** option, which  
115489                    shall be significant in command line order. If no **-k** option is specified, a default  
115490                    sort key of the entire line shall be used.
- 115491                    When there are multiple key fields, later keys shall be compared only after all  
115492                    earlier keys compare equal. Except when the **-u** option is specified, lines that  
115493                    otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or  
115494                    **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in  
115495                    the lines significant to the comparison. The order in which lines that still compare  
115496                    equal are written is unspecified.

115497 **OPERANDS**

115498 The following operand shall be supported:

115499 *file* A pathname of a file to be sorted, merged, or checked. If no *file* operands are  
 115500 specified, or if a *file* operand is '-', the standard input shall be used. If *sort*  
 115501 encounters an error when opening or reading a *file* operand, it may exit without  
 115502 writing any output to standard output or processing later operands.

115503 **STDIN**

115504 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 115505 See the INPUT FILES section.

115506 **INPUT FILES**

115507 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a  
 115508 file ending with an incomplete last line.

115509 **ENVIRONMENT VARIABLES**

115510 The following environment variables shall affect the execution of *sort*:

115511 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 115512 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 115513 variables used to determine the values of locale categories.)

115514 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 115515 internationalization variables.

115516 *LC\_COLLATE*

115517 Determine the locale for ordering rules.

115518 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 115519 characters (for example, single-byte as opposed to multi-byte characters in  
 115520 arguments and input files) and the behavior of character classification for the **-b**,  
 115521 **-d**, **-f**, **-i**, and **-n** options.

115522 *LC\_MESSAGES*

115523 Determine the locale that should be used to affect the format and contents of  
 115524 diagnostic messages written to standard error.

115525 *LC\_NUMERIC*

115526 Determine the locale for the definition of the radix character and thousands  
 115527 separator for the **-n** option.

115528 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

115529 *TMPDIR* Provide a pathname that shall override the default directory for temporary files, if  
 115530 any.

115531 **ASYNCHRONOUS EVENTS**

115532 Default.

115533 **STDOUT**

115534 Unless the **-o** or **-c** options are in effect, the standard output shall contain the sorted input.

115535 **STDERR**

115536 The standard error shall be used for diagnostic messages. When **-c** is specified, if disorder is  
 115537 detected (or if **-u** is also specified and a duplicate key is detected), a message shall be written to  
 115538 the standard error which identifies the input line at which disorder (or a duplicate key) was  
 115539 detected. A warning message about correcting an incomplete last line of an input file may be  
 115540 generated, but need not affect the final exit status.

115541 **OUTPUT FILES**

115542 If the `-o` option is in effect, the sorted input shall be written to the file *output*.

115543 **EXTENDED DESCRIPTION**

115544 The notation:

115545 `-k field_start[type] [, field_end[type]]`

115546 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
115547 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
115548 *field\_end* shall mean the last character of the line.

115549 A field comprises a maximal sequence of non-separating characters and, in the absence of option  
115550 `-t`, any preceding field separator.

115551 The *field\_start* portion of the *keydef* option-argument shall have the form:

115552 `field_number[.first_character]`

115553 Fields and characters within fields shall be numbered starting with 1. The *field\_number* and  
115554 *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to  
115555 be used as part of a sort key. If *first\_character* is omitted, it shall refer to the first character of the  
115556 field.

115557 The *field\_end* portion of the *keydef* option-argument shall have the form:

115558 `field_number[.last_character]`

115559 The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted  
115560 as a non-negative decimal integer, shall specify the last character to be used as part of the sort  
115561 key. If *last\_character* evaluates to zero or *last\_character* is omitted, it shall refer to the last  
115562 character of the field specified by *field\_number*.

115563 If the `-b` option or `b` type modifier is in effect, characters within a field shall be counted from the  
115564 first non-`<blank>` in the field. (This shall apply separately to *first\_character* and *last\_character*.)

115565 **EXIT STATUS**

115566 The following exit values shall be returned:

115567 0 All input files were output successfully, or `-c` was specified and the input file was correctly  
115568 sorted.

115569 1 Under the `-c` option, the file was not ordered as specified, or if the `-c` and `-u` options were  
115570 both specified, two input lines were found with equal keys.

115571 `>1` An error occurred.

115572 **CONSEQUENCES OF ERRORS**

115573 The default requirements shall apply, except that if *sort* encounters an error when opening or  
115574 reading a *file* operand, it may exit without writing any output to standard output or processing  
115575 later operands.

## 115576 APPLICATION USAGE

115577 The default value for `-t`, `<blank>`, has different properties from, for example, `-t"<space>"`. If a  
 115578 line contains:

115579 `<space><space>foo`

115580 the following treatment would occur with default separation as opposed to specifically selecting  
 115581 a `<space>`:

| Field | Default                                    | <code>-t "&lt;space&gt;"</code> |
|-------|--------------------------------------------|---------------------------------|
| 1     | <code>&lt;space&gt;&lt;space&gt;foo</code> | <i>empty</i>                    |
| 2     | <i>empty</i>                               | <i>empty</i>                    |
| 3     | <i>empty</i>                               | foo                             |

115586 The leading field separator itself is included in a field when `-t` is not used. For example, this  
 115587 command returns an exit status of zero, meaning the input was already sorted:

```
115588 sort -c -k 2 <<eof
115589 y<tab>b
115590 x<space>a
115591 eof
```

115592 (assuming that a `<tab>` precedes the `<space>` in the current collating sequence). The field  
 115593 separator is not included in a field when it is explicitly set via `-t`. This is historical practice and  
 115594 allows usage such as:

```
115595 sort -t "|" -k 2n <<eof
115596 Atlanta|425022|Georgia
115597 Birmingham|284413|Alabama
115598 Columbia|100385|South Carolina
115599 eof
```

115600 where the second field can be correctly sorted numerically without regard to the non-numeric  
 115601 field separator.

115602 The wording in the OPTIONS section clarifies that the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options have to  
 115603 come before the first sort key specified if they are intended to apply to all specified keys. The  
 115604 way it is described in this volume of POSIX.1-2024 matches historical practice, not historical  
 115605 documentation. The results are unspecified if these options are specified after a `-k` option.

115606 The `-f` option might not work as expected in locales where there is not a one-to-one mapping  
 115607 between an uppercase and a lowercase letter.

115608 When using `sort` to process pathnames, it is recommended that `LC_ALL`, or at least `LC_CTYPE`  
 115609 and `LC_COLLATE`, are set to `POSIX` or `C` in the environment, since pathnames can contain byte  
 115610 sequences that do not form valid characters in some locales, in which case the utility's behavior  
 115611 would be undefined. In the `POSIX` locale each byte is a valid single-byte character, and therefore  
 115612 this problem is avoided.

115613 If the collating sequence of the current locale does not have a total ordering of all characters,  
 115614 since `sort -u` suppresses lines with duplicate keys, it suppresses lines that collate equally but are  
 115615 not identical.

## 115616 EXAMPLES

115617 1. The following command sorts the contents of `infile` with the second field as the sort key:

```
115618 sort -k 2,2 infile
```

115619 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**,  
 115620 placing the output in **outfile** and using the second character of the second field as the sort  
 115621 key (assuming that the first character of the second field is the field separator):

```
115622 sort -r -o outfile -k 2.2,2.2 infile1 infile2
```

115623 3. The following command sorts the contents of **infile1** and **infile2** using the second  
 115624 non-<blank> of the second field as the sort key:

```
115625 sort -k 2.2b,2.2b infile1 infile2
```

115626 4. The following command prints the System V password file (user database) sorted by the  
 115627 numeric user ID (the third <colon>-separated field):

```
115628 sort -t : -k 3,3n /etc/passwd
```

115629 5. The following command prints the lines of the already sorted file **infile**, suppressing all  
 115630 but one occurrence of lines having the same third field:

```
115631 sort -um -k 3.1,3.0 infile
```

### 115632 RATIONALE

115633 Examples in some historical documentation state that options **-um** with one input file keep the  
 115634 first in each set of lines with equal keys. This behavior was deemed to be an implementation  
 115635 artifact and was not standardized.

115636 The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with  
 115637 using *sort* to sort several files individually and then merge them together. The text concerning **-z**  
 115638 in historical documentation appeared to require implementations to determine the proper buffer  
 115639 length during the sort phase of operation, but not during the merge.

115640 The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was  
 115641 omitted because of non-portability in international usage.

115642 An undocumented **-T** option exists in some implementations. It is used to specify a directory for  
 115643 intermediate files. Implementations are encouraged to support the use of the *TMPDIR*  
 115644 environment variable instead of adding an option to support this functionality.

115645 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is  
 115646 not consistent with other utility conventions. Second, it did not meet syntax guideline  
 115647 requirements.

115648 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already  
 115649 states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled,  
 115650 rather than implied, by **-n**, this has unusual side-effects. When a character offset is used in a  
 115651 column of numbers (for example, to sort modulo 100), that offset is measured relative to the  
 115652 most significant digit, not to the column. Based upon a recommendation from the author of the  
 115653 original *sort* utility, the **-b** implication has been omitted from this volume of POSIX.1-2024, and  
 115654 an application wishing to achieve the previously mentioned side-effects has to code the **-b** flag  
 115655 explicitly.

115656 Earlier versions of this standard allowed the **-o** option to appear after operands. Historical  
 115657 practice allowed all options to be interspersed with operands. This version of the standard  
 115658 allows implementations to accept options after operands but conforming applications should  
 115659 not use this form.

115660 Earlier versions of this standard also allowed the *-number* and *+number* options. These options  
 115661 are no longer specified by POSIX.1-2024 but may be present in some implementations.

115662 Historical implementations produced a message on standard error when **-c** was specified and

115663 disorder was detected, and when `-c` and `-u` were specified and a duplicate key was detected. An  
 115664 earlier version of this standard contained wording that did not make it clear that this message  
 115665 was allowed and some implementations removed this message to be sure that they conformed  
 115666 to the standard's requirements. Confronted with this difference in behavior, interactive users  
 115667 that wanted to be sure that they got visual feedback instead of just exit code 1 could have used a  
 115668 command like:

```
115669 sort -c file || echo disorder
```

115670 whether or not the *sort* utility provided a message in this case. But, it was not easy for a user to  
 115671 find where the disorder or duplicate key occurred on implementations that do not produce a  
 115672 message, especially when some parts of the input line were not part of the key and when one or  
 115673 more of the `-b`, `-d`, `-f`, `-i`, `-n`, or `-r` options or *keydef* type modifiers were in use. POSIX.1-2024  
 115674 requires a message to be produced in this case. POSIX.1-2024 also contains the `-C` option giving  
 115675 users the ability to choose either behavior.

115676 When a disorder or duplicate is found when the `-c` option is specified, some implementations  
 115677 print a message containing the first line that is out of order or contains a duplicate key; others  
 115678 print a message specifying the line number of the offending line. This standard allows either  
 115679 type of message.

115680 The required further byte-by-byte comparison of lines that collate equally may have an impact  
 115681 on efficiency, but this can be mitigated by only performing the additional comparison if the  
 115682 current locale's collating sequence does not have a total ordering of all characters (if the  
 115683 implementation provides a way to query this) or by only performing the additional comparison  
 115684 if the locale name associated with the *LC\_COLLATE* category has an '@' modifier in the name  
 115685 (since implementation-supplied locales without an '@' modifier have a total ordering of all  
 115686 characters — see XBD Section 7.3.2 (on page 139) — and *localedef* users are warned to follow the  
 115687 same convention). Note that if the implementation provides a *stable sort* option as an extension  
 115688 (usually `-s`), the additional comparison should not be performed when this option has been  
 115689 specified.

#### 115690 FUTURE DIRECTIONS

115691 If this utility is directed to create a new directory entry that contains any bytes that have the  
 115692 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 115693 error. A future version of this standard may require implementations to treat this as an error.

#### 115698 CHANGE HISTORY

115699 First released in Issue 2.

#### 115700 Issue 6

115701 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

115702 IEEE PASC Interpretation 1003.2 #168 is applied.

#### 115703 Issue 7

115704 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
 115705 Syntax Guidelines does not apply and noting that '+' may be recognized as an option delimiter.

115706 Austin Group Interpretation 1003.1-2001 #120 is applied, clarifying the use of the `-c` option and  
 115707 introducing the `-C` option.

- 115708 XCU-ERN-81 is applied, modifying the description of the `-i` option.
- 115709 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 115710 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0182 [963], XCU/TC2-2008/0183  
115711 [584], XCU/TC2-2008/0184 [510], XCU/TC2-2008/0185 [962], XCU/TC2-2008/0186 [663], and  
115712 XCU/TC2-2008/0187 [963] are applied.
- 115713 **Issue 8**
- 115714 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
115715 filenames containing any bytes that have the encoded value of a <newline> character.
- 115716 Austin Group Defect 862 is applied, adding `TMPDIR` to the ENVIRONMENT VARIABLES  
115717 section.
- 115718 Austin Group Defect 1070 is applied, requiring that any lines of input that collate equally when  
115719 comparing them as whole lines are further compared byte-by-byte using the collating sequence  
115720 for the POSIX locale.
- 115721 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

115722 **NAME**115723 `split` — split a file into pieces115724 **SYNOPSIS**115725 `split [-l line_count] [-a suffix_length] [file [name]]`115726 `split -b n[k|m] [-a suffix_length] [file [name]]`115727 **DESCRIPTION**

115728 The *split* utility shall read an input file and write zero or more output files. The default size of  
 115729 each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 115730 of the `-b` or `-l` options. Each output file shall be created with a unique suffix. The suffix shall  
 115731 consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 115732 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 115733 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 115734 'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 115735 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 115736 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

115737 If the number of files required exceeds the maximum allowed by the suffix length provided,  
 115738 such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 115739 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 115740 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 115741 input file, and may be smaller than the requested size. If the input is an empty file, no output file  
 115742 shall be created and this shall not be considered to be an error.

115743 **OPTIONS**115744 The *split* utility shall conform to XBD [Section 12.2](#) (on page 215).

115745 The following options shall be supported:

115746 `-a suffix_length`

115747 Use *suffix\_length* letters to form the suffix portion of the filenames of the split file. If  
 115748 `-a` is not specified, the default suffix length shall be two. If the sum of the *name*  
 115749 operand and the *suffix\_length* option-argument would create a filename exceeding  
 115750 {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic message  
 115751 and no files shall be created.

115752 `-b n` Split a file into pieces *n* bytes in size.115753 `-b nk` Split a file into pieces *n*\*1 024 bytes in size.115754 `-b nm` Split a file into pieces *n*\*1 048 576 bytes in size.

115755 `-l line_count` Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 115756 an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 115757 <newline>, the partial line shall be included in the last output file.

115758 **OPERANDS**

115759 The following operands shall be supported:

115760 *file* The pathname of the ordinary file to be split. If no input file is given or *file* is '-',  
 115761 the standard input shall be used.

115762 *name* The prefix to be used for each of the files resulting from the split operation. If no  
 115763 *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 115764 combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 115765 {NAME\_MAX} bytes. See the OPTIONS section.

115766 **STDIN**

115767 See the INPUT FILES section.

115768 **INPUT FILES**

115769 Any file can be used as input.

115770 **ENVIRONMENT VARIABLES**115771 The following environment variables shall affect the execution of *split*:

115772 **LANG** Provide a default value for the internationalization variables that are unset or null.  
115773 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
115774 variables used to determine the values of locale categories.)

115775 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
115776 internationalization variables.

115777 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
115778 characters (for example, single-byte as opposed to multi-byte characters in  
115779 arguments and input files).

115780 **LC\_MESSAGES**

115781 Determine the locale that should be used to affect the format and contents of  
115782 diagnostic messages written to standard error.

115783 **XSI NLSPATH** Determine the location of messages objects and message catalogs.

115784 **ASYNCHRONOUS EVENTS**

115785 Default.

115786 **STDOUT**

115787 Not used.

115788 **STDERR**

115789 The standard error shall be used only for diagnostic messages.

115790 **OUTPUT FILES**

115791 The output files contain portions of the original input file; otherwise, unchanged.

115792 **EXTENDED DESCRIPTION**

115793 None.

115794 **EXIT STATUS**

115795 The following exit values shall be returned:

115796 0 Successful completion.

115797 &gt;0 An error occurred.

115798 **CONSEQUENCES OF ERRORS**

115799 Default.

115800 **APPLICATION USAGE**

115801 None.

115802 **EXAMPLES**115803 In the following examples **foo** is a text file that contains 5 000 lines.115804 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:115805 

```
split foo
```

115806 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
115807 **xaab**, **xaac**, **xaad**, and **xaae**:115808 

```
split -a 3 foo
```

115809 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
115810 **bar\_aaac**:115811 

```
split -a 4 -l 2000 foo bar_
```

115812 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
115813 default prefix of **x** and a five-letter suffix:115814 

```
split -a 5 -b 20k foo
```

115815 **RATIONALE**115816 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
115817 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
115818 additional uses.115819 The **-a** option was added to overcome the limitation of being able to create only 676 files.115820 Consideration was given to deleting this utility, using the rationale that the functionality  
115821 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the  
115822 purpose of the User Portability Utilities option, it was decided to retain both this utility and the  
115823 *csplit* utility because users use both utilities and have historical expectations of their behavior.  
115824 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
115825 *csplit*.115826 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
115827 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
115828 historical behavior of *split* is made explicit to avoid misinterpretation.115829 Earlier versions of this standard allowed a *-line\_count* option. This form is no longer specified by  
115830 POSIX.1-2024 but may be present in some implementations.115831 **FUTURE DIRECTIONS**115832 If this utility is directed to create a new directory entry that contains any bytes that have the  
115833 encoded value of a <newline> character, implementations are encouraged to treat this as an  
115834 error. A future version of this standard may require implementations to treat this as an error.115835 **SEE ALSO**115836 [\*csplit\*](#)115837 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)115838 **CHANGE HISTORY**

115839 First released in Issue 2.

115840 **Issue 6**

115841 This utility is marked as part of the User Portability Utilities option.

115842 The APPLICATION USAGE section is added.

115843 The obsolescent SYNOPSIS is removed.

115844 **Issue 7**

115845 Austin Group Interpretation 1003.1-2001 #027 is applied.

115846 The *split* utility is moved from the User Portability Utilities option to the Base. User Portability  
115847 Utilities is now an option for interactive utilities.

115848 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

115849 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0188 [731] is applied.

115850 **Issue 8**

115851 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
115852 filenames containing any bytes that have the encoded value of a <newline> character.

115853 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

115854 **NAME**

115855 strings — find printable strings in files

115856 **SYNOPSIS**115857 strings [-a] [-t *format*] [-n *number*] [*file...*]115858 **DESCRIPTION**

115859 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
 115860 standard output. A printable string is any sequence of four (by default) or more printable  
 115861 characters terminated by a <newline> or NUL character. Additional implementation-defined  
 115862 strings may be written; see *localedef*.

115863 If any argument is '-', the results are unspecified.

115864 **OPTIONS**

115865 The *strings* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified  
 115866 usage of '-'.

115867 The following options shall be supported:

115868 **-a** Scan files in their entirety. If **-a** is not specified, it is implementation-defined what  
 115869 portion of each file is scanned for strings.

115870 **-n *number*** Specify the minimum string length, where the *number* argument is a positive  
 115871 decimal integer. The default shall be 4.

115872 **-t *format*** Write each string preceded by its byte offset from the start of the file. The format  
 115873 shall be dependent on the single character used as the *format* option-argument:

115874 d The offset shall be written in decimal.

115875 o The offset shall be written in octal.

115876 x The offset shall be written in hexadecimal.

115877 **OPERANDS**

115878 The following operand shall be supported:

115879 *file* A pathname of a regular file to be used as input. If no *file* operand is specified, the  
 115880 *strings* utility shall read from the standard input.

115881 **STDIN**

115882 See the INPUT FILES section.

115883 **INPUT FILES**

115884 The input files named by the utility arguments or the standard input shall be regular files of any  
 115885 format.

115886 **ENVIRONMENT VARIABLES**115887 The following environment variables shall affect the execution of *strings*:

115888 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 115889 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 115890 variables used to determine the values of locale categories.)

115891 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 115892 internationalization variables.

115893 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 115894 characters (for example, single-byte as opposed to multi-byte characters in  
 115895 arguments and input files) and to identify printable strings.

- 115896 **LC\_MESSAGES**  
 115897 Determine the locale that should be used to affect the format and contents of  
 115898 diagnostic messages written to standard error.
- 115899 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 115900 **ASYNCHRONOUS EVENTS**  
 115901 Default.
- 115902 **STDOUT**  
 115903 Strings found shall be written to the standard output, one per line.  
 115904 When the `-t` option is not specified, the format of the output shall be:  
 115905 `"%s", <string>`  
 115906 With the `-t o` option, the format of the output shall be:  
 115907 `"%o %s", <byte offset>, <string>`  
 115908 With the `-t x` option, the format of the output shall be:  
 115909 `"%x %s", <byte offset>, <string>`  
 115910 With the `-t d` option, the format of the output shall be:  
 115911 `"%d %s", <byte offset>, <string>`
- 115912 **STDERR**  
 115913 The standard error shall be used only for diagnostic messages.
- 115914 **OUTPUT FILES**  
 115915 None.
- 115916 **EXTENDED DESCRIPTION**  
 115917 None.
- 115918 **EXIT STATUS**  
 115919 The following exit values shall be returned:  
 115920 0 Successful completion.  
 115921 >0 An error occurred.
- 115922 **CONSEQUENCES OF ERRORS**  
 115923 Default.
- 115924 **APPLICATION USAGE**  
 115925 By default the data area (as opposed to the text, ```bss```, or header areas) of a binary executable  
 115926 file is scanned. Implementations document which areas are scanned.  
 115927 Some historical implementations do not require NUL or `<newline>` terminators for strings to  
 115928 permit those languages that do not use NUL as a string terminator to have their strings written.
- 115929 **EXAMPLES**  
 115930 None.
- 115931 **RATIONALE**  
 115932 Apart from rationalizing the option syntax and slight difficulties with object and executable  
 115933 binary files, *strings* is specified to match historical practice closely. The `-a` and `-n` options were  
 115934 introduced to replace the non-conforming `-` and `-number` options. These options are no longer  
 115935 specified by POSIX.1-2024 but may be present in some implementations.

- 115936 The `-o` option historically means different things on different implementations. Some use it to mean “offset in decimal”, while others use it as “offset in octal”. Instead of trying to decide which way would be least objectionable, the `-t` option was added. It was originally named `-O` to mean “offset”, but was changed to `-t` to be consistent with *od*.
- 115937
- 115938
- 115939
- 115940 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of
- 115941 POSIX.1-2024 requires implementations to write strings as defined by the current locale.
- 115942 **FUTURE DIRECTIONS**
- 115943 None.
- 115944 **SEE ALSO**
- 115945 *localedef, nm*
- 115946 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)
- 115947 **CHANGE HISTORY**
- 115948 First released in Issue 4.
- 115949 **Issue 6**
- 115950 This utility is marked as part of the User Portability Utilities option.
- 115951 The obsolescent SYNOPSIS is removed.
- 115952 The normative text is reworded to avoid use of the term “must” for application requirements.
- 115953 **Issue 7**
- 115954 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first
- 115955 argument is `'-'`.
- 115956 The *strings* utility is moved from the User Portability Utilities option to the Base. User
- 115957 Portability Utilities is now an option for interactive utilities.
- 115958 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 115959 **Issue 8**
- 115960 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 115961 Austin Group Defect 1599 is applied, making the behavior unspecified when any argument is
- 115962 `'-'`.

115963 **NAME**115964 strip — remove unnecessary information from strippable files (**DEVELOPMENT**)115965 **SYNOPSIS**115966 SD strip *file...*115967 **DESCRIPTION**115968 XSI A strippable file is defined as a relocatable, object, or executable file. On XSI-conformant  
115969 systems, a strippable file can also be an archive of object or relocatable files.115970 The *strip* utility shall remove from strippable files named by the *file* operands any information  
115971 the implementor deems unnecessary for execution of those files. The nature of that information  
115972 is unspecified. The effect of *strip* on object and executable files shall be similar to the use of the  
115973 XSI **-s** option to *c17*. The effect of *strip* on an archive of object files shall be similar to the use of the  
115974 **-s** option to *c17* for each object file in the archive.115975 **OPTIONS**

115976 None.

115977 **OPERANDS**

115978 The following operand shall be supported:

115979 *file* A pathname referring to a strippable file.115980 **STDIN**

115981 Not used.

115982 **INPUT FILES**115983 The input files shall be in the form of strippable files successfully produced by any compiler  
115984 XSI defined by this volume of POSIX.1-2024 or produced by creating or updating an archive of such  
115985 files using the *ar* utility.115986 **ENVIRONMENT VARIABLES**115987 The following environment variables shall affect the execution of *strip*:115988 *LANG* Provide a default value for the internationalization variables that are unset or null.  
115989 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
115990 variables used to determine the values of locale categories.)115991 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
115992 internationalization variables.115993 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
115994 characters (for example, single-byte as opposed to multi-byte characters in  
115995 arguments).115996 *LC\_MESSAGES*115997 Determine the locale that should be used to affect the format and contents of  
115998 diagnostic messages written to standard error.115999 XSI *NLSPATH* Determine the location of messages objects and message catalogs.116000 **ASYNCHRONOUS EVENTS**

116001 Default.

116002 **STDOUT**

116003 Not used.

**116004 STDERR**

116005 The standard error shall be used only for diagnostic messages.

**116006 OUTPUT FILES**

116007 The *strip* utility shall produce strippable files of unspecified format.

**116008 EXTENDED DESCRIPTION**

116009 None.

**116010 EXIT STATUS**

116011 The following exit values shall be returned:

116012 0 Successful completion.

116013 >0 An error occurred.

**116014 CONSEQUENCES OF ERRORS**

116015 Default.

**116016 APPLICATION USAGE**

116017 None.

**116018 EXAMPLES**

116019 None.

**116020 RATIONALE**

116021 Historically, this utility has been used to remove the symbol table from a strippable file. It was  
116022 included since it is known that the amount of symbolic information can amount to several  
116023 megabytes; the ability to remove it in a portable manner was deemed important, especially for  
116024 smaller systems.

116025 The behavior of *strip* on object and executable files is said to be the same as the `-s` option to a  
116026 compiler. While the end result is essentially the same, it is not required to be identical.

116027 XSI-conformant systems support use of *strip* on archive files containing object files or relocatable  
116028 files.

**116029 FUTURE DIRECTIONS**

116030 None.

**116031 SEE ALSO**

**116034 CHANGE HISTORY**

116035 First released in Issue 2.

**116036 Issue 6**

116037 This utility is marked as part of the Software Development Utilities option.

**116038 Issue 7**

116039 Austin Group Interpretation 1003.1-2001 #103 is applied.

**116040 Issue 8**

116041 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116042 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

116043 **NAME**116044 `stty` — set the options for a terminal116045 **SYNOPSIS**116046 `stty [-a|-g]`116047 `stty operand...`116048 **DESCRIPTION**

116049 The `stty` utility shall set or report on terminal I/O characteristics for the device that is its  
 116050 standard input. Without options or operands specified, it shall report the settings of certain  
 116051 characteristics, usually those that differ from implementation-defined defaults. Otherwise, it  
 116052 shall modify the terminal state according to the specified operands. Detailed information about  
 116053 the modes listed in the first five groups below are described in XBD [Chapter 11](#) (on page 199).  
 116054 Operands in the Combination Modes group (see [Combination Modes](#), on page 3410) are  
 116055 implemented using operands in the previous groups. Some combinations of operands are  
 116056 mutually-exclusive on some terminal types; the results of using such combinations are  
 116057 unspecified.

116058 Typical implementations of this utility require a communications line configured to use the  
 116059 **termios** interface defined in the System Interfaces volume of POSIX.1-2024. On systems where  
 116060 none of these lines are available, and on lines not currently configured to support the **termios**  
 116061 interface, some of the operands need not affect terminal characteristics.

116062 **OPTIONS**116063 The `stty` utility shall conform to XBD [Section 12.2](#) (on page 215).

116064 The following options shall be supported:

- 116065 **-a** Write to standard output all the current settings for the terminal.
- 116066 **-g** Write to standard output all the current settings, optionally excluding the terminal  
 116067 window size, in an unspecified form that, when stripped of trailing `<newline>`  
 116068 characters, and used as the one and only argument to another invocation of the `stty`  
 116069 utility on the same system, attempts to apply those settings to the terminal. The  
 116070 form used shall not contain any sequence that would form an Informational Query,  
 116071 and shall consist of one line of text consisting of only printable characters from the  
 116072 portable character set, excluding white-space characters (other than the  
 116073 terminating `<newline>`) and these characters that could be altered by pathname  
 116074 expansion performed by the shell: `'*'`, `'?'`, and `'['`.

116075 **OPERANDS**

116076 The following operands shall be supported.

116077 **Control Modes**

116078 **par**en**b** (**-par**en**b**) Enable (disable) parity generation and detection. This shall have the effect of  
 116079 setting (not setting) PARENb in the **termios** `c_flag` field, as defined in XBD  
 116080 [Chapter 11](#) (on page 199).

116081 **par**od**d** (**-par**od**d**)  
 116082 Select odd (even) parity. This shall have the effect of setting (not setting)  
 116083 PARODD in the **termios** `c_flag` field, as defined in XBD [Chapter 11](#) (on page  
 116084 199).

116085 **cs**5** cs**6** cs**7** cs**8**** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 116086 CS7, and CS8, respectively, in the **termios** `c_flag` field, as defined in XBD  
 116087 [Chapter 11](#) (on page 199).

|        |                                  |                                                                                                                                                                                                                                                                                                                               |
|--------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 116088 | <i>number</i>                    | Set terminal baud rate to the number given, if possible. If the baud rate is set to zero, the modem control lines shall no longer be asserted. This shall have the effect of setting the input and output <b>termios</b> baud rate values as defined in XBD <a href="#">Chapter 11</a> (on page 199).                         |
| 116089 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116090 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116091 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116092 | <b>ispeed</b> <i>number</i>      | Set terminal input baud rate to the number given, if possible. If the input baud rate is set to zero, the input baud rate shall be specified by the value of the output baud rate. This shall have the effect of setting the input <b>termios</b> baud rate value as defined in XBD <a href="#">Chapter 11</a> (on page 199). |
| 116093 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116094 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116095 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116096 | <b>ospeed</b> <i>number</i>      | Set terminal output baud rate to the number given, if possible. If the output baud rate is set to zero, the modem control lines shall no longer be asserted. This shall have the effect of setting the output <b>termios</b> baud rate value as defined in XBD <a href="#">Chapter 11</a> (on page 199).                      |
| 116097 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116098 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116099 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116100 | <b>hupcl</b> ( <b>-hupcl</b> )   | Stop asserting modem control lines (do not stop asserting modem control lines) on last close. This shall have the effect of setting (not setting) HUPCL in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                               |
| 116101 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116102 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116103 | <b>hup</b> ( <b>-hup</b> )       | Equivalent to <b>hupcl</b> ( <b>-hupcl</b> ).                                                                                                                                                                                                                                                                                 |
| 116104 | <b>cstopb</b> ( <b>-cstopb</b> ) | Use two (one) stop bits per character. This shall have the effect of setting (not setting) CSTOPB in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                     |
| 116105 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116106 |                                  |                                                                                                                                                                                                                                                                                                                               |
| 116107 | <b>cread</b> ( <b>-cread</b> )   | Enable (disable) the receiver. This shall have the effect of setting (not setting) CREAD in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                              |
| 116108 |                                  |                                                                                                                                                                                                                                                                                                                               |

This shall have the effect of setting (not setting) ICANON in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                    |
| 116203 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116204 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116205 |     | <b>iexten</b> ( <b>-iexten</b> ) | Enable (disable) any implementation-defined special control characters not currently controlled by <b>icanon</b> , <b>isig</b> , <b>ixon</b> , or <b>ixoff</b> . This shall have the effect of setting (not setting) IEXTEN in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199). |
| 116206 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116207 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116208 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116209 |     | <b>echo</b> ( <b>-echo</b> )     | Echo back (do not echo back) every character typed. This shall have the effect of setting (not setting) ECHO in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                |
| 116210 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116211 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116212 |     | <b>echoe</b> ( <b>-echoe</b> )   | The ERASE character visually erases (does not erase) the last character in the current line from the display, if possible. This shall have the effect of setting (not setting) ECHOE in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                        |
| 116213 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116214 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |
| 116215 |     |                                  |                                                                                                                                                                                                                                                                                                                                     |

- 116216 **echok** (**-echok**) Echo (do not echo) NL after KILL character. This shall have the effect of setting  
 116217 (not setting) ECHOK in the **termios** *c\_lflag* field, as defined in XBD [Chapter 11](#)  
 116218 (on page 199).
- 116219 **echonl** (**-echonl**) Echo (do not echo) NL, even if **echo** is disabled. This shall have the effect of  
 116220 setting (not setting) ECHONL in the **termios** *c\_lflag* field, as defined in XBD  
 116221 [Chapter 11](#) (on page 199).
- 116222 **noflsh** (**-noflsh**) Disable (enable) flush after INTR, QUIT, SUSP. This shall have the effect of  
 116223 setting (not setting) NOFLSH in the **termios** *c\_lflag* field, as defined in XBD  
 116224 [Chapter 11](#) (on page 199).
- 116225 **tostop** (**-tostop**) Send SIGTTOU for background output. This shall have the effect of setting  
 116226 (not setting) TOSTOP in the **termios** *c\_lflag* field, as defined in XBD [Chapter 11](#)  
 116227 (on page 199).

### 116228 Special Control Character Assignments

116229 *<control>-character string*

116230 Set *<control>-character* to *string*. If *<control>-character* is one of the character sequences in the  
 116231 first column of the following table, the corresponding XBD [Chapter 11](#) (on page 199) control  
 116232 character from the second column shall be recognized. This has the effect of setting the  
 116233 corresponding element of the **termios** *c\_cc* array (see XBD [Chapter 14](#) (on page 221),  
 116234 **<termios.h>**).

116235 **Table 3-20** Control Character Names in *stty*

| Control Character | <i>c_cc</i> Subscript | Description     |
|-------------------|-----------------------|-----------------|
| <b>eof</b>        | VEOF                  | EOF character   |
| <b>eol</b>        | VEOL                  | EOL character   |
| <b>erase</b>      | VERASE                | ERASE character |
| <b>intr</b>       | VINTR                 | INTR character  |
| <b>kill</b>       | VKILL                 | KILL character  |
| <b>quit</b>       | VQUIT                 | QUIT character  |
| <b>susp</b>       | VSUSP                 | SUSP character  |
| <b>start</b>      | VSTART                | START character |
| <b>stop</b>       | VSTOP                 | STOP character  |

116246 If *string* is a single character, the control character shall be set to that character. If *string* is the  
 116247 two-character sequence "**^**-" or the string *undef*, the control character shall be set to  
 116248 **\_POSIX\_VDISABLE**, if it is in effect for the device; if **\_POSIX\_VDISABLE** is not in effect for  
 116249 the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character  
 116250 sequence beginning with **<circumflex>** ('**^**'), and the second character is one of those listed  
 116251 in the "**^c**" column of the following table, the control character shall be set to the  
 116252 corresponding character value in the Value column of the table.

116253

Table 3-21 Circumflex Control Characters in *stty*

116261

116262

116263

116264

116265

| <b>^c</b> | <b>Value</b> | <b>^c</b> | <b>Value</b> | <b>^c</b> | <b>Value</b> |
|-----------|--------------|-----------|--------------|-----------|--------------|
| a, A      | <SOH>        | l, L      | <FF>         | w, W      | <ETB>        |
| b, B      | <STX>        | m, M      | <CR>         | x, X      | <CAN>        |
| c, C      | <ETX>        | n, N      | <SO>         | y, Y      | <EM>         |
| d, D      | <EOT>        | o, O      | <SI>         | z, Z      | <SUB>        |
| e, E      | <ENQ>        | p, P      | <DLE>        | [         | <ESC>        |
| f, F      | <ACK>        | q, Q      | <DC1>        | \         | <FS>         |
| g, G      | <BEL>        | r, R      | <DC2>        | ]         | <GS>         |
| h, H      | <BS>         | s, S      | <DC3>        | ^         | <RS>         |
| i, I      | <HT>         | t, T      | <DC4>        | _         | <US>         |
| j, J      | <LF>         | u, U      | <NAK>        | ?         | <DEL>        |
| k, K      | <VT>         | v, V      | <SYN>        |           |              |

116266

**min number**

116267

Set the value of MIN to *number*. MIN is used in non-canonical mode input processing (**-icanon**).

116268

116269

**time number**

116270

Set the value of TIME to *number*. TIME is used in non-canonical mode input processing (**-icanon**).

116271

116272

**Combination Modes**

116273

**saved settings**

116274

Set the current terminal characteristics to the saved settings produced by the **-g** option.

116275

**evenp or parity**

116276

Enable **parenb** and **cs7**; disable **parodd**.

116277

**oddp**

116278

Enable **parenb**, **cs7**, and **parodd**.

116279

**-parity, -evenp, or -oddp**

116280

Disable **parenb**, and set **cs8**.

116281 XSI

**raw (-raw or cooked)**

116282

Enable (disable) raw input and output. Raw mode shall be equivalent to setting:

116283

```
stty cs8 erase ^- kill ^- intr ^- \
quit ^- eof ^- eol ^- -post -inpck
```

116284

116285

**nl (-nl)**

116286

Disable (enable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.

116287

**ek** Reset ERASE and KILL characters back to system defaults.

116288

**sane**

116289

Reset all modes to some reasonable, unspecified, values.

116290 **Terminal Window Size**116291 **rows** *number*

116292 Set the number of rows in the terminal window size to the number given.

116293 **cols** *number*

116294 Set the number of columns in the terminal window size to the number given.

116295 The terminal window size shall be updated as if the *stty* utility calls *tcgetwinsize()* to populate a  
 116296 **winsize** structure, updates one or both of the *ws\_row* and *ws\_col* members according to the **rows**  
 116297 and **cols** numbers specified, and then calls *tcsetwinsize()* with the updated structure (see XSH  
 116298 *tcgetwinsize()* and *tcsetwinsize()*).

116299 **Informational Queries**116300 **size**

116301 Write the current terminal window size to standard output.

116302 **STDIN**

116303 Although no input is read from standard input, standard input shall be used to get the current  
 116304 terminal I/O characteristics and to set new terminal I/O characteristics.

116305 **INPUT FILES**

116306 None.

116307 **ENVIRONMENT VARIABLES**116308 The following environment variables shall affect the execution of *stty*:

116309 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 116310 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 116311 variables used to determine the values of locale categories.)

116312 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 116313 internationalization variables.

116314 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 116315 text data as characters (for example, single-byte as opposed to multi-byte  
 116316 characters in arguments) and which characters are in the class **print**.

116317 **LC\_MESSAGES**

116318 Determine the locale that should be used to affect the format and contents of  
 116319 diagnostic messages written to standard error.

116320 XSI **NLSPATH** Determine the location of messages objects and message catalogs.116321 **ASYNCHRONOUS EVENTS**

116322 Default.

116323 **STDOUT**

116324 If operands are specified and they do not include any Informational Queries, no output shall be  
 116325 produced.

116326 If the **size** operand is specified, *stty* shall write to standard output the terminal window size as  
 116327 follows:

116328 "%1dΔ%1d\n", *<rows>*, *<columns>*

116329 where *<rows>* and *<columns>* are the number of rows and columns in the terminal window size,  
 116330 respectively.

116331 If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that

116332 can be used as arguments to another instance of *stty* on the same system.

116333 If the **-a** option is specified, all of the information as described in the OPERANDS section shall  
 116334 be written to standard output. Unless otherwise specified, this information shall be written as  
 116335 <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified  
 116336 number of tokens per line. Additional information may be written.

116337 If no options or operands are specified, an unspecified subset of the information written for the  
 116338 **-a** option shall be written.

116339 If speed information is written as part of the default output, or if the **-a** option is specified and if  
 116340 the terminal input speed and output speed are the same, the speed information shall be written  
 116341 as follows:

116342 "speed %d baud;", <speed>

116343 Otherwise, speeds shall be written as:

116344 "ispeed %d baud; ospeed %d baud;", <ispeed>, <ospeed>

116345 In locales other than the POSIX locale, the word **baud** may be changed to something more  
 116346 appropriate in those locales.

116347 If control characters are written as part of the default output, or if the **-a** option is specified,  
 116348 control characters shall be written as:

116349 "%s = %s;", <control-character name>, <value>

116350 where <value> is either the character, or some visual representation of the character if it is non-  
 116351 printable, or the string "<undef>" if the character is disabled.

**116352 STDERR**

116353 The standard error shall be used only for diagnostic messages.

**116354 OUTPUT FILES**

116355 None.

**116356 EXTENDED DESCRIPTION**

116357 None.

**116358 EXIT STATUS**

116359 The following exit values shall be returned:

116360 0 Successful completion.

116361 >0 An error occurred.

**116362 CONSEQUENCES OF ERRORS**

116363 Default.

**116364 APPLICATION USAGE**

116365 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.  
 116366 For example, a program may:

```

116367 saveterm=$(stty -g)                                # save terminal state
116368 restoresize=$(
116369     printf "stty rows %d cols %d" $(stty size)
116370 )  # save terminal size
116371 stty new settings                                  # set new state
116372 ...
116373 [ -n "$saveterm" ] && stty "$saveterm"             # restore terminal state
  
```

- 116374           eval "\$restoresize"                               # restore terminal size
- 116375           Since the format is unspecified, the saved value is not portable across systems.
- 116376           Since the `-a` format is so loosely specified, scripts that save and restore terminal settings should  
116377           use the `-g` option.
- 116378 **EXAMPLES**
- 116379           None.
- 116380 **RATIONALE**
- 116381           The original *stty* description was taken directly from System V and reflected the System V  
116382           terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.
- 116383           Output modes are specified only for XSI-conformant systems. All implementations are expected  
116384           to provide *stty* operands corresponding to all of the output modes they support.
- 116385           The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the  
116386           preferred ERASE and KILL characters. As an application programming utility, *stty* can be used  
116387           within shell scripts to alter the terminal settings for the duration of the script.
- 116388           The **termios** section states that individual disabling of control characters is possible through the  
116389           option `_POSIX_VDISABLE`. If enabled, two conventions currently exist for specifying this:  
116390           System V uses `^~`, and BSD uses *undef*. Both are accepted by *stty* in this volume of  
116391           POSIX.1-2024. The other BSD convention of using the letter 'u' was rejected because it conflicts  
116392           with the actual letter 'u', which is an acceptable value for a control character.
- 116393           Early proposals did not specify the mapping of `^c` to control characters because the control  
116394           characters were not specified in the POSIX locale character set description file requirements. The  
116395           control character set is now specified in XBD [Chapter 3](#) (on page 31), so the historical mapping is  
116396           specified. Note that although the mapping corresponds to control-character key assignments on  
116397           many terminals that use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the  
116398           mapping specified here is to the control characters, not their keyboard encodings.
- 116399           Since **termios** supports separate speeds for input and output, two new options were added to  
116400           specify each distinctly.
- 116401           Some historical implementations use standard input to get and set terminal characteristics;  
116402           others use standard output. Since input from a login TTY is usually restricted to the owner while  
116403           output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
116404           accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
116405           also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
116406           input is required by this volume of POSIX.1-2024.
- 116407 **FUTURE DIRECTIONS**
- 116408           None.
- 116409 **SEE ALSO**
- 116410           [Chapter 2](#) (on page 2472)
- 116411           XBD [Chapter 8](#) (on page 167), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215), [<termios.h>](#)
- 116412 **CHANGE HISTORY**
- 116413           First released in Issue 2.
- 116414 **Issue 5**
- 116415           The description of **tabs** is clarified.
- 116416           The FUTURE DIRECTIONS section is added.

116417 **Issue 6**

116418 The LEGACY items **iuclc** (**-iuclc**), **xcase** (**-xcase**), **olcuc** (**-olcuc**), **lcase** (**-lcase**), and **LCASE**  
116419 (**-LCASE**) are removed.

116420 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/37 is applied, applying IEEE PASC  
116421 Interpretation 1003.2 #133, fixing an error in the OPERANDS section for the Combination Modes  
116422 **nl** (**-nl**).

116423 **Issue 7**

116424 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the  
116425 IXANY symbol from the XSI option to the Base.

116426 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116427 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0189 [908] is applied.

116428 **Issue 8**

116429 Austin Group Defects 1053, 1532, and 1687 are applied, changing the **-g** option and adding the  
116430 **rows number**, **cols number**, and **size** operands.

116431 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116432 Austin Group Defect 1508 is applied, changing the EXIT STATUS section.

116433 Austin Group Defect 1604 is applied, changing *undef* to "`<undef>`" in the STDOUT section, and  
116434 changing **icanon** to **-icanon** in the descriptions of **min** and **time**.

116435 **NAME**

116436 tabs — set terminal tabs

116437 **SYNOPSIS**116438 XSI tabs [-n | -a | -a2 | -c | -c2 | -c3 | -f | -p | -s | -u ] [-T *type*]116439 tabs [-T *type*] n [[*sep*[+]n] . . . ]116440 **DESCRIPTION**

116441 The *tabs* utility shall display a series of characters that first clears the hardware terminal tab  
 116442 XSI settings and then initializes the tab stops at the specified positions and optionally adjusts the  
 116443 margin.

116444 The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
 116445 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
 116446 on that line. The maximum number of tab stops allowed is terminal-dependent.

116447 It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from  
 116448 the *TERM* environment variable or *-T* option represents such a terminal, an appropriate  
 116449 diagnostic message shall be written to standard error and *tabs* shall exit with a status greater  
 116450 than zero.

116451 **OPTIONS**

116452 XSI The *tabs* utility shall conform to XBD Section 12.2 (on page 215), except for various extensions:  
 116453 the options *-a2*, *-c2*, and *-c3* are multi-character.

116454 The following options shall be supported:

116455 *-n* Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
 116456 where *n* is a single-digit decimal number. The default usage of *tabs* with no  
 116457 arguments shall be equivalent to *tabs -8*. When *-0* is used, the tab stops shall be  
 116458 cleared and no new ones set.

116459 XSI *-a* 1,10,16,36,72  
 116460 Assembler, applicable to some mainframes.

116461 XSI *-a2* 1,10,16,40,72  
 116462 Assembler, applicable to some mainframes.

116463 XSI *-c* 1,8,12,16,20,55  
 116464 COBOL, normal format.

116465 XSI *-c2* 1,6,10,14,49  
 116466 COBOL, compact format (columns 1 to 6 omitted).

116467 XSI *-c3* 1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
 116468 COBOL compact format (columns 1 to 6 omitted), with more tabs than *-c2*.

116469 XSI *-f* 1,7,11,15,19,23  
 116470 FORTRAN

116471 XSI *-p* 1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
 116472 PL/1

116473 XSI *-s* 1,10,55  
 116474 SNOBOL

116475 XSI *-u* 1,12,20,44  
 116476 Assembler, applicable to some mainframes.

116477            -T *type*        Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 116478                                    is unset or null, an unspecified default terminal type shall be used. The setting of  
 116479                                    *type* shall take precedence over the value in *TERM*.

116480 **OPERANDS**

116481            The following operand shall be supported:

116482            *n*[[*sep*[+]*n*]...] A single command line argument that consists of one or more tab-stop values (*n*)  
 116483                                    separated by a separator character (*sep*) which is either a <comma> or a <blank>  
 116484                                    character. The application shall ensure that the tab-stop values are positive decimal  
 116485                                    integers in strictly ascending order. If any tab-stop value (except the first one) is  
 116486                                    preceded by a <plus-sign>, it is taken as an increment to be added to the previous  
 116487                                    value. For example, the tab lists 1,10,20,30 and "1 10 +10 +10" are considered  
 116488                                    to be identical.

116489 **STDIN**

116490            Not used.

116491 **INPUT FILES**

116492            None.

116493 **ENVIRONMENT VARIABLES**

116494            The following environment variables shall affect the execution of *tabs*:

116495            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 116496                                    (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 116497                                    variables used to determine the values of locale categories.)

116498            *LC\_ALL*         If set to a non-empty string value, override the values of all the other  
 116499                                    internationalization variables.

116500            *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 116501                                    characters (for example, single-byte as opposed to multi-byte characters in  
 116502                                    arguments).

116503            *LC\_MESSAGES*

116504                                    Determine the locale that should be used to affect the format and contents of  
 116505                                    diagnostic messages written to standard error.

116506 XSI        *NLSPATH*        Determine the location of messages objects and message catalogs.

116507            *TERM*            Determine the terminal type. If this variable is unset or null, and if the -T option is  
 116508                                    not specified, an unspecified default terminal type shall be used.

116509 **ASYNCHRONOUS EVENTS**

116510            Default.

116511 **STDOUT**

116512            If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
 116513                                    written to standard output in an unspecified format. If standard output is not a terminal,  
 116514                                    undefined results occur.

116515 **STDERR**

116516            The standard error shall be used only for diagnostic messages.

116517 **OUTPUT FILES**

116518            None.

116519 **EXTENDED DESCRIPTION**

116520 None.

116521 **EXIT STATUS**

116522 The following exit values shall be returned:

116523 0 Successful completion.

116524 &gt;0 An error occurred.

116525 **CONSEQUENCES OF ERRORS**

116526 Default.

116527 **APPLICATION USAGE**116528 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

116529 This utility is not recommended for application use.

116530 Some integrated display units might not have escape sequences to set tab stops, but may be set  
116531 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
116532 terminal; if output is directed to another file, however, *tabs* fails.

116533 **EXAMPLES**

116534 None.

116535 **RATIONALE**

116536 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
116537 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
116538 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or  
116539 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary  
116540 tab stops.

116541 The System V *tabs* interface is very complex; the version in this volume of POSIX.1-2024 has a  
116542 reduced feature list, but many of the features omitted were restored as part of the XSI option  
116543 even though the supported languages and coding styles are primarily historical.

116544 There was considerable sentiment for specifying only a means of resetting the tabs back to a  
116545 known state—presumably the “standard” of tabs every eight positions. The following features  
116546 were omitted:

- 116547 • Setting tab stops via the first line in a file, using *--file*. Since even the SVID has no  
116548 complete explanation of this feature, it is doubtful that it is in widespread use.

116549 In an early proposal, a *-t tablist* option was added for consistency with *expand*; this was later  
116550 removed when inconsistencies with the historical list of tabs were identified.

116551 Consideration was given to adding a *-p* option that would output the current tab settings so  
116552 that they could be saved and then later restored. This was not accepted because querying the tab  
116553 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
116554 supported on a wide range of terminals.

116555 **FUTURE DIRECTIONS**

116556 None.

116557 **SEE ALSO**116558 *expand*, *stty*, *tput*, *unexpand*

116559 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

116560 **CHANGE HISTORY**

116561 First released in Issue 2.

116562 **Issue 6**

116563 This utility is marked as part of the User Portability Utilities option.

116564 The normative text is reworded to avoid use of the term ``must'' for application requirements.

116565 **Issue 7**

116566 The *tabs* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

116568 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116569 The SYNOPSIS and OPERANDS sections are updated.

116570 **Issue 8**

116571 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116572 **NAME**

116573 tail — copy the last part of a file

116574 **SYNOPSIS**116575 tail [-f] [-c *number*|-n *number*] [*file*]116576 tail -r [-n *number*] [*file*]116577 **DESCRIPTION**116578 The *tail* utility shall copy its input file to the standard output beginning at a designated place.116579 Copying shall begin at the point in the file indicated by the *-c number* or *-n number* options. The  
116580 option-argument *number* shall be counted in units of lines or bytes, according to the options *-n*  
116581 and *-c*. Both line and byte counts start from 1.116582 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
116583 length. Such a buffer, if any, shall be no smaller than {LINE\_MAX}\*10 bytes.116584 **OPTIONS**116585 The *tail* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
116586 recognized as an option delimiter as well as '-'.  
116587

116587 The following options shall be supported:

116588 *-c number* The application shall ensure that the *number* option-argument is a decimal integer,  
116589 optionally including a sign. The sign shall affect the location in the file, measured  
116590 in bytes, to begin the copying:

116591

116592

116593

116594

| Sign        | Copying Starts                         |
|-------------|----------------------------------------|
| +           | Relative to the beginning of the file. |
| -           | Relative to the end of the file.       |
| <i>none</i> | Relative to the end of the file.       |

116595 The application shall ensure that if the sign of the *number* option-argument is '+',  
116596 the *number* option-argument is a non-zero decimal integer.116597 The origin for counting shall be 1; that is, *-c +1* represents the first byte of the file,  
116598 *-c -1* the last.116599 *-f* If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
116600 terminate after the last line of the input file has been copied, but read and copy  
116601 further bytes from the input file when they become available. If no *file* operand is  
116602 specified and standard input is a pipe or FIFO, the *-f* option shall be ignored. If the  
116603 input file is not a FIFO, pipe, or regular file, it is unspecified whether or not the *-f*  
116604 option shall be ignored.116605 *-n number* If *-r* is not specified, this option shall be equivalent to *-c number*, except the  
116606 starting location in the file shall be measured in lines instead of bytes. The origin  
116607 for counting shall be 1; that is, *-n +1* represents the first line of the file, *-n -1* the  
116608 last.116609 If *-r* is specified, *number* shall specify the number of lines to read (in reverse) from  
116610 the end of the input file. The application shall ensure that *number* does not have a  
116611 sign.116612 *-r* Copy the lines in reverse order (last line first). If *-n* is specified, that many lines of  
116613 the file, starting with the last line, shall be copied. If *-n* is not specified, every line  
116614 of the input file shall be copied.116615 If none of the *-c*, *-n* or *-r* options is specified, *-n 10* shall be assumed.

116616 **OPERANDS**

116617 The following operand shall be supported:

116618 *file* A pathname of an input file. If no *file* operand is specified, the standard input shall  
116619 be used.

116620 **STDIN**

116621 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
116622 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
116623 the standard input shall not be used. See the INPUT FILES section.

116624 **INPUT FILES**

116625 If the -c option is specified, the input file can contain arbitrary data; otherwise, the input file  
116626 shall be a text file.

116627 **ENVIRONMENT VARIABLES**

116628 The following environment variables shall affect the execution of *tail*:

116629 *LANG* Provide a default value for the internationalization variables that are unset or null.  
116630 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
116631 variables used to determine the values of locale categories.)

116632 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
116633 internationalization variables.

116634 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
116635 characters (for example, single-byte as opposed to multi-byte characters in  
116636 arguments and input files).

116637 *LC\_MESSAGES*

116638 Determine the locale that should be used to affect the format and contents of  
116639 diagnostic messages written to standard error.

116640 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

116641 **ASYNCHRONOUS EVENTS**

116642 Default.

116643 **STDOUT**

116644 The designated portion of the input file shall be written to standard output.

116645 **STDERR**

116646 The standard error shall be used only for diagnostic messages.

116647 **OUTPUT FILES**

116648 None.

116649 **EXTENDED DESCRIPTION**

116650 None.

116651 **EXIT STATUS**

116652 The following exit values shall be returned:

116653 0 Successful completion.

116654 >0 An error occurred.

## 116655 CONSEQUENCES OF ERRORS

116656 Default.

## 116657 APPLICATION USAGE

116658 The `-c` option should be used with caution when the input is a text file containing multi-byte  
 116659 characters; it may produce output that does not start on a character boundary.

116660 Although the input file to *tail* can be any type, the results might not be what would be expected  
 116661 on some character special device files or on file types not described by the System Interfaces  
 116662 volume of POSIX.1-2024. Since this volume of POSIX.1-2024 does not specify the block size used  
 116663 when doing input, *tail* need not read all of the data from devices that only perform block  
 116664 transfers.

116665 When using *tail* to process pathnames, and the `-c` option is not specified, it is recommended that  
 116666 `LC_ALL`, or at least `LC_CTYPE` and `LC_COLLATE`, are set to `POSIX` or `C` in the environment,  
 116667 since pathnames can contain byte sequences that do not form valid characters in some locales, in  
 116668 which case the utility's behavior would be undefined. In the `POSIX` locale each byte is a valid  
 116669 single-byte character, and therefore this problem is avoided.

## 116670 EXAMPLES

116671 The `-f` option can be used to monitor the growth of a file that is being written by some other  
 116672 process. For example, the command:

```
116673 tail -f fred
```

116674 prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between  
 116675 the time *tail* is initiated and killed. As another example, the command:

```
116676 tail -f -c 15 fred
```

116677 prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between  
 116678 the time *tail* is initiated and killed.

## 116679 RATIONALE

116680 This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The  
 116681 historical `-b` option was omitted because of the general non-portability of block-sized units of  
 116682 text. The `-c` option historically meant “characters”, but this volume of POSIX.1-2024 indicates  
 116683 that it means “bytes”. This was selected to allow reasonable implementations when multi-byte  
 116684 characters are possible; it was not named `-b` to avoid confusion with the historical `-b`.

116685 The origin of counting both lines and bytes is 1, matching all widespread historical  
 116686 implementations. Hence *tail -n +0* is not conforming usage because it attempts to output line  
 116687 zero; but note that *tail -n 0* does conform, and outputs nothing.

116688 Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
116689 tail -[number] [b|c|l] [f] [file]
```

```
116690 tail +[number] [b|c|l] [f] [file]
```

116691 These forms are no longer specified by POSIX.1-2024, but may be present in some  
 116692 implementations.

116693 The restriction on the internal buffer is a compromise between the historical System V  
 116694 implementation of 4 096 bytes and the BSD 32 768 bytes.

116695 The `-f` option has been implemented as a loop that sleeps for 1 second and copies any bytes that  
 116696 are available. This is sufficient, but if more efficient methods of determining when new data are  
 116697 available are developed, implementations are encouraged to use them.

116698 Historical documentation indicates that *tail* ignores the `-f` option if the input file is a pipe (pipe

116699 and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System  
116700 V-based systems, this was true when input was taken from standard input, but it did not ignore  
116701 the `-f` flag if a FIFO was named as the *file* operand. Since the `-f` option is not useful on pipes and  
116702 all historical implementations ignore `-f` if no *file* operand is specified and standard input is a  
116703 pipe, this volume of POSIX.1-2024 requires this behavior. However, since the `-f` option is useful  
116704 on a FIFO, this volume of POSIX.1-2024 also requires that if a FIFO is named, the `-f` option shall  
116705 not be ignored. Earlier versions of this standard did not state any requirement for the case where  
116706 no *file* operand is specified and standard input is a FIFO. The standard has been updated to  
116707 reflect current practice which is to treat this case the same as a pipe on standard input. Although  
116708 historical behavior does not ignore the `-f` option for other file types, this is unspecified so that  
116709 implementations are allowed to ignore the `-f` option if it is known that the file cannot be  
116710 extended.

116711 The functionality made available by `tail -r` has been historically provided on some systems by a  
116712 separate utility (*tac*), although *tac* traditionally lacked support for `-n` to limit the output. While  
116713 both `tail -n$n | tac` and `tac | head -n$n` can be used to output a fixed length of  
116714 reversed line output, the standard developers decided that it was preferable to have a single  
116715 utility `tail -r -n$n` for the same purpose. Furthermore, in deciding whether to standardize  
116716 *tac* rather than `tail -r`, it was determined that more implementations that have achieved POSIX  
116717 certification had already implemented `tail -r` as an extension.

#### 116718 FUTURE DIRECTIONS

116719 None.

#### 116720 SEE ALSO

116721 [head](#)

116722 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 116723 CHANGE HISTORY

116724 First released in Issue 2.

#### 116725 Issue 6

116726 The obsolescent SYNOPSIS lines and associated text are removed.

116727 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 116728 Issue 7

116729 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
116730 as an option delimiter in the OPTIONS section.

116731 Austin Group Interpretation 1003.1-2001 #092 is applied.

116732 Austin Group Interpretation 1003.1-2001 #100 is applied, adding the requirement on applications  
116733 that if the sign of the option-argument *number* is '+', the *number* option-argument is a non-zero  
116734 decimal integer.

116735 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116736 SD5-XCU-ERN-114 is applied, updating the OPTIONS section (the `-f` option).

116737 SD5-XCU-ERN-149 is applied.

116738 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0190 [663] is applied.

#### 116739 Issue 8

116740 Austin Group Defect 877 is applied, adding the `-r` option.

116741

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116742 **NAME**

116743 talk — talk to another user

116744 **SYNOPSIS**116745 UP `talk address [terminal]`116746 **DESCRIPTION**116747 The *talk* utility is a two-way, screen-oriented communication program.116748 When first invoked, *talk* shall send a message similar to:

```
116749 Message from <unspecified string>
116750 talk: connection requested by your_address
116751 talk: respond with: talk your_address
```

116752 to the specified *address*. At this point, the recipient of the message can reply by typing:116753 `talk your_address`116754 Once communication is established, the two parties can type simultaneously, with their output  
116755 displayed in separate regions of the screen. Characters shall be processed as follows:

- 116756 • Typing the <alert> character shall alert the recipient's terminal.
- 116757 • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 116758 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
116759 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 116760 • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the  
116761 *talk* session has been terminated on one side, the other side of the *talk* session shall be  
116762 notified that the *talk* session has been terminated and shall be able to do nothing except  
116763 exit.
- 116764 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
116765 characters to be sent to the recipient's terminal.
- 116766 • When and only when the *stty iexten* local mode is enabled, the existence and processing of  
116767 additional special control characters and multi-byte or single-byte functions shall be  
116768 implementation-defined.
- 116769 • Typing other non-printable characters shall cause implementation-defined sequences of  
116770 printable characters to be sent to the recipient's terminal.

116771 Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.  
116772 However, a user's privilege may further constrain the domain of accessibility of other users'  
116773 terminals. The *talk* utility shall fail when the user lacks appropriate privileges to perform the  
116774 requested action.

116775 Certain block-mode terminals do not have all the capabilities necessary to support the  
116776 simultaneous exchange of messages required for *talk*. When this type of exchange cannot be  
116777 supported on such terminals, the implementation may support an exchange with reduced levels  
116778 of simultaneous interaction or it may report an error describing the terminal-related deficiency.

116779 **OPTIONS**

116780 None.

116781 **OPERANDS**

116782 The following operands shall be supported:

116783 *address* The recipient of the *talk* session. One form of *address* is the *<user name>*, as returned  
 116784 by the *who* utility. Other address formats and how they are handled are  
 116785 unspecified.

116786 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to  
 116787 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
 116788 shall be displayed on one or more accessible terminals in use by the recipient. The  
 116789 format of *terminal* shall be the same as that returned by the *who* utility.

116790 **STDIN**

116791 Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
 116792 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
 116793 non-zero status.

116794 **INPUT FILES**

116795 None.

116796 **ENVIRONMENT VARIABLES**

116797 The following environment variables shall affect the execution of *talk*:

116798 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 116799 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 116800 variables used to determine the values of locale categories.)

116801 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 116802 internationalization variables.

116803 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 116804 characters (for example, single-byte as opposed to multi-byte characters in  
 116805 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 116806 equivalent to the sender's, the results are undefined.

116807 *LC\_MESSAGES*

116808 Determine the locale that should be used to affect the format and contents of  
 116809 diagnostic messages written to standard error and informative messages written to  
 116810 standard output.

116811 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

116812 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,  
 116813 an unspecified default terminal type shall be used.

116814 **ASYNCHRONOUS EVENTS**

116815 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
 116816 status. It shall take the standard action for all other signals.

116817 **STDOUT**

116818 If standard output is a terminal, characters copied from the recipient's standard input may be  
 116819 written to standard output. Standard output also may be used for diagnostic messages. If  
 116820 standard output is not a terminal, *talk* shall exit with a non-zero status.

116821 **STDERR**

116822 None.

116823 **OUTPUT FILES**

116824 None.

116825 **EXTENDED DESCRIPTION**

116826 None.

116827 **EXIT STATUS**

116828 The following exit values shall be returned:

116829 0 Successful completion.

116830 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.116831 **CONSEQUENCES OF ERRORS**

116832 Default.

116833 **APPLICATION USAGE**

116834 Because the handling of non-printable, non-`<space>` characters is tied to the *stty* description of  
116835 **iexten**, implementation extensions within the terminal driver can be accessed. For example,  
116836 some implementations provide line editing functions with certain control character sequences.

116837 **EXAMPLES**

116838 None.

116839 **RATIONALE**

116840 The *write* utility was included in this volume of POSIX.1-2024 since it can be implemented on all  
116841 terminal types. The *talk* utility, which cannot be implemented on certain terminals, was  
116842 considered to be a “better” communications interface. Both of these programs are in widespread  
116843 use on historical implementations. Therefore, both utilities have been specified.

116844 All references to networking abilities (*talking* to a user on another system) were removed as  
116845 being outside the scope of this volume of POSIX.1-2024.

116846 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
116847 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
116848 continues to enter text that is interpreted by the shell when the other terminates the session.  
116849 Therefore, the version of *talk* specified by this volume of POSIX.1-2024 requires both users to  
116850 terminate their end of the session explicitly.

116851 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 116852 • The original “Message from `<unspecified string> ...`” message sent to the terminal of the  
116853 recipient cannot be internationalized because the environment of the recipient is as yet  
116854 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 116855 • Subsequent communication between the two parties cannot be internationalized because  
116856 the two parties may specify different languages in their environment (and non-portable  
116857 characters cannot be mapped from one language to another).
- 116858 • Neither party can be required to communicate in a language other than C and/or the one  
116859 specified by their environment because unavailable terminal hardware support (for  
116860 example, fonts) may be required.

116861 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
116862 implementations actually use standard output to write to the terminal, but this volume of  
116863 POSIX.1-2024 does not require that to be the case.

116864 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
116865 require that they all use or accept the same format.

116866 The handling of non-printable characters is partially implementation-defined because the details  
116867 of mapping them to printable sequences is not needed by the user. Historical implementations,  
116868 for security reasons, disallow the transmission of non-printable characters that may send  
116869 commands to the other terminal.

116870 **FUTURE DIRECTIONS**

116871 None.

116872 **SEE ALSO**

116873 *mesg, stty, who, write*

116874 XBD [Chapter 8](#) (on page 167), [Chapter 11](#) (on page 199)

116875 **CHANGE HISTORY**

116876 First released in Issue 4.

116877 **Issue 6**

116878 This utility is marked as part of the User Portability Utilities option.

116879 **Issue 8**

116880 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116881 **NAME**

116882 tee — duplicate standard input

116883 **SYNOPSIS**116884 tee [-ai] [*file...*]116885 **DESCRIPTION**116886 The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.116887 The *tee* utility shall not buffer output.116888 If the **-a** option is not specified, output files shall be written (see [Section 1.1.1.4](#), on page 2454).116889 **OPTIONS**116890 The *tee* utility shall conform to XBD [Section 12.2](#) (on page 215).

116891 The following options shall be supported:

116892 **-a** Append the output to the files.116893 **-i** Ignore the SIGINT signal.116894 **OPERANDS**

116895 The following operands shall be supported:

116896 *file* A pathname of an output file. If a *file* operand is '-', it shall refer to a file named  
 116897 -; implementations shall not treat it as meaning standard output. Processing of at  
 116898 least 13 *file* operands shall be supported.

116899 **STDIN**

116900 The standard input can be of any type.

116901 **INPUT FILES**

116902 None.

116903 **ENVIRONMENT VARIABLES**116904 The following environment variables shall affect the execution of *tee*:

116905 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 116906 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 116907 variables used to determine the values of locale categories.)

116908 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 116909 internationalization variables.

116910 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 116911 characters (for example, single-byte as opposed to multi-byte characters in  
 116912 arguments).

116913 *LC\_MESSAGES*

116914 Determine the locale that should be used to affect the format and contents of  
 116915 diagnostic messages written to standard error.

116916 *XSI NLSPATH* Determine the location of messages objects and message catalogs.

116917 **ASYNCHRONOUS EVENTS**116918 Default, except that if the **-i** option was specified, SIGINT shall be ignored.116919 **STDOUT**

116920 The standard output shall be a copy of the standard input.

**116921 STDERR**

116922 The standard error shall be used only for diagnostic messages.

**116923 OUTPUT FILES**

116924 If any *file* operands are specified, the standard input shall be copied to each named file.

**116925 EXTENDED DESCRIPTION**

116926 None.

**116927 EXIT STATUS**

116928 The following exit values shall be returned:

116929 0 The standard input was successfully copied to all output files.

116930 >0 An error occurred.

**116931 CONSEQUENCES OF ERRORS**

116932 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
116933 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
116934 the default actions specified in [Section 1.4](#) (on page 2462) apply.

**116935 APPLICATION USAGE**

116936 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

116937 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

**116938 EXAMPLES**

116939 Save an unsorted intermediate form of the data in a pipeline:

116940 `... | tee unsorted | sort > sorted`

**116941 RATIONALE**

116942 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
116943 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

116944 It should be noted that early versions of BSD ignore any invalid options and accept a single '-'  
116945 as an alternative to -i. They also print a message if unable to open a file:

116946 `"tee: cannot access %s\n", <pathname>`

116947 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
116948 POSIX.1-2024.

116949 Some historical implementations use O\_APPEND when providing append mode; others use the  
116950 *lseek()* function to seek to the end-of-file after opening the file without O\_APPEND. This volume  
116951 of POSIX.1-2024 requires functionality equivalent to using O\_APPEND; see [Section 1.1.1.4](#) (on  
116952 page 2454).

**116953 FUTURE DIRECTIONS**

116954 If this utility is directed to create a new directory entry that contains any bytes that have the  
116955 encoded value of a <newline> character, implementations are encouraged to treat this as an  
116956 error. A future version of this standard may require implementations to treat this as an error.

**116957 SEE ALSO**

116958 [Chapter 1](#) (on page 2453), *cat*

116959 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

116960 XSH *lseek()*

116961 **CHANGE HISTORY**

116962 First released in Issue 2.

116963 **Issue 6**

116964 IEEE PASC Interpretation 1003.2 #168 is applied.

116965 **Issue 7**

116966 Austin Group Interpretation 1003.1-2001 #092 is applied.

116967 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116968 **Issue 8**

116969 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of filenames containing any bytes that have the encoded value of a <newline> character.

116971 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

116972 Austin Group Defect 1494 is applied, inserting a missing closing parenthesis.

116973 **NAME**

116974 test — evaluate expression

116975 **SYNOPSIS**116976 test [*expression*]116977 [ [*expression*] ]116978 **DESCRIPTION**

116979 The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit  
 116980 status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 116981 1 indicates that the expression evaluated as false.

116982 In the second form of the utility, where the utility name used is *l* rather than *test*, the application  
 116983 shall ensure that the closing square bracket is a separate argument. The *test* and *l* utilities may be  
 116984 implemented as a single linked utility which examines the basename of the zeroth command  
 116985 line argument to determine whether to behave as the *test* or *l* variant. Applications using the *exec*  
 116986 family of functions to execute these utilities shall ensure that the argument passed in *argv* or  
 116987 *argv*[0] is '[' when executing the *l* utility and has a basename of "test" when executing the  
 116988 *test* utility.

116989 **OPTIONS**

116990 The *test* utility shall not recognize the "--" argument in the manner specified by Guideline 10 in  
 116991 XBD [Section 12.2](#) (on page 215). In addition, when the utility name used is *l* the utility does not  
 116992 conform to Guidelines 1 and 2.

116993 No options shall be supported.

116994 **OPERANDS**

116995 The application shall ensure that all operators and elements of primaries are presented as  
 116996 separate arguments to the *test* utility.

116997 The following primaries can be used to construct *expression*:

116998 **-b** *pathname* True if *pathname* resolves to an existing directory entry for a block special file. False  
 116999 if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117000 for a file that is not a block special file.

117001 **-c** *pathname* True if *pathname* resolves to an existing directory entry for a character special file.  
 117002 False if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory  
 117003 entry for a file that is not a character special file.

117004 **-d** *pathname* True if *pathname* resolves to an existing directory entry for a directory. False if  
 117005 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117006 for a file that is not a directory.

117007 **-e** *pathname* True if *pathname* resolves to an existing directory entry. False if *pathname* cannot be  
 117008 resolved.

117009 *pathname1* **-ef** *pathname2*

117010 True if *pathname1* and *pathname2* resolve to existing directory entries for the same  
 117011 file; otherwise, false.

117012 **-f** *pathname* True if *pathname* resolves to an existing directory entry for a regular file. False if  
 117013 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117014 for a file that is not a regular file.

117015 **-g** *pathname* True if *pathname* resolves to an existing directory entry for a file that has its set-  
 117016 group-ID flag set. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 117017 existing directory entry for a file that does not have its set-group-ID flag set.

- 117018        **-h** *pathname* True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 117019            *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117020            for a file that is not a symbolic link. If the final component of *pathname* is a  
 117021            symbolic link, that symbolic link is not followed.
- 117022        **-L** *pathname* True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 117023            *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117024            for a file that is not a symbolic link. If the final component of *pathname* is a  
 117025            symbolic link, that symbolic link is not followed.
- 117026        **-n** *string*     True if the length of *string* is non-zero; otherwise, false.
- 117027        *pathname1* **-nt** *pathname2*  
 117028            True if *pathname1* resolves to an existing file and *pathname2* cannot be resolved, or if  
 117029            both resolve to existing files and *pathname1* is newer than *pathname2* according to  
 117030            their last data modification timestamps; otherwise, false.
- 117031        *pathname1* **-ot** *pathname2*  
 117032            True if *pathname2* resolves to an existing file and *pathname1* cannot be resolved, or if  
 117033            both resolve to existing files and *pathname1* is older than *pathname2* according to  
 117034            their last data modification timestamps; otherwise, false.
- 117035        **-p** *pathname* True if *pathname* resolves to an existing directory entry for a FIFO. False if *pathname*  
 117036            cannot be resolved, or if *pathname* resolves to an existing directory entry for a file  
 117037            that is not a FIFO.
- 117038        **-r** *pathname* True if *pathname* resolves to an existing directory entry for a file for which  
 117039            permission to read from the file is granted, as defined in [Section 1.1.1.4](#) (on page  
 117040            2454). False if *pathname* cannot be resolved, or if *pathname* resolves to an existing  
 117041            directory entry for a file for which permission to read from the file is not granted.
- 117042        **-S** *pathname* True if *pathname* resolves to an existing directory entry for a socket. False if  
 117043            *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 117044            for a file that is not a socket.
- 117045        **-s** *pathname* True if *pathname* resolves to an existing directory entry for a file that has a size  
 117046            greater than zero. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 117047            existing directory entry for a file that does not have a size greater than zero.
- 117048        **-t** *file\_descriptor*  
 117049            True if file descriptor number *file\_descriptor* is open and is associated with a  
 117050            terminal. False if *file\_descriptor* is not a valid file descriptor number, or if file  
 117051            descriptor number *file\_descriptor* is not open, or if it is open but is not associated  
 117052            with a terminal.
- 117053        **-u** *pathname* True if *pathname* resolves to an existing directory entry for a file that has its set-  
 117054            user-ID flag set. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 117055            existing directory entry for a file that does not have its set-user-ID flag set.
- 117056        **-w** *pathname* True if *pathname* resolves to an existing directory entry for a file for which  
 117057            permission to write to the file is granted, as defined in [Section 1.1.1.4](#) (on page  
 117058            2454). False if *pathname* cannot be resolved, or if *pathname* resolves to an existing  
 117059            directory entry for a file for which permission to write to the file is not granted.
- 117060        **-x** *pathname* True if *pathname* resolves to an existing directory entry for a file for which  
 117061            permission to execute the file (or search it, if it is a directory) is granted, as defined  
 117062            in [Section 1.1.1.4](#) (on page 2454). False if *pathname* cannot be resolved, or if  
 117063            *pathname* resolves to an existing directory entry for a file for which permission to

117064 execute (or search) the file is not granted.

117065 `-z string` True if the length of string *string* is zero; otherwise, false.

117066 `string` True if the string *string* is not the null string; otherwise, false.

117067 `s1 = s2` True if the strings *s1* and *s2* are identical; otherwise, false.

117068 `s1 != s2` True if the strings *s1* and *s2* are not identical; otherwise, false.

117069 `s1 > s2` True if *s1* collates after *s2* in the current locale; otherwise, false.

117070 `s1 < s2` True if *s1* collates before *s2* in the current locale; otherwise, false.

117071 `n1 -eq n2` True if the integers *n1* and *n2* are algebraically equal; otherwise, false.

117072 `n1 -ne n2` True if the integers *n1* and *n2* are not algebraically equal; otherwise, false.

117073 `n1 -gt n2` True if the integer *n1* is algebraically greater than the integer *n2*; otherwise, false.

117074 `n1 -ge n2` True if the integer *n1* is algebraically greater than or equal to the integer *n2*;  
117075 otherwise, false.

117076 `n1 -lt n2` True if the integer *n1* is algebraically less than the integer *n2*; otherwise, false.

117077 `n1 -le n2` True if the integer *n1* is algebraically less than or equal to the integer *n2*; otherwise,  
117078 false.

117079 With the exception of the `-h pathname` and `-L pathname` primaries, if a *pathname*, *pathname1*, or  
117080 *pathname2* argument is a symbolic link, *test* shall evaluate the expression by resolving the  
117081 symbolic link and using the file referenced by the link.

117082 These primaries can be combined with the following operator:

117083 `! expression` True if *expression* is false. False if *expression* is true.

117084 The primaries with two elements of the form:

117085 `-primary_operator primary_operand`

117086 are known as *unary primaries*. The primaries with three elements in either of the two forms:

117087 `primary_operand -primary_operator primary_operand`

117088 `primary_operand primary_operator primary_operand`

117089 are known as *binary primaries*. Additional implementation-defined operators and  
117090 *primary\_operators* may be provided by implementations. They shall be of the form `-operator`  
117091 where the first character of *operator* is not a digit.

117092 The algorithm for determining the precedence of the operators and the return value that shall be  
117093 generated is based on the number of arguments presented to *test*. (However, when using the  
117094 "[...]" form, the <right-square-bracket> final argument shall not be counted in this  
117095 algorithm.)

117096 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:

117097 0 arguments: Exit false (1).

117098 1 argument: Exit true (0) if \$1 is not null; otherwise, exit false.

117099 2 arguments: • If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.

- 117100                   • If \$1 is a unary primary, exit true if the unary test is true, false if the  
117101                   unary test is false.
- 117102                   • Otherwise, produce unspecified results.
- 117103           3 arguments:       • If \$2 is a binary primary, perform the binary test of \$1 and \$3.  
117104                   • If \$1 is '!', negate the two-argument test of \$2 and \$3.  
117105                   • Otherwise, produce unspecified results.
- 117106           4 arguments:       • If \$1 is '!', negate the three-argument test of \$2, \$3, and \$4.  
117107                   • Otherwise, the results are unspecified.
- 117108           >4 arguments:   The results are unspecified.
- 117109 **STDIN**
- 117110           Not used.
- 117111 **INPUT FILES**
- 117112           None.
- 117113 **ENVIRONMENT VARIABLES**
- 117114           The following environment variables shall affect the execution of *test*:
- 117115           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
117116                   (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
117117                   variables used to determine the values of locale categories.)
- 117118           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
117119                   internationalization variables.
- 117120           *LC\_COLLATE*
- 117121                   Determine the locale for the behavior of the > and < string comparison operators.
- 117122           *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
117123                   characters (for example, single-byte as opposed to multi-byte characters in  
117124                   arguments).
- 117125           *LC\_MESSAGES*
- 117126                   Determine the locale that should be used to affect the format and contents of  
117127                   diagnostic messages written to standard error.
- 117128 *XSI*        *NLSPATH* Determine the location of messages objects and message catalogs.
- 117129 **ASYNCHRONOUS EVENTS**
- 117130           Default.
- 117131 **STDOUT**
- 117132           Not used.
- 117133 **STDERR**
- 117134           The standard error shall be used only for diagnostic messages.
- 117135 **OUTPUT FILES**
- 117136           None.
- 117137 **EXTENDED DESCRIPTION**
- 117138           None.

117139 **EXIT STATUS**

117140 The following exit values shall be returned:

- 117141 0 *expression* evaluated to true.
- 117142 1 *expression* evaluated to false or *expression* was missing.
- 117143 >1 An error occurred.

117144 **CONSEQUENCES OF ERRORS**

117145 Default.

117146 **APPLICATION USAGE**

117147 Since '>' and '<' are operators in the shell language, applications need to quote them when  
117148 passing them as arguments to *test* from a shell.

117149 The **-a** and **-o** binary primaries and the '(' and ')' operators have been removed. (Many  
117150 expressions using them were ambiguously defined by the grammar depending on the specific  
117151 expressions being evaluated.) Scripts using these expressions should be converted to the forms  
117152 given below. Even though many implementations will continue to support these forms, scripts  
117153 should be extremely careful when dealing with user-supplied input that could be confused with  
117154 these and other primaries and operators. Unless the application developer knows all the cases  
117155 that produce input to the script, invocations like:

117156 `test "$1" -a "$2"`

117157 should be written as:

117158 `test "$1" && test "$2"`

117159 to avoid problems if a user supplied values such as \$1 set to '!' and \$2 set to the null string.  
117160 That is, replace:

117161 `test expr1 -a expr2`

117162 with:

117163 `test expr1 && test expr2`

117164 and replace:

117165 `test expr1 -o expr2`

117166 with:

117167 `test expr1 || test expr2`

117168 but note that, in *test*, **-a** was specified as having higher precedence than **-o** while "&&" and  
117169 "||" have equal precedence in the shell.

117170 Parentheses or braces can be used in the shell command language to effect grouping.

117171 The two commands:

117172 `test "$1"`  
117173 `test ! "$1"`

117174 could not be used reliably on some historical systems. Unexpected results would occur if such a  
117175 *string* expression were used and \$1 expanded to '!', '(', or a known unary primary. Better  
117176 constructs are:

117177 `test -n "$1"`  
117178 `test -z "$1"`

117179 respectively.

117180 Historical systems have also been unreliable given the common construct:

```
117181 test "$response" = "expected string"
```

117182 One of the following is a more reliable form:

```
117183 test "X$response" = "Xexpected string"
```

```
117184 test "expected string" = "$response"
```

117185 Note that the second form assumes that *expected string* could not be confused with any unary  
117186 primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used  
117187 instead. Using the preceding rules, any of the three comparison forms is reliable, given any  
117188 input. (However, note that the strings are quoted in all cases.)

117189 Historically, the string comparison binary primaries, '=' and '!=', had a higher precedence  
117190 than any unary primary in the greater than 4 argument case, and consequently unexpected  
117191 results could occur if arguments were not properly prepared. For example, in:

```
117192 test -d "$1" -o -d "$2"
```

117193 If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a  
117194 string comparison, which causes a syntax error when the second -d is encountered. The  
117195 following form prevents this:

```
117196 test -d "$1" || test -d "$2"
```

117197 Also in the greater than 4 argument case:

```
117198 test "$1" = "bat" -a "$2" = "ball"
```

117199 syntax errors would occur if \$1 evaluates to ' (' or '!'. One of the following forms prevents  
117200 this; the second is preferred:

```
117201 test "$1" = "bat" && test "$2" = "ball"
```

```
117202 test "X$1" = "Xbat" && test "X$2" = "Xball"
```

117203 Note that none of the following examples are permitted by the syntax described:

```
117204 [-f file]
```

```
117205 [-f file ]
```

```
117206 [ -f file]
```

```
117207 [ -f file
```

```
117208 test -f file ]
```

117209 In the first two cases, if a utility named *[-f]* exists, that utility would be invoked, and not *test*. In  
117210 the remaining cases, the brackets are mismatched, and the behavior is unspecified. However:

```
117211 test ! ]
```

117212 does have a defined meaning, and must exit with status 1. Similarly:

```
117213 test ]
```

117214 must exit with status 0.

## 117215 EXAMPLES

117216 1. Exit if there are not two or three arguments (two variations):

```
117217 if [ $# -ne 2 ] && [ $# -ne 3 ]; then exit 1; fi
```

```
117218 if [ $# -lt 2 ] || [ $# -gt 3 ]; then exit 1; fi
```

```

117219      2. Perform a mkdir if a directory does not exist:
117220          test ! -d tempdir && mkdir tempdir
117221
117221      3. Wait for a file to become non-readable:
117222          while test -r thefile
117223          do
117224              sleep 30
117225          done
117226          echo "thefile" is no longer readable'
117227
117227      4. Perform a command if the argument is one of three strings (two variations):
117228          if [ "$1" = "pear" ] || [ "$1" = "grape" ] || [ "$1" = "apple" ]
117229          then
117230              command
117231          fi
117232
117232          case "$1" in
117233              pear|grape|apple) command ;;
117234          esac

```

#### 117235 RATIONALE

117236 The KornShell-derived conditional command (double bracket `[[ ]]`) was removed from the shell  
 117237 command language description in an early proposal. Objections were raised that the real  
 117238 problem is misuse of the *test* command (`!`), and putting it into the shell is the wrong way to fix  
 117239 the problem. Instead, proper documentation and a new shell reserved word (`!`) are sufficient. A  
 117240 later proposal to add `[[ ]]` in Issue 8 was also rejected because existing implementations of it were  
 117241 found to be error-prone in a similar way to historical versions of *test*, and there was also too  
 117242 much variation in behavior between shells that support it.

117243 Tests that require multiple *test* operations can be done at the shell level using individual  
 117244 invocations of the *test* command and shell logicals, rather than using the error-prone historical  
 117245 `-a` and `-o` operators of *test*.

117246 The BSD and System V versions of `-f` were not the same. The BSD definition was:

117247 `-f file` True if *file* exists and is not a directory.

117248 The SVID version (true if the file exists and is a regular file) was chosen for this volume of  
 117249 POSIX.1-2024 because its use is consistent with the `-b`, `-c`, `-d`, and `-p` operands (*file* exists and is  
 117250 a specific file type).

117251 The `-e` primary, possessing similar functionality to that provided by the C shell, was added  
 117252 because it provides the only way for a shell script to find out if a file exists without trying to  
 117253 open the file. Since implementations are allowed to add additional file types, a portable script  
 117254 cannot use:

```
117255 test -b foo || test -c foo || test -d foo || test -f foo || test -p foo
```

117256 to find out if **foo** is an existing file. On historical BSD systems, the existence of a file could be  
 117257 determined by:

```
117258 test -f foo || test -d foo
```

117259 but there was no easy way to determine that an existing file was a regular file. An early proposal  
 117260 used the KornShell `-a` primary (with the same meaning), but this was changed to `-e` because  
 117261 there were concerns about the high probability of humans confusing the `-a` primary with the  
 117262 historical `-a` binary operator.

117263 The following options were not included in this volume of POSIX.1-2024, although they are  
 117264 provided by some implementations. These operands should not be used by new  
 117265 implementations for other purposes:

117266 **-k file** True if *file* exists and its sticky bit is set.

117267 **-C file** True if *file* is a contiguous file.

117268 **-V file** True if *file* is a version file.

117269 The following option was not included because it was undocumented in most implementations,  
 117270 has been removed from some implementations (including System V), and the functionality is  
 117271 provided by the shell (see [Section 2.6.2](#) (on page 2485)).

117272 **-l string** The length of the string *string*.

117273 The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not  
 117274 provide them. The **-k** operand is derived from System V; historical BSD does not provide it.

117275 On historical BSD systems, *test -w directory* always returned false because *test* tried to open the  
 117276 directory for writing, which always fails.

117277 Some additional primaries newly invented or from the KornShell appeared in an early proposal  
 117278 as part of the conditional command (`([[ ]]: s1 > s2, s1 < s2, f1 -nt f2, f1 -ot f2, and f1 -ef f2`). They  
 117279 were not carried forward into the *test* utility when the conditional command was removed from  
 117280 the shell because they had not been included in the *test* utility built into historical  
 117281 implementations of the *sh* utility. However, they were later added to this standard once support  
 117282 for them became widespread.

117283 The **-t file\_descriptor** primary is shown with a mandatory argument because the grammar is  
 117284 ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,  
 117285 providing a default of 1.

117286 It is noted that ' [ ' is not part of the portable filename character set; however, since it is required  
 117287 to be encoded by a single byte, and is part of the portable character set, the name of this utility  
 117288 forms a character string across all supported locales.

#### 117289 **FUTURE DIRECTIONS**

117290 None.

#### 117291 **SEE ALSO**

117292 [Section 1.1.1.4](#) (on page 2454), *find*

117293 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 117294 **CHANGE HISTORY**

117295 First released in Issue 2.

#### 117296 **Issue 5**

117297 The FUTURE DIRECTIONS section is added.

#### 117298 **Issue 6**

117299 The **-h** operand is added for symbolic links, and access permission requirements are clarified for  
 117300 the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.

117301 The normative text is reworded to avoid use of the term “must” for application requirements.

117302 The **-L** and **-S** operands are added for symbolic links and sockets.

117303 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/38 is applied, adding XSI margin  
 117304 marking and shading to a line in the OPERANDS section referring to the use of parentheses as

- 117305 arguments to the *test* utility.
- 117306 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/30 is applied, rewording the existence  
117307 primaries for the *test* utility.
- 117308 **Issue 7**
- 117309 Austin Group Interpretation 1003.1-2001 #107 is applied.
- 117310 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0143 [291] is applied.
- 117311 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0191 [898], XCU/TC2-2008/0192  
117312 [730], and XCU/TC2-2008/0193 [898] are applied.
- 117313 **Issue 8**
- 117314 Austin Group Defect 375 is applied, adding the *pathname1 -ef pathname2*,  
117315 *pathname1 -nt pathname2*, *pathname1 -ot pathname2*, *s1 > s2*, and *s1 < s2* primaries.
- 117316 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 117317 Austin Group Defect 1330 is applied, removing the obsolescent (and optional) *-a* and *-o* binary  
117318 primaries, and ' (' and ' ) ' operators.
- 117319 Austin Group Defect 1348 is applied, removing ``()'' from ``the *exec()* family of functions''.
- 117320 Austin Group Defect 1373 is applied, clarifying that when the utility name used is *[* the utility  
117321 does not conform to Guidelines 1 and 2.

117322 **NAME**

117323 time — time a simple command

117324 **SYNOPSIS**117325 time [-p] *utility* [*argument...*]117326 **DESCRIPTION**

117327 The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 117328 the *argument* operands and write a message to standard error that lists timing statistics for the  
 117329 utility. The message shall include the following information:

- 117330 • The elapsed (real) time between invocation of *utility* and its termination.
- 117331 • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned  
 117332 by the *times()* function defined in the System Interfaces volume of POSIX.1-2024 for the  
 117333 process in which *utility* is executed.
- 117334 • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields  
 117335 returned by the *times()* function for the process in which *utility* is executed.

117336 The precision of the timing shall be no less than the granularity defined for the size of the clock  
 117337 tick unit on the system, but the results shall be reported in terms of standard time units (for  
 117338 example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

117339 When *time* is used in any of the following circumstances, via a simple command for which the  
 117340 word **time** is the command name (see [Section 2.9.1.1](#), on page 2500), and none of the characters  
 117341 in the word **time** is quoted, the results (including parsing of later words) are unspecified:

- 117342 • The simple command for which the word **time** is the command name includes one or more  
 117343 redirections (see [Section 2.7](#), on page 2493) or is (directly) part of a pipeline (see [Section](#)  
 117344 [2.9.2](#), on page 2504).
- 117345 • The next word that follows **time** would, if the word **time** were not present, be recognized  
 117346 as a reserved word (see [Section 2.4](#), on page 2478) or a control operator (see XBD [Section](#)  
 117347 [3.85](#), on page 44).

117348 Since these limitations only apply when *time* is executed via a simple command for which the  
 117349 word **time** is the command name and none of the characters in the word **time** is quoted, they  
 117350 can be avoided by quoting all or part of the word **time**, by arranging for the command name not  
 117351 to be **time** (for example, by having the command name be a word expansion), or by executing  
 117352 *time* via another utility such as *command* or *env*.

117353 The limitations on redirections and pipelines can also be overcome by embedding the simple  
 117354 command within a compound command—most commonly a grouping command (see [Section](#)  
 117355 [2.9.4.1](#), on page 2508)—and applying the redirections or piping to the compound command  
 117356 instead.

117357 Note that in no circumstances where the results are specified is it possible to apply different  
 117358 redirections to the *time* utility than are applied to the utility it invokes.

117359 The following examples (where *a* and *b* are assumed to be the names of utilities found by  
 117360 searching *PATH*) show unspecified usages:

```

117361 time a arg1 arg2 | b      # part of a pipeline
117362 a | time -p b            # part of a pipeline
117363 time a >/dev/null        # output redirection
117364 </dev/null time a        # input redirection
117365 time while anything...   # reserved word after time
117366 time ( cmd )             # control operator after time
  
```

```

117367     time;                # control operator after time
117368     time shift           # special built-in utility
117369     time -p cd /        # intrinsic utility

```

117370 The following examples have specified results and can be used as alternatives for the first four of  
 117371 the above when the *time* utility as specified here is intended to be invoked:

```

117372     { time a arg1 arg2; } | b
117373     t=time; a | $t -p b
117374     command time a >/dev/null
117375     </dev/null \time a

```

#### 117376 OPTIONS

117377 The *time* utility shall conform to XBD [Section 12.2](#) (on page 215).

117378 The following option shall be supported:

117379 **-p** Write the timing output to standard error in the format shown in the STDERR  
 117380 section.

#### 117381 OPERANDS

117382 The following operands shall be supported:

117383 *utility* The name of a utility that is to be invoked. If the *utility* operand names a special  
 117384 built-in utility (see [Section 2.15](#), on page 2526), an intrinsic utility (see [Section 1.7](#),  
 117385 on page 2470), or a function (see [Section 2.9.5](#), on page 2511), the results are  
 117386 unspecified.

117387 *argument* Any string to be supplied as an argument when invoking the utility named by the  
 117388 *utility* operand.

#### 117389 STDIN

117390 Not used.

#### 117391 INPUT FILES

117392 None.

#### 117393 ENVIRONMENT VARIABLES

117394 The following environment variables shall affect the execution of *time*:

117395 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 117396 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 117397 variables used to determine the values of locale categories.)

117398 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 117399 internationalization variables.

117400 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 117401 characters (for example, single-byte as opposed to multi-byte characters in  
 117402 arguments).

117403 *LC\_MESSAGES*

117404 Determine the locale that should be used to affect the format and contents of  
 117405 diagnostic and informative messages written to standard error.

117406 *LC\_NUMERIC*

117407 Determine the locale for numeric formatting.

- 117408 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 117409 **PATH** Determine the search path that shall be used to locate the utility to be invoked; see  
117410 XBD [Chapter 8](#) (on page 167).
- 117411 **ASYNCHRONOUS EVENTS**
- 117412 Default.
- 117413 **STDOUT**
- 117414 Not used.
- 117415 **STDERR**
- 117416 If the *utility* utility is invoked, the standard error shall be used to write the timing statistics and  
117417 may be used to write a diagnostic message if the utility terminates abnormally; otherwise, the  
117418 standard error shall be used to write diagnostic messages and may also be used to write the  
117419 timing statistics.
- 117420 If **-p** is specified, the following format shall be used for the timing statistics in the POSIX locale:
- 117421 "real %f\nuser %f\nsys %f\n", <real seconds>, <user seconds>,  
117422 <system seconds>
- 117423 where each floating-point number shall be expressed in seconds. The precision used may be less  
117424 than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the  
117425 clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits  
117426 shall follow the radix character). The number of digits following the radix character shall be no  
117427 less than one, even if this always results in a trailing zero. The implementation may append  
117428 white space and additional information following the format shown here. The implementation  
117429 may also prepend a single empty line before the format shown here.
- 117430 **OUTPUT FILES**
- 117431 None.
- 117432 **EXTENDED DESCRIPTION**
- 117433 None.
- 117434 **EXIT STATUS**
- 117435 If the *utility* utility is invoked, the exit status of *time* shall be the exit status of *utility*; otherwise,  
117436 the *time* utility shall exit with one of the following values:
- 117437 1-125 An error occurred in the *time* utility.
- 117438 126 The utility specified by *utility* was found but could not be invoked.
- 117439 127 The utility specified by *utility* could not be found.
- 117440 **CONSEQUENCES OF ERRORS**
- 117441 Default.
- 117442 **APPLICATION USAGE**
- 117443 The *command*, *env*, *nice*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit  
117444 code 127 if a utility to be invoked cannot be found, so that applications can distinguish "failure  
117445 to find a utility" from "invoked utility exited with an error indication". The value 127 was  
117446 chosen because it is not commonly used for other meanings; most utilities use small values for  
117447 "normal error conditions" and the values above 128 can be confused with termination due to  
117448 receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could  
117449 be found, but not invoked. Some scripts produce meaningful error messages differentiating the  
117450 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice  
117451 that uses 127 when all attempts to *exec* the utility fail with [ENOENT], and uses 126 when any

117452 attempt to *exec* the utility fails for any other reason.

#### 117453 EXAMPLES

117454 It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by  
117455 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
117456 the *time* applies to everything in the file.

117457 Alternatively, the following command can be used to apply *time* to a complex command:

```
117458 time sh -c -- 'complex-command-line'
```

#### 117459 RATIONALE

117460 When the *time* utility was originally proposed to be included in the ISO POSIX-2:1993 standard,  
117461 questions were raised about its suitability for inclusion on the grounds that it was not useful for  
117462 conforming applications, specifically:

- 117463 • The underlying CPU definitions from the System Interfaces volume of POSIX.1-2024 are  
117464 vague, so the numeric output could not be compared accurately between systems or even  
117465 between invocations.
- 117466 • The creation of portable benchmark programs was outside the scope this volume of  
117467 POSIX.1-2024.

117468 However, *time* does fit in the scope of user portability. Human judgement can be applied to the  
117469 analysis of the output, and it could be very useful in hands-on debugging of applications or in  
117470 providing subjective measures of system performance. Hence it has been included in this  
117471 volume of POSIX.1-2024.

117472 The default output format has been left unspecified because historical implementations differ  
117473 greatly in their style of depicting this numeric output. The `-p` option was invented to provide  
117474 scripts with a common means of obtaining this information.

117475 In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather  
117476 than just a simple command. The POSIX definition has been worded to allow this  
117477 implementation. Consideration was given to invalidating this approach because of the historical  
117478 model from the C shell and System V shell. However, since the System V *time* utility historically  
117479 has not produced accurate results in pipeline timing (because the constituent processes are not  
117480 all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to  
117481 break historical KornShell usage.

117482 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
117483 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
117484 includes user application programs and shell scripts, not just the standard utilities.

#### 117485 FUTURE DIRECTIONS

117486 None.

#### 117491 CHANGE HISTORY

117492 First released in Issue 2.

117493 **Issue 6**

117494 This utility is marked as part of the User Portability Utilities option.

117495 **Issue 7**

117496 The *time* utility is moved from the User Portability Utilities option to the Base. User Portability  
117497 Utilities is now an option for interactive utilities.

117498 SD5-XCU-ERN-115 is applied, updating the example in the DESCRIPTION.

117499 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0144 [266] is applied.

117500 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0194 [723] is applied.

117501 **Issue 8**

117502 Austin Group Defect 267 is applied, allowing **time** to be a reserved word.

117503 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

117504 Austin Group Defect 1530 is applied, changing ``sh -c`` to ``sh -c --``.

117505 Austin Group Defect 1586 is applied, adding the *timeout* utility.

117506 Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

117507 **NAME**

117508            timeout — execute a utility with a time limit

117509 **SYNOPSIS**117510            timeout [-fp] [-k *time*] [-s *signal\_name*] *duration utility [argument...]*117511 **DESCRIPTION**

117512            The *timeout* utility shall execute the utility named by the *utility* operand, with arguments  
 117513            supplied as the *argument* operands (if any), in a child process. If the value of the *duration*  
 117514            operand is non-zero and the child process has not terminated after the specified time period,  
 117515            *timeout* shall send the signal specified by the *-s* option, or the SIGTERM signal if *-s* is not given.

117516            If the *-f* option is specified, the signal shall be sent only to the child process. Otherwise, it is  
 117517            implementation defined which one of the following methods is used to signal additional  
 117518            processes:

- 117519            • The *timeout* utility ensures it is a process group leader before creating the child process  
 117520            which executes the utility, in which case it shall send the signal to its process group.
- 117521            • The *timeout* utility arranges for any descendants of the child process that are orphaned to  
 117522            have their parent process changed to the *timeout* utility, in which case the signal shall be  
 117523            sent to the child process and all of its descendants.

117524            If the subsequent wait status of the child process shows that it was stopped by a signal, a  
 117525            SIGCONT signal shall also be sent in the same manner as the first signal; otherwise, a SIGCONT  
 117526            signal may be sent in the same manner.

117527            If the *-k* option is specified, and the child process created to execute the utility still has not  
 117528            terminated after the time period specified by the *time* option-argument has elapsed since the first  
 117529            signal was sent, *timeout* shall send a SIGKILL signal in the same manner as the first signal. If  
 117530            *timeout* receives a signal and propagates it to the child process (see ASYNCHRONOUS EVENTS  
 117531            below), this shall be treated as the first signal.

117532 **OPTIONS**117533            The *timeout* utility shall conform to XBD [Section 12.2](#) (on page 215).

117534            The following options shall be supported:

- 117535            **-f**            Only time out the utility itself, not its descendants.
- 117536            **-k *time***       Send a SIGKILL signal if the child process created to execute the utility has not  
 117537            terminated after the time period specified by *time* has elapsed since the first signal  
 117538            was sent. The value of *time* shall be interpreted as specified for the *duration*  
 117539            operand (see OPERANDS below).
- 117540            **-p**            Always preserve (mimic) the wait status of the executed utility, even if the time  
 117541            limit was reached.
- 117542            **-s *signal\_name***  
 117543            Specify the signal to send when the time limit is reached, using one of the symbolic  
 117544            names defined in the **<signal.h>** header. Values of *signal\_name* shall be recognized  
 117545            in a case-independent fashion, without the SIG prefix. By default, SIGTERM shall  
 117546            be sent.

117547 **OPERANDS**

117548            The following operands shall be supported:

- 117549            *duration*       The maximum amount of time to allow the utility to run, specified as a decimal  
 117550            number with an optional decimal fraction and an optional suffix, which can be:

|        |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 117551 |                              | <b>s</b> seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 117589 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 117590 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 117591 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 117592 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

117593           • If the `-f` option is not specified, then if *timeout* sends a signal to its process group, it shall  
 117594           briefly change the disposition of that signal to ignored while it sends the signal, so that it  
 117595           does not receive the signal itself.

117596           With the single exception of the signal specified with the `-s` option, or SIGTERM if `-s` is not  
 117597           used, all signal dispositions inherited by the utility specified by the *utility* operand shall be the  
 117598           same as the disposition that *timeout* inherited.

#### 117599 **STDOUT**

117600           Not used.

#### 117601 **STDERR**

117602           The standard error shall be used only for diagnostic messages.

#### 117603 **OUTPUT FILES**

117604           None.

#### 117605 **EXTENDED DESCRIPTION**

117606           None.

#### 117607 **EXIT STATUS**

117608           If the `-p` option is not specified and the time limit was reached:

117609           • If the `-k` option was not specified or the utility terminated before the time period specified  
 117610           by the *time* option-argument elapsed since the first signal was sent, the exit status shall be  
 117611           124.

117612           • If the `-k` option was specified and the SIGKILL signal was sent, it is unspecified whether  
 117613           the exit status is 124 or the behavior is as if the `-p` option was specified.

117614           Otherwise, if the executed utility terminated by exiting, the exit status of *timeout* shall be that of  
 117615           the utility; if the utility was terminated by a signal, *timeout* shall terminate itself with the same  
 117616           signal while ensuring that a core image is not created.

117617           If an error occurs, the following exit values shall be returned:

117618           125 An error other than the two described below occurred.

117619           126 The utility specified by *utility* was found but could not be executed.

117620           127 The utility specified by *utility* could not be found.

#### 117621 **CONSEQUENCES OF ERRORS**

117622           Default.

#### 117623 **APPLICATION USAGE**

117624           Unlike the *kill* utility, the `-s` option of *timeout* is not required to accept the symbolic name 0 to  
 117625           represent signal value zero.

117626           When the value of *duration* is zero, *timeout* does not time out the utility, but it does still perform  
 117627           signal propagation (including to descendants of the utility if `-f` is not specified).

117628           Regardless of locale, the `<period>` character (the decimal-point character of the POSIX locale) is  
 117629           the decimal-point character recognized in the *duration* operand and the *time* option-argument.

117630           The *command*, *env*, *nice*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit  
 117631           code 127 if a utility to be invoked cannot be found, so that applications can distinguish “failure  
 117632           to find a utility” from “invoked utility exited with an error indication”. The value 127 was  
 117633           chosen because it is not commonly used for other meanings; most utilities use small values for  
 117634           “normal error conditions” and the values above 128 can be confused with termination due to  
 117635           receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could

117636 be found, but not invoked. Some scripts produce meaningful error messages differentiating the  
117637 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice  
117638 that uses 127 when all attempts to *exec* the utility fail with [ENOENT], and uses 126 when any  
117639 attempt to *exec* the utility fails for any other reason. The *timeout* utility extends these special exit  
117640 codes to 125 and 124, with the meanings described in EXIT STATUS. A *timeout* exit status below  
117641 124 can only result from passing through the exit status of the executed utility.

#### 117642 EXAMPLES

117643 None.

#### 117644 RATIONALE

117645 Some *timeout* implementations make themselves a process group leader (when *-f* is not used) in  
117646 order to be able to send signals to descendants of the child process. However, using this method  
117647 means that any descendants which change their process group do not receive the signal. To  
117648 ensure all descendants receive the signal, some implementations instead make use of a feature  
117649 whereby descendants that are orphaned have their parent process changed to the *timeout*  
117650 utility—that is, *timeout* becomes their “reaper”—together with the ability of a reaper to send a  
117651 signal to all of its descendants.

117652 Some historical *timeout* implementations exited with status *128+signal\_number* when the child  
117653 process was terminated by a signal before the time limit was reached (or when *-p* was used).  
117654 This is reasonable when *timeout* is invoked from a shell which sets  *\$?*  to *128+signal\_number*, but  
117655 not all shells do that. In particular, the KornShell sets  *\$?*  to *256+signal\_number* and so an exit  
117656 status of *128+signal\_number* from *timeout* would be misleading. In order to avoid any possible  
117657 ambiguity, this standard requires that *timeout* mimics the wait status of the child process by  
117658 terminating itself with the same signal. When it does this it needs to ensure that it does not  
117659 create a core image, otherwise it could overwrite one created by the invoked utility.

117660 The *timeout* utility ignores SIGTTIN and SIGTTOU so that if the utility it executes reads from or  
117661 writes to the controlling terminal and this generates a SIGTTIN or SIGTTOU for the process  
117662 group, *timeout* will not be stopped by the signal and can still time out the utility.

117663 Some historical *timeout* implementations always set the disposition for SIGTTIN and SIGTTOU  
117664 in the child process to default, even if these signals were inherited as ignored. This could result  
117665 in processes being stopped unexpectedly. Likewise, they did not ensure that for signals they  
117666 caught, the disposition inherited by the executed utility was the same as the disposition that was  
117667 inherited by *timeout*. This meant that, for example, if *timeout* was used in a script that was run  
117668 with *nohup*, the utility executed by *timeout* would unexpectedly not be protected from SIGHUP.  
117669 This standard requires that all signal dispositions inherited by the utility specified by the *utility*  
117670 operand are the same as the disposition that *timeout* inherited, with the single exception of the  
117671 signal that *timeout* sends when the time limit is reached, which needs to be inherited as default  
117672 in order for the timeout to take effect (without resorting to SIGKILL if *-k* is specified).

117673 Some historical *timeout* implementations only propagated a subset of the signals whose default  
117674 action is to terminate the process to the child process if one was delivered to the *timeout* utility.  
117675 Propagating these signals is beneficial, as otherwise termination of the *timeout* utility by a signal  
117676 results in the utility it executed being left running indefinitely (unless it also received the signal,  
117677 for example a terminal-generated SIGINT). There is no reason to select a subset of these signals  
117678 to be propagated, therefore this standard requires them all to be propagated (except SIGKILL,  
117679 which cannot). In the event that a user wants to prevent the utility being timed out, sending  
117680 *timeout* a SIGKILL can be used for this purpose.

117681 **FUTURE DIRECTIONS**

117682 None.

117683 **SEE ALSO**117684 *kill*117685 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215), [<signal.h>](#) (on page 346)117686 **CHANGE HISTORY**

117687 First released in Issue 8.

117688 **NAME**

117689 touch — change file access and modification times

117690 **SYNOPSIS**117691 touch [-acm] [-r *ref\_file*|-t *time*|-d *date\_time*] *file*...117692 **DESCRIPTION**117693 The *touch* utility shall change the last data modification timestamps, the last data access  
117694 timestamps, or both.117695 The time used can be specified by the **-t** *time* option-argument, the corresponding *time* fields of  
117696 the file referenced by the **-r** *ref\_file* option-argument, or the **-d** *date\_time* option-argument, as  
117697 specified in the following sections. If none of these are specified, *touch* shall use the current time.117698 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined  
117699 in the System Interfaces volume of POSIX.1-2024:

- 117700 1. If *file* does not exist:
  - 117701 a. The *creat()* function is called with the following arguments:
    - 117702 — The *file* operand is used as the *path* argument.
    - 117703 — The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP,  
117704 S\_IWGRP, S\_IROTH, and S\_IWOTH is used as the *mode* argument.
  - 117705 b. The *futimens()* function is called with the following arguments:
    - 117706 — The file descriptor opened in step 1a.
    - 117707 — The access time and the modification time, set as described in the OPTIONS  
117708 section, are used as the first and second elements of the *times* array argument,  
117709 respectively.
- 117710 2. If *file* exists, the *utimensat()* function is called with the following arguments:
  - 117711 a. The AT\_FDCWD special value is used as the *fd* argument.
  - 117712 b. The *file* operand is used as the *path* argument.
  - 117713 c. The access time and the modification time, set as described in the OPTIONS  
117714 section, are used as the first and second elements of the *times* array argument,  
117715 respectively.
  - 117716 d. The *flag* argument is set to zero.

117717 **OPTIONS**117718 The *touch* utility shall conform to XBD [Section 12.2](#) (on page 215).

117719 The following options shall be supported:

- 117720 **-a** Change the access time of *file*. Do not change the modification time unless **-m** is  
117721 also specified.
- 117722 **-c** Do not create a specified *file* if it does not exist. Do not write any diagnostic  
117723 messages concerning this condition.
- 117724 **-d** *date\_time* Use the specified *date\_time* instead of the current time. The option-argument shall  
117725 be a string of the form:  
117726 `YYYY-MM-DDThh:mm:ss[.frac][tz]`  
117727 or:

117728 `YYYY-MM-DDThh:mm:SS[,frac][tz]`

117729 where:

- 117730 • YYYY are at least four decimal digits giving the year.
- 117731 • MM, DD, hh, mm, and SS are as with `-t time`.
- 117732 • T is the time designator, and can be replaced by a single <space>.
- 117733 • [.frac] and [,frac] are either empty, or a <period> ('.') or a <comma>
- 117734 (' , ') respectively, followed by one or more decimal digits, specifying a
- 117735 fractional second.
- 117736 • [tz] is either empty, signifying local time, or the letter 'Z', signifying UTC.
- 117737 If [tz] is empty, the resulting time shall be affected by the value of the TZ
- 117738 environment variable.

117739 If the resulting time precedes the Epoch, the behavior is implementation-defined. If

117740 the time cannot be represented as the file's timestamp, *touch* shall exit immediately

117741 with an error status.

117742 **-m** Change the modification time of *file*. Do not change the access time unless **-a** is

117743 also specified.

117744 **-r ref\_file** Use the corresponding time of the file named by the pathname *ref\_file* instead of

117745 the current time.

117746 **-t time** Use the specified *time* instead of the current time. The option-argument shall be a

117747 decimal number of the form:

117748 `[[CC]YY]MMDDhhmm[.SS]`

117749 where each two digits represents the following:

117750 *MM* The month of the year [01,12].

117751 *DD* The day of the month [01,31].

117752 *hh* The hour of the day [00,23].

117753 *mm* The minute of the hour [00,59].

117754 *CC* The first two digits of the year (the century).

117755 *YY* The second two digits of the year.

117756 *SS* The second of the minute [00,60].

117757 Both *CC* and *YY* shall be optional. If neither is given, the current year shall be

117758 assumed. If *YY* is specified, but *CC* is not, *CC* shall be derived as follows:

| If YY is: | CC becomes: |
|-----------|-------------|
| [69,99]   | 19          |
| [00,68]   | 20          |

117762 **Note:** It is expected that in a future version of this standard the default century inferred

117763 from a 2-digit year will change. (This would apply to all commands accepting a

117764 2-digit year as input.)

117765 The resulting time shall be affected by the value of the *TZ* environment variable. If

117766 the resulting time value precedes the Epoch, the behavior is implementation-

117767 defined. If the time is out of range for the file's timestamp, *touch* shall exit

- 117768 immediately with an error status. The range of valid times past the Epoch is  
 117769 implementation-defined, but it shall extend to at least the time 0 hours, 0 minutes,  
 117770 0 seconds, January 1, 2038, Coordinated Universal Time. Some implementations  
 117771 may not be able to represent dates beyond January 18, 2038, because they use  
 117772 **signed int** as a time holder.
- 117773 The range for *SS* is [00,60] rather than [00,59] because of leap seconds. If *SS* is 60,  
 117774 and the resulting time, as affected by the *TZ* environment variable, does not refer  
 117775 to a leap second, the resulting time shall be one second after a time where *SS* is 59.  
 117776 If *SS* is not given a value, it is assumed to be zero.
- 117777 If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**  
 117778 options were specified.
- 117779 **OPERANDS**
- 117780 The following operands shall be supported:
- 117781 *file* A pathname of a file whose times shall be modified.
- 117782 **STDIN**
- 117783 Not used.
- 117784 **INPUT FILES**
- 117785 None.
- 117786 **ENVIRONMENT VARIABLES**
- 117787 The following environment variables shall affect the execution of *touch*:
- 117788 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 117789 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 117790 variables used to determine the values of locale categories.)
- 117791 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 117792 internationalization variables.
- 117793 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 117794 characters (for example, single-byte as opposed to multi-byte characters in  
 117795 arguments).
- 117796 *LC\_MESSAGES*
- 117797 Determine the locale that should be used to affect the format and contents of  
 117798 diagnostic messages written to standard error.
- 117799 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.
- 117800 *TZ* Determine the timezone to be used for interpreting the *time* option-argument. If *TZ*  
 117801 is unset or null, an unspecified default timezone shall be used.
- 117802 **ASYNCHRONOUS EVENTS**
- 117803 Default.
- 117804 **STDOUT**
- 117805 Not used.
- 117806 **STDERR**
- 117807 The standard error shall be used only for diagnostic messages.

117808 **OUTPUT FILES**

117809 None.

117810 **EXTENDED DESCRIPTION**

117811 None.

117812 **EXIT STATUS**

117813 The following exit values shall be returned:

117814 0 The utility executed successfully and all requested changes were made.

117815 &gt;0 An error occurred.

117816 **CONSEQUENCES OF ERRORS**

117817 Default.

117818 **APPLICATION USAGE**

117819 The interpretation of time is taken to be *seconds since the Epoch* (see XBD Section 4.19, on page  
 117820 107). It should be noted that implementations conforming to the System Interfaces volume of  
 117821 POSIX.1-2024 do not take leap seconds into account when computing seconds since the Epoch.  
 117822 When *SS=60* is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a time  
 117823 when *SS=59*.

117824 Although the *-t time* option-argument specifies values in 1969, the access time and modification  
 117825 time fields are defined in terms of seconds since the Epoch (00:00:00 on 1 January 1970 UTC).  
 117826 Therefore, depending on the value of *TZ* when *touch* is run, there is never more than a few valid  
 117827 hours in 1969 and there need not be any valid times in 1969.

117828 If the *T* time designator is replaced by a <space> for the *-d date\_time* option-argument, the  
 117829 <space> must be quoted to prevent the shell from splitting the argument.

117830 **EXAMPLES**

117831 Create or update a file called **dwc**; the resulting file has both the last data modification and last  
 117832 data access timestamps set to November 12, 2007 at 10:15:30 local time:

117833 `touch -d 2007-11-12T10:15:30 dwc`

117834 Create or update a file called **nick**; the resulting file has both the last data modification and last  
 117835 data access timestamps set to November 12, 2007 at 10:15:30 UTC:

117836 `touch -d 2007-11-12T10:15:30Z nick`

117837 Create or update a file called **gwc**; the resulting file has both the last data modification and last  
 117838 data access timestamps set to November 12, 2007 at 10:15:30 local time with a fractional second  
 117839 timestamp of .002 seconds:

117840 `touch -d 2007-11-12T10:15:30,002 gwc`

117841 Create or update a file called **ajosey**; the resulting file has both the last data modification and  
 117842 last data access timestamps set to November 12, 2007 at 10:15:30 UTC with a fractional second  
 117843 timestamp of .002 seconds:

117844 `touch -d "2007-11-12 10:15:30.002Z" ajosey`

117845 Create or update a file called **cathy**; the resulting file has both the last data modification and last  
 117846 data access timestamps set to November 12, 2007 at 10:15:00 local time:

117847 `touch -t 200711121015 cathy`

117848 Create or update a file called **drepper**; the resulting file has both the last data modification and  
 117849 last data access timestamps set to November 12, 2007 at 10:15:30 local time:

117850 touch -t 200711121015.30 drepper

117851 Create or update a file called **ebb9**; the resulting file has both the last data modification and last  
117852 data access timestamps set to November 12, 2007 at 10:15:30 local time:

117853 touch -t 0711121015.30 ebb9

117854 Create or update a file called **eggert**; the resulting file has the last data access timestamp set to  
117855 the corresponding time of the file named **mark** instead of the current time. If the file exists, the  
117856 last data modification time is not changed:

117857 touch -a -r mark eggert

#### 117858 RATIONALE

117859 The functionality of *touch* is described almost entirely through references to functions in the  
117860 System Interfaces volume of POSIX.1-2024. In this way, there is no duplication of effort required  
117861 for describing such side-effects as the relationship of user IDs to the user database, permissions,  
117862 and so on.

117863 There are some significant differences between the *touch* utility in this volume of POSIX.1-2024  
117864 and those in System V and BSD systems. They are upwards-compatible for historical  
117865 applications from both implementations:

- 117866 1. In System V, an ambiguity exists when a pathname that is a decimal number leads the  
117867 operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be  
117868 *touched* to the current time. The **-t** *time* construct solves these problems for future  
117869 conforming applications (note that the **-t** option is not historical practice).
- 117870 2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is  
117871 treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates  
117872 following the Epoch was included as recognition that some implementations are not able  
117873 to represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

117874 The **-r** option was added because several comments requested this capability. This option was  
117875 named **-f** in an early proposal, but was changed because the **-f** option is used in the BSD  
117876 version of *touch* with a different meaning.

117877 At least one historical implementation of *touch* incremented the exit code if **-c** was specified and  
117878 the file did not exist. This volume of POSIX.1-2024 requires exit status zero if no errors occur.

117879 In previous version of the standard, if at least two operands are specified, and the first operand  
117880 is an eight or ten-digit decimal integer, the first operand was assumed to be a *date\_time* operand.  
117881 This usage was removed in this version of the standard since it had been marked obsolescent  
117882 previously.

117883 The **-d** *date\_time* format is an ISO 8601-1:2019 standard complete representation of date and time  
117884 extended format with an optional decimal point or <comma> followed by a string of digits  
117885 following the seconds portion to specify fractions of a second. It is not necessary to recognize  
117886 "[+/-]hh:mm" and "[+/-]hh" to specify timezones other than local time and UTC. The *T*  
117887 time designator in the ISO 8601-1:2019 standard extended format may be replaced by <space>.

#### 117888 FUTURE DIRECTIONS

117889 If this utility is directed to create a new directory entry that contains any bytes that have the  
117890 encoded value of a <newline> character, implementations are encouraged to treat this as an  
117891 error. A future version of this standard may require implementations to treat this as an error.

117892 **SEE ALSO**117893 *date*117894 XBD [Section 4.19](#) (on page 107), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215), [<sys/stat.h>](#)117895 XSH *creat()*, *futimens()*, *time()*117896 **CHANGE HISTORY**

117897 First released in Issue 2.

117898 **Issue 6**117899 The obsolescent *date\_time* operand is removed.

117900 The Open Group Corrigendum U027/1 is applied. This extends the range of valid time past the Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated Universal Time. This is a new requirement on POSIX implementations.

117903 The range for seconds is changed from [00,61] to [00,60] to align with the ISO/IEC 9899:1999 standard, and to allow for positive leap seconds.

117905 **Issue 7**

117906 Austin Group Interpretation 1003.1-2001 #118 is applied.

117907 Austin Group Interpretation 1003.1-2001 #193 is applied, adding support for subsecond timestamps.

117909 SD5-XCU-ERN-45 is applied, adding a new paragraph to the RATIONALE.

117910 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

117911 SD5-XCU-ERN-110 is applied, updating the OPTIONS section.

117912 Changes are made related to support for finegrained timestamps.

117913 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0195 [474] is applied.

117914 **Issue 8**

117915 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of filenames containing any bytes that have the encoded value of a &lt;newline&gt; character.

117917 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

117918 **NAME**

117919 tput — change terminal characteristics

117920 **SYNOPSIS**117921 tput [-T *type*] *operand*...117922 **DESCRIPTION**

117923 The *tput* utility shall display terminal-dependent information. The manner in which this  
 117924 information is retrieved is unspecified. The information displayed shall clear the terminal  
 117925 screen, initialize the user's terminal, or reset the user's terminal, depending on the operand  
 117926 given. The exact consequences of displaying this information are unspecified.

117927 **OPTIONS**117928 The *tput* utility shall conform to XBD [Section 12.2](#) (on page 215).

117929 The following option shall be supported:

117930 **-T *type*** Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 117931 is unset or null, an unspecified default terminal type shall be used. The setting of  
 117932 *type* shall take precedence over the value in *TERM*.

117933 **OPERANDS**

117934 The following strings shall be supported as operands by the implementation in the POSIX locale:

117935 **clear** Display the clear-screen sequence.

117936 **init** Display the sequence that initializes the user's terminal in an implementation-  
 117937 defined manner.

117938 **reset** Display the sequence that resets the user's terminal in an implementation-defined  
 117939 manner.

117940 If a terminal does not support any of the operations described by these operands, this shall not  
 117941 be considered an error condition.

117942 **STDIN**

117943 Not used.

117944 **INPUT FILES**

117945 None.

117946 **ENVIRONMENT VARIABLES**117947 The following environment variables shall affect the execution of *tput*:

117948 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 117949 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 117950 variables used to determine the values of locale categories.)

117951 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 117952 internationalization variables.

117953 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 117954 characters (for example, single-byte as opposed to multi-byte characters in  
 117955 arguments).

117956 **LC\_MESSAGES**

117957 Determine the locale that should be used to affect the format and contents of  
 117958 diagnostic messages written to standard error.

|        |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-----|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 117959 | XSI | <b>NLSPATH</b>                | Determine the location of messages objects and message catalogs.                                                                                                                                                                                                                                                                                                                                              |
| 117960 |     | <b>TERM</b>                   | Determine the terminal type. If this variable is unset or null, and if the <code>-T</code> option is not specified, an unspecified default terminal type shall be used.                                                                                                                                                                                                                                       |
| 117961 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117962 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117963 |     |                               | Default.                                                                                                                                                                                                                                                                                                                                                                                                      |
| 117964 |     | <b>STDOUT</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117965 |     |                               | If standard output is a terminal device, it may be used for writing the appropriate sequence to clear the screen or reset or initialize the terminal. If standard output is not a terminal device, undefined results occur.                                                                                                                                                                                   |
| 117966 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |

| 117985 |     | <b>APPLICATION USAGE</b>      |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117986 |     |                               | The difference between resetting and initializing a terminal is left unspecified, as they vary greatly based on hardware types. In general, resetting is a more severe action.                                                                                                                                                                                                                                |
| 117987 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117988 |     |                               | Some terminals use control characters to perform the stated functions, and on such terminals it might make sense to use <i>tput</i> to store the initialization strings in a file or environment variable for later use. However, because other terminals might rely on system calls to do this work, the standard output cannot be used in a portable manner, such as the following non-portable constructs: |
| 117989 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117990 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117991 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117992 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117993 |     |                               | <code>ClearVar=`tput clear`</code>                                                                                                                                                                                                                                                                                                                                                                            |
| 117994 |     |                               | <code>tput reset   mailx -s "Wake Up" ddg</code>                                                                                                                                                                                                                                                                                                                                                              |
| 117995 |     | <b>EXAMPLES</b>               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117996 |     | 1.                            | Initialize the terminal according to the type of terminal in the environmental variable <i>TERM</i> . This command can be included in a <b>profile</b> file.                                                                                                                                                                                                                                                  |
| 117997 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 117998 |     |                               | <code>tput init</code>                                                                                                                                                                                                                                                                                                                                                                                        |

117999           2. Reset a 450 terminal.  
118000           tput -T 450 reset

#### 118001 RATIONALE

118002           The list of operands was reduced to a minimum for the following reasons:

- 118003           • The only features chosen were those that were likely to be used by human users interacting  
118004           with a terminal.
- 118005           • Specifying the full *terminfo* set was not considered desirable, but the standard developers  
118006           did not want to select among operands.
- 118007           • This volume of POSIX.1-2024 does not attempt to provide applications with sophisticated  
118008           terminal handling capabilities, as that falls outside of its assigned scope and intersects with  
118009           the responsibilities of other standards bodies.

118010           The difference between resetting and initializing a terminal is left unspecified as this varies  
118011           greatly based on hardware types. In general, resetting is a more severe action.

118012           The exit status of 1 is historically reserved for finding out if a Boolean operand is not set.  
118013           Although the operands were reduced to a minimum, the exit status of 1 should still be reserved  
118014           for the Boolean operands, for those sites that wish to support them.

#### 118015 FUTURE DIRECTIONS

118016           None.

#### 118017 SEE ALSO

118018           [stty](#), [tabs](#)

118019           XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 118020 CHANGE HISTORY

118021           First released in Issue 4.

#### 118022 Issue 6

118023           This utility is marked as part of the User Portability Utilities option.

#### 118024 Issue 7

118025           The *tput* utility is moved from the User Portability Utilities option to the Base. User Portability  
118026           Utilities is now an option for interactive utilities.

#### 118027 Issue 8

118028           Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

118029 **NAME**

118030 tr — translate characters

118031 **SYNOPSIS**118032 tr [-c|-C] [-s] *string1 string2*118033 tr -s [-c|-C] *string1*118034 tr -d [-c|-C] *string1*118035 tr -ds [-c|-C] *string1 string2*118036 **DESCRIPTION**

118037 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 118038 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 118039 translations that occur while copying characters and single-character collating elements.

118040 **OPTIONS**118041 The *tr* utility shall conform to XBD [Section 12.2](#) (on page 215).

118042 The following options shall be supported:

118043 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 118044 DESCRIPTION section.

118045 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 118046 DESCRIPTION section.

118047 **-d** Delete all occurrences of input characters that are specified by *string1*.

118048 **-s** Replace instances of repeated characters with a single character, as described in the  
 118049 EXTENDED DESCRIPTION section.

118050 **OPERANDS**

118051 The following operands shall be supported:

118052 *string1, string2*

118053 Translation control strings. Each string shall represent a set of characters to be  
 118054 converted into an array of characters used for the translation. For a detailed  
 118055 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 118056 section.

118057 **STDIN**

118058 The standard input can be any type of file.

118059 **INPUT FILES**

118060 None.

118061 **ENVIRONMENT VARIABLES**118062 The following environment variables shall affect the execution of *tr*:

118063 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 118064 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 118065 variables used to determine the values of locale categories.)

118066 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 118067 internationalization variables.

118068 **LC\_COLLATE**

118069 Determine the locale for the behavior of range expressions and equivalence classes.

- 118070 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and the behavior of character classes.
- 118071
- 118072
- 118073 **LC\_MESSAGES**
- 118074 Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
- 118075
- 118076 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 118077 **ASYNCHRONOUS EVENTS**
- 118078 Default.
- 118079 **STDOUT**
- 118080 The *tr* output shall be identical to the input, with the exception of the specified transformations.
- 118081 **STDERR**
- 118082 The standard error shall be used only for diagnostic messages.
- 118083 **OUTPUT FILES**
- 118084 None.
- 118085 **EXTENDED DESCRIPTION**
- 118086 The operands *string1* and *string2* (if specified) define two arrays of characters. The constructs in the following list can be used to specify characters or single-character collating elements. If any of the constructs result in multi-character collating elements, *tr* shall exclude, without a diagnostic, those multi-character elements from the resulting array.
- 118087
- 118088
- 118089
- 118090 *character* Any character not described by one of the conventions below shall represent itself.
- 118091 *\octal* Octal sequences can be used to represent characters with specific coded values. An octal sequence shall consist of a <backslash> followed by the longest sequence of one, two, or three-octal-digit characters (01234567). The sequence shall cause the value whose encoding is represented by the one, two, or three-digit octal integer to be placed into the array. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.
- 118092
- 118093
- 118094
- 118095
- 118096
- 118097 *\character* The <backslash>-escape sequences in XBD [Table 5-1](#) (on page 113) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be supported. The results of using any other character, other than an octal digit, following the <backslash> are unspecified. Also, if there is no character following the <backslash>, the results are unspecified.
- 118098
- 118099
- 118100
- 118101
- 118102 *c-c* In the POSIX locale, this construct shall represent the range of collating elements between the range endpoints (as long as neither endpoint is an octal sequence of the form *\octal*), inclusive, as defined by the collation sequence. The characters or collating elements in the range shall be placed in the array in ascending collation sequence. If the second endpoint precedes the starting endpoint in the collation sequence, it is unspecified whether the range of collating elements is empty, or this construct is treated as invalid. In locales other than the POSIX locale, this construct has unspecified behavior.
- 118103
- 118104
- 118105
- 118106
- 118107
- 118108
- 118109
- 118110 If either or both of the range endpoints are octal sequences of the form *\octal*, this shall represent the range of specific coded values between the two range endpoints, inclusive.
- 118111
- 118112

| 118120 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 118121 |                        | When both the <code>-d</code> and <code>-s</code> options are specified, any of the character class names shall be accepted in <code>string2</code> . Otherwise, only character class names <b>lower</b> or <b>upper</b> are valid in <code>string2</code> and then only if the corresponding character class ( <b>upper</b> and <b>lower</b> , respectively) is specified in the same relative position in <code>string1</code> . Such a specification shall be interpreted as a request for case conversion. When <code>[:lower:]</code> appears in <code>string1</code> and <code>[:upper:]</code> appears in <code>string2</code> , the arrays shall contain the characters from the <b>toupper</b> mapping in the <code>LC_CTYPE</code> category of the current locale. When <code>[:upper:]</code> appears in <code>string1</code> and <code>[:lower:]</code> appears in <code>string2</code> , the arrays shall contain the characters from the <b>tolower</b> mapping in the <code>LC_CTYPE</code> category of the current locale. The first character from each mapping pair shall be in the array for <code>string1</code> and the second character from each mapping pair shall be in the array for <code>string2</code> in the same relative position. |

| 118142 | <code>[x*n]</code>     | Represents <code>n</code> repeated occurrences of the character <code>x</code> . Because this expression is used to map multiple characters to one, it is only valid when it occurs in <code>string2</code> . If <code>n</code> is omitted or is zero, it shall be interpreted as large enough to extend the <code>string2</code> -based sequence to the length of the <code>string1</code> -based sequence. If <code>n</code> has a leading zero, it shall be interpreted as an octal value. Otherwise, it shall be interpreted as a decimal value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 118153 |                        | • If the <code>-C</code> option is specified, the complements of the characters specified by <code>string1</code> (the set of all characters in the current character set, as defined by the current setting of <code>LC_CTYPE</code> , except for those actually specified in the <code>string1</code> operand) shall be placed in the array in ascending collation sequence, as defined by the current setting of <code>LC_COLLATE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 118154 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 118155 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 118156 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

118157 • If the `-c` option is specified, the complement of the values specified by *string1* shall be  
118158 placed in the array in ascending order by binary value.

118159 • Because the order in which characters specified by character class expressions or  
118160 equivalence class expressions is undefined, such expressions should only be used if the  
118161 intent is to map several characters into one. An exception is case conversion, as described  
118162 previously.

118163 When the `-d` option is specified:

118164 • Input characters found in the array specified by *string1* shall be deleted.

118165 • When the `-C` option is specified with `-d`, all characters except those specified by *string1*  
118166 shall be deleted. The contents of *string2* are ignored, unless the `-s` option is also specified.

118167 • When the `-c` option is specified with `-d`, all values except those specified by *string1* shall  
118168 be deleted. The contents of *string2* shall be ignored, unless the `-s` option is also specified.

118169 • The same string cannot be used for both the `-d` and the `-s` option; when both options are  
118170 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be  
118171 required.

118172 When the `-s` option is specified, after any deletions or translations have taken place, repeated  
118173 sequences of the same character shall be replaced by one occurrence of the same character, if the  
118174 character is found in the array specified by the last operand. If the last operand contains a  
118175 character class, such as the following example:

```
118176 tr -s '[:space:]'
```

118177 the last operand's array shall contain all of the characters in that character class. However, in a  
118178 case conversion, as described previously, such as:

```
118179 tr -s '[:upper:]' '[:lower:]'
```

118180 the last operand's array shall contain only those characters defined as the second characters in  
118181 each of the **toupper** or **tolower** character pairs, as appropriate.

118182 An empty string used for *string1* or *string2* produces undefined results.

### 118183 EXIT STATUS

118184 The following exit values shall be returned:

118185 0 All input was processed successfully.

118186 >0 An error occurred.

### 118187 CONSEQUENCES OF ERRORS

118188 Default.

### 118189 APPLICATION USAGE

118190 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

118191 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must  
118192 use the full three digits to avoid ambiguity.

118193 When *string2* is shorter than *string1*, a difference results between historical System V and BSD  
118194 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible  
118195 to do the following:

```
118196 tr 0123456789 d
```

118197 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in

118198 this volume of POSIX.1-2024, both the BSD and System V behaviors are allowed, but a  
 118199 conforming application cannot rely on the BSD behavior. It would have to code the example in  
 118200 the following way:

```
118201 tr 0123456789 '[d*]'
```

118202 It should be noted that, despite similarities in appearance, the string operands used by *tr* are not  
 118203 regular expressions.

118204 Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL  
 118205 characters in its input stream. NUL characters can be stripped by using:

```
118206 tr -d '\000'
```

#### 118207 EXAMPLES

118208 1. The following example creates a list of all words in **file1** one per line in **file2**, where a  
 118209 word is taken to be a maximal string of letters.

```
118210 tr -cs "[:alpha:]" "[\n*]" <file1 >file2
```

118211 2. The next example translates all lowercase characters in **file1** to uppercase and writes the  
 118212 results to standard output.

```
118213 tr "[:lower:]" "[:upper:]" <file1
```

118214 3. This example uses an equivalence class to identify accented variants of the base character  
 118215 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

```
118216 tr "[=e]" "[e*]" <file1 >file2
```

#### 118217 RATIONALE

118218 In some early proposals, an explicit option `-n` was added to disable the historical behavior of  
 118219 stripping NUL characters from the input. It was considered that automatically stripping NUL  
 118220 characters from the input was not correct functionality. However, the removal of `-n` in a later  
 118221 proposal does not remove the requirement that *tr* correctly process NUL characters in its input  
 118222 stream. NUL characters can be stripped by using `tr -d '\000'`.

118223 Historical implementations of *tr* differ widely in syntax and behavior. For example, the BSD  
 118224 version has not needed the bracket characters for the repetition sequence. The *tr* utility syntax is  
 118225 based more closely on the System V and XPG3 model while attempting to accommodate  
 118226 historical BSD implementations. In the case of the short *string2* padding, the decision was to  
 118227 unspecified the behavior and preserve System V and XPG3 scripts, which might find difficulty  
 118228 with the BSD method. The assumption was made that BSD users of *tr* have to make  
 118229 accommodations to meet the syntax defined here. Since it is possible to use the repetition  
 118230 sequence to duplicate the desired behavior, whereas there is no simple way to achieve the  
 118231 System V method, this was the correct, if not desirable, approach.

118232 The use of octal values to specify control characters, while having historical precedents, is not  
 118233 portable. The introduction of escape sequences for control characters should provide the  
 118234 necessary portability. It is recognized that this may cause some historical scripts to break.

118235 An early proposal included support for multi-character collating elements. It was pointed out  
 118236 that, while *tr* does employ some syntactical elements from REs, the aim of *tr* is quite different;  
 118237 ranges, for example, do not have a similar meaning (`any of the chars in the range matches`,  
 118238 *versus* `translate each character in the range to the output counterpart`). As a result, the  
 118239 previously included support for multi-character collating elements has been removed. What  
 118240 remains are ranges in current collation order (to support, for example, accented characters),  
 118241 character classes, and equivalence classes.

118242 In XPG3 the `[class:]` and `[equiv=]` conventions are shown with double brackets, as in RE syntax.  
 118243 However, *tr* does not implement RE principles; it just borrows part of the syntax. Consequently,  
 118244 `[class:]` and `[equiv=]` should be regarded as syntactical elements on a par with `[x*n]`, which is  
 118245 not an RE bracket expression.

118246 The standard developers will consider changes to *tr* that allow it to translate characters between  
 118247 different character encodings, or they will consider providing a new utility to accomplish this.

118248 On historical System V systems, a range expression requires enclosing square-brackets, such as:

```
118249 tr '[a-z]' '[A-Z]'
```

118250 However, BSD-based systems did not require the brackets, and this convention is used here to  
 118251 avoid breaking large numbers of BSD scripts:

```
118252 tr a-z A-Z
```

118253 The preceding System V script will continue to work because the brackets, treated as regular  
 118254 characters, are translated to themselves. However, any System V script that relied on "a-z"  
 118255 representing the three characters 'a', '-', and 'z' have to be rewritten as "az-".

118256 The ISO POSIX-2:1993 standard had a `-c` option that behaved similarly to the `-C` option, but did  
 118257 not supply functionality equivalent to the `-c` option specified in POSIX.1-2024.

118258 The earlier version also said that octal sequences referred to collating elements and could be  
 118259 placed adjacent to each other to specify multi-byte characters. However, it was noted that this  
 118260 caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were  
 118261 intending to specify multi-byte characters or multiple single byte characters. POSIX.1-2024  
 118262 specifies that octal sequences always refer to single byte binary values when used to specify an  
 118263 endpoint of a range of collating elements.

118264 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
 118265 but this has been modified in this version.

#### 118266 FUTURE DIRECTIONS

118267 None.

#### 118271 CHANGE HISTORY

118272 First released in Issue 2.

#### 118273 Issue 6

118274 The `-C` operand is added, and the description of the `-c` operand is changed to align with the  
 118275 IEEE P1003.2b draft standard.

118276 The normative text is reworded to avoid use of the term “must” for application requirements.

118277 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/31 is applied, removing text describing  
 118278 behavior on systems with bytes consisting of more than eight bits.

118279 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/32 is applied, updating an example in the  
 118280 EXAMPLES section to avoid using unspecified behavior.

118281 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/33 is applied, making a correction to the  
 118282 RATIONALE.

118283 **Issue 7**

118284 SD5-XCU-ERN-30 is applied.

118285 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

118286 Austin Group Interpretation 1003.1-2001 #132 is applied, adding rationale to the `\character`  
118287 construct.

118288 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0145 [325] is applied.

118289 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0196 [663] is applied.

118290 **Issue 8**

118291 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

118292 **NAME**

118293 true — return true value

118294 **SYNOPSIS**

118295 true

118296 **DESCRIPTION**

118297 The *true* utility shall return with exit code zero.

118298 **OPTIONS**

118299 None.

118300 **OPERANDS**

118301 None.

118302 **STDIN**

118303 Not used.

118304 **INPUT FILES**

118305 None.

118306 **ENVIRONMENT VARIABLES**

118307 None.

118308 **ASYNCHRONOUS EVENTS**

118309 Default.

118310 **STDOUT**

118311 Not used.

118312 **STDERR**

118313 Not used.

118314 **OUTPUT FILES**

118315 None.

118316 **EXTENDED DESCRIPTION**

118317 None.

118318 **EXIT STATUS**

118319 Zero.

118320 **CONSEQUENCES OF ERRORS**

118321 None.

118322 **APPLICATION USAGE**

118323 This utility is typically used in shell scripts, as shown in the **EXAMPLES** section.

118324 Although the special built-in utility `:` (*colon*) is similar to *true*, there are some notable differences,  
118325 including:

- 118326 • Whereas *colon* is required to accept, and do nothing with, any number of arguments, *true* is  
118327 only required to accept, and discard, a first argument of "--". Passing any other  
118328 argument(s) to *true* may cause its behavior to differ from that described in this standard.
- 118329 • A non-interactive shell exits when a redirection error occurs with *colon* (unless executed via  
118330 *command*), whereas with *true* it does not.
- 118331 • Variable assignments preceding the command name persist after executing *colon* (unless  
118332 executed via *command*), but not after executing *true*.

- 118333                   • In shell implementations where *true* is not provided as a built-in, using *colon* avoids the  
118334                   overheads associated with executing an external utility.

**118335 EXAMPLES**

118336                   This command is executed forever:

```
118337                   while true  
118338                   do  
118339                    command  
118340                   done
```

**118341 RATIONALE**

118342                   None.

**118343 FUTURE DIRECTIONS**

118344                   None.

**118345 SEE ALSO**

118346                   [Section 2.9](#) (on page 2499), *colon*, *command*, *false*

**118347 CHANGE HISTORY**

118348                   First released in Issue 2.

**118349 Issue 6**

118350                   IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/39 is applied, replacing the terms “None”  
118351                   and “Default” from the STDERR and EXIT STATUS sections, respectively, with terms as defined  
118352                   in [Section 1.4](#) (on page 2462).

**118353 Issue 8**

118354                   Austin Group Defect 1640 is applied, clarifying the differences between *true* and *:* (*colon*).

118355 **NAME**

118356 tsort — topological sort

118357 **SYNOPSIS**118358 tsort [-w] [*file*]118359 **DESCRIPTION**118360 The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
118361 partial ordering of items contained in the input.118362 The application shall ensure that the input consists of pairs of items (non-empty strings)  
118363 separated by one or more <blank> or <newline> characters. It is unspecified whether other  
118364 white-space characters can also be used as separators. Pairs of different items shall indicate  
118365 ordering. Pairs of identical items shall indicate presence, but not ordering.118366 If a cycle is found in the input, diagnostic or warning messages shall be written to standard error  
118367 reporting that there is a cycle and indicating which nodes are in the cycle(s). If the *-w* option is  
118368 specified, these messages shall be diagnostic messages. If a diagnostic message is written, the  
118369 final exit status shall be non-zero.118370 **OPTIONS**118371 The *tsort* utility shall conform to XBD [Section 12.2](#) (on page 215).

118372 The following option shall be supported:

118373 *-w* Set the exit status to the number of cycles found in the input, or to an  
118374 implementation-defined maximum if there are more cycles than that maximum. If  
118375 no cycles are found, the exit status shall be zero unless another error occurs.118376 **OPERANDS**

118377 The following operand shall be supported:

118378 *file* A pathname of a text file to order. If no *file* operand is given, the standard input  
118379 shall be used.118380 **STDIN**118381 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
118382 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
118383 the standard input shall not be used. See the INPUT FILES section.118384 **INPUT FILES**

118385 The input file shall be a text file.

118386 **ENVIRONMENT VARIABLES**118387 The following environment variables shall affect the execution of *tsort*:118388 *LANG* Provide a default value for the internationalization variables that are unset or null.  
118389 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
118390 variables used to determine the values of locale categories.)118391 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
118392 internationalization variables.118393 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
118394 characters (for example, single-byte as opposed to multi-byte characters in  
118395 arguments and input files).118396 *LC\_MESSAGES*118397 Determine the locale that should be used to affect the format and contents of  
118398 diagnostic messages written to standard error.

118399 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

118400 **ASYNCHRONOUS EVENTS**

118401 Default.

118402 **STDOUT**

118403 The standard output shall be a text file consisting of the ordered list of items, with one item per  
118404 line, produced from the partially ordered input.

118405 **STDERR**

118406 The standard error shall be used only for diagnostic and warning messages.

118407 **OUTPUT FILES**

118408 None.

118409 **EXTENDED DESCRIPTION**

118410 None.

118411 **EXIT STATUS**

118412 The following exit values shall be returned:

118413 0 Successful completion.

118414 >0 An error occurred. If the *-w* option is specified and one or more cycles were found in the  
118415 input, the exit status shall be the number of cycles found, or an implementation-defined  
118416 maximum if more cycles than that maximum were found.

118417 **CONSEQUENCES OF ERRORS**

118418 Default.

118419 **APPLICATION USAGE**

118420 The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
118421 lexicographic, but depends on the pairs of items given as input.

118422 **EXAMPLES**

118423 The command:

118424 `tsort <<EOF`  
118425 `a b c c d e`  
118426 `g g`  
118427 `f g e f`  
118428 `h h`  
118429 `EOF`

118430 produces the output:

118431 **a**  
118432 **b**  
118433 **c**  
118434 **d**  
118435 **e**  
118436 **f**  
118437 **g**  
118438 **h**

**118439 RATIONALE**

118440 At the time that the `-w` option was added to this standard, the only known implementation  
118441 reported a maximum of 255 cycles via the exit status. This has the drawback that applications  
118442 cannot distinguish, from the exit status, errors caused by cycles from other errors or (when *tsort*  
118443 is executed from a shell) termination by a signal. Implementations are urged to set the  
118444 implementation-defined maximum number of cycles reported via the exit status to at most 124,  
118445 leaving values above that maximum through 125 for other errors, and leaving values 126 and  
118446 greater to have the special meanings that the shell assigns to them.

**118447 FUTURE DIRECTIONS**

118448 A future version of this standard may require that when the `-w` option is specified, the  
118449 maximum number of cycles reported through the exit status of *tsort* is at most 124 and that exit  
118450 status values greater than 126 are not used by *tsort*.

**118451 SEE ALSO**

118452 XBD [Chapter 8](#) (on page 167)

**118453 CHANGE HISTORY**

118454 First released in Issue 2.

**118455 Issue 6**

118456 The normative text is reworded to avoid use of the term “must” for application requirements.

**118457 Issue 7**

118458 Austin Group Interpretation 1003.1-2001 #092 is applied.

118459 The *tsort* utility is moved from the XSI option to the Base.

118460 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0146 [241] is applied.

**118461 Issue 8**

118462 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

118463 Austin Group Defects 1617 and 1629 are applied, clarifying how *tsort* handles cycles found in the  
118464 input.

118465 Austin Group Defect 1745 is applied, clarifying the input separator characters and the output  
118466 format.

118467 **NAME**118468 `tty` — return user's terminal name118469 **SYNOPSIS**118470 `tty`118471 **DESCRIPTION**

118472 The `tty` utility shall write to the standard output the name of the terminal that is open as  
 118473 standard input. The name that is used shall be equivalent to the string that would be returned by  
 118474 the `ttyname()` function defined in the System Interfaces volume of POSIX.1-2024.

118475 **OPTIONS**118476 The `tty` utility shall conform to XBD [Section 12.2](#) (on page 215).118477 **OPERANDS**

118478 None.

118479 **STDIN**

118480 While no input is read from standard input, standard input shall be examined to determine  
 118481 whether or not it is a terminal, and, if so, to determine the name of the terminal.

118482 **INPUT FILES**

118483 None.

118484 **ENVIRONMENT VARIABLES**118485 The following environment variables shall affect the execution of `tty`:

118486 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 118487 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 118488 variables used to determine the values of locale categories.)

118489 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 118490 internationalization variables.

118491 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 118492 characters (for example, single-byte as opposed to multi-byte characters in  
 118493 arguments).

118494 `LC_MESSAGES`

118495 Determine the locale that should be used to affect the format and contents of  
 118496 diagnostic messages written to standard error and informative messages written to  
 118497 standard output.

118498 `XSI` `NLSPATH` Determine the location of messages objects and message catalogs.

118499 **ASYNCHRONOUS EVENTS**

118500 Default.

118501 **STDOUT**

118502 If standard input is a terminal device, a pathname of the terminal as specified by the `ttyname()`  
 118503 function defined in the System Interfaces volume of POSIX.1-2024 shall be written in the  
 118504 following format:

118505 `"%s\n", <terminal name>`

118506 Otherwise, a message shall be written indicating that standard input is not connected to a  
 118507 terminal. In the POSIX locale, the `tty` utility shall use the format:

118508 `"not a tty\n"`

**118509 STDERR**

118510 The standard error shall be used only for diagnostic messages.

**118511 OUTPUT FILES**

118512 None.

**118513 EXTENDED DESCRIPTION**

118514 None.

**118515 EXIT STATUS**

118516 The following exit values shall be returned:

118517 0 Standard input is a terminal, and the output specified in STDOUT was successfully written  
118518 to standard output.

118519 1 Standard input is not a terminal, and the output specified in STDOUT was successfully  
118520 written to standard output.

118521 >1 An error occurred.

**118522 CONSEQUENCES OF ERRORS**

118523 Default.

**118524 APPLICATION USAGE**

118525 This utility checks the status of the file open as standard input against that of an  
118526 implementation-defined set of files. It is possible that no match can be found, or that the match  
118527 found need not be the same file as that which was opened for standard input (although they are  
118528 the same device).

**118529 EXAMPLES**

118530 None.

**118531 RATIONALE**

118532 None.

**118533 FUTURE DIRECTIONS**

118534 None.

**118535 SEE ALSO**

118536 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**118538 CHANGE HISTORY**

118539 First released in Issue 2.

**118540 Issue 5**

118541 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
118542 as obsolete. This is a clarification and does not change the functionality published in previous  
118543 issues.

**118544 Issue 6**

118545 The obsolescent `-s` option is removed.

**118546 Issue 8**

118547 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

118548 Austin Group Defect 1509 is applied, changing the EXIT STATUS section.

118549 **NAME**

118550            type — write a description of command type

118551 **SYNOPSIS**118552 XSI        type *name*...118553 **DESCRIPTION**118554            The *type* utility shall indicate how each argument would be interpreted if used as a command  
118555            name.118556 **OPTIONS**

118557            None.

118558 **OPERANDS**

118559            The following operand shall be supported:

118560            *name*            A name to be interpreted.118561 **STDIN**

118562            Not used.

118563 **INPUT FILES**

118564            None.

118565 **ENVIRONMENT VARIABLES**118566            The following environment variables shall affect the execution of *type*:118567            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
118568                                (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
118569                                variables used to determine the values of locale categories.)118570            *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
118571                                internationalization variables.118572            *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
118573                                characters (for example, single-byte as opposed to multi-byte characters in  
118574                                arguments).118575            *LC\_MESSAGES*118576                                Determine the locale that should be used to affect the format and contents of  
118577                                diagnostic messages written to standard error.118578            *NLSPATH*     Determine the location of messages objects and message catalogs.118579            *PATH*         Determine the location of *name*, as described in XBD [Chapter 8](#) (on page 167).118580 **ASYNCHRONOUS EVENTS**

118581            Default.

118582 **STDOUT**118583            The standard output of *type* contains information about each operand in an unspecified format.118584            The information provided typically identifies the operand as a shell built-in, function, alias, or  
118585            keyword, and where applicable, may display the operand's pathname.118586 **STDERR**

118587            The standard error shall be used only for diagnostic messages.

118588 **OUTPUT FILES**

118589 None.

118590 **EXTENDED DESCRIPTION**

118591 None.

118592 **EXIT STATUS**

118593 The following exit values shall be returned:

118594 0 Successful completion.

118595 &gt;0 An error occurred.

118596 **CONSEQUENCES OF ERRORS**

118597 Default.

118598 **APPLICATION USAGE**118599 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

118600 Since *type* must be aware of the contents of the current shell execution environment (such as the  
118601 lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
118602 regular built-in. If it is called in a separate utility execution environment, such as one of the  
118603 following:

118604 `nohup type writer`118605 `find . -type f -exec type {} +`

118606 it might not produce accurate results.

118607 **EXAMPLES**

118608 None.

118609 **RATIONALE**

118610 None.

118611 **FUTURE DIRECTIONS**

118612 If this utility is directed to display a pathname that contains any bytes that have the encoded  
118613 value of a <newline> character when <newline> is a terminator or separator in the output  
118614 format being used, implementations are encouraged to treat this as an error. A future version of  
118615 this standard may require implementations to treat this as an error.

118616 **SEE ALSO**118617 [command](#), [hash](#)118618 [XBD Chapter 8](#) (on page 167)118619 **CHANGE HISTORY**

118620 First released in Issue 2.

118621 **Issue 8**118622 Austin Group Defect 248 is applied, changing a command line in the APPLICATION USAGE  
118623 section.

118624 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
118625 directed to display a pathname that contains any bytes that have the encoded value of a  
118626 <newline> character when <newline> is a terminator or separator in the output format being  
118627 used.

118628 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
118629 this utility is required to be intrinsic.

118630

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

118631 **NAME**

118632 ulimit — report or set resource limits

118633 **SYNOPSIS**

118634 ulimit [-H|-S] -a

118635 XSI ulimit [-H|-S] [-c|-d|-f|-n|-s|-t|-v] [*newlimit*]118636 **DESCRIPTION**118637 The *ulimit* utility shall report or set the resource limits in effect in the process in which it is  
118638 executed.118639 Soft limits can be changed by a process to any value that is less than or equal to the hard limit. A  
118640 process can (irreversibly) lower its hard limit to any value that is greater than or equal to the soft  
118641 limit. Only a process with appropriate privileges can raise a hard limit.118642 The value **unlimited** for a resource shall be considered to be larger than any other limit value.  
118643 When a resource has this limit value, the implementation shall not enforce limits on that  
118644 resource. In locales other than the POSIX locale, *ulimit* may support additional non-numeric  
118645 values with the same meaning as **unlimited**.118646 The behavior when resource limits are exceeded shall be as described in the System Interfaces  
118647 volume of POSIX.1-2024 for the *setrlimit()* function.118648 **OPTIONS**118649 The *ulimit* utility shall conform to XBD [Section 12.2](#) (on page 215), except that:

- 118650 • The order in which options other than **-H**, **-S**, and **-a** are specified may be significant.
- 118651 • Conforming applications shall specify each option separately; that is, grouping option  
118652 letters (for example, **-fH**) need not be recognized by all implementations.

118653 The following options shall be supported:

- |        |           |                                                                                                                                                                                                                                                                |
|--------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 118654 | <b>-H</b> | Report hard limit(s) or set only a hard limit.                                                                                                                                                                                                                 |
| 118655 | <b>-S</b> | Report soft limit(s) or set only a soft limit.                                                                                                                                                                                                                 |
| 118656 | <b>-a</b> | Report the limit value for all of the resources named below and for any<br>118657 implementation-specific additional resources.                                                                                                                                |
| 118658 | <b>-c</b> | Report, or set if the <i>newlimit</i> operand is present, the core image size limit(s) in units<br>118659 of 512 bytes. [RLIMIT_CORE]                                                                                                                          |
| 118660 | <b>-d</b> | Report, or set if the <i>newlimit</i> operand is present, the data segment size limit(s) in<br>118661 units of 1 024 bytes. [RLIMIT_DATA]                                                                                                                      |
| 118662 | <b>-f</b> | Report, or set if the <i>newlimit</i> operand is present, the file size limit(s) in units of 512<br>118663 bytes. [RLIMIT_FSIZE]                                                                                                                               |
| 118664 | <b>-n</b> | Report, or set if the <i>newlimit</i> operand is present, the limit(s) on the number of open<br>118665 file descriptors, given as a number one greater than the maximum value that the<br>118666 system assigns to a newly-created descriptor. [RLIMIT_NOFILE] |
| 118667 | <b>-s</b> | Report, or set if the <i>newlimit</i> operand is present, the stack size limit(s) in units of<br>118668 1 024 bytes. [RLIMIT_STACK]                                                                                                                            |
| 118669 | <b>-t</b> | Report, or set if the <i>newlimit</i> operand is present, the per-process CPU time limit(s)<br>118670 in units of seconds. [RLIMIT_CPU]                                                                                                                        |

118671        **-v**            Report, or set if the *newlimit* operand is present, the address space size limit(s) in  
118672                    units of 1 024 bytes. [RLIMIT\_AS]

118673        Where an option description is followed by [RLIMIT\_name] it indicates which resource for the  
118674        *getrlimit()* and *setrlimit()* functions, defined in the System Interfaces volume of POSIX.1-2024,  
118675        the option corresponds to.

118676        If neither the **-H** nor **-S** option is specified:

- 118677            • If the *newlimit* operand is present, it shall be used as the new value for both the hard and  
118678            soft limits.
- 118679            • If the *newlimit* operand is not present, **-S** shall be the default.

118680        If no options other than **-H** or **-S** are specified, the behavior shall be as if the **-f** option was  
118681        (also) specified.

118682        If any option other than **-H** or **-S** is repeated, the behavior is unspecified.

#### 118683 OPERANDS

118684        The following operand shall be supported:

118685        *newlimit*    Either an integer value to use as the new limit(s) for the specified resource, in the  
118686                    units specified in OPTIONS, or a non-numeric string indicating no limit, as  
118687                    described in the DESCRIPTION section. Numerals in the range 0 to the maximum  
118688                    limit value supported by the implementation for any resource shall be syntactically  
118689                    recognized as numeric values.

#### 118690 STDIN

118691        Not used.

#### 118692 INPUT FILES

118693        None.

#### 118694 ENVIRONMENT VARIABLES

118695        The following environment variables shall affect the execution of *ulimit*:

118696        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
118697                    (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
118698                    variables used to determine the values of locale categories.)

118699        *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
118700                    internationalization variables.

118701        *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
118702                    characters (for example, single-byte as opposed to multi-byte characters in  
118703                    arguments).

118704        *LC\_MESSAGES*

118705                    Determine the locale that should be used to affect the format and contents of  
118706                    diagnostic messages written to standard error.

118707        *NLSPATH*    Determine the location of messages objects and message catalogs.

#### 118708 ASYNCHRONOUS EVENTS

118709        Default.

118710 **STDOUT**

118711 The standard output shall be used when no *newlimit* operand is present.

118712 If the **-a** option is specified, the output written for each resource shall consist of one line that  
118713 includes:

- 118714 • A short phrase identifying the resource (for example `file size`).
- 118715 • An indication of the units used for the resource, if the corresponding option description in  
118716 **OPTIONS** specifies the units to be used.
- 118717 • The *ulimit* option used to specify the resource.
- 118718 • The limit value.

118719 The format used within each line is unspecified, except that the format used for the limit value  
118720 shall be as described below for the case where a single limit value is written.

118721 If a single limit value is to be written; that is, the **-a** option is not specified and at most one  
118722 option other than **-H** or **-S** is specified:

- 118723 • If the resource being reported has a numeric limit, the limit value shall be written in the  
118724 following format:

118725 `"%ld\n", <limit value>`

118726 where *<limit value>* is the value of the limit in the units specified in **OPTIONS**.

- 118727 • If the resource being reported does not have a numeric limit, in the POSIX locale the  
118728 following format shall be used:

118729 `"unlimited\n"`

118730 **STDERR**

118731 The standard error shall be used only for diagnostic messages.

118732 **OUTPUT FILES**

118733 None.

118734 **EXTENDED DESCRIPTION**

118735 None.

118736 **EXIT STATUS**

118737 The following exit values shall be returned:

118738 0 Successful completion.

118739 >0 A request for a higher limit was rejected or an error occurred.

118740 **CONSEQUENCES OF ERRORS**

118741 Default.

118742 **APPLICATION USAGE**

118743 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

118744 Since *ulimit* affects the current shell execution environment, it is always provided as a shell  
118745 regular built-in. If it is called with an operand in a separate utility execution environment, such  
118746 as one of the following:

118747 `nohup ulimit -f 10000`

118748 `env ulimit -S -c 10000`

118749 it does not affect the limit(s) in the caller's environment.

118750 See also the APPLICATION USAGE for *getrlimit()*.

#### 118751 EXAMPLES

118752 Set the hard and soft file size limits to 51 200 bytes:

```
118753 ulimit -f 100
```

118754 Save and restore a soft resource limit (where *X* is an option letter specifying a resource):

```
118755 saved=$(ulimit -X)
```

```
118756 ...
```

```
118757 ulimit -X -S "$saved"
```

118758 Execute a utility with a CPU limit of 5 minutes (using an asynchronous subshell to ensure the  
118759 limit is set in a child process):

```
118760 (ulimit -t 300; exec utility_name </dev/null) &  
118761 wait $!
```

#### 118762 RATIONALE

118763 The *ulimit* utility has no equivalent of the special values RLIM\_SAVED\_MAX and  
118764 RLIM\_SAVED\_CUR returned by *getrlimit()*, as *ulimit* is required to be able to output, and accept  
118765 as input, all numeric limit values supported by the system.

118766 Implementations differ in their behavior when the *-a* option is not specified and more than one  
118767 option other than *-H* or *-S* is specified. Some write output for all of the specified resources in  
118768 the same format as for *-a*; others write only the value for the last specified option. Both  
118769 behaviors are allowed by the standard, since the SYNOPSIS lists the options as mutually  
118770 exclusive.

#### 118771 FUTURE DIRECTIONS

118772 None.

#### 118773 SEE ALSO

118774 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

118775 XSH *getrlimit()*

#### 118776 CHANGE HISTORY

118777 First released in Issue 2.

#### 118778 Issue 7

118779 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 118780 Issue 8

118781 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
118782 this utility is required to be intrinsic.

118783 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

118784 Austin Group Defect 1418 is applied, adding the *-H*, *-S*, *-a*, *-c*, *-d*, *-n*, *-s*, *-t*, and *-v* options,  
118785 and relating the *-f* option to the RLIMIT\_FSIZE resource for *setrlimit()*.

118786 Austin Group Defect 1669 is applied, moving the *ulimit* utility, excluding the *-t* option, from the  
118787 XSI option to the Base.

118788 **NAME**

118789 umask — get or set the file mode creation mask

118790 **SYNOPSIS**118791 umask [-S] [*mask*]118792 **DESCRIPTION**

118793 The *umask* utility shall set the file mode creation mask of the current shell execution environment  
 118794 (see [Section 2.13](#), on page 2522) to the value specified by the *mask* operand. This mask shall affect  
 118795 the initial value of the file permission bits of subsequently created files. If *umask* is called in a  
 118796 subshell or separate utility execution environment, such as one of the following:

```
118797 (umask 002)
118798 nohup umask ...
118799 find . -exec umask ... \;
```

118800 it shall not affect the file mode creation mask of the caller's environment.

118801 If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 118802 the file mode creation mask of the invoking process.

118803 **OPTIONS**118804 The *umask* utility shall conform to XBD [Section 12.2](#) (on page 215).

118805 The following option shall be supported:

118806 **-S** Produce symbolic output.

118807 The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 118808 *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

118809 **OPERANDS**

118810 The following operand shall be supported:

118811 *mask* A string specifying the new file mode creation mask. The string is treated in the  
 118812 same way as the *mode* operand described in the EXTENDED DESCRIPTION  
 118813 section for *chmod*.

118814 For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 118815 the logical complement of the file permission bits portion of the file mode specified  
 118816 by the *symbolic\_mode* string.

118817 In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 118818 interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 118819 for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 118820 the indicated permissions to be set in the mask.

118821 The interpretation of *mode* values that specify file mode bits other than the file  
 118822 permission bits is unspecified.

118823 In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 118824 mask.

118825 The file mode creation mask shall be set to the resulting numeric value.

118826 The default output of a prior invocation of *umask* on the same system with no  
 118827 operand also shall be recognized as a *mask* operand.

118828 **STDIN**

118829 Not used.

118830 **INPUT FILES**

118831 None.

118832 **ENVIRONMENT VARIABLES**118833 The following environment variables shall affect the execution of *umask*:

118834 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 118835 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 118836 variables used to determine the values of locale categories.)

118837 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 118838 internationalization variables.

118839 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 118840 characters (for example, single-byte as opposed to multi-byte characters in  
 118841 arguments).

118842 *LC\_MESSAGES*

118843 Determine the locale that should be used to affect the format and contents of  
 118844 diagnostic messages written to standard error.

118845 *XSHELL* *NLSPATH* Determine the location of messages objects and message catalogs.

118846 **ASYNCHRONOUS EVENTS**

118847 Default.

118848 **STDOUT**

118849 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 118850 output that can later be used as a *umask mask* operand.

118851 If *-S* is specified, the message shall be in the following format:

118852 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 118853 <other permissions>

118854 where the three values shall be combinations of letters from the set {*r, w, x*}; the presence of a  
 118855 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

118856 If a *mask* operand is specified, there shall be no output written to standard output.

118857 **STDERR**

118858 The standard error shall be used only for diagnostic messages.

118859 **OUTPUT FILES**

118860 None.

118861 **EXTENDED DESCRIPTION**

118862 None.

118863 **EXIT STATUS**

118864 The following exit values shall be returned:

118865 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

118866 >0 An error occurred.

## 118867 CONSEQUENCES OF ERRORS

118868 Default.

## 118869 APPLICATION USAGE

118870 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.118871 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
118872 regular built-in.118873 In contrast to the negative permission logic provided by the file mode creation mask and the  
118874 octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those  
118875 permissions that are left alone.

## 118876 EXAMPLES

118877 Either of the commands:

118878 `umask a=rX,ug+w`118879 `umask 002`

118880 sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

118881 After setting the mode mask with either of the above commands, the *umask* command can be  
118882 used to write out the current value of the mode mask:118883 `$ umask`118884 **0002**118885 (The output format is unspecified, but historical implementations use the octal integer mode  
118886 format.)118887 `$ umask -S`118888 **u=rwx,g=rwx,o=rX**118889 Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask*  
118890 utility.

118891 Assuming the mode mask is set as above, the command:

118892 `umask g-w`118893 sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits  
118894 cleared.

118895 The command:

118896 `umask -- -w`118897 sets the mode mask so that subsequently created files have all their write bits cleared. Note that  
118898 *mask* operands `-r`, `-w`, `-x` or anything beginning with a <hyphen-minus>, must be preceded by  
118899 `"--"` to keep it from being interpreted as an option.

## 118900 RATIONALE

118901 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
118902 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
118903 of the following:118904 `(umask 002)`118905 `nohup umask ...`118906 `find . -exec umask ... \;`

118907 it does not affect the file mode creation mask of the environment of the caller.

118908 The description of the historical utility was modified to allow it to use the symbolic modes of  
118909 *chmod*. The `-s` option used in early proposals was changed to `-S` because `-s` could be confused  
118910 with a *symbolic\_mode* form of mask referring to the `S_ISUID` and `S_ISGID` bits.

118911 The default output style is unspecified to permit implementors to provide migration to the new  
118912 symbolic style at the time most appropriate to their users. A `-o` flag to force octal mode output  
118913 was omitted because the octal mode may not be sufficient to specify all of the information that  
118914 may be present in the file mode creation mask when more secure file access permission checks  
118915 are implemented.

118916 It has been suggested that trusted systems developers might appreciate ameliorating the  
118917 requirement that the mode mask “affects” the file access permissions, since it seems access  
118918 control lists might replace the mode mask to some degree. The wording has been changed to say  
118919 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
118920 the file access permissions to the description in the System Interfaces volume of POSIX.1-2024.

#### 118921 FUTURE DIRECTIONS

118922 None.

#### 118923 SEE ALSO

118924 [Chapter 2](#) (on page 2472), *chmod*

118925 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

118926 XSH *umask()*

#### 118927 CHANGE HISTORY

118928 First released in Issue 2.

#### 118929 Issue 6

118930 The following new requirements on POSIX implementations derive from alignment with the  
118931 Single UNIX Specification:

- 118932 • The octal mode is supported.

118933 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/34 is applied, making a correction to the  
118934 RATIONALE.

#### 118935 Issue 7

118936 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

118937 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0197 [584] is applied.

#### 118938 Issue 8

118939 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
118940 this utility is required to be intrinsic.

118941 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

118942 **NAME**

118943 unalias — remove alias definitions

118944 **SYNOPSIS**118945 unalias *alias-name*...

118946 unalias -a

118947 **DESCRIPTION**

118948 The *unalias* utility shall remove the definition for each alias name specified. See [Section 2.3.1](#) (on  
 118949 page 2477). The aliases shall be removed from the current shell execution environment; see  
 118950 [Section 2.13](#) (on page 2522).

118951 **OPTIONS**118952 The *unalias* utility shall conform to XBD [Section 12.2](#) (on page 215).

118953 The following option shall be supported:

118954 **-a** Remove all alias definitions from the current shell execution environment.118955 **OPERANDS**

118956 The following operand shall be supported:

118957 *alias-name* The name of an alias to be removed.118958 **STDIN**

118959 Not used.

118960 **INPUT FILES**

118961 None.

118962 **ENVIRONMENT VARIABLES**118963 The following environment variables shall affect the execution of *unalias*:

118964 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 118965 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 118966 variables used to determine the values of locale categories.)

118967 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 118968 internationalization variables.

118969 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 118970 characters (for example, single-byte as opposed to multi-byte characters in  
 118971 arguments).

118972 **LC\_MESSAGES**

118973 Determine the locale that should be used to affect the format and contents of  
 118974 diagnostic messages written to standard error.

118975 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.118976 **ASYNCHRONOUS EVENTS**

118977 Default.

118978 **STDOUT**

118979 Not used.

118980 **STDERR**

118981 The standard error shall be used only for diagnostic messages.

**118982 OUTPUT FILES**

118983 None.

**118984 EXTENDED DESCRIPTION**

118985 None.

**118986 EXIT STATUS**

118987 The following exit values shall be returned:

118988 0 Successful completion.

118989 >0 One of the *alias-name* operands specified did not represent a valid alias definition, or an  
118990 error occurred.

**118991 CONSEQUENCES OF ERRORS**

118992 Default.

**118993 APPLICATION USAGE**

118994 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

118995 Since *unalias* affects the current shell execution environment, it is generally provided as a shell  
118996 regular built-in.

**118997 EXAMPLES**

118998 None.

**118999 RATIONALE**

119000 The *unalias* description is based on that from historical KornShell implementations. Known  
119001 differences exist between that and the C shell. The KornShell version was adopted to be  
119002 consistent with all the other KornShell features in this volume of POSIX.1-2024, such as  
119003 command line editing.

119004 The `-a` option is the equivalent of the *unalias \** form of the C shell and is provided to address  
119005 security concerns about unknown aliases entering the environment of a user (or application)  
119006 through the allowable implementation-defined predefined alias route or as a result of an *ENV*  
119007 file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*  
119008 rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*  
119009 would have to be quoted in case there was an alias for *unalias*.)

**119010 FUTURE DIRECTIONS**

119011 None.

**119012 SEE ALSO**

119013 [Chapter 2](#) (on page 2472), *alias*

119014 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**119015 CHANGE HISTORY**

119016 First released in Issue 4.

**119017 Issue 6**

119018 This utility is marked as part of the User Portability Utilities option.

**119019 Issue 7**

119020 The *unalias* utility is moved from the User Portability Utilities option to the Base. User  
119021 Portability Utilities is now an option for interactive utilities.

119022 **Issue 8**

119023 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
119024 this utility is required to be intrinsic.

119025 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119026 **NAME**

119027            uname — return system name

119028 **SYNOPSIS**

119029            uname [-amnrsv]

119030 **DESCRIPTION**

119031            By default, the *uname* utility shall write the operating system name to standard output. When  
 119032            options are specified, symbols representing one or more system characteristics shall be written to  
 119033            the standard output. The format and contents of the symbols are implementation-defined. On  
 119034            systems conforming to the System Interfaces volume of POSIX.1-2024, the symbols written shall  
 119035            be those supported by the *uname()* function as defined in the System Interfaces volume of  
 119036            POSIX.1-2024.

119037 **OPTIONS**119038            The *uname* utility shall conform to XBD [Section 12.2](#) (on page 215).

119039            The following options shall be supported:

- 119040            **-a**            Behave as though all of the options **-mnrsv** were specified.
- 119041            **-m**            Write the name of the hardware type on which the system is running to standard  
 119042            output.
- 119043            **-n**            Write the name of this node within an implementation-defined communications  
 119044            network.
- 119045            **-r**            Write the current release level of the operating system implementation.
- 119046            **-s**            Write the name of the implementation of the operating system.
- 119047            **-v**            Write the current version level of this release of the operating system  
 119048            implementation.

119049            If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
 119050            option had been specified.

119051 **OPERANDS**

119052            None.

119053 **STDIN**

119054            Not used.

119055 **INPUT FILES**

119056            None.

119057 **ENVIRONMENT VARIABLES**119058            The following environment variables shall affect the execution of *uname*:

- 119059            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 119060            (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 119061            variables used to determine the values of locale categories.)
- 119062            **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
 119063            internationalization variables.
- 119064            **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
 119065            characters (for example, single-byte as opposed to multi-byte characters in  
 119066            arguments).

119067 **LC\_MESSAGES**  
119068 Determine the locale that should be used to affect the format and contents of  
119069 diagnostic messages written to standard error.

119070 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

119071 **ASYNCHRONOUS EVENTS**  
119072 Default.

119073 **STDOUT**  
119074 By default, the output shall be a single line of the following form:  
119075 "%s\n", <sysname>  
119076 If the **-a** option is specified, the output shall be a single line of the following form:  
119077 "%s %s %s %s %s\n", <sysname>, <nodename>, <release>,  
119078 <version>, <machine>  
119079 Additional implementation-defined symbols may be written; all such symbols shall be written at  
119080 the end of the line of output before the <newline>.  
119081 If options are specified to select different combinations of the symbols, only those symbols shall  
119082 be written, in the order shown above for the **-a** option. If a symbol is not selected for writing, its  
119083 corresponding trailing <blank> characters also shall not be written.

119084 **STDERR**  
119085 The standard error shall be used only for diagnostic messages.

119086 **OUTPUT FILES**  
119087 None.

119088 **EXTENDED DESCRIPTION**  
119089 None.

119090 **EXIT STATUS**  
119091 The following exit values shall be returned:  
119092 0 The requested information was successfully written.  
119093 >0 An error occurred.

119094 **CONSEQUENCES OF ERRORS**  
119095 Default.

119096 **APPLICATION USAGE**  
119097 Note that any of the symbols could include embedded <space> characters, which may affect  
119098 parsing algorithms if multiple options are selected for output.  
119099 The node name is typically a name that the system uses to identify itself for inter-system  
119100 communication addressing.

119101 **EXAMPLES**  
119102 The following command:  
119103 `uname -sr`  
119104 writes the operating system name and release level, separated by one or more <blank>  
119105 characters.

119106 **RATIONALE**

119107 It was suggested that this utility cannot be used portably since the format of the symbols is  
119108 implementation-defined. The POSIX.1 working group could not achieve consensus on defining  
119109 these formats in the underlying *uname()* function, and there was no expectation that this volume  
119110 of POSIX.1-2024 would be any more successful. Some applications may still find this historical  
119111 utility of value. For example, the symbols could be used for system log entries or for comparison  
119112 with operator or user input.

119113 **FUTURE DIRECTIONS**

119114 None.

119115 **SEE ALSO**

119116 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

119117 XSH *uname()*

119118 **CHANGE HISTORY**

119119 First released in Issue 2.

119120 **Issue 8**

119121 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119122 **NAME**

119123 uncompress — expand compressed data

119124 **SYNOPSIS**

119125 XSI `uncompress [-cfv] [file...]`

119126 **DESCRIPTION**

119127 Refer to *compress*.

119128 **NAME**

119129 unexpand — convert spaces to tabs

119130 **SYNOPSIS**119131 unexpand [-a|-t *tablist*] [*file...*]119132 **DESCRIPTION**

119133 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>  
 119134 characters at the beginning of each line into the maximum number of <tab> characters followed  
 119135 by the minimum number of <space> characters needed to fill the same column positions  
 119136 originally filled by the translated <blank> characters. By default, tabstops shall be set at every  
 119137 eighth column position. Each <backspace> shall be copied to the output, and shall cause the  
 119138 column position count for tab calculations to be decremented; the count shall never be  
 119139 decremented to a value less than one.

119140 **OPTIONS**119141 The *unexpand* utility shall conform to XBD [Section 12.2](#) (on page 215).

119142 The following options shall be supported:

119143 **-a** In addition to translating <blank> characters at the beginning of each line,  
 119144 translate all sequences of two or more <blank> characters immediately preceding a  
 119145 tab stop to the maximum number of <tab> characters followed by the minimum  
 119146 number of <space> characters needed to fill the same column positions originally  
 119147 filled by the translated <blank> characters.

119148 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 119149 is a single argument consisting of a single positive decimal integer or multiple  
 119150 positive decimal integers, separated by <blank> or <comma> characters, in  
 119151 ascending order. If a single number is given, tabs shall be set *tablist* column  
 119152 positions apart instead of the default 8. If multiple numbers are given, the tabs  
 119153 shall be set at those specific column positions.

119154 The application shall ensure that each tab-stop position *N* is an integer value  
 119155 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 119156 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 119157 next character output to be in the (*N*+1)th column position on that line. When the  
 119158 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 119159 (except for the interaction with **-a**, described below).

119160 No <space>-to-<tab> conversions shall occur for characters at positions beyond  
 119161 the last of those specified in a multiple tab-stop list.

119162 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 119163 conversion shall not be limited to the processing of leading <blank> characters.

119164 **OPERANDS**

119165 The following operand shall be supported:

119166 *file* A pathname of a text file to be used as input.119167 **STDIN**

119168 See the INPUT FILES section.

119169 **INPUT FILES**

119170 The input files shall be text files.

119171 **ENVIRONMENT VARIABLES**

119172 The following environment variables shall affect the execution of *unexpand*:

119173 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 119174 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 119175 variables used to determine the values of locale categories.)

119176 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 119177 internationalization variables.

119178 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 119179 characters (for example, single-byte as opposed to multi-byte characters in  
 119180 arguments and input files), the processing of <tab> and <space> characters, and  
 119181 for the determination of the width in column positions each character would  
 119182 occupy on an output device.

119183 *LC\_MESSAGES*

119184 Determine the locale that should be used to affect the format and contents of  
 119185 diagnostic messages written to standard error.

119186 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

119187 **ASYNCHRONOUS EVENTS**

119188 Default.

119189 **STDOUT**

119190 The standard output shall be equivalent to the input files with the specified <space>-to-<tab>  
 119191 conversions.

119192 **STDERR**

119193 The standard error shall be used only for diagnostic messages.

119194 **OUTPUT FILES**

119195 None.

119196 **EXTENDED DESCRIPTION**

119197 None.

119198 **EXIT STATUS**

119199 The following exit values shall be returned:

119200 0 Successful completion.

119201 >0 An error occurred.

119202 **CONSEQUENCES OF ERRORS**

119203 Default.

119204 **APPLICATION USAGE**

119205 One non-intuitive aspect of *unexpand* is its restriction to leading <space> characters when neither  
 119206 *-a* nor *-t* is specified. Users who always want to convert all <space> characters in a file can  
 119207 easily alias *unexpand* to use the *-a* or *-t 8* option.

119208 **EXAMPLES**

119209 None.

119210 **RATIONALE**

119211 On several occasions, consideration was given to adding a *-t* option to the *unexpand* utility to  
 119212 complement the *-t* in *expand* (see *expand*). The historical intent of *unexpand* was to translate  
 119213 multiple <blank> characters into tab stops, where tab stops were a multiple of eight column

119214 positions on most UNIX systems. An early proposal omitted `-t` because it seemed outside the  
119215 scope of the User Portability Utilities option; it was not described in any of the base documents  
119216 for IEEE Std 1003.2-1992. However, hard-coding tab stops every eight columns was not suitable  
119217 for the international community and broke historical precedents for some vendors in the  
119218 FORTRAN community, so `-t` was restored in conjunction with the list of valid extension  
119219 categories considered by the standard developers. Thus, *unexpand* is now the logical converse of  
119220 *expand*.

#### 119221 **FUTURE DIRECTIONS**

119222 None.

#### 119223 **SEE ALSO**

119224 *expand*, *tabs*

119225 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 119226 **CHANGE HISTORY**

119227 First released in Issue 4.

#### 119228 **Issue 6**

119229 This utility is marked as part of the User Portability Utilities option.

119230 The definition of the `LC_CTYPE` environment variable is changed to align with the  
119231 IEEE P1003.2b draft standard.

119232 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 119233 **Issue 7**

119234 The *unexpand* utility is moved from the User Portability Utilities option to the Base. User  
119235 Portability Utilities is now an option for interactive utilities.

119236 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

119237 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0198 [885] is applied.

#### 119238 **Issue 8**

119239 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

119240 **NAME**119241 unget — undo a previous get of an SCCS file (**DEVELOPMENT**)119242 **SYNOPSIS**119243 XSI unget [-ns] [-r *SID*] *file...*119244 **DESCRIPTION**119245 The *unget* utility shall reverse the effect of a *get -e* done prior to creating the intended new delta.119246 **OPTIONS**119247 The *unget* utility shall conform to XBD [Section 12.2](#) (on page 215).

119248 The following options shall be supported:

119249 **-r** *SID* Uniquely identify which delta is no longer intended. (This would have been  
 119250 specified by *get* as the new delta.) The use of this option is necessary only if two or  
 119251 more outstanding *get* commands for editing on the same SCCS file were done by  
 119252 the same person (login name).

119253 **-s** Suppress the writing to standard output of the intended delta's *SID*.

119254 **-n** Retain the file that was obtained by *get*, which would normally be removed from  
 119255 the current directory.

119256 **OPERANDS**

119257 The following operands shall be supported:

119258 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *unget*  
 119259 utility shall behave as though each file in the directory were specified as a named  
 119260 file, except that non-SCCS files (last component of the pathname does not begin  
 119261 with **s**.) and unreadable files shall be silently ignored.

119262 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 119263 each line of the standard input shall be taken to be the name of an SCCS file to be  
 119264 processed. Non-SCCS files and unreadable files shall be silently ignored.

119265 **STDIN**

119266 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 119267 line of the text file shall be interpreted as an SCCS pathname.

119268 **INPUT FILES**

119269 Any SCCS files processed shall be files of an unspecified format.

119270 **ENVIRONMENT VARIABLES**119271 The following environment variables shall affect the execution of *unget*:

119272 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 119273 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 119274 variables used to determine the values of locale categories.)

119275 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 119276 internationalization variables.

119277 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 119278 characters (for example, single-byte as opposed to multi-byte characters in  
 119279 arguments and input files).

119280 **LC\_MESSAGES**

119281 Determine the locale that should be used to affect the format and contents of  
 119282 diagnostic messages written to standard error.

- 119283 *NLSPATH* Determine the location of messages objects and message catalogs.
- 119284 **ASYNCHRONOUS EVENTS**
- 119285 Default.
- 119286 **STDOUT**
- 119287 The standard output shall consist of a line for each file, in the following format:
- 119288 "%s\n", <*SID removed from file*>
- 119289 If there is more than one named file or if a directory or standard input is named, each pathname shall be written before each of the preceding lines:
- 119291 "\n%s:\n", <*pathname*>
- 119292 **STDERR**
- 119293 The standard error shall be used only for diagnostic messages.
- 119294 **OUTPUT FILES**
- 119295 Any SCCS files updated shall be files of an unspecified format. During processing of a *file*, a locking *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and deleted. The *p-file* and *g-file*, as described in *get*, shall be deleted.
- 119298 **EXTENDED DESCRIPTION**
- 119299 None.
- 119300 **EXIT STATUS**
- 119301 The following exit values shall be returned:
- 119302 0 Successful completion.
- 119303 >0 An error occurred.
- 119304 **CONSEQUENCES OF ERRORS**
- 119305 Default.
- 119306 **APPLICATION USAGE**
- 119307 None.
- 119308 **EXAMPLES**
- 119309 None.
- 119310 **RATIONALE**
- 119311 None.
- 119312 **FUTURE DIRECTIONS**
- 119313 If this utility is directed to create a new directory entry that contains any bytes that have the encoded value of a <newline> character, implementations are encouraged to treat this as an error. A future version of this standard may require implementations to treat this as an error.
- 119316 **SEE ALSO**
- 119317 *delta*, *get*, *sact*
- 119318 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)
- 119319 **CHANGE HISTORY**
- 119320 First released in Issue 2.

119321 **Issue 6**

119322 The normative text is reworded to avoid use of the term “must” for application requirements.

119323 **Issue 7**

119324 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

119325 **Issue 8**

119326 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
119327 filenames containing any bytes that have the encoded value of a <newline> character.

119328 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119329 **NAME**

119330            `uniq` — report or filter out repeated lines in a file

119331 **SYNOPSIS**

119332            `uniq [-c|-d|-u] [-f fields] [-s char] [input_file [output_file]]`

119333 **DESCRIPTION**

119334            The *uniq* utility shall read an input file comparing adjacent lines, and write one copy of each  
 119335            input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 119336            not be written. The trailing <newline> of each line in the input shall be ignored when doing  
 119337            comparisons.

119338            Repeated lines in the input shall not be detected if they are not adjacent.

119339 **OPTIONS**

119340            The *uniq* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
 119341            recognized as an option delimiter as well as '-'.

119342            The following options shall be supported:

119343            **-c**            Precede each output line with a count of the number of times the line occurred in  
 119344            the input.

119345            **-d**            Suppress the writing of lines that are not repeated in the input.

119346            **-f *fields***       Ignore the first *fields* fields on each input line when doing comparisons, where  
 119347            *fields* is a positive decimal integer. A field is the maximal string matched by the  
 119348            basic regular expression:

119349            `[[:blank:]]*^[[:blank:]]*`

119350            If the *fields* option-argument specifies more fields than appear on an input line, a  
 119351            null string shall be used for comparison.

119352            **-s *chars***       Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 119353            positive decimal integer. If specified in conjunction with the **-f** option, the first  
 119354            *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 119355            argument specifies more characters than remain on an input line, a null string shall  
 119356            be used for comparison.

119357            **-u**            Suppress the writing of lines that are repeated in the input.

119358 **OPERANDS**

119359            The following operands shall be supported:

119360            *input\_file*       A pathname of the input file. If the *input\_file* operand is not specified, or if the  
 119361            *input\_file* is '-', the standard input shall be used.

119362            *output\_file*       A pathname of the output file. If the *output\_file* operand is not specified, the  
 119363            standard output shall be used. The results are unspecified if the file named by  
 119364            *output\_file* is the file named by *input\_file*.

119365 **STDIN**

119366            The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is '-'.

119367            See the INPUT FILES section.

119368 **INPUT FILES**

119369            The input file shall be a text file.

119370 **ENVIRONMENT VARIABLES**

119371 The following environment variables shall affect the execution of *unig*:

119372 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 119373 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 119374 variables used to determine the values of locale categories.)

119375 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 119376 internationalization variables.

119377 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 119378 characters (for example, single-byte as opposed to multi-byte characters in  
 119379 arguments and input files) and which characters constitute a <blank> in the  
 119380 current locale.

119381 *LC\_MESSAGES*

119382 Determine the locale that should be used to affect the format and contents of  
 119383 diagnostic messages written to standard error.

119384 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

119385 **ASYNCHRONOUS EVENTS**

119386 Default.

119387 **STDOUT**

119388 The standard output shall be used if no *output\_file* operand is specified, and shall be used if the  
 119389 *output\_file* operand is '-' and the implementation treats the '-' as meaning standard output.  
 119390 Otherwise, the standard output shall not be used. See the OUTPUT FILES section.

119391 **STDERR**

119392 The standard error shall be used only for diagnostic messages.

119393 **OUTPUT FILES**

119394 If the *-c* option is specified, the output file shall be empty or each line shall be of the form:

119395 "%d %s", <number of duplicates>, <line>

119396 otherwise, the output file shall be empty or each line shall be of the form:

119397 "%s", <line>

119398 **EXTENDED DESCRIPTION**

119399 None.

119400 **EXIT STATUS**

119401 The following exit values shall be returned:

119402 0 Successful completion.

119403 >0 An error occurred.

119404 **CONSEQUENCES OF ERRORS**

119405 Default.

119406 **APPLICATION USAGE**

119407 The *sort* utility can be used to cause repeated lines to be adjacent in the input file.

119408 If the collating sequence of the current locale does not have a total ordering of all characters, the  
 119409 behavior of `sort | uniq` differs from `sort -u`, as *uniq* treats lines as duplicates only if they  
 119410 are identical, whereas `sort -u` treats lines as duplicates if they collate equally.

119411 When using *uniq* to process pathnames, it is recommended that `LC_ALL`, or at least `LC_CTYPE`  
 119412 and `LC_COLLATE`, are set to `POSIX` or `C` in the environment, since pathnames can contain byte  
 119413 sequences that do not form valid characters in some locales, in which case the utility's behavior  
 119414 would be undefined. In the `POSIX` locale each byte is a valid single-byte character, and therefore  
 119415 this problem is avoided.

119416 **EXAMPLES**

119417 The following input file data (but flushed left) was used for a test series on *uniq*:

```
119418 #01 foo0 bar0 fool bar1
119419 #02 bar0 fool bar1 fool
119420 #03 foo0 bar0 fool bar1
119421 #04
119422 #05 foo0 bar0 fool bar1
119423 #06 foo0 bar0 fool bar1
119424 #07 bar0 fool bar1 foo0
```

119425 What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options  
 119426 against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the  
 119427 input data as a sequence of strings delimited by `'\n'`. Accordingly, for the *fieldsth* member of  
 119428 the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields+1th*  
 119429 member.

- 119430 1. This first example tests the line counting option, comparing each line of the input file data  
 119431 starting from the second field:

```
119432 uniq -c -f 1 uniq_0I.t
119433     1 #01 foo0 bar0 fool bar1
119434     1 #02 bar0 fool bar1 fool
119435     1 #03 foo0 bar0 fool bar1
119436     1 #04
119437     2 #05 foo0 bar0 fool bar1
119438     1 #07 bar0 fool bar1 foo0
```

119439 The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a  
 119440 pair of repeated lines. Given the input data, this can only be true when *uniq* is run using  
 119441 the `-f 1` option (which shall cause *uniq* to ignore the first field on each input line).

- 119442 2. The second example tests the option to suppress unique lines, comparing each line of the  
 119443 input file data starting from the second field:

```
119444 uniq -d -f 1 uniq_0I.t
119445 #05 foo0 bar0 fool bar1
```

- 119446 3. This test suppresses repeated lines, comparing each line of the input file data starting  
 119447 from the second field:

```
119448 uniq -u -f 1 uniq_0I.t
119449 #01 foo0 bar0 fool bar1
119450 #02 bar0 fool bar1 fool
119451 #03 foo0 bar0 fool bar1
```

119452 #04  
119453 #07 bar0 fool bar1 foo0

119454 4. This suppresses unique lines, comparing each line of the input file data starting from the  
119455 third character:

119456 `uniq -d -s 2 uniq_0I.t`

119457 In the last example, the *uniq* utility found no input matching the above criteria.

#### 119458 RATIONALE

119459 Some historical implementations have limited lines to be 1 080 bytes in length, which does not  
119460 meet the implied {LINE\_MAX} limit.

119461 Earlier versions of this standard allowed the *-number* and *+number* options. These options are no  
119462 longer specified by POSIX.1-2024 but may be present in some implementations.

#### 119463 FUTURE DIRECTIONS

119464 If this utility is directed to create a new directory entry that contains any bytes that have the  
119465 encoded value of a <newline> character, implementations are encouraged to treat this as an  
119466 error. A future version of this standard may require implementations to treat this as an error.

#### 119467 SEE ALSO

119468 *comm*, *sort*

119469 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 119470 CHANGE HISTORY

119471 First released in Issue 2.

#### 119472 Issue 6

119473 The obsolescent SYNOPSIS and associated text are removed.

119474 The normative text is reworded to avoid use of the term “must” for application requirements.

119475 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/40 is applied, adding *LC\_COLLATE* to the  
119476 ENVIRONMENT VARIABLES section, and changing “the application shall ensure that” in the  
119477 OUTPUT FILES section.

#### 119478 Issue 7

119479 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
119480 as an option delimiter in the OPTIONS section.

119481 Austin Group Interpretation 1003.1-2001 #092 is applied.

119482 Austin Group Interpretation 1003.1-2001 #133 is applied, clarifying the behavior of the trailing  
119483 <newline>.

119484 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

119485 SD5-XCU-ERN-141 is applied, updating the EXAMPLES section.

119486 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0199 [963] and XCU/TC2-2008/0200  
119487 [663] are applied.

#### 119488 Issue 8

119489 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
119490 filenames containing any bytes that have the encoded value of a <newline> character.

119491 Austin Group Defect 1070 is applied, changing the APPLICATION USAGE section.

119492 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119493

Austin Group Defect 1492 is applied, changing the EXIT STATUS section.

119494 **NAME**

119495 unlink — call the *unlink()* function

119496 **SYNOPSIS**

119497 XSI unlink *file*

119498 **DESCRIPTION**

119499 The *unlink* utility shall perform the function call:

119500 unlink(*file*);

119501 A user may need appropriate privileges to invoke the *unlink* utility.

119502 **OPTIONS**

119503 None.

119504 **OPERANDS**

119505 The following operands shall be supported:

119506 *file* The pathname of an existing file.

119507 **STDIN**

119508 Not used.

119509 **INPUT FILES**

119510 Not used.

119511 **ENVIRONMENT VARIABLES**

119512 The following environment variables shall affect the execution of *unlink*:

119513 *LANG* Provide a default value for the internationalization variables that are unset or null.  
119514 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
119515 variables used to determine the values of locale categories.)

119516 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
119517 internationalization variables.

119518 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
119519 characters (for example, single-byte as opposed to multi-byte characters in  
119520 arguments).

119521 *LC\_MESSAGES*  
119522 Determine the locale that should be used to affect the format and contents of  
119523 diagnostic messages written to standard error.

119524 *NLSPATH* Determine the location of messages objects and message catalogs.

119525 **ASYNCHRONOUS EVENTS**

119526 Default.

119527 **STDOUT**

119528 None.

119529 **STDERR**

119530 The standard error shall be used only for diagnostic messages.

119531 **OUTPUT FILES**

119532 None.

119533 **EXTENDED DESCRIPTION**

119534 None.

119535 **EXIT STATUS**

119536 The following exit values shall be returned:

119537 0 Successful completion.

119538 &gt;0 An error occurred.

119539 **CONSEQUENCES OF ERRORS**

119540 Default.

119541 **APPLICATION USAGE**

119542 None.

119543 **EXAMPLES**

119544 None.

119545 **RATIONALE**

119546 None.

119547 **FUTURE DIRECTIONS**

119548 None.

119549 **SEE ALSO**119550 *link, rm*119551 XBD [Chapter 8](#) (on page 167)119552 XSH *unlink()*119553 **CHANGE HISTORY**

119554 First released in Issue 5.

119555 **Issue 8**119556 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119557 **NAME**

119558 uucp — system-to-system copy

119559 **SYNOPSIS**119560 UU `uucp [-cCdfjmr] [-n user] source-file... destination-file`119561 **DESCRIPTION**

119562 The *uucp* utility shall copy files named by the *source-file* argument to the *destination-file* argument.  
 119563 The files named can be on local or remote systems.

119564 The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
 119565 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 119566 filenames need not be portable to non-internationalized systems, and so on. Under these  
 119567 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 119568 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
 119569 and that only characters defined in the portable filename character set be used for naming files.  
 119570 The protocol for transfer of files is unspecified by POSIX.1-2024.

119571 Typical implementations of this utility require a communications line configured to use XBD  
 119572 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 119573 there are no available communications means (either temporarily or permanently), this utility  
 119574 shall write an error message describing the problem and exit with a non-zero exit status.

119575 **OPTIONS**119576 The *uucp* utility shall conform to XBD [Section 12.2](#) (on page 215).

119577 The following options shall be supported:

- 119578 **-c** Do not copy local file to the spool directory for transfer to the remote machine  
 119579 (default).
- 119580 **-C** Force the copy of local files to the spool directory for transfer.
- 119581 **-d** Make all necessary directories for the file copy (default).
- 119582 **-f** Do not make intermediate directories for the file copy.
- 119583 **-j** Write the job identification string to standard output. This job identification can be  
 119584 used by *uustat* to obtain the status or terminate a job.
- 119585 **-m** Send mail to the requester when the copy is completed.
- 119586 **-n user** Notify *user* on the remote system that a file was sent.
- 119587 **-r** Do not start the file transfer; just queue the job.

119588 **OPERANDS**

119589 The following operands shall be supported:

119590 *destination-file, source-file*

119591 A pathname of a file to be copied to, or from, respectively. Either name can be a  
 119592 pathname on the local machine, or can have the form:

119593 *system-name!pathname*

119594 where *system-name* is taken from a list of system names that *uucp* knows about.  
 119595 The destination *system-name* can also be a list of names such as:

119596 *system-name!system-name!...!system-name!pathname*

119597 in which case, an attempt is made to send the file via the specified route to the

119598 destination. Care should be taken to ensure that intermediate nodes in the route  
119599 are willing to forward information.

119600 The shell pattern matching notation characters '?', '\*', and "[...]" appearing  
119601 in *pathname* shall be expanded on the appropriate system.

119602 Pathnames can be one of:

- 119603 1. An absolute pathname.
- 119604 2. A pathname preceded by *~user* where *user* is a login name on the specified  
119605 system and is replaced by that user's login directory. Note that if an invalid  
119606 login is specified, the default is to the public directory (called *PUBDIR*; the  
119607 actual location of *PUBDIR* is implementation-defined).
- 119608 3. A pathname preceded by *~/destination* where *destination* is appended to  
119609 *PUBDIR*.

119610 **Note:** This destination is treated as a filename unless more than one file is being  
119611 transferred by this request or the destination is already a directory. To  
119612 ensure that it is a directory, follow the destination with a '/'. For  
119613 example, *~/dan/* as the destination makes the directory **PUBDIR/dan** if it  
119614 does not exist and puts the requested files in that directory.

- 119615 4. Anything else shall be prefixed by the current directory.

119616 If the result is an erroneous pathname for the remote system, the copy shall fail. If  
119617 the *destination-file* is a directory, the last part of the *source-file* name shall be used.

119618 The read, write, and execute permissions given by *uucp* are implementation-  
119619 defined.

#### 119620 STDIN

119621 Not used.

#### 119622 INPUT FILES

119623 The files to be copied are regular files.

#### 119624 ENVIRONMENT VARIABLES

119625 The following environment variables shall affect the execution of *uucp*:

119626 *LANG* Provide a default value for the internationalization variables that are unset or null.  
119627 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
119628 variables used to determine the values of locale categories.)

119629 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
119630 internationalization variables.

#### 119631 *LC\_COLLATE*

119632 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
119633 character collating elements within bracketed filename patterns.

119634 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
119635 characters (for example, single-byte as opposed to multi-byte characters in  
119636 arguments and input files) and the behavior of character classes within bracketed  
119637 filename patterns (for example, "'[:lower:]'\*").

#### 119638 *LC\_MESSAGES*

119639 Determine the locale that should be used to affect the format and contents of  
119640 diagnostic messages written to standard error, and informative messages written  
119641 to standard output.

- 119642 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 119643 **ASYNCHRONOUS EVENTS**
- 119644 Default.
- 119645 **STDOUT**
- 119646 Not used.
- 119647 **STDERR**
- 119648 The standard error shall be used only for diagnostic messages.
- 119649 **OUTPUT FILES**
- 119650 The output files (which may be on other systems) are copies of the input files.
- 119651 If **-m** is used, mail files are modified.
- 119652 **EXTENDED DESCRIPTION**
- 119653 None.
- 119654 **EXIT STATUS**
- 119655 The following exit values shall be returned:
- 119656 0 Successful completion.
- 119657 >0 An error occurred.
- 119658 **CONSEQUENCES OF ERRORS**
- 119659 Default.
- 119660 **APPLICATION USAGE**
- 119661 This utility is part of the UUCP Utilities option and need not be supported by all  
119662 implementations.
- 119663 The domain of remotely accessible files can (and for obvious security reasons usually should) be  
119664 severely restricted.
- 119665 Note that the '!' character in addresses has to be escaped when using *cs*h as a command  
119666 interpreter because of its history substitution syntax. For *ksh* and *sh* the escape is not necessary,  
119667 but may be used.
- 119668 As noted above, shell metacharacters appearing in pathnames are expanded on the appropriate  
119669 system. On an internationalized system, this is done under the control of local settings of  
119670 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
119671 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
119672 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
119673 need not be supported on non-internationalized systems.
- 119674 **EXAMPLES**
- 119675 None.
- 119676 **RATIONALE**
- 119677 None.
- 119678 **FUTURE DIRECTIONS**
- 119679 If this utility is directed to create a new directory entry that contains any bytes that have the  
119680 encoded value of a <newline> character, implementations are encouraged to treat this as an  
119681 error. A future version of this standard may require implementations to treat this as an error.

119682 **SEE ALSO**119683 *mailx, uuencode, uustat, uux*

119684 XBD Chapter 8 (on page 167), Chapter 11 (on page 199), Section 12.2 (on page 215)

119685 **CHANGE HISTORY**

119686 First released in Issue 2.

119687 **Issue 6**119688 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.119689 The UN margin codes and associated shading are removed from the *-C*, *-f*, *-j*, *-n*, and *-r*  
119690 options in response to The Open Group Base Resolution bwg2001-003.119691 **Issue 7**

119692 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

119693 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

119694 **Issue 8**119695 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
119696 filenames containing any bytes that have the encoded value of a <newline> character.119697 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.119698 Austin Group Defect 1516 is applied, adding XSI shading to text relating to *NLSPATH*.

119699 **NAME**

119700 uudecode — decode a binary file

119701 **SYNOPSIS**119702 uudecode [-o *outfile*] [*file*]119703 **DESCRIPTION**

119704 The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 119705 created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 119706 compatible with one of the formats specified in *uuencode*, and determine the pathname for the  
 119707 output file from the *-o* option if given, otherwise from the input data. If the pathname for the  
 119708 output file is either of the magic cookies *-* or */dev/stdout*, *uudecode* shall write the decoded file to  
 119709 standard output, otherwise it shall attempt to create or overwrite the file named by the  
 119710 pathname. The file access permission bits and contents for the file to be produced shall be  
 119711 contained in the input data. The mode bits of the created file (other than standard output) shall  
 119712 be set from the file access permission bits contained in the data; that is, other attributes of the  
 119713 mode, including the file mode creation mask (see *umask*), shall not affect the file being produced.  
 119714 If either of the *op* characters '+' and '-' (see *chmod*) are specified in symbolic mode, the initial  
 119715 mode on which those operations are based is unspecified.

119716 If the pathname of the file resolves to an existing file and the user does not have write  
 119717 permission on that file, *uudecode* shall terminate with an error. If the pathname of the file resolves  
 119718 to an existing file and the user has write permission on that file, the existing file shall be  
 119719 overwritten and, if possible, the mode bits of the file (other than standard output) shall be set as  
 119720 described above; if the mode bits cannot be set, *uudecode* shall not treat this as an error.

119721 If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 119722 than on the target system, the results of *uudecode* are unspecified.

119723 **OPTIONS**119724 The *uudecode* utility shall conform to XBD [Section 12.2](#) (on page 215).

119725 The following option shall be supported by the implementation:

119726 *-o outfile* A pathname of a file that shall be used instead of any pathname contained in the  
 119727 input data. Specifying an *outfile* option-argument of *-* or */dev/stdout* shall indicate  
 119728 standard output.

119729 **OPERANDS**

119730 The following operand shall be supported:

119731 *file* The pathname of a file containing the output of *uuencode*.119732 **STDIN**

119733 See the INPUT FILES section.

119734 **INPUT FILES**119735 The input files shall be files containing the output of *uuencode*.119736 **ENVIRONMENT VARIABLES**119737 The following environment variables shall affect the execution of *uudecode*:

119738 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 119739 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 119740 variables used to determine the values of locale categories.)

119741 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 119742 internationalization variables.

- 119743 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
- 119744
- 119745
- 119746 *LC\_MESSAGES*
- 119747 Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
- 119748
- 119749 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 119750 **ASYNCHRONOUS EVENTS**
- 119751 Default.
- 119752 **STDOUT**
- 119753 If the pathname specified for the output file is `-` or `/dev/stdout`, the standard output shall be in the same format as the file originally encoded by *uuencode*. Otherwise, the standard output shall not be used.
- 119754
- 119755
- 119756 **STDERR**
- 119757 The standard error shall be used only for diagnostic messages.
- 119758 **OUTPUT FILES**
- 119759 The output file shall be in the same format as the file originally encoded by *uuencode*.
- 119760 **EXTENDED DESCRIPTION**
- 119761 None.
- 119762 **EXIT STATUS**
- 119763 The following exit values shall be returned:
- 119764 0 Successful completion.
- 119765 >0 An error occurred.
- 119766 **CONSEQUENCES OF ERRORS**
- 119767 Default.
- 119768 **APPLICATION USAGE**
- 119769 The user who is invoking *uudecode* must have write permission on any file being created.
- 119770 The output of *uuencode* is essentially an encoded bit stream that is not cognizant of byte boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source, if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only data that is meaningful for such a transfer between architectures is generally character data.
- 119771
- 119772
- 119773
- 119774 In order to create an output file named `-`, it needs to be specified using an alternative pathname, for example, `-o ./-`, since `-` alone is considered a magic cookie by *uudecode*. Likewise, in order to write to an output file named `/dev/stdout` it also needs to be specified as, for example, `-o ///dev/stdout`.
- 119775
- 119776
- 119777
- 119778 **EXAMPLES**
- 119779 None.
- 119780 **RATIONALE**
- 119781 Input files are not necessarily text files, as stated by an early proposal. Although the *uuencode* output is a text file, that output could have been wrapped within another file or mail message that is not a text file.
- 119782
- 119783
- 119784 The `-o` option is not historical practice, but was added at the request of WG15 so that the user could override the target pathname without having to edit the input data itself.
- 119785

119786 In early drafts, the `[-o outfile]` option-argument allowed the use of `-` to mean standard output.  
119787 The standard developers did not wish to overload the meaning of `-` in this manner, resulting in  
119788 previous versions only using `/dev/stdout` for this purpose. POSIX.1-2024 now allows it as most  
119789 implementations were already supporting `-` as an extension. The file `/dev/stdout` exists as a  
119790 special file on most modern systems. However, the `/dev/stdout` syntax in *uudecode* does not refer  
119791 to a new file. It is just a magic cookie to specify standard output.

#### 119792 FUTURE DIRECTIONS

119793 If this utility is directed to create a new directory entry that contains any bytes that have the  
119794 encoded value of a `<newline>` character, implementations are encouraged to treat this as an  
119795 error. A future version of this standard may require implementations to treat this as an error.

#### 119799 CHANGE HISTORY

119800 First released in Issue 4.

#### 119801 Issue 6

119802 This utility is marked as part of the User Portability Utilities option.

119803 The `-o outfile` option is added, as specified in the IEEE P1003.2b draft standard.

119804 The normative text is reworded to avoid use of the term “must” for application requirements.

119805 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/35 is applied, clarifying in the  
119806 DESCRIPTION that the initial mode used if either of the *op* characters is '+' or '-' is  
119807 unspecified.

#### 119808 Issue 7

119809 The *uudecode* utility is moved from the User Portability Utilities option to the Base. User  
119810 Portability Utilities is now an option for interactive utilities.

119811 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

119812 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0201 [635] is applied.

#### 119813 Issue 8

119814 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
119815 filenames containing any bytes that have the encoded value of a `<newline>` character.

119816 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

119817 Austin Group Defect 1544 is applied, changing the `-o` option to require that an option-argument  
119818 of `-` is treated as meaning standard output.

119819 **NAME**

119820 uuencode — encode a binary file

119821 **SYNOPSIS**119822 uuencode [-m] [*file*] *decode\_pathname*119823 **DESCRIPTION**

119824 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 119825 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 119826 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 119827 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 119828 another system that conforms to this volume of POSIX.1-2024.

119829 **OPTIONS**119830 The *uuencode* utility shall conform to XBD [Section 12.2](#) (on page 215).

119831 The following option shall be supported by the implementation:

119832 **-m** Encode the output using the MIME Base64 algorithm described in STDOUT. If **-m**  
 119833 is not specified, the historical algorithm described in STDOUT shall be used.

119834 **OPERANDS**

119835 The following operands shall be supported:

119836 *decode\_pathname*

119837 The pathname of the file into which the *uudecode* utility shall place the decoded  
 119838 file. Specifying a *decode\_pathname* operand of **-** or **/dev/stdout** shall indicate that  
 119839 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 119840 are not in the portable filename character set the results are unspecified.

119841 *file* A pathname of the file to be encoded.119842 **STDIN**

119843 See the INPUT FILES section.

119844 **INPUT FILES**

119845 Input files can be files of any type.

119846 **ENVIRONMENT VARIABLES**119847 The following environment variables shall affect the execution of *uuencode*:

119848 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 119849 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 119850 variables used to determine the values of locale categories.)

119851 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 119852 internationalization variables.

119853 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 119854 characters (for example, single-byte as opposed to multi-byte characters in  
 119855 arguments and input files).

119856 **LC\_MESSAGES**

119857 Determine the locale that should be used to affect the format and contents of  
 119858 diagnostic messages written to standard error.

119859 **XSIX** **NLSPATH** Determine the location of messages objects and message catalogs.

119860 **ASYNCHRONOUS EVENTS**

119861 Default.

119862 **STDOUT**

119863 **uuencode Base64 Algorithm**

119864 The standard output shall be a text file (encoded in the character set of the current locale) that  
119865 begins with the line:

119866 "begin-base64Δ%sΔ\n", <mode>, <decode\_pathname>

119867 and ends with the line:

119868 "====\n"

119869 In both cases, the lines shall have no preceding or trailing <blank> characters.

119870 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
119871 characters. Proceeding from left to right, a 24-bit input group shall be formed by concatenating  
119872 three 8-bit input groups. Each 24-bit input group then shall be treated as four concatenated 6-bit  
119873 groups, each of which shall be translated into a single digit in the Base64 alphabet. When  
119874 encoding a bit stream via the Base64 encoding, the bit stream shall be presumed to be ordered  
119875 with the most-significant bit first. That is, the first bit in the stream shall be the high-order bit in  
119876 the first byte, and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit  
119877 group is used as an index into an array of 64 printable characters, as shown in Table 3-22.

119878 **Table 3-22 uuencode Base64 Values**

| Value | Encoding | Value | Encoding | Value | Encoding | Value | Encoding |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 0     | A        | 17    | R        | 34    | i        | 51    | z        |
| 1     | B        | 18    | S        | 35    | j        | 52    | 0        |
| 2     | C        | 19    | T        | 36    | k        | 53    | 1        |
| 3     | D        | 20    | U        | 37    | l        | 54    | 2        |
| 4     | E        | 21    | V        | 38    | m        | 55    | 3        |
| 5     | F        | 22    | W        | 39    | n        | 56    | 4        |
| 6     | G        | 23    | X        | 40    | o        | 57    | 5        |
| 7     | H        | 24    | Y        | 41    | p        | 58    | 6        |
| 8     | I        | 25    | Z        | 42    | q        | 59    | 7        |
| 9     | J        | 26    | a        | 43    | r        | 60    | 8        |
| 10    | K        | 27    | b        | 44    | s        | 61    | 9        |
| 11    | L        | 28    | c        | 45    | t        | 62    | +        |
| 12    | M        | 29    | d        | 46    | u        | 63    | /        |
| 13    | N        | 30    | e        | 47    | v        | (pad) | =        |
| 14    | O        | 31    | f        | 48    | w        |       |          |
| 15    | P        | 32    | g        | 49    | x        |       |          |
| 16    | Q        | 33    | h        | 50    | y        |       |          |

119897 The character referenced by the index shall be placed in the output string.

119898 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
119899 each. All line breaks or other characters not found in the table shall be ignored by decoding  
119900 software (see *uudecode*).

119901 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
119902 or encapsulated part of a message. A full encoding quantum shall always be completed at the

119903 end of a message. When fewer than 24 input bits are available in an input group, zero bits shall  
 119904 be added (on the right) to form an integral number of 6-bit groups. Output character positions  
 119905 that are not required to represent actual input data shall be set to the character '='. Since all  
 119906 Base64 input is an integral number of octets, only the following cases can arise:

- 119907 1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit  
 119908 of encoded output shall be an integral multiple of 4 characters with no '=' padding.
- 119909 2. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded  
 119910 output shall be three characters followed by one '=' padding character.
- 119911 3. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded  
 119912 output shall be two characters followed by two '=' padding characters.

119913 A terminating "====" evaluates to nothing and denotes the end of the encoded data.

### 119914 uuencode Historical Algorithm

119915 The standard output shall be a text file (encoded in the character set of the current locale) that  
 119916 begins with the line:

```
119917 "beginΔ%sΔ%s\n" <mode>, <decode_pathname>
```

119918 and ends with the line:

```
119919 "end\n"
```

119920 In both cases, the lines shall have no preceding or trailing <blank> characters.

119921 The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input  
 119922 and writes four characters of output by splitting the input at six-bit intervals into four octets,  
 119923 containing data in the lower six bits only. These octets shall be converted to characters in the  
 119924 ISO/IEC 646:1991 standard encoded character set by adding a value of 0x20 to each octet, so  
 119925 that each octet is in the range [0x20,0x5f], and then optionally replacing any 0x20 octets with  
 119926 0x60. If necessary, these characters shall then be translated into the corresponding character  
 119927 codes for the codeset in use in the current locale. For example, the octet 0x41, representing 'A',  
 119928 would be translated to 'A' in the current codeset, such as 0xc1 if it were EBCDIC; the octet 0x20,  
 119929 representing <space>, would optionally be replaced with 0x60, representing '`', and then  
 119930 translated to either <space> (0x40 if EBCDIC) or '`' (0x79 if EBCDIC), respectively.

119931 Where the bits of two octets are combined, the least significant bits of the first octet shall be  
 119932 shifted left and combined with the most significant bits of the second octet shifted right. Thus  
 119933 the three octets *A*, *B*, *C* shall be converted into the four octets:

```
119934 0x20 + (( A >> 2 ) & 0x3F)
119935 0x20 + (((A << 4) | ((B >> 4) & 0xF)) & 0x3F)
119936 0x20 + (((B << 2) | ((C >> 6) & 0x3)) & 0x3F)
119937 0x20 + (( C ) & 0x3F)
```

119938 before any replacement of 0x20 with 0x60 and translation into the local character set.

119939 Each encoded line shall contain a length character, equal to the number of characters to be  
 119940 decoded plus 0x20 translated to the local character set as described above, followed by between  
 119941 1 and 45, inclusive, encoded characters. The last encoded line, or the **begin** line if the input is  
 119942 empty, shall be followed by a line containing only a <space> or '`' character before the  
 119943 terminating <newline>.

119944 **STDERR**

119945 The standard error shall be used only for diagnostic messages.

119946 **OUTPUT FILES**

119947 None.

119948 **EXTENDED DESCRIPTION**

119949 None.

119950 **EXIT STATUS**

119951 The following exit values shall be returned:

119952 0 Successful completion.

119953 >0 An error occurred.

119954 **CONSEQUENCES OF ERRORS**

119955 Default.

119956 **APPLICATION USAGE**

119957 The file is expanded by 35 percent (each three octets become four, plus control information)  
119958 causing it to take longer to transmit.

119959 Since this utility is intended to create files to be used for data interchange between systems with  
119960 possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
119961 standard was chosen for a midpoint in the algorithm as a known reference point. The output  
119962 from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
119963 standard codeset, it might not be a text file (at least because the <newline> characters might not  
119964 match), and the goal of creating a text file would be defeated. If this text file was then carried to  
119965 another machine with the same codeset, it would be perfectly compatible with that system's  
119966 *uudecode*. If it was transmitted over a mail system or sent to a machine with a different codeset,  
119967 it is assumed that, as for every other text file, some translation mechanism would convert it (by  
119968 the time it reached a user on the other system) into an appropriate codeset. This translation only  
119969 makes sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
119970 representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
119971 intermixed with other text files in the same codeset.

119972 Since *uudecode* treats a *decode\_pathname* of `-` to mean decode to standard output, in order to  
119973 specify that a file named `-` is to be created, *decode\_pathname* should be specified using an  
119974 alternative pathname, for example `./-`. Likewise, in order to specify that a file with the  
119975 pathname `/dev/stdout` is to be written, *decode\_pathname* should be specified as, for example,  
119976 `///dev/stdout`.

119977 **EXAMPLES**

119978 None.

119979 **RATIONALE**

119980 A new algorithm was added at the request of the international community to parallel work in  
119981 RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
119982 is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
119983 65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
119984 per printable character. (The extra 65th character, `'`, is used to signify a special processing  
119985 function.)

119986 This subset has the important property that it is represented identically in all versions of the  
119987 ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
119988 represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
119989 share this property, which is the reason that a second algorithm was added to the ISO POSIX-2

- 119990 standard.
- 119991 The string "====" was used for the termination instead of the end used in the original format  
119992 because the latter is a string that could be valid encoded input.
- 119993 In an early draft, the `-m` option was named `-b` (for Base64), but it was renamed to reflect its  
119994 relationship to the RFC 2045. A `-u` was also present to invoke the default algorithm, but since  
119995 this was not historical practice, it was omitted as being unnecessary.
- 119996 See the RATIONALE section in *uudecode* for the derivation of the `/dev/stdout` symbol.
- 119997 Historically the encoding used only octets in the range [0x20,0x5f], and thus the encoded lines  
119998 could contain trailing spaces, which were at risk of being stripped by whatever transport  
119999 method was used to send the file. To avoid this problem some implementations use 0x60  
120000 instead of 0x20, resulting in ' ` ' characters instead of spaces in the output, and implementations  
120001 are encouraged to do this.
- 120002 **FUTURE DIRECTIONS**
- 120003 None.
- 120004 **SEE ALSO**
- 120005 *chmod, mailx, uudecode*
- 120006 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)
- 120007 **CHANGE HISTORY**
- 120008 First released in Issue 4.
- 120009 **Issue 6**
- 120010 This utility is marked as part of the User Portability Utilities option.
- 120011 The Base64 algorithm and the ability to output to `/dev/stdout` are added as specified in the  
120012 IEEE P1003.2b draft standard.
- 120013 **Issue 7**
- 120014 The *uuencode* utility is moved from the User Portability Utilities option to the Base. User  
120015 Portability Utilities is now an option for interactive utilities.
- 120016 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

- 120018 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 120019 Austin Group Defect 1140 is applied, changing the description of the *uuencode* historical  
120020 algorithm.
- 120021 Austin Group Defect 1544 is applied, changing the OPERANDS and APPLICATION USAGE  
120022 sections.

120023 **NAME**

120024 uustat — uucp status enquiry and job control

120025 **SYNOPSIS**120026 UU uustat [-q|-k *jobid*|-r *jobid*]120027 uustat [-s *system*] [-u *user*]120028 **DESCRIPTION**120029 The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
120030 provide general status on *uucp* connections to other systems.120031 When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
120032 issued by the current user.120033 Typical implementations of this utility require a communications line configured to use XBD  
120034 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
120035 there are no available communications means (either temporarily or permanently), this utility  
120036 shall write an error message describing the problem and exit with a non-zero exit status.120037 **OPTIONS**120038 The *uustat* utility shall conform to XBD [Section 12.2](#) (on page 215).

120039 The following options shall be supported:

120040 **-q** Write the jobs queued for each machine.120041 **-k *jobid*** Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
120042 that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
120043 has appropriate privileges.120044 **-r *jobid*** Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
120045 modification time is set to the current time. This prevents the cleanup program  
120046 from deleting the job until the jobs modification time reaches the limit imposed by  
120047 the program.120048 **-s *system*** Write the status of all *uucp* requests for remote system *system*.120049 **-u *user*** Write the status of all *uucp* requests issued by *user*.120050 **OPERANDS**

120051 None.

120052 **STDIN**

120053 Not used.

120054 **INPUT FILES**

120055 None.

120056 **ENVIRONMENT VARIABLES**120057 The following environment variables shall affect the execution of *uustat*:120058 **LANG** Provide a default value for the internationalization variables that are unset or null.  
120059 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
120060 variables used to determine the values of locale categories.)120061 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
120062 internationalization variables.

- 120063 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
- 120064
- 120065
- 120066 *LC\_MESSAGES*
- 120067 Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error, and informative messages written to standard output.
- 120068
- 120069
- 120070 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 120071 **ASYNCHRONOUS EVENTS**
- 120072 Default.
- 120073 **STDOUT**
- 120074 The standard output shall consist of information about each job selected, in an unspecified format. The information shall include at least the job ID, the user ID or name, and the remote system name.
- 120075
- 120076
- 120077 **STDERR**
- 120078 The standard error shall be used only for diagnostic messages.
- 120079 **OUTPUT FILES**
- 120080 None.
- 120081 **EXTENDED DESCRIPTION**
- 120082 None.
- 120083 **EXIT STATUS**
- 120084 The following exit values shall be returned:
- 120085 0 Successful completion.
- 120086 >0 An error occurred.
- 120087 **CONSEQUENCES OF ERRORS**
- 120088 Default.
- 120089 **APPLICATION USAGE**
- 120090 This utility is part of the UUCP Utilities option and need not be supported by all implementations.
- 120091
- 120092 **EXAMPLES**
- 120093 None.

- 120101 **CHANGE HISTORY**
- 120102 First released in Issue 2.

120103 **Issue 6**

120104 The normative text is reworded to avoid use of the term “must” for application requirements.

120105 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

120106 The UN margin code and associated shading are removed from the *-q* option in response to The  
120107 Open Group Base Resolution bwg2001-003.

120108 **Issue 7**

120109 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

120110 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

120111 **Issue 8**

120112 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

120113 Austin Group Defect 1516 is applied, adding XSI shading to text relating to *NLSPATH*.

120114 **NAME**

120115 uux — remote command execution

120116 **SYNOPSIS**120117 UU `uux [-jnp] command-string`120118 **DESCRIPTION**

120119 The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 120120 [Section 2.9](#), on page 2499) on a specified system, and then send the standard output of the  
 120121 command to a file on a specified system. Only the first command of a pipeline can have a *system-*  
 120122 *name!* prefix. All other commands in the pipeline shall be executed on the system of the first  
 120123 command.

120124 The following restrictions are applicable to the shell pipeline processed by *uux*:

120125 • In gathering files from different systems, pathname expansion shall not be performed by  
 120126 *uux*. Thus, a request such as:

120127 `uux "c17 remsys!~/*.c"`

120128 would attempt to copy the file named literally `*.c` to the local system.

120129 • The redirection operators "`>>`", "`<<`", "`>|`", and "`>&`" shall not be accepted. Any use of  
 120130 these redirection operators shall cause this utility to write an error message describing the  
 120131 problem and exit with a non-zero exit status.

120132 • The reserved word `!` cannot be used at the head of the pipeline to modify the exit status.  
 120133 (See the *command-string* operand description below.)

120134 • Alias substitution shall not be performed.

120135 A filename can be specified as for *uucp*; it can be an absolute pathname, a pathname preceded by  
 120136 *~name* (which is replaced by the corresponding login directory), a pathname specified as *~/dest*  
 120137 (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 120138 implementation-defined), or a simple filename (which is prefixed by *uux* with the current  
 120139 directory). See *uucp* for the details.

120140 The execution of commands on remote systems shall take place in an execution directory known  
 120141 to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 120142 already reside on that machine. Therefore, the application shall ensure that non-local filenames  
 120143 (without path or machine reference) are unique within the *uux* request.

120144 The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 120145 the application shall ensure that the filename is escaped using parentheses.

120146 The remote system shall notify the user by mail if the requested command on the remote system  
 120147 was disallowed or the files were not accessible. This notification can be turned off by the `-n`  
 120148 option.

120149 Typical implementations of this utility require a communications line configured to use XBD  
 120150 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 120151 there are no available communications means (either temporarily or permanently), this utility  
 120152 shall write an error message describing the problem and exit with a non-zero exit status.

120153 The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 120154 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 120155 filenames need not be portable to non-internationalized systems, and so on. Under these  
 120156 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 120157 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used

120158 and that only characters defined in the portable filename character set be used for naming files.

#### 120159 OPTIONS

120160 The *uux* utility shall conform to XBD [Section 12.2](#) (on page 215).

120161 The following options shall be supported:

120162 **-j** Write the job identification string to standard output. This job identification can be  
120163 used by *uustat* to obtain the status or terminate a job.

120164 **-n** Do not notify the user if the command fails.

120165 **-p** Make the standard input to *uux* the standard input to the *command-string*.

#### 120166 OPERANDS

120167 The following operand shall be supported:

120168 *command-string*

120169 A string made up of one or more arguments that are similar to normal command  
120170 arguments, except that the command and any filenames can be prefixed by *system-*  
120171 *name!*. A null *system-name* shall be interpreted as the local system.

#### 120172 STDIN

120173 The standard input shall not be used unless the **-** or **-p** option is specified; in those cases, the  
120174 standard input shall be made the standard input of the *command-string*.

#### 120175 INPUT FILES

120176 Input files shall be selected according to the contents of *command-string*.

#### 120177 ENVIRONMENT VARIABLES

120178 The following environment variables shall affect the execution of *uux*:

120179 **LANG** Provide a default value for the internationalization variables that are unset or null.  
120180 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
120181 variables used to determine the values of locale categories.)

120182 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
120183 internationalization variables.

120184 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
120185 characters (for example, single-byte as opposed to multi-byte characters in  
120186 arguments).

120187 **LC\_MESSAGES**

120188 Determine the locale that should be used to affect the format and contents of  
120189 diagnostic messages written to standard error.

120190 **XS** **NLSPATH** Determine the location of messages objects and message catalogs.

#### 120191 ASYNCHRONOUS EVENTS

120192 Default.

#### 120193 STDOUT

120194 The standard output shall not be used unless the **-j** option is specified; in that case, the job  
120195 identification string shall be written to standard output in the following format:

120196 "%s\n", <*jobid*>

120197 **STDERR**

120198 The standard error shall be used only for diagnostic messages.

120199 **OUTPUT FILES**

120200 Output files shall be created or written, or both, according to the contents of *command-string*.

120201 If **-n** is not used, mail files shall be modified following any command or file-access failures on  
120202 the remote system.

120203 **EXTENDED DESCRIPTION**

120204 None.

120205 **EXIT STATUS**

120206 The following exit values shall be returned:

120207 0 Successful completion.

120208 >0 An error occurred.

120209 **CONSEQUENCES OF ERRORS**

120210 Default.

120211 **APPLICATION USAGE**

120212 This utility is part of the UUCP Utilities option and need not be supported by all  
120213 implementations.

120214 Note that, for security reasons, many installations limit the list of commands executable on  
120215 behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
120216 via *uux*.

120217 Any characters special to the command interpreter should be quoted either by quoting the entire  
120218 *command-string* or quoting the special characters as individual arguments.

120219 As noted in *uucp*, shell pattern matching notation characters appearing in pathnames are  
120220 expanded on the appropriate local system. This is done under the control of local settings of  
120221 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
120222 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
120223 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
120224 need not be supported on non-internationalized systems.

120225 **EXAMPLES**

120226 1. The following command gets **file1** from system **a** and **file2** from system **b**, executes *diff* on  
120227 the local system, and puts the results in **file.diff** in the local *PUBDIR* directory. (*PUBDIR*  
120228 is the *uucp* public directory on the local system.)

```
120229 uux "!diff a!/usr/file1 b!/a4/file2 >!~/file.diff"
```

120230 2. The following command fails because *uux* places all files copied to a system in the same  
120231 working directory. Although the files **xyz** are from two different systems, their filenames  
120232 are the same and conflict.

```
120233 uux "!diff a!/usr1/xyz b!/usr2/xyz >!~/xyz.diff"
```

120234 3. The following command succeeds (assuming *diff* is permitted on system **a**) because the  
120235 file local to system **a** is not copied to the working directory, and hence does not conflict  
120236 with the file from system **c**.

```
120237 uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"
```

- 120238 **RATIONALE**  
120239 None.

- 120245 **CHANGE HISTORY**  
120246 First released in Issue 2.
- 120247 **Issue 6**  
120248 The obsolescent SYNOPSIS is removed.  
120249 The normative text is reworded to avoid use of the term “must” for application requirements.  
120250 The UN margin code and associated shading are removed from the -j option in response to The  
120251 Open Group Base Resolution bwg2001-003.
- 120252 **Issue 7**  
120253 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.
- 120254 **Issue 8**  
120255 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.  
120256 Austin Group Defect 1516 is applied, adding XSI shading to text relating to *NLSPATH*.

120257 **NAME**120258 val — validate SCCS files (**DEVELOPMENT**)120259 **SYNOPSIS**

```
120260 XSI val -
120261 val [-s] [-m name] [-r SID] [-y type] file...
```

120262 **DESCRIPTION**

120263 The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
 120264 characteristics specified by the options.

120265 **OPTIONS**

120266 The *val* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the usage of the '-'  
 120267 operand is not strictly as intended by the guidelines (that is, reading options and operands from  
 120268 standard input).

120269 The following options shall be supported:

- 120270 **-m name** Specify a *name*, which is compared with the SCCS %M% keyword in *file*; see *get*.
- 120271 **-r SID** Specify a *SID* (SCCS Identification String), an SCCS delta number. A check shall be  
 120272 made to determine whether the *SID* is ambiguous (for example, **-r 1** is ambiguous  
 120273 because it physically does not exist but implies 1.1, 1.2, and so on, which may exist)  
 120274 or invalid (for example, **-r 1.0** or **-r 1.1.0** are invalid because neither case can exist  
 120275 as a valid delta number). If the *SID* is valid and not ambiguous, a check shall be  
 120276 made to determine whether it actually exists.
- 120277 **-s** Silence the diagnostic message normally written to standard output for any error  
 120278 that is detected while processing each named file on a given command line.
- 120279 **-y type** Specify a *type*, which shall be compared with the SCCS %Y% keyword in *file*; see  
 120280 *get*.

120281 **OPERANDS**

120282 The following operands shall be supported:

- 120283 *file* A pathname of an existing SCCS file. If exactly one *file* operand appears, and it is  
 120284 '-', the standard input shall be read: each line shall be independently processed  
 120285 as if it were a command line argument list. (However, the line is not subjected to  
 120286 any of the shell word expansions, such as parameter expansion or quote removal.)

120287 **STDIN**

120288 The standard input shall be a text file used only when the *file* operand is specified as '-'.

120289 **INPUT FILES**

120290 Any SCCS files processed shall be files of an unspecified format.

120291 **ENVIRONMENT VARIABLES**

120292 The following environment variables shall affect the execution of *val*:

- 120293 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 120294 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 120295 variables used to determine the values of locale categories.)
- 120296 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 120297 internationalization variables.

120298 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 120299 characters (for example, single-byte as opposed to multi-byte characters in  
 120300 arguments and input files).

120301 **LC\_MESSAGES**  
 120302 Determine the locale that should be used to affect the format and contents of  
 120303 diagnostic messages written to standard error, and informative messages written  
 120304 to standard output.

120305 **NLSPATH** Determine the location of messages objects and message catalogs.

120306 **ASYNCHRONOUS EVENTS**  
 120307 Default.

120308 **STDOUT**  
 120309 The standard output shall consist of informative messages about either:  
 120310 1. Each file processed  
 120311 2. Each command line read from standard input

120312 If the standard input is not used, for each *file* operand yielding a discrepancy, the output line  
 120313 shall have the following format:  
 120314 "%s: %s\n", <pathname>, <unspecified string>

120315 If the standard input is used, for each input line yielding a discrepancy, the output shall have the  
 120316 following format:  
 120317 "%s\n\n %s: %s\n", <input>, <pathname>, <unspecified string>

120318 where <input> is the input line minus its terminating <newline>.

120319 **STDERR**  
 120320 Not used.

120321 **OUTPUT FILES**  
 120322 None.

120323 **EXTENDED DESCRIPTION**  
 120324 None.

120325 **EXIT STATUS**  
 120326 The 8-bit code returned by *val* shall be a disjunction of the possible errors; that is, it can be  
 120327 interpreted as a bit string where set bits are interpreted as follows:

120328 0x80 = Missing file argument.  
 120329 0x40 = Unknown or duplicate option.  
 120330 0x20 = Corrupted SCCS file.  
 120331 0x10 = Cannot open file or file not SCCS.  
 120332 0x08 = *SID* is invalid or ambiguous.  
 120333 0x04 = *SID* does not exist.  
 120334 0x02 = %Y%, -y mismatch.  
 120335 0x01 = %M%, -m mismatch.

120336 Note that *val* can process two or more files on a given command line and can process multiple  
 120337 command lines (when reading the standard input). In these cases an aggregate code shall be  
 120338 returned: a logical OR of the codes generated for each command line and file processed.

120339 **CONSEQUENCES OF ERRORS**

120340 Default.

120341 **APPLICATION USAGE**

120342 Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it  
 120343 terminated due to a missing file argument or receipt of a signal.

120344 **EXAMPLES**

120345 In a directory with three SCCS files—*s.x* (of *t* type `text`), *s.y*, and *s.z* (a corrupted file)—the  
 120346 following command could produce the output shown:

```
120347 val - <<EOF
120348 -y source s.x
120349 -m y s.y
120350 s.z
120351 EOF
120352 -y source s.x

120353 s.x: %Y%, -y mismatch
120354 s.z
120355 s.z: corrupted SCCS file
```

120356 **RATIONALE**

120357 None.

120358 **FUTURE DIRECTIONS**

120359 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 120360 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
 120361 format being used, implementations are encouraged to treat this as an error. A future version of  
 120362 this standard may require implementations to treat this as an error.

120363 **SEE ALSO**120364 *admin, delta, get, prs*

120365 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

120366 **CHANGE HISTORY**

120367 First released in Issue 2.

120368 **Issue 6**

120369 The Open Group Corrigendum U025/4 is applied, correcting a typographical error in the EXIT  
 120370 STATUS.

120371 **Issue 7**

120372 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

120373 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0147 [416] and XCU/TC1-2008/0148  
 120374 [416] are applied.

120375 **Issue 8**

120376 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
 120377 directed to display a pathname that contains any bytes that have the encoded value of a  
 120378 `<newline>` character when `<newline>` is a terminator or separator in the output format being  
 120379 used.

120380 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

120381 **NAME**

120382 vi — screen-oriented (visual) display editor

120383 **SYNOPSIS**120384 UP `vi [-rR] [-c command] [-t tagstring] [-w size] [file...]`120385 **DESCRIPTION**120386 This utility shall be provided on systems that both support the User Portability Utilities option  
120387 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.120388 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
120389 editor are described in POSIX.1-2024; see the line editor *ex* for additional editing capabilities  
120390 used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex* commands from  
120391 within *vi*.120392 This reference page uses the term *edit buffer* to describe the current working text. No specific  
120393 implementation is implied by this term. All editing changes are performed on the edit buffer,  
120394 and no changes to it shall affect any file until an editor command writes the file.120395 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
120396 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
120397 shall indicate the position within the editing buffer.120398 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
120399 When these commands cannot be supported on such terminals, this condition shall not produce  
120400 an error message such as “not an editor command” or report a syntax error. The implementation  
120401 may either accept the commands and produce results on the screen that are the result of an  
120402 unsuccessful attempt to meet the requirements of this volume of POSIX.1-2024 or report an error  
120403 describing the terminal-related deficiency.120404 **OPTIONS**120405 The *vi* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
120406 recognized as an option delimiter as well as '-'.  
120407 The following options shall be supported:

120407 The following options shall be supported:

120408 `-c command` See the *ex* command description of the `-c` option.120409 `-r` See the *ex* command description of the `-r` option.120410 `-R` See the *ex* command description of the `-R` option.120411 `-t tagstring` See the *ex* command description of the `-t` option.120412 `-w size` See the *ex* command description of the `-w` option.120413 **OPERANDS**120414 See the OPERANDS section of the *ex* command for a description of the operands supported by  
120415 the *vi* command.120416 **STDIN**120417 If standard input is not a terminal device, the results are undefined. The standard input consists  
120418 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.120419 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
120420 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

120421 **INPUT FILES**

120422 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
120423 the *vi* command.

120424 **ENVIRONMENT VARIABLES**

120425 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
120426 that affect the execution of the *vi* command.

120427 **ASYNCHRONOUS EVENTS**

120428 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
120429 execution of the *vi* command.

120430 **STDOUT**

120431 If standard output is not a terminal device, undefined results occur.

120432 Standard output may be used for writing prompts to the user, for informational messages, and  
120433 for writing lines from the file.

120434 **STDERR**

120435 If standard output is not a terminal device, undefined results occur.

120436 The standard error shall be used only for diagnostic messages.

120437 **OUTPUT FILES**

120438 See the OUTPUT FILES section of the *ex* command for a description of the output files  
120439 supported by the *vi* command.

120440 **EXTENDED DESCRIPTION**

120441 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
120442 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
120443 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
120444 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
120445 command mode; other uses of <ESC> are described later in this section; see [Terminate  
120446 Command or Input Mode](#) (on page 3536).

120447 **Initialization in *ex* and *vi***

120448 See [Initialization in \*ex\* and \*vi\*](#) (on page 2842) for a description of *ex* and *vi* initialization for the *vi*  
120449 utility.

120450 **Command Descriptions in *vi***

120451 The following symbols are used in this reference page to represent arguments to commands.

120452 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
120453 see [Command Descriptions in \*ex\*](#) (on page 2852).

120454 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
120455 preceding the command name, they can be specified in either order.

120456 *count* A positive integer used as an optional argument to most commands, either to give a  
120457 repeat count or as a size. This argument is optional and shall default to 1 unless  
120458 otherwise specified.

120459 The Synopsis lines for the *vi* commands <control>-G, <control>-L, <control>-R,  
120460 <control>-], %, &, ^, D, m, M, Q, u, U, and ZZ do not have *count* as an optional  
120461 argument. Regardless, it shall not be an error to specify a *count* to these commands, and  
120462 any specified *count* shall be ignored.

120463 *motion* An optional trailing argument used by the **!**, **<**, **>**, **c**, **d**, and **y** commands, which is used  
 120464 to indicate the region of text that shall be affected by the command. The motion can be  
 120465 either one of the command characters repeated or one of several other *vi* commands  
 120466 (listed in the following table). Each of the applicable commands specifies the region of  
 120467 text matched by repeating the command; each command that can be used as a motion  
 120468 command specifies the region of text it affects.

120469 Commands that take *motion* arguments operate on either lines or characters, depending  
 120470 on the circumstances. When operating on lines, all lines that fall partially or wholly  
 120471 within the text region specified for the command shall be affected. When operating on  
 120472 characters, only the exact characters in the specified text region shall be affected. Each  
 120473 motion command specifies this individually.

120474 When commands that may be motion commands are not used as motion commands,  
 120475 they shall set the current position to the current line and column as specified.

120476 The following commands shall be valid cursor motion commands:

|        |                   |   |    |   |   |   |
|--------|-------------------|---|----|---|---|---|
| 120477 | <apostrophe>      | ( | -  | j | H |   |
| 120478 | <carriage-return> | ) | \$ | k | L |   |
| 120479 | <comma>           | [ | [  | % | l | M |
| 120480 | <control>-H       | ] | ]  | _ | n | N |
| 120481 | <control>-N       | { | ;  | t | T |   |
| 120482 | <control>-P       | } | ?  | w | W |   |
| 120483 | <grave-accent>    | ^ | b  | B |   |   |
| 120484 | <newline>         | + | e  | E |   |   |
| 120485 | <space>           |   | f  | F |   |   |
| 120486 | <zero>            | / | h  | G |   |   |

120487 Any *count* that is specified to a command that has an associated motion command shall  
 120488 be applied to the motion command. If a *count* is applied to both the command and its  
 120489 associated motion command, the effect shall be multiplicative.

120490 The following symbols are used in this section to specify locations in the edit buffer:

120491 *current character*

120492 The character that is currently indicated by the cursor.

120493 *end of a line*

120494 The point located between the last non-<newline> (if any) and the terminating  
 120495 <newline> of a line. For an empty line, this location coincides with the beginning of the  
 120496 line.

120497 *end of the edit buffer*

120498 The location corresponding to the end of the last line in the edit buffer.

120499 The following symbols are used in this section to specify command actions:

120500 *bigword* In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

- 120501 1. A maximal sequence of non-<blank> characters preceded and followed by  
 120502 <blank> characters or the beginning or end of a line or the edit buffer
- 120503 2. One or more sequential blank lines
- 120504 3. The first character in the edit buffer

- 120505 4. The last non-`<newline>` in the edit buffer
- 120506 *word* In the POSIX locale, *vi* shall recognize five kinds of words:
- 120507 1. A maximal sequence of letters, digits, and underscores, delimited at both ends
- 120508 by:
- 120509 — Characters other than letters, digits, or underscores
- 120510 — The beginning or end of a line
- 120511 — The beginning or end of the edit buffer
- 120512 2. A maximal sequence of characters other than letters, digits, underscores, or
- 120513 `<blank>` characters, delimited at both ends by:
- 120514 — A letter, digit, underscore
- 120515 — `<blank>` characters
- 120516 — The beginning or end of a line
- 120517 — The beginning or end of the edit buffer
- 120518 3. One or more sequential blank lines
- 120519 4. The first character in the edit buffer
- 120520 5. The last non-`<newline>` in the edit buffer
- 120521 *section boundary*
- 120522 A *section boundary* is one of the following:
- 120523 1. A line whose first character is a `<form-feed>`
- 120524 2. A line whose first character is an open curly brace (`' { '`)
- 120525 3. A line whose first character is a `<period>` and whose second and third characters
- 120526 match a two-character pair in the **sections** edit option (see *ex*)
- 120527 4. A line whose first character is a `<period>` and whose only other character
- 120528 matches the first character of a two-character pair in the **sections** edit option,
- 120529 where the second character of the two-character pair is a `<space>`
- 120530 5. The first line of the edit buffer
- 120531 6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a
- 120532 `]]` or `}` command; otherwise, the last non-`<newline>` of the last line of the edit
- 120533 buffer
- 120534 *paragraph boundary*
- 120535 A *paragraph boundary* is one of the following:
- 120536 1. A section boundary
- 120537 2. A line whose first character is a `<period>` and whose second and third characters
- 120538 match a two-character pair in the **paragraphs** edit option (see *ex*)
- 120539 3. A line whose first character is a `<period>` and whose only other character
- 120540 matches the first character of a two-character pair in the *paragraphs* edit option,
- 120541 where the second character of the two-character pair is a `<space>`

120542 4. One or more sequential blank lines

120543 *remembered search direction*

120544 See the description of *remembered search direction* in *ex*.

120545 *sentence boundary*

120546 A *sentence boundary* is one of the following:

- 120547 1. A paragraph boundary
- 120548 2. The first non-<blank> that occurs after a paragraph boundary
- 120549 3. The first non-<blank> that occurs after a <period> (' . '), <exclamation-mark>  
120550 (' ! '), or <question-mark> (' ? '), followed by two <space> characters or the end  
120551 of a line; any number of closing parenthesis (' ) '), closing brackets (' ] '),  
120552 double-quote (' " '), or single-quote (<apostrophe>) characters can appear  
120553 between the punctuation mark and the two <space> characters or end-of-line

120554 In the remainder of the description of the *vi* utility, the term “buffer line” refers to a line in the  
120555 edit buffer and the term “display line” refers to the line or lines on the display screen used to  
120556 display one buffer line. The term “current line” refers to a specific “buffer line”.

120557 If there are display lines on the screen for which there are no corresponding buffer lines because  
120558 they correspond to lines that would be after the end of the file, they shall be displayed as a single  
120559 <tilde> (' ~ ') character, plus the terminating <newline>.

120560 The last line of the screen shall be used to report errors or display informational messages. It  
120561 shall also be used to display the input for “line-oriented commands” (*/*, *?*, *:*, and *!*). When a line-  
120562 oriented command is executed, the editor shall enter text input mode on the last line on the  
120563 screen, using the respective command characters as prompt characters. (In the case of the *!*  
120564 command, the associated motion shall be entered by the user before the editor enters text input  
120565 mode.) The line entered by the user shall be terminated by a <newline>, a  
120566 non-<control>-V-escaped <carriage-return>, or unescaped <ESC>. It is unspecified if more  
120567 characters than require a display width minus one column number of screen columns can be  
120568 entered.

120569 If any command is executed that overwrites a portion of the screen other than the last line of the  
120570 screen (for example, the *ex* **suspend** or *!* commands), other than the *ex* **shell** command, the user  
120571 shall be prompted for a character before the screen is refreshed and the edit session continued.

120572 <tab> characters shall take up the number of columns on the screen set by the **tabstop** edit  
120573 option (see *ex*), unless there are less than that number of columns before the display margin that  
120574 will cause the displayed line to be folded; in this case, they shall only take up the number of  
120575 columns up to that boundary.

120576 The cursor shall be placed on the current line and relative to the current column as specified by  
120577 each command described in the following sections.

120578 In open mode, if the current line is not already displayed, then it shall be displayed.

120579 In visual mode, if the current line is not displayed, then the lines that are displayed shall be  
120580 expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be  
120581 displayed. If the screen is redrawn, no more than the number of display lines specified by the  
120582 value of the **window** edit option shall be displayed (unless the current line cannot be completely  
120583 displayed in the number of display lines specified by the **window** edit option) and the current  
120584 line shall be positioned as close to the center of the displayed lines as possible (within the  
120585 constraints imposed by the distance of the line from the beginning or end of the edit buffer). If  
120586 the current line is before the first line in the display and the screen is scrolled, an unspecified

120587 portion of the current line shall be placed on the first line of the display. If the current line is after  
 120588 the last line in the display and the screen is scrolled, an unspecified portion of the current line  
 120589 shall be placed on the last line of the display.

120590 In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into  
 120591 the lines at the bottom of the display that are available for its presentation, the editor may choose  
 120592 not to display any portion of the line. The lines of the display that do not contain text from the  
 120593 edit buffer for this reason shall each consist of a single '@' character.

120594 In visual mode, the editor may choose for unspecified reasons to not update lines in the display  
 120595 to correspond to the underlying edit buffer text. The lines of the display that do not correctly  
 120596 correspond to text from the edit buffer for this reason shall consist of a single '@' character (plus  
 120597 the terminating <newline>), and the <control>-R command shall cause the editor to update the  
 120598 screen to correctly represent the edit buffer.

120599 Open and visual mode commands that set the current column set it to a column position in the  
 120600 display, and not a character position in the line. In this case, however, the column position in the  
 120601 display shall be calculated for an infinite width display; for example, the column related to a  
 120602 character that is part of a line that has been folded onto additional screen lines is offset from the  
 120603 display line column where the buffer line begins, not from the beginning of a particular display  
 120604 line.

120605 The display cursor column in the display is based on the value of the current column, as follows,  
 120606 with each rule applied in turn:

- 120607 1. If the current column is after the last display line column used by the displayed line, the  
 120608 display cursor column shall be set to the last display line column occupied by the last  
 120609 non-<newline> in the current line; otherwise, the display cursor column shall be set to the  
 120610 current column.
- 120611 2. If the character of which some portion is displayed in the display line column specified by  
 120612 the display cursor column requires more than a single display line column:
  - 120613 a. If in text input mode, the display cursor column shall be adjusted to the first  
 120614 display line column in which any portion of that character is displayed.
  - 120615 b. Otherwise, the display cursor column shall be adjusted to the last display line  
 120616 column in which any portion of that character is displayed.

120617 The current column shall not be changed by these adjustments to the display cursor column.

120618 If an error occurs during the parsing or execution of a *vi* command:

- 120619 • The terminal shall be alerted. Execution of the *vi* command shall stop, and the cursor (for  
 120620 example, the current line and column) shall not be further modified.
- 120621 • Unless otherwise specified by the following command sections, it is unspecified whether  
 120622 an informational message shall be displayed.
- 120623 • Any partially entered *vi* command shall be discarded.
- 120624 • If the *vi* command resulted from a **map** expansion, all characters from that **map** expansion  
 120625 shall be discarded, except as otherwise specified by the **map** command (see *ex*).
- 120626 • If the *vi* command resulted from the execution of a buffer, no further commands caused by  
 120627 the execution of the buffer shall be executed.

120628 **Page Backwards**120629 *Synopsis:* [count] <control>-B120630 If in open mode, the <control>-B command shall behave identically to the **z** command.  
120631 Otherwise, if the current line is the first line of the edit buffer, it shall be an error.120632 If the **window** edit option is less than 3, display a screen where the last line of the display shall  
120633 be some portion of:120634 *(current first line) -1*

120635 otherwise, display a screen where the first line of the display shall be some portion of:

120636 *(current first line) - count x ((window edit option) -2)*120637 If this calculation would result in a line that is before the first line of the edit buffer, the first line  
120638 of the display shall display some portion of the first line of the edit buffer.120639 *Current line:* If no lines from the previous display remain on the screen, set to the last line of the  
120640 display; otherwise, set to *(line - the number of new lines displayed on this screen)*.120641 *Current column:* Set to non-<blank>.120642 **Scroll Forward**120643 *Synopsis:* [count] <control>-D

120644 If the current line is the last line of the edit buffer, it shall be an error.

120645 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
120646 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
120647 shall default to the value of the **scroll** edit option.120648 If in open mode, write lines starting with the line after the current line, until *count* lines or the  
120649 last line of the file have been written.120650 *Current line:* If the current line + *count* is past the last line of the edit buffer, set to the last line of  
120651 the edit buffer; otherwise, set to the current line + *count*.120652 *Current column:* Set to non-<blank>.120653 **Scroll Forward by Line**120654 *Synopsis:* [count] <control>-E

120655 Display the line count lines after the last line currently displayed.

120656 If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines  
120657 after the last line currently displayed, the last line of the display shall display some portion of  
120658 the last line of the edit buffer.120659 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
120660 line displayed.120661 *Current column:* Unchanged.

120662 **Page Forward**120663 *Synopsis:* `[count] <control>-F`120664 If in open mode, the `<control>-F` command shall behave identically to the `z` command.  
120665 Otherwise, if the current line is the last line of the edit buffer, it shall be an error.120666 If the **window** edit option is less than 3, display a screen where the first line of the display shall  
120667 be some portion of:120668 `(current last line) +1`

120669 otherwise, display a screen where the first line of the display shall be some portion of:

120670 `(current first line) + count x ((window edit option) -2)`120671 If this calculation would result in a line that is after the last line of the edit buffer, the last line of  
120672 the display shall display some portion of the last line of the edit buffer.120673 *Current line:* If no lines from the previous display remain on the screen, set to the first line of the  
120674 display; otherwise, set to `(line + the number of new lines displayed on this screen)`.120675 *Current column:* Set to non-`<blank>`.120676 **Display Information**120677 *Synopsis:* `<control>-G`120678 This command shall be equivalent to the `ex file` command.120679 **Move Cursor Backwards**120680 *Synopsis:* `[count] <control>-H`120681 `[count] h`120682 the current *erase* character (see `stty`)120683 If there are no characters before the current character on the current line, it shall be an error. If  
120684 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
120685 number of previous characters on the line.

120686 If used as a motion command:

- 120687 1. The text region shall be from the character before the starting cursor up to and including  
120688 the *count*th character before the starting cursor.
- 120689 2. Any text copied to a buffer shall be in character mode.

120690 If not used as a motion command:

120691 *Current line:* Unchanged.120692 *Current column:* Set to `(column - the number of columns occupied by count characters ending  
120693 with the previous current column)`.

120694 **Move Down**

120695 *Synopsis:*    [*count*] <newline>  
 120696            [*count*] <control>-J  
 120697            [*count*] <control>-M  
 120698            [*count*] <control>-N  
 120699            [*count*] j  
 120700            [*count*] <carriage-return>  
 120701            [*count*] +

120702 If there are less than *count* lines after the current line in the edit buffer, it shall be an error.

120703 If used as a motion command:

- 120704     1. The text region shall include the starting line and the next *count* – 1 lines.
- 120705     2. Any text copied to a buffer shall be in line mode.

120706 If not used as a motion command:

120707 *Current line:* Set to *current line*+ *count*.

120708 *Current column:* Set to non-<blank> for the <carriage-return>, <control>-M, and + commands;  
 120709 otherwise, unchanged.

120710 **Clear and Redisplay**

120711 *Synopsis:*    <control>-L

120712 If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay  
 120713 the screen.

120714 *Current line:* Unchanged.

120715 *Current column:* Unchanged.

120716 **Move Up**

120717 *Synopsis:*    [*count*] <control>-P  
 120718            [*count*] k  
 120719            [*count*] –

120720 If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

120721 If used as a motion command:

- 120722     1. The text region shall include the starting line and the previous *count* lines.
- 120723     2. Any text copied to a buffer shall be in line mode.

120724 If not used as a motion command:

120725 *Current line:* Set to *current line* – *count*.

120726 *Current column:* Set to non-<blank> for the – command; otherwise, unchanged.

**120727 Redraw Screen**

120728 *Synopsis:*     <control>-R

120729     If any lines have been deleted from the display screen and flagged as deleted on the terminal  
120730     using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall  
120731     be redisplayed to match the contents of the edit buffer.

120732     It is unspecified whether lines flagged with @ because they do not fit on the terminal display  
120733     shall be affected.

120734     *Current line:* Unchanged.

120735     *Current column:* Unchanged.

**120736 Scroll Backward**

120737 *Synopsis:*     [*count*] <control>-U

120738     If the current line is the first line of the edit buffer, it shall be an error.

120739     If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
120740     or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
120741     shall default to the value of the **scroll** edit option.

120742     *Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line -  
120743     *count*.

120744     *Current column:* Set to non-<blank>.

**120745 Scroll Backward by Line**

120746 *Synopsis:*     [*count*] <control>-Y

120747     Display the line *count* lines before the first line currently displayed.

120748     If the current line is the first line of the edit buffer, it shall be an error. If this calculation would  
120749     result in a line that is before the first line of the edit buffer, the first line of the display shall  
120750     display some portion of the first line of the edit buffer.

120751     *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
120752     line displayed.

120753     *Current column:* Unchanged.

**120754 Edit the Alternate File**

120755 *Synopsis:*     <control>-^

120756     This command shall be equivalent to the *ex edit* command, with the alternate pathname as its  
120757     argument.

120758 **Terminate Command or Input Mode**

120759 *Synopsis:*     <ESC>

120760 If a partial *vi* command (as defined by at least one, non-*count* character) has been entered,  
120761 discard the *count* and the command character(s).

120762 Otherwise, if no command characters have been entered, and the <ESC> was the result of a map  
120763 expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall  
120764 not be an error.

120765 Otherwise, it shall be an error.

120766 *Current line:* Unchanged.

120767 *Current column:* Unchanged.

120768 **Search for tagstring**

120769 *Synopsis:*     <control>-]

120770 If the current character is not a word or <blank>, it shall be an error.

120771 This command shall be equivalent to the *ex tag* command, with the argument to that command  
120772 defined as follows.

120773 If the current character is a <blank>:

- 120774     1. Skip all <blank> characters after the cursor up to the end of the line.
- 120775     2. If the end of the line is reached, it shall be an error.

120776 Then, the argument to the *ex tag* command shall be the current character and all subsequent  
120777 characters, up to the first non-word character or the end of the line.

120778 **Move Cursor Forward**

120779 *Synopsis:*     [*count*] <space>  
120780                [*count*] 1 (ell)

120781 If there are less than *count* non-<newline> characters after the cursor on the current line, *count*  
120782 shall be adjusted to the number of non-<newline> characters after the cursor on the line.

120783 If used as a motion command:

- 120784     1. If the current or *count*th character after the cursor is the last non-<newline> in the line, the  
120785       text region shall be comprised of the current character up to and including the last  
120786       non-<newline> in the line. Otherwise, the text region shall be from the current character  
120787       up to, but not including, the *count*th character after the cursor.
- 120788     2. Any text copied to a buffer shall be in character mode.

120789 If not used as a motion command:

120790 If there are no non-<newline> characters after the current character on the current line, it shall be  
120791 an error.

120792 *Current line:* Unchanged.

120793 *Current column:* Set to the last column that displays any portion of the *count*th character after the  
120794 current character.

120795 **Replace Text with Results from Shell Command**

120796 *Synopsis:* `[count] ! motion shell-commands <newline>`

120797 If the motion command is the `!` command repeated:

- 120798 1. If the edit buffer is empty and no *count* was supplied, the command shall be the  
 120799 equivalent of the `ex :read !` command, with the text input, and no text shall be copied to  
 120800 any buffer.
- 120801 2. Otherwise:
- 120802 a. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be  
 120803 an error.
- 120804 b. The text region shall be from the current line up to and including the next *count* -1  
 120805 lines.

120806 Otherwise, the text region shall be the lines in which any character of the text region specified by  
 120807 the motion command appear.

120808 Any text copied to a buffer shall be in line mode.

120809 This command shall be equivalent to the `ex !` command for the specified lines.

120810 **Move Cursor to End-of-Line**

120811 *Synopsis:* `[count] $`

120812 It shall be an error if there are less than (*count* -1) lines after the current line in the edit buffer.

120813 If used as a motion command:

- 120814 1. If *count* is 1:
- 120815 a. It shall be an error if the line is empty.
- 120816 b. Otherwise, the text region shall consist of all characters from the starting cursor to  
 120817 the last non-`<newline>` in the line, inclusive, and any text copied to a buffer shall  
 120818 be in character mode.
- 120819 2. Otherwise, if the starting cursor position is at or before the first non-`<blank>` in the line,  
 120820 the text region shall consist of the current and the next *count* -1 lines, and any text saved  
 120821 to a buffer shall be in line mode.
- 120822 3. Otherwise, the text region shall consist of all characters from the starting cursor to the last  
 120823 non-`<newline>` in the line that is *count* -1 lines forward from the current line, and any text  
 120824 copied to a buffer shall be in character mode.

120825 If not used as a motion command:

120826 *Current line:* Set to the *current line* + *count* -1.

120827 *Current column:* The current column is set to the last display line column of the last  
 120828 non-`<newline>` in the line, or column position 1 if the line is empty.

120829 The current column shall be adjusted to be on the last display line column of the last  
 120830 non-`<newline>` of the current line as subsequent commands change the current line, until a  
 120831 command changes the current column.

120832       **Move to Matching Character**

120833       *Synopsis:*       %

120834       If the character at the current position is not a parenthesis, bracket, or curly brace, search  
120835       forward in the line to the first one of those characters. If no such character is found, it shall be an  
120836       error.

120837       The matching character shall be the parenthesis, bracket, or curly brace matching the  
120838       parenthesis, bracket, or curly brace, respectively, that was at the current position or that was  
120839       found on the current line.

120840       Matching shall be determined as follows, for an open parenthesis:

- 120841           1. Set a counter to 1.
- 120842           2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.
- 120843           3. If the end of the edit buffer is reached, it shall be an error.
- 120844           4. If an open parenthesis is found, increment the counter by 1.
- 120845           5. If a close parenthesis is found, decrement the counter by 1.
- 120846           6. If the counter is zero, the current character is the matching character.

120847       Matching for a close parenthesis shall be equivalent, except that the search shall be backwards,  
120848       from the starting character to the beginning of the buffer, a close parenthesis shall increment the  
120849       counter by 1, and an open parenthesis shall decrement the counter by 1.

120850       Matching for brackets and curly braces shall be equivalent, except that searching shall be done  
120851       for open and close brackets or open and close curly braces. It is implementation-defined whether  
120852       other characters are searched for and matched as well.

120853       If used as a motion command:

- 120854           1. If the matching cursor was after the starting cursor in the edit buffer, and the starting  
120855           cursor position was at or before the first non-<blank> non-<newline> in the starting line,  
120856           and the matching cursor position was at or after the last non-<blank> non-<newline> in  
120857           the matching line, the text region shall consist of the current line to the matching line,  
120858           inclusive, and any text copied to a buffer shall be in line mode.
- 120859           2. If the matching cursor was before the starting cursor in the edit buffer, and the starting  
120860           cursor position was at or after the last non-<blank> non-<newline> in the starting line,  
120861           and the matching cursor position was at or before the first non-<blank> non-<newline> in  
120862           the matching line, the text region shall consist of the current line to the matching line,  
120863           inclusive, and any text copied to a buffer shall be in line mode.
- 120864           3. Otherwise, the text region shall consist of the starting character to the matching character,  
120865           inclusive, and any text copied to a buffer shall be in character mode.

120866       If not used as a motion command:

120867       *Current line:* Set to the line where the matching character is located.

120868       *Current column:* Set to the last column where any portion of the matching character is displayed.

120869       **Repeat Substitution**

120870       *Synopsis:*       &

120871       Repeat the previous substitution command. This command shall be equivalent to the *ex &*  
120872       command with the current line as its addresses, and without *options, count, or flags*.

120873       **Return to Previous Context at Beginning of Line**

120874       *Synopsis:*       ' *character*

120875       It shall be an error if there is no line in the edit buffer marked by *character*.

120876       If used as a motion command:

- 120877           1. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
120878           and the marked cursor in the edit buffer shall be logically swapped.
- 120879           2. The text region shall consist of the starting line up to and including the marked line, and  
120880           any text copied to a buffer shall be in line mode.

120881       If not used as a motion command:

120882       *Current line:* Set to the line referenced by the mark.

120883       *Current column:* Set to non-<blank>.

120884       **Return to Previous Context**

120885       *Synopsis:*       ` *character*

120886       It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer  
120887       contains a character in the saved numbered character position, it shall be as if the marked  
120888       position is the first non-<blank>.

120889       If used as a motion command:

- 120890           1. It shall be an error if the marked cursor references the same character in the edit buffer as  
120891           the starting cursor.
- 120892           2. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
120893           and the marked cursor in the edit buffer shall be logically swapped.
- 120894           3. If the starting line is empty or the starting cursor is at or before the first non-<blank>  
120895           non-<newline> of the starting line, and the marked cursor line is empty or the marked  
120896           cursor references the first character of the marked cursor line, the text region shall consist  
120897           of all lines containing characters from the starting cursor to the line before the marked  
120898           cursor line, inclusive, and any text copied to a buffer shall be in line mode.
- 120899           4. Otherwise, if the marked cursor line is empty or the marked cursor references a character  
120900           at or before the first non-<blank> non-<newline> of the marked cursor line, the region of  
120901           text shall be from the starting cursor to the last non-<newline> of the line before the  
120902           marked cursor line, inclusive, and any text copied to a buffer shall be in character mode.
- 120903           5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked  
120904           cursor (exclusive), and any text copied to a buffer shall be in character mode.

120905       If not used as a motion command:

120906       *Current line:* Set to the line referenced by the mark.

120907       *Current column:* Set to the last column in which any portion of the character referenced by the

120908 mark is displayed.

### 120909 **Return to Previous Section**

120910 *Synopsis:* [ *count* ] [ [

120911 Move the cursor backward through the edit buffer to the first character of the previous section  
120912 boundary, *count* times.

120913 If used as a motion command:

- 120914 1. If the starting cursor was at the first character of the starting line or the starting line was  
120915 empty, and the first character of the boundary was the first character of the boundary line,  
120916 the text region shall consist of the current line up to and including the line where the  
120917 *count*th next boundary starts, and any text copied to a buffer shall be in line mode.
- 120918 2. If the boundary was the last line of the edit buffer or the last non-<newline> of the last  
120919 line of the edit buffer, the text region shall consist of the last character in the edit buffer up  
120920 to and including the starting character, and any text saved to a buffer shall be in character  
120921 mode.
- 120922 3. Otherwise, the text region shall consist of the starting character up to but not including  
120923 the first character in the *count*th next boundary, and any text copied to a buffer shall be in  
120924 character mode.

120925 If not used as a motion command:

120926 *Current line:* Set to the line where the *count*th next boundary in the edit buffer starts.

120927 *Current column:* Set to the last column in which any portion of the first character of the *count*th  
120928 next boundary is displayed, or column position 1 if the line is empty.

### 120929 **Move to Next Section**

120930 *Synopsis:* [ *count* ] ] ]

120931 Move the cursor forward through the edit buffer to the first character of the next section  
120932 boundary, *count* times.

120933 If used as a motion command:

- 120934 1. If the starting cursor was at the first character of the starting line or the starting line was  
120935 empty, and the first character of the boundary was the first character of the boundary line,  
120936 the text region shall consist of the current line up to and including the line where the  
120937 *count*th previous boundary starts, and any text copied to a buffer shall be in line mode.
- 120938 2. If the boundary was the first line of the edit buffer, the text region shall consist of the first  
120939 character in the edit buffer up to but not including the starting character, and any text  
120940 copied to a buffer shall be in character mode.
- 120941 3. Otherwise, the text region shall consist of the first character in the *count*th previous  
120942 section boundary up to but not including the starting character, and any text copied to a  
120943 buffer shall be in character mode.

120944 If not used as a motion command:

120945 *Current line:* Set to the line where the *count*th previous boundary in the edit buffer starts.

120946 *Current column:* Set to the last column in which any portion of the first character of the *count*th  
120947 previous boundary is displayed, or column position 1 if the line is empty.

120948 **Move to First Non-<blank> Position on Current Line**

120949 *Synopsis:*     ^

120950 If used as a motion command:

- 120951     1. If the line has no non-<blank> non-<newline> characters, or if the cursor is at the first  
120952       non-<blank> non-<newline> of the line, it shall be an error.
- 120953     2. If the cursor is before the first non-<blank> non-<newline> of the line, the text region  
120954       shall be comprised of the current character, up to, but not including, the first non-<blank>  
120955       non-<newline> of the line.
- 120956     3. If the cursor is after the first non-<blank> non-<newline> of the line, the text region shall  
120957       be from the character before the starting cursor up to and including the first non-<blank>  
120958       non-<newline> of the line.
- 120959     4. Any text copied to a buffer shall be in character mode.

120960 If not used as a motion command:

120961 *Current line:* Unchanged.

120962 *Current column:* Set to non-<blank>.

120963 **Current and Line Above**

120964 *Synopsis:*     [*count*] \_

120965 If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.

120966 If used as a motion command:

- 120967     1. If *count* is less than 2, the text region shall be the current line.
- 120968     2. Otherwise, the text region shall include the starting line and the next *count* -1 lines.
- 120969     3. Any text copied to a buffer shall be in line mode.

120970 If not used as a motion command:

120971 *Current line:* Set to current line + *count* -1.

120972 *Current column:* Set to non-<blank>.

120973 **Move Back to Beginning of Sentence**

120974 *Synopsis:*     [*count*] (

120975 Move backward to the beginning of a sentence. This command shall be equivalent to the [[  
120976 command, with the exception that sentence boundaries shall be used instead of section  
120977 boundaries.

120978 **Move Forward to Beginning of Sentence**

120979 *Synopsis:*     [*count*] )

120980 Move forward to the beginning of a sentence. This command shall be equivalent to the ]]  
120981 command, with the exception that sentence boundaries shall be used instead of section  
120982 boundaries.

120983      **Move Back to Preceding Paragraph**

120984      *Synopsis:*      [*count*] {

120985      Move back to the beginning of the preceding paragraph. This command shall be equivalent to  
120986      the `[[` command, with the exception that paragraph boundaries shall be used instead of section  
120987      boundaries.

120988      **Move Forward to Next Paragraph**

120989      *Synopsis:*      [*count*] }

120990      Move forward to the beginning of the next paragraph. This command shall be equivalent to the  
120991      `]]` command, with the exception that paragraph boundaries shall be used instead of section  
120992      boundaries.

120993      **Move to Specific Column Position**

120994      *Synopsis:*      [*count*] |

120995      For the purposes of this command, lines that are too long for the current display and that have  
120996      been folded shall be treated as having a single, 1-based, number of columns.

120997      If there are less than *count* columns in which characters from the current line are displayed on  
120998      the screen, *count* shall be adjusted to be the last column in which any portion of the line is  
120999      displayed on the screen.

121000      If used as a motion command:

- 121001      1. If the line is empty, or the cursor character is the same as the character on the *count*th  
121002      column of the line, it shall be an error.
- 121003      2. If the cursor is before the *count*th column of the line, the text region shall be comprised of  
121004      the current character, up to but not including the character on the *count*th column of the  
121005      line.
- 121006      3. If the cursor is after the *count*th column of the line, the text region shall be from the  
121007      character before the starting cursor up to and including the character on the *count*th  
121008      column of the line.
- 121009      4. Any text copied to a buffer shall be in character mode.

121010      If not used as a motion command:

121011      *Current line:* Unchanged.

121012      *Current column:* Set to the last column in which any portion of the character that is displayed in  
121013      the *count* column of the line is displayed.

121014      **Reverse Find Character**

121015      *Synopsis:*      [*count*] ,

121016      If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or  
121017      **T** command, respectively, with the specified *count* and the same search character.

121018      If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

121019 **Repeat**121020 *Synopsis:* [count] .

121021 Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall  
 121022 be an error if none of these commands have been executed. Commands (other than commands  
 121023 that enter text input mode) executed as a result of map expansions, shall not change the value of  
 121024 the last repeatable command.

121025 Repeated commands with associated motion commands shall repeat the motion command as  
 121026 well; however, any specified *count* shall replace the *count*(s) that were originally specified to the  
 121027 repeated command or its associated motion command.

121028 If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall  
 121029 not set the remembered search character for the **;** and **,** commands.

121030 If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric  
 121031 buffer named with a number less than 9, the buffer associated with the repeated command shall  
 121032 be set to be the buffer named by the name of the previous buffer logically incremented by 1.

121033 If the repeated character is a text input command, the input text associated with that command  
 121034 is repeated literally:

- 121035 • Input characters are neither macro or abbreviation-expanded.
- 121036 • Input characters are not interpreted in any special way with the exception that <newline>,  
 121037 <carriage-return>, and <control>-T behave as described in [Input Mode Commands in vi](#)  
 121038 (on page 3561).

121039 *Current line:* Set as described for the repeated command.

121040 *Current column:* Set as described for the repeated command.

121041 **Find Regular Expression**121042 *Synopsis:* /

121043 If the input line contains no non-<newline> characters, it shall be equivalent to a line containing  
 121044 only the last regular expression encountered. The enhanced regular expressions supported by *vi*  
 121045 are described in [Regular Expressions in ex](#) (on page 2875).

121046 Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed  
 121047 by an address offset or a *vi z* command.

121048 If the regular expression is not the last regular expression on the line, or if a line offset or **z**  
 121049 command is specified, the regular expression shall be terminated by an unescaped **'/'**  
 121050 character, which shall not be used as part of the regular expression. If the regular expression is  
 121051 not the first regular expression on the line, it shall be preceded by zero or more <blank>  
 121052 characters, a <semicolon>, zero or more <blank> characters, and a leading **'/'** character, which  
 121053 shall not be interpreted as part of the regular expression. It shall be an error to precede any  
 121054 regular expression with any characters other than these.

121055 Each search shall begin from the character after the first character of the last match (or, if it is the  
 121056 first search, after the cursor). If the **wraps**can edit option is set, the search shall continue to the  
 121057 character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be  
 121058 an error if any search fails to find a match, and an informational message to this effect shall be  
 121059 displayed.

121060 An optional address offset (see [Addressing in ex](#), on page 2845) can be specified after the last  
 121061 regular expression by including a trailing **'/'** character after the regular expression and

121062 specifying the address offset. This offset shall be from the line containing the match for the last  
 121063 regular expression specified. It shall be an error if the line offset would indicate a line address  
 121064 less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be  
 121065 supported. It shall be an error to follow the address offset with any other characters than  
 121066 <blank> characters.

121067 If not used as a motion command, an optional **z** command (see [Redraw Window](#), on page 3560)  
 121068 can be specified after the last regular expression by including a trailing '/' character after the  
 121069 regular expression, zero or more <blank> characters, a 'z', zero or more <blank> characters, an  
 121070 optional new **window** edit option value, zero or more <blank> characters, and a location  
 121071 character. The effect shall be as if the **z** command was executed after the / command. It shall be  
 121072 an error to follow the **z** command with any other characters than <blank> characters.

121073 The remembered search direction shall be set to forward.

121074 If used as a motion command:

- 121075 1. It shall be an error if the last match references the same character in the edit buffer as the  
 121076 starting cursor.
- 121077 2. If any address offset is specified, the last match shall be adjusted by the specified offset as  
 121078 described previously.
- 121079 3. If the starting cursor is after the last match, then the locations of the starting cursor and  
 121080 the last match in the edit buffer shall be logically swapped.
- 121081 4. If any address offset is specified, the text region shall consist of all lines containing  
 121082 characters from the starting cursor to the last match line, inclusive, and any text copied to  
 121083 a buffer shall be in line mode.
- 121084 5. Otherwise, if the starting line is empty or the starting cursor is at or before the first  
 121085 non-<blank> non-<newline> of the starting line, and the last match line is empty or the  
 121086 last match starts at the first character of the last match line, the text region shall consist of  
 121087 all lines containing characters from the starting cursor to the line before the last match  
 121088 line, inclusive, and any text copied to a buffer shall be in line mode.
- 121089 6. Otherwise, if the last match line is empty or the last match begins at a character at or  
 121090 before the first non-<blank> non-<newline> of the last match line, the region of text shall  
 121091 be from the current cursor to the last non-<newline> of the line before the last match line,  
 121092 inclusive, and any text copied to a buffer shall be in character mode.
- 121093 7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first  
 121094 character of the last match (exclusive), and any text copied to a buffer shall be in character  
 121095 mode.

121096 If not used as a motion command:

121097 *Current line*: If a match is found, set to the last matched line plus the address offset, if any;  
 121098 otherwise, unchanged.

121099 *Current column*: Set to the last column on which any portion of the first character in the last  
 121100 matched string is displayed, if a match is found; otherwise, unchanged.

121101 **Move to First Character in Line**121102 *Synopsis:* 0 (zero)121103 Move to the first character on the current line. The character '0' shall not be interpreted as a  
121104 command if it is immediately preceded by a digit.

121105 If used as a motion command:

- 121106 1. If the cursor character is the first character in the line, it shall be an error.
- 121107 2. The text region shall be from the character before the cursor character up to and including  
121108 the first character in the line.
- 121109 3. Any text copied to a buffer shall be in character mode.

121110 If not used as a motion command:

121111 *Current line:* Unchanged.121112 *Current column:* The last column in which any portion of the first character in the line is  
121113 displayed, or if the line is empty, unchanged.121114 **Execute an ex Command**121115 *Synopsis:* :121116 Execute one or more *ex* commands.121117 If any portion of the screen other than the last line of the screen was overwritten by any *ex*  
121118 command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from  
121119 the user, and shall then read a character. This action may also be taken for other, unspecified  
121120 reasons.121121 If the next character entered is a ':', another *ex* command shall be accepted and executed. Any  
121122 other character shall cause the screen to be refreshed and *vi* shall return to command mode.121123 *Current line:* As specified for the *ex* command.121124 *Current column:* As specified for the *ex* command.121125 **Repeat Find**121126 *Synopsis:* [count] ;121127 This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and  
121128 with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**,  
121129 **f**, **T**, or **t** command, it shall be an error.121130 **Shift Left**121131 *Synopsis:* [count] < *motion*

121132 If the motion command is the &lt; command repeated:

- 121133 1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
121134 error.
- 121135 2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

121136 Shift any line in the text region specified by the *count* and motion command one shiftwidth (see  
121137 the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The  
121138 unshifted lines shall be copied to the unnamed buffer in line mode.

121139 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 121140 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 121141 specified by the motion command.

121142 *Current column*: Set to non-<blank>.

### 121143 **Shift Right**

121144 *Synopsis*: `[count] > motion`

121145 If the motion command is the `>` command repeated:

- 121146 1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
 121147 error.
- 121148 2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

121149 Shift any line with characters in the text region specified by the *count* and motion command one  
 121150 shiftwidth (see the *ex* **shiftwidth** option) away from the start of the line, as described by the *ex* `>`  
 121151 command. The unshifted lines shall be copied into the unnamed buffer in line mode.

121152 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 121153 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 121154 specified by the motion command.

121155 *Current column*: Set to non-<blank>.

### 121156 **Scan Backwards for Regular Expression**

121157 *Synopsis*: `?`

121158 Scan backwards; the `?` command shall be equivalent to the `/` command (see [Find Regular](#)  
 121159 [Expression](#), on page 3543) with the following exceptions:

- 121160 1. The input prompt shall be a `'?'`.
- 121161 2. Each search shall begin from the character before the first character of the last match (or, if  
 121162 it is the first search, the character before the cursor character).
- 121163 3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
 121164 the **wrapscan** edit option shall affect whether the search wraps to the end of the edit  
 121165 buffer and continues.
- 121166 4. The remembered search direction shall be set to backward.

### 121167 **Execute**

121168 *Synopsis*: `@buffer`

121169 If the *buffer* is specified as `@`, the last buffer executed shall be used. If no previous buffer has been  
 121170 executed, it shall be an error.

121171 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
 121172 line-mode buffer, and all but the last line of a character mode buffer, behave as if a `<newline>`  
 121173 were entered as standard input.

121174 If an error occurs during this process, an error message shall be written, and no more characters  
 121175 resulting from the execution of this command shall be processed.

121176 If a *count* is specified, behave as if that count were entered as user input before the characters  
 121177 from the `@` buffer were entered.

121178 *Current line*: As specified for the individual commands.

121179 *Current column*: As specified for the individual commands.

### 121180 **Reverse Case**

121181 *Synopsis*: [count] ~

121182 Reverse the case of the current character and the next *count* -1 characters, such that lowercase  
121183 characters that have uppercase counterparts shall be changed to uppercase characters, and  
121184 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
121185 as prescribed by the current locale. No other characters shall be affected by this command.

121186 If there are less than *count* -1 characters after the cursor in the edit buffer, *count* shall be adjusted  
121187 to the number of characters after the cursor in the edit buffer minus 1.

121188 For the purposes of this command, the next character after the last non-<newline> on the line  
121189 shall be the next character in the edit buffer.

121190 *Current line*: Set to the line including the (*count*-1)th character after the cursor.

121191 *Current column*: Set to the last column in which any portion of the (*count*-1)th character after the  
121192 cursor is displayed.

### 121193 **Append**

121194 *Synopsis*: [count] a

121195 Enter text input mode after the current cursor position. No characters already in the edit buffer  
121196 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
121197 more times to the end of the input.

121198 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
121199 on page 3561).

### 121200 **Append at End-of-Line**

121201 *Synopsis*: [count] A

121202 This command shall be equivalent to the *vi* command:

121203 \$ [ count ] a

121204 (see [Append](#)).

### 121205 **Move Backward to Preceding Word**

121206 *Synopsis*: [count] b

121207 With the exception that words are used as the delimiter instead of bigwords, this command shall  
121208 be equivalent to the **B** command.

## 121209 Move Backward to Preceding Bigword

121210 *Synopsis:* [count] B

121211 If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an  
 121212 error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count*  
 121213 shall be adjusted to the number of bigword beginnings between the cursor and the start of the  
 121214 edit buffer.

121215 If used as a motion command:

- 121216 1. The text region shall be from the first character of the *count*th previous bigword beginning  
 121217 up to but not including the cursor character.
- 121218 2. Any text copied to a buffer shall be in character mode.

121219 If not used as a motion command:

121220 *Current line:* Set to the line containing the *current column*.

121221 *Current column:* Set to the last column upon which any part of the first character of the *count*th  
 121222 previous bigword is displayed.

## 121223 Change

121224 *Synopsis:* [buffer] [count] c motion

121225 If the motion command is the **c** command repeated:

- 121226 1. The buffer text shall be in line mode.
- 121227 2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
 121228 error.
- 121229 3. The text region shall be from the current line up to and including the next *count* -1 lines.

121230 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

121231 The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text  
 121232 to be replaced contains characters from more than a single line, or the buffer text is in line mode,  
 121233 the replaced text shall be copied into the numeric buffers as well.

121234 If the buffer text is in line mode:

- 121235 1. Any lines that contain characters in the region shall be deleted, and the editor shall enter  
 121236 text input mode at the beginning of a new line which shall replace the first line deleted.
- 121237 2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent**  
 121238 characters on the first line deleted shall be inserted as if entered by the user.

121239 Otherwise, if characters from more than one line are in the region of text:

- 121240 1. The text shall be deleted.
- 121241 2. Any text remaining in the last line in the text region shall be appended to the first line in  
 121242 the region, and the last line in the region shall be deleted.
- 121243 3. The editor shall enter text input mode after the last character not deleted from the first  
 121244 line in the text region, if any; otherwise, on the first column of the first line in the region.

121245 Otherwise:

- 121246 1. If the glyph for '\$' is smaller than the region, the end of the region shall be marked with  
121247 a '\$'.
- 121248 2. The editor shall enter text input mode, overwriting the region of text.

121249 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
121250 on page 3561).

### 121251 **Change to End-of-Line**

121252 *Synopsis:* `[buffer] [count] C`

121253 This command shall be equivalent to the *vi* command:

121254 `[buffer] [count] c$`

121255 See the **c** command.

### 121256 **Delete**

121257 *Synopsis:* `[buffer] [count] d motion`

121258 If the motion command is the **d** command repeated:

- 121259 1. The buffer text shall be in line mode.
- 121260 2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
121261 error.
- 121262 3. The text region shall be from the current line up to and including the next *count* -1 lines.

121263 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

121264 If in open mode, and the current line is deleted, and the line remains on the display, an '@'  
121265 character shall be displayed as the first glyph of that line.

121266 Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be  
121267 deleted contains characters from more than a single line, or the buffer text is in line mode, the  
121268 deleted text shall be copied into the numeric buffers, as well.

121269 *Current line:* Set to the first text region line that appears in the edit buffer, unless that line has  
121270 been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit  
121271 buffer is empty.

121272 *Current column:*

- 121273 1. If the line is empty, set to column position 1.
- 121274 2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the  
121275 end of the edit buffer:
- 121276 a. If a character from the current line is displayed in the current column, set to the  
121277 last column that displays any portion of that character.
- 121278 b. Otherwise, set to the last column in which any portion of any character in the line  
121279 is displayed.
- 121280 3. Otherwise, if a character is displayed in the column that began the text region, set to the  
121281 last column that displays any portion of that character.

121282 4. Otherwise, set to the last column in which any portion of any character in the line is  
121283 displayed.

#### 121284 **Delete to End-of-Line**

121285 *Synopsis:* `[buffer] D`

121286 Delete the text from the current position to the end of the current line; equivalent to the *vi*  
121287 command:

121288 `[buffer] d$`

#### 121289 **Move to End-of-Word**

121290 *Synopsis:* `[count] e`

121291 With the exception that words are used instead of bigwords as the delimiter, this command shall  
121292 be equivalent to the **E** command.

#### 121293 **Move to End-of-Bigword**

121294 *Synopsis:* `[count] E`

121295 If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor  
121296 and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between  
121297 the cursor and the end of the edit buffer.

121298 If used as a motion command:

- 121299 1. The text region shall be from the last character of the *count*th next bigword up to and  
121300 including the cursor character.
- 121301 2. Any text copied to a buffer shall be in character mode.

121302 If not used as a motion command:

121303 *Current line:* Set to the line containing the current column.

121304 *Current column:* Set to the last column upon which any part of the last character of the *count*th  
121305 next bigword is displayed.

#### 121306 **Find Character in Current Line (Forward)**

121307 *Synopsis:* `[count] f character`

121308 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

121309 If used as a motion command:

- 121310 1. The text range shall be from the cursor character up to and including the *count*th  
121311 occurrence of the specified character after the cursor.
- 121312 2. Any text copied to a buffer shall be in character mode.

121313 If not used as a motion command:

121314 *Current line:* Unchanged.

121315 *Current column:* Set to the last column in which any portion of the *count*th occurrence of the  
121316 specified character after the cursor appears in the line.

121317 **Find Character in Current Line (Reverse)**121318 *Synopsis:* [count] F *character*121319 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

121320 If used as a motion command:

- 121321 1. The text region shall be from the *count*th occurrence of the specified character before the  
121322 cursor, up to, but not including the cursor character.
- 121323 2. Any text copied to a buffer shall be in character mode.

121324 If not used as a motion command:

121325 *Current line:* Unchanged.121326 *Current column:* Set to the last column in which any portion of the *count*th occurrence of the  
121327 specified character before the cursor appears in the line.121328 **Move to Line**121329 *Synopsis:* [count] G121330 If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than  
121331 the last line of the edit buffer, it shall be an error.

121332 If used as a motion command:

- 121333 1. The text region shall be from the cursor line up to and including the specified line.
- 121334 2. Any text copied to a buffer shall be in line mode.

121335 If not used as a motion command:

121336 *Current line:* Set to *count* if *count* is specified; otherwise, the last line.121337 *Current column:* Set to non-<blank>.121338 **Move to Top of Screen**121339 *Synopsis:* [count] H121340 If the beginning of the line *count* greater than the first line of which any portion appears on the  
121341 display does not exist, it shall be an error.

121342 If used as a motion command:

- 121343 1. If in open mode, the text region shall be the current line.
- 121344 2. Otherwise, the text region shall be from the starting line up to and including (the first line  
121345 of the display + *count* -1).
- 121346 3. Any text copied to a buffer shall be in line mode.

121347 If not used as a motion command:

121348 If in open mode, this command shall set the current column to non-&lt;blank&gt; and do nothing else.

121349 Otherwise, it shall set the current line and current column as follows.

121350 *Current line:* Set to (the first line of the display + *count* -1).121351 *Current column:* Set to non-<blank>.

121352        **Insert Before Cursor**

121353        *Synopsis:*        [count] i

121354        Enter text input mode before the current cursor position. No characters already in the edit buffer  
121355        shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
121356        more times to the end of the input.

121357        *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
121358        on page 3561).

121359        **Insert at Beginning of Line**

121360        *Synopsis:*        [count] I

121361        This command shall be equivalent to the *vi* command  $\wedge$ [count]i.

121362        **Join**

121363        *Synopsis:*        [count] J

121364        If the current line is the last line in the edit buffer, it shall be an error.

121365        This command shall be equivalent to the *ex* **join** command with no addresses, and an *ex*  
121366        command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex*  
121367        command *count* value of *count* -1 for any other value of *count*, except that the current line and  
121368        column shall be set as follows.

121369        *Current line:* Unchanged.

121370        *Current column:* The last column in which any portion of the character following the last  
121371        character in the initial line is displayed, or the last non-<newline> in the line if no characters  
121372        were appended.

121373        **Move to Bottom of Screen**

121374        *Synopsis:*        [count] L

121375        If the beginning of the line *count* less than the last line of which any portion appears on the  
121376        display does not exist, it shall be an error.

121377        If used as a motion command:

- 121378            1. If in open mode, the text region shall be the current line.
- 121379            2. Otherwise, the text region shall include all lines from the starting cursor line to (the last  
121380            line of the display -(*count* -1)).
- 121381            3. Any text copied to a buffer shall be in line mode.

121382        If not used as a motion command:

- 121383            1. If in open mode, this command shall set the current column to non-<blank> and do  
121384            nothing else.
- 121385            2. Otherwise, it shall set the current line and current column as follows.

121386        *Current line:* Set to (the last line of the display -(*count* -1)).

121387        *Current column:* Set to non-<blank>.

121388 **Mark Position**121389 *Synopsis:* m letter121390 This command shall be equivalent to the *ex* **mark** command with the specified character as an  
121391 argument.121392 **Move to Middle of Screen**121393 *Synopsis:* M

121394 The middle line of the display shall be calculated as follows:

121395  $(\text{the top line of the display}) + ((\text{number of lines displayed}) + 1) / 2) - 1$ 

121396 If used as a motion command:

- 121397 1. If in open mode, the text region shall be the current line.
- 121398 2. Otherwise, the text region shall include all lines from the starting cursor line up to and  
121399 including the middle line of the display.
- 121400 3. Any text copied to a buffer shall be in line mode.

121401 If not used as a motion command:

121402 If in open mode, this command shall set the current column to non-&lt;blank&gt; and do nothing else.

121403 Otherwise, it shall set the current line and current column as follows.

121404 *Current line:* Set to the middle line of the display.121405 *Current column:* Set to non-<blank>.121406 **Repeat Regular Expression Find (Forward)**121407 *Synopsis:* n121408 If the remembered search direction was forward, the **n** command shall be equivalent to the *vi* /  
121409 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi* ?  
121410 command with no characters entered by the user.121411 If the **n** command is used as a motion command for the **!** command, the editor shall not enter  
121412 text input mode on the last line on the screen, and shall behave as if the user entered a single  
121413 '!' character as the text input.121414 **Repeat Regular Expression Find (Reverse)**121415 *Synopsis:* N121416 Scan for the next match of the last pattern given to / or ?, but in the reverse direction; this is the  
121417 reverse of **n**.121418 If the remembered search direction was forward, the **N** command shall be equivalent to the *vi* ?  
121419 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi* /  
121420 command with no characters entered by the user. If the **N** command is used as a motion  
121421 command for the **!** command, the editor shall not enter text input mode on the last line on the  
121422 screen, and shall behave as if the user entered a single **!** character as the text input.

121423 **Insert Empty Line Below**

121424 *Synopsis:*     ○

121425 Enter text input mode in a new line appended after the current line. A *count* shall cause the input  
121426 text to be appended *count* -1 more times to the end of the already added text, each time starting  
121427 on a new, appended line.

121428 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
121429 on page 3561).

121430 **Insert Empty Line Above**

121431 *Synopsis:*     ○

121432 Enter text input mode in a new line inserted before the current line. A *count* shall cause the input  
121433 text to be appended *count* -1 more times to the end of the already added text, each time starting  
121434 on a new, appended line.

121435 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
121436 on page 3561).

121437 **Put from Buffer Following**

121438 *Synopsis:*     [*buffer*] p

121439 If no *buffer* is specified, the unnamed buffer shall be used.

121440 If the buffer text is in line mode, the text shall be appended below the current line, and each line  
121441 of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
121442 appended *count* -1 more times to the end of the already added text, each time starting on a new,  
121443 appended line.

121444 If the buffer text is in character mode, the text shall be appended into the current line after the  
121445 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
121446 buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the  
121447 already added text, each time starting after the last added character.

121448 *Current line:* If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.

121449 *Current column:* If the buffer text is in line mode:

- 121450     1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any  
121451       portion of the first non-<blank> in the line is displayed.
- 121452     2. If there is no non-<blank> in the first line of the buffer, set to the last column on which  
121453       any portion of the last non-<newline> in the first line of the buffer is displayed.

121454 If the buffer text is in character mode:

- 121455     1. If the text in the buffer is from more than a single line, then set to the last column on  
121456       which any portion of the first character from the buffer is displayed.
- 121457     2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any  
121458       portion of the last character from the buffer is displayed.
- 121459     3. Otherwise, set to the first column on which any portion of the first character from the  
121460       buffer is displayed.

121461 **Put from Buffer Before**121462 *Synopsis:* `[buffer] P`121463 If no *buffer* is specified, the unnamed buffer shall be used.

121464 If the buffer text is in line mode, the text shall be inserted above the current line, and each line of  
 121465 the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
 121466 appended *count* -1 more times to the end of the already added text, each time starting on a new,  
 121467 appended line.

121468 If the buffer text is in character mode, the text shall be inserted into the current line before the  
 121469 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
 121470 buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the  
 121471 already added text, each time starting after the last added character.

121472 *Current line:* Unchanged.121473 *Current column:* If the buffer text is in line mode:

- 121474 1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any  
 121475 portion of that character is displayed.
- 121476 2. If there is no non-<blank> in the first line of the buffer, set to the last column on which  
 121477 any portion of the last non-<newline> in the first line of the buffer is displayed.

121478 If the buffer text is in character mode:

- 121479 1. If the text in the buffer is from more than a single line, then set to the last column on  
 121480 which any portion of the first character from the buffer is displayed.
- 121481 2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any  
 121482 portion of the last character from the buffer is displayed.
- 121483 3. Otherwise, set to the first column on which any portion of the first character from the  
 121484 buffer is displayed.

121485 **Enter ex Mode**121486 *Synopsis:* `Q`121487 Leave visual or open mode and enter *ex* command mode.121488 *Current line:* Unchanged.121489 *Current column:* Unchanged.121490 **Replace Character**121491 *Synopsis:* `[count] r character`

121492 Replace the *count* characters at and after the cursor with the specified character. If there are less  
 121493 than *count* non-<newline> characters at and after the cursor on the line, it shall be an error.

121494 If character is <control>-V, any next character other than the <newline> shall be stripped of any  
 121495 special meaning and used as a literal character.

121496 If character is <ESC>, no replacement shall be made and the current line and current column  
 121497 shall be unchanged.

121498 If character is <carriage-return> or <newline>, *count* new lines shall be appended to the current  
 121499 line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be

121500 discarded, and any remaining characters after the cursor in the current line shall be moved to the  
 121501 last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same  
 121502 number of **autoindent** characters found on the line from which the command was executed.

121503 *Current line*: Unchanged unless the replacement character is a <carriage-return> or <newline>, in  
 121504 which case it shall be set to line + *count*.

121505 *Current column*: Set to the last column position on which a portion of the last replaced character  
 121506 is displayed, or if the replacement character caused new lines to be created, set to non-<blank>.

### 121507 **Replace Characters**

121508 *Synopsis*:       R

121509 Enter text input mode at the current cursor position possibly replacing text on the current line. A  
 121510 *count* shall cause the input text to be appended *count* - 1 more times to the end of the input.

121511 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
 121512 on page 3561).

### 121513 **Substitute Character**

121514 *Synopsis*:       [*buffer*] [*count*] s

121515 This command shall be equivalent to the *vi* command:

121516 [*buffer*] [*count*] c<space>

### 121517 **Substitute Lines**

121518 *Synopsis*:       [*buffer*] [*count*] S

121519 This command shall be equivalent to the *vi* command:

121520 [*buffer*] [*count*] c\_

### 121521 **Move Cursor to Before Character (Forward)**

121522 *Synopsis*:       [*count*] t *character*

121523 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

121524 If used as a motion command:

- 121525       1. The text region shall be from the cursor up to but not including the *count*th occurrence of  
 121526       the specified character after the cursor.
- 121527       2. Any text copied to a buffer shall be in character mode.

121528 If not used as a motion command:

121529 *Current line*: Unchanged.

121530 *Current column*: Set to the last column in which any portion of the character before the *count*th  
 121531 occurrence of the specified character after the cursor appears in the line.

121532 **Move Cursor to After Character (Reverse)**121533 *Synopsis:* [count] T character121534 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

121535 If used as a motion command:

- 121536 1. If the character before the cursor is the specified character, it shall be an error.
- 121537 2. The text region shall be from the character before the cursor up to but not including the
- 121538 *count*th occurrence of the specified character before the cursor.
- 121539 3. Any text copied to a buffer shall be in character mode.

121540 If not used as a motion command:

121541 *Current line:* Unchanged.121542 *Current column:* Set to the last column in which any portion of the character after the *count*th  
121543 occurrence of the specified character before the cursor appears in the line.121544 **Undo**121545 *Synopsis:* u121546 This command shall be equivalent to the *ex* **undo** command except that the current line and  
121547 current column shall be set as follows:121548 *Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding  
121549 any deleted text if one exists; otherwise, move to line 1.121550 *Current column:* If undoing an *ex* command, set to the first non-<blank>.

121551 Otherwise, if undoing a text input command:

- 121552 1. If the command was a **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to
- 121553 the value it held when the text input command was entered.
- 121554 2. Otherwise, set to the last column in which any portion of the first character after the
- 121555 deleted text is displayed, or, if no non-<newline> characters follow the text deleted from
- 121556 this line, set to the last column in which any portion of the last non-<newline> in the line
- 121557 is displayed, or 1 if the line is empty.

121558 Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

- 121559 1. If text was added or changed, set to the last column in which any portion of the first
- 121560 character added or changed is displayed.
- 121561 2. If text was deleted, set to the last column in which any portion of the first character after
- 121562 the deleted text is displayed, or, if no non-<newline> characters follow the deleted text,
- 121563 set to the last column in which any portion of the last non-<newline> in the line is
- 121564 displayed, or 1 if the line is empty.

121565 Otherwise, set to non-&lt;blank&gt;.

121566      **Undo Current Line**

121567      *Synopsis:*      U

121568      Restore the current line to its state immediately before the most recent time that it became the  
121569      current line.

121570      *Current line:* Unchanged.

121571      *Current column:* Set to the first column in the line in which any portion of the first character in  
121572      the line is displayed.

121573      **Move to Beginning of Word**

121574      *Synopsis:*      [count] w

121575      With the exception that words are used as the delimiter instead of bigwords, this command shall  
121576      be equivalent to the **W** command.

121577      **Move to Beginning of Bigword**

121578      *Synopsis:*      [count] W

121579      If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the  
121580      cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last  
121581      bigword in the edit buffer.

121582      If used as a motion command:

- 121583            1. If the associated command is **c**, *count* is 1, and the cursor is on a <blank>, the region of  
121584            text shall be the current character and no further action shall be taken.
- 121585            2. If there are less than *count* bigwords between the cursor and the end of the edit buffer,  
121586            then the command shall succeed, and the region of text shall include the last character of  
121587            the edit buffer.
- 121588            3. If there are <blank> characters or an end-of-line that precede the *count*th bigword, and the  
121589            associated command is **c**, the region of text shall be up to and including the last character  
121590            before the preceding <blank> characters or end-of-line.
- 121591            4. If there are <blank> characters or an end-of-line that precede the bigword, and the  
121592            associated command is **d** or **y**, the region of text shall be up to and including the last  
121593            <blank> before the start of the bigword or end-of-line.
- 121594            5. Any text copied to a buffer shall be in character mode.

121595      If not used as a motion command:

- 121596            1. If the cursor is on the last character of the edit buffer, it shall be an error.

121597      *Current line:* Set to the line containing the current column.

121598      *Current column:* Set to the last column in which any part of the first character of the *count*th next  
121599      bigword is displayed.

121600 **Delete Character at Cursor**121601 *Synopsis:* `[buffer] [count] x`121602 Delete the *count* characters at and after the current character into *buffer*, if specified, and into the  
121603 unnamed buffer.121604 If the line is empty, it shall be an error. If there are less than *count* non-<newline> characters at  
121605 and after the cursor on the current line, *count* shall be adjusted to the number of non-<newline>  
121606 characters at and after the cursor.121607 *Current line:* Unchanged.121608 *Current column:* If the line is empty, set to column position 1. Otherwise, if there were *count* or  
121609 less non-<newline> characters at and after the cursor on the current line, set to the last column  
121610 that displays any part of the last non-<newline> of the line. Otherwise, unchanged.121611 **Delete Character Before Cursor**121612 *Synopsis:* `[buffer] [count] X`121613 Delete the *count* characters before the current character into *buffer*, if specified, and into the  
121614 unnamed buffer.121615 If there are no characters before the current character on the current line, it shall be an error. If  
121616 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
121617 number of previous characters on the line.121618 *Current line:* Unchanged.121619 *Current column:* Set to (current column – the width of the deleted characters).121620 **Yank**121621 *Synopsis:* `[buffer] [count] y motion`121622 Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.121623 If the motion command is the *y* command repeated:

- 121624 1. The buffer shall be in line mode.
- 121625 2. If there are less than *count* –1 lines after the current line in the edit buffer, it shall be an  
121626 error.
- 121627 3. The text region shall be from the current line up to and including the next *count* –1 lines.

121628 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

121629 *Current line:* If the motion was from the current cursor position toward the end of the edit buffer,  
121630 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
121631 specified by the motion command.121632 *Current column:*

- 121633 1. If the motion was from the current cursor position toward the end of the edit buffer,  
121634 unchanged.
- 121635 2. Otherwise, if the current line is empty, set to column position 1.
- 121636 3. Otherwise, set to the last column that displays any part of the first character in the file  
121637 that is part of the text region specified by the motion command.

121638 **Yank Current Line**121639 *Synopsis:* `[buffer] [count] Y`121640 This command shall be equivalent to the *vi* command:121641 `[buffer] [count] y_`121642 **Redraw Window**121643 If in open mode, the **z** command shall have the Synopsis:121644 *Synopsis:* `[count] z`

121645 If *count* is not specified, it shall default to the **window** edit option `-1`. The **z** command shall be  
 121646 equivalent to the *ex z* command, with a type character of `=` and a *count* of *count* `-2`, except that  
 121647 the current line and current column shall be set as follows, and the **window** edit option shall not  
 121648 be affected. If the calculation for the *count* argument would result in a negative number, the  
 121649 *count* argument to the *ex z* command shall be zero. A blank line shall be written after the last line  
 121650 is written.

121651 *Current line:* Unchanged.121652 *Current column:* Unchanged.121653 If not in open mode, the **z** command shall have the following Synopsis:121654 *Synopsis:* `[line] z [count] character`

121655 If *line* is not specified, it shall default to the current line. If *line* is specified, but is greater than the  
 121656 number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.

121657 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in the  
 121658 *ex window* command), and the screen shall be redrawn.

121659 *line* shall be placed as specified by the following characters:121660 `<newline>`, `<carriage-return>`

121661 Place the beginning of the line on the first line of the display.

121662 . Place the beginning of the line in the center of the display. The middle line of the display  
 121663 shall be calculated as described for the **M** command.

121664 `-` Place an unspecified portion of the line on the last line of the display.

121665 + If *line* was specified, equivalent to the `<newline>` case. If *line* was not specified, display a  
 121666 screen where the first line of the display shall be (current last line) `+1`. If there are no lines  
 121667 after the last line in the display, it shall be an error.

121668 ^ If *line* was specified, display a screen where the last line of the display shall contain an  
 121669 unspecified portion of the first line of a display that had an unspecified portion of the  
 121670 specified line on the last line of the display. If this calculation results in a line before the  
 121671 beginning of the edit buffer, display the first screen of the edit buffer.

121672 Otherwise, display a screen where the last line of the display shall contain an unspecified  
 121673 portion of (current first line `-1`). If this calculation results in a line before the beginning of  
 121674 the edit buffer, it shall be an error.

121675 *Current line*: If *line* and the '^' character were specified:

121676 1. If the first screen was displayed as a result of the command attempting to display lines

121677 before the beginning of the edit buffer: if the first screen was already displayed,

121678 unchanged; otherwise, set to (current first line -1).

121679 2. Otherwise, set to the last line of the display.

121680 If *line* and the '+' character were specified, set to the first line of the display.

121681 Otherwise, if *line* was specified, set to *line*.

121682 Otherwise, unchanged.

121683 *Current column*: Set to non-<blank>.

## 121684 **Exit**

121685 *Synopsis*: ZZ

121686 This command shall be equivalent to the *ex xit* command with no addresses, trailing **!**, or

121687 filename (see the *ex xit* command).

## 121688 **Input Mode Commands in vi**

121689 In text input mode, the current line shall consist of zero or more of the following categories, plus

121690 the terminating <newline>:

121691 1. Characters preceding the text input entry point

121692 Characters in this category shall not be modified during text input mode.

121693 2. **autoindent** characters

121694 **autoindent** characters shall be automatically inserted into each line that is created in text

121695 input mode, either as a result of entering a <newline> or <carriage-return> while in text

121696 input mode, or as an effect of the command itself; for example, **O** or **o** (see the *ex*

121697 **autoindent** command), as if entered by the user.

121698 It shall be possible to erase **autoindent** characters with the <control>-D command; it is

121699 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W

121700 characters. Erasing any **autoindent** character turns the glyph into erase-columns and

121701 deletes the character from the edit buffer, but does not change its representation on the

121702 screen.

121703 3. Text input characters

121704 Text input characters are the characters entered by the user. Erasing any text input

121705 character turns the glyph into erase-columns and deletes the character from the edit

121706 buffer, but does not change its representation on the screen.

121707 Each text input character entered by the user (that does not have a special meaning) shall

121708 be treated as follows:

121709 a. The text input character shall be appended to the last character in the edit buffer

121710 from the first, second, or third categories.

121711 b. If there are no erase-columns on the screen, the text input command was the **R**

121712 command, and characters in the fifth category from the original line follow the

121713 cursor, the next such character shall be deleted from the edit buffer. If the

121714 **slowopen** edit option is not set, the corresponding glyph on the screen shall

- 121715 become erase-columns.
- 121716 c. If there are erase-columns on the screen, as many columns as they occupy, or as are  
121717 necessary, shall be overwritten to display the text input character. (If only part of a  
121718 multi-column glyph is overwritten, the remainder shall be left on the screen, and  
121719 continue to be treated as erase-columns; it is unspecified whether the remainder of  
121720 the glyph is modified in any way.)
- 121721 d. If additional display line columns are needed to display the text input character:
- 121722 i. If the **slowopen** edit option is set, the text input characters shall be  
121723 displayed on subsequent display line columns, overwriting any characters  
121724 displayed in those columns.
- 121725 ii. Otherwise, any characters currently displayed on or after the column on the  
121726 display line where the text input character is to be displayed shall be  
121727 pushed ahead the number of display line columns necessary to display the  
121728 rest of the text input character.

#### 121729 4. Erase-columns

121730 Erase-columns are not logically part of the edit buffer, appearing only on the screen, and  
121731 may be overwritten on the screen by subsequent text input characters. When text input  
121732 mode ends, all erase-columns shall no longer appear on the screen.

121733 Erase-columns are initially the region of text specified by the **c** command (see [Change](#), on  
121734 page 3548); however, erasing **autoindent** or text input characters causes the glyphs of the  
121735 erased characters to be treated as erase-columns.

#### 121736 5. Characters following the text region for the **c** command, or the text input entry point for 121737 all other commands

121738 Characters in this category shall not be modified during text input mode, except as  
121739 specified in category 3.b. for the **R** text input command, or as <blank> characters deleted  
121740 when a <newline> or <carriage-return> is entered.

121741 It is unspecified whether it is an error to attempt to erase past the beginning of a line that was  
121742 created by the entry of a <newline> or <carriage-return> during text input mode. If it is not an  
121743 error, the editor shall behave as if the erasing character was entered immediately after the last  
121744 text input character entered on the previous line, and all of the non-<newline> characters on the  
121745 current line shall be treated as erase-columns.

121746 When text input mode is entered, or after a text input mode character is entered (except as  
121747 specified for the special characters below), the cursor shall be positioned as follows:

- 121748 1. On the first column that displays any part of the first erase-column, if one exists
- 121749 2. Otherwise, if the **slowopen** edit option is set, on the first display line column after the last  
121750 character in the first, second, or third categories, if one exists
- 121751 3. Otherwise, the first column that displays any part of the first character in the fifth  
121752 category, if one exists
- 121753 4. Otherwise, the display line column after the last character in the first, second, or third  
121754 categories, if one exists
- 121755 5. Otherwise, on column position 1

121756 The characters that are updated on the screen during text input mode are unspecified, other than  
121757 that the last text input character shall always be updated, and, if the **slowopen** edit option is not

121758 set, the current cursor character shall always be updated.

121759 The following specifications are for command characters entered during text input mode.

121760 **NUL**

121761 *Synopsis:* NUL

121762 If the first character of the text input is a NUL, the most recently input text shall be input as if  
 121763 entered by the user, and then text input mode shall be exited. The text shall be input literally;  
 121764 that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted  
 121765 in any special manner. It is unspecified whether implementations shall support more than 256  
 121766 bytes of remembered input text.

121767 **<control>-D**

121768 *Synopsis:* <control>-D

121769 The <control>-D character shall have no special meaning when in text input mode for a line-  
 121770 oriented command (see [Command Descriptions in vi](#), on page 3527).

121771 This command need not be supported on block-mode terminals.

121772 If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or  
 121773 '^' character:

- 121774 1. If the cursor is in column position 1, the <control>-D character shall be discarded and no  
 121775 further action taken.
- 121776 2. Otherwise, the <control>-D character shall have no special meaning.

121777 If the last input character was a '0', the cursor shall be moved to column position 1.

121778 Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.  
 121779 In addition, the **autoindent** level for the next input line shall be derived from the same line from  
 121780 which the **autoindent** level for the current input line was derived.

121781 Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the  
 121782 *ex* **shiftwidth** command) boundary.

121783 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 121784 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 121785 page 3561).

121786 *Current line:* Unchanged.

121787 *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to  
 121788 (column -1) - ((column -2) % **shiftwidth**).

121789 **<control>-H**

121790 *Synopsis:* <control>-H

121791 If in text input mode for a line-oriented command, and there are no characters to erase, text  
 121792 input mode shall be terminated, no further action shall be done for this command, and the  
 121793 current line and column shall be unchanged.

121794 If there are characters other than **autoindent** characters that have been input on the current line  
 121795 before the cursor, the cursor shall move back one character.

121796 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is

121797 implementation-defined whether the <control>-H command is an error or if the cursor moves  
 121798 back one **autoindent** character.

121799 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
 121800 input, it is implementation-defined whether the <control>-H command is an error or if it is  
 121801 equivalent to entering <control>-H after the last input character on the previous input line.

121802 Otherwise, it shall be an error.

121803 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 121804 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 121805 page 3561).

121806 The current erase character (see *stty*) shall cause an equivalent action to the <control>-H  
 121807 command, unless the previously inserted character was a <backslash>, in which case it shall be  
 121808 as if the literal current erase character had been inserted instead of the <backslash>.

121809 *Current line*: Unchanged, unless previously input lines are erased, in which case it shall be set to  
 121810 line -1.

121811 *Current column*: Set to the first column that displays any portion of the character backed up over.

121812 **<newline>**

121813 *Synopsis*:     <newline>  
 121814                 <carriage-return>  
 121815                 <control>-J  
 121816                 <control>-M

121817 If input was part of a line-oriented command, text input mode shall be terminated and the  
 121818 command shall continue execution with the input provided.

121819 Otherwise, terminate the current line. If there are no characters other than **autoindent** characters  
 121820 on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the  
 121821 **autoindent** characters in the line are modified by entering these characters.

121822 Continue text input mode on a new line appended after the current line. If the **slowopen** edit  
 121823 option is set, the lines on the screen below the current line shall not be pushed down, but the  
 121824 first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the  
 121825 screen below the current line shall be pushed down.

121826 If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be  
 121827 added as a prefix to the line as described by the *ex* **autoindent** edit option.

121828 All columns after the cursor that are erase-columns (as described in [Input Mode Commands in vi](#),  
 121829 on page 3561) shall be discarded.

121830 If the **autoindent** edit option is set, all <blank> characters immediately following the cursor shall  
 121831 be discarded.

121832 All remaining characters after the cursor shall be transferred to the new line, positioned after  
 121833 any **autoindent** characters.

121834 *Current line*: Set to current line +1.

121835 *Current column*: Set to the first column that displays any portion of the first character after the  
 121836 **autoindent** characters on the new line, if any, or the first column position after the last  
 121837 **autoindent** character, if any, or column position 1.

121838        **<control>-T**121839        *Synopsis:*        <control>-T121840        The <control>-T character shall have no special meaning when in text input mode for a line-oriented command (see [Command Descriptions in vi](#), on page 3527).

121841        This command need not be supported on block-mode terminals.

121842        Behave as if the user entered the minimum number of <blank> characters necessary to move the cursor forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth** command) boundary.121843        *Current line:* Unchanged.121844        *Current column:* Set to  $column + \mathbf{shiftwidth} - ((column - 1) \% \mathbf{shiftwidth})$ .121848        **<control>-U**121849        *Synopsis:*        <control>-U121850        If there are characters other than **autoindent** characters that have been input on the current line before the cursor, the cursor shall move to the first character input after the **autoindent** characters.121851        Otherwise, if there are **autoindent** characters on the current line before the cursor, it is implementation-defined whether the <control>-U command is an error or if the cursor moves to the first column position on the line.

121852        Otherwise, if the cursor is in column position 1 and there are previous lines that have been input, it is implementation-defined whether the &lt;control&gt;-U command is an error or if it is equivalent to entering &lt;control&gt;-U after the last input character on the previous input line.

121853        Otherwise, it shall be an error.

121854        All of the glyphs on columns between the starting cursor position and (inclusively) the ending cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on page 3561).121855        The current *kill* character (see *stty*) shall cause an equivalent action to the <control>-U command, unless the previously inserted character was a <backslash>, in which case it shall be as if the literal current *kill* character had been inserted instead of the <backslash>.121856        *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to line -1.121857        *Current column:* Set to the first column that displays any portion of the last character backed up over.121866        **<control>-V**121867        *Synopsis:*        <control>-V

121868        &lt;control&gt;-Q

121869        Allow the entry of any subsequent character, other than &lt;control&gt;-J or the &lt;newline&gt;, as a literal character, removing any special meaning that it may have to the editor in text input mode. If a &lt;control&gt;-V or &lt;control&gt;-Q is entered before a &lt;control&gt;-J or &lt;newline&gt;, the &lt;control&gt;-V or &lt;control&gt;-Q character shall be discarded, and the &lt;control&gt;-J or &lt;newline&gt; shall behave as described in the &lt;newline&gt; command character during input mode.

121870        For purposes of the display only, the editor shall behave as if a '^' character was entered, and

121879 the cursor shall be positioned as if overwriting the '^' character. When a subsequent character  
 121880 is entered, the editor shall behave as if that character was entered instead of the original  
 121881 <control>-V or <control>-Q character.

121882 *Current line:* Unchanged.

121883 *Current column:* Unchanged.

#### 121884 <control>-W

121885 *Synopsis:* <control>-W

121886 If there are characters other than **autoindent** characters that have been input on the current line  
 121887 before the cursor, the cursor shall move back over the last word preceding the cursor (including  
 121888 any <blank> characters between the end of the last word and the current cursor); the cursor shall  
 121889 not move to before the first character after the end of any **autoindent** characters.

121890 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 121891 implementation-defined whether the <control>-W command is an error or if the cursor moves to  
 121892 the first column position on the line.

121893 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
 121894 input, it is implementation-defined whether the <control>-W command is an error or if it is  
 121895 equivalent to entering <control>-W after the last input character on the previous input line.

121896 Otherwise, it shall be an error.

121897 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 121898 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 121899 page 3561).

121900 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
 121901 line -1.

121902 *Current column:* Set to the first column that displays any portion of the last character backed up  
 121903 over.

#### 121904 <ESC>

121905 *Synopsis:* <ESC>

121906 If input was part of a line-oriented command:

- 121907 1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to  
 121908 command mode. The terminal shall be alerted.
- 121909 2. If <ESC> was entered, text input mode shall be terminated and the command shall  
 121910 continue execution with the input provided.

121911 Otherwise, terminate text input mode and return to command mode.

121912 Any **autoindent** characters entered on newly created lines that have no other non-<newline>  
 121913 characters shall be deleted.

121914 Any leading **autoindent** and <blank> characters on newly created lines shall be rewritten to be  
 121915 the minimum number of <blank> characters possible.

121916 The screen shall be redisplayed as necessary to match the contents of the edit buffer.

121917 *Current line:* Unchanged.

121918 *Current column:*

- 121919 1. If there are text input characters on the current line, the column shall be set to the last  
121920 column where any portion of the last text input character is displayed.
- 121921 2. Otherwise, if a character is displayed in the current column, unchanged.
- 121922 3. Otherwise, set to column position 1.

#### 121923 **EXIT STATUS**

121924 The following exit values shall be returned:

- 121925 0 Successful completion.
- 121926 >0 An error occurred.

#### 121927 **CONSEQUENCES OF ERRORS**

121928 When an unrecoverable error is encountered it shall be equivalent to a SIGHUP asynchronous  
121929 event.

121930 Otherwise, when an error is encountered, the editor shall behave as specified in [Command](#)  
121931 [Descriptions in vi](#) (on page 3527).

#### 121932 **APPLICATION USAGE**

121933 None.

#### 121934 **EXAMPLES**

121935 None.

#### 121936 **RATIONALE**

121937 See the RATIONALE for *ex* for more information on *vi*. Major portions of the *vi* utility  
121938 specification point to *ex* to avoid inadvertent divergence. While *ex* and *vi* have historically been  
121939 implemented as a single utility, this is not required by POSIX.1-2024.

121940 It is recognized that portions of *vi* would be difficult, if not impossible, to implement  
121941 satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,  
121942 thus it is not a mandatory requirement that such features should work on all terminals. It is the  
121943 intention, however, that a *vi* implementation should provide the full set of capabilities on all  
121944 terminals capable of supporting them.

121945 Historically, *vi* exited immediately if the standard input was not a terminal. POSIX.1-2024  
121946 permits, but does not require, this behavior. An end-of-file condition is not equivalent to an end-  
121947 of-file character. A common end-of-file character, <control>-D, is historically a *vi* command.

121948 The text in the STDOUT section reflects the usage of the verb *display* in this section; some  
121949 implementations of *vi* use standard output to write to the terminal, but POSIX.1-2024 does not  
121950 require that to be the case.

121951 Historically, implementations reverted to open mode if the terminal was incapable of supporting  
121952 full visual mode. POSIX.1-2024 requires this behavior. Historically, the open mode of *vi* behaved  
121953 roughly equivalently to the visual mode, with the exception that only a single line from the edit  
121954 buffer (one “buffer line”) was kept current at any time. This line was normally displayed on the  
121955 next-to-last line of a terminal with cursor addressing (and the last line performed its normal  
121956 visual functions for line-oriented commands and messages). In addition, some few commands  
121957 behaved differently in open mode than in visual mode. POSIX.1-2024 requires conformance to  
121958 historical practice.

121959 Historically, *ex* and *vi* implementations have expected text to proceed in the usual  
121960 European/Latin order of left to right, top to bottom. There is no requirement in POSIX.1-2024  
121961 that this be the case. The specification was deliberately written using words like “before”,

121962 ``after'', ``first'', and ``last'' in order to permit implementations to support the natural text order  
121963 of the language.

121964 Historically, lines past the end of the edit buffer were marked with single <tilde> ('~')  
121965 characters; that is, if the one-based display was 20 lines in length, and the last line of the file was  
121966 on line one, then lines 2-20 would contain only a single '~' character.

121967 Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it  
121968 did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the  
121969 bottom of the screen, the screen lines where the line would have been displayed were displayed  
121970 as single '@' characters, instead of displaying part of the line. POSIX.1-2024 permits, but does  
121971 not require, this behavior. Implementations are encouraged to attempt always to display a  
121972 complete line at the bottom of the screen when doing scrolling or screen positioning by buffer  
121973 lines.

121974 Historically, lines marked with '@' were also used to minimize output to dumb terminals over  
121975 slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen  
121976 that were not close to the cursor were simply marked with an '@' sign instead of being updated  
121977 to match the current text. POSIX.1-2024 permits, but does not require this feature because it is  
121978 used ever less frequently as terminals become smarter and connections are faster.

### 121979 Initialization in *ex* and *vi*

121980 Historically, *vi* always had a line in the edit buffer, even if the edit buffer was ``empty''. For  
121981 example:

- 121982 1. The *ex* command = executed from visual mode wrote ``1'' when the buffer was empty.
- 121983 2. Writes from visual mode of an empty edit buffer wrote files of a single character (a  
121984 <newline>), while writes from *ex* mode of an empty edit buffer wrote empty files.
- 121985 3. Put and read commands into an empty edit buffer left an empty line at the top of the edit  
121986 buffer.

121987 For consistency, POSIX.1-2024 does not permit any of these behaviors.

121988 Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was  
121989 modified if it was not originally set. POSIX.1-2024 does not permit this behavior.

### 121990 Command Descriptions in *vi*

121991 Motion commands are among the most complicated aspects of *vi* to describe. With some  
121992 exceptions, the text region and buffer type effect of a motion command on a *vi* command are  
121993 described on a case-by-case basis. The descriptions of text regions in POSIX.1-2024 are not  
121994 intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a  
121995 region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can  
121996 be in either direction, and, if the **wrapsan** option is set, so can movements to search points.  
121997 Historically, lines are always stored into buffers in text order; that is, from the start of the edit  
121998 buffer to the end. POSIX.1-2024 requires conformance to historical practice.

121999 Historically, command counts were applied to any associated motion, and were multiplicative to  
122000 any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**.  
122001 POSIX.1-2024 requires this behavior. Historically, *vi* commands that used bigwords, words,  
122002 paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only  
122003 <blank> characters, inconsistently. Some commands treated them as a single entity, while others  
122004 treated each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty  
122005 lines as individual words; that is, the command would move the cursor to each new empty line.

122006 The **e** and **E** commands treated groups of empty lines as a single word; that is, the first use  
 122007 would move past the group of lines. The **b** command would just beep at the user, or if done from  
 122008 the start of the line as a motion command, fail in unexpected ways. If the lines contained only (or  
 122009 ended with) <blank> characters, the **w** and **W** commands would just beep at the user, the **E** and  
 122010 **e** commands would treat the group as a single word, and the **B** and **b** commands would treat the  
 122011 lines as individual words. For consistency and simplicity of specification, POSIX.1-2024 requires  
 122012 that all *vi* commands treat groups of empty or blank lines as a single entity, and that movement  
 122013 through lines ending with <blank> characters be consistent with other movements.

122014 Historically, *vi* documentation indicated that any number of double-quotes were skipped after  
 122015 punctuation marks at sentence boundaries; however, implementations only skipped single-  
 122016 quotes. POSIX.1-2024 requires both to be skipped.

122017 Historically, the first and last characters in the edit buffer were word boundaries. This historical  
 122018 practice is required by POSIX.1-2024.

122019 Historically, *vi* attempted to update the minimum number of columns on the screen possible,  
 122020 which could lead to misleading information being displayed. POSIX.1-2024 makes no  
 122021 requirements other than that the current character being entered is displayed correctly, leaving  
 122022 all other decisions in this area up to the implementation.

122023 Historically, lines were arbitrarily folded between columns of any characters that required  
 122024 multiple column positions on the screen, with the exception of tabs, which terminated at the  
 122025 right-hand margin. POSIX.1-2024 permits the former and requires the latter. Implementations  
 122026 that do not arbitrarily break lines between columns of characters that occupy multiple column  
 122027 positions should not permit the cursor to rest on a column that does not contain any part of a  
 122028 character.

122029 The historical *vi* had a problem in that all movements were by buffer lines, not by display or  
 122030 screen lines. This is often the right thing to do; for example, single line movements, such as **j** or  
 122031 **k**, should work on buffer lines. Commands like **dj**, or **j.**, where **.** is a change command, only  
 122032 make sense for buffer lines. It is not, however, the right thing to do for screen motion or scrolling  
 122033 commands like <control>-D, <control>-F, and **H**. If the window is fairly small, using buffer lines  
 122034 in these cases can result in completely random motion; for example, **1<control>-D** can result in a  
 122035 completely changed screen, without any overlap. This is clearly not what the user wanted. The  
 122036 problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at  
 122037 the first non-<blank> of the line, they may all refer to the same location in large lines, and will  
 122038 result in no movement at all.

122039 In addition, if the line is larger than the screen, using buffer lines can make it impossible to  
 122040 display parts of the line—there are not any commands that do not display the beginning of the  
 122041 line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the  
 122042 same time, the user suffers. Finally, the page and half-page scrolling commands historically  
 122043 moved to the first non-<blank> in the new line. If the line is approximately the same size as the  
 122044 screen, this is inadequate because the cursor before and after a <control>-D command will refer  
 122045 to the same location on the screen.

122046 Implementations of *ex* and *vi* exist that do not have these problems because the relevant  
 122047 commands (<control>-B, <control>-D, <control>-F, <control>-U, <control>-Y, <control>-E, **H**, **L**,  
 122048 and **M**) operate on display (screen) lines, not (edit) buffer lines.

122049 POSIX.1-2024 does not permit this behavior by default because the standard developers believed  
 122050 that users would find it too confusing. However, historical practice has been relaxed. For  
 122051 example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part of a  
 122052 line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of the  
 122053 line was displayed, and the screen lines corresponding to the line contained single '@'

122054 characters. This behavior is permitted, but not required by POSIX.1-2024, so that it is possible for  
122055 implementations to support long lines in small screens more reasonably without changing the  
122056 commands to be oriented to the display (instead of oriented to the buffer). POSIX.1-2024 also  
122057 permits implementations to refuse to edit any edit buffer containing a line that will not fit on the  
122058 screen in its entirety.

122059 The display area (for example, the value of the **window** edit option) has historically been  
122060 “grown”, or expanded, to display new text when local movements are done in displays where  
122061 the number of lines displayed is less than the maximum possible. Expansion has historically  
122062 been the first choice, when the target line is less than the maximum possible expansion value  
122063 away. Scrolling has historically been the next choice, done when the target line is less than half a  
122064 display away, and otherwise, the screen was redrawn. There were exceptions, however, in that *ex*  
122065 commands generally always caused the screen to be redrawn. POSIX.1-2024 does not specify a  
122066 standard behavior because there may be external issues, such as connection speed, the number  
122067 of characters necessary to redraw as opposed to scroll, or terminal capabilities that  
122068 implementations will have to accommodate.

122069 The current line in POSIX.1-2024 maps one-to-one to a buffer line in the file. The current column  
122070 does not. There are two different column values that are described by POSIX.1-2024. The first is  
122071 the current column value as set by many of the *vi* commands. This value is remembered for the  
122072 lifetime of the editor. The second column value is the actual position on the screen where the  
122073 cursor rests. The two are not always the same. For example, when the cursor is backed by a  
122074 multi-column character, the actual cursor position on the screen has historically been the last  
122075 column of the character in command mode, and the first column of the character in input mode.

122076 Commands that set the current line, but that do not set the current cursor value (for example, **j**  
122077 and **k**) attempt to get as close as possible to the remembered column position, so that the cursor  
122078 tends to restrict itself to a vertical column as the user moves around in the edit buffer.  
122079 POSIX.1-2024 requires conformance to historical practice, requiring that the display location of  
122080 the cursor on the display line be adjusted from the current column value as necessary to support  
122081 this historical behavior.

122082 Historically, only a single line (and for some terminals, a single line minus 1 column) of  
122083 characters could be entered by the user for the line-oriented commands; that is, **:**, **!**, **/**, or **?**.  
122084 POSIX.1-2024 permits, but does not require, this limitation.

122085 Historically, “soft” errors in *vi* caused the terminal to be alerted, but no error message was  
122086 displayed. As a general rule, no error message was displayed for errors in command execution  
122087 in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when  
122088 a searched-for object was not found. Examples of soft errors included **h** at the left margin,  
122089 **<control>-B** or **[** at the beginning of the file, **2G** at the end of the file, and so on. In addition,  
122090 errors such as **%**, **]**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well.  
122091 Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n**  
122092 displayed an error message if no previous regular expression had been specified, and **;** did not  
122093 display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in  
122094 this area might reasonably be based on a runtime evaluation of the speed of a network  
122095 connection. Finally, some implementations have provided error messages for soft errors in order  
122096 to assist naive users, based on the value of a verbose edit option. POSIX.1-2024 does not list  
122097 specific errors for which an error message shall be displayed. Implementations should conform  
122098 to historical practice in the absence of any strong reason to diverge.

122099

**Page Backwards**

122100

122101

122102

122103

122104

122105

122106

122107

122108

The <control>-B and <control>-F commands historically considered it an error to attempt to page past the beginning or end of the file, whereas the <control>-D and <control>-U commands simply moved to the beginning or end of the file. For consistency, POSIX.1-2024 requires the latter behavior for all four commands. All four commands still consider it an error if the current line is at the beginning (<control>-B, <control>-U) or end (<control>-F, <control>-D) of the file. Historically, the <control>-B and <control>-F commands skip two lines in order to include overlapping lines when a single command is entered. This makes less sense in the presence of a *count*, as there will be, by definition, no overlapping lines. The actual calculation used by historical implementations of the *vi* editor for <control>-B was:

122109

```
((current first line) - count x (window edit option)) +2
```

122110

and for <control>-F was:

122111

```
((current first line) + count x (window edit option)) -2
```

122112

122113

122114

122115

This calculation does not work well when intermixing commands with and without counts; for example, 3<control>-F is not equivalent to entering the <control>-F command three times, and is not reversible by entering the <control>-B command three times. For consistency with other *vi* commands that take counts, POSIX.1-2024 requires a different calculation.

122116

**Scroll Forward**

122117

122118

The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll** command. 4BSD used:

122119

```
((window edit option) +1) /2
```

122120

122121

122122

122123

while System V used the value of the **scroll** edit option. The System V version is specified by POSIX.1-2024 because the standard developers believed that it was more intuitive and permitted the user a method of setting the scroll value initially without also setting the number of lines that are displayed.

122124

**Scroll Forward by Line**

122125

122126

122127

122128

122129

Historically, the <control>-E and <control>-Y commands considered it an error if the last and first lines, respectively, were already on the screen. POSIX.1-2024 requires conformance to historical practice. Historically, the <control>-E and <control>-Y commands had no effect in open mode. For simplicity and consistency of specification, POSIX.1-2024 requires that they behave as usual, albeit with a single line screen.

122130

**Clear and Redisplay**

122131

122132

122133

122134

122135

The historical <control>-L command refreshed the screen exactly as it was supposed to be currently displayed, replacing any '@' characters for lines that had been deleted but not updated on the screen with refreshed '@' characters. The intent of the <control>-L command is to refresh when the screen has been accidentally overwritten; for example, by a **write** command from another user, or modem noise.

### 122136 **Redraw Screen**

122137 The historical <control>-R command redisplayed only when necessary to update lines that had  
 122138 been deleted but not updated on the screen and that were flagged with '@' characters. There is  
 122139 no requirement that the screen be in any way refreshed if no lines of this form are currently  
 122140 displayed. POSIX.1-2024 permits implementations to extend this command to refresh lines on  
 122141 the screen flagged with '@' characters because they are too long to be displayed in the current  
 122142 framework; however, the current line and column need not be modified.

### 122143 **Search for tagstring**

122144 Historically, the first non-<blank> at or after the cursor was the first character, and all  
 122145 subsequent characters that were word characters, up to the end of the line, were included. For  
 122146 example, with the cursor on the leading <space> or on the '#' character in the text "#bar@",  
 122147 the tag was "#bar". On the character 'b' it was "bar", and on the 'a' it was "ar".  
 122148 POSIX.1-2024 requires this behavior.

### 122149 **Replace Text with Results from Shell Command**

122150 Historically, the <, >, and ! commands considered most cursor motions other than line-oriented  
 122151 motions an error; for example, the command >/foo<CR> succeeded, while the command >I  
 122152 failed, even though the text region described by the two commands might be identical. For  
 122153 consistency, all three commands only consider entire lines and not partial lines, and the region is  
 122154 defined as any line that contains a character that was specified by the motion.

### 122155 **Move to Matching Character**

122156 Other matching characters have been left implementation-defined in order to allow extensions  
 122157 such as matching '<' and '>' for searching HTML, or #ifdef, #else, and #endif for searching C  
 122158 source.

### 122159 **Repeat Substitution**

122160 POSIX.1-2024 requires that any c and g flags specified to the previous substitute command be  
 122161 ignored; however, the r flag may still apply, if supported by the implementation.

### 122162 **Return to Previous (Context or Section)**

122163 The [, ], (, ), {, and } commands are all affected by "section boundaries", but in some historical  
 122164 implementations not all of the commands recognize the same section boundaries. This is a bug,  
 122165 not a feature, and a unique section-boundary algorithm was not described for each command.  
 122166 One special case that is preserved is that the sentence command moves to the end of the last line  
 122167 of the edit buffer while the other commands go to the beginning, in order to preserve the  
 122168 traditional character cut semantics of the sentence command. Historically, vi section boundaries  
 122169 at the beginning and end of the edit buffer were the first non-<blank> on the first and last lines  
 122170 of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit  
 122171 buffer if one exists. To increase consistency with other section locations, this has been simplified  
 122172 by POSIX.1-2024 to the first character of the first and last lines of the edit buffer, or the first and  
 122173 the last lines of the edit buffer if they are empty.

122174 Sentence boundaries were problematic in the historical vi. They were not only the boundaries as  
 122175 defined for the section and paragraph commands, but they were the first non-<blank> that  
 122176 occurred after those boundaries, as well. Historically, the vi section commands were  
 122177 documented as taking an optional window size as a count preceding the command. This was not  
 122178 implemented in historical versions, so POSIX.1-2024 requires that the count repeat the command,

122179 for consistency with other *vi* commands.

### 122180 **Repeat**

122181 Historically, mapped commands other than text input commands could not be repeated using  
122182 the **period** command. POSIX.1-2024 requires conformance to historical practice.

122183 The restrictions on the interpretation of special characters (for example, <control>-H) in the  
122184 repetition of text input mode commands is intended to match historical practice. For example,  
122185 given the input sequence:

```
122186 iab<control>-H<control>-H<control>-Hdef<escape>
```

122187 the user should be informed of an error when the sequence is first entered, but not during a  
122188 command repetition. The character <control>-T is specifically exempted from this restriction.  
122189 Historical implementations of *vi* ignored <control>-T characters that were input in the original  
122190 command during command repetition. POSIX.1-2024 prohibits this behavior.

### 122191 **Find Regular Expression**

122192 Historically, commands did not affect the line searched to or from if the motion command was a  
122193 search (*/*, *?*, **N**, **n**) and the final position was the start/end of the line. There were some special  
122194 cases and *vi* was not consistent. POSIX.1-2024 does not permit this behavior, for consistency.  
122195 Historical implementations permitted but were unable to handle searches as motion commands  
122196 that wrapped (that is, due to the edit option **wrapsan**) to the original location. POSIX.1-2024  
122197 requires that this behavior be treated as an error.

122198 Historically, the syntax `"/RE/0"` was used to force the command to cut text in line mode.  
122199 POSIX.1-2024 requires conformance to historical practice.

122200 Historically, in open mode, a **z** specified to a search command redisplayed the current line  
122201 instead of displaying the current screen with the current line highlighted. For consistency and  
122202 simplicity of specification, POSIX.1-2024 does not permit this behavior.

122203 Historically, trailing **z** commands were permitted and ignored if entered as part of a search used  
122204 as a motion command. For consistency and simplicity of specification, POSIX.1-2024 does not  
122205 permit this behavior.

### 122206 **Execute an ex Command**

122207 Historically, *vi* implementations restricted the commands that could be entered on the colon  
122208 command line (for example, **append** and **change**), and some other commands were known to  
122209 cause them to fail catastrophically. For consistency, POSIX.1-2024 does not permit these  
122210 restrictions. When executing an *ex* command by entering `:`, it is not possible to enter a <newline>  
122211 as part of the command because it is considered the end of the command. A different approach  
122212 is to enter *ex* command mode by using the *vi* **Q** command (and later resuming visual mode with  
122213 the *ex* **vi** command). In *ex* command mode, the single-line limitation does not exist. So, for  
122214 example, the following is valid:

```
122215 Q
122216 s/break here/break\
122217 here/
122218 vi
```

122219 POSIX.1-2024 requires that, if the *ex* command overwrites any part of the screen that would be  
122220 erased by a refresh, *vi* pauses for a character from the user. Historically, this character could be  
122221 any character; for example, a character input by the user before the message appeared, or even a

122222 mapped character. This is probably a bug, but implementations that have tried to be more  
122223 rigorous by requiring that the user enter a specific character, or that the user enter a character  
122224 after the message was displayed, have been forced by user indignation back into historical  
122225 behavior. POSIX.1-2024 requires conformance to historical practice.

#### 122226 **Shift Left (Right)**

122227 Refer to the Rationale for the **!** and **/** commands. Historically, the **<** and **>** commands sometimes  
122228 moved the cursor to the first non-**<blank>** (for example if the command was repeated or with **\_**  
122229 as the motion command), and sometimes left it unchanged. POSIX.1-2024 does not permit this  
122230 inconsistency, requiring instead that the cursor always move to the first non-**<blank>**.  
122231 Historically, the **<** and **>** commands did not support buffer arguments, although some  
122232 implementations allow the specification of an optional buffer. This behavior is neither required  
122233 nor disallowed by POSIX.1-2024.

#### 122234 **Execute**

122235 Historically, buffers could execute other buffers, and loops, infinite and otherwise, were  
122236 possible. POSIX.1-2024 requires conformance to historical practice. The *\*buffer* syntax of *ex* is not  
122237 required in *vi*, because it is not historical practice and has been used in some *vi* implementations  
122238 to support additional scripting languages.

#### 122239 **Reverse Case**

122240 Historically, the **~** command ignored any associated *count*, and acted only on the characters in the  
122241 current line. For consistency with other *vi* commands, POSIX.1-2024 requires that an associated  
122242 *count* act on the next *count* characters, and that the command move to subsequent lines if  
122243 warranted by *count*, to make it possible to modify large pieces of text in a reasonably efficient  
122244 manner. There exist *vi* implementations that optionally require an associated motion command  
122245 for the **~** command. Implementations supporting this functionality are encouraged to base it on  
122246 the **tildedop** edit option and handle the text regions and cursor positioning identically to the  
122247 **yank** command.

#### 122248 **Append**

122249 Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line  
122250 *count* times, and did not repeat the subsequent lines of the input text. POSIX.1-2024 requires that  
122251 the entire text input be repeated *count* times.

#### 122252 **Move Backward to Preceding Word**

122253 Historically, *vi* became confused if word commands were used as motion commands in empty  
122254 files. POSIX.1-2024 requires that this be an error. Historical implementations of *vi* had a large  
122255 number of bugs in the word movement commands, and they varied greatly in behavior in the  
122256 presence of empty lines, “words” made up of a single character, and lines containing only  
122257 **<blank>** characters. For consistency and simplicity of specification, POSIX.1-2024 does not  
122258 permit this behavior.

**122259 Change to End-of-Line**

122260 Some historical implementations of the **C** command did not behave as described by  
122261 POSIX.1-2024 when the **\$** key was remapped because they were implemented by pushing the **\$**  
122262 key onto the input queue and reprocessing it. POSIX.1-2024 does not permit this behavior.  
122263 Historically, the **C**, **S**, and **s** commands did not copy replaced text into the numeric buffers. For  
122264 consistency and simplicity of specification, POSIX.1-2024 requires that they behave like their  
122265 respective **c** commands in all respects.

**122266 Delete**

122267 Historically, lines in open mode that were deleted were scrolled up, and an **@** glyph written over  
122268 the beginning of the line. In the case of terminals that are incapable of the necessary cursor  
122269 motions, the editor erased the deleted line from the screen. POSIX.1-2024 requires conformance  
122270 to historical practice; that is, if the terminal cannot display the **'@'** character, the line cannot  
122271 remain on the screen.

**122272 Delete to End-of-Line**

122273 Some historical implementations of the **D** command did not behave as described by  
122274 POSIX.1-2024 when the **\$** key was remapped because they were implemented by pushing the **\$**  
122275 key onto the input queue and reprocessing it. POSIX.1-2024 does not permit this behavior.

**122276 Join**

122277 An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent. POSIX.1-2024  
122278 requires conformance to historical practice. The *vi* **J** command is specified in terms of the *ex* **join**  
122279 command with an *ex* command *count* value. The address correction for a *count* that is past the  
122280 end of the edit buffer is necessary for historical compatibility for both *ex* and *vi*.

**122281 Mark Position**

122282 Historical practice is that only lowercase letters, plus backquote and single-quote, could be used  
122283 to mark a cursor position. POSIX.1-2024 requires conformance to historical practice, but  
122284 encourages implementations to support other characters as marks as well.

**122285 Repeat Regular Expression Find (Forward and Reverse)**

122286 Historically, the **N** and **n** commands could not be used as motion components for the **c**  
122287 command. With the exception of the **cN** command, which worked if the search crossed a line  
122288 boundary, the text region would be discarded, and the user would not be in text input mode. For  
122289 consistency and simplicity of specification, POSIX.1-2024 does not permit this behavior.

**122290 Insert Empty Line (Below and Above)**

122291 Historically, counts to the **O** and **o** commands were used as the number of physical lines to  
122292 open, if the terminal was dumb and the **slowopen** option was not set. This was intended to  
122293 minimize traffic over slow connections and repainting for dumb terminals. POSIX.1-2024 does  
122294 not permit this behavior, requiring that a *count* to the open command behave as for other text  
122295 input commands. This change to historical practice was made for consistency, and because a  
122296 superset of the functionality is provided by the **slowopen** edit option.

### 122297 **Put from Buffer (Following and Before)**

122298 Historically, *counts* to the **p** and **P** commands were ignored if the buffer was a line mode buffer,  
 122299 but were (mostly) implemented as described in POSIX.1-2024 if the buffer was a character mode  
 122300 buffer. Because implementations exist that do not have this limitation, and because pasting lines  
 122301 multiple times is generally useful, POSIX.1-2024 requires that *count* be supported for all **p** and **P**  
 122302 commands.

122303 Historical implementations of *vi* were widely known to have major problems in the **p** and **P**  
 122304 commands, particularly when unusual regions of text were copied into the edit buffer. The  
 122305 standard developers viewed these as bugs, and they are not permitted for consistency and  
 122306 simplicity of specification.

122307 Historically, a **P** or **p** command (or an *ex put* command executed from open or visual mode)  
 122308 executed in an empty file, left an empty line as the first line of the file. For consistency and  
 122309 simplicity of specification, POSIX.1-2024 does not permit this behavior.

### 122310 **Replace Character**

122311 Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as  
 122312 arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return>  
 122313 argument, for which it replaced *count* characters with a single <newline>. POSIX.1-2024 does  
 122314 not permit these inconsistencies.

122315 Historically, the **r** command permitted the <control>-V escaping of entered characters, such as  
 122316 <ESC> and the <carriage-return>; however, it required two leading <control>-V characters  
 122317 instead of one. POSIX.1-2024 requires that this be changed for consistency with the other text  
 122318 input commands of *vi*.

122319 Historically, it is an error to enter the **r** command if there are less than *count* characters at or after  
 122320 the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r**  
 122321 command on empty lines, it would require that too large a *count* be adjusted to match the  
 122322 number of characters at or after the cursor for consistency, which is sufficiently different from  
 122323 historical practice to be avoided. POSIX.1-2024 requires conformance to historical practice.

### 122324 **Replace Characters**

122325 Historically, if there were **autoindent** characters in the line on which the **R** command was run,  
 122326 and **autoindent** was set, the first <newline> would be properly indented and no characters  
 122327 would be replaced by the <newline>. Each additional <newline> would replace *n* characters,  
 122328 where *n* was the number of characters that were needed to indent the rest of the line to the  
 122329 proper indentation level. This behavior is a bug and is not permitted by POSIX.1-2024.

### 122330 **Undo**

122331 Historical practice for cursor positioning after undoing commands was mixed. In most cases,  
 122332 when undoing commands that affected a single line, the cursor was moved to the start of added  
 122333 or changed text, or immediately after deleted text. However, if the user had moved from the line  
 122334 being changed, the column was either set to the first non-<blank>, returned to the origin of the  
 122335 command, or remained unchanged. When undoing commands that affected multiple lines or  
 122336 entire lines, the cursor was moved to the first character in the first line restored. As an example  
 122337 of how inconsistent this was, a search, followed by an **o** text input command, followed by an  
 122338 **undo** would return the cursor to the location where the **o** command was entered, but a **cw**  
 122339 command followed by an **o** command followed by an **undo** would return the cursor to the first  
 122340 non-<blank> of the line. POSIX.1-2024 requires the most useful of these behaviors, and discards  
 122341 the least useful, in the interest of consistency and simplicity of specification.

122342 **Yank**

122343 Historically, the **yank** command did not move to the end of the motion if the motion was in the  
 122344 forward direction. It moved to the end of the motion if the motion was in the backward  
 122345 direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion  
 122346 was on the current line. This was further complicated by the fact that for a number of motion  
 122347 commands, the **yank** command moved the cursor but did not update the screen; for example, a  
 122348 subsequent command would move the cursor from the end of the motion, even though the  
 122349 cursor on the screen had not reflected the cursor movement for the **yank** command.  
 122350 POSIX.1-2024 requires that all **yank** commands associated with backward motions move the  
 122351 cursor to the end of the motion for consistency, and specifically, to make **'** commands as motions  
 122352 consistent with search patterns as motions.

122353 **Yank Current Line**

122354 Some historical implementations of the **Y** command did not behave as described by  
 122355 POSIX.1-2024 when the **'\_'** key was remapped because they were implemented by pushing the  
 122356 **'\_'** key onto the input queue and reprocessing it. POSIX.1-2024 does not permit this behavior.

122357 **Redraw Window**

122358 Historically, the **z** command always redrew the screen. This is permitted but not required by  
 122359 POSIX.1-2024, because of the frequent use of the **z** command in macros such as **map n nz.** for  
 122360 screen positioning, instead of its use to change the screen size. The standard developers  
 122361 believed that expanding or scrolling the screen offered a better interface for users. The ability to  
 122362 redraw the screen is preserved if the optional new window size is specified, and in the  
 122363 **<control>-L** and **<control>-R** commands.

122364 The semantics of **z^** are confusing at best. Historical practice is that the screen before the screen  
 122365 that ended with the specified line is displayed. POSIX.1-2024 requires conformance to historical  
 122366 practice.

122367 Historically, the **z** command would not display a partial line at the top or bottom of the screen. If  
 122368 the partial line would normally have been displayed at the bottom of the screen, the command  
 122369 worked, but the partial line was replaced with **'@'** characters. If the partial line would normally  
 122370 have been displayed at the top of the screen, the command would fail. For consistency and  
 122371 simplicity of specification, POSIX.1-2024 does not permit this behavior.

122372 Historically, the **z** command with a line specification of 1 ignored the command. For consistency  
 122373 and simplicity of specification, POSIX.1-2024 does not permit this behavior.

122374 Historically, the **z** command did not set the cursor column to the first non-**<blank>** for the  
 122375 character if the first screen was to be displayed, and was already displayed. For consistency and  
 122376 simplicity of specification, POSIX.1-2024 does not permit this behavior.

122377 **Input Mode Commands in vi**

122378 Historical implementations of **vi** did not permit the user to erase more than a single line of input,  
 122379 or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase **autoindent**  
 122380 characters. As there exist implementations of **vi** that do not have these limitations, both  
 122381 behaviors are permitted, but only historical practice is required. In the case of these extensions,  
 122382 **vi** is required to pause at the **autoindent** and previous line boundaries.

122383 Historical implementations of **vi** updated only the portion of the screen where the current cursor  
 122384 character was displayed. For example, consider the **vi** input keystrokes:

122385 `iabcd<escape>0C<tab>`

122386 Historically, the <tab> would overwrite the characters "abcd" when it was displayed. Other  
 122387 implementations replace only the 'a' character with the <tab>, and then push the rest of the  
 122388 characters ahead of the cursor. Both implementations have problems. The historical  
 122389 implementation is probably visually nicer for the above example; however, for the keystrokes:

122390 iabcd<ESC>OR<tab><ESC>

122391 the historical implementation results in the string "bcd" disappearing and then magically  
 122392 reappearing when the <ESC> character is entered. POSIX.1-2024 requires the former behavior  
 122393 when overwriting erase-columns—that is, overwriting characters that are no longer logically  
 122394 part of the edit buffer—and the latter behavior otherwise.

122395 Historical implementations of *vi* discarded the <control>-D and <control>-T characters when  
 122396 they were entered at places where their command functionality was not appropriate.  
 122397 POSIX.1-2024 requires that the <control>-T functionality always be available, and that  
 122398 <control>-D be treated as any other key when not operating on **autoindent** characters.

## 122399 NUL

122400 Some historical implementations of *vi* limited the number of characters entered using the NUL  
 122401 input character to 256 bytes. POSIX.1-2024 permits this limitation; however, implementations are  
 122402 encouraged to remove this limit.

## 122403 <control>-D

122404 See also Rationale for the input mode command <newline>. The hidden assumptions in the  
 122405 <control>-D command (and in the *vi* **autoindent** specification in general) is that <space>  
 122406 characters take up a single column on the screen and that <tab> characters are comprised of an  
 122407 integral number of <space> characters.

## 122408 <newline>

122409 Implementations are permitted to rewrite **autoindent** characters in the line when <newline>,  
 122410 <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are  
 122411 used, because historical implementations have both done so and found it necessary to do so. For  
 122412 example, a <control>-D when the cursor is preceded by a single <tab>, with **tabstop** set to 8, and  
 122413 **shiftwidth** set to 3, will result in the <tab> being replaced by several <space> characters.

## 122414 <control>-T

122415 See also the Rationale for the input mode command <newline>. Historically, <control>-T only  
 122416 worked if no non-<blank> characters had yet been input in the current input line. In addition,  
 122417 the characters inserted by <control>-T were treated as **autoindent** characters, and could not be  
 122418 erased using normal user erase characters. Because implementations exist that do not have  
 122419 these limitations, and as moving to a column boundary is generally useful, POSIX.1-2024  
 122420 requires that both limitations be removed.

- 122421           **<control>-V**
- 122422           Historically, *vi* used **^V**, regardless of the value of the literal-next character of the terminal.  
122423           POSIX.1-2024 requires conformance to historical practice.
- 122424           The uses described for **<control>-V** can also be accomplished with **<control>-Q**, which is useful  
122425           on terminals that use **<control>-V** for the down-arrow function. However, most historical  
122426           implementations use **<control>-Q** for the *termios* START character, so the editor will generally  
122427           not receive the **<control>-Q** unless **stty ixon** mode is set to off. (In addition, some historical  
122428           implementations of *vi* explicitly set **ixon** mode to on, so it was difficult for the user to set it to  
122429           off.) Any of the command characters described in POSIX.1-2024 can be made ineffective by their  
122430           selection as *termios* control characters, using the *stty* utility or other methods described in the  
122431           System Interfaces volume of POSIX.1-2024.
- 122432           **<ESC>**
- 122433           Historically, SIGINT alerted the terminal when used to end input mode. This behavior is  
122434           permitted, but not required, by POSIX.1-2024.
- 122435           **FUTURE DIRECTIONS**
- 122436           If this utility is directed to create a new directory entry that contains any bytes that have the  
122437           encoded value of a **<newline>** character, implementations are encouraged to treat this as an  
122438           error. A future version of this standard may require implementations to treat this as an error.
- 122439           **SEE ALSO**
- 122440           *ed, ex, stty*
- 122441           XBD [Section 12.2](#) (on page 215)
- 122442           **CHANGE HISTORY**
- 122443           First released in Issue 2.
- 122444           **Issue 5**
- 122445           The FUTURE DIRECTIONS section is added.
- 122446           **Issue 6**
- 122447           This utility is marked as part of the User Portability Utilities option.
- 122448           The APPLICATION USAGE section is added.
- 122449           The obsolescent SYNOPSIS is removed.
- 122450           The following new requirements on POSIX implementations derive from alignment with the  
122451           Single UNIX Specification:
- 122452
  - The **reindent** command description is added.

122453           The *vi* utility has been extensively rewritten for alignment with the IEEE P1003.2b draft  
122454           standard.

122455           IEEE PASC Interpretations 1003.2 #57, #62, #63, #64, #78, and #188 are applied.

122456           IEEE PASC Interpretation 1003.2 #207 is applied, clarifying the description of the **R** command in  
122457           a manner similar to the descriptions of other text input mode commands such as **i**, **o**, and **O**.

122458           The **-l** option is removed.

122459           IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/41 is applied, adding *[count]* to the  
122460           Synopsis for **[[**.

122461           IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/42 is applied, adding *[count]* to the

- 122462 Synopsis for `ll`.
- 122463 **Issue 7**
- 122464 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
122465 as an option delimiter in the `OPTIONS` section.
- 122466 Austin Group Interpretation 1003.1-2001 #087 is applied, updating the `Put from Buffer Before (P)`  
122467 command description to address multi-line requirements.
- 122468 `SD5-XCU-ERN-97` is applied, updating the `SYNOPSIS`.
- 122469 `POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0202 [812]` is applied.
- 122470 **Issue 8**
- 122471 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
122472 filenames containing any bytes that have the encoded value of a `<newline>` character.
- 122473 Austin Group Defect 1310 is applied, changing the `CONSEQUENCES OF ERRORS` section.
- 122474 Austin Group Defect 1676 is applied, changing the typeface of some bold text in the  
122475 `RATIONALE` section.

122476 **NAME**

122477           wait — await process completion

122478 **SYNOPSIS**122479           wait [*pid*...]122480 **DESCRIPTION**122481           The *wait* utility shall wait for one or more child processes whose process IDs are known in the  
122482           current shell execution environment (see [Section 2.13](#), on page 2522) to terminate.122483           If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
122484           invoking shell have terminated and exit with a zero exit status.122485           If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
122486           wait until all of them have terminated. If one or more *pid* operands are specified that represent  
122487           unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
122488           exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
122489           requested by the last *pid* operand.122490           Once a process ID that is known in the current shell execution environment (see [Section 2.13](#), on  
122491           page 2522) has been successfully waited for, it shall be removed from the list of process IDs that  
122492           are known in the current shell execution environment. If the process ID is associated with a  
122493           background job, the corresponding job shall also be removed from the list of background jobs.122494 **OPTIONS**

122495           None.

122496 **OPERANDS**

122497           The following operand shall be supported:

122498           *pid*           One of the following:

- 122499                           1. The unsigned decimal integer process ID of a child process whose  
122500                           termination the utility is to wait for.
- 122501                           2. A job ID (see [XBD Section 3.182](#), on page 57) that identifies a process group  
122502                           in the case of a job-control background job, or a process ID in the case of a  
122503                           non-job-control background job (if supported), to be waited for. The job ID  
122504                           notation is applicable only for invocations of *wait* in the current shell  
122505                           execution environment; see [Section 2.13](#) (on page 2522). The exit status of  
122506                           *wait* shall be determined by the exit status of the last pipeline to be executed.

122507           **Note:**       The job ID type of *pid* is only available on systems supporting the User  
122508                           Portability Utilities option or supporting non-job-control background  
122509                           jobs.

122510 **STDIN**

122511           Not used.

122512 **INPUT FILES**

122513           None.

122514 **ENVIRONMENT VARIABLES**122515           The following environment variables shall affect the execution of *wait*:

122516           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
122517                           (See [XBD Section 8.2](#) (on page 169) for the precedence of internationalization  
122518                           variables used to determine the values of locale categories.)

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 122519 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 122520 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 122521 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 122539 |                               | If one or more operands were specified, all of them have terminated or were not known in the invoking shell execution environment, and the status of the last operand specified is known, then the exit status of <i>wait</i> shall be the status of the last operand specified. If the process terminated abnormally due to the receipt of a signal, the exit status shall be greater than 128 and shall be distinct from the exit status generated by other signals, but the exact value is unspecified. (See the <i>kill -l</i> option.) Otherwise, the <i>wait</i> utility shall exit with one of the following values: |

| 122554 |                               | This utility is required to be intrinsic. See <a href="#">Section 1.7</a> (on page 2470) for details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 122555 |                               | On most implementations, <i>wait</i> is a shell built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 122556 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 122557 |                               | (wait)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 122558 |                               | nohup wait ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 122559 |                               | find . -exec wait ... \;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 122560 |                               | it returns immediately because there are no known process IDs to wait for in those environments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 122561 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

122562 The use of job ID notation is not dependent on job control being enabled. When job control has  
 122563 been disabled using *set +m*, *wait* can still be used to wait for the process group associated with a  
 122564 job-control background job, or the process ID associated with a non-control background job (if  
 122565 supported), using

```
122566 wait %<background job number>
```

122567 See also the RATIONALE for *jobs* and *kill*.

122568 The shell is allowed to discard the status of any process if it determines that the application  
 122569 cannot get the process ID for that process from the shell. It is also required to remember only  
 122570 {CHILD\_MAX} number of processes in this way. Since the only way to get the process ID from  
 122571 the shell is by using the '!' shell parameter, the shell is allowed to discard the status of an  
 122572 asynchronous AND-OR list if "\$!" was not referenced before another asynchronous AND-OR  
 122573 list was started. (This means that the shell only has to keep the status of the last asynchronous  
 122574 AND-OR list started if the application did not reference "\$!". If the implementation of the shell  
 122575 is smart enough to determine that a reference to "\$!" was not saved anywhere that the  
 122576 application can retrieve it later, it can use this information to trim the list of saved information.  
 122577 Note also that a successful call to *wait* with no operands discards the exit status of all  
 122578 asynchronous AND-OR lists.)

122579 If the exit status of *wait* is greater than 128, there is no way for the application to know if the  
 122580 waited-for process exited with that value or was killed by a signal. Since most utilities exit with  
 122581 small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just  
 122582 need to know that the asynchronous job failed; it does not matter whether it detected an error  
 122583 and failed or was killed and did not complete its job normally.

122584 Some historical shells returned from *wait* when a process stops instead of only when it  
 122585 terminates. This standard does not allow *wait* to return when a process stops for two reasons:

- 122586 1. The vast majority, if not all, shell scripts that use *wait* (without using an extension) expect  
 122587 it not to return until the process terminates.
- 122588 2. It is not possible to write a portable shell script that can correctly handle *wait* returning  
 122589 when a process stops, because an exit status indicating a process was stopped by a signal  
 122590 cannot be distinguished from one indicating that the process called *exit()* with the same  
 122591 value.

122592 The standard developers considered allowing interactive shells to return from *wait* when a  
 122593 process stops, since the interactive user would see a message which would allow them to tell  
 122594 whether the process stopped or terminated. However, they decided that it would be inadvisable  
 122595 to introduce an inconsistency between interactive and non-interactive shells, particularly as the  
 122596 most likely use of *wait* in an interactive shell is to try out commands before putting them in a  
 122597 shell script. Implementations can provide an extension that could be used to request that *wait*  
 122598 returns when a process stops. It is recommended that any such extension uses a different  
 122599 method of returning information about the wait status of the process so that the information can  
 122600 be unambiguous. One suitable method would be an option that takes a variable name as an  
 122601 option-argument. The named variable would be set to a numeric value and the exit status of  
 122602 wait would indicate whether this value is an exit value or a signal number, and whether the  
 122603 signal terminated the process or stopped it. Such an extension would also provide a way for  
 122604 shell scripts to obtain the full exit value (as would be returned by *waitid()*).

## 122605 EXAMPLES

122606 Although the exact value used when a process is terminated by a signal is unspecified, if it is  
 122607 known that a signal terminated a process, a script can still reliably determine which signal by  
 122608 using *kill* as shown by the following script:

```

122609     sleep 1000&
122610     pid=$!
122611     kill -kill $pid
122612     wait $pid
122613     echo $pid was terminated by a SIG$(kill -l $?) signal.

```

122614 If the following sequence of commands is run in less than 31 seconds:

```

122615     sleep 257 | sleep 31 &
122616     jobs -l %%

```

122617 either of the following commands returns the exit status of the second *sleep* in the pipeline:

```

122618     wait <pid of sleep 31>
122619     wait %%

```

#### 122620 RATIONALE

122621 The description of *wait* does not refer to the *waitpid()* function from the System Interfaces  
 122622 volume of POSIX.1-2024 because that would needlessly overspecify this interface. However, the  
 122623 wording means that *wait* is required to wait for an explicit process when it is given an argument  
 122624 so that the status information of other processes is not consumed. Historical implementations  
 122625 use the *wait()* function defined in the System Interfaces volume of POSIX.1-2024 until *wait()*  
 122626 returns the requested process ID or finds that the requested process does not exist. Because this  
 122627 means that a shell script could not reliably get the status of all background children if a second  
 122628 background job was ever started before the first job finished, it is recommended that the *wait*  
 122629 utility use a method such as the functionality provided by the *waitpid()* function.

122630 The ability to wait for multiple *pid* operands was adopted from the KornShell.

122631 This new functionality was added because it is needed to determine the exit status of any  
 122632 asynchronous AND-OR list accurately. The only compatibility problem that this change creates  
 122633 is for a script like

```

122634     while sleep 60 do
122635         job& echo Job started $(date) as $! done

```

122636 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
 122637 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
 122638 occasionally *wait* for jobs it started.

#### 122639 FUTURE DIRECTIONS

122640 A future version of this standard may add an option which takes a variable name as an option-  
 122641 argument, allowing *wait* to return information about the wait status of a process in an  
 122642 unambiguous way.

#### 122647 CHANGE HISTORY

122648 First released in Issue 2.

#### 122649 Issue 8

122650 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
 122651 this utility is required to be intrinsic.

122652 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

122653  
122654

Austin Group Defect 1254 is applied, updating various requirements for the *jobs* utility to account for the addition of [Section 2.11](#) (on page 2518).

122655 **NAME**122656 `wc` — word, line, and byte or character count122657 **SYNOPSIS**122658 `wc [-c|-m] [-lw] [file...]`122659 **DESCRIPTION**122660 The *wc* utility shall read one or more input files and, by default, write the number of <newline>  
122661 characters, words, and bytes contained in each input file to the standard output.122662 The utility also shall write a total count for all named files, if more than one input file is  
122663 specified.122664 The *wc* utility shall consider a *word* to be a non-zero-length string of characters delimited by  
122665 white space.122666 **OPTIONS**122667 The *wc* utility shall conform to XBD [Section 12.2](#) (on page 215).

122668 The following options shall be supported:

122669 `-c` Write to the standard output the number of bytes in each input file.122670 `-l` Write to the standard output the number of <newline> characters in each input  
122671 file.122672 `-m` Write to the standard output the number of characters in each input file.122673 `-w` Write to the standard output the number of words in each input file.122674 When any option is specified, *wc* shall report only the information requested by the specified  
122675 options.122676 **OPERANDS**

122677 The following operand shall be supported:

122678 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
122679 shall be used.122680 **STDIN**122681 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
122682 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
122683 the standard input shall not be used. See the INPUT FILES section.122684 **INPUT FILES**

122685 The input files may be of any type.

122686 **ENVIRONMENT VARIABLES**122687 The following environment variables shall affect the execution of *wc*:122688 *LANG* Provide a default value for the internationalization variables that are unset or null.  
122689 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
122690 variables used to determine the values of locale categories.)122691 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
122692 internationalization variables.122693 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
122694 characters (for example, single-byte as opposed to multi-byte characters in  
122695 arguments and input files) and which characters are defined as white-space  
122696 characters.

- 122697 **LC\_MESSAGES**
- 122698 Determine the locale that should be used to affect the format and contents of
- 122699 diagnostic messages written to standard error and informative messages written to
- 122700 standard output.
- 
- 122701 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 122702 **ASYNCHRONOUS EVENTS**
- 122703 Default.
- 122704 **STDOUT**
- 122705 By default, the standard output shall contain an entry for each input file of the form:
- 122706 "%d %d %d %s\n", <newlines>, <words>, <bytes>, <file>
- 122707 If the **-m** option is specified, the number of characters shall replace the <bytes> field in this
- 122708 format.
- 122709 If any options are specified and the **-l** option is not specified, the number of <newline>
- 122710 characters shall not be written.
- 122711 If any options are specified and the **-w** option is not specified, the number of words shall not be
- 122712 written.
- 122713 If any options are specified and neither **-c** nor **-m** is specified, the number of bytes or characters
- 122714 shall not be written.
- 122715 If no input *file* operands are specified, no name shall be written and no <blank> characters
- 122716 preceding the pathname shall be written.
- 122717 If more than one input *file* operand is specified, an additional line shall be written, of the same
- 122718 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead
- 122719 of a pathname and the total of each column shall be written as appropriate. Such an additional
- 122720 line, if any, is written at the end of the output.
- 122721 **STDERR**
- 122722 The standard error shall be used only for diagnostic messages.
- 122723 **OUTPUT FILES**
- 122724 None.
- 122725 **EXTENDED DESCRIPTION**
- 122726 None.
- 122727 **EXIT STATUS**
- 122728 The following exit values shall be returned:
- 122729 0 Successful completion.
- 122730 >0 An error occurred.
- 122731 **CONSEQUENCES OF ERRORS**
- 122732 Default.

122733 **APPLICATION USAGE**

122734 The `-m` option is not a switch, but an option at the same level as `-c`. Thus, to produce the full  
 122735 default output with character counts instead of bytes, the command required is:

122736 `wc -mlw`

122737 **EXAMPLES**

122738 None.

122739 **RATIONALE**

122740 The output file format pseudo-*printf()* string differs from the System V version of *wc*:

122741 `"%7d%7d%7d %s\n"`

122742 which produces possibly ambiguous and unparseable results for very large files, as it assumes no  
 122743 number shall exceed six digits.

122744 Some historical implementations use only `<space>`, `<tab>`, and `<newline>` as word separators.  
 122745 The equivalent of the ISO C standard *isspace()* function is more appropriate.

122746 The `-c` option stands for “character” count, even though it counts bytes. This stems from the  
 122747 sometimes erroneous historical view that bytes and characters are the same size. Due to  
 122748 international requirements, the `-m` option (reminiscent of “multi-byte”) was added to obtain  
 122749 actual character counts.

122750 Early proposals only specified the results when input files were text files. The current  
 122751 specification more closely matches historical practice. (Bytes, words, and `<newline>` characters  
 122752 are counted separately and the results are written when an end-of-file is detected.)

122753 Historical implementations of the *wc* utility only accepted one argument to specify the options  
 122754 `-c`, `-l`, and `-w`. Some of them also had multiple occurrences of an option cause the  
 122755 corresponding count to be written multiple times and had the order of specification of the  
 122756 options affect the order of the fields on output, but did not document either of these. Because  
 122757 common usage either specifies no options or only one option, and because none of this was  
 122758 documented, the changes required by this volume of POSIX.1-2024 should not break many  
 122759 historical applications (and do not break any historical conforming applications).

122760 **FUTURE DIRECTIONS**

122761 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 122762 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
 122763 format being used, implementations are encouraged to treat this as an error. A future version of  
 122764 this standard may require implementations to treat this as an error.

122765 **SEE ALSO**

122767 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

122768 **CHANGE HISTORY**

122769 First released in Issue 2.

122770 **Issue 7**

122771 Austin Group Interpretation 1003.1-2001 #092 is applied.

122772 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

122773 **Issue 8**

122774 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
122775 directed to display a pathname that contains any bytes that have the encoded value of a  
122776 <newline> character when <newline> is a terminator or separator in the output format being  
122777 used.

122778 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

122779 **NAME**122780 what — identify SCCS files (**DEVELOPMENT**)122781 **SYNOPSIS**122782 XSI `what [-s] file...`122783 **DESCRIPTION**

122784 The *what* utility shall search the given files for all occurrences of the pattern that *get* (see [get](#))  
 122785 substitutes for the %Z% keyword ("@ (#) "). The *what* utility shall write to standard output the  
 122786 identification string that follows up to, but not including, the first occurrence of one of the  
 122787 following: <double-quote> ('"'), <greater-than-sign> ('>'), <newline>, <backslash> ('\\'),  
 122788 <NUL> ('\0'), or an end-of-file condition on the input file. If not at end-of-file, the *what* utility  
 122789 shall then look for the next occurrence of "@ (#) " after one of those characters.

122790 **OPTIONS**122791 The *what* utility shall conform to XBD [Section 12.2](#) (on page 215).

122792 The following option shall be supported:

122793 **-s** Write at most one identification string for each file. After locating and writing to  
 122794 standard output the identification string following the first pattern (if any) in a file,  
 122795 no further data shall be read from that file and the search shall recommence from  
 122796 the beginning of the next file, if any.

122797 **OPERANDS**

122798 The following operands shall be supported:

122799 *file* A pathname of a file to search.122800 **STDIN**

122801 Not used.

122802 **INPUT FILES**

122803 The input files shall be of any file type.

122804 **ENVIRONMENT VARIABLES**122805 The following environment variables shall affect the execution of *what*:

122806 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 122807 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 122808 variables used to determine the values of locale categories.)

122809 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 122810 internationalization variables.

122811 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 122812 characters (for example, single-byte as opposed to multi-byte characters in  
 122813 arguments and input files).

122814 **LC\_MESSAGES**

122815 Determine the locale that should be used to affect the format and contents of  
 122816 diagnostic messages written to standard error.

122817 **NLSPATH** Determine the location of messages objects and message catalogs.

122818 **ASYNCHRONOUS EVENTS**

122819 Default.

122820 **STDOUT**

122821 For each *file* operand, the standard output shall consist of:

122822 "%s:\n", <pathname>

122823 followed by zero or more of:

122824 "\t%s\n", <identification string>

122825 one for each identification string located.

122826 **STDERR**

122827 The standard error shall be used only for diagnostic messages.

122828 **OUTPUT FILES**

122829 None.

122830 **EXTENDED DESCRIPTION**

122831 None.

122832 **EXIT STATUS**

122833 The following exit values shall be returned:

122834 0 One or more matches were found and the output specified in STDOUT was successfully  
122835 written to standard output.

122836 1 No matches were found or an error occurred.

122837 **CONSEQUENCES OF ERRORS**

122838 Default.

122839 **APPLICATION USAGE**

122840 The *what* utility is intended to be used in conjunction with the SCCS command *get*, which  
122841 automatically inserts identifying information, but it can also be used where the information is  
122842 inserted by any other means.

122843 When the string "@ (#) " is included in a library routine in a shared library, it might not be found  
122844 in an **a.out** file using that library routine.

122845 **EXAMPLES**

122846 If the C-language program in file **f.c** contains:

122847 char ident[] = "@ (#) identification information";

122848 and **f.c** is compiled to yield **f.o** and **a.out**, then the command:

122849 what f.c f.o a.out

122850 writes:

122851 f.c:  
122852 identification information

122853 ...

122854 f.o:  
122855 identification information

122856 ...

122857 a.out:  
122858 identification information

122859 ...

122860 **RATIONALE**

122861 This standard requires that when the `-s` option is used, *what* does not continue reading from the  
122862 current file after writing the first identification string. This might seem an unimportant detail,  
122863 but applications would experience different behavior if a *file* operand named a FIFO special file  
122864 and *what* waited for an end-of-file condition rather than closing the file straight away.

122865 **FUTURE DIRECTIONS**

122866 If this utility is directed to display a pathname that contains any bytes that have the encoded  
122867 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
122868 format being used, implementations are encouraged to treat this as an error. A future version of  
122869 this standard may require implementations to treat this as an error.

122870 **SEE ALSO**

122871 *get*  
122872 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

122873 **CHANGE HISTORY**

122874 First released in Issue 2.

122875 **Issue 8**

122876 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
122877 directed to display a pathname that contains any bytes that have the encoded value of a  
122878 `<newline>` character when `<newline>` is a terminator or separator in the output format being  
122879 used.

122880 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

122881 Austin Group Defect 1512 is applied, changing the EXIT STATUS section.

122882 Austin Group Defect 1538 is applied, clarifying the `-s` option.

122883 Austin Group Defect 1563 is applied, clarifying the output format when the *what* utility finds  
122884 multiple identification strings in one file.

122885 **NAME**122886        **who** — display who is on the system122887 **SYNOPSIS**122888 XSI        **who** [-mTu] [-abdHlprt] [*file*]122889 XSI        **who** [-mu] -s [-bHlprt] [*file*]122890        **who** -q [*file*]122891        **who** am i122892        **who** am I122893 **DESCRIPTION**122894        The *who* utility shall list various pieces of information about accessible users. The domain of  
122895 accessibility is implementation-defined.122896 XSI        Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
122897 time since activity occurred on the line, and the process ID of the command interpreter for each  
122898 current system user.122899 **OPTIONS**122900        The *who* utility shall conform to XBD Section 12.2 (on page 215).122901        The following options shall be supported. The metavariables, such as *<line>*, refer to fields  
122902 described in the STDOUT section.122903 XSI        **-a**        Process the implementation-defined database or named file with the **-b**, **-d**, **-l**, **-p**,  
122904 **-r**, **-t**, **-T** and **-u** options turned on.122905 XSI        **-b**        Write the time and date of the last system reboot. The system reboot time is the  
122906 time at which the implementation is able to commence running processes.122907 XSI        **-d**        Write a list of all processes that have expired and not been respawned by the *init*  
122908 system process. The *<exit>* field shall appear for dead processes and contain the  
122909 termination and exit values of the dead process. This can be useful in determining  
122910 why a process terminated.122911 XSI        **-H**        Write column headings above the regular output.122912 XSI        **-l**        (The letter ell.) List only those lines on which the system is waiting for someone to  
122913 login. The *<name>* field shall be **LOGIN** in such cases. Other fields shall be the  
122914 same as for user entries except that the *<state>* field does not exist.122915        **-m**        Output only information about the current terminal.122916 XSI        **-p**        List any other process that is currently active and has been previously spawned by  
122917 *init*.122918 XSI        **-q**        (Quick.) List only the names and the number of users currently logged on. When  
122919 this option is used, all other options shall be ignored.122920 XSI        **-r**        Write the current *run-level* of the *init* process.122921 XSI        **-s**        List only the *<name>*, *<line>*, and *<time>* fields. This is the default case.122922 XSI        **-t**        Indicate the last change to the system clock.122923        **-T**        Show the state of each terminal, as described in the STDOUT section.

122924            **-u**            Write ``idle time'' for each displayed user in addition to any other information. The  
 122925                            idle time is the time since any activity occurred on the user's terminal. The method  
 122926 XSI                           of determining this is unspecified. This option shall list only those users who are  
 122927                            currently logged in. The *<name>* is the user's login name. The *<line>* is the name  
 122928                            of the line as found in the directory */dev*. The *<time>* is the time that the user  
 122929                            logged in. The *<activity>* is the number of hours and minutes since activity last  
 122930                            occurred on that particular line. A dot indicates that the terminal has seen activity  
 122931                            in the last minute and is therefore ``current''. If more than twenty-four hours have  
 122932                            elapsed or the line has not been used since boot time, the entry shall be marked  
 122933                            *<old>*. This field is useful when trying to determine whether a person is working at  
 122934                            the terminal or not. The *<pid>* is the process ID of the user's login process.

#### 122935 OPERANDS

122936 XSI            The following operands shall be supported:

122937            **am i, am I**    In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 122938                            the **-m** option. The **am** and **i** or **I** need to be separate arguments.

122939            *file*           Specify a pathname of a file to substitute for the implementation-defined database  
 122940                            of logged-on users that *who* uses by default.

#### 122941 STDIN

122942            Not used.

#### 122943 INPUT FILES

122944            None.

#### 122945 ENVIRONMENT VARIABLES

122946            The following environment variables shall affect the execution of *who*:

122947            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 122948                            (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 122949                            variables used to determine the values of locale categories.)

122950            **LC\_ALL**           If set to a non-empty string value, override the values of all the other  
 122951                            internationalization variables.

122952            **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 122953                            characters (for example, single-byte as opposed to multi-byte characters in  
 122954                            arguments).

122955            **LC\_MESSAGES**

122956                            Determine the locale that should be used to affect the format and contents of  
 122957                            diagnostic messages written to standard error.

122958            **LC\_TIME**        Determine the locale used for the format and contents of the date and time strings.

122959 XSI            **NLSPATH**        Determine the location of messages objects and message catalogs.

122960            **TZ**             Determine the timezone used when writing date and time information. If **TZ** is  
 122961                            unset or null, an unspecified default timezone shall be used.

#### 122962 ASYNCHRONOUS EVENTS

122963            Default.

#### 122964 STDOUT

122965            The *who* utility shall write its default format to the standard output in an implementation-  
 122966                            defined format, subject only to the requirement of containing the information described above.

122967 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 122968 following general format:

122969 `<name> [<state>] <line> <time> [<activity>] [<pid>] [<comment>] [<exit>]`

122970 For the `-b` option, `<line>` shall be "system boot". The `<name>` is unspecified.

122971 The following format shall be used for the `-T` option:

122972 `"%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
 122973 <time of login>`

122974 where `<terminal state>` is one of the following characters:

122975 + The terminal allows write access to other users.

122976 - The terminal denies write access to other users.

122977 ? The terminal write-access state cannot be determined.

122978 `<space>` This entry is not associated with a terminal.

122979 In the POSIX locale, the `<time of login>` shall be equivalent in format to the output of:

122980 `date +"%b %e %H:%M"`

122981 If the `-u` option is used with `-T`, the idle time shall be added to the end of the previous format in  
 122982 an unspecified format.

#### 122983 **STDERR**

122984 The standard error shall be used only for diagnostic messages.

#### 122985 **OUTPUT FILES**

122986 None.

#### 122987 **EXTENDED DESCRIPTION**

122988 None.

#### 122989 **EXIT STATUS**

122990 The following exit values shall be returned:

122991 0 Successful completion.

122992 >0 An error occurred.

#### 122993 **CONSEQUENCES OF ERRORS**

122994 Default.

#### 122995 **APPLICATION USAGE**

122996 The name *init* used for the system process is the most commonly used on historical systems, but  
 122997 it may vary.

122998 The "domain of accessibility" referred to is a broad concept that permits interpretation either on  
 122999 a very secure basis or even to allow a network-wide implementation like the historical *rwho*.

#### 123000 **EXAMPLES**

123001 None.

#### 123002 **RATIONALE**

123003 Due to differences between historical implementations, the base options provided were a  
 123004 compromise to allow users to work with those functions. The standard developers also  
 123005 considered removing all the options, but felt that these options offered users valuable  
 123006 functionality. Additional options to match historical systems are available on XSI-conformant

- 123007 systems.
- 123008 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
123009 secure environment. The standard developers considered, however, that having some standard  
123010 method of determining the “accessibility” of other users would aid user portability.
- 123011 No format was specified for the default *who* output for systems not supporting the XSI option. In  
123012 such a user-oriented command, designed only for human use, this was not considered to be a  
123013 deficiency.
- 123014 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
123015 that they use the same format.
- 123016 It is acceptable for an implementation to produce no output for an invocation of *who mil*.
- 123017 **FUTURE DIRECTIONS**
- 123018 None.
- 123019 **SEE ALSO**
- 123020 *mesg*
- 123021 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)
- 123022 **CHANGE HISTORY**
- 123023 First released in Issue 2.
- 123024 **Issue 6**
- 123025 This utility is marked as part of the User Portability Utilities option.
- 123026 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.
- 123027 **Issue 7**
- 123028 SD5-XCU-ERN-58 is applied, clarifying the **-b** option.
- 123029 The *who* utility is moved from the User Portability Utilities option to the Base. User Portability  
123030 Utilities is now an option for interactive utilities.
- 123031 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 123032 **Issue 8**
- 123033 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

123034 **NAME**

123035 write — write to another user

123036 **SYNOPSIS**123037 write *user\_name* [*terminal*]123038 **DESCRIPTION**123039 The *write* utility shall read lines from the standard input and write them to the terminal of the  
123040 specified user. When first invoked, it shall write the message:123041 **Message from** *sender-login-id* (*sending-terminal*) [*date*]...123042 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
123043 alerted twice to indicate that what the sender is typing is being written to the recipient's  
123044 terminal.

123045 If the recipient wants to reply, this can be accomplished by typing:

123046 write *sender-login-id* [*sending-terminal*]123047 upon receipt of the initial message. Whenever a line of input as delimited by an NL, EOF, or  
123048 EOL special character (see XBD [Chapter 11](#), on page 199) is accumulated while in canonical  
123049 input mode, the accumulated data shall be written on the other user's terminal. Characters shall  
123050 be processed as follows:

- 123051 • Typing <alert> shall write the <alert> character to the recipient's terminal.
- 123052 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
123053 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 123054 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
123055 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 123056 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
123057 characters to be sent to the recipient's terminal.
- 123058 • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of  
123059 additional special control characters and multi-byte or single-byte functions is  
123060 implementation-defined.
- 123061 • Typing other non-printable characters shall cause implementation-defined sequences of  
123062 printable characters to be written to the recipient's terminal.

123063 To write to a user who is logged in more than once, the *terminal* argument can be used to  
123064 indicate which terminal to write to; otherwise, the recipient's terminal is selected in an  
123065 implementation-defined manner and an informational message is written to the sender's  
123066 standard output, indicating which terminal was chosen.

123067 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
123068 utility. However, a user's privilege may further constrain the domain of accessibility of other  
123069 users' terminals. The *write* utility shall fail when the user lacks appropriate privileges to perform  
123070 the requested action.

123071 **OPTIONS**

123072 None.

123073 **OPERANDS**

- 123074 The following operands shall be supported:
- 123075 *user\_name* Login name of the person to whom the message shall be written. The application  
123076 shall ensure that this operand is of the form returned by the *who* utility.
- 123077 *terminal* Terminal identification in the same format provided by the *who* utility.
- 123078 **STDIN**
- 123079 Lines to be copied to the recipient's terminal are read from standard input.
- 123080 **INPUT FILES**
- 123081 None.
- 123082 **ENVIRONMENT VARIABLES**
- 123083 The following environment variables shall affect the execution of *write*:
- 123084 *LANG* Provide a default value for the internationalization variables that are unset or null.  
123085 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
123086 variables used to determine the values of locale categories.)
- 123087 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
123088 internationalization variables.
- 123089 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
123090 characters (for example, single-byte as opposed to multi-byte characters in  
123091 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
123092 equivalent to the sender's, the results are undefined.
- 123093 *LC\_MESSAGES*
- 123094 Determine the locale that should be used to affect the format and contents of  
123095 diagnostic messages written to standard error and informative messages written to  
123096 standard output.
- 123097 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 123098 **ASYNCHRONOUS EVENTS**
- 123099 If an interrupt signal is received, *write* shall write an appropriate message on the recipient's  
123100 terminal and exit with a status of zero. It shall take the standard action for all other signals.
- 123101 **STDOUT**
- 123102 An informational message shall be written to standard output if a recipient is logged in more  
123103 than once.
- 123104 **STDERR**
- 123105 The standard error shall be used only for diagnostic messages.
- 123106 **OUTPUT FILES**
- 123107 The recipient's terminal is used for output.
- 123108 **EXTENDED DESCRIPTION**
- 123109 None.
- 123110 **EXIT STATUS**
- 123111 The following exit values shall be returned:
- 123112 0 Successful completion.
- 123113 >0 The addressed user is not logged on or the addressed user denies permission.

123114 **CONSEQUENCES OF ERRORS**

123115 Default.

123116 **APPLICATION USAGE**123117 The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.123118 **EXAMPLES**

123119 None.

123120 **RATIONALE**

123121 The *write* utility was included in this volume of POSIX.1-2024 since it can be implemented on all  
123122 terminal types. The standard developers considered the *talk* utility, which cannot be  
123123 implemented on certain terminals, to be a “better” communications interface. Both of these  
123124 programs are in widespread use on historical implementations. Therefore, the standard  
123125 developers decided that both utilities should be specified.

123126 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
123127 require that they all use or accept the same format.

123128 **FUTURE DIRECTIONS**

123129 None.

123130 **SEE ALSO**123131 *mesg*, *talk*, *who*123132 XBD [Chapter 8](#) (on page 167), [Chapter 11](#) (on page 199)123133 **CHANGE HISTORY**

123134 First released in Issue 2.

123135 **Issue 5**

123136 The FUTURE DIRECTIONS section is added.

123137 **Issue 6**

123138 This utility is marked as part of the User Portability Utilities option.

123139 The normative text is reworded to avoid use of the term “must” for application requirements.

123140 **Issue 7**

123141 The *write* utility is moved from the User Portability Utilities option to the Base. User Portability  
123142 Utilities is now an option for interactive utilities.

123143 **Issue 8**123144 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

123145 **NAME**

123146 xargs — construct argument lists and invoke utility

123147 **SYNOPSIS**

```
123148 XSI xargs [-prtx] [-E eofstr|-0] [-I replstr|-L number|-n number]
123149 [-s size] [utility [argument...]]
```

123150 **DESCRIPTION**

123151 The *xargs* utility shall construct a command line consisting of the *utility* and *argument* operands  
 123152 specified followed by as many arguments read in sequence from standard input as fit in length  
 123153 and number constraints specified by the options. The *xargs* utility shall then invoke the  
 123154 constructed command line and wait for its completion. This sequence shall be repeated until one  
 123155 of the following occurs:

- 123156 • An end-of-file condition is detected on standard input.
- 123157 • An argument consisting of just the logical end-of-file string (see the `-E eofstr` option) is  
 123158 found on standard input after double-quote processing, <apostrophe> processing, and  
 123159 <backslash>-escape processing (see next paragraph). All arguments up to but not  
 123160 including the argument consisting of just the logical end-of-file string shall be used as  
 123161 arguments in constructed command lines.
- 123162 • An invocation of a constructed command line returns an exit status of 255.

123163 If the `-0` option is not specified, the application shall ensure that arguments in the standard  
 123164 input are delimited by unquoted <blank> characters, unescaped <blank> characters, or  
 123165 <newline> characters, and quoting characters shall be interpreted as follows:

- 123166 • A string of zero or more non-double-quote ( ' ' ) non-<newline> characters can be quoted  
 123167 by enclosing them in double-quotes.
- 123168 • A string of zero or more non-<apostrophe> ( ' \ ' ) non-<newline> characters can be  
 123169 quoted by enclosing them in <apostrophe> characters.
- 123170 • Any unquoted character can be escaped by preceding it with a <backslash>.

123171 Multiple adjacent delimiter characters shall be treated as a single delimiter. If the standard input  
 123172 is not empty and does not end with a <newline>, the behavior is undefined (because the  
 123173 requirement in STDIN that the input is a text file is not met in that case).

123174 If the `-0` option is specified, the application shall ensure that arguments in the standard input are  
 123175 delimited by null bytes. If multiple adjacent null bytes occur in the input, each null byte shall be  
 123176 treated as a delimiter. If the standard input is not empty and does not end with a null byte, *xargs*  
 123177 should ignore the trailing non-null bytes (as this can signal incomplete data) but may use them  
 123178 as the last argument passed to utility.

123179 The utility named by *utility* shall be executed zero or more times until the end-of-file is reached  
 123180 or the logical end-of file string is found. If no arguments are supplied on standard input, the  
 123181 utility named by *utility* shall be executed zero times if the `-r` option is specified and shall be  
 123182 executed exactly once if the `-r` option is not specified. The results are unspecified if the utility  
 123183 named by *utility* attempts to read from its standard input.

123184 The generated command line length shall be the sum of the size in bytes of the utility name and  
 123185 each argument treated as strings, including a null byte terminator for each of these strings. The  
 123186 *xargs* utility shall limit the command line length such that when the command line is invoked,  
 123187 the combined argument and environment lists (see the *exec* family of functions in the System  
 123188 Interfaces volume of POSIX.1-2024) shall not exceed {ARG\_MAX}-2 048 bytes. Within this  
 123189 constraint, if neither the `-n` nor the `-s` option is specified, the default command line length shall  
 123190 be at least {LINE\_MAX}.

123191 **OPTIONS**

123192 The *xargs* utility shall conform to XBD Section 12.2 (on page 215).

123193 The following options shall be supported:

123194 **-E *eofstr*** Use *eofstr* as the logical end-of-file string. If neither **-E** nor **-0** is specified, it is  
 123195 unspecified whether the logical end-of-file string is the `<underscore>` character  
 123196 ('\_') or the end-of-file string capability is disabled. When *eofstr* is the null string,  
 123197 the logical end-of-file string capability shall be disabled and `<underscore>`  
 123198 characters shall be taken literally.

123199 XSI **-I *replstr*** Insert mode: invoke *utility* for each argument from standard input. If **-0** is not  
 123200 specified, arguments in the standard input shall be delimited only by unescaped  
 123201 `<newline>` characters, not by `<blank>` characters, and any unquoted unescaped  
 123202 `<blank>` characters at the beginning of each line shall be ignored. The resulting  
 123203 argument shall be inserted in *arguments* in place of each occurrence of *replstr*. At  
 123204 least five arguments in *arguments* can each contain one or more instances of *replstr*.  
 123205 Each of these constructed arguments cannot grow larger than an implementation-  
 123206 defined limit greater than or equal to 255 bytes. Option **-x** shall be forced on.

123207 XSI **-L *number*** Invoke *utility* for each set of *number* arguments from standard input. The last  
 123208 invocation of *utility* shall be with fewer arguments if fewer than *number* remain. If  
 123209 the **-0** option is not specified, each line in the standard input shall be treated as  
 123210 containing one argument except that empty lines shall be ignored and a line  
 123211 ending with a trailing unescaped `<blank>` shall signal continuation to the next  
 123212 non-empty line, inclusive; such continuation shall result in removal of all trailing  
 123213 unescaped `<blank>` characters and all `<newline>` characters that immediately  
 123214 follow them from the argument.

123215 **-n *number*** Invoke *utility* using as many standard input arguments as possible, up to *number* (a  
 123216 positive decimal integer) arguments maximum. Fewer arguments shall be used if:

123217 • The command line length accumulated exceeds the size specified by the **-s**  
 123218 option (or `{LINE_MAX}` if there is no **-s** option).

123219 • The last iteration has fewer than *number*, but not zero, operands remaining.

123220 **-p** Prompt mode: the user is asked whether to execute *utility* at each invocation. Trace  
 123221 mode (**-t**) is turned on to write the command instance to be executed, followed by  
 123222 a prompt to standard error. An affirmative response read from `/dev/tty` shall  
 123223 execute the command; otherwise, that particular invocation of *utility* shall be  
 123224 skipped.

123225 **-r** Do not execute the utility named by *utility* if no arguments are supplied on  
 123226 standard input.

123227 **-s *size*** Invoke *utility* using as many standard input arguments as possible yielding a  
 123228 command line length less than *size* (a positive decimal integer) bytes. Fewer  
 123229 arguments shall be used if:

123230 • The total number of arguments exceeds that specified by the **-n** option.

123231 XSI • The total number of arguments exceeds that specified by the **-L** option.

123232 • End-of-file is encountered on standard input before *size* bytes are  
 123233 accumulated.

123234 Values of *size* up to at least `{LINE_MAX}` bytes shall be supported, provided that  
 123235 the constraints specified in the DESCRIPTION are met. It shall not be considered

123236 an error if a value larger than that supported by the implementation or exceeding  
 123237 the constraints specified in the DESCRIPTION is given; *xargs* shall use the largest  
 123238 value it supports within the constraints.

123239 **-t** Enable trace mode. Each generated command line shall be written to standard  
 123240 error just prior to invocation.

123241 **-x** Terminate if a constructed command line will not fit in the implied or specified size  
 123242 (see the **-s** option above).

123243 **-0** Use a null byte as the input argument delimiter and do not treat any other input  
 123244 bytes as special.

123245 If the mutually exclusive **-0** and **-E eofstr** options are both specified, the behavior is unspecified,  
 123246 except that if *eofstr* is the null string the behavior shall be the same as if **-0** was specified without  
 123247 **-E eofstr**.

#### 123248 OPERANDS

123249 The following operands shall be supported:

123250 *utility* The name of the utility to be invoked, found by search path using the *PATH*  
 123251 environment variable, described in XBD [Chapter 8](#) (on page 167). If *utility* is  
 123252 omitted, the default shall be the *echo* utility. If the *utility* operand names any of the  
 123253 special built-in utilities in [Section 2.15](#) (on page 2526), the results are undefined.

123254 *argument* An initial option or operand for the invocation of *utility*.

#### 123255 STDIN

123256 If the **-0** option is not specified, the standard input shall be a text file and the results are  
 123257 unspecified if an end-of-file condition is detected immediately following an escaped `<newline>`.

123258 If the **-0** option is specified, the standard input need not be a text file, and *xargs* shall process the  
 123259 input as bytes, not characters.

#### 123260 INPUT FILES

123261 The file `/dev/tty` shall be used to read responses required by the **-p** option.

#### 123262 ENVIRONMENT VARIABLES

123263 The following environment variables shall affect the execution of *xargs*:

123264 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 123265 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 123266 variables used to determine the values of locale categories.)

123267 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 123268 internationalization variables.

123269 *LC\_COLLATE*

123270 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 123271 character collating elements used in the extended regular expression defined for  
 123272 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

123273 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 123274 characters (for example, single-byte as opposed to multi-byte characters in  
 123275 arguments and input files) and the behavior of character classes used in the  
 123276 extended regular expression defined for the **yesexpr** locale keyword in the  
 123277 *LC\_MESSAGES* category.

- 123278 **LC\_MESSAGES**
- 123279 Determine the locale used to process affirmative responses, and the locale used to
- 123280 affect the format and contents of diagnostic messages and prompts written to
- 123281 standard error.
- 123282 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 123283 **PATH** Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 167).
- 123284 **ASYNCHRONOUS EVENTS**
- 123285 Default.
- 123286 **STDOUT**
- 123287 Not used.
- 123288 **STDERR**
- 123289 The standard error shall be used for diagnostic messages and the **-t** and **-p** options. If the **-t**
- 123290 option is specified, the *utility* and its constructed argument list shall be written to standard error,
- 123291 as it will be invoked, prior to invocation. If **-p** is specified, a prompt of the following format
- 123292 shall be written (in the POSIX locale):
- 123293 " ? . . . "
- 123294 at the end of the line of the output from **-t**.
- 123295 **OUTPUT FILES**
- 123296 None.
- 123297 **EXTENDED DESCRIPTION**
- 123298 None.
- 123299 **EXIT STATUS**
- 123300 The following exit values shall be returned:
- 123301 0 Successful completion.
- 123302 1-125 A command line meeting the specified requirements could not be assembled, one or
- 123303 more of the invocations of *utility* returned a non-zero exit status, or some other error
- 123304 occurred.
- 123305 126 The utility specified by *utility* was found but could not be invoked.
- 123306 127 The utility specified by *utility* could not be found.
- 123307 **CONSEQUENCES OF ERRORS**
- 123308 If a command line meeting the specified requirements cannot be assembled, the utility cannot be
- 123309 invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits
- 123310 with exit status 255, the *xargs* utility shall write a diagnostic message and exit without
- 123311 processing any remaining input.
- 123312 **APPLICATION USAGE**
- 123313 The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no
- 123314 further invocations using the current data stream will succeed. Thus, *utility* should explicitly *exit*
- 123315 with an appropriate value to avoid accidentally returning with 255.
- 123316 Note that since input is parsed as lines (if **-0** is not specified), with <blank> characters
- 123317 separating arguments and <backslash>, <apostrophe>, and double-quote characters used for
- 123318 quoting, if *xargs* is used to bundle the output of commands like *find dir -print* or *ls* into
- 123319 commands to be executed, unexpected results are likely if any filenames contain <blank>,
- 123320 <newline>, or quoting characters. This can be solved by using the **-print0** primary of *find*

123321 together with the *xargs* `-0` option, or by using *find* to call a script that converts each file found  
 123322 into a quoted string that is then piped to *xargs*, but in most cases it is preferable just to have *find*  
 123323 do the argument aggregation itself by using `-exec` with a '+' terminator instead of ';' . Note  
 123324 that the quoting rules used by *xargs* are not the same as in the shell. They were not made  
 123325 consistent here because existing applications depend on the current rules. An easy (but  
 123326 inefficient) method that can be used to transform input consisting of one argument per line into  
 123327 a quoted form that *xargs* interprets correctly is to precede each non-`<newline>` character with a  
 123328 `<backslash>`. More efficient alternatives are shown in Example 2 and Example 5 below.

123329 On implementations with a large value for `{ARG_MAX}`, *xargs* may produce command lines  
 123330 longer than `{LINE_MAX}`. For invocation of utilities, this is not a problem. If *xargs* is being used  
 123331 to create a text file, users should explicitly set the maximum command line length with the `-s`  
 123332 option.

123333 The *command*, *env*, *nice*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit  
 123334 code 127 if a utility to be invoked cannot be found, so that applications can distinguish "failure  
 123335 to find a utility" from "invoked utility exited with an error indication". The value 127 was  
 123336 chosen because it is not commonly used for other meanings; most utilities use small values for  
 123337 "normal error conditions" and the values above 128 can be confused with termination due to  
 123338 receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could  
 123339 be found, but not invoked. Some scripts produce meaningful error messages differentiating the  
 123340 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice  
 123341 that uses 127 when all attempts to *exec* the utility fail with `[ENOENT]`, and uses 126 when any  
 123342 attempt to *exec* the utility fails for any other reason.

#### 123343 EXAMPLES

123344 1. The following command combines the output of the parenthesized commands (minus the  
 123345 `<apostrophe>` characters) onto one line, which is then appended to the file `log`. It assumes  
 123346 that the expansion of `"$0 $*"` does not include any `<apostrophe>` or `<newline>`  
 123347 characters.

```
123348 (logname; date; printf "'%s'\n" "$0 $*") | xargs -E "" >>log
```

123349 2. The following command invokes *diff* with successive pairs of arguments originally typed  
 123350 as command line arguments.

```
123351 printf "%s\n" "$@" | xargs -0 -n 2 -x diff --
```

123352 3. In the following command, the user is asked which regular files below the current  
 123353 directory are to be archived.

```
123354 find . -type f -print0 | xargs -0 -p -L 1 ar -r arch
```

123355 4. The following command invokes *command1* one or more times with multiple arguments,  
 123356 stopping if an invocation of *command1* has a non-zero exit status.

```
123357 xargs -E "" sh -c 'command1 "$@" || exit 255' sh < xargs_input
```

#### 123358 RATIONALE

123359 The *xargs* utility was usually found only in System V-based systems; BSD systems included an  
 123360 *apply* utility that provided functionality similar to *xargs* `-n number`. The SVID lists *xargs* as a  
 123361 software development extension. This volume of POSIX.1-2024 does not share the view that it is  
 123362 used only for development, and therefore it is not optional.

123363 The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the  
 123364 number of processes launched by a simplistic use of the *find* `-exec` combination. The *xargs* utility  
 123365 is also used to enforce an upper limit on memory required to launch a process. With this basis in

123366 mind, this volume of POSIX.1-2024 selected only the minimal features required.

123367 Although the 255 exit status is mostly an accident of historical implementations, it allows a  
 123368 utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the  
 123369 current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125  
 123370 range when *xargs* exits. There is no statement of how the various non-zero utility exit status  
 123371 codes are accumulated by *xargs*. The value could be the addition of all codes, their highest  
 123372 value, the last one received, or a single value such as 1. Since no algorithm is arguably better  
 123373 than the others, and since many of the standard utilities say little more (portably) than  
 123374 “pass/fail”, no new algorithm was invented.

123375 Several other *xargs* options were removed because simple alternatives already exist within this  
 123376 volume of POSIX.1-2024. For example, the `-i replstr` option can be just as efficiently performed  
 123377 using a shell `for` loop. Since *xargs* calls an *exec* function with each input line, the `-i` option does  
 123378 not usually exploit the grouping capabilities of *xargs*.

123379 The requirement that *xargs* never produces command lines such that invocation of *utility* is  
 123380 within 2048 bytes of hitting the POSIX *exec* {ARG\_MAX} limitations is intended to guarantee  
 123381 that the invoked utility has room to modify its environment variables and command line  
 123382 arguments and still be able to invoke another utility. Note that the minimum {ARG\_MAX}  
 123383 allowed by the System Interfaces volume of POSIX.1-2024 is 4096 bytes and the minimum value  
 123384 allowed by this volume of POSIX.1-2024 is 2048 bytes; therefore, the 2048 bytes difference seems  
 123385 reasonable. Note, however, that *xargs* may never be able to invoke a utility if the environment  
 123386 passed in to *xargs* comes close to using {ARG\_MAX} bytes.

123387 The version of *xargs* required by this volume of POSIX.1-2024 is required to wait for the  
 123388 completion of the invoked command before invoking another command. This was done because  
 123389 historical scripts using *xargs* assumed sequential execution. Implementations wanting to provide  
 123390 parallel operation of the invoked utilities are encouraged to add an option enabling parallel  
 123391 invocation, but should still wait for termination of all of the children before *xargs* terminates  
 123392 normally.

123393 The `-e` option was omitted from the ISO POSIX-2:1993 standard in the belief that the *eofstr*  
 123394 option-argument was recognized only when it was on a line by itself and before quote and  
 123395 escape processing were performed, and that the logical end-of-file processing was only enabled  
 123396 if a `-e` option was specified. In that case, a simple *sed* script could be used to duplicate the `-e`  
 123397 functionality. Further investigation revealed that:

- 123398 • The logical end-of-file string was checked for after quote and escape processing, making a  
 123399 *sed* script that provided equivalent functionality much more difficult to write.
- 123400 • The default was to perform logical end-of-file processing with an `<underscore>` as the  
 123401 logical end-of-file string.

123402 To correct this misunderstanding, the `-E eofstr` option was adopted from the X/Open Portability  
 123403 Guide. Users should note that the description of the `-E` option matches historical documentation  
 123404 of the `-e` option (which was not adopted because it did not support the Utility Syntax  
 123405 Guidelines), by saying that if *eofstr* is the null string, logical end-of-file processing is disabled.  
 123406 Historical implementations of *xargs* actually did not disable logical end-of-file processing; they  
 123407 treated a null argument found in the input as a logical end-of-file string. (A null *string* argument  
 123408 could be generated using single or double-quotes ( ' ' or " " ). Since this behavior was not  
 123409 documented historically, it is considered to be a bug.

123410 The `-I`, `-L`, and `-n` options are mutually-exclusive. Some implementations use the last one  
 123411 specified if more than one is given on a command line; other implementations treat  
 123412 combinations of the options in different ways.

123413 **FUTURE DIRECTIONS**

123414 A future version of this standard may require that, when the `-0` option is specified, if the  
123415 standard input is not empty and does not end with a null byte, *xargs* ignores the trailing non-  
123416 null bytes.

123421 **CHANGE HISTORY**

123422 First released in Issue 2.

123423 **Issue 5**

123424 A second FUTURE DIRECTION is added.

123425 **Issue 6**

123426 The obsolescent `-e`, `-i`, and `-l` options are removed.

123427 The following new requirements on POSIX implementations derive from alignment with the  
123428 Single UNIX Specification:

- 123429 • The `-p` option is added.
- 123430 • In the INPUT FILES section, the file `/dev/tty` is used to read responses required by the `-p`  
123431 option.
- 123432 • The STDERR section is updated to describe the `-p` option.

123433 The description of the `-E` option is aligned with the ISO POSIX-2: 1993 standard.

123434 The normative text is reworded to avoid use of the term “must” for application requirements.

123435 **Issue 7**

123436 Austin Group Interpretation 1003.1-2001 #123 is applied, changing the description of the *xargs* `-I`  
123437 option.

123438 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
123439 `LC_MESSAGES` environment variable.

123440 SD5-XCU-ERN-68 is applied.

123441 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

123442 SD5-XCU-ERN-128 is applied, clarifying the DESCRIPTION of the logical end-of-file string.

123443 SD5-XCU-ERN-132 is applied, updating the EXAMPLES section.

123444 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0149 [342] is applied.

123445 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0203 [499] is applied.

123446 **Issue 8**

123447 Austin Group Defect 243 is applied, adding the `-r` and `-0` options.

123448 Austin Group Defect 248 is applied, changing the EXAMPLES section.

123449 Austin Group Defect 1122 is applied, changing the description of `NLSPATH`.

123450 Austin Group Defect 1586 is applied, adding the *timeout* utility.

123451

Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

## 123452 NAME

123453 *xgettext* — extract *gettext* call strings from C-language source files (DEVELOPMENT)

## 123454 SYNOPSIS

```
123455 CD xgettext [-j] [-n] [-d default-domain] [-K keyword-spec]...
123456 [-p pathname] file...
123457 xgettext -a [-n] [-d default-domain] [-p pathname]
123458 [-x exclude-file] file...
```

## 123459 DESCRIPTION

123460 The *xgettext* utility shall automate the creation of portable messages object source files (dot-po  
123461 files). A dot-po file shall contain copies of string literals that are found in C-language source  
123462 code in files specified by *file* operands. The dot-po file can be used as input to the *msgfmt* utility,  
123463 to produce a messages object file that can be used by applications.

123464 The *xgettext* utility shall write *msgid* argument strings that are passed as string literals in  
123465 *gettext()*, *gettext\_l()*, *ngettext()*, and *ngettext\_l()* calls in C-language source code to the default  
123466 output file; this file shall be named **messages.po** unless it is changed by the **-d** option. The  
123467 *xgettext* utility shall also write *msgid* argument strings that are passed as string literals in  
123468 *dcgettext()*, *dcgettext\_l()*, *dcngettext()*, *dcngettext\_l()*, *dgettext()*, *dgettext\_l()*, *dngettext()*, and  
123469 *dngettext\_l()* calls either to the default output file or to the output file *domainname.po* where  
123470 *domainname* is the first parameter to the call; it is implementation-defined which of those output  
123471 files is used. A **msgid** directive shall precede each *msgid* argument string. For the functions that  
123472 have a *msgid\_plural* argument, a **msgid\_plural** directive followed by that argument string shall  
123473 also be written directly after the corresponding **msgid** directive. A **msgstr** directive or  
123474 **msgstr[index]** directives with an empty string shall be written after the corresponding **msgid** or  
123475 **msgid\_plural** directive, respectively. The function names that *xgettext* searches for can be  
123476 changed using the **-K** option.

123477 The first directive in each created dot-po file shall be a **domain** directive giving the associated  
123478 domain name, except that this directive is optional in the default output file.

123479 If the **-p pathname** option is specified, *xgettext* shall create the dot-po files in the *pathname*  
123480 directory. Otherwise, the dot-po files shall be created in the current working directory.

123481 The **msgid** values shall be in the same order that the strings are extracted from each *file* and  
123482 subsections with duplicate **msgid** values shall be written to the dot-po files as comment lines.

## 123483 OPTIONS

123484 The *xgettext* utility shall conform to XBD [Section 12.2](#) (on page 215).

123485 The following options shall be supported:

123486 **-a** Extract all strings, not just those found in calls to *gettext* family functions. Only one  
123487 dot-po file shall be created.

123488 **-d default-domain**  
123489 Name the default output file *default-domain.po* instead of **messages.po**.

123490 **-j** Join messages from C-language source files with existing dot-po files. For each  
123491 dot-po file that *xgettext* writes messages to, if the file does not exist, it shall be  
123492 created. New messages shall be appended but any subsections with duplicate  
123493 **msgid** values except the first (including **msgid** values found in an existing dot-po  
123494 file) shall either be commented out or omitted in the resulting dot-po file; if  
123495 omitted, a warning message may be written to standard error. Domain directives  
123496 in the existing dot-po files shall be ignored; the assumption is that all previous

123497 **msgid** values belong to the same domain. The behavior is unspecified if an existing  
123498 dot-po file was not created by *xgettext* or has been modified by another application.

123499 **-K** *keyword-spec*

123500 Specify an additional keyword to be looked for:

123501 • If *keyword-spec* is an empty string, this shall disable the use of default  
123502 keywords for the *gettext* family of functions.

123503 • If *keyword-spec* is a C identifier, *xgettext* shall look for strings in the first  
123504 argument of each call to the function or macro *keyword-spec*.

123505 • If *keyword-spec* is of the form *id:argnum* then *xgettext* shall treat the *argnum*-th  
123506 argument of a call to the function or macro *id* as the *msgid* argument, where  
123507 *argnum* 1 is the first argument.

123508 • If *keyword-spec* is of the form *id:argnum1,argnum2* then *xgettext* shall treat  
123509 strings in the *argnum1*-th argument and in the *argnum2*-th argument of a call  
123510 to the function or macro *id* as the *msgid* and *msgid\_plural* arguments,  
123511 respectively.

123512 For all mentioned forms, the application shall ensure that if *argnum2* is given, it is  
123513 not equal to *argnum1*. All numeric values shall be converted as specified in item 6  
123514 in XBD [Section 12.1](#) (on page 213).

123515 **-n** Add comment lines to the output file indicating pathnames and line numbers in  
123516 the source files where each extracted string is encountered. These lines shall  
123517 appear before each **msgid** directive. Such comments should have the format:

123518 `#: pathname1:linenumber1 [pathname2:linenumber2...]`

123519 **-p** *pathname*

123520 Create output files in the directory specified by *pathname* instead of in the current  
123521 working directory.

123522 **-x** *exclude-file*

123523 Specify a file containing strings that shall not be extracted from the input files. The  
123524 format of *exclude-file* is identical to that of a dot-po file. However, only statements  
123525 containing **msgid** directives in *exclude-file* shall be used. All other statements shall  
123526 be ignored.

## 123527 OPERANDS

123528 The following operand shall be supported:

123529 *file* A pathname of an input file containing C-language source code. If '-' is specified  
123530 for an instance of *file*, the standard input shall be used.

## 123531 STDIN

123532 The standard input shall not be used unless a *file* operand is specified as '- '.

## 123533 INPUT FILES

123534 The input files specified as *file* operands shall be C-language source files. The input file specified  
123535 as the option-argument for the **-x** option shall be a dot-po file in the format specified as input for  
123536 the *msgfmt* utility.

## 123537 ENVIRONMENT VARIABLES

123538 The following environment variables shall affect the execution of *xgettext*:

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 123539 | <i>LANG</i>                   | Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 169) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                                                  |
| 123540 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123541 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123542 | XSI <i>LANGUAGE</i>           | Determine the location of messages objects if <i>NLSPATH</i> is not set or the evaluation of <i>NLSPATH</i> did not lead to a suitable messages object being found.                                                                                                                                                                                                                                                 |
| 123543 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123544 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                            |
| 123545 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123546 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                                                                                                                                                                                           |

| 123573 | <b>APPLICATION USAGE</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123574 |                               | Implementations differ as to whether they write all output to the default output file or split the output into separate per-domain files. Portable applications can either ensure that each C-language source file contains calls to <i>gettext</i> family functions for only a single domain, or force all output to be to the default output file by using the <b>-K</b> option to override the default keywords. |

| 123578 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123579 |                               | Some implementations of <i>xgettext</i> are not able to extract cast strings (unless <b>-a</b> is used), for example casts of literal strings to ( <b>const char *</b> ). Use of a cast is unnecessary anyway, since the prototypes in <b>&lt;libintl.h&gt;</b> already specify this type.                                                                                                                          |
| 123580 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 123581 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                     |

123582 The *xgettext* utility is not required to handle C preprocessor directives. Therefore if, for example,  
 123583 calls to *gettext* family functions are wrapped by macros, they might not be found unless the **-K**  
 123584 option is used to tell *xgettext* to look for the macro calls.

## 123585 EXAMPLES

### 123586 Example 1

123587 The following example shows how **-K** can be used to force all output to be to the default output  
 123588 file:

```
123589 xgettext -K "" -K gettext:1 -K dgettext:2 -K dcgettext:2 \  

  123590 -K ngettext:1,2 -K dngettext:2,3 -K dcngettext:2,3 source.c
```

123591 By overriding the default keywords using the **-K** option as above, the *xgettext* utility is directed  
 123592 to ignore the *domainname* arguments to the *dgettext()*, *dcgettext()*, *dngettext()*, and *dcngettext()*  
 123593 functions. Thus, the utility treats the functions as their respective equivalent without the *d* prefix,  
 123594 ignoring the *domainname* argument and writing generated output to the default output file,  
 123595 **messages.po**. Additional **-K** options would be needed for the variants of the functions with an  
 123596 *\_l* suffix if they are used.

### 123597 Example 2

123598 If the source uses a macro definition such as:

```
123599 #define i18n gettext
```

123600 the use of:

```
123601 xgettext -K i18n:1 source.c
```

123602 will pick up **msgid** values from a line such as:

```
123603 fprintf(stdout, i18n("The value is %s"), value1);
```

## 123604 RATIONALE

123605 The **-K** option is based on the **-k** option of GNU *xgettext*; the only difference is that GNU's **-k**  
 123606 takes an optional option-argument whereas **-K** in this standard has a mandatory option-  
 123607 argument in order to comply with the syntax guidelines.

123608 The standard developers considered including functionality equivalent to the **-c**, **-m**, and **-M**  
 123609 options in existing implementations. However, those letters could not be used as the syntax  
 123610 differed between implementations. The usual solution of adding an uppercase equivalent of  
 123611 lowercase options with the standard syntax instead was not possible, for obvious reasons for **-m**  
 123612 and **-M**, and as **-C** was already in use for another purpose in one implementation.

123613 The **-s** option is not included as it has been deprecated in at least one implementation because it  
 123614 has been found to deprive translators of valuable context.

## 123615 FUTURE DIRECTIONS

123616 If this utility is directed to create a new directory entry that contains any bytes that have the  
 123617 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 123618 error. A future version of this standard may require implementations to treat this as an error.

123619 A future version of this standard may change the description of the **-n** option to mandate the  
 123620 given comment format (by using ``shall'' instead of ``should'').

123624 XSH *xgettext*  
123625 **CHANGE HISTORY**  
123626 First released in Issue 8.

123627 **NAME**123628 yacc — yet another compiler compiler (**DEVELOPMENT**)123629 **SYNOPSIS**123630 CD `yacc [-dltv] [-b file_prefix] [-p sym_prefix] grammar`123631 **DESCRIPTION**

123632 The *yacc* utility shall read a description of a context-free grammar in *grammar* and write C source  
 123633 code, conforming to the ISO C standard, to a code file, and optionally header information into a  
 123634 header file, in the current directory. The generated source code shall not depend on any  
 123635 undefined, unspecified, or implementation-defined behavior, except in cases where it is copied  
 123636 directly from the supplied grammar, or in cases that are documented by the implementation.  
 123637 The C code shall define a function and related routines and macros for an automaton that  
 123638 executes a parsing algorithm meeting the requirements in [Algorithms](#) (on page 3625).

123639 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

123640 The C source code and header file shall be produced in a form suitable as input for the C  
 123641 compiler (see [c17](#)).

123642 **OPTIONS**

123643 The *yacc* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

123644 The following options shall be supported:

123645 **-b *file\_prefix*** Use *file\_prefix* instead of **y** as the prefix for all output filenames. The code file  
 123646 **y.tab.c**, the header file **y.tab.h** (created when **-d** is specified), and the description  
 123647 file **y.output** (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 123648 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

123649 **-d** Write the header file; by default only the code file is written. See the OUTPUT  
 123650 FILES section.

123651 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 123652 present, it is unspecified whether the code file or header file contains **#line**  
 123653 directives. This should only be used after the grammar and the associated actions  
 123654 are fully debugged.

123655 **-p *sym\_prefix***

123656 Use *sym\_prefix* instead of **yy** as the prefix for all external names produced by *yacc*.  
 123657 The names affected shall include the functions *yyparse()*, *yylex()*, and *yyerror()*, and  
 123658 the variables *yyval*, *yychar*, and *yydebug*. (In the remainder of this section, the six  
 123659 symbols cited are referenced using their default names only as a notational  
 123660 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 123661 option shall not affect **#define** symbols generated by *yacc*.

123662 **-t** Modify conditional compilation directives to permit compilation of debugging  
 123663 code in the code file. Runtime debugging statements shall always be contained in  
 123664 the code file, but by default conditional compilation directives prevent their  
 123665 compilation.

123666 **-v** Write a file containing a description of the parser and a report of conflicts  
 123667 generated by ambiguities in the grammar.

123668 **OPERANDS**

123669 The following operand is required:

123670 *grammar* A pathname of a file containing instructions, hereafter called *grammar*, for which a  
 123671 parser is to be created. The format for the grammar is described in the EXTENDED  
 123672 DESCRIPTION section.

123673 **STDIN**

123674 Not used.

123675 **INPUT FILES**

123676 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
 123677 section.

123678 **ENVIRONMENT VARIABLES**123679 The following environment variables shall affect the execution of *yacc*:

123680 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 123681 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 123682 variables used to determine the values of locale categories.)

123683 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 123684 internationalization variables.

123685 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 123686 characters (for example, single-byte as opposed to multi-byte characters in  
 123687 arguments and input files).

123688 *LC\_MESSAGES*

123689 Determine the locale that should be used to affect the format and contents of  
 123690 diagnostic messages written to standard error.

123691 *XSHELL* *NLSPATH* Determine the location of messages objects and message catalogs.

123692 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main()*  
 123693 function defined in [Yacc Library](#) (on page 3624) shall call:

123694 `setlocale(LC_ALL, "")`

123695 and thus the program generated by *yacc* shall also be affected by the contents of these variables  
 123696 at runtime.

123697 **ASYNCHRONOUS EVENTS**

123698 Default.

123699 **STDOUT**

123700 Not used.

123701 **STDERR**

123702 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* shall write a report of  
 123703 those conflicts to the standard error in an unspecified format.

123704 Standard error shall also be used for diagnostic messages.

123705 **OUTPUT FILES**

123706 The code file, the header file, and the description file shall be text files. All are described in the  
 123707 following sections.

123708 **Code File**

123709 This file shall contain the C source code for the *yyparse()* function. It shall contain code for the  
 123710 various semantic actions with macro substitution performed on them as described in the  
 123711 EXTENDED DESCRIPTION section. Preceding this code it shall contain an `extern int`  
 123712 `yychar` declaration or `int yychar` definition, and **#define** statements for the following  
 123713 macros:

123714 **YYEMPTY** Token number indicating there is no lookahead token. This macro shall expand to  
 123715 an integer constant with a value less than zero, protected by parentheses.

123716 **YYEOF** Token number indicating the end of input. This macro shall expand to the value 0.

123717 It also shall contain a copy of the **#define** statements in the header file, prior to any code copied  
 123718 from semantic actions in *grammar*, and the following function prototypes for the *yyerror()*,  
 123719 *yylex()*, and *yyparse()* functions, after any code copied from within `{` and `}` in the declarations  
 123720 section in *grammar* and before any code copied from semantic actions in *grammar*:

```
123721 void yyerror(const char *);
123722 int yylex(void);
123723 int yyparse(void);
```

123724 The declarations of *yyerror()* and *yylex()* shall be protected by **#ifndef** or **#if** preprocessor  
 123725 statements such that each is only visible if a preprocessor macro with the name *yyerror* or *yylex*,  
 123726 respectively, is not already defined, where the *yy* in the macro names is replaced by *sym\_prefix* if  
 123727 the `-p sym_prefix` option is used.

123728 If a **%union** declaration is used, the declaration for **YYSTYPE** and an `extern YYSTYPE`  
 123729 `yylval` declaration or **YYSTYPE** `yylval` definition shall also be included in this file.

123730 The code file shall not contain a declaration of the *main()* function, unless one is present within  
 123731 `{` and `}` in the declarations section in *grammar*.

123732 **Header File**

123733 The header file shall contain **#define** statements that associate the token numbers with the token  
 123734 names. This allows source files other than the code file to access the token codes. If a **%union**  
 123735 declaration is used, the declaration for **YYSTYPE** and an `extern YYSTYPE` `yylval`  
 123736 declaration shall also be included in this file. The header file may also declare the *yyparse()*  
 123737 function, using a function prototype. It shall not declare the *yyerror()* and *yylex()* functions.

123738 **Description File**

123739 The description file shall be a text file containing a description of the state machine  
 123740 corresponding to the parser, using an unspecified format. Limits for internal tables (see [Limits](#),  
 123741 on page 3625) shall also be reported, in an implementation-defined manner. (Some  
 123742 implementations may use dynamic allocation techniques and have no specific limit values to  
 123743 report.)

123744 **EXTENDED DESCRIPTION**

123745 The *yacc* command accepts a language that is used to define a grammar for a target language to  
 123746 be parsed by the tables and code generated by *yacc*. The language accepted by *yacc* as a  
 123747 grammar for the target language is described below using the *yacc* input language itself.

123748 The input *grammar* includes rules describing the input structure of the target language and code  
 123749 to be invoked when these rules are recognized to provide the associated semantic action. The  
 123750 code to be executed shall appear as bodies of text that are intended to be C-language code. These  
 123751 bodies of text shall not contain C-language trigraphs. The C-language inclusions are presumed

123752 to form a correct function when processed by *yacc* into its output files. The code included in this  
123753 way shall be executed during the recognition of the target language.

123754 Given a grammar, the *yacc* utility generates the files described in the OUTPUT FILES section.  
123755 The code file can be compiled and linked using *c17*. If the declaration and programs sections of  
123756 the grammar file did not include definitions of *main()*, *yylex()*, and *yyerror()*, the compiled  
123757 output requires linking with externally supplied versions of those functions. Default versions of  
123758 *main()* and *yyerror()* are supplied in the *yacc* library and can be linked in by using the `-I y`  
123759 operand to *c17*. The *yacc* library interfaces need not support interfaces with other than the  
123760 default **yy** symbol prefix. The application provides the lexical analyzer function, *yylex()*; the *lex*  
123761 utility is specifically designed to generate such a routine.

### 123762 **Input Language**

123763 The application shall ensure that every specification file consists of three sections in order:  
123764 *declarations*, *grammar rules*, and *programs*, separated by double <percent-sign> characters ("%").  
123765 The declarations and programs sections can be empty. If the latter is empty, the preceding "%"  
123766 mark separating it from the rules section can be omitted.

123767 The input is free form text following the structure of the grammar defined below.

### 123768 **Lexical Structure of the Grammar**

123769 The <blank>, <newline>, and <form-feed> character shall be ignored, except that the application  
123770 shall ensure that they do not appear in names or multi-character reserved symbols. Comments  
123771 shall be enclosed in `"/ * . . . */`, and can appear wherever a name is valid.

123772 Names are of arbitrary length, made up of letters, periods ('.'), underscores ('\_'), and non-  
123773 initial digits. Uppercase and lowercase letters are distinct. Conforming applications shall not  
123774 use names beginning in **yy** or **YY** since the *yacc* parser uses such names. Many of the names  
123775 appear in the final output of *yacc*, and thus they should be chosen to conform with any  
123776 additional rules created by the C compiler to be used. In particular they appear in **#define**  
123777 statements.

123778 A literal shall consist of a single character enclosed in single-quote characters. All of the escape  
123779 sequences supported for character constants by the ISO C standard shall be supported by *yacc*.

123780 The relationship with the lexical analyzer is discussed in detail below.

123781 The application shall ensure that the NUL character is not used in grammar rules or literals.

### 123782 **Declarations Section**

123783 The declarations section is used to define the symbols used to define the target language and  
123784 their relationship with each other. In particular, much of the additional information required to  
123785 resolve ambiguities in the context-free grammar for the target language is provided here.

123786 Usually *yacc* assigns the relationship between the symbolic names it generates and their  
123787 underlying numeric value. The declarations section makes it possible to control the assignment  
123788 of these values.

123789 It is also possible to keep semantic information associated with the tokens currently on the parse  
123790 stack in a user-defined C-language **union**, if the members of the union are associated with the  
123791 various names in the grammar. The declarations section provides for this as well.

123792 The first group of declarators below all take a list of names as arguments. That list can optionally  
123793 be preceded by the name of a C union member (called a *tag* below) appearing within '<' and  
123794 '>'. (As an exception to the typographical conventions of the rest of this volume of

123795 POSIX.1-2024, in this case `<tag>` does not represent a metavariable, but the literal angle bracket  
 123796 characters surrounding a symbol.) The use of `tag` specifies that the tokens named on this line  
 123797 shall be of the same C type as the union member referenced by `tag`. This is discussed in more  
 123798 detail below.

123799 For lists used to define tokens, the first appearance of a given token can be followed by a  
 123800 positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it  
 123801 for lexical purposes shall be taken to be that number.

123802 The following declares `name` to be a token:

```
123803 %token [<tag>] name [number] [name [number]]...
```

123804 If `tag` is present, the C type for all tokens on this line shall be declared to be the type referenced  
 123805 by `tag`. If a positive integer, `number`, follows a `name`, that value shall be assigned to the token.

123806 The following declares `name` to be a token, and assigns precedence to it:

```
123807 %left [<tag>] name [number] [name [number]]...
123808 %right [<tag>] name [number] [name [number]]...
```

123809 One or more lines, each beginning with one of these symbols, can appear in this section. All  
 123810 tokens on the same line have the same precedence level and associativity; the lines are in order  
 123811 of increasing precedence or binding strength. `%left` denotes that the operators on that line are  
 123812 left associative, and `%right` similarly denotes right associative operators. If `tag` is present, it shall  
 123813 declare a C type for `names` as described for `%token`.

123814 The following declares `name` to be a token, and indicates that this cannot be used associatively:

```
123815 %nonassoc [<tag>] name [number] [name [number]]...
```

123816 If the parser encounters associative use of this token it reports an error. If `tag` is present, it shall  
 123817 declare a C type for `names` as described for `%token`.

123818 The following declares that union member `names` are non-terminals, and thus it is required to  
 123819 have a `tag` field at its beginning:

```
123820 %type <tag> name...
```

123821 Because it deals with non-terminals only, assigning a token number or using a literal is also  
 123822 prohibited. If this construct is present, `yacc` shall perform type checking; if this construct is not  
 123823 present, the parse stack shall hold only the `int` type.

123824 Every name used in `grammar` not defined by a `%token`, `%left`, `%right`, or `%nonassoc` declaration  
 123825 is assumed to represent a non-terminal symbol. The `yacc` utility shall report an error for any non-  
 123826 terminal symbol that does not appear on the left side of at least one grammar rule.

123827 Once the type, precedence, or token number of a name is specified, it shall not be changed. If the  
 123828 first declaration of a token does not assign a token number, `yacc` shall assign a token number.  
 123829 Once this assignment is made, the token number shall not be changed by explicit assignment.

123830 The following declarators do not follow the previous pattern.

123831 The following declares the non-terminal `name` to be the *start symbol*, which represents the largest,  
 123832 most general structure described by the grammar rules:

```
123833 %start name
```

123834 By default, it is the left-hand side of the first grammar rule; this default can be overridden with  
 123835 this declaration.

123836 The following declares the `yacc` value stack to be a union of the various types of values desired.

123837       %union { *body of union (in C)* }

123838       The body of the union shall not contain unbalanced curly brace preprocessing tokens.

123839       By default, the values returned by actions (see below) and the lexical analyzer shall be of type  
123840       **int**. The *yacc* utility keeps track of types, and it shall insert corresponding union member names  
123841       in order to perform strict type checking of the resulting parser.

123842       Alternatively, given that at least one *<tag>* construct is used, the union can be declared in a  
123843       header file (which shall be included in the declarations section by using a **#include** construct  
123844       within *%{* and *%}*), and a **typedef** used to define the symbol *YYSTYPE* to represent this union.  
123845       The effect of **%union** is to provide the declaration of *YYSTYPE* directly from the *yacc* input.

123846       C-language declarations and definitions can appear in the declarations section, enclosed by the  
123847       following marks:

123848       %{ . . . % }

123849       These statements shall be copied into the code file, and have global scope within it so that they  
123850       can be used in the rules and program sections. The statements shall not contain *"%}"* outside a  
123851       comment, string literal, or multi-character constant.

123852       The application shall ensure that the declarations section is terminated by the token *%%*.

### 123853       **Grammar Rules in yacc**

123854       The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
123855       and associates with those rules C-language actions and additional precedence information. The  
123856       grammar is described below, and a formal definition follows.

123857       The rules section is comprised of one or more grammar rules. A grammar rule has the form:

123858       A : BODY ;

123859       The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
123860       more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
123861       Only the names and literals participate in the formation of the grammar; the semantic actions  
123862       and precedence rules are used in other ways. The *<colon>* and the *<semicolon>* are *yacc*  
123863       punctuation. If there are several successive grammar rules with the same left-hand side, the  
123864       *<vertical-line>* (*'|'*) can be used to avoid rewriting the left-hand side; in this case the  
123865       *<semicolon>* appears only after the last rule. The *BODY* part can be empty (or empty of names  
123866       and literals) to indicate that the non-terminal symbol matches the empty string.

123867       The *yacc* utility assigns a unique number to each rule. Rules using the vertical bar notation are  
123868       distinct rules. The number assigned to the rule appears in the description file.

123869       The elements comprising a *BODY* are:

123870       *name, literal*   These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*  
123871       stands for itself (less the lexically required quotation marks).

123872       *semantic action*

123873       With each grammar rule, the user can associate actions to be performed each time  
123874       the rule is recognized in the input process. (Note that the word *"action"* can also  
123875       refer to the actions of the parser—shift, reduce, and so on.)

123876       These actions can return values and can obtain the values returned by previous  
123877       actions. These values are kept in objects of type *YYSTYPE* (see **%union**). The  
123878       result value of the action shall be kept on the parse stack with the left-hand side of  
123879       the rule, to be accessed by other reductions as part of their right-hand side. By

123880 using the `<tag>` information provided in the declarations section, the code  
 123881 generated by *yacc* can be strictly type checked and contain arbitrary information. In  
 123882 addition, the lexical analyzer can provide the same kinds of values for tokens, if  
 123883 desired.

123884 An action is an arbitrary C statement and as such can do input or output, call  
 123885 subprograms, and alter external variables. An action is one or more C statements  
 123886 enclosed in curly braces '{' and '}'. The statements shall not contain  
 123887 unbalanced curly brace preprocessing tokens.

123888 Certain pseudo-variables can be used in the action. These are macros for access to  
 123889 data structures known internally to *yacc*.

123890 **\$\$** The value of the action can be set by assigning it to **\$\$**. If type  
 123891 checking is enabled and the type of the value to be assigned cannot  
 123892 be determined, a diagnostic message may be generated.

123893 **\$number** This refers to the value returned by the component specified by the  
 123894 token *number* in the right side of a rule, reading from left to right;  
 123895 *number* can be zero or negative. If *number* is zero or negative, it refers  
 123896 to the data associated with the name on the parser's stack preceding  
 123897 the leftmost symbol of the current rule. (That is, "\$0" refers to the  
 123898 name immediately preceding the leftmost name in the current rule to  
 123899 be found on the parser's stack and "\$-1" refers to the symbol to *its*  
 123900 left.) If *number* refers to an element past the current point in the rule,  
 123901 or beyond the bottom of the stack, the result is undefined. If type  
 123902 checking is enabled and the type of the value to be assigned cannot  
 123903 be determined, a diagnostic message may be generated.

123904 **\$<tag>number**  
 123905 These correspond exactly to the corresponding symbols without the  
 123906 *tag* inclusion, but allow for strict type checking (and preclude  
 123907 unwanted type conversions). The effect is that the macro is expanded  
 123908 to use *tag* to select an element from the YYSTYPE union (using  
 123909 *dataname.tag*). This is particularly useful if *number* is not positive.

123910 **\$<tag>\$** This imposes on the reference the type of the union member  
 123911 referenced by *tag*. This construction is applicable when a reference to  
 123912 a left context value occurs in the grammar, and provides *yacc* with a  
 123913 means for selecting a type.

123914 Actions can occur anywhere in a rule (not just at the end); an action can access  
 123915 values returned by actions to its left, and in turn the value it returns can be  
 123916 accessed by actions to its right. An action appearing in the middle of a rule shall be  
 123917 equivalent to replacing the action with a new non-terminal symbol and adding an  
 123918 empty rule with that non-terminal symbol on the left-hand side. The semantic  
 123919 action associated with the new rule shall be equivalent to the original action. The  
 123920 use of actions within rules might introduce conflicts that would not otherwise  
 123921 exist.

123922 By default, the value of a rule shall be the value of the first element in it. If the first  
 123923 element does not have a type (particularly in the case of a literal) and type  
 123924 checking is turned on by **%type**, an error message shall result.

123925 *precedence* The keyword **%prec** can be used to change the precedence level associated with a  
 123926 particular grammar rule. Examples of this are in cases where a unary and binary  
 123927 operator have the same symbolic representation, but need to be given different  
 123928 precedences, or where the handling of an ambiguous if-else construction is  
 123929 necessary. The reserved symbol **%prec** can appear immediately after the body of  
 123930 the grammar rule and can be followed by a token name or a literal. It shall cause  
 123931 the precedence of the grammar rule to become that of the following token name or  
 123932 literal. The action for the rule as a whole can follow **%prec**.

123933 If a program section follows, the application shall ensure that the grammar rules are terminated  
 123934 by **%%**.

### 123935 **Programs Section**

123936 The *programs* section can include the definition of the lexical analyzer *yylex()*, and any other  
 123937 functions; for example, those used in the actions specified in the grammar rules. It is unspecified  
 123938 whether the programs section precedes or follows the semantic actions in the output file;  
 123939 therefore, if the application contains any macro definitions and declarations intended to apply to  
 123940 the code in the semantic actions, it shall place them within "**%{ . . . %}**" in the declarations  
 123941 section.

### 123942 **Input Grammar**

123943 The following input to *yacc* yields a parser for the input to *yacc*. This formal syntax takes  
 123944 precedence over the preceding text syntax description.

123945 The lexical structure is defined less precisely; [Lexical Structure of the Grammar](#) (on page 3616)  
 123946 defines most terms. The correspondence between the previous terms and the tokens below is as  
 123947 follows.

123948 **IDENTIFIER** This corresponds to the concept of *name*, given previously. It also includes  
 123949 literals as defined previously.

123950 **C\_IDENTIFIER** This is a name, and additionally it is known to be followed by a <colon>. A  
 123951 literal cannot yield this token.

123952 **NUMBER** A string of digits (a non-negative decimal integer).

123953 **TYPE, LEFT, MARK, LCURL, RCURL**

123954 These correspond directly to **%type**, **%left**, **%%**, **%{**, and **%}**.

123955 **{...}** This indicates C-language source code, with the possible inclusion of '\$'  
 123956 macros as discussed previously.

```

### 124033 Conflicts

124034 The parser produced for an input grammar may contain states in which conflicts occur. The  
 124035 conflicts occur because the grammar is not LALR(1). An ambiguous grammar always contains at  
 124036 least one LALR(1) conflict. The *yacc* utility shall resolve all conflicts, using either default rules or  
 124037 user-specified precedence rules.

124038 Conflicts are either shift/reduce conflicts or reduce/reduce conflicts. A shift/reduce conflict is  
 124039 where, for a given state and lookahead symbol, both a shift action and a reduce action are  
 124040 possible. A reduce/reduce conflict is where, for a given state and lookahead symbol, reductions  
 124041 by two different rules are possible.

124042 The rules below describe how to specify what actions to take when a conflict occurs. Not all  
 124043 shift/reduce conflicts can be successfully resolved this way because the conflict may be due to  
 124044 something other than ambiguity, so incautious use of these facilities can cause the language  
 124045 accepted by the parser to be much different from that which was intended. The description file  
 124046 shall contain sufficient information to understand the cause of the conflict. Where ambiguity is  
 124047 the reason either the default or explicit rules should be adequate to produce a working parser.

124048 The declared precedences and associativities (see [Declarations Section](#), on page 3616) are used to  
 124049 resolve parsing conflicts as follows:

- 124050 1. A precedence and associativity is associated with each grammar rule; it is the precedence  
 124051 and associativity of the last token or literal in the body of the rule. If the `%prec` keyword  
 124052 is used, it overrides this default. Some grammar rules might not have both precedence  
 124053 and associativity.
- 124054 2. If there is a shift/reduce conflict, and both the grammar rule and the input symbol have  
 124055 precedence and associativity associated with them, then the conflict is resolved in favor of  
 124056 the action (shift or reduce) associated with the higher precedence. If the precedences are  
 124057 the same, then the associativity is used; left associative implies reduce, right associative  
 124058 implies shift, and non-associative implies an error in the string being parsed.
- 124059 3. When there is a shift/reduce conflict that cannot be resolved by rule 2, the shift is done.  
 124060 Conflicts resolved this way are counted in the diagnostic output described in [Error  
 124061 Handling](#) (on page 3623).

124062 4. When there is a reduce/reduce conflict, a reduction is done by the grammar rule that  
124063 occurs earlier in the input sequence. Conflicts resolved this way are counted in the  
124064 diagnostic output described in [Error Handling](#).

124065 Conflicts resolved by precedence or associativity shall not be counted in the shift/reduce and  
124066 reduce/reduce conflicts reported by *yacc* on either standard error or in the description file.

## 124067 **Error Handling**

124068 The token **error** shall be reserved for error handling. The name **error** can be used in grammar  
124069 rules. It indicates places where the parser can recover from a syntax error. The default value of  
124070 **error** shall be 256. Its value can be changed using a **%token** declaration. The lexical analyzer  
124071 should not return the value of **error**.

124072 The parser shall detect a syntax error when it is in a state where the action associated with the  
124073 lookahead symbol is **error**. A semantic action can cause the parser to initiate error handling by  
124074 executing the macro YYERROR. When YYERROR is executed, the semantic action passes control  
124075 back to the parser. YYERROR cannot be used outside of semantic actions.

124076 When the parser detects a syntax error, it normally calls *yyerror()* with the character string  
124077 "syntax error" as its argument. The call shall not be made if the parser is still recovering  
124078 from a previous error when the error is detected. The parser is considered to be recovering from  
124079 a previous error until the parser has shifted over at least three normal input symbols since the  
124080 last error was detected or a semantic action has executed the macro *yyerrok*. The parser shall not  
124081 call *yyerror()* when YYERROR is executed.

124082 The macro function YYRECOVERING shall return 1 if a syntax error has been detected and the  
124083 parser has not yet fully recovered from it. Otherwise, zero shall be returned.

124084 When a syntax error is detected by the parser, the parser shall check if a previous syntax error  
124085 has been detected. If a previous error was detected, and if no normal input symbols have been  
124086 shifted since the preceding error was detected, the parser checks if the lookahead symbol is an  
124087 endmarker (see [Interface to the Lexical Analyzer](#), on page 3624). If it is, the parser shall return  
124088 with a non-zero value. Otherwise, the lookahead symbol shall be discarded and normal parsing  
124089 shall resume.

124090 When YYERROR is executed or when the parser detects a syntax error and no previous error has  
124091 been detected, or at least one normal input symbol has been shifted since the previous error was  
124092 detected, the parser shall pop back one state at a time until the parse stack is empty or the  
124093 current state allows a shift over **error**. If the parser empties the parse stack, it shall return with a  
124094 non-zero value. Otherwise, it shall shift over **error** and then resume normal parsing. If the parser  
124095 reads a lookahead symbol before the error was detected, that symbol shall still be the lookahead  
124096 symbol when parsing is resumed.

124097 The macro *yyerrok* in a semantic action shall cause the parser to act as if it has fully recovered  
124098 from any previous errors. The macro *yyclearin* shall cause the parser to discard the current  
124099 lookahead token. If the current lookahead token has not yet been read, *yyclearin* shall have no  
124100 effect.

124101 The macro YYACCEPT shall cause the parser to return with the value zero. The macro  
124102 YYABORT shall cause the parser to return with a non-zero value.

124103 **Interface to the Lexical Analyzer**

124104 The application shall ensure that the *yylex()* function is an integer-valued function that returns a  
 124105 *token number* greater than zero representing the kind of token read, or a value less than or equal  
 124106 to zero when the end of input is reached. When the parser generated by *yacc* calls *yylex()*, it shall  
 124107 assign the returned value, if greater than zero, to the external variable *yychar*. If there is a value  
 124108 associated with the returned token (see the discussion of *tag* above), it shall be assigned to the  
 124109 external variable *yyval*. If the return value from *yylex()* is less than or equal to zero, the parser  
 124110 shall assign the value *YYEOF* to *yychar*.

124111 If the parser and *yylex()* do not agree on these token numbers, reliable communication between  
 124112 them cannot occur. For (single-byte character) literals, the token is simply the numeric value of  
 124113 the character in the current character set. The numbers for other tokens can either be chosen by  
 124114 *yacc*, or chosen by the user. In either case, the **#define** construct of C is used to allow *yylex()* to  
 124115 return these numbers symbolically. The **#define** statements are put into the code file, and the  
 124116 header file if that file is requested. The set of characters permitted by *yacc* in an identifier is  
 124117 larger than that permitted by C. Token names found to contain such characters shall not be  
 124118 included in the **#define** declarations.

124119 If the token numbers are chosen by *yacc*, the tokens other than literals shall be assigned numbers  
 124120 greater than 256, although no order is implied. A token can be explicitly assigned a number by  
 124121 following its first appearance in the declarations section with a number. Names and literals not  
 124122 defined this way retain their default definition. All token numbers assigned by *yacc* shall be  
 124123 unique and distinct from the token numbers used for literals and user-assigned tokens. If  
 124124 duplicate token numbers cause conflicts in parser generation, *yacc* shall report an error;  
 124125 otherwise, it is unspecified whether the token assignment is accepted or an error is reported.

124126 When a parser action is executed, *yychar* shall hold either the token number of the lookahead  
 124127 token, or *YYEMPTY* indicating that there is no lookahead token, or *YYEOF* indicating the end of  
 124128 input. If *yychar* holds the token number of the lookahead token, *yyval* shall hold the value  
 124129 associated with that token, if any.

124130 The application shall ensure that when the end of input is reached, the *yylex()* function returns a  
 124131 value that is zero or negative. The parser shall treat this as the token number *YYEOF* for a  
 124132 special token called the *endmarker*. If the tokens up to, but excluding, the endmarker form a  
 124133 structure that matches the start symbol, the parser shall accept the input. If the endmarker is  
 124134 seen in any other context, it shall be considered an error.

124135 **Completing the Program**

124136 In addition to *yparse()* and *yylex()*, the functions *yyerror()* and *main()* are required to make a  
 124137 complete program. The application can supply *main()* and *yyerror()*, or those routines can be  
 124138 obtained from the *yacc* library.

124139 **Yacc Library**

124140 The following functions shall appear only in the *yacc* library accessible through the **-I y** operand  
 124141 to *c17*; they can therefore be redefined by a conforming application:

124142 **int main(void)**

124143 This function shall call *yparse()* and exit with an unspecified value. Other actions within  
 124144 this function are unspecified.

124145 **void yyerror(const char \*s)**

124146 This function shall write the NUL-terminated argument to standard error, followed by a  
 124147 <newline>.

124148 The order of the `-ly` and `-ll` operands given to `c17` is significant; the application shall either  
124149 provide its own `main()` function or ensure that `-ly` precedes `-ll`.

### 124150 **Debugging the Parser**

124151 The parser generated by `yacc` shall have diagnostic facilities in it that can be optionally enabled  
124152 at either compile time or at runtime (if enabled at compile time). The compilation of the runtime  
124153 debugging code is under the control of `YYDEBUG`, a preprocessor symbol. If `YYDEBUG` has a  
124154 non-zero value, the debugging code shall be included. If its value is zero, the code shall not be  
124155 included.

124156 In parsers where the debugging code has been included, the external `int yydebug` can be used to  
124157 turn debugging on (with a non-zero value) and off (zero value) at runtime. The initial value of  
124158 `yydebug` shall be zero.

124159 When `-t` is specified, the code file shall be built such that, if `YYDEBUG` is not already defined at  
124160 compilation time (using the `c17 -D YYDEBUG` option, for example), `YYDEBUG` shall be set  
124161 explicitly to 1. When `-t` is not specified, the code file shall be built such that, if `YYDEBUG` is not  
124162 already defined, it shall be set explicitly to zero.

124163 The format of the debugging output is unspecified but includes at least enough information to  
124164 determine the shift and reduce actions, and the input symbols. It also provides information  
124165 about error recovery.

### 124166 **Algorithms**

124167 The parser constructed by `yacc` implements an LALR(1) parsing algorithm as documented in the  
124168 literature. It is unspecified whether the parser is table-driven or direct-coded.

124169 A parser generated by `yacc` shall never request an input symbol from `yylex()` while in a state  
124170 where the only actions other than the error action are reductions by a single rule.

124171 The literature of parsing theory defines these concepts.

### 124172 **Limits**

124173 The `yacc` utility may have several internal tables. The minimum maximums for these tables are  
124174 shown in the following table. The exact meaning of these values is implementation-defined. The  
124175 implementation shall define the relationship between these values and between them and any  
124176 error messages that the implementation may generate should it run out of space for any internal  
124177 structure. An implementation may combine groups of these resources into a single pool as long  
124178 as the total available to the user does not fall below the sum of the sizes specified by this section.

| {NTERMS}   | 126                | Number of tokens.                                                                                                                                                                                                                                                  |
| {NNONTERM} | 200                | Number of non-terminals.                                                                                                                                                                                                                                           |
| {NPROD}    | 300                | Number of rules.                                                                                                                                                                                                                                                   |
| {NSTATES}  | 600                | Number of states.                                                                                                                                                                                                                                                  |
| {MEMSIZE}  | 5 200              | Length of rules. The total length, in names (tokens and non-terminals), of all the rules of the grammar. The left-hand side is counted for each rule, even if it is not explicitly repeated, as specified in <a href="#">Grammar Rules in yacc</a> (on page 3618). |
| {ACTSIZE}  | 4 000              | Number of actions. “Actions” here (and in the description file) refer to parser actions (shift, reduce, and so on) not to semantic actions defined in <a href="#">Grammar Rules in yacc</a> (on page 3618).                                                        |

124197 **EXIT STATUS**

124198 The following exit values shall be returned:

124199 0 Successful completion.

124200 &gt;0 An error occurred.

124201 **CONSEQUENCES OF ERRORS**

124202 If any errors are encountered, the run is aborted and *yacc* exits with a non-zero status. Partial  
 124203 code files and header files may be produced. The summary information in the description file  
 124204 shall always be produced if the `-v` flag is present.

124205 **APPLICATION USAGE**

124206 Historical implementations experience name conflicts on the names `yacc.tmp`, `yacc.acts`,  
 124207 `yacc.debug`, `y.tab.c`, `y.tab.h`, and `y.output` if more than one copy of *yacc* is running in a single  
 124208 directory at one time. The `-b` option was added to overcome this problem. The related problem  
 124209 of allowing multiple *yacc* parsers to be placed in the same file was addressed by adding a `-p`  
 124210 option to override the previously hard-coded `yy` variable prefix.

124211 The description of the `-p` option specifies the minimal set of function and variable names that  
 124212 cause conflict when multiple parsers are linked together. `YYSTYPE` does not need to be changed.  
 124213 Instead, the programmer can use `-b` to give the header files for different parsers different names,  
 124214 and then the file with the `yylex()` for a given parser can include the header for that parser.  
 124215 Names such as `yyclearerr` do not need to be changed because they are used only in the actions;  
 124216 they do not have linkage. It is possible that an implementation has other names, either internal  
 124217 ones for implementing things such as `yyclearerr`, or providing non-standard features that it wants  
 124218 to change with `-p`.

124219 Unary operators that are the same token as a binary operator in general need their precedence  
 124220 adjusted. This is handled by the `%prec` advisory symbol associated with the particular grammar  
 124221 rule defining that unary operator. (See [Grammar Rules in yacc](#) (on page 3618).) Applications are  
 124222 not required to use this operator for unary operators, but the grammars that do not require it are  
 124223 rare.

124224 If `yyerror()` and `yylex()` are not defined within `%{` and `%}` in the declarations section as functions  
 124225 or macros, nor in the programs section as functions, recommended practice is to declare them as

124226 functions in a separate header file and include that file in the declarations section, followed by  
 124227 `#define yyerror yyerror` and `#define yylex yylex`. This lets the separate header file  
 124228 be the definitive API for all code defining or using these functions.

#### 124229 EXAMPLES

124230 Access to the *yacc* library is obtained with library search operands to *c17*. To use the *yacc* library  
 124231 *main()*:

```
124232 c17 y.tab.c -l y
```

124233 Both the *lex* library and the *yacc* library contain *main()*. To access the *yacc main()*:

```
124234 c17 y.tab.c lex.yy.c -l y -l l
```

124235 This ensures that the *yacc* library is searched first, so that its *main()* is used.

124236 The historical *yacc* libraries have contained two simple functions that are normally coded by the  
 124237 application programmer. These functions are similar to the following code:

```
124238 #include <locale.h>
124239 int main(void)
124240 {
124241     extern int yyparse();
124242     setlocale(LC_ALL, "");
124243     /* If the following parser is one created by lex, the
124244        application must be careful to ensure that LC_CTYPE
124245        and LC_COLLATE are set to the POSIX locale. */
124246     (void) yyparse();
124247     return (0);
124248 }
124249 #include <stdio.h>
124250 void yyerror(const char *msg)
124251 {
124252     (void) fprintf(stderr, "%s\n", msg);
124253     return (0);
124254 }
```

#### 124255 RATIONALE

124256 The references in **Referenced Documents** may be helpful in constructing the parser generator.  
 124257 The referenced DeRemer and Pennello article (along with the works it references) describes a  
 124258 technique to generate parsers that conform to this volume of POSIX.1-2024. Work in this area  
 124259 continues to be done, so implementors should consult current literature before doing any new  
 124260 implementations. The original Knuth article is the theoretical basis for this kind of parser, but the  
 124261 tables it generates are impractically large for reasonable grammars and should not be used. The  
 124262 “equivalent to” wording is intentional to assure that the best tables that are LALR(1) can be  
 124263 generated.

124264 There has been confusion between the class of grammars, the algorithms needed to generate  
 124265 parsers, and the algorithms needed to parse the languages. They are all reasonably orthogonal.  
 124266 In particular, a parser generator that accepts the full range of LR(1) grammars need not generate  
 124267 a table any more complex than one that accepts SLR(1) (a relatively weak class of LR grammars)  
 124268 for a grammar that happens to be SLR(1). Such an implementation need not recognize the case,  
 124269 either; table compression can yield the SLR(1) table (or one even smaller than that) without  
 124270 recognizing that the grammar is SLR(1). The speed of an LR(1) parser for any class is dependent

124271 more upon the table representation and compression (or the code generation if a direct parser is  
 124272 generated) than upon the class of grammar that the table generator handles.

124273 The speed of the parser generator is somewhat dependent upon the class of grammar it handles.  
 124274 However, the original Knuth article algorithms for constructing LR parsers were judged by its  
 124275 author to be impractically slow at that time. Although full LR is more complex than LALR(1), as  
 124276 computer speeds and algorithms improve, the difference (in terms of acceptable wall-clock  
 124277 execution time) is becoming less significant.

124278 Potential authors are cautioned that the referenced DeRemer and Pennello article previously  
 124279 cited identifies a bug (an over-simplification of the computation of LALR(1) lookahead sets) in  
 124280 some of the LALR(1) algorithm statements that preceded it to publication. They should take the  
 124281 time to seek out that paper, as well as current relevant work, particularly Aho's.

124282 The **-b** option was added to provide a portable method for permitting *yacc* to work on multiple  
 124283 separate parsers in the same directory. If a directory contains more than one *yacc* grammar, and  
 124284 both grammars are constructed at the same time (by, for example, a parallel *make* program),  
 124285 conflict results. While the solution is not historical practice, it corrects a known deficiency in  
 124286 historical implementations. Corresponding changes were made to all sections that referenced  
 124287 the filenames **y.tab.c** (now ``the code file''), **y.tab.h** (now ``the header file''), and **y.output** (now  
 124288 ``the description file'').

124289 The grammar for *yacc* input is based on System V documentation. The textual description shows  
 124290 there that the **' ; '** is required at the end of the rule. The grammar and the implementation do  
 124291 not require this. (The use of **C\_IDENTIFIER** causes a reduce to occur in the right place.)

124292 Also, in that implementation, the constructs such as **%token** can be terminated by a  
 124293 <semicolon>, but this is not permitted by the grammar. The keywords such as **%token** can also  
 124294 appear in uppercase, which is again not discussed. In most places where **'%'** is used,  
 124295 <backslash> can be substituted, and there are alternate spellings for some of the symbols (for  
 124296 example, **%LEFT** can be **"%<"** or even **"\<"**).

124297 Historically, <tag> can contain any characters except **'>'**, including white space, in the  
 124298 implementation. However, since the *tag* must reference an ISO C standard union member, in  
 124299 practice conforming implementations need to support only the set of characters for ISO C  
 124300 standard identifiers in this context.

124301 Some historical implementations are known to accept actions that are terminated by a period.  
 124302 Historical implementations often allow **'\$'** in names. A conforming implementation does not  
 124303 need to support either of these behaviors.

124304 Deciding when to use **%prec** illustrates the difficulty in specifying the behavior of *yacc*. There  
 124305 may be situations in which the *grammar* is not, strictly speaking, in error, and yet *yacc* cannot  
 124306 interpret it unambiguously. The resolution of ambiguities in the grammar can in many instances  
 124307 be resolved by providing additional information, such as using **%type** or **%union** declarations.  
 124308 It is often easier and it usually yields a smaller parser to take this alternative when it is  
 124309 appropriate.

124310 The size and execution time of a program produced without the runtime debugging code is  
 124311 usually smaller and slightly faster in historical implementations.

124312 Statistics messages from several historical implementations include the following types of  
 124313 information:

124314 *n*/512 terminals, *n*/300 non-terminals  
 124315 *n*/600 grammar rules, *n*/1500 states  
 124316 *n* shift/reduce, *n* reduce/reduce conflicts reported

124317  $n/350$  working sets used  
 124318 Memory: states, etc.  $n/15000$ , parser  $n/15000$   
 124319  $n/600$  distinct lookahead sets  
 124320  $n$  extra closures  
 124321  $n$  shift entries,  $n$  exceptions  
 124322  $n$  goto entries  
 124323  $n$  entries saved by goto default  
 124324 Optimizer space used: input  $n/15000$ , output  $n/15000$   
 124325  $n$  table entries,  $n$  zero  
 124326 Maximum spread:  $n$ , Maximum offset:  $n$

124327 The report of internal tables in the description file is left implementation-defined because all  
 124328 aspects of these limits are also implementation-defined. Some implementations may use  
 124329 dynamic allocation techniques and have no specific limit values to report.

124330 The format of the **y.output** file is not given because specification of the format was not seen to  
 124331 enhance applications portability. The listing is primarily intended to help human users  
 124332 understand and debug the parser; use of **y.output** by a conforming application script would be  
 124333 unusual. Furthermore, implementations have not produced consistent output and no popular  
 124334 format was apparent. The format selected by the implementation should be human-readable, in  
 124335 addition to the requirement that it be a text file.

124336 Standard error reports are not specifically described because they are seldom of use to  
 124337 conforming applications and there was no reason to restrict implementations.

124338 Some implementations recognize "`={"`" as equivalent to "`{`" because it appears in historical  
 124339 documentation. This construction was recognized and documented as obsolete as long ago as  
 124340 1978, in the referenced *Yacc: Yet Another Compiler-Compiler*. This volume of POSIX.1-2024 chose to  
 124341 leave it as obsolete and omit it.

124342 Multi-byte characters should be recognized by the lexical analyzer and returned as tokens. They  
 124343 should not be returned as multi-byte character literals. The token **error** that is used for error  
 124344 recovery is normally assigned the value 256 in the historical implementation. Thus, the token  
 124345 value 256, which is used in many multi-byte character sets, is not available for use as the value  
 124346 of a user-defined token.

124347 Earlier versions of this standard did not require the code file created by *yacc* to contain  
 124348 declarations of *yyerror()*, *yylex()*, and *yyparse()*. This meant that portable applications that did  
 124349 not define them had to declare them in the *grammar* file, to ensure they would not be diagnosed  
 124350 by the compiler as being called without being declared, but this was not stated in those versions  
 124351 of the standard either. The standard developers decided it was preferable for *yacc* to include the  
 124352 declarations in the code file and this is now a requirement. However, the declarations of  
 124353 *yyerror()* and *yylex()* are only visible if a macro of the same name is not defined, which provides  
 124354 application writers with a way to suppress the declaration if desired (for example, in order to  
 124355 provide their own declaration that would conflict with the one written by *yacc*). These functions  
 124356 are not declared in the header file because a macro definition in the declaration section would  
 124357 not be able to suppress them there.

124358 Earlier versions of this standard were also silent about a declaration of *main()*. However, the  
 124359 equivalent solution was not adopted because a declaration of *main()* would only be needed if it  
 124360 is called recursively by an application. Although in theory an application could call the *yacc*  
 124361 library version of *main()* from code in a *grammar* file, it is questionable why any application  
 124362 (other than a test suite) would do so, in particular because that version of *main()* does not accept  
 124363 any arguments and it calls *exit()*—it does not return—and therefore is of little use recursively.  
 124364 An application that includes its own definition of *main()* could call it recursively, but can

124365 reasonably be expected to ensure it does not call *main()* without previously defining or declaring  
 124366 it. An additional complication is that *main()* has multiple different allowed prototypes. The  
 124367 standard developers decided the simplest solution was to disallow *yacc* from providing a  
 124368 declaration of *main()* in the code file.

#### 124369 **FUTURE DIRECTIONS**

124370 If this utility is directed to create a new directory entry that contains any bytes that have the  
 124371 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 124372 error. A future version of this standard may require implementations to treat this as an error.

124374 *c17, lex*

124375 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 124376 **CHANGE HISTORY**

124377 First released in Issue 2.

#### 124378 **Issue 5**

124379 The FUTURE DIRECTIONS section is added.

#### 124380 **Issue 6**

124381 This utility is marked as part of the C-Language Development Utilities option.

124382 Minor changes have been added to align with the IEEE P1003.2b draft standard.

124383 The normative text is reworded to avoid use of the term “must” for application requirements.

124384 IEEE PASC Interpretation 1003.2 #177 is applied, changing the comment on **RCURL** from the }%  
 124385 token to the %}.

#### 124386 **Issue 7**

124387 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for  
 124388 generated code to conform to the ISO C standard.

124389 Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language  
 124390 trigraphs and curly brace preprocessing tokens.

124391 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
 124392 apply.

124393 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

124394 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0204 [977] is applied.

#### 124395 **Issue 8**

124396 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
 124397 filenames containing any bytes that have the encoded value of a <newline> character.

124398 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

124399 Austin Group Defect 1269 is applied, changing the required contents of the code file (including  
 124400 **#define** statements for **YYEMPTY** and **YYEOF**) and adding new requirements for the interface to  
 124401 the lexical analyzer.

124402 Austin Group Defect 1388 is applied, changing the requirements relating to declarations of  
 124403 *yyerror()*, *yylex()*, *yyparse()*, and *main()*.

# Rationale for Base Definitions

## 124422 A.1 Introduction

### 124423 A.1.1 Scope

124424 POSIX.1-2024 is one of a family of standards known as POSIX. The family of standards extends  
124425 to many topics; POSIX.1 consists of both operating system interfaces and shell and utilities.  
124426 POSIX.1-2024 is technically identical to The Open Group Base Specifications, Issue 8.

#### 124427 Scope of POSIX.1-2024

124428 The (paraphrased) goals of this development were to revise the single document that is ISO/IEC  
124429 9945:2009 Parts 1 through 4 as amended by ISO/IEC 9945:2009/Cor.1:2013 and ISO/IEC  
124430 9945:2009/Cor.2:2017, IEEE Std 1003.1-2017, and the appropriate parts of The Open Group  
124431 Single UNIX Specification, Version 5. This work has been undertaken by the Austin Group, a  
124432 joint working group of IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

124433 The following are the base documents in this version:

- 124434 • IEEE Std 1003.1-2017
- 124435 • IEEE Std 1003.26-2003
- 124436 • ISO/IEC 9899: 2018, Programming Languages — C

124437 This version has addressed the following areas:

- 124438 • Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1,  
124439 and ISO/IEC defect reports against ISO/IEC 9945

124440 The repository of interpretations can be accessed at [www.opengroup.org/austin/interps](http://www.opengroup.org/austin/interps).

- 124441 • Issues raised in corrigenda for The Open Group Standards and working group resolutions  
124442 from The Open Group

- 124443 • Changes to make the text self-consistent with the additional material merged

124444 A list of the new interfaces is included in [Section B.1.1](#) (on page 3731).

- 124445 • Features, marked obsolescent in the base documents, have been considered for removal in  
124446 this version

124447 See [Section B.1.1](#) (on page 3731) and [Section C.1.1](#) (on page 3855).

- 124448 • Alignment with the ISO/IEC 9899: 2018 standard

124449 The following were requirements on POSIX.1-2024:

- 124450 • Backward-compatibility

124451 For interfaces carried forward, it was agreed that there should be no breakage of  
124452 functionality in the existing base documents. All strictly conforming applications will be

124453 conforming but not necessarily strictly conforming to the revised standard. The goal is for  
 124454 system implementations to be able to support the existing and revised standards  
 124455 simultaneously.

124456 • Architecture and *n*-bit-neutral

124457 The common standard should not make any implicit assumptions about the system  
 124458 architecture or size of data types; for example, previously some 32-bit implicit assumptions  
 124459 had crept into the standards.

124460 • Extensibility

124461 It should be possible to extend the common standard without breaking backwards-  
 124462 compatibility; for example, the name space should be reserved and structured to avoid  
 124463 duplication of names between the standard and extensions to it.

#### 124464 **POSIX.1 and the ISO C Standard**

124465 The standard developers believed it essential for a programmer to have a single complete  
 124466 reference place, but recognized that deference to the formal standard has to be addressed for the  
 124467 duplicate interface definitions between the ISO C standard and POSIX.1-2024.

124468 Where an interface has a version in the ISO C standard, the DESCRIPTION section describes the  
 124469 relationship to the ISO C standard and markings are included as appropriate to show where the  
 124470 ISO C standard has been extended in the text.

124471 A block of text is included at the start of each affected reference page stating whether the page is  
 124472 aligned with the ISO C standard or extended. Each page has been parsed for additions beyond  
 124473 the ISO C standard (that is, including both POSIX and UNIX extensions), and these extensions  
 124474 are marked as CX extensions (for C extensions).

#### 124475 **FIPS Requirements**

124476 The Federal Information Processing Standards (FIPS) are a series of US government  
 124477 procurement standards managed and maintained on behalf of the US Department of Commerce  
 124478 by the National Institute of Standards and Technology (NIST).

124479 The following restrictions were integrated into IEEE Std 1003.1-2001. They originally came from  
 124480 FIPS 151-2 which was withdrawn by NIST on February 25 2000.

124481 • The implementation supports `_POSIX_CHOWN_RESTRICTED`.

124482 • The limit `{NGROUPS_MAX}` is greater than or equal to 8.

124483 • The implementation supports the setting of the group ID of a file (when it is created) to  
 124484 that of the parent directory.

124485 • The implementation supports `_POSIX_SAVED_IDS`.

124486 • The implementation supports `_POSIX_VDISABLE`.

124487 • The implementation supports `_POSIX_JOB_CONTROL`.

124488 • The implementation supports `_POSIX_NO_TRUNC`.

124489 • The `read()` function returns the number of bytes read when interrupted by a signal and  
 124490 does not return `-1`.

124491 • The `write()` function returns the number of bytes written when interrupted by a signal and  
 124492 does not return `-1`.

- 124493 • In the environment for the login shell, the environment variables *LOGNAME* and *HOME*
- 124494 are defined and have the properties described in POSIX.1-2024.
- 124495 • The value of {CHILD\_MAX} is greater than or equal to 25.
- 124496 • The value of {OPEN\_MAX} is greater than or equal to 20.
- 124497 • The implementation supports the functionality associated with the symbols CS7, CS8,
- 124498 CSTOPB, PARODD, and PARENB defined in `<termios.h>`.

### 124499 **A.1.2 Word Usage**

124500 The content of this section is mandated by IEEE and consequently it cannot be combined with  
124501 the “Terminology” section.

124502 Note that where the footnotes state that “must” is used only to describe unavoidable situations  
124503 and “will” is only used in statements of fact, they are referring to uses of these words in  
124504 normative text. In informative text, they are used in other ways with their usual dictionary  
124505 meanings.

### 124506 **A.1.3 Conformance**

124507 See [Section A.2](#) (on page 3643).

### 124508 **A.1.4 Normative References**

124509 There is no additional rationale provided for this section.

### 124510 **A.1.5 Change History**

124511 For Issue 7 onwards, in references to Technical Corrigenda, the original Austin Group defect  
124512 report numbers that gave rise to the change are included in square brackets after the change  
124513 number from the Technical Corrigendum. For more information on Austin Group defect reports  
124514 see [www.opengroup.org/austin/defectform.html](http://www.opengroup.org/austin/defectform.html).

### 124515 **A.1.6 Terminology**

124516 The meanings specified in POSIX.1-2024 for the words *shall*, *should*, and *may* are mandated by  
124517 ISO/IEC directives.

124518 In the Rationale (Informative) volume of POSIX.1-2024, the words *shall*, *should*, and *may* are  
124519 sometimes used to illustrate similar usages in POSIX.1-2024. However, the rationale itself does  
124520 not specify anything regarding implementations or applications.

#### 124521 **conformance document**

124522 As a practical matter, the conformance document is effectively part of the system  
124523 documentation. Conformance documents are distinguished by POSIX.1-2024 so that they  
124524 can be referred to distinctly.

#### 124525 **implementation-defined**

124526 This definition is analogous to that of the ISO C standard and, together with “undefined”  
124527 and “unspecified”, provides a range of specification of freedom allowed to the interface  
124528 implementor.

- 124529       **may**
- 124530       The use of *may* has been limited as much as possible, due both to confusion stemming from
- 124531       its ordinary English meaning and to objections regarding the desirability of having as few
- 124532       options as possible and those as clearly specified as possible.
- 124533       The usage of *can* and *may* were selected to contrast optional application behavior (can)
- 124534       against optional implementation behavior (may).
- 124535       **shall**
- 124536       Declarative sentences are sometimes used in POSIX.1-2024 as if they included the word
- 124537       *shall*, and facilities thus specified are no less required. For example, the two statements:
- 124538           1. The *foo()* function shall return zero.
- 124539           2. The *foo()* function returns zero.
- 124540       are meant to be exactly equivalent.
- 124541       **should**
- 124542       In POSIX.1-2024, the word *should* does not usually apply to the implementation, but rather
- 124543       to the application. Thus, the important words regarding implementations are *shall*, which
- 124544       indicates requirements, and *may*, which indicates options.
- 124545       **obsolescent**
- 124546       The term “obsolescent” means “do not use this feature in new applications”. A feature
- 124547       noted as obsolescent is supported by all implementations, but may be removed in a future
- 124548       version; new applications should not use these features. The obsolescence concept is not an
- 124549       ideal solution, but was used as a method of increasing consensus: many more objections
- 124550       would be heard from the user community if some of these historical features were suddenly
- 124551       removed without the grace period obsolescence implies. The phrase “may be removed in a
- 124552       future version” implies that the result of that consideration might in fact keep those features
- 124553       indefinitely if the predominance of applications do not migrate away from them quickly.
- 124554       **legacy**
- 124555       The term “legacy” was included in earlier versions of this standard but is no longer used in
- 124556       the current version.
- 124557       **system documentation**
- 124558       The system documentation should normally describe the whole of the implementation,
- 124559       including any extensions provided by the implementation. Such documents normally
- 124560       contain information at least as detailed as the specifications in POSIX.1-2024. Few
- 124561       requirements are made on the system documentation, but the term is needed to avoid a
- 124562       dangling pointer where the conformance document is permitted to point to the system
- 124563       documentation.
- 124564       **undefined**
- 124565       See *implementation-defined*.
- 124566       **unspecified**
- 124567       See *implementation-defined*.
- 124568       The definitions for “unspecified” and “undefined” appear nearly identical at first
- 124569       examination, but are not. The term “unspecified” means that a conforming application may
- 124570       deal with the unspecified behavior, and it should not care what the outcome is. The term
- 124571       “undefined” says that a conforming application should not do it because no definition is
- 124572       provided for what it does (and implicitly it would care what the outcome was if it tried it).
- 124573       It is important to remember, however, that if the syntax permits the statement at all, it must
- 124574       have some outcome in a real implementation.

124575 Thus, the terms “undefined” and “unspecified” apply to the way the application should  
124576 think about the feature. In terms of the implementation, it is always “defined”—there is  
124577 always some result, even if it is an error. The implementation is free to choose the behavior  
124578 it prefers.

124579 This also implies that an implementation, or another standard, could specify or define the  
124580 result in a useful fashion. The terms apply to POSIX.1-2024 specifically.

124581 The term “implementation-defined” implies requirements for documentation that are not  
124582 required for “undefined” (or “unspecified”). Where there is no need for a conforming  
124583 program to know the definition, the term “undefined” is used, even though  
124584 “implementation-defined” could also have been used in this context. There could be a  
124585 fourth term, specifying “this standard does not say what this does; it is acceptable to define  
124586 it in an implementation, but it does not need to be documented”, and undefined would  
124587 then be used very rarely for the few things for which any definition is not useful. In  
124588 particular, implementation-defined is used where it is believed that certain classes of  
124589 application will need to know such details to determine whether the application can be  
124590 successfully ported to the implementation. Such applications are not always strictly  
124591 portable, but nevertheless are common and useful; often the requirements met by the  
124592 application cannot be met without dealing with the issues implied by “implementation-  
124593 defined”. In some places the text refers to facilities supplied by the implementation that are  
124594 outside the standard as implementation-supplied or implementation-provided. This is not  
124595 intended to imply a requirement for documentation. If it were, the term “implementation-  
124596 defined” would have been used.

124597 In many places POSIX.1-2024 is silent about the behavior of some possible construct. For  
124598 example, a variable may be defined for a specified range of values and behaviors are  
124599 described for those values; nothing is said about what happens if the variable has any other  
124600 value. That kind of silence can imply an error in the standard, but it may also imply that the  
124601 standard was intentionally silent and that any behavior is permitted. There is a natural  
124602 tendency to infer that if the standard is silent, a behavior is prohibited. That is not the intent.  
124603 Silence is intended to be equivalent to the term “unspecified”.

124604 Three terms used within POSIX.1-2024 overlap in meaning: “macro”, “symbolic name”, and  
124605 “symbolic constant”.

#### 124606 **macro**

124607 This usually describes a C preprocessor symbol, the result of the **#define** operator, with or  
124608 without an argument. It may also be used to describe similar mechanisms in editors and  
124609 text processors.

#### 124610 **symbolic name**

124611 In earlier versions of this standard this was also sometimes used to refer to a C preprocessor  
124612 symbol (without arguments), but the intention is for all such uses to have been removed. It  
124613 is now mainly used to refer to the names for characters in character sets, but is sometimes  
124614 used to refer to host names and even filenames.

#### 124615 **symbolic constant**

124616 This also refers to a C preprocessor symbol, with specific associated requirements. See the  
124617 definition in [Section 3.363](#) (on page 84).

124618 **A.1.7 Definitions and Concepts**

124619 There is no additional rationale provided for this section.

124620 **A.1.8 Portability**

124621 To aid the identification of options within POSIX.1-2024, a notation consisting of margin codes  
 124622 and shading is used. This is based on the notation used in earlier versions of The Open Group  
 124623 Base specifications.

124624 The benefit of this approach is a reduction in the number of *if* statements within the running  
 124625 text, that makes the text easier to read, and also an identification to the programmer that they  
 124626 need to ensure that their target platforms support the underlying options. For example, if  
 124627 functionality is marked with RPP in the margin, it will be available on all systems supporting  
 124628 the Robust Mutex Priority Protection option, but may not be available on some others.

124629 *A.1.8.1 Codes*

124630 This section includes codes for options defined in XBD [Section 2.1.6](#) (on page 25), and the  
 124631 following additional codes for other purposes:

124632 **CX** This margin code is used to denote extensions beyond and, in exceptional cases,  
 124633 deviations from the ISO C standard. For interfaces that are duplicated between  
 124634 POSIX.1-2024 and the ISO C standard, a CX introduction block describes the nature of  
 124635 the duplication, with any extensions or deviations appropriately CX marked and  
 124636 shaded. Where deviations exist, the reasons for them are explained in the RATIONALE  
 124637 section of the affected interface. Deviations have become necessary because there is no  
 124638 longer any formal way for ISO to acknowledge defects in the ISO C standard. For the  
 124639 original C90 standard and the C99 revision, defect reports (DRs) were issued, but there  
 124640 is no equivalent mechanism for the current revision. Even if the defect is corrected in a  
 124641 later revision, without stating deviations POSIX.1-2024 would continue to require the  
 124642 incorrect behavior described in the version of the ISO C standard that it references.

124643 Where an interface is added to an ISO C standard header, within the header the  
 124644 interface has an appropriate margin marker and shading (for example, CX, XSI, TSE,  
 124645 and so on) and the same marking appears on the reference page in the SYNOPSIS  
 124646 section. This enables a programmer to easily identify that the interface is extending an  
 124647 ISO C standard header.

124648 Austin Group Defect 1755 is applied, changing the CX code description to include  
 124649 intentional conflicts (deviations).

124650 **MX and MXX**

124651 These two margin codes both relate to the IEC 60559 Floating-Point option. The MX  
 124652 code denotes functionality that is mandated by the ISO C standard for IEC 60559  
 124653 implementations; the MXX code denotes IEC 60559 functionality that is an extension to  
 124654 the ISO C standard.

124655 **MXC** This margin code is used to denote functionality related to the IEC 60559 Complex  
 124656 Floating-Point option.

124657 **OB** This margin code is used to denote obsolescent behavior and thus flag a possible future  
 124658 applications portability warning.

124659 OH The Single UNIX Specification has historically tried to reduce the number of headers an  
 124660 application has had to include when using a particular interface. Sometimes this was  
 124661 fewer than the base standard, and hence a notation is used to flag which headers are  
 124662 optional if you are using a system supporting the XSI option.

124663 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0001 [591] is applied.

#### 124664 A.1.8.2 Margin Code Notation

124665 Since some features may depend on one or more options, or require more than one option, a  
 124666 notation is used. Where a feature requires support of a single option, a single margin code will  
 124667 occur in the margin. If it depends on two options and both are required, then the codes will  
 124668 appear with a <space> separator. If either of two options are required, then a logical OR is  
 124669 denoted using the ' | ' symbol. If more than two codes are used, a special notation is used.

## 124670 A.2 Conformance

124671 The terms “profile” and “profiling” are used throughout this section.

124672 A profile of a standard or standards is a codified set of option selections, such that by being  
 124673 conformant to a profile, particular classes of users are specifically supported.

### 124674 A.2.1 Implementation Conformance

124675 These definitions allow application developers to know what to depend on in an  
 124676 implementation.

124677 There is no definition of a “strictly conforming implementation”; that would be an  
 124678 implementation that provides *only* those facilities specified by POSIX.1 with no extensions  
 124679 whatsoever. This is because no actual operating system implementation can exist without  
 124680 system administration and initialization facilities that are beyond the scope of POSIX.1.

#### 124681 A.2.1.1 Requirements

124682 The word “support” is used in certain instances, rather than “provide”, in order to allow an  
 124683 implementation that has no resident software development facilities, but that supports the  
 124684 execution of a *Strictly Conforming POSIX.1 Application*, to be a *conforming implementation*.

124685 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0002 [810] is applied.

#### 124686 A.2.1.2 Documentation

124687 The conformance documentation is required to use the same numbering scheme as POSIX.1 for  
 124688 purposes of cross-referencing. All options that an implementation chooses are reflected in  
 124689 <limits.h> and <unistd.h>.

124690 Note that the use of “may” in terms of where conformance documents record where  
 124691 implementations may vary, implies that it is not required to describe those features identified as  
 124692 undefined or unspecified.

124693 Other aspects of systems must be evaluated by purchasers for suitability. Many systems  
 124694 incorporate buffering facilities, maintaining updated data in volatile storage and transferring  
 124695 such updates to non-volatile storage asynchronously. Various exception conditions, such as a  
 124696 power failure or a system crash, can cause this data to be lost. The data may be associated with a

124697 file that is still open, with one that has been closed, with a directory, or with any other internal  
124698 system data structures associated with permanent storage. This data can be lost, in whole or  
124699 part, so that only careful inspection of file contents could determine that an update did not  
124700 occur.

124701 Also, interrelated file activities, where multiple files and/or directories are updated, or where  
124702 space is allocated or released in the file system structures, can leave inconsistencies in the  
124703 relationship between data in the various files and directories, or in the file system itself. Such  
124704 inconsistencies can break applications that expect updates to occur in a specific sequence, so that  
124705 updates in one place correspond with related updates in another place.

124706 For example, if a user creates a file, places information in the file, and then records this action in  
124707 another file, a system or power failure at this point followed by restart may result in a state in  
124708 which the record of the action is permanently recorded, but the file created (or some of its  
124709 information) has been lost. The consequences of this to the user may be undesirable. For a user  
124710 on such a system, the only safe action may be to require the system administrator to have a  
124711 policy that requires, after any system or power failure, that the entire file system must be  
124712 restored from the most recent backup copy (causing all intervening work to be lost).

124713 The characteristics of each implementation will vary in this respect and may or may not meet  
124714 the requirements of a given application or user. Enforcement of such requirements is beyond the  
124715 scope of POSIX.1. It is up to the purchaser to determine what facilities are provided in an  
124716 implementation that affect the exposure to possible data or sequence loss, and also what  
124717 underlying implementation techniques and/or facilities are provided that reduce or limit such  
124718 loss or its consequences.

#### 124719 A.2.1.3 *POSIX Conformance*

124720 This really means conformance to the base standard; however, since this document includes the  
124721 core material of the Single UNIX Specification, the standard developers decided that it was  
124722 appropriate to segment the conformance requirements into two, the former for the base  
124723 standard, and the latter for the Single UNIX Specification (denoted XSI Conformance).

124724 Within POSIX.1 there are some symbolic constants that, if defined to a certain value or range of  
124725 values, indicate that a certain option is enabled. Other symbolic constants exist in POSIX.1 for  
124726 other reasons.

124727 In this version, some features that were previously optional have been made mandatory. For  
124728 backwards compatibility, the symbolic constants associated with the option are still required  
124729 now with fixed allowable ranges or values. The following options from previous versions of this  
124730 standard are now mandatory:

124731            \_POSIX\_ASYNCHRONOUS\_IO  
 124732            \_POSIX\_BARRIERS  
 124733            \_POSIX\_CLOCK\_SELECTION  
 124734            \_POSIX\_MAPPED\_FILES  
 124735            \_POSIX\_MEMORY\_PROTECTION  
 124736            \_POSIX\_MONOTONIC\_CLOCK  
 124737            \_POSIX\_READER\_WRITER\_LOCKS  
 124738            \_POSIX\_REALTIME\_SIGNALS  
 124739            \_POSIX\_SEMAPHORES  
 124740            \_POSIX\_SPIN\_LOCKS  
 124741            \_POSIX\_THREAD\_SAFE\_FUNCTIONS  
 124742            \_POSIX\_THREADS  
 124743            \_POSIX\_TIMEOUTS  
 124744            \_POSIX\_TIMERS

124745            A POSIX-conformant system may support the XSI option required by the Single UNIX  
 124746            Specification. This was intentional since the standard developers intend them to be upwards-  
 124747            compatible, so that a system conforming to the Single UNIX Specification can also conform to  
 124748            the base standard at the same time.

124749            POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0003 [637] is applied.

124750            Austin Group Defect 729 is applied, adding \_POSIX\_DEVICE\_CONTROL.

124751            Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

#### 124752 A.2.1.4 XSI Conformance

124753            This section is included to describe the conformance requirements for the base volumes of the  
 124754            Single UNIX Specification.

124755            XSI conformance can be thought of as a profile, selecting certain options from POSIX.1-2024.

#### 124756 A.2.1.5 Option Groups

124757            The concept of “Option Groups” is included to allow collections of related functions or options  
 124758            to be grouped together. This has been used as follows: the “XSI Option Groups” have been  
 124759            created to allow super-options, collections of underlying options and related functions, to be  
 124760            collectively supported by XSI-conforming systems.

124761            The standard developers considered the matter of subprofiling and decided it was better to  
 124762            include an enabling mechanism rather than detailed normative requirements. A set of  
 124763            subprofiling options was developed and included later in this volume of POSIX.1-2024 as an  
 124764            informative illustration.

#### 124765 Subprofiling Considerations

124766            The goal of not simultaneously fixing maximums and minimums was to allow implementations  
 124767            of the base standard or standards to support multiple profiles without conflict.

124768 The following summarizes the rules for the limit types:

| Limit Type       | Fixed Value                   | Minimum Acceptable Value                   | Maximum Acceptable Value                   |
|------------------|-------------------------------|--------------------------------------------|--------------------------------------------|
| Standard Profile | Xs<br>Xp == Xs<br>(No change) | Ys<br>Yp >= Ys<br>(May increase the limit) | Zs<br>Zp <= Zs<br>(May decrease the limit) |

124774 The intent is that ranges specified by limits in profiles be entirely contained within the  
 124775 corresponding ranges of the base standard or standards being profiled, and that the unlimited  
 124776 end of a range in a base standard must remain unlimited in any profile of that standard.

124777 Thus, the fixed `_POSIX_*` limits are constants and must not be changed by a profile. The variable  
 124778 counterparts (typically without the leading `_POSIX_`) can be changed but still remain  
 124779 semantically the same; that is, they still allow implementation values to vary as long as they  
 124780 meet the requirements for that value (be it a minimum or maximum).

124781 Where a profile does not provide a feature upon which a limit is based, the limit is not relevant.  
 124782 Applications written to that profile should be written to operate independently of the value of  
 124783 the limit.

124784 An example which has previously allowed implementations to support both the base standard  
 124785 and two other profiles in a compatible manner follows:

```
124786 Base standard (POSIX.1-1996): _POSIX_CHILD_MAX 6
124787 Base standard: CHILD_MAX minimum maximum _POSIX_CHILD_MAX
124788 FIPS profile/SUSv2 CHILD_MAX 25 (minimum maximum)
```

124789 Another example:

```
124790 Base standard (POSIX.1-1996): _POSIX_NGROUPS_MAX 0
124791 Base standard: NGROUPS_MAX minimum maximum _POSIX_NGROUP_MAX
124792 FIPS profile/SUSv2 NGROUPS_MAX 8
```

124793 A profile may lower a minimum maximum below the equivalent `_POSIX` value:

```
124794 Base standard: _POSIX_foo_MAX Z
124795 Base standard: foo_MAX _POSIX_foo_MAX
124796 profile standard : foo_MAX X (X can be less than, equal to,
124797 or greater than _POSIX_foo_MAX)
```

124798 In this case an implementation conforming to the profile may not conform to the base standard,  
 124799 but an implementation to the base standard will conform to the profile.

124800 **XSI Option Groups**

124801 Austin Group Defect 1192 is applied, marking the `encrypt()` and `setkey()` functions as  
 124802 obsolescent.

124803 Austin Group Defect 1346 is applied, removing `_POSIX_MONOTONIC_CLOCK` from the  
 124804 Advanced Realtime option group.

124805 *A.2.1.6 Options*

124806 The final subsections within *Implementation Conformance* list the core options within  
 124807 POSIX.1-2024. This includes both options for the System Interfaces volume of POSIX.1-2024 and  
 124808 the Shell and Utilities volume of POSIX.1-2024.

124809 Austin Group Defect 190 is applied, adding `man` to the list of utilities in the User Portability

124810 Utilities option.

## 124811 A.2.2 Application Conformance

124812 These definitions guide users or adapters of applications in determining on which  
124813 implementations an application will run and how much adaptation would be required to make  
124814 it run on others. These definitions are modeled after related ones in the ISO C standard.

124815 POSIX.1 occasionally uses the expressions “portable application” or “conforming application”.  
124816 As they are used, these are synonyms for any of these terms. The differences between the classes  
124817 of application conformance relate to the requirements for other standards, the options supported  
124818 (such as the XSI option) or, in the case of the Conforming POSIX.1 Application Using Extensions,  
124819 to implementation extensions. When one of the less explicit expressions is used, it should be  
124820 apparent from the context of the discussion which of the more explicit names is appropriate

### 124821 A.2.2.1 Strictly Conforming POSIX Application

124822 This definition is analogous to that of an ISO C standard “conforming program”.

124823 The major difference between a Strictly Conforming POSIX Application and an ISO C standard  
124824 strictly conforming program is that the latter is not allowed to use features of POSIX that are not  
124825 in the ISO C standard.

### 124826 A.2.2.2 Conforming POSIX Application

124827 Examples of <National Bodies> include ANSI, BSI, and AFNOR.

### 124828 A.2.2.3 Conforming POSIX Application Using Extensions

124829 Due to possible requirements for configuration or implementation characteristics in excess of the  
124830 specifications in <limits.h> or related to the hardware (such as array size or file space), not  
124831 every Conforming POSIX Application Using Extensions will run on every conforming  
124832 implementation.

### 124833 A.2.2.4 Strictly Conforming XSI Application

124834 This is intended to be upwards-compatible with the definition of a Strictly Conforming POSIX  
124835 Application, with the addition of the facilities and functionality included in the XSI option.

### 124836 A.2.2.5 Conforming XSI Application Using Extensions

124837 Such applications may use extensions beyond the facilities defined by POSIX.1-2024 including  
124838 the XSI option, but need to document the additional requirements.

### 124839 **A.2.3 Language-Dependent Services for the C Programming Language**

124840 POSIX.1 is, for historical reasons, both a specification of an operating system interface, shell and  
 124841 utilities, and a C binding for that specification. Efforts had been previously undertaken to  
 124842 generate a language-independent specification; however, that had failed, and the fact that the  
 124843 ISO C standard is the *de facto* primary language on POSIX and the UNIX system makes this a  
 124844 necessary and workable situation.

### 124845 **A.2.4 Other Language-Related Specifications**

124846 There is no additional rationale provided for this section.

## 124847 **A.3 Definitions**

124848 The definitions in this section are stated so that they can be used as exact substitutes for the  
 124849 terms in text. They should not contain requirements or cross-references to sections within  
 124850 POSIX.1-2024; that is accomplished by using an informative note. In addition, the term should  
 124851 not be included in its own definition. Where requirements or descriptions need to be addressed  
 124852 but cannot be included in the definitions, due to not meeting the above criteria, these occur in  
 124853 the General Concepts chapter.

124854 In this version, the definitions have been reworked extensively to meet style requirements and to  
 124855 include terms from the base documents (see the Scope).

124856 Many of these definitions are necessarily circular, and some of the terms (such as “process”) are  
 124857 variants of basic computing science terms that are inherently hard to define. Where some  
 124858 definitions are more conceptual and contain requirements, these appear in the General Concepts  
 124859 chapter. Those listed in this section appear in an alphabetical glossary format of terms.

124860 Some definitions must allow extension to cover terms or facilities that are not explicitly  
 124861 mentioned in POSIX.1-2024. For example, the definition of “Extended Security Controls”  
 124862 permits implementations beyond those defined in POSIX.1-2024.

124863 Some terms in the following list of notes do not appear in POSIX.1-2024; these are marked  
 124864 suffixed with an asterisk (\*). Many of them have been specifically excluded from POSIX.1-2024  
 124865 because they concern system administration, implementation, or other issues that are not  
 124866 specific to the programming interface. Those are marked with a reason, such as  
 124867 “implementation-defined”.

#### 124868 **Alias Name**

124869 Austin Group Defect 1050 is applied, adding '-' to the characters that can be used in an alias  
 124870 name.

#### 124871 **Anonymous Memory Object**

124872 Austin Group Defect 850 is applied, adding anonymous memory objects.

124873 **Application**

124874 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0004 [937] is applied.

124875 **Appropriate Privileges**

124876 One of the fundamental security problems with many historical UNIX systems has been that the  
 124877 privilege mechanism is monolithic—a user has either no privileges or *all* privileges. Thus, a  
 124878 successful “trojan horse” attack on a privileged process defeats all security provisions.  
 124879 Therefore, POSIX.1 allows more granular privilege mechanisms to be defined. For many  
 124880 historical implementations of the UNIX system, the presence of the term “appropriate  
 124881 privileges” in POSIX.1 may be understood as a synonym for “superuser” (UID 0). However,  
 124882 other systems have emerged where this is not the case and each discrete controllable action has  
 124883 *appropriate privileges* associated with it. Because this mechanism is implementation-defined, it  
 124884 must be described in the conformance document. Although that description affects several parts  
 124885 of POSIX.1 where the term “appropriate privilege” is used, because the term “implementation-  
 124886 defined” only appears here, the description of the entire mechanism and its effects on these  
 124887 other sections belongs in this equivalent section of the conformance document. This is especially  
 124888 convenient for implementations with a single mechanism that applies in all areas, since it only  
 124889 needs to be described once.

124890 **Async-Signal-Safe Function**

124891 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0005 [516] is applied.

124892 **Background Job**

124893 Austin Group Defect 1254 is applied, changing this definition.

124894 **Base Character\***

124895 The term “Base Character” has been removed, as it was felt that the use of this term within  
 124896 POSIX.1-2024 was common usage English.

124897 **Basename**

124898 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0006 [653] is applied.

124899 **Built-In Utility**

124900 Austin Group Defect 854 is applied, changing text relating to regular built-in utilities.

124901 **Byte**

124902 The restriction that a byte is now exactly eight bits was a conscious decision by the standard  
 124903 developers. It came about due to a combination of factors, primarily the use of the type **int8\_t**  
 124904 within the networking functions and the alignment with the ISO/IEC 9899:1999 standard,  
 124905 where the **intN\_t** types were first defined.

124906 According to the ISO/IEC 9899:1999 standard:

- 124907 • The **[u]intN\_t** types must be two’s complement with no padding bits and no illegal values.
- 124908 • All types (apart from bit fields, which are not relevant here) must occupy an integral  
 124909 number of bytes.
- 124910 • If a type with width  $W$  occupies  $B$  bytes with  $C$  bits per byte ( $C$  is the value of  
 124911  $\{\text{CHAR\_BIT}\}$ ), then it has  $P$  padding bits where  $P+W=B*C$ .

124912 • Therefore, for `int8_t`  $P=0$ ,  $W=8$ . Since  $B \geq 1$ ,  $C \geq 8$ , the only solution is  $B=1$ ,  $C=8$ .

124913 The standard developers also felt that this was not an undue restriction for the current state-of-  
124914 the-art for this version of the standard, but recognize that if industry trends continue, a wider  
124915 character type may be required in the future.

#### 124916 **Character**

124917 The term “character” is used to mean a sequence of one or more bytes representing a member of  
124918 a character set. The deviation in the exact text of the ISO C standard definition for “byte” meets  
124919 the intent of the rationale of the ISO C standard also clears up the ambiguity raised by the term  
124920 “basic execution character set”. The octet-minimum requirement is a reflection of the  
124921 {CHAR\_BIT} value.

124922 Austin Group Defect 1356 is applied, changing the definition of “character” to match the  
124923 definition of the term “multi-byte character” in the ISO C standard.

#### 124924 **Child Process**

124925 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/3 is applied, adding the `vfork()` function  
124926 to those listed.

#### 124927 **Clock Tick**

124928 The ISO C standard defines a similar interval for use by the `clock()` function. There is no  
124929 requirement that these intervals be the same. In historical implementations these intervals are  
124930 different.

#### 124931 **Code Block**

124932 Austin Group Defect 613 is applied, adding this definition.

#### 124933 **Command**

124934 The terms “command” and “utility” are related but have distinct meanings. Command is  
124935 defined as “a directive to a shell to perform a specific task”. The directive can be in the form of a  
124936 single utility name (for example, `ls`), or the directive can take the form of a compound command  
124937 (for example, `"ls | grep name | pr"`). A utility is a program that can be called by name  
124938 from a shell. Issuing only the name of the utility to a shell is the equivalent of a one-word  
124939 command. A utility may be invoked as a separate program that executes in a different process  
124940 than the command language interpreter, or it may be implemented as a part of the command  
124941 language interpreter. For example, the `echo` command (the directive to perform a specific task)  
124942 may be implemented such that the `echo` utility (the logic that performs the task of echoing) is in a  
124943 separate program; therefore, it is executed in a process that is different from the command  
124944 language interpreter. Conversely, the logic that performs the `echo` utility could be built into the  
124945 command language interpreter; therefore, it could execute in the same process as the command  
124946 language interpreter.

124947 The terms “tool” and “application” can be thought of as being synonymous with “utility” from  
124948 the perspective of the operating system kernel. Tools, applications, and utilities historically have  
124949 run, typically, in processes above the kernel level. Tools and utilities historically have been a part  
124950 of the operating system non-kernel code and have performed system-related functions, such as  
124951 listing directory contents, checking file systems, repairing file systems, or extracting system  
124952 status information. Applications have not generally been a part of the operating system, and  
124953 they perform non-system-related functions, such as word processing, architectural design,  
124954 mechanical design, workstation publishing, or financial analysis. Utilities have most frequently  
124955 been provided by the operating system distributor, applications by third-party software

124956 distributors, or by the users themselves. Nevertheless, POSIX.1-2024 does not differentiate  
 124957 between tools, utilities, and applications when it comes to receiving services from the system, a  
 124958 shell, or the standard utilities. (For example, the *xargs* utility invokes another utility; it would be  
 124959 of fairly limited usefulness if the users could not run their own applications in place of the  
 124960 standard utilities.) Utilities are not applications in the sense that they are not themselves subject  
 124961 to the restrictions of POSIX.1-2024 or any other standard—there is no requirement for *grep*, *stty*,  
 124962 or any of the utilities defined here to be any of the classes of conforming applications.

### 124963 **Column Positions**

124964 In most 1-byte character sets, such as ASCII, the concept of column positions is identical to  
 124965 character positions and to bytes. Therefore, it has been historically acceptable for some  
 124966 implementations to describe line folding or tab stops or table column alignment in terms of  
 124967 bytes or character positions. Other character sets pose complications, as they can have internal  
 124968 representations longer than one octet and they can have display characters that have different  
 124969 widths on the terminal screen or printer.

124970 In POSIX.1-2024 the term “column positions” has been defined to mean character—not byte—  
 124971 positions in input files. Output files describe the column position in terms of the display width  
 124972 of the narrowest printable character in the character set, adjusted to fit the characteristics of the  
 124973 output device. It is very possible that *n* column positions will not be able to hold *n* characters in  
 124974 some character sets, unless all of those characters are of the narrowest width. It is assumed that  
 124975 the implementation is aware of the width of the various characters, deriving this information  
 124976 from the value of *LC\_CTYPE*, and thus can determine how many column positions to allot for  
 124977 each character in those utilities where it is important.

124978 The term “column position” was used instead of the more natural “column” because the latter is  
 124979 frequently used in the different contexts of columns of figures, columns of table values, and so  
 124980 on. Wherever confusion might result, these latter types of columns are referred to as “text  
 124981 columns”.

### 124982 **Condition Variable**

124983 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

### 124984 **Control Operator**

124985 Austin Group Defect 449 is applied, adding ; & to the list of control operators.

### 124986 **Controlling Terminal**

124987 The question of which of possibly several special files referring to the terminal is meant is not  
 124988 addressed in POSIX.1. The pathname */dev/tty* is a synonym for the controlling terminal  
 124989 associated with a process.

### 124990 **Core Image**

124991 Austin Group Defect 1141 is applied, replacing the core file definition with a core image  
 124992 definition.

- 124993           **CPU Time (Execution Time)**
- 124994           Austin Group Defect 1116 is applied, removing a reference to the Threads option that existed in  
124995           earlier versions of this standard.
- 124996           **Decimal-Point Character**
- 124997           Austin Group Defect 1449 is applied, adding this definition.
- 124998           **Declaration Utility**
- 124999           Austin Group Defect 351 is applied, adding this definition.
- 125000           **Device Number\***
- 125001           The concept is handled in *stat()* as *ID of device*.
- 125002           **Direct I/O**
- 125003           Historically, direct I/O refers to the system bypassing intermediate buffering, but may be  
125004           extended to cover implementation-defined optimizations.
- 125005           **Directory**
- 125006           The format of the directory file is implementation-defined and differs radically between  
125007           System V and 4.3 BSD. However, routines (derived from 4.3 BSD) for accessing directories and  
125008           certain constraints on the format of the information returned by those routines are described in  
125009           the **<dirent.h>** header.
- 125010           **Directory Entry (or Hard Link)**
- 125011           Austin Group Defect 1380 is applied, changing “link” to “hard link”.
- 125012           **Display**
- 125013           The Shell and Utilities volume of POSIX.1-2024 assigns precise requirements for the terms  
125014           “display” and “write”. Some historical systems have chosen to implement certain utilities  
125015           without using the traditional file descriptor model. For example, the *vi* editor might employ  
125016           direct screen memory updates on a personal computer, rather than a *write()* system call. An  
125017           instance of user prompting might appear in a dialog box, rather than with standard error. When  
125018           the Shell and Utilities volume of POSIX.1-2024 uses the term “display”, the method of  
125019           outputting to the terminal is unspecified; many historical implementations use *termcap* or  
125020           *terminfo*, but this is not a requirement. The term “write” is used when the Shell and Utilities  
125021           volume of POSIX.1-2024 mandates that a file descriptor be used and that the output can be  
125022           redirected. However, it is assumed that when the writing is directly to the terminal (it has not  
125023           been redirected elsewhere), there is no practical way for a user or test suite to determine whether  
125024           a file descriptor is being used. Therefore, the use of a file descriptor is mandated only for the  
125025           redirection case and the implementation is free to use any method when the output is not  
125026           redirected. The verb *write* is used almost exclusively, with the very few exceptions of those  
125027           utilities where output redirection need not be supported: *tabs*, *talk*, *tput*, and *vi*.

- 125028           **Dot**
- 125029           The symbolic name *dot* is carefully used in POSIX.1 to distinguish the working directory  
125030           filename from a period or a decimal point.
- 125031           **Dot-Dot**
- 125032           Historical implementations permit the use of these filenames without their special meanings.  
125033           Such use precludes any meaningful use of these filenames by a Conforming POSIX.1  
125034           Application. Therefore, such use is considered an extension, the use of which makes an  
125035           implementation non-conforming; see also [Section A.4.16](#) (on page 3683).
- 125036           **Dot-Po File**
- 125037           Austin Group Defect 1122 is applied, adding this definition.
- 125038           **Empty Directory**
- 125039           Austin Group Defect 1380 is applied, changing “link” to “hard link”.
- 125040           **Epoch**
- 125041           Historically, the origin of UNIX system time was referred to as “00:00:00 GMT, January 1, 1970”.  
125042           Greenwich Mean Time is actually not a term acknowledged by the international standards  
125043           community; therefore, this term, “Epoch”, is used to abbreviate the reference to the actual  
125044           standard, Coordinated Universal Time.
- 125045           **FIFO Special File**
- 125046           See [Pipe](#) (on page 3663).
- 125047           **File**
- 125048           It is permissible for an implementation-defined file type to be non-readable or non-writable.
- 125049           **File Classes**
- 125050           These classes correspond to the historical sets of permission bits. The classes are general to  
125051           allow implementations flexibility in expanding the access mechanism for more stringent security  
125052           environments. Note that a process is in one and only one class, so there is no ambiguity.
- 125053           **File Descriptor**
- 125054           Austin Group Defect 1493 is applied, moving some information from XCU [Section 2.7](#) (on page  
125055           2493) to this definition.
- 125056           **File Lock**
- 125057           Austin Group Defect 768 is applied, changing this definition.

- 125058           **File Mode**
- 125059           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0007 [834] is applied.
- 125060           **Filename**
- 125061           Filenames are sequences of bytes, not sequences of characters. The only bytes that this standard  
125062           says cannot appear in any filename are the slash byte and the null byte. This is a side-effect of  
125063           the fact that no conforming implementations of the standard currently provide a way to pass  
125064           information specifying the locale associated with strings passed between user-level applications  
125065           and the kernel. This decision could be revisited if implementations develop a way to associate a  
125066           locale with the strings passed between kernel space and user space.
- 125067           Implementations may add other restrictions to the byte sequences allowed in filenames except  
125068           that any filename consisting of no more than {NAME\_MAX} bytes from the set of characters in  
125069           the portable filename character set must be allowed.
- 125070           See [Pathname](#) (on page 3663).
- 125071           **File System**
- 125072           Historically, the meaning of this term has been overloaded with two meanings: that of the  
125073           complete file hierarchy, and that of a mountable subset of that hierarchy; that is, a mounted file  
125074           system. POSIX.1 uses the term “file system” in the second sense, except that it is limited to the  
125075           scope of a process (and root directory of a process). This usage also clarifies the domain in which  
125076           a file serial number is unique.
- 125077           **Foreground Job**
- 125078           Austin Group Defect 1254 is applied, changing this definition.
- 125079           **Graphic Character**
- 125080           This definition is made available for those definitions (in particular, *TZ*) which must exclude  
125081           control characters.
- 125082           **Group Database**
- 125083           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/4 is applied, removing the words “of  
125084           implementation-defined format”. See [User Database](#) (on page 3675).
- 125085           **Group File\***
- 125086           Implementation-defined; see [User Database](#) (on page 3675).
- 125087           **Group ID**
- 125088           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0008 [511] is applied.
- 125089           **Group Name**
- 125090           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0009 [584] is applied.

- 125091           **Hard Link**
- 125092           Austin Group Defect 1380 is applied, changing this definition.
- 125093           **Historical Implementations\***
- 125094           This refers to previously existing implementations of programming interfaces and operating  
125095           systems that are related to the interface specified by POSIX.1.
- 125096           **Hole**
- 125097           Austin Group Defect 415 is applied, adding this definition.
- 125098           **Hosted Implementation\***
- 125099           This refers to a POSIX.1 implementation that is accomplished through interfaces from the  
125100           POSIX.1 services to some alternate form of operating system kernel services. Note that the line  
125101           between a hosted implementation and a native implementation is blurred, since most  
125102           implementations will provide some services directly from the kernel and others through some  
125103           indirect path. (For example, *fopen()* might use *open()*; or *mkfifo()* might use *mknod()*.) There is  
125104           no necessary relationship between the type of implementation and its correctness, performance,  
125105           and/or reliability.
- 125106           **Implementation\***
- 125107           This term is generally used instead of its synonym, “system”, to emphasize the consequences of  
125108           decisions to be made by system implementors. Perhaps if no options or extensions to POSIX.1  
125109           were allowed, this usage would not have occurred.
- 125110           The term “specific implementation” is sometimes used as a synonym for “implementation”.  
125111           This should not be interpreted too narrowly; both terms can represent a relatively broad group  
125112           of systems. For example, a hardware vendor could market a very wide selection of systems that  
125113           all used the same instruction set, with some systems desktop models and others large multi-user  
125114           minicomputers. This wide range would probably share a common POSIX.1 operating system,  
125115           allowing an application compiled for one to be used on any of the others; this is a [*specific*]  
125116           *implementation*. However, such a wide range of machines probably has some differences  
125117           between the models. Some may have different clock rates, different file systems, different  
125118           resource limits, different network connections, and so on, depending on their sizes or intended  
125119           usages. Even on two identical machines, the system administrators may configure them  
125120           differently. Each of these different systems is known by the term “a specific instance of a specific  
125121           implementation”. This term is only used in the portions of POSIX.1 dealing with runtime  
125122           queries: *sysconf()* and *pathconf()*.
- 125123           **Incomplete Pathname\***
- 125124           Absolute pathname has been adequately defined.
- 125125           **Interactive Device**
- 125126           Austin Group Defect 1347 is applied, adding a definition of interactive device.

**125127 Intrinsic Utility**

125128 Austin Group Defect 854 is applied, adding intrinsic utilities.

**125129 Job**

125130 Austin Group Defect 1254 is applied, changing this definition.

**125131 Job Control**

125132 In order to understand the job control facilities in POSIX.1 it is useful to understand how they  
125133 are used by a job control-cognizant shell to create the user interface effect of job control.

125134 While the job control facilities supplied by POSIX.1 can, in theory, support different types of  
125135 interactive job control interfaces supplied by different types of shells, there was historically one  
125136 particular interface that was most common when the standard was originally developed  
125137 (provided by BSD C Shell).

125138 This discussion describes that interface as a means of illustrating how the POSIX.1 job control  
125139 facilities can be used.

125140 Job control allows users to selectively stop (suspend) the execution of processes and continue  
125141 (resume) their execution at a later point. The user typically employs this facility via the  
125142 interactive interface jointly supplied by the terminal I/O driver and a command interpreter  
125143 (shell).

125144 The user can launch jobs (command pipelines) in either the foreground or background. When  
125145 launched in the foreground, the shell waits for the job to complete before prompting for  
125146 additional commands. When launched in the background, the shell does not wait, but  
125147 immediately prompts for new commands.

125148 If the user launches a job in the foreground and subsequently regrets this, the user can type the  
125149 suspend character (typically set to <control>-Z), which causes the foreground process group to  
125150 stop, and the shell to convert the corresponding foreground job to a suspended job and begin  
125151 prompting for new commands. The suspended job can be continued by the user (via special  
125152 shell commands) either as a foreground job or as a background job. Background jobs can also be  
125153 moved into the foreground via shell commands.

125154 If a background process group attempts to access the login terminal (controlling terminal), it is  
125155 stopped by the terminal driver and the shell detects this and, in turn, suspends the  
125156 corresponding background job and notifies the user. (Terminal access includes *read()* and certain  
125157 terminal control functions, and conditionally includes *write()*.) The user can continue the  
125158 suspended job in the foreground, thus allowing the terminal access to succeed in an orderly  
125159 fashion. After the terminal access succeeds, the user can optionally move the job into the  
125160 background via the suspend character and shell commands.

**125161 Implementing Job Control Shells**

125162 The job control features of the POSIX shell (described in [Section 2.11](#), on page 2518) and of other  
125163 shells can be implemented using the job control facilities of the System Interfaces volume of  
125164 POSIX.1-2024 in the following way.

125165 The key feature necessary to provide job control is a way to group processes into jobs. This  
125166 grouping is necessary in order to direct signals to a single job and also to identify which job is in  
125167 the foreground. (There is at most one job that is in the foreground on any controlling terminal at  
125168 a time.)

125169 The concept of process groups is used to provide this grouping. The shell places the process(es)  
125170 it creates for each job in a separate process group via the *setpgid()* function. To do this, the

125171 *setpgid()* function is invoked by the shell for each process in the job. It is actually useful to  
125172 invoke *setpgid()* twice for each process: once in the child process, after calling *fork()* to create the  
125173 process, but before calling one of the *exec* family of functions to begin execution of the program,  
125174 and once in the parent shell process, after calling *fork()* to create the child. The redundant  
125175 invocation avoids a race condition by ensuring that the child process is placed into the new  
125176 process group before either the parent or the child relies on this being the case. The process  
125177 group ID for the job is selected by the shell to be equal to the process ID of one of the processes  
125178 in the job. Some shells choose to make one process in the job be the parent of the other processes  
125179 in the job (if any). Other shells (for example, the C Shell) choose to make themselves the parent  
125180 of all processes in the job. In order to support this latter case, the *setpgid()* function accepts a  
125181 process group ID parameter since the correct process group ID cannot be inherited from the  
125182 shell.

125183 The shell also controls which job is currently in the foreground. A foreground and background  
125184 job differ in two ways: the shell waits for a foreground command to complete (or stop) before  
125185 continuing to read new commands, and the terminal I/O driver inhibits terminal access by  
125186 background jobs (causing the processes to stop). Thus, the shell must work cooperatively with  
125187 the terminal I/O driver and have a common understanding of which job is currently in the  
125188 foreground. It is the user who decides which command should be currently in the foreground,  
125189 and the user informs the shell via shell commands. The shell, in turn, informs the terminal I/O  
125190 driver via the *tcsetpgrp()* function. This indicates to the terminal I/O driver the process group ID  
125191 of the foreground process group. When the current foreground job is either suspended or  
125192 terminated, the shell places its own process group in the foreground via *tcsetpgrp()* before  
125193 prompting for additional commands. Note that when a job is created the new process group  
125194 begins as a background process group. It requires an explicit act of the shell via *tcsetpgrp()*  
125195 to move a process group into the foreground.

125196 When a process in a job stops or terminates, its parent (for example, the shell) receives  
125197 synchronous notification by calling the *waitpid()* function with the WUNTRACED flag set.  
125198 Asynchronous notification is also provided when the parent establishes a signal handler for  
125199 SIGCHLD and does not specify the SA\_NOCLDSTOP flag. Usually all processes in a job stop as  
125200 a unit since the terminal I/O driver always sends job control stop signals to all processes in the  
125201 process group.

125202 To continue a suspended job, the shell sends a SIGCONT signal to the corresponding process  
125203 group. In addition, if the job is being continued in the foreground, the shell invokes *tcsetpgrp()*  
125204 to place the process group in the foreground before sending SIGCONT. Otherwise, the shell  
125205 leaves itself in the foreground and reads additional commands.

125206 There is additional flexibility in the POSIX.1 job control facilities that allows deviations from the  
125207 typical interface. Clearing the TOSTOP terminal flag allows background jobs to perform *write()*  
125208 functions without stopping. The same effect can be achieved on a per-process basis by having a  
125209 process set the signal action for SIGTTOU to SIG\_IGN.

125210 A login session that is not using the job control facilities can be thought of as a large collection of  
125211 processes that are all in the same job. Such a login session may have a partial distinction  
125212 between foreground and background processes; that is, the shell waits for some processes before  
125213 continuing to read new commands and does not wait for other processes. However, the terminal  
125214 I/O driver considers all these processes to be in the foreground since they are all members of the  
125215 same process group.

125216 In addition to the basic job control operations already mentioned, a job control-cognizant shell  
125217 needs to perform the following actions.

125218 When a foreground (not background) job is suspended, the shell needs to sample and remember  
125219 the current terminal settings so that it can restore them later when it continues the suspended

- 125220 job in the foreground (via the *tcgetattr()* and *tcsetattr()* functions).
- 125221 Because a shell itself can be spawned from a shell, it must take special action to ensure that child  
125222 shells interact well with their parent shells. A child shell can be spawned to perform an  
125223 interactive function (prompting the terminal for commands) or a non-interactive function  
125224 (reading commands from a file). When operating non-interactively, the job control shell will by  
125225 default refrain from performing the job control-specific actions described above. It will behave  
125226 as a shell that does not support job control. For example, all jobs will be left in the same process  
125227 group as the shell, which itself remains in the process group established for it by its parent. This  
125228 allows the shell and its children to be treated as a single job by a parent shell, and they can be  
125229 affected as a unit by terminal keyboard signals.
- 125230 An interactive child shell can be spawned from another job control-cognizant shell in either the  
125231 foreground or background. (For example, the user can execute an interactive shell in the  
125232 background by means of the command "sh &".) Before the child shell activates job control by  
125233 calling *setpgid()* to place itself in its own process group and *tcsetpgrp()* to place its new process  
125234 group in the foreground, it needs to ensure that it has already been placed in the foreground by  
125235 its parent. (Otherwise, there could be multiple job control shells that simultaneously attempt to  
125236 control mediation of the terminal.) To determine this, the shell retrieves its own process group  
125237 via *getpgrp()* and the process group of the current foreground job via *tcgetpgrp()*. If these are not  
125238 equal, the shell sends SIGTTIN to its own process group, causing itself to stop. When continued  
125239 later by its parent, the shell repeats the process group check. When the process groups finally  
125240 match, the shell is in the foreground and it can proceed to take control. After this point, the shell  
125241 ignores all the job control stop signals so that it does not inadvertently stop itself.
- 125242 *Implementing Job Control Applications*
- 125243 Most applications do not need to be aware of job control signals and operations; the intuitively  
125244 correct behavior happens by default. However, sometimes an application can inadvertently  
125245 interfere with normal job control processing, or an application may choose to overtly effect job  
125246 control in cooperation with normal shell procedures.
- 125247 An application can inadvertently subvert job control processing by "blindly" altering the  
125248 handling of signals. A common application error is to learn how many signals the system  
125249 supports and to ignore or catch them all. Such an application makes the assumption that it does  
125250 not know what this signal is, but knows the right handling action for it. The system may  
125251 initialize the handling of job control stop signals so that they are being ignored. This allows  
125252 shells that do not support job control to inherit and propagate these settings and hence to be  
125253 immune to stop signals. A job control shell will set the handling to the default action and  
125254 propagate this, allowing processes to stop. In doing so, the job control shell is taking  
125255 responsibility for restarting the stopped applications. If an application wishes to catch the stop  
125256 signals itself, it should first determine their inherited handling states. If a stop signal is being  
125257 ignored, the application should continue to ignore it. This is directly analogous to the  
125258 recommended handling of SIGINT described in the referenced UNIX Programmer's Manual.
- 125259 If an application is reading the terminal and has disabled the interpretation of special characters  
125260 (by clearing the ISIG flag), the terminal I/O driver will not send SIGTSTP when the suspend  
125261 character is typed. Such an application can simulate the effect of the suspend character by  
125262 recognizing it and sending SIGTSTP to its process group as the terminal driver would have  
125263 done. Note that the signal is sent to the process group, not just to the application itself; this  
125264 ensures that other processes in the job also stop. (Note also that other processes in the job could  
125265 be children, siblings, or even ancestors.) Applications should not assume that the suspend  
125266 character is <control>-Z (or any particular value); they should retrieve the current setting at  
125267 startup.

- 125268 *Implementing Job Control Systems*
- 125269 The intent in adding 4.2 BSD-style job control functionality was to adopt the necessary 4.2 BSD  
125270 programmatic interface with only minimal changes to resolve syntactic or semantic conflicts  
125271 with System V or to close recognized security holes. The goal was to maximize the ease of  
125272 providing both conforming implementations and Conforming POSIX.1 Applications.
- 125273 It is only useful for a process to be affected by job control signals if it is the descendant of a job  
125274 control shell. Otherwise, there will be nothing that continues the stopped process.
- 125275 POSIX.1 does not specify how controlling terminal access is affected by a user logging out (that  
125276 is, by a controlling process terminating). 4.2 BSD uses the *vhangup()* function to prevent any  
125277 access to the controlling terminal through file descriptors opened prior to logout. System V does  
125278 not prevent controlling terminal access through file descriptors opened prior to logout (except  
125279 for the case of the special file, */dev/tty*). Some implementations choose to make processes  
125280 immune from job control after logout (that is, such processes are always treated as if in the  
125281 foreground); other implementations continue to enforce foreground/background checks after  
125282 logout. Therefore, a Conforming POSIX.1 Application should not attempt to access the  
125283 controlling terminal after logout since such access is unreliable. If an implementation chooses to  
125284 deny access to a controlling terminal after its controlling process exits, POSIX.1 requires a certain  
125285 type of behavior (see [Controlling Terminal](#), on page 3651).
- 125286 Austin Group Defect 1254 is applied, changing this definition.
- 125287 **Job ID**
- 125288 Austin Group Defect 1254 is applied, changing ``job control job ID'' to ``job ID''.
- 125289 **Joinable Thread**
- 125290 Austin Group Defect 792 is applied, adding this definition.
- 125291 **Kernel\***
- 125292 See [System Call\\*](#) (on page 3673).
- 125293 **Library Routine\***
- 125294 See [System Call\\*](#) (on page 3673).
- 125295 **Link**
- 125296 Austin Group Defect 1380 is applied, changing this definition.
- 125297 **Live Process**
- 125298 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0010 [690] is applied.
- 125299 **Live Thread**
- 125300 Austin Group Defect 792 is applied, adding this definition.

- 125301        **Logical Device\***
- 125302        Implementation-defined.
- 125303        **Map**
- 125304        The definition of map is included to clarify the usage of mapped pages in the description of the  
125305        behavior of process memory locking.
- 125306        **Memory-Resident**
- 125307        The term “memory-resident” is historically understood to mean that the so-called resident pages  
125308        are actually present in the physical memory of the computer system and are immune from  
125309        swapping, paging, copy-on-write faults, and so on. This is the actual intent of POSIX.1-2024 in  
125310        the process memory locking section for implementations where this is logical. But for some  
125311        implementations—primarily mainframes—actually locking pages into primary storage is not  
125312        advantageous to other system objectives, such as maximizing throughput. For such  
125313        implementations, memory locking is a “hint” to the implementation that the application wishes  
125314        to avoid situations that would cause long latencies in accessing memory. Furthermore, there are  
125315        other implementation-defined issues with minimizing memory access latencies that “memory  
125316        residency” does not address—such as MMU reload faults. The definition attempts to  
125317        accommodate various implementations while allowing conforming applications to specify to the  
125318        implementation that they want or need the best memory access times that the implementation  
125319        can provide.
- 125320        **Memory Object\***
- 125321        The term “memory object” usually implies shared memory. If the object is the same as a  
125322        filename in the file system name space of the implementation, it is expected that the data written  
125323        into the memory object be preserved on disk. A memory object may also apply to a physical  
125324        device on an implementation. In this case, writes to the memory object are sent to the controller  
125325        for the device and reads result in control registers being returned.
- 125326        **Messages Object**
- 125327        Austin Group Defect 1122 is applied, adding this definition.
- 125328        **Mounted File System\***
- 125329        See [File System](#) (on page 3654).
- 125330        **Multi-Threaded Library**
- 125331        POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0011 [625] is applied.
- 125332        **Multi-Threaded Process**
- 125333        POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0011 [625] is applied.

**125334 Multi-Threaded Program**

125335 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0011 [625] is applied.

125336 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

**125337 Mutex**

125338 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

**125339 Name**

125340 There are no explicit limits in POSIX.1-2024 on the sizes of names, words (see the definition of  
125341 word in the Base Definitions volume of POSIX.1-2024), lines, or other objects. However, other  
125342 implicit limits do apply: shell script lines produced by many of the standard utilities cannot  
125343 exceed {LINE\_MAX} and the sum of exported variables comes under the {ARG\_MAX} limit.  
125344 Historical shells dynamically allocate memory for names and words and parse incoming lines a  
125345 character at a time. Lines cannot have an arbitrary {LINE\_MAX} limit because of historical  
125346 practice, such as *makefiles*, where *make* removes the <newline> characters associated with the  
125347 commands for a target and presents the shell with one very long line. The text on INPUT FILES  
125348 in XCU [Section 1.4](#) (on page 2462) does allow a shell to run out of memory, but it cannot have  
125349 arbitrary programming limits.

**125350 Native Implementation\***

125351 This refers to an implementation of POSIX.1 that interfaces directly to an operating system  
125352 kernel; see also *hosted implementation*. A similar concept is a native UNIX system, which would  
125353 be a kernel derived from one of the original UNIX system products.

**125354 Negative**

125355 Austin Group Defect 1428 is applied, adding this definition.

**125356 Nice Value**

125357 This definition is not intended to suggest that all processes in a system have priorities that are  
125358 comparable. Scheduling policy extensions, such as adding realtime priorities, make the notion of  
125359 a single underlying priority for all scheduling policies problematic. Some implementations may  
125360 implement the features related to *nice* to affect all processes on the system, others to affect just  
125361 the general time-sharing activities implied by POSIX.1-2024, and others may have no effect at all.  
125362 Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of  
125363 implementation strategies is possible.

**125364 Null Pointer**

125365 Austin Group Defect 940 is applied, adding a statement that any pointer object whose  
125366 representation has all bits set to zero will be interpreted as a null pointer.

**125367 Null Terminator**

125368 Austin Group Defect 1621 is applied, adding this definition.

**125369 OFD-Owned File Lock**

125370 Austin Group Defect 768 is applied, adding this definition.

**125371 Open File Description**

125372 An “open file description”, as it is currently named, describes how a file is being accessed. What  
125373 is currently called a “file descriptor” is actually just an identifier or “handle”; it does not  
125374 actually describe anything.

125375 The following alternate names were discussed:

- 125376 • For “open file description”:  
125377 “open instance”, “file access description”, “open file information”, and “file access  
125378 information”.
- 125379 • For “file descriptor”:  
125380 “file handle”, “file number” (cf., *fileno()*). Some historical implementations use the term  
125381 “file table entry”.

**125382 Option-Argument**

125383 Austin Group Defect 1784 is applied, changing this definition.

**125384 Orphaned Process Group**

125385 Historical implementations have a concept of an orphaned process, which is a process whose  
125386 parent process has exited. When job control is in use, it is necessary to prevent processes from  
125387 being stopped in response to interactions with the terminal after they no longer are controlled by  
125388 a job control-cognizant program. Because signals generated by the terminal are sent to a process  
125389 group and not to individual processes, and because a signal may be provoked by a process that  
125390 is not orphaned, but sent to another process that is orphaned, it is necessary to define an  
125391 orphaned process group. The definition assumes that a process group will be manipulated as a  
125392 group and that the job control-cognizant process controlling the group is outside of the group  
125393 and is the parent of at least one process in the group (so that state changes may be reported via  
125394 *waitpid()*). Therefore, a group is considered to be controlled as long as at least one process in the  
125395 group has a parent that is outside of the process group, but within the session.

125396 This definition of orphaned process groups ensures that a session leader’s process group is  
125397 always considered to be orphaned, and thus it is prevented from stopping in response to  
125398 terminal signals.

**125399 Page**

125400 The term “page” is defined to support the description of the behavior of memory mapping for  
125401 shared memory and memory mapped files, and the description of the behavior of process  
125402 memory locking. It is not intended to imply that shared memory/file mapping and memory  
125403 locking are applicable only to “paged” architectures. For the purposes of POSIX.1-2024,  
125404 whatever the granularity on which an architecture supports mapping or locking, this is  
125405 considered to be a “page”. If an architecture cannot support the memory mapping or locking  
125406 functions specified by POSIX.1-2024 on any granularity, then these options will not be  
125407 implemented on the architecture.

125408 **Pathname**

125409 Pathnames historically allowed all bytes except for the <slash> and <NUL> characters. For  
 125410 compatibility with existing file systems, this usage is maintained throughout the standard by  
 125411 noting that a pathname need not be a valid character string in all locales. However, the  
 125412 properties of the portable filename character set are such that a pathname using only those  
 125413 characters and the <slash> is portable in all locales as a character string.

125414 Austin Group Defect 1073 is applied, making it implementation-defined whether the case of  
 125415 exactly two leading <slash> characters is treated specially.

125416 **Passwd File\***

125417 Implementation-defined; see [User Database](#) (on page 3675).

125418 **Parent Directory**

125419 There may be more than one directory entry pointing to a given directory in some  
 125420 implementations. The wording here identifies that exactly one of those is the parent directory. In  
 125421 pathname resolution, dot-dot is identified as the way that the unique directory is identified.  
 125422 (That is, the parent directory is the one to which dot-dot points.) In the case of a remote file  
 125423 system, if the same file system is mounted several times, it would appear as if they were distinct  
 125424 file systems (with interesting synchronization properties).

125425 **Pattern**

125426 Austin Group Defect 1443 is applied, changing this definition to be inclusive of all uses of shell  
 125427 pattern matching notation.

125428 **Pipe**

125429 It proved convenient to define a pipe as a special case of a FIFO, even though historically the  
 125430 latter was not introduced until System III and does not exist at all in 4.3 BSD.

125431 **Portable Filename**

125432 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0012 [584] is applied.

125433 **Portable Filename Character Set**

125434 The encoding of this character set is not specified—specifically, ASCII is not required. But the  
 125435 implementation must provide a unique character code for each of the printable graphics  
 125436 specified by POSIX.1; see also [Section A.4.9](#) (on page 3678).

125437 Situations where characters beyond the portable filename character set (or historically ASCII or  
 125438 the ISO/IEC 646:1991 standard) would be used (in a context where the portable filename  
 125439 character set or the ISO/IEC 646:1991 standard is required by POSIX.1) are expected to be  
 125440 common. Although such a situation renders the use technically non-compliant, mutual  
 125441 agreement among the users of an extended character set will make such use portable between  
 125442 those users. Such a mutual agreement could be formalized as an optional extension to POSIX.1.  
 125443 (Making it required would eliminate too many possible systems, as even those systems using the  
 125444 ISO/IEC 646:1991 standard as a base character set extend their character sets for Western  
 125445 Europe and the rest of the world in different ways.)

125446 Nothing in POSIX.1 is intended to preclude the use of extended characters where interchange is  
 125447 not required or where mutual agreement is obtained. It has been suggested that in several places  
 125448 “should” be used instead of “shall”. Because (in the worst case) use of any character beyond the  
 125449 portable filename character set would render the program or data not portable to all possible

- 125450 systems, no extensions are permitted in this context.
- 125451 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0013 [584] is applied.
- 125452 **Portable Messages Object Source File (or Dot-Po File)**
- 125453 Austin Group Defect 1122 is applied, adding this definition.
- 125454 **Positional Parameter**
- 125455 Austin Group Defect 1514 is applied, changing this definition in line with earlier changes to the  
125456 cross-reference to which it refers.
- 125457 **Positive**
- 125458 Austin Group Defect 1428 is applied, adding this definition.
- 125459 **Process**
- 125460 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0014 [690] is applied.
- 125461 **Process Lifetime**
- 125462 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/5 is applied, adding *fork()*, *posix\_spawn()*,  
125463 *posix\_spawnp()*, and *vfork()* to the list of functions.
- 125464 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0014 [690] is applied.
- 125465 **Process Termination**
- 125466 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/6 is applied, rewording the definition to  
125467 address the “passive exit” on termination of the last thread or the *\_Exit()* function.
- 125468 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0014 [690] is applied.
- 125469 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 125470 **Process-Owned File Lock**
- 125471 Austin Group Defect 768 is applied, adding this definition.
- 125472 **Pseudo-Terminal**
- 125473 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
125474 devices.
- 125475 **Radix Character (or Decimal-Point Character)**
- 125476 Austin Group Defect 1449 is applied, adding “(or Decimal-Point Character)”.
- 125477 **Record Lock**
- 125478 Austin Group Defect 768 is applied, adding this definition.

- 125479           **Regular Built-In Utility (or Regular Built-In)**
- 125480           Austin Group Defect 850 is applied, adding this entry as a pointer to the *Built-In Utility*
- 125481           definition.
- 125482           **Regular File**
- 125483           POSIX.1 does not intend to preclude the addition of structuring data (for example, record
- 125484           lengths) in the file, as long as such data is not visible to an application that uses the features
- 125485           described in POSIX.1.
- 125486           **Root Directory**
- 125487           This definition permits the operation of *chroot()*, even though that function is not in POSIX.1; see
- 125488           also [Section A.4.8](#) (on page 3678).
- 125489           **Root File System\***
- 125490           Implementation-defined.
- 125491           **Root of a File System\***
- 125492           Commonly used to refer to a mount point; this standard uses the latter.
- 125493           **Signal**
- 125494           The definition implies a double meaning for the term. Although a signal is an event, common
- 125495           usage implies that a signal is an identifier of the class of event.
- 125496           **Single-Threaded Process**
- 125497           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0011 [625] is applied.
- 125498           **Single-Threaded Program**
- 125499           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0011 [625] is applied.
- 125500           Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 125501           **Source Code**
- 125502           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0015 [896] is applied.
- 125503           **Sparse File**
- 125504           Austin Group Defect 415 is applied, adding this definition.
- 125505           **Special Built-In Utility (or Special Built-In)**
- 125506           Austin Group Defect 1583 is applied, clarifying that “special built-in utility” and “special built-
- 125507           in” are equivalent terms.

- 125508           **Standard Error**
- 125509           Austin Group Defect 1493 is applied, expanding this definition to cover uses of the term outside  
125510           the XSH volume.
- 125511           **Standard Input**
- 125512           Austin Group Defect 1493 is applied, expanding this definition to cover uses of the term outside  
125513           the XSH volume.
- 125514           **Standard Output**
- 125515           Austin Group Defect 1493 is applied, expanding this definition to cover uses of the term outside  
125516           the XSH volume.
- 125517           **Stream**
- 125518           Austin Group Defect 1371 is applied, updating the stream definition so that it applies to the shell  
125519           command language as well as the C language.
- 125520           **Superuser\***
- 125521           This concept, with great historical significance to UNIX system users, has been replaced with the  
125522           notion of appropriate privileges.
- 125523           **Supplementary Group ID**
- 125524           The POSIX.1-1990 standard is inconsistent in its treatment of supplementary groups. The  
125525           definition of supplementary group ID explicitly permits the effective group ID to be included in  
125526           the set, but wording in the description of the *setuid()* and *setgid()* functions states: “Any  
125527           supplementary group IDs of the calling process remain unchanged by these function calls”.  
125528           In the case of *setgid()* this contradicts that definition. In addition, some felt that the unspecified  
125529           behavior in the definition of supplementary group IDs adds unnecessary portability problems.  
125530           The standard developers considered several solutions to this problem:
- 125531           1.   Reword the description of *setgid()* to permit it to change the supplementary group IDs to  
125532           reflect the new effective group ID. A problem with this is that it adds more “may”s to the  
125533           wording and does not address the portability problems of this optional behavior.
  - 125534           2.   Mandate the inclusion of the effective group ID in the supplementary set (giving  
125535           {NGROUPS\_MAX} a minimum value of 1). This is the behavior of 4.4 BSD. In that  
125536           system, the effective group ID is the first element of the array of supplementary group  
125537           IDs (there is no separate copy stored, and changes to the effective group ID are made only  
125538           in the supplementary group set). By convention, the initial value of the effective group ID  
125539           is duplicated elsewhere in the array so that the initial value is not lost when executing a  
125540           set-group-ID program.
  - 125541           3.   Change the definition of supplementary group ID to exclude the effective group ID and  
125542           specify that the effective group ID does not change the set of supplementary group IDs.  
125543           This is the behavior of 4.2 BSD, 4.3 BSD, and System V Release 4.
  - 125544           4.   Change the definition of supplementary group ID to exclude the effective group ID, and  
125545           require that *getgroups()* return the union of the effective group ID and the supplementary  
125546           group IDs.
  - 125547           5.   Change the definition of {NGROUPS\_MAX} to be one more than the number of  
125548           supplementary group IDs, so it continues to be the number of values returned by  
125549           *getgroups()* and existing applications continue to work. This alternative is effectively the

125550 same as the second (and might actually have the same implementation).

125551 The standard developers decided to permit either 2 or 3. The effective group ID is orthogonal to  
 125552 the set of supplementary group IDs, and it is implementation-defined whether *getgroups()*  
 125553 returns this. If the effective group ID is returned with the set of supplementary group IDs, then  
 125554 all changes to the effective group ID affect the supplementary group set returned by *getgroups()*.  
 125555 It is permissible to eliminate duplicates from the list returned by *getgroups()*. However, if a  
 125556 group ID is contained in the set of supplementary group IDs, setting the group ID to that value  
 125557 and then to a different value should not remove that value from the supplementary group IDs.

125558 The definition of supplementary group IDs has been changed to not include the effective group  
 125559 ID. This simplifies permanent rationale and makes the relevant functions easier to understand.  
 125560 The *getgroups()* function has been modified so that it can, on an implementation-defined basis,  
 125561 return the effective group ID. By making this change, functions that modify the effective group  
 125562 ID do not need to discuss adding to the supplementary group list; the only view into the  
 125563 supplementary group list that the application developer has is through the *getgroups()* function.

### 125564 **Suspended Job**

125565 Austin Group Defect 1254 is applied, changing this definition.

### 125566 **Symbolic Constant**

125567 Earlier versions of this standard used a variety of terms other than “macro” for many of the  
 125568 constants defined in headers, and it was not clear in which of these cases they were required to  
 125569 be macros or not, or to be pre-processor constants (i.e., usable in *#if*) or not. In cases where the  
 125570 symbols had a reserved prefix or suffix, there was often inconsistency between whether the  
 125571 prefix/suffix was reserved only for macros or for any use, and whether the term “macro” or a  
 125572 different term was used in the descriptions of the symbols. There were also some unintentional  
 125573 differences from the ISO C standard.

125574 One of the most commonly used terms was “symbolic constant”. This has now been designated  
 125575 as the default term to be used wherever appropriate, and a formal definition of the term has  
 125576 been added giving the exact requirements for symbols that are described as symbolic constants.

125577 The standard developers have performed a major rationalization of the header descriptions of  
 125578 symbols with constant values according to the following policy:

125579 • Where symbols are from the ISO C standard, the wording from the ISO C standard (or  
 125580 equivalent, in cases where the exact wording is not appropriate) is used to describe them.

125581 • For all other constants, the first choice is to use “symbolic constant” when the  
 125582 requirements for the symbol are a reasonably close fit with those of the term.

125583 The description of the symbol can override individual requirements for symbolic  
 125584 constants; e.g., to specify a non-integer type, or to add a requirement that the symbol is  
 125585 usable in *#if* preprocessor directives.

125586 • When neither of the above apply, the exact requirements are stated in the description.  
 125587 (Note that macros are not required to be usable in *#if*, or even to expand to constant  
 125588 expressions, unless explicitly stated.)

125589 • In cases where there is a reserved prefix or suffix, if the symbol(s) with that prefix/suffix  
 125590 are from the ISO C standard and are required to be macros, or if the symbol is required to  
 125591 be usable in *#if*, then the prefix/suffix is reserved for use only as macros. If the symbol(s)  
 125592 are “symbolic constants” and not required to be usable in *#if*, the prefix/suffix is reserved  
 125593 for any use except in a few special cases.

125594 Where a constant is required to be a macro but is also allowed to be another type of constant

125595 such as an enumeration constant, on implementations which do define it as another type of  
125596 constant the macro is typically defined as follows:

```
125597 #define macro_name macro_name
```

125598 This allows applications to use `#ifdef`, etc. to determine whether the macro is defined, but the  
125599 macro is not usable in `#if` preprocessor directives because the preprocessor will treat the  
125600 unexpanded word `macro_name` as having the value zero.

## 125601 Symbolic Link

125602 Earlier versions of this standard did not require symbolic links to have attributes such as  
125603 ownership and a file serial number. This was because the 4.4 BSD implementation did not have  
125604 them, and it was expected that other implementations may wish to do the same. However,  
125605 experience with 4.4 BSD has shown that symbolic links implemented in this way cause problems  
125606 for users and application developers, and later BSD systems have reverted to using `inodes` to  
125607 implement symbolic links. Allowing `no-inode` symbolic links also caused problems in the  
125608 standard. For example, leaving the `st_ino` value for symbolic links unspecified meant that the  
125609 common technique of comparing the `st_dev` and `st_ino` values for two pathnames to see if they  
125610 refer to the same file could only be used with `stat()` in conforming applications and not with  
125611 `lstat()`. The standard now requires symbolic links to have meaningful values for the same **struct**  
125612 **stat** fields as regular files, except for the file mode bits in `st_mode`. Historically, the file mode bits  
125613 were unused (the contents of a symbolic link could always be read), but implementations  
125614 differed as to whether the file mode bits (as returned in `st_mode` or reported by `ls -l`) were set  
125615 according to the `umask` or just to a fixed value such as `0777`. Accordingly, the standard requires  
125616 the file mode bits to be ignored by `readlink()` and when a symbolic link is followed during  
125617 pathname resolution, but leaves the corresponding part of the value returned in `st_mode`  
125618 unspecified.

125619 Historical implementations were followed when determining which interfaces should apply to  
125620 symbolic links. Interfaces that historically followed symbolic links include `chmod()`, `stat()`, and  
125621 `utime()`. Interfaces that historically did not follow symbolic links include `lstat()`, `rename()`,  
125622 `remove()`, `rmdir()`, and `unlink()`. For `chown()` and `link()`, historical implementations differed.  
125623 POSIX.1-2024 inherited the `lchown()` function from the Single UNIX Specification, Version 2, and  
125624 therefore requires `chown()` to follow symbolic links. Earlier versions of this standard required  
125625 `link()` to follow symbolic links, but with the addition of the `linkat()` function (which has a flag to  
125626 indicate whether to follow symbolic links), both behaviors are now allowed for `link()`.

125627 When the final component of a pathname is a symbolic link, the standard requires that a trailing  
125628 `<slash>` causes the link to be followed. This is the behavior of historical implementations. For  
125629 example, for `/a/b` and `/a/b/`, if `/a/b` is a symbolic link to a directory, then `/a/b` refers to the  
125630 symbolic link, and `/a/b/` refers to the directory to which the symbolic link points.

125631 Because a symbolic link and its referenced object coexist in the file system name space, confusion  
125632 can arise in distinguishing between the link itself and the referenced object. Historically, utilities  
125633 and system calls have adopted their own link following conventions in a somewhat *ad hoc*  
125634 fashion. Rules for a uniform approach are outlined here, although historical practice has been  
125635 adhered to as much as was possible. To promote consistent system use, user-written utilities are  
125636 encouraged to follow these same rules.

125637 Symbolic links are handled either by operating on the link itself, or by operating on the object  
125638 referenced by the link. In the latter case, an application or system call is said to “follow” the link.  
125639 Symbolic links may reference other symbolic links, in which case links are dereferenced until an  
125640 object that is not a symbolic link is found, a symbolic link that references a file that does not exist  
125641 is found, or a loop is detected. (Current implementations do not detect loops, but have a limit on  
125642 the number of symbolic links that they will dereference before declaring it an error.)

125643 There are four domains for which default symbolic link policy is established in a system. In  
 125644 almost all cases, there are utility options that override this default behavior. The four domains  
 125645 are as follows:

- 125646 1. Symbolic links specified to system calls that take pathname arguments
- 125647 2. Symbolic links specified as command line pathname arguments to utilities that are not  
 125648 performing a traversal of a file hierarchy
- 125649 3. Symbolic links referencing files not of type directory, specified to utilities that are  
 125650 performing a traversal of a file hierarchy
- 125651 4. Symbolic links referencing files of type directory, specified to utilities that are performing  
 125652 a traversal of a file hierarchy

#### 125653 *First Domain*

125654 The first domain is considered in earlier rationale.

#### 125655 *Second Domain*

125656 The reason this category is restricted to utilities that are not traversing the file hierarchy is that  
 125657 some standard utilities take an option that specifies a hierarchical traversal, but by default  
 125658 operate on the arguments themselves. Generally, users specifying the option for a file hierarchy  
 125659 traversal wish to operate on a single, physical hierarchy, and therefore symbolic links, which  
 125660 may reference files outside of the hierarchy, are ignored. For example, *chown owner file* is a  
 125661 different operation from the same command with the **-R** option specified. In this example, the  
 125662 behavior of the command *chown owner file* is described here, while the behavior of the command  
 125663 *chown -R owner file* is described in the third and fourth domains.

125664 The general rule is that the utilities in this category follow symbolic links named as arguments.

125665 Exceptions in the second domain are:

- 125666 • The *mv* and *rm* utilities do not follow symbolic links named as arguments, but respectively  
 125667 attempt to rename or delete them.
- 125668 • The *ls* utility is also an exception to this rule. For compatibility with historical systems,  
 125669 when the **-R** option is not specified, the *ls* utility follows symbolic links named as  
 125670 arguments if the **-L** option is specified or if the **-F**, **-d**, or **-l** options are not specified. (If  
 125671 the **-L** option is specified, *ls* always follows symbolic links; it is the only utility where the  
 125672 **-L** option affects its behavior even though a tree walk is not being performed.)

125673 All other standard utilities, when not traversing a file hierarchy, always follow symbolic links  
 125674 named as arguments.

125675 Historical practice is that the **-h** option is specified if standard utilities are to act upon symbolic  
 125676 links instead of upon their targets. Examples of commands that have historically had a **-h** option  
 125677 for this purpose are the *chgrp*, *chown*, *file*, and *test* utilities.

#### 125678 *Third Domain*

125679 The third domain is symbolic links, referencing files not of type directory, specified to utilities  
 125680 that are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
 125681 command line pathname arguments or encountered during the traversal.)

125682 The intention of the Shell and Utilities volume of POSIX.1-2024 is that the operation that the  
 125683 utility is performing is applied to the symbolic link itself, if that operation is applicable to  
 125684 symbolic links. If the operation is not applicable to symbolic links, the symbolic link should be  
 125685 ignored. Specifically, by default, no change should be made to the file referenced by the symbolic  
 125686 link.

125687 *Fourth Domain*

125688 The fourth domain is symbolic links referencing files of type directory, specified to utilities that  
 125689 are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
 125690 command line pathname arguments or encountered during the traversal.)

125691 Most standard utilities do not, by default, indirect into the file hierarchy referenced by the  
 125692 symbolic link. (The Shell and Utilities volume of POSIX.1-2024 uses the informal term “physical  
 125693 walk” to describe this case. The case where the utility does indirect through the symbolic link is  
 125694 termed a “logical walk”.)

125695 There are three reasons for the default to be a physical walk:

- 125696 1. With very few exceptions, a physical walk has been the historical default on UNIX  
 125697 systems supporting symbolic links. Because some utilities (that is, *rm*) must default to a  
 125698 physical walk, regardless, changing historical practice in this regard would be confusing  
 125699 to users and needlessly incompatible.
- 125700 2. For systems where symbolic links have the historical file attributes (that is, *owner*, *group*,  
 125701 *mode*), defaulting to a logical traversal would require the addition of a new option to the  
 125702 commands to modify the attributes of the link itself. This is painful and more complex  
 125703 than the alternatives.
- 125704 3. There is a security issue with defaulting to a logical walk. Historically, the command  
 125705 *chown -R user file* has been safe for the superuser because *setuid* and *setgid* bits were lost  
 125706 when the ownership of the file was changed. If the walk were logical, changing  
 125707 ownership would no longer be safe because a user might have inserted a symbolic link  
 125708 pointing to any file in the tree. Again, this would necessitate the addition of an option to  
 125709 the commands doing hierarchy traversal to not indirect through the symbolic links, and  
 125710 historical scripts doing recursive walks would instantly become security problems. While  
 125711 this is mostly an issue for system administrators, it is preferable to not have different  
 125712 defaults for different classes of users.

125713 However, the standard developers agreed to leave it unspecified to achieve consensus.

125714 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 125715 traversal to follow any symbolic links named on the command line, regardless of the type of file  
 125716 they reference, by specifying the **-H** (for half logical) option. This option is intended to make the  
 125717 command line name space look like the logical name space.

125718 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 125719 traversal to follow any symbolic links named on the command line as well as any symbolic links  
 125720 encountered during the traversal, regardless of the type of file they reference, by specifying the  
 125721 **-L** (for logical) option. This option is intended to make the entire name space look like the  
 125722 logical name space.

125723 For consistency, implementors are encouraged to use the **-P** (for “physical”) flag to specify the  
 125724 physical walk in utilities that do logical walks by default for whatever reason.

125725 When one or more of the **-H**, **-L**, and **-P** flags can be specified, the last one specified determines  
 125726 the behavior of the utility. This permits users to alias commands so that the default behavior is a  
 125727 logical walk and then override that behavior on the command line.

125728 *Exceptions in the Third and Fourth Domains*

125729 The *ls* and *rm* utilities are exceptions to these rules. The *rm* utility never follows symbolic links  
 125730 and does not support the **-H**, **-L**, or **-P** options. Some historical versions of *ls* always followed  
 125731 symbolic links given on the command line whether the **-L** option was specified or not.  
 125732 Historical versions of *ls* did not support the **-H** option. In POSIX.1-2024, unless one of the **-H** or

125733            –**L** options is specified, the *ls* utility only follows symbolic links to directories that are given as  
125734            operands. The *ls* utility does not support the –**P** option.

125735            The Shell and Utilities volume of POSIX.1-2024 requires that the standard utilities *ls*, *find*, and  
125736            *pax* detect infinite loops when doing logical walks; that is, a directory, or more commonly a  
125737            symbolic link, that refers to an ancestor in the current file hierarchy. If the file system itself is  
125738            corrupted, causing the infinite loop, it may be impossible to recover. Because *find* and *ls* are often  
125739            used in system administration and security applications, they should attempt to recover and  
125740            continue as best as they can. The *pax* utility should terminate because the archive it was creating  
125741            is by definition corrupted. Other, less vital, utilities should probably simply terminate as well.  
125742            Implementations are strongly encouraged to detect infinite loops in all utilities.

125743            Historical practice is shown in [Table A-1](#) (on page 3672). The heading **SVID3** stands for the  
125744            Third Edition of the System V Interface Definition.

125745            Historically, several shells have had built-in versions of the *pwd* utility. In some of these shells,  
125746            *pwd* reported the physical path, and in others, the logical path. Implementations of the shell  
125747            corresponding to POSIX.1-2024 must report the logical path by default.

125748            The *cd* command is required, by default, to treat the filename dot-dot logically. Implementors are  
125749            required to support the –**P** flag in *cd* so that users can have their current environment handled  
125750            physically. In 4.3 BSD, *chgrp* during tree traversal changed the group of the symbolic link, not  
125751            the target. Symbolic links in 4.4 BSD did not have *owner*, *group*, *mode*, or other standard UNIX  
125752            system file attributes.

125753

Table A-1 Historical Practice for Symbolic Links

| Utility | SVID3   | 4.3 BSD | 4.4 BSD | POSIX | Comments                                |
|---------|---------|---------|---------|-------|-----------------------------------------|
| 125754  |         |         |         | -L    | Treat ". ." logically.                  |
| 125755  |         |         |         | -P    | Treat ". ." physically.                 |
| 125756  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125757  |         |         | -h      | -L    | Follow symlinks.                        |
| 125758  |         |         |         | -h    | Affect the symlink.                     |
| 125759  | -h      |         |         |       | Affect the symlink.                     |
| 125760  |         |         | -H      |       | Follow command line symlinks.           |
| 125761  |         |         | -h      |       | Follow symlinks.                        |
| 125762  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125763  |         |         | -h      | -L    | Follow symlinks.                        |
| 125764  |         |         |         | -h    | Affect the symlink.                     |
| 125765  | -h      |         |         |       | Affect the symlink.                     |
| 125766  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125767  |         |         | -h      | -L    | Follow symlinks.                        |
| 125768  | -L      |         | -L      |       | Follow symlinks.                        |
| 125769  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125770  |         |         | -h      | -L    | Follow symlinks.                        |
| 125771  | -h      |         |         | -h    | Affect the symlink.                     |
| 125772  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125773  |         |         | -h      | -L    | Follow symlinks.                        |
| 125774  | -follow |         | -follow |       | Follow symlinks.                        |
| 125775  | -s      | -s      | -s      | -s    | Create a symbolic link.                 |
| 125776  | -L      | -L      | -L      | -L    | Follow symlinks.                        |
| 125777  |         |         |         | -H    | Follow command line symlinks.           |
| 125778  |         |         |         |       | Operates on the symlink.                |
| 125779  |         |         | -H      | -H    | Follow command line symlinks.           |
| 125780  |         |         | -h      | -L    | Follow symlinks.                        |
| 125781  |         |         |         | -L    | Printed path may contain symlinks.      |
| 125782  |         |         |         | -P    | Printed path will not contain symlinks. |
| 125783  |         |         |         |       | Operates on the symlink.                |
| 125784  |         |         | -H      |       | Follow command line symlinks.           |
| 125785  |         | -h      | -h      |       | Follow symlinks.                        |
| 125786  | -h      |         | -h      | -h    | Affect the symlink.                     |

125787

**Synchronized I/O Data Integrity Completion**

125788

Austin Group Defect 672 is applied, clarifying how this definition applies to directories, and that it does not apply to symbolic links.

125789

125790

**Synchronously-Generated Signal**

125791

Those signals that may be generated synchronously include SIGABRT, SIGBUS, SIGILL, SIGFPE, SIGPIPE, and SIGSEGV.

125792

125793

Any signal sent via the *raise()* function or a *kill()* function targeting the current process is also considered synchronous.

125794

**125795 System Call\***

125796 The distinction between a “system call” and a “library routine” is an implementation detail that  
125797 may differ between implementations and has thus been excluded from POSIX.1.

125798 See “Interface, Not Implementation” in the Preface.

**125799 System Console**

125800 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/7 is applied, changing from “An  
125801 implementation-defined device” to “A device”.

**125802 System Databases**

125803 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/9 is applied, rewording the definition to  
125804 reference the existing definitions for “group database” and “user database”.

**125805 System Process**

125806 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/8 is applied, rewording the definition to  
125807 remove the requirement for an implementation to define the object.

**125808 System Reboot**

125809 A “system reboot” is an event initiated by an unspecified circumstance that causes all processes  
125810 (other than special system processes) to be terminated in an implementation-defined manner,  
125811 after which any changes to the state and contents of files created or written to by a Conforming  
125812 POSIX.1 Application prior to the event are implementation-defined.

125813 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/10 is applied, changing “An  
125814 implementation-defined sequence of events” to “An unspecified sequence of events”.

**125815 Synchronized I/O Data (and File) Integrity Completion**

125816 These terms specify that for synchronized read operations, pending writes must be successfully  
125817 completed before the read operation can complete. This is motivated by two circumstances.  
125818 Firstly, when synchronizing processes can access the same file, but not share common buffers  
125819 (such as for a remote file system), this requirement permits the reading process to guarantee that  
125820 it can read data written remotely. Secondly, having data written synchronously is insufficient to  
125821 guarantee the order with respect to a subsequent write by a reading process, and thus this extra  
125822 read semantic is necessary.

**125823 Text Domain**

125824 Austin Group Defect 1122 is applied, adding this definition.

**125825 Text File**

125826 The term “text file” does not prevent the inclusion of control or other non-printable characters  
125827 (other than NUL). Therefore, standard utilities that list text files as inputs or outputs are either  
125828 able to process the special characters or they explicitly describe their limitations within their  
125829 individual descriptions. The definition of “text file” has caused controversy. The only difference  
125830 between text and binary files is that text files have lines of less than {LINE\_MAX} bytes, with no  
125831 NUL characters, each terminated by a <newline>. The definition allows a file with a single  
125832 <newline>, or a totally empty file, to be called a text file. If a file ends with an incomplete line it  
125833 is not strictly a text file by this definition. The <newline> referred to in POSIX.1-2024 is not some  
125834 generic line separator, but a single character; files created on systems where they use multiple  
125835 characters for ends of lines are not portable to all conforming systems without some translation

125836 process unspecified by POSIX.1-2024.

125837 **Thread**

125838 POSIX.1-2024 defines a live thread to be a flow of control within a process. Each thread has a  
125839 minimal amount of private state; most of the state associated with a process is shared among all  
125840 of the threads in the process. While most multi-thread extensions to POSIX have taken this  
125841 approach, others have made different decisions.

125842 **Note:** The choice to put threads within a process does not constrain implementations to implement  
125843 threads in that manner. However, all functions have to behave as though threads share the  
125844 indicated state information with the process from which they were created.

125845 Threads need to share resources in order to cooperate. Memory has to be widely shared between  
125846 threads in order for the threads to cooperate at a fine level of granularity. Threads keep data  
125847 structures and the locks protecting those data structures in shared memory. For a data structure  
125848 to be usefully shared between threads, such structures should not refer to any data that can only  
125849 be interpreted meaningfully by a single thread. Thus, any system resources that might be  
125850 referred to in data structures need to be shared between all threads. File descriptors, pathnames,  
125851 and pointers to stack variables are all things that programmers want to share between their  
125852 threads. Thus, the file descriptor table, the root directory, the current working directory, and the  
125853 address space have to be shared.

125854 Library implementations are possible as long as the effective behavior is as if system services  
125855 invoked by one thread do not suspend other threads. This may be difficult for some library  
125856 implementations on systems that do not provide asynchronous facilities.

125857 See [Section B.2.9](#) (on page 3806) for additional rationale.

125858 Austin Group Defect 792 is applied, changing this definition.

125859 **Thread ID**

125860 See [Section B.2.9.2](#) (on page 3823) for additional rationale.

125861 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

125862 **Thread Lifetime**

125863 Austin Group Defect 792 is applied, adding this definition.

125864 **Thread Termination**

125865 Austin Group Defect 792 is applied, adding this definition.

125866 **Thread-Safe**

125867 All functions required by POSIX.1-2024 need to be thread-safe; see [Section A.4.22](#) (on page 3687)  
125868 and [Section B.2.9.1](#) (on page 3820) for additional rationale.

125869 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

125870 **Thread-Specific Data Key**

125871 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

125872 **User Database**

125873 There are no references in POSIX.1-2024 to a “passwd file” or a “group file”, and there is no  
 125874 requirement that the *group* or *passwd* databases be kept in files containing editable text. Many  
 125875 large timesharing systems use *passwd* databases that are hashed for speed. Certain security  
 125876 classifications prohibit certain information in the *passwd* database from being publicly readable.

125877 The term “encoded” is used instead of “encrypted” in order to avoid the implementation  
 125878 connotations (such as reversibility or use of a particular algorithm) of the latter term.

125879 The *getgrent()*, *setgrent()*, *endgrent()*, *getpwent()*, *setpwent()*, and *endpwent()* functions are not  
 125880 included as part of the base standard because they provide a linear database search capability  
 125881 that is not generally useful (the *getpwuid()*, *getpwnam()*, *getgrgid()*, and *getgrnam()* functions are  
 125882 provided for keyed lookup) and because in certain distributed systems, especially those with  
 125883 different authentication domains, it may not be possible or desirable to provide an application  
 125884 with the ability to browse the system databases indiscriminately. They are provided on XSI-  
 125885 conformant systems due to their historical usage by many existing applications.

125886 A change from historical implementations is that the structures used by these functions have  
 125887 fields of the types **gid\_t** and **uid\_t**, which are required to be defined in the **<sys/types.h>** header.  
 125888 POSIX.1-2024 requires implementations to ensure that these types are defined by inclusion of  
 125889 **<grp.h>** and **<pwd.h>**, respectively, without imposing any name space pollution or errors from  
 125890 redefinition of types.

125891 POSIX.1-2024 is silent about the content of the strings containing user or group names. These  
 125892 could be digit strings. POSIX.1-2024 is also silent as to whether such digit strings bear any  
 125893 relationship to the corresponding (numeric) user or group ID.

125894 *Database Access*

125895 The thread-safe versions of the user and group database access functions return values in user-  
 125896 supplied buffers instead of possibly using static data areas that may be overwritten by each call.

125897 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/11 is applied, removing the words “of  
 125898 implementation-defined format”.

125899 **User ID**

125900 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0016 [511] is applied.

125901 **User Name**

125902 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0017 [584] is applied.

125903 **Virtual Processor\***

125904 The term “virtual processor” was chosen as a neutral term describing all kernel-level  
 125905 schedulable entities, such as processes, Mach tasks, or lightweight processes. Implementing  
 125906 threads using multiple processes as virtual processors, or implementing multiplexed threads  
 125907 above a virtual processor layer, should be possible, provided some mechanism has also been  
 125908 implemented for sharing state between processes or virtual processors. Many systems may also  
 125909 wish to provide implementations of threads on systems providing “shared processes” or  
 125910 “variable-weight processes”. It was felt that exposing such implementation details would  
 125911 severely limit the type of systems upon which the threads interface could be supported and  
 125912 prevent certain types of valid implementations. It was also determined that a virtual processor

- 125913 interface was out of the scope of the Rationale (Informative) volume of POSIX.1-2024.
- 125914 **White Space**
- 125915 Austin Group Defect 1163 is applied, clarifying the definition of white space and adding  
125916 definitions of white-space byte, white-space character, and white-space wide character.
- 125917 **XSI**
- 125918 This is included to allow POSIX.1-2024 to be adopted as an IEEE standard and a standard of The  
125919 Open Group, serving both POSIX and the Single UNIX Specification in a core set of volumes.
- 125920 When POSIX.1 and the Single UNIX Specification were merged, the term “XSI” had been used  
125921 for over 10 years in connection with the XPG series and the first and second versions of the base  
125922 volumes of the Single UNIX Specification. The XSI margin code was introduced to denote the  
125923 extended or more restrictive semantics beyond POSIX that are applicable to UNIX systems.
- 125924 **Zombie Process**
- 125925 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0018 [690] is applied.
- 125926 **Zombie Thread**
- 125927 Austin Group Defect 792 is applied, adding this definition.
- 125928 **A.4 General Concepts**
- 125929 The general concepts are similar in nature to the definitions section, with the exception that a  
125930 term defined in general concepts can contain normative requirements.
- 125931 **A.4.1 Case Insensitive Comparisons**
- 125932 Case-insensitive matching is defined in this standard in terms of a simple algorithm whereby, for  
125933 each character in the string to be matched, if the character is uppercase then the lowercase  
125934 equivalent (if any) is also checked for a match, and if the character is lowercase then the  
125935 uppercase equivalent (if any) is also checked for a match. It is described this way to make the  
125936 expected behavior easier to understand; however, implementations may internally use more  
125937 sophisticated algorithms to improve efficiency, provided that the result is the same as the simple  
125938 algorithm would produce.
- 125939 Austin Group Defect 1031 is applied, adding case insensitive comparisons.
- 125940 **A.4.2 Concurrent Execution**
- 125941 There is no additional rationale provided for this section.

**125942 A.4.3 Default Initialization**

125943 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0019 [934] is applied.

125944 Austin Group Defect 940 is applied, removing text that was conditional on the all-zero bit  
125945 pattern of a pointer object being a null pointer, as this is now mandated.

**125946 A.4.4 Directory Operations**

125947 Earlier versions of this standard did not make clear that directory modifications are performed  
125948 atomically and serially, although that is the historical behavior and was always intended.

125949 Austin Group Defect 672 is applied, adding this subsection.

**125950 A.4.5 Directory Protection**

125951 There is no additional rationale provided for this section.

**125952 A.4.6 Extended Security Controls**

125953 Allowing an implementation to define extended security controls enables the use of  
125954 POSIX.1-2024 in environments that require different or more rigorous security than that  
125955 provided in POSIX.1. Extensions are allowed in two areas: privilege and file access permissions.  
125956 The semantics of these areas have been defined to permit extensions with reasonable, but not  
125957 exact, compatibility with all existing practices. For example, the elimination of the superuser  
125958 definition precludes identifying a process as privileged or not by virtue of its effective user ID.

**125959 A.4.7 File Access Permissions**

125960 A process should not try to anticipate the result of an attempt to access data by *a priori* use of  
125961 these rules. Rather, it should make the attempt to access data and examine the return value (and  
125962 possibly *errno* as well), or use *access()*. An implementation may include other security  
125963 mechanisms in addition to those specified in POSIX.1, and an access attempt may fail because of  
125964 those additional mechanisms, even though it would succeed according to the rules given in this  
125965 section. (For example, the user's security level might be lower than that of the object of the  
125966 access attempt.) The supplementary group IDs provide another reason for a process to not  
125967 attempt to anticipate the result of an access attempt.

125968 Since the current standard does not specify a method for opening a directory for searching, it is  
125969 unspecified whether search permission on the *fd* argument to *openat()* and related functions is  
125970 based on whether the directory was opened with search mode or on the current permissions  
125971 allowed by the directory at the time a search is performed. When there is existing practice that  
125972 supports opening directories for searching, it is expected that these functions will be modified to  
125973 specify that the search permissions will be granted based on the file access modes of the  
125974 directory's file descriptor identified by *fd*, and not on the mode of the directory at the time the  
125975 directory is searched.

125976 **A.4.8 File Hierarchy**

125977 Though the file hierarchy is commonly regarded to be a tree, POSIX.1 does not define it as such  
125978 for three reasons:

- 125979 1. Links may join branches.
- 125980 2. In some network implementations, there may be no single absolute root directory; see  
125981 *pathname resolution*.
- 125982 3. With symbolic links, the file system need not be a tree or even a directed acyclic graph.

125983 **A.4.9 Filenames**

125984 Historically, certain filenames and pathnames have been reserved. This list includes **core**,  
125985 **/etc/passwd**, and so on. Conforming applications should avoid these.

125986 Most historical implementations prohibit case folding in filenames; that is, treating uppercase  
125987 and lowercase alphabetic characters as identical. However, some consider case folding desirable:

- 125988 • For user convenience
- 125989 • For ease-of-implementation of the POSIX.1 interface as a hosted system on some popular  
125990 operating systems

125991 Variants, such as maintaining case distinctions in filenames, but ignoring them in comparisons,  
125992 have been suggested. Methods of allowing escaped characters of the case opposite the default  
125993 have been proposed.

125994 Many reasons have been expressed for not allowing case folding, including:

- 125995 • No solid evidence has been produced as to whether case-sensitivity or case-insensitivity is  
125996 more convenient for users.
- 125997 • Making case-insensitivity a POSIX.1 implementation option would be worse than either  
125998 having it or not having it, because:
- 125999 — More confusion would be caused among users.
- 126000 — Application developers would have to account for both cases in their code.
- 126001 — POSIX.1 implementors would still have other problems with native file systems, such  
126002 as short or otherwise constrained filenames or pathnames, and the lack of  
126003 hierarchical directory structure.
- 126004 • Case folding is not easily defined in many European languages, both because many of  
126005 them use characters outside the US ASCII alphabetic set, and because:
- 126006 — In Spanish, the digraph "ll" is considered to be a single letter, the capitalized form  
126007 of which may be either "Ll" or "LL", depending on context.
- 126008 — In French, the capitalized form of a letter with an accent may or may not retain the  
126009 accent, depending on the country in which it is written.
- 126010 — In German, the sharp ess may be represented as a single character resembling a  
126011 Greek beta ( $\beta$ ) in lowercase, but as the digraph "SS" in uppercase.
- 126012 — In Greek, there are several lowercase forms of some letters; the one to use depends on  
126013 its position in the word. Arabic has similar rules.

- 126014 • Many East Asian languages, including Japanese, Chinese, and Korean, do not distinguish
- 126015 case and are sometimes encoded in character sets that use more than one byte per
- 126016 character.
- 126017 • Multiple character codes may be used on the same machine simultaneously. There are
- 126018 several ISO character sets for European alphabets. In Japan, several Japanese character
- 126019 codes are commonly used together, sometimes even in filenames; this is evidently also the
- 126020 case in China. To handle case insensitivity, the kernel would have to at least be able to
- 126021 distinguish for which character sets the concept made sense.
- 126022 • The file system implementation historically deals only with bytes, not with characters.
- 126023 Limitations on valid encodings ensure that the byte sequences for the <slash> character,
- 126024 <period> character, and <NUL> character will not be confused with any other character in
- 126025 any locale. However, there exist common single-shift encodings where other single-byte
- 126026 characters from the portable filename character set can also occur as a subset of a multi-
- 126027 byte character, making case folding of portable filename bytes dependent on the context of
- 126028 whether a shift-state is active.
- 126029 • The purpose of POSIX.1 is to standardize the common, existing definition, not to change it.
- 126030 Mandating case-insensitivity would make all historical implementations non-standard.
- 126031 • Not only the interface, but also application programs would need to change, counter to the
- 126032 purpose of having minimal changes to existing application code.
- 126033 • At least one of the original developers of the UNIX system has expressed objection in the
- 126034 strongest terms to either requiring case-insensitivity or making it an option, mostly on the
- 126035 basis that POSIX.1 should not hinder portability of application programs across related
- 126036 implementations in order to allow compatibility with unrelated operating systems.

126037 Two proposals were entertained regarding case folding in filenames:

- 126038 1. Remove all wording that previously permitted case folding.
- 126039 Rationale Case folding is inconsistent with the portable filename character set and
- 126040 filename definitions (all bytes except <slash> and null). No known
- 126041 implementations allowing all bytes except <slash> and null also do case
- 126042 folding.
- 126043 2. Change “though this practice is not recommended:” to “although this practice is strongly
- 126044 discouraged.”
- 126045 Rationale If case folding must be included in POSIX.1, the wording should be stronger
- 126046 to discourage the practice.

126047 The consensus selected the first proposal. Otherwise, a conforming application would have to

126048 assume that case folding would occur when it was not wanted, but that it would not occur when

126049 it was wanted.

#### 126050 A.4.10 Filename Portability

126051 Filenames should be constructed from the portable filename character set because the use of

126052 other characters can be confusing or ambiguous in certain contexts. (For example, the use of a

126053 <colon> ( ' : ' ) in a pathname could cause ambiguity if that pathname were included in a *PATH*

126054 definition.)

126055 The constraint on use of the <hyphen-minus> character as the first character of a portable

126056 filename is a constraint on application behavior and not on implementations, since applications

126057 might not work as expected when such a filename is passed as a command line argument.

126058 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0020 [584] is applied.

#### 126059 **A.4.11 File System Cache**

126060 Earlier versions of this standard did not specify the behavior of *aio\_fsync()*, *fdatasync()*, or  
126061 *fsync()* on directories, nor did they specify constraints on the underlying storage in the absence  
126062 of calls to *aio\_fsync()*, *fdatasync()*, or *fsync()*.

126063 Although directory operations are atomic and serializable, they are not necessarily durable. An  
126064 application that requires a directory modification to be durable should use *fdatasync()* or *fsync()*  
126065 (or *aio\_fsync()*) on the directory. However, the intention of the requirements for directory  
126066 modifications is that most applications should not need to do this. For example, a common  
126067 method of updating a file is to create a new temporary file, call *fdatasync()* or *fsync()* to  
126068 synchronize the new file, and then use *rename()* to replace the old file with the new file. If a  
126069 crash occurs after the *rename()*, then the file being updated will have either its old contents or its  
126070 new contents on the storage device when the system is rebooted. An application needs to  
126071 synchronize the directory only if it wants to be sure the updated file will have its new contents  
126072 on the storage device.

126073 Some operations, such as *rename()*, can affect more than one directory, whereas synchronization  
126074 calls such as *fsync()* can affect at most one directory at a time. Two calls to *fsync()* may be  
126075 needed after a *rename()* to ensure its durability.

126076 If the file system is inconsistent after a crash it is usually automatically checked and repaired  
126077 when the system is rebooted, or can be repaired manually using a utility such as *fsck*.

126078 If an unrecoverable I/O error occurs when cache is transferred to storage, this standard provides  
126079 no way for applications to discover the error reliably. Implementations are encouraged to report  
126080 such errors on subsequent reads of the storage.

126081 Austin Group Defect 672 is applied, adding this subsection.

#### 126082 **A.4.12 File Times Update**

126083 This section reflects the actions of historical implementations. The times are not updated  
126084 immediately, but are only marked for update by the functions. An implementation may update  
126085 these times immediately.

126086 The accuracy of the time update values is intentionally left unspecified so that systems can  
126087 control the bandwidth of a possible covert channel.

126088 The wording was carefully chosen to make it clear that there is no requirement that the  
126089 conformance document contain information that might incidentally affect file timestamps. Any  
126090 function that performs pathname resolution might update several last data access timestamps.  
126091 Functions such as *getpwnam()* and *getgrnam()* might update the last data access timestamp of  
126092 some specific file or files. It is intended that these are not required to be documented in the  
126093 conformance document, but they should appear in the system documentation.

126094 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0021 [626] is applied.

126095 **A.4.13 Host and Network Byte Order**

126096 There is no additional rationale provided for this section.

126097 **A.4.14 Measurement of Execution Time**

126098 The methods used to measure the execution time of processes and threads, and the precision of  
 126099 these measurements, may vary considerably depending on the software architecture of the  
 126100 implementation, and on the underlying hardware. Implementations can also make tradeoffs  
 126101 between the scheduling overhead and the precision of the execution time measurements.  
 126102 POSIX.1-2024 does not impose any requirement on the accuracy of the execution time; it instead  
 126103 specifies that the measurement mechanism and its precision are implementation-defined.

126104 **A.4.15 Memory Ordering and Synchronization**

126105 Austin Group Defect 1302 is applied, adding the *Memory Ordering* subsection, adapted from the  
 126106 ISO/IEC 9899:2018 standard.

126107 *A.4.15.1 Memory Ordering*

126108 There is no additional rationale provided for this section.

126109 *A.4.15.2 Memory Synchronization*

126110 In older multi-processors, access to memory by the processors was strictly multiplexed. This  
 126111 meant that a processor executing program code interrogates or modifies memory in the order  
 126112 specified by the code and that all the memory operation of all the processors in the system  
 126113 appear to happen in some global order, though the operation histories of different processors are  
 126114 interleaved arbitrarily. The memory operations of such machines are said to be sequentially  
 126115 consistent. In this environment, threads can synchronize using ordinary memory operations. For  
 126116 example, a producer thread and a consumer thread can synchronize access to a circular data  
 126117 buffer as follows:

```

126118 int rdptr = 0;
126119 int wrptr = 0;
126120 data_t buf[BUFSIZE];

126121 Thread 1:
126122     while (work_to_do) {
126123         int next;

126124         buf[wrptr] = produce();
126125         next = (wrptr + 1) % BUFSIZE;
126126         while (rdptr == next)
126127             ;
126128         wrptr = next;
126129     }

126130 Thread 2:
126131     while (work_to_do) {
126132         while (rdptr == wrptr)
126133             ;
126134         consume(buf[rdptr]);
  
```

```

126135         rdptr = (rdptr + 1) % BUFSIZE;
126136     }

```

126137 In modern multi-processors, these conditions are relaxed to achieve greater performance. If one  
 126138 processor stores values in location A and then location B, then other processors loading data  
 126139 from location B and then location A may see the new value of B but the old value of A. The  
 126140 memory operations of such machines are said to be weakly ordered. On these machines, the  
 126141 circular buffer technique shown in the example will fail because the consumer may see the new  
 126142 value of *wrptr* but the old value of the data in the buffer. In such machines, synchronization can  
 126143 only be achieved through the use of special instructions that enforce an order on memory  
 126144 operations. Most high-level language compilers only generate ordinary memory operations to  
 126145 take advantage of the increased performance. They usually cannot determine when memory  
 126146 operation order is important and generate the special ordering instructions. Instead, they rely on  
 126147 the programmer to use synchronization primitives correctly to ensure that modifications to a  
 126148 location in memory are ordered with respect to modifications and/or access to the same location  
 126149 in other threads. Access to read-only data need not be synchronized. The resulting program is  
 126150 said to be data race-free.

126151 Synchronization is still important even when accessing a single primitive variable (for example,  
 126152 an integer). On machines where the integer may not be aligned to the bus data width or be  
 126153 larger than the data width, a single memory load may require multiple memory cycles. This  
 126154 means that it may be possible for some parts of the integer to have an old value while other  
 126155 parts have a newer value. On some processor architectures this cannot happen, but portable  
 126156 programs cannot rely on this.

126157 In summary, a portable multi-threaded program, or a multi-process program that shares  
 126158 writable memory between processes, has to use the synchronization primitives to synchronize  
 126159 data access. It cannot rely on modifications to memory being observed by other threads in the  
 126160 order written in the application or even on modification of a single variable being seen  
 126161 atomically.

126162 Conforming applications may only use the functions listed to synchronize threads of control  
 126163 with respect to memory access. There are many other candidates for functions that might also be  
 126164 used. Examples are: signal sending and reception, or pipe writing and reading. In general, any  
 126165 function that allows one thread of control to wait for an action caused by another thread of  
 126166 control is a candidate. POSIX.1-2024 does not require these additional functions to synchronize  
 126167 memory access since this would imply the following:

- 126168 • All these functions would have to be recognized by advanced compilation systems so that  
 126169 memory operations and calls to these functions are not reordered by optimization.
- 126170 • All these functions would potentially have to have memory synchronization instructions  
 126171 added, depending on the particular machine.
- 126172 • The additional functions complicate the model of how memory is synchronized and make  
 126173 automatic data race detection techniques impractical.

126174 Formal definitions of the memory model were rejected as unreadable by the vast majority of  
 126175 programmers. In addition, most of the formal work in the literature has concentrated on the  
 126176 memory as provided by the hardware as opposed to the application programmer through the  
 126177 compiler and runtime system. It was believed that a simple statement intuitive to most  
 126178 programmers would be most effective. POSIX.1-2024 defines functions that can be used to  
 126179 synchronize access to memory, but it leaves open exactly how one relates those functions to the  
 126180 semantics of each function as specified elsewhere in POSIX.1-2024. POSIX.1-2024 also does not  
 126181 make a formal specification of the partial ordering in time that the functions can impose, as that  
 126182 is implied in the description of the semantics of each function. It simply states that the  
 126183 programmer has to ensure that modifications do not occur “simultaneously” with other access

- 126184 to a memory location.
- 126185 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/4 is applied, adding a new paragraph  
126186 beneath the table of functions: “The *pthread\_once()* function shall synchronize memory for the  
126187 first call in each thread for a given **pthread\_once\_t** object.”.
- 126188 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0022 [863] is applied.
- 126189 Austin Group Defect 1216 is applied, adding *pthread\_cond\_clockwait()*, *pthread\_mutex\_clocklock()*,  
126190 *pthread\_rwlock\_clockrdlock()*, *pthread\_rwlock\_clockwrlock()*, and *sem\_clockwait()* to the list of  
126191 functions that synchronize memory.
- 126192 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 126193 Austin Group Defect 1426 is applied, clarifying under what conditions the functions named in  
126194 this section are required to synchronize memory, and adding *pthread\_mutex\_setprioceiling()* to the  
126195 named functions.
- 126196 Austin Group Defect 1625 is applied, adding *waitid()* to the list of functions that synchronize  
126197 memory with respect to other threads on all successful calls.

#### 126198 **A.4.16 Pathname Resolution**

- 126199 It is necessary to differentiate between the definition of pathname and the concept of pathname  
126200 resolution with respect to the handling of trailing <slash> characters. By specifying the behavior  
126201 here, it is not possible to provide an implementation that is conforming but extends all interfaces  
126202 that handle pathnames to also handle strings that are not legal pathnames (because they have  
126203 trailing <slash> characters).
- 126204 Pathnames that end with one or more trailing <slash> characters must refer to directory paths.  
126205 Earlier versions of this standard were not specific about the distinction between trailing <slash>  
126206 characters on files and directories, and both were permitted.
- 126207 Two types of implementation have been prevalent; those that ignored trailing <slash> characters  
126208 on all pathnames regardless, and those that permitted them only on existing directories.
- 126209 An earlier version of this standard required that a pathname with a trailing <slash> character be  
126210 treated as if it had a trailing " / ." everywhere. This specification was ambiguous. In situations  
126211 where the intent was that the application wanted to require the implementation to accept the  
126212 pathname only if it named a directory (existing or to be created as a result of the call performing  
126213 pathname resolution), literally adding a ' .' after the trailing <slash> could be interpreted to  
126214 require use of that pathname to fail. Some of the uses that created ambiguous requirements  
126215 included *mkdir("newdir/")* and *rmdir("existing-dir/")*. POSIX.1-2024 requires that a pathname  
126216 with a trailing <slash> be rejected unless it refers to a file that is a directory or to a file that is to  
126217 be created as a directory. The *rename()* function and the *mv* utility further specify that a trailing  
126218 <slash> cannot be used on a pathname naming a file that does not exist when used as the last  
126219 argument to *rename()* or *renameat()*, or as the last operand to *mv*.
- 126220 Note that this change does not break any conforming applications; since there were two different  
126221 types of implementation, no application could have portably depended on either behavior. This  
126222 change does however require some implementations to be altered to remain compliant.  
126223 Substantial discussion over a three-year period has shown that the benefits to application  
126224 developers outweighs the disadvantages for some vendors.
- 126225 On a historical note, some early applications automatically appended a '/' to every path.  
126226 Rather than fix the applications, the system implementation was modified to accept this  
126227 behavior by ignoring any trailing <slash>.

126228 Each directory has exactly one parent directory which is represented by the name **dot-dot** in the  
 126229 first directory. No other directory, regardless of linkages established by symbolic links, is  
 126230 considered the parent directory by POSIX.1-2024.

126231 There are two general categories of interfaces involving pathname resolution: those that follow  
 126232 the symbolic link, and those that do not. There are several exceptions to this rule; for example,  
 126233 *open(path,O\_CREAT|O\_EXCL)* will fail when *path* names a symbolic link. However, in all other  
 126234 situations, the *open()* function will follow the link.

126235 What the filename **dot-dot** refers to relative to the root directory is implementation-defined. In  
 126236 Version 7 it refers to the root directory itself; this is the behavior mentioned in POSIX.1-2024. In  
 126237 some networked systems the construction *././hostname/* is used to refer to the root directory of  
 126238 another host, and POSIX.1 permits this behavior.

126239 Other networked systems use the construct *//hostname* for the same purpose; that is, a double  
 126240 initial <slash> is used. There is a potential problem with existing applications that create full  
 126241 pathnames by taking a trunk and a relative pathname and making them into a single string  
 126242 separated by '/', because they can accidentally create networked pathnames when the trunk is  
 126243 '/'. This practice is not prohibited because such applications can be made to conform by  
 126244 simply changing to use "/" as a separator instead of '/':

- 126245 • If the trunk is '/', the full pathname will begin with "/" (the initial '/' and the  
 126246 separator "/"). This is the same as '/', which is what is desired. (This is the general  
 126247 case of making a relative pathname into an absolute one by prefixing with "/" instead  
 126248 of '/'.)
- 126249 • If the trunk is "/A", the result is "/A//..."; since non-leading sequences of two or more  
 126250 <slash> characters are treated as a single <slash>, this is equivalent to the desired  
 126251 "/A/...".
- 126252 • If the trunk is "//A", the implementation-defined semantics will apply. (The multiple  
 126253 <slash> rule would apply.)

126254 Application developers should avoid generating pathnames that start with "//".  
 126255 Implementations are strongly encouraged to avoid using this special interpretation since a  
 126256 number of applications currently do not follow this practice and may inadvertently generate  
 126257 "//...".

126258 The term "root directory" is only defined in POSIX.1 relative to the process. In some  
 126259 implementations, there may be no absolute root directory. The initialization of the root directory  
 126260 of a process is implementation-defined.

126261 When the standard says: "Pathname resolution for a given pathname shall yield the same results  
 126262 when used by any interface in POSIX.1-2024 as long as there are no changes to any files  
 126263 evaluated during pathname resolution for the given pathname between resolutions", this  
 126264 applies to absolute pathnames or to relative pathnames from the same current working  
 126265 directory. Using the same relative pathname from two different working directories may yield  
 126266 different results.

126267 Earlier versions of this standard were unclear as to whether a pathname was required to be a  
 126268 character string or just a string. This standard is now clear that filenames are just strings, and  
 126269 that pathname processing is locale-independent.

126270 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0023 [541,649,825] and  
 126271 XBD/TC2-2008/0024 [825] are applied.

126272 Austin Group Defect 1603 is applied, making a wording improvement related to symbolic links  
 126273 to directories.

126274 **A.4.17 Process ID Reuse**

126275 There is no additional rationale provided for this section.

126276 **A.4.18 Scheduling Policy**

126277 There is no additional rationale provided for this section.

126278 **A.4.19 Seconds Since the Epoch**

126279 Coordinated Universal Time (UTC) includes leap seconds. However, in POSIX time (seconds  
 126280 since the Epoch), leap seconds are ignored (not applied) to provide an easy and compatible  
 126281 method of computing time differences. Broken-down POSIX time is therefore not necessarily  
 126282 UTC, despite its appearance.

126283 As of December 2007, 23 leap seconds had been added to UTC since the Epoch, 1 January, 1970.  
 126284 Historically, one leap second is added every 15 months on average, so this offset can be expected  
 126285 to grow with time.

126286 Most systems' notion of "time" is that of a continuously increasing value, so this value should  
 126287 increase even during leap seconds. However, not only do most systems not keep track of leap  
 126288 seconds, but most systems are probably not synchronized to any standard time reference.  
 126289 Therefore, it is inappropriate to require that a time represented as seconds since the Epoch  
 126290 precisely represent the number of seconds between the referenced time and the Epoch.

126291 It is sufficient to require that applications be allowed to treat this time as if it represented the  
 126292 number of seconds between the referenced time and the Epoch. It is the responsibility of the  
 126293 vendor of the system, and the administrator of the system, to ensure that this value represents  
 126294 the number of seconds between the referenced time and the Epoch as closely as necessary for the  
 126295 application being run on that system.

126296 It is important that the interpretation of time names and seconds since the Epoch values be  
 126297 consistent across conforming systems; that is, it is important that all conforming systems  
 126298 interpret "536 457 599 seconds since the Epoch" as 59 seconds, 59 minutes, 23 hours 31 December  
 126299 1986, regardless of the accuracy of the system's idea of the current time. The expression is given  
 126300 to ensure a consistent interpretation, not to attempt to specify the calendar. The relationship  
 126301 between *tm\_yday* and the day of week, day of month, and month is in accordance with the  
 126302 Gregorian calendar, and so is not specified in POSIX.1.

126303 Consistent interpretation of seconds since the Epoch can be critical to certain types of distributed  
 126304 applications that rely on such timestamps to synchronize events. The accrual of leap seconds in a  
 126305 time standard is not predictable. The number of leap seconds since the Epoch will likely  
 126306 increase. POSIX.1 is more concerned about the synchronization of time between applications of  
 126307 astronomically short duration.

126308 Note that *tm\_yday* is zero-based, not one-based, so the day number in the example above is 364.  
 126309 Note also that the division is an integer division (discarding remainder) as in the C language.

126310 Note also that the meaning of *gmtime()*, *localtime()*, and *mktime()* is specified in terms of this  
 126311 expression. However, the ISO C standard computes *tm\_yday* from *tm\_mday*, *tm\_mon*, and *tm\_year*  
 126312 in *mktime()*. Because it is stated as a (bidirectional) relationship, not a function, and because the  
 126313 conversion between month-day-year and day-of-year dates is presumed well known and is also  
 126314 a relationship, this is not a problem.

126315 The number of seconds since the epoch overflows a signed 32-bit integer in 2038. This standard  
 126316 requires that **time\_t** is an integer type with a width of at least 64 bits (in conforming

126317 programming environments). The requirement that **time\_t** is an integer type is an additional  
 126318 constraint beyond the ISO C standard, which allows a real-floating **time\_t**. Implementation  
 126319 practice has shown that much existing code is unprepared to deal with a floating-point **time\_t**,  
 126320 and that use of **struct timespec** is a more uniform way to provide sub-second time manipulation  
 126321 within applications.

126322 See also [Epoch](#) (on page 3653).

126323 The topic of whether seconds since the Epoch should account for leap seconds has been debated  
 126324 on a number of occasions, and each time consensus was reached (with acknowledged dissent  
 126325 each time) that the majority of users are best served by treating all days identically. (That is, the  
 126326 majority of applications were judged to assume a single length—as measured in seconds since  
 126327 the Epoch—for all days. Thus, leap seconds are not applied to seconds since the Epoch.) Those  
 126328 applications which do care about leap seconds can determine how to handle them in whatever  
 126329 way those applications feel is best. This was particularly emphasized because there was  
 126330 disagreement about what the best way of handling leap seconds might be. It is a practical  
 126331 impossibility to mandate that a conforming implementation must have a fixed relationship to  
 126332 any particular official clock (consider isolated systems, or systems performing “reruns” by  
 126333 setting the clock to some arbitrary time).

126334 Note that as a practical consequence of this, the length of a second as measured by some external  
 126335 standard is not specified. This unspecified second is nominally equal to an International System  
 126336 (SI) second in duration. Applications must be matched to a system that provides the particular  
 126337 handling of external time in the way required by the application.

126338 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/12 is applied, making an editorial  
 126339 correction to the paragraph commencing “How any changes to the value of seconds ...”.

126340 Austin Group Defect 1627 is applied, clarifying that the relationship between the actual date and  
 126341 time in Coordinated Universal Time, as determined by the International Earth Rotation Service,  
 126342 and the system’s current value for seconds since the Epoch is unspecified.

#### 126343 **A.4.20 Semaphore**

126344 Austin Group Defect 502 is applied, clarifying the range of values that an XSI semaphore can  
 126345 have.

126346 Austin Group Defect 1116 is applied, removing a reference to the Semaphores option that existed  
 126347 in earlier versions of this standard.

#### 126348 **A.4.21 Special Device Drivers**

126349 POSIX systems interact with their physical environment using a variety of devices (such as  
 126350 analog-digital converters, digital-analog converters, counters, and video graphic equipment),  
 126351 which provide a set of services that cannot be fully utilized in terms of read and/or write  
 126352 semantics. Traditional practice uses a single function, called *ioctl()*, to encapsulate all the control  
 126353 operations on the different devices connected to the system, both special or common devices.  
 126354 The POSIX.1-1988 standard developers decided not to standardize this interface because it was  
 126355 not type safe, it had a variable number of parameters, and it had behaviors that could not be  
 126356 specified by the standard because they were driver-dependent. Instead, the POSIX.1-1988  
 126357 standard defined a device-specific application program interface (API) for a common class of  
 126358 drivers, Terminals. Later, The Single UNIX Specification, Version 1 included the *ioctl()* function,  
 126359 but restricted it to control of STREAMS devices.

126360 Although the POSIX.1-1988 standard’s solution for common classes of devices is the best from

126361 the point of view of application portability, there is still a need for a way to interact with special,  
126362 or even common devices, for which developing a full standard API is not practical. The device  
126363 control option standardized in POSIX.26 and now included in this standard is a general method  
126364 for interfacing to the widest possible range of devices, through a new service to pass control  
126365 information and commands between the application and the device drivers.

126366 A driver for a special device will normally not be portable between POSIX implementations, but  
126367 an application that uses such a driver can be made portable if all functions calling the driver are  
126368 well defined and standardized. Users and integrators of realtime systems often add drivers for  
126369 special devices, and a standardized function format for interfacing with these devices greatly  
126370 simplifies this process.

126371 Austin Group Defect 729 is applied, adding this subsection.

#### 126372 **A.4.22 Thread-Safety**

126373 Where the interface of a function required by POSIX.1-2024 precludes thread-safety, an alternate  
126374 thread-safe form is provided. The names of these thread-safe forms are the same as the non-  
126375 thread-safe forms with the addition of the suffix ``\_r''. The suffix ``\_r'' is historical, where the  
126376 'r' stood for ``reentrant''.

126377 In some cases, thread-safety is provided by restricting the arguments to an existing function.

126378 See also [Section B.2.9.1](#) (on page 3820).

#### 126379 **A.4.23 Treatment of Error Conditions for Mathematical Functions**

126380 It is intended that undeserved underflow and inexact floating-point exceptions are raised only if  
126381 avoiding them would be too costly.

126382 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0025 [543] is applied.

126383 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

#### 126384 **A.4.24 Treatment of NaN Arguments for Mathematical Functions**

126385 There is no additional rationale provided for this section.

#### 126386 **A.4.25 Utility**

126387 There is no additional rationale provided for this section.

#### 126388 **A.4.26 Variable Assignment**

126389 Austin Group Defect 351 is applied, adding a requirement relating to declaration utilities.

## 126390 A.5 File Format Notation

126391 The notation for spaces allows some flexibility for application output. Note that an empty  
 126392 character position in *format* represents one or more <blank> characters on the output (not *white*  
 126393 *space*, which can include <newline> characters). Therefore, another utility that reads that output  
 126394 as its input must be prepared to parse the data using *scanf()*, *awk*, and so on. The ' $\Delta$ ' character  
 126395 is used when exactly one <space> is output.

126396 The treatment of integers and spaces is different from the *printf()* function in that they can be  
 126397 surrounded with <blank> characters. This was done so that, given a format such as:

```
126398 "%d\n", <foo>
```

126399 the implementation could use a *printf()* call such as:

```
126400 printf("%6d\n", foo);
```

126401 and still conform. This notation is thus somewhat like *scanf()* in addition to *printf()*.

126402 The *printf()* function was chosen as a model because most of the standard developers were  
 126403 familiar with it. One difference from the C function *printf()* is that the l and h conversion  
 126404 specifier characters are not used. As expressed by the Shell and Utilities volume of  
 126405 POSIX.1-2024, there is no differentiation between decimal values for type **int**, type **long**, or type  
 126406 **short**. The conversion specifications %d or %i should be interpreted as an arbitrary length  
 126407 sequence of digits. Also, no distinction is made between single precision and double precision  
 126408 numbers (**float** or **double** in C). These are simply referred to as floating-point numbers.

126409 Many of the output descriptions in the Shell and Utilities volume of POSIX.1-2024 use the term  
 126410 “line”, such as:

```
126411 "%s", <input line>
```

126412 Since the definition of *line* includes the trailing <newline> already, there is no need to include a  
 126413 '\n' in the format; a double <newline> would otherwise result.

126414 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0026 [584] is applied.

126415 Austin Group Defect 1205 is applied, changing the description of the % conversion specifier.

126416 Austin Group Defect 1687 is applied, clarifying the references to <blank> characters to specify  
 126417 they are from the portable character set.

## 126418 A.6 Character Set

### 126419 A.6.1 Portable Character Set

126420 The portable character set is listed in full so there is no dependency on the ISO/IEC 646:1991  
 126421 standard (or historically ASCII) encoded character set, although the set is identical to the  
 126422 characters defined in the International Reference version of the ISO/IEC 646:1991 standard.

126423 POSIX.1-2024 poses no requirement that multiple character sets or codesets be supported,  
 126424 leaving this as a marketing differentiation for implementors. Although multiple charmap files  
 126425 are supported, it is the responsibility of the implementation to provide the file(s); if only one is  
 126426 provided, only that one will be accessible using the *localedef -f* option.

126427 The statement about invariance in codesets for the portable character set is worded to avoid

126428 precluding implementations where multiple incompatible codesets are available (for instance,  
126429 ASCII and EBCDIC). The standard utilities cannot be expected to produce predictable results if  
126430 they access portable characters that vary on the same implementation.

126431 Not all character sets need include the portable character set, but each locale must include it. For  
126432 example, a Japanese-based locale might be supported by a mixture of character sets: JIS X 0201  
126433 Roman (a Japanese version of the ISO/IEC 646:1991 standard), JIS X 0208, and JIS X 0201  
126434 Katakana. Not all of these character sets include the portable characters, but at least one does  
126435 (JIS X 0201 Roman).

126436 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0027 [584,967] and  
126437 XBD/TC2-2008/0028 [745] are applied.

## 126438 **A.6.2 Character Encoding**

126439 Encoding mechanisms based on single shifts, such as the EUC encoding used in some Asian and  
126440 other countries, can be supported via the current charmap mechanism. With single-shift  
126441 encoding, each character is preceded by a shift code (SS2 or SS3). A complete EUC code,  
126442 consisting of the portable character set (G0) and up to three additional character sets (G1, G2,  
126443 G3), can be described using the current charmap mechanism; the encoding for each character in  
126444 additional character sets G2 and G3 must then include their single-shift code. Other mechanisms  
126445 to support locales based on encoding mechanisms such as locking shift are not addressed by this  
126446 volume of POSIX.1-2024.

126447 The encodings for <slash> and <period> are required to be the same across all locales, in part  
126448 because pathname resolution requires recognition of these bytes. It is a fortunate accident that all  
126449 common shift-based encodings did not use either <slash> or <period> as a valid second byte in  
126450 a multi-byte character.

126451 The encodings for <newline> and <carriage-return> are required to be the same across all  
126452 locales since they are special to the general terminal interface and cannot be changed (see XBD  
126453 [Section 11.1.9](#), on page 203).

126454 Earlier versions of this standard did not state the requirement that the POSIX locale contains 256  
126455 single-byte characters. This was an oversight; the intention was always that the POSIX locale  
126456 should have an 8-bit-clean single-byte encoding.

126457 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0029 [663,967] and  
126458 XBD/TC2-2008/0030 [745] are applied.

## 126459 **A.6.3 C Language Wide-Character Codes**

126460 The standard does not specify how wide characters are encoded or provide a method for  
126461 defining wide characters in a charmap. It specifies ways of translating between wide characters  
126462 and multi-byte characters. The standard does not prevent an extension from providing a method  
126463 to define wide characters.

126464 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/13 is applied, adding a statement that the  
126465 standard has no means of defining a wide-character codeset.

126466 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

126467 **A.6.4 Character Set Description File**

126468 IEEE PASC Interpretation 1003.2 #196 is applied, removing three lines of text dealing with  
 126469 ranges of symbolic names using position constant values which had been erroneously included  
 126470 in the final IEEE P1003.2b draft standard.

126471 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/14 is applied, correcting the example and  
 126472 adding a statement that the standard provides no means of defining a wide-character codeset.

126473 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/15 is applied, allowing the value zero for  
 126474 the width value of **WIDTH** and **WIDTH\_DEFAULT**. This is required to cover some existing  
 126475 locales.

126476 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0031 [967] is applied.

126477 *A.6.4.1 State-Dependent Character Encodings*

126478 A requirement was considered that would force utilities to eliminate any redundant locking  
 126479 shifts, but this was left as a quality of implementation issue.

126480 This change satisfies the following requirement from the ISO POSIX-2:1993 standard, Annex  
 126481 H.1:

126482 *The support of state-dependent (shift encoding) character sets should be addressed fully. See*  
 126483 *descriptions of these in XBD Section 6.2 (on page 120). If such character encodings are supported,*  
 126484 *it is expected that this will impact XBD Section 6.2 (on page 120), Chapter 7 (on page 127),*  
 126485 *Chapter 9 (on page 179), and the comm, cut, diff, grep, head, join, paste, and tail utilities.*

126486 The character set description file provides:

- 126487 • The capability to describe character set attributes (such as collation order or character  
 126488 classes) independent of character set encoding, and using only the characters in the  
 126489 portable character set. This makes it possible to create generic *localedef* source files for all  
 126490 codesets that share the portable character set (such as the ISO 8859 family or IBM Extended  
 126491 ASCII).
- 126492 • Standardized symbolic names for all characters in the portable character set, making it  
 126493 possible to refer to any such character regardless of encoding.

126494 Implementations are free to choose their own symbolic names, as long as the names identified  
 126495 by the Base Definitions volume of POSIX.1-2024 are also defined; this provides support for  
 126496 already existing “character names”.

126497 The names selected for the members of the portable character set follow the  
 126498 ISO/IEC 8859-1:1998 standard and the ISO/IEC 10646:2020 standard. However, several  
 126499 commonly used UNIX system names occur as synonyms in the list:

- 126500 • The historical UNIX system names are used for control characters.
- 126501 • The word “slash” is given in addition to “solidus”.
- 126502 • The word “backslash” is given in addition to “reverse-solidus”.
- 126503 • The word “hyphen” is given in addition to “hyphen-minus”.
- 126504 • The word “period” is given in addition to “full-stop”.
- 126505 • For digits, the word “digit” is eliminated.

- 126506           • For letters, the words “Latin Capital Letter” and “Latin Small Letter” are eliminated.
- 126507           • The words “left brace” and “right brace” are given in addition to “left-curly-bracket” and  
126508           “right-curly-bracket”.
- 126509           • The names of the digits are preferred over the numbers to avoid possible confusion  
126510           between '0' and 'o', and between '1' and 'l' (one and the letter ell).
- 126511           The names for the control characters in XBD Chapter 6 (on page 117) were taken from the  
126512           ISO/IEC 4873:1991 standard.
- 126513           The charmap file was introduced to resolve problems with the portability of, especially, *localedef*  
126514           sources. POSIX.1-2024 assumes that the portable character set is constant across all locales, but  
126515           does not prohibit implementations from supporting two incompatible codings, such as both  
126516           ASCII and EBCDIC. Such dual-support implementations should have all charmaps and *localedef*  
126517           sources encoded using one portable character set, in effect cross-compiling for the other  
126518           environment. Naturally, charmaps (and *localedef* sources) are only portable without  
126519           transformation between systems using the same encodings for the portable character set. They  
126520           can, however, be transformed between two sets using only a subset of the actual characters (the  
126521           portable character set). However, the particular coded character set used for an application or an  
126522           implementation does not necessarily imply different characteristics or collation; on the contrary,  
126523           these attributes should in many cases be identical, regardless of codeset. The charmap provides  
126524           the capability to define a common locale definition for multiple codesets (the same *localedef*  
126525           source can be used for codesets with different extended characters; the ability in the charmap to  
126526           define empty names allows for characters missing in certain codesets).
- 126527           The `<escape_char>` declaration was added at the request of the international community to ease  
126528           the creation of portable charmap files on terminals not implementing the default  
126529           `<backslash>`-escape. The `<comment_char>` declaration was added at the request of the  
126530           international community to eliminate the potential confusion between the `<number-sign>` and  
126531           the hash sign.
- 126532           The octal number notation with no leading zero required was selected to match those of *awk* and  
126533           *tr* and is consistent with that used by *localedef*. To avoid confusion between an octal constant and  
126534           the back-references used in *localedef* source, the octal, hexadecimal, and decimal constants must  
126535           contain at least two digits. As single-digit constants are relatively rare, this should not impose  
126536           any significant hardship. Provision is made for more digits to account for systems in which the  
126537           byte size is larger than 8 bits. For example, a Unicode (ISO/IEC 10646:2020 standard) system  
126538           that has defined 16-bit bytes may require six octal, four hexadecimal, and five decimal digits.
- 126539           The decimal notation is supported because some newer international standards define character  
126540           values in decimal, rather than in the old column/row notation.
- 126541           The charmap identifies the coded character sets supported by an implementation. At least one  
126542           charmap must be provided, but no implementation is required to provide more than one.  
126543           Likewise, implementations can allow users to generate new charmaps (for instance, for a new  
126544           version of the ISO 8859 family of coded character sets), but does not have to do so. If users are  
126545           allowed to create new charmaps, the system documentation describes the rules that apply (for  
126546           instance, “only coded character sets that are supersets of the ISO/IEC 646:1991 standard IRV, no  
126547           multi-byte characters”).
- 126548           This addition of the **WIDTH** specification satisfies the following requirement from the  
126549           ISO POSIX-2:1993 standard, Annex H.1:
- 126550           (9) *The definition of column position relies on the implementation’s knowledge of the integral*  
126551           *width of the characters. The charmap or LC\_CTYPE locale definitions should be enhanced to*  
126552           *allow application specification of these widths.*

126553 The character “width” information was first considered for inclusion under *LC\_CTYPE* but was  
 126554 moved because it is more closely associated with the information in the charmap than  
 126555 information in the locale source (cultural conventions information). Concerns were raised that  
 126556 formalizing this type of information is moving the locale source definition from the codeset-  
 126557 independent entity that it was designed to be to a repository of codeset-specific information. A  
 126558 similar issue occurred with the `<code_set_name>`, `<mb_cur_max>`, and `<mb_cur_min>`  
 126559 information, which was resolved to reside in the charmap definition.

126560 The width definition was added to the IEEE P1003.2b draft standard with the intent that the  
 126561 *wcswidth()* and/or *wcwidth()* functions (currently specified in the System Interfaces volume of  
 126562 POSIX.1-2024) be the mechanism to retrieve the character width information.

## 126563 A.7 Locale

### 126564 A.7.1 General

126565 The description of locales is based on work performed in the UniForum Technical Committee,  
 126566 Subcommittee on Internationalization. Wherever appropriate, keywords are taken from the  
 126567 ISO C standard or the X/Open Portability Guide.

126568 The value used to specify a locale with environment variables is the name specified as the *name*  
 126569 operand to the *localedef* utility when the locale was created. This provides a verifiable method to  
 126570 create and invoke a locale.

126571 The “object” definitions need not be portable, as long as “source” definitions are. Strictly  
 126572 speaking, source definitions are portable only between implementations using the same  
 126573 character set(s). Such source definitions, if they use symbolic names only, easily can be ported  
 126574 between systems using different codesets, as long as the characters in the portable character set  
 126575 (see XBD Section 6.1, on page 117) have common values between the codesets; this is frequently  
 126576 the case in historical implementations. Of source, this requires that the symbolic names used for  
 126577 characters outside the portable character set be identical between character sets. The definition  
 126578 of symbolic names for characters is outside the scope of POSIX.1-2024, but is certainly within the  
 126579 scope of other standards organizations.

126580 Applications can select the desired locale by invoking the *setlocale()* function (or equivalent)  
 126581 with the appropriate value. If the function is invoked with an empty string, the value of the  
 126582 corresponding environment variable is used. If the environment variable is not set or is set to the  
 126583 empty string, the implementation sets the appropriate environment as defined in XBD Chapter 8  
 126584 (on page 167).

126585 The locale settings of individual categories cannot be truly independent and still guarantee  
 126586 correct results. For example, when collating two strings, characters must first be extracted from  
 126587 each string (governed by *LC\_CTYPE*) before being mapped to collating elements (governed by  
 126588 *LC\_COLLATE*) for comparison. That is, if *LC\_CTYPE* is causing parsing according to the rules of  
 126589 a large, multi-byte code set (potentially returning 20000 or more distinct character codeset  
 126590 values), but *LC\_COLLATE* is set to handle only an 8-bit codeset with 256 distinct characters,  
 126591 meaningful results are obviously impossible.

126592 Earlier versions of this standard stated that if different character sets are used by the locale  
 126593 categories, the results achieved by an application utilizing these categories are undefined. This  
 126594 was felt to be overly restrictive. For example, when setting:

126595 `LANG=en_US.utf8`

- 126596 LC\_TIME=POSIX
- 126597 on a system where the codeset for the POSIX locale is ASCII and the codeset for en\_US.utf8 is  
126598 UTF-8, all of the characters used in the LC\_TIME locale data exist, with the same encoding, in  
126599 the codeset used for LC\_CTYPE (via LANG), so there is no reason for the behavior to be  
126600 undefined in this case. This standard now has more precise requirements in this area.
- 126601 Austin Group Defect 1122 is applied, adding item 3 to the list of ways to select the locale to be  
126602 used by some C-language functions.
- 126603 Austin Group Defect 1477 is applied, clarifying the behavior when locale categories have  
126604 different character sets.

## 126605 A.7.2 POSIX Locale

- 126606 On POSIX.1 implementations the POSIX locale is equal to the C locale, even though the  
126607 requirements for the POSIX locale are more extensive than the ISO C standard requirements for  
126608 the C locale. To avoid being classified as a C-language function, the name has been changed to  
126609 the POSIX locale; the environment variable value can be either "POSIX" or, for historical  
126610 reasons, "C".
- 126611 The POSIX definitions mirror the historical UNIX system behavior.
- 126612 The use of symbolic names for characters in the tables does not imply that the POSIX locale must  
126613 be described using symbolic character names, but merely that it may be advantageous to do so.
- 126614 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0032 [796] and XBD/TC2-2008/0033  
126615 [663] are applied.

## 126616 A.7.3 Locale Definition

- 126617 The decision to separate the file format from the *localedef* utility description was only partially  
126618 editorial. Implementations may provide other interfaces than *localedef*. Requirements on “the  
126619 utility”, mostly concerning error messages, are described in this way because they are meant to  
126620 affect the other interfaces implementations may provide as well as *localedef*.
- 126621 The text about POSIX2\_LOCALEDEF does not mean that internationalization is optional; only  
126622 that the functionality of the *localedef* utility is. REs, for instance, must still be able to recognize,  
126623 for example, character class expressions such as "[[:alpha:]]". A possible analogy is with  
126624 an applications development environment; while all conforming implementations must be  
126625 capable of executing applications, not all need to have the development environment installed.  
126626 The assumption is that the capability to modify the behavior of utilities (and applications) via  
126627 locale settings must be supported. If the *localedef* utility is not present, then the only choice is to  
126628 select an existing (presumably implementation-documented) locale. An implementation could,  
126629 for example, choose to support only the POSIX locale, which would in effect limit the amount of  
126630 changes from historical implementations quite drastically. The *localedef* utility is still required,  
126631 but would always terminate with an exit code indicating that no locale could be created.  
126632 Supported locales must be documented using the syntax defined in this chapter. (This ensures  
126633 that users can accurately determine what capabilities are provided. If the implementation  
126634 decides to provide additional capabilities to the ones in this chapter, that is already provided  
126635 for.)
- 126636 If the option is present (that is, locales can be created), then the *localedef* utility must be capable  
126637 of creating locales based on the syntax and rules defined in this chapter. This does not mean that  
126638 the implementation cannot also provide alternate means for creating locales.

126639 The octal, decimal, and hexadecimal notations are the same employed by the charmap facility  
 126640 (see XBD Section 6.4, on page 121). To avoid confusion between an octal constant and a back-  
 126641 reference, the octal, hexadecimal, and decimal constants must contain at least two digits. As  
 126642 single-digit constants are relatively rare, this should not impose any significant hardship.  
 126643 Provision is made for more digits to account for systems in which the byte size is larger than 8  
 126644 bits. For example, a Unicode (see the ISO/IEC 10646:2020 standard) system that has defined  
 126645 16-bit bytes may require six octal, four hexadecimal, and five decimal digits. As with the  
 126646 charmap file, multi-byte characters are described in the locale definition file using “big-endian”  
 126647 notation for reasons of portability. There is no requirement that the internal representation in the  
 126648 computer memory be in this same order.

126649 One of the guidelines used for the development of this volume of POSIX.1-2024 is that  
 126650 characters outside the invariant part of the ISO/IEC 646:1991 standard should not be used in  
 126651 portable specifications. The <backslash> character is not in the invariant part; the <number-  
 126652 sign> is, but with multiple representations: as a <number-sign>, and as a hash sign. As far as  
 126653 general usage of these symbols, they are covered by the “grandfather clause”, but for newly  
 126654 defined interfaces, the WG15 POSIX working group has requested that POSIX provide alternate  
 126655 representations. Consequently, while the default escape character remains the <backslash> and  
 126656 the default comment character is the <number-sign>, implementations are required to recognize  
 126657 alternative representations, identified in the applicable source file via the <escape\_char> and  
 126658 <comment\_char> keywords.

#### 126659 A.7.3.1 LC\_CTYPE

126660 The *LC\_CTYPE* category is primarily used to define the encoding-independent aspects of a  
 126661 character set, such as character classification. In addition, certain encoding-dependent  
 126662 characteristics are also defined for an application via the *LC\_CTYPE* category. POSIX.1-2024 does  
 126663 not mandate that the encoding used in the locale is the same as the one used by the application  
 126664 because an implementation may decide that it is advantageous to define locales in a system-  
 126665 wide encoding rather than having multiple, logically identical locales in different encodings, and  
 126666 to convert from the application encoding to the system-wide encoding on usage. Other  
 126667 implementations could require encoding-dependent locales.

126668 In either case, the *LC\_CTYPE* attributes that are directly dependent on the encoding, such as  
 126669 <mb\_cur\_max> and the display width of characters, are not user-specifiable in a locale source  
 126670 and are consequently not defined as keywords.

126671 Implementations may define additional keywords or extend the *LC\_CTYPE* mechanism to allow  
 126672 application-defined keywords.

126673 The text “The ellipsis specification shall only be valid within a single encoded character set” is  
 126674 present because it is possible to have a locale supported by multiple character encodings, as  
 126675 explained in the rationale for XBD Section 6.1 (on page 117). An example given there is of a  
 126676 possible Japanese-based locale supported by a mixture of the character sets JIS X 0201 Roman,  
 126677 JIS X 0208, and JIS X 0201 Katakana. Attempting to express a range of characters across these sets  
 126678 is not logical and the implementation is free to reject such attempts.

126679 As the *LC\_CTYPE* character classes are based on the ISO C standard character class definition,  
 126680 the category does not support multi-character elements. For instance, the German character  
 126681 <sharp-s> is traditionally classified as a lowercase letter. There is no corresponding uppercase  
 126682 letter; in proper capitalization of German text, the <sharp-s> will be replaced by "SS"; that is, by  
 126683 two characters. This kind of conversion is outside the scope of the **toupper** and **tolower**  
 126684 keywords.

126685 Where POSIX.1-2024 specifies that only certain characters can be specified, as for the keywords  
 126686 **digit** and **xdigit**, the specified characters must be from the portable character set, as shown. As

- 126687 an example, only the Arabic digits 0 through 9 are acceptable as digits.
- 126688 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included  
126689 characters. These only need to be specified if the character values (that is, encoding) differs from  
126690 the implementation default values. It is not possible to define a locale without these  
126691 automatically included characters unless some implementation extension is used to prevent  
126692 their inclusion. Such a definition would not be a proper superset of the C locale, and thus, it  
126693 might not be possible for the standard utilities to be implemented as programs conforming to  
126694 the ISO C standard.
- 126695 The definition of character class **digit** requires that only ten characters—the ones defining  
126696 digits—can be specified; alternate digits (for example, Hindi or Kanji) cannot be specified here.  
126697 However, the encoding may vary if an implementation supports more than one encoding.
- 126698 The definition of character class **xdigit** requires that the characters included in character class  
126699 **digit** are included here also and allows for different symbols for the hexadecimal digits 10  
126700 through 15.
- 126701 The inclusion of the **charclass** keyword satisfies the following requirement from the  
126702 ISO POSIX-2: 1993 standard, Annex H.1:
- 126703 (3) *The LC\_CTYPE (2.5.2.1) locale definition should be enhanced to allow user-specified additional*  
126704 *character classes, similar in concept to the ISO C standard Multibyte Support Extension (MSE)*  
126705 *iswctype() function.*
- 126706 This keyword was previously included in The Open Group specifications and is now mandated  
126707 in the Shell and Utilities volume of POSIX.1-2024.
- 126708 The symbolic constant {CHARCLASS\_NAME\_MAX} was also adopted from The Open Group  
126709 specifications. Applications portability is enhanced by the use of symbolic constants.
- 126710 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0033 [663], XBD/TC2-2008/0034 [663],  
126711 XBD/TC2-2008/0035 [584], and XBD/TC2-2008/0036 [584] are applied.
- 126712 Austin Group Defect 1078 is applied, clarifying that only the specified set of characters can be  
126713 included in the **digit** and **xdigit** classes in all locales, not just the POSIX locale.
- 126714 Austin Group Defect 1589 is applied, disallowing some characters from being included in the  
126715 **blank** class.
- 126716 A.7.3.2 LC\_COLLATE
- 126717 The rules governing collation depend to some extent on the use. At least five different levels of  
126718 increasingly complex collation rules can be distinguished:
- 126719 1. *Byte/machine code order*: This is the historical collation order in the UNIX system and many  
126720 proprietary operating systems. Collation is here performed character by character,  
126721 without any regard to context. The primary virtue is that it usually is quite fast and also  
126722 completely deterministic; it works well when the native machine collation sequence  
126723 matches the user expectations.
  - 126724 2. *Character order*: On this level, collation is also performed character by character, without  
126725 regard to context. The order between characters is, however, not determined by the code  
126726 values, but on the expectations by the user of the “correct” order between characters. In  
126727 addition, such a (simple) collation order can specify that certain characters collate equally  
126728 (for example, uppercase and lowercase letters).

- 126729 3. *String ordering*: On this level, entire strings are compared based on relatively  
 126730 straightforward rules. Several “passes” may be required to determine the order between  
 126731 two strings. Characters may be ignored in some passes, but not in others; the strings may  
 126732 be compared in different directions; and simple string substitutions may be performed  
 126733 before strings are compared. This level is best described as “dictionary” ordering; it is  
 126734 based on the spelling, not the pronunciation, or meaning, of the words.
- 126735 4. *Text search ordering*: This is a further refinement of the previous level, best described as  
 126736 “telephone book ordering”; some common homonyms (words spelled differently but  
 126737 with the same pronunciation) are collated together; numbers are collated as if they were  
 126738 spelled out, and so on.
- 126739 5. *Semantic-level ordering*: Words and strings are collated based on their meaning; entire  
 126740 words (such as “the”) are eliminated; the ordering is not deterministic. This usually  
 126741 requires special software and is highly dependent on the intended use.

126742 While the historical collation order formally is at level 1, for the English language it corresponds  
 126743 roughly to elements at level 2. The user expects to see the output from the *ls* utility sorted very  
 126744 much as it would be in a dictionary. While telephone book ordering would be an optimal goal  
 126745 for standard collation, this was ruled out as the order would be language-dependent.  
 126746 Furthermore, a requirement was that the order must be determined solely from the text string  
 126747 and the collation rules; no external information (for example, “pronunciation dictionaries”)  
 126748 could be required.

126749 As a result, the goal for the collation support is at level 3. This also matches the requirements for  
 126750 the Canadian collation order, as well as other, known collation requirements for alphabetic  
 126751 scripts. It specifically rules out collation based on pronunciation rules or based on semantic  
 126752 analysis of the text.

126753 The syntax for the *LC\_COLLATE* category source meets the requirements for level 3 and has  
 126754 been verified to produce the correct result with examples based on French, Canadian, and  
 126755 Danish collation order. Because it supports multi-character collating elements, it is also capable  
 126756 of supporting collation in codesets where a character is expressed using non-spacing characters  
 126757 followed by the base character (such as the ISO/IEC 6937:2001 standard).

126758 The directives that can be specified in an operand to the **order\_start** keyword are based on the  
 126759 requirements specified in several proposed standards and in customary use. The following is a  
 126760 rephrasing of rules defined for “lexical ordering in English and French” by the Canadian  
 126761 Standards Association (the text in square brackets is rephrased):

- 126762 • Once special characters [punctuation] have been removed from original strings, the  
 126763 ordering is determined by scanning forwards (left to right) [disregarding case and  
 126764 diacriticals].
- 126765 • In case of equivalence, special characters are once again removed from original strings and  
 126766 the ordering is determined by scanning backwards (starting from the rightmost character  
 126767 of the string and back), character by character [disregarding case but considering  
 126768 diacriticals].
- 126769 • In case of repeated equivalence, special characters are removed again from original strings  
 126770 and the ordering is determined by scanning forwards, character by character [considering  
 126771 both case and diacriticals].
- 126772 • If there is still an ordering equivalence after the first three rules have been applied, then  
 126773 only special characters and the position they occupy in the string are considered to  
 126774 determine ordering. The string that has a special character in the lowest position comes  
 126775 first. If two strings have a special character in the same position, the character [with the  
 126776 lowest collation value] comes first. In case of equality, the other special characters are

- 126777 considered until there is a difference or until all special characters have been exhausted.
- 126778 It is estimated that this part of POSIX.1-2024 covers the requirements for all European  
126779 languages, and no particular problems are anticipated with Slavic or Middle East character sets.
- 126780 The Far East (particularly Japanese/Chinese) collations are often based on contextual  
126781 information and pronunciation rules (the same ideogram can have different meanings and  
126782 different pronunciations). Such collation, in general, falls outside the desired goal of  
126783 POSIX.1-2024. There are, however, several other collation rules (stroke/radical or “most  
126784 common pronunciation”) that can be supported with the mechanism described here.
- 126785 The character order is defined by the order in which characters and elements are specified  
126786 between the **order\_start** and **order\_end** keywords. Weights assigned to the characters and  
126787 elements define the collation sequence; in the absence of weights, the character order is also the  
126788 collation sequence.
- 126789 The **position** keyword provides the capability to consider, in a compare, the relative position of  
126790 characters not subject to **IGNORE**. As an example, consider the two strings "o-ring" and  
126791 "or-ing". Assuming the <hyphen-minus> is subject to **IGNORE** on the first pass, the two  
126792 strings compare equal, and the position of the <hyphen-minus> is immaterial. On second pass,  
126793 all characters except the <hyphen-minus> are subject to **IGNORE**, and in the normal case the  
126794 two strings would again compare equal. By taking position into account, the first collates before  
126795 the second.
- 126796 This standard requires that all implementation-provided locales define a collation sequence that  
126797 has a total ordering of all characters unless the locale name has an '@' modifier indicating that  
126798 it has a special collation sequence. Defining locales in this way eliminates unexpected behavior  
126799 when non-identical strings can collate equally (for example, `sort -u` and `sort | uniq` are  
126800 not equivalent). The exception for locales with a suitable '@' modifier in the name allows  
126801 implementations to supply locales which do not have a total ordering of all characters provided  
126802 that they draw attention to it in the modifier name. For example, `@icase` could indicate that  
126803 each upper and lowercase character pair collates equally. Even with an '@' modifier, total  
126804 ordering is preferred when possible; for example, characters that are “ignored” in dictionary  
126805 order need not be completely ignored (by using **IGNORE** for all collation weights), but can  
126806 instead be given a unique weight after one or more **IGNORE** weights.
- 126807 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0037 [938], XBD/TC2-2008/0038 [663],  
126808 and XBD/TC2-2008/0039 [584] are applied.
- 126809 Austin Group Defect 948 is applied, requiring that all implementation-provided locales define a  
126810 collation sequence that has a total ordering of all characters unless the locale name has an '@'  
126811 modifier indicating that it has a special collation sequence.
- 126812 Austin Group Defect 1740 is applied, noting that it is the responsibility of the locale writer to  
126813 ensure <NUL> has the lowest primary weight in a collation ordering.
- 126814 A.7.3.3 *LC\_MONETARY*
- 126815 The currency symbol does not appear in *LC\_MONETARY* because it is not defined in the C  
126816 locale of the ISO C standard.
- 126817 The ISO C standard limits the size of decimal points and thousands delimiters to single-byte  
126818 values. In locales based on multi-byte coded character sets, this cannot be enforced;  
126819 POSIX.1-2024 does not prohibit such characters, but makes the behavior unspecified (in the text  
126820 “In contexts where other standards ...”).
- 126821 The grouping specification is based on, but not identical to, the ISO C standard. The -1 indicates  
126822 that no further grouping is performed; the equivalent of {CHAR\_MAX} in the ISO C standard.

126823 The text “the value is not available in the locale” is taken from the ISO C standard and is used  
 126824 instead of the “unspecified” text in early proposals. There is no implication that omitting these  
 126825 keywords or assigning them values of " " or -1 produces unspecified results; such omissions or  
 126826 assignments eliminate the effects described for the keyword or produce zero-length strings, as  
 126827 appropriate.

126828 The locale definition is an extension of the ISO C standard *localeconv()* specification. In  
 126829 particular, rules on how **currency\_symbol** is treated are extended to also cover **int\_curr\_symbol**,  
 126830 and **p\_sep\_by\_space** and **n\_sep\_by\_space** have been augmented with the value 2, which places  
 126831 a <space> between the sign and the symbol. This has been updated to match the  
 126832 ISO/IEC 9899:1999 standard requirements and is an incompatible change from UNIX 98 and the  
 126833 ISO POSIX-2 standard and the ISO POSIX-1:1996 standard requirements. The following table  
 126834 shows the result of various combinations:

|                          |                        | <b>p_sep_by_space</b> |           |          |
|--------------------------|------------------------|-----------------------|-----------|----------|
|                          |                        | <b>2</b>              | <b>1</b>  | <b>0</b> |
| <b>p_cs_precedes = 1</b> | <b>p_sign_posn = 0</b> | (\$1.25)              | (\$ 1.25) | (\$1.25) |
|                          | <b>p_sign_posn = 1</b> | + \$1.25              | +\$ 1.25  | +\$1.25  |
|                          | <b>p_sign_posn = 2</b> | \$1.25 +              | \$ 1.25+  | \$1.25+  |
|                          | <b>p_sign_posn = 3</b> | + \$1.25              | +\$ 1.25  | +\$1.25  |
| <b>p_cs_precedes = 0</b> | <b>p_sign_posn = 4</b> | \$ +1.25              | \$+ 1.25  | \$+1.25  |
|                          | <b>p_sign_posn = 0</b> | (1.25 \$)             | (1.25 \$) | (1.25\$) |
|                          | <b>p_sign_posn = 1</b> | +1.25 \$              | +1.25 \$  | +1.25\$  |
|                          | <b>p_sign_posn = 2</b> | 1.25\$ +              | 1.25 \$+  | 1.25\$+  |
|                          | <b>p_sign_posn = 3</b> | 1.25+ \$              | 1.25 +\$  | 1.25+\$  |
|                          | <b>p_sign_posn = 4</b> | 1.25\$ +              | 1.25 \$+  | 1.25\$+  |

126847 The following is an example of the interpretation of the **mon\_grouping** keyword. Assuming that  
 126848 the value to be formatted is 123456789 and the **mon\_thousands\_sep** is <apostrophe>, then the  
 126849 following table shows the result. The third column shows the equivalent string in the ISO C  
 126850 standard that would be used by the *localeconv()* function to accommodate this grouping.

| <b>mon_grouping</b> | <b>Formatted Value</b> | <b>ISO C String</b> |
|---------------------|------------------------|---------------------|
| 3;-1                | 123456'789             | "\3\177"            |
| 3                   | 123'456'789            | "\3"                |
| 3;2;-1              | 1234'56'789            | "\3\2\177"          |
| 3;2                 | 12'34'56'789           | "\3\2"              |
| -1                  | 123456789              | "\177"              |

126857 In these examples, the octal value of {CHAR\_MAX} is 177.

126858 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/6 adds a correction that permits the Euro  
 126859 currency symbol and addresses extensibility. The correction is stated using the term “should”  
 126860 intentionally, in order to make this a recommendation rather than a restriction on  
 126861 implementations. This allows for flexibility in implementations on how they handle future  
 126862 currency symbol additions.

126863 IEEE Std 1003.1-2001/Cor 1-2002, tem XBD/TC1/D6/5 is applied, adding the **int\_[np]\_\*** values  
 126864 to the POSIX locale definition of *LC\_MONETARY*.

126865 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/16 is applied, updating the descriptions  
 126866 of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space** to match  
 126867 the description of these keywords in the ISO C standard and the System Interfaces volume of  
 126868 POSIX.1-2024, *localeconv()*.

126869 Austin Group Defect 1199 is applied, adding a requirement that *localedef* does not accept certain

- 126870 combinations of **\*\_sign\_posn**, **positive\_sign**, and **negative\_sign** values.
- 126871 Austin Group Defect 1241 is applied, clarifying the meaning of empty string values.
- 126872 A.7.3.4 *LC\_NUMERIC*
- 126873 See the rationale for *LC\_MONETARY* for a description of the behavior of grouping.
- 126874 Austin Group Defect 1241 is applied, clarifying the meaning of empty string values.
- 126875 A.7.3.5 *LC\_TIME*
- 126876 Although certain of the conversion specifications in the POSIX locale (such as the name of the  
126877 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
126878 using these conversion specifications may need to adjust the capitalization if the output is going  
126879 to be used at the beginning of a sentence.
- 126880 The *LC\_TIME* descriptions of **abday**, **day**, **mon**, and **abmon** imply a Gregorian style calendar  
126881 (7-day weeks, 12-month years, leap years, and so on). Formatting time strings for other types of  
126882 calendars is outside the scope of POSIX.1-2024.
- 126883 While the ISO 8601-1:2019 standard numbers the weekdays starting with Monday, historical  
126884 practice is to use the Sunday as the first day. Rather than change the order and introduce  
126885 potential confusion, the days must be specified beginning with Sunday; previous references to  
126886 “first day” have been removed. Note also that the Shell and Utilities volume of POSIX.1-2024  
126887 *date* utility supports numbering compliant with the ISO 8601-1:2019 standard.
- 126888 As specified under *date* in the Shell and Utilities volume of POSIX.1-2024 and *strftime()* in the  
126889 System Interfaces volume of POSIX.1-2024, the conversion specifications corresponding to the  
126890 optional keywords consist of a modifier followed by a traditional conversion specification (for  
126891 instance, %Ex). If the optional keywords are not supported by the implementation or are  
126892 unspecified for the current locale, these modified conversion specifications are treated as the  
126893 traditional conversion specifications. For example, assume the following keywords:
- 126894 alt\_digits "0th"; "1st"; "2nd"; "3rd"; "4th"; "5th"; \  
126895 "6th"; "7th"; "8th"; "9th"; "10th"
- 126896 d\_fmt "The %Od day of %B in %Y"
- 126897 On July 4th 1776, the %x conversion specifications would result in "The 4th day of July  
126898 in 1776", while on July 14th 1789 it would result in "The 14 day of July in 1789". It  
126899 can be noted that the above example is for illustrative purposes only; the %O modifier is  
126900 primarily intended to provide for Kanji or Hindi digits in *date* formats.
- 126901 The following is an example for Japan that supports the current plus last three Emperors and  
126902 reverts to Western style numbering for years prior to the Meiji era. The example also allows for  
126903 the custom of using a special name for the first year of an era instead of using 1. (The examples  
126904 substitute romaji where kanji should be used.)
- 126905 era\_d\_fmt "%EY%mgatsu%dnichi (%a) "
- 126906 era "+:2:1990/01/01:+\*:Heisei:%EC%Eynen"; \  
126907 "+:1:1989/01/08:1989/12/31:Heisei:%ECgannen"; \  
126908 "+:2:1927/01/01:1989/01/07:Shouwa:%EC%Eynen"; \  
126909 "+:1:1926/12/25:1926/12/31:Shouwa:%ECgannen"; \  
126910 "+:2:1913/01/01:1926/12/24:Taishou:%EC%Eynen"; \  
126911 "+:1:1912/07/30:1912/12/31:Taishou:%ECgannen"; \  
126912 "+:2:1869/01/01:1912/07/29:Meiji:%EC%Eynen"; \  
126913 "

126913 "+:1:1868/09/08:1868/12/31:Meiji:%ECgannen";\  
 126914 "-:1868:1868/09/07:-\*::%Ey"

126915 Assuming that the current date is September 21, 1991, a request to *date* or *strftime()* would yield  
 126916 the following results:

126917 %Ec - Heisei3nen9gatsu21nichi (Sat) 14:39:26  
 126918 %EC - Heisei  
 126919 %Ex - Heisei3nen9gatsu21nichi (Sat)  
 126920 %Ey - 3  
 126921 %EY - Heisei3nen

126922 Example era definitions for the Republic of China:

126923 era "+:2:1913/01/01:+\*:ChungHwaMingGuo:%EC%EyNen";\  
 126924 "+:1:1912/1/1:1912/12/31:ChungHwaMingGuo:%ECYuenNen";\  
 126925 "+:1:1911/12/31:-\*:MingChien:%EC%EyNen"

126926 Example definitions for the Christian Era:

126927 era "+:1:0001/01/01:+\*:AD:%EC %Ey";\  
 126928 "+:1:-0001/12/31:-\*:BC:%Ey %EC"

126929 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0040 [912] is applied.

126930 Austin Group Defects 258 and 1166 are applied, adding the **alt\_mon** and **ab\_alt\_mon** locale  
 126931 keywords.

126932 Austin Group Defect 1307 is applied, changing the **am\_pm** and **t\_fmt\_ampm** keywords and the  
 126933 AM\_STR, PM\_STR, and T\_FMT\_AMPM constants in relation to locales that do not support the  
 126934 12-hour clock format.

#### 126935 A.7.3.6 LC\_MESSAGES

126936 The **yesstr** and **nostr** locale keywords and the YESSTR and NOSTR *langinfo* items were formerly  
 126937 used to match user affirmative and negative responses. In POSIX.1-2024, the **yesexpr**, **noexpr**,  
 126938 YESEXPR, and NOEXPR extended regular expressions have replaced them. Applications  
 126939 should use the general locale-based messaging facilities to issue prompting messages which  
 126940 include sample desired responses.

126941 Affirmative responses like:

126942 y  
 126943 Yes  
 126944 Yes!

126945 and negative responses like:

126946 N  
 126947 No  
 126948 Never  
 126949 No way!

126950 should all be recognized as affirmative and negative responses, respectively, by the EREs  
 126951 identified by the **yesexpr** and **noexpr** keywords for English language-based locales. There is no  
 126952 requirement that multi-line responses nor ambiguous responses like:

126953 no or yes  
 126954 yes or no  
 126955 maybe

126956 be correctly classified by either of these EREs. Application writers are encouraged to include  
126957 locale-specific suggestions for affirmative and negative responses in prompts.

#### 126958 **A.7.4 Locale Definition Grammar**

126959 There is no additional rationale provided for this section.

##### 126960 *A.7.4.1 Locale Lexical Conventions*

126961 There is no additional rationale provided for this section.

##### 126962 *A.7.4.2 Locale Grammar*

126963 Austin Group Defects 258 and 1166 are applied, adding the **alt\_mon** and **ab\_alt\_mon** locale  
126964 keywords.

#### 126965 **A.7.5 Locale Definition Example**

126966 The following is an example of a locale definition file that could be used as input to the *localedef*  
126967 utility. It assumes that the utility is executed with the `-f` option, naming a charmap file with (at  
126968 least) the following content:

```
126969 CHARMAP
126970 <space>      \x20
126971 <dollar>     \x24
126972 <A>          \101
126973 <a>          \141
126974 <A-acute>    \346
126975 <a-acute>    \365
126976 <A-grave>    \300
126977 <a-grave>    \366
126978 <b>          \142
126979 <C>          \103
126980 <c>          \143
126981 <c-cedilla>  \347
126982 <d>          \x64
126983 <H>          \110
126984 <h>          \150
126985 <eszet>     \xb7
126986 <s>          \x73
126987 <z>          \x7a
126988 END CHARMAP
```

126989 It should not be taken as complete or to represent any actual locale, but only to illustrate the  
126990 syntax.

```
126991 #
126992 LC_CTYPE
126993 lower  <a>;<b>;<c>;<c-cedilla>;<d>;...;<z>
126994 upper  A;B;C;Ç;...;Z
126995 space  \x20;\x09;\x0a;\x0b;\x0c;\x0d
126996 blank  \040;\011
```

```

126997 toupper (<a>,<A>); (b,B); (c,C); (ç,Ç); (d,D); (z,Z)
126998 END LC_CTYPE
126999 #
127000 LC_COLLATE
127001 #
127002 # The following example of collation is based on
127003 # Canadian standard Z243.4.1-1998, "Canadian Alphanumeric
127004 # Ordering Standard for Character Sets of CSA Z234.4 Standard".
127005 # (Other parts of this example locale definition file do not
127006 # purport to relate to Canada, or to any other real culture.)
127007 # The proposed standard defines a 4-weight collation, such that
127008 # in the first pass, characters are compared without regard to
127009 # case or accents; in the second pass, backwards-compare without
127010 # regard to case; in the third pass, forwards-compare without
127011 # regard to diacriticals. In the 3 first passes, non-alphabetic
127012 # characters are ignored; in the fourth pass, only special
127013 # characters are considered, such that "The string that has a
127014 # special character in the lowest position comes first. If two
127015 # strings have a special character in the same position, the
127016 # collation value of the special character determines ordering.
127017 #
127018 # Only a subset of the character set is used here; mostly to
127019 # illustrate the set-up.
127020 #
127021 collating-symbol <NULL>
127022 collating-symbol <LOW_VALUE>

## 127139 A.8 Environment Variables

### 127140 A.8.1 Environment Variable Definition

127141 The variable *environ* is not intended to be declared in any header, but rather to be declared by  
 127142 the user for accessing the array of strings that is the environment. This is the traditional usage of  
 127143 the symbol. Putting it into a header could break some programs that use the symbol for their  
 127144 own purposes.

127145 The decision to restrict conforming systems to the use of digits, uppercase letters, and  
 127146 underscores for environment variable names allows applications to use lowercase letters in their  
 127147 environment variable names without conflicting with any conforming system.

127148 In addition to the obvious conflict with the shell syntax for positional parameter substitution,  
 127149 some historical applications (including some shells) exclude names with leading digits from the  
 127150 environment.

127151 Some historical implementations removed certain environment variables during program  
 127152 startup when security criteria were not met, instead of just ignoring them at the point of use. The  
 127153 standard developers decided not to allow this behavior because if a process drops all privileges  
 127154 and sets its effective user and group IDs to be the same as its real user and group IDs before  
 127155 executing a program or utility, the behavior should be the same as if the process had originally  
 127156 met the security criteria.

127157 Austin Group Defect 367 is applied, adding requirements relating to the use of *readonly* on  
 127158 environment variables that are manipulated by shell built-in utilities.

127159 Austin Group Defect 922 is applied, allowing implementations to ignore some environment  
 127160 variables at the point of use for security reasons.

127161 Austin Group Defect 1561 is applied, clarifying that environment variable values can contain  
 127162 byte sequences that do not form valid characters.

## 127163 **A.8.2 Internationalization Variables**

127164 Utilities conforming to the Shell and Utilities volume of POSIX.1-2024 and written in standard C  
 127165 can access the locale variables by issuing the following call:

```
127166 setlocale(LC_ALL, "")
```

127167 If this were omitted, the ISO C standard specifies that the C (or POSIX) locale would be used.

127168 The DESCRIPTION of *setlocale()* requires that when setting all categories of a locale, if the value  
 127169 of any of the environment variable searches yields a locale that is not supported (and non-null),  
 127170 the *setlocale()* function returns a null pointer and the global locale is unchanged.

127171 For the standard utilities, if any of the environment variables are invalid, it makes sense to  
 127172 default to an implementation-defined, consistent locale environment. It is more confusing for a  
 127173 user to have partial settings occur in case of a mistake. All utilities would then behave in one  
 127174 language/cultural environment. Furthermore, it provides a way of forcing the whole  
 127175 environment to be the implementation-defined default. Disastrous results could occur if a  
 127176 pipeline of utilities partially uses the environment variables in different ways. In this case, it  
 127177 would be appropriate for utilities that use *LANG* and related variables to exit with an error if  
 127178 any of the variables are invalid. For example, users typing individual commands at a terminal  
 127179 might want *date* to work if *LC\_MONETARY* is invalid as long as *LC\_TIME* is valid. Since these  
 127180 are conflicting reasonable alternatives, POSIX.1-2024 leaves the results unspecified if the locale  
 127181 environment variables would not produce a complete locale matching the specification of the  
 127182 user.

127183 The *LC\_MESSAGES* variable affects the language of messages generated by the standard  
 127184 utilities.

127185 The description of the environment variable names starting with the characters “LC\_”  
 127186 acknowledges the fact that the interfaces presented may be extended as new international  
 127187 functionality is required. In the ISO C standard, names preceded by “LC\_” are reserved in the  
 127188 name space for future categories.

127189 To avoid name clashes, new categories and environment variables are divided into two  
 127190 classifications: “implementation-independent” and “implementation-defined”.

127191 Implementation-independent names will have the following format:

- 127192 LC\_NAME
- 127193 where *NAME* is the name of the new category and environment variable. Capital letters must be  
127194 used for implementation-independent names.
- 127195 Implementation-defined names must be in lowercase letters, as below:
- 127196 LC\_name
- 127197 Austin Group Defect 1122 is applied, adding the *LANGUAGE*, *TEXTDOMAIN*, and  
127198 *TEXTDOMAINDIR* environment variables and updating *NLS\_PATH* with requirements relating  
127199 to the *gettext* family of functions and the *gettext* and *ngettext* utilities.
- 127200 Austin Group Defect 1477 is applied, moving a paragraph of rationale about incompatible locale  
127201 categories to [Section A.7.1](#) (on page 3692).
- 127202 Austin Group Defect 1571 is applied, simplifying the final item in the precedence order for  
127203 internationalization environment variables.

### 127204 A.8.3 Other Environment Variables

#### 127205 COLUMNS, LINES

- 127206 The default values for the number of column positions when *COLUMNS* is unset or null, and  
127207 screen height when *LINES* is unset or null, are unspecified if the terminal window size cannot be  
127208 obtained (from *tcgetwinsize()*) because historical implementations use different methods to  
127209 determine the values. Users should not need to set these variables in the environment unless  
127210 there is a specific reason to override the default behavior of the implementation, such as to  
127211 display data in an area arbitrarily smaller than the terminal or window. Values for these  
127212 variables that are not decimal integers greater than zero are implicitly undefined values; it is  
127213 unnecessary to enumerate all of the possible values outside of the acceptable set.
- 127214 Austin Group Defect 1185 is applied, changing the descriptions of the *COLUMNS* and *LINES*  
127215 environment variables.

#### 127216 LOGNAME

- 127217 In most implementations, the value of such a variable is easily forged, so security-critical  
127218 applications should rely on other means of determining user identity. *LOGNAME* is required to  
127219 be constructed from the portable filename character set for reasons of interchange. No diagnostic  
127220 condition is specified for violating this rule, and no requirement for enforcement exists. The  
127221 intent of the requirement is that if extended characters are used, the “guarantee” of portability  
127222 implied by a standard is void.

#### 127223 PATH

- 127224 Many historical implementations of the Bourne shell do not interpret a trailing <colon> to  
127225 represent the current working directory and are thus non-conforming. The C Shell and the  
127226 KornShell conform to POSIX.1-2024 on this point. The usual name of dot may also be used to  
127227 refer to the current working directory.
- 127228 Many implementations historically have used a default value of */bin* and */usr/bin* for the *PATH*  
127229 variable. POSIX.1-2024 does not mandate this default path be identical to that retrieved from  
127230 *getconf PATH* because it is likely that the standardized utilities may be provided in another  
127231 directory separate from the directories used by some historical applications.
- 127232 The standard specifies that (when no <slash> character is included in a command pathname)  
127233 special built-in utilities and intrinsic utilities are not subject to a search using *PATH*. All other

127234 standard utilities, even if implemented as shell built-ins, are required to be found by searching  
 127235 *PATH*. This means that if a shell includes a built-in for a standard utility that is not intrinsic, a  
 127236 user can write a utility that will override that built-in. The standard also requires that all  
 127237 standard utilities can be executed by commands like:

```
127238 find . -type d -exec printf 'Found directory: %s\n' '{}' +
```

127239 So, other than differences caused by using different shell execution environments, a standard  
 127240 utility that is implemented as a built-in and the non-built-in version of that standard utility are  
 127241 both required to behave as the standard specifies. But, if a non-standard utility is found in *PATH*  
 127242 before the standard utility's location in *PATH*, the non-standard utility must be invoked rather  
 127243 than the built-in. For instance, if the shell includes a built-in *printf* utility (which most shells do),  
 127244 *PATH* is initialized using:

```
127245 PATH="$HOME/bin:$(command -p getconf PATH) "
```

127246 and ***\$HOME/bin/printf*** is an executable file containing:

```
127247 command -p printf 'In %s with args:\n' "${0##*/}" >&2  

  127248 command -p printf '%s\n' "$@" >&2  

  127249 command -V printf >&2  

  127250 command -Vp printf >&2  

  127251 command -p printf "$@"
```

127252 then the command:

```
127253 printf '%s %s\n' HOME "$HOME" PATH "$PATH"
```

127254 should produce output similar to:

```
127255 In printf with args:  

  127256     %s %s\n  

  127257     HOME  

  127258     /Users/dwc  

  127259     PATH  

  127260     /Users/dwc/bin:/usr/bin:/bin:/usr/sbin:/sbin  

  127261 printf is a tracked alias for /Users/dwc/bin/printf  

  127262 printf is a shell builtin  

  127263 HOME /Users/dwc  

  127264 PATH /Users/dwc/bin:/usr/bin:/bin:/usr/sbin:/sbin
```

127265 The current version of the Korn shell installs built-ins into the shell using a *builtin* utility that  
 127266 allows the built-in to be associated with the pathname of the non-built-in version of that utility.  
 127267 (Unfortunately, some implementations that use *ksh93* as their standard *sh* utility do not make use  
 127268 of this feature and install built-ins for standard utilities that are not associated with a *PATH*  
 127269 search. And, most other shells incorrectly always use a built-in utility if one is installed, even  
 127270 when it should be overridden by a *PATH* search that should find the non-standard version of a  
 127271 utility with the name of that built-in.) Some other shells use a `<percent-sign>` character in a  
 127272 directory pathname in *PATH* to indicate one or more directories that should be used when  
 127273 processing *PATH* to determine when non-intrinsic standard utilities should be found. The  
 127274 POSIX.1-2024 revision of the standard allows either of these methods to be used to install built-  
 127275 ins that meet the requirements stated in XCU [Section 2.9.1.4](#) (on page 2502) by making the  
 127276 behavior of the built-in path search implementation-defined when a `<percent-sign>` character is  
 127277 found in *PATH*.

127278 Austin Group Defect 854 is applied, changing how *PATH* searching applies to built-in utilities.

127279 Austin Group Defect 1340 is applied, clarifying the description of *PATH*.

127280 **SHELL**

127281 The *SHELL* variable names the preferred shell of the user; it is a guide to applications. There is  
 127282 no direct requirement that that shell conform to POSIX.1-2024; that decision should rest with the  
 127283 user. It is the intention of the standard developers that alternative shells be permitted, if the user  
 127284 chooses to develop or acquire one. An operating system that builds its shell into the “kernel” in  
 127285 such a manner that alternative shells would be impossible does not conform to the spirit of  
 127286 POSIX.1-2024.

127287 **TZ**

127288 The quoted form of the timezone variable allows timezone names of the form UTC+1 (or any  
 127289 name that contains the <plus-sign> ('+'), the <hyphen-minus> ('-'), or digits), which may be  
 127290 appropriate for countries that do not have an official timezone name. It would be coded as  
 127291 <UTC+1>+1<UTC+2>, which would cause *std* to have a value of UTC+1 and *dst* a value of  
 127292 UTC+2, each with a length of 5 characters. This does not appear to conflict with any existing  
 127293 usage. The characters '<' and '>' were chosen for quoting because they are easier to parse  
 127294 visually than a quoting character that does not provide some sense of bracketing (and in a string  
 127295 like this, such bracketing is helpful). They were also chosen because they do not need special  
 127296 treatment when assigning to the *TZ* variable. Users are often confused by embedding quotes in a  
 127297 string. Because '<' and '>' are meaningful to the shell, the whole string would have to be  
 127298 quoted, but that is easily explained. (Parentheses would have presented the same problems.)  
 127299 Although the '>' symbol could have been permitted in the string by either escaping it or  
 127300 doubling it, it seemed of little value to require that. This could be provided as an extension if  
 127301 there was a need. Timezone names of this new form lead to a requirement that the value of  
 127302 {\_POSIX\_TZNAME\_MAX} change from 3 to 6.

127303 Since the *TZ* environment variable is usually inherited by all applications started by a user after  
 127304 the value of the *TZ* environment variable is changed and since many applications run using the  
 127305 C or POSIX locale, using characters that are not in the portable character set in the *std* and *dst*  
 127306 fields could cause unexpected results.

127307 Implementations are encouraged to incorporate the IANA timezone database into the timezone  
 127308 database used for *TZ* values specifying geographical and special timezones, and to provide a  
 127309 method to allow it to be updated in accordance with RFC 6557.

127310 The *TZ* format beginning with <colon> was originally introduced as a way for implementations  
 127311 to support geographical timezones in the form :*Area/Location* as an extension, but  
 127312 implementations started to support them without the leading <colon> (as well as with it) and  
 127313 their use without the <colon> became the de-facto standard. Consequently when geographical  
 127314 timezones were added to this standard, it was without the <colon>.

127315 The format of the *TZ* environment variable is changed in Issue 6 to allow for the quoted form, as  
 127316 defined in earlier versions of the ISO POSIX-1 standard.

127317 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/7 is applied, adding the *ctime\_r()* and  
 127318 *localtime\_r()* functions to the list of functions that use the *TZ* environment variable.

127319 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0041 [584] is applied.

127320 Austin Group Defect 1030 is applied, making it implementation-defined when the changes to  
 127321 and from Daylight Saving Time occur if the *dst* field is specified in *TZ* and the *rule* field is not.

127322 Austin Group Defect 1252 is applied, changing the *time* field to allow the hour to range from  
 127323 zero to 167 and allowing a leading sign.

127324 Austin Group Defect 1253 is applied, changing “alternative time” to “Daylight Saving Time”.

127325 Austin Group Defect 1410 is applied, removing the *ctime\_r()* function.

127326 Austin Group Defect 1619 is applied, adding support for a third TZ format with values  
127327 specifying geographical and special timezones.

127328 Austin Group Defects 1638 and 1639 are applied, clarifying the length limits for the *std* and *dst*  
127329 fields of TZ.

## 127330 A.9 Regular Expressions

127331 Rather than repeating the description of REs for each utility supporting REs, the standard  
127332 developers preferred a common, comprehensive description of regular expressions in one place.  
127333 The most common behavior is described here, and exceptions or extensions to this are  
127334 documented for the respective utilities, as appropriate.

127335 The BRE corresponds to the *ed* or historical *grep* type, and the ERE corresponds to the historical  
127336 *egrep* type (now *grep -E*).

127337 The text is based on the *ed* description and substantially modified, primarily to aid developers  
127338 and others in the understanding of the capabilities and limitations of REs. Much of this was  
127339 influenced by internationalization requirements.

127340 It should be noted that the definitions in this section do not cover the *tr* utility; the *tr* syntax does  
127341 not employ REs.

127342 The specification of REs is particularly important to internationalization because pattern  
127343 matching operations are very basic operations in business and other operations. The syntax and  
127344 rules of REs are intended to be as intuitive as possible to make them easy to understand and use.  
127345 The historical rules and behavior do not provide that capability to non-English language users,  
127346 and do not provide the necessary support for commonly used characters and language  
127347 constructs. It was necessary to provide extensions to the historical RE syntax and rules to  
127348 accommodate other languages.

127349 As they are limited to bracket expressions, the rationale for these modifications is in XBD [Section](#)  
127350 [9.3.5](#) (on page 182).

### 127351 A.9.1 Regular Expression Definitions

127352 It is possible to determine what strings correspond to subexpressions by recursively applying  
127353 the leftmost longest rule to each subexpression, but only with the proviso that the overall match  
127354 is leftmost longest. For example, matching "`\(ac*\\)c*d[ac]*\1`" against *acdacaaa* matches  
127355 *acdacaaa* (with `\1=a`); simply matching the longest match for "`\(ac*\\)`" would yield `\1=ac`, but  
127356 the overall match would be smaller (*acdac*). Conceptually, the implementation must examine  
127357 every possible match and among those that yield the leftmost longest total matches, pick the one  
127358 that does the longest match for the leftmost subexpression, and so on. Note that this means that  
127359 matching by subexpressions is context-dependent: a subexpression within a larger RE may  
127360 match a different string from the one it would match as an independent RE, and two instances of  
127361 the same subexpression within the same larger RE may match different lengths even in similar  
127362 sequences of characters. For example, in the ERE "`(a.*b)(a.*b)`", the two identical  
127363 subexpressions would match four and six characters, respectively, of *acbbaccbb*.

127364 The definition of single character has been expanded to include also collating elements  
127365 consisting of two or more characters; this expansion is applicable only when a bracket  
127366 expression is included in the BRE or ERE. An example of such a collating element may be the  
127367 Dutch *ij*, which collates as a 'y'. In some encodings, a ligature ``i with j'' exists as a character  
127368 and would represent a single-character collating element. In another encoding, no such ligature  
127369 exists, and the two-character sequence *ij* is defined as a multi-character collating element.

127370 Outside brackets, the *ij* is treated as a two-character RE and matches the same characters in a  
 127371 string. Historically, a bracket expression only matched a single character. The ISO POSIX-2: 1993  
 127372 standard required bracket expressions like "[[:lower:]]" to match multi-character collating  
 127373 elements such as "ij". However, this requirement led to behavior that many users did not  
 127374 expect and that could not feasibly be mimicked in user code, and it was rarely if ever  
 127375 implemented correctly. The current standard leaves it unspecified whether a bracket expression  
 127376 matches a multi-character collating element, allowing both historical and ISO POSIX-2: 1993  
 127377 standard implementations to conform.

127378 Also, in the current standard, it is unspecified whether character class expressions like  
 127379 "[[:lower:]]" can include multi-character collating elements like "ij"; hence  
 127380 "[[:lower:]]" can match "ij", and "[^[:lower:]]" can fail to match "ij". Common  
 127381 practice is for a character class expression to match a collating element if it matches the collating  
 127382 element's first character.

127383 Austin Group Defect 1329 is applied, adding a definition of "leftmost" and updating the  
 127384 definition of "matched" to include an example ERE using the repetition modifier '?'.  
 127385

127385 Austin Group Defect 1546 is applied, adding a definition of "escape sequence".

## 127386 A.9.2 Regular Expression General Requirements

127387 The definition of which sequence is matched when several are possible is based on the leftmost-  
 127388 longest rule historically used by deterministic recognizers. This rule is easier to define and  
 127389 describe, and arguably more useful, than the first-match rule historically used by non-  
 127390 deterministic recognizers. It is thought that dependencies on the choice of rule are rare; carefully  
 127391 contrived examples are needed to demonstrate the difference.

127392 A formal expression of the leftmost-longest rule is:

127393       The search is performed as if all possible suffixes of the string were tested for a prefix  
 127394       matching the pattern; the longest suffix containing a matching prefix is chosen, and the  
 127395       longest possible matching prefix of the chosen suffix is identified as the matching  
 127396       sequence.

127397 EREs can optionally use a leftmost-shortest rule for repetitions (enabled via the REG\_MINIMAL  
 127398 flag or the '?' repetition modifier), in which case the shortest possible matching prefix is  
 127399 instead identified as the matching sequence for the affected repetition(s).

127400 Historically, most RE implementations only match lines, not strings. However, that is more an  
 127401 effect of the usage than of an inherent feature of REs themselves. Consequently, POSIX.1-2024  
 127402 does not regard <newline> characters as special; they are ordinary characters, and both a  
 127403 <period> and a non-matching list can match them. Those utilities (like *grep*) that do not allow  
 127404 <newline> characters to match are responsible for eliminating any <newline> from strings  
 127405 before matching against the RE. The *regcomp()* function, however, can provide support for such  
 127406 processing without violating the rules of this section.

127407 Some implementations of *egrep* have had very limited flexibility in handling complex EREs.  
 127408 POSIX.1-2024 does not attempt to define the complexity of a BRE or ERE, but does place a lower  
 127409 limit on it—any RE must be handled, as long as it can be expressed in 256 bytes or less. (Of  
 127410 course, this does not place an upper limit on the implementation.) There are historical programs  
 127411 using a non-deterministic-recognizer implementation that should have no difficulty with this  
 127412 limit. It is possible that a good approach would be to attempt to use the faster, but more limited,  
 127413 deterministic recognizer for simple expressions and to fall back on the non-deterministic  
 127414 recognizer for those expressions requiring it. Non-deterministic implementations must be  
 127415 careful to observe the rules on which match is chosen; the longest match, not the first match,

127416 starting at a given character is used.

127417 The term “invalid” highlights a difference between this section and some others: POSIX.1-2024  
 127418 frequently avoids mandating of errors for syntax violations because they can be used by  
 127419 implementors to trigger extensions. However, the authors of the internationalization features of  
 127420 REs wanted to mandate errors for certain conditions to identify usage problems or non-portable  
 127421 constructs. These are identified within this rationale as appropriate. The remaining syntax  
 127422 violations have been left implicitly or explicitly undefined. For example, the BRE construct  
 127423 “\{1, 2, 3\}” does not comply with the grammar. A conforming application cannot rely on it  
 127424 producing an error nor matching the literal characters “\{1, 2, 3\}”.

127425 The term “undefined” was used in favor of “unspecified” because many of the situations are  
 127426 considered errors on some implementations, and the standard developers considered that  
 127427 consistency throughout the section was preferable to mixing undefined and unspecified.

127428 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0042 [554] is applied.

127429 Austin Group Defect 1031 is applied, replacing text relating to case insensitive comparisons with  
 127430 a reference to XBD [Section 4.1](#) (on page 95).

### 127431 **A.9.3 Basic Regular Expressions**

127432 Austin Group Defect 1139 is applied, making minor editorial changes to several subsections of  
 127433 this section and changing them to require that, when not inside a bracket expression, “\]”  
 127434 matches ‘]’.

#### 127435 *A.9.3.1 BREs Matching a Single Character or Collating Element*

127436 There is no additional rationale provided for this section.

#### 127437 *A.9.3.2 BRE Ordinary Characters*

127438 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0043 [554] is applied.

127439 Austin Group Defect 1546 is applied, adding optional support for “\?”, “\+”, and “\|”.

#### 127440 *A.9.3.3 BRE Special Characters*

127441 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0043 [554] is applied.

127442 Austin Group Defect 1546 is applied, adding optional support for “\?”, “\+”, and “\|”.

#### 127443 *A.9.3.4 Periods in BREs*

127444 There is no additional rationale provided for this section.

#### 127445 *A.9.3.5 RE Bracket Expression*

127446 Range expressions are, historically, an integral part of REs. However, the requirements of  
 127447 “natural language behavior” and portability do conflict. In the POSIX locale, ranges must be  
 127448 treated according to the collating sequence and include such characters that fall within the range  
 127449 based on that collating sequence, regardless of character values. In other locales, ranges have  
 127450 unspecified behavior.

127451 Some historical implementations allow range expressions where the ending range point of one  
 127452 range is also the starting point of the next (for instance, "[a-m-o]"). This behavior should not  
 127453 be permitted, but to avoid breaking historical implementations, it is now *undefined* whether it is  
 127454 a valid expression and how it should be interpreted.

127455 Current practice in *awk* and *lex* is to accept escape sequences in bracket expressions as per XBD  
 127456 Table 5-1 (on page 113), while the normal ERE behavior is to regard such a sequence as  
 127457 consisting of two characters. Allowing the *awk/lex* behavior in EREs would change the normal  
 127458 behavior in an unacceptable way; it is expected that *awk* and *lex* will decode escape sequences in  
 127459 EREs before passing them to *regcomp()* or comparable routines. Each utility describes the escape  
 127460 sequences it accepts as an exception to the rules in this section; the list is not the same, for  
 127461 historical reasons.

127462 As noted previously, the new syntax and rules have been added to accommodate other  
 127463 languages than English. The remainder of this section describes the rationale for these  
 127464 modifications.

127465 In the POSIX locale, a regular expression that starts with a range expression matches a set of  
 127466 strings that are contiguously sorted, but this is not necessarily true in other locales. For example,  
 127467 a French locale might have the following behavior:

```
127468 $ ls
127469 alpha Alpha estimé ESTIMÉ été eurêka
127470 $ ls [a-e]*
127471 alpha Alpha estimé eurêka
```

127472 Such disagreements between matching and contiguous sorting are unavoidable because POSIX  
 127473 sorting cannot be implemented in terms of a deterministic finite-state automaton (DFA), but  
 127474 range expressions by design are implementable in terms of DFAs.

127475 Historical implementations used native character order to interpret range expressions. The  
 127476 ISO POSIX-2:1993 standard instead required collating element order (CEO): the order that  
 127477 collating elements were specified between the **order\_start** and **order\_end** keywords in the  
 127478 *LC\_COLLATE* category of the current locale. CEO had some advantages in portability over the  
 127479 native character order, but it also had some disadvantages:

- 127480 • CEO could not feasibly be mimicked in user code, leading to inconsistencies between  
 127481 POSIX matchers and matchers in popular user programs like Emacs, *ksh*, and Perl.
- 127482 • CEO caused range expressions to match accented and capitalized letters contrary to many  
 127483 users' expectations. For example, "[a-e]" typically matched both 'E' and 'á' but  
 127484 neither 'A' nor 'é'.
- 127485 • CEO was not consistent across implementations. In practice, CEO was often less portable  
 127486 than native character order. For example, it was common for the CEOs of two  
 127487 implementation-supplied locales to disagree, even if both locales were named "da\_DK".

127488 Because of these problems, some implementations of regular expressions continued to use native  
 127489 character order. Others used the collation sequence, which is more consistent with sorting than  
 127490 either CEO or native order, but which departs further from the traditional POSIX semantics  
 127491 because it generally requires "[a-e]" to match either 'A' or 'E' but not both. As a result of  
 127492 this kind of implementation variation, programmers who wanted to write portable regular  
 127493 expressions could not rely on the ISO POSIX-2:1993 standard guarantees in practice.

127494 While revising the standard, lengthy consideration was given to proposals to attack this problem  
 127495 by adding an API for querying the CEO to allow user-mode matchers, but none of these  
 127496 proposals had implementation experience and none achieved consensus. Leaving the standard  
 127497 alone was also considered, but rejected due to the problems described above.

127498 The current standard leaves unspecified the behavior of a range expression outside the POSIX  
 127499 locale. This makes it clearer that conforming applications should avoid range expressions  
 127500 outside the POSIX locale, and it allows implementations and compatible user-mode matchers to  
 127501 interpret range expressions using native order, CEO, collation sequence, or other, more  
 127502 advanced techniques. The concerns which led to this change were raised in IEEE PASC  
 127503 interpretation 1003.2 #43 and others, and related to ambiguities in the specification of how  
 127504 multi-character collating elements should be handled in range expressions. These ambiguities  
 127505 had led to multiple interpretations of the specification, in conflicting ways, which led to varying  
 127506 implementations. As noted above, efforts were made to resolve the differences, but no solution  
 127507 has been found that would be specific enough to allow for portable software while not  
 127508 invalidating existing implementations.

127509 The standard developers recognize that collating elements are important, such elements being  
 127510 common in several European languages; for example, 'ch' or 'll' in traditional Spanish;  
 127511 'aa' in several Scandinavian languages. Existing internationalized implementations have  
 127512 processed, and continue to process, these elements in range expressions. Efforts are expected to  
 127513 continue in the future to find a way to define the behavior of these elements precisely and  
 127514 portably.

127515 The ISO POSIX-2:1993 standard required "[b-a]" to be an invalid expression in the POSIX  
 127516 locale, but this requirement has been relaxed in this version of the standard so that "[b-a]" can  
 127517 instead be treated as a valid expression that does not match any string.

127518 The standard specifies three possible behaviors for regular expressions such as "[alpha:]".  
 127519 One behavior is the traditional implementation, which behaves like "[ahlp]". Another, for  
 127520 alignment with the *tr* utility, is to treat it like "[[:alpha:]]". And finally, the standard allows  
 127521 rejecting the regular expression as invalid, as a means of alerting a user to the non-portable  
 127522 aspect of that regular expression. The set of regular expressions with this undefined behavior is  
 127523 limited solely to the expressions where the outer '[' and ']' of the bracket expression can be  
 127524 confused with the missing bracket pair '[' and ']' necessary to form a collating symbol,  
 127525 equivalence class, or character class; thus "[\_alpha:]" or "[::]" do not trigger the  
 127526 unspecified behavior.

127527 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0044 [938], XBD/TC2-2008/0045 [872],  
 127528 XBD/TC2-2008/0046 [938], XBD/TC2-2008/0047 [584], and XBD/TC2-2008/0048 [584] are  
 127529 applied.

127530 Austin Group Defect 948 is applied, requiring that an ordinary character in a matching list only  
 127531 matches that character.

127532 Austin Group Defect 1190 is applied, clarifying which characters lose their special meaning  
 127533 inside a bracket expression.

127534 Austin Group Defect 1288 is applied, changing "rejected as an error" to "treated as an invalid  
 127535 bracket expression".

#### 127536 A.9.3.6 BREs Matching Multiple Characters

127537 The limit of nine back-references to subexpressions in the RE is based on the use of a single-digit  
 127538 identifier; increasing this to multiple digits would break historical applications. This does not  
 127539 imply that only nine subexpressions are allowed in REs. The following is a valid BRE with ten  
 127540 subexpressions:

```
127541 \ (\ ( (ab\)*c\)*d\)\ (e\)\* \ (gh\)\{2\}\ (ij\)* \ (kl\)* \ (mn\)* \ (op\)* \ (qr\)*
```

127542 The standard developers regarded the common historical behavior, which supported "\n\*", but  
 127543 not "\n{min,max}", "\(...)\*", or "\(...)\{min,max\}", as a non-intentional

- 127544 result of a specific implementation, and they supported both duplication and interval  
127545 expressions following subexpressions and back-references.
- 127546 The changes to the processing of the back-reference expression remove an unspecified or  
127547 ambiguous behavior in the Shell and Utilities volume of POSIX.1-2024, aligning it with the  
127548 requirements specified for the *regcomp()* expression, and is the result of PASC Interpretation  
127549 1003.2-92 #43 submitted for the ISO POSIX-2: 1993 standard.
- 127550 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0049 [595] is applied.
- 127551 *A.9.3.7 BRE Precedence*
- 127552 There is no additional rationale provided for this section.
- 127553 *A.9.3.8 BRE Expression Anchoring*
- 127554 Often, the <dollar-sign> is viewed as matching the ending <newline> in text files. This is not  
127555 strictly true; the <newline> is typically eliminated from the strings to be matched, and the  
127556 <dollar-sign> matches the terminating null character.
- 127557 The ability of '^', '\$', and '\*' to be non-special in certain circumstances may be confusing to  
127558 some programmers, but this situation was changed only in a minor way from historical practice  
127559 to avoid breaking many historical scripts. Some consideration was given to making the use of  
127560 the anchoring characters undefined if not escaped and not at the beginning or end of strings.  
127561 This would cause a number of historical BREs, such as "2^10", "\$HOME", and "\$1.35", that  
127562 relied on the characters being treated literally, to become invalid.
- 127563 However, one relatively uncommon case was changed to allow an extension used on some  
127564 implementations. Historically, the BREs "^foo" and "\(^foo\)" did not match the same  
127565 string, despite the general rule that subexpressions and entire BREs match the same strings. To  
127566 increase consensus, POSIX.1-2024 has allowed an extension on some implementations to treat  
127567 these two cases in the same way by declaring that anchoring *may* occur at the beginning or end  
127568 of a subexpression. Therefore, portable BREs that require a literal <circumflex> at the beginning  
127569 or a <dollar-sign> at the end of a subexpression must escape them. Note that a BRE such as  
127570 "a\(^bc\)" will either match "a^bc" or nothing on different systems under the rules.
- 127571 ERE anchoring has been different from BRE anchoring in all historical systems. An unescaped  
127572 anchor character has never matched its literal counterpart outside a bracket expression. Some  
127573 implementations treated "foo\$bar" as a valid expression that never matched anything; others  
127574 treated it as invalid. POSIX.1-2024 mandates the former, valid unmatched behavior.
- 127575 Some implementations have extended the BRE syntax to add alternation. For example, the  
127576 subexpression "\ (foo\$ | bar\)" would match either "foo" at the end of the string or "bar"  
127577 anywhere. The extension is triggered by the use of the undefined "\|" sequence. Because the  
127578 BRE is undefined for portable scripts, the extending system is free to make other assumptions,  
127579 such that the '\$' represents the end-of-line anchor in the middle of a subexpression. If it were  
127580 not for the extension, the '\$' would match a literal <dollar-sign> under the rules.
- 127581 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0049 [595] is applied.
- 127582 Austin Group Defect 1546 is applied, adding optional support for "\?", "\+", and "\|".
- 127583 Austin Group Defect 1579 is applied, eliminating an inconsistency between the list items relating  
127584 to <circumflex> and <dollar-sign>.

127585 **A.9.4 Extended Regular Expressions**

127586 As with BREs, the standard developers decided to make the interpretation of escaped ordinary  
127587 characters undefined.

127588 The <right-parenthesis> is not listed as an ERE special character because it is only special in the  
127589 context of a preceding <left-parenthesis>. If found without a preceding <left-parenthesis>, the  
127590 <right-parenthesis> has no special meaning.

127591 The interval expression, " $\{m, n\}$ ", has been added to EREs. Historically, the interval expression  
127592 has only been supported in some ERE implementations. The standard developers estimated that  
127593 the addition of interval expressions to EREs would not decrease consensus and would also make  
127594 BREs more of a subset of EREs than in many historical implementations.

127595 It was suggested that, in addition to interval expressions, back-references (' $\backslash n$ ') should also be  
127596 added to EREs. This was rejected by the standard developers as likely to decrease consensus.

127597 In historical implementations, multiple duplication symbols are usually interpreted from left to  
127598 right and treated as additive. As an example, " $a^*b$ " matches zero or more instances of 'a'  
127599 followed by a 'b'. In POSIX.1-2024, multiple duplication symbols are undefined; that is, they  
127600 cannot be relied upon for conforming applications. One reason for this is to provide some scope  
127601 for future enhancements.

127602 The precedence of operations differs between EREs and those in *lex*; in *lex*, for historical reasons,  
127603 interval expressions have a lower precedence than concatenation.

127604 Austin Group Defect 1139 is applied, making minor editorial changes to several subsections of  
127605 this section and changing them to require that, when not inside a bracket expression, " $\backslash ]$ "  
127606 matches ']' and " $\backslash }$ " matches '}'.

127607 *A.9.4.1 EREs Matching a Single Character or Collating Element*

127608 There is no additional rationale provided for this section.

127609 *A.9.4.2 ERE Ordinary Characters*

127610 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0050 [554] is applied.

127611 *A.9.4.3 ERE Special Characters*

127612 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0050 [554] is applied.

127613 *A.9.4.4 Periods in EREs*

127614 There is no additional rationale provided for this section.

127615 *A.9.4.5 ERE Bracket Expression*

127616 There is no additional rationale provided for this section.

127617 A.9.4.6 EREs Matching Multiple Characters

127618 Austin Group Defects 793 and 1329 are applied, adding the repetition modifier '?' and the  
127619 REG\_MINIMAL flag.

127620 A.9.4.7 ERE Alternation

127621 There is no additional rationale provided for this section.

127622 A.9.4.8 ERE Precedence

127623 There is no additional rationale provided for this section.

127624 A.9.4.9 ERE Expression Anchoring

127625 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0051 [595] is applied.

## 127626 A.9.5 Regular Expression Grammar

127627 The grammars are intended to represent the range of acceptable syntaxes available to  
127628 conforming applications. There are instances in the text where undefined constructs are  
127629 described; as explained previously, these allow implementation extensions. There is no intended  
127630 requirement that an implementation extension must somehow fit into the grammars shown  
127631 here.

127632 The BRE grammar does not permit L\_ANCHOR or R\_ANCHOR inside "\ (" and "\ )" (which  
127633 implies that '^' and '\$' are ordinary characters). This reflects the semantic limits on the  
127634 application, as noted in XBD Section 9.3.8 (on page 186). Implementations are permitted to  
127635 extend the language to interpret '^' and '\$' as anchors in these locations, and as such,  
127636 conforming applications cannot use unescaped '^' and '\$' in positions inside "\ (" and "\ )"   
127637 that might be interpreted as anchors.

127638 The ERE grammar does not permit several constructs that XBD Section 9.4.2 (on page 187) and  
127639 Section 9.4.3 (on page 188) specify as having undefined results:

- 127640 • ORD\_CHAR preceded by <backslash>
- 127641 • ERE\_dupl\_symbol(s) appearing first in an ERE, or immediately following '|', '^', or '('
- 127642 • '{' not part of a valid ERE\_dupl\_symbol
- 127643 • '|' appearing first or last in an ERE, or immediately following '|' or '(' , or  
127644 immediately preceding ')'

127645 Implementations are permitted to extend the language to allow these. Conforming applications  
127646 cannot use such constructs.

127647 A.9.5.1 BRE/ERE Grammar Lexical Conventions

127648 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0052 [554] is applied.

127649 Austin Group Defect 1139 is applied, updating QUOTED\_CHAR to add \] to the BRE list and  
127650 add \] and \} to the ERE list, and changing "outside bracket expressions" to "except inside  
127651 bracket expressions".

127652 Austin Group Defect 1546 is applied, adding optional support for \?, \+, and \| in BREs.

## 127653 A.9.5.2 RE and Bracket Expression Grammar

127654 The removal of the `Back_open_paren Back_close_paren` option from the `nondupl_RE` specification is  
 127655 the result of PASC Interpretation 1003.2-92 #43 submitted for the ISO POSIX-2:1993 standard.  
 127656 Although the grammar required support for null subexpressions, this section does not describe  
 127657 the meaning of, and historical practice did not support, this construct.

127658 Austin Group Defect 1546 is applied, adding optional support for `\?`, `\+`, and `\|` in BREs.

## 127659 A.9.5.3 ERE Grammar

127660 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0052 [554] and XBD/TC2-2008/0053  
 127661 [916] are applied.

127662 **A.10 Directory Structure and Devices**127663 **A.10.1 Directory Structure and Files**

127664 A description of the historical `/usr/tmp` was omitted, removing any concept of differences in  
 127665 emphasis between the `/` and `/usr` directories. The descriptions of `/bin`, `/usr/bin`, `/lib`, and `/usr/lib`  
 127666 were omitted because they are not useful for applications. In an early draft, a distinction was  
 127667 made between system and application directory usage, but this was not found to be useful.

127668 The directories `/` and `/dev` are included because the notion of a hierarchical directory structure is  
 127669 key to other information presented elsewhere in POSIX.1-2024. In early drafts, it was argued that  
 127670 special devices and temporary files could conceivably be handled without a directory structure  
 127671 on some implementations. For example, the system could treat the characters `"/tmp"` as a  
 127672 special token that would store files using some non-POSIX file system structure. This notion was  
 127673 rejected by the standard developers, who required that all the files in this section be  
 127674 implemented via POSIX file systems.

127675 The `/tmp` directory is retained in POSIX.1-2024 to accommodate historical applications that  
 127676 assume its availability. Implementations are encouraged to provide suitable directory names in  
 127677 the environment variable `TMPDIR` and applications are encouraged to use the contents of  
 127678 `TMPDIR` for creating temporary files.

127679 The standard files `/dev/null` and `/dev/tty` are required to be both readable and writable to allow  
 127680 applications to have the intended historical access to these files.

127681 The standard file `/dev/console` has been added for alignment with the Single UNIX  
 127682 Specification.

127683 **A.10.2 Output Devices and Terminal Types**

127684 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/17 is applied, making it clear that the  
 127685 requirements for documenting terminal support are in the system documentation.

127686 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0054 [967] is applied.

## 127687 A.11 General Terminal Interface

127688 If the implementation does not support this interface on any device types, it should behave as if  
 127689 it were being used on a device that is not a terminal device (in most cases *errno* will be set to  
 127690 [ENOTTY] on return from functions defined by this interface). This is based on the fact that  
 127691 many applications are written to run both interactively and in some non-interactive mode, and  
 127692 they adapt themselves at runtime. Requiring that they all be modified to test an environment  
 127693 variable to determine whether they should try to adapt is unnecessary. On a system that  
 127694 provides no general terminal interface, providing all the entry points as stubs that return  
 127695 [ENOTTY] (or an equivalent, as appropriate) has the same effect and requires no changes to the  
 127696 application.

127697 Although the needs of both interface implementors and application developers were addressed  
 127698 throughout POSIX.1-2024, this section pays more attention to the needs of the latter. This is  
 127699 because, while many aspects of the programming interface can be hidden from the user by the  
 127700 application developer, the terminal interface is usually a large part of the user interface.  
 127701 Although to some extent the application developer can build missing features or work around  
 127702 inappropriate ones, the difficulties of doing that are greater in the terminal interface than  
 127703 elsewhere. For example, efficiency prohibits the average program from interpreting every  
 127704 character passing through it in order to simulate character erase, line kill, and so on. These  
 127705 functions should usually be done by the operating system, possibly at the interrupt level.

127706 The *tc\**() functions were introduced as a way of avoiding the problems inherent in the  
 127707 traditional *ioctl*() function and in variants of it that were proposed. For example, *tcsetattr*() is  
 127708 specified in place of the use of the TCSETA *ioctl*() command function. This allows specification  
 127709 of all the arguments in a manner consistent with the ISO C standard unlike the varying third  
 127710 argument of *ioctl*(), which is sometimes a pointer (to any of many different types) and  
 127711 sometimes an **int**.

127712 The advantages of this new method include:

- 127713 • It allows strict type checking.
- 127714 • The direction of transfer of control data is explicit.
- 127715 • Portable capabilities are clearly identified.
- 127716 • The need for a general interface routine is avoided.
- 127717 • Size of the argument is well-defined (there is only one type).

127718 The disadvantages include:

- 127719 • No historical implementation used the new method.
- 127720 • There are many small routines instead of one general-purpose one.
- 127721 • The historical parallel with *fcntl*() is broken.

127722 The issue of modem control was excluded from POSIX.1-2024 on the grounds that:

- 127723 • It was concerned with setting and control of hardware timers.
- 127724 • The appropriate timers and settings vary widely internationally.
- 127725 • Feedback from European computer manufacturers indicated that this facility was not  
 127726 consistent with European needs and that specification of such a facility was not a  
 127727 requirement for portability.

127728 **A.11.1 Interface Characteristics**127729 *A.11.1.1 Opening a Terminal Device File*

127730 The `O_TTY_INIT` flag for `open()` has been added to POSIX.1-2024 to solve a problem  
 127731 encountered by applications written for earlier versions of this standard which need to open a  
 127732 modem or similar device and initialize all of the parameter settings. Using the  
 127733 `tcgetattr()-modify-tcsetattr()` method mandated by the standard could result in non-conforming  
 127734 behavior if the device had previously been used with non-conforming parameter settings, on  
 127735 implementations which do not reset the parameter settings in between the last close of the  
 127736 device by one application and the first open by another application. To avoid this problem, some  
 127737 application developers were resorting to using `memset()` to zero the **termios** structure before  
 127738 setting all of the standard parameters, but this risks non-conforming behavior on systems where  
 127739 some non-standard parameter needs a non-zero value in order for the terminal to behave in a  
 127740 conforming manner.

127741 On systems which do reset the parameter settings to defaults between uses of a terminal device,  
 127742 it is expected that either `O_TTY_INIT` will have the value zero or `open(ttypath,  
 127743 O_RDWR|O_TTY_INIT)` will do nothing additional.

127744 The standard developers considered an alternative solution of a special *fildev* argument for the  
 127745 `tcgetattr()` call to obtain default parameters. However, this would not be adequate if a system  
 127746 supports several different types of terminal device and the default settings need to differ  
 127747 between the different types. With the `O_TTY_INIT` open flag, the implementor can determine  
 127748 which device type is being opened.

127749 The standard developers also considered a special `POSIX_TTY_INIT` value for the **termios**  
 127750 structure used in `tcsetattr()`, which would reset the values if used immediately after an `open()`  
 127751 call. However, it was felt that this would lead to confusion amongst application developers who  
 127752 wanted to reset the parameters at other points, and implementations might diverge.

127753 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
 127754 devices.

127755 *A.11.1.2 Process Groups*

127756 There is a potential race when the members of the foreground process group on a terminal leave  
 127757 that process group, either by exit or by changing process groups. After the last process exits the  
 127758 process group, but before the foreground process group ID of the terminal is changed (usually  
 127759 by a job control shell), it would be possible for a new process to be created with its process ID  
 127760 equal to the terminal's foreground process group ID. That process might then become the  
 127761 process group leader and accidentally be placed into the foreground on a terminal that was not  
 127762 necessarily its controlling terminal. As a result of this problem, the controlling terminal is  
 127763 defined to not have a foreground process group during this time.

127764 The cases where a controlling terminal has no foreground process group occur when all  
 127765 processes in the foreground process group either terminate and are waited for or join other  
 127766 process groups via `setpgid()` or `setsid()`. If the process group leader terminates, this is the first  
 127767 case described; if it leaves the process group via `setpgid()`, this is the second case described (a  
 127768 process group leader cannot successfully call `setsid()`). When one of those cases causes a  
 127769 controlling terminal to have no foreground process group, it has two visible effects on  
 127770 applications. The first is the value returned by `tcgetpgrp()`. The second (which occurs only in the  
 127771 case where the process group leader terminates) is the sending of signals in response to special

127772 input characters. The intent of POSIX.1-2024 is that no process group be wrongly identified as  
 127773 the foreground process group by *tcgetpgrp()* or unintentionally receive signals because of  
 127774 placement into the foreground.

127775 In 4.3 BSD, the old process group ID continues to be used to identify the foreground process  
 127776 group and is returned by the function equivalent to *tcgetpgrp()*. In that implementation it is  
 127777 possible for a newly created process to be assigned the same value as a process ID and then form  
 127778 a new process group with the same value as a process group ID. The result is that the new  
 127779 process group would receive signals from this terminal for no apparent reason, and  
 127780 POSIX.1-2024 precludes this by forbidding a process group from entering the foreground in this  
 127781 way. It would be more direct to place part of the requirement made by the last sentence under  
 127782 *fork()*, but there is no convenient way for that section to refer to the value that *tcgetpgrp()*  
 127783 returns, since in this case there is no process group and thus no process group ID.

127784 One possibility for a conforming implementation is to behave similarly to 4.3 BSD, but to  
 127785 prevent this reuse of the ID, probably in the implementation of *fork()*, as long as it is in use by  
 127786 the terminal.

127787 Another possibility is to recognize when the last process stops using the terminal's foreground  
 127788 process group ID, which is when the process group lifetime ends, and to change the terminal's  
 127789 foreground process group ID to a reserved value that is never used as a process ID or process  
 127790 group ID. (See the definition of *process group lifetime* in the definitions section.) The process ID  
 127791 can then be reserved until the terminal has another foreground process group.

127792 The 4.3 BSD implementation permits the leader (and only member) of the foreground process  
 127793 group to leave the process group by calling the equivalent of *setpgid()* and to later return,  
 127794 expecting to return to the foreground. There are no known application needs for this behavior,  
 127795 and POSIX.1-2024 neither requires nor forbids it (except that it is forbidden for session leaders)  
 127796 by leaving it unspecified.

#### 127797 A.11.1.3 The Controlling Terminal

127798 POSIX.1-2024 does not specify a mechanism by which to allocate a controlling terminal. This is  
 127799 normally done by a system utility (such as *getty*) and is considered an administrative feature  
 127800 outside the scope of POSIX.1-2024.

127801 Historical implementations allocate controlling terminals on certain *open()* calls. Since *open()* is  
 127802 part of POSIX.1, its behavior had to be dealt with. The traditional behavior is not required  
 127803 because it is not very straightforward or flexible for either implementations or applications.  
 127804 However, because of its prevalence, it was not practical to disallow this behavior either. Thus, a  
 127805 mechanism was standardized to ensure portable, predictable behavior in *open()*.

127806 Some historical implementations deallocate a controlling terminal on the last system-wide close.  
 127807 This behavior is neither required nor prohibited. Even on implementations that do provide this  
 127808 behavior, applications generally cannot depend on it due to its system-wide nature.

#### 127809 A.11.1.4 Terminal Access Control

127810 The access controls described in this section apply only to a process that is accessing its  
 127811 controlling terminal. A process accessing a terminal that is not its controlling terminal is  
 127812 effectively treated the same as a member of the foreground process group. While this may seem  
 127813 unintuitive, note that these controls are for the purpose of job control, not security, and job  
 127814 control relates only to the controlling terminal of a process. Normal file access permissions  
 127815 handle security.

127816 If the process calling *read()* or *write()* is in a background process group that is orphaned, it is not

127817 desirable to stop the process group, as it is no longer under the control of a job control shell that  
 127818 could put it into the foreground again. Accordingly, calls to *read()* or *write()* functions by such  
 127819 processes receive an immediate error return. This is different from 4.2 BSD, which kills orphaned  
 127820 processes that receive terminal stop signals.

127821 The foreground/background/orphaned process group check performed by the terminal driver  
 127822 must be repeatedly performed until the calling process moves into the foreground or until the  
 127823 process group of the calling process becomes orphaned. That is, when the terminal driver  
 127824 determines that the calling process is in the background and should receive a job control signal,  
 127825 it sends the appropriate signal (SIGTTIN or SIGTTOU) to every process in the process group of  
 127826 the calling process and then it allows the calling process to immediately receive the signal. The  
 127827 latter is typically performed by blocking the process so that the signal is immediately noticed.  
 127828 Note, however, that after the process finishes receiving the signal and control is returned to the  
 127829 driver, the terminal driver must re-execute the foreground/background/orphaned process  
 127830 group check. The process may still be in the background, either because it was continued in the  
 127831 background by a job control shell, or because it caught the signal and did nothing.

127832 The terminal driver repeatedly performs the foreground/background/orphaned process group  
 127833 checks whenever a process is about to access the terminal. In the case of *write()* or the control  
 127834 *tc\*()* functions, the check is performed at the entry of the function. In the case of *read()*, the  
 127835 check is performed not only at the entry of the function, but also after blocking the process to  
 127836 wait for input characters (if necessary). That is, once the driver has determined that the process  
 127837 calling the *read()* function is in the foreground, it attempts to retrieve characters from the input  
 127838 queue. If the queue is empty, it blocks the process waiting for characters. When characters are  
 127839 available and control is returned to the driver, the terminal driver must return to the repeated  
 127840 foreground/background/orphaned process group check again. The process may have moved  
 127841 from the foreground to the background while it was blocked waiting for input characters.

127842 Austin Group Defect 1151 is applied, adding *tcsetwinsize()*.

#### 127843 A.11.1.5 *Input Processing and Reading Data*

127844 There is no additional rationale provided for this section.

#### 127845 A.11.1.6 *Canonical Mode Input Processing*

127846 The term “character” is intended here. ERASE should erase the last character, not the last byte.  
 127847 In the case of multi-byte characters, these two may be different.

127848 4.3 BSD has a WERASE character that erases the last “word” typed (but not any preceding  
 127849 <blank> or <tab> characters). A word is defined as a sequence of non-<blank> characters, with  
 127850 <tab> characters counted as <blank> characters. Like ERASE, WERASE does not erase beyond  
 127851 the beginning of the line. This WERASE feature has not been specified in POSIX.1 because it is  
 127852 difficult to define in the international environment. It is only useful for languages where words  
 127853 are delimited by <blank> characters. In some ideographic languages, such as Japanese and  
 127854 Chinese, words are not delimited at all. The WERASE character should presumably go back to  
 127855 the beginning of a sentence in those cases; practically, this means it would not be used much for  
 127856 those languages.

127857 It should be noted that there is a possible inherent deadlock if the application and  
 127858 implementation conflict on the value of {MAX\_CANON}. With ICANON set (if IXOFF is  
 127859 enabled) and more than {MAX\_CANON} characters transmitted without a <linefeed>,  
 127860 transmission will be stopped, the <linefeed> (or <carriage-return> when ICRLF is set) will never  
 127861 arrive, and the *read()* will never be satisfied.

127862 An application should not set IXOFF if it is using canonical mode unless it knows that (even in  
 127863 the face of a transmission error) the conditions described previously cannot be met or unless it is  
 127864 prepared to deal with the possible deadlock in some other way, such as timeouts.

127865 It should also be noted that this can be made to happen in non-canonical mode if the trigger  
 127866 value for sending IXOFF is less than VMIN and VTIME is zero.

#### 127867 A.11.1.7 Non-Canonical Mode Input Processing

127868 Some points to note about MIN and TIME:

- 127869 1. The interactions of MIN and TIME are not symmetric. For example, when MIN>0 and  
 127870 TIME=0, TIME has no effect. However, in the opposite case where MIN=0 and TIME>0,  
 127871 both MIN and TIME play a role in that MIN is satisfied with the receipt of a single  
 127872 character.
- 127873 2. Also note that in case A (MIN>0, TIME>0), TIME represents an inter-character timer,  
 127874 while in case C (MIN=0, TIME>0), TIME represents a read timer.

127875 These two points highlight the dual purpose of the MIN/TIME feature. Cases A and B, where  
 127876 MIN>0, exist to handle burst-mode activity (for example, file transfer programs) where a  
 127877 program would like to process at least MIN characters at a time. In case A, the inter-character  
 127878 timer is activated by a user as a safety measure; in case B, it is turned off.

127879 Cases C and D exist to handle single-character timed transfers. These cases are readily adaptable  
 127880 to screen-based applications that need to know if a character is present in the input queue before  
 127881 refreshing the screen. In case C, the read is timed; in case D, it is not.

127882 Another important note is that MIN is always just a minimum. It does not denote a record  
 127883 length. That is, if a program does a read of 20 bytes, MIN is 10, and 25 characters are present, 20  
 127884 characters are returned to the user. In the special case of MIN=0, this still applies: if more than  
 127885 one character is available, they all will be returned immediately.

#### 127886 A.11.1.8 Writing Data and Output Processing

127887 There is no additional rationale provided for this section.

#### 127888 A.11.1.9 Special Characters

127889 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0055 [745] is applied.

#### 127890 A.11.1.10 Modem Disconnect

127891 There is no additional rationale provided for this section.

#### 127892 A.11.1.11 Closing a Terminal Device File

127893 POSIX.1-2024 does not specify that a *close()* on a terminal device file include the equivalent of a  
 127894 call to *tcflow(fd,TCOON)*.

127895 An implementation that discards output at the time *close()* is called after reporting the return  
 127896 value to the *write()* call that data was written does not conform with POSIX.1-2024. An  
 127897 application has functions such as *tcdrain()*, *tcflush()*, and *tcflow()* available to obtain the detailed  
 127898 behavior it requires with respect to flushing of output.

127899 At the time of the last close on a terminal device, an application relinquishes any ability to exert

127900 flow control via *tcflow()*.

## 127901 A.11.2 Parameters that Can be Set

### 127902 A.11.2.1 *The termios Structure*

127903 This structure is part of an interface that, in general, retains the historic grouping of flags.  
127904 Although a more optimal structure for implementations may be possible, the degree of change  
127905 to applications would be significantly larger.

### 127906 A.11.2.2 *Input Modes*

127907 Some historical implementations treated a long break as multiple events, as many as one per  
127908 character time. The wording in POSIX.1 explicitly prohibits this.

127909 Although the ISTRIP flag is normally superfluous with today's terminal hardware and software,  
127910 it is historically supported. Therefore, applications may be using ISTRIP, and there is no  
127911 technical problem with supporting this flag. Also, applications may wish to receive only 7-bit  
127912 input bytes and may not be connected directly to the hardware terminal device (for example,  
127913 when a connection traverses a network).

127914 Also, there is no requirement in general that the terminal device ensures that high-order bits  
127915 beyond the specified character size are cleared. ISTRIP provides this function for 7-bit  
127916 characters, which are common.

127917 In dealing with multi-byte characters, the consequences of a parity error in such a character, or  
127918 in an escape sequence affecting the current character set, are beyond the scope of POSIX.1 and  
127919 are best dealt with by the application processing the multi-byte characters.

### 127920 A.11.2.3 *Output Modes*

127921 POSIX.1 does not describe post-processing of output to a terminal or detailed control of that  
127922 from a conforming application. (That is, translation of <newline> to <carriage-return> followed  
127923 by <linefeed> or <tab> processing.) There is nothing that a conforming application should do to  
127924 its output for a terminal because that would require knowledge of the operation of the terminal.  
127925 It is the responsibility of the operating system to provide post-processing appropriate to the  
127926 output device, whether it is a terminal or some other type of device.

127927 Extensions to POSIX.1 to control the type of post-processing already exist and are expected to  
127928 continue into the future. The control of these features is primarily to adjust the interface between  
127929 the system and the terminal device so the output appears on the display correctly. This should  
127930 be set up before use by any application.

127931 In general, both the input and output modes should not be set absolutely, but rather modified  
127932 from the inherited state.

127933 A.11.2.4 *Control Modes*

127934 This section could be misread that the symbol ``CSIZE'' is a title in the **termios** *c\_flag* field.  
 127935 Although it does serve that function, it is also a required symbol, as a literal reading of POSIX.1  
 127936 (and the caveats about typography) would indicate.

127937 A.11.2.5 *Local Modes*

127938 Non-canonical mode is provided to allow fast bursts of input to be read efficiently while still  
 127939 allowing single-character input.

127940 The ECHONL function historically has been in many implementations. Since there seems to be  
 127941 no technical problem with supporting ECHONL, it is included in POSIX.1 to increase consensus.

127942 The alternate behavior possible when ECHOK or ECHOE are specified with ICANON is  
 127943 permitted as a compromise depending on what the actual terminal hardware can do. Erasing  
 127944 characters and lines is preferred, but is not always possible.

127945 A.11.2.6 *Special Control Characters*

127946 Permitting VMIN and VTIME to overlap with VEOF and VEOL was a compromise for historical  
 127947 implementations. Only when backwards-compatibility of object code is a serious concern to an  
 127948 implementor should an implementation continue this practice. Correct applications that work  
 127949 with the overlap (at the source level) should also work if it is not present, but not the reverse.

127950 **A.12 Utility Conventions**127951 **A.12.1 Utility Argument Syntax**

127952 The standard developers considered that recent trends toward diluting the SYNOPSIS sections  
 127953 of historical reference pages to the equivalent of:

127954 `command [options] [operands]`

127955 were a disservice to the reader. Therefore, considerable effort was placed into rigorous  
 127956 definitions of all the command line arguments and their interrelationships. The relationships  
 127957 depicted in the synopses are normative parts of POSIX.1-2024; this information is sometimes  
 127958 repeated in textual form, but that is only for clarity within context.

127959 The use of ``undefined'' for conflicting argument usage and for repeated usage of the same  
 127960 option is meant to prevent conforming applications from using conflicting arguments or  
 127961 repeated options unless specifically allowed (as is the case with *ls*, which allows simultaneous,  
 127962 repeated use of the *-C*, *-l*, and *-1* options). Many historical implementations will tolerate this  
 127963 usage, choosing either the first or the last applicable argument. This tolerance can continue, but  
 127964 conforming applications cannot rely upon it. (Other implementations may choose to print usage  
 127965 messages instead.)

127966 The use of ``undefined'' for conflicting argument usage also allows an implementation to make  
 127967 reasonable extensions to utilities where the implementor considers mutually-exclusive options  
 127968 according to POSIX.1-2024 to have a sensible meaning and result.

127969 POSIX.1-2024 does not define the result of a command when an option-argument or operand is  
 127970 not followed by ellipses and the application specifies more than one of that option-argument or

127971 operand. This allows an implementation to define valid (although non-standard) behavior for  
 127972 the utility when more than one such option or operand is specified.

127973 The requirements for option-arguments are summarized as follows:

|                                      | SYNOPSIS Shows:                 |                      |
|--------------------------------------|---------------------------------|----------------------|
|                                      | -a <i>arg</i>                   | -c [ <i>arg</i> ]    |
| Conforming application uses:         | -a <i>arg</i>                   | -c <i>arg</i> or -c  |
| System supports:                     | -a <i>arg</i> and -a <i>arg</i> | -c <i>arg</i> and -c |
| Non-conforming applications may use: | -a <i>arg</i>                   | N/A                  |

127979 Earlier versions of this standard included obsolescent syntax which showed some options with  
 127980 (mandatory) adjacent option-arguments in the SYNOPSIS for some utilities. These have since  
 127981 been removed. For all options with mandatory option-arguments, the SYNOPSIS now shows  
 127982 <blank> characters between the option and the option-argument; however, historical usage has  
 127983 not been consistent in this area; therefore, <blank> characters are required to be used by  
 127984 conforming applications and to be handled by all implementations, but implementations are  
 127985 also required to handle an adjacent option-argument in order to preserve backwards-  
 127986 compatibility for old scripts. One of the justifications for selecting the multiple-argument  
 127987 method was that the single-argument case is inherently ambiguous when the option-argument  
 127988 can legitimately be a null string.

127989 POSIX.1-2024 explicitly states that digits are permitted as operands and option-arguments. The  
 127990 lower and upper bounds for the values of the numbers used for operands and option-arguments  
 127991 were derived from the ISO C standard values for {LONG\_MIN} and {LONG\_MAX}. The  
 127992 requirement on the standard utilities is that numbers in the specified range do not cause a  
 127993 syntax error, although the specification of a number need not be semantically correct for a  
 127994 particular operand or option-argument of a utility. For example, the specification of:

127995 `dd obs=3000000000`

127996 would yield undefined behavior for the application and could be a syntax error because the  
 127997 number 3 000 000 000 is outside of the range -2 147 483 647 to +2 147 483 647. On the other hand:

127998 `dd obs=2000000000`

127999 may cause some error, such as “blocksize too large”, rather than a syntax error.

128000 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0056 [584] and XBD/TC2-2008/0057  
 128001 [813] are applied.

128002 Austin Group Defect 1062 is applied, correcting the spacing in some example SYNOPSIS lines.

## 128003 A.12.2 Utility Syntax Guidelines

128004 This section is based on the rules listed in the SVID. It was included for two reasons:

- 128005 1. The individual utility descriptions in XCU [Chapter 3](#) (on page 2573) needed a set of  
 128006 common (although not universal) actions on which they could anchor their descriptions  
 128007 of option and operand syntax. Most of the standard utilities actually do use these  
 128008 guidelines, and many of their historical implementations use the *getopt()* function for  
 128009 their parsing. Therefore, it was simpler to cite the rules and merely identify exceptions.
- 128010 2. Developers of conforming applications need suggested guidelines if the POSIX  
 128011 community is to avoid the chaos of historical UNIX system command syntax.

128012 It is recommended that all *future* utilities and applications use these guidelines to enhance “user

128013 portability". The fact that some historical utilities could not be changed (to avoid breaking  
128014 historical applications) should not deter this future goal.

128015 The voluntary nature of the guidelines is highlighted by repeated uses of the word *should*  
128016 throughout. This usage should not be misinterpreted to imply that utilities that claim  
128017 conformance in their OPTIONS sections do not always conform.

128018 Guidelines 1 and 2 encourage utility writers to use only characters from the portable character  
128019 set because use of locale-specific characters may make the utility inaccessible from other locales.  
128020 Use of uppercase letters is discouraged due to problems associated with porting utilities to  
128021 systems that do not distinguish between uppercase and lowercase characters in filenames. Use  
128022 of non-alphanumeric characters is discouraged due to the number of utilities that treat non-  
128023 alphanumeric characters in "special" ways depending on context (such as the shell using white-  
128024 space characters to delimit arguments, various quote characters for quoting, the <dollar-sign> to  
128025 introduce variable expansion, etc.).

128026 In XCU Section 2.9.1 (on page 2500), it is further stated that a command used in the Shell  
128027 Command Language cannot be named with a trailing <colon>.

128028 Guideline 3 was changed to allow alphanumeric characters (letters and digits) from the  
128029 character set to allow compatibility with historical usage. Historical practice allows the use of  
128030 digits wherever practical, and there are no portability issues that would prohibit the use of  
128031 digits. In fact, from an internationalization viewpoint, digits (being non-language-dependent)  
128032 are preferable over letters (a -2 is intuitively self-explanatory to any user, while in the -f filename  
128033 the letter 'f' is a mnemonic aid only to speakers of Latin-based languages where "filename"  
128034 happens to translate to a word that begins with 'f'). Since Guideline 3 still retains the word  
128035 "single", multi-digit options are not allowed. Instances of historical utilities that used them have  
128036 been marked obsolescent, with the numbers being changed from option names to option-  
128037 arguments.

128038 It was difficult to achieve a satisfactory solution to the problem of name space in option  
128039 characters. When the standard developers desired to extend the historical *cc* utility to accept  
128040 ISO C standard programs, they found that all of the portable alphabet was already in use by  
128041 various vendors. Thus, they had to devise a new name, *c89* (subsequently superseded by *c99*  
128042 and now by *c17*), rather than something like *cc -X*. There were suggestions that implementors  
128043 be restricted to providing extensions through various means (such as using a <plus-sign> as the  
128044 option delimiter or using option characters outside the alphanumeric set) that would reserve all  
128045 of the remaining alphanumeric characters for future POSIX standards. These approaches were  
128046 resisted because they lacked the historical style of UNIX systems. Furthermore, if a vendor-  
128047 provided option should become commonly used in the industry, it would be a candidate for  
128048 standardization. It would be desirable to standardize such a feature using historical practice for  
128049 the syntax (the semantics can be standardized with any syntax). This would not be possible if  
128050 the syntax was one reserved for the vendor. However, since the standardization process may  
128051 lead to minor changes in the semantics, it may prove to be better for a vendor to use a syntax  
128052 that will not be affected by standardization.

128053 Guideline 8 includes the concept of <comma>-separated lists in a single argument. It is up to the  
128054 utility to parse such a list itself because *getopt()* just returns the single string. This situation was  
128055 retained so that certain historical utilities would not violate the guidelines. Applications  
128056 preparing for international use should be aware of an occasional problem with  
128057 <comma>-separated lists: in some locales, the <comma> is used as the radix character. Thus, if  
128058 an application is preparing operands for a utility that expects a <comma>-separated list, it  
128059 should avoid generating non-integer values through one of the means that is influenced by  
128060 setting the *LC\_NUMERIC* variable (such as *awk*, *bc*, *printf*, or *printf()*).

128061 Unless explicitly stated otherwise in the utility description, Guideline 9 requires applications to

128062 put options before operands, and requires utilities to accept any such usage without  
 128063 misinterpreting operands as options. For example, if an implementation of the *printf* utility  
 128064 supports a *-e* option as an extension, the command:

```
128065 printf %s -e
```

128066 must output the string "-e" without interpreting the *-e* as an option. Similarly, the command:

```
128067 ls myfile -l
```

128068 must interpret the *-l* argument as a second file operand, not as a *-l* option.

128069 Applications calling any utility with a first operand starting with '-' should usually specify *--*,  
 128070 as indicated by Guideline 10, to mark the end of the options. This is true even if the SYNOPSIS  
 128071 in the Shell and Utilities volume of POSIX.1-2024 does not specify any options; implementations  
 128072 may provide options as extensions to the Shell and Utilities volume of POSIX.1-2024. The  
 128073 standard utilities that do not support Guideline 10 indicate that fact in the OPTIONS section of  
 128074 the utility description.

128075 Guideline 7 allows any string to be an option-argument; an option-argument can begin with any  
 128076 character, can be *-* or *--*, and can be an empty string. For example, the commands *pr -h -*, *pr -h*  
 128077 *--*, *pr -h -d*, *pr -h +2*, and *pr -h ''* contain the option-arguments *-*, *--*, *-d*, *+2*, and an empty  
 128078 string, respectively. Conversely, the command *pr -h -- -d* treats *-d* as an option, not as an  
 128079 argument, because the *—* is an option-argument here, not a delimiter.

128080 Guideline 11 was modified to clarify that the order of different options should not matter  
 128081 relative to one another. However, the order of repeated options that also have option-arguments  
 128082 may be significant; therefore, such options are required to be interpreted in the order that they  
 128083 are specified. The *make* utility is an instance of a historical utility that uses repeated options in  
 128084 which the order is significant. Multiple files are specified by giving multiple instances of the *-f*  
 128085 option; for example:

```
128086 make -f common_header -f specific_rules target
```

128087 Guideline 13 does not imply that all of the standard utilities automatically accept the operand  
 128088 '-' to mean standard input or output, nor does it specify the actions of the utility upon  
 128089 encountering multiple '-' operands. It simply says that, by default, '-' operands are not used  
 128090 for other purposes in the file reading or writing (but not when using *stat()*, *unlink()*, *touch*, and  
 128091 so on) utilities. In earlier versions of this standard, all information concerning actual treatment of  
 128092 the '-' operand is found in the individual utility sections. Many implementations, however,  
 128093 treated '-' as standard input or output and many applications depended on this behavior even  
 128094 though it was not standard. This behavior is now implementation-defined. Portable applications  
 128095 should not use '-' to mean standard input or output unless it is explicitly stated to do so in the  
 128096 utility description and they should always use './-' if they intend to refer to a file named *-* in  
 128097 the current working directory.

128098 Guideline 14 is intended to prohibit implementations that would treat the command *ls -l -d* as if  
 128099 it were *ls -- -l -d* or *ls -l -- -d*.

128100 The standard permits implementations to have extensions that violate the Utility Syntax  
 128101 Guidelines so long as when the utility is used in line with the forms defined by the standard it  
 128102 follows the Utility Syntax Guidelines. Thus, *head-42file* and *ls--help* are permitted extensions.  
 128103 The intent is to allow extensions so long as the standard form is accepted and follows the  
 128104 guidelines.

128105 An area of concern was that as implementations mature, implementation-defined utilities and  
 128106 implementation-defined utility options will result. The idea was expressed that there needed to  
 128107 be a standard way, say an environment variable or some such mechanism, to identify  
 128108 implementation-defined utilities separately from standard utilities that may have the same

128109 name. It was decided that there already exist several ways of dealing with this situation and that  
 128110 it is outside of the scope to attempt to standardize in the area of non-standard items. A method  
 128111 that exists on some historical implementations is the use of the so-called **/local/bin** or  
 128112 **/usr/local/bin** directory to separate local or additional copies or versions of utilities. Another  
 128113 method that is also used is to isolate utilities into completely separate domains. Still another  
 128114 method to ensure that the desired utility is being used is to request the utility by its full  
 128115 pathname. There are many approaches to this situation; the examples given above serve to  
 128116 illustrate that there is more than one.

## 128117 **A.13 Namespace and Future Directions**

128118 **A.14** Austin Group Defect 1071 is applied, adding this chapter.

## **Headers**

### 128119 **A.14.1 Format of Entries**

128120 Each header reference page has a common layout of sections describing the interface. This  
 128121 layout is similar to the manual page or “man” page format shipped with most UNIX systems,  
 128122 and each header has sections describing the SYNOPSIS and DESCRIPTION. These are the two  
 128123 sections that relate to conformance.

128124 Additional sections are informative, and add considerable information for the application  
 128125 developer. APPLICATION USAGE sections provide additional caveats, issues, and  
 128126 recommendations to the developer. RATIONALE sections give additional information on the  
 128127 decisions made in defining the interface.

128128 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 128129 the future, and often cautions the developer to architect the code to account for a change in this  
 128130 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 128131 feature or interface in the future.

128132 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
 128133 changed.

128134 Option labels and margin markings in the page can be useful in guiding the application  
 128135 developer.

### 128136 **A.14.2 Removed Headers in Issue 8**

128137 The headers removed in Issue 8 (from the Issue 7 base document) are as follows:

128138

128139

128140

| Removed Headers in Issue 8 |           |
|----------------------------|-----------|
| <stropts.h>                | <trace.h> |
| <ulimit.h>                 | <utime.h> |

# Rationale for System Interfaces

## 128148 **B.1 Introduction**

### 128149 **B.1.1 Change History**

128150 The change history is provided as an informative section, to track changes from earlier versions  
128151 of this standard.

128152 The following sections describe changes made to the System Interfaces volume of POSIX.1-2024  
128153 since Issue 7 of the base document. The CHANGE HISTORY section for each entry details the  
128154 technical changes that have been made in Issue 5 and later. Changes made before Issue 5 are not  
128155 included.

#### 128156 **Changes from Issue 7 to Issue 8 (POSIX.1-2024)**

128157 The following list summarizes the major changes that were made in the System Interfaces  
128158 volume of POSIX.1-2024 from Issue 7 to Issue 8:

- 128159 • The Open Group Standard, 2021, Additional APIs for the Base Specifications Issue 8, Part 1  
128160 is incorporated.
- 128161 • The Open Group Standard, 2022, Additional APIs for the Base Specifications Issue 8, Part 2  
128162 is incorporated.
- 128163 • IEEE Std 1003.26-2003 is incorporated.
- 128164 • Existing functionality is aligned with the ISO/IEC 9899:2018 standard.
- 128165 • New functionality from the ISO/IEC 9899:2018 standard is incorporated.
- 128166 • Austin Group defect reports and IEEE Interpretations against IEEE Std 1003.1 are applied.
- 128167 • The Open Group corrigenda and resolutions are applied.
- 128168 • Features, marked obsolescent in the base document, have been considered for removal in  
128169 this version.
- 128170 • The Device Control option is added.
- 128171 • The IEC 60559 Complex Floating-Point option is added.

128172 **New Features in Issue 8**

128173 The functions first introduced in Issue 8 (over the Issue 7 base document) are as follows:

| New Functions in Issue 8 |                                                        |                                           |
|--------------------------|--------------------------------------------------------|-------------------------------------------|
| 128174                   |                                                        |                                           |
| 128175                   | <code>_Fork()</code>                                   | <code>c32rtomb()</code>                   |
| 128176                   | <code>aligned_alloc()</code>                           | <code>call_once()</code>                  |
| 128177                   | <code>at_quick_exit()</code>                           | <code>cnd_broadcast()</code>              |
| 128178                   | <code>atomic_compare_exchange_strong()</code>          | <code>cnd_destroy()</code>                |
| 128179                   | <code>atomic_compare_exchange_strong_explicit()</code> | <code>cnd_init()</code>                   |
| 128180                   | <code>atomic_compare_exchange_weak()</code>            | <code>cnd_signal()</code>                 |
| 128181                   | <code>atomic_compare_exchange_weak_explicit()</code>   | <code>cnd_timedwait()</code>              |
| 128182                   | <code>atomic_exchange()</code>                         | <code>cnd_wait()</code>                   |
| 128183                   | <code>atomic_exchange_explicit()</code>                | <code>dcgettext()</code>                  |
| 128184                   | <code>atomic_fetch_add()</code>                        | <code>dcgettext_l()</code>                |
| 128185                   | <code>atomic_fetch_add_explicit()</code>               | <code>dcngettext()</code>                 |
| 128186                   | <code>atomic_fetch_and()</code>                        | <code>dcngettext_l()</code>               |
| 128187                   | <code>atomic_fetch_and_explicit()</code>               | <code>dgettext()</code>                   |
| 128188                   | <code>atomic_fetch_or()</code>                         | <code>dgettext_l()</code>                 |
| 128189                   | <code>atomic_fetch_or_explicit()</code>                | <code>dladdr()</code>                     |
| 128190                   | <code>atomic_fetch_sub()</code>                        | <code>dngettext()</code>                  |
| 128191                   | <code>atomic_fetch_sub_explicit()</code>               | <code>dngettext_l()</code>                |
| 128192                   | <code>atomic_fetch_xor()</code>                        | <code>getentropy()</code>                 |
| 128193                   | <code>atomic_fetch_xor_explicit()</code>               | <code>getlocalename_l()</code>            |
| 128194                   | <code>atomic_flag_clear()</code>                       | <code>getresgid()</code>                  |
| 128195                   | <code>atomic_flag_clear_explicit()</code>              | <code>getresuid()</code>                  |
| 128196                   | <code>atomic_flag_test_and_set()</code>                | <code>gettext()</code>                    |
| 128197                   | <code>atomic_flag_test_and_set_explicit()</code>       | <code>gettext_l()</code>                  |
| 128198                   | <code>atomic_init()</code>                             | <code>mbrtoc16()</code>                   |
| 128199                   | <code>atomic_is_lock_free()</code>                     | <code>mbrtoc32()</code>                   |
| 128200                   | <code>atomic_load()</code>                             | <code>memmem()</code>                     |
| 128201                   | <code>atomic_load_explicit()</code>                    | <code>mtx_destroy()</code>                |
| 128202                   | <code>atomic_signal_fence()</code>                     | <code>mtx_init()</code>                   |
| 128203                   | <code>atomic_store()</code>                            | <code>mtx_lock()</code>                   |
| 128204                   | <code>atomic_store_explicit()</code>                   | <code>mtx_timedlock()</code>              |
| 128205                   | <code>atomic_thread_fence()</code>                     | <code>mtx_trylock()</code>                |
| 128206                   | <code>bind_textdomain_codeset()</code>                 | <code>mtx_unlock()</code>                 |
| 128207                   | <code>bindtextdomain()</code>                          | <code>ngettext()</code>                   |
| 128208                   | <code>c16rtomb()</code>                                | <code>ngettext_l()</code>                 |
|                          |                                                        | <code>posix_close()</code>                |
|                          |                                                        | <code>posix_devctl()</code>               |
|                          |                                                        | <code>posix_getdents()</code>             |
|                          |                                                        | <code>ppoll()</code>                      |
|                          |                                                        | <code>pthread_cond_clockwait()</code>     |

|                          |                                                        | <code>thrd_sleep()</code>                 |
|                          |                                                        | <code>thrd_yield()</code>                 |
|                          |                                                        | <code>timespec_get()</code>               |
|                          |                                                        | <code>tss_create()</code>                 |
|                          |                                                        | <code>tss_delete()</code>                 |
|                          |                                                        | <code>tss_get()</code>                    |
|                          |                                                        | <code>tss_set()</code>                    |
|                          |                                                        | <code>wcslcat()</code>                    |
|                          |                                                        | <code>wcsncpy()</code>                    |

128209 The following new headers are introduced in Issue 8:

| New Headers in Issue 8 |                                 |                                    |
|------------------------|---------------------------------|------------------------------------|
| 128210                 |                                 |                                    |
| 128211                 | <code>&lt;devctl.h&gt;</code>   | <code>&lt;stdatomic.h&gt;</code>   |
| 128212                 | <code>&lt;libintl.h&gt;</code>  | <code>&lt;stdnoreturn.h&gt;</code> |
| 128213                 | <code>&lt;stdalign.h&gt;</code> | <code>&lt;threads.h&gt;</code>     |
|                        |                                 | <code>&lt;uchar.h&gt;</code>       |

128214 **Obsolescent Functions in Issue 8**

128215 The base functions moved to obsolescent status in Issue 8 (from the Issue 7 base document) are  
128216 as follows:

128217

128218

|                                              |  |
|----------------------------------------------|--|
| <b>Obsolescent Base Functions in Issue 8</b> |  |
|----------------------------------------------|--|

|                    |                    |
|--------------------|--------------------|
| <i>inet_addr()</i> | <i>inet_ntoa()</i> |
|--------------------|--------------------|

128219 The XSI functions moved to obsolescent status in Issue 8 (from the Issue 7 base document) are as  
128220 follows:

128221

128222

|                                             |  |
|---------------------------------------------|--|
| <b>Obsolescent XSI Functions in Issue 8</b> |  |
|---------------------------------------------|--|

|                  |                 |
|------------------|-----------------|
| <i>encrypt()</i> | <i>setkey()</i> |
|------------------|-----------------|

128223 **Removed Functions in Issue 8**

128224 The functions removed in Issue 8 (from the Issue 7 base document) are as follows:

128225

**Removed Functions in Issue 8**

|        |                                                     |                                               |
|--------|-----------------------------------------------------|-----------------------------------------------|
| 128226 | <i>_longjmp()</i>                                   | <i>posix_trace_eventid_equal()</i>            |
| 128227 | <i>_setjmp()</i>                                    | <i>posix_trace_eventid_get_name()</i>         |

| 128266 | <i>posix_trace_event()</i>                          | <i>utime()</i>                                |

## 128267 **B.1.2 Relationship to Other Formal Standards**

128268 There is no additional rationale provided for this section.

## 128269 **B.1.3 Format of Entries**

128270 Each system interface reference page has a common layout of sections describing the interface.  
 128271 This layout is similar to the manual page or “man” page format shipped with most UNIX  
 128272 systems, and each header has sections describing the SYNOPSIS, DESCRIPTION, RETURN  
 128273 VALUE, and ERRORS. These are the four sections that relate to conformance.

128274 Additional sections are informative, and add considerable information for the application  
 128275 developer. EXAMPLES sections provide example usage. APPLICATION USAGE sections  
 128276 provide additional caveats, issues, and recommendations to the developer. RATIONALE  
 128277 sections give additional information on the decisions made in defining the interface.

128278 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 128279 the future, and often cautions the developer to architect the code to account for a change in this  
 128280 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 128281 feature or interface in the future.

128282 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
 128283 changed.

128284 Option labels and margin markings in the page can be useful in guiding the application  
 128285 developer.

## 128286 **B.2 General Information**

### 128287 **B.2.1 Use and Implementation of Interfaces**

#### 128288 *B.2.1.1 Use and Implementation of Functions*

128289 The information concerning the use of functions was adapted from a description in the ISO C  
 128290 standard. Here is an example of how an application program can protect itself from functions  
 128291 that may or may not be macros, rather than true functions:

128292 The *atoi()* function may be used in any of several ways:

- 128293 • By use of its associated header (possibly generating a macro expansion):

```
128294 #include <stdlib.h>
128295 /* ... */
128296 i = atoi(str);
```

- 128297 • By use of its associated header (assuredly generating a true function call):

```
128298 #include <stdlib.h>
128299 #undef atoi
128300 /* ... */
128301 i = atoi(str);
```

128302           or:

128303           #include <stdlib.h>

128304           /\* ... \*/

128305           i = (atoi) (str);

128306           • By explicit declaration:

128307           extern int atoi (const char \*);

128308           /\* ... \*/

128309           i = atoi(str);

128310           • By implicit declaration:

128311           /\* ... \*/

128312           i = atoi(str);

128313           (Assuming no function prototype is in scope. This is not allowed by the ISO C standard for

128314           functions with variable arguments; furthermore, parameter type conversion “widening” is

128315           subject to different rules in this case.)

128316           Note that the ISO C standard reserves names starting with ‘\_’ for the compiler. Therefore, the

128317           compiler could, for example, implement an intrinsic, built-in function *\_asm\_builtin\_atoi()*, which

128318           it recognized and expanded into inline assembly code. Then, in <stdlib.h>, there could be the

128319           following:

128320           #define atoi(X) \_asm\_builtin\_atoi(X)

128321           The user’s “normal” call to *atoi()* would then be expanded inline, but the implementor would

128322           also be required to provide a callable function named *atoi()* for use when the application

128323           requires it; for example, if its address is to be stored in a function pointer variable.

128324           Implementors should note that since applications can **#undef** a macro in order to ensure that the

128325           function is used, this means that it is not safe for implementations to use the names of any

128326           standard functions in macro values, since the application could use **#undef** to ensure that no

128327           macro exists and then use the same name for an identifier with local scope. For example,

128328           historically it was common for a *getchar()* macro to be defined in <stdio.h> as:

128329           #define getchar() getc(stdin)

128330           This definition does not conform, because an application is allowed to use the identifier *getc*

128331           with local scope, and the expansion of the *getchar()* macro would then pick up the local *getc*.

128332           The following is conforming code, but would not compile with the above definition of *getchar()*:

128333           #include <stdio.h>

128334           #undef getc

128335           int main(void)

128336           {

128337            int getc;

128338            getc = getchar();

128339            return getc;

128340           }

128341           This does not only affect function-like macros. For example, the following definition does not

128342           conform because there could be a local *sysconf* variable in scope when SIGRTMIN is expanded:

128343           #define SIGRTMIN ((int)sysconf(\_SC\_SIGRT\_MIN))

128344           Implementors can avoid the problem by using aliases for standard functions instead of the

128345 actual function, with names that conforming applications cannot use for local variables. For  
128346 example:

```
128347 #define SIGRTMIN ((int)__sysconf(_SC_SIGRT_MIN))
```

128348 Austin Group Defect 655 is applied, making the requirement relating to explicit function  
128349 declarations apply only to functions from the ISO C standard.

128350 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

128351 Austin Group Defect 1404 is applied, adding to the examples of invalid values for function  
128352 arguments.

128353 *B.2.1.2 Use and Implementation of Macros*

128354 There is no additional rationale provided for this section.

## 128355 **B.2.2 The Compilation Environment**

128356 *B.2.2.1 POSIX.1 Symbols*

128357 This and the following section address the issue of “name space pollution”. The ISO C standard  
128358 requires that the name space beyond what it reserves not be altered except by explicit action of  
128359 the application developer. This section defines the actions to add the POSIX.1 symbols for those  
128360 headers where both the ISO C standard and POSIX.1 need to define symbols, and also where the  
128361 XSI option extends the base standard.

128362 When headers are used to provide symbols, there is a potential for introducing symbols that the  
128363 application developer cannot predict. Ideally, each header should only contain one set of  
128364 symbols, but this is not practical for historical reasons. Thus, the concept of feature test macros is  
128365 included. Two feature test macros are explicitly defined by POSIX.1-2024; it is expected that  
128366 future versions may add to this.

128367 **Note:** Feature test macros allow an application to announce to the implementation its desire to have  
128368 certain symbols and prototypes exposed. They should not be confused with the version test  
128369 macros and constants for options in `<unistd.h>` which are the implementation’s way of  
128370 announcing functionality to the application.

128371 It is further intended that these feature test macros apply only to the headers specified by  
128372 POSIX.1-2024. Implementations are expressly permitted to make visible symbols not specified  
128373 by POSIX.1-2024, within both POSIX.1 and other headers, under the control of feature test  
128374 macros that are not defined by POSIX.1-2024.

### 128375 **The `_POSIX_C_SOURCE` Feature Test Macro**

128376 The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been  
128377 superseded by `_POSIX_C_SOURCE`. This symbol will allow implementations to support various  
128378 versions of this standard simultaneously. For instance, when `_POSIX_C_SOURCE` is defined as  
128379 `202405L`, the system should make visible the same name space as permitted and required by the  
128380 POSIX.1-2024 standard. A special case is the one where the implementation wishes to make  
128381 available support for the 1990 version of the POSIX standard, in which instance when either  
128382 `_POSIX_SOURCE` is defined or `_POSIX_C_SOURCE` is defined as `1`, the system should make  
128383 visible the same name space as permitted and required by the POSIX.1-1990 standard.

128384 It is expected that C bindings to future POSIX standards will define new values for

128385 `_POSIX_C_SOURCE`, with each new value reserving the name space for that new standard.

#### 128386 **The `_XOPEN_SOURCE` Feature Test Macro**

128387 The feature test macro `_XOPEN_SOURCE` is provided as the announcement mechanism for the  
128388 application that it requires functionality from the Single UNIX Specification. `_XOPEN_SOURCE`  
128389 must be defined to the value 800 before the inclusion of any header to enable the functionality in  
128390 the Single UNIX Specification Version 5. Its definition subsumes the use of `_POSIX_C_SOURCE`.

128391 An extract of code from a conforming application, that appears before any **#include** statements,  
128392 is given below:

```
128393 #define _XOPEN_SOURCE 800 /* Single UNIX Specification, Version 5 */
128394 #include ...
```

128395 Note that the definition of `_XOPEN_SOURCE` with the value 800 makes the definition of  
128396 `_POSIX_C_SOURCE` redundant and it can safely be omitted.

#### 128397 **The `__STDC_WANT_LIB_EXT1__` Feature Test Macro**

128398 The ISO C standard specifies the feature test macro `__STDC_WANT_LIB_EXT1__` as the  
128399 announcement mechanism for the application that it requires functionality from Annex K. It  
128400 specifies that the symbols specified in Annex K (if supported) are made visible when  
128401 `__STDC_WANT_LIB_EXT1__` is 1 and are not made visible when it is 0, but leaves it unspecified  
128402 whether they are made visible when `__STDC_WANT_LIB_EXT1__` is undefined. POSIX.1  
128403 requires that they are not made visible when the macro is undefined (except for those symbols  
128404 that are already explicitly allowed to be visible through the definition of `_POSIX_C_SOURCE` or  
128405 `_XOPEN_SOURCE`, or both).

128406 POSIX.1 does not include the interfaces specified in Annex K of the ISO C standard, but allows  
128407 the symbols to be made visible in headers when requested by the application in order that  
128408 applications can use symbols from Annex K and symbols from POSIX.1 in the same translation  
128409 unit.

128410 Austin Group Defect 1302 is applied, adding this subsection.

#### 128411 *B.2.2.2 The Name Space*

128412 The reservation of identifiers is paraphrased from the ISO C standard. The text is included  
128413 because it needs to be part of POSIX.1-2024, regardless of possible changes in future versions of  
128414 the ISO C standard.

128415 These identifiers may be used by implementations, particularly for feature test macros.  
128416 Implementations should not use feature test macro names that might be reasonably used by a  
128417 standard.

128418 Including headers more than once is a reasonably common practice, and it should be carried  
128419 forward from the ISO C standard. More significantly, having definitions in more than one  
128420 header is explicitly permitted. Where the potential declaration is “benign” (the same definition  
128421 twice) the declaration can be repeated, if that is permitted by the compiler. (This is usually true  
128422 of macros, for example.) In those situations where a repetition is not benign (for example,  
128423 **typedefs**), conditional compilation must be used. The situation actually occurs both within the  
128424 ISO C standard and within POSIX.1: **time\_t** should be in `<sys/types.h>`, and the ISO C standard  
128425 mandates that it be in `<time.h>`.

128426 The area of name space pollution *versus* additions to structures is difficult because of the macro  
128427 structure of C. The following discussion summarizes all the various problems with and

128428 objections to the issue.

128429 Note the phrase “user-defined macro”. Users are not permitted to define macro names (or any  
128430 other name) beginning with “\_[A-Z\_]”. Thus, the conflict cannot occur for symbols reserved  
128431 to the vendor’s name space, and the permission to add fields automatically applies, without  
128432 qualification, to those symbols.

128433 1. Data structures (and unions) need to be defined in headers by implementations to meet  
128434 certain requirements of POSIX.1 and the ISO C standard.

128435 2. The structures defined by POSIX.1 are typically minimal, and any practical  
128436 implementation would wish to add fields to these structures either to hold additional  
128437 related information or for backwards-compatibility (or both). Future standards (and *de*  
128438 *facto* standards) would also wish to add to these structures. Issues of field alignment  
128439 make it impractical (at least in the general case) to simply omit fields when they are not  
128440 defined by the particular standard involved.

128441 The **dirent** structure is an example of such a minimal structure (although one could argue  
128442 about whether the other fields need visible names). The *st\_rdev* field of most  
128443 implementations’ **stat** structure is a common example where extension is needed and  
128444 where a conflict could occur.

128445 3. Fields in structures are in an independent name space, so the addition of such fields  
128446 presents no problem to the C language itself in that such names cannot interact with  
128447 identically named user symbols because access is qualified by the specific structure name.

128448 4. There is an exception to this: macro processing is done at a lexical level. Thus, symbols  
128449 added to a structure might be recognized as user-provided macro names at the location  
128450 where the structure is declared. This only can occur if the user-provided name is declared  
128451 as a macro before the header declaring the structure is included. The user’s use of the  
128452 name after the declaration cannot interfere with the structure because the symbol is  
128453 hidden and only accessible through access to the structure. Presumably, the user would  
128454 not declare such a macro if there was an intention to use that field name.

128455 5. Macros from the same or a related header might use the additional fields in the structure,  
128456 and those field names might also collide with user macros. Although this is a less  
128457 frequent occurrence, since macros are expanded at the point of use, no constraint on the  
128458 order of use of names can apply.

128459 6. An “obvious” solution of using names in the reserved name space and then redefining  
128460 them as macros when they should be visible does not work because this has the effect of  
128461 exporting the symbol into the general name space. For example, given a (hypothetical)  
128462 system-provided header **<h.h>**, and two parts of a C program in **a.c** and **b.c**, in header  
128463 **<h.h>**:

```
128464 struct foo {
128465     int __i;
128466 }

128467 #ifdef _FEATURE_TEST
128468 #define i __i;
128469 #endif
```

128470 In file **a.c**:

```
128471 #include h.h
128472 extern int i;
128473 ...
```

128474 In file **b.c**:  
 128475 `extern int i;`  
 128476 `...`

128477 The symbol that the user thinks of as *i* in both files has an external name of `__i` in **a.c**; the  
 128478 same symbol *i* in **b.c** has an external name *i* (ignoring any hidden manipulations the  
 128479 compiler might perform on the names). This would cause a mysterious name resolution  
 128480 problem when **a.o** and **b.o** are linked.

128481 Simply avoiding definition then causes alignment problems in the structure.

128482 A structure of the form:

```
128483 struct foo {
128484     union {
128485         int __i;
128486 #ifdef _FEATURE_TEST
128487         int i;
128488 #endif
128489     } __ii;
128490 }
```

128491 does not work because the name of the logical field *i* is `__ii.i`, and introduction of a macro  
 128492 to restore the logical name immediately reintroduces the problem discussed previously  
 128493 (although its manifestation might be more immediate because a syntax error would result  
 128494 if a recursive macro did not cause it to fail first).

128495 7. A more workable solution would be to declare the structure:

```
128496 struct foo {
128497 #ifdef _FEATURE_TEST
128498     int i;
128499 #else
128500     int __i;
128501 #endif
128502 }
```

128503 However, if a macro (particularly one required by a standard) is to be defined that uses  
 128504 this field, two must be defined: one that uses *i*, the other that uses `__i`. If more than one  
 128505 additional field is used in a macro and they are conditional on distinct combinations of  
 128506 features, the complexity goes up as  $2^n$ .

128507 All this leaves a difficult situation: vendors must provide very complex headers to deal with  
 128508 what is conceptually simple and safe—adding a field to a structure. It is the possibility of user-  
 128509 provided macros with the same name that makes this difficult.

128510 Several alternatives were proposed that involved constraining the user's access to part of the  
 128511 name space available to the user (as specified by the ISO C standard). In some cases, this was  
 128512 only until all the headers had been included. There were two proposals discussed that failed to  
 128513 achieve consensus:

- 128514 1. Limiting it for the whole program.
- 128515 2. Restricting the use of identifiers containing only uppercase letters until after all system  
 128516 headers had been included. It was also pointed out that because macros might wish to  
 128517 access fields of a structure (and macro expansion occurs totally at point of use) restricting  
 128518 names in this way would not protect the macro expansion, and thus the solution was  
 128519 inadequate.

- 128520 It was finally decided that reservation of symbols would occur, but as constrained.
- 128521 The current wording also allows the addition of fields to a structure, but requires that user  
128522 macros of the same name not interfere. This allows vendors to do one of the following:
- 128523 • Not create the situation (do not extend the structures with user-accessible names or use the  
128524 solution in (7) above)
  - 128525 • Extend their compilers to allow some way of adding names to structures and macros safely
- 128526 There are at least two ways that the compiler might be extended: add new preprocessor  
128527 directives that turn off and on macro expansion for certain symbols (without changing the value  
128528 of the macro) and a function or lexical operation that suppresses expansion of a word. The latter  
128529 seems more flexible, particularly because it addresses the problem in macros as well as in  
128530 declarations.
- 128531 The following seems to be a possible implementation extension to the C language that will do  
128532 this: any token that during macro expansion is found to be preceded by three '#' symbols shall  
128533 not be further expanded in exactly the same way as described for macros that expand to their  
128534 own name as in Section 6.10.3.4 of the ISO C standard. A vendor may also wish to implement  
128535 this as an operation that is lexically a function, which might be implemented as:
- ```
128536 #define __safe_name(x) ###x
```
- 128537 Using a function notation would insulate vendors from changes in standards until such a  
128538 functionality is standardized (if ever). Standardization of such a function would be valuable  
128539 because it would then permit third parties to take advantage of it portably in software they may  
128540 supply.
- 128541 The symbols that are “explicitly permitted, but not required by POSIX.1-2024” include those  
128542 classified below. (That is, the symbols classified below might, but are not required to, be present  
128543 when `_POSIX_C_SOURCE` is defined to have the value 202405L.)
- 128544 • Symbols in `<limits.h>` and `<unistd.h>` that are defined to indicate support for options or  
128545 limits that are constant at compile-time
  - 128546 • Symbols in the name space reserved for the implementation by the ISO C standard
  - 128547 • Symbols in a name space reserved for a particular type of extension (for example, type  
128548 names ending with `_t` in `<sys/types.h>`)
  - 128549 • Additional members of structures or unions whose names do not reduce the name space  
128550 reserved for applications
- 128551 Since both implementations and future versions of this standard and other POSIX standards  
128552 may use symbols in the reserved spaces described in these tables, there is a potential for name  
128553 space clashes. To avoid future name space clashes when adding symbols, implementations  
128554 should not use the `posix_`, `POSIX_`, or `_POSIX_` prefixes.
- 128555 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/2 is applied, deleting the entries `POSIX_`,  
128556 `_POSIX_`, and `posix_` from the column of allowed name space prefixes for use by an  
128557 implementation in the first table. The presence of these prefixes was contradicting later text  
128558 which states that: “The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by XCU  
128559 [Chapter 2](#) (on page 2472) and other POSIX standards. Implementations may add symbols to the  
128560 headers shown in the following table, provided the identifiers ... do not use the reserved  
128561 prefixes `posix_`, `POSIX_`, or `_POSIX_`.”
- 128562 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/3 is applied, correcting the reserved  
128563 macro prefix from: “`PRI[a-z]`, `SCN[a-z]`” to: “`PRI[Xa-z]`, `SCN[Xa-z]`” in the second table. The  
128564 change was needed since the ISO C standard allows implementations to define macros of the

- 128565 form PRI or SCN followed by any lowercase letter or 'x' in `<inttypes.h>`. (The  
128566 ISO/IEC 9899:1999 standard, Subclause 7.26.4.)
- 128567 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/4 is applied, adding a new section listing  
128568 reserved names for the `<stdint.h>` header. This change is for alignment with the ISO C standard.
- 128569 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/2 is applied, making it clear that  
128570 implementations are permitted to have symbols with the prefix `_POSIX_` visible in any header.
- 128571 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/3 is applied, updating the table of  
128572 allowed macro prefixes to include the prefix `FP_[A-Z]` for `<math.h>`. This text is added for  
128573 consistency with the `<math.h>` reference page in the Base Definitions volume of POSIX.1-2024  
128574 which permits additional implementation-defined floating-point classifications.
- 128575 Austin Group Interpretation 1003.1-2001 #048 is applied, reserving `SEEK_` in the name space.
- 128576 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0001 [801], XSH/TC2-2008/0002 [780],  
128577 XSH/TC2-2008/0003 [790], XSH/TC2-2008/0004 [780], XSH/TC2-2008/0005 [790],  
128578 XSH/TC2-2008/0006 [782], XSH/TC2-2008/0007 [790], and XSH/TC2-2008/0008 [790] are  
128579 applied.
- 128580 Austin Group Defect 162 is applied, adding the `<endian.h>` header.
- 128581 Austin Group Defect 697 is applied, reserving `DT_` in the name space.
- 128582 Austin Group Defect 845 is applied, reserving `in6addr_` in the name space.
- 128583 Austin Group Defect 993 is applied, reserving `dli_` in the name space.
- 128584 Austin Group Defect 1003 is applied, correcting a mismatch with the ISO C standard regarding  
128585 reservation of each identifier with file scope described in the header section.
- 128586 Austin Group Defect 1122 is applied, adding `<libintl.h>`.
- 128587 Austin Group Defect 1151 is applied, adding `ws_` as a reserved prefix for `<termios.h>`.
- 128588 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 128589 Austin Group Defect 1456 is applied, clarifying the reservation of symbolic constants with the  
128590 prefix `_CS_`, `_PC_`, and `_SC_` for `<unistd.h>`.

### 128591 **B.2.3 Error Numbers**

- 128592 It was the consensus of the standard developers that to allow the conformance document to state  
128593 that an error occurs and under what conditions, but to disallow a statement that it never occurs,  
128594 does not make sense. It could be implied by the current wording that this is allowed, but to  
128595 reduce the possibility of future interpretation requests, it is better to make an explicit statement.
- 128596 The original ISO C standard just required that `errno` be a modifiable lvalue. Since the  
128597 introduction of threads in 2011, the ISO C standard has instead required that `errno` be a macro  
128598 which expands to a modifiable lvalue that has thread local storage duration.
- 128599 Checking the value of `errno` alone is not sufficient to determine the existence or type of an error,  
128600 since it is not required that a successful function call clear `errno`. The variable `errno` should only  
128601 be examined when the return value of a function indicates that the value of `errno` is meaningful.  
128602 In that case, the function is required to set the variable to something other than zero.
- 128603 The variable `errno` is never set to zero by any function call; to do so would contradict the ISO C  
128604 standard.
- 128605 POSIX.1 requires (in the ERRORS sections of function descriptions) certain error values to be set

128606 in certain conditions because many existing applications depend on them. Some error numbers,  
 128607 such as [EFAULT], are entirely implementation-defined and are noted as such in their  
 128608 description in the ERRORS section. This section otherwise allows wide latitude to the  
 128609 implementation in handling error reporting.

128610 Some of the ERRORS sections in POSIX.1-2024 have two subsections. The first:

128611        ``The function shall fail if:``

128612 could be called the ``mandatory`` section.

128613 The second:

128614        ``The function may fail if:``

128615 could be informally known as the ``optional`` section.

128616 Attempting to infer the quality of an implementation based on whether it detects optional error  
 128617 conditions is not useful.

128618 Following each one-word symbolic name for an error, there is a description of the error. The  
 128619 rationale for some of the symbolic names follows:

128620 [ECANCELED] This spelling was chosen as being more common.

128621 [EFAULT] Most historical implementations do not catch an error and set *errno* when an  
 128622 invalid address is given to the functions *wait()*, *time()*, or *times()*. Some  
 128623 implementations cannot reliably detect an invalid address. And most systems  
 128624 that detect invalid addresses will do so only for a system call, not for a library  
 128625 routine.

128626 [EFTYPE] This error code was proposed in earlier proposals as ``Inappropriate operation  
 128627 for file type``, meaning that the operation requested is not appropriate for the  
 128628 file specified in the function call. This code was proposed, although the same  
 128629 idea was covered by [ENOTTY], because the connotations of the name would  
 128630 be misleading. It was pointed out that the *fcntl()* function uses the error code  
 128631 [EINVAL] for this notion, and hence all instances of [EFTYPE] were changed  
 128632 to this code.

128633 [EINTR] POSIX.1 prohibits conforming implementations from restarting interrupted  
 128634 system calls of conforming applications unless the SA\_RESTART flag is in  
 128635 effect for the signal. However, it does not require that [EINTR] be returned  
 128636 when another legitimate value may be substituted; for example, a partial  
 128637 transfer count when *read()* or *write()* are interrupted. This is only given when  
 128638 the signal-catching function returns normally as opposed to returns by  
 128639 mechanisms like *longjmp()* or *siglongjmp()*.

128640 [ELOOP] In specifying conditions under which implementations would generate this  
 128641 error, the following goals were considered:

- 128642        • To ensure that actual loops are detected, including loops that result from  
 128643        symbolic links across distributed file systems.
- 128644        • To ensure that during pathname resolution an application can rely on  
 128645        the ability to follow at least {SYMLOOP\_MAX} symbolic links in the  
 128646        absence of a loop.
- 128647        • To allow implementations to provide the capability of traversing more  
 128648        than {SYMLOOP\_MAX} symbolic links in the absence of a loop.

- 128649                   • To allow implementations to detect loops and generate the error prior to  
128650                   encountering {SYMLOOP\_MAX} symbolic links.
- 128651           [ENAMETOOLONG]
- 128652           When a symbolic link is encountered during pathname resolution, the  
128653           contents of that symbolic link are used to create a new pathname. The  
128654           standard developers intended to allow, but not require, that implementations  
128655           enforce the restriction of {PATH\_MAX} on the result of this pathname  
128656           substitution.
- 128657           Implementations are allowed, but not required, to treat a pathname longer  
128658           than {PATH\_MAX} passed into the system as an error. Implementations are  
128659           required to return a pathname (even if it is longer than {PATH\_MAX}) when  
128660           the user supplies a buffer with an interface that specifies the buffer size, as  
128661           long as the user-supplied buffer is large enough to hold the entire pathname  
128662           (see XSH *getcwd()* for an example of this type of interface). Implementations  
128663           are required to treat a request to pass a pathname longer than {PATH\_MAX}  
128664           from the system to a user-supplied buffer of an unspecified size (usually  
128665           assumed to be of size {PATH\_MAX}) as an error (see XSH *realpath()* for an  
128666           example of this type of interface).
- 128667           [ENOMEM]       The term “main memory” is not used in POSIX.1 because it is  
128668           implementation-defined.
- 128669           [ENOTSUP]       This error code is to be used when an implementation chooses to implement  
128670           the required functionality of POSIX.1-2024 but does not support optional  
128671           facilities defined by POSIX.1-2024. In some earlier versions of this standard,  
128672           the difference between [ENOTSUP] and [ENOSYS] was that [ENOSYS]  
128673           indicated that the function was not supported at all. This is no longer the case  
128674           as [ENOSYS] can also be used to indicate non-support of optional  
128675           functionality for a function that has some required functionality. (See XSH  
128676           *encrypt()*.)
- 128677           [ENOTTY]       The symbolic name for this error is derived from a time when device control  
128678           was done by *ioctl()* and that operation was only permitted on a terminal  
128679           interface. The term “TTY” is derived from “teletypewriter”, the devices to  
128680           which this error originally applied.
- 128681           [E\_OVERFLOW]   Most of the uses of this error code are related to large file support. Typically,  
128682           these cases occur on systems which support multiple programming  
128683           environments with different sizes for **off\_t**, but they may also occur in  
128684           connection with remote file systems.
- 128685           In addition, when different programming environments have different widths  
128686           for types such as **int** and **uid\_t**, several functions may encounter a condition  
128687           where a value in a particular environment is too wide to be represented. In  
128688           that case, this error should be raised. For example, suppose the currently  
128689           running process has 64-bit **int**, and file descriptor 9 223 372 036 854 775 807 is  
128690           open and does not have the close-on-exec flag set. If the process then uses  
128691           *execl()* to *exec* a file compiled in a programming environment with 32-bit **int**,  
128692           the call to *execl()* can fail with *errno* set to [E\_OVERFLOW]. A similar failure  
128693           can occur with *execl()* if any of the user IDs or any of the group IDs to be  
128694           assigned to the new process image are out of range for the executed file’s  
128695           programming environment.
- 128696           Note, however, that this condition cannot occur for functions that are  
128697           explicitly described as always being successful, such as *getpid()*.

128698 [EPIPE] This condition normally generates the signal SIGPIPE; the error is returned if  
 128699 the generation of the signal is suppressed or the signal does not terminate the  
 128700 process.

128701 [EROFS] In historical implementations, attempting to *unlink()* or *rmdir()* a mount point  
 128702 would generate an [EBUSY] error. An implementation could be envisioned  
 128703 where such an operation could be performed without error. In this case, if  
 128704 *either* the directory entry or the actual data structures reside on a read-only file  
 128705 system, [EROFS] is the appropriate error to generate. (For example, changing  
 128706 the link count of a file on a read-only file system could not be done, as is  
 128707 required by *unlink()*, and thus an error should be reported.)

128708 Three error numbers, [EDOM], [EILSEQ], and [ERANGE], were added to this section primarily  
 128709 for consistency with the ISO C standard.

128710 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0009 [496] and XSH/TC2-2008/0010  
 128711 [681] are applied.

128712 Austin Group Defect 1067 is applied, adding [ESOCKTNOSUPPORT].

128713 Austin Group Defect 1380 is applied, changing the descriptions of [EMLINK] and [EXDEV].

128714 Austin Group Defect 1669 is applied, changing the description of [EFBIG].

#### 128715 **Alternative Solutions for Per-Thread *errno***

128716 The historical implementation of *errno* as a single global variable does not work in a multi-  
 128717 threaded environment. In such an environment, a thread may make a POSIX.1 call and get a -1  
 128718 error return, but before that thread can check the value of *errno*, another thread might have  
 128719 made a second POSIX.1 call that also set *errno*. This behavior is unacceptable in robust  
 128720 programs. There were a number of alternatives that were considered for handling the *errno*  
 128721 problem:

- 128722 • Implement *errno* as a per-thread integer variable.
- 128723 • Implement *errno* as a service that can access the per-thread error number.
- 128724 • Change all POSIX.1 calls to accept an extra status argument and avoid setting *errno*.
- 128725 • Change all POSIX.1 calls to raise a language exception.

128726 The first option offers the highest level of compatibility with existing practice but requires  
 128727 special support in the linker, compiler, and/or virtual memory system to support the new  
 128728 concept of thread private variables. When compared with current practice, the third and fourth  
 128729 options are much cleaner, more efficient, and encourage a more robust programming style, but  
 128730 they require new versions of all of the POSIX.1 functions that might detect an error. The second  
 128731 option offers compatibility with existing code that uses the **<errno.h>** header to define the  
 128732 symbol *errno*. In this option, *errno* may be a macro defined:

```
128733 #define errno (*__errno())
128734 extern int      *__errno();
```

128735 This option may be implemented as a per-thread variable whereby an *errno* field is allocated in  
 128736 the user space object representing a thread, and whereby the function *\_\_errno()* makes a system  
 128737 call to determine the location of its user space object and returns the address of the *errno* field of  
 128738 that object. Another implementation, one that avoids calling the kernel, involves allocating  
 128739 stacks in chunks. The stack allocator keeps a side table indexed by chunk number containing a  
 128740 pointer to the thread object that uses that chunk. The *\_\_errno()* function then looks at the stack  
 128741 pointer, determines the chunk number, and uses that as an index into the chunk table to find its  
 128742 thread object and thus its private value of *errno*. On most architectures, this can be done in four

128743 to five instructions. Some compilers may wish to implement `__errno()` inline to improve  
128744 performance.

#### 128745 **Disallowing Return of the [EINTR] Error Code**

128746 Many blocking interfaces defined by POSIX.1-2024 may return [EINTR] if interrupted during  
128747 their execution by a signal handler. Blocking interfaces introduced under the threads  
128748 functionality do not have this property. Instead, they require that the interface appear to be  
128749 atomic with respect to interruption. In particular, applications calling blocking interfaces need  
128750 not handle any possible [EINTR] return as a special case since it will never occur. In the case of  
128751 threads functions in `<threads.h>`, the requirement is stated in terms of the call not being affected  
128752 if the calling thread executes a signal handler during the call, since these functions return errors  
128753 in a different way and cannot distinguish an [EINTR] condition from other error conditions. If it  
128754 is necessary to restart operations or complete incomplete operations following the execution of a  
128755 signal handler, this is handled by the implementation, rather than by the application.

128756 Requiring applications to handle [EINTR] errors on blocking interfaces has been shown to be a  
128757 frequent source of often unreproducible bugs, and it adds no compelling value to the available  
128758 functionality. Thus, blocking interfaces introduced for use by multi-threaded programs do not  
128759 use this paradigm. In particular, in none of the functions `flockfile()`, `pthread_cond_timedwait()`,  
128760 `pthread_cond_wait()`, `pthread_join()`, `pthread_mutex_lock()`, and `sigwait()` did providing [EINTR]  
128761 returns add value, or even particularly make sense. Thus, these functions do not provide for an  
128762 [EINTR] return, even when interrupted by a signal handler. The same arguments can be applied  
128763 to `sem_wait()`, `sem_trywait()`, `sigwaitinfo()`, and `sigtimedwait()`, but implementations are  
128764 permitted to return [EINTR] error codes for these functions for compatibility with earlier  
128765 versions of this standard. Applications cannot rely on calls to these functions returning [EINTR]  
128766 error codes when signals are delivered to the calling thread, but they should allow for the  
128767 possibility.

128768 Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and  
128769 [EOPNOTSUPP] to be the same values.

#### 128770 **B.2.3.1 Additional Error Numbers**

128771 The ISO C standard defines the name space for implementations to add additional error  
128772 numbers.

### 128773 **B.2.4 Signal Concepts**

128774 Historical implementations of signals, using the `signal()` function, have shortcomings that make  
128775 them unreliable for many application uses. Because of this, a new signal mechanism, based very  
128776 closely on the one of 4.2 BSD and 4.3 BSD, was added to POSIX.1.

#### 128777 **Signal Names**

128778 The restriction on the actual type used for `sigset_t` is intended to guarantee that these objects can  
128779 always be assigned, have their address taken, and be passed as parameters by value. It is not  
128780 intended that this type be a structure including pointers to other data structures, as that could  
128781 impact the portability of applications performing such operations. A reasonable implementation  
128782 could be a structure containing an array of some integer type.

128783 The signals described in POSIX.1-2024 must have unique values so that they may be named as  
128784 parameters of `case` statements in the body of a C-language `switch` clause. However,  
128785 implementation-defined signals may have values that overlap with each other or with signals

128786 specified in POSIX.1-2024. An example of this is SIGABRT, which traditionally overlaps some  
128787 other signal, such as SIGIOT.

128788 SIGKILL, SIGTERM, SIGUSR1, and SIGUSR2 are ordinarily generated only through the explicit  
128789 use of the *kill()* function, although some implementations generate SIGKILL under  
128790 extraordinary circumstances. SIGTERM is traditionally the default signal sent by the *kill*  
128791 command.

128792 The signals SIGBUS, SIGEMT, SIGIOT, SIGTRAP, and SIGSYS were omitted from POSIX.1  
128793 because their behavior is implementation-defined and could not be adequately categorized.  
128794 Conforming implementations may deliver these signals, but must document the circumstances  
128795 under which they are delivered and note any restrictions concerning their delivery. The signals  
128796 SIGFPE, SIGILL, and SIGSEGV are similar in that they also generally result only from  
128797 programming errors. They were included in POSIX.1 because they do indicate three relatively  
128798 well-categorized conditions. They are all defined by the ISO C standard and thus would have to  
128799 be defined by any system with an ISO C standard binding, even if not explicitly included in  
128800 POSIX.1.

128801 There is very little that a Conforming POSIX.1 Application can do by catching, ignoring, or  
128802 masking any of the signals SIGILL, SIGTRAP, SIGIOT, SIGEMT, SIGBUS, SIGSEGV, SIGSYS, or  
128803 SIGFPE. They will generally be generated by the system only in cases of programming errors.  
128804 While it may be desirable for some robust code (for example, a library routine) to be able to  
128805 detect and recover from programming errors in other code, these signals are not nearly sufficient  
128806 for that purpose. One portable use that does exist for these signals is that a command interpreter  
128807 can recognize them as the cause of termination of a process (with *wait()*) and print an  
128808 appropriate message. The mnemonic tags for these signals are derived from their PDP-11 origin.

128809 The signals SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU, and SIGCONT are provided for job control  
128810 and are unchanged from 4.2 BSD. The signal SIGCHLD is also typically used by job control  
128811 shells to detect children that have terminated or, as in 4.2 BSD, stopped.

128812 Some implementations, including System V, have a signal named SIGCLD, which is similar to  
128813 SIGCHLD in 4.2 BSD. POSIX.1 permits implementations to have a single signal with both  
128814 names. POSIX.1 carefully specifies ways in which conforming applications can avoid the  
128815 semantic differences between the two different implementations. The name SIGCHLD was  
128816 chosen for POSIX.1 because most current application usages of it can remain unchanged in  
128817 conforming applications. SIGCLD in System V has more cases of semantics that POSIX.1 does  
128818 not specify, and thus applications using it are more likely to require changes in addition to the  
128819 name change.

128820 The signals SIGUSR1 and SIGUSR2 are commonly used by applications for notification of  
128821 exceptional behavior and are described as “reserved as application-defined” so that such use is  
128822 not prohibited. Implementations should not generate SIGUSR1 or SIGUSR2, except when  
128823 explicitly requested by *kill()*. It is recommended that libraries not use these two signals, as such  
128824 use in libraries could interfere with their use by applications calling the libraries. If such use is  
128825 unavoidable, it should be documented. It is prudent for non-portable libraries to use non-  
128826 standard signals to avoid conflicts with use of standard signals by portable libraries.

128827 There is no portable way for an application to catch or ignore non-standard signals. Some  
128828 implementations define the range of signal numbers, so applications can install signal-catching  
128829 functions for all of them. Unfortunately, implementation-defined signals often cause problems  
128830 when caught or ignored by applications that do not understand the reason for the signal. While  
128831 the desire exists for an application to be more robust by handling all possible signals (even those  
128832 only generated by *kill()*), no existing mechanism was found to be sufficiently portable to include  
128833 in POSIX.1. The value of such a mechanism, if included, would be diminished given that  
128834 SIGKILL would still not be catchable.

128835 A number of new signal numbers are reserved for applications because the two user signals  
128836 defined by POSIX.1 are insufficient for many realtime applications. A range of signal numbers is  
128837 specified, rather than an enumeration of additional reserved signal names, because different  
128838 applications and application profiles will require a different number of application signals. It is  
128839 not desirable to burden all application domains and therefore all implementations with the  
128840 maximum number of signals required by all possible applications. Note that in this context,  
128841 signal numbers are essentially different signal priorities.

128842 The relatively small number of required additional signals, `{_POSIX_RTSIG_MAX}`, was chosen  
128843 so as not to require an unreasonably large signal mask/set. While this number of signals  
128844 defined in POSIX.1 will fit in a single 32-bit word signal mask, it is recognized that most existing  
128845 implementations define many more signals than are specified in POSIX.1 and, in fact, many  
128846 implementations have already exceeded 32 signals (including the “null signal”). Support of  
128847 `{_POSIX_RTSIG_MAX}` additional signals may push some implementation over the single 32-bit  
128848 word line, but is unlikely to push any implementations that are already over that line beyond  
128849 the 64-signal line.

#### 128850 B.2.4.1 Signal Generation and Delivery

128851 The terms defined in this section are not used consistently in documentation of historical  
128852 systems. Each signal can be considered to have a lifetime beginning with generation and ending  
128853 with delivery or acceptance. The POSIX.1 definition of “delivery” does not exclude ignored  
128854 signals; this is considered a more consistent definition. This revised text in several parts of  
128855 POSIX.1-2024 clarifies the distinct semantics of asynchronous signal delivery and synchronous  
128856 signal acceptance. The previous wording attempted to categorize both under the term  
128857 “delivery”, which led to conflicts over whether the effects of asynchronous signal delivery  
128858 applied to synchronous signal acceptance.

128859 Signals generated for a process are delivered to only one thread. Thus, if more than one thread  
128860 is eligible to receive a signal, one has to be chosen. The choice of threads is left entirely up to the  
128861 implementation both to allow the widest possible range of conforming implementations and to  
128862 give implementations the freedom to deliver the signal to the “easiest possible” thread should  
128863 there be differences in ease of delivery between different threads.

128864 Note that should multiple delivery among cooperating threads be required by an application,  
128865 this can be trivially constructed out of the provided single-delivery semantics. The construction  
128866 of a `sigwait_multiple()` function that accomplishes this goal is presented with the rationale for  
128867 `sigwaitinfo()`.

128868 Implementations should deliver unblocked signals as soon after they are generated as possible.  
128869 However, it is difficult for POSIX.1 to make specific requirements about this, beyond those in  
128870 `kill()` and `sigprocmask()`. Even on systems with prompt delivery, scheduling of higher priority  
128871 processes is always likely to cause delays.

128872 In general, the interval between the generation and delivery of unblocked signals cannot be  
128873 detected by an application. Thus, references to pending signals generally apply to blocked,  
128874 pending signals. An implementation registers a signal as pending on the process when no  
128875 thread has the signal unblocked and there are no threads blocked in a `sigwait()` function for that  
128876 signal. Thereafter, the implementation delivers the signal to the first thread that unblocks the  
128877 signal or calls a `sigwait()` function on a signal set containing this signal rather than choosing the  
128878 recipient thread at the time the signal is sent.

128879 In the 4.3 BSD system, signals that are blocked and set to `SIG_IGN` are discarded immediately  
128880 upon generation. For a signal that is ignored as its default action, if the action is `SIG_DFL` and  
128881 the signal is blocked, a generated signal remains pending. In the 4.1 BSD system and in  
128882 System V Release 3 (two other implementations that support a somewhat similar signal

128883 mechanism), all ignored blocked signals remain pending if generated. Because it is not normally  
 128884 useful for an application to simultaneously ignore and block the same signal, it was unnecessary  
 128885 for POSIX.1 to specify behavior that would invalidate any of the historical implementations.

128886 There is one case in some historical implementations where an unblocked, pending signal does  
 128887 not remain pending until it is delivered. In the System V implementation of *signal()*, pending  
 128888 signals are discarded when the action is set to SIG\_DFL or a signal-catching routine (as well as  
 128889 to SIG\_IGN). Except in the case of setting SIGCHLD to SIG\_DFL, implementations that do this  
 128890 do not conform completely to POSIX.1. Some earlier proposals for POSIX.1 explicitly stated this,  
 128891 but these statements were redundant due to the requirement that functions defined by POSIX.1  
 128892 not change attributes of processes defined by POSIX.1 except as explicitly stated.

128893 POSIX.1 specifically states that the order in which multiple, simultaneously pending signals are  
 128894 delivered is unspecified. This order has not been explicitly specified in historical  
 128895 implementations, but has remained quite consistent and been known to those familiar with the  
 128896 implementations. Thus, there have been cases where applications (usually system utilities) have  
 128897 been written with explicit or implicit dependencies on this order. Implementors and others  
 128898 porting existing applications may need to be aware of such dependencies.

128899 When there are multiple pending signals that are not blocked, implementations should arrange  
 128900 for the delivery of all signals at once, if possible. Some implementations stack calls to all pending  
 128901 signal-catching routines, making it appear that each signal-catcher was interrupted by the next  
 128902 signal. In this case, the implementation should ensure that this stacking of signals does not  
 128903 violate the semantics of the signal masks established by *sigaction()*. Other implementations  
 128904 process at most one signal when the operating system is entered, with remaining signals saved  
 128905 for later delivery. Although this practice is widespread, this behavior is neither standardized  
 128906 nor endorsed. In either case, implementations should attempt to deliver signals associated with  
 128907 the current state of the process (for example, SIGFPE) before other signals, if possible.

128908 In 4.2 BSD and 4.3 BSD, it is not permissible to ignore or explicitly block SIGCONT, because if  
 128909 blocking or ignoring this signal prevented it from continuing a stopped process, such a process  
 128910 could never be continued (only killed by SIGKILL). However, 4.2 BSD and 4.3 BSD do block  
 128911 SIGCONT during execution of its signal-catching function when it is caught, creating exactly  
 128912 this problem. A proposal was considered to disallow catching SIGCONT in addition to ignoring  
 128913 and blocking it, but this limitation led to objections. The consensus was to require that  
 128914 SIGCONT always continue a stopped process when generated. This removed the need to  
 128915 disallow ignoring or explicit blocking of the signal; note that SIG\_IGN and SIG\_DFL are  
 128916 equivalent for SIGCONT.

#### 128917 B.2.4.2 Realtime Signal Generation and Delivery

128918 The realtime signals functionality is required in this version of the standard for the following  
 128919 reasons:

- 128920 • The **sigevent** structure is used by other POSIX.1 functions that result in asynchronous  
 128921 event notifications to specify the notification mechanism to use and other information  
 128922 needed by the notification mechanism. POSIX.1-2024 defines only three symbolic values  
 128923 for the notification mechanism:
  - 128924 — SIGEV\_NONE is used to indicate that no notification is required when the event  
 128925 occurs. This is useful for applications that use asynchronous I/O with polling for  
 128926 completion.
  - 128927 — SIGEV\_SIGNAL indicates that a signal is generated when the event occurs.

128928 — SIGEV\_THREAD provides for “callback functions” for asynchronous notifications  
 128929 done by a function call within the context of a new thread. This provides a multi-  
 128930 threaded process with a more natural means of notification than signals.

128931 The primary difficulty with previous notification approaches has been to specify the  
 128932 environment of the notification routine.

128933 — One approach is to limit the notification routine to call only functions permitted in a  
 128934 signal handler. While the list of permissible functions is clearly stated, this is overly  
 128935 restrictive.

128936 — A second approach is to define a new list of functions or classes of functions that are  
 128937 explicitly permitted or not permitted. This would give a programmer more lists to  
 128938 deal with, which would be awkward.

128939 — The third approach is to define completely the environment for execution of the  
 128940 notification function. A clear definition of an execution environment for notification  
 128941 is provided by executing the notification function in the environment of a newly  
 128942 created thread.

128943 Implementations may support additional notification mechanisms by defining new values  
 128944 for *sigev\_notify*.

128945 For a notification type of SIGEV\_SIGNAL, the other members of the **sigevent** structure  
 128946 defined by POSIX.1-2024 specify the realtime signal—that is, the signal number and  
 128947 application-defined value that differentiates between occurrences of signals with the same  
 128948 number—that will be generated when the event occurs. The structure is defined in  
 128949 **<signal.h>**, even though the structure is not directly used by any of the signal functions,  
 128950 because it is part of the signals interface used by the POSIX.1b “client functions”. When the  
 128951 client functions include **<signal.h>** to define the signal names, the **sigevent** structure will  
 128952 also be defined.

128953 An application-defined value passed to the signal handler is used to differentiate between  
 128954 different “events” instead of requiring that the application use different signal numbers for  
 128955 several reasons:

128956 — Realtime applications potentially handle a very large number of different events.  
 128957 Requiring that implementations support a correspondingly large number of distinct  
 128958 signal numbers will adversely impact the performance of signal delivery because the  
 128959 signal masks to be manipulated on entry and exit to the handlers will become large.

128960 — Event notifications are prioritized by signal number (the rationale for this is  
 128961 explained in the following paragraphs) and the use of different signal numbers to  
 128962 differentiate between the different event notifications overloads the signal number  
 128963 more than has already been done. It also requires that the application developer  
 128964 make arbitrary assignments of priority to events that are logically of equal priority.

128965 A union is defined for the application-defined value so that either an integer constant or a  
 128966 pointer can be portably passed to the signal-catching function. On some architectures a  
 128967 pointer cannot be cast to an **int** and *vice versa*.

128968 Use of a structure here with an explicit notification type discriminant rather than explicit  
 128969 parameters to realtime functions, or embedded in other realtime structures, provides for  
 128970 future extensions to POSIX.1-2024. Additional, perhaps more efficient, notification  
 128971 mechanisms can be supported for existing realtime function interfaces, such as timers and  
 128972 asynchronous I/O, by extending the **sigevent** structure appropriately. The existing  
 128973 realtime function interfaces will not have to be modified to use any such new notification  
 128974 mechanism. The revised text concerning the SIGEV\_SIGNAL value makes consistent the

128975 semantics of the members of the **sigevent** structure, particularly in the definitions of  
 128976 *lio\_listio()* and *aio\_fsync()*. For uniformity, other revisions cause this specification to be  
 128977 referred to rather than inaccurately duplicated in the descriptions of functions and  
 128978 structures using the **sigevent** structure. The revised wording does not relax the  
 128979 requirement that the signal number be in the range SIGRTMIN to SIGRTMAX to guarantee  
 128980 queuing and passing of the application value, since that requirement is still implied by the  
 128981 signal names.

128982 • POSIX.1-2024 is intentionally vague on whether “non-realtime” signal-generating  
 128983 mechanisms can result in a **siginfo\_t** being supplied to the handler on delivery. In one  
 128984 existing implementation, a **siginfo\_t** is posted on signal generation, even though the  
 128985 implementation does not support queuing of multiple occurrences of a signal. It is not the  
 128986 intent of POSIX.1-2024 to preclude this, independent of the mandate to define signals that  
 128987 do support queuing. Any interpretation that appears to preclude this is a mistake in the  
 128988 reading or writing of the standard.

128989 • Signals handled by realtime signal handlers might be generated by functions or conditions  
 128990 that do not allow the specification of an application-defined value and do not queue.  
 128991 POSIX.1-2024 specifies the *si\_code* member of the **siginfo\_t** structure used in existing  
 128992 practice and defines additional codes so that applications can detect whether an  
 128993 application-defined value is present or not. The code SI\_USER for *kill()*-generated signals  
 128994 is adopted from existing practice.

128995 • The *sigaction()* *sa\_flags* value SA\_SIGINFO tells the implementation that the signal-  
 128996 catching function expects two additional arguments. When the flag is not set, a single  
 128997 argument, the signal number, is passed as specified by POSIX.1-2024. Although  
 128998 POSIX.1-2024 does not explicitly allow the *info* argument to the handler function to be  
 128999 NULL, this is existing practice. This provides for compatibility with programs whose  
 129000 signal-catching functions are not prepared to accept the additional arguments.  
 129001 POSIX.1-2024 is explicitly unspecified as to whether signals actually queue when  
 129002 SA\_SIGINFO is not set for a signal, as there appear to be no benefits to applications in  
 129003 specifying one behavior or another. One existing implementation queues a **siginfo\_t** on  
 129004 each signal generation, unless the signal is already pending, in which case the  
 129005 implementation discards the new **siginfo\_t**; that is, the queue length is never greater than  
 129006 one. This implementation only examines SA\_SIGINFO on signal delivery, discarding the  
 129007 queued **siginfo\_t** if its delivery was not requested.

129008 The third argument to the signal-catching function, *context*, is left undefined by  
 129009 POSIX.1-2024, but is specified in the interface because it matches existing practice for the  
 129010 SA\_SIGINFO flag. It was considered undesirable to require a separate implementation for  
 129011 SA\_SIGINFO for POSIX conformance on implementations that already support the two  
 129012 additional parameters.

129013 • The requirement to deliver lower numbered signals in the range SIGRTMIN to SIGRTMAX  
 129014 first, when multiple unblocked signals are pending, results from several considerations:

129015 — A method is required to prioritize event notifications. The signal number was chosen  
 129016 instead of, for instance, associating a separate priority with each request, because an  
 129017 implementation has to check pending signals at various points and select one for  
 129018 delivery when more than one is pending. Specifying a selection order is the minimal  
 129019 additional semantic that will achieve prioritized delivery. If a separate priority were  
 129020 to be associated with queued signals, it would be necessary for an implementation to  
 129021 search all non-empty, non-blocked signal queues and select from among them the  
 129022 pending signal with the highest priority. This would significantly increase the cost of  
 129023 and decrease the determinism of signal delivery.

129024 — Given the specified selection of the lowest numeric unblocked pending signal,  
 129025 preemptive priority signal delivery can be achieved using signal numbers and signal  
 129026 masks by ensuring that the *sa\_mask* for each signal number blocks all signals with a  
 129027 higher numeric value.

129028 For realtime applications that want to use only the newly defined realtime signal  
 129029 numbers without interference from the standard signals, this can be achieved by  
 129030 blocking all of the standard signals in the thread signal mask and in the *sa\_mask*  
 129031 installed by the signal action for the realtime signal handlers.

129032 POSIX.1-2024 explicitly leaves unspecified the ordering of signals outside of the range of  
 129033 realtime signals and the ordering of signals within this range with respect to those outside  
 129034 the range. It was believed that this would unduly constrain implementations or standards  
 129035 in the future definition of new signals.

129036 Austin Group Defect 633 is applied, reducing to two the allowed behaviors for the signal mask  
 129037 of the thread that is created to handle a SIGEV\_THREAD notification.

129038 Austin Group Defect 1116 is applied, removing a reference to the Realtime Signals Extension  
 129039 option that existed in earlier versions of this standard.

#### 129040 B.2.4.3 Signal Actions

129041 Early proposals mentioned SIGCONT as a second exception to the rule that signals are not  
 129042 delivered to stopped processes until continued. Because POSIX.1-2024 now specifies that  
 129043 SIGCONT causes the stopped process to continue when it is generated, delivery of SIGCONT is  
 129044 not prevented because a process is stopped, even without an explicit exception to this rule.

129045 Ignoring a signal by setting the action to SIG\_IGN (or SIG\_DFL for signals whose default action  
 129046 is to ignore) is not the same as installing a signal-catching function that simply returns. Invoking  
 129047 such a function will interrupt certain system functions that block processes (for example, *wait()*,  
 129048 *sigsuspend()*, *pause()*, *read()*, *write()*) while ignoring a signal has no such effect on the process.

129049 Historical implementations discard pending signals when the action is set to SIG\_IGN.  
 129050 However, they do not always do the same when the action is set to SIG\_DFL and the default  
 129051 action is to ignore the signal. POSIX.1-2024 requires this for the sake of consistency and also for  
 129052 completeness, since the only signal this applies to is SIGCHLD, and POSIX.1-2024 disallows  
 129053 setting its action to SIG\_IGN.

129054 Some implementations (System V, for example) assign different semantics for SIGCHLD  
 129055 depending on whether the action is set to SIG\_IGN or SIG\_DFL. Since POSIX.1 requires that the  
 129056 default action for SIGCHLD be to ignore the signal, applications should always set the action to  
 129057 SIG\_DFL in order to avoid SIGCHLD.

129058 Whether or not an implementation allows SIG\_IGN as a SIGCHLD disposition to be inherited  
 129059 across a call to one of the *exec* family of functions or *posix\_spawn()* is explicitly left as  
 129060 unspecified. This change was made as a result of IEEE PASC Interpretation 1003.1 #132, and  
 129061 permits the implementation to decide between the following alternatives:

- 129062 • Unconditionally leave SIGCHLD set to SIG\_IGN, in which case the implementation would  
 129063 not allow applications that assume inheritance of SIG\_DFL to conform to POSIX.1-2024  
 129064 without change. The implementation would, however, retain an ability to control  
 129065 applications that create child processes but never call on the *wait* family of functions,  
 129066 potentially filling up the process table.
- 129067 • Unconditionally reset SIGCHLD to SIG\_DFL, in which case the implementation would  
 129068 allow applications that assume inheritance of SIG\_DFL to conform. The implementation  
 129069 would, however, lose an ability to control applications that spawn child processes but

129070 never reap them.

- 129071 • Provide some mechanism, not specified in POSIX.1-2024, to control inherited SIGCHLD
- 129072 dispositions.

129073 Some implementations (System V, for example) will deliver a SIGCLD signal immediately when  
 129074 a process establishes a signal-catching function for SIGCLD when that process has a child that  
 129075 has already terminated. Other implementations, such as 4.3 BSD, do not generate a new  
 129076 SIGCHLD signal in this way. In general, a process should not attempt to alter the signal action  
 129077 for the SIGCHLD signal while it has any outstanding children. However, it is not always  
 129078 possible for a process to avoid this; for example, shells sometimes start up processes in pipelines  
 129079 with other processes from the pipeline as children. Processes that cannot ensure that they have  
 129080 no children when altering the signal action for SIGCHLD thus need to be prepared for, but not  
 129081 depend on, generation of an immediate SIGCHLD signal.

129082 The default action of the stop signals (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is to stop a  
 129083 process that is executing. If a stop signal is delivered to a process that is already stopped, it has  
 129084 no effect. In fact, if a stop signal is generated for a stopped process whose signal mask blocks the  
 129085 signal, the signal will never be delivered to the process since the process must receive a  
 129086 SIGCONT, which discards all pending stop signals, in order to continue executing.

129087 The SIGCONT signal continues a stopped process even if SIGCONT is blocked (or ignored).  
 129088 However, if a signal-catching routine has been established for SIGCONT, it will not be entered  
 129089 until SIGCONT is unblocked.

129090 If a process in an orphaned process group stops, it is no longer under the control of a job control  
 129091 shell and hence would not normally ever be continued. Because of this, orphaned processes that  
 129092 receive terminal-related stop signals (SIGTSTP, SIGTTIN, SIGTTOU, but not SIGSTOP) must not  
 129093 be allowed to stop. The goal is to prevent stopped processes from languishing forever. (As  
 129094 SIGSTOP is sent only via *kill()*, it is assumed that the process or user sending a SIGSTOP can  
 129095 send a SIGCONT when desired.) Instead, the system must discard the stop signal. As an  
 129096 extension, it may also deliver another signal in its place. 4.3 BSD sends a SIGKILL, which is  
 129097 overly effective because SIGKILL is not catchable. Another possible choice is SIGHUP. 4.3 BSD  
 129098 also does this for orphaned processes (processes whose parent has terminated) rather than for  
 129099 members of orphaned process groups; this is less desirable because job control shells manage  
 129100 process groups. POSIX.1 also prevents SIGTTIN and SIGTTOU signals from being generated for  
 129101 processes in orphaned process groups as a direct result of activity on a terminal, preventing  
 129102 infinite loops when *read()* and *write()* calls generate signals that are discarded; see [Section](#)  
 129103 [A.11.1.4](#) (on page 3720). A similar restriction on the generation of SIGTSTP was considered, but  
 129104 that would be unnecessary and more difficult to implement due to its asynchronous nature.

129105 Although POSIX.1 requires that signal-catching functions be called with only one argument,  
 129106 there is nothing to prevent conforming implementations from extending POSIX.1 to pass  
 129107 additional arguments, as long as Strictly Conforming POSIX.1 Applications continue to compile  
 129108 and execute correctly. Most historical implementations do, in fact, pass additional, signal-  
 129109 specific arguments to certain signal-catching routines.

129110 There was a proposal to change the declared type of the signal handler to:

```
129111 void func (int sig, ...);
```

129112 The usage of ellipses ("*...*") is ISO C standard syntax to indicate a variable number of  
 129113 arguments. Its use was intended to allow the implementation to pass additional information to  
 129114 the signal handler in a standard manner.

129115 Unfortunately, this construct would require all signal handlers to be defined with this syntax  
 129116 because the ISO C standard allows implementations to use a different parameter passing  
 129117 mechanism for variable parameter lists than for non-variable parameter lists. Thus, all existing

129118 signal handlers in all existing applications would have to be changed to use the variable syntax  
129119 in order to be standard and portable. This is in conflict with the goal of Minimal Changes to  
129120 Existing Application Code.

129121 When terminating a process from a signal-catching function, processes should be aware of any  
129122 interpretation that their parent may make of the status returned by *wait()*, *waitid()*, or *waitpid()*.  
129123 In particular, a signal-catching function should not call *exit(0)* or *\_exit(0)* unless it wants to  
129124 indicate successful termination. A non-zero argument to *exit()* or *\_exit()* can be used to indicate  
129125 unsuccessful termination. Alternatively, the process can use *kill()* to send itself a fatal signal  
129126 (first ensuring that the signal is set to the default action and not blocked). See also the  
129127 RATIONALE section of the *\_exit()* function.

129128 The behavior of *unsafe* functions, as defined by this section, is undefined when they are called  
129129 from (or after a *longjmp()* or *siglongjmp()* out of) signal-catching functions in certain  
129130 circumstances. The behavior of *async-signal-safe* functions, as defined by this section, is as  
129131 specified by POSIX.1, regardless of invocation from a signal-catching function. This is the only  
129132 intended meaning of the statement that *async-signal-safe* functions may be used in signal-  
129133 catching functions without restriction. Applications must still consider all effects of such  
129134 functions on such things as data structures, files, and process state. In particular, application  
129135 developers need to consider the restrictions on interactions when interrupting *sleep()* (see  
129136 *sleep()*) and interactions among multiple handles for a file description. The fact that any specific  
129137 function is listed as *async-signal-safe* does not necessarily mean that invocation of that function  
129138 from a signal-catching function is recommended.

129139 In order to prevent errors arising from interrupting non-*async-signal-safe* function calls,  
129140 applications should protect calls to these functions either by blocking the appropriate signals or  
129141 through the use of some programmatic semaphore. POSIX.1 does not address the more general  
129142 problem of synchronizing access to shared data structures. Note in particular that even the  
129143 “safe” functions may modify the global variable *errno*; the signal-catching function may want to  
129144 save and restore its value. The same principles apply to the *async-signal-safety* of application  
129145 routines and asynchronous data access.

129146 Note that although *longjmp()* and *siglongjmp()* are in the list of *async-signal-safe* functions, there  
129147 are restrictions on subsequent behavior after the function is called from a signal-catching  
129148 function. This is because the code executing after *longjmp()* or *siglongjmp()* can call any *unsafe*  
129149 functions with the same danger as calling those *unsafe* functions directly from the signal  
129150 handler. Applications that use *longjmp()* or *siglongjmp()* out of signal handlers require rigorous  
129151 protection in order to be portable. Many of the other functions that are excluded from the list are  
129152 traditionally implemented using either the C language *malloc()* or *free()* functions or the ISO C  
129153 standard I/O library, both of which traditionally use data structures in a non-*async-signal-safe*  
129154 manner. Because any combination of different functions using a common data structure can  
129155 cause *async-signal-safety* problems, POSIX.1 does not define the behavior when any *unsafe*  
129156 function is called in (or after a *longjmp()* or *siglongjmp()* out of) a signal handler that interrupts  
129157 any *unsafe* function or the non-*async-signal-safe* processing equivalent to *exit()* that is  
129158 performed after return from the initial call to *main()*.

129159 The only realtime extension to signal actions is the addition of the additional parameters to the  
129160 signal-catching function. This extension has been explained and motivated in the previous  
129161 section. In making this extension, though, developers of POSIX.1b ran into issues relating to  
129162 function prototypes. In response to input from the POSIX.1 standard developers, members were  
129163 added to the **sigaction** structure to specify function prototypes for the newer signal-catching  
129164 function specified by POSIX.1b. These members follow changes that are being made to POSIX.1.  
129165 Note that POSIX.1-2024 explicitly states that these fields may overlap so that a union can be  
129166 defined. This enabled existing implementations of POSIX.1 to maintain binary-compatibility  
129167 when these extensions were added.

129168 The **siginfo\_t** structure was adopted for passing the application-defined value to match existing  
 129169 practice, but the existing practice has no provision for an application-defined value, so this was  
 129170 added. Note that POSIX normally reserves the “\_t” type designation for opaque types. The  
 129171 **siginfo\_t** structure breaks with this convention to follow existing practice and thus promote  
 129172 portability.

129173 POSIX.1-2024 specifies several values for the *si\_code* member of the **siginfo\_t** structure. Some  
 129174 were introduced in POSIX.1b; others were XSI functionality in the Single UNIX Specification,  
 129175 Version 2 and Version 3, that has now become Base functionality. Historically, an *si\_code* value of  
 129176 less than or equal to zero indicated that the signal was generated by a process via the *kill()*  
 129177 function, and values of *si\_code* that provided additional information for implementation-  
 129178 generated signals, such as SIGFPE or SIGSEGV, were all positive. This functionality is partially  
 129179 specified for XSI systems in that if *si\_code* is less than or equal to zero, the signal was generated  
 129180 by a process. However, since POSIX.1b did not specify that SI\_USER (or SI\_QUEUE) had a value  
 129181 less than or equal to zero, it is not true that when the signal is generated by a process, the value  
 129182 of *si\_code* will always be less than or equal to zero. XSI applications should check whether *si\_code*  
 129183 is SI\_USER or SI\_QUEUE in addition to checking whether it is less than or equal to zero.  
 129184 Applications on systems that do not support the XSI option should just check for SI\_USER and  
 129185 SI\_QUEUE.

129186 If an implementation chooses to define additional values for *si\_code*, these values have to be  
 129187 different from the values of the non-signal-specific symbols specified by POSIX.1-2024. This will  
 129188 allow conforming applications to differentiate between signals generated by standard events  
 129189 and those generated by other implementation events in a manner compatible with existing  
 129190 practice.

129191 The unique values of *si\_code* for the POSIX.1b asynchronous events have implications for  
 129192 implementations of, for example, asynchronous I/O or message passing in user space library  
 129193 code. Such an implementation will be required to provide a hidden interface to the signal  
 129194 generation mechanism that allows the library to specify the standard values of *si\_code*.

129195 POSIX.1-2024 also specifies additional members of **siginfo\_t**, beyond those that were in  
 129196 POSIX.1b. Like the *si\_code* values mentioned above, these were XSI functionality in the Single  
 129197 UNIX Specification, Version 2 and Version 3, that has now become Base functionality. They  
 129198 provide additional information when *si\_code* has one of the values that moved from XSI to Base.

129199 Although it is not explicitly visible to applications, there are additional semantics for signal  
 129200 actions implied by queued signals and their interaction with other POSIX.1b realtime functions.  
 129201 Specifically:

- 129202 • It is not necessary to queue signals whose action is SIG\_IGN.
- 129203 • For implementations that support POSIX.1b timers, some interaction with the timer  
 129204 functions at signal delivery is implied to manage the timer overrun count.

129205 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/5 is applied, reordering the RTS shaded  
 129206 text under the third and fourth paragraphs of the SIG\_DFL description. This corrects an earlier  
 129207 editorial error in this section.

129208 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/6 is applied, adding the *abort()* function  
 129209 to the list of async-signal-safe functions.

129210 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/4 is applied, adding the *socketmark()*  
 129211 function to the list of async-signal-safe functions.

129212 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0011 [690], XSH/TC2-2008/0012 [516],  
 129213 XSH/TC2-2008/0013 [692], XSH/TC2-2008/0014 [615], XSH/TC2-2008/0015 [516], and  
 129214 XSH/TC2-2008/0016 [807] are applied.

- 129215 Austin Group Defect 62 is applied, adding the `_Fork()` function to, and removing the `fork()`  
129216 function from, the list of async-signal-safe functions.
- 129217 Austin Group Defect 162 is applied, adding functions from the `<endian.h>` header to the list of  
129218 async-signal-safe functions.
- 129219 Austin Group Defect 411 is applied, adding `accept4()`, `dup3()`, and `pipe2()` to the list of async-  
129220 signal-safe functions.
- 129221 Austin Group Defect 614 is applied, adding `posix_close()` to the list of async-signal-safe  
129222 functions.
- 129223 Austin Group Defect 699 is applied, adding `setegid()`, `seteuid()`, `setregid()`, and `setreuid()` to the  
129224 list of async-signal-safe functions.
- 129225 Austin Group Defect 711 is applied, adding `va_arg()`, `va_copy()`, `va_end()`, and `va_start()` to the  
129226 list of async-signal-safe functions and updating related text to apply to function-like macros.
- 129227 Austin Group Defect 728 is applied, reducing the set of circumstances in which undefined  
129228 behavior results when a signal handler refers to an object with static or thread storage duration.
- 129229 Austin Group Defect 841 is applied, adding `pthread_setcancelstate()` to the list of async-signal-safe  
129230 functions and making it implementation-defined which additional interfaces are also async-  
129231 signal-safe.
- 129232 Austin Group Defect 986 is applied, adding `strlcat()`, `strlcpy()`, `wcslcat()`, and `wcslcpy()` to the list  
129233 of async-signal-safe functions.
- 129234 Austin Group Defect 1138 is applied, adding the `sig2str()` function to the list of async-signal-safe  
129235 functions.
- 129236 Austin Group Defect 1141 is applied, changing “core file” to “core image”.
- 129237 Austin Group Defects 1142, 1455, and 1625 are applied, adding the `pread()`, `pwrite()`, `readv()`,  
129238 `waitid()`, and `writev()` functions to the list of async-signal-safe functions.
- 129239 Austin Group Defect 1151 is applied, adding the `tcgetwinsize()` and `tcsetwinsize()` functions to the  
129240 list of async-signal-safe functions.
- 129241 Austin Group Defect 1215 is applied, removing XSI shading from text relating to abnormal  
129242 process termination with additional actions.
- 129243 Austin Group Defect 1263 is applied, adding the `ppoll()` function to the list of async-signal-safe  
129244 functions.
- 129245 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 129246 Austin Group Defect 1667 is applied, adding `getresgid()`, `getresuid()`, `setresgid()`, and `setresuid()` to  
129247 the list of async-signal-safe functions.
- 129248 Austin Group Defect 1744 is applied, adding `killpg()` to the list of async-signal-safe functions.

129249 **B.2.4.4** *Signal Effects on Other Functions*

- 129250 The most common behavior of an interrupted function after a signal-catching function returns is  
129251 for the interrupted function to give an [EINTR] error unless the SA\_RESTART flag is in effect for  
129252 the signal. However, there are a number of specific exceptions, including `sleep()` and certain  
129253 situations with `read()` and `write()`.
- 129254 The historical implementations of many functions defined by POSIX.1-2024 are not interruptible,  
129255 but delay delivery of signals generated during their execution until after they complete. This is  
129256 never a problem for functions that are guaranteed to complete in a short (imperceptible to a

129257 human) period of time. It is normally those functions that can suspend a process indefinitely or  
 129258 for long periods of time (for example, *wait()*, *pause()*, *sigsuspend()*, *sleep()*, or *read()/write()* on a  
 129259 slow device like a terminal) that are interruptible. This permits applications to respond to  
 129260 interactive signals or to set timeouts on calls to most such functions with *alarm()*. Therefore,  
 129261 implementations should generally make such functions (including ones defined as extensions)  
 129262 interruptible.

129263 Functions not mentioned explicitly as interruptible may be so on some implementations,  
 129264 possibly as an extension where the function gives an [EINTR] error. There are several functions  
 129265 (for example, *getpid()*, *getuid()*) that are specified as never returning an error, which can thus  
 129266 never be extended in this way.

129267 If a signal-catching function returns while the SA\_RESTART flag is in effect, an interrupted  
 129268 function is restarted at the point it was interrupted. Conforming applications cannot make  
 129269 assumptions about the internal behavior of interrupted functions, even if the functions are  
 129270 async-signal-safe. For example, suppose the *read()* function is interrupted with SA\_RESTART in  
 129271 effect, the signal-catching function closes the file descriptor being read from and returns, and the  
 129272 *read()* function is then restarted; in this case the application cannot assume that the *read()*  
 129273 function will give an [EBADF] error, since *read()* might have checked the file descriptor for  
 129274 validity before being interrupted.

129275 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0017 [807] is applied.

## 129276 B.2.5 Standard I/O Streams

129277 Although the ISO C standard guarantees that, at program start-up, *stdin* is open for reading and  
 129278 *stdout* and *stderr* are open for writing, this guarantee is contingent (as are all guarantees made by  
 129279 the ISO C and POSIX standards) on the program being executed in a conforming environment.  
 129280 Programs executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not  
 129281 open for writing are executed in a non-conforming environment. Application writers are warned  
 129282 (in *exec*, *posix\_spawn()*, and Section C.2.7, on page 3890) not to execute a standard utility or a  
 129283 conforming application with file descriptor 0 not open for reading or with file descriptor 1 or 2  
 129284 not open for writing.

129285 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0018 [608] is applied.

129286 Austin Group Defect 689 is applied, clarifying the handling of deadlock situations when locking  
 129287 a stream.

129288 Austin Group Defect 1144 is applied, clarifying the effect of *setvbuf()* on memory streams.

129289 Austin Group Defect 1153 is applied, clarifying that the behavior is undefined if a memory  
 129290 buffer associated with a standard I/O stream overlaps with the destination buffer of a call that  
 129291 reads from the stream or with the source buffer of a call that writes to the stream.

129292 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

129293 Austin Group Defect 1347 is applied, clarifying the requirements for how *stderr*, *stdin*, and *stdout*  
 129294 are opened at program start-up.

### 129295 B.2.5.1 Interaction of File Descriptors and Standard I/O Streams

129296 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0019 [480] is applied.

129297 Austin Group Defect 1183 is applied, changing “non-full” to “non-null”.

129298 Austin Group Defect 1318 is applied, changing the list of functions that close file descriptors.

129299 B.2.5.2 *Stream Orientation and Encoding Rules*

129300 Austin Group Defect 1040 is applied, clarifying that conversion to or from (possibly multi-byte)  
 129301 characters is not performed by wide character I/O functions when the stream was opened using  
 129302 *open\_wmemstream()*.

129303 **B.2.6 File Descriptor Allocation**

129304 Functions such as *pipe()* and *socketpair()* which allocate two file descriptors are permitted to  
 129305 perform the two allocations independently. This means that other threads or signal handlers  
 129306 may perform operations on file descriptors in between the two allocations and this can result in  
 129307 the two file descriptors not having adjacent values or in the second allocation producing a lower  
 129308 value than the first.

129309 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0032 [835] is applied.

129310 **B.2.7 XSI Interprocess Communication**

129311 There are two forms of IPC supported as options in POSIX.1-2024. The traditional System V IPC  
 129312 routines derived from the SVID—that is, the *msg\*()*, *sem\*()*, and *shm\*()* interfaces—are  
 129313 mandatory on XSI-conformant systems. Thus, all XSI-conformant systems provide the same  
 129314 mechanisms for manipulating messages, shared memory, and semaphores.

129315 In addition, the POSIX Realtime Extension provides an alternate set of routines for those systems  
 129316 supporting the appropriate options.

129317 The application developer is presented with a choice: the System V interfaces or the POSIX  
 129318 interfaces (loosely derived from the Berkeley interfaces). The XSI profile prefers the System V  
 129319 interfaces, but the POSIX interfaces may be more suitable for realtime or other performance-  
 129320 sensitive applications.

129321 B.2.7.1 *IPC General Description*

129322 General information that is shared by all three mechanisms is described in this section. The  
 129323 common permissions mechanism is briefly introduced, describing the mode bits, and how they  
 129324 are used to determine whether or not a process has access to read or write/alter the appropriate  
 129325 instance of one of the IPC mechanisms. All other relevant information is contained in the  
 129326 reference pages themselves.

129327 The semaphore type of IPC allows processes to communicate through the exchange of  
 129328 semaphore values. A semaphore is a positive integer. Since many applications require the use of  
 129329 more than one semaphore, XSI-conformant systems have the ability to create sets or arrays of  
 129330 semaphores.

129331 Calls to support semaphores include:

129332 *semctl()*, *semget()*, *semop()*

129333 Semaphore sets are created by using the *semget()* function.

129334 The message type of IPC allows processes to communicate through the exchange of data stored  
 129335 in buffers. This data is transmitted between processes in discrete portions known as messages.

129336 Calls to support message queues include:

129337 *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

129338 The shared memory type of IPC allows two or more processes to share memory and  
 129339 consequently the data contained therein. This is done by allowing processes to set up access to a  
 129340 common memory address space. This sharing of memory provides a fast means of exchange of  
 129341 data between processes.

129342 Calls to support shared memory include:

129343 `shmctl()`, `shmdt()`, `shmget()`

129344 The `ftok()` interface is also provided.

129345 Austin Group Defect 377 is applied, changing the table giving the values for the *mode* member of  
 129346 the `ipc_perm` structure.

## 129347 B.2.8 Realtime

### 129348 Advisory Information

129349 POSIX.1b contains an Informative Annex with proposed interfaces for “realtime files”. These  
 129350 interfaces could determine groups of the exact parameters required to do “direct I/O” or  
 129351 “extents”. These interfaces were objected to by a significant portion of the balloting group as too  
 129352 complex. A conforming application had little chance of correctly navigating the large parameter  
 129353 space to match its desires to the system. In addition, they only applied to a new type of file  
 129354 (realtime files) and they told the implementation exactly what to do as opposed to advising the  
 129355 implementation on application behavior and letting it optimize for the system the (portable)  
 129356 application was running on. For example, it was not clear how a system that had a disk array  
 129357 should set its parameters.

129358 There seemed to be several overall goals:

- 129359 • Optimizing sequential access
- 129360 • Optimizing caching behavior
- 129361 • Optimizing I/O data transfer
- 129362 • Preallocation

129363 The advisory interfaces, `posix_fadvise()` and `posix_madvise()`, satisfy the first two goals. The  
 129364 `POSIX_FADV_SEQUENTIAL` and `POSIX_MADV_SEQUENTIAL` advice tells the  
 129365 implementation to expect serial access. Typically the system will prefetch the next several serial  
 129366 accesses in order to overlap I/O. It may also free previously accessed serial data if memory is  
 129367 tight. If the application is not doing serial access it can use `POSIX_FADV_WILLNEED` and  
 129368 `POSIX_MADV_WILLNEED` to accomplish I/O overlap, as required. When the application  
 129369 advises `POSIX_FADV_RANDOM` or `POSIX_MADV_RANDOM` behavior, the implementation  
 129370 usually tries to fetch a minimum amount of data with each request and it does not expect much  
 129371 locality. `POSIX_FADV_DONTNEED` and `POSIX_MADV_DONTNEED` allow the system to free  
 129372 up caching resources as the data will not be required in the near future.

129373 `POSIX_FADV_NOREUSE` tells the system that caching the specified data is not optimal. For file  
 129374 I/O, the transfer should go directly to the user buffer instead of being cached internally by the  
 129375 implementation. To portably perform direct disk I/O on all systems, the application must  
 129376 perform its I/O transfers according to the following rules:

- 129377 1. The user buffer should be aligned according to the `{POSIX_REC_XFER_ALIGN}`  
 129378 `pathconf()` variable.

- 129379 2. The number of bytes transferred in an I/O operation should be a multiple of the  
129380 {POSIX\_ALLOC\_SIZE\_MIN} *pathconf()* variable.
- 129381 3. The offset into the file at the start of an I/O operation should be a multiple of the  
129382 {POSIX\_ALLOC\_SIZE\_MIN} *pathconf()* variable.
- 129383 4. The application should ensure that all threads which open a given file specify  
129384 POSIX\_FADV\_NOREUSE to be sure that there is no unexpected interaction between  
129385 threads using buffered I/O and threads using direct I/O to the same file.

129386 In some cases, a user buffer must be properly aligned in order to be transferred directly to/from  
129387 the device. The {POSIX\_REC\_XFER\_ALIGN} *pathconf()* variable tells the application the proper  
129388 alignment.

129389 The preallocation goal is met by the space control function, *posix\_fallocate()*. The application can  
129390 use *posix\_fallocate()* to guarantee no [ENOSPC] errors and to improve performance by prepaying  
129391 any overhead required for block allocation.

129392 Implementations may use information conveyed by a previous *posix\_fadvise()* call to influence  
129393 the manner in which allocation is performed. For example, if an application did the following  
129394 calls:

```
129395 fd = open("file");
129396 posix_fadvise(fd, offset, len, POSIX_FADV_SEQUENTIAL);
129397 posix_fallocate(fd, len, size);
```

129398 an implementation might allocate the file contiguously on disk.

129399 Finally, the *pathconf()* variables {POSIX\_REC\_MIN\_XFER\_SIZE},  
129400 {POSIX\_REC\_MAX\_XFER\_SIZE}, and {POSIX\_REC\_INCR\_XFER\_SIZE} tell the application a  
129401 range of transfer sizes that are recommended for best I/O performance.

129402 Where bounded response time is required, the vendor can supply the appropriate settings of the  
129403 advisories to achieve a guaranteed performance level.

129404 The interfaces meet the goals while allowing applications using regular files to take advantage  
129405 of performance optimizations. The interfaces tell the implementation expected application  
129406 behavior which the implementation can use to optimize performance on a particular system  
129407 with a particular dynamic load.

129408 The *posix\_memalign()* function was added to allow for the allocation of specifically aligned  
129409 buffers; for example, for {POSIX\_REC\_XFER\_ALIGN}.

129410 The working group also considered the alternative of adding a function which would return an  
129411 aligned pointer to memory within a user-supplied buffer. This was not considered to be the best  
129412 method, because it potentially wastes large amounts of memory when buffers need to be aligned  
129413 on large alignment boundaries.

## 129414 Message Passing

129415 This section provides the rationale for the definition of the message passing interface in  
129416 POSIX.1-2024. This is presented in terms of the objectives, models, and requirements imposed  
129417 upon this interface.

- 129418 • Objectives

129419 Many applications, including both realtime and database applications, require a means of  
129420 passing arbitrary amounts of data between cooperating processes comprising the overall  
129421 application on one or more processors. Many conventional interfaces for interprocess  
129422 communication are insufficient for realtime applications in that efficient and deterministic

129423 data passing methods cannot be implemented. This has prompted the definition of  
129424 message passing interfaces providing these facilities:

- 129425 — Open a message queue.
- 129426 — Send a message to a message queue.
- 129427 — Receive a message from a queue, either synchronously or asynchronously.
- 129428 — Alter message queue attributes for flow and resource control.

129429 It is assumed that an application may consist of multiple cooperating processes and that  
129430 these processes may wish to communicate and coordinate their activities. The message  
129431 passing facility described in POSIX.1-2024 allows processes to communicate through  
129432 system-wide queues. These message queues are accessed through names that may be  
129433 pathnames. A message queue can be opened for use by multiple sending and/or multiple  
129434 receiving processes.

#### 129435 • Background on Embedded Applications

129436 Interprocess communication utilizing message passing is a key facility for the construction  
129437 of deterministic, high-performance realtime applications. The facility is present in all  
129438 realtime systems and is the framework upon which the application is constructed. The  
129439 performance of the facility is usually a direct indication of the performance of the resulting  
129440 application.

129441 Realtime applications, especially for embedded systems, are typically designed around the  
129442 performance constraints imposed by the message passing mechanisms. Applications for  
129443 embedded systems are typically very tightly constrained. Application developers expect to  
129444 design and control the entire system. In order to minimize system costs, the writer will  
129445 attempt to use all resources to their utmost and minimize the requirement to add  
129446 additional memory or processors.

129447 The embedded applications usually share address spaces and only a simple message  
129448 passing mechanism is required. The application can readily access common data incurring  
129449 only mutual-exclusion overheads. The models desired are the simplest possible with the  
129450 application building higher-level facilities only when needed.

#### 129451 • Requirements

129452 The following requirements determined the features of the message passing facilities  
129453 defined in POSIX.1-2024:

##### 129454 — Naming of Message Queues

129455 The mechanism for gaining access to a message queue is a pathname evaluated in a  
129456 context that is allowed to be a file system name space, or it can be independent of  
129457 any file system. This is a specific attempt to allow implementations based on either  
129458 method in order to address both embedded systems and to also allow  
129459 implementation in larger systems.

129460 The interface of `mq_open()` is defined to allow but not require the access control and  
129461 name conflicts resulting from utilizing a file system for name resolution. All required  
129462 behavior is specified for the access control case. Yet a conforming implementation,  
129463 such as an embedded system kernel, may define that there are no distinctions  
129464 between users and may define that all processes have all access privileges.

##### 129465 — Embedded System Naming

129466 Embedded systems need to be able to utilize independent name spaces for accessing  
129467 the various system objects. They typically do not have a file system, precluding its

- 129468 utilization as a common name resolution mechanism. The modularity of an  
 129469 embedded system limits the connections between separate mechanisms that can be  
 129470 allowed.
- 129471 Embedded systems typically do not have any access protection. Since the system  
 129472 does not support the mixing of applications from different areas, and usually does  
 129473 not even have the concept of an authorization entity, access control is not useful.
- 129474 — Large System Naming
- 129475 On systems with more functionality, the name resolution must support the ability to  
 129476 use the file system as the name resolution mechanism/object storage medium and to  
 129477 have control over access to the objects. Utilizing the pathname space can result in  
 129478 further errors when the names conflict with other objects.
- 129479 — Fixed Size of Messages
- 129480 The interfaces impose a fixed upper bound on the size of messages that can be sent to  
 129481 a specific message queue. The size is set on an individual queue basis and cannot be  
 129482 changed dynamically.
- 129483 The purpose of the fixed size is to increase the ability of the system to optimize the  
 129484 implementation of *mq\_send()* and *mq\_receive()*. With fixed sizes of messages and  
 129485 fixed numbers of messages, specific message blocks can be pre-allocated. This  
 129486 eliminates a significant amount of checking for errors and boundary conditions.  
 129487 Additionally, an implementation can optimize data copying to maximize  
 129488 performance. Finally, with a restricted range of message sizes, an implementation is  
 129489 better able to provide deterministic operations.
- 129490 — Prioritization of Messages
- 129491 Message prioritization allows the application to determine the order in which  
 129492 messages are received. Prioritization of messages is a key facility that is provided by  
 129493 most realtime kernels and is heavily utilized by the applications. The major purpose  
 129494 of having priorities in message queues is to avoid priority inversions in the message  
 129495 system, where a high-priority message is delayed behind one or more lower-priority  
 129496 messages. This allows the applications to be designed so that they do not need to be  
 129497 interrupted in order to change the flow of control when exceptional conditions occur.  
 129498 The prioritization does add additional overhead to the message operations, in those  
 129499 cases it is actually used, but a clever implementation can optimize for the FIFO case  
 129500 to make that more efficient.
- 129501 — Asynchronous Notification
- 129502 The interface supports the ability to have a task asynchronously notified of the  
 129503 availability of a message on the queue. The purpose of this facility is to allow the task  
 129504 to perform other functions and yet still be notified that a message has become  
 129505 available on the queue.
- 129506 To understand the requirement for this function, it is useful to understand two  
 129507 models of application design: a single task performing multiple functions and  
 129508 multiple tasks performing a single function. Each of these models has advantages.
- 129509 Asynchronous notification is required to build the model of a single task performing  
 129510 multiple operations. This model typically results from either the expectation that  
 129511 interruption is less expensive than utilizing a separate task or from the growth of the  
 129512 application to include additional functions.

**Semaphores**

129513  
129514 Semaphores are a high-performance process synchronization mechanism. Semaphores are  
129515 named by null-terminated strings of characters.

129516 A semaphore is created using the *sem\_init()* function or the *sem\_open()* function with the  
129517 *O\_CREAT* flag set in *oflag*.

129518 To use a semaphore, a process has to first initialize the semaphore or inherit an open descriptor  
129519 for the semaphore via *fork()*.

129520 A semaphore preserves its state when the last reference is closed. For example, if a semaphore  
129521 has a value of 13 when the last reference is closed, it will have a value of 13 when it is next  
129522 opened.

129523 When a semaphore is created, an initial state for the semaphore has to be provided. This value is  
129524 a non-negative integer. Negative values are not possible since they indicate the presence of  
129525 blocked processes. The persistence of any of these objects across a system crash or a system  
129526 reboot is undefined. Conforming applications must not depend on any sort of persistence across  
129527 a system reboot or a system crash.

129528 • Models and Requirements

129529 A realtime system requires synchronization and communication between the processes  
129530 comprising the overall application. An efficient and reliable synchronization mechanism  
129531 has to be provided in a realtime system that will allow more than one schedulable process  
129532 mutually-exclusive access to the same resource. This synchronization mechanism has to  
129533 allow for the optimal implementation of synchronization or systems implementors will  
129534 define other, more cost-effective methods.

129535 At issue are the methods whereby multiple processes (tasks) can be designed and  
129536 implemented to work together in order to perform a single function. This requires  
129537 interprocess communication and synchronization. A semaphore mechanism is the lowest  
129538 level of synchronization that can be provided by an operating system.

129539 A semaphore is defined as an object that has an integral value and a set of blocked  
129540 processes associated with it. If the value is positive or zero, then the set of blocked  
129541 processes is empty; otherwise, the size of the set is equal to the absolute value of the  
129542 semaphore value. The value of the semaphore can be incremented or decremented by any  
129543 process with access to the semaphore and must be done as an indivisible operation. When  
129544 a semaphore value is less than or equal to zero, any process that attempts to lock it again  
129545 will block or be informed that it is not possible to perform the operation.

129546 A semaphore may be used to guard access to any resource accessible by more than one  
129547 schedulable task in the system. It is a global entity and not associated with any particular  
129548 process. As such, a method of obtaining access to the semaphore has to be provided by the  
129549 operating system. A process that wants access to a critical resource (section) has to wait on  
129550 the semaphore that guards that resource. When the semaphore is locked on behalf of a  
129551 process, it knows that it can utilize the resource without interference by any other  
129552 cooperating process in the system. When the process finishes its operation on the resource,  
129553 leaving it in a well-defined state, it posts the semaphore, indicating that some other  
129554 process may now obtain the resource associated with that semaphore.

129555 In this section, mutexes and condition variables are specified as the synchronization  
129556 mechanisms between threads.

129557 These primitives are typically used for synchronizing threads that share memory in a  
129558 single process. However, this section provides an option allowing the use of these  
129559 synchronization interfaces and objects between processes that share memory, regardless of

- 129560 the method for sharing memory.
- 129561 Much experience with semaphores shows that there are two distinct uses of  
129562 synchronization: locking, which is typically of short duration; and waiting, which is  
129563 typically of long or unbounded duration. These distinct usages map directly onto mutexes  
129564 and condition variables, respectively.
- 129565 Semaphores are provided in POSIX.1-2024 primarily to provide a means of  
129566 synchronization for processes; these processes may or may not share memory. Mutexes  
129567 and condition variables are specified as synchronization mechanisms between threads;  
129568 these threads always share (some) memory. Both are synchronization paradigms that have  
129569 been in widespread use for a number of years. Each set of primitives is particularly well  
129570 matched to certain problems.
- 129571 With respect to binary semaphores, experience has shown that condition variables and  
129572 mutexes are easier to use for many synchronization problems than binary semaphores. The  
129573 primary reason for this is the explicit appearance of a Boolean predicate that specifies  
129574 when the condition wait is satisfied. This Boolean predicate terminates a loop, including  
129575 the call to `pthread_cond_wait()`. As a result, extra wakeups are benign since the predicate  
129576 governs whether the thread will actually proceed past the condition wait. With stateful  
129577 primitives, such as binary semaphores, the wakeup in itself typically means that the wait is  
129578 satisfied. The burden of ensuring correctness for such waits is thus placed on *all* signalers  
129579 of the semaphore rather than on an *explicitly coded* Boolean predicate located at the  
129580 condition wait. Experience has shown that the latter creates a major improvement in safety  
129581 and ease-of-use.
- 129582 Counting semaphores are well matched to dealing with producer/consumer problems,  
129583 including those that might exist between threads of different processes, or between a signal  
129584 handler and a thread. In the former case, there may be little or no memory shared by the  
129585 processes; in the latter case, one is not communicating between co-equal threads, but  
129586 between a thread and an interrupt-like entity. It is for these reasons that POSIX.1-2024  
129587 allows semaphores to be used by threads.
- 129588 Mutexes and condition variables have been effectively used with and without priority  
129589 inheritance, priority ceiling, and other attributes to synchronize threads that share  
129590 memory. The efficiency of their implementation is comparable to or better than that of  
129591 other synchronization primitives that are sometimes harder to use (for example, binary  
129592 semaphores). Furthermore, there is at least one known implementation of Ada tasking that  
129593 uses these primitives. Mutexes and condition variables together constitute an appropriate,  
129594 sufficient, and complete set of inter-thread synchronization primitives.
- 129595 Efficient multi-threaded applications require high-performance synchronization  
129596 primitives. Considerations of efficiency and generality require a small set of primitives  
129597 upon which more sophisticated synchronization functions can be built.
- 129598 • Standardization Issues
- 129599 It is possible to implement very high-performance semaphores using test-and-set  
129600 instructions on shared memory locations. The library routines that implement such a high-  
129601 performance interface have to properly ensure that a `sem_wait()` or `sem_trywait()` operation  
129602 that cannot be performed will issue a blocking semaphore system call or properly report  
129603 the condition to the application. The same interface to the application program would be  
129604 provided by a high-performance implementation.

129605 B.2.8.1 *Realtime Signals*

## 129606 **Realtime Signals Extension**

129607 This portion of the rationale presents models, requirements, and standardization issues relevant  
129608 to the Realtime Signals Extension. This extension provides the capability required to support  
129609 reliable, deterministic, asynchronous notification of events. While a new mechanism,  
129610 unencumbered by the historical usage and semantics of POSIX.1 signals, might allow for a more  
129611 efficient implementation, the application requirements for event notification can be met with a  
129612 small number of extensions to signals. Therefore, a minimal set of extensions to signals to  
129613 support the application requirements is specified.

129614 The realtime signal extensions specified in this section are used by other realtime functions  
129615 requiring asynchronous notification:

- 129616 • **Models**

129617 The model supported is one of multiple cooperating processes, each of which handles  
129618 multiple asynchronous external events. Events represent occurrences that are generated as  
129619 the result of some activity in the system. Examples of occurrences that can constitute an  
129620 event include:

- 129621 — Completion of an asynchronous I/O request
- 129622 — Expiration of a POSIX.1b timer
- 129623 — Arrival of an interprocess message
- 129624 — Generation of a user-defined event

129625 Processing of these events may occur synchronously via polling for event notifications or  
129626 asynchronously via a software interrupt mechanism. Existing practice for this model is  
129627 well established for traditional proprietary realtime operating systems, realtime  
129628 executives, and realtime extended POSIX-like systems.

129629 A contrasting model is that of “cooperating sequential processes” where each process  
129630 handles a single priority of events via polling. Each process blocks while waiting for  
129631 events, and each process depends on the preemptive, priority-based process scheduling  
129632 mechanism to arbitrate between events of different priority that need to be processed  
129633 concurrently. Existing practice for this model is also well established for small realtime  
129634 executives that typically execute in an unprotected physical address space, but it is just  
129635 emerging in the context of a fuller function operating system with multiple virtual address  
129636 spaces.

129637 It could be argued that the cooperating sequential process model, and the facilities  
129638 supported by the POSIX Threads Extension obviate a software interrupt model. But, even  
129639 with the cooperating sequential process model, the need has been recognized for a  
129640 software interrupt model to handle exceptional conditions and process aborting, so the  
129641 mechanism must be supported in any case. Furthermore, it is not the purview of  
129642 POSIX.1-2024 to attempt to convince realtime practitioners that their current application  
129643 models based on software interrupts are “broken” and should be replaced by the  
129644 cooperating sequential process model. Rather, it is the charter of POSIX.1-2024 to provide  
129645 standard extensions to mechanisms that support existing realtime practice.

- 129646 • **Requirements**

129647 This section discusses the following realtime application requirements for asynchronous  
129648 event notification:

- 129649 — Reliable delivery of asynchronous event notification
- 129650 The events notification mechanism guarantees delivery of an event notification.  
129651 Asynchronous operations (such as asynchronous I/O and timers) that complete  
129652 significantly after they are invoked have to guarantee that delivery of the event  
129653 notification can occur at the time of completion.
- 129654 — Prioritized handling of asynchronous event notifications
- 129655 The events notification mechanism supports the assigning of a user function as an  
129656 event notification handler. Furthermore, the mechanism supports the preemption of  
129657 an event handler function by a higher priority event notification and supports the  
129658 selection of the highest priority pending event notification when multiple  
129659 notifications (of different priority) are pending simultaneously.
- 129660 The model here is based on hardware interrupts. Asynchronous event handling  
129661 allows the application to ensure that time-critical events are immediately processed  
129662 when delivered, without the indeterminism of being at a random location within a  
129663 polling loop. Use of handler priority allows the specification of how handlers are  
129664 interrupted by other higher priority handlers.
- 129665 — Differentiation between multiple occurrences of event notifications of the same type
- 129666 The events notification mechanism passes an application-defined value to the event  
129667 handler function. This value can be used for a variety of purposes, such as enabling  
129668 the application to identify which of several possible events of the same type (for  
129669 example, timer expirations) has occurred.
- 129670 — Polled reception of asynchronous event notifications
- 129671 The events notification mechanism supports blocking and non-blocking polls for  
129672 asynchronous event notification.
- 129673 The polled mode of operation is often preferred over the interrupt mode by those  
129674 practitioners accustomed to this model. Providing support for this model facilitates  
129675 the porting of applications based on this model to POSIX.1b conforming systems.
- 129676 — Deterministic response to asynchronous event notifications
- 129677 The events notification mechanism does not preclude implementations that provide  
129678 deterministic event dispatch latency and minimizes the number of system calls  
129679 needed to use the event facilities during realtime processing.
- 129680 • Rationale for Extension
- 129681 POSIX.1 signals have many of the characteristics necessary to support the asynchronous  
129682 handling of event notifications, and the Realtime Signals Extension addresses the  
129683 following deficiencies in the POSIX.1 signal mechanism:
- 129684 — Signals do not support reliable delivery of event notification. Subsequent  
129685 occurrences of a pending signal are not guaranteed to be delivered.
- 129686 — Signals do not support prioritized delivery of event notifications. The order of signal  
129687 delivery when multiple unblocked signals are pending is undefined.
- 129688 — Signals do not support the differentiation between multiple signals of the same type.

## 129689 B.2.8.2 Asynchronous I/O

129690 Many applications need to interact with the I/O subsystem in an asynchronous manner. The  
129691 asynchronous I/O mechanism provides the ability to overlap application processing and I/O  
129692 operations initiated by the application. The asynchronous I/O mechanism allows a single  
129693 process to perform I/O simultaneously to a single file multiple times or to multiple files  
129694 multiple times.

129695 **Overview**

129696 Asynchronous I/O operations proceed in logical parallel with the processing done by the  
129697 application after the asynchronous I/O has been initiated. Other than this difference,  
129698 asynchronous I/O behaves similarly to normal I/O using *read()*, *write()*, *lseek()*, and *fsync()*.  
129699 The effect of issuing an asynchronous I/O request is as if a separate thread of execution were to  
129700 perform atomically the implied *lseek()* operation, if any, and then the requested I/O operation  
129701 (either *read()*, *write()*, or *fsync()*). There is no seek implied with a call to *aiio\_fsync()*. Concurrent  
129702 asynchronous operations and synchronous operations applied to the same file update the file as  
129703 if the I/O operations had proceeded serially.

129704 When asynchronous I/O completes, a signal can be delivered to the application to indicate the  
129705 completion of the I/O. This signal can be used to indicate that buffers and control blocks used  
129706 for asynchronous I/O can be reused. Signal delivery is not required for an asynchronous  
129707 operation and may be turned off on a per-operation basis by the application. Signals may also be  
129708 synchronously polled using *aiio\_suspend()*, *sigtimedwait()*, or *sigwaitinfo()*.

129709 Normal I/O has a return value and an error status associated with it. Asynchronous I/O  
129710 returns a value and an error status when the operation is first submitted, but that only relates to  
129711 whether the operation was successfully queued up for servicing. The I/O operation itself also  
129712 has a return status and an error value. To allow the application to retrieve the return status and  
129713 the error value, functions are provided that, given the address of an asynchronous I/O control  
129714 block, yield the return and error status associated with the operation. Until an asynchronous I/O  
129715 operation is done, its error status is [EINPROGRESS]. Thus, an application can poll for  
129716 completion of an asynchronous I/O operation by waiting for the error status to become equal to  
129717 a value other than [EINPROGRESS]. The return status of an asynchronous I/O operation is  
129718 undefined so long as the error status is equal to [EINPROGRESS].

129719 Storage for asynchronous operation return and error status may be limited. Submission of  
129720 asynchronous I/O operations may fail if this storage is exceeded. When an application retrieves  
129721 the return status of a given asynchronous operation, therefore, any system-maintained storage  
129722 used for this status and the error status may be reclaimed for use by other asynchronous  
129723 operations.

129724 Asynchronous I/O can be performed on file descriptors that have been enabled for POSIX.1b  
129725 synchronized I/O. In this case, the I/O operation still occurs asynchronously, as defined herein;  
129726 however, the asynchronous operation I/O in this case is not completed until the I/O has reached  
129727 either the state of synchronized I/O data integrity completion or synchronized I/O file integrity  
129728 completion, depending on the sort of synchronized I/O that is enabled on the file descriptor.

129729 **Models**

129730 Three models illustrate the use of asynchronous I/O: a journalization model, a data acquisition  
129731 model, and a model of the use of asynchronous I/O in supercomputing applications.

## 129732 • Journalization Model

129733 Many realtime applications perform low-priority journalizing functions. Journalizing  
129734 requires that logging records be queued for output without blocking the initiating process.

## 129735 • Data Acquisition Model

129736 A data acquisition process may also serve as a model. The process has two or more  
129737 channels delivering intermittent data that must be read within a certain time. The process  
129738 issues one asynchronous read on each channel. When one of the channels needs data  
129739 collection, the process reads the data and posts it through an asynchronous write to  
129740 secondary memory for future processing.

## 129741 • Supercomputing Model

129742 The supercomputing community has used asynchronous I/O much like that specified in  
129743 POSIX.1 for many years. This community requires the ability to perform multiple I/O  
129744 operations to multiple devices with a minimal number of entries to “the system”; each  
129745 entry to “the system” provokes a major delay in operations when compared to the normal  
129746 progress made by the application. This existing practice motivated the use of combined  
129747 *lseek()* and *read()* or *write()* calls, as well as the *lio\_listio()* call. Another common practice is  
129748 to disable signal notification for I/O completion, and simply poll for I/O completion at  
129749 some interval by which the I/O should be completed. Likewise, interfaces like *aio\_cancel()*  
129750 have been in successful commercial use for many years. Note also that an underlying  
129751 implementation of asynchronous I/O will require the ability, at least internally, to cancel  
129752 outstanding asynchronous I/O, at least when the process exits. (Consider an asynchronous  
129753 read from a terminal, when the process intends to exit immediately.)

129754 **Requirements**

129755 Asynchronous input and output for realtime implementations have these requirements:

- 129756 • The ability to queue multiple asynchronous read and write operations to a single open  
129757 instance. Both sequential and random access should be supported.
- 129758 • The ability to queue asynchronous read and write operations to multiple open instances.
- 129759 • The ability to obtain completion status information by polling and/or asynchronous event  
129760 notification.
- 129761 • Asynchronous event notification on asynchronous I/O completion is optional.
- 129762 • It has to be possible for the application to associate the event with the *aioctx* for the  
129763 operation that generated the event.
- 129764 • The ability to cancel queued requests.
- 129765 • The ability to wait upon asynchronous I/O completion in conjunction with other types of  
129766 events.
- 129767 • The ability to accept an *aio\_read()* and an *aio\_cancel()* for a device that accepts a *read()*, and  
129768 the ability to accept an *aio\_write()* and an *aio\_cancel()* for a device that accepts a *write()*.  
129769 This does not imply that the operation is asynchronous.

129770 **Standardization Issues**

129771 The following issues are addressed by the standardization of asynchronous I/O:

## 129772 • Rationale for New Interface

129773 Non-blocking I/O does not satisfy the needs of either realtime or high-performance  
 129774 computing models; these models require that a process overlap program execution and  
 129775 I/O processing. Realtime applications will often make use of direct I/O to or from the  
 129776 address space of the process, or require synchronized (unbuffered) I/O; they also require  
 129777 the ability to overlap this I/O with other computation. In addition, asynchronous I/O  
 129778 allows an application to keep a device busy at all times, possibly achieving greater  
 129779 throughput. Supercomputing and database architectures will often have specialized  
 129780 hardware that can provide true asynchrony underlying the logical asynchrony provided  
 129781 by this interface. In addition, asynchronous I/O should be supported by all types of files  
 129782 and devices in the same manner.

## 129783 • Effect of Buffering

129784 If asynchronous I/O is performed on a file that is buffered prior to being actually written  
 129785 to the device, it is possible that asynchronous I/O will offer no performance advantage  
 129786 over normal I/O; the cycles *stolen* to perform the asynchronous I/O will be taken away  
 129787 from the running process and the I/O will occur at interrupt time. This potential lack of  
 129788 gain in performance in no way obviates the need for asynchronous I/O by realtime  
 129789 applications, which very often will use specialized hardware support, multiple processors,  
 129790 and/or unbuffered, synchronized I/O.

129791 *B.2.8.3 Memory Management*129792 All memory management and shared memory definitions are located in the `<sys/mman.h>`  
129793 header. This is for alignment with historical practice.129794 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/7 is applied, correcting the shading and  
129795 margin markers in the introduction to Section 2.8.3.1.129796 **Memory Locking Functions**129797 This portion of the rationale presents models, requirements, and standardization issues relevant  
129798 to process memory locking.

## 129799 • Models

129800 Realtime systems that conform to POSIX.1-2024 are expected (and desired) to be supported  
 129801 on systems with demand-paged virtual memory management, non-paged swapping  
 129802 memory management, and physical memory systems with no memory management  
 129803 hardware. The general case, however, is the demand-paged, virtual memory system with  
 129804 each POSIX process running in a virtual address space. Note that this includes  
 129805 architectures where each process resides in its own virtual address space and architectures  
 129806 where the address space of each process is only a portion of a larger global virtual address  
 129807 space.

129808 The concept of memory locking is introduced to eliminate the indeterminacy introduced  
 129809 by paging and swapping, and to support an upper bound on the time required to access  
 129810 the memory mapped into the address space of a process. Ideally, this upper bound will be  
 129811 the same as the time required for the processor to access “main memory”, including any  
 129812 address translation and cache miss overheads. But some implementations—primarily on  
 129813 mainframes—will not actually force locked pages to be loaded and held resident in main  
 129814 memory. Rather, they will handle locked pages so that accesses to these pages will meet the

129815 performance metrics for locked process memory in the implementation. Also, although it  
 129816 is not, for example, the intention that this interface, as specified, be used to lock process  
 129817 memory into “cache”, it is conceivable that an implementation could support a large static  
 129818 RAM memory and define this as “main memory” and use a large[r] dynamic RAM as  
 129819 “backing store”. These interfaces could then be interpreted as supporting the locking of  
 129820 process memory into the static RAM. Support for multiple levels of backing store would  
 129821 require extensions to these interfaces.

129822 Implementations may also use memory locking to guarantee a fixed translation between  
 129823 virtual and physical addresses where such is beneficial to improving determinacy for  
 129824 direct-to/from-process input/output. POSIX.1-2024 does not guarantee to the application  
 129825 that the virtual-to-physical address translations, if such exist, are fixed, because such  
 129826 behavior would not be implementable on all architectures on which implementations of  
 129827 POSIX.1-2024 are expected. But POSIX.1-2024 does mandate that an implementation  
 129828 define, for the benefit of potential users, whether or not locking guarantees fixed  
 129829 translations.

129830 Memory locking is defined with respect to the address space of a process. Only the pages  
 129831 mapped into the address space of a process may be locked by the process, and when the  
 129832 pages are no longer mapped into the address space—for whatever reason—the locks  
 129833 established with respect to that address space are removed. Shared memory areas warrant  
 129834 special mention, as they may be mapped into more than one address space or mapped  
 129835 more than once into the address space of a process; locks may be established on pages  
 129836 within these areas with respect to several of these mappings. In such a case, the lock state  
 129837 of the underlying physical pages is the logical OR of the lock state with respect to each of  
 129838 the mappings. Only when all such locks have been removed are the shared pages  
 129839 considered unlocked.

129840 In recognition of the page granularity of Memory Management Units (MMU), and in order  
 129841 to support locking of ranges of address space, memory locking is defined in terms of  
 129842 “page” granularity. That is, for the interfaces that support an address and size specification  
 129843 for the region to be locked, the address must be on a page boundary, and all pages mapped  
 129844 by the specified range are locked, if valid. This means that the length is implicitly rounded  
 129845 up to a multiple of the page size. The page size is implementation-defined and is available  
 129846 to applications as a compile-time symbolic constant or at runtime via *sysconf()*.

129847 A “real memory” POSIX.1b implementation that has no MMU could elect not to support  
 129848 these interfaces, returning [ENOSYS]. But an application could easily interpret this as  
 129849 meaning that the implementation would unconditionally page or swap the application  
 129850 when such is not the case. It is the intention of POSIX.1-2024 that such a system could  
 129851 define these interfaces as “NO-OPs”, returning success without actually performing any  
 129852 function except for mandated argument checking.

129853 • Requirements

129854 For realtime applications, memory locking is generally considered to be required as part of  
 129855 application initialization. This locking is performed after an application has been loaded  
 129856 (that is, *exec'd*) and the program remains locked for its entire lifetime. But to support  
 129857 applications that undergo major mode changes where, in one mode, locking is required,  
 129858 but in another it is not, the specified interfaces allow repeated locking and unlocking of  
 129859 memory within the lifetime of a process.

129860 When a realtime application locks its address space, it should not be necessary for the  
 129861 application to then “touch” all of the pages in the address space to guarantee that they are  
 129862 resident or else suffer potential paging delays the first time the page is referenced. Thus,  
 129863 POSIX.1-2024 requires that the pages locked by the specified interfaces be resident when

129864 the locking functions return successfully.

129865 Many architectures support system-managed stacks that grow automatically when the  
129866 current extent of the stack is exceeded. A realtime application has a requirement to be able  
129867 to “preallocate” sufficient stack space and lock it down so that it will not suffer page faults  
129868 to grow the stack during critical realtime operation. There was no consensus on a portable  
129869 way to specify how much stack space is needed, so POSIX.1-2024 supports no specific  
129870 interface for preallocating stack space. But an application can portably lock down a specific  
129871 amount of stack space by specifying `MCL_FUTURE` in a call to `mlockall()` and then calling  
129872 a dummy function that declares an automatic array of the desired size.

129873 Memory locking for realtime applications is also generally considered to be an “all or  
129874 nothing” proposition. That is, the entire process, or none, is locked down. But, for  
129875 applications that have well-defined sections that need to be locked and others that do not,  
129876 POSIX.1-2024 supports an optional set of interfaces to lock or unlock a range of process  
129877 addresses. Reasons for locking down a specific range include:

- 129878 — An asynchronous event handler function that must respond to external events in a  
129879 deterministic manner such that page faults cannot be tolerated
- 129880 — An input/output “buffer” area that is the target for direct-to-process I/O, and the  
129881 overhead of implicit locking and unlocking for each I/O call cannot be tolerated

129882 Finally, locking is generally viewed as an “application-wide” function. That is, the  
129883 application is globally aware of which regions are locked and which are not over time. This  
129884 is in contrast to a function that is used temporarily within a “third party” library routine  
129885 whose function is unknown to the application, and therefore must have no “side-effects”.  
129886 The specified interfaces, therefore, do not support “lock stacking” or “lock nesting” within  
129887 a process. But, for pages that are shared between processes or mapped more than once  
129888 into a process address space, “lock stacking” is essentially mandated by the requirement  
129889 that unlocking of pages that are mapped by more than one process or more than once by  
129890 the same process does not affect locks established on the other mappings.

129891 There was some support for “lock stacking” so that locking could be transparently used in  
129892 functions or opaque modules. But the consensus was not to burden all implementations  
129893 with lock stacking (and reference counting), and an implementation option was proposed.  
129894 There were strong objections to the option because applications would have to support  
129895 both options in order to remain portable. The consensus was to eliminate lock stacking  
129896 altogether, primarily through overwhelming support for the System V “`m[un]lock[all]`”  
129897 interface on which POSIX.1-2024 is now based.

129898 Locks are not inherited across `fork()`s because some implementations implement `fork()` by  
129899 creating new address spaces for the child. In such an implementation, requiring locks to be  
129900 inherited would lead to new situations in which a fork would fail due to the inability of  
129901 the system to lock sufficient memory to lock both the parent and the child. The consensus  
129902 was that there was no benefit to such inheritance. Note that this does not mean that locks  
129903 are removed when, for instance, a thread is created in the same address space.

129904 Similarly, locks are not inherited across `exec` because some implementations implement `exec`  
129905 by unmapping all of the pages in the address space (which, by definition, removes the  
129906 locks on these pages), and maps in pages of the `exec`’d image. In such an implementation,  
129907 requiring locks to be inherited would lead to new situations in which `exec` would fail.  
129908 Reporting this failure would be very cumbersome to detect in time to report to the calling  
129909 process, and no appropriate mechanism exists for informing the `exec`’d process of its status.

129910 It was determined that, if the newly loaded application required locking, it was the  
129911 responsibility of that application to establish the locks. This is also in keeping with the

129912 general view that it is the responsibility of the application to be aware of all locks that are  
129913 established.

129914 There was one request to allow (not mandate) locks to be inherited across *fork()*, and a  
129915 request for a flag, *MCL\_INHERIT*, that would specify inheritance of memory locks across  
129916 *execs*. Given the difficulties raised by this and the general lack of support for the feature in  
129917 POSIX.1-2024, it was not added. POSIX.1-2024 does not preclude an implementation from  
129918 providing this feature for administrative purposes, such as a “run” command that will  
129919 lock down and execute a specified application. Additionally, the rationale for the objection  
129920 equated *fork()* with creating a thread in the address space. POSIX.1-2024 does not mandate  
129921 releasing locks when creating additional threads in an existing process.

129922 • Standardization Issues

129923 One goal of POSIX.1-2024 is to define a set of primitives that provide the necessary  
129924 functionality for realtime applications, with consideration for the needs of other  
129925 application domains where such were identified, which is based to the extent possible on  
129926 existing industry practice.

129927 The Memory Locking option is required by many realtime applications to tune  
129928 performance. Such a facility is accomplished by placing constraints on the virtual memory  
129929 system to limit paging of time of the process or of critical sections of the process. This  
129930 facility should not be used by most non-realtime applications.

129931 Optional features provided in POSIX.1-2024 allow applications to lock selected address  
129932 ranges with the caveat that the process is responsible for being aware of the page  
129933 granularity of locking and the unnested nature of the locks.

129934 **Mapped Files Functions**

129935 The memory mapped files functionality provides a mechanism that allows a process to access  
129936 files by directly incorporating file data into its address space. Once a file is “mapped” into a  
129937 process address space, the data can be manipulated by instructions as memory. The use of  
129938 mapped files can significantly reduce I/O data movement since file data does not have to be  
129939 copied into process data buffers as in *read()* and *write()*. If more than one process maps a file, its  
129940 contents are shared among them. This provides a low overhead mechanism by which processes  
129941 can synchronize and communicate.

129942 • Historical Perspective

129943 Realtime applications have historically been implemented using a collection of cooperating  
129944 processes or tasks. In early systems, these processes ran on bare hardware (that is, without  
129945 an operating system) with no memory relocation or protection. The application paradigms  
129946 that arose from this environment involve the sharing of data between the processes.

129947 When realtime systems were implemented on top of vendor-supplied operating systems,  
129948 the paradigm or performance benefits of direct access to data by multiple processes was  
129949 still deemed necessary. As a result, operating systems that claim to support realtime  
129950 applications must support the shared memory paradigm.

129951 Additionally, a number of realtime systems provide the ability to map specific sections of  
129952 the physical address space into the address space of a process. This ability is required if an  
129953 application is to obtain direct access to memory locations that have specific properties (for  
129954 example, refresh buffers or display devices, dual ported memory locations, DMA target  
129955 locations). The use of this ability is common enough to warrant some degree of  
129956 standardization of its interface. This ability overlaps the general paradigm of shared  
129957 memory in that, in both instances, common global objects are made addressable by  
129958 individual processes or tasks.

129959 Finally, a number of systems also provide the ability to map process addresses to files. This  
 129960 provides both a general means of sharing persistent objects, and using files in a manner  
 129961 that optimizes memory and swapping space usage.

129962 Simple shared memory is clearly a special case of the more general file mapping capability.  
 129963 In addition, there is relatively widespread agreement and implementation of the file  
 129964 mapping interface. In these systems, many different types of objects can be mapped (for  
 129965 example, files, memory, devices, and so on) using the same mapping interfaces. This  
 129966 approach both minimizes interface proliferation and maximizes the generality of programs  
 129967 using the mapping interfaces.

129968 • Memory Mapped Files Usage

129969 A memory object can be concurrently mapped into the address space of one or more  
 129970 processes. The *mmap()* and *munmap()* functions allow a process to manipulate their  
 129971 address space by mapping portions of memory objects into it and removing them from it.  
 129972 When multiple processes map the same memory object, they can share access to the  
 129973 underlying data. Implementations may restrict the size and alignment of mappings to be  
 129974 on *page*-size boundaries. The page size, in bytes, is the value of the system-configurable  
 129975 variable {PAGESIZE}, typically accessed by calling *sysconf()* with a *name* argument of  
 129976 *\_SC\_PAGESIZE*. If an implementation has no restrictions on size or alignment, it may  
 129977 specify a 1-byte page size.

129978 To map memory, a process first opens a memory object. The *ftruncate()* function can be  
 129979 used to contract or extend the size of the memory object even when the object is currently  
 129980 mapped. If the memory object is extended, the contents of the extended areas are zeros.

129981 After opening a memory object, the application maps the object into its address space  
 129982 using the *mmap()* function call. Once a mapping has been established, it remains mapped  
 129983 until unmapped with *munmap()*, even if the memory object is closed. The *mprotect()*  
 129984 function can be used to change the memory protections initially established by *mmap()*.

129985 A *close()* of the file descriptor, while invalidating the file descriptor itself, does not unmap  
 129986 any mappings established for the memory object. The address space, including all mapped  
 129987 regions, is inherited on *fork()*. The entire address space is unmapped on process  
 129988 termination or by successful calls to any of the *exec* family of functions.

129989 The *msync()* function is used to force mapped file data to permanent storage.

129990 • Effects on Other Functions

129991 With memory mapped files, the operation of the *open()*, *creat()*, and *unlink()* functions are  
 129992 a natural result of using the file system name space to map the global names for memory  
 129993 objects.

129994 The *ftruncate()* function can be used to set the length of a sharable memory object.

129995 The meaning of *stat()* fields other than the size and protection information is undefined on  
 129996 implementations where memory objects are not implemented using regular files. When  
 129997 regular files are used, the times reflect when the implementation updated the file image of  
 129998 the data, not when a process updated the data in memory.

129999 The operations of *fdopen()*, *write()*, *read()*, and *lseek()* were made unspecified for objects  
 130000 opened with *shm\_open()*, so that implementations that did not implement memory objects  
 130001 as regular files would not have to support the operation of these functions on shared  
 130002 memory objects.

130003 The behavior of memory objects with respect to *close()*, *dup()*, *dup2()*, *dup3()*, *open()*,  
 130004 *close()*, *fork()*, *\_exit()*, and the *exec* family of functions is the same as the behavior of the

130005 existing practice of the `mmap()` function.

130006 A memory object can still be referenced after a close. That is, any mappings made to the  
130007 file are still in effect, and reads and writes that are made to those mappings are still valid  
130008 and are shared with other processes that have the same mapping. Likewise, the memory  
130009 object can still be used if any references remain after its name(s) have been deleted. Any  
130010 references that remain after a close must not appear to the application as file descriptors.

130011 This is existing practice for `mmap()` and `close()`. In addition, there are already mappings  
130012 present (text, data, stack) that do not have open file descriptors. The text mapping in  
130013 particular is considered a reference to the file containing the text. The desire was to treat all  
130014 mappings by the process uniformly. Also, many modern implementations use `mmap()` to  
130015 implement shared libraries, and it would not be desirable to keep file descriptors for each  
130016 of the many libraries an application can use. It was felt there were many other existing  
130017 programs that used this behavior to free a file descriptor, and thus POSIX.1-2024 could not  
130018 forbid it and still claim to be using existing practice.

130019 For implementations that implement memory objects using memory only, memory objects  
130020 will retain the memory allocated to the file after the last close and will use that same  
130021 memory on the next open. Note that closing the memory object is not the same as deleting  
130022 the name, since the memory object is still defined in the memory object name space.

130023 The locks of `fcntl()` do not block any read or write operation, including read or write access  
130024 to shared memory or mapped files. In addition, implementations that only support shared  
130025 memory objects should not be required to implement record locks. The reference to `fcntl()`  
130026 is added to make this point explicitly. The other `fcntl()` commands are useful with shared  
130027 memory objects.

130028 The size of pages that mapping hardware may be able to support may be a configurable  
130029 value, or it may change based on hardware implementations. The addition of the  
130030 `_SC_PAGESIZE` parameter to the `sysconf()` function is provided for determining the  
130031 mapping page size at runtime.

### 130032 **Shared Memory Functions**

130033 Implementations may support the Shared Memory Objects option independently of memory  
130034 mapped files. Shared memory objects are named regions of storage that may be independent of  
130035 the file system and can be mapped into the address space of one or more processes to allow  
130036 them to share the associated memory.

- 130037 • Requirements

130038 Shared memory is used to share data among several processes, each potentially running at  
130039 different priority levels, responding to different inputs, or performing separate tasks.  
130040 Shared memory is not just simply providing common access to data, it is providing the  
130041 fastest possible communication between the processes. With one memory write operation,  
130042 a process can pass information to as many processes as have the memory region mapped.

130043 As a result, shared memory provides a mechanism that can be used for all other  
130044 interprocess communication facilities. It may also be used by an application for  
130045 implementing more sophisticated mechanisms than semaphores and message queues.

130046 The need for a shared memory interface is obvious for virtual memory systems, where the  
130047 operating system is directly preventing processes from accessing each other's data.  
130048 However, in unprotected systems, such as those found in some embedded controllers, a  
130049 shared memory interface is needed to provide a portable mechanism to allocate a region of  
130050 memory to be shared and then to communicate the address of that region to other  
130051 processes.

130052 This, then, provides the minimum functionality that a shared memory interface must have  
 130053 in order to support realtime applications: to allocate and name an object to be mapped into  
 130054 memory for potential sharing (*open()* or *shm\_open()*), and to make the memory object  
 130055 available within the address space of a process (*mmap()*). To complete the interface, a  
 130056 mechanism to release the claim of a process on a shared memory object (*munmap()*) is also  
 130057 needed, as well as a mechanism for deleting the name of a sharable object that was  
 130058 previously created (*unlink()* or *shm\_unlink()*).

130059 After a mapping has been established, an implementation should not have to provide  
 130060 services to maintain that mapping. All memory writes into that area will appear  
 130061 immediately in the memory mapping of that region by any other processes.

130062 Thus, requirements include:

- 130063 — Support creation of sharable memory objects and the mapping of these objects into  
 130064 the address space of a process.
- 130065 — Sharable memory objects should be accessed by global names accessible from all  
 130066 processes.
- 130067 — Support the mapping of specific sections of physical address space (such as a  
 130068 memory mapped device) into the address space of a process. This should not be  
 130069 done by the process specifying the actual address, but again by an implementation-  
 130070 defined global name (such as a special device name) dedicated to this purpose.
- 130071 — Support the mapping of discrete portions of these memory objects.
- 130072 — Support for minimum hardware configurations that contain no physical media on  
 130073 which to store shared memory contents permanently.
- 130074 — The ability to preallocate the entire shared memory region so that minimum  
 130075 hardware configurations without virtual memory support can guarantee contiguous  
 130076 space.
- 130077 — The maximizing of performance by not requiring functionality that would require  
 130078 implementation interaction above creating the shared memory area and returning  
 130079 the mapping.

130080 Note that the above requirements do not preclude:

- 130081 — The sharable memory object from being implemented using actual files on an actual  
 130082 file system.
- 130083 — The global name that is accessible from all processes being restricted to a file system  
 130084 area that is dedicated to handling shared memory.
- 130085 — An implementation not providing implementation-defined global names for the  
 130086 purpose of physical address mapping.

#### 130087 • Shared Memory Objects Usage

130088 If the Shared Memory Objects option is supported, a shared memory object may be  
 130089 created, or opened if it already exists, with the *shm\_open()* function. If the shared memory  
 130090 object is created, it has a length of zero. The *ftruncate()* function can be used to set the size  
 130091 of the shared memory object after creation. The *shm\_unlink()* function removes the name  
 130092 for a shared memory object created by *shm\_open()*.

#### 130093 • Shared Memory Overview

130094 The shared memory facility defined by POSIX.1-2024 usually results in memory locations  
 130095 being added to the address space of the process. The implementation returns the address

130096 of the new space to the application by means of a pointer. This works well in languages  
130097 like C. However, in languages without pointer types it will not work. In the bindings for  
130098 such a language, either a special COMMON section will need to be defined (which is  
130099 unlikely), or the binding will have to allow existing structures to be mapped. The  
130100 implementation will likely have to place restrictions on the size and alignment of such  
130101 structures or will have to map a suitable region of the address space of the process into the  
130102 memory object, and thus into other processes. These are issues for that particular language  
130103 binding. For POSIX.1-2024, however, the practice will not be forbidden, merely undefined.

130104 Two potentially different name spaces are used for naming objects that may be mapped  
130105 into process address spaces. When using memory mapped files, files may be accessed via  
130106 *open()*. When the Shared Memory Objects option is supported, sharable memory objects  
130107 that might not be files may be accessed via the *shm\_open()* function. These operations are  
130108 not mutually-exclusive.

130109 Some implementations supporting the Shared Memory Objects option may choose to  
130110 implement the shared memory object name space as part of the file system name space.  
130111 There are several reasons for this:

- 130112 — It allows applications to prevent name conflicts by use of the directory structure.
- 130113 — It uses an existing mechanism for accessing global objects and prevents the creation  
130114 of a new mechanism for naming global objects.

130115 In such implementations, memory objects can be implemented using regular files, if that is  
130116 what the implementation chooses. The *shm\_open()* function can be implemented as an  
130117 *open()* call in a fixed directory with the O\_CLOEXEC flag set. The *shm\_unlink()* function  
130118 can be implemented as an *unlink()* call.

130119 On the other hand, it is also expected that small embedded systems that support the  
130120 Shared Memory Objects option may wish to implement shared memory without having  
130121 any file systems present. In this case, the implementations may choose to use a simple  
130122 string valued name space for shared memory regions. The *shm\_open()* function permits  
130123 either type of implementation.

130124 Some implementations have hardware that supports protection of mapped data from  
130125 certain classes of access and some do not. Systems that supply this functionality support  
130126 the memory protection functionality.

130127 Some implementations restrict size, alignment, and protections to be on *page-size*  
130128 boundaries. If an implementation has no restrictions on size or alignment, it may specify a  
130129 1-byte page size. Applications on implementations that do support larger pages must be  
130130 cognizant of the page size since this is the alignment and protection boundary.

130131 Simple embedded implementations may have a 1-byte page size and only support the  
130132 Shared Memory Objects option. This provides simple shared memory between processes  
130133 without requiring mapping hardware.

130134 POSIX.1-2024 specifically allows a memory object to remain referenced after a close  
130135 because that is existing practice for the *mmap()* function.

130136 **Typed Memory Functions**

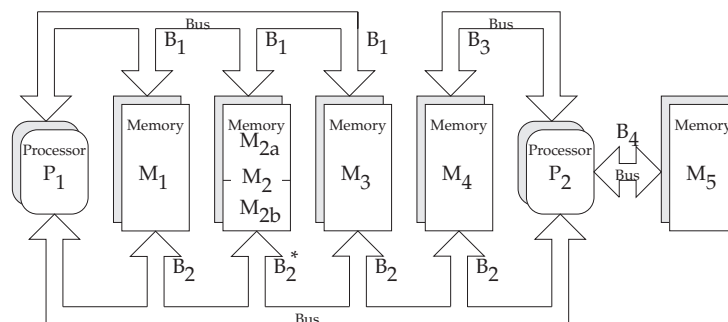

130137 Implementations may support the Typed Memory Objects option without supporting either the  
 130138 Shared Memory option or memory mapped files. Types memory objects are pools of specialized  
 130139 storage, different from the main memory resource normally used by a processor to hold code  
 130140 and data, that can be mapped into the address space of one or more processes.

## 130141 • Model

130142 Realtime systems conforming to one of the POSIX.13 realtime profiles are expected (and  
 130143 desired) to be supported on systems with more than one type or pool of memory (for  
 130144 example, SRAM, DRAM, ROM, EPROM, EEPROM), where each type or pool of memory  
 130145 may be accessible by one or more processors via one or more buses (ports). Memory  
 130146 mapped files, shared memory objects, and the language-specific storage allocation  
 130147 operators (*malloc()* for the ISO C standard, *new* for ISO Ada) fail to provide application  
 130148 program interfaces versatile enough to allow applications to control their utilization of  
 130149 such diverse memory resources. The typed memory interfaces *posix\_typed\_mem\_open()*,  
 130150 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *mmap()*, and *munmap()* defined herein  
 130151 support the model of typed memory described below.

130152 For purposes of this model, a system comprises several processors (for example,  $P_1$  and  
 130153  $P_2$ ), several physical memory pools (for example,  $M_1, M_2, M_{2a}, M_{2b}, M_3, M_4,$  and  $M_5$ ), and  
 130154 several buses or "ports" (for example,  $B_1, B_2, B_3,$  and  $B_4$ ) interconnecting the various  
 130155 processors and memory pools in some system-specific way. Notice that some memory  
 130156 pools may be contained in others (for example,  $M_{2a}$  and  $M_{2b}$  are contained in  $M_2$ ).

130157 **Figure B-1** shows an example of such a model. In a system like this, an application should  
 130158 be able to perform the following operations:

- \* All addresses in pool  $M_2$  (comprising pools  $M_{2a}$  and  $M_{2b}$ ) accessible via port  $B_1$ .
- Addresses in pool  $M_{2b}$  are also accessible via port  $B_2$ .
- Addresses in pool  $M_{2a}$  are *not* accessible via port  $B_2$ .

130159 **Figure B-1** Example of a System with Typed Memory

## 130160 — Typed Memory Allocation

130161 An application should be able to allocate memory dynamically from the desired pool  
 130162 using the desired bus, and map it into the address space of a process. For example,  
 130163 processor  $P_1$  can allocate some portion of memory pool  $M_1$  through port  $B_1$ , treating  
 130164 all unmapped subareas of  $M_1$  as a heap-storage resource from which memory may be  
 130165 allocated. This portion of memory is mapped into address space of the process, and  
 130166 subsequently deallocated when unmapped from all processes.

- 130167 — Using the Same Storage Region from Different Buses
- 130168 An application process with a mapped region of storage that is accessed from one  
130169 bus should be able to map that same storage area at another address (subject to page  
130170 size restrictions detailed in *mmap()*), to allow it to be accessed from another bus. For  
130171 example, processor  $P_1$  may wish to access the same region of memory pool  $M_{2b}$  both  
130172 through ports  $B_1$  and  $B_2$ .
- 130173 — Sharing Typed Memory Regions
- 130174 Several application processes running on the same or different processors may wish  
130175 to share a particular region of a typed memory pool. Each process or processor may  
130176 wish to access this region through different buses. For example, processor  $P_1$  may  
130177 want to share a region of memory pool  $M_4$  with processor  $P_2$ , and they may be  
130178 required to use buses  $B_2$  and  $B_3$ , respectively, to minimize bus contention. A problem  
130179 arises here when a process allocates and maps a portion of fragmented memory and  
130180 then wants to share this region of memory with another process, either in the same  
130181 processor or different processors. The solution adopted is to allow the first process to  
130182 find out the memory map (offsets and lengths) of all the different fragments of  
130183 memory that were mapped into its address space, by repeatedly calling  
130184 *posix\_mem\_offset()*. Then, this process can pass the offsets and lengths obtained to  
130185 the second process, which can then map the same memory fragments into its address  
130186 space.
- 130187 — Contiguous Allocation
- 130188 The problem of finding the memory map of the different fragments of the memory  
130189 pool that were mapped into logically contiguous addresses of a given process can be  
130190 solved by requesting contiguous allocation. For example, a process in  $P_1$  can allocate  
130191 10 Kbytes of physically contiguous memory from  $M_3-B_1$ , and obtain the offset (within  
130192 pool  $M_3$ ) of this block of memory. Then, it can pass this offset (and the length) to a  
130193 process in  $P_2$  using some interprocess communication mechanism. The second  
130194 process can map the same block of memory by using the offset transferred and  
130195 specifying  $M_3-B_2$ .
- 130196 — Unallocated Mapping
- 130197 Any subarea of a memory pool that is mapped to a process, either as the result of an  
130198 allocation request or an explicit mapping, is normally unavailable for allocation.  
130199 Special processes such as debuggers, however, may need to map large areas of a  
130200 typed memory pool, yet leave those areas available for allocation.
- 130201 Typed memory allocation and mapping has to coexist with storage allocation operators  
130202 like *malloc()*, but systems are free to choose how to implement this coexistence. For  
130203 example, it may be system configuration-dependent if all available system memory is  
130204 made part of one of the typed memory pools or if some part will be restricted to  
130205 conventional allocation operators. Equally system configuration-dependent may be the  
130206 availability of operators like *malloc()* to allocate storage from certain typed memory pools.  
130207 It is not excluded to configure a system such that a given named pool,  $P_1$ , is in turn split  
130208 into non-overlapping named subpools. For example,  $M_1-B_1$ ,  $M_2-B_1$ , and  $M_3-B_1$  could also be  
130209 accessed as one common pool  $M_{123}-B_1$ . A call to *malloc()* on  $P_1$  could work on such a larger  
130210 pool while full optimization of memory usage by  $P_1$  would require typed memory  
130211 allocation at the subpool level.
- 130212 • Existing Practice
- 130213 OS-9 provides for the naming (numbering) and prioritization of memory types by a system  
130214 administrator. It then provides APIs to request memory allocation of typed (colored)

130215 memory by number, and to generate a bus address from a mapped memory address  
 130216 (translate). When requesting colored memory, the user can specify type 0 to signify  
 130217 allocation from the first available type in priority order.

130218 HP-RT presents interfaces to map different kinds of storage regions that are visible through  
 130219 a VME bus, although it does not provide allocation operations. It also provides functions  
 130220 to perform address translation between VME addresses and virtual addresses. It represents  
 130221 a VME-bus unique solution to the general problem.

130222 The PSOS approach is similar (that is, based on a pre-established mapping of bus address  
 130223 ranges to specific memories) with a concept of segments and regions (regions dynamically  
 130224 allocated from a heap which is a special segment). Therefore, PSOS does not fully address  
 130225 the general allocation problem either. PSOS does not have a "process"-based model, but  
 130226 more of a "thread"-only-based model of multi-tasking. So mapping to a process address  
 130227 space is not an issue.

130228 QNX uses the System V approach of opening specially named devices (shared memory  
 130229 segments) and using *mmap()* to then gain access from the process. They do not address  
 130230 allocation directly, but once typed shared memory can be mapped, an "allocation  
 130231 manager" process could be written to handle requests for allocation.

130232 The System V approach also included allocation, implemented by opening yet other  
 130233 special "devices" which allocate, rather than appearing as a whole memory object.

130234 The Orkid realtime kernel interface definition has operations to manage memory "regions"  
 130235 and "pools", which are areas of memory that may reflect the differing physical nature of  
 130236 the memory. Operations to allocate memory from these regions and pools are also  
 130237 provided.

#### 130238 • Requirements

130239 Existing practice in SVID-derived UNIX systems relies on functionality similar to *mmap()*  
 130240 and its related interfaces to achieve mapping and allocation of typed memory. However,  
 130241 the issue of sharing typed memory (allocated or mapped) and the complication of multiple  
 130242 ports are not addressed in any consistent way by existing UNIX system practice. Part of  
 130243 this functionality is existing practice in specialized realtime operating systems. In order to  
 130244 solidify the capabilities implied by the model above, the following requirements are  
 130245 imposed on the interface:

#### 130246 — Identification of Typed Memory Pools and Ports

130247 All processes (running in all processors) in the system are able to identify a particular  
 130248 (system configured) typed memory pool accessed through a particular (system  
 130249 configured) port by a name. That name is a member of a name space common to all  
 130250 these processes, but need not be the same name space as that containing ordinary  
 130251 pathnames. The association between memory pools/ports and corresponding names  
 130252 is typically established when the system is configured. The "open" operation for  
 130253 typed memory objects should be distinct from the *open()* function, for consistency  
 130254 with other similar services, but implementable on top of *open()*. This implies that the  
 130255 handle for a typed memory object will be a file descriptor.

#### 130256 — Allocation and Mapping of Typed Memory

130257 Once a typed memory object has been identified by a process, it is possible to both  
 130258 map user-selected subareas of that object into process address space and to map  
 130259 system-selected (that is, dynamically allocated) subareas of that object, with user-  
 130260 specified length, into process address space. It is also possible to determine the  
 130261 maximum length of memory allocation that may be requested from a given typed

- 130262 memory object.
- 130263 — Sharing Typed Memory
- 130264 Two or more processes are able to share portions of typed memory, either user-
- 130265 selected or dynamically allocated. This requirement applies also to dynamically
- 130266 allocated regions of memory that are composed of several non-contiguous pieces.
- 130267 — Contiguous Allocation
- 130268 For dynamic allocation, it is the user's option whether the system is required to
- 130269 allocate a contiguous subarea within the typed memory object, or whether it is
- 130270 permitted to allocate discontinuous fragments which appear contiguous in the
- 130271 process mapping. Contiguous allocation simplifies the process of sharing allocated
- 130272 typed memory, while discontinuous allocation allows for potentially better recovery
- 130273 of deallocated typed memory.
- 130274 — Accessing Typed Memory Through Different Ports
- 130275 Once a subarea of a typed memory object has been mapped, it is possible to
- 130276 determine the location and length corresponding to a user-selected portion of that
- 130277 object within the memory pool. This location and length can then be used to remap
- 130278 that portion of memory for access from another port. If the referenced portion of
- 130279 typed memory was allocated discontinuously, the length thus determined may be
- 130280 shorter than anticipated, and the user code must adapt to the value returned.
- 130281 — Deallocation
- 130282 When a previously mapped subarea of typed memory is no longer mapped by any
- 130283 process in the system—as a result of a call or calls to *munmap()*—that subarea
- 130284 becomes potentially reusable for dynamic allocation; actual reuse of the subarea is a
- 130285 function of the dynamic typed memory allocation policy.
- 130286 — Unallocated Mapping
- 130287 It must be possible to map user-selected subareas of a typed memory object without
- 130288 marking that subarea as unavailable for allocation. This option is not the default
- 130289 behavior, and requires appropriate privileges.
- 130290 • Scenario
- 130291 The following scenario will serve to clarify the use of the typed memory interfaces.
- 130292 Process A running on  $P_1$  (see [Figure B-1](#), on page 3777) wants to allocate some memory
- 130293 from memory pool  $M_2$ , and it wants to share this portion of memory with process B
- 130294 running on  $P_2$ . Since  $P_2$  only has access to the lower part of  $M_2$ , both processes will use the
- 130295 memory pool named  $M_{2b}$  which is the part of  $M_2$  that is accessible both from  $P_1$  and  $P_2$ . The
- 130296 operations that both processes need to perform are shown below:
- 130297 — Allocating Typed Memory
- 130298 Process A calls *posix\_typed\_mem\_open()* with the name **/typed.m2b-b1** and a *tflag* of
- 130299 POSIX\_TYPED\_MEM\_ALLOCATE to get a file descriptor usable for allocating from
- 130300 pool  $M_{2b}$  accessed through port  $B_1$ . It then calls *mmap()* with this file descriptor
- 130301 requesting a length of 4 096 bytes. The system allocates two discontinuous blocks of
- 130302 sizes 1 024 and 3 072 bytes within  $M_{2b}$ . The *mmap()* function returns a pointer to a
- 130303 4 096-byte array in process A's logical address space, mapping the allocated blocks
- 130304 contiguously. Process A can then utilize the array, and store data in it.

## 130305 — Determining the Location of the Allocated Blocks

130306 Process A can determine the lengths and offsets (relative to  $M_{2b}$ ) of the two blocks  
 130307 allocated, by using the following procedure: First, process A calls `posix_mem_offset()`  
 130308 with the address of the first element of the array and length 4096. Upon return, the  
 130309 offset and length (1024 bytes) of the first block are returned. A second call to  
 130310 `posix_mem_offset()` is then made using the address of the first element of the array  
 130311 plus 1024 (the length of the first block), and a new length of 4096–1024. If there were  
 130312 more fragments allocated, this procedure could have been continued within a loop  
 130313 until the offsets and lengths of all the blocks were obtained. Notice that this relatively  
 130314 complex procedure can be avoided if contiguous allocation is requested (by opening  
 130315 the typed memory object with the `tflag`  
 130316 `POSIX_TYPED_MEM_ALLOCATE_CONTIG`).

## 130317 — Sharing Data Across Processes

130318 Process A passes the two offset values and lengths obtained from the  
 130319 `posix_mem_offset()` calls to process B running on  $P_2$ , via some form of interprocess  
 130320 communication. Process B can gain access to process A's data by calling  
 130321 `posix_typed_mem_open()` with the name `/typed.m2b-b2` and a `tflag` of zero, then using  
 130322 two `mmap()` calls on the resulting file descriptor to map the two subareas of that  
 130323 typed memory object to its own address space.

130324 • Rationale for no `mem_alloc()` and `mem_free()`

130325 The standard developers had originally proposed a pair of new flags to `mmap()` which,  
 130326 when applied to a typed memory object descriptor, would cause `mmap()` to allocate  
 130327 dynamically from an unallocated and unmapped area of the typed memory object.  
 130328 Deallocation was similarly accomplished through the use of `munmap()`. This was rejected  
 130329 by the ballot group because it excessively complicated the (already rather complex)  
 130330 `mmap()` interface and introduced semantics useful only for typed memory, to a function  
 130331 which must also map shared memory and files. They felt that a memory allocator should  
 130332 be built on top of `mmap()` instead of being incorporated within the same interface, much as  
 130333 the ISO C standard libraries build `malloc()` on top of the virtual memory mapping  
 130334 functions `brk()` and `sbrk()`. This would eliminate the complicated semantics involved with  
 130335 unmapping only part of an allocated block of typed memory.

130336 To attempt to achieve ballot group consensus, typed memory allocation and deallocation  
 130337 was first migrated from `mmap()` and `munmap()` to a pair of complementary functions  
 130338 modeled on the ISO C standard `malloc()` and `free()`. The `mem_alloc()` function specified  
 130339 explicitly the typed memory object (typed memory pool/access port) from which  
 130340 allocation takes place, unlike `malloc()` where the memory pool and port are unspecified.  
 130341 The `mem_free()` function handled deallocation. These new semantics still met all of the  
 130342 requirements detailed above without modifying the behavior of `mmap()` except to allow it  
 130343 to map specified areas of typed memory objects. An implementation would have been free  
 130344 to implement `mem_alloc()` and `mem_free()` over `mmap()`, through `mmap()`, or independently  
 130345 but cooperating with `mmap()`.

130346 The ballot group was queried to see if this was an acceptable alternative, and while there  
 130347 was some agreement that it achieved the goal of removing the complicated semantics of  
 130348 allocation from the `mmap()` interface, several balloters realized that it just created two  
 130349 additional functions that behaved, in great part, like `mmap()`. These balloters proposed an  
 130350 alternative which has been implemented here in place of a separate `mem_alloc()` and  
 130351 `mem_free()`. This alternative is based on four specific suggestions:

- 130352 1. The `posix_typed_mem_open()` function should provide a flag which specifies  
 130353 ``allocate on `mmap()`'' (otherwise, `mmap()` just maps the underlying object). This  
 130354 allows things roughly similar to `/dev/zero` versus `/dev/swap`. Two such flags have  
 130355 been implemented, one of which forces contiguous allocation.
- 130356 2. The `posix_mem_offset()` function is acceptable because it can be applied usefully to  
 130357 mapped objects in general. It should return the file descriptor of the underlying  
 130358 object.
- 130359 3. The `mem_get_info()` function in an earlier draft should be renamed  
 130360 `posix_typed_mem_get_info()` because it is not generally applicable to memory objects.  
 130361 It should probably return the file descriptor's allocation attribute. The renaming of  
 130362 the function has been implemented, but having it return a piece of information  
 130363 which is readily known by an application without this function has been rejected.  
 130364 Its whole purpose is to query the typed memory object for attributes that are not  
 130365 user-specified, but determined by the implementation.
- 130366 4. There should be no separate `mem_alloc()` or `mem_free()` functions. Instead, using  
 130367 `mmap()` on a typed memory object opened with an ``allocate on `mmap()`'' flag  
 130368 should be used to force allocation. These are precisely the semantics defined in the  
 130369 current draft.

130370 • Rationale for no Typed Memory Access Management

130371 The working group had originally defined an additional interface (and an additional kind  
 130372 of object: typed memory manager) to establish and dissolve mappings to typed memory  
 130373 on behalf of devices or processors which were independent of the operating system and  
 130374 had no inherent capability to directly establish mappings on their own. This was to have  
 130375 provided functionality similar to device driver interfaces such as `physio()` and their  
 130376 underlying bus-specific interfaces (for example, `mballoc()`) which serve to set up and break  
 130377 down DMA pathways, and derive mapped addresses for use by hardware devices and  
 130378 processor cards.

130379 The ballot group felt that this was beyond the scope of POSIX.1 and its amendments.  
 130380 Furthermore, the removal of interrupt handling interfaces from a preceding amendment  
 130381 (the IEEE Std 1003.1d-1999) during its balloting process renders these typed memory  
 130382 access management interfaces an incomplete solution to portable device management from  
 130383 a user process; it would be possible to initiate a device transfer to/from typed memory, but  
 130384 impossible to handle the transfer-complete interrupt in a portable way.

130385 To achieve ballot group consensus, all references to typed memory access management  
 130386 capabilities were removed. The concept of portable interfaces from a device driver to both  
 130387 operating system and hardware is being addressed by the Uniform Driver Interface (UDI)  
 130388 industry forum, with formal standardization deferred until proof of concept and industry-  
 130389 wide acceptance and implementation.

130390 B.2.8.4 Process Scheduling

130391 IEEE PASC Interpretation 1003.1 #96 has been applied, adding the `pthread_setschedprio()`  
 130392 function. This was added since previously there was no way for a thread to lower its own  
 130393 priority without going to the tail of the threads list for its new priority. This capability is  
 130394 necessary to bound the duration of priority inversion encountered by a thread.

130395 The following portion of the rationale presents models, requirements, and standardization  
 130396 issues relevant to process and thread scheduling; see [Section B.2.9.4](#) (on page 3824) for  
 130397 additional rationale relevant to thread scheduling.

130398 In an operating system supporting multiple concurrent processes or threads, the system  
130399 determines the order in which processes or threads execute to meet implementation-defined  
130400 goals. For time-sharing systems, the goal is to enhance system throughput and promote fairness;  
130401 the application is provided with little or no control over this sequencing function. While this is  
130402 acceptable and desirable behavior in a time-sharing system, it is inappropriate in a realtime  
130403 system; realtime applications must specifically control the execution sequence of their  
130404 concurrent processes or threads in order to meet externally defined response requirements.

130405 In POSIX.1-2024, the control over process and thread sequencing is provided using a concept of  
130406 scheduling policies. These policies, described in detail in this section, define the behavior of the  
130407 system whenever processor resources are to be allocated to competing processes or threads.  
130408 Only the behavior of the policy is defined; conforming implementations are free to use any  
130409 mechanism desired to achieve the described behavior.

130410 • Models

130411 In an operating system supporting multiple concurrent processes or threads, the system  
130412 determines the order in which threads (including those that are the only thread in a single-  
130413 threaded process) execute and might force long-running threads to yield to other threads  
130414 at certain intervals. Typically, the scheduling code is executed whenever an event occurs  
130415 that might alter the thread to be executed next.

130416 The simplest scheduling strategy is a “first-in, first-out” (FIFO) dispatcher. Whenever a  
130417 thread becomes runnable, it is placed on the end of a ready list. When processing resources  
130418 become available, the thread at the front of the ready list starts or resumes execution and is  
130419 removed from the list. This thread is executed until it exits or becomes blocked, at which  
130420 point the processing resources used to execute it become available to execute another  
130421 runnable thread. This scheduling technique is also known as “run-to-completion” or “run-  
130422 to-block”.

130423 A natural extension to this scheduling technique is the assignment of a “non-migrating  
130424 priority” to each thread. This policy differs from strict FIFO scheduling in only one respect:  
130425 whenever a thread becomes runnable, it is placed at the end of the list of threads runnable  
130426 at that priority level. When selecting a thread to run, the system always selects the first  
130427 thread from the highest priority queue with a runnable thread. Thus, when a thread  
130428 becomes unblocked, it will preempt a running thread of lower priority without otherwise  
130429 altering the ready list. Further, if a running or runnable thread’s priority is altered, it is  
130430 removed from the ready list for its old priority (if present in the list; that is, not running)  
130431 and is inserted into the ready list for its new priority, according to the policy above, except  
130432 that threads executing at a temporarily elevated priority as a consequence of owning a  
130433 mutex initialized with the PTHREAD\_PRIO\_INHERIT or PTHREAD\_PRIO\_PROTECT  
130434 protocol are exempted from this in order to ensure that a thread can lock and unlock such  
130435 as mutex without the implicit yield that any resulting priority changes would normally  
130436 cause.

130437 While the above policy might be considered unfriendly in a time-sharing environment in  
130438 which multiple users require more balanced resource allocation, it could be ideal in a  
130439 realtime environment for several reasons. The most important of these is that it is  
130440 deterministic: the highest-priority thread is always run and, among threads of equal  
130441 priority, the thread that has been runnable for the longest time is executed first. Because of  
130442 this determinism, cooperating threads can implement more complex scheduling simply by  
130443 altering their priority. For instance, if threads at a single priority were to reschedule  
130444 themselves at fixed time intervals, a time-slice policy would result.

130445 In a dedicated operating system in which all threads belong to well-behaved realtime  
130446 applications, non-migrating priority scheduling is sufficient. However, many existing

- 130447 implementations provide for more complex scheduling policies.
- 130448 For process scheduling, POSIX.1-2024 specifies a linear scheduling model. In this model,  
130449 every process in the system has a priority. The system scheduler always dispatches a  
130450 process that has the highest (generally the most time-critical) priority among all runnable  
130451 processes in the system. As long as there is only one such process, the dispatching policy is  
130452 trivial. When multiple processes of equal priority are eligible to run, they are ordered  
130453 according to a strict run-to-completion (FIFO) policy. Thread scheduling is similar, except  
130454 that the scheduling policy can be applied just to the threads within one process  
130455 (PTHREAD\_SCOPE\_PROCESS scheduling contention scope) or to all threads system-wide  
130456 (PTHREAD\_SCOPE\_SYSTEM scheduling contention scope). This and other considerations  
130457 specific to thread scheduling are the subject of [Section B.2.9.4](#) (on page 3824); the  
130458 remainder of this section is described in terms of process scheduling but is also relevant to  
130459 thread scheduling when read in conjunction with [Section B.2.9.4](#).
- 130460 The priority is represented as a positive integer and is inherited from the parent process.  
130461 For processes running under a fixed priority scheduling policy, the priority is never altered  
130462 except by an explicit function call.
- 130463 It was determined arbitrarily that larger integers correspond to “higher priorities”.
- 130464 Certain implementations might impose restrictions on the priority ranges to which  
130465 processes can be assigned. There also can be restrictions on the set of policies to which  
130466 processes can be set.
- 130467 • Requirements
- 130468 Realtime processes require that scheduling be fast and deterministic, and that it guarantees  
130469 to preempt lower priority processes.
- 130470 Thus, given the linear scheduling model, realtime processes require that they be run at a  
130471 priority that is higher than other processes. Within this framework, realtime processes are  
130472 free to yield execution resources to each other in a completely portable and  
130473 implementation-defined manner.
- 130474 As there is a generally perceived requirement for processes at the same priority level to  
130475 share processor resources more equitably, provisions are made by providing a scheduling  
130476 policy (that is, SCHED\_RR) intended to provide a timeslice-like facility.
- 130477 **Note:** The following topics assume that low numeric priority implies low scheduling criticality  
130478 and *vice versa*.
- 130479 • Rationale for New Interface
- 130480 Realtime applications need to be able to determine when processes will run in relation to  
130481 each other. It must be possible to guarantee that a critical process will run whenever it is  
130482 runnable; that is, whenever it wants to for as long as it needs. SCHED\_FIFO satisfies this  
130483 requirement. Additionally, SCHED\_RR was defined to meet a realtime requirement for a  
130484 well-defined time-sharing policy for processes at the same priority.
- 130485 It would be possible to use the BSD *setpriority()* and *getpriority()* functions by redefining  
130486 the meaning of the “nice” parameter according to the scheduling policy currently in use by  
130487 the process. The System V *nice()* interface was felt to be undesirable for realtime because it  
130488 specifies an adjustment to the “nice” value, rather than setting it to an explicit value.  
130489 Realtime applications will usually want to set priority to an explicit value. Also, System V  
130490 *nice()* does not allow for changing the priority of another process.
- 130491 With the POSIX.1b interfaces, the traditional “nice” value does not affect the SCHED\_FIFO  
130492 or SCHED\_RR scheduling policies. If a “nice” value is supported, it is implementation-  
130493 defined whether it affects the SCHED\_OTHER policy.

130494 An important aspect of POSIX.1-2024 is the explicit description of the queuing and  
130495 preemption rules. It is critical, to achieve deterministic scheduling, that such rules be  
130496 stated clearly in POSIX.1-2024.

130497 POSIX.1-2024 does not address the interaction between priority and swapping. The issues  
130498 involved with swapping and virtual memory paging are extremely implementation-  
130499 defined and would be nearly impossible to standardize at this point. The proposed  
130500 scheduling paradigm, however, fully describes the scheduling behavior of runnable  
130501 processes, of which one criterion is that the working set be resident in memory. Assuming  
130502 the existence of a portable interface for locking portions of a process in memory, paging  
130503 behavior need not affect the scheduling of realtime processes.

130504 POSIX.1-2024 also does not address the priorities of “system” processes. In general, these  
130505 processes should always execute in low-priority ranges to avoid conflict with other  
130506 realtime processes. Implementations should document the priority ranges in which system  
130507 processes run.

130508 The default scheduling policy is not defined. The effect of I/O interrupts and other system  
130509 processing activities is not defined. The temporary lending of priority from one process to  
130510 another (such as for the purposes of affecting freeing resources) by the system is not  
130511 addressed. Preemption of resources is not addressed. Restrictions on the ability of a  
130512 process to affect other processes beyond a certain level (influence levels) is not addressed.

130513 The rationale used to justify the simple time-quantum scheduler is that it is common  
130514 practice to depend upon this type of scheduling to ensure “fair” distribution of processor  
130515 resources among portions of the application that must interoperate in a serial fashion. Note  
130516 that POSIX.1-2024 is silent with respect to the setting of this time quantum, or whether it is  
130517 a system-wide value or a per-process value, although it appears that the prevailing  
130518 realtime practice is for it to be a system-wide value.

130519 In a system with  $N$  processes at a given priority, all processor-bound, in which the time  
130520 quantum is equal for all processes at a specific priority level, the following assumptions  
130521 are made of such a scheduling policy:

- 130522 1. A time quantum  $Q$  exists and the current process will own control of the processor  
130523 for at least a duration of  $Q$  and will have the processor for a duration of  $Q$ .
- 130524 2. The  $N$ th process at that priority will control a processor within a duration of  $(N-1)$   
130525  $\times Q$ .

130526 These assumptions are necessary to provide equal access to the processor and bounded  
130527 response from the application.

130528 The assumptions hold for the described scheduling policy only if no system overhead,  
130529 such as interrupt servicing, is present. If the interrupt servicing load is non-zero, then one  
130530 of the two assumptions becomes fallacious, based upon how  $Q$  is measured by the system.

130531 If  $Q$  is measured by clock time, then the assumption that the process obtains a duration  $Q$   
130532 processor time is false if interrupt overhead exists. Indeed, a scenario can be constructed  
130533 with  $N$  processes in which a single process undergoes complete processor starvation if a  
130534 peripheral device, such as an analog-to-digital converter, generates significant interrupt  
130535 activity periodically with a period of  $N \times Q$ .

130536 If  $Q$  is measured as actual processor time, then the assumption that the  $N$ th process runs in  
130537 within the duration  $(N-1) \times Q$  is false.

130538 It should be noted that SCHED\_FIFO suffers from interrupt-based delay as well. However,  
130539 for SCHED\_FIFO, the implied response of the system is “as soon as possible”, so that the  
130540 interrupt load for this case is a vendor selection and not a compliance issue.

130541 With this in mind, it is necessary either to complete the definition by including bounds on  
 130542 the interrupt load, or to modify the assumptions that can be made about the scheduling  
 130543 policy.

130544 Since the motivation of inclusion of the policy is common usage, and since current  
 130545 applications do not enjoy the luxury of bounded interrupt load, item (2) above is sufficient  
 130546 to express existing application needs and is less restrictive in the standard definition. No  
 130547 difference in interface is necessary.

130548 In an implementation in which the time quantum is equal for all processes at a specific  
 130549 priority, our assumptions can then be restated as:

- 130550 — A time quantum  $Q$  exists, and a processor-bound process will be rescheduled after a  
 130551 duration of, at most,  $Q$ . Time quantum  $Q$  may be defined in either wall clock time or  
 130552 execution time.

- 130553 — In general, the  $N$ th process of a priority level should wait no longer than  $(N-1) \times Q$   
 130554 time to execute, assuming no processes exist at higher priority levels.

- 130555 — No process should wait indefinitely.

130556 For implementations supporting per-process time quanta, these assumptions can be  
 130557 readily extended.

130558 Austin Group Defect 1302 is applied, making requirements on `sched_yield()` also apply to  
 130559 `thrd_yield()`.

130560 Austin Group Defect 1610 is applied, clarifying the effects of `PTHREAD_PRIO_INHERIT` and  
 130561 `PTHREAD_PRIO_PROTECT` on scheduling queues.

### 130562 Sporadic Server Scheduling Policy

130563 The sporadic server is a mechanism defined for scheduling aperiodic activities in time-critical  
 130564 realtime systems. This mechanism reserves a certain bounded amount of execution capacity for  
 130565 processing aperiodic events at a high priority level. Any aperiodic events that cannot be  
 130566 processed within the bounded amount of execution capacity are executed in the background at a  
 130567 low priority level. Thus, a certain amount of execution capacity can be guaranteed to be  
 130568 available for processing periodic tasks, even under burst conditions in the arrival of aperiodic  
 130569 processing requests (that is, a large number of requests in a short time interval). The sporadic  
 130570 server also simplifies the schedulability analysis of the realtime system, because it allows  
 130571 aperiodic processes or threads to be treated as if they were periodic. The sporadic server was  
 130572 first described by Sprunt, et al.

130573 The key concept of the sporadic server is to provide and limit a certain amount of computation  
 130574 capacity for processing aperiodic events at their assigned normal priority, during a time interval  
 130575 called the “replenishment period”. Once the entity controlled by the sporadic server mechanism  
 130576 is initialized with its period and execution-time budget attributes, it preserves its execution  
 130577 capacity until an aperiodic request arrives. The request will be serviced (if there are no higher  
 130578 priority activities pending) as long as there is execution capacity left. If the request is completed,  
 130579 the actual execution time used to service it is subtracted from the capacity, and a replenishment  
 130580 of this amount of execution time is scheduled to happen one replenishment period after the  
 130581 arrival of the aperiodic request. If the request is not completed, because there is no execution  
 130582 capacity left, then the aperiodic process or thread is assigned a lower background priority. For  
 130583 each portion of consumed execution capacity the execution time used is replenished after one  
 130584 replenishment period. At the time of replenishment, if the sporadic server was executing at a  
 130585 background priority level, its priority is elevated to the normal level. Other similar  
 130586 replenishment policies have been defined, but the one presented here represents a compromise  
 130587 between efficiency and implementation complexity.

130588 The interface that appears in this section defines a new scheduling policy for threads and  
130589 processes that behaves according to the rules of the sporadic server mechanism. Scheduling  
130590 attributes are defined and functions are provided to allow the user to set and get the parameters  
130591 that control the scheduling behavior of this mechanism, namely the normal and low priority, the  
130592 replenishment period, the maximum number of pending replenishment operations, and the  
130593 initial execution-time budget.

130594 • Scheduling Aperiodic Activities

130595 Virtually all realtime applications are required to process aperiodic activities. In many  
130596 cases, there are tight timing constraints that the response to the aperiodic events must  
130597 meet. Usual timing requirements imposed on the response to these events are:

130598 — The effects of an aperiodic activity on the response time of lower priority activities  
130599 must be controllable and predictable.

130600 — The system must provide the fastest possible response time to aperiodic events.

130601 — It must be possible to take advantage of all the available processing bandwidth not  
130602 needed by time-critical activities to enhance average-case response times to aperiodic  
130603 events.

130604 Traditional methods for scheduling aperiodic activities are background processing, polling  
130605 tasks, and direct event execution:

130606 — Background processing consists of assigning a very low priority to the processing of  
130607 aperiodic events. It utilizes all the available bandwidth in the system that has not  
130608 been consumed by higher priority threads. However, it is very difficult, or  
130609 impossible, to meet requirements on average-case response time, because the  
130610 aperiodic entity has to wait for the execution of all other entities which have higher  
130611 priority.

130612 — Polling consists of creating a periodic process or thread for servicing aperiodic  
130613 requests. At regular intervals, the polling entity is started and its services  
130614 accumulated pending aperiodic requests. If no aperiodic requests are pending, the  
130615 polling entity suspends itself until its next period. Polling allows the aperiodic  
130616 requests to be processed at a higher priority level. However, worst and average-case  
130617 response times of polling entities are a direct function of the polling period, and there  
130618 is execution overhead for each polling period, even if no event has arrived. If the  
130619 deadline of the aperiodic activity is short compared to the inter-arrival time, the  
130620 polling frequency must be increased to guarantee meeting the deadline. For this case,  
130621 the increase in frequency can dramatically reduce the efficiency of the system and,  
130622 therefore, its capacity to meet all deadlines. Yet, polling represents a good way to  
130623 handle a large class of practical problems because it preserves system predictability,  
130624 and because the amortized overhead drops as load increases.

130625 — Direct event execution consists of executing the aperiodic events at a high fixed-  
130626 priority level. Typically, the aperiodic event is processed by an interrupt service  
130627 routine as soon as it arrives. This technique provides predictable response times for  
130628 aperiodic events, but makes the response times of all lower priority activities  
130629 completely unpredictable under burst arrival conditions. Therefore, if the density of  
130630 aperiodic event arrivals is unbounded, it may be a dangerous technique for time-  
130631 critical systems. Yet, for those cases in which the physics of the system imposes a  
130632 bound on the event arrival rate, it is probably the most efficient technique.

130633 — The sporadic server scheduling algorithm combines the predictability of the polling  
130634 approach with the short response times of the direct event execution. Thus, it allows  
130635 systems to meet an important class of application requirements that cannot be met by

130636 using the traditional approaches. Multiple sporadic servers with different attributes  
130637 can be applied to the scheduling of multiple classes of aperiodic events, each with  
130638 different kinds of timing requirements, such as individual deadlines, average  
130639 response times, and so on. It also has many other interesting applications for  
130640 realtime, such as scheduling producer/consumer tasks in time-critical systems,  
130641 limiting the effects of faults on the estimation of task execution-time requirements,  
130642 and so on.

130643 • Existing Practice

130644 The sporadic server has been used in different kinds of applications, including military  
130645 avionics, robot control systems, industrial automation systems, and so on. There are  
130646 examples of many systems that cannot be successfully scheduled using the classic  
130647 approaches, such as direct event execution, or polling, and are schedulable using a  
130648 sporadic server scheduler. The sporadic server algorithm itself can successfully schedule  
130649 all systems scheduled with direct event execution or polling.

130650 The sporadic server scheduling policy has been implemented as a commercial product in  
130651 the run-time system of the Verdex Ada compiler. There are also many applications that  
130652 have used a much less efficient application-level sporadic server. These realtime  
130653 applications would benefit from a sporadic server scheduler implemented at the scheduler  
130654 level.

130655 • Library-Level *versus* Kernel-Level Implementation

130656 The sporadic server interface described in this section requires the sporadic server policy  
130657 to be implemented at the same level as the scheduler. This means that the process sporadic  
130658 server must be implemented at the kernel level and the thread sporadic server policy  
130659 implemented at the same level as the thread scheduler; that is, kernel or library level.

130660 In an earlier interface for the sporadic server, this mechanism was implementable at a  
130661 different level than the scheduler. This feature allowed the implementor to choose between  
130662 an efficient scheduler-level implementation, or a simpler user or library-level  
130663 implementation. However, the working group considered that this interface made the use  
130664 of sporadic servers more complex, and that library-level implementations would lack some  
130665 of the important functionality of the sporadic server, namely the limitation of the actual  
130666 execution time of aperiodic activities. The working group also felt that the interface  
130667 described in this chapter does not preclude library-level implementations of threads  
130668 intended to provide efficient low-overhead scheduling for those threads that are not  
130669 scheduled under the sporadic server policy.

130670 • Range of Scheduling Priorities

130671 Each of the scheduling policies supported in POSIX.1-2024 has an associated range of  
130672 priorities. The priority ranges for each policy might or might not overlap with the priority  
130673 ranges of other policies. For time-critical realtime applications it is usual for periodic and  
130674 aperiodic activities to be scheduled together in the same processor. Periodic activities will  
130675 usually be scheduled using the SCHED\_FIFO scheduling policy, while aperiodic activities  
130676 may be scheduled using SCHED\_SPORADIC. Since the application developer will require  
130677 complete control over the relative priorities of these activities in order to meet his timing  
130678 requirements, it would be desirable for the priority ranges of SCHED\_FIFO and  
130679 SCHED\_SPORADIC to overlap completely. Therefore, although POSIX.1-2024 does not  
130680 require any particular relationship between the different priority ranges, it is  
130681 recommended that these two ranges should coincide.

- 130682
- Dynamically Setting the Sporadic Server Policy
- 130683 Several members of the working group requested that implementations should not be  
 130684 required to support dynamically setting the sporadic server scheduling policy for a thread.  
 130685 The reason is that this policy may have a high overhead for library-level implementations  
 130686 of threads, and if threads are allowed to dynamically set this policy, this overhead can be  
 130687 experienced even if the thread does not use that policy. By disallowing the dynamic setting  
 130688 of the sporadic server scheduling policy, these implementations can accomplish efficient  
 130689 scheduling for threads using other policies. If a strictly conforming application needs to  
 130690 use the sporadic server policy, and is therefore willing to pay the overhead, it must set this  
 130691 policy at the time of thread creation.
- 130692
- Limitation of the Number of Pending Replenishments
- 130693 The number of simultaneously pending replenishment operations must be limited for each  
 130694 sporadic server for two reasons: an unlimited number of replenishment operations would  
 130695 need an unlimited number of system resources to store all the pending replenishment  
 130696 operations; on the other hand, in some implementations each replenishment operation will  
 130697 represent a source of priority inversion (just for the duration of the replenishment  
 130698 operation) and thus, the maximum amount of replenishments must be bounded to  
 130699 guarantee bounded response times. The way in which the number of replenishments is  
 130700 bounded is by lowering the priority of the sporadic server to *sched\_ss\_low\_priority* when  
 130701 the number of pending replenishments has reached its limit. In this way, no new  
 130702 replenishments are scheduled until the number of pending replenishments decreases.
- 130703 In the sporadic server scheduling policy defined in POSIX.1-2024, the application can  
 130704 specify the maximum number of pending replenishment operations for a single sporadic  
 130705 server, by setting the value of the *sched\_ss\_max\_repl* scheduling parameter. This value must  
 130706 be between one and {SS\_REPL\_MAX}, which is a maximum limit imposed by the  
 130707 implementation. The limit {SS\_REPL\_MAX} must be greater than or equal to  
 130708 {\_POSIX\_SS\_REPL\_MAX}, which is defined to be four in POSIX.1-2024. The minimum  
 130709 limit of four was chosen so that an application can at least guarantee that four different  
 130710 aperiodic events can be processed during each interval of length equal to the  
 130711 replenishment period.
- 130712 *B.2.8.5 Clocks and Timers*
- Clocks
- 130714 POSIX.1-2024 and the ISO C standard both define functions for obtaining system time.  
 130715 Implicit behind these functions is a mechanism for measuring passage of time. This  
 130716 specification makes this mechanism explicit and calls it a clock. The CLOCK\_REALTIME  
 130717 clock required by POSIX.1-2024 is a higher resolution version of the clock that maintains  
 130718 POSIX.1 system time. This is a “system-wide” clock, in that it is visible to all processes  
 130719 and, were it possible for multiple processes to all read the clock at the same time, they  
 130720 would see the same value.
- 130721 An extensible interface was defined, with the ability for implementations to define  
 130722 additional clocks. This was done because of the observation that many realtime platforms  
 130723 support multiple clocks, and it was desired to fit this model within the standard interface.  
 130724 But implementation-defined clocks need not represent actual hardware devices, nor are  
 130725 they necessarily system-wide.
- Timers
- 130726 Two timer types are required for a system to support realtime applications:  
 130727

130728 1. One-shot

130729 A one-shot timer is a timer that is armed with an initial expiration time, either  
 130730 relative to the current time or at an absolute time (based on some timing base, such  
 130731 as time in seconds and nanoseconds since the Epoch). The timer expires once and  
 130732 then is disarmed. With the specified facilities, this is accomplished by setting the  
 130733 *it\_value* member of the *value* argument to the desired expiration time and the  
 130734 *it\_interval* member to zero.

130735 2. Periodic

130736 A periodic timer is a timer that is armed with an initial expiration time, again either  
 130737 relative or absolute, and a repetition interval. When the initial expiration occurs,  
 130738 the timer is reloaded with the repetition interval and continues counting. With the  
 130739 specified facilities, this is accomplished by setting the *it\_value* member of the *value*  
 130740 argument to the desired initial expiration time and the *it\_interval* member to the  
 130741 desired repetition interval.

130742 For both of these types of timers, the time of the initial timer expiration can be specified in  
 130743 two ways:

130744 1. Relative (to the current time)

130745 2. Absolute

130746 • Examples of Using Realtime Timers

130747 In the diagrams below, *S* indicates a program schedule, *R* shows a schedule method  
 130748 request, and *E* suggests an internal operating system event.

130749 — Periodic Timer: Data Logging

130750 During an experiment, it might be necessary to log realtime data periodically to an  
 130751 internal buffer or to a mass storage device. With a periodic scheduling method, a  
 130752 logging module can be started automatically at fixed time intervals to log the data.

130753 Program schedule is requested every 10 seconds.

130758 To achieve this type of scheduling using the specified facilities, one would allocate a  
 130759 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 130760 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an  
 130761 initial expiration value and a repetition interval of 10 seconds.

130762 — One-shot Timer (Relative Time): Device Initialization

130763 In an emission test environment, large sample bags are used to capture the exhaust  
 130764 from a vehicle. The exhaust is purged from these bags before each and every test.  
 130765 With a one-shot timer, a module could initiate the purge function and then suspend  
 130766 itself for a predetermined period of time while the sample bags are prepared.

130767 Program schedule requested 20 seconds after call is issued.

130771 [Time (in Seconds)]

130772 To achieve this type of scheduling using the specified facilities, one would allocate a  
 130773 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 130774 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an  
 130775 initial expiration value of 20 seconds and a repetition interval of zero.

130776 Note that if the program wishes merely to suspend itself for the specified interval, it  
 130777 could more easily use `nanosleep()`.

130778 — One-shot Timer (Absolute Time): Data Transmission

130779 The results from an experiment are often moved to a different system within a  
 130780 network for post-processing or archiving. With an absolute one-shot timer, a module  
 130781 that moves data from a test-cell computer to a host computer can be automatically  
 130782 scheduled on a daily basis.

130783 Program schedule requested for 2:30 a.m.

130787 [Time of Day]

130788 To achieve this type of scheduling using the specified facilities, a per-process timer  
 130789 would be allocated based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 130790 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag set, and an initial  
 130791 expiration value equal to 2:30 a.m. of the next day.

130792 — Periodic Timer (Relative Time): Signal Stabilization

130793 Some measurement devices, such as emission analyzers, do not respond  
 130794 instantaneously to an introduced sample. With a periodic timer with a relative initial  
 130795 expiration time, a module that introduces a sample and records the average response  
 130796 could suspend itself for a predetermined period of time while the signal is stabilized  
 130797 and then sample at a fixed rate.

130798 Program schedule requested 15 seconds after call is issued and every 2 seconds  
 130799 thereafter.

130803 [Time (in Seconds)]

130804 To achieve this type of scheduling using the specified facilities, one would allocate a  
 130805 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 130806 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag reset, and with an  
 130807 initial expiration value of 15 seconds and a repetition interval of 2 seconds.

130808 — Periodic Timer (Absolute Time): Work Shift-related Processing

130809 Resource utilization data is useful when time to perform experiments is being  
 130810 scheduled at a facility. With a periodic timer with an absolute initial expiration time,  
 130811 a module can be scheduled at the beginning of a work shift to gather resource  
 130812 utilization data throughout the shift. This data can be used to allocate resources  
 130813 effectively to minimize bottlenecks and delays and maximize facility throughput.

130814 Program schedule requested for 2:00 a.m. and every 15 minutes thereafter.

```

130815                R                                S S S S S S
130816          -----+-----+-----+-----+-----+-----+-----+----->
130817                23:00 23:30 24:00 00:30 01:00 01:30 02:00 02:30 03:00

```

130818 [Time of Day]

130819 To achieve this type of scheduling using the specified facilities, one would allocate a  
 130820 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 130821 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag set, and with an initial  
 130822 expiration value equal to 2:00 a.m. and a repetition interval equal to 15 minutes.

130823 • Relationship of Timers to Clocks

130824 The relationship between clocks and timers armed with an absolute time is  
 130825 straightforward: a timer expiration signal is requested when the associated clock reaches  
 130826 or exceeds the specified time. The relationship between clocks and timers armed with a  
 130827 relative time (an interval) is less obvious, but not unintuitive. In this case, a timer  
 130828 expiration signal is requested when the specified interval, *as measured by the associated clock*,  
 130829 has passed. For the required `CLOCK_REALTIME` clock, this allows timer expiration  
 130830 signals to be requested at specified “wall clock” times (absolute), or when a specified  
 130831 interval of “realtime” has passed (relative). For an implementation-defined clock—say, a  
 130832 process virtual time clock—timer expirations could be requested when the process has  
 130833 used a specified total amount of virtual time (absolute), or when it has used a specified  
 130834 *additional* amount of virtual time (relative).

130835 The interfaces also allow flexibility in the implementation of the functions. For example, an  
 130836 implementation could convert all absolute times to intervals by subtracting the clock value  
 130837 at the time of the call from the requested expiration time and “counting down” at the  
 130838 supported resolution. Or it could convert all relative times to absolute expiration time by  
 130839 adding in the clock value at the time of the call and comparing the clock value to the  
 130840 expiration time at the supported resolution. Or it might even choose to maintain absolute  
 130841 times as absolute and compare them to the clock value at the supported resolution for  
 130842 absolute timers, and maintain relative times as intervals and count them down at the  
 130843 resolution supported for relative timers. The choice will be driven by efficiency  
 130844 considerations and the underlying hardware or software clock implementation.

130845 • Data Definitions for Clocks and Timers

130846 POSIX.1-2024 uses a time representation capable of supporting nanosecond resolution  
 130847 timers for the following reasons:

- 130848 — To enable POSIX.1-2024 to represent those computer systems already using  
 130849 nanosecond or submicrosecond resolution clocks.
- 130850 — To accommodate those per-process timers that might need nanoseconds to specify an  
 130851 absolute value of system-wide clocks, even though the resolution of the per-process  
 130852 timer may only be milliseconds, or *vice versa*.
- 130853 — Because the number of nanoseconds in a second can be represented in 32 bits.

130854 Time values are represented in the `timespec` structure. The `tv_sec` member is of type `time_t`  
 130855 so that this member is compatible with time values used by POSIX.1 functions and the  
 130856 ISO C standard. The `tv_nsec` member is a **signed long** in order to simplify and clarify code  
 130857 that decrements or finds differences of time values. Note that because 1 billion (number of  
 130858 nanoseconds per second) is less than half of the value representable by a signed 32-bit  
 130859 value, it is always possible to add two valid fractional seconds represented as integral  
 130860 nanoseconds without overflowing the signed 32-bit value.

130861 A maximum allowable resolution for the `CLOCK_REALTIME` clock of 20 ms (1/50

130862 seconds) was chosen to allow line frequency clocks in European countries to be  
130863 conforming. 60 Hz clocks in the US will also be conforming, as will finer granularity  
130864 clocks, although a Strictly Conforming Application cannot assume a granularity of less  
130865 than 20 ms (1/50 seconds).

130866 The minimum allowable maximum time allowed for the CLOCK\_REALTIME clock and  
130867 the function *nanosleep()*, and timers created with *clock\_id=CLOCK\_REALTIME*, is  
130868 determined by the fact that the *tv\_sec* member is of type **time\_t**.

130869 POSIX.1-2024 specifies that timer expirations must not be delivered early, and *nanosleep()*  
130870 must not return early due to quantization error. POSIX.1-2024 discusses the various  
130871 implementations of *alarm()* in the rationale and states that implementations that do not  
130872 allow alarm signals to occur early are the most appropriate, but refrained from mandating  
130873 this behavior. Because of the importance of predictability to realtime applications,  
130874 POSIX.1-2024 takes a stronger stance.

130875 The standard developers considered using a time representation that differs from  
130876 POSIX.1b in the second 32 bit of the 64-bit value. Whereas POSIX.1b defines this field as a  
130877 fractional second in nanoseconds, the other methodology defines this as a binary fraction  
130878 of one second, with the radix point assumed before the most significant bit.

130879 POSIX.1b is a software, source-level standard and most of the benefits of the alternate  
130880 representation are enjoyed by hardware implementations of clocks and algorithms. It was  
130881 felt that mandating this format for POSIX.1b clocks and timers would unnecessarily  
130882 burden the application developer with writing, possibly non-portable, multiple precision  
130883 arithmetic packages to perform conversion between binary fractions and integral units  
130884 such as nanoseconds, milliseconds, and so on.

#### 130885 **Rationale for the Monotonic Clock**

130886 For those applications that use time services to achieve realtime behavior, changing the value of  
130887 the clock on which these services rely may cause erroneous timing behavior. For these  
130888 applications, it is necessary to have a monotonic clock which cannot run backwards, and which  
130889 has a maximum clock jump that is required to be documented by the implementation.  
130890 Additionally, it is desirable (but not required by POSIX.1-2024) that the monotonic clock  
130891 increases its value uniformly. This clock should not be affected by changes to the system time;  
130892 for example, to synchronize the clock with an external source or to account for leap seconds.  
130893 Such changes would cause errors in the measurement of time intervals for those time services  
130894 that use the absolute value of the clock.

130895 One could argue that by defining the behavior of time services when the value of a clock is  
130896 changed, deterministic realtime behavior can be achieved. For example, one could specify that  
130897 relative time services should be unaffected by changes in the value of a clock. However, there are  
130898 time services that are based upon an absolute time, but that are essentially intended as relative  
130899 time services. For example, *pthread\_cond\_timedwait()* uses an absolute time to allow it to wake  
130900 up after the required interval despite spurious wakeups. Although sometimes the  
130901 *pthread\_cond\_timedwait()* timeouts are absolute in nature, there are many occasions in which they  
130902 are relative, and their absolute value is determined from the current time plus a relative time  
130903 interval. In this latter case, if the clock changes while the thread is waiting, the wait interval will  
130904 not be the expected length. If a *pthread\_cond\_timedwait()* function were created that would take a  
130905 relative time, it would not solve the problem because to retain the intended “deadline” a thread  
130906 would need to compensate for latency due to the spurious wakeup, and preemption between  
130907 wakeup and the next wait.

130908 The solution is to create a new monotonic clock, whose value does not change except for the  
130909 regular ticking of the clock, and use this clock for implementing the various relative timeouts

130910 that appear in the different POSIX interfaces, as well as allow `pthread_cond_timedwait()` to choose  
 130911 this new clock for its timeout. A new `clock_nanosleep()` function is created to allow an application  
 130912 to take advantage of this newly defined clock. Notice that the monotonic clock may be  
 130913 implemented using the same hardware clock as the system clock.

130914 Relative timeouts for `sigtimedwait()` and `aio_suspend()` have been redefined to use the monotonic  
 130915 clock, if present. The `alarm()` function has not been redefined, because the same effect but with  
 130916 better resolution can be achieved by creating a timer (for which the appropriate clock may be  
 130917 chosen).

130918 The `pthread_cond_timedwait()` function has been treated in a different way, compared to other  
 130919 functions with absolute timeouts, because it is used to wait for an event, and thus it may have a  
 130920 deadline, while the other timeouts are generally used as an error recovery mechanism, and for  
 130921 them the use of the monotonic clock is not so important. Since the desired timeout for the  
 130922 `pthread_cond_timedwait()` function may either be a relative interval or an absolute time of day  
 130923 deadline, a new initialization attribute has been created for condition variables to specify the  
 130924 clock that is used for measuring the timeout in a call to `pthread_cond_timedwait()`. In this way, if  
 130925 a relative timeout is desired, the monotonic clock will be used; if an absolute deadline is  
 130926 required instead, the `CLOCK_REALTIME` or another appropriate clock may be used. For  
 130927 condition variables, this capability is also available by passing `CLOCK_MONOTONIC` to the  
 130928 `pthread_cond_clockwait()` function. Similarly, `CLOCK_MONOTONIC` can be specified when  
 130929 calling `pthread_mutex_clocklock()`, `pthread_rwlock_clockrdlock()`, `pthread_rwlock_clockwrlock()`, and  
 130930 `sem_clockwait()`.

130931 It was later found necessary to add variants of almost all interfaces that accept absolute timeouts  
 130932 that allow the clock to be specified. This is because, despite the claim in the previous paragraph,  
 130933 it is not possible to safely use a `CLOCK_REALTIME` absolute timeout even to prevent errors  
 130934 when the system clock is warped by a potentially large amount. A “safety timeout” of a minute  
 130935 on a call to `pthread_mutex_timedlock()` could actually mean that the call would return  
 130936 `ETIMEDOUT` early without acquiring the lock if the system clock is warped forwards  
 130937 immediately prior to or during the call. On the other hand, a short timeout could end up being  
 130938 arbitrarily long if the system clock is warped backwards immediately prior to or during the call.  
 130939 These problems are solved by the new `clockwait` and `clocklock` variants of the existing `timedwait`  
 130940 and `timedlock` functions. These variants accept an extra `clockid_t` parameter to indicate the clock  
 130941 to be used for the wait. The clock ID is passed rather than using attributes as previously for  
 130942 `pthread_cond_timedwait()` in order to allow the ISO/IEC 14882:2011 standard (C++11) and later to  
 130943 be implemented correctly. C++ requires that the clock to use for the wait is not known until the  
 130944 time of the wait call, so it cannot be supplied during creation. The new functions are  
 130945 `pthread_cond_clockwait()`, `pthread_mutex_clocklock()`, `pthread_mutex_clockrdlock()`,  
 130946 `pthread_mutex_clockwrlock()`, and `sem_clockwait()`. It is expected that `mq_clockreceive()` and  
 130947 `mq_clocksend()` functions will be added in a future version of this standard.

130948 The `nanosleep()` function has not been modified with the introduction of the monotonic clock.  
 130949 Instead, a new `clock_nanosleep()` function has been created, in which the desired clock may be  
 130950 specified in the function call.

#### 130951 • History of Resolution Issues

130952 Due to the shift from relative to absolute timeouts in IEEE Std 1003.1d-1999, the  
 130953 amendments to the `sem_timedwait()`, `pthread_mutex_timedlock()`, `mq_timedreceive()`, and  
 130954 `mq_timedsend()` functions of that standard have been removed. Those amendments  
 130955 specified that `CLOCK_MONOTONIC` would be used for the (relative) timeouts if the  
 130956 (optional at the time) Monotonic Clock was supported.

130957 Having these functions continue to be tied solely to `CLOCK_MONOTONIC` would not  
 130958 work. Since the absolute value of a time value obtained from `CLOCK_MONOTONIC` is

130959 unspecified, under the absolute timeouts interface, applications would behave differently  
 130960 depending on whether the Monotonic Clock was supported or not (because the absolute  
 130961 value of the clock would have different meanings in either case).

130962 Two options were considered:

- 130963 1. Leave the current behavior unchanged, which specifies the CLOCK\_REALTIME  
 130964 clock for these (absolute) timeouts, to allow portability of applications between  
 130965 implementations supporting or not the Monotonic Clock.
- 130966 2. Modify these functions in the way that *pthread\_cond\_timedwait()* was modified to  
 130967 allow a choice of clock, so that an application could use CLOCK\_REALTIME when  
 130968 it is trying to achieve an absolute timeout and CLOCK\_MONOTONIC when it is  
 130969 trying to achieve a relative timeout.

130970 It was decided that the features of CLOCK\_MONOTONIC are not as critical to these  
 130971 functions as they are to *pthread\_cond\_timedwait()*. The *pthread\_cond\_timedwait()* function is  
 130972 given an absolute timeout; the timeout may represent a deadline for an event. When other  
 130973 functions are given relative timeouts, the timeouts are typically for error recovery  
 130974 purposes and need not be so precise.

130975 Therefore, it was decided that these functions should be tied to CLOCK\_REALTIME and  
 130976 not complicated by being given a choice of clock.

130977 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

## 130978 Execution Time Monitoring

### 130979 • Introduction

130980 The main goals of the execution time monitoring facilities defined in this chapter are to  
 130981 measure the execution time of processes and threads and to allow an application to  
 130982 establish CPU time limits for these entities.

130983 The analysis phase of time-critical realtime systems often relies on the measurement of  
 130984 execution times of individual threads or processes to determine whether the timing  
 130985 requirements will be met. Also, performance analysis techniques for soft deadline realtime  
 130986 systems rely heavily on the determination of these execution times. The execution time  
 130987 monitoring functions provide application developers with the ability to measure these  
 130988 execution times online and open the possibility of dynamic execution-time analysis and  
 130989 system reconfiguration, if required.

130990 The second goal of allowing an application to establish execution time limits for individual  
 130991 processes or threads and detecting when they overrun allows program robustness to be  
 130992 increased by enabling online checking of the execution times.

130993 If errors are detected—possibly because of erroneous program constructs, the existence of  
 130994 errors in the analysis phase, or a burst of event arrivals—online detection and recovery is  
 130995 possible in a portable way. This feature can be extremely important for many time-critical  
 130996 applications. Other applications require trapping CPU-time errors as a normal way to exit  
 130997 an algorithm; for instance, some realtime artificial intelligence applications trigger a  
 130998 number of independent inference processes of varying accuracy and speed, limit how long  
 130999 they can run, and pick the best answer available when time runs out. In many periodic  
 131000 systems, overrun processes are simply restarted in the next resource period, after necessary  
 131001 end-of-period actions have been taken. This allows algorithms that are inherently data-  
 131002 dependent to be made predictable.

131003 The interface that appears in this chapter defines a new type of clock, the CPU-time clock,  
 131004 which measures execution time. Each process or thread can invoke the clock and timer

131005 functions defined in POSIX.1 to use them. Functions are also provided to access the CPU-  
 131006 time clock of other processes or threads to enable remote monitoring of these clocks.  
 131007 Monitoring of threads of other processes is not supported, since these threads are not  
 131008 visible from outside of their own process with the interfaces defined in POSIX.1.

131009 • Execution Time Monitoring Interface

131010 The clock and timer interface defined in POSIX.1 historically only defined one clock, which  
 131011 measures wall-clock time. The requirements for measuring execution time of processes and  
 131012 threads, and setting limits to their execution time by detecting when they overrun, can be  
 131013 accomplished with that interface if a new kind of clock is defined. These new clocks  
 131014 measure execution time, and one is associated with each process and with each thread. The  
 131015 clock functions currently defined in POSIX.1 can be used to read and set these CPU-time  
 131016 clocks, and timers can be created using these clocks as their timing base. These timers can  
 131017 then be used to send a signal when some specified execution time has been exceeded. The  
 131018 CPU-time clocks of each process or thread can be accessed by using the symbols  
 131019 `CLOCK_PROCESS_CPUTIME_ID` or `CLOCK_THREAD_CPUTIME_ID`.

131020 The clock and timer interface defined in POSIX.1 and extended with the new kind of CPU-  
 131021 time clock would only allow processes or threads to access their own CPU-time clocks.  
 131022 However, many realtime systems require the possibility of monitoring the execution time  
 131023 of processes or threads from independent monitoring entities. In order to allow  
 131024 applications to construct independent monitoring entities that do not require cooperation  
 131025 from or modification of the monitored entities, two functions have been added:  
 131026 `clock_getcpuclockid()`, for accessing CPU-time clocks of other processes, and  
 131027 `pthread_getcpuclockid()`, for accessing CPU-time clocks of other threads. These functions  
 131028 return the clock identifier associated with the process or thread specified in the call. These  
 131029 clock IDs can then be used in the rest of the clock function calls.

131030 The clocks accessed through these functions could also be used as a timing base for the  
 131031 creation of timers, thereby allowing independent monitoring entities to limit the CPU time  
 131032 consumed by other entities. However, this possibility would imply additional complexity  
 131033 and overhead because of the need to maintain a timer queue for each process or thread, to  
 131034 store the different expiration times associated with timers created by different processes or  
 131035 threads. The working group decided this additional overhead was not justified by  
 131036 application requirements. Therefore, creation of timers attached to the CPU-time clocks of  
 131037 other processes or threads has been specified as implementation-defined.

131038 • Overhead Considerations

131039 The measurement of execution time may introduce additional overhead in the thread  
 131040 scheduling, because of the need to keep track of the time consumed by each of these  
 131041 entities. In library-level implementations of threads, the efficiency of scheduling could be  
 131042 somehow compromised because of the need to make a kernel call, at each context switch,  
 131043 to read the process CPU-time clock. Consequently, a thread creation attribute called *cpu-  
 131044 clock-requirement* was defined, to allow threads to disconnect their respective CPU-time  
 131045 clocks. However, the Ballot Group considered that this attribute itself introduced some  
 131046 overhead, and that in current implementations it was not worth the effort. Therefore, the  
 131047 attribute was deleted, and thus thread CPU-time clocks are required for all threads if the  
 131048 Thread CPU-Time Clocks option is supported.

131049 • Accuracy of CPU-Time Clocks

131050 The mechanism used to measure the execution time of processes and threads is specified in  
 131051 POSIX.1-2024 as implementation-defined. The reason for this is that both the underlying  
 131052 hardware and the implementation architecture have a very strong influence on the  
 131053 accuracy achievable for measuring CPU time. For some implementations, the specification

131054 of strict accuracy requirements would represent very large overheads, or even the  
131055 impossibility of being implemented.

131056 Since the mechanism for measuring execution time is implementation-defined, realtime  
131057 applications will be able to take advantage of accurate implementations using a portable  
131058 interface. Of course, strictly conforming applications cannot rely on any particular degree  
131059 of accuracy, in the same way as they cannot rely on a very accurate measurement of wall  
131060 clock time. There will always exist applications whose accuracy or efficiency requirements  
131061 on the implementation are more rigid than the values defined in POSIX.1-2024 or any  
131062 other standard.

131063 In any case, there is a minimum set of characteristics that realtime applications would  
131064 expect from most implementations. One such characteristic is that the sum of all the  
131065 execution times of all the threads in a process equals the process execution time, when no  
131066 CPU-time clocks are disabled. This need not always be the case because implementations  
131067 may differ in how they account for time during context switches. Another characteristic is  
131068 that the sum of the execution times of all processes in a system equals the number of  
131069 processors, multiplied by the elapsed time, assuming that no processor is idle during that  
131070 elapsed time. However, in some implementations it might not be possible to relate CPU  
131071 time to elapsed time. For example, in a heterogeneous multi-processor system in which  
131072 each processor runs at a different speed, an implementation may choose to define each  
131073 “second” of CPU time to be a certain number of “cycles” that a CPU has executed.

- 131074 • Existing Practice

131075 Measuring and limiting the execution time of each concurrent activity are common  
131076 features of most industrial implementations of realtime systems. Almost all critical  
131077 realtime systems are currently built upon a cyclic executive. With this approach, a regular  
131078 timer interrupt kicks off the next sequence of computations. It also checks that the current  
131079 sequence has completed. If it has not, then some error recovery action can be undertaken  
131080 (or at least an overrun is avoided). Current software engineering principles and the  
131081 increasing complexity of software are driving application developers to implement these  
131082 systems on multi-threaded or multi-process operating systems. Therefore, if a POSIX  
131083 operating system is to be used for this type of application, then it must offer the same level  
131084 of protection.

131085 Execution time clocks are also common in most UNIX implementations, although these  
131086 clocks usually have requirements different from those of realtime applications. The  
131087 POSIX.1 *times()* function supports the measurement of the execution time of the calling  
131088 process, and its terminated child processes. This execution time is measured in clock ticks  
131089 and is supplied as two different values with the user and system execution times,  
131090 respectively. BSD supports the function *getrusage()*, which allows the calling process to get  
131091 information about the resources used by itself and/or all of its terminated child processes.  
131092 The resource usage includes user and system CPU time. Some UNIX systems have options  
131093 to specify high resolution (up to one microsecond) CPU-time clocks using the *times()* or  
131094 the *getrusage()* functions.

131095 The *times()* and *getrusage()* interfaces do not meet important realtime requirements, such  
131096 as the possibility of monitoring execution time from a different process or thread, or the  
131097 possibility of detecting an execution time overrun. The latter requirement is supported in  
131098 some UNIX implementations that are able to send a signal when the execution time of a  
131099 process has exceeded some specified value. For example, BSD defines the functions  
131100 *getitimer()* and *setitimer()*, which can operate either on a realtime clock (wall-clock), or on  
131101 virtual-time or profile-time clocks which measure CPU time in two different ways. These  
131102 functions do not support access to the execution time of other processes.

131103 At least one operating system supports per-process and per-thread execution time clocks,  
131104 and also supports limiting the execution time of a given process.

131105 Given all this existing practice, the working group considered that the POSIX.1 clocks and  
131106 timers interface was appropriate to meet most of the requirements that realtime  
131107 applications have for execution time clocks. Functions were added to get the CPU time  
131108 clock IDs, and to allow/disallow the thread CPU-time clocks (in order to preserve the  
131109 efficiency of some implementations of threads).

131110 • Clock Constants

131111 The definition of the manifest constants `CLOCK_PROCESS_CPUTIME_ID` and  
131112 `CLOCK_THREAD_CPUTIME_ID` allows processes or threads, respectively, to access their  
131113 own execution-time clocks. However, given a process or thread, access to its own  
131114 execution-time clock is also possible if the clock ID of this clock is obtained through a call  
131115 to `clock_getcpuclockid()` or `pthread_getcpuclockid()`. Therefore, these constants are not  
131116 necessary and could be deleted to make the interface simpler. Their existence saves one  
131117 system call in the first access to the CPU-time clock of each process or thread. The working  
131118 group considered this issue and decided to leave the constants in POSIX.1-2024 because  
131119 they are closer to the POSIX.1b use of clock identifiers.

131120 • Library Implementations of Threads

131121 In library implementations of threads, kernel entities and library threads can coexist. In  
131122 this case, if the CPU-time clocks are supported, most of the clock and timer functions will  
131123 need to have two implementations: one in the thread library, and one in the system calls  
131124 library. The main difference between these two implementations is that the thread library  
131125 implementation will have to deal with clocks and timers that reside in the thread space,  
131126 while the kernel implementation will operate on timers and clocks that reside in kernel  
131127 space. In the library implementation, if the clock ID refers to a clock that resides in the  
131128 kernel, a kernel call will have to be made. The correct version of the function can be chosen  
131129 by specifying the appropriate order for the libraries during the link process.

131130 • History of Resolution Issues: Deletion of the *enable* Attribute

131131 In early proposals, consideration was given to inclusion of an attribute called *enable* for  
131132 CPU-time clocks. This would allow implementations to avoid the overhead of measuring  
131133 execution time for those processes or threads for which this measurement was not  
131134 required. However, this is unnecessary since processes are already required to measure  
131135 execution time by the POSIX.1 `times()` function. Consequently, the *enable* attribute is not  
131136 present.

131137 **Rationale Relating to Timeouts**

131138 • Requirements for Timeouts

131139 Realtime systems which must operate reliably over extended periods without human  
131140 intervention are characteristic in embedded applications such as avionics, machine control,  
131141 and space exploration, as well as more mundane applications such as cable TV, security  
131142 systems, and plant automation. A multi-tasking paradigm, in which many independent  
131143 and/or cooperating software functions relinquish the processor(s) while waiting for a  
131144 specific stimulus, resource, condition, or operation completion, is very useful in producing  
131145 well engineered programs for such systems. For such systems to be robust and fault-  
131146 tolerant, expected occurrences that are unduly delayed or that never occur must be  
131147 detected so that appropriate recovery actions may be taken. This is difficult if there is no  
131148 way for a task to regain control of a processor once it has relinquished control (blocked)  
131149 awaiting an occurrence which, perhaps because of corrupted code, hardware malfunction,

131150 or latent software bugs, will not happen when expected. Therefore, the common practice  
 131151 in realtime operating systems is to provide a capability to time out such blocking services.  
 131152 Although there are several methods to achieve this already defined by POSIX, none are as  
 131153 reliable or efficient as initiating a timeout simultaneously with initiating a blocking service.  
 131154 This is especially critical in hard-realtime embedded systems because the processors  
 131155 typically have little time reserve, and allowed fault recovery times are measured in  
 131156 milliseconds rather than seconds.

131157 The working group largely agreed that such timeouts were necessary and ought to become  
 131158 part of POSIX.1-2024, particularly vendors of realtime operating systems whose customers  
 131159 had already expressed a strong need for timeouts. There was some resistance to inclusion  
 131160 of timeouts in POSIX.1-2024 because the desired effect, fault tolerance, could, in theory, be  
 131161 achieved using existing facilities and alternative software designs, but there was no  
 131162 compelling evidence that realtime system designers would embrace such designs at the  
 131163 sacrifice of performance and/or simplicity.

131164 • Which Services should be Timed Out?

131165 Originally, the working group considered the prospect of providing timeouts on all  
 131166 blocking services, including those currently existing in POSIX.1, POSIX.1b, and POSIX.1c,  
 131167 and future interfaces to be defined by other working groups, as sort of a general policy.  
 131168 This was rather quickly rejected because of the scope of such a change, and the fact that  
 131169 many of those services would not normally be used in a realtime context. More traditional  
 131170 timesharing solutions to timeout would suffice for most of the POSIX.1 interfaces, while  
 131171 others had asynchronous alternatives which, while more complex to utilize, would be  
 131172 adequate for some realtime and all non-realtime applications.

131173 The list of potential candidates for timeouts was narrowed to the following for further  
 131174 consideration:

- 131175 — POSIX.1b
  - 131176 — *sem\_wait()*
  - 131177 — *mq\_receive()*
  - 131178 — *mq\_send()*
  - 131179 — *lio\_listio()*
  - 131180 — *aio\_suspend()*
  - 131181 — *sigwait()* (timeout already implemented by *sigtimedwait()*)
- 131182 — POSIX.1c
  - 131183 — *pthread\_mutex\_lock()*
  - 131184 — *pthread\_join()*
  - 131185 — *pthread\_cond\_wait()*
  - 131186 (timeout already implemented by *pthread\_cond\_timedwait()*)
- 131187 — POSIX.1
  - 131188 — *read()*
  - 131189 — *write()*

131190 After further review by the working group, the *lio\_listio()*, *read()*, and *write()* functions (all  
 131191 forms of blocking synchronous I/O) were eliminated from the list because of the  
 131192 following:

- 131193 — Asynchronous alternatives exist
- 131194 — Timeouts can be implemented, albeit non-portably, in device drivers
- 131195 — A strong desire not to introduce modifications to POSIX.1 interfaces

131196 The working group ultimately rejected `pthread_join()` since both that interface and a timed  
 131197 variant of that interface are non-minimal and may be implemented as a function. See  
 131198 below for a library implementation of `pthread_join()`.

131199 Thus, there was a consensus among the working group members to add timeouts to 4 of  
 131200 the remaining 5 functions (the timeout for `aio_suspend()` was ultimately added directly to  
 131201 POSIX.1b, while the others were added by POSIX.1d). However, `pthread_mutex_lock()`  
 131202 remained contentious.

131203 Many feel that `pthread_mutex_lock()` falls into the same class as the other functions; that is,  
 131204 it is desirable to time out a mutex lock because a mutex may fail to be unlocked due to  
 131205 errant or corrupted code in a critical section (looping or branching outside of the unlock  
 131206 code), and therefore is equally in need of a reliable, simple, and efficient timeout. In fact,  
 131207 since mutexes are intended to guard small critical sections, most `pthread_mutex_lock()` calls  
 131208 would be expected to obtain the lock without blocking nor utilizing any kernel service,  
 131209 even in implementations of threads with global contention scope; the timeout alternative  
 131210 need only be considered after it is determined that the thread must block.

131211 Those opposed to timing out mutexes feel that the very simplicity of the mutex is  
 131212 compromised by adding a timeout semantic, and that to do so is senseless. They claim that  
 131213 if a timed mutex is really deemed useful by a particular application, then it can be  
 131214 constructed from the facilities already in POSIX.1b and POSIX.1c. The following two C-  
 131215 language library implementations of mutex locking with timeout represent the solutions  
 131216 offered (in both implementations, the timeout parameter is specified as absolute time, not  
 131217 relative time as in the proposed POSIX.1c interfaces).

#### 131218 • Spinlock Implementation

```

131219 #include <pthread.h>
131220 #include <time.h>
131221 #include <errno.h>

131222 int pthread_mutex_timedlock(pthread_mutex_t *mutex,
131223                             const struct timespec *timeout)
131224 {
131225     struct timespec timenow;

131226     while (pthread_mutex_trylock(mutex) == EBUSY)
131227     {
131228         clock_gettime(CLOCK_REALTIME, &timenow);
131229         if (timespec_cmp(&timenow, timeout) >= 0)
131230         {
131231             return ETIMEDOUT;
131232         }
131233         sched_yield();
131234     }
131235     return 0;
131236 }

```

131237 The Spinlock implementation is generally unsuitable for any application using priority-  
 131238 based thread scheduling policies such as SCHED\_FIFO or SCHED\_RR, since the mutex  
 131239 could currently be held by a thread of lower priority within the same allocation domain,

131240 but since the waiting thread never blocks, only threads of equal or higher priority will ever  
 131241 run, and the mutex cannot be unlocked. Setting priority inheritance or priority ceiling  
 131242 protocol on the mutex does not solve this problem, since the priority of a mutex owning  
 131243 thread is only boosted if higher priority threads are blocked waiting for the mutex; clearly  
 131244 not the case for this spinlock.

131245 • Condition Wait Implementation

```

131246 #include <pthread.h>
131247 #include <time.h>
131248 #include <errno.h>

131249 struct timed_mutex {
131250     int locked;
131251     pthread_mutex_t mutex;
131252     pthread_cond_t cond;
131253 };
131254 typedef struct timed_mutex timed_mutex_t;

131255 int timed_mutex_lock(timed_mutex_t *tm,
131256                    const struct timespec *timeout)
131257 {
131258     int timedout=FALSE;
131259     int error_status;

131260     pthread_mutex_lock(&tm->mutex);
131261     while (tm->locked && !timedout)
131262     {
131263         if ((error_status=pthread_cond_timedwait(&tm->cond,
131264         &tm->mutex, timeout))!=0)
131265         {
131266             if (error_status==ETIMEDOUT) timedout = TRUE;
131267         }
131268     }

131269     if(timedout)
131270     {
131271         pthread_mutex_unlock(&tm->mutex);
131272         return ETIMEDOUT;
131273     }
131274     else
131275     {
131276         tm->locked = TRUE;
131277         pthread_mutex_unlock(&tm->mutex);
131278         return 0;
131279     }
131280 }

131281 void timed_mutex_unlock(timed_mutex_t *tm)
131282 {
131283     pthread_mutex_lock(&tm->mutex); / for case assignment not atomic /
131284     tm->locked = FALSE;
131285     pthread_mutex_unlock(&tm->mutex);
131286     pthread_cond_signal(&tm->cond);
131287 }

```

131288 The Condition Wait implementation effectively substitutes the `pthread_cond_timedwait()`  
 131289 function (which is currently timed out) for the desired `pthread_mutex_timedlock()`. Since  
 131290 waits on condition variables currently do not include protocols which avoid priority  
 131291 inversion, this method is generally unsuitable for realtime applications because it does not  
 131292 provide the same priority inversion protection as the untimed `pthread_mutex_lock()`. Also,  
 131293 for any given implementations of the current mutex and condition variable primitives, this  
 131294 library implementation has a performance cost at least 2.5 times that of the untimed  
 131295 `pthread_mutex_lock()` even in the case where the timed mutex is readily locked without  
 131296 blocking (the interfaces required for this case are shown in bold). Even in uniprocessors or  
 131297 where assignment is atomic, at least an additional `pthread_cond_signal()` is required.  
 131298 `pthread_mutex_timedlock()` could be implemented at effectively no performance penalty in  
 131299 this case because the timeout parameters need only be considered after it is determined  
 131300 that the mutex cannot be locked immediately.

131301 Thus it has not yet been shown that the full semantics of mutex locking with timeout can  
 131302 be efficiently and reliably achieved using existing interfaces. Even if the existence of an  
 131303 acceptable library implementation were proven, it is difficult to justify why the interface  
 131304 itself should not be made portable, especially considering approval for the other four  
 131305 timeouts.

131306 • Rationale for Library Implementation of `pthread_timedjoin()`

131307 Library implementation of `pthread_timedjoin()`:

```
131308 /*
131309  * Construct a thread variety entirely from existing functions
131310  * with which a join can be done, allowing the join to time out.
131311  */
131312 #include <pthread.h>
131313 #include <time.h>
131314 struct timed_thread {
131315     pthread_t t;
131316     pthread_mutex_t m;
131317     int exiting;
131318     pthread_cond_t exit_c;
131319     void *(*start_routine)(void *arg);
131320     void *arg;
131321     void *status;
131322 };
131323 typedef struct timed_thread *timed_thread_t;
131324 static pthread_key_t timed_thread_key;
131325 static pthread_once_t timed_thread_once = PTHREAD_ONCE_INIT;
131326 static void timed_thread_init()
131327 {
131328     pthread_key_create(&timed_thread_key, NULL);
131329 }
131330 static void *timed_thread_start_routine(void *args)
131331 /*
131332  * Routine to establish thread-specific data value and run the actual
131333  * thread start routine which was supplied to timed_thread_create().
131334  */
131335 {
```

```

131336         timed_thread_t tt = (timed_thread_t) args;
131337         pthread_once(&timed_thread_once, timed_thread_init);
131338         pthread_setspecific(timed_thread_key, (void *)tt);
131339         timed_thread_exit((tt->start_routine)(tt->arg));
131340     }

131341     int timed_thread_create(timed_thread_t ttp, const pthread_attr_t *attr,
131342         void *(*start_routine)(void *), void *arg)

131343     /*
131344      * Allocate a thread which can be used with timed_thread_join().
131345      */
131346     {
131347         timed_thread_t tt;
131348         int result;

131349         tt = (timed_thread_t) malloc(sizeof(struct timed_thread));
131350         pthread_mutex_init(&tt->m, NULL);
131351         tt->exiting = FALSE;
131352         pthread_cond_init(&tt->exit_c, NULL);
131353         tt->start_routine = start_routine;
131354         tt->arg = arg;
131355         tt->status = NULL;

131356         if ((result = pthread_create(&tt->t, attr,
131357             timed_thread_start_routine, (void *)tt)) != 0) {
131358             free(tt);
131359             return result;
131360         }

131361         pthread_detach(tt->t);
131362         ttp = tt;
131363         return 0;
131364     }

131365     int timed_thread_join(timed_thread_t tt,
131366         struct timespec *timeout,
131367         void **status)
131368     {
131369         int result;

131370         pthread_mutex_lock(&tt->m);
131371         result = 0;
131372         /*
131373          * Wait until the thread announces that it is exiting,
131374          * or until timeout.
131375          */
131376         while (result == 0 && ! tt->exiting) {
131377             result = pthread_cond_timedwait(&tt->exit_c, &tt->m, timeout);
131378         }
131379         pthread_mutex_unlock(&tt->m);
131380         if (result == 0 && tt->exiting) {
131381             *status = tt->status;
131382             free((void *)tt);
131383             return result;
131384         }

```

```

131385         return result;
131386     }
131387 void timed_thread_exit(void *status)
131388 {
131389     timed_thread_t tt;
131390     void *specific;
131391
131392     if ((specific=pthread_getspecific(timed_thread_key)) == NULL) {
131393         /*
131394          * Handle cases which will not happen with correct usage.
131395          */
131396         pthread_exit( NULL);
131397     }
131398     tt = (timed_thread_t) specific;
131399     pthread_mutex_lock(&tt->m);
131400     /*
131401      * Tell a joiner that we are exiting.
131402      */
131403     tt->status = status;
131404     tt->exiting = TRUE;
131405     pthread_cond_signal(&tt->exit_c);
131406     pthread_mutex_unlock(&tt->m);
131407     /*
131408      * Call pthread exit() to call destructors and really
131409      * exit the thread.
131410      */
131411     pthread_exit(NULL);
131412 }

```

131412 The *pthread\_join()* C-language example shown above demonstrates that it is possible,  
131413 using existing pthread facilities, to construct a variety of thread which allows for joining  
131414 such a thread, but which allows the join operation to time out. It does this by using a  
131415 *pthread\_cond\_timedwait()* to wait for the thread to exit. A **timed\_thread\_t** descriptor  
131416 structure is used to pass parameters from the creating thread to the created thread, and  
131417 from the exiting thread to the joining thread. This implementation is roughly equivalent to  
131418 what a normal *pthread\_join()* implementation would do, with the single change being that  
131419 *pthread\_cond\_timedwait()* is used in place of a simple *pthread\_cond\_wait()*.

131420 Since it is possible to implement such a facility entirely from existing pthread interfaces,  
131421 and with roughly equal efficiency and complexity to an implementation which would be  
131422 provided directly by a pthreads implementation, it was the consensus of the working  
131423 group members that any *pthread\_timedjoin()* facility would be unnecessary, and should not  
131424 be provided.

#### 131425 • Form of the Timeout Interfaces

131426 The working group considered a number of alternative ways to add timeouts to blocking  
131427 services. At first, a system interface which would specify a one-shot or persistent timeout  
131428 to be applied to subsequent blocking services invoked by the calling process or thread was  
131429 considered because it allowed all blocking services to be timed out in a uniform manner  
131430 with a single additional interface; this was rather quickly rejected because it could easily  
131431 result in the wrong services being timed out.

131432 It was suggested that a timeout value might be specified as an attribute of the object  
131433 (semaphore, mutex, message queue, and so on), but there was no consensus on this, either

131434 on a case-by-case basis or for all timeouts.

131435 Looking at the two existing timeouts for blocking services indicates that the working  
131436 group members favor a separate interface for the timed version of a function. However,  
131437 `pthread_cond_timedwait()` utilizes an absolute timeout value while `sigtimedwait()` uses a  
131438 relative timeout value. The working group members agreed that relative timeout values  
131439 are appropriate where the timeout mechanism's primary use was to deal with an  
131440 unexpected or error situation, but they are inappropriate when the timeout must expire at  
131441 a particular time, or before a specific deadline. For the timeouts being introduced in  
131442 POSIX.1-2024, the working group considered allowing both relative and absolute timeouts  
131443 as is done with POSIX.1b timers, but ultimately favored the simpler absolute timeout form.

131444 An absolute time measure can be easily implemented on top of an interface that specifies  
131445 relative time, by reading the clock, calculating the difference between the current time and  
131446 the desired wakeup time, and issuing a relative timeout call. But there is a race condition  
131447 with this approach because the thread could be preempted after reading the clock, but  
131448 before making the timed-out call; in this case, the thread would be awakened later than it  
131449 should and, thus, if the wakeup time represented a deadline, it would miss it.

131450 There is also a race condition when trying to build a relative timeout on top of an interface  
131451 that specifies absolute timeouts. In this case, the clock would have to be read to calculate  
131452 the absolute wakeup time as the sum of the current time plus the relative timeout interval.  
131453 In this case, if the thread is preempted after reading the clock but before making the timed-  
131454 out call, the thread would be awakened earlier than desired.

131455 But the race condition with the absolute timeouts interface is not as bad as the one that  
131456 happens with the relative timeout interface, because there are simple workarounds. For the  
131457 absolute timeouts interface, if the timing requirement is a deadline, the deadline can still  
131458 be met because the thread woke up earlier than the deadline. If the timeout is just used as  
131459 an error recovery mechanism, the precision of timing is not really important. If the timing  
131460 requirement is that between actions A and B a minimum interval of time must elapse, the  
131461 absolute timeout interface can be safely used by reading the clock after action A has been  
131462 started. It could be argued that, since the call with the absolute timeout is atomic from the  
131463 application point of view, it is not possible to read the clock after action A, if this action is  
131464 part of the timed-out call. But looking at the nature of the calls for which timeouts are  
131465 specified (locking a mutex, waiting for a semaphore, waiting for a message, or waiting  
131466 until there is space in a message queue), the timeouts that an application would build on  
131467 these actions would not be triggered by these actions themselves, but by some other  
131468 external action. For example, if waiting for a message to arrive to a message queue, and  
131469 waiting for at least 20 milliseconds, this time interval would start to be counted from some  
131470 event that would trigger both the action that produces the message, as well as the action  
131471 that waits for the message to arrive, and not by the wait-for-message operation itself. In  
131472 this case, the workaround proposed above could be used.

131473 For these reasons, the absolute timeout is preferred over the relative timeout interface.

131474 **B.2.9 Threads**

131475 Threads will normally be more expensive than subroutines (or functions, routines, and so on) if  
131476 specialized hardware support is not provided. Nevertheless, threads should be sufficiently  
131477 efficient to encourage their use as a medium to fine-grained structuring mechanism for  
131478 parallelism in an application. Structuring an application using threads then allows it to take  
131479 immediate advantage of any underlying parallelism available in the host environment. This  
131480 means implementors are encouraged to optimize for fast execution at the possible expense of  
131481 efficient utilization of storage. For example, a common thread creation technique is to cache  
131482 appropriate thread data structures. That is, rather than releasing system resources, the  
131483 implementation retains these resources and reuses them when the program next asks to create a  
131484 new thread. If this reuse of thread resources is to be possible, there has to be very little unique  
131485 state associated with each thread, because any such state has to be reset when the thread is  
131486 reused.

131487 **Thread Creation Attributes**

131488 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
131489 support probable future standardization in these areas without requiring that the interface itself  
131490 be changed.

131491 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
131492 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
131493 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
131494 can help by allowing the changes to be isolated in a single place, rather than being spread across  
131495 every instance of thread creation.

131496 Attributes objects can be used to set up *classes* of threads with similar attributes; for example,  
131497 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
131498 can be defined in a single place and then referenced wherever threads need to be created.  
131499 Changes to “class” decisions become straightforward, and detailed analysis of each  
131500 *pthread\_create()* call is not required.

131501 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
131502 been specified as structures, adding new attributes would force recompilation of all multi-  
131503 threaded programs when the attributes objects are extended; this might not be possible if  
131504 different program components were supplied by different vendors.

131505 Additionally, opaque attributes objects present opportunities for improving performance.  
131506 Argument validity can be checked once when attributes are set, rather than each time a thread is  
131507 created. Implementations will often need to cache kernel objects that are expensive to create.  
131508 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
131509 invalid due to attribute changes.

131510 Because assignment is not necessarily defined on a given opaque type, implementation-defined  
131511 default values cannot be defined in a portable way. The solution to this problem is to allow  
131512 attribute objects to be initialized dynamically by attributes object initialization functions, so that  
131513 default values can be supplied automatically by the implementation.

131514 The following proposal was provided as a suggested alternative to the supplied attributes:

- 131515 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
131516 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
131517 parameter containing the flags should be an opaque type for extensibility. If no flags are  
131518 set in the parameter, then the objects are created with default characteristics. An  
131519 implementation may specify implementation-defined flag values and associated  
131520 behavior.

131521 2. If further specialization of mutexes and condition variables is necessary, implementations  
 131522 may specify additional procedures that operate on the `pthread_mutex_t` and  
 131523 `pthread_cond_t` objects (instead of on attributes objects).

131524 The difficulties with this solution are:

131525 1. A bitmask is not opaque if bits have to be set into bit-vector attributes objects using  
 131526 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an `int`,  
 131527 application programmers need to know the location of each bit. If bits are set or read by  
 131528 encapsulation (that is, `get*()` or `set*()` functions), then the bitmask is merely an  
 131529 implementation of attributes objects as currently defined and should not be exposed to  
 131530 the programmer.

131531 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
 131532 policy may be placed in 3 bits or 4 bits, but priority requires 5 bits or more, thereby taking  
 131533 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,  
 131534 the bitmask can only reasonably control whether particular attributes are set or not, and it  
 131535 cannot serve as the repository of the value itself. The value needs to be specified as a  
 131536 function parameter (which is non-extensible), or by setting a structure field (which is non-  
 131537 opaque), or by `get*()` and `set*()` functions (making the bitmask a redundant addition to  
 131538 the attributes objects).

131539 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
 131540 machine-dependent. Some implementations may not be able to change the size of the stack, for  
 131541 example, and others may not need to because stack pages may be discontinuous and can be  
 131542 allocated and released on demand.

131543 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
 131544 to the attribute mechanism or to any attributes object defined in POSIX.1-2024 have to be done  
 131545 with care so as not to affect binary-compatibility.

131546 Attribute objects, even if allocated by means of dynamic allocation functions such as `malloc()`,  
 131547 may have their size fixed at compile time. This means, for example, a `pthread_create()` in an  
 131548 implementation with extensions to the `pthread_attr_t` cannot look beyond the area that the  
 131549 binary application assumes is valid. This suggests that implementations should maintain a size  
 131550 field in the attributes object, as well as possibly version information, if extensions in different  
 131551 directions (possibly by different vendors) are to be accommodated.

## 131552 Thread Implementation Models

131553 There are various thread implementation models. At one end of the spectrum is the “library-  
 131554 thread model”. In such a model, the threads of a process are not visible to the operating system  
 131555 kernel, and the threads are not kernel-scheduled entities. The process is the only kernel-  
 131556 scheduled entity. The process is scheduled onto the processor by the kernel according to the  
 131557 scheduling attributes of the process. The threads are scheduled onto the single kernel-scheduled  
 131558 entity (the process) by the runtime library according to the scheduling attributes of the threads.  
 131559 A problem with this model is that it constrains concurrency. Since there is only one kernel-  
 131560 scheduled entity (namely, the process), only one thread per process can execute at a time. If the  
 131561 thread that is executing blocks on I/O, then the whole process blocks.

131562 At the other end of the spectrum is the “kernel-thread model”. In this model, all threads are  
 131563 visible to the operating system kernel. Thus, all threads are kernel-scheduled entities, and all  
 131564 threads can concurrently execute. The threads are scheduled onto processors by the kernel  
 131565 according to the scheduling attributes of the threads. The drawback to this model is that the  
 131566 creation and management of the threads entails operating system calls, as opposed to subroutine  
 131567 calls, which makes kernel threads heavier weight than library threads.

131568 Hybrids of these two models are common. A hybrid model offers the speed of library threads  
 131569 and the concurrency of kernel threads. In hybrid models, a process has some (relatively small)  
 131570 number of kernel scheduled entities associated with it. It also has a potentially much larger  
 131571 number of library threads associated with it. Some library threads may be bound to kernel-  
 131572 scheduled entities, while the other library threads are multiplexed onto the remaining kernel-  
 131573 scheduled entities. There are two levels of thread scheduling:

- 131574 1. The runtime library manages the scheduling of (unbound) library threads onto kernel-  
 131575 scheduled entities.
- 131576 2. The kernel manages the scheduling of kernel-scheduled entities onto processors.

131577 For this reason, a hybrid model is referred to as a two-level threads scheduling model. In this  
 131578 model, the process can have multiple concurrently executing threads; specifically, it can have as  
 131579 many concurrently executing threads as it has kernel-scheduled entities.

### 131580 Thread-Specific Data

131581 Many applications require that a certain amount of context be maintained on a per-thread basis  
 131582 across procedure calls. A common example is a multi-threaded library routine that allocates  
 131583 resources from a common pool and maintains an active resource list for each thread. The thread-  
 131584 specific data interface provided to meet these needs may be viewed as a two-dimensional array  
 131585 of values with keys serving as the row index and thread IDs as the column index (although the  
 131586 implementation need not work this way).

#### 131587 • Models

131588 Three possible thread-specific data models were considered:

#### 131589 1. No Explicit Support

131590 A standard thread-specific data interface is not strictly necessary to support  
 131591 applications that require per-thread context. One could, for example, provide a hash  
 131592 function that converted a **pthread\_t** into an integer value that could then be used to  
 131593 index into a global array of per-thread data pointers. This hash function, in  
 131594 conjunction with *pthread\_self()*, would be all the interface required to support a  
 131595 mechanism of this sort. Unfortunately, this technique is cumbersome. It can lead to  
 131596 duplicated code as each set of cooperating modules implements their own per-  
 131597 thread data management schemes. This technique would also require that **pthread\_t**  
 131598 not be an opaque type.

#### 131599 2. Single (**void \***) Pointer

131600 Another technique would be to provide a single word of per-thread storage and a  
 131601 pair of functions to fetch and store the value of this word. The word could then hold  
 131602 a pointer to a block of per-thread memory. The allocation, partitioning, and general  
 131603 use of this memory would be entirely up to the application. Although this method  
 131604 is not as problematic as technique 1, it suffers from interoperability problems. For  
 131605 example, all modules using the per-thread pointer would have to agree on a  
 131606 common usage protocol.

#### 131607 3. Key/Value Mechanism

131608 This method associates an opaque key (for example, stored in a variable of type  
 131609 **pthread\_key\_t**) with each per-thread datum. These keys play the role of identifiers  
 131610 for per-thread data. This technique is the most generic and avoids the problems  
 131611 noted above, albeit at the cost of some complexity.

131612 The primary advantage of the third model is its information hiding properties. Modules

131613 using this model are free to create and use their own key(s) independent of all other such  
 131614 usage, whereas the other models require that all modules that use thread-specific context  
 131615 explicitly cooperate with all other such modules. The data-independence provided by the  
 131616 third model is worth the additional interface. Therefore, the third model was chosen.

131617 • Requirements

131618 It is important that it be possible to implement the thread-specific data interface without  
 131619 the use of thread private memory. To do otherwise would increase the weight of each  
 131620 thread, thereby limiting the range of applications for which the threads interfaces provided  
 131621 by POSIX.1-2024 is appropriate.

131622 The values that one binds to the key via `pthread_setspecific()` may, in fact, be pointers to  
 131623 shared storage locations available to all threads. It is only the key/value bindings that are  
 131624 maintained on a per-thread basis, and these can be kept in any portion of the address space  
 131625 that is reserved for use by the calling thread (for example, on the stack). Thus, no per-  
 131626 thread MMU state is required to implement the interface. On the other hand, there is  
 131627 nothing in the interface specification to preclude the use of a per-thread MMU state if it is  
 131628 available (for example, the key values returned by `pthread_key_create()` could be thread  
 131629 private memory addresses).

131630 • Standardization Issues

131631 Thread-specific data is a requirement for a usable thread interface. The binding described  
 131632 in this section provides a portable thread-specific data mechanism for languages that do  
 131633 not directly support a thread-specific storage class. A binding to POSIX.1-2024 for a  
 131634 language that does include such a storage class need not provide this specific interface.

131635 If a language were to include the notion of thread-specific storage, it would be desirable  
 131636 (but *not* required) to provide an implementation of the pthreads thread-specific data  
 131637 interface based on the language feature. For example, assume that a compiler for a C-like  
 131638 language supports a *private* storage class that provides thread-specific storage. Something  
 131639 similar to the following macros might be used to effect a compatible implementation:

```
131640 #define pthread_key_t                private void *
131641 #define pthread_key_create(key)      /* no-op */
131642 #define pthread_setspecific(key,value) (key)=(value)
131643 #define pthread_getspecific(key)     (key)
```

131644 **Note:** For the sake of clarity, this example ignores destructor functions. A correct  
 131645 implementation would have to support them.

131646 **Barriers**

131647 • Background

131648 Barriers are typically used in parallel DO/FOR loops to ensure that all threads have  
 131649 reached a particular stage in a parallel computation before allowing any to proceed to the  
 131650 next stage. Highly efficient implementation is possible on machines which support a  
 131651 “Fetch and Add” operation as described in the referenced Almasi and Gottlieb (1989).

131652 The use of return value `PTHREAD_BARRIER_SERIAL_THREAD` is shown in the  
 131653 following example:

```
131654 if ( (status=pthread_barrier_wait(&barrier)) ==
131655     PTHREAD_BARRIER_SERIAL_THREAD) {
131656     ...serial section
131657 }
131658 else if (status != 0) {
```

```

131659         ...error processing
131660     }
131661     status=pthread_barrier_wait (&barrier);
131662     ...

```

131663 This behavior allows a serial section of code to be executed by one thread as soon as all  
 131664 threads reach the first barrier. The second barrier prevents the other threads from  
 131665 proceeding until the serial section being executed by the one thread has completed.

131666 Although barriers can be implemented with mutexes and condition variables, the  
 131667 referenced Almasi and Gottlieb (1989) provides ample illustration that such  
 131668 implementations are significantly less efficient than is possible. While the relative  
 131669 efficiency of barriers may well vary by implementation, it is important that they be  
 131670 recognized in the POSIX.1-2024 to facilitate applications portability while providing the  
 131671 necessary freedom to implementors.

131672 • Lack of Timeout Feature

131673 Alternate versions of most blocking routines have been provided to support watchdog  
 131674 timeouts. No alternate interface of this sort has been provided for barrier waits for the  
 131675 following reasons:

- 131676 • Multiple threads may use different timeout values, some of which may be indefinite.  
 131677 It is not clear which threads should break through the barrier with a timeout error if  
 131678 and when these timeouts expire.
- 131679 • The barrier may become unusable once a thread breaks out of a *pthread\_barrier\_wait()*  
 131680 with a timeout error. There is, in general, no way to guarantee the consistency of a  
 131681 barrier's internal data structures once a thread has timed out of a  
 131682 *pthread\_barrier\_wait()*. Even the inclusion of a special barrier reinitialization function  
 131683 would not help much since it is not clear how this function would affect the behavior  
 131684 of threads that reach the barrier between the original timeout and the call to the  
 131685 reinitialization function.

131686 **Spin Locks**

131687 • Background

131688 Spin locks represent an extremely low-level synchronization mechanism suitable primarily  
 131689 for use on shared memory multi-processors. It is typically an atomically modified Boolean  
 131690 value that is set to one when the lock is held and to zero when the lock is freed.

131691 When a caller requests a spin lock that is already held, it typically spins in a loop testing  
 131692 whether the lock has become available. Such spinning wastes processor cycles so the lock  
 131693 should only be held for short durations and not across sleep/block operations. Callers  
 131694 should unlock spin locks before calling sleep operations.

131695 Spin locks are available on a variety of systems. The functions included in POSIX.1-2024  
 131696 are an attempt to standardize that existing practice.

131697 • Lack of Timeout Feature

131698 Alternate versions of most blocking routines have been provided to support watchdog  
 131699 timeouts. No alternate interface of this sort has been provided for spin locks for the  
 131700 following reasons:

- 131701 • It is impossible to determine appropriate timeout intervals for spin locks in a  
 131702 portable manner. The amount of time one can expect to spend spin-waiting is  
 131703 inversely proportional to the degree of parallelism provided by the system.

131704 It can vary from a few cycles when each competing thread is running on its own  
 131705 processor, to an indefinite amount of time when all threads are multiplexed on a  
 131706 single processor (which is why spin locking is not advisable on uniprocessors).

131707 • When used properly, the amount of time the calling thread spends waiting on a spin  
 131708 lock should be considerably less than the time required to set up a corresponding  
 131709 watchdog timer. Since the primary purpose of spin locks is to provide a low-  
 131710 overhead synchronization mechanism for multi-processors, the overhead of a  
 131711 timeout mechanism was deemed unacceptable.

131712 It was also suggested that an additional *count* argument be provided (on the  
 131713 *pthread\_spin\_lock()* call) in lieu of a true timeout so that a spin lock call could fail gracefully  
 131714 if it was unable to apply the lock after *count* attempts. This idea was rejected because it is  
 131715 not existing practice. Furthermore, the same effect can be obtained with  
 131716 *pthread\_spin\_trylock()*, as illustrated below:

```
131717 int n = MAX_SPIN;
131718 while ( --n >= 0 )
131719 {
131720     if ( !pthread_spin_try_lock(...) )
131721         break;
131722 }
131723 if ( n >= 0 )
131724 {
131725     /* Successfully acquired the lock */
131726 }
131727 else
131728 {
131729     /* Unable to acquire the lock */
131730 }
```

131731 • *process-shared* Attribute

131732 The initialization functions associated with most POSIX synchronization objects (for  
 131733 example, mutexes, barriers, and read-write locks) take an attributes object with a *process-  
 131734 shared* attribute that specifies whether or not the object is to be shared across processes. In  
 131735 the draft corresponding to the first balloting round, two separate initialization functions  
 131736 are provided for spin locks, however: one for spin locks that were to be shared across  
 131737 processes (*spin\_init()*), and one for locks that were only used by multiple threads within a  
 131738 single process (*pthread\_spin\_init()*). This was done so as to keep the overhead associated  
 131739 with spin waiting to an absolute minimum. However, the balloting group requested that,  
 131740 since the overhead associated to a bit check was small, spin locks should be consistent with  
 131741 the rest of the synchronization primitives, and thus the *process-shared* attribute was  
 131742 introduced for spin locks.

131743 • Spin Locks *versus* Mutexes

131744 It has been suggested that mutexes are an adequate synchronization mechanism and spin  
 131745 locks are not necessary. Locking mechanisms typically must trade off the processor  
 131746 resources consumed while setting up to block the thread and the processor resources  
 131747 consumed by the thread while it is blocked. Spin locks require very little resources to set  
 131748 up the blocking of a thread. Existing practice is to simply loop, repeating the atomic  
 131749 locking operation until the lock is available. While the resources consumed to set up  
 131750 blocking of the thread are low, the thread continues to consume processor resources while  
 131751 it is waiting.

131752 On the other hand, mutexes may be implemented such that the processor resources  
131753 consumed to block the thread are large relative to a spin lock. After detecting that the  
131754 mutex lock is not available, the thread must alter its scheduling state, add itself to a set of  
131755 waiting threads, and, when the lock becomes available again, undo all of this before taking  
131756 over ownership of the mutex. However, while a thread is blocked by a mutex, no processor  
131757 resources are consumed.

131758 Therefore, spin locks and mutexes may be implemented to have different characteristics.  
131759 Spin locks may have lower overall overhead for very short-term blocking, and mutexes  
131760 may have lower overall overhead when a thread will be blocked for longer periods of time.  
131761 The presence of both interfaces allows implementations with these two different  
131762 characteristics, both of which may be useful to a particular application.

131763 It has also been suggested that applications can build their own spin locks from the  
131764 `pthread_mutex_trylock()` function:

```
131765 while (pthread_mutex_trylock(&mutex));
```

131766 The apparent simplicity of this construct is somewhat deceiving, however. While the actual  
131767 wait is quite efficient, various guarantees on the integrity of mutex objects (for example,  
131768 priority inheritance rules) may add overhead to the successful path of the trylock  
131769 operation that is not required of spin locks. One could, of course, add an attribute to the  
131770 mutex to bypass such overhead, but the very act of finding and testing this attribute  
131771 represents more overhead than is found in the typical spin lock.

131772 The need to hold spin lock overhead to an absolute minimum also makes it impossible to  
131773 provide guarantees against starvation similar to those provided for mutexes or read-write  
131774 locks. The overhead required to implement such guarantees (for example, disabling  
131775 preemption before spinning) may well exceed the overhead of the spin wait itself by many  
131776 orders of magnitude. If a "safe" spin wait seems desirable, it can always be provided  
131777 (albeit at some performance cost) via appropriate mutex attributes.

### 131778 **Robust Mutexes**

131779 Robust mutexes are intended to protect applications that use mutexes to protect data shared  
131780 between different processes. If a process is terminated by a signal while a thread is holding a  
131781 mutex, there is no chance for the process to clean up after it. Waiters for the locked mutex might  
131782 wait indefinitely.

131783 With robust mutexes the problem can be solved: whenever a fatal signal terminates a process,  
131784 current or future waiters of the mutex are notified about this fact. The locking function provides  
131785 notification of this condition through the error condition [EOWNERDEAD]. A thread then has  
131786 the chance to clean up the state protected by the mutex and mark the state as consistent again by  
131787 a call to `pthread_mutex_consistent()`.

131788 Pre-existing implementations have used the semantics of robust mutexes for a variety of  
131789 situations, some of them not defined in the standard. Where a normally terminated process (i.e.,  
131790 when one thread calls `exit()`) causes notification of other waiters of robust mutexes if the mutex  
131791 is locked by any thread in the process. This behavior is defined in the standard and makes sense  
131792 because no thread other than the thread calling `exit()` has the chance to clean up its data.

131793 If a thread is terminated by cancellation or if it calls `pthread_exit()`, the situation is different. In  
131794 both these situations the thread has the chance to clean up after itself by registering appropriate  
131795 cleanup handlers. There is no real reason to demand that other waiters for a robust mutex the  
131796 terminating thread owns are notified. The committee felt that this is actively encouraging bad  
131797 practice because programmers are tempted to rely on the robust mutex semantics instead of  
131798 correctly cleaning up after themselves.

131799 Therefore, the standard does not require notification of other waiters at the time a thread is  
131800 terminated while the process continues to run. The mutex is still recognized as being locked by  
131801 the process (with the thread gone it makes no sense to refer to the thread owning the mutex).  
131802 Therefore, a terminating process will cause notifications about the dead owner to be sent to all  
131803 waiters. This delay in the notification is not required, but programmers cannot rely on prompt  
131804 notification after a thread is terminated.

131805 For the same reason is it not required that an implementation supports robust mutexes that are  
131806 not shared between processes. If a robust mutex is used only within one process, all the cleanup  
131807 can be performed by the threads themselves by registering appropriate cleanup handlers. Fatal  
131808 signals are of no importance in this case because after the signal is delivered there is no thread  
131809 remaining to use the mutex.

131810 Some implementations might choose to support intra-process robust mutexes and they might  
131811 also send notification of a dead owner right after the previous owner died. But applications  
131812 must not rely on this. Applications should only use robust mutexes for the purpose of handling  
131813 fatal signals in situations where inter-process mutexes are in use.

#### 131814 **Supported Threads Functions**

131815 On POSIX-conforming systems, the following symbolic constants are always conforming:

131816        \_POSIX\_READER\_WRITER\_LOCKS  
131817        \_POSIX\_THREADS

131818 Therefore, the following threads functions are always supported:

131819	<i>pthread_atfork()</i>	<i>pthread_kill()</i>
131820	<i>pthread_attr_destroy()</i>	<i>pthread_mutex_destroy()</i>
131821	<i>pthread_attr_getdetachstate()</i>	<i>pthread_mutex_init()</i>
131822	<i>pthread_attr_getguardsize()</i>	<i>pthread_mutex_lock()</i>
131823	<i>pthread_attr_getschedparam()</i>	<i>pthread_mutex_trylock()</i>
131824	<i>pthread_attr_init()</i>	<i>pthread_mutex_unlock()</i>
131825	<i>pthread_attr_setdetachstate()</i>	<i>pthread_mutexattr_destroy()</i>
131826	<i>pthread_attr_setguardsize()</i>	<i>pthread_mutexattr_getpshared()</i>
131827	<i>pthread_attr_setschedparam()</i>	<i>pthread_mutexattr_gettype()</i>
131828	<i>pthread_cancel()</i>	<i>pthread_mutexattr_init()</i>
131829	<i>pthread_cleanup_pop()</i>	<i>pthread_mutexattr_setpshared()</i>
131830	<i>pthread_cleanup_push()</i>	<i>pthread_mutexattr_settype()</i>
131831	<i>pthread_cond_broadcast()</i>	<i>pthread_once()</i>
131832	<i>pthread_cond_clockwait()</i>	<i>pthread_rwlock_destroy()</i>
131833	<i>pthread_cond_destroy()</i>	<i>pthread_rwlock_init()</i>
131834	<i>pthread_cond_init()</i>	<i>pthread_rwlock_rdlock()</i>
131835	<i>pthread_cond_signal()</i>	<i>pthread_rwlock_tryrdlock()</i>
131836	<i>pthread_cond_timedwait()</i>	<i>pthread_rwlock_trywrlock()</i>
131837	<i>pthread_cond_wait()</i>	<i>pthread_rwlock_unlock()</i>
131838	<i>pthread_condattr_destroy()</i>	<i>pthread_rwlock_wrlock()</i>
131839	<i>pthread_condattr_getpshared()</i>	<i>pthread_rwlockattr_destroy()</i>
131840	<i>pthread_condattr_init()</i>	<i>pthread_rwlockattr_getpshared()</i>
131841	<i>pthread_condattr_setpshared()</i>	<i>pthread_rwlockattr_init()</i>
131842	<i>pthread_create()</i>	<i>pthread_rwlockattr_setpshared()</i>
131843	<i>pthread_detach()</i>	<i>pthread_self()</i>
131844	<i>pthread_equal()</i>	<i>pthread_setcancelstate()</i>
131845	<i>pthread_exit()</i>	<i>pthread_setcanceltype()</i>
131846	<i>pthread_getspecific()</i>	<i>pthread_setspecific()</i>
131847	<i>pthread_join()</i>	<i>pthread_sigmask()</i>
131848	<i>pthread_key_create()</i>	<i>pthread_testcancel()</i>
131849	<i>pthread_key_delete()</i>	<i>sigwait()</i>

131850 On POSIX-conforming systems, the symbolic constant `_POSIX_THREAD_SAFE_FUNCTIONS` is  
 131851 always defined. Therefore, the following functions are always supported:

131852	<code>flockfile()</code>	<code>getpwuid_r()</code>
131853	<code>ftrylockfile()</code>	<code>gmtime_r()</code>
131854	<code>funlockfile()</code>	<code>localtime_r()</code>
131855	<code>getc_unlocked()</code>	<code>putc_unlocked()</code>
131856	<code>getchar_unlocked()</code>	<code>putchar_unlocked()</code>
131857	<code>getgrgid_r()</code>	<code>readdir_r()</code>
131858	<code>getgrnam_r()</code>	<code>strerror_r()</code>
131859	<code>getpwnam_r()</code>	<code>strtok_r()</code>

## 131860 Threads Extensions

131861 The following extensions to the IEEE P1003.1c draft standard are now supported in  
 131862 POSIX.1-2024 as part of the alignment with the Single UNIX Specification:

- 131863 • Extended mutex attribute types
- 131864 • Read-write locks and attributes (also introduced by the IEEE Std 1003.1j-2000 amendment)
- 131865 • Thread concurrency level
- 131866 • Thread stack guard size
- 131867 • Parallel I/O
- 131868 • Robust mutexes

131869 These extensions carefully follow the threads programming model specified in POSIX.1c. As  
 131870 with POSIX.1c, all the new functions return zero if successful; otherwise, an error number is  
 131871 returned to indicate the error.

131872 The concept of attribute objects was introduced in POSIX.1c to allow implementations to extend  
 131873 POSIX.1-2024 without changing the existing interfaces. Attribute objects were defined for  
 131874 threads, mutexes, and condition variables. Attributes objects are defined as implementation-  
 131875 defined opaque types to aid extensibility, and functions are defined to allow attributes to be set  
 131876 or retrieved. This model has been followed when adding the new type attribute of  
 131877 **`pthread_mutexattr_t`** or the new read-write lock attributes object **`pthread_rwlockattr_t`**.

- 131878 • Extended Mutex Attributes

131879 POSIX.1c defines a mutex attributes object as an implementation-defined opaque object of  
 131880 type **`pthread_mutexattr_t`**, and specifies a number of attributes which this object must  
 131881 have and a number of functions which manipulate these attributes. These attributes  
 131882 include *detachstate*, *inheritsched*, *schedparam*, *schedpolicy*, *contentionscope*, *stackaddr*, and  
 131883 *stacksize*.

131884 The System Interfaces volume of POSIX.1-2024 specifies another mutex attribute called  
 131885 *type*. The *type* attribute allows applications to specify the behavior of mutex locking  
 131886 operations in situations where POSIX.1c behavior is undefined. The OSF DCE threads  
 131887 implementation, based on Draft 4 of POSIX.1c, specified a similar attribute. Note that the  
 131888 names of the attributes have changed somewhat from the OSF DCE threads  
 131889 implementation.

131890 The System Interfaces volume of POSIX.1-2024 also extends the specification of the  
 131891 following POSIX.1c functions which manipulate mutexes:

131892 `pthread_mutex_lock()`  
 131893 `pthread_mutex_trylock()`  
 131894 `pthread_mutex_unlock()`

131895 to take account of the new mutex attribute type and to specify behavior which was  
 131896 declared as undefined in POSIX.1c. How a calling thread acquires or releases a mutex now  
 131897 depends upon the mutex *type* attribute.

131898 The *type* attribute can have the following values:

131899 PTHREAD\_MUTEX\_NORMAL

131900 Basic mutex with no specific error checking built in. Does not report a deadlock error.

131901 PTHREAD\_MUTEX\_RECURSIVE

131902 Allows any thread to recursively lock a mutex. The mutex must be unlocked an equal  
 131903 number of times to release the mutex.

131904 PTHREAD\_MUTEX\_ERRORCHECK

131905 Detects and reports simple usage errors; that is, an attempt to unlock a mutex that is  
 131906 not locked by the calling thread or that is not locked at all, or an attempt to relock a  
 131907 mutex the thread already owns.

131908 PTHREAD\_MUTEX\_DEFAULT

131909 The default mutex type. May be mapped to any of the above mutex types or may be  
 131910 an implementation-defined type.

131911 *Normal* mutexes do not detect deadlock conditions; for example, a thread will hang if it  
 131912 tries to relock a normal mutex that it already owns. Attempting to unlock a mutex locked  
 131913 by another thread, or unlocking an unlocked mutex, results in undefined behavior. Normal  
 131914 mutexes will usually be the fastest type of mutex available on a platform but provide the  
 131915 least error checking.

131916 *Recursive* mutexes are useful for converting old code where it is difficult to establish clear  
 131917 boundaries of synchronization. A thread can relock a recursive mutex without first  
 131918 unlocking it. The relocking deadlock which can occur with normal mutexes cannot occur  
 131919 with this type of mutex. However, multiple locks of a recursive mutex require the same  
 131920 number of unlocks to release the mutex before another thread can acquire the mutex.  
 131921 Furthermore, this type of mutex maintains the concept of an owner. Thus, a thread  
 131922 attempting to unlock a recursive mutex which another thread has locked returns with an  
 131923 error. A thread attempting to unlock a recursive mutex that is not locked returns with an  
 131924 error. Never use a recursive mutex with condition variables because the implicit unlock  
 131925 performed by `pthread_cond_clockwait()`, `pthread_cond_timedwait()`, or `pthread_cond_wait()`  
 131926 will not actually release the mutex if it had been locked multiple times.

131927 *Errorcheck* mutexes provide error checking and are useful primarily as a debugging aid. A  
 131928 thread attempting to relock an errorcheck mutex without first unlocking it returns with an  
 131929 error. Again, this type of mutex maintains the concept of an owner. Thus, a thread  
 131930 attempting to unlock an errorcheck mutex which another thread has locked returns with  
 131931 an error. A thread attempting to unlock an errorcheck mutex that is not locked also returns  
 131932 with an error. It should be noted that errorcheck mutexes will almost always be much  
 131933 slower than normal mutexes due to the extra state checks performed.

131934 The default mutex type provides implementation-defined error checking. The default  
 131935 mutex may be mapped to one of the other defined types or may be something entirely  
 131936 different. This enables each vendor to provide the mutex semantics which the vendor feels  
 131937 will be most useful to their target users. Most vendors will probably choose to make  
 131938 normal mutexes the default so as to give applications the benefit of the fastest type of

- 131939 mutexes available on their platform. Check your implementation's documentation.
- 131940 An application developer can use any of the mutex types almost interchangeably as long  
131941 as the application does not depend upon the implementation detecting (or failing to  
131942 detect) any particular errors. Note that a recursive mutex can be used with condition  
131943 variable waits as long as the application never recursively locks the mutex.
- 131944 Two functions are provided for manipulating the *type* attribute of a mutex attributes object.  
131945 This attribute is set or returned in the *type* parameter of these functions. The  
131946 *pthread\_mutexattr\_settype()* function is used to set a specific type value while  
131947 *pthread\_mutexattr\_gettype()* is used to return the type of the mutex. Setting the *type*  
131948 attribute of a mutex attributes object affects only mutexes initialized using that mutex  
131949 attributes object. Changing the *type* attribute does not affect mutexes previously initialized  
131950 using that mutex attributes object.
- 131951 • Read-Write Locks and Attributes
- 131952 The read-write locks introduced have been harmonized with those in IEEE Std  
131953 1003.1j-2000; see also [Section B.2.9.6](#) (on page 3833).
- 131954 Read-write locks (also known as reader-writer locks) allow a thread to exclusively lock  
131955 some shared data while updating that data, or allow any number of threads to have  
131956 simultaneous read-only access to the data.
- 131957 Unlike a mutex, a read-write lock distinguishes between reading data and writing data. A  
131958 mutex excludes all other threads. A read-write lock allows other threads access to the data,  
131959 providing no thread is modifying the data. Thus, a read-write lock is less primitive than  
131960 either a mutex-condition variable pair or a semaphore.
- 131961 Application developers should consider using a read-write lock rather than a mutex to  
131962 protect data that is frequently referenced but seldom modified. Most threads (readers) will  
131963 be able to read the data without waiting and will only have to block when some other  
131964 thread (a writer) is in the process of modifying the data. Conversely a thread that wants to  
131965 change the data is forced to wait until there are no readers. This type of lock is often used  
131966 to facilitate parallel access to data on multi-processor platforms or to avoid context  
131967 switches on single processor platforms where multiple threads access the same data.
- 131968 If a read-write lock becomes unlocked and there are multiple threads waiting to acquire  
131969 the write lock, the implementation's scheduling policy determines which thread acquires  
131970 the read-write lock for writing. If there are multiple threads blocked on a read-write lock  
131971 for both read locks and write locks, it is unspecified whether the readers or a writer  
131972 acquire the lock first. However, for performance reasons, implementations often favor  
131973 writers over readers to avoid potential writer starvation.
- 131974 A read-write lock object is an implementation-defined opaque object of type  
131975 **pthread\_rwlock\_t** as defined in `<pthread.h>`. There are two different sorts of locks  
131976 associated with a read-write lock: a read lock and a write lock.
- 131977 The *pthread\_rwlockattr\_init()* function initializes a read-write lock attributes object with the  
131978 default value for all the attributes defined in the implementation. After a read-write lock  
131979 attributes object has been used to initialize one or more read-write locks, changes to the  
131980 read-write lock attributes object, including destruction, do not affect previously initialized  
131981 read-write locks.
- 131982 Implementations must provide at least the read-write lock attribute *process-shared*. This  
131983 attribute can have the following values:

- 131984 PTHREAD\_PROCESS\_SHARED  
 131985 Any thread of any process that has access to the memory where the read-write lock  
 131986 resides can manipulate the read-write lock.
- 131987 PTHREAD\_PROCESS\_PRIVATE  
 131988 Only threads created within the same process as the thread that initialized the read-  
 131989 write lock can manipulate the read-write lock. This is the default value.
- 131990 The *pthread\_rwlockattr\_setpshared()* function is used to set the *process-shared* attribute of an  
 131991 initialized read-write lock attributes object while the function  
 131992 *pthread\_rwlockattr\_getpshared()* obtains the current value of the *process-shared* attribute.
- 131993 A read-write lock attributes object is destroyed using the *pthread\_rwlockattr\_destroy()*  
 131994 function. The effect of subsequent use of the read-write lock attributes object is undefined.
- 131995 A thread creates a read-write lock using the *pthread\_rwlock\_init()* function. The attributes  
 131996 of the read-write lock can be specified by the application developer; otherwise, the default  
 131997 implementation-defined read-write lock attributes are used if the pointer to the read-write  
 131998 lock attributes object is NULL. In cases where the default attributes are appropriate, the  
 131999 PTHREAD\_RWLOCK\_INITIALIZER macro can be used to initialize read-write locks.
- 132000 A thread which wants to apply a read lock to the read-write lock can use either  
 132001 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()*. If *pthread\_rwlock\_rdlock()* is used, the  
 132002 thread acquires a read lock if a writer does not hold the write lock and there are no writers  
 132003 blocked on the write lock. If a read lock is not acquired, the calling thread blocks until it  
 132004 can acquire a lock. However, if *pthread\_rwlock\_tryrdlock()* is used, the function returns  
 132005 immediately with the error [EBUSY] if any thread holds a write lock or there are blocked  
 132006 writers waiting for the write lock.
- 132007 A thread which wants to apply a write lock to the read-write lock can use either of two  
 132008 functions: *pthread\_rwlock\_wrlock()* or *pthread\_rwlock\_trywrlock()*. If *pthread\_rwlock\_wrlock()*  
 132009 is used, the thread acquires the write lock if no other reader or writer threads hold the  
 132010 read-write lock. If the write lock is not acquired, the thread blocks until it can acquire the  
 132011 write lock. However, if *pthread\_rwlock\_trywrlock()* is used, the function returns  
 132012 immediately with the error [EBUSY] if any thread is holding either a read or a write lock.
- 132013 The *pthread\_rwlock\_unlock()* function is used to unlock a read-write lock object held by the  
 132014 calling thread. Results are undefined if the read-write lock is not held by the calling thread.  
 132015 If there are other read locks currently held on the read-write lock object, the read-write  
 132016 lock object remains in the read locked state but without the current thread as one of its  
 132017 owners. If this function releases the last read lock for this read-write lock object, the read-  
 132018 write lock object is put in the unlocked read state. If this function is called to release a write  
 132019 lock for this read-write lock object, the read-write lock object is put in the unlocked state.
- 132020 • Thread Concurrency Level
- 132021 On threads implementations that multiplex user threads onto a smaller set of kernel  
 132022 execution entities, the system attempts to create a reasonable number of kernel execution  
 132023 entities for the application upon application startup.
- 132024 On some implementations, these kernel entities are retained by user threads that block in  
 132025 the kernel. Other implementations do not *timeslice* user threads so that multiple compute-  
 132026 bound user threads can share a kernel thread. On such implementations, some  
 132027 applications may use up all the available kernel execution entities before their user-space  
 132028 threads are used up. The process may be left with user threads capable of doing work for  
 132029 the application but with no way to schedule them.

## 132030 • Thread Stack Guard Size

132031 DCE threads introduced the concept of a “thread stack guard size”. Most thread  
132032 implementations add a region of protected memory to a thread’s stack, commonly known  
132033 as a “guard region”, as a safety measure to prevent stack pointer overflow in one thread  
132034 from corrupting the contents of another thread’s stack. The default size of the guard  
132035 regions attribute is {PAGESIZE} bytes and is implementation-defined.

132036 Some application developers may wish to change the stack guard size. When an  
132037 application creates a large number of threads, the extra page allocated for each stack may  
132038 strain system resources. In addition to the extra page of memory, the kernel’s memory  
132039 manager has to keep track of the different protections on adjoining pages. When this is a  
132040 problem, the application developer may request a guard size of 0 bytes to conserve system  
132041 resources by eliminating stack overflow protection.

132042 Conversely an application that allocates large data structures such as arrays on the stack  
132043 may wish to increase the default guard size in order to detect stack overflow. If a thread  
132044 allocates two pages for a data array, a single guard page provides little protection against  
132045 thread stack overflows since the thread can corrupt adjoining memory beyond the guard  
132046 page.

132047 The System Interfaces volume of POSIX.1-2024 defines a new attribute of a thread  
132048 attributes object; that is, the *guardsize* attribute which allows applications to specify the size  
132049 of the guard region of a thread’s stack.

132050 Two functions are provided for manipulating a thread’s stack guard size. The  
132051 *pthread\_attr\_setguardsize()* function sets the thread *guardsize* attribute, and the  
132052 *pthread\_attr\_getguardsize()* function retrieves the current value.

132053 An implementation may round up the requested guard size to a multiple of the  
132054 configurable system variable {PAGESIZE}. In this case, *pthread\_attr\_getguardsize()* returns  
132055 the guard size specified by the previous *pthread\_attr\_setguardsize()* function call and not  
132056 the rounded up value.

132057 If an application is managing its own thread stacks using the *stackaddr* attribute, the  
132058 *guardsize* attribute is ignored and no stack overflow protection is provided. In this case, it is  
132059 the responsibility of the application to manage stack overflow along with stack allocation.

## 132060 • Parallel I/O

132061 Suppose two or more threads independently issue read requests on the same file. To read  
132062 specific data from a file, a thread must first call *lseek()* to seek to the proper offset in the  
132063 file, and then call *read()* to retrieve the required data. If more than one thread does this at  
132064 the same time, the first thread may complete its seek call, but before it gets a chance to  
132065 issue its read call a second thread may complete its seek call, resulting in the first thread  
132066 accessing incorrect data when it issues its read call. One workaround is to lock the file  
132067 descriptor while seeking and reading or writing, but this reduces parallelism and adds  
132068 overhead.

132069 Instead, the System Interfaces volume of POSIX.1-2024 provides two functions to make  
132070 seek/read and seek/write operations atomic. The file descriptor’s current offset is  
132071 unchanged, thus allowing multiple read and write operations to proceed in parallel. This  
132072 improves the I/O performance of threaded applications. The *pread()* function is used to do  
132073 an atomic read of data from a file into a buffer. Conversely, the *pwrite()* function does an  
132074 atomic write of data from a buffer to a file.

132075 B.2.9.1 *Thread-Safety*

132076 All functions required by POSIX.1-2024 need to be thread-safe. Implementations have to  
 132077 provide internal synchronization when necessary in order to achieve this goal. In certain cases—  
 132078 for example, most floating-point implementations—context switch code may have to manage  
 132079 the writable shared state.

132080 While a read from a pipe of  $\{\text{PIPE\_BUF}\} \times 2$  bytes may not generate a single atomic and thread-  
 132081 safe stream of bytes, it should generate “several” (individually atomic) thread-safe streams of  
 132082 bytes. Similarly, while reading from a terminal device may not generate a single atomic and  
 132083 thread-safe stream of bytes, it should generate some finite number of (individually atomic) and  
 132084 thread-safe streams of bytes. That is, concurrent calls to read for a pipe, FIFO, or terminal device  
 132085 are not allowed to result in corrupting the stream of bytes or other internal data. However,  
 132086 *read()*, in these cases, is not required to return a single contiguous and atomic stream of bytes.

132087 It is not required that all functions provided by POSIX.1-2024 be either async-cancel-safe or  
 132088 async-signal-safe.

132089 As it turns out, some functions are inherently not thread-safe; that is, their interface  
 132090 specifications preclude thread-safety. For example, some functions (such as *asctime()*) return a  
 132091 pointer to a result stored in memory space allocated by the function on a per-process basis. Such  
 132092 a function is not thread-safe, because its result can be overwritten by successive invocations.  
 132093 Other functions, while not inherently non-thread-safe, may be implemented in ways that lead to  
 132094 them not being thread-safe. For example, some functions (such as *rand()*) store state information  
 132095 (such as a seed value, which survives multiple function invocations) in memory space allocated  
 132096 by the function on a per-process basis. The implementation of such a function is not thread-safe  
 132097 if the implementation fails to synchronize invocations of the function and thus fails to protect  
 132098 the state information. The problem is that when the state information is not protected,  
 132099 concurrent invocations can interfere with one another (for example, applications using *rand()*  
 132100 may see the same seed value).

132101 *Thread-Safety and Locking of Existing Functions*

132102 Originally, POSIX.1 was not designed to work in a multi-threaded environment, and some  
 132103 implementations of some existing functions will not work properly when executed concurrently.  
 132104 To provide routines that will work correctly in an environment with threads (“thread-safe”), two  
 132105 problems need to be solved:

- 132106 1. Routines that maintain or return pointers to static areas internal to the routine (which  
 132107 may now be shared) need to be modified. The routines *ttynname()* and *localtime()* are  
 132108 examples.
- 132109 2. Routines that access data space shared by more than one thread need to be modified. The  
 132110 *malloc()* function and the *stdio* family routines are examples.

132111 There are a variety of constraints on these changes. The first is compatibility with the existing  
 132112 versions of these functions—non-thread-safe functions will continue to be in use for some time,  
 132113 as the original interfaces are used by existing code. Another is that the new thread-safe versions  
 132114 of these functions represent as small a change as possible over the familiar interfaces provided  
 132115 by the existing non-thread-safe versions. The new interfaces should be independent of any  
 132116 particular threads implementation. In particular, they should be thread-safe without depending  
 132117 on explicit thread-specific memory. Finally, there should be minimal performance penalty due to  
 132118 the changes made to the functions.

132119 It is intended that the list of functions from POSIX.1 that cannot be made thread-safe and for  
 132120 which corrected versions are provided be complete.

132121 *Thread-Safety and Locking Solutions*

132122 Many of the POSIX.1 functions were thread-safe and did not change at all. However, some  
132123 functions (for example, the math functions typically found in **libm**) are not thread-safe because  
132124 of writable shared global state. For instance, in IEEE Std 754-1985 floating-point  
132125 implementations, the computation modes and flags are global and shared.

132126 Some functions are not thread-safe because a particular implementation is not reentrant,  
132127 typically because of a non-essential use of static storage. These require only a new  
132128 implementation.

132129 Thread-safe libraries are useful in a wide range of parallel (and asynchronous) programming  
132130 environments, not just within pthreads. In order to be used outside the context of pthreads,  
132131 however, such libraries still have to use some synchronization method. These could either be  
132132 independent of the pthread synchronization operations, or they could be a subset of the pthread  
132133 interfaces. Either method results in thread-safe library implementations that can be used without  
132134 the rest of pthreads.

132135 Some functions, such as the *stdio* family interface and dynamic memory allocation functions  
132136 such as *malloc()*, are inter-dependent routines that share resources (for example, buffers) across  
132137 related calls. These require synchronization to work correctly, but they do not require any  
132138 change to their external (user-visible) interfaces.

132139 In some cases, such as *getc()* and *putc()*, adding synchronization is likely to create an  
132140 unacceptable performance impact. In this case, slower thread-safe synchronized functions are to  
132141 be provided, but the original, faster (but unsafe) functions (which may be implemented as  
132142 macros) are retained under new names. Some additional special-purpose synchronization  
132143 facilities are necessary for these macros to be usable in multi-threaded programs. This also  
132144 requires changes in **<stdio.h>**.

132145 The other common reason that functions are unsafe is that they return a pointer to static storage,  
132146 making the functions non-thread-safe. This has to be changed, and there are three natural  
132147 choices:

132148 1. Return a pointer to thread-specific storage

132149 This could incur a severe performance penalty on those architectures with a costly  
132150 implementation of the thread-specific data interface.

132151 A variation on this technique is to use *malloc()* to allocate storage for the function output  
132152 and return a pointer to this storage. This technique may also have an undesirable  
132153 performance impact, however, and a simplistic implementation requires that the user  
132154 program explicitly free the storage object when it is no longer needed. This technique is  
132155 used by some existing POSIX.1 functions. With careful implementation for infrequently  
132156 used functions, there may be little or no performance or storage penalty, and the  
132157 maintenance of already-standardized interfaces is a significant benefit.

132158 2. Return the actual value computed by the function

132159 This technique can only be used with functions that return pointers to structures—  
132160 routines that return character strings would have to wrap their output in an enclosing  
132161 structure in order to return the output on the stack. There is also a negative performance  
132162 impact inherent in this solution in that the output value has to be copied twice before it  
132163 can be used by the calling function: once from the called routine's local buffers to the top  
132164 of the stack, then from the top of the stack to the assignment target. Finally, many older  
132165 compilers cannot support this technique due to a historical tendency to use internal static  
132166 buffers to deliver the results of structure-valued functions.

- 132167 3. Have the caller pass the address of a buffer to contain the computed value
- 132168 The only disadvantage of this approach is that extra arguments have to be provided by
- 132169 the calling program. It represents the most efficient solution to the problem, however,
- 132170 and, unlike the `malloc()` technique, it is semantically clear.
- 132171 There are some routines (often groups of related routines) whose interfaces are inherently non-
- 132172 thread-safe because they communicate across multiple function invocations by means of static
- 132173 memory locations. The solution is to redesign the calls so that they are thread-safe, typically by
- 132174 passing the needed data as extra parameters. Unfortunately, this may require major changes to
- 132175 the interface as well.
- 132176 A floating-point implementation using IEEE Std 754-1985 is a case in point. A less problematic
- 132177 example is the `rand48` family of pseudo-random number generators. The functions `getgrgid()`,
- 132178 `getgrnam()`, `getpwnam()`, and `getpwuid()` are another such case.
- 132179 The problems with `errno` are discussed in [Alternative Solutions for Per-Thread `errno`](#) (on page
- 132180 3745).
- 132181 Some functions can be thread-safe or not, depending on their arguments. These include the
- 132182 `tmpnam()` and `ctermid()` functions. These functions have pointers to character strings as
- 132183 arguments. If the pointers are not NULL, the functions store their results in the character string;
- 132184 however, if the pointers are NULL, the functions store their results in an area that may be static
- 132185 and thus subject to overwriting by successive calls. These should only be called by multi-thread
- 132186 applications when their arguments are non-NULL.
- 132187 *Asynchronous Safety and Thread-Safety*
- 132188 A floating-point implementation has many modes that effect rounding and other aspects of
- 132189 computation. Functions in some math library implementations may change the computation
- 132190 modes for the duration of a function call. If such a function call is interrupted by a signal or
- 132191 cancellation, the floating-point state is not required to be protected.
- 132192 There is a significant cost to make floating-point operations async-cancel-safe or async-signal-
- 132193 safe; accordingly, neither form of async safety is required.
- 132194 *Functions Returning Pointers to Static Storage*
- 132195 For those functions that are not thread-safe because they return values in fixed size statically
- 132196 allocated structures, alternate ```_r``` forms are provided that pass a pointer to an explicit result
- 132197 structure. Those that return pointers into library-allocated buffers have forms provided with
- 132198 explicit buffer and length parameters.
- 132199 For functions that return pointers to library-allocated buffers, it makes sense to provide ```_r```
- 132200 versions that allow the application control over allocation of the storage in which results are
- 132201 returned. This allows the state used by these functions to be managed on an application-specific
- 132202 basis, supporting per-thread, per-process, or other application-specific sharing relationships.
- 132203 Early proposals had provided ```_r``` versions for functions that returned pointers to variable-size
- 132204 buffers without providing a means for determining the required buffer size. This would have
- 132205 made using such functions exceedingly clumsy, potentially requiring iteratively calling them
- 132206 with increasingly larger guesses for the amount of storage required. Hence, `sysconf()` variables
- 132207 have been provided for such functions that return the maximum required buffer size.
- 132208 Thus, the rule that has been followed by POSIX.1-2024 when adapting single-threaded non-
- 132209 thread-safe functions is as follows: all functions returning pointers to library-allocated storage
- 132210 should have ```_r``` versions provided, allowing the application control over the storage
- 132211 allocation. Those with variable-sized return values accept both a buffer address and a length
- 132212 parameter. The `sysconf()` variables are provided to supply the appropriate buffer sizes when

- 132213 required. Implementors are encouraged to apply the same rule when adapting their own  
132214 existing functions to a pthreads environment.
- 132215 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0020 [631], XSH/TC2-2008/0021 [826],  
132216 and XSH/TC2-2008/0022 [631] are applied.
- 132217 Austin Group Defect 188 is applied, removing *getenv()* from the list of functions that need not be  
132218 thread-safe.
- 132219 Austin Group Defect 696 is applied, requiring *readdir()* to be thread-safe except when concurrent  
132220 calls are made for the same directory stream.
- 132221 Austin Group Defect 922 is applied, adding the *secure\_getenv()* function.
- 132222 Austin Group Defect 1064 is applied, removing *basename()* and *dirname()* from the list of  
132223 functions that need not be thread-safe.
- 132224 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

132225 *B.2.9.2 Thread IDs*

132226 Separate applications should communicate through well-defined interfaces and should not  
132227 depend on each other's implementation. For example, if a programmer decides to rewrite the  
132228 *sort* utility using multiple threads, it should be easy to do this so that the interface to the *sort*  
132229 utility does not change. Consider that if the user causes SIGINT to be generated while the *sort*  
132230 utility is running, keeping the same interface means that the entire *sort* utility is killed, not just  
132231 one of its threads. As another example, consider a realtime application that manages a reactor.  
132232 Such an application may wish to allow other applications to control the priority at which it  
132233 watches the control rods. One technique to accomplish this is to write the ID of the thread  
132234 watching the control rods into a file and allow other programs to change the priority of that  
132235 thread as they see fit. A simpler technique is to have the reactor process accept IPCs  
132236 (Interprocess Communication messages) from other processes, telling it at a semantic level what  
132237 priority the program should assign to watching the control rods. This allows the programmer  
132238 greater flexibility in the implementation. For example, the programmer can change the  
132239 implementation from having one thread per rod to having one thread watching all of the rods  
132240 without changing the interface. Having threads live inside the process means that the  
132241 implementation of a process is invisible to outside processes (excepting debuggers and system  
132242 management tools).

132243 Threads do not provide a protection boundary. Every thread model allows threads to share  
132244 memory with other threads and encourages this sharing to be widespread. This means that one  
132245 thread can wipe out memory that is needed for the correct functioning of other threads that are  
132246 sharing its memory. Consequently, providing each thread with its own user and/or group IDs  
132247 would not provide a protection boundary between threads sharing memory.

132248 Some applications make the assumption that the implementation can always detect invalid uses  
132249 of thread IDs of type **pthread\_t**. This is an invalid assumption. Specifically, if **pthread\_t**  
132250 is defined as a pointer type, no access check needs to be performed before using the ID.

132251 As with other interfaces that take pointer parameters, the outcome of passing an invalid  
132252 parameter can result in an invalid memory reference or an attempt to access an undefined  
132253 portion of a memory object, cause signals to be sent (SIGSEGV or SIGBUS) and possible  
132254 termination of the process. This is a similar case to passing an invalid buffer pointer to *read()*.  
132255 Some implementations might implement *read()* as a system call and set an [EFAULT] error  
132256 condition. Other implementations might contain parts of *read()* at user level and the first  
132257 attempt to access data at an invalid reference will cause a signal to be sent instead.

132258 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

132259 that the function should fail and report an [ESRCH] error. This does not imply that  
 132260 implementations are required to return in this case. It is legitimate behavior to send an “invalid  
 132261 memory reference” signal (SIGSEGV or SIGBUS). It is the application’s responsibility to use only  
 132262 valid thread IDs and to keep track of the lifetime of the underlying threads.

132263 Austin Group Defect 792 is applied, clarifying thread lifetime.

132264 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

#### 132265 B.2.9.3 Thread Mutexes

132266 Austin Group Defect 1216 is applied, adding `pthread_cond_clockwait()` and  
 132267 `pthread_mutex_clocklock()`.

132268 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

#### 132269 B.2.9.4 Thread Scheduling

##### 132270 • Scheduling Implementation Models

132271 The following scheduling implementation models are presented in terms of threads and  
 132272 “kernel entities”. This is to simplify exposition of the models, and it does not imply that  
 132273 an implementation actually has an identifiable “kernel entity”.

132274 A kernel entity is not defined beyond the fact that it has scheduling attributes that are used  
 132275 to resolve contention with other kernel entities for execution resources. A kernel entity  
 132276 may be thought of as an envelope that holds a thread or a separate kernel thread. It is not a  
 132277 conventional process, although it shares with the process the attribute that it has a single  
 132278 thread of control; it does not necessarily imply an address space, open files, and so on. It is  
 132279 better thought of as a primitive facility upon which conventional processes and threads  
 132280 may be constructed.

##### 132281 — System Thread Scheduling Model

132282 This model consists of one thread per kernel entity. The kernel entity is solely  
 132283 responsible for scheduling thread execution on one or more processors. This model  
 132284 schedules all threads against all other threads in the system using the scheduling  
 132285 attributes of the thread.

##### 132286 — Process Scheduling Model

132287 A generalized process scheduling model consists of two levels of scheduling. A  
 132288 threads library creates a pool of kernel entities, as required, and schedules threads to  
 132289 run on them using the scheduling attributes of the threads. Typically, the size of the  
 132290 pool is a function of the simultaneously runnable threads, not the total number of  
 132291 threads. The kernel then schedules the kernel entities onto processors according to  
 132292 their scheduling attributes, which are managed by the threads library. This set model  
 132293 potentially allows a wide range of mappings between threads and kernel entities.

##### 132294 • System and Process Scheduling Model Performance

132295 There are a number of important implications on the performance of applications using  
 132296 these scheduling models. The process scheduling model potentially provides lower  
 132297 overhead for making scheduling decisions, since there is no need to access kernel-level  
 132298 information or functions and the set of schedulable entities is smaller (only the threads  
 132299 within the process).

132300 On the other hand, since the kernel is also making scheduling decisions regarding the

132301 system resources under its control (for example, CPU(s), I/O devices, memory), decisions  
132302 that do not take thread scheduling parameters into account can result in unspecified  
132303 delays for realtime application threads, causing them to miss maximum response time  
132304 limits.

132305 • Rate Monotonic Scheduling

132306 Rate monotonic scheduling was considered, but rejected for standardization in the context  
132307 of pthreads. A sporadic server policy is included.

132308 • Scheduling Options

132309 In POSIX.1-2024, the basic thread scheduling functions are defined under the threads  
132310 functionality, so that they are required of all threads implementations. However, there are  
132311 no specific scheduling policies required by this functionality to allow for conforming  
132312 thread implementations that are not targeted to realtime applications.

132313 Specific standard scheduling policies are defined to be under the Thread Execution  
132314 Scheduling option, and they are specifically designed to support realtime applications by  
132315 providing predictable resource-sharing sequences. The name of this option was chosen to  
132316 emphasize that this functionality is defined as appropriate for realtime applications that  
132317 require simple priority-based scheduling.

132318 It is recognized that these policies are not necessarily satisfactory for some multi-processor  
132319 implementations, and work is ongoing to address a wider range of scheduling behaviors.  
132320 The interfaces have been chosen to create abundant opportunity for future scheduling  
132321 policies to be implemented and standardized based on this interface. In order to  
132322 standardize a new scheduling policy, all that is required (from the standpoint of thread  
132323 scheduling attributes) is to define a new policy name, new members of the thread  
132324 attributes object, and functions to set these members when the scheduling policy is equal  
132325 to the new value.

132326 **Scheduling Contention Scope**

132327 In order to accommodate the requirement for realtime response, each thread has a scheduling  
132328 contention scope attribute. Threads with a system scheduling contention scope have to be  
132329 scheduled with respect to all other threads in the system. These threads are usually bound to a  
132330 single kernel entity that reflects their scheduling attributes and are directly scheduled by the  
132331 kernel.

132332 Threads with a process scheduling contention scope need be scheduled only with respect to the  
132333 other threads in the process. These threads may be scheduled within the process onto a pool of  
132334 kernel entities. The implementation is also free to bind these threads directly to kernel entities  
132335 and let them be scheduled by the kernel. Process scheduling contention scope allows the  
132336 implementation the most flexibility and is the default if both contention scopes are supported  
132337 and none is specified.

132338 Thus, the choice by implementors to provide one or the other (or both) of these scheduling  
132339 models is driven by the need of their supported application domains for worst-case (that is,  
132340 realtime) response, or average-case (non-realtime) response.

**132341 Scheduling Allocation Domain**

132342 The SCHED\_FIFO and SCHED\_RR scheduling policies take on different characteristics on a  
132343 multi-processor. Other scheduling policies are also subject to changed behavior when executed  
132344 on a multi-processor. The concept of scheduling allocation domain determines the set of  
132345 processors on which the threads of an application may run. By considering the application's  
132346 processor scheduling allocation domain for its threads, scheduling policies can be defined in  
132347 terms of their behavior for varying processor scheduling allocation domain values. It is  
132348 conceivable that not all scheduling allocation domain sizes make sense for all scheduling  
132349 policies on all implementations. The concept of scheduling allocation domain, however, is a  
132350 useful tool for the description of multi-processor scheduling policies.

132351 The "process control" approach to scheduling obtains significant performance advantages from  
132352 dynamic scheduling allocation domain sizes when it is applicable.

132353 Non-Uniform Memory Access (NUMA) multi-processors may use a system scheduling structure  
132354 that involves reassignment of threads among scheduling allocation domains. In NUMA  
132355 machines, a natural model of scheduling is to match scheduling allocation domains to clusters of  
132356 processors. Load balancing in such an environment requires changing the scheduling allocation  
132357 domain to which a thread is assigned.

**132358 Scheduling Documentation**

132359 Implementation-provided scheduling policies need to be completely documented in order to be  
132360 useful. This documentation includes a description of the attributes required for the policy, the  
132361 scheduling interaction of threads running under this policy and all other supported policies, and  
132362 the effects of all possible values for processor scheduling allocation domain. Note that for the  
132363 implementor wishing to be minimally-compliant, it is (minimally) acceptable to define the  
132364 behavior as undefined.

**132365 Scheduling Contention Scope Attribute**

132366 The scheduling contention scope defines how threads compete for resources. Within  
132367 POSIX.1-2024, scheduling contention scope is used to describe only how threads are scheduled  
132368 in relation to one another in the system. That is, either they are scheduled against all other  
132369 threads in the system ("system scope") or only against those threads in the process ("process  
132370 scope"). In fact, scheduling contention scope may apply to additional resources, including  
132371 virtual timers and profiling, which are not currently considered by POSIX.1-2024.

**132372 Mixed Scopes**

132373 If only one scheduling contention scope is supported, the scheduling decision is straightforward.  
132374 To perform the processor scheduling decision in a mixed scope environment, it is necessary to  
132375 map the scheduling attributes of the thread with process-wide contention scope to the same  
132376 attribute space as the thread with system-wide contention scope.

132377 Since a conforming implementation has to support one and may support both scopes, it is useful  
132378 to discuss the effects of such choices with respect to example applications. If an implementation  
132379 supports both scopes, mixing scopes provides a means of better managing system-level (that is,  
132380 kernel-level) and library-level resources. In general, threads with system scope will require the  
132381 resources of a separate kernel entity in order to guarantee the scheduling semantics. On the  
132382 other hand, threads with process scope can share the resources of a kernel entity while  
132383 maintaining the scheduling semantics.

132384 The application is free to create threads with dedicated kernel resources, and other threads that  
132385 multiplex kernel resources. Consider the example of a window server. The server allocates two  
132386 threads per widget: one thread manages the widget user interface (including drawing), while

132387 the other thread takes any required application action. This allows the widget to be “active”  
132388 while the application is computing. A screen image may be built from thousands of widgets. If  
132389 each of these threads had been created with system scope, then most of the kernel-level  
132390 resources might be wasted, since only a few widgets are active at any one time. In addition,  
132391 mixed scope is particularly useful in a window server where one thread with high priority and  
132392 system scope handles the mouse so that it tracks well. As another example, consider a database  
132393 server. For each of the hundreds or thousands of clients supported by a large server, an  
132394 equivalent number of threads will have to be created. If each of these threads were system scope,  
132395 the consequences would be the same as for the window server example above. However, the  
132396 server could be constructed so that actual retrieval of data is done by several dedicated threads.  
132397 Dedicated threads that do work for all clients frequently justify the added expense of system  
132398 scope. If it were not permissible to mix system and process threads in the same process, this type  
132399 of solution would not be possible.

#### 132400 **Dynamic Thread Scheduling Parameters Access**

132401 In many time-constrained applications, there is no need to change the scheduling attributes  
132402 dynamically during thread or process execution, since the general use of these attributes is to  
132403 reflect directly the time constraints of the application. Since these time constraints are generally  
132404 imposed to meet higher-level system requirements, such as accuracy or availability, they  
132405 frequently should remain unchanged during application execution.

132406 However, there are important situations in which the scheduling attributes should be changed.  
132407 Generally, this will occur when external environmental conditions exist in which the time  
132408 constraints change. Consider, for example, a space vehicle major mode change, such as the  
132409 change from ascent to descent mode, or the change from the space environment to the  
132410 atmospheric environment. In such cases, the frequency with which many of the sensors or  
132411 actuators need to be read or written will change, which will necessitate a priority change. In  
132412 other cases, even the existence of a time constraint might be temporary, necessitating not just a  
132413 priority change, but also a policy change for ongoing threads or processes. For this reason, it is  
132414 critical that the interface should provide functions to change the scheduling parameters  
132415 dynamically, but, as with many of the other realtime functions, it is important that applications  
132416 use them properly to avoid the possibility of unnecessarily degrading performance.

132417 In providing functions for dynamically changing the scheduling behavior of threads, there were  
132418 two options: provide functions to get and set the individual scheduling parameters of threads,  
132419 or provide a single interface to get and set all the scheduling parameters for a given thread  
132420 simultaneously. Both approaches have merit. Access functions for individual parameters allow  
132421 simpler control of thread scheduling for simple thread scheduling parameters. However, a single  
132422 function for setting all the parameters for a given scheduling policy is required when first setting  
132423 that scheduling policy. Since the single all-encompassing functions are required, it was decided  
132424 to leave the interface as minimal as possible. Note that simpler functions (such as  
132425 *pthread\_setprio()* for threads running under the priority-based schedulers) can be easily defined  
132426 in terms of the all-encompassing functions.

132427 If the *pthread\_setschedparam()* function executes successfully, it will have set all of the scheduling  
132428 parameter values indicated in *param*; otherwise, none of the scheduling parameters will have  
132429 been modified. This is necessary to ensure that the scheduling of this and all other threads  
132430 continues to be consistent in the presence of an erroneous scheduling parameter.

132431 The [EPERM] error value is included in the list of possible *pthread\_setschedparam()* error returns  
132432 as a reflection of the fact that the ability to change scheduling parameters increases risks to the  
132433 implementation and application performance if the scheduling parameters are changed  
132434 improperly. For this reason, and based on some existing practice, it was felt that some  
132435 implementations would probably choose to define specific permissions for changing either a

132436 thread's own or another thread's scheduling parameters. POSIX.1-2024 does not include  
132437 portable methods for setting or retrieving permissions, so any such use of permissions is  
132438 completely unspecified.

#### 132439 **Mutex Initialization Scheduling Attributes**

132440 In a priority-driven environment, a direct use of traditional primitives like mutexes and  
132441 condition variables can lead to unbounded priority inversion, where a higher priority thread can  
132442 be blocked by a lower priority thread, or set of threads, for an unbounded duration of time. As a  
132443 result, it becomes impossible to guarantee thread deadlines. Priority inversion can be bounded  
132444 and minimized by the use of priority inheritance protocols. This allows thread deadlines to be  
132445 guaranteed even in the presence of synchronization requirements.

132446 Two useful but simple members of the family of priority inheritance protocols are the basic  
132447 priority inheritance protocol and the priority ceiling protocol emulation. Under the Basic  
132448 Priority Inheritance protocol (governed by the Non-Robust Mutex Priority Inheritance option), a  
132449 thread that is blocking higher priority threads executes at the priority of the highest priority  
132450 thread that it blocks. This simple mechanism allows priority inversion to be bounded by the  
132451 duration of critical sections and makes timing analysis possible.

132452 Under the Priority Ceiling Protocol Emulation protocol (governed by the Thread Priority  
132453 Protection option), each mutex has a priority ceiling, usually defined as the priority of the  
132454 highest priority thread that can lock the mutex. When a thread is executing inside critical  
132455 sections, its priority is unconditionally increased to the highest of the priority ceilings of all the  
132456 mutexes owned by the thread. This protocol has two very desirable properties in uni-processor  
132457 systems. First, a thread can be blocked by a lower priority thread for at most the duration of one  
132458 single critical section. Furthermore, when the protocol is correctly used in a single processor, and  
132459 if threads do not become blocked while owning mutexes, mutual deadlocks are prevented.

132460 The priority ceiling emulation can be extended to multiple processor environments, in which  
132461 case the values of the priority ceilings will be assigned depending on the kind of mutex that is  
132462 being used: local to only one processor, or global, shared by several processors. Local priority  
132463 ceilings will be assigned the usual way, equal to the priority of the highest priority thread that  
132464 may lock that mutex. Global priority ceilings will usually be assigned a priority level higher  
132465 than all the priorities assigned to any of the threads that reside in the involved processors to  
132466 avoid the effect called remote blocking.

#### 132467 **Change the Priority Ceiling of a Mutex**

132468 In order for the priority protect protocol to exhibit its desired properties of bounding priority  
132469 inversion and avoidance of deadlock, it is critical that the ceiling priority of a mutex be the same  
132470 as the priority of the highest thread that can ever hold it, or higher. Thus, if the priorities of the  
132471 threads using such mutexes never change dynamically, there is no need ever to change the  
132472 priority ceiling of a mutex.

132473 However, if a major system mode change results in an altered response time requirement for one  
132474 or more application threads, their priority has to change to reflect it. It will occasionally be the  
132475 case that the priority ceilings of mutexes held also need to change. While changing priority  
132476 ceilings should generally be avoided, it is important that POSIX.1-2024 provide these interfaces  
132477 for those cases in which it is necessary.

132478 B.2.9.5 *Thread Cancellation*

132479 Many existing threads packages have facilities for canceling an operation or canceling a thread.  
132480 These facilities are used for implementing user requests (such as the CANCEL button in a  
132481 window-based application), for implementing OR parallelism (for example, telling the other  
132482 threads to stop working once one thread has found a forced mate in a parallel chess program), or  
132483 for implementing the ABORT mechanism in Ada.

132484 POSIX programs traditionally have used the signal mechanism combined with either *longjmp()*  
132485 or polling to cancel operations. Many POSIX programmers have trouble using these facilities to  
132486 solve their problems efficiently in a single-threaded process. With the introduction of threads,  
132487 these solutions become even more difficult to use.

132488 The main issues with implementing a cancellation facility are specifying the operation to be  
132489 canceled, cleanly releasing any resources allocated to that operation, controlling when the target  
132490 notices that it has been canceled, and defining the interaction between asynchronous signals and  
132491 cancellation.

132492 **Specifying the Operation to Cancel**

132493 Consider a thread that calls through five distinct levels of program abstraction and then, inside  
132494 the lowest-level abstraction, calls a function that suspends the thread. (An abstraction boundary  
132495 is a layer at which the client of the abstraction sees only the service being provided and can  
132496 remain ignorant of the implementation. Abstractions are often layered, each level of abstraction  
132497 being a client of the lower-level abstraction and implementing a higher-level abstraction.)  
132498 Depending on the semantics of each abstraction, one could imagine wanting to cancel only the  
132499 call that causes suspension, only the bottom two levels, or the operation being done by the entire  
132500 thread. Canceling operations at a finer grain than the entire thread is difficult because threads  
132501 are active and they may be run in parallel on a multi-processor. By the time one thread can make  
132502 a request to cancel an operation, the thread performing the operation may have completed that  
132503 operation and gone on to start another operation whose cancellation is not desired. Thread IDs  
132504 are not reused until the thread has exited, and either it was created with the *Attr detachstate*  
132505 attribute set to *PTHREAD\_CREATE\_DETACHED* or the *pthread\_join()* or *pthread\_detach()*  
132506 function has been called for that thread. Consequently, a thread cancellation will never be  
132507 misdirected when the thread terminates. For these reasons, the canceling of operations is done at  
132508 the granularity of the thread. Threads are designed to be inexpensive enough so that a separate  
132509 thread may be created to perform each separately cancelable operation; for example, each  
132510 possibly long running user request.

132511 For cancellation to be used in existing code, cancellation scopes and handlers will have to be  
132512 established for code that needs to release resources upon cancellation, so that it follows the  
132513 programming discipline described in the text.

132514 **A Special Signal Versus a Special Interface**

132515 Two different mechanisms were considered for providing the cancellation interfaces. The first  
132516 was to provide an interface to direct signals at a thread and then to define a special signal that  
132517 had the required semantics. The other alternative was to use a special interface that delivered the  
132518 correct semantics to the target thread.

132519 The solution using signals produced a number of problems. It required the implementation to  
132520 provide cancellation in terms of signals whereas a perfectly valid (and possibly more efficient)  
132521 implementation could have both layered on a low-level set of primitives. There were so many  
132522 exceptions to the special signal (it cannot be used with *kill()*, no POSIX.1 interfaces can be used  
132523 with it) that it was clearly not a valid signal. Its semantics on delivery were also completely  
132524 different from any existing POSIX.1 signal. As such, a special interface that did not mandate the  
132525 implementation and did not confuse the semantics of signals and cancellation was felt to be the

132526 better solution.

### 132527 Races Between Cancellation and Resuming Execution

132528 Due to the nature of cancellation, there is generally no synchronization between the thread  
132529 requesting the cancellation of a blocked thread and events that may cause that thread to resume  
132530 execution. For this reason, and because excess serialization hurts performance, when both an  
132531 event that a thread is waiting for has occurred and a cancellation request has been made and  
132532 cancellation is enabled, POSIX.1-2024 explicitly allows the implementation to choose between  
132533 returning from the blocking call or acting on the cancellation request.

### 132534 Interaction of Cancellation with Asynchronous Signals

132535 A typical use of cancellation is to acquire a lock on some resource and to establish a cancellation  
132536 cleanup handler for releasing the resource when and if the thread is canceled.

132537 A correct and complete implementation of cancellation in the presence of asynchronous signals  
132538 requires considerable care. An implementation has to push a cancellation cleanup handler on the  
132539 cancellation cleanup stack while maintaining the integrity of the stack data structure. If an  
132540 asynchronously-generated signal is posted to the thread during a stack operation, the signal  
132541 handler cannot manipulate the cancellation cleanup stack. As a consequence, asynchronous  
132542 signal handlers may not cancel threads or otherwise manipulate the cancellation state of a  
132543 thread. Threads may, of course, be canceled by another thread that used a *sigwait()* function to  
132544 wait synchronously for an asynchronous signal.

132545 In order for cancellation to function correctly, it is required that asynchronous signal handlers  
132546 not change the cancellation state. This requires that some elements of existing practice, such as  
132547 using *longjmp()* to exit from an asynchronous signal handler implicitly, be prohibited in cases  
132548 where the integrity of the cancellation state of the interrupt thread cannot be ensured.

### 132549 Thread Cancellation Overview

#### 132550 • Cancelability States

132551 The three possible cancelability states (disabled, deferred, and asynchronous) are encoded  
132552 into two separate bits ((disable, enable) and (deferred, asynchronous)) to allow them to be  
132553 changed and restored independently. For instance, short code sequences that will not block  
132554 sometimes disable cancelability on entry and restore the previous state upon exit.  
132555 Likewise, long or unbounded code sequences containing no convenient explicit  
132556 cancellation points will sometimes set the cancelability type to asynchronous on entry and  
132557 restore the previous value upon exit.

#### 132558 • Cancellation Points

132559 Cancellation points are points inside of certain functions where a thread has to act on any  
132560 pending cancellation request when cancelability is enabled. For functions in the “shall  
132561 occur” list, a cancellation check must be performed on every call regardless of whether,  
132562 absent the cancellation, the call would have blocked. For functions in the “may occur” list,  
132563 a cancellation check may be performed on some calls but not others; i.e., whether or not a  
132564 cancellation point occurs when one of these functions is being executed can depend on  
132565 current conditions.

132566 The idea was considered of allowing implementations to define whether blocking calls  
132567 such as *read()* should be cancellation points. It was decided that it would adversely affect  
132568 the design of conforming applications if blocking calls were not cancellation points  
132569 because threads could be left blocked in an uncancelable state.

132570 There are several important blocking routines that are specifically not made cancellation

- 132571 points:
- 132572 — `pthread_mutex_lock()`
- 132573 If `pthread_mutex_lock()` were a cancellation point, every routine that called it would  
 132574 also become a cancellation point (that is, any routine that touched shared state would  
 132575 automatically become a cancellation point). For example, `malloc()`, `free()`, and `rand()`  
 132576 would become cancellation points under this scheme. Having too many cancellation  
 132577 points makes programming very difficult, leading to either much disabling and  
 132578 restoring of cancelability or much difficulty in trying to arrange for reliable cleanup  
 132579 at every possible place.
- 132580 Since `pthread_mutex_lock()` is not a cancellation point, threads could result in being  
 132581 blocked uninterruptibly for long periods of time if mutexes were used as a general  
 132582 synchronization mechanism. As this is normally not acceptable, mutexes should only  
 132583 be used to protect resources that are held for small fixed lengths of time where not  
 132584 being able to be canceled will not be a problem. Resources that need to be held  
 132585 exclusively for long periods of time should be protected with condition variables.
- 132586 — `pthread_barrier_wait()`
- 132587 Canceling a barrier wait will render a barrier unusable. Similar to a barrier timeout  
 132588 (which the standard developers rejected), there is no way to guarantee the  
 132589 consistency of a barrier's internal data structures if a barrier wait is canceled.
- 132590 — `pthread_spin_lock()`
- 132591 As with mutexes, spin locks should only be used to protect resources that are held for  
 132592 small fixed lengths of time where not being cancelable will not be a problem.
- 132593 Every library routine should specify whether or not it includes any cancellation points.  
 132594 Typically, only those routines that may block or compute indefinitely need to include  
 132595 cancellation points.
- 132596 Correctly coded routines only reach cancellation points after having set up a cancellation  
 132597 cleanup handler to restore invariants if the thread is canceled at that point. Being  
 132598 cancelable only at specified cancellation points allows programmers to keep track of  
 132599 actions needed in a cancellation cleanup handler more easily. A thread should only be  
 132600 made asynchronously cancelable when it is not in the process of acquiring or releasing  
 132601 resources or otherwise in a state from which it would be difficult or impossible to recover.
- 132602 • Thread Cancellation Cleanup Handlers
- 132603 The cancellation cleanup handlers provide a portable mechanism, easy to implement, for  
 132604 releasing resources and restoring invariants. They are easier to use than signal handlers  
 132605 because they provide a stack of cancellation cleanup handlers rather than a single handler,  
 132606 and because they have an argument that can be used to pass context information to the  
 132607 handler.
- 132608 The alternative to providing these simple cancellation cleanup handlers (whose only use is  
 132609 for cleaning up when a thread is canceled) is to define a general exception package that  
 132610 could be used for handling and cleaning up after hardware traps and software-detected  
 132611 errors. This was too far removed from the charter of providing threads to handle  
 132612 asynchrony. However, it is an explicit goal of POSIX.1-2024 to be compatible with existing  
 132613 exception facilities and languages having exceptions.
- 132614 The interaction of this facility and other procedure-based or language-level exception  
 132615 facilities is unspecified in this version of POSIX.1-2024. However, it is intended that it be  
 132616 possible for an implementation to define the relationship between these cancellation

- 132617 cleanup handlers and Ada, C++, or other language-level exception handling facilities.
- 132618 It was suggested that the cancellation cleanup handlers should also be called when the  
132619 process exits or calls the *exec* function. This was rejected partly due to the performance  
132620 problem caused by having to call the cancellation cleanup handlers of every thread before  
132621 the operation could continue. The other reason was that the only state expected to be  
132622 cleaned up by the cancellation cleanup handlers would be the intraprocess state. Any  
132623 handlers that are to clean up the interprocess state would be registered with *atexit()*. There  
132624 is the orthogonal problem that the *exec* functions do not honor the *atexit()* handlers, but  
132625 resolving this is beyond the scope of POSIX.1-2024.
- 132626 • Async-Cancel Safety
- 132627 A function is said to be async-cancel-safe if it is written in such a way that entering the  
132628 function with asynchronous cancelability enabled will not cause any invariants to be  
132629 violated, even if a cancellation request is delivered at any arbitrary instruction. Functions  
132630 that are async-cancel-safe are often written in such a way that they need to acquire no  
132631 resources for their operation and the visible variables that they may write are strictly  
132632 limited.
- 132633 Any routine that gets a resource as a side-effect cannot be made async-cancel-safe (for  
132634 example, *malloc()*). If such a routine were called with asynchronous cancelability enabled,  
132635 it might acquire the resource successfully, but as it was returning to the client, it could act  
132636 on a cancellation request. In such a case, the application would have no way of knowing  
132637 whether the resource was acquired or not.
- 132638 Indeed, because many interesting routines cannot be made async-cancel-safe, most library  
132639 routines in general are not async-cancel-safe. Every library routine should specify whether  
132640 or not it is async-cancel safe so that programmers know which routines can be called from  
132641 code that is asynchronously cancelable.
- 132642 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/8 is applied, adding the *pselect()* function  
132643 to the list of functions with cancellation points.
- 132644 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/5 is applied, adding the *fdatasync()*  
132645 function into the table of functions that shall have cancellation points.
- 132646 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/6 is applied, adding the numerous  
132647 functions into the table of functions that may have cancellation points.
- 132648 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/7 is applied, clarifying the requirements  
132649 in Thread Cancellation Cleanup Handlers.
- 132650 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0023 [627], XSH/TC2-2008/0024  
132651 [627,632], XSH/TC2-2008/0025 [627], XSH/TC2-2008/0026 [632], and XSH/TC2-2008/0027  
132652 [622] are applied.
- 132653 Austin Group Defect 411 is applied, adding *accept4()* to the table of functions that shall have  
132654 cancellation points.
- 132655 Austin Group Defect 508 is applied, adding *ptsname()* and *ptsname\_r()* to the table of functions  
132656 that may have cancellation points.
- 132657 Austin Group Defect 614 is applied, adding *posix\_close()* to the table of functions that shall have  
132658 cancellation points.
- 132659 Austin Group Defect 697 is applied, adding *posix\_getdents()* to the table of functions that may  
132660 have cancellation points.
- 132661 Austin Group Defect 729 is applied, adding *posix\_devctl()* to the table of functions that may have

- 132662 cancellation points.
- 132663 Austin Group Defect 841 is applied, allowing `pthread_setcancelstate()` to be used to disable  
132664 cancellation in a signal catching function in order to avoid undefined behavior when the signal  
132665 is delivered during execution of a function that is not `async-cancel-safe`.
- 132666 Austin Group Defect 1076 is applied, moving `sem_wait()` and `sem_timedwait()` from the table of  
132667 functions that are required to have cancellation points to the table of functions that may have  
132668 cancellation points.
- 132669 Austin Group Defect 1122 is applied, adding `bindtextdomain()` and the `gettext` family of functions  
132670 to the table of functions that may have cancellation points.
- 132671 Austin Group Defect 1143 is applied, clarifying the conditions under which it is unspecified  
132672 whether the cancellation request is acted upon or whether the cancellation request remains  
132673 pending.
- 132674 Austin Group Defect 1216 is applied, adding `pthread_cond_clockwait()` to the table of functions  
132675 that are required to have cancellation points, and adding `pthread_rwlock_clockwrlock()`,  
132676 `pthread_rwlock_clockrdlock()`, and `sem_clockwait()` to the table of functions that may have  
132677 cancellation points.
- 132678 Austin Group Defect 1263 is applied, adding `ppoll()` to the table of functions that are required to  
132679 have cancellation points.
- 132680 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
- 132681 Austin Group Defect 1410 is applied, removing the `asctime_r()` and `ctime_r()` functions.

132682 *B.2.9.6 Thread Read-Write Locks*

132683 **Background**

132684 Read-write locks are often used to allow parallel access to data on multi-processors, to avoid  
132685 context switches on uni-processors when multiple threads access the same data, and to protect  
132686 data structures that are frequently accessed (that is, read) but rarely updated (that is, written).  
132687 The in-core representation of a file system directory is a good example of such a data structure.  
132688 One would like to achieve as much concurrency as possible when searching directories, but limit  
132689 concurrent access when adding or deleting files.

132690 Although read-write locks can be implemented with mutexes and condition variables, such  
132691 implementations are significantly less efficient than is possible. Therefore, this synchronization  
132692 primitive is included in POSIX.1-2024 for the purpose of allowing more efficient  
132693 implementations in multi-processor systems.

132694 **Queuing of Waiting Threads**

132695 The `pthread_rwlock_unlock()` function description states that one writer or one or more readers  
132696 must acquire the lock if it is no longer held by any thread as a result of the call. However, the  
132697 function does not specify which thread(s) acquire the lock, unless the Thread Execution  
132698 Scheduling option is supported.

132699 The standard developers considered the issue of scheduling with respect to the queuing of  
132700 threads blocked on a read-write lock. The question turned out to be whether POSIX.1-2024  
132701 should require priority scheduling of read-write locks for threads whose execution scheduling  
132702 policy is priority-based (for example, `SCHED_FIFO` or `SCHED_RR`). There are tradeoffs  
132703 between priority scheduling, the amount of concurrency achievable among readers, and the  
132704 prevention of writer and/or reader starvation.

132705 For example, suppose one or more readers hold a read-write lock and the following threads  
132706 request the lock in the listed order:

132707 pthread\_rwlock\_wrlock() - Low priority thread writer\_a  
132708 pthread\_rwlock\_rdlock() - High priority thread reader\_a  
132709 pthread\_rwlock\_rdlock() - High priority thread reader\_b  
132710 pthread\_rwlock\_rdlock() - High priority thread reader\_c

132711 When the lock becomes available, should *writer\_a* block the high priority readers? Or, suppose a  
132712 read-write lock becomes available and the following are queued:

132713 pthread\_rwlock\_rdlock() - Low priority thread reader\_a  
132714 pthread\_rwlock\_rdlock() - Low priority thread reader\_b  
132715 pthread\_rwlock\_rdlock() - Low priority thread reader\_c  
132716 pthread\_rwlock\_wrlock() - Medium priority thread writer\_a  
132717 pthread\_rwlock\_rdlock() - High priority thread reader\_d

132718 If priority scheduling is applied then *reader\_d* would acquire the lock and *writer\_a* would block  
132719 the remaining readers. But should the remaining readers also acquire the lock to increase  
132720 concurrency? The solution adopted takes into account that when the Thread Execution  
132721 Scheduling option is supported, high priority threads may in fact starve low priority threads  
132722 (the application developer is responsible in this case for designing the system in such a way that  
132723 this starvation is avoided). Therefore, POSIX.1-2024 specifies that high priority readers take  
132724 precedence over lower priority writers. However, to prevent writer starvation from threads of  
132725 the same or lower priority, writers take precedence over readers of the same or lower priority.

132726 Priority inheritance mechanisms are non-trivial in the context of read-write locks. When a high  
132727 priority writer is forced to wait for multiple readers, for example, it is not clear which subset of  
132728 the readers should inherit the writer's priority. Furthermore, the internal data structures that  
132729 record the inheritance must be accessible to all readers, and this implies some sort of  
132730 serialization that could negate any gain in parallelism achieved through the use of multiple  
132731 readers in the first place. Finally, existing practice does not support the use of priority  
132732 inheritance for read-write locks. Therefore, no specification of priority inheritance or priority  
132733 ceiling is attempted. If reliable priority-scheduled synchronization is absolutely required, it can  
132734 always be obtained through the use of mutexes.

### 132735 **Comparison to fcntl() Locks**

132736 The read-write locks and the *fcntl()* locks in POSIX.1-2024 share a common goal: increasing  
132737 concurrency among readers, thus increasing throughput and decreasing delay.

132738 However, the read-write locks have two features not present in the *fcntl()* locks. First, under  
132739 priority scheduling, read-write locks are granted in priority order. Second, also under priority  
132740 scheduling, writer starvation is prevented by giving writers preference over readers of equal or  
132741 lower priority.

132742 Also, read-write locks can be used in systems lacking a file system, such as those conforming to  
132743 the minimal realtime system profile of IEEE Std 1003.13-1998.

132744 **History of Resolution Issues**

132745 Based upon some balloting objections, early drafts specified the behavior of threads waiting on a  
 132746 read-write lock during the execution of a signal handler, as if the thread had not called the lock  
 132747 operation. However, this specified behavior would require implementations to establish  
 132748 internal signal handlers even though this situation would be rare, or never happen for many  
 132749 programs. This would introduce an unacceptable performance hit in comparison to the little  
 132750 additional functionality gained. Therefore, the behavior of read-write locks and signals was  
 132751 reverted back to its previous mutex-like specification.

132752 *B.2.9.7 Thread Interactions with File Operations*

132753 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0028 [498] is applied.

132754 Austin Group Defect 411 is applied, adding *dup3()*.

132755 Austin Group Defect 695 is applied, extending the requirements in this section to non-regular  
 132756 files.

132757 *B.2.9.8 Use of Application-Managed Thread Stacks*

132758 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/8 is applied, adding this new section. It  
 132759 was added to make it clear that the current standard does not allow an application to determine  
 132760 when a stack can be reclaimed. This may be addressed in a future version.

132761 *B.2.9.9 Synchronization Object Copies and Alternative Mappings*

132762 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0029 [972] is applied.

132763 Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.

132764 **B.2.10 Sockets**

132765 The base document for the sockets interfaces in POSIX.1-2024 is the XNS, Issue 5.2 specification.  
 132766 This was primarily chosen as it aligns with IPv6. Additional material has been added from  
 132767 IEEE Std 1003.1g-2000, notably socket concepts, raw sockets, the *pselect()* function, the  
 132768 *socketmark()* function, and the `<sys/select.h>` header.

132769 *B.2.10.1 Address Families*

132770 There is no additional rationale provided for this section.

132771 *B.2.10.2 Addressing*

132772 There is no additional rationale provided for this section.

132773 *B.2.10.3 Protocols*

132774 There is no additional rationale provided for this section.

## 132775 B.2.10.4 Routing

132776 There is no additional rationale provided for this section.

## 132777 B.2.10.5 Interfaces

132778 There is no additional rationale provided for this section.

## 132779 B.2.10.6 Socket Types

132780 The type **socklen\_t** was invented to cover the range of implementations seen in the field. The  
132781 intent of **socklen\_t** is to be the type for all lengths that are naturally bounded in size; that is, that  
132782 they are the length of a buffer which cannot sensibly become of massive size: network addresses,  
132783 host names, string representations of these, ancillary data, control messages, and socket options  
132784 are examples. Truly boundless sizes are represented by **size\_t** as in *read()*, *write()*, and so on.

132785 All **socklen\_t** types were originally (in BSD UNIX) of type **int**. During the development of  
132786 POSIX.1-2024, it was decided to change all buffer lengths to **size\_t**, which appears at face value  
132787 to make sense. When dual mode 32/64-bit systems came along, this choice unnecessarily  
132788 complicated system interfaces because **size\_t** (with **long**) was a different size under ILP32 and  
132789 LP64 models. Reverting to **int** would have happened except that some implementations had  
132790 already shipped 64-bit-only interfaces. The compromise was a type which could be defined to be  
132791 any size by the implementation: **socklen\_t**.

## 132792 B.2.10.7 Socket I/O Mode

132793 There is no additional rationale provided for this section.

## 132794 B.2.10.8 Socket Owner

132795 There is no additional rationale provided for this section.

## 132796 B.2.10.9 Socket Queue Limits

132797 There is no additional rationale provided for this section.

## 132798 B.2.10.10 Pending Error

132799 There is no additional rationale provided for this section.

## 132800 B.2.10.11 Socket Receive Queue

132801 There is no additional rationale provided for this section.

## 132802 B.2.10.12 Socket Out-of-Band Data State

132803 There is no additional rationale provided for this section.

132804 B.2.10.13 *Connection Indication Queue*

132805 There is no additional rationale provided for this section.

132806 B.2.10.14 *Signals*

132807 There is no additional rationale provided for this section.

132808 B.2.10.15 *Asynchronous Errors*

132809 Austin Group Defect 1010 is applied, removing [EHOSTDOWN] from the list of asynchronous  
132810 errors.

132811 B.2.10.16 *Use of Options*

132812 Austin Group Defect 840 is applied, adding SO\_DOMAIN and SO\_PROTOCOL.

132813 Austin Group Defect 1337 is applied, clarifying socket option default values.

132814 B.2.10.17 *Use of Sockets for Local UNIX Connections*

132815 There is no additional rationale provided for this section.

132816 B.2.10.18 *Use of Sockets over Internet Protocols*

132817 A raw socket allows privileged users direct access to a protocol; for example, raw access to the  
132818 IP and ICMP protocols is possible through raw sockets. Raw sockets are intended for  
132819 knowledgeable applications that wish to take advantage of some protocol feature not directly  
132820 accessible through the other sockets interfaces.

132821 B.2.10.19 *Use of Sockets over Internet Protocols Based on IPv4*

132822 There is no additional rationale provided for this section.

132823 B.2.10.20 *Use of Sockets over Internet Protocols Based on IPv6*

132824 The Open Group Base Resolution bwg2001-012 is applied, clarifying that IPv6 implementations  
132825 are required to support use of AF\_INET6 sockets over IPv4.

132826 Austin Group Defect 411 is applied, adding *accept4()*.

132827 **B.2.11 Data Types**132828 B.2.11.1 *Defined Types*

132829 The requirement that additional types defined in this section end in ``\_t'' was prompted by the  
132830 problem of name space pollution. It is difficult to define a type (where that type is not one  
132831 defined by POSIX.1-2024) in one header file and use it in another without adding symbols to the  
132832 name space of the program. To allow implementors to provide their own types, all conforming  
132833 applications are required to avoid symbols ending in ``\_t'', which permits the implementor to

132834 provide additional types. Because a major use of types is in the definition of structure members,  
 132835 which can (and in many cases must) be added to the structures defined in POSIX.1-2024, the  
 132836 need for additional types is compelling.

132837 The types, such as **ushort** and **ulong**, which are in common usage, are not defined in  
 132838 POSIX.1-2024 (although **ushort\_t** would be permitted as an extension). They can be added to  
 132839 **<sys/types.h>** using a feature test macro (see [Section B.2.2.1](#), on page 3737). A suggested symbol  
 132840 for these is **\_SYSIII**. Similarly, the types like **u\_short** would probably be best controlled by **\_BSD**.

132841 Some of these symbols may appear in other headers; see [Section B.2.2.2](#) (on page 3738).

132842 **dev\_t** This type may be made large enough to accommodate host-locality considerations  
 132843 of networked systems.

132844 This type must be arithmetic. Earlier proposals allowed this to be non-arithmetic  
 132845 (such as a structure) and provided a *samefile()* function for comparison.

132846 **gid\_t** Some implementations had separated **gid\_t** from **uid\_t** before POSIX.1 was  
 132847 completed. It would be difficult for them to coalesce them when it was  
 132848 unnecessary. Additionally, it is quite possible that user IDs might be different from  
 132849 group IDs because the user ID might wish to span a heterogeneous network,  
 132850 where the group ID might not.

132851 For current implementations, the cost of having a separate **gid\_t** will be only  
 132852 lexical.

132853 **mode\_t** This type was chosen so that implementations could choose the appropriate  
 132854 integer type, and for compatibility with the ISO C standard. 4.3 BSD uses  
 132855 **unsigned short** and the SVID uses **ushort**, which is the same. Historically, only the  
 132856 low-order sixteen bits are significant.

132857 **nlink\_t** This type was introduced in place of **short** for *st\_nlink* (see the **<sys/stat.h>** header)  
 132858 in response to an objection that **short** was too small.

132859 **off\_t** This type is used to represent a file offset or file size. On systems supporting large  
 132860 files, **off\_t** is larger than 32 bits in at least one programming environment. Other  
 132861 programming environments may use different sizes for **off\_t**, for compatibility or  
 132862 other reasons.

132863 **pid\_t** The inclusion of this symbol was controversial because it is tied to the issue of the  
 132864 representation of a process ID as a number. From the point of view of a  
 132865 conforming application, process IDs should be “magic cookies”<sup>9</sup> that are produced  
 132866 by calls such as *fork()*, used by calls such as *waitpid()* or *kill()*, and not otherwise  
 132867 analyzed (except that the sign is used as a flag for certain operations).

132868 The concept of a {PID\_MAX} value interacted with this in early proposals. Treating  
 132869 process IDs as an opaque type both removes the requirement for {PID\_MAX} and  
 132870 allows systems to be more flexible in providing process IDs that span a large range  
 132871 of values, or a small one.

132872 Since the values in **uid\_t**, **gid\_t**, and **pid\_t** will be numbers generally, and  
 132873 potentially both large in magnitude and sparse, applications that are based on  
 132874 arrays of objects of this type are unlikely to be fully portable in any case. Solutions  
 132875 that treat them as magic cookies will be portable.

---

132876 9. An historical term meaning: “An opaque object, or token, of determinate size, whose significance is known only to the entity which  
 132877 created it. An entity receiving such a token from the generating entity may only make such use of the ‘cookie’ as is defined and permitted  
 132878 by the supplying entity.”

132879		{CHILD_MAX} precludes the possibility of a “toy implementation”, where there would only be one process.
132880		
132881	<b>ssize_t</b>	This is intended to be a signed analog of <b>size_t</b> . The wording is such that an implementation may either choose to use a longer type or simply to use the signed version of the type that underlies <b>size_t</b> . All functions that return <b>ssize_t</b> ( <i>read()</i> and <i>write()</i> ) describe as “implementation-defined” the result of an input exceeding {SSIZE_MAX}. It is recognized that some implementations might have <b>ints</b> that are smaller than <b>size_t</b> . A conforming application would be constrained not to perform I/O in pieces larger than {SSIZE_MAX}, but a conforming application using extensions would be able to use the full range if the implementation provided an extended range, while still having a single type-compatible interface.
132882		
132883		
132884		
132885		
132886		
132887		
132888		
132889		
132890		The symbols <b>size_t</b> and <b>ssize_t</b> are also required in <b>&lt;unistd.h&gt;</b> to minimize the changes needed for calls to <i>read()</i> and <i>write()</i> . Implementors are reminded that it must be possible to include both <b>&lt;sys/types.h&gt;</b> and <b>&lt;unistd.h&gt;</b> in the same program (in either order) without error.
132891		
132892		
132893		
132894	<b>uid_t</b>	Before the addition of this type, the data types used to represent these values varied throughout early proposals. The <b>&lt;sys/stat.h&gt;</b> header defined these values as type <b>short</b> , the <b>&lt;passwd.h&gt;</b> file (now <b>&lt;pwd.h&gt;</b> and <b>&lt;grp.h&gt;</b> ) used an <b>int</b> , and <i>getuid()</i> returned an <b>int</b> . In response to a strong objection to the inconsistent definitions, all the types were switched to <b>uid_t</b> .
132895		
132896		
132897		
132898		
132899		In practice, those historical implementations that use varying types of this sort can typedef <b>uid_t</b> to <b>short</b> with no serious consequences.
132900		
132901		The problem associated with this change concerns object compatibility after structure size changes. Since most implementations will define <b>uid_t</b> as a <b>short</b> , the only substantive change will be a reduction in the size of the <b>passwd</b> structure. Consequently, implementations with an overriding concern for object compatibility can pad the structure back to its current size. For that reason, this problem was not considered critical enough to warrant the addition of a separate type to POSIX.1.
132902		
132903		
132904		
132905		
132906		
132907		
132908		The types <b>uid_t</b> and <b>gid_t</b> are magic cookies. There is no {UID_MAX} defined by POSIX.1, and no structure imposed on <b>uid_t</b> and <b>gid_t</b> other than that they be positive arithmetic types. (In fact, they could be <b>unsigned char</b> .) There is no maximum or minimum specified for the number of distinct user or group IDs.
132909		
132910		
132911		
132912		POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0030 [733] is applied.
132913		Austin Group Defect 697 is applied, adding <b>reclen_t</b> .
132914		Austin Group Defect 1302 is applied, aligning this section with the ISO/IEC 9899:2018 standard.
132915	B.2.11.2	<i>The char Type</i>
132916		POSIX.1-2024 explicitly requires that a <b>char</b> type is exactly one byte (8 bits).

**132917 B.2.12 Status Information**

132918 POSIX.1-2024 does not require all matching WNOWAIT threads (threads in a matching call to  
132919 *waitid()* with the WNOWAIT flag set) to obtain a child's status information because the status  
132920 information might be discarded (consumed or replaced) before one of the matching WNOWAIT  
132921 threads is scheduled. If the status information is not discarded, it will remain available, so all of  
132922 the matching WNOWAIT threads will (eventually) obtain the status information.

132923 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0031 [690] is applied.

**132924 B.3 System Interfaces**

132925 See the RATIONALE sections on the individual reference pages.

**132926 B.3.1 System Interfaces Removed in this Version**

132927 This section contains a list of options and interfaces removed in POSIX.1-2024, together with  
132928 advice for application developers on the alternative interfaces that should be used.

**132929 B.3.1.1 STREAMS Option**

132930 Applications are recommended to use UNIX domain sockets as an alternative for much of the  
132931 functionality provided by this option. For example, file descriptor passing can be performed  
132932 using *sendmsg()* and *recvmsg()* with SCM\_RIGHTS on a UNIX domain socket instead of using  
132933 *ioctl()* with I\_SENDFD and I\_RECVFD on a STREAM.

**132934 B.3.1.2 Tracing Option**

132935 Applications are recommended to use implementation-provided extension interfaces instead of  
132936 the functionality provided by this option. (Such interfaces were in widespread use before the  
132937 Tracing option was added to POSIX.1 and continued to be used in preference to the Tracing  
132938 option interfaces.)

**132939 B.3.1.3 *\_longjmp()* and *\_setjmp()***

132940 Applications are recommended to use *siglongjmp()* and *sigsetjmp()* instead of these functions.

**132941 B.3.1.4 *\_tolower()* and *\_toupper()***

132942 Applications are recommended to use *tolower()* and *toupper()* instead of these functions.

**132943 B.3.1.5 *ftw()***

132944 Applications are recommended to use *nftw()* instead of this function.

- 132945 B.3.1.6 *getitimer()* and *setitimer()*
- 132946 Applications are recommended to use *timer\_gettime()* and *timer\_settime()* instead of these  
132947 functions.
- 132948 B.3.1.7 *gets()*
- 132949 Applications are recommended to use *fgets()* instead of this function.
- 132950 B.3.1.8 *gettimeofday()*
- 132951 Applications are recommended to use *clock\_gettime()* instead of this function.
- 132952 B.3.1.9 *isascii()* and *toascii()*
- 132953 Applications are recommended to use macros equivalent to the following instead of these  
132954 functions:
- ```
132955 #define isascii(c) (((c) & ~0177) == 0)
132956 #define toascii(c) ((c) & 0177)
```
- 132957 An alternative replacement for *isascii()*, depending on the intended outcome if the code is  
132958 ported to implementations with different character encodings, might be:
- ```
132959 #define isascii(c) (isprint((c)) || iscntrl((c)))
```
- 132960 (In the C or POSIX locale, this determines whether *c* is a character in the portable character set.)
- 132961 B.3.1.10 *pthread\_getconcurrency()* and *pthread\_setconcurrency()*
- 132962 Applications are recommended to use thread scheduling (on implementations that support the  
132963 Thread Execution Scheduling option) instead of these functions; see XSH [Section 2.9.4](#) (on page  
132964 540).
- 132965 B.3.1.11 *rand\_r()*
- 132966 Applications are recommended to use *nrand48()* or *random()* instead of this function.
- 132967 B.3.1.12 *setpggrp()*
- 132968 Applications are recommended to use *setpgid()* or *setsid()* instead of this function.
- 132969 B.3.1.13 *sighold()*, *sigpause()*, and *sigrelse()*
- 132970 Applications are recommended to use *pthread\_sigmask()* or *sigprocmask()* instead of these  
132971 functions.
- 132972 B.3.1.14 *sigignore()*, *siginterrupt()*, and *sigset()*
- 132973 Applications are recommended to use *sigtaction()* instead of these functions.

132974 B.3.1.15 *tempnam()*

132975 Applications are recommended to use *mkdtemp()*, *mkstemp()*, or *tmpfile()* instead of this  
132976 function.

132977 B.3.1.16 *ulimit()*

132978 Applications are recommended to use *getrlimit()* or *setrlimit()* instead of this function.

132979 B.3.1.17 *utime()*

132980 Applications are recommended to use *futimens()* if a file descriptor for the file is open, otherwise  
132981 *utimensat()*, instead of this function.

### 132982 B.3.2 System Interfaces Removed in the Previous Version

132983 The functions and symbols removed in Issue 7 (from the Issue 6 base document) were as  
132984 follows:

132985

Removed Functions and Symbols in Issue 7		
<i>bcmp()</i>	<i>gethostbyaddr()</i>	<i>rindex()</i>
<i>bcopy()</i>	<i>gethostbyname()</i>	<i>scalb()</i>
<i>bsd_signal()</i>	<i>getwd()</i>	<i>setcontext()</i>
<i>bzero()</i>	<i>h_errno</i>	<i>swapcontext()</i>
<i>ecvt()</i>	<i>index()</i>	<i>ualarm()</i>
<i>fcvt()</i>	<i>makecontext()</i>	<i>usleep()</i>
<i>ftime()</i>	<i>mktemp()</i>	<i>vfork()</i>
<i>gcvt()</i>	<i>pthread_attr_getstackaddr()</i>	<i>wcswcs()</i>
<i>getcontext()</i>	<i>pthread_attr_setstackaddr()</i>	

### 132995 B.3.3 Examples for Spawn

132996 The following long examples are provided in the Rationale (Informative) volume of  
132997 POSIX.1-2024 as a supplement to the reference page for *posix\_spawn()*.

#### 132998 Example Library Implementation of Spawn

132999 The *posix\_spawn()* or *posix\_spawnnp()* functions provide the following:

- 133000 • Simply start a process executing a process image. This is the simplest application for  
133001 process creation, and it may cover most executions of *fork()*.
- 133002 • Support I/O redirection, including pipes.
- 133003 • Run the child under a user and group ID in the domain of the parent.
- 133004 • Run the child at any priority in the domain of the parent.

133005 The *posix\_spawn()* or *posix\_spawnnp()* functions do not cover every possible use of the *fork()*  
133006 function, but they do span the common applications: typical use by a shell and a login utility.

133007 The price for an application is that before it calls *posix\_spawn()* or *posix\_spawnnp()*, the parent  
133008 must adjust to a state that *posix\_spawn()* or *posix\_spawnnp()* can map to the desired state for the  
133009 child. Environment changes require the parent to save some of its state and restore it afterwards.  
133010 The example below demonstrates an initial approach to implementing *posix\_spawn()* using other

```

133011     POSIX operations, although an actual implementation will need to be more robust at handling
133012     all possible filenames.

133013     #include <sys/types.h>
133014     #include <stdlib.h>
133015     #include <stdio.h>
133016     #include <unistd.h>
133017     #include <sched.h>
133018     #include <fcntl.h>
133019     #include <signal.h>
133020     #include <errno.h>
133021     #include <string.h>
133022     #include <signal.h>

133023     /* #include <spawn.h> */
133024     /*****
133025     /* Things that could be defined in spawn.h */
133026     /*****

133466         return 0;
133467     }
133468     int posix_spawnattr_setsigdefault(posix_spawnattr_t *attr,
133469         const sigset_t *sigdefault)
133470     {
133471         attr->posix_attr_sigdefault = *sigdefault;
133472         return 0;
133473     }

```

### 133474 **I/O Redirection with Spawn**

133475 I/O redirection with *posix\_spawn()* or *posix\_spawnnp()* is accomplished by crafting a *file\_actions*  
133476 argument to effect the desired redirection. Such a redirection follows the general outline of the  
133477 following example:

```

133478     /* To redirect new standard output (fd 1) to a file, */
133479     /* and redirect new standard input (fd 0) from my fd socket_pair[1], */
133480     /* and close my fd socket_pair[0] in the new process. */
133481     posix_spawn_file_actions_t file_actions;
133482     posix_spawn_file_actions_init(&file_actions);
133483     posix_spawn_file_actions_addopen(&file_actions, 1, "newout", ...);
133484     posix_spawn_file_actions_dup2(&file_actions, socket_pair[1], 0);
133485     posix_spawn_file_actions_close(&file_actions, socket_pair[0]);
133486     posix_spawn_file_actions_close(&file_actions, socket_pair[1]);
133487     posix_spawn(..., &file_actions, ...);
133488     posix_spawn_file_actions_destroy(&file_actions);

```

### 133489 **Spawning a Process Under a New User ID**

133490 Spawning a process under a new user ID follows the outline shown in the following example:

```

133491     Save = getuid();
133492     setuid(newid);
133493     posix_spawn(...);
133494     setuid(Save);

```

# Rationale for Shell and Utilities

## C.1 Introduction

### C.1.1 Change History

The change history is provided as an informative section, to track changes from earlier versions of this standard.

The following sections describe changes made to the Shell and Utilities volume of POSIX.1-2024 since Issue 7 of the base document. The CHANGE HISTORY section for each utility describes technical changes made to that utility in Issue 5 and later. Changes made before Issue 5 are not included.

#### Changes from Issue 7 to Issue 8 (POSIX.1-2024)

The following list summarizes the major changes that were made in the Shell and Utilities volume of POSIX.1-2024 from Issue 7 to Issue 8:

- The Open Group Standard, 2022, Additional APIs for the Base Specifications Issue 8, Part 2 is incorporated.
- Austin Group defect reports and IEEE Interpretations against IEEE Std 1003.1 are applied.
- The Open Group corrigenda and resolutions are applied.
- Features, marked obsolescent in the base document, have been considered for removal in this version.

#### New Features in Issue 8

The utilities first introduced in Issue 8 (over the Issue 7 base document) are as follows:

133521

133522

133523

133524

New Utilities in Issue 8		
<i>gettext</i>	<i>readlink</i>	<i>xgettext</i>
<i>msgfmt</i>	<i>realpath</i>	
<i>ngettext</i>	<i>timeout</i>	

#### Removed Utilities in Issue 8

The utilities removed in Issue 8 (from the Issue 7 base document) are as follows:

133527

133528

133529

133530

133531

Removed Utilities in Issue 8		
<i>fort77</i>	<i>qmove</i>	<i>qselect</i>
<i>qalter</i>	<i>qmsg</i>	<i>qsig</i>
<i>qdel</i>	<i>qrerun</i>	<i>qstat</i>
<i>qhold</i>	<i>qrls</i>	<i>qsub</i>

133532 **C.1.2 Relationship to Other Documents**133533 *C.1.2.1 System Interfaces*

133534 It has been pointed out that the Shell and Utilities volume of POSIX.1-2024 assumes that a great  
 133535 deal of functionality from the System Interfaces volume of POSIX.1-2024 is present, but never  
 133536 states exactly how much (and strictly does not need to since both are mandated on a conforming  
 133537 system). This section is an attempt to clarify the assumptions.

133538 **File Read, Write, and Creation**

133539 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/2 is applied, updating Table 1-1.

133540 **File Removal**

133541 This is intended to be a summary of the *unlink()* and *rmdir()* requirements. Note that it is  
 133542 possible using the *unlink()* function for item 4. to occur.

133543 *C.1.2.2 Concepts Derived from the ISO C Standard*

133544 This section was introduced to address the issue that there was insufficient detail presented by  
 133545 such utilities as *awk* or *sh* about their procedural control statements and their methods of  
 133546 performing arithmetic functions.

133547 The ISO C standard was selected as a model because most historical implementations of the  
 133548 standard utilities were written in C. Thus, it was more likely that they would act in the desired  
 133549 manner without modification.

133550 Using the ISO C standard is primarily a notational convenience so that the many procedural  
 133551 languages in the Shell and Utilities volume of POSIX.1-2024 would not have to be rigorously  
 133552 described in every aspect. Its selection does not require that the standard utilities be written in  
 133553 Standard C; they could be written in Common Usage C, Ada, Pascal, assembler language, or  
 133554 anything else.

133555 The sizes of the various numeric values refer to C-language data types that are allowed to be  
 133556 different sizes by the ISO C standard. Thus, like a C-language application, a shell application  
 133557 cannot rely on their exact size. However, it can rely on their minimum sizes expressed in the  
 133558 ISO C standard, such as {LONG\_MAX} for a **long** type.

133559 The behavior on overflow is undefined for ISO C standard arithmetic. Therefore, the standard  
 133560 utilities can use “bignum” representation for integers so that there is no fixed maximum unless  
 133561 otherwise stated in the utility description. Similarly, standard utilities can use infinite-precision  
 133562 representations for floating-point arithmetic, as long as these representations exceed the ISO C  
 133563 standard requirements.

133564 This section addresses only the issue of semantics; it is not intended to specify syntax. For  
 133565 example, the ISO C standard requires that 0L be recognized as an integer constant equal to zero,  
 133566 but utilities such as *awk* and *sh* are not required to recognize 0L (though they are allowed to, as  
 133567 an extension).

133568 The ISO C standard requires that a C compiler must issue a diagnostic for constants that are too  
 133569 large to represent. Most standard utilities are not required to issue these diagnostics; for  
 133570 example, the command:

133571 `diff -C 2147483648 file1 file2`

133572 has undefined behavior, and the *diff* utility is not required to issue a diagnostic even if the  
 133573 number 2 147 483 648 cannot be represented.  
 133574 Austin Group Defect 1128 is applied, adding a note about the comma operator.

### 133575 C.1.3 Utility Limits

133576 This section grew out of an idea that originated with the original POSIX.1, in the tables of system  
 133577 limits for the *sysconf*() and *pathconf*() functions. The idea being that a conforming application  
 133578 can be written to use the most restrictive values that a minimal system can provide, but it should  
 133579 not have to. The values provided represent compromises so that some vendors can use  
 133580 historically limited versions of UNIX system utilities. They are the highest values that a strictly  
 133581 conforming application can assume, given no other information.

133582 However, by using the *getconf* utility or the *sysconf*() function, the elegant application can be  
 133583 tailored to more liberal values on some of the specific instances of specific implementations.

133584 There is no explicitly stated requirement that an implementation provide finite limits for any of  
 133585 these numeric values; the implementation is free to provide essentially unbounded capabilities  
 133586 (where it makes sense), stopping only at reasonable points such as {ULONG\_MAX} (from the  
 133587 ISO C standard). Therefore, applications desiring to tailor themselves to the values on a  
 133588 particular implementation need to be ready for possibly huge values; it may not be a good idea  
 133589 to allocate blindly a buffer for an input line based on the value of {LINE\_MAX}, for instance.  
 133590 However, unlike the System Interfaces volume of POSIX.1-2024, there is no set of limits that  
 133591 return a special indication meaning “unbounded”. The implementation should always return an  
 133592 actual number, even if the number is very large.

133593 The statement:

133594 “It is not guaranteed that the application ...”

133595 is an indication that many of these limits are designed to ensure that implementors design their  
 133596 utilities without arbitrary constraints related to unimaginative programming. There are certainly  
 133597 conditions under which combinations of options can cause failures that would not render an  
 133598 implementation non-conforming. For example, {EXPR\_NEST\_MAX} and {ARG\_MAX} could  
 133599 collide when expressions are large; combinations of {BC\_SCALE\_MAX} and {BC\_DIM\_MAX}  
 133600 could exceed virtual memory.

133601 In the Shell and Utilities volume of POSIX.1-2024, the notion of a limit being guaranteed for the  
 133602 process lifetime, as it is in the System Interfaces volume of POSIX.1-2024, is not as useful to a  
 133603 shell script. The *getconf* utility is probably a process itself, so the guarantee would be without  
 133604 value. Therefore, the Shell and Utilities volume of POSIX.1-2024 requires the guarantee to be for  
 133605 the session lifetime. This will mean that many vendors will either return very conservative  
 133606 values or possibly implement *getconf* as a built-in.

133607 It may seem confusing to have limits that apply only to a single utility grouped into one global  
 133608 section. However, the alternative, which would be to disperse them out into their utility  
 133609 description sections, would cause great difficulty when *sysconf*() and *getconf* were described.  
 133610 Therefore, the standard developers chose the global approach.

133611 Each language binding could provide symbol names that are slightly different from those shown  
 133612 here. For example, the C-Language Binding option adds a leading <underscore> to the symbols  
 133613 as a prefix.

133614 The following comments describe selection criteria for the symbols and their values:

- 133615 {ARG\_MAX}  
 133616 This is defined by the System Interfaces volume of POSIX.1-2024. Unfortunately, it is very  
 133617 difficult for a conforming application to deal with this value, as it does not know how much  
 133618 of its argument space is being consumed by the environment variables of the user.
- 133619 {BC\_BASE\_MAX}  
 133620 {BC\_DIM\_MAX}  
 133621 {BC\_SCALE\_MAX}  
 133622 These were originally one value, {BC\_SCALE\_MAX}, but it was unreasonable to link all  
 133623 three concepts into one limit.
- 133624 {CHILD\_MAX}  
 133625 This is defined by the System Interfaces volume of POSIX.1-2024.
- 133626 {COLL\_WEIGHTS\_MAX}  
 133627 The weights assigned to **order** can be considered as “passes” through the collation  
 133628 algorithm.
- 133629 {EXPR\_NEST\_MAX}  
 133630 The value for expression nesting was borrowed from the ISO C standard.
- 133631 {LINE\_MAX}  
 133632 This is a global limit that affects all utilities, unless otherwise noted. The {MAX\_CANON}  
 133633 value from the System Interfaces volume of POSIX.1-2024 may further limit input lines from  
 133634 terminals. The {LINE\_MAX} value was the subject of much debate and is a compromise  
 133635 between those who wished to have unlimited lines and those who understood that many  
 133636 historical utilities were written with fixed buffers. Frequently, utility writers selected the  
 133637 UNIX system constant BUFSIZ to allocate these buffers; therefore, some utilities were  
 133638 limited to 512 bytes for I/O lines, while others achieved 4 096 bytes or greater.
- 133639 It should be noted that {LINE\_MAX} applies only to input line length; there is no  
 133640 requirement in POSIX.1-2024 that limits the length of output lines. Utilities such as *awk*, *sed*,  
 133641 and *paste* could theoretically construct lines longer than any of the input lines they received,  
 133642 depending on the options used or the instructions from the application. They are not  
 133643 required to truncate their output to {LINE\_MAX}. It is the responsibility of the application  
 133644 to deal with this. If the output of one of those utilities is to be piped into another of the  
 133645 standard utilities, line length restrictions will have to be considered; the *fold* utility, among  
 133646 others, could be used to ensure that only reasonable line lengths reach utilities or  
 133647 applications.
- 133648 {LINK\_MAX}  
 133649 This is defined by the System Interfaces volume of POSIX.1-2024.
- 133650 {MAX\_CANON}  
 133651 {MAX\_INPUT}  
 133652 {NAME\_MAX}  
 133653 {NGROUPS\_MAX}  
 133654 {OPEN\_MAX}  
 133655 {PATH\_MAX}  
 133656 {PIPE\_BUF}  
 133657 These limits are defined by the System Interfaces volume of POSIX.1-2024. Note that the  
 133658 byte lengths described by some of these values continue to represent bytes, even if the  
 133659 applicable character set uses a multi-byte encoding.
- 133660 {RE\_DUP\_MAX}  
 133661 The value selected is consistent with historical practice. Although the name implies that it  
 133662 applies to all REs, only BREs use the interval notation  $\{m,n\}$  addressed by this limit.

133663 {POSIX2\_SYMLINKS}

133664 The {POSIX2\_SYMLINKS} variable indicates that the underlying operating system supports  
 133665 the creation of symbolic links in specific directories. Many of the utilities defined in  
 133666 POSIX.1-2024 that deal with symbolic links do not depend on this value. For example, a  
 133667 utility that follows symbolic links (or does not, as the case may be) will only be affected by a  
 133668 symbolic link if it encounters one. Presumably, a file system that does not support symbolic  
 133669 links will not contain any. This variable does affect such utilities as *ln -s* and *pax* that  
 133670 attempt to create symbolic links.

133671 There are different limits associated with command lines and input to utilities, depending on the  
 133672 method of invocation. In the case of a C program *exec*-ing a utility, {ARG\_MAX} is the  
 133673 underlying limit. In the case of the shell reading a script and *exec*-ing a utility, {LINE\_MAX}  
 133674 limits the length of lines the shell is required to process, and {ARG\_MAX} will still be a limit. If a  
 133675 user is entering a command on a terminal to the shell, requesting that it invoke the utility,  
 133676 {MAX\_INPUT} may restrict the length of the line that can be given to the shell to a value below  
 133677 {LINE\_MAX}.

133678 When an option is supported, *getconf* returns a value of 1. For example, when C development is  
 133679 supported:

```
133680 if [ "$(getconf POSIX2_C_DEV)" -eq 1 ]; then
133681     echo C supported
133682 fi
```

133683 The *sysconf()* function in the C-Language Binding option would return 1.

133684 The following comments describe selection criteria for the symbols and their values:

```
133685 POSIX2_C_BIND
133686 POSIX2_C_DEV
133687 POSIX2_FORT_RUN
133688 POSIX2_SW_DEV
133689 POSIX2_UPE
```

133690 It is possible for some (usually privileged) operations to remove utilities that support these  
 133691 options or otherwise to render these options unsupported. The header files, the *sysconf()*  
 133692 function, or the *getconf* utility will not necessarily detect such actions, in which case they  
 133693 should not be considered as rendering the implementation non-conforming. A test suite  
 133694 should not attempt tests such as:

```
133695 rm /usr/bin/c17
133696 getconf POSIX2_C_DEV
```

133697 POSIX2\_LOCALEDEF

133698 This symbol was introduced to allow implementations to restrict supported locales to only  
 133699 those supplied by the implementation.

133700 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/2 is applied, deleting the entry for  
 133701 {POSIX2\_VERSION} since it is not a utility limit minimum value.

133702 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/3 is applied, changing the text in Utility  
 133703 Limits from: “utility (see *getconf*) through the *sysconf()* function defined in the System Interfaces  
 133704 volume of POSIX.1-2024. The literal names shown in Table 1-3 apply only to the *getconf* utility;  
 133705 the high-level language binding describes the exact form of each name to be used by the  
 133706 interfaces in that binding.” to: “utility (see *getconf*).”.

133707 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0001 [666] is applied.

133708 **C.1.4 Grammar Conventions**

133709 There is no additional rationale provided for this section.

133710 **C.1.5 Utility Description Defaults**133711 This section is arranged with headings in the same order as all the utility descriptions. It is a  
133712 collection of related and unrelated information concerning:

- 133713 1. The default actions of utilities
- 133714 2. The meanings of notations used in POSIX.1-2024 that are specific to individual utility  
133715 sections

133716 Although this material may seem out of place here, it is important that this information appear  
133717 before any of the utilities to be described later.133718 **NAME**

133719 There is no additional rationale provided for this section.

133720 **SYNOPSIS**

133721 There is no additional rationale provided for this section.

133722 **DESCRIPTION**

133723 Austin Group Defect 351 is applied, adding a requirement relating to declaration utilities.

133724 **OPTIONS**133725 Although it has not always been possible, the standard developers tried to avoid repeating  
133726 information to reduce the risk that duplicate explanations could each be modified differently.133727 The need to recognize `--` is required because conforming applications need to shield their  
133728 operands from any arbitrary options that the implementation may provide as an extension. For  
133729 example, if the standard utility *foo* is listed as taking no options, and the application needed to  
133730 give it a pathname with a leading `<hyphen-minus>`, it could safely do it as:133731 `foo -- -myfile`133732 and avoid any problems with `-m` used as an extension.

133733 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0002 [584] is applied.

133734 **OPERANDS**133735 The usage of `-` is never shown in the SYNOPSIS. Similarly, the usage of `--` is never shown.133736 The requirement for processing operands in command-line order is to avoid a “WeirdNIX”  
133737 utility that might choose to sort the input files alphabetically, by size, or by directory order.  
133738 Although this might be acceptable for some utilities, in general the programmer has a right to  
133739 know exactly what order will be chosen.133740 Some of the standard utilities take multiple *file* operands and act as if they were processing the  
133741 concatenation of those files. For example:133742 `asa file1 file2`

133743 and:

133744 `cat file1 file2 | asa`

133745 have similar results when questions of file access, errors, and performance are ignored. Other  
 133746 utilities such as *grep* or *wc* have completely different results in these two cases. This latter type of  
 133747 utility is always identified in its DESCRIPTION or OPERANDS sections, whereas the former is  
 133748 not. Although it might be possible to create a general assertion about the former case, the  
 133749 following points must be addressed:

- 133750 • Access times for the files might be different in the operand case *versus* the *cat* case.
- 133751 • The utility may have error messages that are cognizant of the input filename, and this  
 133752 added value should not be suppressed. (As an example, *awk* sets a variable with the  
 133753 filename at each file boundary.)

## 133754 **STDIN**

133755 There is no additional rationale provided for this section.

## 133756 **INPUT FILES**

133757 A conforming application cannot assume the following three commands are equivalent:

```
133758 tail -n +2 file
133759 (sed -n 1q; cat) < file
133760 cat file | (sed -n 1q; cat)
```

133761 The second command is equivalent to the first only when the file is seekable. In the third  
 133762 command, if the file offset in the open file description were not unspecified, *sed* would have to  
 133763 be implemented so that it read from the pipe 1 byte at a time or it would have to employ some  
 133764 method to seek backwards on the pipe. Such functionality is not defined currently in POSIX.1  
 133765 and does not exist on all historical systems. Other utilities, such as *head*, *read*, and *sh*, have similar  
 133766 properties, so the restriction is described globally in this section.

133767 The definition of “text file” is strictly enforced for input to the standard utilities; very few of  
 133768 them list exceptions to the undefined results called for here. (Of course, “undefined” here does  
 133769 not mean that historical implementations necessarily have to change to start indicating error  
 133770 conditions. Conforming applications cannot rely on implementations succeeding or failing when  
 133771 non-text files are used.)

133772 The utilities that allow line continuation are generally those that accept input languages, rather  
 133773 than pure data. It would be unusual for an input line of this type to exceed {LINE\_MAX} bytes  
 133774 and unreasonable to require that the implementation allow unlimited accumulation of multiple  
 133775 lines, each of which could reach {LINE\_MAX}. Thus, for a conforming application the total of all  
 133776 the continued lines in a set cannot exceed {LINE\_MAX}.

133777 The format description is intended to be sufficiently rigorous to allow other applications to  
 133778 generate these input files. However, since <blank> characters can legitimately be included in  
 133779 some of the fields described by the standard utilities, particularly in locales other than the POSIX  
 133780 locale, this intent is not always realized.

**133781 ENVIRONMENT VARIABLES**

133782 There is no additional rationale provided for this section.

**133783 ASYNCHRONOUS EVENTS**

133784 Because there is no language prohibiting it, a utility is permitted to catch a signal, perform some  
133785 additional processing (such as deleting temporary files), restore the default signal action, and  
133786 resignal itself.

133787 Austin Group Defects 1648 and 1772 are applied, clarifying the default behavior for signal  
133788 handling.

**133789 STDOUT**

133790 The format description is intended to be sufficiently rigorous to allow post-processing of output  
133791 by other programs, particularly by an *awk* or *lex* parser.

**133792 STDERR**

133793 This section does not describe error messages that refer to incorrect operation of the utility.  
133794 Consider a utility that processes program source code as its input. This section is used to  
133795 describe messages produced by a correctly operating utility that encounters an error in the  
133796 program source code on which it is processing. However, a message indicating that the utility  
133797 had insufficient memory in which to operate would not be described.

133798 Some utilities have traditionally produced warning messages without returning a non-zero exit  
133799 status; these are specifically noted in their sections. Other utilities shall not write to standard  
133800 error if they complete successfully, unless the implementation provides some sort of extension to  
133801 increase the verbosity or debugging level.

133802 The format descriptions are intended to be sufficiently rigorous to allow post-processing of  
133803 output by other programs.

**133804 OUTPUT FILES**

133805 The format description is intended to be sufficiently rigorous to allow post-processing of output  
133806 by other programs, particularly by an *awk* or *lex* parser.

133807 Receipt of the SIGQUIT signal should generally cause termination (unless in some debugging  
133808 mode) that would bypass any attempted recovery actions.

**133809 EXTENDED DESCRIPTION**

133810 There is no additional rationale provided for this section.

**133811 EXIT STATUS**

133812 Note the additional discussion of exit values in *Exit Status for Commands* in the *sh* utility. It  
133813 describes requirements for returning exit values greater than 125.

133814 A utility may list zero as a successful return, 1 as a failure for a specific reason, and greater than  
133815 1 as "an error occurred". In this case, unspecified conditions may cause a 2 or 3, or other value,  
133816 to be returned. A strictly conforming application should be written so that it tests for successful  
133817 exit status values (zero in this case), rather than relying upon the single specific error value listed  
133818 in POSIX.1-2024. In that way, it will have maximum portability, even on implementations with  
133819 extensions.

133820 The standard developers are aware that the general non-enumeration of errors makes it difficult

133821 to write test suites that test the *incorrect* operation of utilities. There are some historical  
133822 implementations that have expended effort to provide detailed status messages and a helpful  
133823 environment to bypass or explain errors, such as prompting, retrying, or ignoring unimportant  
133824 syntax errors; other implementations have not. Since there is no realistic way to mandate system  
133825 behavior in cases of undefined application actions or system problems—in a manner acceptable  
133826 to all cultures and environments—attention has been limited to the correct operation of utilities  
133827 by the conforming application. Furthermore, the conforming application does not need detailed  
133828 information concerning errors that it caused through incorrect usage or that it cannot correct.

133829 Austin Group Defect 1492 is applied, adding the **Default Behavior** paragraph.

### 133830 CONSEQUENCES OF ERRORS

133831 Several actions are possible when a utility encounters an error condition, depending on the  
133832 severity of the error and the state of the utility. Included in the possible actions of various  
133833 utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; and  
133834 validity checking of the file system or directory.

133835 The text about recursive traversing is meant to ensure that utilities such as *find* process as many  
133836 files in the hierarchy as they can. They should not abandon all of the hierarchy at the first error  
133837 and resume with the next command-line operand, but should attempt to keep going.

133838 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0001 [150] is applied.

133839 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0003 [913] is applied.

133840 Austin Group Defect 251 is applied, adding a note about the treatment of pathnames containing  
133841 any bytes that have the encoded value of a <newline> character.

133842 Austin Group Defect 1499 is applied, requiring utilities to exit with an exit status that indicates  
133843 an error occurred, instead of any non-zero exit status.

### 133844 APPLICATION USAGE

133845 This section provides additional caveats, issues, and recommendations to the developer.

### 133846 EXAMPLES

133847 This section provides sample usage.

### 133848 RATIONALE

133849 There is no additional rationale provided for this section.

### 133850 FUTURE DIRECTIONS

133851 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
133852 the future, and often cautions the developer to architect the code to account for a change in this  
133853 area. Note that a future directions statement should not be taken as a commitment to adopt a  
133854 feature or interface in the future.

133855 **SEE ALSO**  
 133856 There is no additional rationale provided for this section.

133857 **CHANGE HISTORY**  
 133858 There is no additional rationale provided for this section.

### 133859 **C.1.6 Considerations for Utilities in Support of Files of Arbitrary Size**

133860 This section is intended to clarify the requirements for utilities in support of large files.

133861 The utilities listed in this section are utilities which are used to perform administrative tasks  
 133862 such as to create, move, copy, remove, change the permissions, or measure the resources of a file.  
 133863 They are useful both as end-user tools and as utilities invoked by applications during software  
 133864 installation and operation.

133865 The *chgrp*, *chmod*, *chown*, *ln*, and *rm* utilities probably require use of large file-capable versions of  
 133866 *stat()*, *lstat()*, *nftw()*, and the **stat** structure.

133867 The *cat*, *cksum*, *cmp*, *cp*, *dd*, *mv*, and *touch* utilities probably require use of large file-capable  
 133868 versions of *creat()*, *open()*, and *fopen()*.

133869 The *cat*, *cksum*, *cmp*, *dd*, *df*, *du*, and *ls* utilities may require writing large integer values. For  
 133870 example:

- 133871 • The *cat* utility might have a **-n** option which counts <newline> characters.
- 133872 • The *cksum* and *ls* utilities report file sizes.
- 133873 • The *cmp* utility reports the line number at which the first difference occurs, and also has a  
 133874 **-l** option which reports file offsets.
- 133875 • The *dd*, *df*, *du*, and *ls* utilities report block counts.

133876 The *dd*, *find*, and *test* utilities may need to interpret command arguments that contain 64-bit  
 133877 values. For *dd*, the arguments include *skip=n*, *seek=n*, and *count=n*. For *find*, the arguments  
 133878 include **-sizen**. For *test*, the arguments are those associated with algebraic comparisons.

133879 The *df* utility might need to access large file systems with *statvfs()*.

133880 The *ulimit* utility will need to use large file-capable versions of *getrlimit()* and *setrlimit()* and be  
 133881 able to read and write large integer values.

133882 Austin Group Defect 1568 is applied, removing references to the *sum* utility.

### 133883 **C.1.7 Built-In Utilities**

133884 Other than the special built-in utilities, there is no requirement to build utilities into the shell  
 133885 itself. However, many shells implement certain utilities as regular built-ins for the following  
 133886 reasons:

- 133887 • To improve performance, especially for frequently used lightweight utilities (such as *test*,  
 133888 *true*, and *false*).
- 133889 • To eliminate the need for some sort of interprocess communication between the shell and  
 133890 those utilities that read or modify the shell's execution environment (such as *cd*).

133891 • To make it easier to satisfy the command search and execution requirements in XCU  
 133892 [Section 2.9.1.4](#) (on page 2502) for intrinsic utilities. Intrinsic utilities must be found prior to  
 133893 the *PATH* search. The shell could satisfy this requirement by keeping a list of the intrinsic  
 133894 utility pathnames and directly accessing the file-system versions regardless of *PATH*, but  
 133895 these utilities usually need to read or modify the shell's execution environment anyway.

133896 With the exception of the intrinsic utilities, all regular built-in utilities are subject to the *PATH*  
 133897 search and can be overridden by a specially crafted *PATH* environment variable.

133898 Earlier versions of this standard required that all of the regular built-in utilities, including  
 133899 intrinsic utilities, could be *exec*-ed. This was always a contentious requirement, and with the  
 133900 introduction of intrinsic utilities the standard developers decided to exempt the utilities that this  
 133901 standard requires to be intrinsic, with the exception of *kill*. The *kill* utility is still genuinely  
 133902 useful when *exec*-ed, only lacking support for the % job ID notation, whereas examples given of  
 133903 uses for the other utilities that are now exempted were considered contrived (such as using *cd* to  
 133904 test accessibility of a directory, which can be done using *test -x*). If an application needs *exec*-  
 133905 able versions of some of the exempted intrinsic utilities, it can easily provide them itself, on  
 133906 systems that support the (non-standard but ubiquitous) "#!" mechanism to make scripts  
 133907 executable by the *exec* family of functions, as links to a two-line shell script:

```
133908 #! /path/to/sh
133909 ${0##*/} "$@"
```

133910 Austin Group Defect 854 is applied, replacing the table of Regular Built-In Utilities with a  
 133911 reference to the new *Intrinsic Utilities* section.

133912 Austin Group Defect 1600 is applied, exempting the intrinsic utilities other than *kill* from the  
 133913 requirement that they can be *exec*-ed.

## 133914 C.1.8 Intrinsic Utilities

133915 There were varying reasons for including utilities in the table of intrinsic utilities:

133916 *alias, fc, unalias*

133917 The functionality of these utilities is performed more simply within the shell itself and that  
 133918 is the model most historical implementations have used.

133919 *bg, fg, jobs*

133920 All of the job control-related utilities are eligible for built-in status because that is the model  
 133921 most historical implementations have used.

133922 *cd, getopts, hash, read, type, ulimit, umask, wait*

133923 The functionality of these utilities is performed more simply within the context of the  
 133924 current process. An example can be taken from the usage of the *cd* utility. The purpose of  
 133925 the *cd* utility is to change the working directory for subsequent operations. The actions of *cd*  
 133926 affect the process in which *cd* is executed and all subsequent child processes of that process.  
 133927 Based on the POSIX standard process model, changes in the process environment of a child  
 133928 process have no effect on the parent process. If the *cd* utility were executed from a child  
 133929 process, the working directory change would be effective only in the child process. Child  
 133930 processes initiated subsequent to the child process that executed the *cd* utility would not  
 133931 have a changed working directory relative to the parent process.

133932 *command*

133933 This utility was placed in the table primarily to protect scripts that are concerned about  
 133934 their *PATH* being manipulated. The "secure" shell script example in the *command* utility in  
 133935 the Shell and Utilities volume of POSIX.1-2024 would not be possible if a *PATH* change  
 133936 retrieved an alien version of *command*. (An alternative would have been to implement

133937 *getconf* as a built-in, but the standard developers considered that it carried too many  
133938 changing configuration strings to require in the shell.)

133939 *kill* Since *kill* provides optional job control functionality using shell notation (%1, %2, and so on),  
133940 some implementations would find it extremely difficult to provide this outside the shell.

133941 The following utilities are frequently implemented as intrinsic (and built-in) utilities. Future  
133942 versions of this standard might not allow these utilities, or any other standard utility not in  
133943 Table 1-5 (on page 2470), to be intrinsic; implementations are encouraged to implement these as  
133944 non-intrinsic utilities instead (but still built-in if they were previously built-in).

133945 *l, echo, false, newgrp, printf, pwd, test, true*

133946 All utilities, including those in the table, are accessible via the *system()* and *popen()* functions in  
133947 the System Interfaces volume of POSIX.1-2024. There are situations where the return  
133948 functionality of *system()* and *popen()* is not desirable. Applications that require the exit status of  
133949 the invoked utility will not be able to use *system()* or *popen()*, since the exit status returned is  
133950 that of the command language interpreter rather than that of the invoked utility. The alternative  
133951 for such applications is the use of the *exec* family.

133952 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0004 [705] is applied.

133953 Austin Group Defect 854 is applied, adding intrinsic utilities.

## 133954 C.2 Shell Command Language

### 133955 C.2.1 Shell Introduction

133956 The System V shell was selected as the starting point for the Shell and Utilities volume of  
133957 POSIX.1-2024. The BSD C shell was excluded from consideration for the following reasons:

- 133958 • Most historically portable shell scripts assume the Version 7 Bourne shell, from which the  
133959 System V shell is derived.
- 133960 • The majority of tutorial materials on shell programming assume the System V shell.

133961 The construct "#!" is reserved for implementations wishing to provide that extension. If it were  
133962 not reserved, the Shell and Utilities volume of POSIX.1-2024 would disallow it by forcing it to be  
133963 a comment. As it stands, a strictly conforming application must not use "#!" as the first two  
133964 characters of the file.

133965 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

133966 Austin Group Defect 1514 is applied, correcting a misuse of the term "positional parameter".

### 133967 C.2.2 Quoting

133968 Although this section contains a note indicating that a future version of this standard may  
133969 extend the conditions under which some characters are special, there are no plans to do so. The  
133970 note is there to encourage application writers to future-proof their shell code. In some cases  
133971 existing widespread use of the characters unquoted would preclude them being given a special  
133972 meaning in those use cases. For example, commas are in widespread use in filenames (notably  
133973 by RCS and CVS) and it is common to pass the token "{}" as an argument to *find* and *xargs*  
133974 unquoted.

133975 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

133976 Austin Group Defects 1191 and 1193 are applied, adding:

133977 ] ^ - ! { , }

133978 to the list of characters that might need to be quoted under certain circumstances.

#### 133979 C.2.2.1 *Escape Character (Backslash)*

133980 Austin Group Defect 500 is applied, changing “follows” to “immediately follows”.

#### 133981 C.2.2.2 *Single-Quotes*

133982 A <backslash> cannot be used to escape a single-quote in a single-quoted string. An embedded  
 133983 quote can be created by writing, for example: "'a'\''b'", which yields "a'b". (See XCU  
 133984 [Section 2.6.5](#) (on page 2491) for a better understanding of how portions of words are either split  
 133985 into fields or remain concatenated.) A single token can be made up of concatenated partial  
 133986 strings containing all three kinds of quoting or escaping, thus permitting any combination of  
 133987 characters.

#### 133988 C.2.2.3 *Double-Quotes*

133989 The escaped <newline> used for line continuation is removed entirely from the input and is not  
 133990 replaced by any white space. Therefore, it cannot serve as a token separator.

133991 In double-quoting, if a <backslash> is immediately followed by a character that would be  
 133992 interpreted as having a special meaning, the <backslash> is deleted and the subsequent  
 133993 character is taken literally. If a <backslash> does not precede a character that would have a  
 133994 special meaning, it is left in place unmodified and the character immediately following it is also  
 133995 left unmodified. Thus, for example:

133996 "\\$" -> \$

133997 "\a" -> \a

133998 It would be desirable to include the statement “The characters from an enclosed "\${" to the  
 133999 matching '}' shall not be affected by the double-quotes”, similar to the one for "\$()".  
 134000 However, historical practice in the System V shell prevents this.

134001 Shell implementations differ widely in their handling of unescaped double-quote characters  
 134002 inside "\${...}" (except for the four substring-processing variants). Hence this standard leaves  
 134003 the behavior unspecified. Single-quotes are ordinary characters in this context, and so cannot be  
 134004 used to quote a '}' within "\${...}". However, <backslash> can be used to escape a '}'. For  
 134005 example, the value of *foo* assigned by the following commands is '}' :

134006 unset bar

134007 foo="\$\${bar-\\} "

134008 When <backslash> is used in this way it is a special character and is therefore removed during  
 134009 quote removal, even though it would not be removed in:

134010 foo="\} "

134011 Differences in processing the "\${...}" form led to inconsistencies between the historical  
 134012 System V shell, BSD, and KornShells, and the text in the Shell and Utilities volume of  
 134013 POSIX.1-2024 is an attempt to converge them without breaking too many applications. The only  
 134014 alternative to this compromise between shells would be to make the behavior unspecified not

134015 just for unescaped double-quote but also for unescaped single-quote, '{', or '}'. The chosen  
 134016 requirements provide the maximum consistency between normal double-quote behavior and  
 134017 parameter expansion within double-quotes; the only real difference being the ability to escape a  
 134018 '}' with <backslash>.

134019 Some implementations have allowed the end of the word to terminate the backquoted command  
 134020 substitution, such as in:

```
134021 "`echo hello"
```

134022 This usage is undefined; the matching backquote is required by the Shell and Utilities volume of  
 134023 POSIX.1-2024. The other undefined usage can be illustrated by the example:

```
134024 sh -c '` echo "foo`'
```

134025 The description of the recursive actions involving command substitution can be illustrated with  
 134026 an example. Upon recognizing the introduction of command substitution, the shell parses input  
 134027 (in a new context), gathering the source for the command substitution until an unbalanced ')' or  
 134028 or '' is located. For example, in the following:

```
134029 echo "$(date; echo "  

  134030     one" )"
```

134031 the double-quote following the *echo* does not terminate the first double-quote; it is part of the  
 134032 command substitution script. Similarly, in:

```
134033 echo "$(echo *)" "
```

134034 the <asterisk> is not quoted since it is inside command substitution; however:

```
134035 echo "$(echo "*" )"
```

134036 is quoted (and represents the <asterisk> character itself).

134037 The '\$'...' construct does not retain its special meaning inside double quotes. This was  
 134038 discussed by the standard developers and rejected. Note that '\$'...' is a quoting mechanism  
 134039 and not an expansion. Losing the special meaning inside double-quotes is consistent with other  
 134040 quoting mechanisms losing their special meaning when quoted.

134041 Austin Group Defect 221 is applied, clarifying the behavior of double-quotes within the string of  
 134042 characters from "\${" to the matching '}' in parameter expansions using that form.

134043 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134044 Austin Group Defect 500 is applied, clarifying the behavior of <backslash> within double-  
 134045 quotes.

134046 Austin Group Defect 1268 is applied, clarifying the effect of double-quotes on the results of  
 134047 parameter expansion, command substitution, or arithmetic expansion.

134048 Austin Group Defect 1342 is applied, clarifying the requirements for alias substitutions inside  
 134049 command substitutions.

#### 134050 C.2.2.4 Dollar-Single-Quotes

134051 The '\$'...' quoting construct has been implemented in several recent shells. It is similar to  
 134052 character string literals ("...") in the ISO C standard with the following exceptions:

- 134053 • The \x escape sequence in C can be followed by an arbitrary number of hexadecimal  
 134054 digits. The *ksh93* implementation of '\$'...' also consumes an arbitrary number of  
 134055 hexadecimal digits; *bash* consumes at most two hexadecimal digits in this case. This  
 134056 standard leaves the result unspecified if more than two hexadecimal digits follow \x.

134057 (Note that a hexadecimal escape followed by a literal hexadecimal character can always be  
134058 represented as `$'\xXX'X`.)

134059 • The `\c` escape sequence is not included in the ISO C standard. There was also some  
134060 disagreement in shells that historically supported `\c` escape sequences in `$'...'`. These  
134061 include:

134062 — Whether `\cA` through `\cZ` produced the byte values 1 through 26, respectively or  
134063 supported the codeset independent control character as specified by the *stty* utility.  
134064 This standard requires codeset independence.

134065 — Whether `\c[`, `\c\`, `\c]`, `\c^`, `\c_`, and `\c?` could be used to yield the <ESC>,  
134066 <FS>, <GS>, <RS>, <US>, and <DEL> control characters, respectively. This standard  
134067 requires support for all of the control characters except NULL (matching what is  
134068 done in the *stty* utility).

134069 — Whether `\c\` or `\c\` was used to represent <FS>. This standard requires `\c\` to  
134070 make <backslash>-escape processing consistent.

134071 The implementors of the most common shells that implement `$'\cX'` agreed to convert to  
134072 the behavior specified in this standard.

134073 Some shells also allow `\c<arbitrary_control_character>` to act as an inverse function to  
134074 `\cX` (that is, `\cm` and `\cM` yield <CR> and `\c<CR>` yields `m` or `M`). This standard leaves this  
134075 behavior implementation-defined.

134076 • The `\e` escape sequence is not included in the ISO C standard, but was provided by all  
134077 historical shells that supported `$'...'`. Some also supported `\E` as a synonym. One  
134078 member of the group objected to adding `\e` because the <ESC> control character is not  
134079 required to be in the portable character set. The `\e` sequence is included because many  
134080 historical users of `$'...'` expect it to be there. The `\E` sequence is not included in this  
134081 standard because <backslash>-escape sequences that start with <backslash> followed by  
134082 an uppercase letter (except `\U`) are reserved by the ISO C standard for implementation use.

134083 • The `\ddd` octal escape sequence and the `\xXX` hexadecimal escape sequence can be used to  
134084 insert a null byte into a C character string literal and into a `$'...'` quoted word in this  
134085 standard. In C, any characters specified after that null byte (including escape sequences)  
134086 continue to be processed and added to the character string literal. In `$'...'` in the shell  
134087 this standard allows the equivalent behavior but also allows the null byte and all  
134088 remaining characters up to the terminating unescaped single-quote to be evaluated and  
134089 discarded. The latter (which was historic practice in *bash*, but not in *ksh93*) allows an  
134090 escape sequence producing a null byte to terminate the dollar-single-quoted expansion,  
134091 but not terminate the token in which it appears if there are characters remaining in the  
134092 token. For example:

```
134093 printf a$b\0c\'d
```

134094 is required by this standard to produce:

```
134095 abd
```

134096 while historic versions of *ksh93* produced:

```
134097 ab
```

134098 • The ISO C standard specifies `\uXXXX` and `\UXXXXXXXX` escape sequences. These need not  
134099 be supported by `$'...'` in the shell. They were omitted because current shell  
134100 implementations that support them differ in behavior. In particular, some shells always  
134101 convert them to the UTF-8 encoding for the named character, even if the current locale's  
134102 character set does not have UTF-8 encoding.

- 134103 • The double-quote character can be used literally, while the single-quote character must be  
134104 represented as an escape sequence. In C, single-quote can be used literally, while double-  
134105 quote requires an escape sequence.
- 134106 • A <backslash> immediately followed by a <newline> has unspecified behavior. In C, this  
134107 sequence is used for line continuations, where both the <backslash> and <newline> are  
134108 deleted and a diagnostic is required if a closing quote is not encountered before a  
134109 <newline> that is not preceded by <backslash>. In current shell implementations, three  
134110 different behaviors have been observed.
- 134111 • The use of <backslash>-escape sequences not described in this standard results in  
134112 unspecified behavior. In C, the result is not a token and a diagnostic is required. This  
134113 allows shells to recognize other <backslash>-escape sequences in other ways as extensions  
134114 to this standard. Furthermore, existing implementations already had different behaviors  
134115 for some <backslash>-escape sequences when \$'...' processing was added to this  
134116 standard.

134117 This standard makes the results implementation-defined if `\e` or `\cX` specifies a character that is  
134118 not present in the current locale. Application authors should note that implementations are  
134119 permitted to have a wide range of behaviors when encountering an unsupported character. For  
134120 example:

- 134121 • The shell might produce an error, possibly causing the shell to terminate.
- 134122 • The unsupported character might be silently discarded.
- 134123 • The unsupported character might be replaced with another character of a different  
134124 character class.
- 134125 • The unsupported character might be replaced with a shell-special character (e.g., ' ? ').
- 134126 • The unsupported character might be replaced with multiple characters, shell-special or  
134127 regular (e.g. if <ESC> is not supported, \$'\e' may be replaced by "???", "XXX", or  
134128 "<ESC>").

134129 However, implementations must document their behavior, and they are prohibited from  
134130 replacing an unsupported character with bytes that do not form valid characters in the current  
134131 locale's character set (e.g., encoding in UTF-8 when the locale has a 7-bit character set). This  
134132 standard does not specify a way for script authors to determine beforehand whether a particular  
134133 `\cX` sequence specifies a character that exists in the current locale. At the time this feature was  
134134 standardized, no known implementations provided such a capability.

134135 Note that the escape sequences recognized by \$'...', file format notation (see [Table 5-1](#), on  
134136 page 113), XSI-conforming implementations of the *echo* utility (see the utility's OPERANDS  
134137 section in *echo*), and the *printf* utility's *format* operand (see the utility's EXTENDED  
134138 DESCRIPTION in *printf*) are not the same. Some escape sequences are not recognized by all of  
134139 the above, the `\c` escape sequence in *echo* is not at all like the `\c` escape sequence in \$'...',  
134140 octal escape sequences in some of the above accept one to four octal digits and require a leading  
134141 zero while others accept one to three octal digits and do not require a leading zero.

134142 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134143 **C.2.3 Token Recognition**

134144 The "(" and ")" symbols are control operators in the KornShell, used for an alternative  
 134145 syntax of an arithmetic expression command. A conforming application cannot use "(" as a  
 134146 single token (with the exception of the "\$ (" form for shell arithmetic).

134147 On some implementations, the symbol "(" is a control operator; its use produces unspecified  
 134148 results. Applications that wish to have nested subshells, such as:

```
134149 ((echo Hello); echo World))
```

134150 must separate the "(" characters into two tokens by including white space between them.  
 134151 Some systems may treat these as invalid arithmetic expressions instead of subshells.

134152 Certain combinations of characters are invalid in portable scripts, as shown in the grammar.  
 134153 Implementations may use these combinations (such as "|&") as valid control operators. Portable  
 134154 scripts cannot rely on receiving errors in all cases where this volume of POSIX.1-2024 indicates  
 134155 that a syntax is invalid.

134156 The (3) rule about combining characters to form operators is not meant to preclude systems from  
 134157 extending the shell language when characters are combined in otherwise invalid ways.  
 134158 Conforming applications cannot use invalid combinations, and test suites should not penalize  
 134159 systems that take advantage of this fact. For example, the unquoted combination "|&" is not  
 134160 valid in a POSIX script, but has a specific KornShell meaning.

134161 The (10) rule about '#' as the current character is the first in the sequence in which a new token  
 134162 is being assembled. The '#' starts a comment only when it is at the beginning of a token. This  
 134163 rule is also written to indicate that the search for the end-of-comment does not consider escaped  
 134164 <newline> specially, so that a comment cannot be continued to the next line.

134165 Because a *complete\_command* encountered during a *program* is executed before the next  
 134166 *complete\_command* is tokenized and parsed, syntax errors are not discovered by the shell until  
 134167 just before the code would be executed. While in some cases it might be desirable to detect and  
 134168 react to syntax errors before anything is executed (possible with *sh -n*), deferring the discovery  
 134169 of syntax errors has several benefits:

- 134170 • It makes it possible for script authors to test for the availability of a nonstandard extension  
 134171 and react appropriately before the use of the extension would trigger a syntax error.
- 134172 • It makes it possible to create self-extracting tarballs (a shell script concatenated with a  
 134173 payload archive that extracts the archive when executed).
- 134174 • The shell does not have to read and parse the complete script before execution, which  
 134175 reduces memory usage when executing extremely long scripts.

134176 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0005 [718], XCU/TC2-2008/0006  
 134177 [647], XCU/TC2-2008/0007 [568], and XCU/TC2-2008/0008 [648] are applied.

134178 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134179 Austin Group Defect 1036 is applied, clarifying how here-documents are parsed.

134180 Austin Group Defect 1055 is applied, clarifying how much of a *program* is parsed before the  
 134181 parsed commands are executed.

134182 Austin Group Defect 1083 is applied, changing "the next character" to "each character in turn".

134183 Austin Group Defect 1085 is applied, clarifying requirements for the start and end of tokens.

134184 C.2.3.1 *Alias Substitution*

134185 The alias capability was added because it is widely used in historical implementations by  
134186 interactive users.

134187 The definition of `alias name` precludes an alias name containing a `<slash>` character. Since the  
134188 text applies to the command words of simple commands, reserved words (in their proper  
134189 places) cannot be confused with aliases.

134190 The placement of alias substitution in token recognition makes it clear that it precedes all of the  
134191 word expansion steps.

134192 An example concerning trailing `<blank>` characters and reserved words follows. If the user  
134193 types:

```
134194 $ alias foo="/bin/ls "  
134195 $ alias while="/"
```

134196 The effect of executing:

```
134197 $ while true  
134198 > do  
134199 > echo "Hello, World"  
134200 > done
```

134201 is a never-ending sequence of `"Hello, World"` strings to the screen. However, if the user  
134202 types:

```
134203 $ foo while
```

134204 the result is an `ls` listing of `/`. Since the alias substitution for `foo` ends in a `<space>`, the next word  
134205 is checked for alias substitution. The next word, `while`, has also been aliased, so it is substituted  
134206 as well. Since it is not in the proper position as a command word, it is not recognized as a  
134207 reserved word.

134208 If the user types:

```
134209 $ foo; while
```

134210 `while` retains its normal reserved-word properties.

134211 Some implementations add a `<space>` after the alias value when performing alias substitution in  
134212 order to prevent the last character of the alias value and the first character after the alias name in  
134213 the input from combining to form an operator. However, the extra `<space>` can have side-effects  
134214 in other situations, such as if the alias value ends with an unquoted `<backslash>`.  
134215 Implementations which do this are encouraged to change to an alternative method of delimiting  
134216 a partial operator token at the end of an alias value.

134217 Some, but not all, shell implementations do not process changes to alias definitions until the  
134218 current *compound\_list* (see XCU Section 2.10, on page 2512) has completed. In these shells, alias  
134219 changes do not take effect until the end of the dot script, *eval* command, function invocation, **if**  
134220 statement, **case** statement, **for** statement, **while** statement, or **until** statement containing the alias  
134221 change.

134222 Many shell implementations execute the contents of a file, typically `~/.profile`, when invoked as  
134223 a login shell. The standard developers are unaware of any such implementations that process  
134224 the contents of `~/.profile` (and similar startup files) as a single *compound\_list*, so alias changes in  
134225 `~/.profile` typically do take effect before the end of `~/.profile`.

134226 Austin Group Defects 953 and 1630 are applied, providing additional detail on how alias  
134227 substitution is performed.

134228 **C.2.4 Reserved Words**

134229 All reserved words are recognized syntactically as such in the contexts described. However, note  
 134230 that **in** is the only meaningful reserved word after a **case** or **for**; similarly, **in** is not meaningful as  
 134231 the first word of a simple command.

134232 Reserved words are recognized only when they are delimited (that is, meet the definition of XBD  
 134233 Section 3.420, on page 93), whereas operators are themselves delimiters. For instance, ' ( ' and  
 134234 ' ) ' are control operators, so that no <space> is needed in (*list*). However, '{ ' and ' } ' are  
 134235 reserved words in { *list*; }, so that in this case the leading <space> and <semicolon> are required.

134236 The list of unspecified reserved words is from the KornShell, so conforming applications cannot  
 134237 use them in places a reserved word would be recognized. Earlier versions of this standard  
 134238 omitted **time** from this list, so that the *time* utility could be included without requiring  
 134239 applications to quote all or part of its name (or use other measures) in order to avoid it being  
 134240 treated as a reserved word. However, although the intent was to allow the reserved word  
 134241 implementation (as evidenced by use of *time* in pipelines being unspecified, and explicit  
 134242 mention in the rationale of the *time* utility), the conditions under which the behavior was  
 134243 unspecified were insufficient to allow this. In particular, redirection in KornShell does not work  
 134244 in the normal way when **time** is a reserved word:

```
134245 time utility 2> time.out
```

134246 only writes the standard error from *utility* to **time.out**; the timing information is written to the  
 134247 shell's standard error, but these versions of the standard required the timing information to be  
 134248 written to **time.out**. Another issue was that if **time** is a reserved word, an application cannot  
 134249 define a function with that name, but these versions of the standard required that applications  
 134250 could do so. Hence **time** has now been added to the list of unspecified reserved words, but with  
 134251 its use as a reserved word limited in order to be compatible with its use as a utility in the cases  
 134252 where the two have traditionally had the same effect (other than possible output format  
 134253 differences).

134254 There was a strong argument for promoting braces to operators (instead of reserved words), so  
 134255 they would be syntactically equivalent to subshell operators. Concerns about compatibility  
 134256 outweighed the advantages of this approach. Nevertheless, conforming applications should  
 134257 consider quoting '{ ' and ' } ' when they represent themselves.

134258 When used in circumstances where reserved words are recognized, all words whose final  
 134259 character is a <colon> ( ' : ' ) are reserved. The case of a name suffixed with a colon is reserved to  
 134260 allow implementations to support named labels for flow control; see the RATIONALE for the  
 134261 *break* special built-in utility. Other words ending in <colon> are reserved to provide  
 134262 implementations with a way to add new reserved words while still conforming to this standard.

134263 It is possible that a future version of the Shell and Utilities volume of POSIX.1-2024 may require  
 134264 that '{ ' and ' } ' be treated individually as control operators, although the token "{ } " will  
 134265 probably be a special-case exemption from this because of the often-used *find*{ } construct.

134266 Austin Group Defect 267 is applied, adding **time** to the list of words that may be recognized as  
 134267 reserved words while specifying its behavior if it is recognized as a reserved word, and  
 134268 extending the reservation of words whose final character is <colon> from those that are a name  
 134269 followed by a <colon> to all such words.

134270 Austin Group Defect 465 is applied, adding **namespace** to the list of words that may be  
 134271 recognized as reserved words.

134272 **C.2.5 Parameters and Variables**

134273 Austin Group Defect 1561 is applied, clarifying that parameters can contain byte sequences that  
 134274 do not form valid characters and that the shell processes their values as characters only when  
 134275 performing operations that are described in this standard in terms of characters.

134276 C.2.5.1 *Positional Parameters*

134277 Austin Group Defect 1491 is applied, clarifying the handling of leading zeros in positional  
 134278 parameter identifiers.

134279 C.2.5.2 *Special Parameters*

134280 Most historical implementations implement subshells by forking; thus, the special parameter  
 134281 '\$' does not necessarily represent the process ID of the shell process executing the commands  
 134282 since the subshell execution environment preserves the value of '\$'.

134283 If a subshell were to execute a background command, the value of "\$!" for the parent would  
 134284 not change. For example:

```
134285 (
134286 date &
134287 echo $!
134288 )
134289 echo $!
```

134290 would echo two different values for "\$!".

134291 The "\$-" special parameter can be used to save and restore *set* options:

```
134292 Save=$(echo $- | sed 's/[ics]//g')
134293 ...
134294 set +aCefnuvx
134295 if [ -n "$Save" ]; then
134296     set -$Save
134297 fi
```

134298 The three options are removed using *sed* in the example because they may appear in the value of  
 134299 "\$-" (from the *sh* command line), but are not valid options to *set*.

134300 The descriptions of parameters '\*' and '@' assume the reader is familiar with the field  
 134301 splitting discussion in XCU [Section 2.6.5](#) (on page 2491) and understands that portions of the  
 134302 word remain concatenated unless there is some reason to split them into separate fields.

134303 The following examples illustrate some of the ways in which '\*' and '@' can be expanded:

```
134304 set "abc" "def ghi" "jkl"
134305 unset novar
134306 IFS=' ' # a space
134307 printf '%s\n' $*
134308 abc
134309 def
134310 ghi
134311 jkl
134312 printf '%s\n' "$*"
134313 abc def ghi jkl

134508 printf "%s\n" "${var##$@"}
134509 printf "%s\n" ${var##%"$@"}

```

134510 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0009 [888] is applied.

134511 Austin Group Defect 1039 is applied, clarifying the description of the '-' special parameter.

134512 Austin Group Defect 1052 is applied, clarifying that decimal valued special parameters expand  
 134513 to the shortest representation.

134514 Austin Group Defects 1150 and 1309 are applied, clarifying the description of the '?' special  
 134515 parameter.

134516 Austin Group Defect 1254 is applied, clarifying how the '?' and '!' special parameters are  
 134517 affected by job control.

## 134518 C.2.5.3 Shell Variables

134519 Since shell variables are parameters denoted by a name, the shell cannot initialize shell variables  
 134520 from environment variables that do not have a valid name. However, the shell may initialize  
 134521 parameters that do not have valid names from such environment variables.

134522 See the discussion of *IFS* in Section C.2.6.5 (on page 3889) and the RATIONALE for the *sh* utility.

134523 The prohibition on *LC\_CTYPE* changes affecting lexical processing protects the shell  
 134524 implementor (and the shell programmer) from the ill effects of changing the definition of  
 134525 <blank> or the set of alphabetic characters in the current environment. It would probably not be  
 134526 feasible to write a compiled version of a shell script without this rule. The rule applies only to  
 134527 the current invocation of the shell and its subshells—invoking a shell script or performing *exec*  
 134528 *sh* would subject the new shell to the changes in *LC\_CTYPE*.

134529 Other common environment variables used by historical shells are not specified by the Shell and  
 134530 Utilities volume of POSIX.1-2024, but they should be reserved for the historical uses.

134531 Tilde expansion for components of *PATH* in an assignment such as:

```
134532 PATH=~hlj/bin:~dwc/bin:$PATH
```

134533 is a feature of some historical shells and is allowed by the wording of XCU Section 2.6.1 (on page  
 134534 2485). Note that the <tilde> characters are expanded during the assignment to *PATH*, not when  
 134535 *PATH* is accessed during command search.

134536 The following entries represent additional information about variables included in the Shell and  
 134537 Utilities volume of POSIX.1-2024, or rationale for common variables in use by shells that have  
 134538 been excluded:

134539 — (Underscore.) While <underscore> is historical practice, its overloaded usage  
 134540 in the KornShell is confusing, and it has been omitted from the Shell and  
 134541 Utilities volume of POSIX.1-2024.

134542 *ENV* This variable can be used to set aliases and other items local to the invocation  
 134543 of a shell. The file referred to by *ENV* differs from **\$HOME/.profile** in that  
 134544 **.profile** is typically executed at session start-up, whereas the *ENV* file is  
 134545 executed at the beginning of each shell invocation. The *ENV* value is  
 134546 interpreted in a manner similar to a dot script, in that the commands are  
 134547 executed in the current environment and the file needs to be readable, but not  
 134548 executable. However, unlike dot scripts, no *PATH* searching is performed. This  
 134549 is used as a guard against Trojan Horse security breaches.

134550 *ERRNO* This variable was omitted from the Shell and Utilities volume of POSIX.1-2024  
 134551 because the values of error numbers are not defined in POSIX.1-2024 in a  
 134552 portable manner.

134553 *FCEDIT* Since this variable affects only the *fc* utility, it has been omitted from this more  
 134554 global place. The value of *FCEDIT* does not affect the command-line editing  
 134555 mode in the shell; see the description of *set -o vi* in the *set* built-in utility.

134556 *PS1* This variable is used for interactive prompts. Historically, the “superuser”  
 134557 has had a prompt of '#'. Since privileges are not required to be monolithic, it  
 134558 is difficult to define which privileges should cause the alternate prompt.  
 134559 However, a sufficiently powerful user should be reminded of that power by  
 134560 having an alternate prompt.

134561 *PS3* This variable is used by the KornShell for the *select* command. Since the POSIX  
 134562 shell does not include *select*, *PS3* was omitted.

134563 *PS4* This variable is used for shell debugging. For example, the following script:

```
134564 PS4=' [ ${LINENO} ] + '
134565 set -x
134566 echo Hello
```

134567 writes the following to standard error:

```
134568 [3]+ echo Hello
```

134569 *RANDOM* This pseudo-random number generator was not seen as being useful to  
134570 interactive users.

134571 *SECONDS* Although this variable is sometimes used with *PS1* to allow the display of the  
134572 current time in the prompt of the user, it is not one that would be manipulated  
134573 frequently enough by an interactive user to include in the Shell and Utilities  
134574 volume of POSIX.1-2024.

134575 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0002 [152] is applied.

134576 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0010 [888], XCU/TC2-2008/0011  
134577 [884], and XCU/TC2-2008/0012 [494] are applied.

134578 Austin Group Defect 953 is applied, clarifying how the *ENV* file is parsed.

134579 Austin Group Defect 1006 is applied, clarifying how the values of the *PS1*, *PS2*, and *PS4*  
134580 variables are expanded.

134581 Austin Group Defect 1441 is applied, requiring *PS4* to be used in non-interactive shells.

134582 Austin Group Defect 1511 is applied, making the description of *LINENO* consistent with other  
134583 variables as regards how they relate to the User Portability Utilities option.

134584 Austin Group Defect 1561 is applied, clarifying that shell variables are initialized only from  
134585 environment variables that have valid names.

## 134586 C.2.6 Word Expansions

134587 Some shells implement *brace expansion* which expands, for example, *file{A,B,C}.c* into the  
134588 fields *fileA.c*, *fileB.c*, and *fileC.c* or *file{1..3}.c* into the fields *file1.c*, *file2.c*,  
134589 and *file3.c*. This form of expansion is allowed but not required by this standard, but if  
134590 supported must be performed before all of the standard word expansions. A variant which some  
134591 shells implement whereby brace expansion is performed following field splitting was  
134592 considered by the standard developers and rejected because it causes surprising behavior if the  
134593 results of parameter expansion and command substitution happen to produce a valid brace  
134594 expansion. For example, if the shell variable *path* contains an arbitrary pathname, glob pattern  
134595 applications cannot rely on *some\_command -- \$path* passing a list of pathnames that match  
134596 the pattern to *some\_command*. Note that quoting the braces or commas prevents this form of  
134597 expansion, but quoting the periods need not prevent it.

134598 Step (2) refers to the “portions of fields generated by step (1)”. For example, if the word being  
134599 expanded were “*\$x+\$y*” and *IFS=+*, the word would be split only if “*\$x*” or “*\$y*” contained  
134600 ‘+’; the ‘+’ in the original word was not generated by step (1).

134601 *IFS* is used for performing field splitting on the results of parameter and command substitution;  
134602 it is not used for splitting all fields. Earlier versions of the shell used it for splitting all fields  
134603 during field splitting, but this has severe problems because the shell can no longer parse its own  
134604 script. There are also important security implications caused by this behavior. All useful  
134605 applications of *IFS* use it for parsing input of the *read* utility and for splitting the results of

134606 parameter and command substitution.

134607 The rule concerning expansion to a single field requires that if **foo=abc** and **bar=def**, that:

134608 `"$foo"$bar"`

134609 expands to the single field:

134610 `abcdef`

134611 The rule concerning empty fields can be illustrated by:

134612 `$ unset foo`

134613 `$ set $foo bar ' ' xyz "$foo" abc`

134614 `$ for i`

134615 `> do`

134616 `> echo "-$i-"`

134617 `> done`

134618 **-bar-**

134619 **--**

134620 **-xyz-**

134621 **--**

134622 **-abc-**

134623 Step (1) indicates that parameter expansion, command substitution, and arithmetic expansion

134624 are all processed simultaneously as they are scanned. For example, the following is valid

134625 arithmetic:

134626 `x=1`

134627 `echo $(( $(echo 3)+$x ))`

134628 An early proposal stated that tilde expansion preceded the other steps, but this is not the case in

134629 known historical implementations; if it were, and if a referenced home directory contained a '\$'

134630 character, expansions would result within the directory name.

134631 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0003 [49,430] is applied.

134632 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134633 Austin Group Defect 985 is applied, clarifying that quote removal is not always performed.

134634 Austin Group Defect 1038 is applied, clarifying that a '\$' that is followed by a <space>, <tab>,

134635 or a <newline>, or is not followed by any character, is treated as a literal character.

134636 Austin Group Defect 1123 is applied, clarifying the environment in which expansions are

134637 performed and requirements relating to empty fields.

134638 Austin Group Defect 1193 is applied, adding optional brace expansion.

134639 **C.2.6.1 Tilde Expansion**

134640 Tilde expansion generally occurs only at the beginning of words, but an exception based on

134641 historical practice has been included:

134642 `PATH=/posix/bin:~djk/bin`

134643 This is eligible for tilde expansion because <tilde> follows a <colon> and none of the relevant

134644 characters is quoted. Consideration was given to prohibiting this behavior because any of the

134645 following are reasonable substitutes:

134646 `PATH=$(printf %s ~karels/bin : ~bostic/bin)`

```

134647     for Dir in ~maat/bin ~srb/bin ...
134648     do
134649         PATH=${PATH:+$PATH:}$Dir
134650     done

```

134651 In the first command, explicit <colon> characters are used for each directory. In all cases, the  
 134652 shell performs tilde expansion on each directory because all are separate words to the shell.

134653 Note that expressions in operands such as:

```

134654     make -k mumble LIBDIR=~chet/lib

```

134655 do not qualify as shell variable assignments, and tilde expansion is not performed (unless the  
 134656 command does so itself, which *make* does not).

134657 Because of the requirement that the word is not quoted, the following are not equivalent; only  
 134658 the last causes tilde expansion:

```

134659     \~hlj/   ~h\lj/   ~"hlj"/   ~hlj\   ~hlj/

```

134660 In an early proposal, tilde expansion occurred following any unquoted <equals-sign> or  
 134661 <colon>, but this was removed because of its complexity and to avoid breaking commands such  
 134662 as:

```

134663     rcp hostname:~marc/.profile .

```

134664 System administrators on systems where // has an implementation-defined meaning which is  
 134665 different to /, should not create users with a home directory of / or //, since this may lead to  
 134666 unexpected filename resolution on those systems.

134667 A suggestion was made that the special sequence "\$~" should be allowed to force tilde  
 134668 expansion anywhere. Since this is not historical practice, it has been left for future  
 134669 implementations to evaluate. (The description in XCU [Section 2.2](#) (on page 2472) requires that a  
 134670 <dollar-sign> be quoted to represent itself, so the "\$~" combination is already unspecified.)

134671 The results of giving <tilde> with an unknown login name are undefined because the KornShell  
 134672 "~+" and "~-" constructs make use of this condition, but in general it is an error to give an  
 134673 incorrect login name with <tilde>. The results of having *HOME* unset are unspecified because  
 134674 some historical shells treat this as an error.

134675 Historically, the Korn shell performed field splitting and pathname expansion on the results of  
 134676 tilde expansion, and earlier versions of this standard reflected this. However, tilde expansion  
 134677 results in a pathname, and performing field splitting and pathname expansion on something  
 134678 that is already a pathname is at best redundant and at worst will change the value from the  
 134679 correct pathname to one or more incorrect ones. Later versions of the Korn shell do not perform  
 134680 these expansions and POSIX.1-2024 has been updated to match. Note that although pathname  
 134681 expansion is not performed on the results of tilde expansion, this does not prevent other parts of  
 134682 the same word from being expanded. For example, ~/a\* expands to all files in *\$HOME*  
 134683 beginning with 'a'.

134684 Austin Group Defect 1172 is applied, clarifying how quoting affects tilde expansion.

134685 Austin Group Defect 1632 is applied, clarifying the treatment of <slash> characters in tilde  
 134686 expansion.

134687 C.2.6.2 *Parameter Expansion*

134688 The rule for finding the closing '}' in "\${...}" is the one used in the KornShell and is  
 134689 upwardly-compatible with the Bourne shell, which does not determine the closing '}' until the  
 134690 word is expanded. The advantage of this is that incomplete expansions, such as:

```
134691 ${foo
```

134692 can be determined during tokenization, rather than during expansion.

134693 Quote removal is performed when assigning the value in the `parameter:=word` form of  
 134694 expansion in order that a subsequent expansion of the same parameter produces the same value  
 134695 as the original expansion. That is, the commands:

```
134696 unset parameter
134697 foo=${parameter:=word}
134698 bar=${parameter}
```

134699 assign the same value to `foo` and `bar`. A consequence of this is that the expansions  
 134700 `parameter:=word` and `parameter:-word` can produce different results for the same `word`.  
 134701 For example, with `parameter` unset or empty:

```
134702 ${parameter:-a\ b}
```

134703 expands to a single field "a b", whereas:

```
134704 ${parameter:=a\ b}
```

134705 expands to two fields 'a' and 'b' (because `parameter` is assigned the value "a b" before its  
 134706 value is substituted).

134707 For rationale regarding expansion of "\${...}" within double-quotes, see [Section C.2.2.3](#) (on  
 134708 page 3867).

134709 The string length and substring capabilities were included because of the demonstrated need for  
 134710 them, based on their usage in other shells, such as C shell and KornShell.

134711 Historical versions of the KornShell have not performed tilde expansion on the word part of  
 134712 parameter expansion; however, it is more consistent to do so.

134713 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0004 [458], XCU/TC1-2008/0005  
 134714 [458], XCU/TC1-2008/0006 [457], XCU/TC1-2008/0007 [457], XCU/TC1-2008/0008 [417],  
 134715 XCU/TC1-2008/0009 [457], XCU/TC1-2008/0010 [457], XCU/TC1-2008/0011 [457],  
 134716 XCU/TC1-2008/0012 [457], XCU/TC1-2008/0013 [457], XCU/TC1-2008/0014 [457],  
 134717 XCU/TC1-2008/0015 [457], XCU/TC1-2008/0016 [457], XCU/TC1-2008/0017 [457], and  
 134718 XCU/TC1-2008/0018 [458] are applied.

134719 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0013 [888] and XCU/TC2-2008/0014  
 134720 [867] are applied.

134721 Austin Group Defect 221 is applied, removing a statement about counting brace levels and  
 134722 clarifying that quote removal is performed when expanding `word` in `parameter:=word`.

134723 Austin Group Defect 985 is applied, clarifying when quote removal is performed.

134724 Austin Group Defect 1052 is applied, clarifying the description of string length expansion.

134725 Austin Group Defect 1268 is applied, removing text relating to parameter expansion inside  
 134726 double-quotes.

134727 Austin Group Defect 1478 is applied, making explicitly unspecified the results of parameter  
 134728 expansions that test whether the parameter '\*' or '@' is unset or null.

134729 Austin Group Defect 1491 is applied, restructuring a paragraph that used "Otherwise" after two

134730 conditions.

134731 Austin Group Defect 1561 is applied, clarifying that the varieties of parameter expansion that  
134732 provide for substring processing process parameter values as characters.

134733 C.2.6.3 *Command Substitution*

134734 The "\$ ()" form of command substitution solves a problem of inconsistent behavior when using  
134735 backquotes. For example:

134736

134737

134738

134739

Command	Output
echo '\\$x'	\\$x
echo `echo '\\$x'`	\$x
echo \$(echo '\\$x')	\\$x

134740 Additionally, the backquoted syntax has historical restrictions on the contents of the embedded  
134741 command. While the newer "\$ ()" form can process any kind of valid embedded script (with a  
134742 few caveats; see below), the backquoted form cannot handle some valid scripts that include  
134743 backquotes. For example, these otherwise valid embedded scripts do not work in the left  
134744 column, but do work on the right:

134745

134746

134747

134748

134749

134750

134751

134752

134753

134754

134755

```

echo `
cat <<\eof
a here-doc with `
eof
`
echo `
echo abc # a comment with `
`
echo `
echo ` `
`
echo $(
cat <<\eof
a here-doc with )
eof
)
echo $(
echo abc # a comment with )
)
echo $(
echo ` `
)

```

134756 Because of these inconsistent behaviors, the backquoted variety of command substitution is not  
134757 recommended for new applications that nest command substitutions or attempt to embed  
134758 complex scripts.

134759 The KornShell feature:

134760

134761

134762

If the *commands* string is of the form `<word>`, *word* is expanded to generate a pathname, and the value of the command substitution is the contents of this file with any trailing `<newline>` characters deleted.

134763

134764

134765

was omitted from the Shell and Utilities volume of POSIX.1-2024 because `$(cat word)` is an appropriate substitute. However, to prevent breaking numerous scripts relying on this feature, it is unspecified to have a script within "\$ ()" that has only redirections.

134766

134767

134768

In IEEE Std 1003.2-1992 the `$(commands)` form of command substitution only had unspecified behavior for a *commands* string consisting solely of redirections. However, two additional unspecified cases have since been added with relation to aliases:

134769

134770

134771

134772

1. Implementations are permitted to parse the entire *commands* string before executing any of it, and in this case *alias* and *unalias* commands in *commands* have no effect during parsing. For example, the following commands:

```
alias foo='echo "hello globe"'
```

134773 `echo $(alias foo='echo "Hello World"';foo)`

134774 produce the output "hello globe" if the *commands* string is executed as an entire  
134775 command and produce the output "Hello World" if the *commands* string is executed  
134776 incrementally.

134777 2. Although existing aliases are required to be expanded when the shell parses the input  
134778 that follows the "\$ (" in order to find the terminating ') ' (see [Section 2.3](#), on page 2475),  
134779 it is unspecified whether the terminating ') ' can result from alias substitution. For  
134780 example, with this script:

```
134781 alias foo="echo foo )"
134782 echo $(foo ; echo bar
```

134783 some shells output lines containing "foo" and "bar" whereas other shells report a  
134784 syntax error because they do not find a terminating ') ' for the command substitution.

134785 Arithmetic expansions have precedence over command substitutions. That is, if the shell can  
134786 parse an expansion beginning with "\$ (" as an arithmetic expansion then it will do so. It will  
134787 only parse the expansion as a command substitution (that starts with a subshell) if it determines  
134788 that it cannot parse the expansion as an arithmetic expansion. If the syntax is valid for neither  
134789 type of expansion, then it is unspecified what kind of syntax error the shell reports.

134790 How well the shell performs this determination is a quality of implementation issue. Current  
134791 shell implementations use heuristics. In particular, the shell need not evaluate nested expansions  
134792 when determining whether it can parse an expansion beginning with "\$ (" as an arithmetic  
134793 expansion. For example:

```
134794 $( (a $op b) )
```

134795 is always an arithmetic expansion if "\$op" expands to, say, '+', but if "\$op" expands to '( '  
134796 then the shell might still parse the expansion as an arithmetic expansion (resulting in a syntax  
134797 error due to unbalanced parentheses) or it might perform a command substitution.

134798 This standard requires that conforming applications always separate the "\$ (" and '( '  
134799 with white space when a command substitution starts with a subshell. This is because  
134800 implementations may support extensions in arithmetic expressions which could result in the  
134801 shell parsing the input as an arithmetic expansion even though a minimally conforming shell  
134802 would not. For example, many shells support arrays with the array index (which can be an  
134803 expression) in square brackets. Therefore, the presence of "myfile[0-9]" within an expansion  
134804 beginning "\$ (" is no guarantee that it will be parsed as a command substitution.

134805 The ambiguity is not restricted to the simple case of a single subshell. More complicated  
134806 ambiguous cases are possible (even with just the standard shell syntax), such as:

```
134807 $( ( cat <<EOH
134808 + ( (
134809 EOH
134810 ) && ( cat <<EOH
134811 ) ) + 1 +
134812 EOH
134813 ) )
```

134814 This can be parsed as an arithmetic expansion, with *cat* and *EOH* as the names of shell variables.  
134815 Ambiguous cases also exist where the end of the expansion is at a different location for the  
134816 arithmetic expansion and the command substitution:

```
134817 $( (cat <<EOF
134818 + ((( (
```

```

134819 EOF
134820 ) && (
134821 cat <<EOF
134822 +
134823 EOF
134824 ) )

```

134825 This is an incomplete arithmetic expansion, but would have been a (complete) command  
 134826 substitution if it could not have been parsed as an arithmetic expansion. If this expansion occurs  
 134827 at the end of input then the shell reports a syntax error; it does not parse it as a command  
 134828 substitution.

134829 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/4 is applied, changing the text from: "If a  
 134830 command substitution occurs inside double-quotes, it shall not be performed on the results of  
 134831 the substitution." to: "If a command substitution occurs inside double-quotes, field splitting and  
 134832 pathname expansion shall not be performed on the results of the substitution.". The  
 134833 replacement text taken from the ISO POSIX-2:1993 standard is clearer about the items that are  
 134834 not performed.

134835 SD5-XCU-ERN-84 is applied, clarifying how the search for the matching backquote is satisfied.

134836 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0019 [217] is applied.

134837 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134838 Austin Group Defect 953 is applied, clarifying how the commands in command substitutions are  
 134839 parsed.

134840 Austin Group Defect 1015 is applied, clarifying the handling of <backslash> when a backquoted  
 134841 command substitution is within double-quotes.

134842 Austin Group Defect 1268 is applied, removing text relating to command substitution inside  
 134843 double-quotes.

134844 Austin Group Defect 1342 is applied, clarifying the requirements for alias substitutions inside  
 134845 command substitutions.

134846 Austin Group Defect 1560 is applied, clarifying that the standard output of the command(s) in a  
 134847 command substitution is treated as a sequence of bytes.

#### 134848 C.2.6.4 Arithmetic Expansion

134849 The standard developers agreed that there was a strong desire for some kind of arithmetic  
 134850 evaluator to provide functionality similar to *expr*, that relating it to '\$' makes it work well with  
 134851 the standard shell language and provides access to arithmetic evaluation in places where  
 134852 accessing a utility would be inconvenient.

134853 The syntax and semantics for arithmetic were revised for the ISO/IEC 9945-2:1993 standard.  
 134854 The language represents a simple subset of the previous arithmetic language (which was  
 134855 derived from the KornShell "(())" construct). The syntax was changed from that of a  
 134856 command denoted by *((expression))* to an expansion denoted by *\$(expression)*. The new form is  
 134857 a dollar expansion ('\$') that evaluates the expression and substitutes the resulting value.  
 134858 Objections to the previous style of arithmetic included that it was too complicated, did not fit in  
 134859 well with the use of variables in the shell, and its syntax conflicted with subshells. The  
 134860 justification for the new syntax is that the shell is traditionally a macro language, and if a new  
 134861 feature is to be added, it should be accomplished by extending the capabilities presented by the  
 134862 current model of the shell, rather than by inventing a new one outside the model; adding a new  
 134863 dollar expansion was perceived to be the most intuitive and least destructive way to add such a

134864 new capability.

134865 The standard requires assignment operators to be supported (as listed in XCU [Section 1.1.2](#), on  
134866 page 2457), and since arithmetic expansions are not specified to be evaluated in a subshell  
134867 environment, changes to variables there have to be in effect after the arithmetic expansion, just  
134868 as in the parameter expansion "\$ {x=value} ".

134869 Note, however, that "\$ ( ( x=5 ) )" need not be equivalent to "\$ ( ( \$x=5 ) )". If the value of  
134870 the environment variable *x* is the string "y=", the expansion of "\$ ( ( x=5 ) )" would set *x* to 5  
134871 and output 5, but "\$ ( ( \$x=5 ) )" would output 0 if the value of the environment variable *y* is  
134872 not 5 and would output 1 if the environment variable *y* is 5. Similarly, if the value of the  
134873 environment variable is 4, the expansion of "\$ ( ( x=5 ) )" would still set *x* to 5 and output 5,  
134874 but "\$ ( ( \$x=5 ) )" (which would be equivalent to "\$ ( ( 4=5 ) )") would yield a syntax  
134875 error.

134876 In early proposals, a form `$(expression)` was used. It was functionally equivalent to the "\$ ( ) "  
134877 of the current text, but objections were lodged that the 1988 KornShell had already implemented  
134878 "\$ ( ) " and there was no compelling reason to invent yet another syntax. Furthermore, the  
134879 "\$ [ ] " syntax had a minor incompatibility involving the patterns in **case** statements.

134880 The portion of the ISO C standard arithmetic operations selected corresponds to the operations  
134881 historically supported in the KornShell. In addition to the exceptions listed in XCU [Section 2.6.4](#)  
134882 (on page 2490), the use of the following are explicitly outside the scope of the rules defined in  
134883 XCU [Section 1.1.2.1](#) (on page 2457):

- 134884 • The prefix operator '&' and the "[ ]", "->", and '.' operators.
- 134885 • Casts

134886 It was concluded that the *test* command (`(l)`) was sufficient for the majority of relational arithmetic  
134887 tests, and that tests involving complicated relational expressions within the shell are rare, yet  
134888 could still be accommodated by testing the value of "\$ ( ) " itself. For example:

```
134889 # a complicated relational expression
134890 while [ $(( ($x + $y)/($a * $b)) < ($foo*$bar) )) -ne 0 ]
```

134891 or better yet, the rare script that has many complex relational expressions could define a  
134892 function like this:

```
134893 val() {
134894     return $(!$1)
134895 }
```

134896 and complicated tests would be less intimidating:

```
134897 while val $(( ($x + $y)/($a * $b)) < ($foo*$bar) ))
134898 do
134899     # some calculations
134900 done
```

134901 A suggestion that was not adopted was to modify *true* and *false* to take an optional argument,  
134902 and *true* would exit true only if the argument was non-zero, and *false* would exit false only if the  
134903 argument was non-zero:

```
134904 while true $(( $x > 5 && $y <= 25 ))
```

134905 There is a minor portability concern with the new syntax. The example "\$ ( ( 2+2 ) )" could have  
134906 been intended to mean a command substitution of a utility named "2+2" in a subshell. The  
134907 standard developers considered this to be obscure and isolated to some KornShell scripts  
134908 (because "\$ ( ) " command substitution existed previously only in the KornShell). The text on

134909 command substitution requires that the "\$(" and '( ' be separate tokens if this usage is  
134910 needed.

134911 An example such as:

```
134912 echo $((echo hi);(echo there))
```

134913 should not be misinterpreted by the shell as arithmetic because attempts to balance the  
134914 parentheses pairs would indicate that they are subshells. However, as indicated by XBD [Section](#)  
134915 [3.85](#) (on page 44), a conforming application must separate two adjacent parentheses with white  
134916 space to indicate nested subshells.

134917 The standard is intentionally silent about how a variable's numeric value in an expression is  
134918 determined from its normal "sequence of bytes" value. It could be done as a text substitution, as  
134919 a conversion like that performed by *strtol()*, or even recursive evaluation. Therefore, the only  
134920 cases for which the standard is clear are those for which both conversions produce the same  
134921 result. The cases where they give the same result are those where the sequence of bytes form a  
134922 valid integer constant. Therefore, if a variable does not contain a valid integer constant, the  
134923 behavior is unspecified.

134924 For the commands:

```
134925 x=010; echo $((x += 1))
```

134926 the output must be 9.

134927 For the commands:

```
134928 x=' 1'; echo $((x += 1))
```

134929 the results are unspecified.

134930 For the commands:

```
134931 x=1+1; echo $((x += 1))
```

134932 the results are unspecified.

134933 Although the ISO C standard requires support for **long long** and allows extended integer types  
134934 with higher ranks, POSIX.1-2024 only requires arithmetic expansions to support **signed long**  
134935 integer arithmetic. Implementations are encouraged to support signed integer values at least as  
134936 large as the size of the largest file allowed on the implementation.

134937 Implementations are also allowed to perform floating-point evaluations as long as an  
134938 application won't see different results for expressions that would not overflow **signed long**  
134939 integer expression evaluation. (This includes appropriate truncation of results to integer values.)

134940 Changes made in response to IEEE PASC Interpretation 1003.2 #208 removed the requirement  
134941 that the integer constant suffixes **l** and **L** had to be recognized. The ISO POSIX-2:1993 standard  
134942 did not require the **u**, **u1**, **uL**, **U**, **U1**, **UL**, **lu**, **lU**, **Lu**, and **LU** suffixes since only signed integer  
134943 arithmetic was required. Since all arithmetic expressions were treated as handling **signed long**  
134944 integer types anyway, the **l** and **L** suffixes were redundant. No known scripts used them and  
134945 some historic shells did not support them. When the ISO/IEC 9899:1999 standard was used as  
134946 the basis for the description of arithmetic processing, the **ll** and **LL** suffixes and combinations  
134947 were also not required. Implementations are still free to accept any or all of these suffixes, but  
134948 are not required to do so.

134949 There was also some confusion as to whether the shell was required to recognize character  
134950 constants. Syntactically, character constants were required to be recognized, but the  
134951 requirements for the handling of <backslash> and single-quote characters (needed to specify  
134952 character constants) within an arithmetic expansion were ambiguous. Furthermore, no known

134953 shells supported them. Changes made in response to IEEE PASC Interpretation 1003.2 #208  
 134954 removed the requirement to support them (if they were indeed required before). POSIX.1-2024  
 134955 clearly does not require support for character constants.

134956 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/3 is applied, clarifying arithmetic  
 134957 expressions.

134958 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0020 [50] is applied.

134959 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0015 [584] is applied.

#### 134960 C.2.6.5 *Field Splitting*

134961 The operation of field splitting using *IFS*, as described in early proposals, was based on the way  
 134962 the KornShell splits words, but it is incompatible with other common versions of the shell.  
 134963 However, each has merit, and so a decision was made to allow both. If the *IFS* variable is unset  
 134964 or is `<space><tab><newline>`, the operation is equivalent to the way the System V shell splits  
 134965 words. Using characters outside the `<space><tab><newline>` set yields the KornShell behavior,  
 134966 where each of the non-`<space><tab><newline>`s is significant. This behavior, which affords the  
 134967 most flexibility, was taken from the way the original *awk* handled field splitting.

134968 The different handling of white space and non-white-space characters in *IFS* can be summarized  
 134969 as a pseudo-ERE:

134970  $(s^*ns^* | s^+)$

134971 where *s* is an *IFS* white-space character and *n* is a character in the *IFS* that is not white space.  
 134972 Any string matching that ERE delimits a field, except that the *s+* form does not delimit fields at  
 134973 the beginning or the end of a line. For example, if *IFS* is `<space>/<comma>/<tab>`, the string:

134974 `<space><space>red<space><space>, <space>white<space>blue`

134975 yields the three colors as the delimited fields.

134976 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0016 [832] is applied.

134977 Austin Group Defect 1123 is applied, clarifying the requirements if no fields are delimited.

134978 Austin Group Defect 1560 is applied, clarifying that the results of word expansions are treated as  
 134979 a sequences of bytes when searching for (bytes that form) *IFS* characters.

134980 Austin Group Defect 1649 is applied, clarifying how field splitting is performed.

#### 134981 C.2.6.6 *Pathname Expansion*

134982 There is no additional rationale provided for this section.

#### 134983 C.2.6.7 *Quote Removal*

134984 The golden rule in quote removal is that if a quote character was treated as special in the original  
 134985 word, it is removed; if it was treated as a literal character, it is not removed.

134986 Austin Group Defect 221 is applied, clarifying the conditions under which quote characters are,  
 134987 or are not, removed.

134988 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

134989 **C.2.7 Redirection**

134990 In the System Interfaces volume of POSIX.1-2024, file descriptors are integers in the range  
134991 0–(`OPEN_MAX`–1). The file descriptors discussed in XCU [Section 2.7](#) (on page 2493) are that  
134992 same set of small integers.

134993 Having multi-digit file descriptor numbers for I/O redirection can cause some obscure  
134994 compatibility problems. Specifically, scripts that depend on an example command:

```
134995 echo 22>/dev/null
```

134996 echoing "2" to standard error or "22" to standard output are no longer portable. However, the  
134997 file descriptor number must still be delimited from the preceding text. For example:

```
134998 cat file2>foo
```

134999 writes the contents of **file2**, not the contents of **file**.

135000 The limitation to 9 file descriptors is overcome in some shells via a form of redirection whereby a  
135001 shell variable stores the file descriptor number. For example:

```
135002 exec {fdvar}> foo
```

135003 opens the file `foo` on a file descriptor greater than 9 and stores the file descriptor number in  
135004 shell variable `fdvar`. (This can later be closed using `exec {fdvar}>&-`.) This form of  
135005 redirection is allowed but not required by this standard.

135006 The "`>|`" format of output redirection was adopted from the KornShell. Along with the  
135007 *noclobber* option, set `-C`, it provides a safety feature to prevent inadvertent overwriting of  
135008 existing files. (See the RATIONALE for the *pathchk* utility for why this step was taken.) The  
135009 restriction on regular files is historical practice.

135010 The System V shell and the KornShell have differed historically on pathname expansion of *word*;  
135011 the former never performed it, the latter only when the result was a single field (file). As a  
135012 compromise, it was decided that the KornShell functionality was useful, but only as a shorthand  
135013 device for interactive users. No reasonable shell script would be written with a command such  
135014 as:

```
135015 cat foo > a*
```

135016 Thus, shell scripts are prohibited from doing it, while interactive users can select the shell with  
135017 which they are most comfortable.

135018 The construct "`2>&1`" is often used to redirect standard error to the same file as standard  
135019 output. Since the redirections take place beginning to end, the order of redirections is significant.  
135020 For example:

```
135021 ls > foo 2>&1
```

135022 directs both standard output and standard error to file **foo**. However:

```
135023 ls 2>&1 > foo
```

135024 only directs standard output to file **foo** because standard error was duplicated as standard  
135025 output before standard output was directed to file **foo**.

135026 Applications should not use the `[n]<&-` or `[n]>&-` operators to execute a utility or application  
135027 with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, as  
135028 this might cause the executed program (or shell built-in) to misbehave. In order not to pass on  
135029 these file descriptors to an executed utility or application, applications should not just close  
135030 them but should reopen them on, for example, `/dev/null`. Some implementations may reopen  
135031 them automatically, but applications should not rely on this being done.

135032 The "<>" operator could be useful in writing an application that worked with several terminals,  
 135033 and occasionally wanted to start up a shell. That shell would in turn be unable to run  
 135034 applications that run from an ordinary controlling terminal unless it could make use of "<>"  
 135035 redirection. The specific example is a historical version of the pager *more*, which reads from  
 135036 standard error to get its commands, so standard input and standard output are both available  
 135037 for their usual usage. There is no way of saying the following in the shell without "<>":

```
135038 cat food | more - >/dev/tty03 2<>/dev/tty03
```

135039 Another example of "<>" is one that opens **/dev/tty** on file descriptor 3 for reading and writing:

```
135040 exec 3<> /dev/tty
```

135041 An example of creating a lock file for a critical code region:

```
135042 set -C
135043 until 2> /dev/null > lockfile
135044 do sleep 30
135045 done
135046 set +C
135047 perform critical function
135048 rm lockfile
```

135049 Since **/dev/null** is not a regular file, no error is generated by redirecting to it in *noclobber* mode.

135050 Tilde expansion is not performed on a here-document because the data is treated as if it were  
 135051 enclosed in double-quotes.

135052 Austin Group Defect 1193 is applied, adding the optional redirection form `{location}redir-`  
 135053 `op word`.

135054 Austin Group Defect 1232 is applied, clarifying the allowed behaviors in an interactive shell  
 135055 when pathname expansion on the word following a redirection operator would result in more  
 135056 than one word.

135057 Austin Group Defect 1493 is applied, moving some information from this section to the  
 135058 definition of "file descriptor" in XBD [Section 3.141](#) (on page 51).

#### 135059 C.2.7.1 *Redirecting Input*

135060 There is no additional rationale provided for this section.

#### 135061 C.2.7.2 *Redirecting Output*

135062 Earlier versions of this standard did not require redirection using '>' when *noclobber* is set to  
 135063 perform the file creation step as an atomic operation. Historical shells just called *stat()* to check  
 135064 if a regular file existed and then called *creat()*. The operation thus involved a race condition  
 135065 which meant that it could not be used for reliable creation of lock files. Many shell  
 135066 implementations improved on this by using *open()* with the `O_CREAT` and `O_EXCL` flags set as  
 135067 one step in a multi-step process which still meant that an existing non-regular file (for example  
 135068 **/dev/null**, **/dev/tty**, or a FIFO) was opened successfully. However, the methods employed still  
 135069 involved a race condition and could produce misleading diagnostics if there is concurrent  
 135070 creation or removal of files.

135071 An ideal solution would be an `O_NOCLOBBER` flag for *open()* which the shell could use in  
 135072 order to perform the entire operation atomically, and implementations are encouraged to adopt  
 135073 this solution, adding the flag as described in the FUTURE DIRECTIONS section of *open()* (on  
 135074 page 1515), and using it in the implementation's POSIX shell and in other shells. Authors of

135075 portable shells should make use of `#ifdef O_NOCLOSE` so that it is used on  
135076 implementations that provide it.

135077 If `O_NOCLOSE` is not used, shells can use one of the following methods:

135078 1. The “`stat` first” method.

135079 a. Call `stat()` and if the file exists and is a regular file, the redirection fails. Otherwise:

135080 b. Call `open()` without `O_CREAT` or `O_TRUNC` to open an existing file. If the open  
135081 succeeds, use `fstat()` to check whether the opened file is a regular file. If it is, close  
135082 it and fail the redirection. If it is a non-regular file, the redirection succeeds.  
135083 Otherwise:

135084 c. Call `open()` with `O_CREAT|O_EXCL`. The redirection succeeds or fails depending  
135085 on whether the open succeeds or fails.

135086 2. The “exclusive create first” method.

135087 a. Call `open()` with `O_CREAT|O_EXCL`. If the open succeeds, the redirection  
135088 succeeds. If the open fails with `[EMFILE]` or `[ENFILE]`, use `stat()` to check whether  
135089 a regular file exists; if it does, fail the redirection. Otherwise:

135090 b. Call `open()` without `O_CREAT` or `O_TRUNC` to open an existing file. If the open  
135091 succeeds, use `fstat()` to check whether the opened file is a regular file. If it is, close  
135092 it and fail the redirection. If it is a non-regular file, the redirection succeeds. If the  
135093 second open fails, the redirection fails with a diagnostic based on the `errno` value  
135094 set by the first open.

135095 (A minor variation of this method could also be used whereby step 2.b is only done if the  
135096 `open()` in step 2.a fails with `[EEXIST]`.)

135097 Method 1 is in widespread use. Method 2 has not been observed exactly as described, although  
135098 an implementation which omits the `stat()` in step 2.a has been observed. Without the `stat()`, this  
135099 method has a problem in that if a regular file exists but the `open()` fails with `[EMFILE]` or  
135100 `[ENFILE]` instead of `[EEXIST]` (which is to be expected if those conditions exist, because  
135101 detecting `[EEXIST]` is more expensive), then the shell will give an incorrect diagnostic.  
135102 (Reporting that no file descriptors are available implies that a non-regular file exists, because the  
135103 shell tried to open the file and it is not supposed to open an existing regular file.)

135104 A variant of method 1 which omits the initial `stat()` call has also been observed; this has the  
135105 same problem with `[EMFILE]` and `[ENFILE]`. With the `stat()`, this misleading diagnostic can also  
135106 happen, but only if a regular file is created in the timing window between steps 1.a and 1.b,  
135107 which makes it an allowed case. (The standard allows a misleading diagnostic when there is  
135108 concurrent creation or removal of files.)

135109 Both methods have cases where a misleading diagnostic is given when a non-regular file is  
135110 concurrently created or removed. With method 1 it occurs if no file exists at steps 1.a and 1.b,  
135111 and a non-regular file is created before step 1.c. With method 2 it occurs if a non-regular file  
135112 exists at step 2.a and is removed before step 2.b. (In both cases, the diagnostic misleadingly  
135113 implies that a regular file exists).

135114 Both methods differ from historical shell behavior in that the redirection fails if there is an  
135115 existing symbolic link whose target does not exist, instead of the link’s target being created as a  
135116 regular file. The standard developers consider reliable lock file creation to be more important  
135117 than the creation of symbolic link targets.

135118 Creation of lock files and unique (often temporary) files with `noclobber` set is only reliable  
135119 provided neither non-regular files nor symbolic links to non-regular files exist or are created in  
135120 the same directory with the same names, and no other processes delete the files while still in use.

- 135121 If a directory such as `/tmp` is used for lock files, then another process could accidentally or  
135122 maliciously create a FIFO (or a special file, given sufficient privilege) with the same name,  
135123 causing multiple processes to simultaneously open the same lock file instead of one succeeding  
135124 and the others failing.
- 135125 Austin Group Defects 1016 and 1364 are applied, changing the requirements when the `noclobber`  
135126 option is set.
- 135127 C.2.7.3 *Appending Redirected Output*
- 135128 Note that when a file is opened (even with the `O_APPEND` flag set), the initial file offset for that  
135129 file is set to the beginning of the file. Some historic shells set the file offset to the current end-of-  
135130 file when **append** mode shell redirection was used, but this is not allowed by POSIX.1-2024.
- 135131 Austin Group Defect 1016 is applied, changing ``with the `O_APPEND` flag`` to ``with the  
135132 `O_APPEND` flag set``.
- 135133 C.2.7.4 *Here-Document*
- 135134 Historical shell behavior was to treat the end of input as being equivalent to the delimiter of a  
135135 here-document, terminating the here-document, usually without any indication, and continuing  
135136 as if the delimiter had been recognized. This can cause problems where the delimiter had been  
135137 intended to occur much earlier in the script, but was incorrectly entered—a mistake which for  
135138 many other errors would have resulted in a syntax error, and an aborted script, instead simply  
135139 generates incorrect results. Because of this some shell implementations have changed to  
135140 reporting an undelimited here-document as a syntax error. Other implementations are  
135141 encouraged to do the same.
- 135142 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0017 [890], XCU/TC2-2008/0018  
135143 [583], and XCU/TC2-2008/0019 [580] are applied.
- 135144 Austin Group Defect 1036 is applied, clarifying how here-documents are parsed.
- 135145 Austin Group Defect 1411 is applied, adding a paragraph break.
- 135146 C.2.7.5 *Duplicating an Input File Descriptor*
- 135147 The file descriptor duplication redirection operators, `[n]<&word` and `[n]>&word`, make a copy  
135148 of one file descriptor as another. If the operation is successful, the new file descriptor has the  
135149 same access mode as the source (old) file descriptor, because the access mode is determined by  
135150 the open file description to which both file descriptors point. To avoid a redirection error,  
135151 applications need to ensure that they use the appropriate redirection operator for the access  
135152 mode of the file descriptor being duplicated.
- 135153 Austin Group Defect 1536 is applied, making it optional whether attempting to duplicate an  
135154 open file descriptor that is not open for input results in a redirection error.
- 135155 C.2.7.6 *Duplicating an Output File Descriptor*
- 135156 See [Section C.2.7.5](#).
- 135157 Austin Group Defect 1536 is applied, making it optional whether attempting to duplicate an  
135158 open file descriptor that is not open for output results in a redirection error.

135159 C.2.7.7 *Open File Descriptors for Reading and Writing*

135160 There is no additional rationale provided for this section.

## 135161 C.2.8 Exit Status and Errors

135162 There is no additional rationale provided for this section.

### 135163 C.2.8.1 *Consequences of Shell Errors*

135164 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0020 [882] and XCU/TC2-2008/0021  
135165 [717,882] are applied.

135166 Austin Group Defect 914 is applied, requiring that the shell does not exit when a redirection  
135167 error occurs with compound commands or with function execution.

135168 Austin Group Defect 1427 is applied, changing this section to account for the effect of the  
135169 *command* utility when it is used to execute a special built-in utility.

135170 Austin Group Defect 1629 is applied, requiring that the shell exits if an unrecoverable read error  
135171 occurs when reading commands.

### 135172 C.2.8.2 *Exit Status for Commands*

135173 There is a historical difference in *sh* and *ksh* non-interactive error behavior. When a command  
135174 named in a script is not found, some implementations of *sh* exit immediately, but *ksh* continues  
135175 with the next command. Thus, the Shell and Utilities volume of POSIX.1-2024 says that the shell  
135176 “may” exit in this case. This puts a small burden on the programmer, who has to test for  
135177 successful completion following a command if it is important that the next command not be  
135178 executed if the previous command was not found. If it is important for the command to have  
135179 been found, it was probably also important for it to complete successfully. The test for successful  
135180 completion would not need to change.

135181 Historically, shells have returned an exit status of  $128+n$ , where  $n$  represents the signal number.  
135182 Since signal numbers are not standardized, there is no portable way to determine which signal  
135183 caused the termination. Also, it is possible for a command to exit with a status in the same range  
135184 of numbers that the shell would use to report that the command was terminated by a signal.  
135185 Implementations are encouraged to choose exit values greater than 256 to indicate programs that  
135186 terminate by a signal so that the exit status cannot be confused with an exit status generated by a  
135187 normal termination. However, the use of exit values greater than 256 poses a problem for the  
135188 shell’s own exit status. Historically this was the exit status of the last command invoked by the  
135189 shell, but if the last command was terminated by a signal and was assigned an exit status greater  
135190 than 256 by the shell, this value would be truncated to eight bits in the shell’s exit status.  
135191 Likewise truncation would occur with use of

135192 `exit $?`

135193 `or`

135194 `ret=$?`

135195 `....`

135196 `exit $ret`

135197 in shell scripts. To avoid this truncation, shells which assign exit statuses greater than 256 are  
135198 required to propagate the wait status of the last command to the shell’s own wait status (by  
135199 sending itself the same signal), and to handle exit values greater than 256 passed to the *exit*

135200 builtin by mimicking the wait status that would give rise to assignment of that exit status in the  
 135201 shell. Note that this requirement does not apply to signals that do not cause termination, such as  
 135202 SIGCHLD, since the shell can never actually assign a corresponding exit status greater than 256,  
 135203 and the requirement is worded in terms of this assignment.

135204 Historical shells make the distinction between “utility not found” and “utility found but cannot  
 135205 execute” in their error messages. By specifying two seldomly used exit status values for these  
 135206 cases, 127 and 126 respectively, this gives an application the opportunity to make use of this  
 135207 distinction without having to parse an error message that would probably change from locale to  
 135208 locale. The *command*, *env*, *nohup*, and *xargs* utilities in the Shell and Utilities volume of  
 135209 POSIX.1-2024 have also been specified to use this convention.

135210 When a command fails during word expansion or redirection, most historical implementations  
 135211 exit with a status of 1. However, there was some sentiment that this value should probably be  
 135212 much higher so that an application could distinguish this case from the more normal exit status  
 135213 values. Thus, the language “greater than zero” was selected to allow either method to be  
 135214 implemented.

135215 If a C application calls `exit(256)`, the command’s exit status in the shell becomes zero due to  
 135216 the modulo 256 operation. Since zero is interpreted as “true” or “success” for `if` statements,  
 135217 AND and OR lists, `set -e`, and so on, applications should be careful to avoid exiting with a  
 135218 value that is a multiple of 256 unless the value is intended to be interpreted as true or success.

135219 To avoid ambiguity caused by the modulo 256 operation, applications are encouraged to avoid  
 135220 using a count or the result of a computation as the exit value unless the value is guaranteed to be  
 135221 non-negative and less than 256.

135222 The ambiguity caused by the modulo 256 operation is unfortunate, but required due to historical  
 135223 implementation behavior. A future version of this standard may change the definition of exit  
 135224 status to remove the modulo 256 requirement and use all bits of the value passed to `exit()` (or  
 135225 equivalent), and may introduce a way to select whether the special parameter ‘?’ contains the  
 135226 exit status modulo 256 or the full exit status.

135227 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0022 [717] is applied.

135228 Austin Group Defect 51 is applied, clarifying the exit status when a command is terminated due  
 135229 to the receipt of a signal.

135230 Austin Group Defect 947 is applied, clarifying the exit status of commands.

## 135231 C.2.9 Shell Commands

135232 A description of an “empty command” was removed from an early proposal because it is only  
 135233 relevant in the cases of `sh -c ""`, `system("")`, or an empty shell-script file (such as the  
 135234 implementation of *true* on some historical systems). Since it is no longer mentioned in the Shell  
 135235 and Utilities volume of POSIX.1-2024, it falls into the silently unspecified category of behavior  
 135236 where implementations can continue to operate as they have historically, but conforming  
 135237 applications do not construct empty commands. (However, note that *sh* does explicitly state an  
 135238 exit status for an empty string or file.) In an interactive session or a script with other commands,  
 135239 extra <newline> or <semicolon> characters, such as:

```
135240 $ false
135241 $
135242 $ echo $?
135243 1
```

135244 would not qualify as the empty command described here because they would be consumed by

- 135245 other parts of the grammar.
- 135246 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0023 [473] is applied.
- 135247 C.2.9.1 *Simple Commands*
- 135248 Austin Group Defect 1224 is applied, correcting a mismatch between the description of simple  
135249 commands and the formal *simple\_command* grammar.
- 135250 Austin Group Defect 1227 is applied, inserting additional subsection headings.
- 135251 **Order of Processing**
- 135252 The enumerated list is used only when the command is actually going to be executed. For  
135253 example, in:
- 135254 `true || $foo *`
- 135255 no expansions are performed.
- 135256 Expansion of words in an assignment context following the command name can only occur for  
135257 declaration utilities, and only when the word can be used as a variable assignment in isolation.
- 135258 For example, this code sequence exports the single variable *a* with the value "1 b=2", but  
135259 invokes *make* with the macro *a* set to '1' and *b* set to '2', since *make* is not a declaration utility:
- 135260 `set '1 b=2'`  
135261 `export a=$1`  
135262 `make a=$1`
- 135263 Conversely, this code sequence exports two variables, *a* set to '1' and *b* set to '2', because the  
135264 use of quoting means that the word could not be recognized as a variable assignment, and  
135265 regular expansion rules require that field splitting occurs on the unquoted expansion of \$1:
- 135266 `set '1 b=2'`  
135267 `export \a=$1`
- 135268 Likewise, this code sequence will not be parsed in assignment context, but is still required to  
135269 export the variable named *foo* with the value '1':
- 135270 `var=foo`  
135271 `export $var=1`
- 135272 Implementations are permitted to provide extensions that serve as declaration utilities, such as  
135273 *typeset* or *local*, or even a way to define a function that can behave as a declaration utility.
- 135274 Declaration utilities are only required to be recognized via lexical analysis; if any expansions are  
135275 required before the command name is known, or before the first argument to the *command* utility  
135276 is known, then it is unspecified whether subsequent arguments will be treated with an  
135277 assignment context during expansion. For example, it is unspecified whether
- 135278 `var=export; $var a=~`
- 135279 sets the variable *a* to a literal <tilde> or to the value of \$HOME, since lexical analysis sees "\$var"  
135280 rather than "export" as the command name.
- 135281 Austin Group Defects 351 and 1535 are applied, adding requirements relating to declaration  
135282 utilities.

135283 **Variable Assignments**

135284 The following example illustrates both how a variable assignment without a command name  
 135285 affects the current execution environment, and how an assignment with a command name only  
 135286 affects the execution environment of the command:

```
135287 $ x=red
135288 $ echo $x
135289 red
135290 $ export x
135291 $ sh -c 'echo $x'
135292 red
135293 $ x=blue sh -c 'echo $x'
135294 blue
135295 $ echo $x
135296 red
```

135297 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0021 [255] is applied.

135298 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0024 [654] is applied.

135299 Austin Group Defect 1009 is applied, clarifying the behavior when a special built-in utility is  
 135300 executed with a variable assignment.

135301 **Commands with no Command Name**

135302 This next example illustrates that redirections without a command name are still performed:

```
135303 $ ls foo
135304 ls: foo: no such file or directory
135305 $ > foo
135306 $ ls foo
135307 foo
```

135308 A command without a command name, but one that includes a command substitution, has an  
 135309 exit status of the last command substitution that the shell performed. For example:

```
135310 if      x=$(command)
135311 then    ...
135312 fi
```

135313 An example of redirections without a command name being performed in a subshell shows that  
 135314 the here-document does not disrupt the standard input of the **while** loop:

```
135315 IFS=:
135316 while read a b
135317 do     echo $a
135318       <<-eof
135319       Hello
135320       eof
135321 done </etc/passwd
```

135322 Following are examples of commands without command names in AND-OR lists:

```
135323 > foo || {
135324     echo "error: foo cannot be created" >&2
135325     exit 1
135326 }
135327 # set saved if /vmunix.save exists
```

135328 `test -f /vmunix.save && saved=1`

135329 Command substitution and redirections without command names both occur in subshells, but  
135330 they are not necessarily the same ones. For example, in:

135331 `exec 3> file`  
135332 `var=$(echo foo >&3) 3>&1`

135333 it is unspecified whether **foo** is echoed to the file or to standard output.

135334 Austin Group Defect 1150 is applied, clarifying the exit status of a command that has no  
135335 command name and has more than one command substitution.

### 135336 **Command Search and Execution**

135337 This description requires that the shell can execute shell scripts directly, even if the underlying  
135338 system does not support the common "#!" interpreter convention. That is, if file **foo** contains  
135339 shell commands and is executable, the following executes **foo**:

135340 `./foo`

135341 The command search shown here does not match all historical implementations. A more typical  
135342 sequence has been:

- 135343 • Any built-in (special or regular)
- 135344 • Functions
- 135345 • Path search for executable files

135346 But there are problems with this sequence. Since the programmer has no idea in advance which  
135347 utilities might have been built into the shell, a function cannot be used to override portably a  
135348 utility of the same name. (For example, a function named *cd* cannot be written for many  
135349 historical systems.) Furthermore, the *PATH* variable is partially ineffective in this case, and only  
135350 a pathname with a <slash> can be used to ensure a specific executable file is invoked.

135351 After the *execve()* failure described, the shell normally executes the file as a shell script. Some  
135352 implementations, however, attempt to detect whether the file is actually a script and not an  
135353 executable from some other architecture. The method used by the KornShell is allowed by the  
135354 text that indicates non-text files may be bypassed.

135355 The sequence selected for the Shell and Utilities volume of POSIX.1-2024 acknowledges that  
135356 special built-ins cannot be overridden, but gives the programmer full control over which  
135357 versions of other utilities are executed (with some exceptions). It provides a means of  
135358 suppressing function lookup (via the *command* utility) for the user's own functions and, with the  
135359 exception of the intrinsic utilities (see XCU Section 1.7, on page 2470), ensures that any regular  
135360 built-ins or functions provided by the implementation are under the control of the path search.  
135361 The mechanisms for associating non-intrinsic built-ins or functions with executable files in the  
135362 path are not specified by the Shell and Utilities volume of POSIX.1-2024, but the wording  
135363 requires that if either is implemented, the application is not able to distinguish a function or  
135364 built-in from an executable (other than in terms of performance, presumably). The  
135365 implementation ensures that all effects specified by the Shell and Utilities volume of  
135366 POSIX.1-2024 resulting from the invocation of the regular built-in or function (interaction with  
135367 the environment, variables, traps, and so on) are identical to those resulting from the invocation  
135368 of an executable file.

135369 Various historical implementations have used the names in item 1.b. as built-ins or reserved  
135370 words. This standard does not specify their behavior, but their existence means that it is  
135371 important for portable applications to avoid giving functions (or utilities in *PATH*) those names  
135372 because the function (or utility in *PATH*) might not be executed as expected.

135373 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/4 is applied, updating the case where  
135374 *execve*() fails due to an error equivalent to the [ENOEXEC] error.

135375 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0022 [168], XCU/TC1-2008/0023  
135376 [168], XCU/TC1-2008/0024 [168], XCU/TC1-2008/0025 [168], XCU/TC1-2008/0026 [168,430],  
135377 XCU/TC1-2008/0027 [168,430], and XCU/TC1-2008/0028 [173] are applied.

135378 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0025 [935] and XCU/TC2-2008/0026  
135379 [705] are applied.

135380 Austin Group Defect 465 is applied, adding *compound*, *enum*, *float*, *integer*, and *nameref* to the  
135381 table of command names for which the results are unspecified.

135382 Austin Group Defect 854 is applied, adding intrinsic utilities.

135383 Austin Group Defect 1391 is applied, clarifying the execution of a standard utility provided by  
135384 the implementation in the form of a function.

### 135385 Standard File Descriptors

135386 There is no additional rationale provided for this section.

### 135387 Non-built-in Utility Execution

135388 Austin Group Defect 1157 is applied, clarifying the execution of non-built-in utilities.

135389 Austin Group Defects 1226 and 1435 are applied, clarifying the circumstances under which the  
135390 shell may bypass execution of a non-built-in utility as a shell script.

### 135391 Examples

135392 Consider three versions of the *ls* utility:

- 135393 1. The application includes a shell function named *ls*.
- 135394 2. The user writes a utility named *ls* and puts it in **/fred/bin**.
- 135395 3. The example implementation provides *ls* as a regular shell built-in that is invoked (either  
135396 by the shell or directly by *exec*) when the path search reaches the directory **/posix/bin**.

135397 If *PATH*=**/posix/bin**, various invocations yield different versions of *ls*:

135398	Invocation	Version of <i>ls</i>
135399	<i>ls</i> (from within application script)	(1) function
135400	<i>command ls</i> (from within application script)	(3) built-in
135401	<i>ls</i> (from within makefile called by application)	(3) built-in
135402	<i>system("ls")</i>	(3) built-in
135403	<i>PATH="/fred/bin:\$PATH" ls</i>	(2) user's version

### 135404 C.2.9.2 Pipelines

135405 Because pipeline assignment of standard input or standard output or both takes place before  
135406 redirection, it can be modified by redirection. For example:

135407 **\$** *command1* 2>&1 | *command2*

135408 sends both the standard output and standard error of *command1* to the standard input of  
135409 *command2*.

135410 The reserved word **!** allows more flexible testing using AND and OR lists. The behavior of **!(** is

135411 unspecified because in the Korn Shell this introduces a negated pathname expansion. Portable  
 135412 applications need to separate the ! and ( to ensure the command is treated as a negated subshell.

135413 It was suggested that it would be better to return a non-zero value if any command in the  
 135414 pipeline terminates with non-zero status (perhaps the bitwise-inclusive OR of all return values).  
 135415 However, the choice of the last-specified command semantics are historical practice and would  
 135416 cause applications to break if changed. An example of historical behavior:

```
135417 $ sleep 5 | (exit 4)
135418 $ echo $?
135419 4
135420 $ (exit 4) | sleep 5
135421 $ echo $?
135422 0
```

135423 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0029 [205] is applied.

135424 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0027 [521] is applied.

### 135425 **Exit Status**

135426 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0030 [52] is applied.

135427 Austin Group Defect 789 is applied, adding the *pipefail* option.

### 135428 C.2.9.3 *Lists*

135429 The equal precedence of "&&" and "||" is historical practice. The standard developers  
 135430 evaluated the model used more frequently in high-level programming languages, such as C, to  
 135431 allow the shell logical operators to be used for complex expressions in an unambiguous way, but  
 135432 they could not allow historical scripts to break in the subtle way unequal precedence might  
 135433 cause. Some arguments were posed concerning the "{}" or "()" groupings that are required  
 135434 historically. There are some disadvantages to these groupings:

- 135435 • The "()" can be expensive, as they spawn other processes on some implementations. This  
 135436 performance concern is primarily an implementation issue.
- 135437 • The "{}" braces are not operators (they are reserved words) and require a trailing  
 135438 <space> after each '{', and a <semicolon> before each '}'. Most programmers (and  
 135439 certainly interactive users) have avoided braces as grouping constructs because of the  
 135440 problematic syntax required. Braces were not changed to operators because that would  
 135441 generate compatibility issues even greater than the precedence question; braces appear  
 135442 outside the context of a keyword in many shell scripts.

135443 IEEE PASC Interpretation 1003.2 #204 is applied, clarifying that the operators "&&" and "||"  
 135444 are evaluated with left associativity.

135445 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0031 [45] and XCU/TC1-2008/0032  
 135446 [45] are applied.

135447 **Asynchronous AND-OR Lists**

135448 Unless the implementation has an internal limit, such as {CHILD\_MAX}, on the retained process  
 135449 IDs, it would require unbounded memory for the following example:

```
135450 while true
135451 do     foo & echo $!
135452 done
```

135453 The treatment of the signals SIGINT and SIGQUIT with asynchronous AND-OR lists is  
 135454 described in XCU [Section 2.12](#) (on page 2521).

135455 Since the connection of the input to the equivalent of /dev/null is considered to occur before  
 135456 redirections, the following script would produce no output:

```
135457 exec < /etc/passwd
135458 cat <&0 &
135459 wait
```

135460 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0028 [760] is applied.

135461 Austin Group Defect 1254 is applied, replacing the *Asynchronous Lists* section with an  
 135462 *Asynchronous AND-OR Lists* section.

135463 **Sequential AND-OR Lists**

135464 Austin Group Defect 1254 is applied, replacing the *Sequential Lists* section with a *Sequential AND-OR Lists* section.

135466 **AND Lists**

135467 There is no additional rationale provided for this section.

135468 **OR Lists**

135469 There is no additional rationale provided for this section.

135470 C.2.9.4 *Compound Commands*

135471 Austin Group Defect 1309 is applied, clarifying the exit status of the **for**, **case**, **if**, **while**, and  
 135472 **until** compound commands.

135473 **Grouping Commands**

135474 The semicolon shown in {*compound-list*; } is an example of a control operator delimiting the }  
 135475 reserved word. Other delimiters are possible, as shown in XCU [Section 2.10](#) (on page 2512);  
 135476 <newline> is frequently used.

135477 A proposal was made to use the <do-done> construct in all cases where command grouping in  
 135478 the current process environment is performed, identifying it as a construct for the grouping  
 135479 commands, as well as for shell functions. This was not included because the shell already has a  
 135480 grouping construct for this purpose ("{}"), and changing it would have been counter-  
 135481 productive.

135482 The requirement for conforming applications to separate two leading ' ( ' characters with white  
 135483 space if a grouping command would be parsed as an arithmetic expansion if preceded by a '\$'  
 135484 is to allow shells which implement the "( arithmetic expression )" extension to  
 135485 apply the same disambiguation rules consistently to \$(...) and (...). See [Section C.2.6.3](#)  
 135486 (on page 3884).

135487 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0033 [217] is applied.

135488 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0029 [473] is applied.

### 135489 For Loop

135490 The format is shown with generous usage of <newline> characters. See the grammar in XCU  
135491 [Section 2.10](#) (on page 2512) for a precise description of where <newline> and <semicolon>  
135492 characters can be interchanged.

135493 Some historical implementations support '{ ' and '}' as substitutes for **do** and **done**. The  
135494 standard developers chose to omit them, even as an obsolescent feature. (Note that these  
135495 substitutes were only for the **for** command; the **while** and **until** commands could not use them  
135496 historically because they are followed by compound-lists that may contain "{ . . . }" grouping  
135497 commands themselves.)

135498 The reserved word pair **do** ... **done** was selected rather than **do** ... **od** (which would have  
135499 matched the spirit of **if** ... **fi** and **case** ... **esac**) because *od* is already the name of a standard  
135500 utility.

135501 PASC Interpretation 1003.2 #169 has been applied changing the grammar.

### 135502 Case Conditional Construct

135503 An optional <left-parenthesis> before *pattern* was added to allow numerous historical KornShell  
135504 scripts to conform. At one time, using the leading parenthesis was required if the **case** statement  
135505 was to be embedded within a "\$ ( )" command substitution; this is no longer the case with the  
135506 POSIX shell. Nevertheless, many historical scripts use the <left-parenthesis>, if only because it  
135507 makes matching-parenthesis searching easier in *vi* and other editors. This is a relatively simple  
135508 implementation change that is upwards-compatible for all scripts.

135509 Consideration was given to requiring *break* inside the *compound-list* to prevent falling through to  
135510 the next pattern action list. This was rejected as being nonexistent practice. Instead, the standard  
135511 now requires a feature first added in KornShell that using ";" &" instead of ";;" as a terminator  
135512 causes the exact opposite behavior—the flow of control continues with the next *compound-list*.

135513 Although the standard is explicit that the order of side-effects due to pattern expansion within a  
135514 single clause is unspecified, it is clear that patterns are expanded in clause order, and that no  
135515 further pattern expansions are attempted after the first match. That is, the following example is  
135516 required to output "1.0":

```
135517 x=0 y=1
135518 case 1 in
135519     $ ((y=0)) ) ;;
135520     $ ((x=1)) ) ;&
135521     $ ((x=2)) ) echo $x.$y ;;
135522 esac
```

135523 Some implementations of the shell also allow ";" &" as a terminator which falls through to the  
135524 next matching pattern (regardless of the choice of terminator in any intermediate non-matching  
135525 clauses), in contrast to ";" &" falling through to the next clause (regardless of the pattern  
135526 guarding that clause). This is an allowed extension, but is not required by the standard at this  
135527 time.

135528 The pattern '\*', given as the last pattern in a **case** construct, is equivalent to the default case in  
135529 a C-language **switch** statement.

135530 The grammar shows that reserved words can be used as patterns, even if one is the first word on  
135531 a line. Obviously, the reserved word **esac** cannot be used in this manner.

135532 Some historical shells would fall back to doing a byte to byte comparison with each pattern if the  
 135533 pattern matching rules did not produce a match. That behavior is not allowed by this standard  
 135534 because it allows user input to bypass input validations like:

```
135535 case $1 in
135536   [0123456789]) : OK;;
135537   *) echo >&2 not a decimal digit; exit 1;;
135538 esac
```

135539 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0029 [473] is applied.

135540 Austin Group Defect 449 is applied, adding ; & as a **case** clause terminator.

135541 Austin Group Defect 1454 is applied, clarifying that a **case** statement with no patterns is valid  
 135542 syntax.

### 135543 **If Conditional Construct**

135544 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2512).

### 135545 **While Loop**

135546 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2512).

### 135547 **Until Loop**

135548 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2512).

### 135549 C.2.9.5 *Function Definition Command*

135550 The description of functions in an early proposal was based on the notion that functions should  
 135551 behave like miniature shell scripts; that is, except for sharing variables, most elements of an  
 135552 execution environment should behave as if they were a new execution environment, and  
 135553 changes to these should be local to the function. For example, traps and options should be reset  
 135554 on entry to the function, and any changes to them do not affect the traps or options of the caller.  
 135555 There were numerous objections to this basic idea, and the opponents asserted that functions  
 135556 were intended to be a convenient mechanism for grouping common commands that were to be  
 135557 executed in the current execution environment, similar to the execution of the *dot* special  
 135558 built-in.

135559 It was also pointed out that the functions described in that early proposal did not provide a local  
 135560 scope for everything a new shell script would, such as the current working directory, or *umask*,  
 135561 but instead provided a local scope for only a few select properties. The basic argument was that  
 135562 if a local scope is needed for the execution environment, the mechanism already existed: the  
 135563 application can put the commands in a new shell script and call that script. All historical shells  
 135564 that implemented functions, other than the KornShell, have implemented functions that operate  
 135565 in the current execution environment. Because of this, traps and options have a global scope  
 135566 within a shell script. Local variables within a function were considered and included in another  
 135567 early proposal (controlled by the special built-in *local*), but were removed because they do not fit  
 135568 the simple model developed for functions and because there was some opposition to adding yet  
 135569 another new special built-in that was not part of historical practice. Implementations should  
 135570 reserve the identifier *local* (as well as *typeset*, as used in the KornShell) in case this local variable  
 135571 mechanism is adopted in a future version of this standard.

135572 A separate issue from the execution environment of a function is the availability of that function  
 135573 to child shells. A few objectors maintained that just as a variable can be shared with child shells  
 135574 by exporting it, so should a function. In early proposals, the *export* command therefore had a *-f*

135575 flag for exporting functions. Functions that were exported were to be put into the environment  
 135576 as *name()*=*value* pairs, and upon invocation, the shell would scan the environment for these and  
 135577 automatically define these functions. This facility was strongly opposed and was omitted. Some  
 135578 of the arguments against exportable functions were as follows:

- 135579 • There was little historical practice. The Ninth Edition shell provided them, but there was  
 135580 controversy over how well it worked.
- 135581 • There are numerous security problems associated with functions appearing in the  
 135582 environment of a user and overriding standard utilities or the utilities owned by the  
 135583 application.
- 135584 • There was controversy over requiring *make* to import functions, where it has historically  
 135585 used an *exec* function for many of its command line executions.
- 135586 • Functions can be big and the environment is of a limited size. (The counter-argument was  
 135587 that functions are no different from variables in terms of size: there can be big ones, and  
 135588 there can be small ones—and just as one does not export huge variables, one does not  
 135589 export huge functions. However, this might not apply to the average shell-function writer,  
 135590 who typically writes much larger functions than variables.)

135591 As far as can be determined, the functions in the Shell and Utilities volume of POSIX.1-2024  
 135592 match those in System V. Earlier versions of the KornShell had two methods of defining  
 135593 functions:

```
135594 function fname { compound-list }
```

135595 and:

```
135596 fname() { compound-list }
```

135597 The latter used the same definition as the Shell and Utilities volume of POSIX.1-2024, but  
 135598 differed in semantics, as described previously. The current edition of the KornShell aligns the  
 135599 latter syntax with the Shell and Utilities volume of POSIX.1-2024 and keeps the former as is.

135600 Some shells accept simple commands (see XCU Section 2.9.1, on page 2500) after *fname()* in  
 135601 addition to compound commands (see XCU Section 2.9.4, on page 2508); however this standard  
 135602 only requires support for compound commands.

135603 The name space for functions is limited to that of a *name* because of historical practice.  
 135604 Complications in defining the syntactic rules for the function definition command and in  
 135605 dealing with known extensions such as the "*@()*" usage in the KornShell prevented the name  
 135606 space from being widened to a *word*. Using functions to support synonyms such as the "*!!*"  
 135607 and "*%*" usage in the C shell is thus disallowed to conforming applications, but acceptable as an  
 135608 extension. For interactive users, the aliasing facilities in the Shell and Utilities volume of  
 135609 POSIX.1-2024 should be adequate for this purpose. It is recognized that the name space for  
 135610 utilities in the file system is wider than that currently supported for functions, if the portable  
 135611 filename character set guidelines are ignored, but it did not seem useful to mandate extensions  
 135612 in systems for so little benefit to conforming applications.

135613 The "*()*" in the function definition command consists of two operators. Therefore, intermixing  
 135614 <blank> characters with the *fname*, '*(*', and '*)*' is allowed, but unnecessary.

135615 An example of how a function definition can be used wherever a simple command is allowed:

```
135616 # If variable i is equal to "yes",
135617 # define function foo to be ls -l
135618 #
135619 [ "$i" = yes ] && foo() {
135620     ls -l
```

135621 }  
 135622 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0034 [383] and XCU/TC1-2008/0035  
 135623 [214] are applied.  
 135624 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0029 [473] and XCU/TC2-2008/0030  
 135625 [654] are applied.

## 135626 C.2.10 Shell Grammar

135627 There are several subtle aspects of this grammar where conventional usage implies rules about  
 135628 the grammar that in fact are not true.

135629 For *compound\_list*, only the forms that end in a *separator* allow a reserved word to be recognized,  
 135630 so usually only a *separator* can be used where a compound list precedes a reserved word (such as  
 135631 **Then, Else, Do, and Rbrace**). Explicitly requiring a separator would disallow such valid (if rare)  
 135632 statements as:

```
135633 if (false) then (echo x) else (echo y) fi
```

135634 See the Note under special grammar rule (1).

135635 Concerning the third sentence of rule (1) (“Also, if the parser ...”):

- 135636 • This sentence applies rather narrowly: when a compound list is terminated by some clear  
 135637 delimiter (such as the closing **fi** of an inner **if\_clause**) then it would apply; where the  
 135638 compound list might continue (as in after a **;**), rule (7a) (and consequently the first  
 135639 sentence of rule (1)) would apply. In many instances the two conditions are identical, but  
 135640 this part of rule (1) does not give license to treating a **WORD** as a reserved word unless it  
 135641 is in a place where a reserved word has to appear.
- 135642 • The statement is equivalent to requiring that when the LR(1) lookahead set contains  
 135643 exactly one reserved word, it must be recognized if it is present. (Here “LR(1)” refers to the  
 135644 theoretical concepts, not to any real parser generator.)

135645 For example, in the construct below, and when the parser is at the point marked with **^**,  
 135646 the only next legal token is **then** (this follows directly from the grammar rules):

```
135647 if if...fi then ... fi
135648         ^
```

135649 At that point, the **then** must be recognized as a reserved word.

135650 (Depending on the parser generator actually used, “extra” reserved words may be in some  
 135651 lookahead sets. It does not really matter if they are recognized, or even if any possible  
 135652 reserved word is recognized in that state, because if it is recognized and is not in the  
 135653 (theoretical) LR(1) lookahead set, an error is ultimately detected. In the example above, if  
 135654 some other reserved word (for example, **while**) is also recognized, an error occurs later.

135655 This is approximately equivalent to saying that reserved words are recognized after other  
 135656 reserved words (because it is after a reserved word that this condition occurs), but avoids  
 135657 the “except for ...” list that would be required for **case**, **for**, and so on. (Reserved words  
 135658 are of course recognized anywhere a *simple\_command* can appear, as well. Other rules take  
 135659 care of the special cases of non-recognition, such as rule (4) for **case** statements.)

135660 Note that the body of here-documents are handled by token recognition (see XCU [Section 2.3](#), on  
 135661 page 2475) and do not appear in the grammar directly. (However, the here-document I/O  
 135662 redirection operator is handled as part of the grammar.)

135663 The optional redirection syntax:

135664 `{location}redir-op word`  
 135665 (see XCU [Section 2.7](#), on page 2493) is accommodated in the grammar rules by the optional  
 135666 **IO\_LOCATION** token identifier and two correspondingly optional elements in `io_redirect`.  
 135667 Without these, the grammar would not permit this form of redirection because it would require  
 135668 that, for example, `echo {var}> foo` is parsed such that `{var}` is a **WORD** to be expanded  
 135669 and passed to `echo`. The grammar does not restrict the location given between the `'{'` and `'}'`  
 135670 in these forms (other than requiring it to be non-empty) since shells may parse an invalid  
 135671 location as part of an `io_redirect` and later treat the invalid location as an error.

#### 135672 C.2.10.1 Shell Grammar Lexical Conventions

135673 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0031 [648] and XCU/TC2-2008/0032  
 135674 [574,646] are applied.

135675 Austin Group Defect 1193 is applied, adding the optional **IO\_LOCATION** token identifier.

135676 Austin Group Defect 1454 is applied, clarifying how to convert the token identifier type of the  
 135677 **TOKEN** when rule 1 applies.

#### 135678 C.2.10.2 Shell Grammar Rules

135679 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0036 [44] is applied.

135680 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0033 [643,839], XCU/TC2-2008/0034  
 135681 [643], XCU/TC2-2008/0035 [648], XCU/TC2-2008/0036 [736], XCU/TC2-2008/0037 [737],  
 135682 XCU/TC2-2008/0038 [581], and XCU/TC2-2008/0039 [735] are applied.

135683 Austin Group Defect 249 is applied, adding the dollar-single-quotes quoting mechanism.

135684 Austin Group Defect 449 is applied, adding `;&` as a **case** clause terminator.

135685 Austin Group Defect 1193 is applied, adding the optional **IO\_LOCATION** token identifier.

135686 Austin Group Defects 1276 and 1279 are applied, clarifying rule 7.

135687 Austin Group Defect 1454 is applied, clarifying how rule 4 applies.

### 135688 C.2.11 Job Control

135689 See also [Job Control](#) (on page 3656).

135690 Shell implementations differ regarding how much of a foreground job is retained when it is  
 135691 converted to a suspended job. For example, given this foreground job:

135692 `sleep 10; echo foo; echo bar &`

135693 if this is suspended during execution of the `sleep`, *ksh93* retains all of the commands in the  
 135694 suspended job and executes them when `fg` is used:

135695 `^Z[1] + Stopped` `sleep 10; echo foo; echo bar &`

135696 `$ jobs`

135697 `[1] + Stopped` `sleep 10; echo foo; echo bar &`

135698 `$ fg`

135699 `sleep 10; echo foo; echo bar`

135700 `foo`

135701 `[1] 30686`

135702 `bar`

135703 §

135704 However, some other shells create a suspended job containing only the `sleep 10` command.

135705 Some historical shells did not handle suspending a foreground AND-OR list well. They would  
 135706 treat the wait status of a process that indicated it had stopped as if it was a non-zero exit status  
 135707 and (if the next operator in the AND-OR list was `|`) would execute the remainder of the AND-  
 135708 OR list at that point. This behavior is not allowed by the standard for two reasons:

135709 1. It does not meet the fundamental requirement of an AND-OR list that the decision on  
 135710 whether to execute each part (except the first) is made based on the exit status of the  
 135711 previous part when it completes.

135712 2. It can lead to data loss. For example, consider a user who often runs this command:

135713 `generate_report > report.out || rm report.out`

135714 with the intention that the incomplete results from a failed `generate_report` run are never  
 135715 retained in order that they cannot be mistaken for a complete set of results. If one day the  
 135716 user decides to check on the progress of the command by stopping it and examining what  
 135717 has been written so far, they will find that the **report.out** file has already been removed.

135718 Austin Group Defects 1254 and 1675 are applied, adding this section.

### 135719 C.2.12 Signals and Error Handling

135720 Historically, some shell implementations silently ignored attempts to use `trap` to set SIGINT or  
 135721 SIGQUIT to the default action or to set a trap for them after they have been set to be ignored by  
 135722 the shell when it executes an asynchronous subshell (and job control is disabled). This behavior  
 135723 is not conforming. For example, if a shell script containing the following line is run in the  
 135724 foreground at a terminal:

135725 `(trap - INT; exec sleep 10) & wait`

135726 and is then terminated by typing the interrupt character, this standard requires that the `sleep`  
 135727 command is terminated by the SIGINT signal.

135728 SD5-XCU-ERN-93 is applied, updating the first paragraph of XCU [Section 2.12](#) (on page 2521).

135729 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0040 [750] is applied.

### 135730 C.2.13 Shell Execution Environment

135731 Some implementations have implemented the last stage of a pipeline in the current environment  
 135732 so that commands such as:

135733 `command | read foo`

135734 set variable **foo** in the current environment. This extension is allowed, but not required;  
 135735 therefore, a shell programmer should consider a pipeline to be in a subshell environment, but  
 135736 not depend on it.

135737 In early proposals, the description of execution environment failed to mention that each  
 135738 command in a multiple command pipeline could be in a subshell execution environment. For  
 135739 compatibility with some historical shells, the wording was phrased to allow an implementation  
 135740 to place any or all commands of a pipeline in the current environment. However, this means that  
 135741 a POSIX application must assume each command is in a subshell environment, but not depend  
 135742 on it.

- 135743 The wording about shell scripts is meant to convey the fact that describing “trap actions” can  
 135744 only be understood in the context of the shell command language. Outside of this context, such  
 135745 as in a C-language program, signals are the operative condition, not traps.
- 135746 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0037 [238] is applied.
- 135747 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0041 [706] is applied.
- 135748 Austin Group Defect 1247 is applied, changing “signal traps” to “traps” and changing “All other  
 135749 commands” to “Except where otherwise stated, all other commands”.
- 135750 Austin Group Defect 1254 is applied, changing the list item relating to process IDs “known to  
 135751 this shell environment”.
- 135752 Austin Group Defect 1384 is applied, changing the requirements for subshells of interactive  
 135753 shells.
- 135754 Austin Group Defect 1580 is applied, adding a list item about environment variables with  
 135755 invalid names.

## 135756 C.2.14 Pattern Matching Notation

- 135757 Pattern matching is a simpler concept and has a simpler syntax than REs, as the former is  
 135758 generally used for the manipulation of filenames, which are relatively simple collections of  
 135759 characters, while the latter is generally used to manipulate arbitrary text strings of potentially  
 135760 greater complexity. However, some of the basic concepts are the same, so this section points  
 135761 liberally to the detailed descriptions in XBD [Chapter 9](#) (on page 179).
- 135762 Austin Group Defect 1443 is applied, adding non-shell uses to the description of what shell  
 135763 pattern matching notation is used for.
- 135764 Austin Group Defect 1564 is applied, clarifying that pattern matching notation is used for  
 135765 matching character strings (not arbitrary byte strings), and that if an attempt is made to use  
 135766 pattern matching notation to match a string that contains one or more bytes that do not form  
 135767 part of a valid character, the behavior is unspecified.

### 135768 C.2.14.1 Patterns Matching a Single Character

- 135769 Both quoting and escaping are described here because pattern matching must work in three  
 135770 separate circumstances:
- 135771 1. Calling directly upon the shell, such as in pathname expansion or in a **case** statement. All  
 135772 of the following match the string or file **abc**:  
 135773 `abc "abc" a"b" c a\bc a[b]c a["b"]c a[\b]c a["\b"]c a?c a*c`  
 135774 The following do not:  
 135775 `"a?c" a*c a\b]c`
  - 135776 2. Calling a utility or function without going through a shell, as described for *find* and the  
 135777 *fnmatch()* and *glob()* functions defined in the System Interfaces volume of POSIX.1-2024,  
 135778 or pattern matching in the shell in situations where the pattern is specified indirectly  
 135779 instead of directly to the shell, such as:  
 135780 `ls -ld -- $pattern`  
 135781 `or`  
 135782 `case $var in ($pattern) ...`

135783 3. Calling utilities such as *find*, *cpio*, *tar*, or *pax* through the shell command line. In this case,  
135784 shell quote removal is performed before the utility sees the argument. For example, in:

```
135785 find /bin -name "e\c[\h]o" -print
```

135786 after quote removal, the `<backslash>` characters are presented to *find* and it treats them as  
135787 escape characters. Both precede ordinary characters, so the *c* and *h* represent themselves  
135788 and *echo* would be found on many historical systems (that have it in */bin*). To find a  
135789 filename that contained shell special characters or pattern characters, both quoting and  
135790 escaping are required, such as:

```
135791 pax -r ... "*a(\?"
```

135792 to extract a filename ending with "a(?".

135793 The wording “In a pattern, or part of one, where a shell-quoting `<backslash>` cannot be used to  
135794 preserve the literal value of a character that would otherwise be treated as special” has been  
135795 carefully crafted so that for the shell it only applies to certain contexts. In particular:

- 135796 • The use of “or part of one” is needed because a single pattern can be produced partly from  
135797 characters directly included in a word and partly from characters that result from one or  
135798 more of the word expansions. For example, in the following command the `<backslash>`  
135799 escapes the `'?'` character:

```
135800 dir='abc\?'  
135801 ls -l -- $dir/*.c
```

- 135802 • The reference to “a shell-quoting `<backslash>`” rather than just using “where shell quoting  
135803 cannot be used” is because there are ways that other types of shell quoting can be used  
135804 where a shell-quoting `<backslash>` cannot, such as placing an expansion within double-  
135805 quotes as in this example:

```
135806 dir='abc?'  
135807 ls -l -- "$dir"/*.c
```

- 135808 • The use of “that would otherwise be treated as special” is needed because otherwise the  
135809 condition would apply to `<backslash>` in single-quotes. For example, in the following  
135810 command the `<backslash>` is not treated as escaping the `'?'` because the `'?'` would not  
135811 be treated as special anyway:

```
135812 ls -l 'abc\?'/*.c
```

135813 In patterns specified indirectly to the shell, it is unspecified whether or not `<backslash>` is  
135814 special inside bracket expressions. This is because there are two mutually exclusive consistency  
135815 aims and neither is considered more important than the other. One is consistency with direct  
135816 patterns, where `<backslash>` is special inside bracket expressions (which is, in turn, for  
135817 consistency with the way single-quotes and double-quotes preserve the literal value of  
135818 characters inside bracket expressions); the other is consistency with regular expressions, *find*,  
135819 *pax*, *fnmatch()*, and *glob()*, where `<backslash>` is not special inside bracket expressions (not  
135820 counting the extra C-string escaping in EREs in *awk*).

135821 Earlier versions of this standard allowed two behaviors when a pattern ends with an unescaped  
135822 `<backslash>`: it could match nothing or be treated as an invalid pattern. However, a third  
135823 behavior has since been observed, where the ending `<backslash>` is treated as a literal  
135824 `<backslash>`, and therefore this standard now simply states that the behavior is unspecified.

135825 Earlier versions of this standard included the statement “The shell special characters always  
135826 require quoting” in XCU [Section 2.14.1](#) (on page 2523). It is unclear what was intended by this,  
135827 since there are pattern matching contexts in which it is not possible to quote those characters,  
135828 such as:

135829 `execlp("find", "find", ".", "-name", "*[()]*", (char *)0);`

135830 where the parentheses cannot be escaped with a <backslash> because <backslash> is not special  
 135831 in bracket expressions in that context. The statement is thought to have been a warning to  
 135832 application writers and interactive shell users that shell special characters (sometimes called  
 135833 metacharacters) always need quoting in patterns that appear directly in shell code; for example,  
 135834 this code:

```
135835 case $char in
135836 [()]) ... ;;
135837 esac
```

135838 is incorrect because the parentheses are parsed as operators—they need to be quoted in order to  
 135839 be treated as part of the pattern. This standard now simply requires instead that applications  
 135840 quote or escape any character that would otherwise be treated as special, in order for it to be  
 135841 matched as an ordinary character. If shell special characters are used without this protection in  
 135842 contexts where they are treated as special, syntax errors can result or implementation extensions  
 135843 can be triggered. Some shells support a series of extensions based on parentheses in patterns  
 135844 that are valid extensions in these contexts because they would otherwise cause syntax errors.  
 135845 However, this means that they are not allowed by this standard to be recognized in contexts  
 135846 where those syntax errors would not occur anyway, such as in:

```
135847 pattern='a*(b)'; ls -- $pattern
```

135848 which this standard requires to list files with names beginning 'a' and ending "(b)". It is  
 135849 recommended that implementations do not extend pattern matching in the shell in ways that are  
 135850 only valid extensions because they would otherwise be syntax errors, in order to avoid  
 135851 inconsistency between different pattern matching contexts. One way to provide an extension  
 135852 that is consistent between different pattern matching contexts in the shell (although still not  
 135853 consistent with *find -name*, *fnmatch()*, etc.) is to enable the extension only when a non-standard  
 135854 shell option is set, or when the shell is executed using a command name other than *sh*.  
 135855 Consistency with non-shell contexts can then be achieved by enabling equivalent extensions in  
 135856 those other contexts by use of non-standard utility options or non-standard FNM\_\* and GLOB\_\*  
 135857 flags.

135858 The restriction on a <circumflex> in a bracket expression is to allow implementations that  
 135859 support pattern matching using the <circumflex> as the negation character in addition to the  
 135860 <exclamation-mark>. A conforming application must use something like "[\^!]" to match  
 135861 either character.

135862 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0042 [806] is applied.

135863 Austin Group Defect 985 is applied, changing the description of the '[' special character.

135864 Austin Group Defect 1234 is applied, clarifying how <backslash> is handled in patterns.

#### 135865 C.2.14.2 *Patterns Matching Multiple Characters*

135866 Since each <asterisk> matches zero or more occurrences, the patterns "a\*b" and "a\*\*b" have  
 135867 identical functionality.

135868 **Examples**

- 135869 `a[bc]` Matches the strings "ab" and "ac".
- 135870 `a*d` Matches the strings "ad", "abd", and "abcd", but not the string "abc".
- 135871 `a*d*` Matches the strings "ad", "abcd", "abcdef", "aaaad", and "adddd".
- 135872 `*a*d` Matches the strings "ad", "abcd", "efabcd", "aaaad", and "adddd".

135873 C.2.14.3 *Patterns Used for Filename Expansion*

135874 The caveat about a `<slash>` within a bracket expression is derived from historical practice. The  
 135875 pattern `"a[b/c]d"` does not match such pathnames as **abd** or **a/d**. On some implementations  
 135876 (including those conforming to the Single UNIX Specification), it matched a pathname of  
 135877 literally `"a[b/c]d"`. On other systems, it produced an undefined condition (an unescaped `'[`  
 135878 used outside a bracket expression). In this version, the XSI behavior is now required.

135879 Filenames beginning with a `<period>` historically have been specially protected from view on  
 135880 UNIX systems. A proposal to allow an explicit `<period>` in a bracket expression to match a  
 135881 leading `<period>` was considered; it is allowed as an implementation extension, but a  
 135882 conforming application cannot make use of it. If this extension becomes popular in the future, it  
 135883 will be considered for a future version of the Shell and Utilities volume of POSIX.1-2024.

135884 Patterns are matched against existing filenames and pathnames only when the pattern contains  
 135885 a `'*'`, `'?'` or `'['` character that will be treated as special. This prevents accidental removal of  
 135886 `<backslash>` characters in variable expansions where generating a list of matching files is not  
 135887 intended and a (usually oddly named) file with a matching name happens to exist. For example,  
 135888 a shell script that tries to be portable to systems that predate the introduction of functions and  
 135889 `printf` might use this on POSIX systems:

135890 `myecho='printf %s\n'`

135891 to be used as:

135892 `$myecho args...`

135893 If `%s\n` were to be matched against existing files, this would not work if a file called `%sn`  
 135894 happened to exist.

135895 Historical systems have varied in their permissions requirements. To match `f*/bar` has required  
 135896 read permissions on the `f*` directories in the System V shell, but the Shell and Utilities volume of  
 135897 POSIX.1-2024, the C shell, and KornShell require only search permissions. If read or search  
 135898 permission is denied, shells do not report an error but treat this as a successful "no match"  
 135899 condition. Error conditions that are related to file system contents and occur when attempting to  
 135900 read or search a directory are also required to be treated the same way because they imply that  
 135901 there are no matches (that are accessible to the process). For example, if the pattern is `foo/*bar`  
 135902 and attempting to open the directory `foo` fails because it does not exist or is not a directory, then  
 135903 there can be no matching pathnames. The error conditions listed in XSH Section 2.3 (on page  
 135904 507) that are related to file system contents and could occur when attempting to open or search a  
 135905 directory are [EACCES], [ELOOP], [ENAMETOOLONG], [ENOENT], and [ENOTDIR]. Error  
 135906 conditions that are not related to file system contents or which occur when reading a directory,  
 135907 notably [EMFILE] and [ENFILE] but also things like [EIO], [ENOMEM], and [EOVERFLOW],  
 135908 can either be treated as errors or be treated the same way as when permission is denied. Treating  
 135909 them as errors is seen as desirable, because to do otherwise would mean the shell could execute  
 135910 a command with an unchanged pattern when pathnames matching the pattern exist, but it is not  
 135911 historical practice. Implementations that handle the two categories of error differently should  
 135912 also handle non-standard error conditions appropriately, if encountered, depending on which

- 135913 category they fit into.
- 135914 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0043 [963] is applied.
- 135915 Austin Group Defect 1070 is applied, requiring that when the matching filenames or pathnames  
135916 are sorted, any that collate equally are further compared byte-by-byte using the collating  
135917 sequence for the POSIX locale.
- 135918 Austin Group Defect 1228 is applied, allowing directory entries for dot and dot-dot to be  
135919 ignored when matching patterns against existing filenames.
- 135920 Austin Group Defect 1234 is applied, changing the behavior of patterns used for filename  
135921 expansion such that a pattern is matched against existing filenames and pathnames only when it  
135922 contains a '\*', '?', or '[' character that will be treated as special.
- 135923 Austin Group Defects 1273 and 1275 are applied, clarifying how errors are treated when  
135924 attempting to open or search a pathname as a directory or attempting to read an opened  
135925 directory.

### 135926 C.2.15 Special Built-In Utilities

- 135927 See the RATIONALE sections on the individual reference pages.
- 135928 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0044 [882] and XCU/TC2-2008/0045  
135929 [654] are applied.
- 135930 Austin Group Defect 1009 is applied, clarifying the behavior when a special built-in utility is  
135931 executed with a variable assignment.
- 135932 Austin Group Defect 1445 is applied, changing text relating to the term "built-in".

## 135933 C.3 Utilities

- 135934 For the utilities included in POSIX.1-2024, see the RATIONALE sections on the individual  
135935 reference pages.

### 135936 C.3.1 Utilities Removed in this Version

- 135937 The following utilities were removed in this version of this standard:

135938	<i>qalter</i>	<i>qmove</i>	<i>qrls</i>	<i>qstat</i>
135939	<i>qdel</i>	<i>qmsg</i>	<i>qselect</i>	<i>qsub</i>
135940	<i>qhold</i>	<i>qrerun</i>	<i>qsig</i>	

### 135941 C.3.2 Utilities Removed in the Previous Version

- 135942 None.

135943 **C.3.3 Exclusion of Utilities**

135944 The set of utilities contained in POSIX.1-2024 is drawn from the base documents for IEEE Std  
135945 1003.2-1992, with one addition: the *c17* utility. This section contains rationale for some of the  
135946 deliberations that led to this set of utilities, and why certain utilities were excluded.

135947 Many utilities were evaluated by the standard developers; more historical utilities were  
135948 excluded from the base documents for IEEE Std 1003.2-1992 than included. The following list  
135949 contains many common UNIX system utilities that were not included as mandatory utilities, in  
135950 the User Portability Utilities option, in the XSI option, or in one of the software development  
135951 groups. It is logistically difficult for this rationale to distribute correctly the reasons for not  
135952 including a utility among the various utility options. Therefore, this section covers the reasons  
135953 for all utilities not included in POSIX.1-2024.

135954 This rationale is limited to a discussion of only those utilities actively or indirectly evaluated by  
135955 the IEEE Std 1003.2-1992 standard developers, rather than the list of all known UNIX utilities  
135956 from all its variants.

135957 *adb* The intent of the various software development utilities was to assist in the  
135958 installation (rather than the actual development and debugging) of applications.  
135959 This utility is primarily a debugging tool. Furthermore, many useful aspects of *adb*  
135960 are very hardware-specific.

135961 *as* Assemblers are hardware-specific and are included implicitly as part of the  
135962 compilers in POSIX.1-2024.

135963 *banner* The only known use of this command is as part of the *lp* printer header pages. It  
135964 was decided that the format of the header is implementation-defined, so this utility  
135965 is superfluous to application portability.

135966 *calendar* This reminder service program is not useful to conforming applications.

135967 *cancel* The *lp* (line printer spooling) system specified is the most basic possible and did  
135968 not need this level of application control.

135969 *chroot* This is primarily of administrative use, requiring superuser privileges.

135970 *col* No utilities defined in POSIX.1-2024 produce output requiring such a filter. The  
135971 *nroff* text formatter is present on many historical systems and will continue to  
135972 remain as an extension; *col* is expected to be shipped by all the systems that ship  
135973 *nroff*.

135974 *cpio* This has been replaced by *pax*, for reasons explained in the rationale for that utility.

135975 *cpp* This is subsumed by *c17*.

135976 *cu* This utility is terminal-oriented and is not useful from shell scripts or typical  
135977 application programs.

135978 *dc* The functionality of this utility can be provided by the *bc* utility; *bc* was selected  
135979 because it was easier to use and had superior functionality. Although the historical  
135980 versions of *bc* are implemented using *dc* as a base, POSIX.1-2024 prescribes the  
135981 interface and not the underlying mechanism used to implement it.

135982 *dircmp* Although a useful concept, the historical output of this directory comparison  
135983 program is not suitable for processing in application programs. Also, the *diff -r*  
135984 command gives equivalent functionality.

135985 *dis* Disassemblers are hardware-specific.

135986	<i>emacs</i>	The community of <i>emacs</i> editing enthusiasts was adamant that the full <i>emacs</i> editor not be included in IEEE Std 1003.2-1992 because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship versions conforming strictly to the standard, but lacking the extensibility required by the community. The author of the original <i>emacs</i> program also expressed his desire to omit the program. Furthermore, there were a number of historical UNIX systems that did not include <i>emacs</i> , or included it without supporting it, but there were very few that did not include and support <i>vi</i> .	
135987			
135988			
135989			
135990			
135991			
135992			
135993			
135994	<i>ld</i>	This is subsumed by <i>c17</i> .	
135995	<i>line</i>	The functionality of <i>line</i> can be provided with <i>read</i> .	
135996	<i>lint</i>	This technology is partially subsumed by <i>c17</i> . It is also hard to specify the degree of checking for possible error conditions in programs in any compiler, and specifying what <i>lint</i> would do in these cases is equally difficult.	
135997			
135998			
135999		It is fairly easy to specify what a compiler does. It requires specifying the language, what it does with that language, and stating that the interpretation of any incorrect program is unspecified. Unfortunately, any description of <i>lint</i> is required to specify what to do with erroneous programs. Since the number of possible errors and questionable programming practices is infinite, one cannot require <i>lint</i> to detect all errors of any given class.	
136000			
136001			
136002			
136003			
136004			
136005			
136006			
136007			
136008			
136009		Additionally, some vendors complained that since many compilers are distributed in a binary form without a <i>lint</i> facility (because the ISO C standard does not require one), implementing the standard as a stand-alone product will be much harder. Rather than being able to build upon a standard compiler component (simply by providing <i>c17</i> as an interface), source to that compiler would most likely need to be modified to provide the <i>lint</i> functionality. This was considered a major burden on system providers for a very small gain to developers (users).	
136010			
136011			
136012	<i>login</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs.	
136013			
136014	<i>lorder</i>	This utility is an aid in creating an implementation-defined detail of object libraries that the standard developers did not feel required standardization.	
136015			
136016	<i>lpstat</i>	The <i>lp</i> system specified is the most basic possible and did not need this level of application control.	
136017			
136018	<i>mail</i>	This utility was omitted in favor of <i>mailx</i> because there was a considerable functionality overlap between the two.	
136019			
136020	<i>mknod</i>	This was omitted in favor of <i>mkfifo</i> , as <i>mknod</i> has too many implementation-defined functions.	
136021			
136022	<i>news</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs.	
136023			
136024	<i>pack</i>	This compression program was considered inferior to <i>compress</i> .	
136025	<i>passwd</i>	This utility was proposed in an early draft of the IEEE Std 1003.2-1992 UPE but met with too many objections to be included. There were various reasons:	
136026			
136027			• Changing a password should not be viewed as a command, but as part of the login sequence. Changing a password should only be done while a trusted path is in effect.
136028			
136029			

136030		<ul style="list-style-type: none"> <li>• Even though the text in early drafts was intended to allow a variety of implementations to conform, the security policy for one site may differ from another site running with identical hardware and software. One site might use password authentication while the other did not. Vendors could not supply a <i>passwd</i> utility that would conform to POSIX.1-2024 for all sites using their system.</li> <li>• This is really a subject for a system administration working group or a security working group.</li> </ul>
136031		
136032		
136033		
136034		
136035		
136036		
136037		
136038	<i>pcat</i>	This compression program was considered inferior to <i>zcat</i> .
136039	<i>pg</i>	This duplicated many of the features of the <i>more</i> pager, which was preferred by the standard developers.
136040		
136041	<i>prof</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool.
136042		
136043		
136044	RCS	RCS was originally considered as part of a version control utilities portion of the scope. However, this aspect was abandoned by the standard developers. SCCS is now included as an optional part of the XSI option.
136045		
136046		
136047	<i>red</i>	Restricted editor. This was not considered by the standard developers because it never provided the level of security restriction required.
136048		
136049	<i>rsh</i>	Restricted shell. This was not considered by the standard developers because it does not provide the level of security restriction that is implied by historical documentation.
136050		
136051		
136052	<i>sdb</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool. Furthermore, some useful aspects of <i>sdb</i> are very hardware-specific.
136053		
136054		
136055		
136056	<i>sdiff</i>	The “side-by-side <i>diff</i> ” utility from System V was omitted because it is used infrequently, and even less so by conforming applications. Despite being in System V, it is not in the SVID or XPG.
136057		
136058		
136059	<i>shar</i>	Any of the numerous “shell archivers” were excluded because they did not meet the requirement of existing practice.
136060		
136061	<i>shl</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs. The job control aspects of the shell command language are generally more useful.
136062		
136063		
136064	<i>size</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool.
136065		
136066		
136067	<i>spell</i>	This utility is not useful from shell scripts or typical application programs. The <i>spell</i> utility was considered, but was omitted because there is no known technology that can be used to make it recognize general language for user-specified input without providing a complete dictionary along with the input file.
136068		
136069		
136070		
136071	<i>su</i>	This utility is not useful from shell scripts or typical application programs. (There was also sentiment to avoid security-related utilities.)
136072		

136073	<i>sum</i>	This utility was renamed <i>cksum</i> .
136074	<i>tar</i>	This has been replaced by <i>pax</i> , for reasons explained in the rationale for that utility.
136075	<i>unpack</i>	This compression program was considered inferior to <i>uncompress</i> .
136076	<i>wall</i>	This utility is terminal-oriented and is not useful in shell scripts or typical applications. It is generally used only by system administrators.
136077

*The Institute of Electrical and Electronics Engineers, Inc.*

136083

136084

## Portability Considerations (Informative)

136085

This section contains information to satisfy various international requirements:

136086

- [Section D.1](#) describes perceived user requirements.

136087

- [Section D.2](#) (on page 3923) indicates how the facilities of POSIX.1-2024 satisfy those requirements.

136088

136089

- [Section D.3](#) (on page 3931) offers guidance to writers of profiles on how the configurable options, limits, and optional behavior of POSIX.1-2024 should be cited in profiles.

136090

### D.1 User Requirements

136092

This section describes the user requirements that were perceived by the standard developers. The primary source for these requirements was an analysis of historical practice in widespread use, as typified by the base documents for the ISO POSIX-1: 1996 standard.

136093

136094

136095

POSIX.1-2024 addresses the needs of users requiring open systems solutions for source code portability of applications. It currently addresses users requiring open systems solutions for source-code portability of applications involving multi-programming and process management (creating processes, signaling, and so on); access to files and directories in a hierarchy of file systems (opening, reading, writing, deleting files, and so on); access to asynchronous communications ports and other special devices; access to information about other users of the system; facilities supporting applications requiring bounded (realtime) response.

136096

136097

136098

136099

136100

136101

136102

The following users are identified for POSIX.1-2024:

136103

- Those employing applications written in high-level languages, such as C, Ada, or FORTRAN.

136104

136105

- Users who desire conforming applications that do not necessarily require the characteristics of high-level languages (for example, the speed of execution of compiled languages or the relative security of source code intellectual property inherent in the compilation process).

136106

136107

136108

136109

- Users who desire conforming applications that can be developed quickly and can be modified readily without the use of compilers and other system components that may be unavailable on small systems or those without special application development capabilities.

136110

136111

136112

136113

- Users who interact with a system to achieve general-purpose time-sharing capabilities common to most business or government offices or academic environments: editing, filing, inter-user communications, printing, and so on.

136114

136115

136116

- Users who develop applications for POSIX-conformant systems.

136117

- Users who develop applications for UNIX systems.

136118

An acknowledged restriction on applicable users is that they are limited to the group of individuals who are familiar with the style of interaction characteristic of historically-derived systems based on one of the UNIX operating systems (as opposed to other historical systems with different models, such as MS/DOS, Macintosh, VMS, MVS, and so on). Typical users

136119

136120

136121

- 136122 would include program developers, engineers, or general-purpose time-sharing users.
- 136123 The requirements of users of POSIX.1-2024 can be summarized as a single goal: *application source portability*. The requirements of the user are stated in terms of the requirements of portability of applications. This in turn becomes a requirement for a standardized set of syntax and semantics for operations commonly found on many operating systems.
- 136124
- 136125
- 136126
- 136127 The following sections list the perceived requirements for application portability.

#### 136128 **D.1.1 Configuration Interrogation**

- 136129 An application must be able to determine whether and how certain optional features are provided and to identify the system upon which it is running, so that it may appropriately adapt to its environment.
- 136130
- 136131
- 136132 Applications must have sufficient information to adapt to varying behaviors of the system.

#### 136133 **D.1.2 Process Management**

- 136134 An application must be able to manage itself, either as a single process or as multiple processes. Applications must be able to manage other processes when appropriate.
- 136135
- 136136 Applications must be able to identify, control, create, and delete processes, and there must be communication of information between processes and to and from the system.
- 136137
- 136138 Applications must be able to use multiple flows of control with a process (threads) and synchronize operations between these flows of control.
- 136139

#### 136140 **D.1.3 Access to Data**

- 136141 Applications must be able to operate on the data stored on the system, access it, and transmit it to other applications. Information must have protection from unauthorized or accidental access or modification.
- 136142
- 136143

#### 136144 **D.1.4 Access to the Environment**

- 136145 Applications must be able to access the external environment to communicate their input and results.
- 136146

#### 136147 **D.1.5 Access to Determinism and Performance Enhancements**

- 136148 Applications must have sufficient control of resource allocation to ensure the timeliness of interactions with external objects.
- 136149

**136150 D.1.6 Operating System-Dependent Profile**

136151 The capabilities of the operating system may make certain optional characteristics of the base  
136152 language in effect no longer optional, and this should be specified.

**136153 D.1.7 I/O Interaction**

136154 The interaction between the C language I/O subsystem (*stdio*) and the I/O subsystem of  
136155 POSIX.1-2024 must be specified.

**136156 D.1.8 Internationalization Interaction**

136157 The effects of the environment of POSIX.1-2024 on the internationalization facilities of the C  
136158 language must be specified.

**136159 D.1.9 C-Language Extensions**

136160 Certain functions in the C language must be extended to support the additional capabilities  
136161 provided by POSIX.1-2024.

**136162 D.1.10 Command Language**

136163 Users should be able to define procedures that combine simple tools and/or applications into  
136164 higher-level components that perform to the specific needs of the user. The user should be able  
136165 to store, recall, use, and modify these procedures. These procedures should employ a powerful  
136166 command language that is used for recurring tasks in conforming applications (scripts) in the  
136167 same way that it is used interactively to accomplish one-time tasks. The language and the  
136168 utilities that it uses must be consistent between systems to reduce errors and retraining.

**136169 D.1.11 Interactive Facilities**

136170 Use the system to accomplish individual tasks at an interactive terminal. The interface should be  
136171 consistent, intuitive, and offer usability enhancements to increase the productivity of terminal  
136172 users, reduce errors, and minimize retraining costs. Online documentation or usage assistance  
136173 should be available.

**136174 D.1.12 Accomplish Multiple Tasks Simultaneously**

136175 Access applications and interactive facilities from a single terminal without requiring serial  
136176 execution: switch between multiple interactive tasks; schedule one-time or periodic background  
136177 work; display the status of all work in progress or scheduled; influence the priority scheduling  
136178 of work, when authorized.

**136179 D.1.13 Complex Data Manipulation**

136180 Manipulate data in files in complex ways: sort, merge, compare, translate, edit, format, pattern  
136181 match, select subsets (strings, columns, fields, rows, and so on). These facilities should be  
136182 available to both conforming applications and interactive users.

**136183 D.1.14 File Hierarchy Manipulation**

136184 Create, delete, move/rename, copy, backup/archive, and display files and directories. These  
136185 facilities should be available to both conforming applications and interactive users.

**136186 D.1.15 Locale Configuration**

136187 Customize applications and interactive sessions for the cultural and language conventions of the  
136188 user. Employ a wide variety of standard character encodings. These facilities should be available  
136189 to both conforming applications and interactive users.

**136190 D.1.16 Inter-User Communication**

136191 Send messages or transfer files to other users on the same system or other systems on a network.  
136192 These facilities should be available to both conforming applications and interactive users.

**136193 D.1.17 System Environment**

136194 Display information about the status of the system (activities of users and their interactive and  
136195 background work, file system utilization, system time, configuration, and presence of optional  
136196 facilities) and the environment of the user (terminal characteristics, and so on). Inform the  
136197 system operator/administrator of problems. Control access to user files and other resources.

**136198 D.1.18 Printing**

136199 Output files on a variety of output device classes, accessing devices on local or network-  
136200 connected systems. Control (or influence) the formatting, priority scheduling, and output  
136201 distribution of work. These facilities should be available to both conforming applications and  
136202 interactive users.

**136203 D.1.19 Software Development**

136204 Develop (create and manage source files, compile/interpret, debug) portable open systems  
136205 applications and package them for distribution to, and updating of, other systems.

## 136206 D.2 Portability Capabilities

136207 This section describes the significant portability capabilities of POSIX.1-2024 and indicates how  
 136208 the user requirements listed in [Section D.1](#) (on page 3919) are addressed. The capabilities are  
 136209 listed in the same format as the preceding user requirements; they are summarized below:

- 136210 • Configuration Interrogation
- 136211 • Process Management
- 136212 • Access to Data
- 136213 • Access to the Environment
- 136214 • Access to Determinism and Performance Enhancements
- 136215 • Operating System-Dependent Profile
- 136216 • I/O Interaction
- 136217 • Internationalization Interaction
- 136218 • C-Language Extensions
- 136219 • Command Language
- 136220 • Interactive Facilities
- 136221 • Accomplish Multiple Tasks Simultaneously
- 136222 • Complex Data Manipulation
- 136223 • File Hierarchy Manipulation
- 136224 • Locale Configuration
- 136225 • Inter-User Communication
- 136226 • System Environment
- 136227 • Printing
- 136228 • Software Development

### 136229 D.2.1 Configuration Interrogation

136230 The *uname()* operation provides basic identification of the system. The *sysconf()*, *pathconf()*, and  
 136231 *fpathconf()* functions and the *getconf* utility provide means to interrogate the implementation to  
 136232 determine how to adapt to the environment in which it is running. These values can be either  
 136233 static (indicating that all instances of the implementation have the same value) or dynamic  
 136234 (indicating that different instances of the implementation have the different values, or that the  
 136235 value may vary for other reasons, such as reconfiguration).

### 136236 Unsatisfied Requirements

136237 None directly. However, as new areas are added, there will be a need for additional capability in  
 136238 this area.

## 136239 D.2.2 Process Management

136240 The *fork()*, *exec* family, *posix\_spawn()*, and *posix\_spawnp()* functions provide for the creation of  
 136241 new processes or the insertion of new applications into existing processes. The *\_Exit()*, *\_exit()*,  
 136242 *exit()*, and *abort()* functions allow for the termination of a process by itself. The *wait()*, *waitid()*,  
 136243 and *waitpid()* functions allow one process to deal with the termination of another.

136244 The *times()* function allows for basic measurement of times used by a process. Various  
 136245 functions, including *fstat()*, *getegid()*, *geteuid()*, *getgid()*, *getgrgid()*, *getgrnam()*, *getlogin()*,  
 136246 *getpid()*, *getppid()*, *getpwnam()*, *getpwuid()*, *getuid()*, *lstat()*, and *stat()*, provide for access to the  
 136247 identifiers of processes and the identifiers and names of owners of processes (and files).

136248 The various functions operating on environment variables provide for communication of  
 136249 information (primarily user-configurable defaults) from a parent to child processes.

136250 The operations on the current working directory control and interrogate the directory from  
 136251 which relative pathname searches start. The *umask()* function controls the default protections  
 136252 applied to files created by the process.

136253 The *alarm()*, *pause()*, *sleep()*, *ualarm()*, and *usleep()* operations allow the process to suspend until  
 136254 a timer has expired or to be notified when a period of time has elapsed. The *time()* operation  
 136255 interrogates the current time and date.

136256 The signal mechanism provides for communication of events either from other processes or  
 136257 from the environment to the application, and the means for the application to control the effect  
 136258 of these events. The mechanism provides for external termination of a process and for a process  
 136259 to suspend until an event occurs. The mechanism also provides for a value to be associated with  
 136260 an event.

136261 Job control provides a means to group processes and control them as groups, and to control their  
 136262 access to the function between the user and the system (the “controlling terminal”). It also  
 136263 provides the means to suspend and resume processes.

136264 The Process Scheduling option provides control of the scheduling and priority of a process.

136265 The Message Passing option provides a means for interprocess communication involving small  
 136266 amounts of data.

136267 The Memory Management facilities provide control of memory resources and for the sharing of  
 136268 memory. This functionality is mandatory on POSIX-conforming systems.

136269 The Threads facilities provide multiple flows of control with a process (threads),  
 136270 synchronization between threads (including mutexes, barriers, and spin locks), association of  
 136271 data with threads, and controlled cancellation of threads.

136272 The XSI interprocess communications functionality provide an alternate set of facilities to  
 136273 manipulate semaphores, message queues, and shared memory. These are provided on XSI-  
 136274 conformant systems to support conforming applications developed to run on UNIX systems.

## 136275 D.2.3 Access to Data

136276 The *open()*, *close()*, *fclose()*, *fopen()*, *freopen()*, *pipe()*, and *pipe2()* functions provide for access to  
 136277 files and data. Such files may be regular files, interprocess data channels (pipes), or devices.  
 136278 Additional types of objects in the file system are permitted and are being contemplated for  
 136279 standardization.

136280 The *access()*, *chmod()*, *chown()*, *dup()*, *dup2()*, *dup3()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*,  
 136281 *futimens()*, *lstat()*, *readlink()*, *realpath()*, *stat()*, and *utimensat()* functions allow for control and

136282 interrogation of file and file-related objects (including symbolic links), and their ownership,  
136283 protections, and timestamps.

136284 The *fgetc()*, *fputc()*, *fread()*, *fseek()*, *fsetpos()*, *fwrite()*, *getc()*, *getchar()*, *lseek()*, *putchar()*, *putc()*,  
136285 *read()*, and *write()* functions provide for data transfer from the application to files (in all their  
136286 forms).

136287 The *closedir()*, *link()*, *mkdir()*, *opendir()*, *readdir()*, *rename()*, *rmdir()*, *rewinddir()*, and *unlink()*  
136288 functions provide for a complete set of operations on directories. Directories can arbitrarily  
136289 contain other directories, and a single file can be mentioned in more than one directory.

136290 The *faccessat()*, *openat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*, *renameat()*, *readlinkat()*,  
136291 *symlinkat()*, and *unlinkat()* functions allow for race-free and thread-safe file access. The  
136292 motivation for the introduction of these functions was as follows:

- 136293 • Interfaces taking a pathname may be limited by the maximum length of a pathname  
136294 (`{PATH_MAX}`). The absolute path of files can far exceed this length. The alternative  
136295 solution of changing the working directory and using relative pathnames is not thread-  
136296 safe.
- 136297 • A second motivation is that files accessed outside the current working directory are subject  
136298 to attacks caused by the race condition created by changing any of the elements of the  
136299 pathnames used.
- 136300 • A third motivation is to allow application code which makes use of a virtual current  
136301 working directory for each individual thread. In the alternative model there is only one  
136302 current working directory for all threads.

136303 The file-locking mechanisms provide for advisory locking (protection during transactions) of  
136304 ranges of bytes (in effect, records) in a file.

136305 The *confstr()*, *fpathconf()*, *pathconf()*, and *sysconf()* functions provide for enquiry as to the  
136306 behavior of the system where variability is permitted.

136307 The asynchronous input and output functions *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*,  
136308 *aio\_return()*, *aio\_suspend()*, *aio\_write()*, and *lio\_listio()* provide for initiation and control of  
136309 asynchronous data transfers.

136310 The Synchronized Input and Output option provides for assured commitment of data to media.

#### 136311 D.2.4 Access to the Environment

136312 The operations and types in XBD are provided for access to asynchronous serial devices. The  
136313 primary intended use for these is the controlling terminal for the application (the interaction  
136314 point between the user and the system). They are general enough to be used to control any  
136315 asynchronous serial device. The functions are also general enough to be used with many other  
136316 device types as a user interface when some emulation is provided.

136317 Less detailed access is provided for other device types, but in many instances an application  
136318 need not know whether an object in the file system is a device or a regular file to operate  
136319 correctly.

136320 **Unsatisfied Requirements**

136321 Detailed control of common device classes, specifically magnetic tape, is not provided.

136322 **D.2.5 Bounded (Realtime) Response**136323 The realtime signal functions *sigqueue()*, *sigtimedwait()*, and *sigwaitinfo()* provide queued signals  
136324 and the prioritization of the handling of signals.136325 The SCHED\_FIFO, SCHED\_SPORADIC, and SCHED\_RR scheduling policies provide control  
136326 over processor allocation.136327 The semaphore functions *sem\_clockwait()*, *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*,  
136328 *sem\_open()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*, and *sem\_wait()* provide  
136329 high-performance synchronization.136330 The memory management functions provide memory locking for control of memory allocation,  
136331 file mapping for high performance, and shared memory for high-performance interprocess  
136332 communication. The Message Passing option provides for interprocess communication without  
136333 being dependent on shared memory.136334 The timers functions *clock\_getres()*, *clock\_gettime()*, *clock\_settime()*, *nanosleep()*, *timer\_create()*,  
136335 *timer\_delete()*, *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* provide functionality to  
136336 manipulate clocks and timers and include a high resolution function called *nanosleep()* with a  
136337 finer resolution than the *sleep()* function.136338 The timeout functions — *pthread\_mutex\_clocklock()*, *pthread\_mutex\_timedlock()*,  
136339 *pthread\_rwlock\_clockrdlock()*, *pthread\_rwlock\_clockwrlock()*, *pthread\_rwlock\_timedrdlock()*,  
136340 *pthread\_rwlock\_timedwrlock()*, *sem\_clockwait()*, and *sem\_timedwait()* — the Typed Memory  
136341 Objects option and the Monotonic Clock facility provide further facilities for applications to use  
136342 to obtain predictable bounded response.136343 **D.2.6 Operating System-Dependent Profile**136344 POSIX.1-2024 makes no distinction between text and binary files. The values of EXIT\_SUCCESS  
136345 and EXIT\_FAILURE are further defined.136346 **Unsatisfied Requirements**136347 None known, but the ISO C standard may contain some additional options that could be  
136348 specified.136349 **D.2.7 I/O Interaction**136350 POSIX.1-2024 defines how each of the ISO C standard *stdio* functions interact with the POSIX.1  
136351 operations, typically specifying the behavior in terms of POSIX.1 operations.

136352 **Unsatisfied Requirements**

136353 None.

136354 **D.2.8 Internationalization Interaction**

136355 The POSIX.1-2024 environment operations provide a means to define the environment for  
 136356 *setlocale()* and time functions such as *ctime()*. The *tzset()* function is provided to set time  
 136357 conversion information.

136358 The *nl\_langinfo()* function is provided to query locale-specific cultural settings.

136359 The multiple concurrent locale functions *duplocale()*, *freelocale()*, *is\*\_l()*, *newlocale()*,  
 136360 *strcasemp\_l()*, *strcoll\_l()*, *strfmon\_l()*, *strncasemp\_l()*, *strxfrm\_l()*, *tolower\_l()*, *toupper\_l()*,  
 136361 *towctrans\_l()*, *towlower()*, *towupper()*, *uselocale()*, *wscasemp\_l()*, *wscoll\_l()*, *wscncasemp\_l()*,  
 136362 *wcsxfrm\_l()*, *wctrans\_l()*, and *wctype\_l()* are provide to support per-thread locale information.

136363 **Unsatisfied Requirements**

136364 None.

136365 **D.2.9 C-Language Extensions**

136366 The *setjmp()* and *longjmp()* functions are not defined to be cognizant of the signal masks defined  
 136367 for POSIX.1. The *sigsetjmp()* and *siglongjmp()* functions are provided to fill this gap.

136368 **Unsatisfied Requirements**

136369 None.

136370 **D.2.10 Command Language**

136371 The shell command language, as described in XCU [Chapter 2](#) (on page 2472), is a common  
 136372 language useful in batch scripts, through an API to high-level languages (for the C-Language  
 136373 Binding option, *system()* and *popen()*) and through an interactive terminal (see the *sh* utility).  
 136374 The shell language has many of the characteristics of a high-level language, but it has been  
 136375 designed to be more suitable for user terminal entry and includes interactive debugging  
 136376 facilities. Through the use of pipelining, many complex commands can be constructed from  
 136377 combinations of data filters and other common components. Shell scripts can be created, stored,  
 136378 recalled, and modified by the user with simple editors.

136379 In addition to the basic shell language, the following utilities offer features that simplify and  
 136380 enhance programmatic access to the utilities and provide features normally found only in high-  
 136381 level languages: *basename*, *bc*, *command*, *dirname*, *echo*, *env*, *expr*, *false*, *printf*, *read*, *sleep*, *tee*, *test*,  
 136382 *time\**,<sup>10</sup> *true*, *wait*, *xargs*, and all of the special built-in utilities in XCU [Section 2.15](#) (on page 2526).

---

136383 10. The utilities listed with an asterisk here and later in this section are present only on systems which support the User Portability Utilities  
 136384 option. There may be further restrictions on the utilities offered with various configuration option combinations; see the individual utility  
 136385 descriptions.

136386 **Unsatisfied Requirements**

136387 None.

136388 **D.2.11 Interactive Facilities**

136389 The utilities offer a common style of command-line interface through conformance to the Utility  
 136390 Syntax Guidelines (see XBD [Section 12.2](#), on page 215) and the common utility defaults (see XCU  
 136391 [Section 1.4](#), on page 2462). The *sh* utility offers an interactive command-line history and editing  
 136392 facility.

136393 The following utilities can be used interactively as well as by scripts; *alias*, *fc*, *mailx*, *unalias*, and  
 136394 *write*.

136395 The following utilities in the User Portability Utilities option provide for interactive use: *ex*, *more*,  
 136396 and *vi*; the *man* utility offers online access to system documentation.

136397 **Unsatisfied Requirements**

136398 The command line interface to individual utilities is as intuitive and consistent as historical  
 136399 practice allows. Work underway based on graphical user interfaces may be more suitable for  
 136400 novice or occasional users of the system.

136401 **D.2.12 Accomplish Multiple Tasks Simultaneously**

136402 The shell command language offers background processing through the asynchronous list  
 136403 command form; see XCU [Section 2.9](#) (on page 2499).

136404 The *nohup* utility makes background processing more robust and usable.

136405 The *kill* utility can terminate background jobs.

136406 The following utilities support periodic job scheduling, control, and display: *at*, *batch*, *crontab*,  
 136407 *nice*, *ps*, and *renice*.

136408 When the User Portability Utilities option is supported, the following utilities allow  
 136409 manipulation of jobs: *bg*, *fg*, and *jobs*.

136410 **Unsatisfied Requirements**

136411 Terminals with multiple windows may be more suitable for some multi-tasking interactive uses  
 136412 than the job control approach in POSIX.1-2024. See the comments on graphical user interfaces in  
 136413 [Section D.2.11](#). The *nice* and *renice* utilities do not necessarily take advantage of complex system  
 136414 scheduling algorithms that are supported by the realtime options within POSIX.1-2024.

136415 **D.2.13 Complex Data Manipulation**

136416 The following utilities address user requirements in this area: *asa*, *awk*, *bc*, *cmp*, *comm*, *csplit*, *cut*,  
 136417 *dd*, *diff*, *ed*, *ex\**, *expand*, *expr*, *find*, *fold*, *grep*, *head*, *join*, *od*, *paste*, *pr*, *printf*, *sed*, *sort*, *split*, *tabs*, *tail*, *tr*,  
 136418 *unexpand*, *uniq*, *uudecode*, *uuencode*, and *wc*.

136419 **Unsatisfied Requirements**

136420 Sophisticated text formatting utilities, such as *troff* or *TeX*, are not included. Standards work in  
136421 the area of SGML may satisfy this.

136422 **D.2.14 File Hierarchy Manipulation**

136423 The following utilities address user requirements in this area: *basename*, *cd*, *chgrp*, *chmod*, *chown*,  
136424 *cksum*, *cp*, *dd*, *df*, *diff*, *dirname*, *du*, *find*, *ls*, *ln*, *mkdir*, *mkfifo*, *mv*, *patch*, *pathchk*, *pax*, *pwd*, *rm*, *rmdir*,  
136425 *test*, and *touch*.

136426 **Unsatisfied Requirements**

136427 Some graphical user interfaces offer more intuitive file manager components that allow file  
136428 manipulation through the use of icons for novice users.

136429 **D.2.15 Locale Configuration**

136430 The standard utilities are affected by the various *LC\_* variables to achieve locale-dependent  
136431 operation: character classification, collation sequences, regular expressions and shell pattern  
136432 matching, date and time formats, numeric formatting, and monetary formatting. When the  
136433 POSIX2\_LOCALEDEF option is supported, applications can provide their own locale definition  
136434 files.

136435 The following utilities address user requirements in this area: *date*, *ed*, *ex\**, *find*, *grep*, *locale*,  
136436 *localedef*, *more\**, *sed*, *sh*, *sort*, *tr*, *uniq*, and *vi\**.

136437 The *iconv()*, *iconv\_close()*, and *iconv\_open()* functions are available to allow an application to  
136438 convert character data between supported character sets.

136439 The *genccat* utility and the *catopen()*, *catclose()*, and *catgets()* functions provide for message  
136440 catalog manipulation.

136441 **Unsatisfied Requirements**

136442 Some aspects of multi-byte character and state-encoded character encodings have not yet been  
136443 addressed. The C-language functions, such as *getopt()*, are generally limited to single-byte  
136444 characters. The effect of the *LC\_MESSAGES* variable on message formats is only suggested at  
136445 this time.

136446 **D.2.16 Inter-User Communication**

136447 The following utilities address user requirements in this area: *cksum*, *mailx*, *mesg*, *patch*, *pax*, *talk*,  
136448 *uudecode*, *uuencode*, *who*, and *write*.

136449 The historical UUCP utilities are included as a separate UUCP Utilities option.

136450 **Unsatisfied Requirements**

136451 None.

136452 **D.2.17 System Environment**136453 The following utilities address user requirements in this area: *chgrp*, *chmod*, *chown*, *df*, *du*, *env*,  
136454 *getconf*, *id*, *logger*, *logname*, *mesg*, *newgrp*, *ps*, *stty*, *tput*, *tty*, *umask*, *uname*, and *who*.136455 The *closelog()*, *openlog()*, *setlogmask()*, and *syslog()* functions provide system logging facilities on  
136456 XSI-conformant systems; these are analogous to the *logger* utility.136457 **Unsatisfied Requirements**

136458 None.

136459 **D.2.18 Printing**136460 The following utilities address user requirements in this area: *pr* and *lp*.136461 **Unsatisfied Requirements**

136462 There are no features to control the formatting or scheduling of the print jobs.

136463 **D.2.19 Software Development**136464 The following utilities address user requirements in this area: *ar*, *asa*, *awk*, *c17*, *ctags*, *getconf*,  
136465 *getopts*, *lex*, *localedef*, *make*, *nm*, *od*, *patch*, *pax*, *strings*, *strip*, *time*, and *yacc*.136466 The *system()*, *popen()*, *pclose()*, *regcomp()*, *regexec()*, *regerror()*, *regfree()*, *fnmatch()*, *getopt()*,  
136467 *glob()*, *globfree()*, *wordexp()*, and *wordfree()* functions allow C-language programmers to access  
136468 some of the interfaces used by the utilities, such as argument processing, regular expressions,  
136469 and pattern matching.136470 The SCCS source-code control system utilities are available on systems supporting the XSI  
136471 Development option.136472 **Unsatisfied Requirements**136473 There are no language-specific development tools related to languages other than C. There is no  
136474 data dictionary or other CASE-like development tools.136475 **D.2.20 Future Growth**136476 It is arguable whether or not all functionality to support applications is potentially within the  
136477 scope of POSIX.1-2024. As a simple matter of practicality, it cannot be. Areas such as graphics,  
136478 application domain-specific functionality, windowing, and so on, should be in unique standards.  
136479 As such, they are properly “Unsatisfied Requirements” in terms of providing fully conforming  
136480 applications, but ones which are outside the scope of POSIX.1-2024.136481 However, as the standards evolve, certain functionality once considered “exotic” enough to be  
136482 part of a separate standard become common enough to be included in a core standard such as  
136483 this. Realtime and networking, for example, have both moved from separate standards (with  
136484 much difficult cross-referencing) into this standard over time, and although no specific areas

136485 have been identified for inclusion in a future version, such inclusions seem likely.

### 136486 **D.3 Profiling Considerations**

136487 This section offers guidance to writers of profiles on how the configurable options, limits, and  
 136488 optional behavior of POSIX.1-2024 should be cited in profiles. Profile writers should consult the  
 136489 general guidance in POSIX.0 when writing POSIX Standardized Profiles.

136490 The information in this section is an inclusive list of features that should be considered by profile  
 136491 writers. Subsetting of POSIX.1-2024 should follow XBD [Section 2.1.5.1](#) (on page 20). A set of  
 136492 profiling options is described in [Appendix E](#) (on page 3943).

#### 136493 **D.3.1 Configuration Options**

136494 There are two set of options suggested by POSIX.1-2024: those for POSIX-conforming systems  
 136495 and those for X/Open System Interface (XSI) conformance. The requirements for XSI  
 136496 conformance are documented in the Base Definitions volume of POSIX.1-2024 and not discussed  
 136497 further here, as they superset the POSIX conformance requirements.

#### 136498 **D.3.2 Configuration Options (Shell and Utilities)**

136499 There are three broad optional configurations for the Shell and Utilities volume of POSIX.1-2024:  
 136500 basic execution system, development system, and user portability interactive system. The  
 136501 options to support these, and other minor configuration options, are listed in XBD [Chapter 2](#) (on  
 136502 page 15). Profile writers should consult the following list and the comments concerning user  
 136503 requirements addressed by various components in [Section D.2](#) (on page 3923).

136504 POSIX2\_UPE

136505 The system supports the User Portability Utilities option.

136506 This option is a requirement for a user portability interactive system. It is required  
 136507 frequently except for those systems, such as embedded realtime or dedicated application  
 136508 systems, that support little or no interactive time-sharing work by users or operators. XSI-  
 136509 conformant systems support this option.

136510 POSIX2\_SW\_DEV

136511 The system supports the Software Development Utilities option.

136512 This option is required by many systems, even those in which actual software development  
 136513 does not occur. The *make* utility, in particular, is required by many application software  
 136514 packages as they are installed onto the system. If POSIX2\_C\_DEV is supported,  
 136515 POSIX2\_SW\_DEV is almost a mandatory requirement because of *ar* and *make*.

136516 POSIX2\_C\_BIND

136517 The system supports the C-Language Bindings option.

136518 This option is required on some implementations developing complex C applications or on  
 136519 any system installing C applications in source form that require the functions in this option.  
 136520 The *system()* and *popen()* functions, in particular, are widely used by applications; the  
 136521 others are rather more specialized.

136522 POSIX2\_C\_DEV

136523 The system supports the C-Language Development Utilities option.

136524 This option is required by many systems, even those in which actual C-language software

136525 development does not occur. The *c17* utility, in particular, is required by many application  
 136526 software packages as they are installed onto the system. The *lex* and *yacc* utilities are used  
 136527 less frequently.

#### 136528 POSIX2\_FORT\_RUN

136529 The system supports the FORTRAN Runtime Utilities option.

136530 This option is required for some FORTRAN applications that need the *asa* utility to convert  
 136531 Hollerith printing statement output. It is unknown how frequently this occurs.

#### 136532 POSIX2\_LOCALEDEF

136533 The system supports the creation of locales.

136534 This option is needed if applications require their own customized locale definitions to  
 136535 operate. It is presently unknown whether many applications are dependent on this.  
 136536 However, the option is virtually mandatory for systems in which internationalized  
 136537 applications are developed.

136538 XSI-conformant systems support this option.

#### 136539 POSIX2\_CHAR\_TERM

136540 The system supports at least one terminal type capable of all operations described in  
 136541 POSIX.1-2024.

136542 On systems with POSIX2\_UPE, this option is almost always required. It was developed  
 136543 solely to allow certain specialized vendors and user applications to bypass the requirement  
 136544 for general-purpose asynchronous terminal support. For example, an application and  
 136545 system that was suitable for block-mode terminals would not need this option.

136546 XSI-conformant systems support this option.

### 136547 D.3.3 Configurable Limits

136548 Very few of the limits need to be increased for profiles. No profile can cite lower values.

136549 {POSIX2\_BC\_BASE\_MAX}

136550 {POSIX2\_BC\_DIM\_MAX}

136551 {POSIX2\_BC\_SCALE\_MAX}

136552 {POSIX2\_BC\_STRING\_MAX}

136553 No increase is anticipated for any of these *bc* values, except for very specialized applications  
 136554 involving huge numbers.

136555 {POSIX2\_COLL\_WEIGHTS\_MAX}

136556 Some natural languages with complex collation requirements require an increase from the  
 136557 default 2 to 4; no higher numbers are anticipated.

136558 {POSIX2\_EXPR\_NEST\_MAX}

136559 No increase is anticipated.

136560 {POSIX2\_LINE\_MAX}

136561 This number is much larger than most historical applications have been able to use. At some  
 136562 future time, applications may be rewritten to take advantage of even larger values.

136563 {POSIX2\_RE\_DUP\_MAX}

136564 No increase is anticipated.

136565 {POSIX2\_VERSION}

136566 This is actually not a limit, but a standard version stamp. Generally, a profile should specify  
 136567 XCU [Chapter 2](#) (on page 2472) by name in the normative references section, not this value.

### 136568 D.3.4 Configuration Options (System Interfaces)

136569 {NGROUPS\_MAX}

136570 A non-zero value indicates that the implementation supports supplementary groups.

136571 This option is needed where there is a large amount of shared use of files, but where a  
 136572 certain amount of protection is needed. Many profiles<sup>11</sup> are known to require this option; it  
 136573 should only be required if needed, but it should never be prohibited.

136574 \_POSIX\_ADVISORY\_INFO

136575 The system provides advisory information for file management.

136576 This option allows the application to specify advisory information that can be used to  
 136577 achieve better or even deterministic response time in file manager or input and output  
 136578 operations.

136579 \_POSIX\_ASYNCHRONOUS\_IO

136580 Support for asynchronous input and output is mandatory in POSIX.1-2024.

136581 \_POSIX\_BARRIERS

136582 Support for barrier synchronization is mandatory in POSIX.1-2024.

136583 This facility allows efficient synchronization of multiple parallel threads in multi-processor  
 136584 systems in which the operation is supported in part by the hardware architecture.

136585 \_POSIX\_CHOWN\_RESTRICTED

136586 The system restricts the right to “give away” files to other users. It is mandatory that an  
 136587 implementation be able to support this facility in POSIX.1-2024; however, it is recognized  
 136588 that implementations need not enable the functionality by default.

136589 Some applications expect that they can change the ownership of files in this way. It is  
 136590 provided where either security or system account requirements cause this ability to be a  
 136591 problem. It is also known to be specified in many profiles.

136592 \_POSIX\_CLOCK\_SELECTION

136593 Support for clock selection is mandatory in POSIX.1-2024.

136594 This facility allows applications to request a high resolution sleep in order to suspend a  
 136595 thread during a relative time interval, or until an absolute time value, using the desired  
 136596 clock. It also allows the application to select the clock used in a *pthread\_cond\_timedwait()*  
 136597 function call.

136598 \_POSIX\_CPUTIME

136599 The system supports the Process CPU-Time Clocks option.

136600 This option allows applications to use a new clock that measures the execution times of  
 136601 processes or threads, and the possibility to create timers based upon these clocks, for  
 136602 runtime detection (and treatment) of execution time overruns.

136603 \_POSIX\_FSYNC

136604 The system supports file synchronization requests.

136605 This option was created to support historical systems that did not provide the feature.  
 136606 Applications that are expecting guaranteed completion of their input and output operations  
 136607 should require the \_POSIX\_SYNC\_IO option. This option should never be prohibited.

136608 XSI-conformant systems support this option.

---

136609 11. There are no formally approved profiles of POSIX.1-2024 at the time of publication; the reference here is to various profiles generated by  
 136610 private bodies or governments.

136611	<code>_POSIX_IPV6</code>	
136612		The system supports facilities related to Internet Protocol Version 6 (IPv6).
136613		This option was created to allow systems to transition to IPv6.
136614	<code>_POSIX_JOB_CONTROL</code>	
136615		Support for job control is mandatory in POSIX.1-2024.
136616		Most applications that use it can run when it is not present, although with a degraded level
136617		of user convenience.
136618	<code>_POSIX_MAPPED_FILES</code>	
136619		Support for memory mapped files is mandatory in POSIX.1-2024.
136620		This facility provides for the mapping of regular files into the process address space.
136621		Both this facility and the Shared Memory Objects option provide shared access to memory
136622		objects in the process address space. The <code>mmap()</code> and <code>munmap()</code> functions provide the
136623		functionality of existing practice for mapping regular files. This functionality was deemed
136624		unnecessary, if not inappropriate, for embedded systems applications and is expected to be
136625		optional in subprofiles.
136626	<code>_POSIX_MEMLOCK</code>	
136627		The system supports the locking of the address space.
136628		This option was created to support historical systems that did not provide the feature. It
136629		should only be required if needed, but it should never be prohibited.
136630	<code>_POSIX_MEMLOCK_RANGE</code>	
136631		The system supports the locking of specific ranges of the address space.
136632		For applications that have well-defined sections that need to be locked and others that do
136633		not, POSIX.1-2024 supports an optional set of functions to lock or unlock a range of process
136634		addresses. The following are two reasons for having a means to lock down a specific range:
136635		1. An asynchronous event handler function that must respond to external events in a
136636		deterministic manner such that page faults cannot be tolerated
136637		2. An input/output “buffer” area that is the target for direct-to-process I/O, and the
136638		overhead of implicit locking and unlocking for each I/O call cannot be tolerated
136639		It should only be required if needed, but it should never be prohibited.
136640	<code>_POSIX_MEMORY_PROTECTION</code>	
136641		Support for memory protection is mandatory in POSIX.1-2024.
136642		The provision of this facility typically imposes additional hardware requirements.
136643	<code>_POSIX_PRIORITIZED_IO</code>	
136644		The system provides prioritization for input and output operations.
136645		The use of this option may interfere with the ability of the system to optimize input and
136646		output throughput. It should only be required if needed, but it should never be prohibited.
136647	<code>_POSIX_MESSAGE_PASSING</code>	
136648		The system supports the passing of messages between processes.
136649		This option was created to support historical systems that did not provide the feature. The
136650		functionality adds a high-performance XSI interprocess communication facility for local
136651		communication. It should only be required if needed, but it should never be prohibited.

- 136652        \_POSIX\_MONOTONIC\_CLOCK  
 136653        Support for a monotonic clock is mandatory in POSIX.1-2024.
- 136654        This facility allows realtime applications to rely on a monotonically increasing clock that  
 136655        does not jump backwards, and whose value does not change except for the regular ticking  
 136656        of the clock.
- 136657        \_POSIX\_PRIORITY\_SCHEDULING  
 136658        The system provides priority-based process scheduling.
- 136659        Support of this option provides predictable scheduling behavior, allowing applications to  
 136660        determine the order in which processes that are ready to run are granted access to a  
 136661        processor. It should only be required if needed, but it should never be prohibited.
- 136662        \_POSIX\_REALTIME\_SIGNALS  
 136663        Support for realtime signals is mandatory in POSIX.1-2024.
- 136664        This facility provides prioritized, queued signals with associated data values.
- 136665        \_POSIX\_REGEX  
 136666        Support for regular expression facilities is mandatory in POSIX.1-2024.
- 136667        \_POSIX\_SAVED\_IDS  
 136668        Support for this feature is mandatory in POSIX.1-2024.
- 136669        Certain classes of applications rely on it for proper operation, and there is no alternative  
 136670        short of giving the application root privileges on most implementations that did not provide  
 136671        \_POSIX\_SAVED\_IDS.
- 136672        \_POSIX\_SEMAPHORES  
 136673        Support for counting semaphores is mandatory in POSIX.1-2024.
- 136674        \_POSIX\_SHARED\_MEMORY\_OBJECTS  
 136675        The system supports the mapping of shared memory objects into the process address space.
- 136676        Both this option and the Memory Mapped Files option provide shared access to memory  
 136677        objects in the process address space. The functions defined under this option provide the  
 136678        functionality of existing practice for shared memory objects. This functionality was deemed  
 136679        appropriate for embedded systems applications and, hence, is provided under this option.  
 136680        It should only be required if needed, but it should never be prohibited.
- 136681        \_POSIX\_SHELL  
 136682        Support for the *sh* utility command line interpreter is mandatory in POSIX.1-2024.
- 136683        \_POSIX\_SPAWN  
 136684        The system supports the spawn option.
- 136685        This option provides applications with an efficient mechanism to spawn execution of a new  
 136686        process.
- 136687        \_POSIX\_SPINLOCKS  
 136688        Support for spin locks is mandatory in POSIX.1-2024.
- 136689        This facility provides a simple and efficient synchronization mechanism for threads  
 136690        executing in multi-processor systems.
- 136691        \_POSIX\_SPORADIC\_SERVER  
 136692        The system supports the sporadic server scheduling policy.
- 136693        This option provides applications with a new scheduling policy for scheduling aperiodic  
 136694        processes or threads in hard realtime applications.

- 136695 `_POSIX_SYNCHRONIZED_IO`  
136696 The system supports guaranteed file synchronization.
- 136697 This option was created to support historical systems that did not provide the feature.  
136698 Applications that are expecting guaranteed completion of their input and output operations  
136699 should require this option, rather than the File Synchronization option. It should only be  
136700 required if needed, but it should never be prohibited.
- 136701 `_POSIX_THREADS`  
136702 Support for multiple threads of control within a single process is mandatory in  
136703 POSIX.1-2024.
- 136704 `_POSIX_THREAD_ATTR_STACKADDR`  
136705 The system supports specification of the stack address for a created thread.
- 136706 Applications may take advantage of support of this option for performance benefits, but  
136707 dependence on this feature should be minimized. This option should never be prohibited.
- 136708 XSI-conformant systems support this option.
- 136709 `_POSIX_THREAD_ATTR_STACKSIZE`  
136710 The system supports specification of the stack size for a created thread.
- 136711 Applications may require this option in order to ensure proper execution, but such usage  
136712 limits portability and dependence on this feature should be minimized. It should only be  
136713 required if needed, but it should never be prohibited.
- 136714 XSI-conformant systems support this option.
- 136715 `_POSIX_THREAD_PRIORITY_SCHEDULING`  
136716 The system provides priority-based thread scheduling.
- 136717 Support of this option provides predictable scheduling behavior, allowing applications to  
136718 determine the order in which threads that are ready to run are granted access to a processor.  
136719 It should only be required if needed, but it should never be prohibited.
- 136720 `_POSIX_THREAD_PRIO_INHERIT`  
136721 The system provides mutual-exclusion operations with priority inheritance.
- 136722 Support of this option provides predictable scheduling behavior, allowing applications to  
136723 determine the order in which threads that are ready to run are granted access to a processor.  
136724 It should only be required if needed, but it should never be prohibited.
- 136725 `_POSIX_THREAD_PRIO_PROTECT`  
136726 The system supports a priority ceiling emulation protocol for mutual-exclusion operations.
- 136727 Support of this option provides predictable scheduling behavior, allowing applications to  
136728 determine the order in which threads that are ready to run are granted access to a processor.  
136729 It should only be required if needed, but it should never be prohibited.
- 136730 `_POSIX_THREAD_PROCESS_SHARED`  
136731 The system provides shared access among multiple processes to synchronization objects.
- 136732 This option was created to support historical systems that did not provide the feature. It  
136733 should only be required if needed, but it should never be prohibited.
- 136734 XSI-conformant systems support this option.
- 136735 `_POSIX_THREAD_SAFE_FUNCTIONS`  
136736 Support for thread-safe functions is mandatory in POSIX.1-2024.

- 136737 `_POSIX_THREAD_SPORADIC_SERVER`  
 136738 The system supports the thread sporadic server scheduling policy.
- 136739 Support for this option provides applications with a new scheduling policy for scheduling  
 136740 aperiodic threads in hard realtime applications.
- 136741 `_POSIX_TIMEOUTS`  
 136742 Support for timeouts for some blocking services is mandatory in POSIX.1-2024.
- 136743 `_POSIX_TIMERS`  
 136744 Support for higher resolution clocks with multiple timers per process is mandatory in  
 136745 POSIX.1-2024.
- 136746 This facility is appropriate for applications requiring higher resolution timestamps or  
 136747 needing to control the timing of multiple activities.
- 136748 `_POSIX_TYPED_MEMORY_OBJECTS`  
 136749 The system supports the Typed Memory Objects option.
- 136750 This option was created to allow realtime applications to access different kinds of physical  
 136751 memory, and allow processes in these applications to share portions of this memory.

### 136752 D.3.5 Configurable Limits

- 136753 In general, the configurable limits in the `<limits.h>` header defined in the Base Definitions  
 136754 volume of POSIX.1-2024 have been set to minimal values; many applications or implementations  
 136755 may require larger values. No profile can cite lower values.
- 136756 `{AIO_LISTIO_MAX}`  
 136757 The current minimum is likely to be inadequate for most applications. It is expected that  
 136758 this value will be increased by profiles requiring support for list input and output  
 136759 operations.
- 136760 `{AIO_MAX}`  
 136761 The current minimum is likely to be inadequate for most applications. It is expected that  
 136762 this value will be increased by profiles requiring support for asynchronous input and  
 136763 output operations.
- 136764 `{AIO_PRIO_DELTA_MAX}`  
 136765 The functionality associated with this limit is needed only by sophisticated applications. It  
 136766 is not expected that this limit would need to be increased under a general-purpose profile.
- 136767 `{ARG_MAX}`  
 136768 The current minimum is likely to need to be increased for profiles, particularly as larger  
 136769 amounts of information are passed through the environment. Many implementations are  
 136770 believed to support larger values.
- 136771 `{CHILD_MAX}`  
 136772 The current minimum is suitable only for systems where a single user is not running  
 136773 applications in parallel. It is significantly too low for any system also requiring windows,  
 136774 and if `_POSIX_JOB_CONTROL` is specified, it should be raised.
- 136775 `{CLOCKRES_MIN}`  
 136776 It is expected that profiles will require a finer granularity clock, perhaps as fine as 1  $\mu$ s,  
 136777 represented by a value of 1 000 for this limit.
- 136778 `{DELAYTIMER_MAX}`  
 136779 It is believed that most implementations will provide larger values.

136780	{LINK_MAX}
136781	For most applications and usage, the current minimum is adequate. Many implementations
136782	have a much larger value, but this should not be used as a basis for raising the value unless
136783	the applications to be used require it.
136784	{LOGIN_NAME_MAX}
136785	This is not actually a limit, but an implementation parameter. No profile should impose a
136786	requirement on this value.
136787	{MAX_CANON}
136788	For most purposes, the current minimum is adequate. Unless high-speed burst serial
136789	devices are used, it should be left as is.
136790	{MAX_INPUT}
136791	See {MAX_CANON}.
136792	{MQ_OPEN_MAX}
136793	The current minimum should be adequate for most profiles.
136794	{MQ_PRIO_MAX}
136795	The current minimum corresponds to the required number of process scheduling priorities.
136796	Many realtime practitioners believe that the number of message priority levels ought to be
136797	the same as the number of execution scheduling priorities.
136798	{NAME_MAX}
136799	Many implementations now support larger values, and many applications and users
136800	assume that larger names can be used. Many existing profiles also specify a larger value.
136801	Specifying this value will reduce the number of conforming implementations, although this
136802	might not be a significant consideration over time. Values greater than 255 should not be
136803	required.
136804	{NGROUPS_MAX}
136805	The value selected will typically be 8 or larger.
136806	{OPEN_MAX}
136807	The historically common value for this has been 20. Many implementations support larger
136808	values. If applications that use larger values are anticipated, an appropriate value should be
136809	specified.
136810	{PAGESIZE}
136811	This is not actually a limit, but an implementation parameter. No profile should impose a
136812	requirement on this value.
136813	{PATH_MAX}
136814	Historically, the minimum has been either 1024 or indefinite, depending on the
136815	implementation. Few applications actually require values larger than 256, but some users
136816	may create file hierarchies that must be accessed with longer paths. This value should only
136817	be changed if there is a clear requirement.
136818	{PIPE_BUF}
136819	The current minimum is adequate for most applications. Historically, it has been larger. If
136820	applications that write single transactions larger than this are anticipated, it should be
136821	increased. Applications that write lines of text larger than this probably do not need it
136822	increased, as the text line is delimited by a <newline>.
136823	{POSIX_VERSION}
136824	This is actually not a limit, but a standard version stamp. Generally, a profile should specify
136825	POSIX.1-2024 by a name in the normative references section, not this value.

136826	{PTHREAD_DESTRUCTOR_ITERATIONS}
136827	It is unlikely that applications will need larger values to avoid loss of memory resources.
136828	{PTHREAD_KEYS_MAX}
136829	The current value should be adequate for most profiles.
136830	{PTHREAD_STACK_MIN}
136831	This should not be treated as an actual limit, but as an implementation parameter. No
136832	profile should impose a requirement on this value.
136833	{PTHREAD_THREADS_MAX}
136834	It is believed that most implementations will provide larger values.
136835	{RTSIG_MAX}
136836	The current limit was chosen so that the set of POSIX.1 signal numbers can fit within a
136837	32-bit field. It is recognized that most existing implementations define many more signals
136838	than are specified in POSIX.1 and, in fact, many implementations have already exceeded 32
136839	signals (including the ``null signal’’). Support of {_POSIX_RTSIG_MAX} additional signals
136840	may push some implementations over the single 32-bit word line, but is unlikely to push
136841	any implementations that are already over that line beyond the 64 signal line.
136842	{SEM_NSEMS_MAX}
136843	The current value should be adequate for most profiles.
136844	{SEM_VALUE_MAX}
136845	The current value should be adequate for most profiles.
136846	{SSIZE_MAX}
136847	This limit reflects fundamental hardware characteristics (the size of an integer), and should
136848	not be specified unless it is clearly required. Extreme care should be taken to assure that
136849	any value that might be specified does not unnecessarily eliminate implementations
136850	because of accidents of hardware design.
136851	{STREAM_MAX}
136852	This limit is very closely related to {OPEN_MAX}. It should never be larger than
136853	{OPEN_MAX}, but could reasonably be smaller for application areas where most files are
136854	not accessed through <i>stdio</i> . Some implementations may limit {STREAM_MAX} to 20 but
136855	allow {OPEN_MAX} to be considerably larger. Such implementations should be allowed for
136856	if the applications permit.
136857	{TIMER_MAX}
136858	The current limit should be adequate for most profiles, but it may need to be larger for
136859	applications with a large number of asynchronous operations.
136860	{TTY_NAME_MAX}
136861	This is not actually a limit, but an implementation parameter. No profile should impose a
136862	requirement on this value.
136863	{TZNAME_MAX}
136864	The minimum has been historically adequate, but if longer timezone names are anticipated
136865	(particularly such values as UTC-1), this should be increased.

**D.3.6 Optional Behavior**

136867 In POSIX.1-2024, there are no instances of the terms unspecified, undefined, implementation-  
136868 defined, or with the verbs “may” or “need not”, that the standard developers anticipate or  
136869 sanction as suitable for profile or test method citation. All of these are merely warnings to  
136870 conforming applications to avoid certain areas that can vary from system to system, and even  
136871 over time on the same system. In many cases, these terms are used explicitly to support  
136872 extensions, but profiles should not anticipate and require such extensions; future versions of this  
136873 standard may do so.

## Subprofiling Considerations (Informative)

136881 This section contains further information to satisfy the requirement that the project scope enable  
 136882 subprofiling of POSIX.1-2024. The approach taken is to include a general requirement in  
 136883 normative text regarding subprofiling and to include an informative section (here) containing a  
 136884 proposed set of subprofiling options.

### 136885 E.1 Subprofiling Option Groups

136886 The following Option Groups<sup>12</sup> are defined to support profiling. Systems claiming support to  
 136887 POSIX.1-2024 need not implement these options apart from the requirements stated in XBD  
 136888 Section 2.1.3 (on page 17). These Option Groups allow profiles to subset the System Interfaces  
 136889 volume of POSIX.1-2024 by collecting sets of related functions and generic functions.

136890 POSIX\_ASYNCHRONOUS\_IO: Asynchronous Input and Output Functions

136891 *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_suspend()*, *aio\_write()*,  
 136892 *lio\_listio()*

136893 POSIX\_BARRIERS: Barriers

136894 *pthread\_barrier\_destroy()*, *pthread\_barrier\_init()*, *pthread\_barrier\_wait()*,  
 136895 *pthread\_barrierattr\_destroy()*, *pthread\_barrierattr\_getpshared()*, *pthread\_barrierattr\_init()*,  
 136896 *pthread\_barrierattr\_setpshared()*

136897 POSIX\_C\_LANG\_ATOMICS: ISO C Atomic Operations

136898 *atomic\_compare\_exchange\_strong()*, *atomic\_compare\_exchange\_strong\_explicit()*,  
 136899 *atomic\_compare\_exchange\_weak()*, *atomic\_compare\_exchange\_weak\_explicit()*, *atomic\_exchange()*,  
 136900 *atomic\_exchange\_explicit()*, *atomic\_fetch\_add()*, *atomic\_fetch\_add\_explicit()*, *atomic\_fetch\_and()*,  
 136901 *atomic\_fetch\_and\_explicit()*, *atomic\_fetch\_or()*, *atomic\_fetch\_or\_explicit()*, *atomic\_fetch\_sub()*,  
 136902 *atomic\_fetch\_sub\_explicit()*, *atomic\_fetch\_xor()*, *atomic\_fetch\_xor\_explicit()*, *atomic\_flag\_clear()*,
