

# IEEE Standard for Information Technology—Portable Operating System Interface (POSIX™)

## Base Specifications, Issue 8

IEEE Computer Society

and

The Open Group

Developed by the  
Microprocessor Standards Committee

**IEEE Std 1003.1™-2024**  
(Revision of IEEE Std 1003.1-2017)

The Open Group Standard Base Specifications, Issue 8

# **IEEE Standard for Information Technology—Portable Operating System Interface (POSIX™)**

## **Base Specifications, Issue 8**

Developed by the

**Microprocessor Committee**  
of the  
**IEEE Computer Society**

and

**The Open Group**

Approved 20 May 2024

**IEEE SA Standards Board**

**Abstract:** POSIX.1-2024 is simultaneously IEEE Std 1003.1™-2024 and The Open Group Standard Base Specifications, Issue 8.

POSIX.1-2024 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. POSIX.1-2024 is intended to be used by both application developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of POSIX.1-2024 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

Permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests should be sent by email to [austin-group-permissions@opengroup.org](mailto:austin-group-permissions@opengroup.org).*

The following areas are outside the scope of POSIX.1-2024:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2024 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

**Keywords:** application program interface (API), argument, asynchronous, basic regular expression (BRE), built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, IEEE 1003.1™, input/output (I/O), job control, network, parent, portable operating system interface (POSIX™), shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

## The Open Group

The Open Group is a global consortium that enables the achievement of business objectives through technology standards and open standards by fostering a culture of collaboration, inclusivity, and mutual respect among our diverse membership of more than 900 organizations. Our membership includes customers, systems and solutions suppliers, tools vendors, integrators, academics, and consultants across multiple industries.

The mission of The Open Group is to drive the creation of Boundaryless Information Flow™ achieved by:

- Working with customers to capture, understand, and address current and emerging requirements, establish policies, and share best practices
- Working with suppliers, consortia, and standards bodies to develop consensus and facilitate interoperability, to evolve and integrate specifications and open source technologies
- Offering a comprehensive set of services to enhance the operational efficiency of consortia
- Developing and operating the industry's premier certification service and encouraging procurement of certified products

Further information on The Open Group is available at <https://www.opengroup.org>.

The Open Group publishes a wide range of technical documentation, most of which is focused on development of Standards and Guides, but which also includes white papers, technical studies, certification and testing documentation, and business titles. Full details and a catalog are available at <https://www.opengroup.org/library>.

## Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE Standards documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page (<https://standards.ieee.org/ipr/disclaimers.html>), appear in all IEEE standards and may be found under the heading “Important Notices and Disclaimers Concerning IEEE Standards Documents.”

### Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents are developed within IEEE Societies and subcommittees of IEEE Standards Association (IEEE SA) Board of Governors. IEEE develops its standards through an accredited consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. IEEE standards are documents developed by volunteers with scientific, academic, and industry-based expertise in technical working groups. Volunteers involved in technical working groups are not necessarily members of IEEE or IEEE SA and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE makes no warranties or representations concerning its standards, and expressly disclaims all warranties, express or implied, concerning all standards, including but not limited to the warranties of merchantability, fitness for a particular purpose and non-infringement. IEEE Standards documents do not guarantee safety, security, health, or environmental protection, or compliance with law, or guarantee against interference with or from other devices or networks. In addition, IEEE does not warrant or represent that the use of the material contained in its standards is free from patent infringement. IEEE Standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document should rely upon their own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

## Translations

The IEEE consensus balloting process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English language version published by IEEE is the approved IEEE standard.

## Use by artificial intelligence systems

In no event shall material in this document be used for the purpose of creating, training, enhancing, developing, maintaining, or contributing to any artificial intelligence systems without the express, written consent of IEEE SA and The Open Group in advance. “Artificial intelligence” refers to any software, application, or other system that uses artificial intelligence, machine learning, or similar technologies, to analyze, train, process, or generate content. Requests for consent can be submitted by email to [austin-group-permissions@opengroup.org](mailto:austin-group-permissions@opengroup.org).

## Official statements

A statement, written or oral, that is not processed in accordance with the IEEE SA Standards Board Operations Manual is not, and shall not be considered or inferred to be, the official position of IEEE or any of its committees and shall not be considered to be, or be relied upon as, a formal position of IEEE or IEEE SA. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that the presenter’s views should be considered the personal views of that individual rather than the formal position of IEEE, IEEE SA, the Standards Committee, or the Working Group. Statements made by volunteers may not represent the formal position of their employer(s) or affiliation(s). News releases about IEEE standards issued by entities other than IEEE SA should be considered the view of the entity issuing the release rather than the formal position of IEEE or IEEE SA.

## Comments on standards

Feedback relating to the material contained within this standard may be submitted by using the Austin Group web site at <http://www.opengroup.org/austin/defectform.html>.

## Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

## Data privacy

Users of IEEE Standards documents should evaluate the standards for considerations of data privacy and data ownership in the context of assessing and using the standards in compliance with applicable laws and regulations.

## Copyrights

IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include both use by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, neither IEEE nor its licensors waive any rights in copyright to the documents.

## Photocopies

Subject to payment of the appropriate licensing fees, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400; <https://www.copyright.com/>. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

## Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every 10 years. When a document is more than 10 years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit [IEEE Xplore](#) or [contact IEEE](#).<sup>1</sup> For more information about the IEEE SA or IEEE's standards development process, visit the IEEE SA Website.

## Errata

Errata, if any, for all IEEE standards can be accessed on the [IEEE SA Website](#).<sup>2</sup> Search for standard number and year of approval to access the web page of the published standard. Errata links are located under the Additional Resources Details section. Errata are also available in [IEEE Xplore](#). Users are encouraged to periodically check for errata.

---

<sup>1</sup> Available at: <https://ieeexplore.ieee.org/browse/standards/collection/ieee>.

<sup>2</sup> Available at: <https://standards.ieee.org/standard/index.html>.

## Patents

IEEE standards are developed in compliance with the [IEEE SA Patent Policy](#).<sup>3</sup>

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE SA Website at <https://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

## IMPORTANT NOTICE

Technologies, application of technologies, and recommended procedures in various industries evolve over time. The IEEE standards development process allows participants to review developments in industries, technologies, and practices, and to determine what, if any, updates should be made to the IEEE standard. During this evolution, the technologies and recommendations in IEEE standards may be implemented in ways not foreseen during the standard's development. IEEE standards development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, data privacy, and interference protection practices and all applicable laws and regulations.

## Participants

IEEE Std 1003.1™-2024 was prepared by the Austin Group, sponsored by the Microprocessor Standards Committee of the IEEE Computer Society, The Open Group, and ISO/IEC JTC 1/SC22.

### The Austin Group

At the time this IEEE standard was completed, the Austin Group had the following membership:

**Andrew Josey**, Chair  
**Donald W. Cragun**, Organizational Representative, IEEE MSC  
**Nicholas M. Stoughton**, Organizational Representative, ISO/IEC JTC 1/SC22  
**Eric Blake**, Organizational Representative, The Open Group  
**Cathy Fox, Geoff Clare**, Technical Editors

### Austin Group Technical Reviewers

William Ahern	Dmitry Goncharov	Quentin Rameau
Mohamed Akram	Christopher M. Graff	Martin Řehák
Joe Auricchio	Quinn Grier	Torvald Riegel
Ori Avtalion	Philip Guenther	G. Branden Robinson

## The Open Group

When The Open Group approved the Base Specifications, Issue 8, (technically identical to this standard) on 21 March 2024, the membership of The Open Group Base Working Group was as follows:

**Andrew Josey**, Chair  
**Eric Blake**, Austin Group Liaison  
**Cathy Fox, Geoff Clare**, Technical Editor

## Base Working Group Members

Joe Auricchio	Geoff Clare	Andrew Josey
Eric Blake	Donald W. Cragun	Mark Ziegast

## IEEE

At the time this standard was completed, the Microprocessor Committee had the following membership:

**Ralph Baker Kearfott**, *Chair*  
**Leonard Tsai**, *Vice Chair and P754 Chair*  
**Andrew Josey**, *P1003.1 Chair*  
**Donald W. Cragun**, *Austin Group Liaison*  
**Joseph M. Gwinn**, *Ex-officio Emeritus*  
**Richard Bugg**, *P1722.1 Chair*  
**Kiran Gunnam**, *P3109 Chair*  
**David Hough**, *Outgoing P754 Chair*  
**Dave Olsen**, *P1722 Chair*  
**Nathalie Revol**, *P1788 Chair*  
**Blaise Vignon**, *P3109 Chair*

The following members of the individual Standards Association balloting group voted on this standard. Balloters may have voted for approval, disapproval, or abstention.

Boon Chong Ang  
Steven Bezner  
Diego Chiozzi  
Donald W. Cragun  
Andrew Fieldsend  
David Fuschi

Jie Guan  
Joseph M. Gwinn  
Werner Hoelzl  
Andrew Josey  
Piotr Karocki  
Kenneth Lang

Rajesh Murthy  
Venkatesha Prasad  
Stephen Schwarm  
Walter Struppler  
Oren Yuen  
Janusz Zalewski

When the IEEE SA Standards Board approved this standard on 20 May 2024, it had the following membership:

**David J. Law**, *Chair*  
**Jon Walter Rosdahl**, *Vice Chair*  
**Gary Hoffman**, *Past Chair*  
**Alpesh Shah**, *Secretary*

Sara R. Biyabani  
Ted Burse

\*Member Emeritus

## Introduction

This introduction is not part of IEEE Std 1003.1™-2024, IEEE Standard for Information Technology—Portable Operating System Interface (POSIX™)—Base Specifications, Issue 8.

This draft standard was developed, and is maintained, by a joint working group of members of the IEEE Microprocessor Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.<sup>4</sup>

The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group is to develop and maintain the core open systems interfaces that are the POSIX 1003.1 (and former 1003.2) standards, ISO/IEC 9945, and the core of the Single UNIX® Specification.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group Standard designation, and an ISO/IEC designation.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see [www.opengroup.org/austin](http://www.opengroup.org/austin).

## Background

The developers of POSIX.1-2024 represent a cross-section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, POSIX.1-2024 describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application developers to write portable applications – it was developed with that goal in mind – it has been designated POSIX,<sup>5</sup> an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE Standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

<sup>4</sup> The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

<sup>5</sup> The name POSIX was suggested by Richard Stallman. It is expected to be pronounced with the first two syllables as in positive, not poh-six, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

## Audience

The intended audience for POSIX.1-2024 is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

- Persons buying hardware and software systems
- Persons managing companies that are deciding on future corporate computing directions
- Persons implementing operating systems, and especially
- Persons developing applications where portability is an objective

## Purpose

Several principles guided the development of POSIX.1-2024:

- **Application-Oriented** – The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. POSIX.1-2024 codifies the common, existing definition of the UNIX system.
- **Interface, Not Implementation** – POSIX.1-2024 defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.
- **Source, Not Object, Portability** – POSIX.1-2024 has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. POSIX.1-2024 does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.
- **The C Language** – The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.
- **No Superuser, No System Administration** – There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in POSIX.1-2024. POSIX.1-2024 is also not concerned with hardware constraints or system maintenance.
- **Minimal Interface, Minimally Defined** – In keeping with the historical design principles of the UNIX system, the mandatory core facilities of POSIX.1-2024 have been kept as minimal as possible. Additional capabilities have been added as optional extensions.
- **Broadly Implementable** – The developers of POSIX.1-2024 endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:
  - All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
  - Compatible systems that are not derived from the original UNIX system code
  - Emulations hosted on entirely different operating systems
  - Networked systems
  - Distributed systems

- Systems running on a broad range of hardware

No direct references to this goal appear in POSIX.1-2024, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations – When the original version – IEEE Std 1003.1-1988 – was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various The Open Group (formerly X/Open) specifications, and IEEE Std 1003.1-2001 and its technical corrigenda have consolidated this consensus, and this version reflects the significantly increased level of consensus arrived at since the original versions. The authors of the original versions tried, as much as possible, to follow the principles below when creating new specifications:

- By standardizing an interface like one in an historical implementation; for example, directories
- By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended tar format defined in the pax utility
- By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the sigaction() function

POSIX.1-2024 is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of POSIX.1-2024. These need to be used with careful management to be able to adapt to future extensions of POSIX.1-2024 and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code—A goal of POSIX.1-2024 was to minimize additional work for application developers. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

## POSIX.1-2024

POSIX.1-2024 defines the Portable Operating System Interface (POSIX) requirements and consists of the following topics arranged as a series of volumes within the standard:

- Base Definitions
- System Interfaces
- Shell and Utilities
- Rationale (Informative)

## Base Definitions

The Base Definitions volume provides common definitions for this standard, therefore readers should be familiar with it before using the other volumes.

This volume is structured as follows:

- Chapter 1 is an introduction.
- Chapter 2 defines the conformance requirements.
- Chapter 3 defines general terms used.
- Chapter 4 describes general concepts used.
- Chapter 5 describes the notation used to specify file input and output formats in this volume and the Shell and Utilities volume.
- Chapter 6 describes the portable character set and the process of character set definition.
- Chapter 7 describes the syntax for defining internationalization locales as well as the POSIX locale provided on all systems.
- Chapter 8 describes the use of environment variables for internationalization and other purposes.
- Chapter 9 describes the syntax of pattern matching using regular expressions employed by many utilities and matched by the *regcomp()* and *regexexec()* functions.
- Chapter 10 describes files and devices found on all systems.
- Chapter 11 describes the asynchronous terminal interface for many of the functions in the System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- Chapter 12 describes the policies for command line argument construction and parsing.
- Chapter 13 describes namespace reservation.
- Chapter 14 defines the contents of headers which declare the functions and global variables, and define types, constants, macros, and data structures that are needed by programs using the services provided by the System Interfaces volume.

Comprehensive references are available in the Index.

## System Interfaces

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the Index.

## Shell and Utilities

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions.
- Chapter 2 describes the command language used in POSIX-conformant systems, and special built-in utilities.
- Chapter 3 consists of reference pages for all utilities, other than the special built-in utilities described in Chapter 2, available on POSIX-conformant systems.

Comprehensive references are available in the Index.

### Rationale (Informative)

The Rationale volume is published to assist in the process of review. It contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers. It also contains notes of interest to application programmers on recommended programming practices, emphasizing the consequences of some aspects of POSIX.1-2024 that may not be immediately apparent.

This volume is organized in parallel to the normative volumes of this standard, with a separate part for each of the three normative volumes.

Within this volume, the following terms are used:

- Base standard—The portions of POSIX.1-2024 that are not optional, equivalent to the definitions of classic POSIX.1 and POSIX.2.
- POSIX.0—Although this term is not used in the normative text of POSIX.1-2024, it is used in this volume to refer to IEEE Std 1003.0-1995.
- POSIX.1b—Although this term is not used in the normative text of POSIX.1-2024, it is used in this volume to refer to the elements of the POSIX Realtime Extension amendment. (This was earlier referred to as POSIX.4 during the standard development process.)
- POSIX.1c—Although this term is not used in the normative text of POSIX.1-2024, it is used in this volume to refer to the POSIX Threads Extension amendment. (This was earlier referred to as POSIX.4a during the standard development process.)
- Standard developers—The individuals and companies in the development organizations responsible for POSIX.1-2024: the IEEE P1003.1 working groups, The Open Group Base working group, advised by the hundreds of individual technical experts who balloted the draft standards within the Austin Group, and the member bodies and technical experts of ISO/IEC JTC 1/SC 22.
- XSI option—The portions of POSIX.1-2024 addressing the extension added for support of the Single UNIX Specification.

### Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as POSIX.1-2024, which is technically identical to The Open Group Base Specifications, Issue 8.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in POSIX.1-2024.

Reference	Example	Notes
C-Language Data Structure	<code>aiocb</code>	

Reference	Example	Notes
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	<b>long</b>	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	< <b>sys/stat.h</b> >	
C-Language Keyword	<b>return</b>	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	NET_ADDRSTRLEN	
C-Language Preprocessing Directive	<b>#define</b>	
Commands within a Utility	<b>a, c</b>	
Conversion Specifier, Specifier/Modifier Character	%A, g, E	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	<b>Hello, World</b>	
Filename	<b>/tmp</b>	
Literal Character	'c', '\r'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	[ ]	
Parameter	< <i>directory pathname</i> >	
Special Character	<newline>	3
Symbolic Constant	_POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	#include <sys/stat.h>	
User Input and Example Code	echo Hello, World	5
Utility Name	<i>awk</i>	
Utility Operand	<i>file_name</i>	
Utility Option	<b>-c</b>	
Utility Option with Option-Argument	<b>-w width</b>	

Note that:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf()* and *fscanf()* formatting functions.

2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. The literal characters <apostrophe> (also known as single-quote) and <backslash> are either shown as the C constants ' \ ' and ' \\ ', respectively, or as the special characters <apostrophe>, single-quote, and <backslash> depending on context.
3. The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct, or obtained at runtime from functions or utilities that return limit or configuration values.
5. Brackets shown in this font, "[ ]", are part of the syntax and do not indicate optional items. In syntax the '| ' symbol is used to separate alternatives, and ellipses (" . . . ") are used to show that additional arguments are optional.

Shading is used to identify extensions and options.

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

1.  $(a,b)$  means the range of all values from  $a$  to  $b$ , including neither  $a$  nor  $b$ .
2.  $[a,b]$  means the range of all values from  $a$  to  $b$ , including  $a$  and  $b$ .
3.  $[a,b)$  means the range of all values from  $a$  to  $b$ , including  $a$ , but not  $b$ .
4.  $(a,b]$  means the range of all values from  $a$  to  $b$ , including  $b$ , but not  $a$ .

NOTE— A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol POSIXstring (where string may contain underscores) is represented by the C identifier \_POSIXstring, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

3-23	Internal Limits in <i>yacc</i> .....	3626
A-1	Historical Practice for Symbolic Links.....	3672

# Trademarks

The following information is given for the convenience of users of POSIX.1-2024 and does not constitute an endorsement by the IEEE or The Open Group of these products. Equivalent products may be used if they can be shown to lead to the same results.

There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

AIX<sup>®</sup> and IBM<sup>®</sup> are registered trademarks of International Business Machines Corporation.

ArchiMate<sup>®</sup>, FACE<sup>®</sup>, FACE<sup>®</sup> logo, Future Airborne Capability Environment<sup>®</sup>, Making Standards Work<sup>®</sup>, Open Footprint<sup>®</sup>, Open O<sup>®</sup> logo, Open O and Check<sup>®</sup> certification logo, OSDU<sup>®</sup>, Platform 3.0<sup>®</sup>, The Open Group<sup>®</sup>, TOGAF<sup>®</sup>, UNIX<sup>®</sup>, UNIXWARE<sup>®</sup>, and X<sup>®</sup> logo are registered trademarks and Boundaryless Information Flow<sup>™</sup>, Build with Integrity Buy with Confidence<sup>™</sup>, Commercial Aviation Reference Architecture<sup>™</sup>, Dependability Through Assuredness<sup>™</sup>, Digital Practitioner Body of Knowledge<sup>™</sup>, DPBoK<sup>™</sup>, EMMM<sup>™</sup>, FHIM Profile Builder<sup>™</sup>, FHIM logo, FPB<sup>™</sup>, IT4IT<sup>™</sup>, IT4IT<sup>™</sup> logo, O-AA<sup>™</sup>, O-DA<sup>™</sup>, O-DEF<sup>™</sup>, O-HERA<sup>™</sup>, O-PAS<sup>™</sup>, O-TTPS<sup>™</sup>, Open Agile Architecture<sup>™</sup>, Open FAIR<sup>™</sup>, Open Process Automation<sup>™</sup>, Open Subsurface Data Universe<sup>™</sup>, Open Trusted Technology Provider<sup>™</sup>, Sensor Integration Simplified<sup>™</sup>, Sensor Open Systems Architecture<sup>™</sup>, SOSA<sup>™</sup>, and SOSA<sup>™</sup> logo are trademarks of The Open Group.

AT&T<sup>®</sup> is a registered trademark of AT&T in the USA and other countries.

BSD<sup>™</sup> is a trademark of the University of California, Berkeley, USA.

Hewlett Packard<sup>®</sup>, HP<sup>®</sup>, and HP-UX<sup>®</sup> are registered trademarks of HP Hewlett Packard Group LLC.

IEEE<sup>®</sup> is a registered trademark, and POSIX<sup>™</sup>, 754<sup>™</sup>, 854<sup>™</sup>, 1003.0<sup>™</sup>, 1003.1<sup>™</sup>, 1003.1d<sup>™</sup>, 1003.1g<sup>™</sup>, 1003.1j<sup>™</sup>, 1003.1q<sup>™</sup>, 1003.2<sup>™</sup>, 1003.2a<sup>™</sup>, 1003.2d<sup>™</sup>, 1003.9<sup>™</sup>, and 1003.13<sup>™</sup> are trademarks of The Institute of Electrical and Electronic Engineers, Inc.

Linux<sup>®</sup> is a registered trademark of Linus Torvalds.

Sun<sup>®</sup> and Sun Microsystems<sup>®</sup> are registered trademarks of Oracle America, Inc.

/usr/group<sup>®</sup> is a registered trademark of UniForum, the International Network of UNIX System Users.

# Acknowledgements

The contributions of the following organizations to the development of POSIX.1-2024 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation
- Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems Inc. for permission to reproduce portions of their copyrighted documentation
- ISO/IEC JTC 1/SC 22/WG 14 C Language Committee
- Red Hat Inc. for permission to reproduce portions of its copyrighted documentation

POSIX.1-2024 was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

# Referenced Documents

## Normative References

Normative references for POSIX.1-2024 are defined in [Section 1.4](#) (on page 5).

## Informative References

MSE Working Draft

Working draft of ISO/IEC 9899:1990/Add3:Draft, Addendum 3 — Multibyte Support Extensions (MSE) as documented in the ISO Working Paper SC22/WG14/N205 dated 31 March 1992.

POSIX.0: 1995

IEEE Std 1003.0™-1995, IEEE Guide to the POSIX Open System Environment (OSE) (identical to ISO/IEC TR 14252).

POSIX.1: 1988

IEEE Std 1003.1™-1988, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language].

## 1.1 Scope

POSIX.1-2024 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-2024 comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-2024, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-2024.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-2024.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-2024.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-2024 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-2024.

The following areas are outside of the scope of POSIX.1-2024:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2024 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-2024 are drawn from the following base documents:

- IEEE Std 1003.1-2017 (POSIX.1-2017)
- IEEE Std 1003.26-2003 (POSIX.26-2003)

- 40 • ISO/IEC 9899:2018, Programming Languages — C (C17)
- 41 • ISO/IEC TR 24731-2:2010, Programming languages, their environments and system  
42 software interfaces — Extensions to the C library — Part 2: Dynamic Allocation Functions
- 43 • The Open Group Standard, 2021, Additional APIs for the Base Specifications Issue 8, Part 1
- 44 • The Open Group Standard, 2022, Additional APIs for the Base Specifications Issue 8, Part 2

45 Emphasis has been placed on standardizing existing practice for existing users, with changes  
46 and additions limited to correcting deficiencies in the following areas:

- 47 • Issues raised by Austin Group defect reports and IEEE Interpretations against IEEE Std  
48 1003.1.
- 49 • Issues raised in corrigenda for The Open Group Standards and working group resolutions  
50 from The Open Group
- 51 • Changes to make the text self-consistent with the additional material merged
- 52 • Features, marked obsolescent in the base documents, have been considered for removal in  
53 this version
- 54 • Alignment with the ISO/IEC 9899:2018 standard

## 55 1.2 Word Usage

56 The word *shall* indicates mandatory requirements strictly to be followed in order to conform to  
57 the standard and from which no deviation is permitted (*shall* equals *is required to*).<sup>1, 2</sup>

58 The word *should* indicates that among several possibilities one is recommended as particularly  
59 suitable, without mentioning or excluding others; or that a certain course of action is preferred  
60 but not necessarily required (*should* equals *is recommended that*).

61 The word *may* is used to indicate a course of action permissible within the limits of the standard  
62 (*may* equals *is permitted to*).

63 The word *can* is used for statements of possibility and capability, whether material, physical, or  
64 causal (*can* equals *is able to*).

## 65 1.3 Conformance

66 Conformance requirements for POSIX.1-2024 are defined in [Chapter 2](#) (on page 15).

---

67 1. The use of the word *must* is deprecated and cannot be used when stating mandatory requirements; *must* is used only to describe  
68 unavoidable situations.

69 2. The use of *will* is deprecated and cannot be used when stating mandatory requirements; *will* is only used in statements of fact.

## 1.4 Normative References

The following standards contain provisions which, through references in POSIX.1-2024, constitute provisions of POSIX.1-2024. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on POSIX.1-2024 are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO/IEC 646: 1991

ISO/IEC 646: 1991, Information Processing — ISO 7-Bit Coded Character Set for Information Interchange.<sup>3</sup>

## 1.5 Change History

Change history is described in the Rationale (Informative) volume of POSIX.1-2024, and in the CHANGE HISTORY section of reference pages.

## 1.6 Terminology

For the purposes of POSIX.1-2024, the following terminology definitions apply:

### **can**

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to POSIX.1-2024. An application can rely on the existence of the feature or behavior.

### **implementation-defined**

Describes a value or behavior that is not defined by POSIX.1-2024 but is selected by an implementor. The value or behavior may vary among implementations that conform to POSIX.1-2024. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

### **legacy**

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable

---

3. ISO/IEC documents can be obtained from <https://www.iso.org/store.html>.

110 applications. New applications should use alternative means of obtaining equivalent  
111 functionality.

112 **may**

113 Describes a feature or behavior that is optional for an implementation that conforms to  
114 POSIX.1-2024. An application should not rely on the existence of the feature or behavior. An  
115 application that relies on such a feature or behavior cannot be assured to be portable across  
116 conforming implementations.

117 To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

118 **shall**

119 For an implementation that conforms to POSIX.1-2024, describes a feature or behavior that  
120 is mandatory. An application can rely on the existence of the feature or behavior.

121 For an application or user, describes a behavior that is mandatory.

122 **should**

123 For an implementation that conforms to POSIX.1-2024, describes a feature or behavior that  
124 is recommended but not mandatory. An application should not rely on the existence of the  
125 feature or behavior. An application that relies on such a feature or behavior cannot be  
126 assured to be portable across conforming implementations.

127 For an application, describes a feature or behavior that is recommended programming  
128 practice for optimum portability.

129 **undefined**

130 Describes the nature of a value or behavior not defined by POSIX.1-2024 which results from  
131 use of an invalid program construct or invalid data input.

132 The value or behavior may vary among implementations that conform to POSIX.1-2024. An  
133 application should not rely on the existence or validity of the value or behavior. An  
134 application that relies on any particular value or behavior cannot be assured to be portable  
135 across conforming implementations.

136 **unspecified**

137 Describes the nature of a value or behavior not specified by POSIX.1-2024 which results  
138 from use of a valid program construct or valid data input.

139 The value or behavior may vary among implementations that conform to POSIX.1-2024. An  
140 application should not rely on the existence or validity of the value or behavior. An  
141 application that relies on any particular value or behavior cannot be assured to be portable  
142 across conforming implementations.

143 **1.7 Definitions and Concepts**

144 Definitions and concepts are defined in [Chapter 3](#) (on page 31) and [Chapter 4](#) (on page 95).

## 145 1.8 Portability

146 Some of the utilities in the Shell and Utilities volume of POSIX.1-2024 and functions in the  
 147 System Interfaces volume of POSIX.1-2024 describe functionality that might not be fully portable  
 148 to systems meeting the requirements for POSIX conformance (see [Chapter 2](#), on page 15).

149 Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in  
 150 the margin identifies the nature of the option, extension, or warning (see [Section 1.8.1](#)). For  
 151 maximum portability, an application should avoid such functionality.

152 Unless the primary task of a utility is to produce textual material on its standard output,  
 153 application developers should not rely on the format or content of any such material that may be  
 154 produced. Where the primary task *is* to provide such material, but the output format is  
 155 incompletely specified, the description is marked with the OF margin code and shading.  
 156 Application developers are warned not to expect that the output of such an interface on one  
 157 system is any guide to its behavior on another system.

### 158 1.8.1 Codes

159 The codes and their meanings are as follows. See also [Section 1.8.2](#) (on page 12).

#### 160 ADV **Advisory Information**

161 The functionality described is optional. The functionality described is also an extension to the  
 162 ISO C standard.

163 Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section.  
 164 Where additional semantics apply to a function, the material is identified by use of the ADV  
 165 margin legend.

#### 166 CD **C-Language Development Utilities**

167 The functionality described is optional.

168 Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.  
 169 Where additional semantics apply to a utility, the material is identified by use of the CD margin  
 170 legend.

#### 171 CPT **Process CPU-Time Clocks**

172 The functionality described is optional. The functionality described is also an extension to the  
 173 ISO C standard.

174 Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.  
 175 Where additional semantics apply to a function, the material is identified by use of the CPT  
 176 margin legend.

#### 177 CX **Extension to the ISO C standard**

178 The functionality described is an extension to the ISO C standard or a deviation from it.  
 179 Application developers can make use of the functionality as it is supported on all  
 180 POSIX.1-2024-conforming systems.

181 With each function or header from the ISO C standard, a statement is included to the effect that  
 182 “any conflict is unintentional”, or “any other conflict is unintentional” if there is an intentional  
 183 conflict (deviation). That is intended to refer to a direct conflict. POSIX.1-2024 acts in part as a  
 184 profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary  
 185 by the ISO C standard. Such limitations and other compatible differences are not considered  
 186 conflicts, even if a CX mark is missing. The markings are for information only.

187 Where additional semantics apply to a function or header, the material is identified by use of the  
 188 CX margin legend.

---

189	DC	<b>Device Control</b>
190		The functionality described is optional. The functionality described is also an extension to the
191		ISO C standard.
192		Where applicable, functions are marked with the DC margin legend in the SYNOPSIS section.
193		Where additional semantics apply to a function, the material is identified by use of the DC
194		margin legend.
195	FR	<b>FORTTRAN Runtime Utilities</b>
196		The functionality described is optional.
197		Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.
198		Where additional semantics apply to a utility, the material is identified by use of the FR margin
199		legend.
200	FSC	<b>File Synchronization</b>
201		The functionality described is optional. The functionality described is also an extension to the
202		ISO C standard.
203		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
204		Where additional semantics apply to a function, the material is identified by use of the FSC
205		margin legend.
206	IP6	<b>IPV6</b>
207		The functionality described is optional. The functionality described is also an extension to the
208		ISO C standard.
209		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
210		Where additional semantics apply to a function, the material is identified by use of the IP6
211		margin legend.
212	MC1	<b>Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust</b>
213		<b>Mutex Priority Protection or Robust Mutex Priority Inheritance</b>
214		The functionality described is optional. The functionality described is also an extension to the
215		ISO C standard.
216		This is a shorthand notation for combinations of multiple option codes.
217		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
218		Where additional semantics apply to a function, the material is identified by use of the MC1
219		margin legend.
220		Refer to <a href="#">Section 1.8.2</a> (on page 12).
221	ML	<b>Process Memory Locking</b>
222		The functionality described is optional. The functionality described is also an extension to the
223		ISO C standard.
224		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
225		Where additional semantics apply to a function, the material is identified by use of the ML
226		margin legend.
227	MLR	<b>Range Memory Locking</b>
228		The functionality described is optional. The functionality described is also an extension to the
229		ISO C standard.
230		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
231		Where additional semantics apply to a function, the material is identified by use of the MLR
232		margin legend.

233	MSG	<b>Message Passing</b>
234		The functionality described is optional. The functionality described is also an extension to the
235		ISO C standard.
236		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.
237		Where additional semantics apply to a function, the material is identified by use of the MSG
238		margin legend.
239	MX	<b>IEC 60559 Floating-Point</b>
240		The functionality described is optional. The functionality described is mandated by the ISO C
241		standard only for implementations that define <code>__STDC_IEC_559__</code> .
242	MXC	<b>IEC 60559 Complex Floating-Point</b>
243		The functionality described is optional. The functionality described is mandated by the ISO C
244		standard only for implementations that define <code>__STDC_IEC_559_COMPLEX__</code> .
245	MXX	<b>IEC 60559 Floating-Point Extension</b>
246		The functionality described is optional. The functionality described is part of the IEC 60559
247		Floating-Point option, but is an extension to the ISO C standard.
248	OB	<b>Obsolescent</b>
249		The functionality described may be removed in a future version of this volume of POSIX.1-2024.
250		Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use
251		obsolescent features.
252		Where applicable, the material is identified by use of the OB margin legend.
253	OF	<b>Output Format Incompletely Specified</b>
254		The functionality described is an XSI extension. The format of the output produced by the
255		utility is not fully specified. It is therefore not possible to post-process this output in a consistent
256		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
257		Where applicable, the material is identified by use of the OF margin legend.
258	OH	<b>Optional Header</b>
259		In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-2024 an
260		included header is marked as in the following example:
261	OH	<code>#include &lt;sys/types.h&gt;</code>
262		<code>#include &lt;fcntl.h&gt;</code>
263		<code>int open(const char *path, int oflag, ...);</code>
264		The OH margin legend indicates that the optional header defines constants that will be needed if
265		the function is called with certain flag arguments; thus it may be required for some of the
266		functionality described, but is not needed otherwise.
267	PIO	<b>Prioritized Input and Output</b>
268		The functionality described is optional. The functionality described is also an extension to the
269		ISO C standard.
270		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
271		Where additional semantics apply to a function, the material is identified by use of the PIO
272		margin legend.
273	PS	<b>Process Scheduling</b>
274		The functionality described is optional. The functionality described is also an extension to the
275		ISO C standard.
276		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
277		Where additional semantics apply to a function, the material is identified by use of the PS

278		margin legend.
279	RPI	<b>Robust Mutex Priority Inheritance</b>
280		The functionality described is optional. The functionality described is also an extension to the
281		ISO C standard.
282		Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section.
283		Where additional semantics apply to a function, the material is identified by use of the RPI
284		margin legend.
285	RPP	<b>Robust Mutex Priority Protection</b>
286		The functionality described is optional. The functionality described is also an extension to the
287		ISO C standard.
288		Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section.
289		Where additional semantics apply to a function, the material is identified by use of the RPP
290		margin legend.
291	RS	<b>Raw Sockets</b>
292		The functionality described is optional. The functionality described is also an extension to the
293		ISO C standard.
294		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
295		Where additional semantics apply to a function, the material is identified by use of the RS
296		margin legend.
297	SD	<b>Software Development Utilities</b>
298		The functionality described is optional.
299		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
300		Where additional semantics apply to a utility, the material is identified by use of the SD margin
301		legend.
302	SHM	<b>Shared Memory Objects</b>
303		The functionality described is optional. The functionality described is also an extension to the
304		ISO C standard.
305		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
306		Where additional semantics apply to a function, the material is identified by use of the SHM
307		margin legend.
308	SIO	<b>Synchronized Input and Output</b>
309		The functionality described is optional. The functionality described is also an extension to the
310		ISO C standard.
311		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
312		Where additional semantics apply to a function, the material is identified by use of the SIO
313		margin legend.
314	SPN	<b>Spawn</b>
315		The functionality described is optional. The functionality described is also an extension to the
316		ISO C standard.
317		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
318		Where additional semantics apply to a function, the material is identified by use of the SPN
319		margin legend.
320	SS	<b>Process Sporadic Server</b>
321		The functionality described is optional. The functionality described is also an extension to the
322		ISO C standard.

323		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
324		Where additional semantics apply to a function, the material is identified by use of the SS
325		margin legend.
326	TCT	<b>Thread CPU-Time Clocks</b>
327		The functionality described is optional. The functionality described is also an extension to the
328		ISO C standard.
329		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.
330		Where additional semantics apply to a function, the material is identified by use of the TCT
331		margin legend.
332	TPI	<b>Non-Robust Mutex Priority Inheritance</b>
333		The functionality described is optional. The functionality described is also an extension to the
334		ISO C standard.
335		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
336		Where additional semantics apply to a function, the material is identified by use of the TPI
337		margin legend.
338	TPP	<b>Non-Robust Mutex Priority Protection</b>
339		The functionality described is optional. The functionality described is also an extension to the
340		ISO C standard.
341		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
342		Where additional semantics apply to a function, the material is identified by use of the TPP
343		margin legend.
344	TPS	<b>Thread Execution Scheduling</b>
345		The functionality described is optional. The functionality described is also an extension to the
346		ISO C standard.
347		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
348		Where additional semantics apply to a function, the material is identified by use of the TPS
349		margin legend.
350	TSA	<b>Thread Stack Address Attribute</b>
351		The functionality described is optional. The functionality described is also an extension to the
352		ISO C standard.
353		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
354		Where additional semantics apply to a function, the material is identified by use of the TSA
355		margin legend.
356	TSH	<b>Thread Process-Shared Synchronization</b>
357		The functionality described is optional. The functionality described is also an extension to the
358		ISO C standard.
359		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
360		Where additional semantics apply to a function, the material is identified by use of the TSH
361		margin legend.
362	TSP	<b>Thread Sporadic Server</b>
363		The functionality described is optional. The functionality described is also an extension to the
364		ISO C standard.
365		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
366		Where additional semantics apply to a function, the material is identified by use of the TSP
367		margin legend.

368	TSS	<b>Thread Stack Size Attribute</b>
369		The functionality described is optional. The functionality described is also an extension to the
370		ISO C standard.
371		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
372		Where additional semantics apply to a function, the material is identified by use of the TSS
373		margin legend.
374	TYM	<b>Typed Memory Objects</b>
375		The functionality described is optional. The functionality described is also an extension to the
376		ISO C standard.
377		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
378		Where additional semantics apply to a function, the material is identified by use of the TYM
379		margin legend.
380	UP	<b>User Portability Utilities</b>
381		The functionality described is optional.
382		Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
383		Where additional semantics apply to a utility, the material is identified by use of the UP margin
384		legend.
385	UU	<b>UUCP Utilities</b>
386		The functionality described is optional. The functionality described is also an extension to the
387		ISO C standard.
388		Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section.
389		Where additional semantics apply to a function, the material is identified by use of the UU
390		margin legend.
391	XSI	<b>X/Open System Interfaces</b>
392		The functionality described is part of the X/Open Systems Interfaces option. Functionality
393		marked XSI is an extension to the ISO C standard. Application developers may confidently
394		make use of such extensions on all systems supporting the X/Open System Interfaces option.
395		If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that
396		reference page is an extension. See <a href="#">Section 2.1.4</a> (on page 19).

## 397 1.8.2 Margin Code Notation

398 Some of the functionality described in POSIX.1-2024 depends on support of more than one  
 399 option, or independently may depend on several options. The following notation for margin  
 400 codes is used to denote the following cases.

### 401 A Feature Dependent on One or Two Options

402 In this case, margin codes have a <space> separator; for example:

403	SHM	This feature requires support for only the Shared Memory Objects option.
404	SHM TYM	This feature requires support for both the Shared Memory Objects option and the Typed
405		Memory Objects option; that is, an application which uses this feature is portable only between
406		implementations that provide both options.

**407 A Feature Dependent on Either of the Options Denoted**

408 In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

409 SHM|TYM This feature is dependent on support for either the Shared Memory Objects option or the Typed  
410 Memory Objects option; that is, an application which uses this feature is portable between  
411 implementations that provide any (or all) of the options.

**412 A Feature Dependent on More than Two Options**

413 The following shorthand notations are used:

414 MC1 The MC1 margin code is shorthand for TPP | TPI | RPP | RPI. Features which are shaded with this  
415 margin code require support of either the Non-Robust Mutex Priority Protection option or the  
416 Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or  
417 the Robust Mutex Priority Inheritance option.

**418 Large Sections Dependent on an Option**

419 Where large sections of text are dependent on support for an option, a lead-in text block is  
420 provided and shaded accordingly; for example:

421 XSI This section describes extensions to support interprocess communication. The functionality  
422 described in this section shall be provided on implementations that support the XSI option (and  
423 the rest of this section is not further shaded).

# Conformance

## 2.1 Implementation Conformance

For the purposes of POSIX.1-2024, the implementation conformance requirements given in this section apply.

### 2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-2024 that are required for POSIX conformance (see [Section 2.1.3](#), on page 17). These interfaces shall support the functional behavior described herein.

2. The system may support the X/Open System Interfaces (XSI) option as described in [Section 2.1.4](#) (on page 19).

3. The system may support one or more options as described under [Section 2.1.5](#) (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.

4. The system may provide non-standard extensions. These are features not required by POSIX.1-2024 and may include, but are not limited to:

- Additional functions

- Additional headers

- Additional symbols in standard headers

- Additional utilities

- Additional options for standard utilities

- Additional environment variables

- Additional file types

- Non-conforming file systems (for example, legacy file systems for which `_POSIX_NO_TRUNC` is false, case-insensitive file systems, or network file systems)

- Dynamically populated file systems (for example, `/proc`)

- Additional character special files with special properties (for example, `/dev/stdin`, `/dev/stdout`, and `/dev/stderr`)

Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-2024 should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-2024. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-2024. In no case shall such an environment require modification of a Strictly Conforming POSIX Application (see

459                   Section 2.2.1, on page 27).

460       **Note:**       If the documented method of setting up a conforming environment includes the need to set one  
461                   or more environment variables, then the values of those environment variables cannot include  
462                   any <space> characters, since the *confstr()* function has to be able to return them in a  
463                   <space>-separated list of variable=value pairs. See XSH *confstr()* (on page 763).

## 464   2.1.2   Documentation

465       A conformance document with the following information shall be available for an  
466       implementation claiming conformance to POSIX.1-2024. The conformance document shall have  
467       the same structure as POSIX.1-2024, with the information presented in the appropriate sections  
468       and subsections. Sections and subsections that consist solely of subordinate section titles, with  
469       no other information, are not required. The conformance document shall not contain  
470       information about extended facilities or capabilities outside the scope of POSIX.1-2024.

471       The conformance document shall contain a statement that indicates the full name, number, and  
472       date of the standard that applies. The conformance document may also list international  
473       software standards that are available for use by a Conforming POSIX Application. Applicable  
474       characteristics where documentation is required by one of these standards, or by standards of  
475       government bodies, may also be included.

476       The conformance document shall describe the limit values found in the headers **<limits.h>** (on  
477       page 282) and **<unistd.h>** (on page 458), stating values, the conditions under which those values  
478       may change, and the limits of such variations, if any.

479       The conformance document shall describe the behavior of the implementation for all  
480       implementation-defined features defined in POSIX.1-2024. This requirement shall be met by  
481       listing these features and providing either a specific reference to the system documentation or  
482       providing full syntax and semantics of these features. When the value or behavior in the  
483       implementation is designed to be variable or customized on each instantiation of the system, the  
484       implementation provider shall document the nature and permissible ranges of this variation.

485       The conformance document may specify the behavior of the implementation for those features  
486       where POSIX.1-2024 states that implementations may vary or where features are identified as  
487       undefined or unspecified.

488       The conformance document shall not contain documentation other than that specified in the  
489       preceding paragraphs except where such documentation is specifically allowed or required by  
490       other provisions of POSIX.1-2024.

491       The phrases “shall document” or “shall be documented” in POSIX.1-2024 mean that  
492       documentation of the feature shall appear in the conformance document, as described  
493       previously, unless there is an explicit reference in the conformance document to show where the  
494       information can be found in the system documentation.

495       The system documentation should also contain the information found in the conformance  
496       document.

### 497 2.1.3 POSIX Conformance

498 A conforming implementation shall meet the following criteria for POSIX conformance.

#### 499 2.1.3.1 POSIX System Interfaces

500 The following requirements apply to the system interfaces (functions and headers):

- 501 • The system shall support all the mandatory functions and headers defined in  
502 POSIX.1-2024, and shall set the symbolic constant `_POSIX_VERSION` to the value 202405L.
- 503 • Although all implementations conforming to POSIX.1-2024 support all the features  
504 described below, there may be system-dependent or file system-dependent configuration  
505 procedures that can remove or modify any or all of these features. Such configurations  
506 should not be made if strict compliance is required.

507 The following symbolic constants shall be defined with a value other than `-1`. If a constant  
508 is defined with the value zero, applications should use the `sysconf()`, `pathconf()`, or  
509 `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the  
510 system at that time or for the particular pathname in question.

511 — `_POSIX_CHOWN_RESTRICTED`

512 The use of `chown()` is restricted to a process with appropriate privileges, and to  
513 changing the group ID of a file only to the effective group ID of the process or to one  
514 of its supplementary group IDs.

515 — `_POSIX_NO_TRUNC`

516 Pathname components longer than `{NAME_MAX}` generate an error.

- 517 • The following symbolic constants shall be defined by the implementation as follows:

518 — Symbolic constants defined with the value 202405L:

519 `_POSIX_ASYNCHRONOUS_IO`  
520 `_POSIX_BARRIERS`  
521 `_POSIX_CLOCK_SELECTION`  
522 `_POSIX_MAPPED_FILES`  
523 `_POSIX_MEMORY_PROTECTION`  
524 `_POSIX_MONOTONIC_CLOCK`  
525 `_POSIX_READER_WRITER_LOCKS`  
526 `_POSIX_REALTIME_SIGNALS`  
527 `_POSIX_SEMAPHORES`  
528 `_POSIX_SPIN_LOCKS`  
529 `_POSIX_THREAD_SAFE_FUNCTIONS`  
530 `_POSIX_THREADS`  
531 `_POSIX_TIMEOUTS`  
532 `_POSIX_TIMERS`  
533 `_POSIX2_C_BIND`

534 — Symbolic constants defined with a value greater than zero:

535 `_POSIX_JOB_CONTROL`  
536 `_POSIX_REGEX`  
537 `_POSIX_SAVED_IDS`  
538 `_POSIX_SHELL`

539 — Symbolic constants defined with a value other than -1.

540 `_POSIX_VDISABLE`

541 **Note:** The symbols above represent historical options that are no longer allowed as options, but  
542 are retained here for backwards-compatibility of applications.

543 • The system may support one or more options (see [Section 2.1.6](#), on page 25) denoted by the  
544 following symbolic constants:

545 `_POSIX_ADVISORY_INFO`  
546 `_POSIX_CPUTIME`  
547 `_POSIX_DEVICE_CONTROL`  
548 `_POSIX_FSYNC`  
549 `_POSIX_IPV6`  
550 `_POSIX_MEMLOCK`  
551 `_POSIX_MEMLOCK_RANGE`  
552 `_POSIX_MESSAGE_PASSING`  
553 `_POSIX_PRIORITIZED_IO`  
554 `_POSIX_PRIORITY_SCHEDULING`  
555 `_POSIX_RAW_SOCKETS`  
556 `_POSIX_SHARED_MEMORY_OBJECTS`  
557 `_POSIX_SPAWN`  
558 `_POSIX_SPORADIC_SERVER`  
559 `_POSIX_SYNCHRONIZED_IO`  
560 `_POSIX_THREAD_ATTR_STACKADDR`  
561 `_POSIX_THREAD_CPUTIME`  
562 `_POSIX_THREAD_ATTR_STACKSIZE`  
563 `_POSIX_THREAD_PRIO_INHERIT`  
564 `_POSIX_THREAD_PRIO_PROTECT`  
565 `_POSIX_THREAD_PRIORITY_SCHEDULING`  
566 `_POSIX_THREAD_PROCESS_SHARED`  
567 `_POSIX_THREAD_SPORADIC_SERVER`  
568 `_POSIX_TYPED_MEMORY_OBJECTS`  
569 `_XOPEN_CRYPT`  
570 `_XOPEN_REALTIME`  
571 `_XOPEN_REALTIME_THREADS`  
572 `_XOPEN_UNIX`

573 If the Advisory Information option is supported, there shall be at least one file system that  
574 supports the functionality.

### 575 2.1.3.2 *POSIX Shell and Utilities*

576 The following requirements apply to the shell and utilities:

- 577 • The system shall provide all the mandatory utilities in the Shell and Utilities volume of  
578 POSIX.1-2024 with all the functional behavior described therein.
- 579 • The system shall support the Large File capabilities described in the Shell and Utilities  
580 volume of POSIX.1-2024.
- 581 • The system may support one or more options (see [Section 2.1.6](#), on page 25) denoted by the  
582 following symbolic constants. (The literal names below apply to the *getconf* utility.)

583           POSIX2\_C\_DEV  
 584           POSIX2\_CHAR\_TERM  
 585           POSIX2\_FORT\_RUN  
 586           POSIX2\_LOCALEDEF  
 587           POSIX2\_SW\_DEV  
 588           POSIX2\_UPE  
 589           XOPEN\_UNIX  
 590           XOPEN\_UUCP

591           Additional language bindings and development utility options may be provided in other related  
 592           standards or in a future version of this standard. In the former case, additional symbolic  
 593           constants of the same general form as shown in this subsection should be defined by the related  
 594           standard document and made available to the application without requiring POSIX.1-2024 to be  
 595           updated.

## 596 **2.1.4 XSI Conformance**

597 XSI       This section describes the criteria for implementations providing conformance to the X/Open  
 598           System Interfaces (XSI) option (see [Section 3.424](#), on page 93). The functionality described in this  
 599           section shall be provided on implementations that support the XSI option (and the rest of this  
 600           section is not further shaded).

601           POSIX.1-2024 describes utilities, functions, and facilities offered to application programs by the  
 602           X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the  
 603           criteria for POSIX conformance and the following requirements listed in this section.

604           XSI-conforming implementations shall set the symbolic constant `_XOPEN_UNIX` to a value  
 605           other than `-1` and shall set the symbolic constant `_XOPEN_VERSION` to the value `800`.

### 606 *2.1.4.1 XSI System Interfaces*

607           The following requirements apply to the system interfaces when the XSI option is supported:

- 608           • The system shall support all the functions and headers defined in POSIX.1-2024 as part of  
 609           the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions  
 610           marked with the XSI option marking (see [Section 1.8.1](#), on page 7) within the text.
- 611           • The system shall support the following options defined within POSIX.1-2024 (see [Section](#)  
 612           [2.1.6](#), on page 25):

613                    `_POSIX_FSYNC`  
 614                    `_POSIX_THREAD_ATTR_STACKADDR`  
 615                    `_POSIX_THREAD_ATTR_STACKSIZE`  
 616                    `_POSIX_THREAD_PROCESS_SHARED`

- 617           • The system may support the following XSI Option Groups (see [Section 2.1.5.2](#), on page 22)  
 618           defined within POSIX.1-2024:

- 619                   — Encryption
- 620                   — Realtime
- 621                   — Advanced Realtime

- 622 — Realtime Threads
- 623 — Advanced Realtime Threads

#### 624 2.1.4.2 XSI Shell and Utilities Conformance

625 The following requirements apply to the shell and utilities when the XSI option is supported:

- 626 • The system shall support all the utilities defined in the Shell and Utilities volume of  
627 POSIX.1-2024 as part of the XSI option denoted by the XSI marking in the SYNOPSIS  
628 section, and any extensions marked with the XSI option marking (see [Section 1.8.1](#), on  
629 page 7) within the text.
- 630 • The system shall support the User Portability Utilities option and the Terminal  
631 Characteristics option.
- 632 • The system shall support creation of locales (see [Chapter 7](#), on page 127).
- 633 • The C-language Development utility *c17* shall be supported.
- 634 • The XSI Development Utilities option may be supported. It consists of the following  
635 software development utilities:

636	<i>admin</i>	<i>delta</i>	<i>rmdel</i>	<i>val</i>
637	<i>cflow</i>	<i>get</i>	<i>sact</i>	<i>what</i>
638	<i>ctags</i>	<i>nm</i>	<i>sccs</i>	
639	<i>cxref</i>	<i>prs</i>	<i>unget</i>	

### 640 2.1.5 Option Groups

641 An Option Group is a group of related functions or options defined within the System Interfaces  
642 volume of POSIX.1-2024.

643 If an implementation supports an Option Group, then the system shall support the functional  
644 behavior described herein.

645 If an implementation does not support an Option Group, then the system need not support the  
646 functional behavior described herein.

#### 647 2.1.5.1 Subprofiling Considerations

648 Profiling standards supporting functional requirements less than that required in POSIX.1-2024  
649 may subset both mandatory and optional functionality required for POSIX Conformance (see  
650 [Section 2.1.3](#), on page 17) or XSI Conformance (see [Section 2.1.4](#), on page 19). Such profiles shall  
651 organize the subsets into Subprofiling Option Groups.

652 XRAT [Appendix E](#) (on page 3943) describes a representative set of such Subprofiling Option  
653 Groups for use by profiles applicable to specialized realtime systems. POSIX.1-2024 does not  
654 require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols  
655 defined in any header) or at runtime (via *sysconf()* or *getconf()*).

656 A Subprofiling Option Group may provide basic system functionality that other Subprofiling  
657 Option Groups and other options depend upon.<sup>4</sup> If a profile of POSIX.1-2024 does not require an  
658 implementation to provide a Subprofiling Option Group that provides features utilized by a  
659 required Subprofiling Option Group (or option),<sup>5</sup> the profile shall specify<sup>6</sup> all of the following:

- 660 • Restricted or altered behavior of interfaces defined in POSIX.1-2024 that may differ on an  
661 implementation of the profile
- 662 • Additional behaviors that may produce undefined or unspecified results
- 663 • Additional implementation-defined behavior that implementations shall be required to  
664 document in the profile's conformance document

665 if any of the above is a result of the profile not requiring an interface required by POSIX.1-2024.

666 The following additional rules shall apply to all profiles of POSIX.1-2024:

- 667 • Any application that conforms to that profile shall also conform to POSIX.1-2024, unless  
668 the application depends on the definition of a profile support indicator macro in  
669 **<unistd.h>** (that is, a profile shall not require restricted, altered, or extended behaviors of  
670 an implementation of POSIX.1-2024).
- 671 • Profiles are permitted to require the definition of a *profile support indicator macro* with a  
672 name beginning `_POSIX_AEP_` in **<unistd.h>**.
- 673 • Profiles shall require the definition of the macro `_POSIX_SUBPROFILE` in **<unistd.h>** on  
674 implementations that do not meet all of the requirements of a POSIX.1-conforming  
675 implementation.
- 676 • Profiles are permitted to add additional requirements to the limits defined in **<limits.h>**  
677 and **<stdint.h>**, subject to the following:

678 For the limits in **<limits.h>** and **<stdint.h>**:

- 679 — If the limit is specified as having a fixed value, it shall not be changed by a profile.
- 680 — If a limit is specified as having a minimum or maximum acceptable value, it may be  
681 changed by a profile as follows:
  - 682 — A profile may increase a minimum acceptable value, but shall not make a  
683 minimum acceptable value smaller.
  - 684 — A profile may reduce a maximum acceptable value, but shall not make a  
685 maximum acceptable value larger.
- 686 • A profile shall not change a limit specified as having a minimum or maximum value into a  
687 limit specified as having a fixed value.
- 688 • A profile shall not create new limits.
- 689 • Any implementation that conforms to POSIX.1-2024 (including all options and extended  
690 limits required by the profile) shall also conform to that profile, except for the possible  
691 omission from **<unistd.h>** of a profile support indicator macro required by the profile.

- 
- 692 4. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are  
693 needed by any interface in POSIX.1-2024 that parses a *path* argument. If a profile requires support for the Device Input and Output  
694 profiling option group but does not require support for the File System profiling option group, the profile needs to specify how pathname  
695 resolution is to behave in that profile, how the `O_CREAT` flag to `open()` is to be handled (and the use of the character 'a' in the *mode*  
696 argument of `fopen()` when a pathname argument names a file that does not exist), and specify lots of other details.
  - 697 5. As an example, POSIX.1-2024 requires that implementations claiming to support the Range Memory Locking option also support the  
698 Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that  
699 the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor  
700 would have to know to build an application or implementation conforming to the profile.
  - 701 6. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified  
702 results.

## 703 2.1.5.2 XSI Option Groups

704 XSI This section describes Option Groups to support the definition of XSI conformance within the  
 705 System Interfaces volume of POSIX.1-2024. The functionality described in this section shall be  
 706 provided on implementations that support the XSI option and the appropriate Option Group  
 707 (and the rest of this section is not further shaded).

708 The following Option Groups are defined.

709 **Encryption**

710 The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes  
 711 the following functions:

712 OB `crypt()`, `encrypt()`, `setkey()`

713 These functions are marked CRYPT.

714 Due to export restrictions on the cryptographic algorithm in some countries, implementations  
 715 may be restricted in making these functions available. All the functions in the Encryption  
 716 Option Group may therefore return `[ENOSYS]` or, alternatively, `encrypt()` shall return `[ENOSYS]`  
 717 for the decryption operation.

718 An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to  
 719 a value other than `-1`.

720 **Realtime**

721 The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

722 This Option Group includes a set of realtime functions drawn from options within POSIX.1-2024  
 723 (see [Section 2.1.6](#), on page 25).

724 Where entire functions are included in the Option Group, the NAME section is marked with  
 725 REALTIME. Where additional semantics have been added to existing pages, the new material is  
 726 identified by use of the appropriate margin legend for the underlying option defined within  
 727 POSIX.1-2024.

728 An implementation that claims conformance to this Option Group shall set  
 729 `_XOPEN_REALTIME` to a value other than `-1`.

730 This Option Group consists of the set of the following options from within POSIX.1-2024 (see  
 731 [Section 2.1.6](#), on page 25):

732 `_POSIX_FSYNC`  
 733 `_POSIX_MEMLOCK`  
 734 `_POSIX_MEMLOCK_RANGE`  
 735 `_POSIX_MESSAGE_PASSING`  
 736 `_POSIX_PRIORITIZED_IO`  
 737 `_POSIX_PRIORITY_SCHEDULING`  
 738 `_POSIX_SHARED_MEMORY_OBJECTS`  
 739 `_POSIX_SYNCHRONIZED_IO`

740 If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the  
 741 following symbolic constants shall be defined by the implementation to have the value 202405L:

742            \_POSIX\_MEMLOCK  
 743            \_POSIX\_MEMLOCK\_RANGE  
 744            \_POSIX\_MESSAGE\_PASSING  
 745            \_POSIX\_PRIORITY\_SCHEDULING  
 746            \_POSIX\_SHARED\_MEMORY\_OBJECTS  
 747            \_POSIX\_SYNCHRONIZED\_IO

748            The functionality associated with `_POSIX_FSYNC` shall always be supported on XSI-conformant  
 749            systems.

750            Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If  
 751            `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by  
 752            `aio_read()`, `aio_write()`, and `lio_listio()` shall be submitted at a priority equal to the scheduling  
 753            priority equal to a base scheduling priority minus `aioctx->aio_reqprio`. If Thread Execution  
 754            Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 755            otherwise, the base scheduling priority is that of the calling thread. The implementation shall  
 756            also document for which files I/O prioritization is supported.

### 757            **Advanced Realtime**

758            An implementation that claims conformance to this Option Group shall also support the  
 759            Realtime Option Group.

760            Where entire functions are included in the Option Group, the NAME section is marked with  
 761            ADVANCED REALTIME. Where additional semantics have been added to existing pages, the  
 762            new material is identified by use of the appropriate margin legend for the underlying option  
 763            defined within POSIX.1-2024.

764            This Option Group consists of the set of the following options from within POSIX.1-2024 (see  
 765            [Section 2.1.6](#), on page 25):

766            \_POSIX\_ADVISORY\_INFO  
 767            \_POSIX\_CPUTIME  
 768            \_POSIX\_SPAWN  
 769            \_POSIX\_SPORADIC\_SERVER  
 770            \_POSIX\_TYPED\_MEMORY\_OBJECTS

771            If the implementation supports the Advanced Realtime Option Group, then the following  
 772            symbolic constants shall be defined by the implementation to have the value 202405L:

773            \_POSIX\_ADVISORY\_INFO  
 774            \_POSIX\_CPUTIME  
 775            \_POSIX\_SPAWN  
 776            \_POSIX\_SPORADIC\_SERVER  
 777            \_POSIX\_TYPED\_MEMORY\_OBJECTS

778            If the symbolic constant `_POSIX_SPORADIC_SERVER` is defined, then the symbolic constant  
 779            `_POSIX_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the  
 780            value 202405L.

781 **Realtime Threads**

782 The Realtime Threads Option Group is denoted by the symbolic constant  
783 `_XOPEN_REALTIME_THREADS`.

784 This Option Group consists of the set of the following options from within POSIX.1-2024 (see  
785 [Section 2.1.6](#), on page 25):

```
786     _POSIX_THREAD_PRIO_INHERIT
787     _POSIX_THREAD_PRIO_PROTECT
788     _POSIX_THREAD_PRIORITY_SCHEDULING
789     _POSIX_THREAD_ROBUST_PRIO_INHERIT
790     _POSIX_THREAD_ROBUST_PRIO_PROTECT
```

791 Where applicable, whole pages are marked `REALTIME_THREADS`, together with the  
792 appropriate option margin legend for the SYNOPSIS section (see [Section 1.8.1](#), on page 7).

793 An implementation that claims conformance to this Option Group shall set  
794 `_XOPEN_REALTIME_THREADS` to a value other than `-1`.

795 If the symbol `_XOPEN_REALTIME_THREADS` is defined to have a value other than `-1`, then the  
796 following options shall also be defined by the implementation to have the value `202405L`:

```
797     _POSIX_THREAD_PRIO_INHERIT
798     _POSIX_THREAD_PRIO_PROTECT
799     _POSIX_THREAD_PRIORITY_SCHEDULING
800     _POSIX_THREAD_ROBUST_PRIO_INHERIT
801     _POSIX_THREAD_ROBUST_PRIO_PROTECT
```

802 **Advanced Realtime Threads**

803 An implementation that claims conformance to this Option Group shall also support the  
804 Realtime Threads Option Group.

805 Where entire functions are included in the Option Group, the NAME section is marked with  
806 `ADVANCED_REALTIME_THREADS`. Where additional semantics have been added to existing  
807 pages, the new material is identified by use of the appropriate margin legend for the underlying  
808 option defined within POSIX.1-2024.

809 This Option Group consists of the set of the following options from within POSIX.1-2024 (see  
810 [Section 2.1.6](#), on page 25):

```
811     _POSIX_THREAD_CPUTIME
812     _POSIX_THREAD_SPORADIC_SERVER
```

813 If the symbolic constant `_POSIX_THREAD_SPORADIC_SERVER` is defined to have the value  
814 `202405L`, then the symbolic constant `_POSIX_THREAD_PRIORITY_SCHEDULING` shall also be  
815 defined by the implementation to have the value `202405L`.

816 If the implementation supports the Advanced Realtime Threads Option Group, then the  
817 following symbolic constants shall be defined by the implementation to have the value `202405L`:

```
818     _POSIX_THREAD_CPUTIME
819     _POSIX_THREAD_SPORADIC_SERVER
```

## 820 2.1.6 Options

821 The symbolic constants defined in `<unistd.h>`, [Constants for Options and Option Groups](#) (on  
822 page 458) reflect implementation options for POSIX.1-2024. These symbols can be used by the  
823 application to determine which of three categories of support for optional facilities are provided  
824 by the implementation.

825 1. Option not supported for compilation.

826 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
827 with value `-1`, or by leaving it undefined) that the option is not supported for compilation  
828 and, at the time of compilation, is not supported for runtime use. In this case, the headers,  
829 data types, function interfaces, and utilities required only for the option need not be  
830 present. A later runtime check using the `fpathconf()`, `pathconf()`, or `sysconf` functions  
831 defined in the System Interfaces volume of POSIX.1-2024 or the `getconf` utility defined in  
832 the Shell and Utilities volume of POSIX.1-2024 can in some circumstances indicate that  
833 the option is supported at runtime. (For example, an old application binary might be run  
834 on a newer implementation to which support for the option has been added.)

835 2. Option always supported.

836 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
837 with a value greater than zero) that the option is supported both for compilation and for  
838 use at runtime. In this case, all headers, data types, function interfaces, and utilities  
839 required only for the option shall be available and shall operate as specified. Runtime  
840 checks with `fpathconf()`, `pathconf()`, or `sysconf` shall indicate that the option is supported.

841 3. Option might or might not be supported at runtime.

842 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
843 with value zero) that the option is supported for compilation and might or might not be  
844 supported at runtime. In this case, the `fpathconf()`, `pathconf()`, or `sysconf()` functions  
845 defined in the System Interfaces volume of POSIX.1-2024 or the `getconf` utility defined in  
846 the Shell and Utilities volume of POSIX.1-2024 can be used to retrieve the value of each  
847 symbol on each specific implementation to determine whether the option is supported at  
848 runtime. All headers, data types, and function interfaces required to compile and execute  
849 applications which use the option at runtime (after checking at runtime that the option is  
850 supported) shall be provided, but if the option is not supported at runtime they need not  
851 operate as specified. Utilities or other facilities required only for the option, but not  
852 needed to compile and execute such applications, need not be present.

853 If an option is not supported for compilation, an application that attempts to use anything  
854 associated only with the option is considered to be requiring an extension. Unless explicitly  
855 specified otherwise, the behavior of functions associated with an option that is not supported at  
856 runtime is unspecified, and an application that uses such functions without first checking  
857 `fpathconf()`, `pathconf()`, or `sysconf` is considered to be requiring an extension.

858 Margin codes are defined for each option (see [Section 1.8.1](#), on page 7).

### 859 2.1.6.1 System Interfaces

860 Refer to `<unistd.h>`, [Constants for Options and Option Groups](#) (on page 458) for the list of  
861 options.

862 2.1.6.2 *Shell and Utilities*

863 Each of these symbols shall be considered valid names by the implementation. Refer to  
864 <**unistd.h**>, [Constants for Options and Option Groups](#) (on page 458).

865 The literal names shown below apply only to the *getconf* utility.

866 CD **POSIX2\_C\_DEV**

867 The system supports the C-Language Development Utilities option.

868 The utilities in the C-Language Development Utilities option are used for the development  
869 of C-language applications, including compilation or translation of C source code and  
870 complex program generators for simple lexical tasks and processing of context-free  
871 grammars.

872 The utilities listed below may be provided by a conforming system; however, any system  
873 claiming conformance to the C-Language Development Utilities option shall provide all of  
874 the utilities listed.

875 *c17*  
876 *lex*  
877 *yacc*

878 **POSIX2\_CHAR\_TERM**

879 The system supports the Terminal Characteristics option. This value need not be present on  
880 a system not supporting the User Portability Utilities option.

881 Where applicable, the dependency is noted within the description of the utility.

882 This option applies only to systems supporting the User Portability Utilities option. If  
883 supported, then the system supports at least one terminal type capable of all operations  
884 described in POSIX.1-2024; see [Section 10.2](#) (on page 197).

885 FR **POSIX2\_FORT\_RUN**

886 The system supports the FORTRAN Runtime Utilities option.

887 The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

888 The *asa* utility may be provided by a conforming system; however, any system claiming  
889 conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

890 **POSIX2\_LOCALEDEF**

891 The system supports the Locale Creation Utilities option.

892 If supported, the system supports the creation of locales as described in the *localedef* utility.

893 The *localedef* utility may be provided by a conforming system; however, any system  
894 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*  
895 utility.

896 SD **POSIX2\_SW\_DEV**

897 The system supports the Software Development Utilities option.

898 The utilities in the Software Development Utilities option are used for the development of  
899 applications, including compilation or translation of source code, the creation and  
900 maintenance of library archives, and the maintenance of groups of inter-dependent  
901 programs.

902 The utilities listed below may be provided by the conforming system; however, any system  
903 claiming conformance to the Software Development Utilities option shall provide all of the  
904 utilities listed here.

905            *ar*  
 906            *make*  
 907            *nm*  
 908            *strip*

909 UP        **POSIX2\_UPE**

910        The system supports the User Portability Utilities option.

911        The utilities in the User Portability Utilities option shall be implemented on all systems that  
 912        claim conformance to this option, except for the *vi* utility which is noted as having features  
 913        that cannot be implemented on all terminal types; if the `POSIX2_CHAR_TERM` option is  
 914        supported, the system shall support all such features on at least one terminal type; see  
 915        [Section 10.2](#) (on page 197).

916        The list of utilities in the User Portability Utilities option is as follows:

917            *bg*   *fc*   *jobs*   *more*   *vi*  
 918            *ex*   *fg*   *man*    *talk*

919 XSI        **XOPEN\_UNIX**

920        The system supports the X/Open System Interfaces (XSI) option (see [Section 2.1.4](#), on page  
 921        19).

922 UU        **XOPEN\_UUCP**

923        The system supports the UUCP Utilities option.

924        The list of utilities in the UUCP Utilities option is as follows:

925            *uucp*  
 926            *uustat*  
 927            *uux*

928 **2.2 Application Conformance**

929        For the purposes of POSIX.1-2024, the application conformance requirements given in this  
 930        section apply.

931        All applications claiming conformance to POSIX.1-2024 shall use only language-dependent  
 932        services for the C programming language described in [Section 2.3](#) (on page 29), shall use only  
 933        the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-2024, and shall fall  
 934        within one of the following categories.

935 **2.2.1 Strictly Conforming POSIX Application**

936        A Strictly Conforming POSIX Application is an application that requires only the facilities  
 937        described in POSIX.1-2024. Such an application:

- 938        1. Shall accept any implementation behavior that results from actions it takes in areas  
 939        described in POSIX.1-2024 as *implementation-defined* or *unspecified*, or where POSIX.1-2024  
 940        indicates that implementations may vary
- 941        2. Shall not perform any actions that are described as producing *undefined* results
- 942        3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2024,  
 943        but shall not rely on any value in the range being greater than the minimums listed or  
 944        being less than the maximums listed in POSIX.1-2024

- 945 4. Shall not use facilities designated as *obsolescent*
- 946 5. Is required to tolerate and permitted to adapt to the presence or absence of optional  
947 facilities whose availability is indicated by [Section 2.1.3](#) (on page 17)
- 948 6. For the C programming language, shall not produce any output dependent on any  
949 behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-*  
950 *defined*, unless the System Interfaces volume of POSIX.1-2024 specifies the behavior
- 951 7. For the C programming language, shall not exceed any minimum implementation limit  
952 defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-2024  
953 specifies a higher minimum implementation limit
- 954 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 202405L before  
955 any header is included
- 956 Within POSIX.1-2024, any restrictions placed upon a Conforming POSIX Application shall  
957 restrict a Strictly Conforming POSIX Application.

## 958 2.2.2 Conforming POSIX Application

### 959 2.2.2.1 ISO/IEC Conforming POSIX Application

960 An ISO/IEC Conforming POSIX Application is an application that uses only the facilities  
961 described in POSIX.1-2024 and approved Conforming Language bindings for any ISO or IEC  
962 standard. Such an application shall include a statement of conformance that documents all  
963 options and limit dependencies, and all other ISO or IEC standards used.

### 964 2.2.2.2 <National Body> Conforming POSIX Application

965 A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming  
966 POSIX Application in that it also may use specific standards of a single ISO/IEC member body  
967 referred to here as <National Body>. Such an application shall include a statement of  
968 conformance that documents all options and limit dependencies, and all other <National Body>  
969 standards used.

## 970 2.2.3 Conforming POSIX Application Using Extensions

971 A Conforming POSIX Application Using Extensions is an application that differs from a  
972 Conforming POSIX Application only in that it uses non-standard facilities that are consistent  
973 with POSIX.1-2024. Such an application shall fully document its requirements for these extended  
974 facilities, in addition to the documentation required of a Conforming POSIX Application. A  
975 Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming  
976 POSIX Application Using Extensions or a <National Body> Conforming POSIX Application  
977 Using Extensions (see [Section 2.2.2.1](#) and [Section 2.2.2.2](#)).

## 978 2.2.4 Strictly Conforming XSI Application

979 A Strictly Conforming XSI Application is an application that requires only the facilities  
980 described in POSIX.1-2024. Such an application:

- 981 1. Shall accept any implementation behavior that results from actions it takes in areas  
982 described in POSIX.1-2024 as *implementation-defined* or *unspecified*, or where POSIX.1-2024  
983 indicates that implementations may vary
- 984 2. Shall not perform any actions that are described as producing *undefined* results
- 985 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2024,  
986 but shall not rely on any value in the range being greater than the minimums listed or  
987 being less than the maximums listed in POSIX.1-2024
- 988 4. Shall not use facilities designated as *obsolescent*
- 989 5. Is required to tolerate and permitted to adapt to the presence or absence of optional  
990 facilities whose availability is indicated by [Section 2.1.4](#) (on page 19)
- 991 6. For the C programming language, shall not produce any output dependent on any  
992 behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-*  
993 *defined*, unless the System Interfaces volume of POSIX.1-2024 specifies the behavior
- 994 7. For the C programming language, shall not exceed any minimum implementation limit  
995 defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-2024  
996 specifies a higher minimum implementation limit
- 997 8. For the C programming language, shall define `_XOPEN_SOURCE` to be 800 before any  
998 header is included

999 Within POSIX.1-2024, any restrictions placed upon a Conforming POSIX Application shall  
1000 restrict a Strictly Conforming XSI Application.

## 1001 2.2.5 Conforming XSI Application Using Extensions

1002 A Conforming XSI Application Using Extensions is an application that differs from a Strictly  
1003 Conforming XSI Application only in that it uses non-standard facilities that are consistent with  
1004 POSIX.1-2024. Such an application shall fully document its requirements for these extended  
1005 facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

## 1006 2.3 Language-Dependent Services for the C Programming Language

1007 Implementors seeking to claim conformance using the ISO C standard shall claim POSIX  
1008 conformance as described in [Section 2.1.3](#) (on page 17).

## 1009 2.4 Other Language-Related Specifications

1010 POSIX.1-2024 is currently specified in terms of the shell command language and ISO C. Bindings  
1011 to other programming languages are being developed.

1012 If conformance to POSIX.1-2024 is claimed for implementation of any programming language,  
1013 the implementation of that language shall support the use of external symbols distinct to at least  
1014 31 bytes in length in the source program text. (That is, identifiers that differ at or before the  
1015 thirty-first byte shall be distinct.) If a national or international standard governing a language  
1016 defines a maximum length that is less than this value, the language-defined maximum shall be

1017 supported. External symbols that differ only by case shall be distinct when the character set in  
1018 use distinguishes uppercase and lowercase characters and the language permits (or requires)  
1019 uppercase and lowercase characters to be distinct in external symbols.

1020

Chapter 3

1021

# Definitions

1022

For the purposes of POSIX.1-2024, the following terms and definitions apply. The Authoritative Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined in this section.

1023

1024

1025

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

1026

1027

1028

## 3.1 Abortive Release

1029

An abrupt termination of a network connection that may result in the loss of data.

1030

## 3.2 Absolute Pathname

1031

A pathname beginning with a single or more than two <slash> characters; see also [Section 3.254](#) (on page 68).

1032

1033

**Note:** Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

1034

## 3.3 Access Mode

1035

A particular form of access permitted to a file.

1036

## 3.4 Additional File Access Control Mechanism

1037

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

1038

1039

1040

**Note:** File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

1041

## 3.5 Address Space

1042

The memory locations that can be referenced by a process or the threads of a process.

1043

## 3.6 Advisory Information

1044

An interface that advises the implementation on (portable) application behavior so that it can optimize the system.

1045

### 1046 3.7 Affirmative Response

1047 An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category  
1048 keyword **yesexpr**, matching an extended regular expression in the current locale.

1049 **Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 159).

### 1050 3.8 Alert

1051 To cause the user's terminal to give some audible or visual indication that an error or some other  
1052 event has occurred. When the standard output is directed to a terminal device, the method for  
1053 alerting the terminal user is unspecified. When the standard output is not directed to a terminal  
1054 device, the alert is accomplished by writing the alert to standard output (unless the utility  
1055 description indicates that the use of standard output produces undefined results in this case).

### 1056 3.9 Alert Character (<alert>)

1057 A character that in the output stream should cause a terminal to alert its user via a visual or  
1058 audible notification. It is the character designated by '\a' in the C language. It is unspecified  
1059 whether this character is the exact sequence transmitted to an output device by the system to  
1060 accomplish the alert function.

### 1061 3.10 Alias Name

1062 In the shell command language, a word consisting solely of alphabetic and digits from the  
1063 portable character set and any of the following characters: '!', '%', ',', '-', '@', '\_'.

1064 Implementations may allow other characters within alias names as an extension.

1065 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 117).

### 1066 3.11 Alignment

1067 A requirement that objects of a particular type be located on storage boundaries with addresses  
1068 that are particular multiples of a byte address.

1069 **Note:** See also the ISO C standard, Section 6.2.8.

### 1070 3.12 Alternate File Access Control Mechanism

1071 An implementation-defined mechanism that is independent of the access control mechanisms  
1072 defined herein, and which if enabled on a file may either restrict or extend the permissions of a  
1073 given user. POSIX.1-2024 defines when such mechanisms can be enabled and when they are  
1074 disabled.

1075 **Note:** File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

### 1076 **3.13 Alternate Signal Stack**

1077 Memory associated with a thread, established upon request by the implementation for a thread,  
1078 separate from the thread signal stack, in which signal handlers responding to signals sent to that  
1079 thread may be executed.

### 1080 **3.14 Ancillary Data**

1081 Protocol-specific, local system-specific, or optional information. The information can be both  
1082 local or end-to-end significant, header information, part of a data portion, protocol-specific, and  
1083 implementation or system-specific.

### 1084 **3.15 Angle Brackets**

1085 The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase  
1086 "enclosed in angle brackets", the symbol '`<`' immediately precedes the object to be enclosed,  
1087 and '`>`' immediately follows it. When describing these characters in the portable character set,  
1088 the names `<less-than-sign>` and `<greater-than-sign>` are used.

### 1089 **3.16 Anonymous Memory Object**

1090 An object that represents memory not associated with any other memory objects.

### 1091 **3.17 Apostrophe Character (<apostrophe>)**

1092 The character designated by '`\'`' in the C language, also known as the single-quote character.

### 1093 **3.18 Application**

1094 A computer program that performs some desired function.

1095 When the User Portability Utilities option is supported, requirements placed on applications  
1096 relating to the use of standard utilities shall also apply to the actions of a user who is entering  
1097 shell command language statements into an interactive shell.

### 1098 **3.19 Application Address**

1099 Endpoint address of a specific application.

### 1100 **3.20 Application Program Interface (API)**

1101 The definition of syntax and semantics for providing computer system services.

### 1102 3.21 Appropriate Privileges

1103 An implementation-defined means of associating privileges with a process with regard to the  
1104 function calls, function call options, and the commands that need special privileges. There may  
1105 be zero or more such means. These means (or lack thereof) are described in the conformance  
1106 document.

1107 **Note:** Function calls are defined in the System Interfaces volume of POSIX.1-2024, and commands are  
1108 defined in the Shell and Utilities volume of POSIX.1-2024.

### 1109 3.22 Argument

1110 In the shell command language, a parameter passed to a utility as the equivalent of a single  
1111 string in the *argv* array created by one of the *exec* functions. An argument is one of the options,  
1112 option-arguments, or operands following the command name.

1113 **Note:** The Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213) and XCU [Section](#)  
1114 [2.9.1.4](#) (on page 2502).

1115 In the C language, an expression in a function call expression or a sequence of preprocessing  
1116 tokens in a function-like macro invocation.

### 1117 3.23 Arm (a Timer)

1118 To start a timer measuring the passage of time, enabling notifying a process when the specified  
1119 time or time interval has passed.

### 1120 3.24 Asterisk Character (<asterisk>)

1121 The character ' \* '.

### 1122 3.25 Async-Cancel-Safe Function

1123 A function that may be safely invoked by an application while the asynchronous form of  
1124 cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

### 1125 3.26 Asynchronous Events

1126 Events that occur independently of the execution of the application.

### 1127 3.27 Asynchronous Input and Output

1128 A functionality enhancement to allow an application process to queue data input and output  
1129 commands with asynchronous notification of completion.

### 1130 3.28 Async-Signal-Safe Function

1131 A function that can be called, without restriction, from signal-catching functions. Note that,  
1132 although there is no restriction on the calls themselves, for certain functions there are restrictions  
1133 on subsequent behavior after the function is called from a signal-catching function. No function  
1134 is async-signal-safe unless explicitly described as such.

1135 **Note:** Async-signal-safety is defined in detail in XSH [Section 2.4.3](#) (on page 516).

### 1136 3.29 Asynchronously-Generated Signal

1137 A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals  
1138 sent from the keyboard, and signals delivered to process groups. Being asynchronous is a  
1139 property of how the signal was generated and not a property of the signal number. All signals  
1140 may be generated asynchronously.

1141 **Note:** The *kill()* function is defined in detail in the System Interfaces volume of POSIX.1-2024.

### 1142 3.30 Asynchronous I/O Completion

1143 For an asynchronous read or write operation, when a corresponding synchronous read or write  
1144 would have completed and when any associated status fields have been updated.

### 1145 3.31 Asynchronous I/O Operation

1146 An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from  
1147 further use of the processor.

1148 This implies that the process and the I/O operation may be running concurrently.

### 1149 3.32 Atomic Operation

1150 An operation that cannot be broken up into smaller parts that could be performed separately. An  
1151 atomic operation is guaranteed to complete either fully or not at all. In the context of the  
1152 functionality provided by the `<stdatomic.h>` header, there are different types of atomic  
1153 operation that are defined in detail in [Section 4.15.1](#) (on page 100).

### 1154 3.33 Authentication

1155 The process of validating a user or process to verify that the user or process is not a counterfeit.

### 1156 3.34 Authorization

1157 The process of verifying that a user or process has permission to use a resource in the manner  
1158 requested.

1159 To assure security, the user or process would also need to be authenticated before granting  
1160 access.

### 1161 3.35 Background Job

1162 In the context of the System Interfaces volume of POSIX.1-2024, a background process group  
1163 (see [Section 3.37](#)).

1164 In the context of the shell, a job that the shell is not waiting for before it executes further  
1165 commands or, if interactive, prompts for further commands. A background job can be a job-  
1166 control background job or a non-job-control background job. A job-control background job is a  
1167 job that started execution (either in the background or the foreground) while job control was  
1168 enabled and is currently in the background. A non-job-control background job is an  
1169 asynchronous AND-OR list that started execution while job control was disabled and was  
1170 assigned a job number. An implementation need not support non-job-control background jobs;  
1171 that is, the shell may, but need not, assign job numbers to asynchronous AND-OR lists that start  
1172 execution while job control is disabled.

1173 **Note:** Asynchronous AND-OR lists are defined in detail in XCU [Section 2.9.3.1](#) (on page 2506).

1174 **Note:** See also [Section 3.158](#) (on page 54), [Section 3.180](#) (on page 57), [Section 3.181](#) (on page 57), and  
1175 [Section 3.362](#) (on page 84).

### 1176 3.36 Background Process

1177 A process that is a member of a background process group.

### 1178 3.37 Background Process Group

1179 Any process group, other than a foreground process group, that is a member of a session that  
1180 has established a connection with a controlling terminal.

1181 **Note:** See also [Section 3.35](#).

### 1182 3.38 Backquote Character

1183 The character ' ` ', also known as <grave-accent>.

### 1184 3.39 Backslash Character (<backslash>)

1185 The character designated by ' \\ ' in the C language, also known as reverse solidus.

### 1186 **3.40 Backspace Character (<backspace>)**

1187 A character that, in the output stream, should cause printing (or displaying) to occur one  
1188 column position previous to the position about to be printed. If the position about to be printed  
1189 is at the beginning of the current line, the behavior is unspecified. It is the character designated  
1190 by '\b' in the C language. It is unspecified whether this character is the exact sequence  
1191 transmitted to an output device by the system to accomplish the backspace function. The  
1192 backspace defined here is not necessarily the ERASE special character.

1193 **Note:** Special Characters are defined in detail in [Section 11.1.9](#) (on page 203).

### 1194 **3.41 Barrier**

1195 A synchronization object that allows multiple threads to synchronize at a particular point in  
1196 their execution.

### 1197 **3.42 Basename**

1198 For pathnames containing at least one filename: the final, or only, filename in the pathname. For  
1199 pathnames consisting only of <slash> characters: either '/' or '/' if the pathname consists of  
1200 exactly two <slash> characters, and '/' otherwise.

### 1201 **3.43 Basic Regular Expression (BRE)**

1202 A regular expression (see [Section 3.308](#), on page 76) used by the majority of utilities that select  
1203 strings from a set of character strings.

1204 **Note:** Basic Regular Expressions are described in detail in [Section 9.3](#) (on page 181).

### 1205 **3.44 Bind**

1206 The process of assigning a network address to an endpoint.

### 1207 **3.45 Blank Character (<blank>)**

1208 One of the characters that belong to the **blank** character class as defined via the *LC\_CTYPE*  
1209 category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a  
1210 <space>.

### 1211 **3.46 Blank Line**

1212 A line consisting solely of zero or more <blank> characters terminated by a <newline>; see also  
1213 [Section 3.120](#) (on page 48).

### 1214 **3.47 Blocked Process (or Thread)**

1215 A process (or thread) that is waiting for some condition (other than the availability of a

1216 processor) to be satisfied before it can continue execution.

### 1217 **3.48 Blocking**

1218 A property of an open file description that causes function calls associated with it to wait for the  
1219 requested action to be performed before returning.

### 1220 **3.49 Block-Mode Terminal**

1221 A terminal device operating in a mode incapable of the character-at-a-time input and output  
1222 operations described by some of the standard utilities.

1223 **Note:** Output Devices and Terminal Types are defined in detail in [Section 10.2](#) (on page 197).

### 1224 **3.50 Block Special File**

1225 A file that refers to a device. A block special file is normally distinguished from a character  
1226 special file by providing access to the device in a manner such that the hardware characteristics  
1227 of the device are not visible.

### 1228 **3.51 Braces**

1229 The characters '{' (left-curly-bracket) and '}' (right-curly-bracket). When used in the phrase  
1230 "enclosed in (curly) braces" the symbol '{' immediately precedes the object to be enclosed, and  
1231 '}' immediately follows it. When describing these characters in the portable character set, the  
1232 names <left-curly-bracket> and <left-brace> are used for '{', and <right-curly-bracket> and  
1233 <right-brace> are used for '}'.

### 1234 **3.52 Brackets**

1235 The characters '[' (left-square-bracket) and ']' (right-square-bracket). When used in the  
1236 phrase "enclosed in (square) brackets" the symbol '[' immediately precedes the object to be  
1237 enclosed, and ']' immediately follows it. When describing these characters in the portable  
1238 character set, the names <left-square-bracket> and <right-square-bracket> are used.

### 1239 **3.53 Broadcast**

1240 The transfer of data from one endpoint to several endpoints, as described in RFC 919 and  
1241 RFC 922.

### 1242 3.54 Built-In Utility (or Built-In)

1243 A utility implemented within a shell. There are two main types of built-in utilities: special built-  
 1244 ins and regular built-ins. Unless qualified, the term “built-in” includes both types. The utilities  
 1245 referred to as special built-ins have special qualities. Regular built-ins are not required to be  
 1246 actually built into the shell on the implementation, but they usually have special command-  
 1247 search qualities, or affect the current execution environment.

1248 **Note:** Special Built-In Utilities are defined in detail in XCU [Section 2.15](#) (on page 2526).

1249 Regular Built-In Utilities are defined in detail in XCU [Section 1.6](#) (on page 2470).

### 1250 3.55 Byte

1251 An individually addressable unit of data storage that is exactly an octet, used to store a character  
 1252 or a portion of a character; see also [Section 3.58](#). A byte is composed of a contiguous sequence of  
 1253 8 bits. The least significant bit is called the “low-order” bit; the most significant is called the  
 1254 “high-order” bit.

1255 **Note:** The definition of byte from the ISO C standard is broader than the above and might  
 1256 accommodate hardware architectures with different sized addressable units than octets.

### 1257 3.56 Byte Input/Output Functions

1258 The functions that perform byte-oriented input from streams or byte-oriented output to streams:  
 1259 *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *getdelim()*,  
 1260 *getline()*, *printf()*, *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

1261 **Note:** Functions are defined in detail in the System Interfaces volume of POSIX.1-2024.

### 1262 3.57 Carriage-Return Character (<carriage-return>)

1263 A character that in the output stream indicates that printing should start at the beginning of the  
 1264 same physical line in which the carriage-return occurred. It is the character designated by '\r'  
 1265 in the C language. It is unspecified whether this character is the exact sequence transmitted to an  
 1266 output device by the system to accomplish the movement to the beginning of the line.

### 1267 3.58 Character

1268 A sequence of one or more bytes representing a member of a character set.

1269 **Note:** This term corresponds to the ISO C standard term multi-byte character, where a single-byte  
 1270 character is a special case of a multi-byte character. Unlike the usage in the ISO C standard,  
 1271 *character* here has no necessary relationship with storage space, and *byte* is used when storage  
 1272 space is discussed.

1273 See the definition of the portable character set in [Section 6.1](#) (on page 117) for a further  
 1274 explanation of the graphical representations of (abstract) characters, as opposed to character  
 1275 encodings.

**1276 3.59 Character Array**

1277 An array of elements of type **char**.

**1278 3.60 Character Class**

1279 A named set of characters sharing an attribute associated with the name of the class. The classes  
1280 and the characters that they contain are dependent on the value of the *LC\_CTYPE* category in  
1281 the current locale.

1282 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 131).

**1283 3.61 Character Set**

1284 A finite set of different characters used for the representation, organization, or control of data.

**1285 3.62 Character Special File**

1286 A file that refers to a device (such as a terminal device file) or that has special properties (such as  
1287 */dev/null*).

1288 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

**1289 3.63 Character String**

1290 A contiguous sequence of characters terminated by and including the first null byte.

**1291 3.64 Child Process**

1292 A new process created (by *fork()*, *posix\_spawn()*, or *posix\_spawnp()*) by a given process. A child  
1293 process remains the child of the creating process as long as both processes continue to exist.

1294 **Note:** The *fork()*, *posix\_spawn()*, and *posix\_spawnp()* functions are defined in detail in the System  
1295 Interfaces volume of POSIX.1-2024.

**1296 3.65 Circumflex Character (<circumflex>)**

1297 The character '^'.

**1298 3.66 Clock**

1299 A software or hardware object that can be used to measure the apparent or actual passage of  
1300 time.

1301 The current value of the time measured by a clock can be queried and, possibly, set to a value  
1302 within the legal range of the clock.

**1303 3.67 Clock Jump**

1304 The difference between two successive distinct values of a clock, as observed from the  
1305 application via one of the ``get time'' operations.

**1306 3.68 Clock Tick**

1307 An interval of time; an implementation-defined number of these occur each second. Clock ticks  
1308 are one of the units that may be used to express a value found in type `clock_t`.

**1309 3.69 Code Block**

1310 In the context of the System Interfaces volume of POSIX.1-2024, a *block* as defined in the ISO C  
1311 standard.

**1312 3.70 Coded Character Set**

1313 A set of unambiguous rules that establishes a character set and the one-to-one relationship  
1314 between each character of the set and its bit representation.

**1315 3.71 Codeset**

1316 The result of applying rules that map a numeric code value to each element of a character set.  
1317 An element of a character set may be related to more than one numeric code value but the  
1318 reverse is not true. However, for state-dependent encodings the relationship between numeric  
1319 code values and elements of a character set may be further controlled by state information. The  
1320 character set may contain fewer elements than the total number of possible numeric code values;  
1321 that is, some code values may be unassigned.

1322 **Note:** Character Encoding is defined in detail in [Section 6.2](#) (on page 120).

**1323 3.72 Collating Element**

1324 The smallest entity used to determine the logical ordering of character or wide-character strings;  
1325 see also [Section 3.74](#) (on page 42). A collating element consists of either a single character, or  
1326 two or more characters collating as a single entity. The value of the `LC_COLLATE` category in the  
1327 current locale determines the current set of collating elements.

### 1328 3.73 Collation

1329 The logical ordering of character or wide-character strings according to defined precedence  
1330 rules. These rules identify a collation sequence between the collating elements, and such  
1331 additional rules that can be used to order strings consisting of multiple collating elements.

### 1332 3.74 Collation Sequence

1333 The relative order of collating elements as determined by the setting of the *LC\_COLLATE*  
1334 category in the current locale. The collation sequence is used for sorting and is determined from  
1335 the collating weights assigned to each collating element. In the absence of weights, the collation  
1336 sequence is the order in which collating elements are specified between **order\_start** and  
1337 **order\_end** keywords in the *LC\_COLLATE* category.

1338 Multi-level sorting is accomplished by assigning elements one or more collation weights, up to  
1339 the limit {*COLL\_WEIGHTS\_MAX*}. On each level, elements may be given the same weight (at  
1340 the primary level, called an equivalence class; see also [Section 3.126](#), on page 49) or be omitted  
1341 from the sequence. Strings that collate equally using the first assigned weight (primary ordering)  
1342 are then compared using the next assigned weight (secondary ordering), and so on.

1343 **Note:** {*COLL\_WEIGHTS\_MAX*} is defined in detail in [<limits.h>](#).

### 1344 3.75 Column Position

1345 A unit of horizontal measure related to characters in a line.

1346 It is assumed that each character in a character set has an intrinsic column width independent of  
1347 any output device. Each printable character in the portable character set has a column width of  
1348 one. The standard utilities, when used as described in POSIX.1-2024, assume that all characters  
1349 have integral column widths. The column width of a character is not necessarily related to the  
1350 internal representation of the character (numbers of bits or bytes).

1351 The column position of a character in a line is defined as one plus the sum of the column widths  
1352 of the preceding characters in the line. Column positions are numbered starting from 1.

### 1353 3.76 Command

1354 A directive to the shell to perform a particular task.

1355 **Note:** Shell Commands are defined in detail in XCU [Section 2.9](#) (on page 2499).

### 1356 3.77 Command Language Interpreter

1357 An interface that interprets sequences of text input as commands. It may operate on an input  
1358 stream or it may interactively prompt and read commands from a terminal. It is possible for  
1359 applications to invoke utilities through a number of interfaces, which are collectively considered  
1360 to act as command interpreters. The most obvious of these are the *sh* utility and the *system()*  
1361 function, although *popen()* and the various forms of *exec* may also be considered to behave as  
1362 interpreters.

1363           **Note:**     The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2024.  
1364                     The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume  
1365                     of POSIX.1-2024.

### 1366   **3.78   Composite Graphic Symbol**

1367           A graphic symbol consisting of a combination of two or more other graphic symbols in a single  
1368           character position, such as a diacritical mark and a base character.

### 1369   **3.79   Condition Variable**

1370           A synchronization object which allows a thread to suspend execution, repeatedly, until some  
1371           associated predicate becomes true. A thread whose execution is suspended on a condition  
1372           variable is said to be blocked on the condition variable.

1373           There are two types of condition variable: those of type **pthread\_cond\_t** which are initialized  
1374           using *pthread\_cond\_init()* and those of type **cond\_t** which are initialized using *cond\_init()*. If an  
1375           application attempts to use the two types interchangeably (that is, pass a condition variable of  
1376           type **pthread\_cond\_t** to a function that takes a **cond\_t**, or vice versa), the behavior is undefined.

1377           **Note:**     The *pthread\_cond\_init()* and *cond\_init()* functions are defined in detail in the System Interfaces  
1378                     volume of POSIX.1-2024.

### 1379   **3.80   Connected Socket**

1380           A connection-mode socket for which a connection has been established, or a connectionless-  
1381           mode socket for which a peer address has been set. See also [Section 3.81](#), [Section 3.82](#), [Section](#)  
1382           [3.83](#), and [Section 3.342](#) (on page 81).

### 1383   **3.81   Connection**

1384           An association established between two or more endpoints for the transfer of data

### 1385   **3.82   Connection Mode**

1386           The transfer of data in the context of a connection; see also [Section 3.83](#).

### 1387   **3.83   Connectionless Mode**

1388           The transfer of data other than in the context of a connection; see also [Section 3.82](#) and [Section](#)  
1389           [3.96](#) (on page 45).

### 1390   **3.84   Control Character**

1391           A character, other than a graphic character, that affects the recording, processing, transmission,  
1392           or interpretation of text.

### 1393 **3.85 Control Operator**

1394 In the shell command language, a token that performs a control function. It is one of the  
1395 following symbols:

1396 & && ( ) ; ;; ;& newline | ||

1397 The end-of-input indicator used internally by the shell is also considered a control operator.

1398 **Note:** Token Recognition is defined in detail in XCU [Section 2.3](#) (on page 2475).

### 1399 **3.86 Controlling Process**

1400 The session leader that established the connection to the controlling terminal. If the terminal  
1401 subsequently ceases to be a controlling terminal for this session, the session leader ceases to be  
1402 the controlling process.

### 1403 **3.87 Controlling Terminal**

1404 A terminal that is associated with a session. Each session may have at most one controlling  
1405 terminal associated with it, and a controlling terminal is associated with exactly one session.  
1406 Certain input sequences from the controlling terminal cause signals to be sent to all processes in  
1407 the foreground process group associated with the controlling terminal.

1408 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

### 1409 **3.88 Conversion Descriptor**

1410 A per-process unique value used to identify an open codeset conversion.

### 1411 **3.89 Core Image**

1412 An unspecified object of unspecified format that may be generated when a process terminates  
1413 abnormally.

### 1414 **3.90 CPU Time (Execution Time)**

1415 The time spent executing a process or thread, including the time spent executing system services  
1416 on behalf of that process or thread. The value of the CPU-time clock for a process is  
1417 implementation-defined. With this definition the sum of all the execution times of all the threads  
1418 in a process might not equal the process execution time, even in a single-threaded process,  
1419 because implementations may differ in how they account for time during context switches or for  
1420 other reasons.

### 1421 **3.91 CPU-Time Clock**

1422 A clock that measures the execution time of a particular process or thread.

**1423 3.92 CPU-Time Timer**

1424 A timer attached to a CPU-time clock.

**1425 3.93 Current Job**

1426 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There  
1427 is at most one current job; see also [Section 3.182](#) (on page 57).

**1428 3.94 Current Working Directory**

1429 See *Working Directory* in [Section 3.421](#) (on page 93).

**1430 3.95 Cursor Position**

1431 The line and column position on the screen denoted by the terminal's cursor.

**1432 3.96 Datagram**

1433 A unit of data transferred from one endpoint to another in connectionless mode service.

**1434 3.97 Data Race**

1435 A situation in which there are two conflicting actions in different threads, at least one of which is  
1436 not atomic, and neither ``happens before'' the other, where the ``happens before'' relation is  
1437 defined formally in [Section 4.15.1](#) (on page 100).

**1438 3.98 Data Segment**

1439 Memory associated with a process, that can contain dynamically allocated data.

**1440 3.99 Decimal-Point Character**

1441 See *Radix Character* in [Section 3.294](#) (on page 74).

**1442 3.100 Declaration Utility**

1443 A utility which can take arguments that cause variable assignments (of the form *varname=value*)  
1444 which will persist in the current shell environment. When the shell recognizes a declaration  
1445 utility as the command name, subsequent arguments that would be a valid variable assignment  
1446 in isolation are subject to different expansion rules (field splitting and pathname expansion are  
1447 suppressed, and tilde expansion occurs after the <equals-sign> and any unquoted <colon>).  
1448 Arguments which are not a valid variable assignment in isolation are processed according to  
1449 normal argument expansion rules.

1450 The following standard utilities are declaration utilities: *export*, *readonly*, and, under certain

1451 conditions, *command*. An implementation may provide other declaration utilities.

### 1452 **3.101 Device**

1453 A computer peripheral or an object that appears to the application as such.

### 1454 **3.102 Device ID**

1455 A non-negative integer used to identify a device.

### 1456 **3.103 Directory**

1457 A file that contains directory entries. No two directory entries in the same directory have the  
1458 same name.

### 1459 **3.104 Directory Entry (or Hard Link)**

1460 An object that associates a filename with a file. Several directory entries can associate names  
1461 with the same file.

### 1462 **3.105 Directory Stream**

1463 A sequence of all the directory entries in a particular directory. An open directory stream may be  
1464 implemented using a file descriptor.

### 1465 **3.106 Disarm (a Timer)**

1466 To stop a timer from measuring the passage of time, disabling any future process notifications  
1467 (until the timer is armed again).

### 1468 **3.107 Display**

1469 To output to the user's terminal. If the output is not directed to a terminal, the results are  
1470 undefined.

### 1471 **3.108 Display Line**

1472 A line of text on a physical device or an emulation thereof. Such a line has a maximum number  
1473 of characters which can be presented.

1474 **Note:** This may also be written as "line on the display".

### 1475 **3.109 Dollar-Sign Character (<dollar-sign>)**

1476 The character '\$'.

### 1477 3.110 Dot

1478 In the context of naming files, the filename consisting of a single <period> character ( ' . ' ).

1479 **Note:** In the context of shell special built-in utilities, see *dot* in XCU [Section 2.15](#) (on page 2526).

1480 Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

### 1481 3.111 Dot-Dot

1482 The filename consisting solely of two <period> characters ( " . . " ).

1483 **Note:** Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

### 1484 3.112 Dot-Po File

1485 See *Portable Messages Object Source File* in [Section 3.266](#) (on page 70).

### 1486 3.113 Double-Quote Character

1487 The character ' " ', also known as <quotation-mark>.

1488 **Note:** The “double” adjective in this term refers to the two strokes in the character glyph.  
1489 POSIX.1-2024 never uses the term “double-quote” to refer to two apostrophes or quotation-  
1490 marks.

### 1491 3.114 Downshifting

1492 The conversion of an uppercase character that has a single-character lowercase representation  
1493 into this lowercase representation.

### 1494 3.115 Driver

1495 A module that controls data transferred to and received from devices.

1496 **Note:** Drivers are traditionally written to be a part of the system implementation, although they are  
1497 frequently written separately from the writing of the implementation. A driver may contain  
1498 processor-specific code, and therefore be non-portable.

### 1499 3.116 Effective Group ID

1500 An attribute of a process that is used in determining various permissions, including file access  
1501 permissions; see also [Section 3.165](#) (on page 55).

### 1502 3.117 Effective User ID

1503 An attribute of a process that is used in determining various permissions, including file access  
1504 permissions; see also [Section 3.408](#) (on page 91).

1505 **3.118 Eight-Bit Transparency**

1506 The ability of a software component to process 8-bit characters without modifying or utilizing  
1507 any part of the character in a way that is inconsistent with the rules of the current coded  
1508 character set.

1509 **3.119 Empty Directory**

1510 A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one hard  
1511 link to it other than its own dot entry (if one exists), in dot-dot. No other hard links to the  
1512 directory can exist. It is unspecified whether an implementation can ever consider the root  
1513 directory to be empty.

1514 **3.120 Empty Line**

1515 A line consisting of only a <newline>; see also [Section 3.46](#) (on page 37).

1516 **3.121 Empty String (or Null String)**

1517 A string whose first byte is a null byte.

1518 **3.122 Empty Wide-Character String**

1519 A wide-character string whose first element is a null wide-character code.

1520 **3.123 Encoding Rule**

1521 The rules used to convert between wide-character codes and multi-byte character codes.

1522 **Note:** Stream Orientation and Encoding Rules are defined in detail in [XSH Section 2.5.2](#) (on page 524).

1523 **3.124 Entire Regular Expression**

1524 The concatenated set of one or more basic regular expressions or extended regular expressions  
1525 that make up the pattern specified for string selection.

1526 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 179).

1527 **3.125 Epoch**

1528 The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time  
1529 (UTC).

1530 **Note:** See also *Seconds Since the Epoch* defined in [Section 4.19](#) (on page 107).

### 1531 **3.126 Equivalence Class**

1532 A set of collating elements with the same primary collation weight.

1533 Elements in an equivalence class are typically elements that naturally group together, such as all  
1534 accented letters based on the same base letter.

1535 The collation order of elements within an equivalence class is determined by the weights  
1536 assigned on any subsequent levels after the primary weight.

### 1537 **3.127 Era**

1538 A locale-specific method for counting and displaying years.

1539 **Note:** The *LC\_TIME* category is defined in detail in [Section 7.3.5](#) (on page 152).

### 1540 **3.128 Event Management**

1541 The mechanism that enables applications to register for and be made aware of external events  
1542 such as data becoming available for reading.

### 1543 **3.129 Executable File**

1544 A regular file acceptable as a new process image file by the equivalent of the *exec* family of  
1545 functions, and thus usable as one form of a utility. The standard utilities described as compilers  
1546 can produce executable files, but other unspecified methods of producing executable files may  
1547 also be provided. The internal format of an executable file is unspecified, but a conforming  
1548 application cannot assume an executable file is a text file.

### 1549 **3.130 Execute**

1550 To perform command search and execution actions, as defined in the Shell and Utilities volume  
1551 of POSIX.1-2024; see also [Section 3.179](#) (on page 57).

1552 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.4](#) (on page 2502).

### 1553 **3.131 Execution Time**

1554 See *CPU Time* in [Section 3.90](#) (on page 44).

### 1555 **3.132 Execution Time Monitoring**

1556 A set of execution time monitoring primitives that allow online measuring of thread and process  
1557 execution times.

### 1558 3.133 Expand

1559 In the shell command language, when not qualified, the act of applying word expansions.

1560 **Note:** Word Expansions are defined in detail in XCU [Section 2.6](#) (on page 2483).

### 1561 3.134 Extended Regular Expression (ERE)

1562 A regular expression (see also [Section 3.308](#), on page 76) that is an alternative to the Basic  
1563 Regular Expression using a more extensive syntax, occasionally used by some utilities.

1564 **Note:** Extended Regular Expressions are described in detail in [Section 9.4](#) (on page 187).

### 1565 3.135 Extended Security Controls

1566 Implementation-defined security controls allowed by the file access permission and appropriate  
1567 privileges (see also [Section 3.21](#), on page 34) mechanisms, through which an implementation can  
1568 support different security policies from those described in POSIX.1-2024.

1569 **Note:** See also *Extended Security Controls* defined in [Section 4.6](#) (on page 96).

1570 File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

### 1571 3.136 Feature Test Macro

1572 A macro used to determine whether a particular set of features is included from a header.

1573 **Note:** See also XSH [Section 2.2](#) (on page 496).

### 1574 3.137 Field

1575 In the shell command language, a unit of text that is the result of parameter expansion,  
1576 arithmetic expansion, command substitution, or field splitting. During command processing, the  
1577 resulting fields are used as the command name and its arguments.

1578 **Note:** Parameter Expansion is defined in detail in XCU [Section 2.6.2](#) (on page 2485).

1579 Arithmetic Expansion is defined in detail in XCU [Section 2.6.4](#) (on page 2490).

1580 Command Substitution is defined in detail in XCU [Section 2.6.3](#) (on page 2489).

1581 Field Splitting is defined in detail in XCU [Section 2.6.5](#) (on page 2491).

1582 For further information on command processing, see XCU [Section 2.9.1](#) (on page 2500).

### 1583 3.138 FIFO Special File (or FIFO)

1584 A type of file with the property that data written to such a file is read on a first-in-first-out basis.

1585 **Note:** Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-2024,  
1586 *lseek()*, *open()*, *read()*, and *write()*.

### 1587 3.139 File

1588 An object that can be written to, or read from, or both. A file has certain attributes, including  
1589 access permissions and type. File types include regular file, character special file, block special  
1590 file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported  
1591 by the implementation.

### 1592 3.140 File Description

1593 See *Open File Description* in [Section 3.241](#) (on page 66).

### 1594 3.141 File Descriptor

1595 A per-process unique, non-negative integer used to identify an open file for the purpose of file  
1596 access. The values 0, 1, and 2 have special meaning and conventional uses, and are referred to as  
1597 *standard input*, *standard output*, and *standard error*, respectively. Programs usually take their input  
1598 from standard input, and write output on standard output. Diagnostic messages are usually  
1599 written on standard error. The value of a newly-created file descriptor is from zero to  
1600 {OPEN\_MAX}-1. A file descriptor can have a value greater than or equal to {OPEN\_MAX} if the  
1601 value of {OPEN\_MAX} has decreased (see *sysconf()*) since the file descriptor was opened. File  
1602 descriptors may also be used to implement message catalog descriptors and directory streams;  
1603 see also [Section 3.241](#) (on page 66).

1604 **Note:** {OPEN\_MAX} is defined in detail in [<limits.h>](#).

### 1605 3.142 File Group Class

1606 The property of a file indicating access permissions for a process related to the group  
1607 identification of a process. A process is in the file group class of a file if the process is not in the  
1608 file owner class and if the effective group ID or one of the supplementary group IDs of the  
1609 process matches the group ID associated with the file. Other members of the class may be  
1610 implementation-defined.

### 1611 3.143 File Lock

1612 Any advisory lock, including a record lock (see [Section 3.302](#), on page 76), obtained on a file for  
1613 the purpose of coordinating transactions among cooperating processes accessing the same file  
1614 with the same lock type. See also [Section 3.237](#) (on page 66) and [Section 3.289](#) (on page 74).

1615 **Note:** All file locks created by interfaces defined in this standard are record locks; however,  
1616 implementations commonly also support a file lock extension interface named *flock()*, which  
1617 creates non-record locks (that is, a file lock that can only be held on the whole file).

1618 **Note:** Advisory locks do not prevent a process with sufficient access permissions from modifying the  
1619 file without taking locks.

### 1620 **3.144 File Mode**

1621 An object containing the file mode bits and some information about the file type of a file.

1622 **Note:** File mode bits and file types are defined in detail in [<sys/stat.h>](#).

### 1623 **3.145 File Mode Bits**

1624 A file's file permission bits, set-user-ID-on-execution bit (S\_ISUID), set-group-ID-on-execution  
1625 bit (S\_ISGID), and, on directories, the restricted deletion flag bit (S\_ISVTX).

1626 **Note:** File Mode Bits are defined in detail in [<sys/stat.h>](#).

### 1627 **3.146 Filename**

1628 A sequence of bytes consisting of 1 to {NAME\_MAX} bytes used to name a file. The bytes  
1629 composing the name shall not contain the <NUL> or <slash> characters. In the context of a  
1630 pathname, each filename shall be followed by a <slash> or a <NUL> character; elsewhere, a  
1631 filename followed by a <NUL> character forms a string (but not necessarily a character string).  
1632 The filenames **dot** and **dot-dot** have special meaning. A filename is sometimes referred to as a  
1633 ``pathname component''. See also [Section 3.254](#) (on page 68).

1634 **Note:** Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

### 1635 **3.147 Filename String**

1636 A string consisting of a filename followed by a <NUL> character.

### 1637 **3.148 File Offset**

1638 The byte position in the file where the next I/O operation begins. Each open file description  
1639 associated with a regular file, block special file, or directory has a file offset. A character special  
1640 file that does not refer to a terminal device may have a file offset. There is no file offset specified  
1641 for a pipe or FIFO.

### 1642 **3.149 File Other Class**

1643 The property of a file indicating access permissions for a process related to the user and group  
1644 identification of a process. A process is in the file other class of a file if the process is not in the  
1645 file owner class or file group class.

### 1646 **3.150 File Owner Class**

1647 The property of a file indicating access permissions for a process related to the user

1648 identification of a process. A process is in the file owner class of a file if the effective user ID of  
1649 the process matches the user ID of the file.

### 1650 **3.151 File Permission Bits**

1651 Information about a file that is used, along with other information, to determine whether a  
1652 process has read, write, or execute/search permission to a file. The bits are divided into three  
1653 parts: owner, group, and other. Each part is used with the corresponding file class of processes.  
1654 These bits are contained in the file mode.

1655 **Note:** File modes are defined in detail in [<sys/stat.h>](#).

1656 File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

### 1657 **3.152 File Serial Number**

1658 A per-file system unique identifier for a file.

### 1659 **3.153 File System**

1660 A collection of files and certain of their attributes. It provides a name space for file serial  
1661 numbers referring to those files.

### 1662 **3.154 File Type**

1663 See *File* in [Section 3.139](#) (on page 51).

### 1664 **3.155 Filter**

1665 A command whose operation consists of reading data from standard input or a list of input files  
1666 and writing data to standard output. Typically, its function is to perform some transformation  
1667 on the data stream.

### 1668 **3.156 First Open (of a File)**

1669 When a process opens a file that is not currently an open file within any process.

### 1670 **3.157 Flow Control**

1671 The mechanism employed by a communications provider that constrains a sending entity to  
1672 wait until the receiving entities can safely receive additional data without loss.

### 1673 3.158 Foreground Job

1674 In the context of the System Interfaces volume of POSIX.1-2024, a foreground process group (see  
1675 [Section 3.160](#)).

1676 In the context of the shell, a job that the shell is waiting for before it executes further commands  
1677 or, if interactive, prompts for further commands.

1678 **Note:** See also [Section 3.35](#) (on page 36), [Section 3.180](#) (on page 57), and [Section 3.362](#) (on page 84).

### 1679 3.159 Foreground Process

1680 A process that is a member of a foreground process group.

### 1681 3.160 Foreground Process Group

1682 A process group whose member processes have certain privileges, denied to processes in  
1683 background process groups, when accessing their controlling terminal. Each session that has  
1684 established a connection with a controlling terminal has at most one process group of the session  
1685 as the foreground process group of that controlling terminal.

1686 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#).

1687 **Note:** See also [Section 3.158](#).

### 1688 3.161 Foreground Process Group ID

1689 The process group ID of the foreground process group.

### 1690 3.162 Form-Feed Character (<form-feed>)

1691 A character that in the output stream indicates that printing should start on the next page of an  
1692 output device. It is the character designated by '\f' in the C language. If the form-feed is not  
1693 the first character of an output line, the result is unspecified. It is unspecified whether this  
1694 character is the exact sequence transmitted to an output device by the system to accomplish the  
1695 movement to the next page.

### 1696 3.163 Graphic Character

1697 A member of the **graph** character class of the current locale.

1698 **Note:** The **graph** character class is defined in detail in [Section 7.3.1](#) (on page 131).

### 1699 3.164 Group Database

1700 A system database that contains at least the following information for each group ID:

- 1701 • Group name
- 1702 • Numerical group ID
- 1703 • List of users allowed in the group

1704 The list of users allowed in the group is used by the *newgrp* utility.

1705 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2024.

### 1706 3.165 Group ID

1707 A non-negative integer, which can be contained in an object of type `gid_t`, that is used to identify  
1708 a group of system users. Each system user is a member of at least one group. When the identity  
1709 of a group is associated with a process, a group ID value is referred to as a real group ID, an  
1710 effective group ID, one of the supplementary group IDs, or a saved set-group-ID. The value  
1711 (`gid_t`)-1 shall not be a valid group ID, but does have a defined use in some interfaces defined in  
1712 this standard.

### 1713 3.166 Group Name

1714 A string that is used to identify a group; see also [Section 3.164](#). To be portable across conforming  
1715 systems, the value is composed of characters from the portable filename character set. The  
1716 <hyphen-minus> should not be used as the first character of a portable group name.

### 1717 3.167 Hard Limit

1718 A system resource limitation that may be reset to a lesser or greater limit by a privileged process.  
1719 A non-privileged process is restricted to only lowering its hard limit.

### 1720 3.168 Hard Link

1721 See Directory Entry in [Section 3.104](#) (on page 46). A file can have multiple hard links as a result  
1722 of an execution of the *ln* utility (without the `-s` option) or the *link()* function. This term is  
1723 contrasted against symbolic link; see also [Section 3.364](#) (on page 85).

### 1724 3.169 Hole

1725 A contiguous region of bytes within a file, all having the value of zero. Not all bytes with the  
1726 value zero need belong to a hole; however, all seekable files shall have a virtual hole starting at  
1727 the current size of the file. A hole is typically created via *truncate()*, or if an *lseek()* call has been  
1728 made to position beyond the end of a file and data subsequently written at that point, although  
1729 it is up to the implementation to define when sparse files can be created and with what  
1730 granularity for the size of holes.

1731 **3.170 Home Directory**

1732 The directory specified by the *HOME* environment variable.

1733 **3.171 Host Byte Order**

1734 The arrangement of bytes in any integer type when using a specific machine architecture.

1735 **Note:** Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format  
1736 for storage of binary data in which the most significant byte is placed first, with the rest in  
1737 descending order. Little-endian is a format for storage or transmission of binary data in which  
1738 the least significant byte is placed first, with the rest in ascending order. See also [Section 4.13](#) (on  
1739 page 99).

1740 **3.172 Incomplete Line**

1741 A sequence of one or more non-`<newline>` characters at the end of the file.

1742 **3.173 Inf**

1743 A value representing +infinity or a value representing -infinity that can be stored in a floating  
1744 type. Not all systems support the Inf values.

1745 **3.174 Interactive Device**

1746 A terminal device.

1747 **Note:** This definition is intended to align with the ISO C standard's use of "interactive device".

1748 **3.175 Interactive Shell**

1749 A processing mode of the shell that is suitable for direct user interaction.

1750 **3.176 Internationalization**

1751 The provision within a computer program of the capability of making itself adaptable to the  
1752 requirements of different native languages, local customs, and coded character sets.

1753 **3.177 Interprocess Communication**

1754 A functionality enhancement to add a high-performance, deterministic interprocess  
1755 communication facility for local communication.

### 1756 3.178 Intrinsic Utility

1757 A utility that is not subject to a *PATH* search during command search, usually implemented as a  
1758 regular built-in utility.

1759 **Note:** Intrinsic Utilities are defined in detail in XCU [Section 1.7](#) (on page 2470).

### 1760 3.179 Invoke

1761 To perform command search and execution actions, except that searching for shell functions and  
1762 special built-in utilities is suppressed; see also [Section 3.130](#) (on page 49).

1763 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.4](#) (on page 2502).

### 1764 3.180 Job

1765 A background job, a foreground job, or a suspended job.

1766 In the context of the shell, jobs are created when a list (see XCU [Section 2.9.3](#), on page 2505) is  
1767 executed while job control is enabled, and may be created when an asynchronous AND-OR list  
1768 is executed while job control is disabled.

1769 **Note:** Job control in the shell is defined in detail in XCU [Section 2.11](#) (on page 2518).

1770 **Note:** See also [Section 3.35](#) (on page 36), [Section 3.158](#) (on page 54), and [Section 3.362](#) (on page 84).

### 1771 3.181 Job Control

1772 A facility that allows users selectively to stop (suspend) the execution of processes and continue  
1773 (resume) their execution at a later point. The user typically employs this facility via the  
1774 interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

1775 The term is also used in connection with system interfaces that can be used by a command  
1776 interpreter to implement job control (see for example *setpgid()*).

1777 **Note:** Job control in the shell is defined in detail in XCU [Section 2.11](#) (on page 2518).

### 1778 3.182 Job ID

1779 A handle that is used to refer to a job. The job ID can be any of the forms shown in the following  
1780 table:

1781

Table 3-1 Job ID Formats

1782

1783

1784

1785

1786

1787

1788

Job ID	Meaning
%%	Current job.
%+	Current job.
%-	Previous job.
%n	Job number <i>n</i> .
%string	Job whose command begins with <i>string</i> .
%?string	Job whose command contains <i>string</i> .

1789

### 3.183 Joinable Thread

1790

1791

1792

1793

A thread that was created either using `pthread_create()` with the `detachstate` attribute not set to `PTHREAD_CREATE_DETACHED` or using `thrd_create()`, and for which neither `pthread_detach()` nor `pthread_join()` has been called and returned zero, and neither `thrd_detach()` nor `thrd_join()` has been called and returned `thrd_success`.

1794

1795

1796

**Note:** The `pthread_attr_setdetachstate()`, `pthread_create()`, `pthread_detach()`, `pthread_join()`, `thrd_create()`, `thrd_detach()`, and `thrd_join()` functions are defined in detail in the System Interfaces volume of POSIX.1-2024.

1797

### 3.184 Last Close (of a File)

1798

When a process closes a file, resulting in the file not being an open file within any process.

1799

### 3.185 Line

1800

A sequence of zero or more non-`<newline>` characters plus a terminating `<newline>` character.

1801

### 3.186 Linger

1802

The period of time before terminating a connection, to allow outstanding data to be transferred.

1803

### 3.187 Link

1804

In the context of the file hierarchy, either a hard link or a symbolic link.

1805

In the context of the `c17` utility, the action performed by the link editor (or linker).

1806

**Note:** The `c17` utility is defined in detail in the Shell and Utilities volume of POSIX.1-2024.

1807

### 3.188 Link Count

1808

The number of directory entries that refer to a particular file.

**1809 3.189 Live Process**

1810 An address space with one or more threads executing within that address space, and the  
1811 required system resources for those threads.

1812 **Note:** Many of the system resources defined by POSIX.1-2024 are shared among all of the threads  
1813 within a process. These include the process ID, the parent process ID, process group ID, session  
1814 membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID,  
1815 supplementary group IDs, current working directory, root directory, file mode creation mask,  
1816 and file descriptors.

**1817 3.190 Live Thread**

1818 A single flow of control within a process. Each thread has its own thread ID, scheduling priority  
1819 and policy, *errno* value, floating point environment, thread-specific key/value bindings, and the  
1820 required system resources to support a flow of control. Anything whose address can be  
1821 determined by a thread, including but not limited to static variables, storage obtained via  
1822 *malloc()*, directly addressable storage obtained through implementation-defined functions, and  
1823 automatic variables, are accessible to all live threads in the same process.

1824 **Note:** The *malloc()* function is defined in detail in the System Interfaces volume of POSIX.1-2024.

**1825 3.191 Local Customs**

1826 The conventions of a geographical area or territory for such things as date, time, and currency  
1827 formats.

**1828 3.192 Local Interprocess Communication (Local IPC)**

1829 The transfer of data between processes in the same system.

**1830 3.193 Locale**

1831 The definition of the subset of a user's environment that depends on language and cultural  
1832 conventions.

1833 **Note:** Locales are defined in detail in [Chapter 7](#) (on page 127).

**1834 3.194 Localization**

1835 The process of establishing information within a computer system specific to the operation of  
1836 particular native languages, local customs, and coded character sets.

**1837 3.195 Lock-Free Operation**

1838 An operation that does not require the use of a lock such as a mutex in order to avoid data races.

**1839 3.196 Login**

1840 The unspecified activity by which a user gains access to the system. Each login is associated  
1841 with exactly one login name.

**1842 3.197 Login Name**

1843 A user name that is associated with a login.

**1844 3.198 Map**

1845 To create an association between a page-aligned range of the address space of a process and  
1846 some memory object, such that a reference to an address in that range of the address space  
1847 results in a reference to the associated memory object. The mapped memory object is not  
1848 necessarily memory-resident.

**1849 3.199 Matched**

1850 A state applying to a sequence of zero or more characters when the characters in the sequence  
1851 correspond to a sequence of characters defined by a basic regular expression or extended regular  
1852 expression pattern.

1853 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 179).

**1854 3.200 Memory Mapped Files**

1855 A facility to allow applications to access files as part of the address space.

**1856 3.201 Memory Object**

1857 One of:

- 1858 • A file (see [Section 3.139](#), on page 51)
- 1859 • An anonymous memory object (see [Section 3.16](#), on page 33)
- 1860 • A shared memory object (see [Section 3.332](#), on page 80)
- 1861 • A typed memory object (see [Section 3.401](#), on page 90)

1862 When used in conjunction with `mmap()`, a memory object appears in the address space of the  
1863 calling process.

1864 **Note:** The `mmap()` function is defined in detail in the System Interfaces volume of POSIX.1-2024.

**1865 3.202 Memory-Resident**

1866 The process of managing the implementation in such a way as to provide an upper bound on  
1867 memory access times.

### 1868 3.203 Message

1869 In the context of programmatic message passing, information that can be transferred between  
1870 processes or threads by being added to and removed from a message queue. A message consists  
1871 of a fixed-size message buffer.

### 1872 3.204 Message Catalog

1873 In the context of providing natural language messages to the user, a file or storage area  
1874 containing program messages, command prompts, and responses to prompts for a particular  
1875 native language, territory, and codeset.

### 1876 3.205 Message Catalog Descriptor

1877 In the context of providing natural language messages to the user, a per-process unique value  
1878 used to identify an open message catalog. A message catalog descriptor may be implemented  
1879 using a file descriptor.

### 1880 3.206 Message Queue

1881 In the context of programmatic message passing, an object to which messages can be added and  
1882 removed. Messages may be removed in the order in which they were added or in priority order.

### 1883 3.207 Messages Object

1884 A file containing message identifiers and translations in an unspecified format. Used by the  
1885 *gettext* family of functions and the *gettext* and *ngettext* utilities for internationalization and  
1886 localization of programs and scripts. Messages objects have the filename suffix **.mo**, and can be  
1887 created by the *msgfmt* utility.

1888 See also [Section 3.386](#) (on page 88).

### 1889 3.208 Mode

1890 A collection of attributes that specifies a file's type and its access permissions.

1891 **Note:** File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

### 1892 3.209 Monotonic Clock

1893 A clock measuring real time, whose value cannot be set via *clock\_settime()* and which cannot  
1894 have negative clock jumps.

### 1895 3.210 Mount Point

1896 Either the system root directory or a directory for which the *st\_dev* field of structure **stat** differs  
1897 from that of its parent directory.

1898 **Note:** The **stat** structure is defined in detail in [<sys/stat.h>](#).

### 1899 3.211 Multi-Character Collating Element

1900 A sequence of two or more characters that collate as an entity. For example, in some coded  
1901 character sets, an accented character is represented by a non-spacing accent, followed by the  
1902 letter. Other examples are the Spanish elements *ch* and *ll*.

### 1903 3.212 Multi-Threaded Library

1904 A library containing object files that were produced by compiling with *c17* using the flags  
1905 output by *getconf* POSIX\_V8\_THREADS\_CFLAGS, or by compiling using a non-standard utility  
1906 with equivalent flags, and which makes use of interfaces that are only made available by *c17*  
1907 when the **-l pthread** option is used or makes use of SIGEV\_THREAD notifications.

### 1908 3.213 Multi-Threaded Process

1909 A process that contains more than one thread.

### 1910 3.214 Multi-Threaded Program

1911 A program whose executable file was produced by compiling with *c17* using the flags output by  
1912 *getconf* POSIX\_V8\_THREADS\_CFLAGS, and linking with *c17* using the flags output by *getconf*  
1913 POSIX\_V8\_THREADS\_LDFLAGS and the **-l pthread** option, or by compiling and linking using  
1914 a non-standard utility with equivalent flags. Execution of a multi-threaded program initially  
1915 creates a single-threaded process; the process can create additional threads using  
1916 *pthread\_create()*, *thrd\_create()*, or SIGEV\_THREAD notifications.

### 1917 3.215 Mutex

1918 A synchronization object used to allow multiple threads to serialize their access to shared data.  
1919 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has  
1920 locked a mutex becomes its owner and remains the owner until that same thread unlocks the  
1921 mutex.

1922 There are two types of mutex: those of type **pthread\_mutex\_t** which are initialized using  
1923 *pthread\_mutex\_init()* and those of type **mtx\_t** which are initialized using *mtx\_init()*. If an  
1924 application attempts to use the two types interchangeably (that is, pass a mutex of type  
1925 **pthread\_mutex\_t** to a function that takes a **mtx\_t**, or vice versa), the behavior is undefined.

1926 **Note:** The *pthread\_mutex\_init()* and *mtx\_init()* functions are defined in detail in the System Interfaces  
1927 volume of POSIX.1-2024.

**1928 3.216 Name**

1929 In the shell command language, a word consisting solely of underscores, digits, and alphabets  
1930 from the portable character set. The first character of a name is not a digit.

1931 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 117).

**1932 3.217 NaN (Not a Number)**

1933 A set of values that may be stored in a floating type but that are neither Inf nor valid floating-  
1934 point numbers. Not all systems support NaN values.

**1935 3.218 Native Language**

1936 A computer user's spoken or written language, such as American English, British English,  
1937 Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

**1938 3.219 Negative**

1939 When describing a value (not a sign), less than zero. Note that in the phrase "negative zero" it  
1940 describes a sign, and therefore negative zero (also represented as -0.0) is not a negative value.

**1941 3.220 Negative Response**

1942 An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category  
1943 keyword **noexpr**, matching an extended regular expression in the current locale.

1944 **Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 159).

**1945 3.221 Network**

1946 A collection of interconnected hosts.

1947 **Note:** The term "network" in POSIX.1-2024 is used to refer to the network of hosts. The term "batch  
1948 system" is used to refer to the network of batch servers.

**1949 3.222 Network Address**

1950 A network-visible identifier used to designate specific endpoints in a network. Specific  
1951 endpoints on host systems have addresses, and host systems may also have addresses.

### 1952 3.223 Network Byte Order

1953 The way of representing any integer type such that, when transmitted over a network via a  
1954 network endpoint, the `int` type is transmitted as an appropriate number of octets with the most  
1955 significant octet first, followed by any other octets in descending order of significance.

1956 **Note:** This order is more commonly known as big-endian ordering. See also [Section 4.13](#) (on page 99).

### 1957 3.224 Newline Character (<newline>)

1958 A character that in the output stream indicates that printing should start at the beginning of the  
1959 next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this  
1960 character is the exact sequence transmitted to an output device by the system to accomplish the  
1961 movement to the next line.

### 1962 3.225 Nice Value

1963 A number used as advice to the system to alter process scheduling. Numerically smaller values  
1964 give a process additional preference when scheduling a process to run. Numerically larger  
1965 values reduce the preference and make a process less likely to run. Typically, a process with a  
1966 smaller nice value runs to completion more quickly than an equivalent process with a higher  
1967 nice value. The symbol `{NZERO}` specifies the default nice value of the system.

### 1968 3.226 Non-Blocking

1969 A property of an open file description that causes function calls involving it to return without  
1970 delay when it is detected that the requested action associated with the function call cannot be  
1971 completed without unknown delay.

1972 **Note:** The exact semantics are dependent on the type of file associated with the open file description.  
1973 For data reads from devices such as ttys and FIFOs, this property causes the read to return  
1974 immediately when no data was available. Similarly, for writes, it causes the call to return  
1975 immediately when the thread would otherwise be delayed in the write operation; for example,  
1976 because no space was available. For networking, it causes functions not to await protocol events  
1977 (for example, acknowledgements) to occur. See also [XSH Section 2.10.7](#) (on page 551).

### 1978 3.227 Non-Spacing Characters

1979 A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001  
1980 standard coded graphic character set, which is used in combination with other characters to  
1981 form composite graphic symbols.

### 1982 3.228 NUL

1983 A character with all bits set to zero.

**1984 3.229 Null Byte**

1985 A byte with all bits set to zero.

**1986 3.230 Null Pointer**

1987 A pointer obtained by converting an integer constant expression with the value 0, or such an  
1988 expression cast to type **void \***, to a pointer type; for example, **(char \*)0**. The C language  
1989 guarantees that a null pointer compares unequal to a pointer to any object or function, so it is  
1990 used by many functions that return pointers to indicate an error. POSIX.1-2024 additionally  
1991 guarantees that any pointer object whose representation has all bits set to zero, perhaps by  
1992 *memset()* to 0 or by *calloc()*, is interpreted as a null pointer.

**1993 3.231 Null String**

1994 See *Empty String* in [Section 3.121](#) (on page 48).

**1995 3.232 Null Terminator**

1996 A term used for the null byte when used as a terminator for a string.

**1997 3.233 Null Wide-Character Code**

1998 A wide-character code with all bits set to zero.

**1999 3.234 Number-Sign Character (<number-sign>)**

2000 The character '#', also known as hash sign.

**2001 3.235 Object File**

2002 A regular file containing the output of a compiler, formatted as input to a linkage editor for  
2003 linking with other object files into an executable form. The methods of linking are unspecified  
2004 and may involve the dynamic linking of objects at runtime. The internal format of an object file  
2005 is unspecified, but a conforming application cannot assume an object file is a text file.

**2006 3.236 Octet**

2007 Unit of data representation that consists of eight contiguous bits.

**2008 3.237 OFD-Owned File Lock**

2009 A record lock owned by an open file description. OFD-owned file locks are obtained through the  
2010 use of *fcntl()* with *F\_OFD\_SETLK* or *F\_OFD\_SETLKW*. Whenever a file descriptor associated  
2011 with the owning open file description is inherited these locks remain in effect. OFD-owned file  
2012 locks are automatically released on the last close of the open file description. These locks are  
2013 only shared among file descriptors associated with the same open file description. Thus, a multi-  
2014 threaded process can use multiple open file descriptions (such as by *open()*) to create  
2015 independent OFD-owned locks that can then be used to coordinate access patterns to the same  
2016 file, while multiple file descriptors associated with the same open file description (such as by  
2017 *dup()*) share lock actions among all other descriptors associated with the same open file  
2018 description.

**2019 3.238 Offset Maximum**

2020 An attribute of an open file description representing the largest value that can be used as a file  
2021 offset.

**2022 3.239 Opaque Address**

2023 An address such that the entity making use of it requires no details about its contents or format.

**2024 3.240 Open File**

2025 A file that is currently associated with a file descriptor.

**2026 3.241 Open File Description**

2027 A record of how a process or group of processes is accessing a file. Each file descriptor refers to  
2028 exactly one open file description, but an open file description can be referred to by more than  
2029 one file descriptor. The file offset, file status, and file access modes are attributes of an open file  
2030 description.

**2031 3.242 Operand**

2032 An argument to a command that is generally used as an object supplying information to a utility  
2033 necessary to complete its processing. Operands generally follow the options in a command line.

2034 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

**2035 3.243 Operator**

2036 In the shell command language, either a control operator or a redirection operator.

### 2037 **3.244 Option**

2038 An argument to a command that is generally used to specify changes in the utility's default  
2039 behavior.

2040 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

### 2041 **3.245 Option-Argument**

2042 A parameter that follows certain options. In some cases an option-argument immediately  
2043 follows the option character within the same argument string as the option; otherwise the  
2044 option-argument is the next argument string.

2045 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

### 2046 **3.246 Orientation**

2047 A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

2048 **Note:** For further information, see XSH [Section 2.5.2](#) (on page 524).

### 2049 **3.247 Orphaned Process Group**

2050 A process group in which the parent of every member is either itself a member of the group or is  
2051 not a member of the group's session.

### 2052 **3.248 Page**

2053 The granularity of process memory mapping or locking.

2054 Physical memory and memory objects can be mapped into the address space of a process on  
2055 page boundaries and in integral multiples of pages. Process address space can be locked into  
2056 memory (made memory-resident) on page boundaries and in integral multiples of pages.

### 2057 **3.249 Page Size**

2058 The size, in bytes, of the system unit of memory allocation, protection, and mapping. On  
2059 systems that have segment rather than page-based memory architectures, the term "page"  
2060 means a segment.

### 2061 3.250 Parameter

2062 In the shell command language, an entity that stores values. There are three types of parameters:  
 2063 variables (named parameters), positional parameters, and special parameters. Parameter  
 2064 expansion is accomplished by introducing a parameter with the '\$' character.

2065 **Note:** See also XCU [Section 2.5](#) (on page 2478).

2066 In the C language, an object declared as part of a function declaration or definition that acquires  
 2067 a value on entry to the function, or an identifier following the macro name in a function-like  
 2068 macro definition.

### 2069 3.251 Parent Directory

2070 When discussing a given directory, the directory that both contains a directory entry for the  
 2071 given directory and is represented by the pathname dot-dot in the given directory.

2072 When discussing other types of files, a directory containing a directory entry for the file under  
 2073 discussion.

2074 This concept does not apply to dot and dot-dot.

### 2075 3.252 Parent Process

2076 The process which created (or inherited) the process under discussion.

### 2077 3.253 Parent Process ID

2078 An attribute of a new process identifying the parent of the process. The parent process ID of a  
 2079 process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime  
 2080 has ended, the parent process ID is the process ID of an implementation-defined system process.

### 2081 3.254 Pathname

2082 A string that is used to identify a file. In the context of POSIX.1-2024, a pathname may be limited  
 2083 to {PATH\_MAX} bytes, including the terminating null byte. It has optional beginning <slash>  
 2084 characters, followed by zero or more filenames separated by <slash> characters. A pathname  
 2085 can optionally contain one or more trailing <slash> characters. Multiple successive <slash>  
 2086 characters are considered to be the same as one <slash>, except it is implementation-defined  
 2087 whether the case of exactly two leading <slash> characters is treated specially.

2088 **Note:** If a pathname consists of only bytes corresponding to characters from the portable filename  
 2089 character set (see [Section 3.265](#), on page 70), <slash> characters, and a single terminating  
 2090 <NUL> character, the pathname will be usable as a character string in all supported locales;  
 2091 otherwise, the pathname might only be a string (rather than a character string). Additionally,  
 2092 since the single-byte encoding of the <slash> character is required to be the same across all  
 2093 locales and to not occur within a multi-byte character, references to a <slash> character within a  
 2094 pathname are well-defined even when the pathname is not a character string. However, this  
 2095 property does not necessarily hold for the remaining characters within the portable filename  
 2096 character set.

2097 Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

### 2098 **3.255 Pathname Component**

2099 See *Filename* in [Section 3.146](#) (on page 52).

### 2100 **3.256 Path Prefix**

2101 The part of a pathname up to, but not including, the last component and any trailing <slash>  
2102 characters, unless the pathname consists entirely of <slash> characters, in which case the path  
2103 prefix is '/' for a pathname containing either a single <slash> or three or more <slash>  
2104 characters, and '// ' for the pathname //. The path prefix of a pathname containing no <slash>  
2105 characters is empty, but is treated as referring to the current working directory.

2106 **Note:** The term is used both in the sense of identifying part of a pathname that forms the prefix and of  
2107 joining a non-empty path prefix to a filename to form a pathname. In the latter case, the path  
2108 prefix need not have a trailing <slash> (in which case the joining is done with a <slash>  
2109 character).

### 2110 **3.257 Pattern**

2111 A sequence of characters used either with regular expression notation or with shell pattern  
2112 matching notation.

2113 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 179).

2114 Shell pattern matching notation is defined in detail in [Section 2.14](#) (on page 2523).

2115 The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-2024 always  
2116 indicates the type of pattern being referred to in the immediate context of the use of the term.

### 2117 **3.258 Period Character (<period>)**

2118 The character '.'. The term "period" is contrasted with dot (see also [Section 3.110](#), on page 47),  
2119 which is used to describe a specific directory entry.

### 2120 **3.259 Permissions**

2121 Attributes of an object that determine the privilege necessary to access or manipulate the object.

2122 **Note:** File Access Permissions are defined in detail in [Section 4.7](#) (on page 97).

### 2123 **3.260 Persistence**

2124 A mode for semaphores, shared memory, and message queues requiring that the object and its  
2125 state (including data, if any) are preserved after the object is no longer referenced by any  
2126 process.

2127 Persistence of an object does not imply that the state of the object is maintained across a system  
2128 crash or a system reboot.

### 2129 3.261 Pipe

2130 An object identical to a FIFO which has no links in the file hierarchy.

2131 **Note:** The `pipe()` function is defined in detail in the System Interfaces volume of POSIX.1-2024.

### 2132 3.262 Polling

2133 A scheduling scheme whereby the local process periodically checks until the pre-specified  
2134 events (for example, read, write) have occurred.

### 2135 3.263 Portable Character Set

2136 The collection of characters that are required to be present in all locales supported by  
2137 conforming systems.

2138 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 117).

2139 This term is contrasted against the smaller portable filename character set; see also [Section 3.265](#).

### 2140 3.264 Portable Filename

2141 A filename consisting only of characters from the portable filename character set.

2142 **Note:** Applications should avoid using filenames that have the <hyphen-minus> character as the first  
2143 character since this may cause problems when filenames are passed as command line  
2144 arguments.

### 2145 3.265 Portable Filename Character Set

2146 The set of characters from which portable filenames are constructed.

2147 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
2148 a b c d e f g h i j k l m n o p q r s t u v w x y z  
2149 0 1 2 3 4 5 6 7 8 9 . \_ -

2150 The last three characters are the <period>, <underscore>, and <hyphen-minus> characters,  
2151 respectively. See also [Section 3.254](#) (on page 68).

### 2152 3.266 Portable Messages Object Source File (or Dot-Po File)

2153 A text file containing messages and directives. A portable messages object source file can be  
2154 compiled into a messages object by the `msgfmt` utility.

2155 **Note:** By convention, portable messages object source files have filenames ending with the `.po` suffix.  
2156 Utility descriptions in this standard frequently use dot-po file as a shorthand for portable  
2157 messages object source file (even though the `.po` suffix need not be included in the filename).  
2158 Template portable messages object source files can be created from C-language source files by  
2159 the `xgettext` utility.

### 2160 3.267 Positional Parameter

2161 In the shell command language, a parameter denoted by a decimal representation of a positive  
2162 integer.

2163 **Note:** For further information, see XCU [Section 2.5.1](#) (on page 2479).

### 2164 3.268 Positive

2165 When describing a value (not a sign), greater than zero. Note that in the common phrase  
2166 “positive zero” (which is not used in this standard, although the representation +0.0 is) it  
2167 describes a sign, and therefore positive zero (+0.0) is not a positive value.

### 2168 3.269 Preallocation

2169 The reservation of resources in a system for a particular use.

2170 Preallocation does not imply that the resources are immediately allocated to that use, but merely  
2171 indicates that they are guaranteed to be available in bounded time when needed.

### 2172 3.270 Preempted Process (or Thread)

2173 A running thread whose execution is suspended due to another thread becoming runnable at a  
2174 higher priority.

### 2175 3.271 Previous Job

2176 In the context of job control, the job used as the default for the *fg* or *bg* utilities if the current job  
2177 exits. There is at most one previous job; see also [Section 3.182](#) (on page 57).

### 2178 3.272 Printable Character

2179 One of the characters included in the **print** character classification of the *LC\_CTYPE* category in  
2180 the current locale.

2181 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 131).

### 2182 3.273 Printable File

2183 A text file consisting only of the characters included in the **print** and **space** character  
2184 classifications of the *LC\_CTYPE* category and the <backspace>, all in the current locale.

2185 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 131).

**2186 3.274 Priority**

2187 A non-negative integer associated with processes or threads whose value is constrained to a  
2188 range defined by the applicable scheduling policy. Numerically higher values represent higher  
2189 priorities.

**2190 3.275 Priority Inversion**

2191 A condition in which a thread that is not voluntarily suspended (waiting for an event or time  
2192 delay) is not running while a lower priority thread is running. Such blocking of the higher  
2193 priority thread is often caused by contention for a shared resource.

**2194 3.276 Priority Scheduling**

2195 A performance and determinism improvement facility to allow applications to determine the  
2196 order in which threads that are ready to run are granted access to processor resources.

**2197 3.277 Priority-Based Scheduling**

2198 Scheduling in which the selection of a running thread is determined by the priorities of the  
2199 runnable processes or threads.

**2200 3.278 Privilege**

2201 See *Appropriate Privileges* in [Section 3.21](#) (on page 34).

**2202 3.279 Process**

2203 A live process (see [Section 3.189](#), on page 59) or a zombie process (see [Section 3.426](#), on page 94).  
2204 The lifetime of a process is described in [Section 3.285](#) (on page 73).

**2205 3.280 Process Group**

2206 A collection of processes that permits the signaling of related processes. Each process in the  
2207 system is a member of a process group that is identified by a process group ID. A newly created  
2208 process joins the process group of its creator.

**2209 3.281 Process Group ID**

2210 The unique positive integer identifier representing a process group during its lifetime.

2211 **Note:** See also *Process Group ID Reuse* defined in [Section 4.17](#) (on page 106).

**2212 3.282 Process Group Leader**

2213 A process whose process ID is the same as its process group ID.

### 2214 3.283 Process Group Lifetime

2215 The period of time that begins when a process group is created and ends when the last  
2216 remaining process in the group leaves the group, due either to the end of the lifetime of the last  
2217 process or to the last remaining process calling the *setsid()* or *setpgid()* functions.

2218 **Note:** The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of  
2219 POSIX.1-2024.

### 2220 3.284 Process ID

2221 The unique positive integer identifier representing a process during its lifetime.

2222 **Note:** See also *Process ID Reuse* defined in [Section 4.17](#) (on page 106).

### 2223 3.285 Process Lifetime

2224 The period of time that begins when a process is created and ends when its process ID is  
2225 returned to the system.

2226 See also [Section 3.189](#) (on page 59), [Section 3.287](#), and [Section 3.426](#) (on page 94).

2227 **Note:** Process creation is defined in detail in the descriptions of the *fork()*, *posix\_spawn()*, and  
2228 *posix\_spawnp()* functions in the System Interfaces volume of POSIX.1-2024.

### 2229 3.286 Process Memory Locking

2230 A performance improvement facility to bind application programs into the high-performance  
2231 random access memory of a computer system. This avoids potential latencies introduced by the  
2232 operating system in storing parts of a program that were not recently referenced on secondary  
2233 memory devices.

### 2234 3.287 Process Termination

2235 There are two kinds of process termination:

- 2236 1. Normal termination occurs by a return from *main()*, when requested with the *exit()*,  
2237 *\_exit()*, or *\_Exit()* functions; or when the last thread in the process terminates by  
2238 returning from its start function, by calling the *pthread\_exit()* or *thrd\_exit()* function, or  
2239 through cancellation.
- 2240 2. Abnormal termination occurs when requested by the *abort()* function or when some  
2241 signals are received.

2242 **Note:** The consequences of process termination can be found in the description of the *\_Exit()* function  
2243 in the System Interfaces volume of POSIX.1-2024. The *\_exit()*, *\_Exit()*, *abort()*, and *exit()*  
2244 functions are defined in detail in the System Interfaces volume of POSIX.1-2024.

**2245 3.288 Process Virtual Time**

2246 The measurement of time in units elapsed by the system clock while a process is executing.

**2247 3.289 Process-Owned File Lock**

2248 A record lock owned by a process. Process-owned file locks are obtained through the use of  
2249 *fcntl()* with *F\_SETLK* or *F\_SETLKW*, or the use of *lockf()*. Process-owned file locks are not  
2250 inherited by child processes, but are preserved across the *exec* family of functions. A process-  
2251 owned file lock is released when the process exits, or when any file descriptor in the process  
2252 referring to the same file is closed (even if via a different open file description). These locks are  
2253 shared among all open file descriptions referring to the same file in the process, making the use  
2254 of process-owned file locks unsuitable for use for coordination of record access among multiple  
2255 threads in a process.

**2256 3.290 Process-To-Process Communication**

2257 The transfer of data between processes.

**2258 3.291 Program**

2259 A prepared sequence of instructions to the system to accomplish a defined task. The term  
2260 “program” in POSIX.1-2024 encompasses applications written in the Shell Command Language,  
2261 complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

**2262 3.292 Protocol**

2263 A set of semantic and syntactic rules for exchanging information.

**2264 3.293 Pseudo-Terminal**

2265 A facility that provides an interface that is identical to the terminal subsystem, except where  
2266 noted otherwise in POSIX.1-2024. A pseudo-terminal is composed of two devices: the “manager  
2267 device” and a “subsidiary device”. The subsidiary device provides processes with an interface  
2268 that is identical to the terminal interface, although there need not be hardware behind that  
2269 interface. Anything written on the manager device is presented to the subsidiary as an input and  
2270 anything written on the subsidiary device is presented as an input on the manager side.

**2271 3.294 Radix Character (or Decimal-Point Character)**

2272 The character that separates the integer part of a number from the fractional part.

**2273 3.295 Read-Only File System**

2274 A file system that has implementation-defined characteristics restricting modifications.

2275 **Note:** File Times Update is described in detail in [Section 4.12](#) (on page 98).

**2276 3.296 Read-Write Lock**

2277 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous  
2278 read-only access to data while allowing only one thread to have write access at any given time.  
2279 They are typically used to protect data that is read-only more frequently than it is changed.

2280 Read-write locks can be used to synchronize threads in the current process and other processes if  
2281 they are allocated in memory that is writable and shared among the cooperating processes and  
2282 have been initialized for this behavior.

**2283 3.297 Real Group ID**

2284 The attribute of a process that, at the time of process creation, identifies the group of the user  
2285 who created the process; see also [Section 3.165](#) (on page 55).

**2286 3.298 Real Time**

2287 Time measured as total units elapsed by the system clock without regard to which thread is  
2288 executing.

**2289 3.299 Realtime Signal Extension**

2290 A determinism improvement facility to enable asynchronous signal notifications to an  
2291 application to be queued without impacting compatibility with the existing signal functions.

**2292 3.300 Real User ID**

2293 The attribute of a process that, at the time of process creation, identifies the user who created the  
2294 process; see also [Section 3.408](#) (on page 91).

**2295 3.301 Record**

2296 A collection of related data units or words which is treated as a unit.

### 2297 **3.302 Record Lock**

2298 A file lock held on a record within a file. A record lock can be used to lock a whole file by  
 2299 specifying a special record with starting offset zero and length zero. (This special record extends  
 2300 to any future end-of-file, not just the current end-of-file.) This includes an OFD-owned file lock  
 2301 (see [Section 3.237](#), on page 66) or a process-owned file lock (see [Section 3.289](#), on page 74). It is  
 2302 unspecified whether an implementation will detect and prevent deadlocks caused by two  
 2303 competing lock owners holding separate locks where each tries to obtain a lock that is blocked  
 2304 by the other's lock.

### 2305 **3.303 Redirection**

2306 In the shell command language, a method of associating files with the input or output of  
 2307 commands.

2308 **Note:** For further information, see XCU [Section 2.7](#) (on page 2493).

### 2309 **3.304 Redirection Operator**

2310 In the shell command language, a token that performs a redirection function. It is one of the  
 2311 following symbols:

2312 < > >| << >> <& >& <<- <>

### 2313 **3.305 Referenced Shared Memory Object**

2314 A shared memory object that is open or has one or more mappings defined on it.

### 2315 **3.306 Refresh**

2316 Make the information on the user's terminal screen up-to-date.

### 2317 **3.307 Regular Built-In Utility (or Regular Built-In)**

2318 See *Built-In Utility* in [Section 3.54](#) (on page 39).

### 2319 **3.308 Regular Expression**

2320 A pattern that selects specific strings from a set of character strings.

2321 **Note:** Regular Expressions are described in detail in [Chapter 9](#) (on page 179).

### 2322 **3.309 Region**

2323 In the context of the address space of a process, a sequence of addresses.

2324 In the context of a file, a sequence of offsets.

**2325 3.310 Regular File**

2326 A file that is a randomly accessible sequence of bytes, with no further structure imposed by the  
2327 system.

**2328 3.311 Relative Pathname**

2329 A pathname not beginning with a <slash> character.

2330 **Note:** Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

**2331 3.312 Relocatable File**

2332 A file holding code or data suitable for linking with other object files to create an executable or a  
2333 shared object file.

**2334 3.313 Relocation**

2335 The process of connecting symbolic references with symbolic definitions. For example, when a  
2336 program calls a function, the associated call instruction transfers control to the proper  
2337 destination address at execution.

**2338 3.314 (Time) Resolution**

2339 The minimum time interval that a clock can measure or whose passage a timer can detect.

**2340 3.315 Robust Mutex**

2341 A mutex with the *robust* attribute set.

2342 **Note:** The *robust* attribute is defined in detail by the `pthread_mutexattr_getrobust()` function.

**2343 3.316 Root Directory**

2344 A directory, associated with a process, that is used in pathname resolution for pathnames that  
2345 begin with a <slash> character.

**2346 3.317 Runnable Process (or Thread)**

2347 A thread that is capable of being a running thread, but for which no processor is available.

**2348 3.318 Running Process (or Thread)**

2349 A thread currently executing on a processor. On multi-processor systems there may be more  
2350 than one such thread in a system at a time.

### 2351 **3.319 Saved Resource Limits**

2352 An attribute of a process that provides some flexibility in the handling of unrepresentable  
2353 resource limits, as described in the *exec* family of functions and *setrlimit()*.

2354 **Note:** The *exec* and *setrlimit()* functions are defined in detail in the System Interfaces volume of  
2355 POSIX.1-2024.

### 2356 **3.320 Saved Set-Group-ID**

2357 An attribute of a process that allows some flexibility in the assignment of the effective group ID  
2358 attribute, as described in the *exec* family of functions and *setgid()*.

2359 **Note:** The *exec* and *setgid()* functions are defined in detail in the System Interfaces volume of  
2360 POSIX.1-2024.

### 2361 **3.321 Saved Set-User-ID**

2362 An attribute of a process that allows some flexibility in the assignment of the effective user ID  
2363 attribute, as described in the *exec* family of functions and *setuid()*.

2364 **Note:** The *exec* and *setuid()* functions are defined in detail in the System Interfaces volume of  
2365 POSIX.1-2024.

### 2366 **3.322 Scheduling**

2367 The application of a policy to select a runnable process or thread to become a running process or  
2368 thread, or to alter one or more of the thread lists.

### 2369 **3.323 Scheduling Allocation Domain**

2370 The set of processors on which an individual thread can be scheduled at any given time.

### 2371 **3.324 Scheduling Contention Scope**

2372 A property of a thread that defines the set of threads against which that thread competes for  
2373 resources.

2374 For example, in a scheduling decision, threads sharing scheduling contention scope compete for  
2375 processor resources. In POSIX.1-2024, a thread has scheduling contention scope of either  
2376 PTHREAD\_SCOPE\_SYSTEM or PTHREAD\_SCOPE\_PROCESS.

### 2377 **3.325 Scheduling Policy**

2378 A set of rules that is used to determine the order of execution of processes or threads to achieve  
2379 some goal.

2380 **Note:** Scheduling Policy is defined in detail in [Section 4.18](#) (on page 107).

### 2381 **3.326 Screen**

2382 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a  
2383 physical display device or may occupy the entire physical area of the display device.

### 2384 **3.327 Scroll**

2385 To move the representation of data vertically or horizontally relative to the terminal screen.  
2386 There are two types of scrolling:

- 2387 1. The cursor moves with the data.
- 2388 2. The cursor remains stationary while the data moves.

### 2389 **3.328 Semaphore**

2390 A minimum synchronization primitive to serve as a basis for more complex synchronization  
2391 mechanisms to be defined by the application program.

2392 **Note:** Semaphores are defined in detail in [Section 4.20](#) (on page 108).

### 2393 **3.329 Session**

2394 A collection of process groups established for job control purposes. Each process group is a  
2395 member of a session. A process is considered to be a member of the session of which its process  
2396 group is a member. A newly created process joins the session of its creator. A process can alter  
2397 its session membership; see *setsid()*. There can be multiple process groups in the same session.

2398 **Note:** The *setsid()* function is defined in detail in the System Interfaces volume of POSIX.1-2024.

### 2399 **3.330 Session Leader**

2400 A process that has created a session.

2401 **Note:** For further information, see the *setsid()* function defined in the System Interfaces volume of  
2402 POSIX.1-2024.

### 2403 **3.331 Session Lifetime**

2404 The period between when a session is created and the end of the lifetime of all the process  
2405 groups that remain as members of the session.

**2406 3.332 Shared Memory Object**

2407 An object that represents memory that can be mapped concurrently into the address space of  
2408 more than one process.

**2409 3.333 Shell**

2410 A program that interprets sequences of text input as commands. It may operate on an input  
2411 stream or it may interactively prompt and read commands from a terminal.

**2412 3.334 Shell, the**

2413 The Shell Command Language Interpreter; a specific instance of a shell.

2414 **Note:** For further information, see the *sh* utility defined in the Shell and Utilities volume of  
2415 POSIX.1-2024.

**2416 3.335 Shell Script**

2417 A file containing shell commands. If the file is made executable, it can be executed by specifying  
2418 its name as a simple command. Execution of a shell script causes a shell to execute the  
2419 commands within the script. Alternatively, a shell can be requested to execute the commands in  
2420 a shell script by specifying the name of the shell script as the operand to the *sh* utility.

2421 **Note:** Simple Commands are defined in detail in XCU [Section 2.9.1](#) (on page 2500).

2422 The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2024.

**2423 3.336 Signal**

2424 A mechanism by which a process or thread may be notified of, or affected by, an event occurring  
2425 in the system. Examples of such events include hardware exceptions and specific actions by  
2426 processes. The term signal is also used to refer to the event itself.

**2427 3.337 Signal Stack**

2428 Memory established for a thread, in which signal handlers catching signals sent to that thread  
2429 are executed.

**2430 3.338 Single-Quote Character**

2431 The character designated by ' \ ' ' in the C language, also known as <apostrophe>.

**2432 3.339 Single-Threaded Process**

2433 A process that contains a single thread.

### 2434 3.340 Single-Threaded Program

2435 A program whose executable file was produced by compiling with *c17* without using the flags  
 2436 output by *getconf* `POSIX_V8_THREADS_CFLAGS` and linking with *c17* using neither the flags  
 2437 output by *getconf* `POSIX_V8_THREADS_LDFLAGS` nor the `-l pthread` option, or by compiling  
 2438 and linking using a non-standard utility with equivalent flags. Execution of a single-threaded  
 2439 program creates a single-threaded process; if the process attempts to create additional threads  
 2440 using *pthread\_create()*, *thrd\_create()*, or `SIGEV_THREAD` notifications, the behavior is undefined.  
 2441 If the process uses *dlopen()* to load a multi-threaded library, the behavior is undefined.

### 2442 3.341 Slash Character (<slash>)

2443 The character ' / ', also known as solidus.

### 2444 3.342 Socket

2445 A file of a particular type that is used as a communications endpoint for process-to-process  
 2446 communication as described in the System Interfaces volume of POSIX.1-2024.

### 2447 3.343 Socket Address

2448 An address associated with a socket or remote endpoint, including an address family identifier  
 2449 and addressing information specific to that address family. The address may include multiple  
 2450 parts, such as a network address associated with a host system and an identifier for a specific  
 2451 endpoint.

### 2452 3.344 Soft Limit

2453 A resource limitation established for each process that the process may set to any value less than  
 2454 or equal to the hard limit.

### 2455 3.345 Source Code

2456 When dealing with the Shell Command Language, input to the command language interpreter.  
 2457 The term “shell script” is synonymous with this meaning.

2458 When dealing with an ISO/IEC-conforming programming language, source code is input to a  
 2459 compiler conforming to that ISO/IEC standard.

2460 Source code also refers to the input statements prepared for the following standard utilities: *awk*,  
 2461 *bc*, *ed*, *ex*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

2462 Source code can also refer to a collection of sources meeting any or all of these meanings.

2463 **Note:** The *awk*, *bc*, *ed*, *ex*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and  
 2464 Utilities volume of POSIX.1-2024.

2465 **3.346 Space Character (<space>)**

2466 The character defined in the portable character set as <space>. The <space> character is a  
 2467 member of the **space** character class of the current locale, but represents the single character, and  
 2468 not all of the possible members of the class; see also [Section 3.413](#) (on page 92).

2469 **3.347 Sparse File**

2470 A file that contains more holes than just the virtual hole at the end of the file.

2471 **3.348 Spawn**

2472 A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient  
 2473 replacement for *fork()/exec*.

2474 **3.349 Special Built-In Utility (or Special Built-In)**

2475 See *Built-In Utility* in [Section 3.54](#) (on page 39).

2476 **3.350 Special Parameter**

2477 In the shell command language, a parameter named by a single character from the following list:

2478 \* @ # ? ! - \$ 0

2479 **Note:** For further information, see XCU [Section 2.5.2](#) (on page 2479).

2480 **3.351 Spin Lock**

2481 A synchronization object used to allow multiple threads to serialize their access to shared data.

2482 **3.352 Sporadic Server**

2483 A scheduling policy for threads and processes that reserves a certain amount of execution  
 2484 capacity for processing aperiodic events at a given priority level.

2485 **3.353 Standard Error**

2486 In the context of file descriptors (see [Section 3.141](#), on page 51), file descriptor number 2.

2487 In the context of standard I/O streams (see XSH [Section 2.5](#), on page 521), an output stream  
 2488 usually intended to be used for diagnostic messages, and accessed using the global variable  
 2489 *stderr*.

2490 **Note:** The file descriptor underlying *stderr* is initially 2, but it can be changed by *freopen()* to 0 or 1  
 2491 (and implementations may have extensions that allow it to be changed to other numbers).  
 2492 Therefore, writing to the standard error stream does not always produce output on the standard  
 2493 error file descriptor.

### 2494 3.354 Standard Input

2495 In the context of file descriptors (see [Section 3.141](#), on page 51), file descriptor number 0.

2496 In the context of standard I/O streams (see XSH [Section 2.5](#), on page 521), an input stream  
2497 usually intended to be used for primary data input, and accessed using the global variable *stdin*.

2498 **Note:** The file descriptor underlying *stdin* is initially 0; this cannot change through the use of  
2499 interfaces defined in this standard, but implementations may have extensions that allow it to be  
2500 changed. Therefore, in conforming applications using extensions, reading from the standard  
2501 input stream does not always obtain input from the standard input file descriptor.

### 2502 3.355 Standard Output

2503 In the context of file descriptors (see [Section 3.141](#), on page 51), file descriptor number 1.

2504 In the context of standard I/O streams (see XSH [Section 2.5](#), on page 521), an output stream  
2505 usually intended to be used for primary data output, and accessed using the global variable  
2506 *stdout*.

2507 **Note:** The file descriptor underlying *stdout* is initially 1, but it can be changed by *freopen()* to 0 (and  
2508 implementations may have extensions that allow it to be changed to other numbers). Therefore,  
2509 writing to the standard output stream does not always produce output on the standard output  
2510 file descriptor.

### 2511 3.356 Standard Utilities

2512 The utilities described in the Shell and Utilities volume of POSIX.1-2024.

### 2513 3.357 Stream

2514 Appearing in lowercase, a stream is an ordered sequence of bytes, as described by the ISO C  
2515 standard.

2516 In the shell command language, each stream is associated with a file descriptor. These can be  
2517 opened using redirection operators.

2518 **Note:** Redirection is defined in detail in XCU [Section 2.7](#) (on page 2493).

2519 In the C language, each stream is accessed via a file access object and is either a stream  
2520 associated with a file descriptor or a memory stream. A file access object associated with a file  
2521 descriptor can be created by the *fdopen()*, *fopen()*, or *popen()* functions. A file access object for a  
2522 memory stream can be created by the *fmemopen()* or *open\_memstream()* functions. A stream  
2523 provides the additional services of user-selectable buffering and formatted input and output.

2524 **Note:** For further information, see XSH [Section 2.5](#) (on page 521).

2525 The *fdopen()*, *fmemopen()*, *fopen()*, *open\_memstream()*, and *popen()* functions are defined in detail  
2526 in the System Interfaces volume of POSIX.1-2024.

### 2527 3.358 String

2528 A contiguous sequence of bytes terminated by and including the first null byte.

### 2529 3.359 Subshell

2530 A shell execution environment, distinguished from the main or current shell execution  
2531 environment.

2532 **Note:** For further information, see XCU [Section 2.13](#) (on page 2522).

### 2533 3.360 Successfully Transferred

2534 For a write operation to a regular file, when the system ensures that all data written is readable  
2535 on any subsequent open of the file (even one that follows a system or power failure) in the  
2536 absence of a failure of the physical storage medium.

2537 For a read operation, when an image of the data on the physical storage medium is available to  
2538 the requesting process.

### 2539 3.361 Supplementary Group ID

2540 An attribute of a process used in determining file access permissions. A process has up to  
2541 {NGROUPS\_MAX} supplementary group IDs in addition to the effective group ID. The  
2542 supplementary group IDs of a process are set to the supplementary group IDs of the parent  
2543 process when the process is created.

### 2544 3.362 Suspended Job

2545 In the context of the System Interfaces volume of POSIX.1-2024, a job that has received a  
2546 SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop.

2547 In the context of the shell, a job, other than a non-job-control background job, that became  
2548 suspended when a process returned a wait status to the shell indicating that the process was  
2549 stopped by a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal.

2550 A suspended job is a job-control background job, but a job-control background job is not  
2551 necessarily a suspended job. A non-job-control background job is never a suspended job, even if  
2552 it includes processes that have been stopped by a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU  
2553 signal.

2554 **Note:** See also [Section 3.35](#) (on page 36), [Section 3.180](#) (on page 57), and [Section 3.158](#) (on page 54).

### 2555 3.363 Symbolic Constant

2556 An object-like macro defined with a constant value.

2557 Unless stated otherwise, the following shall apply to every symbolic constant:

- 2558 • It expands to a compile-time constant expression with an integer type.
- 2559 • It may be defined as another type of constant—e.g., an enumeration constant—as well as  
2560 being a macro.
- 2561 • It need not be usable in `#if` preprocessing directives.

### 2562 **3.364 Symbolic Link**

2563 A type of file with the property that when the file is encountered during pathname resolution, a  
2564 string stored by the file is used to modify the pathname resolution. The stored string has a  
2565 length of {SYMLINK\_MAX} bytes or fewer.

2566 **Note:** Pathname Resolution is defined in detail in [Section 4.16](#) (on page 105).

### 2567 **3.365 Synchronization Operation**

2568 An operation that synchronizes memory. See [Section 4.15](#) (on page 100).

### 2569 **3.366 Synchronized Input and Output**

2570 A determinism and robustness improvement mechanism to enhance the data input and output  
2571 mechanisms, so that an application can be assured that the data being manipulated is physically  
2572 present on secondary mass storage devices.

### 2573 **3.367 Synchronized I/O Completion**

2574 The state of an I/O operation that has either been successfully transferred or diagnosed as  
2575 unsuccessful.

### 2576 **3.368 Synchronized I/O Data Integrity Completion**

2577 For read, when the operation has been completed or diagnosed if unsuccessful. The read is  
2578 complete only when an image of the data has been successfully transferred to the requesting  
2579 process. If there were any pending write requests affecting the data to be read at the time that  
2580 the synchronized read operation was requested, these write requests are successfully transferred  
2581 prior to reading the data.

2582 For write, when the operation has been completed or diagnosed if unsuccessful. The write is  
2583 complete only when the data specified in the write request is successfully transferred and all file  
2584 system information required to retrieve the data is successfully transferred.

2585 For the purpose of this definition, an operation that reads or searches a directory is considered to  
2586 be a read operation, an operation that modifies a directory is considered to be a write operation,  
2587 and a directory's entries are considered to be the data read or written.

2588 This standard provides no way to synchronize the contents or attributes of a symbolic link.

2589 File attributes that are not necessary for data retrieval (access time, modification time, status  
2590 change time) need not be successfully transferred prior to returning to the calling process.

### 2591 **3.369 Synchronized I/O File Integrity Completion**

2592 Identical to a synchronized I/O data integrity completion with the addition that all file  
2593 attributes relative to the I/O operation (including access time, modification time, status change  
2594 time) are successfully transferred prior to returning to the calling process.

**2595 3.370 Synchronized I/O Operation**

2596 An I/O operation performed on a file that provides the application assurance of the integrity of  
2597 its data and files.

**2598 3.371 Synchronous I/O Operation**

2599 An I/O operation that causes the thread requesting the I/O to be blocked from further use of the  
2600 processor until that I/O operation completes.

2601 **Note:** A synchronous I/O operation does not imply synchronized I/O data integrity completion or  
2602 synchronized I/O file integrity completion.

**2603 3.372 Synchronously-Generated Signal**

2604 A signal that is attributable to a specific thread.

2605 For example, a thread executing an illegal instruction or touching invalid memory causes a  
2606 synchronously-generated signal. Being synchronous is a property of how the signal was  
2607 generated and not a property of the signal number.

**2608 3.373 System**

2609 An implementation of POSIX.1-2024.

**2610 3.374 System Boot**

2611 An unspecified sequence of events that may result in the loss of transitory data; that is, data that  
2612 is not saved in permanent storage. For example, message queues, shared memory, semaphores,  
2613 and processes.

**2614 3.375 System Clock**

2615 A clock with at least one second resolution that contains seconds since the Epoch.

**2616 3.376 System Console**

2617 A device that receives messages sent by the *syslog()* function, and the *fntmsg()* function when  
2618 the MM\_CONSOLE flag is set.

2619 **Note:** The *syslog()* and *fntmsg()* functions are defined in detail in the System Interfaces volume of  
2620 POSIX.1-2024.

**2621 3.377 System Crash**

2622 An interval initiated by an unspecified circumstance that causes all processes (possibly other  
2623 than special system processes) to be terminated in an undefined manner, after which any

2624 changes to the state and contents of files created or written to by an application prior to the  
2625 interval are undefined, except as required elsewhere in POSIX.1-2024.

### 2626 **3.378 System Databases**

2627 An implementation provides two system databases: the ``group database'' (see also [Section](#)  
2628 [3.164](#), on page 55) and the ``user database'' (see also [Section 3.407](#), on page 91).

### 2629 **3.379 System Documentation**

2630 All documentation provided with an implementation except for the conformance document.  
2631 Electronically distributed documents for an implementation are considered part of the system  
2632 documentation.

### 2633 **3.380 System Process**

2634 An object other than a process executing an application, that is provided by the system and has a  
2635 process ID.

### 2636 **3.381 System Reboot**

2637 See *System Boot* defined in [Section 3.374](#) (on page 86).

### 2638 **3.382 System-Wide**

2639 Pertaining to events occurring in all processes existing in an implementation at a given point in  
2640 time.

### 2641 **3.383 Tab Character (<tab>)**

2642 A character that in the output stream indicates that printing or displaying should start at the  
2643 next horizontal tabulation position on the current line. It is the character designated by '`\t`' in  
2644 the C language. If the current position is at or past the last defined horizontal tabulation  
2645 position, the behavior is unspecified. It is unspecified whether this character is the exact  
2646 sequence transmitted to an output device by the system to accomplish the tabulation.

### 2647 **3.384 Terminal (or Terminal Device)**

2648 A character special file that obeys the specifications of the general terminal interface.

2649 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

### 2650 **3.385 Text Column**

2651 A roughly rectangular block of characters capable of being laid out side-by-side next to other  
2652 text columns on an output page or terminal screen. The widths of text columns are measured in

2653 column positions.

### 2654 3.386 Text Domain

2655 A named collection of messages objects (one messages object per supported language) for  
2656 internationalization and localization purposes. A text domain is often named after the  
2657 application or library that provides the collection, but may have a more general name if it is  
2658 intended to be shared by multiple applications or libraries.

2659 **Note:** The use of text domains is defined in detail in the descriptions of the *bindtextdomain()* and  
2660 *gettext* family of functions in the System Interfaces volume of POSIX.1-2024.

### 2661 3.387 Text File

2662 A file that contains characters organized into zero or more lines. The lines do not contain NUL  
2663 characters and none can exceed {LINE\_MAX} bytes in length, including the <newline>  
2664 character. Although POSIX.1-2024 does not distinguish between text files and binary files (see  
2665 the ISO C standard), many utilities only produce predictable or meaningful output when  
2666 operating on text files. The standard utilities that have such restrictions always specify ``text  
2667 files'' in their STDIN or INPUT FILES sections.

### 2668 3.388 Thread

2669 A live thread (see [Section 3.190](#), on page 59) or a zombie thread (see [Section 3.427](#), on page 94).  
2670 The lifetime of a thread is described in [Section 3.390](#) (on page 89).

### 2671 3.389 Thread ID

2672 A value that uniquely identifies each thread in a process during the thread's lifetime. The value  
2673 shall be unique across all threads in a process, regardless of whether the thread is:

- 2674 • The initial thread
- 2675 • A thread created using *pthread\_create()*
- 2676 • A thread created using *thrd\_create()*
- 2677 • A thread created via a SIGEV\_THREAD notification

2678 **Note:** Since *pthread\_create()* returns an ID of type **pthread\_t** and *thrd\_create()* returns an ID of type  
2679 **thrd\_t**, this uniqueness requirement necessitates that these two types are defined as the same  
2680 underlying type because calls to *pthread\_self()* and *thrd\_current()* from the initial thread need to  
2681 return the same thread ID. The *pthread\_create()*, *pthread\_self()*, *thrd\_create()*, and *thrd\_current()*  
2682 functions and SIGEV\_THREAD notifications are defined in detail in the System Interfaces  
2683 volume of POSIX.1-2024.

### 2684 3.390 Thread Lifetime

2685 The period of time that begins when a thread is created and ends when its thread ID is returned  
2686 to the process.

2687 See also *Live Thread* in [Section 3.190](#) (on page 59), *Thread Termination* in [Section 3.392](#), and *Zombie*  
2688 *Thread* in [Section 3.427](#) (on page 94).

2689 **Note:** Thread creation is defined in detail in the descriptions of the `pthread_create()` and `thrd_create()`  
2690 functions in the System Interfaces volume of POSIX.1-2024.

### 2691 3.391 Thread List

2692 An ordered set of runnable threads that all have the same ordinal value for their priority.

2693 The ordering of threads on the list is determined by a scheduling policy or policies. The set of  
2694 thread lists includes all runnable threads in the system.

### 2695 3.392 Thread Termination

2696 Thread termination occurs when a thread executes `pthread_exit()` or `thrd_exit()`, when it returns  
2697 from the `start_routine` function passed to `pthread_create()` or from the `func` function passed to  
2698 `thrd_create()`, or when it acts on a cancellation request initiated by `pthread_cancel()`.

2699 **Note:** The `pthread_cancel()`, `pthread_create()`, `pthread_exit()`, `thrd_create()`, and `thrd_exit()` functions are  
2700 defined in detail in the System Interfaces volume of POSIX.1-2024.

### 2701 3.393 Thread-Safe

2702 A thread-safe function shall avoid data races with other calls to the same function, and with calls  
2703 to any other thread-safe functions, by multiple threads. Each function defined in the System  
2704 Interfaces volume of POSIX.1-2024 is thread-safe unless explicitly stated otherwise. Examples  
2705 are any “pure” function, a function which holds a mutex locked while it is accessing static  
2706 storage, or objects shared among threads.

2707 A function that is not required to be thread-safe need not avoid data races with other calls to the  
2708 same function, nor with calls to any other function (including thread-safe functions), by multiple  
2709 threads, unless explicitly stated otherwise.

### 2710 3.394 Thread-Specific Data Key

2711 A process global handle which is used for naming thread-specific data. There are two types of  
2712 key: those of type `pthread_key_t` which are created using `pthread_key_create()` and those of type  
2713 `tss_t` which are created using `tss_create()`. If an application attempts to use the two types of key  
2714 interchangeably (that is, pass a key of type `pthread_key_t` to a function that takes a `tss_t`, or vice  
2715 versa), the behavior is undefined.

2716 Although the same key value can be used by different threads, the values bound to the key by  
2717 `pthread_setspecific()` for keys of type `pthread_key_t`, and by `tss_set()` for keys of type `tss_t`, are  
2718 maintained on a per-thread basis and persist for the life of the calling thread.

2719 **Note:** The `pthread_getspecific()`, `pthread_setspecific()`, `tss_create()`, and `tss_set()` functions are defined in  
2720 detail in the System Interfaces volume of POSIX.1-2024.

### 2721 **3.395 Tilde Character (<tilde>)**

2722 The character '~'.

### 2723 **3.396 Timeouts**

2724 A method of limiting the length of time an interface will block; see also [Section 3.47](#) (on page 37).

### 2725 **3.397 Timer**

2726 A mechanism that can notify a thread when the time as measured by a particular clock has  
2727 reached or passed a specified value, or when a specified amount of time has passed.

### 2728 **3.398 Timer Overrun**

2729 A condition that occurs each time a timer, for which there is already an expiration signal queued  
2730 to the process, expires.

### 2731 **3.399 Token**

2732 In the shell command language, a sequence of characters that the shell considers as a single unit  
2733 when reading input. A token is either an operator or a word.

2734 **Note:** The rules for reading input are defined in detail in XCU [Section 2.3](#) (on page 2475).

### 2735 **3.400 Typed Memory Name Space**

2736 A system-wide name space that contains the names of the typed memory objects present in the  
2737 system. It is configurable for a given implementation.

### 2738 **3.401 Typed Memory Object**

2739 A combination of a typed memory pool and a typed memory port. The entire contents of the  
2740 pool are accessible from the port. The typed memory object is identified through a name that  
2741 belongs to the typed memory name space.

### 2742 **3.402 Typed Memory Pool**

2743 An extent of memory with the same operational characteristics. Typed memory pools may be  
2744 contained within each other.

**2745 3.403 Typed Memory Port**

2746 A hardware access path to one or more typed memory pools.

**2747 3.404 Unbind**

2748 Remove the association between a network address and an endpoint.

**2749 3.405 Unit Data**

2750 See *Datagram* in [Section 3.96](#) (on page 45).

**2751 3.406 Upshifting**

2752 The conversion of a lowercase character that has a single-character uppercase representation into  
2753 this uppercase representation.

**2754 3.407 User Database**

2755 A system database that contains at least the following information for each user ID:

- 2756 • User name
- 2757 • Numerical user ID
- 2758 • Initial numerical group ID
- 2759 • Initial working directory
- 2760 • Initial user program

2761 The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under  
2762 which the initial values are operative are implementation-defined.

2763 If the initial user program field is null, an implementation-defined program is used.

2764 If the initial working directory field is null, the interpretation of that field is implementation-  
2765 defined.

2766 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2024.

**2767 3.408 User ID**

2768 A non-negative integer that is used to identify a system user. When the identity of a user is  
2769 associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or  
2770 a saved set-user-ID. The value (**uid\_t**)-1 shall not be a valid user ID, but does have a defined use  
2771 in some interfaces defined in this standard.

**2772 3.409 User Name**

2773 A string that is used to identify a user; see also [Section 3.407](#). To be portable across systems  
2774 conforming to POSIX.1-2024, the value is composed of characters from the portable filename

2775 character set. The <hyphen-minus> character should not be used as the first character of a  
2776 portable user name.

### 2777 **3.410 Utility**

2778 A program, excluding special built-in utilities provided as part of the Shell Command Language,  
2779 that can be called by name from a shell to perform a specific task, or related set of tasks.

2780 **Note:** For further information on special built-in utilities, see XCU [Section 2.15](#) (on page 2526).

### 2781 **3.411 Variable**

2782 In the shell command language, a named parameter.

2783 **Note:** For further information, see XCU [Section 2.5](#) (on page 2478).

### 2784 **3.412 Vertical-Tab Character (<vertical-tab>)**

2785 A character that in the output stream indicates that printing should start at the next vertical  
2786 tabulation position. It is the character designated by '\v' in the C language. If the current  
2787 position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is  
2788 unspecified whether this character is the exact sequence transmitted to an output device by the  
2789 system to accomplish the tabulation.

### 2790 **3.413 White Space**

2791 A sequence of one or more characters that belong to the **space** character class as defined via the  
2792 *LC\_CTYPE* category in the current locale or a specified locale.

2793 In the POSIX locale, white space consists of one or more <blank> (<space> and <tab>  
2794 characters), <newline>, <carriage-return>, <form-feed>, and <vertical-tab> characters.

### 2795 **3.414 White-Space Byte**

2796 A single-byte white-space character; that is, a character for which the *isspace()* or *isspace\_1()*  
2797 function returns a non-zero value.

### 2798 **3.415 White-Space Character**

2799 A character that belongs to the **space** character class as defined via the *LC\_CTYPE* category in  
2800 the current locale or a specified locale.

### 2801 **3.416 White-Space Wide Character**

2802 A wide-character code that belongs to the **space** character class as defined via the *LC\_CTYPE*  
2803 category in the current locale or a specified locale.

### 2804 3.417 Wide-Character Code (C Language)

2805 An integer value corresponding to a single graphic symbol or control code.

2806 **Note:** C Language Wide-Character Codes are defined in detail in [Section 6.3](#) (on page 120).

### 2807 3.418 Wide-Character Input/Output Functions

2808 The functions that perform wide-oriented input from streams or wide-oriented output to  
2809 streams: *fgetwc()*, *fgetws()*, *fputwc()*, *fputws()*, *fwprintf()*, *fwscanf()*, *getwc()*, *getwchar()*, *putwc()*,  
2810 *putwchar()*, *ungetwc()*, *vwprintf()*, *vwscanf()*, *vwpprintf()*, *vwscanf()*, *wprintf()*, and *wscanf()*.

2811 **Note:** These functions are defined in detail in the System Interfaces volume of POSIX.1-2024.

### 2812 3.419 Wide-Character String

2813 A contiguous sequence of wide-character codes terminated by and including the first null wide-  
2814 character code.

### 2815 3.420 Word

2816 In the shell command language, a token other than an operator. In some cases a word is also a  
2817 portion of a word token: in the various forms of parameter expansion, such as *\${name-word}*,  
2818 and variable assignment, such as *name=word*, the word is the portion of the token depicted by  
2819 *word*. The concept of a word is no longer applicable following word expansions—only fields  
2820 remain.

2821 **Note:** For further information, see XCU [Section 2.6.2](#) (on page 2485) and [Section 2.6](#) (on page 2483).

### 2822 3.421 Working Directory (or Current Working Directory)

2823 A directory, associated with a process, that is used in pathname resolution for pathnames that do  
2824 not begin with a <slash> character.

### 2825 3.422 Worldwide Portability Interface

2826 Functions for handling characters in a codeset-independent manner.

### 2827 3.423 Write

2828 To output characters to a file, such as standard output or standard error. Unless otherwise stated,  
2829 standard output is the default output destination for all uses of the term “write”; see the  
2830 distinction between display and write in [Section 3.107](#) (on page 46).

### 2831 3.424 XSI

2832 The X/Open System Interfaces (XSI) option is the core application programming interface for C

2833 and *sh* programming for systems conforming to the Single UNIX Specification. This is a  
2834 superset of the mandatory requirements for conformance to POSIX.1-2024.

### 2835 **3.425 XSI-Conformant**

2836 A system which allows an application to be built using a set of services that are consistent across  
2837 all systems that conform to POSIX.1-2024 and that support the XSI option.

2838 **Note:** See also [Chapter 2](#) (on page 15).

### 2839 **3.426 Zombie Process**

2840 The remains of a live process (see [Section 3.189](#), on page 59) after it terminates (see [Section 3.287](#),  
2841 on page 73) and before its status information (see [XSH Section 2.12](#), on page 563) is consumed by  
2842 its parent process.

### 2843 **3.427 Zombie Thread**

2844 The remains of a joinable live thread (see [Section 3.183](#) (on page 58) and [Section 3.190](#), on page  
2845 59) after it terminates (see [Section 3.392](#), on page 89) and before it has been joined with  
2846 *pthread\_join()* or *thrd\_join()* or detached with *pthread\_detach()* or *thrd\_detach()*.

2847 **Note:** The *pthread\_detach()*, *pthread\_join()*, *thrd\_detach()*, and *thrd\_join()* functions are defined in detail  
2848 in the System Interfaces volume of POSIX.1-2024.

### 2849 **3.428 ±0**

2850 The algebraic sign provides additional information about any variable that has the value zero  
2851 when the representation allows the sign to be determined.

2852

2853

# General Concepts

2854

For the purposes of POSIX.1-2024, the general concepts given in [Chapter 4](#) apply.

2855

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

2856

2857

2858

## 4.1 Case Insensitive Comparisons

2859

When a standard utility or function that uses regular expressions or pattern matching specifies that matching shall be case insensitive, then if a string would match the regular expression or pattern when doing a case-sensitive match, the same string with any of its characters replaced with their case counterparts, as defined by the **toupper** and **tolower** character mappings (see [Section 7.3.1](#), on page 131), shall also match when doing a case-insensitive match.

2860

2861

2862

2863

2864

This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters, as each character in the string is matched using both its cases. For example, in a locale with a "Ch" multi-character collating element (see [Section 9.3.2](#), on page 139), the bracket expression "[[.Ch.]]" (see [Section 9.3.5](#) (on page 182) item 4) matches the strings "ch", "Ch", "cH", and "CH" when matching without regard to case.

2865

2866

2867

2868

2869

## 4.2 Concurrent Execution

2870

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

2871

2872

## 4.3 Default Initialization

2873

Default initialization causes an object to be initialized according to these rules:

2874

- If it has pointer type, it is initialized to a null pointer.
- If it has arithmetic type, it is initialized to (positive or unsigned) zero.
- If it is an aggregate, every member is initialized (recursively) according to these rules.
- If it is a union, the first named member is initialized (recursively) according to these rules.

2875

2876

2877

2878

For an object of aggregate type with an explicit initializer, the initialization shall occur in initializer list order, each initializer provided for a particular subobject overriding any previously listed initializer for the same subobject; all subobjects that are not initialized explicitly shall be initialized implicitly according to the rules for default initialization.

2879

2880

2881

2882

Objects with static storage duration but no explicit initializer shall be initialized implicitly according to the rules for default initialization.

2883

2884

An explicit initializer of { 0 } works to perform explicit default initialization for any object of scalar or aggregate type, and for any storage duration.

2885

2886 **Notes:**

- 2887
- 2888
- 2889
- 2890
- 2891
- 2892
- 2893
- 2894
- 2895
- 2896
1. The ISO C standard does not require a compiler to set any field alignment padding bits in a structure or array definition to a particular value. Because of this, a structure initialized using `{ 0 }` might not *memcmp()* as equal to the same structure initialized using *memset()* to zero. For consistent results, portable applications comparing structures should test each field individually.
  2. If an implementation treats the all-zero bit pattern of a floating-point object as equivalent to positive 0, then *memset()* to zero and *calloc()* have the same effects as default initialization for all named members of a structure. Implementations that define `__STDC_IEC_559__` guarantee that the all-zero bit pattern of a floating-point object represents 0.0.

## 2897 4.4 Directory Operations

2898 All file system operations that read or search a directory or that modify the contents of a  
 2899 directory (for example creating, unlinking, or renaming a file) shall operate atomically. That is,  
 2900 each operation shall either have its entire effect and succeed, or shall not affect the file system  
 2901 and shall fail. Furthermore, these operations shall be serializable; that is, the state of the file  
 2902 system and of the results of each operation shall always be values that would be obtained if the  
 2903 operations were executed one after the other.

## 2904 4.5 Directory Protection

2905 If a directory is writable and the mode bit `S_ISVTX` is set on the directory, a process may remove  
 2906 or rename files within that directory only if one or more of the following is true:

- 2907
- 2908
- 2909
- 2910
- 2911
- The effective user ID of the process is the same as that of the owner ID of the file.
  - The effective user ID of the process is the same as that of the owner ID of the directory.
  - The process has appropriate privileges.
  - Optionally, the file is writable by the process. Whether or not files that are writable by the process can be removed or renamed is implementation-defined.

2912 If the `S_ISVTX` bit is set on a non-directory file, the behavior is unspecified.

## 2913 4.6 Extended Security Controls

2914 An implementation may provide implementation-defined extended security controls (see  
 2915 [Section 3.135](#), on page 50). These permit an implementation to provide security mechanisms to  
 2916 implement different security policies than those described in POSIX.1-2024. These mechanisms  
 2917 shall not alter or override the defined semantics of any of the interfaces in POSIX.1-2024.

## 2918 4.7 File Access Permissions

2919 The standard file access control mechanism uses the file permission bits, as described below.

2920 Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An  
2921 additional access control mechanism shall only further restrict the access permissions defined by  
2922 the file permission bits. An alternate file access control mechanism shall:

- 2923 • Specify file permission bits for the file owner class, file group class, and file other class of  
2924 that file, corresponding to the access permissions.
- 2925 • Be enabled only by explicit user action, on a per-file basis by the file owner or a user with  
2926 appropriate privileges.
- 2927 • Be disabled for a file after the file permission bits are changed for that file with *chmod()*.  
2928 The disabling of the alternate mechanism need not disable any additional mechanisms  
2929 supported by an implementation.

2930 Whenever a process requests file access permission for read, write, or execute/search, if no  
2931 additional mechanism denies access, access shall be determined as follows:

- 2932 • If a process has appropriate privileges:
  - 2933 — If read, write, or directory search permission is requested, access shall be granted.
  - 2934 — If execute permission is requested, access shall be granted if execute permission is  
2935 granted to at least one user by the file permission bits or by an alternate access  
2936 control mechanism; otherwise, access shall be denied.
- 2937 • Otherwise:
  - 2938 — The file permission bits of a file contain read, write, and execute/search permissions  
2939 for the file owner class, file group class, and file other class.
  - 2940 — Access shall be granted if an alternate access control mechanism is not enabled and  
2941 the requested access permission bit is set for the class (file owner class, file group  
2942 class, or file other class) to which the process belongs, or if an alternate access control  
2943 mechanism is enabled and it allows the requested access; otherwise, access shall be  
2944 denied.

## 2945 4.8 File Hierarchy

2946 Files in the system are organized in a hierarchical structure in which all of the non-terminal  
2947 nodes are directories and all of the terminal nodes are any other type of file. Since multiple  
2948 directory entries may refer to the same file, the hierarchy is properly described as a “directed  
2949 graph”.

## 2950 4.9 Filenames

2951 Uppercase and lowercase letters shall retain their unique identities between conforming  
2952 implementations.

## 2953 4.10 Filename Portability

2954 For a filename to be portable across implementations conforming to POSIX.1-2024, it shall  
2955 consist only of the portable filename character set as defined in [Section 3.265](#) (on page 70).

2956 **Note:** Applications should avoid using filenames that have the <hyphen-minus> character as the first  
2957 character since this may cause problems when filenames are passed as command line  
2958 arguments.

## 2959 4.11 File System Cache

2960 If the file system is accessed via a memory cache, file-related requirements stated in the rest of  
2961 this standard shall apply to the cache, except where explicitly stated otherwise: this includes  
2962 directory atomicity and serializability requirements (see [Section 4.4](#)), file times update  
2963 requirements (see [Section 4.12](#)), and read-write serializability requirements (see [write\(\)](#)). Cache  
2964 entries shall be transferred to the underlying storage as the result of successful calls to  
2965 [fdatasync\(\)](#), [fsync\(\)](#), or [aio\\_fsync\(\)](#), and may be transferred to storage automatically at other  
2966 times. Such transfers shall be atomic, with minimum units being directory entries (for directory  
2967 contents), aligned data blocks of the fundamental file system block size (for regular-file contents;  
2968 see [<sys/statvfs.h>](#)), and all attributes of a single file (for file attributes).

2969 **Note:** If the system crashes before the cache is fully transferred, later operations' effects may be  
2970 present in storage with earlier effects missing.

2971 **Note:** Operations that create or modify multiple directory entries, aligned data blocks, or file  
2972 attributes (e.g., [mkdir\(\)](#), [rename\(\)](#), [write\(\)](#) with large buffer size, [open\(\)](#) with `O_CREAT`) may  
2973 have only part of their effects transferred to storage, and after a crash these operations may  
2974 appear to have been only partly done, with the parts not necessarily done in any order. For  
2975 example, only the second half of a [write\(\)](#) may be transferred; or `rename("a", "b")` may  
2976 result in `b` being created without `a` being removed.

2977 **Note:** Although conforming file systems are required to perform all caching as described above, some  
2978 file systems may support non-conforming configurations (for example via mount options) for  
2979 which this is not the case. Applications that are used on non-conforming file systems cannot  
2980 rely on files being synchronized properly.

## 2981 4.12 File Times Update

2982 Many operations have requirements to update file timestamps. These requirements do not apply  
2983 to streams that have no underlying file description (for example, memory streams created by  
2984 [open\\_memstream\(\)](#) have no underlying file description).

2985 Each file has three distinct associated timestamps: the time of last data access, the time of last  
2986 data modification, and the time the file status last changed. These values are returned in the file  
2987 characteristics structure `struct stat`, as described in [<sys/stat.h>](#) (on page 414).

2988 Each function or utility in POSIX.1-2024 that reads or writes data (even if the data does not  
2989 change) or performs an operation to change file status (even if the file status does not change)  
2990 indicates which of the appropriate timestamps shall be marked for update. If an implementation  
2991 of such a function or utility marks for update one of these timestamps in a place or time not  
2992 specified by POSIX.1-2024, this shall be documented, except that any changes caused by  
2993 pathname resolution need not be documented. For the other functions or utilities in  
2994 POSIX.1-2024 (those that are not explicitly required to read or write file data or change file  
2995 status, but that in some implementations happen to do so), the effect is unspecified.

2996 An implementation may update timestamps that are marked for update immediately, or it may  
2997 update such timestamps periodically. At the point in time when an update occurs, any marked  
2998 timestamps shall be set to the current time and the update marks shall be cleared. All  
2999 timestamps that are marked for update shall be updated when the file ceases to be open by any  
3000 process or before a *fstat()*, *fstatat()*, *fsync()*, *futimens()*, *lstat()*, *stat()*, *utimensat()*, or *utimes()*  
3001 is successfully performed on the file. Other times at which updates are done are unspecified.  
3002 Marks for update, and updates themselves, shall not be done for files on read-only file systems;  
3003 see [Section 3.295](#) (on page 75).

3004 The resolution of timestamps of files in a file system is implementation-defined, but shall be no  
3005 coarser than one-second resolution. The three timestamps shall always have values that are  
3006 supported by the file system. Whenever any of a file's timestamps are to be set to a value *V*  
3007 according to the rules of the preceding paragraphs of this section, the implementation shall  
3008 immediately set the timestamp to the greatest value supported by the file system that is not  
3009 greater than *V*.

### 3010 4.13 Host and Network Byte Orders

3011 When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned  
3012 values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be  
3013 stored in several octets. The convention is that all such values are stored with 8 bits in each octet,  
3014 and with the first (lowest-addressed) octet holding the most-significant bits. This is called  
3015 "network byte order".

3016 Network byte order may not be convenient for processing actual values. For this, it is more  
3017 sensible for values to be stored as ordinary integers. This is known as "host byte order". In host  
3018 byte order:

- 3019 • The most significant bit might not be stored in the first byte in address order.
- 3020 • Bits might not be allocated to bytes in any obvious order at all.

3021 8-bit values stored in **uint8\_t** objects do not require conversion to or from host byte order, as  
3022 they have the same representation. 16 and 32-bit values can be converted using the *htonl()*,  
3023 *htons()*, *ntohl()*, and *ntohs()* functions. When reading data that is to be converted to host byte  
3024 order, it should either be received directly into a **uint16\_t** or **uint32\_t** object or should be copied  
3025 from an array of bytes using *memcpy()* or similar. Passing the data through other types could  
3026 cause the byte order to be changed. Similar considerations apply when sending data.

### 3027 4.14 Measurement of Execution Time

3028 The mechanism used to measure execution time shall be implementation-defined. The  
3029 implementation shall also define to whom the CPU time that is consumed by interrupt handlers  
3030 and system services on behalf of the operating system will be charged. See [Section 3.90](#) (on page  
3031 44).

## 3032 4.15 Memory Ordering and Synchronization

### 3033 4.15.1 Memory Ordering

#### 3034 4.15.1.1 Data Races

3035 The value of an object visible to a thread *T* at a particular point is the initial value of the object, a  
3036 value stored in the object by *T*, or a value stored in the object by another thread, according to the  
3037 rules below.

3038 Two expression evaluations *conflict* if one of them modifies a memory location and the other one  
3039 reads or modifies the same memory location.

3040 This standard defines a number of atomic operations (see `<stdatomic.h>`) and operations on  
3041 mutexes (see `<threads.h>`) that are specially identified as synchronization operations. These  
3042 operations play a special role in making assignments in one thread visible to another. A  
3043 synchronization operation on one or more memory locations is either an *acquire operation*, a  
3044 *release operation*, both an acquire and release operation, or a *consume operation*. A synchronization  
3045 operation without an associated memory location is a *fence* and can be either an acquire fence, a  
3046 release fence, or both an acquire and release fence. In addition, there are *relaxed atomic operations*,  
3047 which are not synchronization operations, and atomic *read-modify-write operations*, which have  
3048 special characteristics.

3049 **Note:** For example, a call that acquires a mutex will perform an acquire operation on the locations  
3050 composing the mutex. Correspondingly, a call that releases the same mutex will perform a  
3051 release operation on those same locations. Informally, performing a release operation on *A*  
3052 forces prior side effects on other memory locations to become visible to other threads that later  
3053 perform an acquire or consume operation on *A*. Relaxed atomic operations are not included as  
3054 synchronization operations although, like synchronization operations, they cannot contribute to  
3055 data races.

3056 All modifications to a particular atomic object *M* occur in some particular total order, called the  
3057 modification order of *M*. If *A* and *B* are modifications of an atomic object *M*, and *A* happens  
3058 before *B*, then *A* shall precede *B* in the modification order of *M*, which is defined below.

3059 **Note:** This states that the modification orders must respect the “happens before” relation.

3060 **Note:** There is a separate order for each atomic object. There is no requirement that these can be  
3061 combined into a single total order for all objects. In general this will be impossible since  
3062 different threads may observe modifications to different variables in inconsistent orders.

3063 A *release sequence* headed by a release operation *A* on an atomic object *M* is a maximal  
3064 contiguous sub-sequence of side effects in the modification order of *M*, where the first operation  
3065 is *A* and every subsequent operation either is performed by the same thread that performed the  
3066 release or is an atomic read-modify-write operation.

3067 Certain system interfaces *synchronize with* other system interfaces performed by another thread.  
3068 In particular, an atomic operation *A* that performs a release operation on an object *M* shall  
3069 synchronize with an atomic operation *B* that performs an acquire operation on *M* and reads a  
3070 value written by any side effect in the release sequence headed by *A*.

3071 **Note:** Except in the specified cases, reading a later value does not necessarily ensure visibility as  
3072 described below. Such a requirement would sometimes interfere with efficient implementation.

3073 **Note:** The specifications of the synchronization operations define when one reads the value written by  
 3074 another. For atomic variables, the definition is clear. All operations on a given mutex occur in a  
 3075 single total order. Each mutex acquisition “reads the value written” by the last mutex release.

3076 An evaluation *A* carries a dependency to an evaluation *B* if:

- 3077 • the value of *A* is used as an operand of *B*, unless:
  - 3078 — *B* is an invocation of the `kill_dependency()` macro,
  - 3079 — *A* is the left operand of a `&&` or `||` operator,
  - 3080 — *A* is the left operand of a `?:` operator, or
  - 3081 — *A* is the left operand of a `,` (comma) operator; or
- 3082 • *A* writes a scalar object or bit-field *M*, *B* reads from *M* the value written by *A*, and *A* is  
 3083 sequenced before *B*, or
- 3084 • for some evaluation *X*, *A* carries a dependency to *X* and *X* carries a dependency to *B*.

3085 An evaluation *A* is *dependency-ordered before* an evaluation *B* if:

- 3086 • *A* performs a release operation on an atomic object *M*, and, in another thread, *B* performs a  
 3087 consume operation on *M* and reads a value written by any side effect in the release  
 3088 sequence headed by *A*, or
- 3089 • for some evaluation *X*, *A* is dependency-ordered before *X* and *X* carries a dependency to *B*.

3090 An evaluation *A* *inter-thread happens before* an evaluation *B* if *A* synchronizes with *B*, *A* is  
 3091 dependency-ordered before *B*, or, for some evaluation *X*:

- 3092 • *A* synchronizes with *X* and *X* is sequenced before *B*,
- 3093 • *A* is sequenced before *X* and *X* inter-thread happens before *B*, or
- 3094 • *A* inter-thread happens before *X* and *X* inter-thread happens before *B*.

3095 **Note:** The “inter-thread happens before” relation describes arbitrary concatenations of “sequenced  
 3096 before”, “synchronizes with”, and “dependency-ordered before” relationships, with two  
 3097 exceptions. The first exception is that a concatenation is not permitted to end with  
 3098 “dependency-ordered before” followed by “sequenced before”. The reason for this limitation is  
 3099 that a consume operation participating in a “dependency-ordered before” relationship provides  
 3100 ordering only with respect to operations to which this consume operation actually carries a  
 3101 dependency. The reason that this limitation applies only to the end of such a concatenation is  
 3102 that any subsequent release operation will provide the required ordering for a prior consume  
 3103 operation. The second exception is that a concatenation is not permitted to consist entirely of  
 3104 “sequenced before”. The reasons for this limitation are (1) to permit “inter-thread happens  
 3105 before” to be transitively closed and (2) the “happens before” relation, defined below, provides  
 3106 for relationships consisting entirely of “sequenced before”.

3107 An evaluation *A* *happens before* an evaluation *B* if *A* is sequenced before *B* or *A* inter-thread  
 3108 happens before *B*. The implementation shall ensure that a cycle in the “happens before” relation  
 3109 never occurs.

3110 **Note:** This cycle would otherwise be possible only through the use of consume operations.

3111 A *visible side effect* *A* on an object *M* with respect to a value computation *B* of *M* satisfies the  
 3112 conditions:

- 3113 • *A* happens before *B*, and
- 3114 • there is no other side effect *X* to *M* such that *A* happens before *X* and *X* happens before *B*.

3115 The value of a non-atomic scalar object *M*, as determined by evaluation *B*, shall be the value

3116 stored by the visible side effect *A*.

3117 **Note:** If there is ambiguity about which side effect to a non-atomic object is visible, then there is a data  
3118 race and the behavior is undefined.

3119 **Note:** This states that operations on ordinary variables are not visibly reordered. This is not actually  
3120 detectable without data races, but it is necessary to ensure that data races, as defined here, and  
3121 with suitable restrictions on the use of atomics, correspond to data races in a simple interleaved  
3122 (sequentially consistent) execution.

3123 The value of an atomic object *M*, as determined by evaluation *B*, shall be the value stored by  
3124 some side effect *A* that modifies *M*, where *B* does not happen before *A*.

3125 **Note:** The set of side effects from which a given evaluation might take its value is also restricted by  
3126 the rest of the rules described here, and in particular, by the coherence requirements below.

3127 If an operation *A* that modifies an atomic object *M* happens before an operation *B* that modifies  
3128 *M*, then *A* shall be earlier than *B* in the modification order of *M*. (This is known as “write-write  
3129 coherence”.)

3130 If a value computation *A* of an atomic object *M* happens before a value computation *B* of *M*, and  
3131 *A* takes its value from a side effect *X* on *M*, then the value computed by *B* shall either be the  
3132 value stored by *X* or the value stored by a side effect *Y* on *M*, where *Y* follows *X* in the  
3133 modification order of *M*. (This is known as “read-read coherence”.)

3134 If a value computation *A* of an atomic object *M* happens before an operation *B* on *M*, then *A*  
3135 shall take its value from a side effect *X* on *M*, where *X* precedes *B* in the modification order of  
3136 *M*. (This is known as “read-write coherence”.)

3137 If a side effect *X* on an atomic object *M* happens before a value computation *B* of *M*, then the  
3138 evaluation *B* shall take its value from *X* or from a side effect *Y* that follows *X* in the modification  
3139 order of *M*. (This is known as “write-read coherence”.)

3140 **Note:** This effectively disallows implementation reordering of atomic operations to a single object,  
3141 even if both operations are “relaxed” loads. By doing so, it effectively makes the “cache  
3142 coherence” guarantee provided by most hardware available to POSIX atomic operations.

3143 **Note:** The value observed by a load of an atomic object depends on the “happens before” relation,  
3144 which in turn depends on the values observed by loads of atomic objects. The intended reading  
3145 is that there must exist an association of atomic loads with modifications they observe that,  
3146 together with suitably chosen modification orders and the “happens before” relation derived as  
3147 described above, satisfy the resulting constraints as imposed here.

3148 An application contains a data race if it contains two conflicting actions in different threads, at  
3149 least one of which is not atomic, and neither happens before the other. Any such data race  
3150 results in undefined behavior.

#### 3151 4.15.1.2 Memory Order and Consistency

3152 The enumerated type **memory\_order**, defined in `<stdatomic.h>` (if supported), specifies the  
3153 detailed regular (non-atomic) memory synchronization operations as defined in [Section 4.15.1.1](#)  
3154 (on page 100) and may provide for operation ordering. Its enumeration constants specify  
3155 memory order as follows:

3156 For `memory_order_relaxed`, no operation orders memory.

3157 For `memory_order_release`, `memory_order_acq_rel`, and `memory_order_seq_cst`, a  
3158 store operation performs a release operation on the affected memory location.

3159 For `memory_order_acquire`, `memory_order_acq_rel`, and `memory_order_seq_cst`, a  
3160 load operation performs an acquire operation on the affected memory location.

3161 For `memory_order_consume`, a load operation performs a consume operation on the affected  
3162 memory location.

3163 There shall be a single total order  $S$  on all `memory_order_seq_cst` operations, consistent with  
3164 the “happens before” order and modification orders for all affected locations, such that each  
3165 `memory_order_seq_cst` operation  $B$  that loads a value from an atomic object  $M$  observes one  
3166 of the following values:

- 3167 • the result of the last modification  $A$  of  $M$  that precedes  $B$  in  $S$ , if it exists, or
- 3168 • if  $A$  exists, the result of some modification of  $M$  that is not `memory_order_seq_cst` and  
3169 that does not happen before  $A$ , or
- 3170 • if  $A$  does not exist, the result of some modification of  $M$  that is not  
3171 `memory_order_seq_cst`.

3172 **Note:** Although it is not explicitly required that  $S$  include lock operations, it can always be extended  
3173 to an order that does include lock and unlock operations, since the ordering between those is  
3174 already included in the “happens before” ordering.

3175 **Note:** Atomic operations specifying `memory_order_relaxed` are relaxed only with respect to  
3176 memory ordering. Implementations must still guarantee that any given atomic access to a  
3177 particular atomic object be indivisible with respect to all other atomic accesses to that object.

3178 For an atomic operation  $B$  that reads the value of an atomic object  $M$ , if there is a  
3179 `memory_order_seq_cst` fence  $X$  sequenced before  $B$ , then  $B$  observes either the last  
3180 `memory_order_seq_cst` modification of  $M$  preceding  $X$  in the total order  $S$  or a later  
3181 modification of  $M$  in its modification order.

3182 For atomic operations  $A$  and  $B$  on an atomic object  $M$ , where  $A$  modifies  $M$  and  $B$  takes its value,  
3183 if there is a `memory_order_seq_cst` fence  $X$  such that  $A$  is sequenced before  $X$  and  $B$  follows  
3184  $X$  in  $S$ , then  $B$  observes either the effects of  $A$  or a later modification of  $M$  in its modification  
3185 order.

3186 For atomic modifications  $A$  and  $B$  of an atomic object  $M$ ,  $B$  occurs later than  $A$  in the  
3187 modification order of  $M$  if:

- 3188 • there is a `memory_order_seq_cst` fence  $X$  such that  $A$  is sequenced before  $X$ , and  $X$   
3189 precedes  $B$  in  $S$ , or
- 3190 • there is a `memory_order_seq_cst` fence  $Y$  such that  $Y$  is sequenced before  $B$ , and  $A$   
3191 precedes  $Y$  in  $S$ , or
- 3192 • there are `memory_order_seq_cst` fences  $X$  and  $Y$  such that  $A$  is sequenced before  $X$ ,  $Y$  is  
3193 sequenced before  $B$ , and  $X$  precedes  $Y$  in  $S$ .

3194 Atomic read-modify-write operations shall always read the last value (in the modification order)  
3195 stored before the write associated with the read-modify-write operation.

3196 An atomic store shall only store a value that has been computed from constants and input values  
3197 by a finite sequence of evaluations, such that each evaluation observes the values of variables as  
3198 computed by the last prior assignment in the sequence. The ordering of evaluations in this  
3199 sequence shall be such that:

- 3200 • If an evaluation  $B$  observes a value computed by  $A$  in a different thread, then  $B$  does not  
3201 happen before  $A$ .
- 3202 • If an evaluation  $A$  is included in the sequence, then all evaluations that assign to the same  
3203 variable and happen before  $A$  are also included.

3204 **Note:** The second requirement disallows “out-of-thin-air”, or “speculative” stores of atomics when  
 3205 relaxed atomics are used. Since unordered operations are involved, evaluations can appear in  
 3206 this sequence out of thread order.

## 3207 4.15.2 Memory Synchronization

3208 In order to avoid data races, applications shall ensure that non-lock-free access to any memory  
 3209 location by more than one thread of control (threads or processes) is restricted such that no  
 3210 thread of control can read or modify a memory location while another thread of control might be  
 3211 modifying it. Such access can be restricted using functions that synchronize thread execution  
 3212 and also synchronize memory with respect to other threads. The following functions shall  
 3213 synchronize memory with respect to other threads on all successful calls:

3214	<i>cond_broadcast()</i>	<i>pthread_rwlock_clockrdlock()</i>	<i>sem_timedwait()</i>
3215	<i>cond_signal()</i>	<i>pthread_rwlock_clockwrlock()</i>	<i>sem_trywait()</i>
3216	<i>fork()</i>	<i>pthread_rwlock_rdlock()</i>	<i>sem_wait()</i>
3217	<i>pthread_barrier_wait()</i>	<i>pthread_rwlock_timedrdlock()</i>	<i>semctl()</i>
3218	<i>pthread_cond_broadcast()</i>	<i>pthread_rwlock_timedwrlock()</i>	<i>semop()</i>
3219	<i>pthread_cond_signal()</i>	<i>pthread_rwlock_tryrdlock()</i>	<i>thr_create()</i>
3220	<i>pthread_create()</i>	<i>pthread_rwlock_trywrlock()</i>	<i>thr_join()</i>
3221	<i>pthread_join()</i>	<i>pthread_rwlock_unlock()</i>	<i>wait()</i>
3222	<i>pthread_spin_lock()</i>	<i>pthread_rwlock_wrlock()</i>	<i>waitid()</i>
3223	<i>pthread_spin_trylock()</i>	<i>sem_clockwait()</i>	<i>waitpid()</i>
3224	<i>pthread_spin_unlock()</i>	<i>sem_post()</i>	

3225 The *pthread\_once()* and *call\_once()* functions shall synchronize memory for the first successful  
 3226 call in each thread for a given **pthread\_once\_t** or **once\_flag** object, respectively. If the *init\_routine*  
 3227 called by *pthread\_once()* or *call\_once()* is a cancellation point and is canceled, a successful call to  
 3228 *pthread\_once()* for the same **pthread\_once\_t** object or to *call\_once()* for the same **once\_flag** object,  
 3229 made from a cancellation cleanup handler shall also synchronize memory.

3230 RPP|TPP The *pthread\_mutex\_clocklock()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_setprioceiling()*,  
 3231 *pthread\_mutex\_timedlock()*, and *pthread\_mutex\_trylock()* functions shall synchronize memory on  
 3232 all calls that acquire the mutex, including those that return [EOWNERDEAD]. The  
 3233 *pthread\_mutex\_unlock()* function shall synchronize memory on all calls that release the mutex.

3234 **Note:** If the mutex type is PTHREAD\_MUTEX\_RECURSIVE, calls to the locking functions do not  
 3235 acquire the mutex if the calling thread already owns it, and calls to *pthread\_mutex\_unlock()* do  
 3236 not release the mutex if it has a lock count greater than one.

3237 The *pthread\_cond\_clockwait()*, *pthread\_cond\_wait()*, and *pthread\_cond\_timedwait()* functions shall  
 3238 synchronize memory on all calls that release and re-acquire the specified mutex, including calls  
 3239 that return [EOWNERDEAD], both when the mutex is released and when it is re-acquired.

3240 **Note:** If the mutex type is PTHREAD\_MUTEX\_RECURSIVE, calls to *pthread\_cond\_clockwait()*,  
 3241 *pthread\_cond\_wait()*, and *pthread\_cond\_timedwait()* do not release and re-acquire the mutex if it  
 3242 has a lock count greater than one.

3243 The *mtx\_lock()*, *mtx\_timedlock()*, and *mtx\_trylock()* functions shall synchronize memory on all  
 3244 calls that acquire the mutex. The *mtx\_unlock()* function shall synchronize memory on all calls  
 3245 that release the mutex.

3246 **Note:** If the mutex is a recursive mutex, calls to the locking functions do not acquire the mutex if the  
 3247 calling thread already owns it, and calls to *mtx\_unlock()* do not release the mutex if it has a lock  
 3248 count greater than one.

3249 The *cond\_wait()* and *cond\_timedwait()* functions shall synchronize memory on all calls that release

3250 and re-acquire the specified mutex, both when the mutex is released and when it is re-acquired.

3251 **Note:** If the mutex is a recursive mutex, calls to `cond_wait()` and `cond_timedwait()` do not release and re-  
3252 acquire the mutex if it has a lock count greater than one.

3253 Unless explicitly stated otherwise, if one of the functions named in this section returns an error,  
3254 it is unspecified whether the invocation causes memory to be synchronized.

3255 Applications can allow more than one thread of control to read a memory location  
3256 simultaneously.

3257 For purposes of determining the existence of a data race, all lock and unlock operations on a  
3258 particular synchronization object that synchronize memory shall behave as atomic operations,  
3259 and they shall occur in some particular total order (see [Section 4.15.1](#), on page 100).

## 3260 4.16 Pathname Resolution

3261 Pathname resolution is performed for a process to resolve a pathname to a particular directory  
3262 entry for a file in the file hierarchy. There may be multiple pathnames that resolve to the same  
3263 directory entry, and multiple directory entries for the same file. When a process resolves a  
3264 pathname of an existing directory entry, the entire pathname shall be resolved as described  
3265 below. When a process resolves a pathname of a directory entry that is to be created immediately  
3266 after the pathname is resolved, pathname resolution terminates when all components of the path  
3267 prefix of the last component have been resolved. It is then the responsibility of the process to  
3268 create the final component.

3269 Each filename in the pathname is located in the directory specified by its predecessor (for  
3270 example, in the pathname fragment **a/b**, file **b** is located in the directory specified by **a**).  
3271 Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a  
3272 `<slash>`, the predecessor of the first filename in the pathname shall be taken to be the root  
3273 directory of the process (such pathnames are referred to as “absolute pathnames”). If the  
3274 pathname does not begin with a `<slash>`, the predecessor of the first filename of the pathname  
3275 shall be taken to be either the current working directory of the process or for certain interfaces  
3276 the directory identified by a file descriptor passed to the interface (such pathnames are referred  
3277 to as “relative pathnames”).

3278 The interpretation of a pathname component is dependent on the value of `{NAME_MAX}` and  
3279 `_POSIX_NO_TRUNC` associated with the path prefix of that component. If any pathname  
3280 component is longer than `{NAME_MAX}`, the implementation shall consider this an error.

3281 A pathname that contains at least one non-`<slash>` character and that ends with one or more  
3282 trailing `<slash>` characters shall not be resolved successfully unless the last pathname  
3283 component before the trailing `<slash>` characters resolves (with symbolic links followed—see  
3284 below) to an existing directory or a directory entry that is to be created for a directory  
3285 immediately after the pathname is resolved. Interfaces using pathname resolution may specify  
3286 additional constraints<sup>7</sup> when a pathname that does not name an existing directory contains at  
3287 least one non-`<slash>` character and contains one or more trailing `<slash>` characters.

3288 If a symbolic link is encountered during pathname resolution, the behavior shall depend on  
3289 whether the pathname component is at the end of the pathname and on the function being  
3290 performed. If all of the following are true, then pathname resolution is complete:

---

3291 7. The only interfaces that further constrain pathnames in POSIX.1-2024 are the `rename()` and `renameat()` functions (see XSH [rename\(\)](#))  
3292 and the `mv` utility (see XCU [mv](#)).

- 3293 1. This is the last pathname component of the pathname.
- 3294 2. The pathname has no trailing `<slash>`.
- 3295 3. The function is required to act on the symbolic link itself, or certain arguments direct that
- 3296 the function act on the symbolic link itself.

3297 In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the  
3298 symbolic link, except that if the contents of the symbolic link is the empty string, then either  
3299 pathname resolution shall fail with functions reporting an [ENOENT] error and utilities writing  
3300 an equivalent diagnostic message, or the pathname of the directory containing the symbolic link  
3301 shall be used in place of the contents of the symbolic link. If the contents of the symbolic link  
3302 consist solely of `<slash>` characters, then all leading `<slash>` characters of the remaining  
3303 pathname shall be omitted from the resulting combined pathname, leaving only the leading  
3304 `<slash>` characters from the symbolic link contents. In the cases where prefixing occurs, if the  
3305 combined length exceeds {PATH\_MAX}, and the implementation considers this to be an error,  
3306 pathname resolution shall fail with functions reporting an [ENAMETOOLONG] error and  
3307 utilities writing an equivalent diagnostic message. Otherwise, the resolved pathname shall be  
3308 the resolution of the pathname just created. If the resulting pathname does not begin with a  
3309 `<slash>`, the predecessor of the first filename of the pathname is taken to be the directory  
3310 containing the symbolic link.

3311 If the system detects a loop in the pathname resolution process, pathname resolution shall fail  
3312 with functions reporting an [ELOOP] error and utilities writing an equivalent diagnostic  
3313 message. The same may happen if during the resolution process more symbolic links were  
3314 followed than the implementation allows. This implementation-defined limit shall not be  
3315 smaller than {SYMLOOP\_MAX}.

3316 The special filename dot shall refer to the directory specified by its predecessor. The special  
3317 filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case,  
3318 in the root directory, dot-dot may refer to the root directory itself.

3319 A pathname consisting of a single `<slash>` shall resolve to the root directory of the process. A  
3320 null pathname shall not be successfully resolved. If a pathname begins with two successive  
3321 `<slash>` characters, the first component following the leading `<slash>` characters may be  
3322 interpreted in an implementation-defined manner, although more than two leading `<slash>`  
3323 characters shall be treated as a single `<slash>` character.

3324 Pathname resolution for a given pathname shall yield the same results when used by any  
3325 interface in POSIX.1-2024 as long as there are no changes to any files evaluated during pathname  
3326 resolution for the given pathname between resolutions.

## 3327 4.17 Process ID Reuse

3328 A process group ID shall not be reused by the system until the process group lifetime ends.

3329 A process ID shall not be reused by the system until the process lifetime ends. In addition, if  
3330 there exists a process group whose process group ID is equal to that process ID, the process ID  
3331 shall not be reused by the system until the process group lifetime ends. A process that is not a  
3332 system process shall not have a process ID of 1.

## 3333 4.18 Scheduling Policy

3334 A scheduling policy affects process or thread ordering:

- 3335 • When a process or thread is a running thread and it becomes a blocked thread
- 3336 • When a process or thread is a running thread and it becomes a preempted thread
- 3337 • When a process or thread is a blocked thread and it becomes a runnable thread
- 3338 • When a running thread calls a function that can change the priority or scheduling policy of
- 3339 a process or thread
- 3340 • In other scheduling policy-defined circumstances

3341 Conforming implementations shall define the manner in which each of the scheduling policies  
 3342 may modify the priorities or otherwise affect the ordering of processes or threads at each of the  
 3343 occurrences listed above. Additionally, conforming implementations shall define in what other  
 3344 circumstances and in what manner each scheduling policy may modify the priorities or affect  
 3345 the ordering of processes or threads.

## 3346 4.19 Seconds Since the Epoch

3347 A value that approximates the number of seconds that have elapsed since the Epoch. A  
 3348 Coordinated Universal Time name (specified in terms of seconds (*tm\_sec*), minutes (*tm\_min*),  
 3349 hours (*tm\_hour*), days since January 1 of the year (*tm\_yday*), and calendar year minus 1900  
 3350 (*tm\_year*)) is related to a time represented as seconds since the Epoch, according to the  
 3351 expression below.

3352 If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and  
 3353 the value is non-negative, the value is related to a Coordinated Universal Time name according  
 3354 to the C-language expression, where *tm\_sec*, *tm\_min*, *tm\_hour*, *tm\_yday*, and *tm\_year* are all  
 3355 integer types:

$$\begin{aligned}
 &tm\_sec + tm\_min*60 + tm\_hour*3600 + tm\_yday*86400 + \\
 &\quad (tm\_year-70)*31536000 + ((tm\_year-69)/4)*86400 - \\
 &\quad ((tm\_year-1)/100)*86400 + ((tm\_year+299)/400)*86400
 \end{aligned}$$

3359 The relationship between the actual date and time in Coordinated Universal Time, as  
 3360 determined by the International Earth Rotation Service, and the system's current value for  
 3361 seconds since the Epoch is unspecified.

3362 How any changes to the value of seconds since the Epoch are made to align to a desired  
 3363 relationship with the current actual time is implementation-defined. As represented in seconds  
 3364 since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

3365 **Note:** The last three terms of the expression add in a day for each year that follows a leap year starting  
 3366 with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973,  
 3367 the second subtracts a day back out every 100 years starting in 2001, and the third adds a day  
 3368 back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that  
 3369 is, the remainder is discarded leaving only the integer quotient.

## 3370 4.20 Semaphore

3371 A minimum synchronization primitive to serve as a basis for more complex synchronization  
3372 mechanisms to be defined by the application program.

3373 For the mandatory semaphores (those not associated with the X/Open System Interfaces (XSI)  
3374 option), a semaphore is represented as a shareable resource that has a non-negative integer  
3375 value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability  
3376 of the semaphore.

3377 For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is  
3378 an integer with minimum value 0 and an implementation-defined maximum value which shall  
3379 be at least 32767. The *semget()* function can be called to create a set or array of semaphores. A  
3380 semaphore set can contain one or more semaphores up to an implementation-defined value.

### 3381 Semaphore Lock Operation

3382 An operation that is applied to a semaphore. If, prior to the operation, the value of the  
3383 semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and  
3384 added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

### 3385 Semaphore Unlock Operation

3386 An operation that is applied to a semaphore. If, prior to the operation, there are any threads in  
3387 the set of threads awaiting the semaphore, then some thread from that set shall be removed from  
3388 the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

## 3389 4.21 Special Device Drivers

3390 Some devices require control operations, other than the operations that are common to most  
3391 devices (such as *read()*, *write()*, *open()*, and *close()*), but because the device belongs to a class that  
3392 is not present in the majority of systems, standardization of a device-specific application  
3393 program interface (API) for controlling it has not been practical. The driver for such a device  
3394 may respond to the *write()* function to transfer data to the device or the *read()* function to collect  
3395 information from the device. The interpretation of the information is defined by the  
3396 implementor of the driver.

3397 The term *special device* refers to hardware, or an object that appears to the application as such;  
3398 access to the driver for this hardware uses the file abstraction *character special file*.  
3399 Implementations supporting the Device Control option shall provide the means to integrate a  
3400 device driver into the system. The means available to integrate drivers into the system and the  
3401 way character special files that refer to them are created are implementation defined. Character  
3402 special files that have no structure defined by this standard can be accessed using the  
3403 *posix\_devctl()* function defined in the System Interfaces volume of POSIX.1-2024.

## 3404 4.22 Thread-Safety

3405 Refer to XSH [Section 2.9](#) (on page 537).

## 3406 4.23 Treatment of Error Conditions for Mathematical Functions

3407 For all the functions in the `<math.h>` header, an application wishing to check for error situations  
3408 should set `errno` to 0 and call `feclearexcept(FE_ALL_EXCEPT)` before calling the function. On  
3409 return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW |`  
3410 `FE_UNDERFLOW)` is non-zero, an error has occurred.

3411 On implementations that support the IEC 60559 Floating-Point option, whether or when  
3412 functions in the `<math.h>` header raise an undeserved underflow floating-point exception is  
3413 unspecified. Otherwise, as implied by XSH `feraiseexcept()`, the `<math.h>` functions do not raise  
3414 spurious floating-point exceptions (detectable by the user), other than the inexact floating-point  
3415 exception.

3416 The error conditions defined for all functions in the `<math.h>` header are domain, pole and  
3417 range errors, described below. If a domain, pole, or range error occurs and the integer expression  
3418 `(math_errhandling & MATH_ERRNO)` is zero, then `errno` shall either be set to the value  
3419 corresponding to the error, as specified below, or be left unmodified. If no such error occurs,  
3420 `errno` shall be left unmodified regardless of the setting of `math_errhandling`.

### 3421 4.23.1 Domain Error

3422 A “domain error” shall occur if an input argument is outside the domain over which the  
3423 mathematical function is defined. The description of each function lists any required domain  
3424 errors; an implementation may define additional domain errors, provided that such errors are  
3425 consistent with the mathematical definition of the function.

3426 On a domain error, the function shall return an implementation-defined value; if the integer  
3427 expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [EDOM]; if  
3428 the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “invalid”  
3429 floating-point exception shall be raised.

### 3430 4.23.2 Pole Error

3431 A “pole error” shall occur if the mathematical result of the function has an exact infinite result as  
3432 the finite input argument(s) are approached in the limit (for example, `log(0.0)`). The  
3433 description of each function lists any required pole errors; an implementation may define  
3434 additional pole errors, provided that such errors are consistent with the mathematical definition  
3435 of the function.

3436 On a pole error, the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or  
3437 `HUGE_VALL` according to the return type, with the same sign as the correct value of the  
3438 function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall  
3439 be set to [ERANGE]; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-  
3440 zero, the “divide-by-zero” floating-point exception shall be raised.

3441 **4.23.3 Range Error**

3442 A “range error” shall occur if the finite mathematical result of the function cannot be  
 3443 represented in an object of the specified type, due to extreme magnitude. The description of  
 3444 each function lists any required range errors; an implementation may define additional range  
 3445 errors, provided that such errors are consistent with the mathematical definition of the function  
 3446 and are the result of either overflow or underflow.

3447 **4.23.3.1 Result Overflows**

3448 A floating result overflows if the magnitude of the mathematical result is finite but so large that  
 3449 the mathematical result cannot be represented without extraordinary roundoff error in an object  
 3450 of the specified type. If a floating result overflows and default rounding is in effect, then the  
 3451 function shall return the value of the macro HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL  
 3452 according to the return type, with the same sign as the correct value of the function; if the integer  
 3453 expression (math\_errhandling & MATH\_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if  
 3454 the integer expression (math\_errhandling & MATH\_ERREXCEPT) is non-zero, the “overflow”  
 3455 floating-point exception shall be raised.

3456 **4.23.3.2 Result Underflows**

3457 The result underflows if the magnitude of the mathematical result is so small that the  
 3458 mathematical result cannot be represented, without extraordinary roundoff error, in an object of  
 3459 the specified type. If the result underflows, the function shall return an implementation-defined  
 3460 value whose magnitude is no greater than the smallest normalized positive number in the  
 3461 specified type; if the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
 3462 whether *errno* is set to [ERANGE] is implementation-defined; if the integer expression  
 3463 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, whether the “underflow” floating-point  
 3464 exception is raised is implementation-defined.

3465 **4.24 Treatment of NaN Arguments for the Mathematical Functions**

3466 For functions called with a NaN argument, no errors shall occur and a NaN shall be returned,  
 3467 except where stated otherwise.

3468 If a function with one or more NaN arguments returns a NaN result, the result should be the  
 3469 same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

3470 On implementations that support the IEC 60559:1989 standard floating point, functions with  
 3471 signaling NaN argument(s) shall be treated as if the function were called with an argument that  
 3472 is a required domain error and shall return a quiet NaN result, except where stated otherwise.

3473 **Note:** The function might never see the signaling NaN, since it might trigger when the arguments are  
 3474 evaluated during the function call.

3475 On implementations that support the IEC 60559:1989 standard floating point, for those  
 3476 functions that do not have a documented domain error, the following shall apply:

3477 These functions shall fail if:

3478 Domain Error Any argument is a signaling NaN.

3479 Either, the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero and *errno*  
 3480 shall be set to [EDOM], or the integer expression (math\_errhandling &  
 3481 MATH\_ERREXCEPT) is non-zero and the invalid floating-point exception shall be raised.

## 3482 4.25 Utility

3483 A utility program shall be either an executable file, such as might be produced by a compiler or  
3484 linker system from computer source code, or a file of shell source code, directly interpreted by  
3485 the shell. The program may have been produced by the user, provided by the system  
3486 implementor, or acquired from an independent distributor.

3487 The system may implement certain utilities as shell functions (see XCU [Section 2.9.5](#), on page  
3488 2511) or built-in utilities, but only an application that is aware of the command search order (as  
3489 described in XCU [Section 2.9.1.4](#), on page 2502) or of performance characteristics can discern  
3490 differences between the behavior of such a function or built-in utility and that of an executable  
3491 file.

## 3492 4.26 Variable Assignment

3493 In the shell command language, a word consisting of the following parts:

3494 *varname=value*

3495 When used in a context where assignment is defined to occur and at no other time, the *value*  
3496 (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.  
3497 Assignment context occurs in the *cmd\_prefix* portion of a shell simple command, as well as in  
3498 arguments of a recognized declaration utility.

3499 **Note:** For further information, see XCU [Section 2.9.1](#) (on page 2500).

3500 The *varname* and *value* parts shall meet the requirements for a name and a word, respectively,  
3501 except that they are delimited by the embedded unquoted <equals-sign>, in addition to other  
3502 delimiters.

3503 **Note:** Additional delimiters are described in XCU [Section 2.3](#) (on page 2475).

3504 When a variable assignment is done, the variable shall be created if it did not already exist. If  
3505 *value* is not specified, the variable shall be given a null value.

3506 **Note:** An alternative form of variable assignment:

3507 *symbol=value*

3508 (where *symbol* is a valid word delimited by an <equals-sign>, but not a valid name) produces  
3509 unspecified results. The form *symbol=value* is used by the KornShell *name[expression]=value*  
3510 syntax.

## File Format Notation

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of POSIX.1-2024 `printf()` function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of POSIX.1-2024 `scanf()` function to read the input file.

The description of an individual record is as follows:

```
"<format>", [<arg1>, <arg2>, ..., <argn>]
```

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not “escape sequences” or “conversion specifications”, as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters and the escape character (<backslash>).
3. *Conversion Specifications* specify the output format of each argument; see below.

The following characters have the following special meaning in the format string:

' ' (An empty character position.) Represents one or more <blank> characters from the portable character set.

Δ Represents exactly one <space> character.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

3532

**Table 5-1** Escape Sequences and Associated Actions

3536

3537

3538

3539

3540

3541

3542

3543

3544

3545

3546

3547

3548

Escape Sequence	Represents Character	Terminal Action
\\	<backslash>	Print the <backslash> character.
\a	<alert>	Attempt to alert the user through audible or visible notification.
\b	<backspace>	Move the printing position to one column before the current position, unless the current position is the start of a line.
\f	<form-feed>	Move the printing position to the initial printing position of the next logical page.
\n	<newline>	Move the printing position to the start of the next line.
\r	<carriage-return>	Move the printing position to the start of the current line.
\t	<tab>	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
\v	<vertical-tab>	Move the printing position to the start of the next <vertical-tab> position. If there are no more <vertical-tab> positions left on the page, the behavior is undefined.

3549 Each conversion specification is introduced by the <percent-sign> character ('%'). After the  
3550 character '%', the following shall appear in sequence:

3551 *flags* Zero or more *flags*, in any order, that modify the meaning of the conversion  
3552 specification.

3553 *field width* An optional string of decimal digits to specify a minimum field width. For an  
3554 output field, if the converted value has fewer bytes than the field width, it shall be  
3555 padded on the left (or right, if the left-adjustment flag ('-'), described below, has  
3556 been given) to the field width.

3557 *precision* Gives the minimum number of digits to appear for the *d*, *o*, *i*, *u*, *x*, or *X* conversion  
3558 specifiers (the field is padded with leading zeros), the number of digits to appear  
3559 after the radix character for the *e* and *f* conversion specifiers, the maximum  
3560 number of significant digits for the *g* conversion specifier; or the maximum  
3561 number of bytes to be written from a string in the *s* conversion specifier. The  
3562 precision shall take the form of a <period> ('.') followed by a decimal digit  
3563 string; a null digit string is treated as zero.

3564 *conversion specifier characters*  
3565 A conversion specifier character (see below) that indicates the type of conversion  
3566 to be applied.

3567 The *flag* characters and their meanings are:

3568 - The result of the conversion shall be left-justified within the field.

3569 + The result of a signed conversion shall always begin with a sign ('+' or '-').

3570 <space> If the first character of a signed conversion is not a sign, a <space> shall be  
3571 prefixed to the result. This means that if the <space> and '+' flags both appear,  
3572 the <space> flag shall be ignored.

3573 # The value shall be converted to an alternative form. For *c*, *d*, *i*, *u*, and *s*  
3574 conversion specifiers, the behavior is undefined. For the *o* conversion specifier, it  
3575 shall increase the precision to force the first digit of the result to be a zero. For *x* or  
3576 *X* conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively.  
3577 For *a*, *A*, *e*, *E*, *f*, *F*, *g*, and *G* conversion specifiers, the result shall always contain a  
3578 radix character, even if no digits follow the radix character. For *g* and *G* conversion  
3579 specifiers, trailing zeros shall not be removed from the result as they usually are.

3580 0 For *a*, *A*, *d*, *e*, *E*, *f*, *F*, *g*, *G*, *i*, *o*, *u*, *x*, and *X* conversion specifiers, leading zeros  
3581 (following any indication of sign or base) shall be used to pad to the field width  
3582 rather than performing space padding, except when converting an infinity or NaN.  
3583 If the '0' and '-' flags both appear, the '0' flag shall be ignored. For *d*, *i*, *o*, *u*,  
3584 *x*, and *X* conversion specifiers, if a precision is specified, the '0' flag shall be  
3585 ignored. For other conversion specifiers, the behavior is undefined.

3586 Each conversion specifier character shall result in fetching zero or more arguments. The results  
3587 are undefined if there are insufficient arguments for the format. If the format is exhausted while  
3588 arguments remain, the excess arguments shall be ignored.

3589 The conversion specifiers and their meanings are:

3590 *a,A* The floating-point number argument representing a floating-point number shall be  
3591 converted in the style "[−]0xh.hhhhp±d", where there is one hexadecimal digit  
3592 (which shall be non-zero if the argument is a normalized floating-point number  
3593 and is otherwise unspecified) before the decimal-point character and the number  
3594 of hexadecimal digits after it is equal to the precision; if the precision is missing

3595		and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact
3596		representation of the value; if the precision is missing and FLT_RADIX is not a
3597		power of 2, then the precision shall be sufficient to distinguish different floating-
3598		point values in the internal representation used by the utility, except that trailing
3599		zeros may be omitted; if the precision is zero and the # flag is not specified, no
3600		decimal-point character shall appear. The letters "abcdef" shall be used for a
3601		conversion and the letters "ABCDEF" for A conversion. The A conversion specifier
3602		produces a number with X and P instead of x and p. The exponent shall always
3603		contain at least one digit, and only as many more digits as necessary to represent
3604		the decimal exponent of 2. If the value is zero, the exponent shall be zero. A
3605		floating-point number argument representing an infinity or NaN shall be
3606		converted in the style of an f or F conversion specifier.
3607	d,i,o,u,x,X	The integer argument shall be written as signed decimal (d or i), unsigned octal
3608		(o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and
3609		i specifiers shall convert to signed decimal in the style "[−]ddd". The x
3610		conversion specifier shall use the numbers and letters "0123456789abcdef" and
3611		the X conversion specifier shall use the numbers and letters
3612		"0123456789ABCDEF". The <i>precision</i> component of the argument shall specify
3613		the minimum number of digits to appear. If the value being converted can be
3614		represented in fewer digits than the specified minimum, it shall be expanded with
3615		leading zeros. The default precision shall be 1. The result of converting a zero
3616		value with a precision of 0 shall be no characters. If both the field width and
3617		precision are omitted, the implementation may precede, follow, or precede and
3618		follow numeric arguments of types d, i, and u with <blank> characters from the
3619		portable character set; arguments of type o (octal) may be preceded with leading
3620		zeros.
3621	f,F	The floating-point number argument shall be written in decimal notation in the
3622		style [−]ddd.ddd, where the number of digits after the radix character (shown here
3623		as a decimal point) shall be equal to the <i>precision</i> specification. The LC_NUMERIC
3624		locale category shall determine the radix character to use in this format. If the
3625		<i>precision</i> is omitted from the argument, six digits shall be written after the radix
3626		character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3627		A floating-point number argument representing an infinity shall be converted in
3628		one of the styles "[−]inf" or "[−]infinity"; which style is implementation-
3629		defined. A floating-point number argument representing a NaN shall be converted
3630		in one of the styles "[−]nan( <i>n-char-sequence</i> )" or "[−]nan"; which style,
3631		and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F
3632		conversion specifier produces "INF", "INFINITY", or "NaN" instead of "inf",
3633		"infinity", or "nan", respectively.
3634	e,E	The floating-point number argument shall be written in the style [−]d.ddde±dd (the
3635		symbol '±' indicates either a <plus-sign> or <hyphen-minus>), where there is one
3636		digit before the radix character (shown here as a decimal point) and the number of
3637		digits after it is equal to the precision. The LC_NUMERIC locale category shall
3638		determine the radix character to use in this format. When the precision is missing,
3639		six digits shall be written after the radix character; if the precision is 0, no radix
3640		character shall appear. The E conversion specifier shall produce a number with E
3641		instead of e introducing the exponent. The exponent shall always contain at least
3642		two digits. However, if the value to be written requires an exponent greater than
3643		two digits, additional exponent digits shall be written as necessary.
3644		A floating-point number argument representing an infinity or NaN shall be

3645		converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
3646	<code>g,G</code>	The floating-point number argument shall be written in style <code>f</code> or <code>e</code> (or in style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style <code>e</code> (or <code>E</code> ) shall be used only if the exponent resulting from the conversion is less than $-4$ or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.
3648		
3649		
3650		
3651		
3652		A floating-point number argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
3653		
3654	<code>c</code>	The single-byte character argument shall be written.
3655	<code>s</code>	The argument shall be taken to be a string and bytes from the string shall be written until the end of the string or the number of bytes indicated by the <i>precision</i> specification of the argument is reached. If the precision is omitted from the argument, it shall be taken to be infinite, so all bytes up to the end of the string shall be written.
3656		
3657		
3658		
3659		
3660	<code>%</code>	Write a <code>'%'</code> character; no argument shall be converted. Applications using the <i>printf</i> utility shall ensure that the complete conversion specification is <code>%%</code> .
3661		
3662		In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term “field width” should not be confused with the term “precision” used in the description of <code>%s</code> .
3663		
3664		
3665		

### Examples

3666		
3667		To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where <i>weekday</i> and <i>month</i> are strings:
3668		
3669		<code>"%s, Δ%sΔ%d, Δ%d: %.2d\n" &lt;weekday&gt;, &lt;month&gt;, &lt;day&gt;, &lt;hour&gt;, &lt;min&gt;</code>
3670		To show <code>'π'</code> written to 5 decimal places:
3671		<code>"piΔ=Δ%.5f\n", &lt;value of π&gt;</code>
3672		To show an input file format consisting of five <code>&lt;colon&gt;</code> -separated fields:
3673		<code>"%s:%s:%s:%s:%s\n", &lt;arg1&gt;, &lt;arg2&gt;, &lt;arg3&gt;, &lt;arg4&gt;, &lt;arg5&gt;</code>

# Character Set

## 6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of POSIX.1-2024. The first eight entries in Table 6-1 and all characters in Table 6-2 (on page 122) are defined in the ISO/IEC 6429:1992 standard. The rest of the characters in Table 6-1 are defined in the ISO/IEC 10646:2020 standard.

3785	<z>	z	<U007A>	LATIN SMALL LETTER Z
3786	<left-brace>, <left-curly-bracket>	{	<U007B>	LEFT CURLY BRACKET
3787	<vertical-line>		<U007C>	VERTICAL LINE
3788	<right-brace>, <right-curly-bracket>	}	<U007D>	RIGHT CURLY BRACKET
3789	<tilde>	~	<U007E>	TILDE

3790 POSIX.1-2024 uses character names other than the above, but only in an informative way; for  
 3791 example, in examples to illustrate the use of characters beyond the portable character set with  
 3792 the facilities of POSIX.1-2024.

3793 [Table 6-1](#) (on page 117) defines the characters in the portable character set and the corresponding  
 3794 symbolic character names used to identify each character in a character set description file.  
 3795 Characters defined in [Table 6-2](#) (on page 122) may also be used in character set description files.

3796 POSIX.1-2024 places only the following requirements on the encoded values of the characters in  
 3797 the portable character set:

- 3798 • If the encoded values associated with each member of the portable character set are not  
 3799 invariant across all locales supported by the implementation, if an application uses any  
 3800 pair of locales where the character encodings differ, or accesses data from an application  
 3801 using a locale which has different encodings from the locales used by the application, the  
 3802 results are unspecified.
- 3803 • The encoded values associated with the digits 0 to 9 shall be such that the value of each  
 3804 character after 0 shall be one greater than the value of the previous character.
- 3805 • A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- 3806 • The encoded values associated with <period>, <slash>, <newline>, and <carriage-return>  
 3807 shall be invariant across all locales supported by the implementation.
- 3808 • The encoded values associated with the members of the portable character set are each  
 3809 represented in a single byte. Moreover, if the value is stored in an object of C-language  
 3810 type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

3811 Conforming implementations shall support certain character and character set attributes, as  
 3812 defined in [Section 7.2](#) (on page 128).

## 3813 6.2 Character Encoding

3814 The POSIX locale shall contain 256 single-byte characters including the characters in [Table 6-1](#)  
3815 (on page 117) and [Table 6-2](#) (on page 122), which have the properties listed in [Section 7.3.1](#) (on  
3816 page 131). It is unspecified whether characters not listed in those two tables are classified as  
3817 **punct** or **cntrl**, or neither. Other locales shall contain the characters in [Table 6-1](#) (on page 117)  
3818 and may contain any or all of the control characters identified in [Table 6-2](#) (on page 122); the  
3819 presence, meaning, and representation of any additional characters are locale-specific.

3820 In locales other than the POSIX locale, a character may have a state-dependent encoding. There  
3821 are two types of these encodings:

- 3822 • A single-shift encoding (where each character not in the initial shift state is preceded by a  
3823 shift code) can be defined if each shift-code and character sequence is considered a multi-  
3824 byte character. This is done using the concatenated-constant format in a character set  
3825 description file, as described in [Section 6.4](#) (on page 121). If the implementation supports a  
3826 character encoding of this type, all of the standard utilities in the Shell and Utilities volume  
3827 of POSIX.1-2024 shall support it. Use of a single-shift encoding with any of the functions in  
3828 the System Interfaces volume of POSIX.1-2024 that do not specifically mention the effects  
3829 of state-dependent encoding is implementation-defined.
- 3830 • A locking-shift encoding (where the state of the character is determined by a shift code  
3831 that may affect more than the single character following it) cannot be defined with the  
3832 current character set description file format. Use of a locking-shift encoding with any of  
3833 the standard utilities in the Shell and Utilities volume of POSIX.1-2024 or with any of the  
3834 functions in the System Interfaces volume of POSIX.1-2024 that do not specifically mention  
3835 the effects of state-dependent encoding is implementation-defined.

3836 While in the initial shift state, all characters in the portable character set shall retain their usual  
3837 interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the  
3838 sequence shall be a function of the current shift state. A byte with all bits zero shall be  
3839 interpreted as the null character independent of shift state. Such a byte shall not occur as part of  
3840 any other character. Likewise, the byte values used to encode <period>, <slash>, <newline>, and  
3841 <carriage-return> shall not occur as part of any other character in any locale.

3842 The maximum allowable number of bytes in a character in the current locale shall be indicated  
3843 by {MB\_CUR\_MAX}, defined in the `<stdlib.h>` header and by the `<mb_cur_max>` value in a  
3844 character set description file; see [Section 6.4](#) (on page 121). The implementation's maximum  
3845 number of bytes in a character shall be defined by the C-language macro {MB\_LEN\_MAX}.

## 3846 6.3 C Language Wide-Character Codes

3847 In the shell, the standard utilities are written so that the encodings of characters are described by  
3848 the locale's `LC_CTYPE` definition (see [Section 7.3.1](#), on page 131) and there is no differentiation  
3849 between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C  
3850 language, a differentiation is made. To ease the handling of variable length characters, the C  
3851 language has introduced the concept of wide-character codes.

3852 All wide-character codes in a given process consist of an equal number of bits. This is in contrast  
3853 to characters, which can consist of a variable number of bytes. The byte or byte sequence that  
3854 represents a character can also be represented as a wide-character code. Wide-character codes  
3855 thus provide a uniform size for manipulating text data. A wide-character code having all bits  
3856 zero is the null wide-character code (see [Section 3.233](#), on page 65), and terminates wide-  
3857 character strings (see [Section 3.417](#), on page 93). The wide-character value for each member of  
3858 the portable character set shall equal its value when used as the lone character in an integer

3859 character constant. Wide-character codes for other characters are locale and implementation-  
3860 defined. State shift bytes shall not have a wide-character code representation. POSIX.1-2024  
3861 provides no means of defining a wide-character codeset.

3862 Arguments to the functions declared in the `<wchar.h>` header can point to arrays containing  
3863 `wchar_t` values that do not correspond to valid wide character codes according to the `LC_CTYPE`  
3864 category of the locale being used. Such values shall be processed according to the specified  
3865 semantics for the function in the System Interfaces volume of POSIX.1-2024, except that it is  
3866 unspecified whether an encoding error occurs if such a value appears in the format string of a  
3867 function that has a format string as a parameter and the specified semantics do not require that  
3868 value to be processed as if by `wcrtomb()`.

## 3869 6.4 Character Set Description File

3870 Implementations shall provide a character set description file for at least one coded character set  
3871 supported by the implementation. These files are referred to elsewhere in POSIX.1-2024 as  
3872 *charmap* files. It is implementation-defined whether or not users or applications can provide  
3873 additional character set description files.

3874 POSIX.1-2024 does not require that multiple character sets or codesets be supported. Although  
3875 multiple charmap files are supported, it is the responsibility of the implementation to provide  
3876 the file or files; if only one is provided, only that one is accessible using the *localedef* utility's `-f`  
3877 option.

3878 Each character set description file, except those that use the ISO/IEC 10646:2020 standard  
3879 position values as the encoding values, shall define characteristics for the coded character set  
3880 and the encoding for the characters specified in [Table 6-1](#) (on page 117), and may define  
3881 encoding for additional characters supported by the implementation. Other information about  
3882 the coded character set may also be in the file. Coded character set character values shall be  
3883 defined using symbolic character names followed by character encoding values.

3884 Each symbolic name specified in [Table 6-1](#) (on page 117) shall be included in the file. Each  
3885 character in [Table 6-1](#) (on page 117) (each row in the table) shall be mapped to a unique coding  
3886 value. For each character in [Table 6-2](#) (on page 122) that exists in the character set described by  
3887 the file, the character's symbolic name(s) from [Table 6-2](#) (on page 122) and the character's single-  
3888 byte encoding value shall be included in the file.

3889

Table 6-2 Non-Portable Control Characters

	Symbolic Name(s)	UCS	Description
3890	<SOH>	<U0001>	START OF HEADING
3891	<STX>	<U0002>	START OF TEXT
3892	<ETX>	<U0003>	END OF TEXT
3893	<EOT>	<U0004>	END OF TRANSMISSION
3894	<ENQ>	<U0005>	ENQUIRY
3895	<ACK>	<U0006>	ACKNOWLEDGE
3896	<SO>	<U000E>	SHIFT OUT
3897	<SI>	<U000F>	SHIFT IN
3898	<DLE>	<U0010>	DATA LINK ESCAPE
3899	<DC1>	<U0011>	DEVICE CONTROL ONE
3900	<DC2>	<U0012>	DEVICE CONTROL TWO
3901	<DC3>	<U0013>	DEVICE CONTROL THREE
3902	<DC4>	<U0014>	DEVICE CONTROL FOUR
3903	<NAK>	<U0015>	NEGATIVE ACKNOWLEDGE
3904	<SYN>	<U0016>	SYNCHRONOUS IDLE
3905	<ETB>	<U0017>	END OF TRANSMISSION BLOCK
3906	<CAN>	<U0018>	CANCEL
3907	<EM>	<U0019>	END OF MEDIUM
3908	<SUB>	<U001A>	SUBSTITUTE
3909	<ESC>	<U001B>	ESCAPE
3910	<IS4>, <FS>	<U001C>	INFORMATION SEPARATOR FOUR
3911	<IS3>, <GS>	<U001D>	INFORMATION SEPARATOR THREE
3912	<IS2>, <RS>	<U001E>	INFORMATION SEPARATOR TWO
3913	<IS1>, <US>	<U001F>	INFORMATION SEPARATOR ONE
3914	<DEL>	<U007F>	DELETE
3915			

3916 The following declarations can precede the character definitions. Each shall consist of the  
 3917 symbol shown in the following list, starting in column 1, including the surrounding brackets,  
 3918 followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

3919 **<code\_set\_name>** The name of the coded character set for which the character set  
 3920 description file is defined. The characters of the name shall be taken from  
 3921 the set of characters with visible glyphs defined in Table 6-1 (on page 117).

3922 **<mb\_cur\_max>** The maximum number of bytes in a multi-byte character. This shall  
 3923 default to 1.

3924 **<mb\_cur\_min>** An unsigned positive integer value that defines the minimum number of  
 3925 XSI bytes in a character for the encoded character set. On XSI-conformant  
 3926 systems, <mb\_cur\_min> shall always be 1.

3927 **<escape\_char>** The character used to indicate that the characters following shall be  
 3928 interpreted in a special way, as defined later in this section. This shall  
 3929 default to <backslash> ('\\'), which is the character used in all the  
 3930 following text and examples, unless otherwise noted.

3931 **<comment\_char>** The character that, when placed in column 1 of a charmap line, is used to  
 3932 indicate that the line shall be ignored. The default character shall be the  
 3933 <number-sign> ('#').

3934 The character set mapping definitions shall be all the lines immediately following an identifier  
 3935 line containing the string "CHARMAP" starting in column 1, and preceding a trailer line

3936 containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a  
 3937 **<comment\_char>** in the first column shall be ignored. Each non-comment line of the character  
 3938 set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file)  
 3939 shall be in either of two forms:

3940 "%s %s %s\n", <symbolic-name>, <encoding>, <comments>

3941 or:

3942 "%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,  
 3943 <encoding>, <comments>

3944 In the first format, the line in the character set mapping definition shall define a single symbolic  
 3945 name and a corresponding encoding. A symbolic name is one or more characters from the set  
 3946 shown with visible glyphs in [Table 6-1](#) (on page 117), enclosed between angle brackets. A  
 3947 character following an escape character is interpreted as itself; for example, the sequence  
 3948 "<\\>" represents the symbolic name "\" enclosed between angle brackets.

3949 In the second format, the line in the character set mapping definition shall define a range of one  
 3950 or more symbolic names. In this form, the symbolic names shall consist of zero or more non-  
 3951 numeric characters from the set shown with visible glyphs in [Table 6-1](#) (on page 117), followed  
 3952 by an integer formed by one or more decimal digits. Both integers shall contain the same  
 3953 number of digits. The characters preceding the integer shall be identical in the two symbolic  
 3954 names, and the integer formed by the digits in the second symbolic name shall be equal to or  
 3955 greater than the integer formed by the digits in the first name. This shall be interpreted as a  
 3956 series of symbolic names formed from the common part and each of the integers between the  
 3957 first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the  
 3958 symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

3959 A character set mapping definition line shall exist for all symbolic names specified in [Table 6-1](#)  
 3960 (on page 117), and shall define the coded character value that corresponds to the character  
 3961 indicated in the table, or the coded character value that corresponds to the control character  
 3962 symbolic name. If the control characters commonly associated with the symbolic names in [Table](#)  
 3963 [6-2](#) (on page 122) are supported by the implementation, the symbolic name and the  
 3964 corresponding encoding value shall be included in the file. Additional unique symbolic names  
 3965 may be included. A coded character value can be represented by more than one symbolic name.

3966 The encoding part is expressed as one (for single-byte character values) or more concatenated  
 3967 decimal, octal, or hexadecimal constants in the following formats:

3968 "%cd%u", <escape\_char>, <decimal byte value>

3969 "%cx%x", <escape\_char>, <hexadecimal byte value>

3970 "%c%o", <escape\_char>, <octal byte value>

3971 Decimal constants shall be represented by two or three decimal digits, preceded by the escape  
 3972 character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143".  
 3973 Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape  
 3974 character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal  
 3975 constants shall be represented by two or three octal digits, preceded by the escape character; for  
 3976 example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an  
 3977 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the  
 3978 same type, and interpreted in sequence from first to last with the first byte of the multi-  
 3979 byte character specified by the first byte in the sequence. The manner in which these constants  
 3980 are represented in the character stored in the system is implementation-defined. (This notation  
 3981 was chosen for reasons of portability. There is no requirement that the internal representation in  
 3982 the computer memory be in this same order.) Omitting bytes from a multi-byte character  
 3983 definition produces undefined results.

3984 In lines defining ranges of symbolic names, the encoded value shall be the value for the first  
 3985 symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic  
 3986 names defined by the range shall have encoding values in increasing order. Bytes shall be  
 3987 treated as unsigned octets, and carry shall be propagated between the bytes as necessary to  
 3988 represent the range. However, because this causes a null byte in the second or subsequent bytes  
 3989 of a character, such a declaration should not be specified. For example, the line:

```
3990 <j0101>...<j0104> \d129\d254
```

3991 is interpreted as:

```
3992 <j0101>          \d129\d254
3993 <j0102>          \d129\d255
3994 <j0103>          \d130\d00
3995 <j0104>          \d130\d01
```

3996 The expanded declaration of the symbol <j0103> in the above example is an invalid  
 3997 specification, because it contains a null byte in the second byte of a character.

3998 The comment is optional.

3999 POSIX.1-2024 provides no means of defining a wide-character codeset.

4000 The following declarations can follow the character set mapping definitions (after the "END  
 4001 CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in  
 4002 column 1, followed by the value(s) to be associated to the keyword, as defined below.

4003 **WIDTH** A non-negative integer value defining the column width (see [Section 3.75](#), on page  
 4004 42) for the printable characters in the coded character set specified in [Table 6-1](#) (on  
 4005 page 117) and [Table 6-2](#) (on page 122). Coded character set character values shall  
 4006 be defined using symbolic character names followed by column width values.  
 4007 Defining a character with more than one **WIDTH** produces undefined results. The  
 4008 **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions.  
 4009 Specifying the width of a non-printable character in a **WIDTH** declaration  
 4010 produces undefined results.

4011 **WIDTH\_DEFAULT**

4012 A non-negative integer value defining the default column width for any printable  
 4013 character not listed by one of the **WIDTH** keywords. If no **WIDTH\_DEFAULT**  
 4014 keyword is included in the charmap, the default character width shall be 1.

### 4015 Example

4016 After the "END CHARMAP" statement, a syntax for a width definition would be:

```
4017 WIDTH
4018 <A> 1
4019 <B> 1
4020 <C>...<Z> 1
4021 ...
4022 <fool>...<foon> 2
4023 ...
4024 END WIDTH
```

4025 In this example, the numerical code point values represented by the symbols <A> and <B> are  
 4026 assigned a width of 1. The code point values <C> to <Z> inclusive (<C>, <D>, <E>, and so on)  
 4027 are also assigned a width of 1. Using <A>...<Z> would have required fewer lines, but the  
 4028 alternative was shown to demonstrate flexibility. The keyword **WIDTH\_DEFAULT** could have

4029           been added as appropriate.

#### 4030 **6.4.1 State-Dependent Character Encodings**

4031           This section addresses the use of state-dependent character encodings (that is, those in which the  
4032           encoding of a character is dependent on one or more shift codes that may precede it).

4033           A single-shift encoding (where each character not in the initial shift state is preceded by a shift  
4034           code) can be defined in the charmap format if each shift-code/character sequence is considered  
4035           a multi-byte character, defined using the concatenated-constant format described in [Section 6.4](#)  
4036           (on page 121). If the implementation supports a character encoding of this type, all of the  
4037           standard utilities shall support it. A locking-shift encoding (where the state of the character is  
4038           determined by a shift code that may affect more than the single character following it) could be  
4039           defined with an extension to the charmap format described in [Section 6.4](#) (on page 121).

4040           If the implementation supports a character encoding of this type, any of the standard utilities  
4041           that describe character (*versus* byte) or text-file manipulation shall have the following  
4042           characteristics:

- 4043           1. The utility shall process the statefully encoded data as a concatenation of state-  
4044           independent characters. The presence of redundant locking shifts shall not affect the  
4045           comparison of two statefully encoded strings.
- 4046           2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall  
4047           produce output that contains locking shifts at the beginning or end of the resulting data,  
4048           if appropriate, to retain correct state information.

# Locale

## 4051 7.1 General

4052 A locale is the definition of the subset of a user's environment that depends on language and  
 4053 cultural conventions. It is made up from one or more categories. Each category is identified by  
 4054 its name and controls specific aspects of the behavior of components of the system. Category  
 4055 names correspond to the following environment variable names:

4056 *LC\_CTYPE* Character classification and case conversion.

4057 *LC\_COLLATE* Collation order.

4058 *LC\_MONETARY* Monetary formatting.

4059 *LC\_NUMERIC* Numeric, non-monetary formatting.

4060 *LC\_TIME* Date and time formats.

4061 *LC\_MESSAGES* Formats of informative and diagnostic messages and interactive responses.

4062 The standard utilities in the Shell and Utilities volume of POSIX.1-2024 shall base their behavior  
 4063 on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility.  
 4064 The behavior of some of the C-language functions defined in the System Interfaces volume of  
 4065 POSIX.1-2024 shall also be modified based on a locale selection. The locale to be used by these  
 4066 functions can be selected in the following ways:

- 4067 1. For functions such as *isalnum\_l()* that take a locale object as an argument, a locale object  
 4068 can be obtained from *newlocale()* or *duplocale()* and passed to the function.
- 4069 2. For functions that do not take a locale object as an argument, the current locale for the  
 4070 thread can be set by calling *uselocale()* or the global locale for the process can be set by  
 4071 calling *setlocale()*. Such functions shall use the current locale of the calling thread if one  
 4072 has been set for that thread; otherwise, they shall use the global locale.
- 4073 3. Some functions, such as *catopen()* and those related to text domains, may reference  
 4074 various environment variables and a locale category of a specific locale to access files they  
 4075 need to use.

4076 Locales other than those supplied by the implementation can be created via the *localedef* utility,  
 4077 provided that the *\_POSIX2\_LOCALEDEF* symbol is defined on the system. Even if *localedef* is  
 4078 not provided, all implementations conforming to the System Interfaces volume of POSIX.1-2024  
 4079 shall provide one or more locales that behave as described in this chapter. The input to the  
 4080 utility is described in Section 7.3 (on page 128). The value that is used to specify a locale when  
 4081 using environment variables shall be the string specified as the *name* operand to the *localedef*  
 4082 utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for  
 4083 the POSIX locale (see Section 7.2, on page 128). When the value of a locale environment variable  
 4084 begins with a <slash> (' / '), it shall be interpreted as the pathname of the locale definition; the  
 4085 type of file (regular, directory, and so on) used to store the locale definition is implementation-  
 4086 defined. If the value does not begin with a <slash>, the mechanism used to locate the locale is  
 4087 implementation-defined.

4088 If incompatible character sets are used by the locale categories, the results achieved by an  
 4089 application utilizing these categories are undefined. Two locale categories have incompatible  
 4090 character sets if one of the categories is *LC\_CTYPE* and the locale data associated with the other  
 4091 category includes at least one character that either is not in the character set used by *LC\_CTYPE*  
 4092 or has a different encoding than the same character in the character set used by *LC\_CTYPE*.

4093 Likewise, unless specified otherwise, if different codesets are used by a particular category of the  
 4094 selected locale and by the data being processed by an interface whose behavior is dependent on  
 4095 that category of the selected locale, the results are undefined.

4096 Applications can select the desired locale by calling the *newlocale()* or *setlocale()* function with  
 4097 the appropriate value. If the function is invoked with an empty string, such as:

```
4098 newlocale(LC_ALL_MASK, "", (locale_t)0);
```

4099 or:

```
4100 setlocale(LC_ALL, "");
```

4101 the value of the corresponding environment variable is used. If the environment variable is  
 4102 unset or is set to the empty string, the implementation shall set the appropriate environment as  
 4103 defined in [Chapter 8](#) (on page 167).

## 4104 7.2 POSIX Locale

4105 Conforming systems shall provide a POSIX locale, also known as the C locale. In POSIX.1 the  
 4106 requirements for the POSIX locale are more extensive than the requirements for the C locale as  
 4107 specified in the ISO C standard. However, in a conforming POSIX implementation, the POSIX  
 4108 locale and the C locale are identical. The behavior of standard utilities and functions in the  
 4109 POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the  
 4110 POSIX locale tables in [Section 7.3](#).

4111 For C-language programs, the POSIX locale shall be the default locale when the *setlocale()*  
 4112 function is not called.

4113 The POSIX locale can be specified by assigning to the appropriate environment variables the  
 4114 values "C" or "POSIX".

4115 All implementations shall define a locale as the default locale, to be invoked when no  
 4116 environment variables are set, or set to the empty string. This default locale can be the POSIX  
 4117 locale or any other implementation-defined locale. Some implementations may provide facilities  
 4118 for local installation administrators to set the default locale, customizing it for each location.  
 4119 POSIX.1-2024 does not require such a facility.

## 4120 7.3 Locale Definition

4121 The capability to specify additional locales to those provided by an implementation is optional,  
 4122 denoted by the *\_POSIX2\_LOCALEDEF* symbol. If the option is not supported, only  
 4123 implementation-supplied locales are available. Such locales shall be documented using the  
 4124 format specified in this section.

4125 Locales can be described with the file format presented in this section. The file format is that  
 4126 accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the  
 4127 "locale definition file", but no locales shall be affected by this file unless it is processed by  
 4128 *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility  
 4129 shall apply to *localedef* or to any other similar utility used to install locale information using the

4130 locale definition file format described here.

4131 The locale definition file shall contain one or more locale category source definitions, and shall  
4132 not contain more than one definition for the same locale category. If the file contains source  
4133 definitions for more than one category, implementation-defined categories, if present, shall  
4134 appear after the categories defined by [Section 7.1](#) (on page 127). A category source definition  
4135 contains either the definition of a category or a **copy** directive. For a description of the **copy**  
4136 directive, see *localedef*. In the event that some of the information for a locale category, as  
4137 specified in this volume of POSIX.1-2024, is missing from the locale source definition, the  
4138 behavior of that category, if it is referenced, is unspecified.

4139 A category source definition shall consist of a category header, a category body, and a category  
4140 trailer. A category header shall consist of the character string naming of the category, beginning  
4141 with the characters *LC\_*. The category trailer shall consist of the string "END", followed by one  
4142 or more <blank> characters and the string used in the corresponding category header.

4143 The category body shall consist of one or more lines of text. Each line shall contain an identifier,  
4144 optionally followed by one or more operands. Identifiers shall be either keywords, identifying a  
4145 particular locale element, or collating elements. In addition to the keywords defined in this  
4146 volume of POSIX.1-2024, the source can contain implementation-defined keywords. Each  
4147 keyword within a locale shall have a unique name (that is, two categories cannot have a  
4148 commonly-named keyword); no keyword shall start with the characters *LC\_*. Identifiers shall be  
4149 separated from the operands by one or more <blank> characters.

4150 Operands shall be characters, collating elements, or strings of characters. Strings shall be  
4151 enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <escape  
4152 character>, described below. When a keyword is followed by more than one operand, the  
4153 operands shall be separated by <semicolon> characters; <blank> characters shall be allowed  
4154 both before and after a <semicolon>.

4155 The first category header in the file can be preceded by a line modifying the comment character.  
4156 It shall have the following format, starting in column 1:

```
4157 "comment_char %c\n", <comment character>
```

4158 The comment character shall default to the <number-sign> ('#'). Blank lines and lines  
4159 containing the <comment character> in the first position shall be ignored.

4160 The first category header in the file can be preceded by a line modifying the escape character to  
4161 be used in the file. It shall have the following format, starting in column 1:

```
4162 "escape_char %c\n", <escape character>
```

4163 The escape character shall default to <backslash>, which is the character used in all examples  
4164 shown in this volume of POSIX.1-2024.

4165 A line can be continued by placing an escape character as the last character on the line; this  
4166 continuation character shall be discarded from the input. Although the implementation need not  
4167 accept any one portion of a continued line with a length exceeding {LINE\_MAX} bytes, it shall  
4168 place no limits on the accumulated length of the continued line. Comment lines shall not be  
4169 continued on a subsequent line using an escaped <newline>.

4170 Individual characters, characters in strings, and collating elements shall be represented using  
4171 symbolic names, as defined below. In addition, characters can be represented using the  
4172 characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic  
4173 notation is used, the resultant locale definitions are in many cases not portable between systems.  
4174 The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when  
4175 used to represent itself it shall be preceded by the escape character. The following rules apply to  
4176 character representation:

4177 1. A character can be represented via a symbolic name, enclosed within angle brackets '<' and '>'. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef* -f option, and it shall be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file shall constitute an error, unless the category is *LC\_CTYPE* or *LC\_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

4188 For example:

```
4189 <c>;<c-cedilla> "<M><a><y>"
```

4190 2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

```
4196 , ; < > escape_char
```

4197 shall be escaped to be interpreted as the character itself.

4198 For example:

```
4199 c "May"
```

4200 3. A character can be represented as an octal constant. An octal constant shall be specified as the escape character followed by two or three octal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

4204 For example:

```
4205 \143;\347;\143\150 "\115\141\171"
```

4206 4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be specified as the escape character followed by an 'x' followed by two hexadecimal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

4211 For example:

```
4212 \x63;\xe7;\x63\x68 "\x4d\x61\x79"
```

4213 5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a 'd' followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

4218 For example:

```
4219 \d99;\d231;\d99\d104 "\d77\d97\d121"
```

4220 Implementations may accept single-digit octal, decimal, or hexadecimal constants following the

4221 escape character. Only characters existing in the character set for which the locale definition is  
 4222 created shall be specified, whether using symbolic names, the characters themselves, or octal,  
 4223 decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the  
 4224 charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not  
 4225 present in the charmap file can be specified and shall be ignored, as specified under item 1  
 4226 above.

### 4227 7.3.1 LC\_CTYPE

4228 The *LC\_CTYPE* category shall define character classification, case conversion, and other  
 4229 character attributes. In addition, a series of characters can be represented by three adjacent  
 4230 <period> characters representing an ellipsis symbol (" . . . "). The ellipsis specification shall be  
 4231 interpreted as meaning that all values between the values preceding and following it represent  
 4232 valid characters. The ellipsis specification shall be valid only within a single encoded character  
 4233 set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as  
 4234 including in the list all characters with an encoded value higher than the encoded value of the  
 4235 character preceding the ellipsis and lower than the encoded value of the character following the  
 4236 ellipsis.

4237 For example:

```
4238 \x30; . . . ; \x39;
```

4239 includes in the character class all characters with encoded values between the endpoints.

4240 The following keywords shall be recognized. In the descriptions, the term “automatically  
 4241 included” means that it shall not be an error either to include or omit any of the referenced  
 4242 characters; the implementation provides them if missing (even if the entire keyword is missing)  
 4243 and accepts them silently if present. When the implementation automatically includes a missing  
 4244 character, it shall have an encoded value dependent on the charmap file in effect (see the  
 4245 description of the *localedef* *-f* option); otherwise, it shall have a value derived from an  
 4246 implementation-defined character mapping.

4247 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included  
 4248 characters. It is not possible to define a locale without these automatically included characters  
 4249 unless some implementation extension is used to prevent their inclusion. Such a definition  
 4250 would not be a proper superset of the C or POSIX locale and, thus, it might not be possible for  
 4251 conforming applications to work properly.

4252 **copy** Specify the name of an existing locale which shall be used as the definition of  
 4253 this category. If this keyword is specified, no other keyword shall be specified.

4254 **upper** Define characters to be classified as uppercase letters.

4255 In the POSIX locale, only:

```
4256 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

4257 shall be included:

4258 In a locale definition file, no character specified for the keywords **ctrl**, **digit**,  
 4259 **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as  
 4260 defined in [Section 6.4](#) (on page 121) (the portable character set), are  
 4261 automatically included in this class.

4262 **lower** Define characters to be classified as lowercase letters.

4263 In the POSIX locale, only:

4264		a b c d e f g h i j k l m n o p q r s t u v w x y z
4265		shall be included.
4266		In a locale definition file, no character specified for the keywords <b>cntrl</b> , <b>digit</b> ,
4267		<b>punct</b> , or <b>space</b> shall be specified. The lowercase letters <a> to <z> of the
4268		portable character set are automatically included in this class.
4269	<b>alpha</b>	Define characters to be classified as letters.
4270		In the POSIX locale, only characters in the classes <b>upper</b> and <b>lower</b> shall be
4271		included.
4272		In a locale definition file, no character specified for the keywords <b>cntrl</b> , <b>digit</b> ,
4273		<b>punct</b> , or <b>space</b> shall be specified. Characters classified as either <b>upper</b> or
4274		<b>lower</b> are automatically included in this class.
4275	<b>digit</b>	Define the characters to be classified as numeric digits.
4276		In all locales, only:
4277		0 1 2 3 4 5 6 7 8 9
4278		shall be included.
4279		In a locale definition file, only the digits <zero>, <one>, <two>, <three>,
4280		<four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in
4281		contiguous ascending sequence by numerical value. The digits <zero> to
4282		<nine> of the portable character set are automatically included in this class.
4283	<b>alnum</b>	Define characters to be classified as letters and numeric digits. Only the
4284		characters specified for the <b>alpha</b> and <b>digit</b> keywords shall be specified.
4285		Characters specified for the keywords <b>alpha</b> and <b>digit</b> are automatically
4286		included in this class.
4287	<b>space</b>	Define characters to be classified as white-space characters.
4288		In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-
4289		return>, <tab>, and <vertical-tab> shall be included.
4290		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4291		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>graph</b> , or <b>xdigit</b> shall be specified. The <space>, <form-
4292		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
4293		character set, and any characters included in the class <b>blank</b> are automatically
4294		included in this class.
4295	<b>cntrl</b>	Define characters to be classified as control characters.
4296		In the POSIX locale, no characters in classes <b>alpha</b> or <b>print</b> shall be included.
4297		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4298		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>punct</b> , <b>graph</b> , <b>print</b> , or <b>xdigit</b> shall be specified.
4299	<b>punct</b>	Define characters to be classified as punctuation characters.
4300		In the POSIX locale, neither the <space> nor any characters in classes <b>alpha</b> ,
4301		<b>digit</b> , or <b>cntrl</b> shall be included.
4302		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4303		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>cntrl</b> , <b>xdigit</b> , or as the <space> shall be specified.

4304	<b>graph</b>	Define characters to be classified as printable characters, not including the
4305		<space>.
4306		In the POSIX locale, all characters in classes <b>alpha</b> , <b>digit</b> , and <b>punct</b> shall be
4307		included; no characters in class <b>cntrl</b> shall be included.
4308		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4309		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , and <b>punct</b> are automatically included in this class. No
4310		character specified for the keyword <b>cntrl</b> shall be specified.
4311	<b>print</b>	Define characters to be classified as printable characters, including the
4312		<space>.
4313		In the POSIX locale, all characters in class <b>graph</b> shall be included; no
4314		characters in class <b>cntrl</b> shall be included.
4315		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4316		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , <b>punct</b> , <b>graph</b> , and the <space> are automatically included
4317		in this class. No character specified for the keyword <b>cntrl</b> shall be specified.
4318	<b>xdigit</b>	Define the characters to be classified as hexadecimal digits.
4319		In all locales, only:
4320		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
4321		shall be included.
4322		In a locale definition file, only the characters defined for the class <b>digit</b> shall be
4323		specified, in contiguous ascending sequence by numerical value, followed by
4324		two sets, in either order, of six characters representing the hexadecimal digits
4325		corresponding to the decimal numbers 10 to 15 inclusive, with each set in
4326		ascending order: <A>, <B>, <C>, <D>, <E>, <F> and <a>, <b>, <c>, <d>, <e>
4327		, <f>. The digits <zero> to <nine>, the uppercase letters <A> to <F>, and the
4328		lowercase letters <a> to <f> of the portable character set are automatically
4329		included in this class.
4330	<b>blank</b>	Define characters to be classified as <blank> characters.
4331		In the POSIX locale, only the <space> and <tab> shall be included.
4332		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4333		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>graph</b> , or <b>xdigit</b> shall be specified, and none of the
4334		characters <form-feed>, <newline>, <carriage-return>, and <vertical-tab> of
4335		the portable character set shall be specified. The <space> and <tab> are
4336		automatically included in this class.
4337	<b>charclass</b>	Define one or more locale-specific character class names as strings separated
4338		by <semicolon> characters. Each named character class can then be defined
4339		subsequently in the <i>LC_CTYPE</i> definition. A character class name shall consist
4340		of at least one and at most {CHARCLASS_NAME_MAX} bytes of
4341		alphanumeric characters from the portable filename character set. The first
4342		character of a character class name shall not be a digit. The name shall not
4343		match any of the <i>LC_CTYPE</i> keywords defined in this volume of
4344		POSIX.1-2024. Future versions of this standard will not specify any <i>LC_CTYPE</i>
4345	keywords containing uppercase letters.	
4346	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific
4347		character class. In the POSIX locale, locale-specific named character classes
4348		need not exist.

4349 If a class name is defined by a **charclass** keyword, but no characters are  
 4350 subsequently assigned to it, this is not an error; it represents a class without  
 4351 any characters belonging to it.

4352 The *charclass-name* can be used as the *property* argument to the *wctype()*  
 4353 function, in regular expression and shell pattern-matching bracket  
 4354 expressions, and by the *tr* command.

4355 **toupper** Define the mapping of lowercase letters to uppercase letters.

4356 In the POSIX locale, the 26 lowercase characters:

4357 a b c d e f g h i j k l m n o p q r s t u v w x y z

4358 shall be mapped to the corresponding 26 uppercase characters:

4359 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4360 In a locale definition file, the operand shall consist of character pairs,  
 4361 separated by <semicolon> characters. The characters in each character pair  
 4362 shall be separated by a <comma> and the pair enclosed by parentheses. The  
 4363 first character in each pair is the lowercase letter, the second the corresponding  
 4364 uppercase letter. Only characters specified for the keywords **lower** and **upper**  
 4365 shall be specified. The lowercase letters <a> to <z>, and their corresponding  
 4366 uppercase letters <A> to <Z>, of the portable character set are automatically  
 4367 included in this mapping, but only when the **toupper** keyword is omitted  
 4368 from the locale definition.

4369 **tolower** Define the mapping of uppercase letters to lowercase letters.

4370 In the POSIX locale, the 26 uppercase characters:

4371 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4372 shall be mapped to the corresponding 26 lowercase characters:

4373 a b c d e f g h i j k l m n o p q r s t u v w x y z

4374 In a locale definition file, the operand shall consist of character pairs,  
 4375 separated by <semicolon> characters. The characters in each character pair  
 4376 shall be separated by a <comma> and the pair enclosed by parentheses. The  
 4377 first character in each pair is the uppercase letter, the second the  
 4378 corresponding lowercase letter. Only characters specified for the keywords  
 4379 **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from  
 4380 the locale definition, the mapping is the reverse mapping of the one specified  
 4381 for **toupper**.

4382 The following table shows the character class combinations allowed:

 x Mutually-exclusive.  
 \* See note 2.
- The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

7.3.1.1 LC\_CTYPE Category in the POSIX Locale

The minimum character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, and the table represents the same information, sorted by character. Implementations may add additional characters to the **cntrl** and **punct** classifications but shall not make any other additions.

```

LC_CTYPE
# The following is the minimum POSIX locale LC_CTYPE.
# "alpha" is by definition "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by definition "alnum", "punct", and the <space>
# "graph" is by definition "alnum" and "punct"
#
upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
         <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>
#
lower    <a>;<b>;<c>;<d>;<e>;<f>;<g>;<h>;<i>;<j>;<k>;<l>;<m>;\
         <n>;<o>;<p>;<q>;<r>;<s>;<t>;<u>;<v>;<w>;<x>;<y>;<z>
#
digit    <zero>;<one>;<two>;<three>;<four>;<five>;<six>;\
         <seven>;<eight>;<nine>
#
space    <tab>;<newline>;<vertical-tab>;<form-feed>;\

```

```

4428         <carriage-return>;<space>
4429     #
4430     cntrl    <alert>;<backspace>;<tab>;<newline>;<vertical-tab>;\
4431             <form-feed>;<carriage-return>;\
4432             <NUL>;<SOH>;<STX>;<ETX>;<EOT>;<ENQ>;<ACK>;<SO>;\
4433             <SI>;<DLE>;<DC1>;<DC2>;<DC3>;<DC4>;<NAK>;<SYN>;\
4434             <ETB>;<CAN>;<EM>;<SUB>;<ESC>;<IS4>;<IS3>;<IS2>;\
4435             <IS1>;<DEL>
4436     #

4594			

4595 **7.3.2 LC\_COLLATE**

4596 The *LC\_COLLATE* category provides a collation sequence definition for numerous utilities in the  
 4597 Shell and Utilities volume of POSIX.1-2024 (*ls*, *sort*, and so on), regular expression matching (see  
 4598 [Chapter 9](#), on page 179), and the *strcoll()*, *strxfrm()*, *wcscoll()*, and *wcsxfrm()* functions in the  
 4599 System Interfaces volume of POSIX.1-2024.

4600 A collation sequence definition shall define the relative order between collating elements  
 4601 (characters and multi-character collating elements) in the locale. This order is expressed in terms  
 4602 of collation values; that is, by assigning each element one or more collation values (also known  
 4603 as collation weights). This does not imply that implementations shall assign such values, but  
 4604 that ordering of strings using the resultant collation definition in the locale behaves as if such  
 4605 assignment is done and used in the collation process. At least the following capabilities are  
 4606 provided:

- 4607 1. **Multi-character collating elements.** Specification of multi-character collating elements  
 4608 (that is, sequences of two or more characters to be collated as an entity).
- 4609 2. **User-defined ordering of collating elements.** Each collating element shall be assigned a  
 4610 collation value defining its order in the character (or basic) collation sequence. This  
 4611 ordering is used by regular expressions and pattern matching and, unless collation  
 4612 weights are explicitly specified, also as the collation weight to be used in sorting.
- 4613 3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or  
 4614 more (up to the limit [COLL\_WEIGHTS\_MAX]), as defined in [<limits.h>](#) collating  
 4615 weights for use in sorting. The first weight is hereafter referred to as the primary weight.

- 4616 4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
- 4617 5. **Equivalence class definition.** Two or more collating elements have the same collation
- 4618 value (primary weight).
- 4619 6. **Ordering by weights.** When two strings are compared to determine their relative order,
- 4620 the two strings are first broken up into a series of collating elements; the elements in each
- 4621 successive pair of elements are then compared according to the relative primary weights
- 4622 for the elements. If equal, and more than one weight has been assigned, then the pairs of
- 4623 collating elements are re-compared according to the relative subsequent weights, until
- 4624 either a pair of collating elements compare unequal or the weights are exhausted.

4625 All implementation-provided locales (either preinstalled or provided as locale definitions which

4626 can be installed later) shall define a collation sequence that has a total ordering of all characters

4627 unless the locale name has an '@' modifier indicating that it has a special collation sequence (for

4628 example, @iCase could indicate that each upper and lowercase character pair collates equally).

4629 **Note:** Users installing their own locales should ensure that they define a collation sequence with a

4630 total ordering of all characters unless an '@' modifier in the locale name (such as @iCase)

4631 indicates that it has a special collation sequence. As <NUL> is reserved as the string terminator

4632 for most usages of LC\_COLLATE, it is the responsibility of the locale writer to ensure <NUL>

4633 has the lowest primary weight in a collation ordering for the interfaces to behave in the way

4634 users typically expect. Unusual behavior may result if it has any other collation order

4635 weighting, or is subject to IGNORE.

4636 The following keywords shall be recognized in a collation sequence definition. They are

4637 described in detail in the following sections.

4638	<b>copy</b>	Specify the name of an existing locale which shall be used as the
4639		definition of this category. If this keyword is specified, no other keyword
4640		shall be specified.
4641	<b>collating-element</b>	Define a collating-element symbol representing a multi-character
4642		collating element. This keyword is optional.
4643	<b>collating-symbol</b>	Define a collating symbol for use in collation order statements. This
4644		keyword is optional.
4645	<b>order_start</b>	Define collation rules. This statement shall be followed by one or more
4646		collation order statements, assigning character collation values and
4647		collation weights to collating elements.
4648	<b>order_end</b>	Specify the end of the collation-order statements.

#### 4649 7.3.2.1 The collating-element Keyword

4650 In addition to the collating elements in the character set, the **collating-element** keyword can be

4651 used to define multi-character collating elements. The syntax is as follows:

```
4652 "collating-element %s from \"%s\"\\n", <collating-symbol>, <string>
```

4653 The <collating-symbol> operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A <collating-element> defined via this keyword is only recognized with the LC\_COLLATE category.

4658 For example:

```
4659 collating-element <ch> from "<c><h>"
```

4660 collating-element <e-acute> from "<acute><e>"  
 4661 collating-element <ll> from "ll"

### 4662 7.3.2.2 *The collating-symbol Keyword*

4663 This keyword shall be used to define symbols for use in collation sequence statements; that is,  
 4664 between the **order\_start** and the **order\_end** keywords. The syntax is as follows:

```
4665 "collating-symbol %s\n", <collating-symbol>
```

4666 The <collating-symbol> shall be a symbolic name, enclosed between angle brackets ('<' and  
 4667 '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any  
 4668 other symbolic name defined in this collation definition. A <collating-symbol> defined via this  
 4669 keyword is only recognized within the *LC\_COLLATE* category.

4670 For example:

```
4671 collating-symbol <UPPER_CASE>  

  4672 collating-symbol <HIGH>
```

4673 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative  
 4674 position in the character order sequence. While such a symbolic name does not represent any  
 4675 collating element, it can be used as a weight.

### 4676 7.3.2.3 *The order\_start Keyword*

4677 The **order\_start** keyword shall precede collation order entries and also define the number of  
 4678 weights for this collation sequence definition and other collation rules. The syntax is as follows:

```
4679 "order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...
```

4680 The operands to the **order\_start** keyword are optional. If present, the operands define rules to be  
 4681 applied when strings are compared. The number of operands define how many weights each  
 4682 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the  
 4683 first operand defines rules to be applied when comparing strings using the first (primary)  
 4684 weight; the second when comparing strings using the second weight, and so on. Operands shall  
 4685 be separated by <semicolon> characters (';'). Each operand shall consist of one or more  
 4686 collation directives, separated by <comma> characters (','). If the number of operands exceeds  
 4687 the {*COLL\_WEIGHTS\_MAX*} limit, the utility shall issue a warning message. The following  
 4688 directives shall be supported:

4689 **forward** Specifies that comparison operations for the weight level shall proceed from start  
 4690 of string towards the end of string.

4691 **backward** Specifies that comparison operations for the weight level shall proceed from end of  
 4692 string towards the beginning of string.

4693 **position** Specifies that comparison operations for the weight level shall consider the relative  
 4694 position of elements in the strings not subject to **IGNORE**. The string containing  
 4695 an element not subject to **IGNORE** after the fewest collating elements subject to  
 4696 **IGNORE** from the start of the compare shall collate first. If both strings contain a  
 4697 character not subject to **IGNORE** in the same relative position, the collating values  
 4698 assigned to the elements shall determine the ordering. In case of equality,  
 4699 subsequent characters not subject to **IGNORE** shall be considered in the same  
 4700 manner.

4701 The directives **forward** and **backward** are mutually-exclusive.

4702 If no operands are specified, a single **forward** operand shall be assumed.

4703 For example:

```
4704 order_start    forward;backward
```

#### 4705 7.3.2.4 Collation Order

4706 The **order\_start** keyword shall be followed by collating identifier entries. The syntax for the  
4707 collating element entries is as follows:

```
4708 "%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...
```

4709 Each *collating-identifier* shall consist of either a character (in any of the forms defined in [Section](#)  
4710 [7.3](#), on page 128), a *collating-element*, a *collating-symbol*, an ellipsis, or the special symbol  
4711 **UNDEFINED**. The order in which collating elements are specified determines the character  
4712 order sequence, such that each collating element shall compare less than the elements following  
4713 it.

4714 A *collating-element* shall be used to specify multi-character collating elements, and indicates  
4715 that the character sequence specified via the *collating-element* is to be collated as a unit and in  
4716 the relative order specified by its place.

4717 A *collating-symbol* can be used to define a position in the relative order for use in weights. No  
4718 weights shall be specified with a *collating-symbol*.

4719 The ellipsis symbol specifies that a sequence of characters shall collate according to their  
4720 encoded character values. It shall be interpreted as indicating that all characters with a coded  
4721 character set value higher than the value of the character in the preceding line, and lower than  
4722 the coded character set value for the character in the following line, in the current coded  
4723 character set, shall be placed in the character collation order between the previous and the  
4724 following character in ascending order according to their coded character set values. An initial  
4725 ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing  
4726 ellipsis as if the following line specified the highest coded character set value in the current  
4727 coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do  
4728 not specify characters in the current coded character set. The use of the ellipsis symbol ties the  
4729 definition to a specific coded character set and may preclude the definition from being portable  
4730 between implementations.

4731 The symbol **UNDEFINED** shall be interpreted as including all coded character set values not  
4732 specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character  
4733 collation order at the point indicated by the symbol, and in ascending order according to their  
4734 coded character set values. If no **UNDEFINED** symbol is specified, and the current coded  
4735 character set contains characters not specified in this section, the utility shall issue a warning  
4736 message and place such characters at the end of the character collation order.

4737 The optional operands for each collation-element shall be used to define the primary, secondary,  
4738 or subsequent weights for the collating element. The first operand specifies the relative primary  
4739 weight, the second the relative secondary weight, and so on. Two or more collation-elements can  
4740 be assigned the same weight; they belong to the same "equivalence class" if they have the same  
4741 primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE**  
4742 are removed, unless the **position** collation directive is specified for the corresponding level with  
4743 the **order\_start** keyword. Then each successive pair of elements shall be compared according to  
4744 the relative weights for the elements. If the two strings compare equal, the process shall be  
4745 repeated for the next weight level, up to the limit {COLL\_WEIGHTS\_MAX}.

4746 Weights shall be assigned such that the collation sequence has a total ordering of all characters

4747 unless an '@' modifier in the locale name indicates that it has a special collation sequence.

4748 Weights shall be expressed as characters (in any of the forms specified in [Section 7.3](#), on page  
4749 128), `<collating-symbol>s`, `<collating-element>s`, an ellipsis, or the special symbol **IGNORE**. A  
4750 single character, a `<collating-symbol>`, or a `<collating-element>` shall represent the relative position  
4751 in the character collating sequence of the character or symbol, rather than the character or  
4752 characters themselves. Thus, rather than assigning absolute values to weights, a particular  
4753 weight is expressed using the relative order value assigned to a collating element based on its  
4754 order in the character collation sequence.

4755 One-to-many mapping is indicated by specifying two or more concatenated characters or  
4756 symbolic names. For example, if the `<eszet>` is given the string "`<s><s>`" as a weight,  
4757 comparisons are performed as if all occurrences of the `<eszet>` are replaced by "`<s><s>`"  
4758 (assuming that "`<s>`" has the collating weight "`<s>`"). If it is necessary to define `<eszet>` and  
4759 "`<s><s>`" as an equivalence class, then a collating element needs to be defined for the string  
4760 "`ss`".

4761 All characters specified via an ellipsis shall by default be assigned unique weights, equal to the  
4762 relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special  
4763 symbol shall by default be assigned the same primary weight (that is, they belong to the same  
4764 equivalence class) if the collation order has more than one weight level. If the collation order has  
4765 only one weight level, these characters shall be assigned unique primary weights, equal to the  
4766 relative order of their character in the character collation sequence.

4767 An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence  
4768 shall have unique weights, equal to the relative order of their character in the character collation  
4769 sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is  
4770 neither an ellipsis nor the special symbol **UNDEFINED**.

4771 The special keyword **IGNORE** as a weight shall indicate that when strings are compared using  
4772 the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that  
4773 is, as if the string did not contain the collating element. In regular expressions and pattern  
4774 matching, all characters that are subject to **IGNORE** in their primary weight form an  
4775 equivalence class.

4776 An empty operand shall be interpreted as the collating element itself.

4777 For example, the order statement:

4778 `<a> <a>; <a>`

4779 is equal to:

4780 `<a>`

4781 An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be  
4782 interpreted as the value of each character defined by the ellipsis.

4783 The collation order as defined in this section affects the interpretation of bracket expressions in  
4784 regular expressions (see [Section 9.3.5](#), on page 182).

```

4785     For example:
4786     order_start  forward;backward
4787     <NUL>       <NUL>;<NUL>
4788     <LOW>
4789     <space>     <LOW>;<space>
4790     ...        <LOW>;...
4791     <a>         <a>;<a>
4792     <a-acute>   <a>;<a-acute>
4793     <a-grave>  <a>;<a-grave>
4794     <A>        <a>;<A>
4795     <A-acute>  <a>;<A-acute>
4796     <A-grave>  <a>;<A-grave>
4797     <ch>       <ch>;<ch>
4798     <Ch>       <ch>;<Ch>
4799     <s>        <s>;<s>
4800     <eszet>    "<s><s>"; "<eszet><eszet>"
4801     UNDEFINED  IGNORE;...
4802     order_end

```

4803 This example is interpreted as follows:

- 4804 1. All characters between <space> and 'a' shall have the same primary equivalence class  
4805 and individual secondary weights based on their ordinal encoded values.
- 4806 2. All characters based on the uppercase or lowercase character 'a' belong to the same  
4807 primary equivalence class.
- 4808 3. The multi-character collating element <ch> is represented by the collating symbol <ch>  
4809 and belongs to the same primary equivalence class as the multi-character collating  
4810 element <Ch>.
- 4811 4. The **UNDEFINED** means that all characters not specified in this definition (explicitly or  
4812 via the ellipsis) shall be ignored when comparing primary weights, and have individual  
4813 secondary weights based on their ordinal encoded values.

#### 4814 7.3.2.5 The *order\_end* Keyword

4815 The collating order entries shall be terminated with an **order\_end** keyword.

#### 4816 7.3.2.6 *LC\_COLLATE* Category in the POSIX Locale

4817 The minimum collation sequence definition of the POSIX locale follows; the code listing depicts  
4818 the *localedef* input. All characters not explicitly listed here shall be inserted in the character  
4819 collation order after the listed characters and shall be assigned unique primary weights. If the  
4820 listed characters have ASCII encoding, the other characters shall be in ascending order according  
4821 to their coded character set values; otherwise, the order of the other characters is unspecified.  
4822 The collation sequence shall not include any multi-character collating elements.

```

4823 LC_COLLATE
4824 # This is the minimum input for the POSIX locale definition for the
4825 # LC_COLLATE category. Characters in this list are in the same order
4826 # as in the ASCII codeset.
4827 order_start forward
4828 <NUL>
4829 <SOH>

```

### 4959 7.3.3 LC\_MONETARY

4960 The *LC\_MONETARY* category shall define the rules and symbols that are used to format  
 4961 monetary numeric information.

4962 This information is available through the *localeconv()* function and is used by the *strfmon()*  
 4963 function.

4964 Some of the information is also available in an alternative form via the *nl\_langinfo()* function  
 4965 (see CRNCYSTR in [<langinfo.h>](#)).

4966 The following items are defined in this category of the locale. The item names are the keywords  
 4967 recognized by the *localedef* utility when defining a locale. They are also similar to the member  
 4968 names of the **lconv** structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the  
 4969 header. The *localeconv()* function returns {CHAR\_MAX} for unavailable integer items and the  
 4970 empty string (" ") for unavailable or size zero string items.

4971 In a locale definition file, the operands are strings, formatted as indicated by the grammar in  
 4972 [Section 7.4](#) (on page 160). For some keywords, the strings can contain only integers. Keywords  
 4973 that are not provided, or integer keywords set to -1, can be used to indicate that the value is not  
 4974 available in the locale. String values set to the empty string (" ") can be used to indicate that the  
 4975 value is available and is an empty string, or that the value is not available. The following  
 4976 keywords shall be recognized:

4977 **copy** Specify the name of an existing locale which shall be used as the  
 4978 definition of this category. If this keyword is specified, no other keyword  
 4979 shall be specified.

4980 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4981	<b>int_curr_symbol</b>	The international currency symbol. The operand shall be a four-character string, with the first three characters containing the alphabetic international currency symbol. The international currency symbol should be chosen in accordance with those specified in the ISO 4217 standard. The fourth character shall be the character used to separate the international currency symbol from the monetary quantity.
4982		
4983		
4984		
4985		
4986		
4987	<b>currency_symbol</b>	The string that shall be used as the local currency symbol.
4988	<b>mon_decimal_point</b>	The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in monetary formatted quantities.
4989		
4990	<b>mon_thousands_sep</b>	The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.
4991		
4992		
4993	<b>mon_grouping</b>	Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not -1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is -1, then no further grouping shall be performed.
4994		
4995		
4996		
4997		
4998		
4999		
5000		
5001	<b>positive_sign</b>	A string that shall be used to indicate a non-negative-valued formatted monetary quantity.
5002		
5003	<b>negative_sign</b>	A string that shall be used to indicate a negative-valued formatted monetary quantity.
5004		
5005	<b>int_frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>int_curr_symbol</b> .
5006		
5007		
5008	<b>frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>currency_symbol</b> .
5009		
5010		
5011	<b>p_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
5012		
5013		
5014	<b>p_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a non-negative formatted monetary quantity.
5015		
5016		The values of <b>p_sep_by_space</b> , <b>n_sep_by_space</b> , <b>int_p_sep_by_space</b> , and <b>int_n_sep_by_space</b> are interpreted according to the following:
5017		
5018		0 No <space> separates the currency symbol and value.
5019		1 If the currency symbol and sign string are adjacent, a <space> separates them from the value; otherwise, a <space> separates the currency symbol from the value.
5020		
5021		
5022		2 If the currency symbol and sign string are adjacent, a <space> separates them; otherwise, a <space> separates the sign string from the value.
5023		
5024		

5025	<b>n_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
5026		
5027		
5028	<b>n_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a negative formatted monetary quantity.
5029		
5030	<b>p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a monetary quantity with a non-negative value. The following integer values shall be recognized for <b>int_n_sign_posn</b> , <b>int_p_sign_posn</b> , <b>n_sign_posn</b> , and <b>p_sign_posn</b> :
5031		
5032		
5033		
5034		0 Parentheses enclose the quantity and the <b>currency_symbol</b> .
5035		1 The sign string precedes the quantity and the <b>currency_symbol</b> .
5036		2 The sign string succeeds the quantity and the <b>currency_symbol</b> .
5037		3 The sign string precedes the <b>currency_symbol</b> .
5038		4 The sign string succeeds the <b>currency_symbol</b> .
5039	<b>n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative formatted monetary quantity.
5040		
5041	<b>int_p_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
5042		
5043		
5044	<b>int_n_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
5045		
5046		
5047	<b>int_p_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a non-negative internationally formatted monetary quantity.
5048		
5049		
5050	<b>int_n_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a negative internationally formatted monetary quantity.
5051		
5052		
5053	<b>int_p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a positive monetary quantity formatted with the international format.
5054		
5055	<b>int_n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative monetary quantity formatted with the international format.
5056		
5057		Certain combinations of the <b>*_sign_posn</b> , <b>positive_sign</b> , and <b>negative_sign</b> values are invalid and shall not be accepted by <i>localedef</i> :
5058		
5059		• If <b>p_sign_posn</b> and <b>n_sign_posn</b> are both greater than 0, and <b>positive_sign</b> and <b>negative_sign</b> have the same value or are both either empty strings or omitted, this combination is invalid because it requires signs to be used but does not provide the means to distinguish negative from positive values using signs.
5060		
5061		
5062		
5063		• Likewise, if <b>int_p_sign_posn</b> and <b>int_n_sign_posn</b> are both greater than 0, and <b>positive_sign</b> and <b>negative_sign</b> have the same value or are both either empty strings or omitted, this combination is invalid.
5064		
5065		
5066		• If <b>p_sign_posn</b> and <b>n_sign_posn</b> are both 0, this combination is invalid because it requires parentheses to be used but does not provide the means to distinguish negative from positive values using parentheses.
5067		
5068		

- Likewise, if `int_p_sign_posn` and `int_n_sign_posn` are both 0, this combination is invalid.

### 5070 7.3.3.1 LC\_MONETARY Category in the POSIX Locale

5071 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the  
 5072 `localedef` input, the table representing the same information with the addition of `localeconv()` and  
 5073 `nl_langinfo()` formats. All values shall be unavailable in the POSIX locale.

```

5074 LC_MONETARY
5075 # This is the POSIX locale definition for
5076 # the LC_MONETARY category.
5077 #
5078 int_curr_symbol      ""
5079 currency_symbol     ""
5080 mon_decimal_point   ""
5081 mon_thousands_sep  ""
5082 mon_grouping        -1
5083 positive_sign       ""
5084 negative_sign       ""
5085 int_frac_digits     -1
5086 frac_digits         -1
5087 p_cs_precedes       -1

int_p_sign_posn	—	N/A	{CHAR_MAX}	-1
int_n_sign_posn	—	N/A	{CHAR_MAX}	-1

The entry N/A indicates that the value is not available in the POSIX locale.

### 7.3.4 LC\_NUMERIC

The *LC\_NUMERIC* category shall define the rules and symbols that are used to format non-monetary numeric information. This information is available through the *localeconv()* function.

Some of the information is also available in an alternative form via the *nl\_langinfo()* function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the *lconv* structure defined in *<locale.h>*; see *<locale.h>* for the exact symbols in the header. The *localeconv()* function returns {CHAR\_MAX} for unavailable integer items and the empty string (" ") for unavailable or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 160). For some keywords, the strings can only contain integers. Keywords that are not provided, or integer keywords set to -1, can be used to indicate that the value is not available in the locale. String values set to the empty string (" ") can be used to indicate that the value is available and is an empty string, or that the value is not available. The following keywords shall be recognized:

- copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.  
**Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.
- decimal\_point** The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal\_point** to a single byte,

5147 the result of specifying a multi-byte operand shall be unspecified.

5148 **thousands\_sep** The operand is a string containing the symbol that shall be used as a separator  
 5149 for groups of digits to the left of the decimal delimiter in numeric, non-  
 5150 monetary formatted monetary quantities. In contexts where standards limit  
 5151 the **thousands\_sep** to a single byte, the result of specifying a multi-byte  
 5152 operand shall be unspecified.

5153 **grouping** Define the size of each group of digits in formatted non-monetary quantities.  
 5154 The operand is a sequence of integers separated by <semicolon> characters.  
 5155 Each integer specifies the number of digits in each group, with the initial  
 5156 integer defining the size of the group immediately preceding the decimal  
 5157 delimiter, and the following integers defining the preceding groups. If the last  
 5158 integer is not -1, then the size of the previous group (if any) shall be  
 5159 repeatedly used for the remainder of the digits. If the last integer is -1, then no  
 5160 further grouping shall be performed.

5161 7.3.4.1 *LC\_NUMERIC Category in the POSIX Locale*

5162 The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing  
 5163 depicting the *localedef* input, the table representing the same information with the addition of  
 5164 *localeconv()* values, and *nl\_langinfo()* constants.

```
5165 LC_NUMERIC
5166 # This is the POSIX locale definition for
5167 # the LC_NUMERIC category.
5168 #
5169 decimal_point    "<period>"
5170 thousands_sep    ""
5171 grouping         -1
5172 #
5173 END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
<b>decimal_point</b>	RADIXCHAR	."	."	.
<b>thousands_sep</b>	THOUSEP	N/A	""	""
<b>grouping</b>	—	N/A	""	-1

5179 The entry N/A indicates that the value is not available in the POSIX locale.

5180 7.3.5 **LC\_TIME**

5181 The *LC\_TIME* category shall define the interpretation of the conversion specifications supported  
 5182 by the *date* utility and shall affect the behavior of the *strptime()*, *wcsftime()*, *strptime()*, and  
 5183 *nl\_langinfo()* functions. Since the interfaces for C-language access and locale definition differ  
 5184 significantly, they are described separately.

## 5185 7.3.5.1 LC\_TIME Locale Definition

5186 In a locale definition, the following mandatory keywords shall be recognized:

5187 **copy** Specify the name of an existing locale which shall be used as the definition of  
5188 this category. If this keyword is specified, no other keyword shall be specified.

5189 **abday** Define the abbreviated weekday names, corresponding to the %a conversion  
5190 specification (conversion specification in the *strptime()*, *wcsftime()*, and  
5191 *strptime()* functions). The operand shall consist of seven  
5192 <semicolon>-separated strings, each surrounded by double-quotes. The first  
5193 string shall be the abbreviated name of the day corresponding to Sunday, the  
5194 second the abbreviated name of the day corresponding to Monday, and so on.

5195 **day** Define the full weekday names, corresponding to the %A conversion  
5196 specification. The operand shall consist of seven <semicolon>-separated  
5197 strings, each surrounded by double-quotes. The first string is the full name of  
5198 the day corresponding to Sunday, the second the full name of the day  
5199 corresponding to Monday, and so on.

5200 **abmon** Define the abbreviated month names, corresponding to the %b conversion  
5201 specification. The operand shall consist of twelve <semicolon>-separated  
5202 strings, each surrounded by double-quotes. The first string shall be the  
5203 abbreviated name of the first month of the year (January), the second the  
5204 abbreviated name of the second month, and so on. For languages having both  
5205 a genitive (when used with a day number) and a nominative (no day number)  
5206 case, this operand shall be used to denote the genitive case.

5207 **ab\_alt\_mon** Define the abbreviated month names, corresponding to the %Ob conversion  
5208 specification. The operand shall consist of twelve <semicolon>-separated  
5209 strings, each surrounded by double-quotes. The first string shall be the  
5210 abbreviated name of the first month of the year (January), the second the  
5211 abbreviated name of the second month, and so on. For languages having both  
5212 a genitive (when used with a day number) and a nominative (no day number)  
5213 case, this operand shall be used to denote the nominative case.

5214 **mon** Define the full month names, corresponding to the %B conversion  
5215 specification. The operand shall consist of twelve <semicolon>-separated  
5216 strings, each surrounded by double-quotes. The first string shall be the full  
5217 name of the first month of the year (January), the second the full name of the  
5218 second month, and so on. For languages having both a genitive (when used  
5219 with a day number) and a nominative (no day number) case, this operand  
5220 shall be used to denote the genitive case.

5221 **alt\_mon** Define the full month names, corresponding to the %OB conversion  
5222 specification. The operand shall consist of twelve <semicolon>-separated  
5223 strings, each surrounded by double-quotes. The first string shall be the full  
5224 name of the first month of the year (January), the second the full name of the  
5225 second month, and so on. For languages having both a genitive (when used  
5226 with a day number) and a nominative (no day number) case, this operand  
5227 shall be used to denote the nominative case.

5228 **d\_t\_fmt** Define the appropriate date and time representation, corresponding to the %c  
5229 conversion specification. The operand shall consist of a string containing any  
5230 combination of characters and conversion specifications. In addition, the  
5231 string can contain escape sequences defined in the table in [Table 5-1](#) (on page  
5232 113) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').

5233	<b>d_fmt</b>	Define the appropriate date representation, corresponding to the %x conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 113).
5234		
5235		
5236		
5237	<b>t_fmt</b>	Define the appropriate time representation, corresponding to the %X conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 113).
5238		
5239		
5240		
5241	<b>am_pm</b>	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i> strings, corresponding to the %p conversion specification. The operand shall consist of two strings, separated by a <semicolon>, each surrounded by double-quotes; the first string shall represent the <i>ante-meridiem</i> designation, the last string the <i>post-meridiem</i> designation. If and only if the 12-hour format is not supported in the locale, both strings shall be empty.
5242		
5243		
5244		
5245		
5246		
5247	<b>t_fmt_ampm</b>	Define the appropriate time representation in the 12-hour clock format with <b>am_pm</b> , corresponding to the %r conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If and only if the 12-hour format is not supported in the locale, the string shall be empty.
5248		
5249		
5250		
5251		
5252	<b>era</b>	Define how years are counted and displayed for each era in a locale. The operand shall consist of <semicolon>-separated strings. Each string shall be an era description segment with the format:  <i>direction:offset:start_date:end_date:era_name:era_format</i>  according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.  <b>Note:</b> The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.  <i>direction</i> Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .  <i>offset</i> The number of the year closest to the <i>start_date</i> in the era, corresponding to the %EY conversion specification.  <i>start_date</i> A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.  <i>end_date</i> The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.  <i>era_name</i> A string representing the name of the era, corresponding to the %EC conversion specification.  <i>era_format</i> A string for formatting the year in the era, corresponding to the %EY conversion specification.
5253		
5254		
5255		
5256		
5257		
5258		
5259		
5260		
5261		
5262		
5263		
5264		
5265		
5266		
5267		
5268		
5269		
5270		
5271		
5272		
5273		
5274		
5275		
5276		
5277		
5278		

5279	<b>era_d_fmt</b>	Define the format of the date in alternative era notation, corresponding to the %Ex conversion specification.
5280		
5281	<b>era_t_fmt</b>	Define the locale's appropriate alternative time format, corresponding to the %EX conversion specification.
5282		
5283	<b>era_d_t_fmt</b>	Define the locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
5284		
5285	<b>alt_digits</b>	Define alternative symbols for digits, corresponding to the %O modified conversion specification. The operand shall consist of <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The %O modifier shall indicate that the string corresponding to the value specified via the conversion specification shall be used instead of the value.
5286		
5287		
5288		
5289		
5290		
5291		
5292		
5293	7.3.5.2	<i>LC_TIME C-Language Access</i>
5294		The following constants used to identify items of <i>langinfo</i> data can be used as arguments to the <i>nl_langinfo()</i> function to access information in the <i>LC_TIME</i> category. These constants are defined in the <b>&lt;langinfo.h&gt;</b> header.
5295		
5296		
5297	<b>ABDAY_x</b>	The abbreviated weekday names (for example, Sun), where <i>x</i> is a number from 1 to 7.
5298		
5299	<b>DAY_x</b>	The full weekday names (for example, Sunday), where <i>x</i> is a number from 1 to 7.
5300		
5301	<b>ABMON_x</b>	The abbreviated month names (for example, Jan), where <i>x</i> is a number from 1 to 12.
5302		
5303	<b>ABALTMON_x</b>	The alternative abbreviated month names (for example, Jan), where <i>x</i> is a number from 1 to 12.
5304		
5305	<b>MON_x</b>	The full month names (for example, January), where <i>x</i> is a number from 1 to 12.
5306		
5307	<b>ALTMON_x</b>	The alternative full month names (for example, January), where <i>x</i> is a number from 1 to 12.
5308		
5309	<b>D_T_FMT</b>	The appropriate date and time representation.
5310	<b>D_FMT</b>	The appropriate date representation.
5311	<b>T_FMT</b>	The appropriate time representation.
5312	<b>AM_STR</b>	The appropriate ante-meridiem affix; if <b>AM_STR</b> and <b>PM_STR</b> are both empty strings, the 12-hour format is not supported in the locale.
5313		
5314	<b>PM_STR</b>	The appropriate post-meridiem affix; if <b>AM_STR</b> and <b>PM_STR</b> are both empty strings, the 12-hour format is not supported in the locale.
5315		
5316	<b>T_FMT_AMPM</b>	The appropriate time representation in the 12-hour clock format; if the 12-hour format is not supported in the locale, this shall be either an empty string or a string specifying a 24-hour clock format.
5317		
5318		
5319	<b>ERA</b>	The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:
5320		
5321		

5322		<i>direction:offset:start_date:end_date:era_name:era_format</i>
5323		according to the definitions below. There can be as many era description
5324		segments as are necessary to describe the different eras. Era description
5325		segments are separated by <semicolon> characters.
5326	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate
5327		that years closer to the <i>start_date</i> have lower numbers than those
5328		closer to the <i>end_date</i> . The '-' character shall indicate that years
5329		closer to the <i>start_date</i> have higher numbers than those closer to
5330		the <i>end_date</i> .
5331	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era.
5332	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the
5333		year, month, and day numbers respectively of the start of the era.
5334		Years prior to AD 1 shall be represented as negative numbers.
5335	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
5336		or one of the two special values "-*" or "+*". The value "-*"
5337		shall indicate that the ending date is the beginning of time. The
5338		value "+*" shall indicate that the ending date is the end of time.
5339	<i>era_name</i>	The era, corresponding to the %EC conversion specification.
5340	<i>era_format</i>	The format of the year in the era, corresponding to the %EY
5341		conversion specification.
5342	ERA_D_FMT	The era date format.
5343	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX
5344		conversion specification.
5345	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to
5346		the %Ec conversion specification.
5347	ALT_DIGITS	The alternative symbols for digits, corresponding to the %O conversion
5348		specification modifier. The value consists of <semicolon>-separated symbols.
5349		The first is the alternative symbol corresponding to zero, the second is the
5350		symbol corresponding to one, and so on. Up to 100 alternative symbols may
5351		be specified.

5352 7.3.5.3 LC\_TIME Category in the POSIX Locale

5353 The LC\_TIME category definition of the POSIX locale follows; the code listing depicts the

5354 *localedef* input; the table represents the same information with the addition of *localedef* keywords,

5355 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*

5356 functions, and *nl\_langinfo()* constants.

```

5357 LC_TIME
5358 # This is the POSIX locale definition for
5359 # the LC_TIME category.
5360 #
5361 # Abbreviated weekday names (%a)
5362 abday      "<S><u><n>"; "<M><o><n>"; "<T><u><e>"; "<W><e><d>"; \
5363           "<T><h><u>"; "<F><r><i>"; "<S><a><t>"
5364 #
5365 # Full weekday names (%A)
5366 day       "<S><u><n><d><a><y>"; "<M><o><n><d><a><y>"; \

```

```

5367         "<T><u><e><s><d><a><y>"; "<W><e><d><n><e><s><d><a><y>"; \
5368         "<T><h><u><r><s><d><a><y>"; "<F><r><i><d><a><y>"; \
5369         "<S><a><t><u><r><d><a><y>"
5370     #
5371     # Abbreviated month names (%b)
5372     abmon      "<J><a><n>"; "<F><e><b>"; "<M><a><r>"; \
5373              "<A><p><r>"; "<M><a><y>"; "<J><u><n>"; \
5374              "<J><u><l>"; "<A><u><g>"; "<S><e><p>"; \
5375              "<O><c><t>"; "<N><o><v>"; "<D><e><c>"
5376     #
5377     # Full month names (%B)
5378     mon        "<J><a><n><u><a><r><y>"; "<F><e><b><r><u><a><r><y>"; \
5379              "<M><a><r><c><h>"; "<A><p><r><i><l>"; \
5380              "<M><a><y>"; "<J><u><n><e>"; \
5381              "<J><u><l><y>"; "<A><u><g><u><s><t>"; \
5382              "<S><e><p><t><e><m><b><e><r>"; "<O><c><t><o><b><e><r>"; \
5383              "<N><o><v><e><m><b><e><r>"; "<D><e><c><e><m><b><e><r>"
5384     #
5385     # Equivalent of AM/PM (%p)          "AM"; "PM"
5386     am_pm      "<A><M>"; "<P><M>"
5387     #
5388     # Appropriate date and time representation (%c)
5389     #      "%a %b %e %H:%M:%S %Y"
5390     d_t_fmt     "<percent-sign><a><space><percent-sign><b>\
5391     <space><percent-sign><e><space><percent-sign><H>\
5392     <colon><percent-sign><M><colon><percent-sign><S>\
5393     <space><percent-sign><Y>"
5394     #
5395     # Appropriate date representation (%x)  "%m/%d/%y"
5396     d_fmt       "<percent-sign><m><slash><percent-sign><d>\
5397     <slash><percent-sign><y>"
5398     #
5399     # Appropriate time representation (%X)  "%H:%M:%S"
5400     t_fmt       "<percent-sign><H><colon><percent-sign><M>\
5401     <colon><percent-sign><S>"
5402     #
5403     # Appropriate 12-hour time representation (%r) "%I:%M:%S %p"
5404     t_fmt_ampm  "<percent-sign><I><colon><percent-sign><M><colon>\
5405     <percent-sign><S><space><percent-sign><p>"
5406     #
5407     END LC_TIME

```

5487 The entry N/A indicates the value is not available in the POSIX locale.

5488 **7.3.6 LC\_MESSAGES**

5489 The *LC\_MESSAGES* category shall define the format and values used by various utilities for  
 5490 affirmative and negative responses. This information is available through the *nl\_langinfo()*  
 5491 function.

5492 The message catalog used by the standard utilities and selected by the *catopen()* function shall be  
 5493 determined by the setting of *NLSPATH*; see [Chapter 8](#) (on page 167). The *LC\_MESSAGES*  
 5494 category can be specified as part of an *NLSPATH* substitution field.

5495 The following keywords shall be recognized as part of the locale definition file.

5496 **copy** Specify the name of an existing locale which shall be used as the definition of this  
 5497 category. If this keyword is specified, no other keyword shall be specified.

5498 **Note:** This is a *localedef* keyword, unavailable through *nl\_langinfo()*.

5499 **yesexpr** The operand consists of an extended regular expression (see [Section 9.4](#), on page  
 5500 187) that describes acceptable affirmative responses to a question expecting an  
 5501 affirmative or negative response.

5502 **noexpr** The operand consists of an extended regular expression that describes acceptable  
 5503 negative responses to a question expecting an affirmative or negative response.

5504 **7.3.6.1 LC\_MESSAGES Category in the POSIX Locale**

5505 The format and values for affirmative and negative responses of the POSIX locale follow; the  
 5506 code listing depicting the *localedef* input, the table representing the same information with the  
 5507 addition of *nl\_langinfo()* constants.

```

5508 LC_MESSAGES
5509 # This is the POSIX locale definition for
5510 # the LC_MESSAGES category.
5511 #
5512 yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
5513 #
    
```

```

5514 noexpr "<circumflex><left-square-bracket><n><N><right-square-bracket>"
5515 #
5516 END LC_MESSAGES
    
```

	localedef Keyword	langinfo Constant	POSIX Locale Value
5517			
5518	yesexpr	YESEXPR	"^[yY]"
5519	noexpr	NOEXPR	"^[nN]"

## 5520 7.4 Locale Definition Grammar

5521 The grammar and lexical conventions in this section shall together describe the syntax for the  
 5522 locale definition source. The general conventions for this style of grammar are described in XCU  
 5523 [Section 1.3](#) (on page 2461). The grammar shall take precedence over the text in this chapter.

### 5524 7.4.1 Locale Lexical Conventions

5525 The lexical conventions for the locale definition grammar are described in this section.

5526 The following tokens shall be processed (in addition to those string constants shown in the  
 5527 grammar):

- 5528 **LOC\_NAME** A string of characters representing the name of a locale.
- 5529 **CHAR** Any single character.
- 5530 **NUMBER** A decimal number, represented by one or more decimal digits.
- 5531 **COLLSYMBOL** A symbolic name, enclosed between angle brackets. The string  
 5532 cannot duplicate any charmap symbol defined in the current  
 5533 charmap (if any), or a **COLLELEMENT** symbol.
- 5534 **COLLELEMENT** A symbolic name, enclosed between angle brackets, which cannot  
 5535 duplicate either any charmap symbol or a **COLLSYMBOL** symbol.
- 5536 **CHARCLASS** A string of alphanumeric characters from the portable character set,  
 5537 the first of which is not a digit, consisting of at least one and at most  
 5538 {CHARCLASS\_NAME\_MAX} bytes, and optionally surrounded by  
 5539 double-quotes.
- 5540 **CHARSYMBOL** A symbolic name, enclosed between angle brackets, from the current  
 5541 charmap (if any).
- 5542 **OCTAL\_CHAR** One or more octal representations of the encoding of each byte in a  
 5543 single character. The octal representation consists of an escape  
 5544 character (normally a <backslash>) followed by two or more octal  
 5545 digits.
- 5546 **HEX\_CHAR** One or more hexadecimal representations of the encoding of each  
 5547 byte in a single character. The hexadecimal representation consists of  
 5548 an escape character followed by the constant *x* and two or more  
 5549 hexadecimal digits.
- 5550 **DECIMAL\_CHAR** One or more decimal representations of the encoding of each byte in  
 5551 a single character. The decimal representation consists of an escape  
 5552 character followed by a character 'd' and two or more decimal  
 5553 digits.

5554	<b>ELLIPSIS</b>	The string "...".
5555	<b>EXTENDED_REG_EXP</b>	An extended regular expression as defined in the grammar in <a href="#">Section 9.5</a> (on page 191).
5556		
5557	<b>EOL</b>	The line termination character <newline>.

## 5558 7.4.2 Locale Grammar

5559 This section presents the grammar for the locale definition.

# Environment Variables

## 8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of POSIX.1-2024 for information on environment variable usage.

The value of an environment variable is an arbitrary sequence of bytes, except for the null byte. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain any bytes that have the encoded value of the character '='. For values to be portable across systems conforming to POSIX.1-2024, the value shall be composed of bytes that have the encoded value of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in an environment of a process has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of POSIX.1-2024 consist solely of uppercase letters, digits, and the <underscore> ('\_') from the characters defined in Table 6-1 (on page 117) and do not begin with a digit. Other characters, and byte sequences that do not form valid characters, may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

**Note:** Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG\_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, assigning a new value to the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-2024.

If the application modifies the pointers to which *environ* points, the behavior of all interfaces described in the System Interfaces volume of POSIX.1-2024 is undefined.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

5856	FC	LFLAGS	OPTARG	TMPDIR
5857	FCEDIT	LINENO	OPTERR	TZ
5858	FFLAGS	LINES	OPTIND	USER
5859	GET	LISTER	PAGER	VISUAL
5860	GFLAGS	LOGNAME	PATH	YACC
5861	HISTFILE	LPDEST	PPID	YFLAGS
5862	HISTORY	MAIL	PRINTER	
5863	HISTSIZE	MAILCHECK	PROCLANG	
5864	HOME	MAILER	PROJECTDIR	

5865 Additionally, a subset of the above variables are manipulated by shell built-in utilities outside of  
 5866 shell assignments. If an attempt is made to mark any of the following variables as *readonly*, then  
 5867 either the *readonly* utility shall reject the attempt, or *readonly* shall succeed but the shell can still  
 5868 modify the variables outside of assignment context, or *readonly* shall succeed but use of a shell  
 5869 built-in that would otherwise modify such a variable shall fail.

5870 *LINENO*  
 5871 *OLDPWD*  
 5872 *OPTARG*  
 5873 *OPTIND*  
 5874 *PWD*

5875 Implementations may provide an implementation-defined set of additional variables which are  
 5876 manipulated by implementation-specific built-in utilities not defined in this standard. The  
 5877 *readonly* utility shall not reject marking these additional variables as *readonly*, but when marked  
 5878 *readonly*, those extension utilities shall either continue to modify the variables, or shall fail  
 5879 because the variable is *readonly*. None of the variables defined by this standard shall be in this  
 5880 implementation-defined set.

5881 If the variables in the following two sections are present in the environment during the  
 5882 execution of an application or utility, they shall be given the meaning described below. Some are  
 5883 placed into the environment by the implementation at the time the user logs in; all can be added  
 5884 or changed by the user or any ancestor of the current process. The implementation adds or  
 5885 changes environment variables named in POSIX.1-2024 only as specified in POSIX.1-2024. If  
 5886 they are defined in the application's environment, the utilities in the Shell and Utilities volume  
 5887 of POSIX.1-2024 and the functions in the System Interfaces volume of POSIX.1-2024 assume they  
 5888 have the specified meaning. Conforming applications shall not set these environment variables  
 5889 to have meanings other than as described. See *getenv()* (on page 1120) and XCU Section 2.13 (on  
 5890 page 2522) for methods of accessing these variables.

5891 Implementations may ignore some environment variables at the point of use for security  
 5892 reasons, for example in programs whose real and effective user IDs or real and effective group  
 5893 IDs were not equal at program startup. The behavior shall be as if the implementation obtains  
 5894 the values for these environment variables using *secure\_getenv()* instead of *getenv()* (see

5895 `getenv()`; they shall not be removed from the environment of affected processes and shall be  
 5896 inherited as required by this standard.

## 5897 8.2 Internationalization Variables

5898 This section describes environment variables that are relevant to the operation of  
 5899 internationalized interfaces described in POSIX.1-2024.

5900 Users may use the following environment variables to announce specific localization  
 5901 requirements to applications. Applications can retrieve this information using the `setlocale()`  
 5902 function to initialize the correct behavior of the internationalized interfaces. The descriptions of  
 5903 the internationalization environment variables describe the resulting behavior only when the  
 5904 application locale is initialized in this way. The use of the internationalization variables by  
 5905 utilities described in the Shell and Utilities volume of POSIX.1-2024 is described in the  
 5906 ENVIRONMENT VARIABLES section for those utilities in addition to the global effects  
 5907 described in this section.

5908 **LANG** This variable shall determine the locale category for native language, local  
 5909 customs, and coded character set in the absence of the `LC_ALL` and other `LC_*`  
 5910 (`LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`,  
 5911 `LC_TIME`) environment variables. This can be used by applications to determine  
 5912 the language to use for error messages and instructions, collating sequences, date  
 5913 formats, and so on.

### 5914 LANGUAGE

5915 The `LANGUAGE` environment variable shall be examined to determine the  
 5916 messages object to be used for the `gettext` family of functions or the `gettext` and  
 5917 XSI `ngettext` utilities if `NLSPATH` is not set or the evaluation of `NLSPATH` did not lead  
 5918 to a suitable messages object being found. The value of `LANGUAGE` shall be a list  
 5919 of locale names separated by a <colon> (':') character. If `LANGUAGE` is set to a  
 5920 non-empty string, each locale name shall be tried in the specified order and if a  
 5921 messages object is found, it shall be used for translation. If a locale name has the  
 5922 format `language[_territory][.codeset][@modifier]`, additional searches of locale names  
 5923 without `.codeset` (if present), without `_territory` (if present), and without `@modifier` (if  
 5924 present) may be performed; if `.codeset` is not present, additional searches of locale  
 5925 names with an added `.codeset` may be performed. If locale names contain a <slash>  
 5926 ('/') character, or consist entirely of a dot (".") or dot-dot (". .") character  
 5927 sequence, or are empty the behavior is implementation defined and they may be  
 5928 ignored for security reasons.

5929 The locale names in `LANGUAGE` shall override the locale name associated with  
 5930 the "active category" of the current locale or, in the case of functions with an `_l`  
 5931 suffix, the provided locale object, and the language-specific part of the default  
 5932 search path for messages objects, unless the locale name that would be overridden  
 5933 is C or POSIX. For the `dcgettext()`, `dcgettext_l()`, `dcngettext()`, and `dcngettext_l()`  
 5934 functions, the active category is specified by the `category` argument; for all other  
 5935 `gettext` family functions and for the `gettext` and `ngettext` utilities, the active category  
 5936 is `LC_MESSAGES`.

5937 For example, if:

- 5938 • The `LC_MESSAGES` environment variable is "de\_DE" (and `LC_ALL` is unset)
- 5939 and `setlocale(LC_ALL, "")` has been used to set the current locale

- 5940 • The *LANGUAGE* environment variable is "fr\_FR:it"
  - 5941 • Messages objects are by default searched for in **/gettextlib**
- 5942 then the following pathnames are tried in this order by *gettext* family functions that  
 5943 have neither a category argument nor an *\_l* suffix until a valid messages object is  
 5944 found:
- 5945 • **/gettextlib/fr\_FR/LC\_MESSAGES/textdomain.mo**
  - 5946 • (Optionally) **/gettextlib/fr/LC\_MESSAGES/textdomain.mo**
  - 5947 • (Optionally) the above two pathnames with added *.codeset* elements
  - 5948 • **/gettextlib/it/LC\_MESSAGES/textdomain.mo**
  - 5949 • (Optionally) the above pathname with added *.codeset* elements
  - 5950 • **/gettextlib/de\_DE/LC\_MESSAGES/textdomain.mo**
- 5951 *LC\_ALL* This variable shall determine the values for all locale categories. The value of the  
 5952 *LC\_ALL* environment variable has precedence over any of the other environment  
 5953 variables starting with *LC\_* (*LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*,  
 5954 *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*) and the *LANG* environment variable.
- 5955 *LC\_COLLATE*  
 5956 This variable shall determine the locale category for character collation. It  
 5957 determines collation information for regular expressions and sorting, including  
 5958 equivalence classes and multi-character collating elements, in various utilities and  
 5959 the *strcoll()* and *strxfrm()* functions. Additional semantics of this variable, if any,  
 5960 are implementation-defined.
- 5961 *LC\_CTYPE* This variable shall determine the locale category for character handling functions,  
 5962 such as *tolower()*, *toupper()*, and *isalpha()*. This environment variable determines  
 5963 the interpretation of sequences of bytes of text data as characters (for example,  
 5964 single as opposed to multi-byte characters), the classification of characters (for  
 5965 example, alpha, digit, graph), and the behavior of character classes. Additional  
 5966 semantics of this variable, if any, are implementation-defined.
- 5967 *LC\_MESSAGES*  
 5968 This variable shall determine the locale category for processing affirmative and  
 5969 negative responses and the language and cultural conventions in which messages  
 5970 should be written. It also affects the behavior of the *catopen()* function in  
 5971 determining the message catalog. Additional semantics of this variable, if any, are  
 5972 implementation-defined. The language and cultural conventions of diagnostic and  
 5973 informative messages whose format is unspecified by POSIX.1-2024 should be  
 5974 affected by the setting of *LC\_MESSAGES*.
- 5975 *LC\_MONETARY*  
 5976 This variable shall determine the locale category for monetary-related numeric  
 5977 formatting information. Additional semantics of this variable, if any, are  
 5978 implementation-defined.
- 5979 *LC\_NUMERIC*  
 5980 This variable shall determine the locale category for numeric formatting (for  
 5981 example, thousands separator and radix character) information in various utilities  
 5982 as well as the formatted I/O operations in *printf()* and *scanf()* and the string  
 5983 conversion functions in *strtod()*. Additional semantics of this variable, if any, are  
 5984 implementation-defined.

5985		<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in <i>strftime()</i> . Additional semantics of this variable, if any, are implementation-defined.
5986			
5987			
5988	XSI	<i>NLSPATH</i>	This variable shall contain a sequence of templates to be used by <i>catopen()</i> when attempting to locate message catalogs, and by the <i>gettext</i> family of functions when locating messages objects. Each template consists of an optional prefix, one or more conversion specifications, and an optional suffix.
5989			
5990			
5991			
5992			The conversion specification descriptions below refer to a "currently active text domain". The currently active text domain is, in decreasing order of precedence:
5993			
5994			• The <i>domain</i> parameter of the <i>gettext</i> family of functions or the <i>gettext</i> and <i>ngettext</i> utilities
5995			
5996			• The text domain bound by the last call to <i>textdomain()</i> when using a <i>gettext</i> family function, or the <i>TEXTDOMAIN</i> environment variable when using the <i>gettext</i> and <i>ngettext</i> utilities
5997			
5998			
5999			• The default text domain
6000			Conversion specifications consist of a '%' symbol, followed by a single-letter keyword. The following conversion specifications are currently defined:
6001			
6002		%N	The value of the <i>name</i> parameter passed to <i>catopen()</i> or the currently active text domain of the <i>gettext</i> family of functions and the <i>gettext</i> and <i>ngettext</i> utilities (see above).
6003			
6004			
6005		%L	The locale name given by the value of the active category (see <i>LANGUAGE</i> above) in either the current locale or, in the case of functions with an <i>_l</i> suffix, the provided locale object.
6006			
6007			
6008		%l	The <i>language</i> element of the locale name that would result from a %L conversion.
6009			
6010		%t	The <i>territory</i> element of the locale name that would result from a %L conversion.
6011			
6012		%c	The <i>codeset</i> element of the locale name that would result from a %L conversion.
6013		%%	A single '%' character.
6014			An empty string shall be substituted if the specified value is not currently defined. The separators <underscore> ('_') and <period> ('.') shall not be included in the %t and %c conversion specifications.
6015			
6016			
6017			Templates defined in <i>NLSPATH</i> are separated by <colon> characters (':'). A leading, trailing, or two adjacent <colon> characters ("::") shall be equivalent to specifying %N.
6018			
6019			
6020			Since <colon> is a separator in this context, directory names that might be used in <i>NLSPATH</i> should not include a <colon> character.
6021			
6022			Example 1, for an application that uses <i>catopen()</i> but does not use the <i>gettext</i> family of functions:
6023			
6024			<code>NLSPATH="/system/nlslib/%N.cat"</code>
6025			indicates that <i>catopen()</i> should look for all message catalogs in the directory <code>/system/nlslib</code> , where the catalog name should be constructed from the <i>name</i> argument (replacing %N) passed to <i>catopen()</i> , with the suffix <code>.cat</code> .
6026			
6027			

6028 Example 2, for an application that uses the *gettext* family of functions but does not  
6029 use *catopen()*:

```
6030 NLSPATH="/usr/lib/locale/fr/LC_MESSAGES/%N.mo"
```

6031 indicates that the *gettext* family of functions (and the *gettext* and *ngettext* utilities)  
6032 should look for all messages objects in the directory  
6033 */usr/lib/locale/fr/LC\_MESSAGES*, where the messages object's name should be  
6034 constructed from the currently active text domain (replacing %N), with the suffix  
6035 **.mo**.

6036 Example 3, for an application that uses *catopen()* but does not use the *gettext* family  
6037 of functions:

```
6038 NLSPATH=":%N.cat:/nlslib/%L/%N.cat"
```

6039 indicates that *catopen()* should look for the requested message catalog in *name*,  
6040 *name.cat*, and */nlslib/localename/name.cat*, where *localename* is the locale name given  
6041 by the value of the *LC\_MESSAGES* category of the current locale.

6042 Example 4, for an application that uses the *gettext* family of functions but does not  
6043 use *catopen()*:

```
6044 NLSPATH="/usr/lib/locale/%L/%N.mo:/usr/lib/locale/fr/%N.mo"
```

6045 indicates that the *gettext* family of functions (and the *gettext* and *ngettext* utilities)  
6046 should look for all messages objects first in  
6047 */usr/lib/locale/localename/textdomain.mo*, and if not found there, then try in  
6048 */usr/lib/locale/fr/textdomain.mo*, where *localename* is the locale name given by the  
6049 value of the active category in the current locale or provided locale object.

6050 Example 5, for an application that uses *catopen()* and the *gettext* family of  
6051 functions:

```
6052 NLSPATH="/usr/lib/locale/%L/%N.mo:/system/nlslib/%L/%N.cat"
```

6053 indicates that the *gettext* family of functions (and the *gettext* and *ngettext* utilities)  
6054 should look for all messages objects in */usr/lib/locale/localename/textdomain.mo*,  
6055 where *localename* is the locale name given by the value of the active category in the  
6056 current locale or provided locale object. Also, *catopen()* should look for all message  
6057 catalogs in the directory */system/nlslib/localename/name.cat*, (assuming that  
6058 */usr/lib/locale/localename/name.mo* is not a message catalog). In this scenario,  
6059 *catopen()* ignores all files that are not valid message catalogs while traversing  
6060 *NLSPATH*. Furthermore, the *gettext* family of functions and the *gettext* and *ngettext*  
6061 utilities ignore all files that are not valid messages objects found while traversing  
6062 *NLSPATH*.

6063 Users should not set the *NLSPATH* variable unless they have a specific reason to  
6064 override the default system path. Setting *NLSPATH* to override the default system  
6065 path may produce undefined results in the standard utilities other than *gettext* and  
6066 *ngettext*, and in applications with appropriate privileges.

6067 Specifying a relative pathname in the *NLSPATH* environment variable should be  
6068 avoided without a specific reason, including the use of a leading, trailing, or two  
6069 adjacent <colon> characters, since it may result in messages objects being searched  
6070 for in a directory relative to the current working directory of the calling process; if  
6071 the process calls the *chdir()* function, the directory searched for may also be  
6072 changed.

6073 *TEXTDOMAIN*  
 6074 Specify the text domain name that the *gettext* and *ngettext* utilities use during the  
 6075 search for messages objects. This is identical to the messages object filename  
 6076 without the **.mo** suffix.

6077 *TEXTDOMAINDIR*  
 6078 Specify the pathname to the root directory of the messages object hierarchy the  
 6079 *gettext* and *ngettext* utilities use during the search for messages objects. If present, it  
 6080 XSI shall replace the default root directory pathname. *NLSPATH* has precedence over  
 6081 *TEXTDOMAINDIR*.

6082 The environment variables *LANG*, *LC\_ALL*, *LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*,  
 6083 *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*, and *NLSPATH* provide for the support of  
 6084 internationalized applications. The standard utilities shall make use of these environment  
 6085 variables as described in this section and the individual ENVIRONMENT VARIABLES sections  
 6086 for the utilities. See [Section 7.1](#) (on page 127) for the consequences of setting these variables to  
 6087 locales with different character sets.

6088 The values of locale categories shall be determined by a precedence order; the first condition met  
 6089 below determines the value:

- 6090 1. If the *LC\_ALL* environment variable is defined and is not null, the value of *LC\_ALL* shall  
 6091 be used.
- 6092 2. If the *LC\_\** environment variable (*LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*,  
 6093 *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*) is defined and is not null, the value of the  
 6094 environment variable shall be used to initialize the category that corresponds to the  
 6095 environment variable.
- 6096 3. If the *LANG* environment variable is defined and is not null, the value of the *LANG*  
 6097 environment variable shall be used.
- 6098 4. Otherwise, the implementation-defined default locale shall be used.

6099 If the locale value is "C" or "POSIX", the POSIX locale shall be used and the standard utilities  
 6100 behave in accordance with the rules in [Section 7.2](#) (on page 128) for the associated category.

6101 If the locale value begins with a <slash>, it shall be interpreted as the pathname of a file that was  
 6102 created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*.  
 6103 Referencing such a pathname shall result in that locale being used for the indicated category.

6104 XSI If the locale value has the form:

```
6105 language[_territory] [.codeset]
```

6106 it refers to an implementation-provided locale, where settings of language, territory, and codeset  
 6107 are implementation-defined.

6108 *LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*, *LC\_MONETARY*, *LC\_NUMERIC*, and *LC\_TIME* are  
 6109 defined to accept an additional field *@modifier*, which allows the user to select a specific instance  
 6110 of localization data within a single category (for example, for selecting the dictionary as opposed  
 6111 to the character ordering of data). The syntax for these environment variables is thus defined as:

```
6112 [language[_territory] [.codeset] [@modifier]]
```

6113 For example, if a user wanted to interact with the system in French, but required to sort German  
 6114 text files, *LANG* and *LC\_COLLATE* could be defined as:

```
6115 LANG=Fr_FR
```

```
6116 LC_COLLATE=De_DE
```

6117 This could be extended to select dictionary collation (say) by use of the `@modifier` field; for  
 6118 example:  
 6119 `LC_COLLATE=De_DE@dict`

6120 An implementation may support other formats.

6121 If the locale value is not recognized by the implementation, the behavior is unspecified.

6122 These environment variables are used by the `newlocale()` and `setlocale()` functions, and by the  
 6123 standard utilities.

6124 Additional criteria for determining a valid locale name are implementation-defined.

### 6125 8.3 Other Environment Variables

6126 **COLUMNS** This variable shall represent a decimal integer >0 used to indicate the user's  
 6127 preferred width in column positions for the terminal screen or window; see  
 6128 [Section 3.75](#) (on page 42). If this variable is unset or null, the number of  
 6129 columns shall be set according to the terminal window size (see XSH  
 6130 `tcgetwinsize()`); if the terminal window size cannot be obtained, the  
 6131 implementation determines the number of columns, appropriate for the  
 6132 terminal or window, in an unspecified manner. When **COLUMNS** is set, the  
 6133 number of columns in the terminal window size and any terminal-width  
 6134 information implied by **TERM** are overridden. Users and conforming  
 6135 applications should not set **COLUMNS** unless they wish to override the  
 6136 system selection and produce output unrelated to the terminal characteristics.

6137 Users should not need to set this variable in the environment unless there is a  
 6138 specific reason to override the implementation's default behavior, such as to  
 6139 display data in an area arbitrarily smaller than the terminal or window.

6140 XSI **DATEMSK** Indicates the pathname of the template file used by `getdate()`.

6141 **HOME** The system shall initialize this variable at the time of login to be a pathname of  
 6142 the user's home directory. See [<pwd.h>](#).

6143 **LINES** This variable shall represent a decimal integer >0 used to indicate the user's  
 6144 preferred number of lines on a page or the vertical screen or window size in  
 6145 lines. A line in this case is a vertical measure large enough to hold the tallest  
 6146 character in the character set being displayed. If this variable is unset or null,  
 6147 the number of lines shall be set either to the number of rows in the terminal  
 6148 window size (see XSH `tcgetwinsize()`) or to a smaller number if appropriate for  
 6149 the terminal or window (for example, if the terminal baud rate is low); if the  
 6150 terminal window size cannot be obtained, the implementation determines the  
 6151 number of lines, appropriate for the terminal or window, in an unspecified  
 6152 manner. When **LINES** is set, the number of rows in the terminal window size  
 6153 and any terminal-height information implied by **TERM** are overridden. Users  
 6154 and conforming applications should not set **LINES** unless they wish to  
 6155 override the system selection and produce output unrelated to the terminal  
 6156 characteristics.

6157 Users should not need to set this variable in the environment unless there is a  
 6158 specific reason to override the implementation's default behavior, such as to  
 6159 display data in an area arbitrarily smaller than the terminal or window.

6160		<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's login name. See <a href="#">&lt;pwd.h&gt;</a> . For a value of <i>LOGNAME</i> to be portable across implementations of POSIX.1-2024, the value should be composed of characters from the portable filename character set.
6161			
6162			
6163			
6164	XSI	<i>MSGVERB</i>	Describes which message components shall be used in writing messages by <i>fntmsg()</i> .
6165			
6166		<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file. The prefixes shall be separated by a <colon> (' : '). If the pathname being sought contains no <slash> (' / ') characters, and hence is a filename, the list shall be searched from beginning to end, applying the filename to each prefix and attempting to resolve the resulting pathname (see <a href="#">Section 4.16</a> , on page 105), until an executable file with appropriate execution permissions is found. When a non-zero-length prefix is applied to this filename, a <slash> shall be inserted between the prefix and the filename if the prefix did not end in <slash>. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent <colon> characters (" : : "), as an initial <colon> preceding the rest of the list, or as a trailing <colon> following the rest of the list. A strictly conforming application shall use an actual pathname (such as .) to represent the current working directory in <i>PATH</i> . If the pathname being sought contains any <slash> characters, the search through the path prefixes shall not be performed and the pathname shall be resolved as described in <a href="#">Section 4.16</a> (on page 105). If <i>PATH</i> is unset or is set to null, or if a path prefix in <i>PATH</i> contains a <percent-sign> character (' % '), the path search is implementation-defined.
6167			
6168			
6169			
6170			
6171			
6172			
6173			
6174			
6175			
6176			
6177			
6178			
6179			
6180			
6181			
6182			
6183			
6184			
6185			Since <colon> is a separator in this context, directory names that might be used in <i>PATH</i> should not include a <colon> character. Since <percent-sign> may have an implementation-defined meaning when searching for built-in utilities, directory names in <i>PATH</i> to be used to search for non-built-in utilities should not contain a <percent-sign> character.
6186			
6187			
6188			
6189			
6190		<i>PWD</i>	This variable shall represent an absolute pathname of the current working directory. It shall not contain any components that are dot or dot-dot. The value is set by the <i>cd</i> utility, and by the <i>sh</i> utility during initialization.
6191			
6192			
6193		<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in XCU <a href="#">Chapter 2</a> (on page 2472), utilities may behave differently from those described in POSIX.1-2024.
6194			
6195			
6196			
6197		<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for programs that need a place to create temporary files.
6198			
6199		<i>TERM</i>	This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.
6200			
6201			
6202			
6203		<i>TZ</i>	This variable shall represent timezone information. The contents of the environment variable named <i>TZ</i> shall be used by the <i>ctime()</i> , <i>localtime()</i> , <i>localtime_r()</i> , <i>strftime()</i> , and <i>mktime()</i> functions, and by various utilities, to override the default timezone. The application shall ensure that the value of <i>TZ</i> is in one of the three formats (spaces inserted for clarity):
6204			
6205			
6206			
6207			

6208                    : *characters*

6209                    or:

6210                    *std offset dst offset, rule*

6211                    or:

6212                    A format specifying a geographical timezone or a special timezone.

6213                    If *TZ* is of the first format (that is, if the first character is a <colon>), the

6214                    characters following the <colon> are handled in an implementation-defined

6215                    manner.

6216                    The expanded form of the second format (without the inserted spaces) is as

6217                    follows:

6218                    *stdoffset [dst [offset] [, start [/time], end [/time]]]*

6219                    Where:

6220                    *std* and *dst*   Indicate no less than three, nor more than {TZNAME\_MAX},

6221                    bytes that are the designation for the standard (*std*) or the

6222                    Daylight Saving (*dst*) timezone. Only *std* is required; if *dst* is

6223                    missing, then Daylight Saving Time does not apply in this locale.

6224                    **Note:**     The usage of the terms “Standard Time” and “Daylight

6225                    Saving Time” is not necessarily related to any legislated

6226                    timezone.

6227                    Each of these fields may occur in either of two formats quoted or

6228                    unquoted:

6229                    — In the quoted form, the first character shall be the <less-

6230                    than-sign> ('<') character and the last character shall be

6231                    the <greater-than-sign> ('>') character. All characters

6232                    between these quoting characters shall be alphanumeric

6233                    characters from the portable character set in the current

6234                    locale, the <plus-sign> ('+') character, or the <hyphen-

6235                    minus> ('-') character. The *std* and *dst* fields in this case

6236                    shall not include the quoting characters and the quoting

6237                    characters do not contribute to the three byte minimum

6238                    length and {TZNAME\_MAX} maximum length.

6239                    — In the unquoted form, all characters in these fields shall be

6240                    alphabetic characters from the portable character set in the

6241                    current locale.

6242                    The interpretation of *std* and, if present, *dst* is unspecified if the

6243                    field is less than three bytes or more than {TZNAME\_MAX}

6244                    bytes, or if it contains characters other than those specified.

6245                    *offset*       Indicates the value added to the local time to arrive at

6246                    Coordinated Universal Time. The *offset* has the form:

6247                    *hh[:mm[:ss]]*

6248                    The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*)

6249                    shall be required and may be a single digit. The *offset* following

6250                    *std* shall be required. If no *offset* follows *dst*, Daylight Saving

6251                    Time is assumed to be one hour ahead of standard time. One or

6252                    more digits may be used; the value is always interpreted as a

6253		decimal number. The hour shall be between zero and 24, and the
6254		minutes (and seconds)—if present—between zero and 59. The
6255		result of using values outside of this range is unspecified. If
6256		preceded by a '-', the timezone shall be east of the Prime
6257		Meridian; otherwise, it shall be west (which may be indicated by
6258		an optional preceding '+').
6259	<i>rule</i>	Indicates when to change from standard time to Daylight Saving
6260		Time, and when to change back. The <i>rule</i> has the form:
6261		<i>date</i> [/ <i>time</i> ], <i>date</i> [/ <i>time</i> ]
6262		where the first <i>date</i> describes when the change from standard
6263		time to Daylight Saving Time occurs and the second <i>date</i>
6264		describes when it ends; if the second <i>date</i> is specified as earlier in
6265		the year than the first, then the year begins and ends in Daylight
6266		Saving Time. Each <i>time</i> field describes when, in current local
6267		time, the change to the other time is made.
6268		The format of <i>date</i> is one of the following:
6269	<i>Jn</i>	The Julian day <i>n</i> ( $1 \leq n \leq 365$ ). Leap days shall not be
6270		counted. That is, in all years—including leap years—
6271		February 28 is day 59 and March 1 is day 60. It is
6272		impossible to refer explicitly to the occasional February
6273		29.
6274	<i>n</i>	The zero-based Julian day ( $0 \leq n \leq 365$ ). Leap days shall
6275		be counted, and it is possible to refer to February 29.
6276	<i>Mm.n.d</i>	The <i>d</i> 'th day ( $0 \leq d \leq 6$ ) of week <i>n</i> of month <i>m</i> of the
6277		year ( $1 \leq n \leq 5, 1 \leq m \leq 12$ , where week 5 means "the last
6278		<i>d</i> day in month <i>m</i> " which may occur in either the fourth
6279		or the fifth week). Week 1 is the first week in which the
6280		<i>d</i> 'th day occurs. Day zero is Sunday.
6281		The <i>time</i> has the same format as <i>offset</i> except that the hour can
6282		range from zero to 167. If preceded by a '-', the time shall
6283		count backwards before midnight. For example, "47:30"
6284		stands for 23:30 the next day, and "-3:30" stands for 20:30 the
6285		previous day. The default, if <i>time</i> is not given, shall be 02:00:00.
6286		Daylight Saving Time is in effect all year if it starts January 1 at 00:00 and ends
6287		December 31 at 24:00 plus the difference between Daylight Saving Time and
6288		standard time, leaving no room for standard time in the calendar. For
6289		example, TZ='EST5EDT,0/0,J365/25' represents a time zone that
6290		observes Daylight Saving Time all year, being 4 hours west of UTC with
6291		abbreviation "EDT".
6292		If the <i>dst</i> field is specified and the <i>rule</i> field is not, it is implementation-defined
6293		when the changes to and from Daylight Saving Time occur.
6294		If <i>TZ</i> is of the third format (that is, if the first character is not a <colon> and
6295		the value does not match the syntax for the second format), the value indicates
6296		either a geographical timezone or a special timezone from an implementation-
6297		defined timezone database. Typically these take the form
6298		<i>Area/Location</i>

6299 as in the IANA timezone database. Examples of geographical timezones that  
6300 may be supported include Africa/Cairo, America/New\_York,  
6301 America/Indiana/Indianapolis, Asia/Tokyo, and Europe/London.  
6302 The data for each geographical timezone shall include:

- 6303 • The offset from Coordinated Universal Time of the timezone's standard  
6304 time.
- 6305 • If Daylight Saving Time (DST) is, or has historically been, observed: a  
6306 method to discover the dates and times of transitions to and from DST  
6307 and the offset from Coordinated Universal Time during periods when  
6308 DST was, is, or is predicted to be, in effect.
- 6309 • The timezone names for standard time (*std*) and, if observed, for DST  
6310 (*dst*) to be used by *tzset()*. These shall each contain no more than  
6311 {TZNAME\_MAX} bytes.

6312 If there are any historical variations, or known future variations, of the above  
6313 data for a geographical timezone, these variations shall be included in the  
6314 database, except that historical variations from before the Epoch need not be  
6315 included.

6316 If the database incorporates an external database such as the one maintained  
6317 by IANA, the implementation shall provide an implementation-defined  
6318 method to allow the database to be updated, for example the method specified  
6319 by RFC 6557.

6320

6321

# Regular Expressions

6322 Regular Expressions (REs) provide a mechanism to select specific strings from a set of character  
6323 strings.

6324 Regular expressions are a context-independent syntax that can represent a wide variety of  
6325 character sets and character set orderings, where these character sets are interpreted according  
6326 to the current locale. While many regular expressions can be interpreted differently depending  
6327 on the current locale, many features, such as character class expressions, provide for contextual  
6328 invariance across locales.

6329 The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 181)  
6330 shall apply to most utilities supporting regular expressions. Some utilities, instead, support the  
6331 Extended Regular Expressions (ERE) described in Section 9.4 (on page 187); any exceptions for  
6332 both cases are noted in the descriptions of the specific utilities using regular expressions. Both  
6333 BREs and EREs are supported by the Regular Expression Matching interface in the System  
6334 Interfaces volume of POSIX.1-2024 under *regcomp()*, *regex()*, and related functions.

## 6335 9.1 Regular Expression Definitions

6336 For the purposes of this section, the following definitions shall apply:

### 6337 entire regular expression

6338 The concatenated set of one or more BREs or EREs that make up the pattern specified for  
6339 string selection.

### 6340 escape sequence

6341 The escape character followed by any single character, which is thereby “escaped”. The  
6342 escape character is a <backslash> that is neither in a bracket expression nor itself escaped.

### 6343 leftmost

6344 The characters closest to the beginning of the string.

### 6345 matched

6346 A sequence of zero or more characters shall be said to be matched by a BRE or ERE when  
6347 the characters in the sequence correspond to a sequence of characters defined by the  
6348 pattern.

6349 Matching shall be based on the bit pattern used for encoding the character, not on the  
6350 graphic representation of the character. This means that if a character set contains two or  
6351 more encodings for a graphic symbol, or if the strings searched contain text encoded in  
6352 more than one codeset, no attempt is made to search for any other representation of the  
6353 encoded symbol. If that is required, the user can specify equivalence classes containing all  
6354 variations of the desired graphic symbol.

6355 The search for a matching sequence starts at the beginning of a string and stops when the  
6356 first sequence matching the expression is found, where “first” is defined to mean “begins  
6357 earliest in the string”. If the pattern permits a variable number of matching characters and  
6358 thus there is more than one such sequence starting at that point, the longest such sequence  
6359 is matched. For example, the BRE "bb\*" matches the second to fourth characters of the

6360 string "abbbc", and the ERE "(wee|week)(knights|night)" matches all ten  
6361 characters of the string "weeknights".

6362 Consistent with the whole match being the longest of the leftmost matches, each subpattern,  
6363 from left to right, shall match the longest possible string. For this purpose, a null string shall  
6364 be considered to be longer than no match at all. For example, matching the BRE  
6365 "\(.\*\)" against "abcdef", the subexpression "(\\1)" is "abcdef", and matching  
6366 the BRE "\(a\*\)" against "bc", the subexpression "(\\1)" is the null string. However,  
6367 matching the ERE "(.\*?)" against "abcdef", the subpattern "(.\*?)" matches the  
6368 empty string, since that is the longest possible match for the ERE ".\*?".

6369 When a multi-character collating element in a bracket expression (see [Section 9.3.5](#), on page  
6370 182) is involved, the longest sequence shall be measured in characters consumed from the  
6371 string to be matched; that is, the collating element counts not as one element, but as the  
6372 number of characters it matches.

### 6373 **BRE (ERE) matching a single character**

6374 A BRE or ERE that shall match either a single character or a single collating element.

6375 Only a BRE or ERE of this type that includes a bracket expression (see [Section 9.3.5](#), on page  
6376 182) can match a collating element.

### 6377 **BRE (ERE) matching multiple characters**

6378 A BRE or ERE that shall match a concatenation of single characters or collating elements.

6379 Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE  
6380 (ERE) special characters.

### 6381 **invalid**

6382 This section uses the term "invalid" for certain constructs or conditions. Invalid REs shall  
6383 cause the utility or function using the RE to generate an error condition. When invalid is not  
6384 used, violations of the specified syntax or semantics for REs produce undefined results: this  
6385 may entail an error, enabling an extended syntax for that RE, or using the construct in error  
6386 as literal characters to be matched. For example, the BRE construct "{1,2,3}" does not  
6387 comply with the grammar. A conforming application cannot rely on it producing an error  
6388 nor matching the literal characters "{1,2,3}".

## 6389 **9.2 Regular Expression General Requirements**

6390 The requirements in this section shall apply to both basic and extended regular expressions.

6391 The use of regular expressions is generally associated with text processing. REs (BREs and EREs)  
6392 operate on text strings; that is, zero or more characters followed by an end-of-string delimiter  
6393 (typically NUL). Some utilities employing regular expressions limit the processing to lines; that  
6394 is, zero or more characters followed by a <newline>.

6395 In the functions processing regular expressions described in System Interfaces volume of  
6396 POSIX.1-2024, the <newline> is regarded as an ordinary character and both a <period> and a  
6397 non-matching list can match one. The Shell and Utilities volume of POSIX.1-2024 specifies  
6398 within the individual descriptions of those standard utilities employing regular expressions  
6399 whether they permit matching of <newline> characters; if not stated otherwise, the use of literal  
6400 <newline> characters or any escape sequence equivalent in either patterns or matched text  
6401 produces undefined results. Those utilities (like *grep*) that do not allow <newline> characters to  
6402 match are responsible for eliminating any <newline> from strings before matching against the  
6403 RE. The *regcomp()* function in the System Interfaces volume of POSIX.1-2024, however, can  
6404 provide support for such processing without violating the rules of this section.

6405 The interfaces specified in POSIX.1-2024 do not permit the inclusion of a NUL character in an RE  
 6406 or in the string to be matched. If during the operation of a standard utility a NUL is included in  
 6407 the text designated to be matched, that NUL may designate the end of the text string for the  
 6408 purposes of matching.

6409 Some standard utilities and functions support case-insensitive regular expression matching.  
 6410 When this type of matching is in effect, the matching process shall be modified as described in  
 6411 [Section 4.1](#) (on page 95).

6412 The implementation shall support any regular expression that does not exceed 256 bytes in  
 6413 length.

## 6414 9.3 Basic Regular Expressions

### 6415 9.3.1 BREs Matching a Single Character or Collating Element

6416 When not inside a bracket expression, the following shall match a single character:

- 6417 • a BRE ordinary character
- 6418 • a BRE special character or ']' preceded by an unescaped <backslash>
- 6419 • a <period>

6420 A bracket expression shall match a single character or a single collating element.

### 6421 9.3.2 BRE Ordinary Characters

6422 An ordinary character is a BRE that matches itself: any character in the supported character set,  
 6423 except for the BRE special characters listed in [Section 9.3.3](#) (on page 182).

6424 When not inside a bracket expression, the interpretation of an ordinary character preceded by an  
 6425 unescaped <backslash> is undefined, except for:

- 6426 • The characters ')', '(', '{', and '}'
- 6427 • The digits 1 to 9 inclusive (see [Section 9.3.6](#), on page 185)
- 6428 • The ']' character; "\]" shall match a ']' character
- 6429 • The '?', '+', and '|' characters; it is implementation-defined whether "\?", "\+", and  
 6430 "\|" each match the literal character '?', '+', or '|', respectively, or behave as  
 6431 described for the ERE special characters '?', '+', and '|', respectively (see [Section 9.4.3](#),  
 6432 on page 188).

6433 **Note:** A future version of this standard may require "\?", "\+", and "\|" to behave as  
 6434 described for the ERE special characters '?', '+', and '|', respectively.

### 6435 9.3.3 BRE Special Characters

6436 A BRE special character has special properties in certain contexts. Outside those contexts, or  
6437 when preceded by an unescaped <backslash>, such a character is a BRE that matches the special  
6438 character itself. The BRE special characters and the contexts in which they have their special  
6439 meaning are as follows:

- 6440 . [ \ The <period>, <left-square-bracket>, and <backslash> shall be special except when  
6441 used in a bracket expression (see [Section 9.3.5](#)). An expression containing a '[' that is  
6442 unescaped and is not part of a bracket expression produces undefined results.
- 6443 \* The <asterisk> shall be special except when used:
  - 6444 — In a bracket expression
  - 6445 — As the first character of an entire BRE (after an initial '^', if any)
  - 6446 — Immediately following a "\|" escape sequence (after an initial '^', if any), if the  
6447 implementation does not match the escape sequence "\|" to the literal character  
6448 '|'.
    - 6449 — As the first character of a subexpression (after an initial '^', if any); see [Section](#)  
6450 [9.3.6](#) (on page 185)
- 6451 ^ The <circumflex> shall be special when used as an anchor (see [Section 9.3.8](#), on page  
6452 186). The <circumflex> shall signify a non-matching list expression when it occurs first  
6453 in a list, immediately following a <left-square-bracket> (see [Section 9.3.5](#)).
- 6454 \$ The <dollar-sign> shall be special when used as an anchor.

### 6455 9.3.4 Periods in BREs

6456 When not inside a bracket expression, a <period> ('.') is a BRE that shall match any character  
6457 in the supported character set except NUL.

### 6458 9.3.5 RE Bracket Expression

6459 A bracket expression (an expression enclosed in square brackets, "[ ]") is an RE that shall  
6460 match a specific set of single characters, and may match a specific set of multi-character collating  
6461 elements, based on the non-empty set of list expressions contained in the bracket expression.

6462 The following rules and definitions apply to bracket expressions:

- 6463 1. A bracket expression is either a matching list expression or a non-matching list  
6464 expression. It consists of one or more expressions: ordinary characters, collating elements,  
6465 collating symbols, equivalence classes, character classes, or range expressions. The <right-  
6466 square-bracket> (']') shall lose its special meaning and represent itself in a bracket  
6467 expression if it occurs first in the list (after an initial <circumflex> ('^'), if any).  
6468 Otherwise, it shall terminate the bracket expression, unless it appears in a collating  
6469 symbol (such as "[.].]") or is the ending <right-square-bracket> for a collating symbol,  
6470 equivalence class, or character class. When the bracket expression appears within a BRE,  
6471 the special characters '.', '\*', '[', and '\\ ' (<period>, <asterisk>, <left-square-  
6472 bracket>, and <backslash>, respectively) shall lose their special meaning within the  
6473 bracket expression. When the bracket expression appears within an ERE, the special  
6474 characters '.', '(', '\*', '+', '?', '{', '|', '\$', '[', and '\\ ' (<period>, <left-  
6475 parenthesis>, <asterisk>, <plus-sign>, <question-mark>, <left-brace>, <vertical-line>,  
6476 <dollar-sign>, <left-square-bracket>, and <backslash>, respectively) shall lose their

6477 special meaning within the bracket expression; <circumflex> ('^') shall lose its special  
 6478 meaning as an anchor. When the bracket expression appears within a shell pattern (see  
 6479 XCU [Section 2.14](#), on page 2523), the special characters '?', '\*', and '[' (<question-  
 6480 mark>, <asterisk>, and <left-square-bracket>, respectively) shall lose their special  
 6481 meaning within the bracket expression; whether or not <backslash> ('\') loses its  
 6482 special meaning as a pattern matching character is described in XCU [Section 2.14.1](#) (on  
 6483 page 2523), but in contexts where a shell-quoting <backslash> can be used it shall retain  
 6484 its special meaning (see XCU [Section 2.2](#), on page 2472). For example:

```
6485 $ ls
6486 ! $ - \ a b c
6487 $ echo [a\-c]
6488 - a c
6489 $ echo [\!a]
6490 ! a
6491 $ echo ["!\$a-c"]
6492 ! $ - a c
6493 $ echo [!"\$a-c"]
6494 ! \ b
6495 $ echo [!\]\]
6496 ! $ - a b c
```

6497 The character sequences "[.", "[=", and "[:" (<left-square-bracket> followed by a  
 6498 <period>, <equals-sign>, or <colon>) shall be special inside a bracket expression and are  
 6499 used to delimit collating symbols, equivalence class expressions, and character class  
 6500 expressions. These symbols shall be followed by a valid expression and the matching  
 6501 terminating sequence ".]", "=]", or ":]", as described in the following items.

6502 2. A matching list expression specifies a list that shall match any single character that is  
 6503 matched by one of the expressions represented in the list. The first character in the list  
 6504 cannot be the <circumflex>. An ordinary character in the list shall only match that  
 6505 character; for example, "[abc]" is an RE that only matches one of the characters 'a',  
 6506 'b', or 'c'.

6507 It is unspecified whether a matching list expression matches a multi-character collating  
 6508 element that is matched by one of the expressions.

6509 3. A non-matching list expression begins with a <circumflex> ('^'), and the matching  
 6510 behavior shall be the logical inverse of the corresponding matching list expression (the  
 6511 same bracket expression but without the leading <circumflex>). For example, since the  
 6512 RE "[abc]" only matches 'a', 'b', or 'c', it follows that "[^abc]" is an RE that  
 6513 matches any character except 'a', 'b', or 'c'. It is unspecified whether a non-matching  
 6514 list expression matches a multi-character collating element that is not matched by any of  
 6515 the expressions. The <circumflex> shall have this special meaning only when it occurs  
 6516 first in the list, immediately following the <left-square-bracket>.

6517 4. A collating symbol is a collating element enclosed within bracket-period ("[" and  
 6518 ".]") delimiters. Collating elements are defined as described in [Section 7.3.2.4](#) (on page  
 6519 142). Conforming applications shall represent multi-character collating elements as  
 6520 collating symbols when it is necessary to distinguish them from a list of the individual  
 6521 characters that make up the multi-character collating element. For example, if the string  
 6522 "ch" is a collating element defined using the line:

```
6523 collating-element <ch-digraph> from "<c><h>"
```

6524 in the locale definition, the expression "[[.ch.]]" shall be treated as an RE containing  
 6525 the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'.

6526 Collating symbols are recognized only inside bracket expressions. If the string is not a  
6527 collating element in the current locale, the expression is invalid.

6528 5. An equivalence class expression shall represent the set of collating elements belonging to  
6529 an equivalence class, as described in [Section 7.3.2.4](#) (on page 142). Only primary  
6530 equivalence classes shall be recognized. The class shall be expressed by enclosing any one  
6531 of the collating elements in the equivalence class within bracket-equal ("`[=`" and "`=]`")  
6532 delimiters. For example, if 'a', 'à', and '^' belong to the same equivalence class, then  
6533 "`[ [=a=] b ]`", "`[ [=à=] b ]`", and "`[ [=^=] b ]`" are each equivalent to "`[ aâ^ b ]`". If the  
6534 collating element does not belong to an equivalence class, the equivalence class  
6535 expression shall be treated as a collating symbol.

6536 6. A character class expression shall represent the union of two sets:  
6537 a. The set of single characters that belong to the character class, as defined in the  
6538 `LC_CTYPE` category in the current locale.  
6539 b. An unspecified set of multi-character collating elements.

6540 All character classes specified in the current locale shall be recognized. A character class  
6541 expression is expressed as a character class name enclosed within bracket-`<colon>` ("`[:`"  
6542 and "`:]`") delimiters.

6543 The following character class expressions shall be supported in all locales:

```
6544 [:alnum:]    [:cntrl:]    [:lower:]    [:space:]
6545 [:alpha:]    [:digit:]    [:print:]    [:upper:]
6546 [:blank:]    [:graph:]    [:punct:]    [:xdigit:]
```

6547 In addition, character class expressions of the form:

```
6548 [:name:]
```

6549 are recognized in those locales where the *name* keyword has been given a **charclass**  
6550 definition in the `LC_CTYPE` category.

6551 7. In the POSIX locale, a range expression represents the set of collating elements that fall  
6552 between two elements in the collation sequence, inclusive. In other locales, a range  
6553 expression has unspecified behavior: strictly conforming applications shall not rely on  
6554 whether the range expression is valid, or on the set of collating elements matched. A  
6555 range expression shall be expressed as the starting point and the ending point separated  
6556 by a `<hyphen-minus>` ('-').

6557 In the following, all examples assume the POSIX locale.

6558 The starting range point and the ending range point shall be a collating element or  
6559 collating symbol. An equivalence class expression used as a starting or ending point of a  
6560 range expression produces unspecified results. An equivalence class can be used portably  
6561 within a bracket expression, but only outside the range. If the represented set of collating  
6562 elements is empty, it is unspecified whether the expression matches nothing, or is treated  
6563 as invalid.

6564 The interpretation of range expressions where the ending range point is also the starting  
6565 range point of a subsequent range expression (for example, "`[a-m-o]`") is undefined.

6566 The `<hyphen-minus>` character shall be treated as itself if it occurs first (after an initial  
6567 '`^`', if any) or last in the list, or as an ending range point in a range expression. As  
6568 examples, the expressions "`[-ac]`" and "`[ac-]`" are equivalent and match any of the  
6569 characters 'a', 'c', or '-'; "`^[^-ac]`" and "`^[^ac-]`" are equivalent and match any  
6570 characters except 'a', 'c', or '-'; the expression "`[%--]`" matches any of the

6571 characters between '-' and '@' inclusive; the expression "[--@]" matches any of the  
 6572 characters between '-' and '@' inclusive; and the expression "[a--@]" is either invalid  
 6573 or equivalent to '@', because the letter 'a' follows the symbol '-' in the POSIX locale.  
 6574 To use a <hyphen-minus> as the starting range point, it shall either come first in the  
 6575 bracket expression or be specified as a collating symbol; for example, "[[.-.]-0]",  
 6576 which matches either a <right-square-bracket> or any character or collating element that  
 6577 collates between <hyphen-minus> and 0, inclusive.

6578 If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the  
 6579 '^', if any) and the '-' last within the bracket expression.

6580 8. If a bracket expression contains at least three list elements, where the first and last list  
 6581 elements are the same single-character element of <period>, <equals-sign>, or <colon>,  
 6582 then it is unspecified whether the bracket expression will be treated as a collating symbol,  
 6583 equivalence class, or character class, respectively; treated as a matching list expression; or  
 6584 treated as an invalid bracket expression.

### 6585 9.3.6 BREs Matching Multiple Characters

6586 The following rules can be used to construct BREs matching multiple characters from BREs  
 6587 matching a single character:

6588 1. The concatenation of BREs shall match the concatenation of the strings matched by each  
 6589 component of the BRE.

6590 2. A subexpression can be defined within a BRE by enclosing it between the character pairs  
 6591 "\(" and "\)". Such a subexpression shall match whatever it would have matched  
 6592 without the "\(" and "\)", except that anchoring within subexpressions is optional  
 6593 behavior; see [Section 9.3.8](#) (on page 186). Subexpressions can be arbitrarily nested.

6594 3. The back-reference expression '\n' shall match the same (possibly empty) string of  
 6595 characters as was matched by a subexpression enclosed between "\(" and "\)"  
 6596 preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the  
 6597 *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the  
 6598 pattern and ends with the corresponding paired "\)"). The expression is invalid if less  
 6599 than *n* subexpressions precede the '\n'. The string matched by a contained  
 6600 subexpression shall be within the string matched by the containing subexpression. If the  
 6601 containing subexpression does not match, or if there is no match for the contained  
 6602 subexpression within the string matched by the containing subexpression, then back-  
 6603 reference expressions corresponding to the contained subexpression shall not match.  
 6604 When a subexpression matches more than one string, a back-reference expression  
 6605 corresponding to the subexpression shall refer to the last matched string. For example, the  
 6606 expression "\^(.\*\)\1\$" matches strings consisting of two adjacent appearances of the  
 6607 same substring, and the expression "\(a\)\*\1" fails to match 'a', the expression  
 6608 "\(a\ (b\)\*\)\*\2" fails to match 'abab', and the expression "\^(ab\*\)\*\1\$" matches  
 6609 'ababbabb', but fails to match 'ababbab'.

6610 4. When a BRE matching a single character, a subexpression, or a back-reference is followed  
 6611 by the special character <asterisk> ('\*'), together with that <asterisk> it shall match  
 6612 what zero or more consecutive occurrences of the BRE would match. For example,  
 6613 "[ab]\*" and "[ab][ab]" are equivalent when matching the string "ab".

6614 5. When a BRE matching a single character, a subexpression, or a back-reference is followed  
 6615 by an interval expression of the format "\{m\}", "\{m,\}", or "\{m,n\}", together  
 6616 with that interval expression it shall match what repeated consecutive occurrences of the  
 6617 BRE would match. The values of *m* and *n* are decimal integers in the range 0

6618  $\leq m \leq n \leq \{RE\_DUP\_MAX\}$ , where  $m$  specifies the exact or minimum number of occurrences  
 6619 and  $n$  specifies the maximum number of occurrences. The expression " $\{m\}$ " shall  
 6620 match exactly  $m$  occurrences of the preceding BRE, " $\{m, \}$ " shall match at least  $m$   
 6621 occurrences, and " $\{m, n\}$ " shall match any number of occurrences between  $m$  and  $n$ ,  
 6622 inclusive.

6623 For example, in the string "abababcccccd" the BRE " $c\{3\}$ " is matched by  
 6624 characters seven to nine, the BRE " $\(ab\)\{4,\}$ " is not matched at all, and the BRE  
 6625 " $c\{1, 3\}d$ " is matched by characters ten to thirteen.

6626 The behavior of multiple adjacent duplication symbols ('\*' and intervals) produces undefined  
 6627 results.

6628 A subexpression repeated by an <asterisk> ('\*') or an interval expression shall not match a null  
 6629 expression unless this is the only match for the repetition or it is necessary to satisfy the exact or  
 6630 minimum number of occurrences for the interval expression.

### 6631 9.3.7 BRE Precedence

6632 The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[ ]
Subexpressions/back-references	\( \) \n
Single-character-BRE duplication	* \{m, n\}
Concatenation	
Anchoring	^ \$

### 6641 9.3.8 BRE Expression Anchoring

6642 A BRE can be limited to matching expressions that begin or end a string; this is called  
 6643 "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered BRE  
 6644 anchors in the following contexts:

6645 1. A <circumflex> ('^') shall be an anchor when used as the first character of an entire BRE  
 6646 and, if the implementation does not match the escape sequence "\|" to the literal  
 6647 character '|', when used immediately following a "\|" escape sequence that is not  
 6648 inside a subexpression. The implementation may also treat a <circumflex> as an anchor  
 6649 when used inside a subexpression; in this case it shall be an anchor only when either of  
 6650 the following is true:

- 6651 • It is the first character of the subexpression.
- 6652 • It immediately follows a "\|" escape sequence and the implementation does not  
 6653 match the escape sequence "\|" to the literal character '|'.

6654 The <circumflex> shall anchor the expression (or optionally subexpression) to the  
 6655 beginning of a string; only sequences starting at the first character of a string shall be  
 6656 matched by the BRE. For example, the BRE " $^ab$ " matches "ab" in the string "abcdef",  
 6657 but fails to match in the string "cdefab". The BRE " $\(^ab\)$ " may match the former  
 6658 string. A portable BRE shall escape a leading <circumflex> in a subexpression to match a  
 6659 literal <circumflex>.

- 6660 2. A <dollar-sign> ( '\$ ' ) shall be an anchor when used as the last character of an entire BRE  
 6661 and, if the implementation does not match the escape sequence "\|" to the literal  
 6662 character '|', when used immediately preceding a "\|" escape sequence that is not  
 6663 inside a subexpression. The implementation may also treat a <dollar-sign> as an anchor  
 6664 when used inside a subexpression; in this case it shall be an anchor only when either of  
 6665 the following is true:
- 6666 • It is the last character of the subexpression.
  - 6667 • It immediately precedes a "\|" escape sequence and the implementation does not  
 6668 match the escape sequence "\|" to the literal character '| '.
- 6669 The <dollar-sign> shall anchor the expression (or optionally subexpression) to the end of  
 6670 the string being matched; the <dollar-sign> can be said to match the end-of-string  
 6671 following the last character. A portable BRE shall escape a trailing <dollar-sign> in a  
 6672 subexpression to match a literal <dollar-sign>.
- 6673 3. A BRE anchored by both '^' and '\$' shall match only an entire string. For example, the  
 6674 BRE "^abcdef\$" matches strings consisting only of "abcdef".

## 6675 9.4 Extended Regular Expressions

6676 The extended regular expression (ERE) notation and construction rules shall apply to utilities  
 6677 defined as using extended regular expressions; any exceptions to the following rules are noted  
 6678 in the descriptions of the specific utilities using EREs.

### 6679 9.4.1 EREs Matching a Single Character or Collating Element

6680 When not inside a bracket expression, the following shall match a single character:

- 6681 • an ERE ordinary character
- 6682 • an ERE special character, ']' , or '}' ' preceded by an unescaped <backslash>
- 6683 • a <period>

6684 A bracket expression shall match a single character or a single collating element. An ERE  
 6685 matching a single character enclosed in parentheses shall match the same as the ERE without  
 6686 parentheses would have matched.

### 6687 9.4.2 ERE Ordinary Characters

6688 An ordinary character is an ERE that matches itself. An ordinary character is any character in the  
 6689 supported character set, except for the ERE special characters listed in [Section 9.4.3](#) (on page  
 6690 188). When not inside a bracket expression, the interpretation of an ordinary character preceded  
 6691 by an unescaped <backslash> is undefined, except for the ']' ' and '}' ' characters; "\]" and  
 6692 "\}" shall match the ']' ' and '}' ' characters, respectively.

### 6693 9.4.3 ERE Special Characters

6694 An ERE special character has special properties in certain contexts. Outside those contexts, or  
6695 when preceded by an unescaped <backslash>, such a character shall be an ERE that matches the  
6696 special character itself. The extended regular expression special characters and the contexts in  
6697 which they shall have their special meaning are as follows:

- 6698 . [ \ ( The <period>, <left-square-bracket>, <backslash>, and <left-parenthesis> shall be  
6699 special except when used in a bracket expression (see [Section 9.3.5](#), on page 182). When  
6700 not inside a bracket expression, an unescaped <left-parenthesis> immediately followed  
6701 by a <right-parenthesis> produces undefined results. A <left-square-bracket> that is  
6702 unescaped and is not part of a bracket expression also produces undefined results.
- 6703 ) The <right-parenthesis> shall be special when matched with a preceding <left-  
6704 parenthesis>, both not inside a bracket expression.
- 6705 \* + ? { The <asterisk>, <plus-sign>, <question-mark>, and <left-brace> shall be special except  
6706 when used in a bracket expression (see [Section 9.3.5](#), on page 182). Any of the  
6707 following uses produce undefined results:
  - 6708 — If these characters appear first in an ERE, or immediately following an unescaped  
6709 <vertical-line>, <circumflex>, <dollar-sign>, or <left-parenthesis>
  - 6710 — If a <left-brace> is not part of a valid interval expression (see [Section 9.4.6](#), on  
6711 page 189)
- 6712 | The <vertical-line> is special except when used in a bracket expression (see [Section](#)  
6713 [9.3.5](#), on page 182). A <vertical-line> appearing first or last in an ERE, or immediately  
6714 following a <vertical-line> or a <left-parenthesis>, or immediately preceding a <right-  
6715 parenthesis>, produces undefined results.
- 6716 ^ The <circumflex> shall be special when used as an anchor (see [Section 9.4.9](#), on page  
6717 190). The <circumflex> shall signify a non-matching list expression when it occurs first  
6718 in a list, immediately following a <left-square-bracket> (see [Section 9.3.5](#), on page 182).
- 6719 \$ The <dollar-sign> shall be special when used as an anchor.

### 6720 9.4.4 Periods in EREs

6721 When not inside a bracket expression, a <period> ( ' . ' ) is an ERE that shall match any character  
6722 in the supported character set except NUL.

### 6723 9.4.5 ERE Bracket Expression

6724 The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see [Section](#)  
6725 [9.3.5](#) (on page 182).

6726 **9.4.6 EREs Matching Multiple Characters**

6727 The following rules shall be used to construct EREs matching multiple characters from EREs  
6728 matching a single character:

6729 1. A concatenation of EREs shall match the concatenation of the character sequences  
6730 matched by each component of the ERE. A concatenation of EREs enclosed in parentheses  
6731 shall match whatever the concatenation without the parentheses matches. For example,  
6732 both the ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of  
6733 the string "abcdefabcdef".

6734 2. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6735 by the special character <plus-sign> ('+'), together with that <plus-sign> it shall match  
6736 what one or more consecutive occurrences of the ERE would match. For example, the  
6737 ERE "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde".  
6738 And, "[ab]+" and "[ab][ab]\*" are equivalent.

6739 3. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6740 by the special character <asterisk> ('\*'), together with that <asterisk> it shall match  
6741 what zero or more consecutive occurrences of the ERE would match. For example, the  
6742 ERE "b\*c" matches the first character in the string "cabbbbcde", and the ERE "b\*cd"  
6743 matches the third to seventh characters in the string "cabbbbcdebbbbbbbcdbc". And,  
6744 "[ab]\*" and "[ab][ab]" are equivalent when matching the string "ab".

6745 4. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6746 by the special character <question-mark> ('?'), together with that <question-mark> it  
6747 shall match what zero or one consecutive occurrences of the ERE would match. For  
6748 example, the ERE "b?c" matches the second character in the string "acabbbbcde".

6749 5. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6750 by an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that  
6751 interval expression it shall match what repeated consecutive occurrences of the ERE  
6752 would match. The values of *m* and *n* are decimal integers in the range  $0 \leq m \leq n \leq \{RE\_DUP\_MAX\}$ , where *m* specifies the exact or minimum number of occurrences  
6753 and *n* specifies the maximum number of occurrences. The expression "{m}" matches  
6754 exactly *m* occurrences of the preceding ERE, "{m,}" matches at least *m* occurrences, and  
6755 "{m,n}" matches any number of occurrences between *m* and *n*, inclusive.  
6756

6757 For example, in the string "abababcccccd" the ERE "c{3}" is matched by characters  
6758 seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

6759 6. Each of the duplication symbols ('+', '\*', '?', and intervals) can be suffixed by the  
6760 repetition modifier '?' (<question-mark>), in which case matching behavior for that  
6761 repetition shall be changed from the leftmost longest possible match to the leftmost  
6762 shortest possible match, including the null match (see [Section A.9](#), on page 3709). For  
6763 example, the ERE ".\*c" matches up to and including the last character ('c') in the  
6764 string "abc abc", whereas the ERE ".\*?c" matches up to and including the first  
6765 character 'c', the third character in the string.

6766 If the REG\_MINIMAL flag, defined in the <regex.h> header, is used when compiling an  
6767 ERE via *regcomp()*, the leftmost shortest possible match shall be the default for all  
6768 duplication symbols, and the repetition modifier '?' can be used to select the leftmost  
6769 longest possible match for the repetition it modifies.

6770 The behavior of multiple adjacent duplication symbols ('+', '\*', '?', and intervals, possibly  
6771 suffixed by the repetition modifier '?') produces undefined results.

6772 An ERE matching a single character repeated by an '\*', '?', or an interval expression shall not

6773 match a null expression unless this is the only match for the repetition or it is necessary to satisfy  
6774 the exact or minimum number of occurrences for the interval expression.

#### 6775 9.4.7 ERE Alternation

6776 Two EREs separated by the special character <vertical-line> ('|') shall match a string that is  
6777 matched by either. For example, the ERE "a(bc|d)" matches the string "abc" and the  
6778 string "ad". Single characters, or expressions matching single characters, separated by the  
6779 <vertical-line> and enclosed in parentheses, shall be treated as an ERE matching a single  
6780 character.

#### 6781 9.4.8 ERE Precedence

6782 The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
6783 Collation-related bracket symbols	[==] [::] [..]
6784 Escaped characters	\<special character>
6785 Bracket expression	[]
6786 Grouping	()
6787 Single-character-ERE duplication	* + ? {m,n}
6788 Concatenation	
6789 Anchoring	^ \$
6790 Alternation	
6791	

6792 For example, the ERE "abba|cde" matches either the string "abba" or the string "cde"  
6793 (rather than the string "abbade" or "abbcde", because concatenation has a higher order of  
6794 precedence than alternation).

#### 6795 9.4.9 ERE Expression Anchoring

6796 An ERE can be limited to matching expressions that begin or end a string; this is called  
6797 "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered ERE  
6798 anchors when used anywhere except inside a bracket expression. This shall have the following  
6799 effects:

- 6800 1. When not inside a bracket expression, a <circumflex> ('^') shall anchor the expression  
6801 or subexpression it begins to the beginning of a string; such an expression or  
6802 subexpression can match only a sequence starting at the first character of a string. For  
6803 example, the EREs "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to  
6804 match in the string "cdefab", and the ERE "a^b" is valid, but can never match because  
6805 the 'a' prevents the expression "a^b" from matching starting at the first character.
- 6806 2. When not inside a bracket expression, a <dollar-sign> ('\$') shall anchor the expression  
6807 or subexpression it ends to the end of a string; such an expression or subexpression can  
6808 match only a sequence ending at the last character of a string. For example, the EREs  
6809 "ef\$" and "(ef\$)" match "ef" in the string "abcdef", but fail to match in the string  
6810 "cdefab", and the ERE "e\$f" is valid, but can never match because the 'f' prevents  
6811 the expression "e\$f" from matching ending at the last character.

## 6812 9.5 Regular Expression Grammar

6813 Grammars describing the syntax of both basic and extended regular expressions are presented in  
6814 this section. The grammar takes precedence over the text. See XCU [Section 1.3](#) (on page 2461).

### 6815 9.5.1 BRE/ERE Grammar Lexical Conventions

6816 The lexical conventions for regular expressions are as described in this section.

6817 Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

6818 The following tokens are processed (in addition to those string constants shown in the  
6819 grammar):

6820	<b>COLL_ELEM_SINGLE</b>	Any single-character collating element, unless it is a <b>META_CHAR</b> .
6821	<b>COLL_ELEM_MULTI</b>	Any multi-character collating element.
6822	<b>BACKREF</b>	Applicable only to basic regular expressions. The character string consisting of a <backslash> character followed by a single-digit numeral, '1' to '9'.
6823		
6824		
6825	<b>DUP_COUNT</b>	Represents a numeric constant. It shall be an integer in the range 0 ≤ <b>DUP_COUNT</b> ≤ { <b>RE_DUP_MAX</b> }. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by a <backslash> character are treated as <b>ORD_CHAR</b> .
6826		
6827		
6828		
6829	<b>META_CHAR</b>	One of the characters:
6830		^      When found first in a bracket expression
6831		–      When found anywhere but first (after an initial '^', if any)
6832		or last in a bracket expression, or as the ending range point
6833		in a range expression
6834		]      When found anywhere but first (after an initial '^', if any)
6835		in a bracket expression
6836	<b>L_ANCHOR</b>	Applicable only to basic regular expressions. The character '^' when it appears either as the first character of a basic regular expression or, if the implementation does not match the escape sequence "\ " to the literal character ' ', when used immediately following a "\ " escape sequence that is not inside a subexpression, and when not <b>QUOTED_CHAR</b> . The '^' may be recognized as an anchor elsewhere; see <a href="#">Section 9.3.8</a> (on page 186).
6837		
6838		
6839		
6840		
6841		
6842		
6843	<b>ORD_CHAR</b>	A character, other than one of the special characters in <b>SPEC_CHAR</b> .
6844	<b>QUOTED_CHAR</b>	In a BRE, one of the character sequences:
6845		\^    \.    \*    \[    \]    \\$    \\
6846		On implementations where the escape sequences "\?", "\+", and "\ " match the literal characters '?', '+', and ' ', respectively, <b>QUOTED_CHAR</b> shall also include:
6847		\?    \+    \
6848		
6849		
6850		In an ERE, one of the character sequences:
6851		\^    \.    \[    \]    \\$    \(    \)    \

6852		<code>\* \+ \? \{ \} \\</code>
6853	<b>R_ANCHOR</b>	(Applicable only to basic regular expressions.) The character '\$' when it appears either as the last character of a basic regular expression or, if the implementation does not match the escape sequence "\ " to the literal character ' ', when used immediately preceding a "\ " escape sequence that is not inside a subexpression, and when not <b>QUOTED_CHAR</b> . The '\$' may be recognized as an anchor elsewhere; see <a href="#">Section 9.3.8</a> (on page 186).
6854		
6855		
6856		
6857		
6858		
6859		
6860	<b>SPEC_CHAR</b>	For basic regular expressions, one of the following special characters:
6861		. Anywhere except inside bracket expressions
6862		\ Anywhere except inside bracket expressions
6863		[ Anywhere except inside bracket expressions
6864		^ When used as an anchor (see <a href="#">Section 9.3.8</a> , on page 186)
6865		\$ When used as an anchor
6866		* Anywhere except first in an entire RE, anywhere in a bracket expression, directly following "\(", directly following an anchoring '^'
6867		
6868		
6869		For extended regular expressions, shall be one of the following special characters found anywhere except inside bracket expressions:
6870		
6871		^ . [ \$ ( )
6872		* + ? { \
6873		The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.
6874		

## 6875 9.5.2 RE and Bracket Expression Grammar

6876 This section presents the grammar for basic regular expressions, including the bracket  
6877 expression grammar that is common to both BREs and EREs.

6878	%token	ORD_CHAR QUOTED_CHAR DUP_COUNT
6879	%token	BACKREF L_ANCHOR R_ANCHOR

6949                 | follow_list '-'
6950         ;
6951     follow_list :          expression_term
6952                | follow_list expression_term
6953         ;
6954     expression_term : single_expression
6955                    | range_expression
6956         ;
6957     single_expression : end_range
6958                       | character_class
6959                       | equivalence_class
6960         ;
6961     range_expression : start_range end_range
6962                     | start_range '-'
6963         ;
6964     start_range : end_range '-'
6965         ;
6966     end_range : COLL_ELEM_SINGLE
6967              | collating_symbol
6968         ;
6969     collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
6970                    | Open_dot COLL_ELEM_MULTI Dot_close
6971                    | Open_dot META_CHAR Dot_close
6972         ;
6973     equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
6974                      | Open_equal COLL_ELEM_MULTI Equal_close
6975         ;
6976     character_class : Open_colon class_name Colon_close
6977         ;

```

6978 Note that although the BRE grammar appears always to permit **L\_ANCHOR** or **R\_ANCHOR**  
6979 inside "**\**(" and "**\**", the lexical conventions (see [Section 9.5.1](#), on page 191) imply that '^'  
6980 and '\$' may be ordinary characters there. This reflects the semantic limits on the application, as  
6981 noted in [Section 9.3.8](#) (on page 186). Since it is an implementation option whether to interpret  
6982 '^' and '\$' as anchors in these locations, conforming applications cannot use unescaped '^'  
6983 and '\$' in positions inside "**\**(" and "**\**" that might be interpreted as anchors.

### 6984 9.5.3 ERE Grammar

6985 This section presents the grammar for extended regular expressions, excluding the bracket  
6986 expression grammar.

6987 **Note:** The bracket expression grammar and the associated **%token** lines are identical between BREs  
6988 and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```

6989 %token  ORD_CHAR QUOTED_CHAR DUP_COUNT
6990 %start  extended_reg_exp
6991 %%

```

```

6992      /* -----
6993         Extended Regular Expression
6994         -----
6995      */
6996      extended_reg_exp      :          ERE_branch
6997                          | extended_reg_exp '|' ERE_branch
6998                          ;
6999      ERE_branch            :          ERE_expression
7000                          | ERE_branch ERE_expression
7001                          ;
7002      ERE_expression       : one_char_or_coll_elem_ERE
7003                          | '^'
7004                          | '$'
7005                          | '(' extended_reg_exp ')'
7006                          | ERE_expression ERE_dupl_symbol
7007                          ;
7008      one_char_or_coll_elem_ERE : ORD_CHAR
7009                          | QUOTED_CHAR
7010                          | '.'
7011                          | bracket_expression
7012                          ;
7013      ERE_dupl_symbol       : '*'
7014                          | '+'
7015                          | '?'
7016                          | '{' DUP_COUNT '}'
7017                          | '{' DUP_COUNT ',' '}'
7018                          | '{' DUP_COUNT ',' DUP_COUNT '}'
7019                          ;

```

7020 The ERE grammar does not permit several constructs that previous sections specify as having  
7021 undefined results. Additionally, there are some constructs which the grammar permits but  
7022 which still give undefined results:

- 7023 • **ORD\_CHAR** preceded by an unescaped <backslash> character
- 7024 • One or more *ERE\_dupl\_symbols* appearing first in an ERE, or immediately following '|',  
7025 '^', '(', or '\$'
- 7026 • '{' not part of a valid *ERE\_dupl\_symbol*
- 7027 • '|' appearing first or last in an ERE, or immediately following '|' or '(', or  
7028 immediately preceding ')'

7029 Implementations are permitted to extend the language to allow these. Strictly Conforming  
7030 applications cannot use such constructs.

# Directory Structure and Devices

## 7033 10.1 Directory Structure and Files

7034 The following directories shall exist on conforming systems and conforming applications shall  
7035 make use of them only as described. Strictly conforming applications shall not assume the  
7036 ability to create files in any of these directories, unless specified below.

7037 **/** The root directory.

7038 **/dev** Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

7039 The following directory shall exist on conforming systems and shall be used as described:

7040 **/tmp** A directory made available for applications that need a place to create temporary  
7041 files. Applications shall be allowed to create files in this directory, but shall not  
7042 assume that such files are preserved between invocations of the application.

7043 The following files shall exist on conforming systems and shall be both readable and writable:

7044 **/dev/null** An empty data source and infinite data sink. Data written to **/dev/null** shall be  
7045 discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

7046 **/dev/tty** In each process, a synonym for the controlling terminal associated with the process  
7047 group of that process, if any. It is useful for programs or shell procedures that wish  
7048 to be sure of writing messages to or reading data from the terminal no matter how  
7049 output has been redirected. It can also be used for applications that demand the  
7050 name of a file for output, when typed output is desired and it is tiresome to find  
7051 out what terminal is currently in use.

7052 The following file shall exist on conforming systems and need not be readable or writable:

7053 **/dev/console** The **/dev/console** file is a generic name given to the system console (see [Section](#)  
7054 [3.376](#), on page 86). It is usually linked to an implementation-defined special file. It  
7055 shall provide an interface to the system console conforming to the requirements of  
7056 [Chapter 11](#) (on page 199).

## 7057 10.2 Output Devices and Terminal Types

7058 The utilities in the Shell and Utilities volume of POSIX.1-2024 historically have been  
7059 implemented on a wide range of terminal types, but a conforming implementation need not  
7060 support all features of all utilities on every conceivable terminal. POSIX.1-2024 states which  
7061 features are optional for certain classes of terminals in the individual utility description sections.  
7062 The implementation shall document in the system documentation which terminal types it  
7063 supports and which of these features and utilities are not supported by each terminal.

7064 When a feature or utility is not supported on a specific terminal type, as allowed by  
7065 POSIX.1-2024, and the implementation considers such a condition to be an error preventing use  
7066 of the feature or utility, the implementation shall indicate such conditions through diagnostic  
7067 messages or exit status values or both (as appropriate to the specific utility description) that

7068 inform the user that the terminal type lacks the appropriate capability.

7069 POSIX.1-2024 uses a notational convention based on historical practice that identifies some of

7070 the control characters defined in [Section 7.3.1](#) (on page 131) in a manner easily remembered by

7071 users on many terminals. The correspondence between this “<control>-char” notation and the

7072 actual control characters is shown in the following table. When POSIX.1-2024 refers to a

7073 character by its <control>-name, it is referring to the actual control character shown in the Value

7074 column of the table, which is not necessarily the exact control key sequence on all terminals.

7075 Some terminals have keyboards that do not allow the direct transmission of all the non-

7076 alphanumeric characters shown. In such cases, the system documentation shall describe which

7077 data sequences transmitted by the terminal are interpreted by the system as representing the

7078 special characters.

7079 **Table 10-1** Control Character Names

Name	Value	Name	Value
<control>-A	<SOH>	<control>-Q	<DC1>
<control>-B	<STX>	<control>-R	<DC2>
<control>-C	<ETX>	<control>-S	<DC3>
<control>-D	<EOT>	<control>-T	<DC4>
<control>-E	<ENQ>	<control>-U	<NAK>
<control>-F	<ACK>	<control>-V	<SYN>
<control>-G	<BEL>	<control>-W	<ETB>
<control>-H	<BS>	<control>-X	<CAN>
<control>-I	<HT>	<control>-Y	<EM>
<control>-J	<LF>	<control>-Z	<SUB>
<control>-K	<VT>	<control>-[	<ESC>
<control>-L	<FF>	<control>-\	<FS>
<control>-M	<CR>	<control>-]	<GS>
<control>-N	<SO>	<control>-^	<RS>
<control>-O	<SI>	<control>-_	<US>
<control>-P	<DLE>	<control>-?	<DEL>

7097 **Note:** The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that

7098 the keystrokes represent control-shift-letter sequences.

# General Terminal Interface

7101 This chapter describes a general terminal interface that shall be provided. It shall be supported  
 7102 on any asynchronous communications ports if the implementation provides them. It is  
 7103 implementation-defined whether it supports network connections or synchronous ports, or  
 7104 both.

## 7105 11.1 Interface Characteristics

### 7106 11.1.1 Opening a Terminal Device File

7107 When a terminal device file is opened, it normally causes the thread to wait until a connection is  
 7108 established. In practice, application programs seldom open these files; they are opened by  
 7109 special programs and become an application's standard input, output, and error files.

7110 Cases where applications do open a terminal device are as follows:

- 7111 1. Opening `/dev/tty`, or the pathname returned by `ctermid()`, in order to obtain a file  
 7112 descriptor for the controlling terminal; see [Section 11.1.3](#) (on page 200).
- 7113 2. Opening the subsidiary side of a pseudo-terminal; see XSH [ptsname\(\)](#).
- 7114 3. Opening a modem or similar piece of equipment connected by a serial line. In this case,  
 7115 the terminal parameters (see [Section 11.2](#), on page 205) may be initialized to default  
 7116 settings by the implementation in between the last close of the device by any process and  
 7117 the next open of the device, or they may persist from one use to the next. The terminal  
 7118 parameters can be set to values that ensure the terminal behaves in a conforming manner  
 7119 by means of the `O_TTY_INIT` open flag when opening a terminal device that is not  
 7120 already open in any process, or by executing the `stty` utility with the operand `sane`.

7121 As described in `open()`, opening a terminal device file with the `O_NONBLOCK` flag clear shall  
 7122 cause the thread to block until the terminal device is ready and available. If `CLOCAL` mode is  
 7123 not set, this means blocking until a connection is established. If `CLOCAL` mode is set in the  
 7124 terminal, or the `O_NONBLOCK` flag is specified in the `open()`, the `open()` function shall return a  
 7125 file descriptor without waiting for a connection to be established.

### 7126 11.1.2 Process Groups

7127 A terminal may have a foreground process group associated with it. This foreground process  
 7128 group plays a special role in handling signal-generating input characters, as discussed in [Section](#)  
 7129 [11.1.9](#) (on page 203).

7130 A command interpreter process supporting job control can allocate the terminal to different jobs,  
 7131 or process groups, by placing related processes in a single process group and associating this  
 7132 process group with the terminal. A terminal's foreground process group may be set or examined  
 7133 by a process, assuming the permission requirements are met; see `tcgetpgrp()` and `tcsetpgrp()`.

7134 The terminal interface aids in this allocation by restricting access to the terminal by processes  
7135 that are not in the current process group; see [Section 11.1.4](#).

7136 When there is no longer any process whose process ID or process group ID matches the  
7137 foreground process group ID, the terminal shall have no foreground process group. It is  
7138 unspecified whether the terminal has a foreground process group when there is a process whose  
7139 process ID matches the foreground process group ID, but whose process group ID does not. No  
7140 actions defined in POSIX.1-2024, other than allocation of a controlling terminal or a successful  
7141 call to *tcsetpgrp()*, shall cause a process group to become the foreground process group of the  
7142 terminal.

### 7143 11.1.3 The Controlling Terminal

7144 A terminal may belong to a process as its controlling terminal. Each process of a session that has  
7145 a controlling terminal has the same controlling terminal. A terminal may be the controlling  
7146 terminal for at most one session. The controlling terminal for a session is allocated by the session  
7147 leader in an implementation-defined manner. If a session leader has no controlling terminal, and  
7148 opens a terminal device file that is not already associated with a session without using the  
7149 O\_NOCTTY option (see *open()*), it is implementation-defined whether the terminal becomes the  
7150 controlling terminal of the session leader. If a process which is not a session leader opens a  
7151 terminal file, or the O\_NOCTTY option is used on *open()*, then that terminal shall not become  
7152 the controlling terminal of the calling process. When a controlling terminal becomes associated  
7153 with a session, its foreground process group shall be set to the process group of the session  
7154 leader.

7155 The controlling terminal is inherited by a child process during a *fork()* function call. A process  
7156 relinquishes its controlling terminal when it creates a new session with the *setsid()* function;  
7157 other processes remaining in the old session that had this terminal as their controlling terminal  
7158 continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in  
7159 the current session) associated with the controlling terminal, it is unspecified whether all  
7160 processes that had that terminal as their controlling terminal cease to have any controlling  
7161 terminal. Whether and how a session leader can reacquire a controlling terminal after the  
7162 controlling terminal has been relinquished in this fashion is unspecified. A process does not  
7163 relinquish its controlling terminal simply by closing all of its file descriptors associated with the  
7164 controlling terminal if other processes continue to have it open.

7165 When a controlling process terminates, the controlling terminal is dissociated from the current  
7166 session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by  
7167 other processes in the earlier session may be denied, with attempts to access the terminal treated  
7168 as if a modem disconnect had been sensed.

### 7169 11.1.4 Terminal Access Control

7170 If a process is in the foreground process group of its controlling terminal, read operations shall  
7171 be allowed, as described in [Section 11.1.5](#) (on page 201). Any attempts by a process in a  
7172 background process group to read from its controlling terminal cause its process group to be  
7173 sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is  
7174 ignoring the SIGTTIN signal or the reading thread is blocking the SIGTTIN signal, or if the  
7175 process group of the reading process is orphaned, the *read()* shall return *-1*, with *errno* set to  
7176 [EIO] and no signal shall be sent. The default action of the SIGTTIN signal shall be to stop the  
7177 process to which it is sent. See [<signal.h>](#).

7178 If a process is in the foreground process group of its controlling terminal, write operations shall

7179 be allowed as described in [Section 11.1.8](#) (on page 203). Attempts by a process in a background  
7180 process group to write to its controlling terminal shall cause the process group to be sent a  
7181 SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if  
7182 TOSTOP is set and the process is ignoring the SIGTTOU signal or the writing thread is blocking  
7183 the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is  
7184 not sent. If TOSTOP is set, the process group of the writing process is orphaned, the writing  
7185 process is not ignoring the SIGTTOU signal, and the writing thread is not blocking the SIGTTOU  
7186 signal, the *write()* shall return  $-1$ , with *errno* set to [EIO] and no signal shall be sent.

7187 Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that  
7188 TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set  
7189 (see [Section 11.2.5](#) (on page 210), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, *tcsetpgrp()*,  
7190 and *tcsetwinsize()*).

### 7191 11.1.5 Input Processing and Reading Data

7192 A terminal device associated with a terminal device file may operate in full-duplex mode, so  
7193 that data may arrive even while output is occurring. Each terminal device file has an input  
7194 queue associated with it, into which incoming data is stored by the system before being read by  
7195 a process. The system may impose a limit, {MAX\_INPUT}, on the number of bytes that may be  
7196 stored in the input queue. The behavior of the system when this limit is exceeded is  
7197 implementation-defined.

7198 Two general kinds of input processing are available, determined by whether the terminal device  
7199 file is in canonical mode or non-canonical mode. These modes are described in [Section 11.1.6](#) (on  
7200 page 202) and [Section 11.1.7](#) (on page 202). Additionally, input characters are processed  
7201 according to the *c\_iflag* (see [Section 11.2.2](#), on page 206) and *c\_lflag* (see [Section 11.2.5](#), on page  
7202 210) fields. Such processing can include “echoing”, which in general means transmitting input  
7203 characters immediately back to the terminal when they are received from the terminal. This is  
7204 useful for terminals that can operate in full-duplex mode.

7205 The manner in which data is provided to a process reading from a terminal device file is  
7206 dependent on whether the terminal file is in canonical or non-canonical mode, and on whether  
7207 or not the O\_NONBLOCK flag is set by *open()* or *fcntl()*.

7208 If the O\_NONBLOCK flag is clear, then the read request shall be blocked until data is available  
7209 or a signal has been received. If the O\_NONBLOCK flag is set, then the read request shall be  
7210 completed, without blocking, in one of three ways:

- 7211 1. If there is enough data available to satisfy the entire request, the *read()* shall complete  
7212 successfully and shall return the number of bytes read.
- 7213 2. If there is not enough data available to satisfy the entire request, the *read()* shall complete  
7214 successfully, having read as much data as possible, and shall return the number of bytes it  
7215 was able to read.
- 7216 3. If there is no data available, the *read()* shall return  $-1$ , with *errno* set to [EAGAIN].

7217 When data is available depends on whether the input processing mode is canonical or non-  
7218 canonical. [Section 11.1.6](#) (on page 202) and [Section 11.1.7](#) (on page 202) describe each of these  
7219 input processing modes.

### 7220 11.1.6 Canonical Mode Input Processing

7221 In canonical mode input processing, terminal input is processed in units of lines. A line is  
 7222 delimited by a <newline> character (NL), an end-of-file character (EOF), or an end-of-line (EOL)  
 7223 character. See Section 11.1.9 (on page 203) for more information on EOF and EOL. This means  
 7224 that a read request shall not return until an entire line has been typed or a signal has been  
 7225 received. Also, no matter how many bytes are requested in the *read()* call, at most one line shall  
 7226 be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even  
 7227 one, may be requested in a *read()* without losing information.

7228 If {MAX\_CANON} is defined for this terminal device, it shall be a limit on the number of bytes  
 7229 in a line. The behavior of the system when this limit is exceeded is implementation-defined. If  
 7230 {MAX\_CANON} is not defined, there shall be no such limit; see *pathconf()*.

7231 Erase and kill processing occur when either of two special characters, the ERASE and KILL  
 7232 characters (see Section 11.1.9, on page 203), is received. This processing shall affect data in the  
 7233 input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited  
 7234 data makes up the current line. The ERASE character shall delete the last character in the current  
 7235 line, if there is one. The KILL character shall delete all data in the current line, if there is any.  
 7236 The ERASE and KILL characters shall have no effect if there is no data in the current line. The  
 7237 ERASE and KILL characters themselves shall not be placed in the input queue.

### 7238 11.1.7 Non-Canonical Mode Input Processing

7239 In non-canonical mode input processing, input bytes are not assembled into lines, and erase and  
 7240 kill processing shall not occur. The values of the MIN and TIME members of the *c\_cc* array are  
 7241 used to determine how to process the bytes received. POSIX.1-2024 does not specify whether  
 7242 the setting of O\_NONBLOCK takes precedence over MIN or TIME settings. Therefore, if  
 7243 O\_NONBLOCK is set, *read()* may return immediately, regardless of the setting of MIN or TIME.  
 7244 Also, if no data is available, *read()* may either return 0, or return -1 with *errno* set to [EAGAIN].

7245 MIN represents the minimum number of bytes that should be received when the *read()* function  
 7246 returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and  
 7247 short-term data transmissions. If MIN is greater than {MAX\_INPUT}, the response to the request  
 7248 is undefined. The four possible values for MIN and TIME and their interactions are described  
 7249 below.

#### 7250 Case A: MIN>0, TIME>0

7251 In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is  
 7252 received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction  
 7253 between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall  
 7254 be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer  
 7255 is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN  
 7256 bytes are received, the characters received to that point shall be returned to the user. Note that if  
 7257 TIME expires at least one byte shall be returned because the timer would not have been enabled  
 7258 unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and  
 7259 TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is  
 7260 in the buffer at the time of the *read()*, the result shall be as if data has been received immediately  
 7261 after the *read()*.

7262 **Case B: MIN>0, TIME=0**

7263 In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A  
 7264 pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall  
 7265 block until MIN bytes are received), or a signal is received. A program that uses case B to read  
 7266 record-based terminal I/O may block indefinitely in the read operation.

7267 **Case C: MIN=0, TIME>0**

7268 In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read  
 7269 timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied  
 7270 as soon as a single byte is received or the read timer expires. Note that in case C if the timer  
 7271 expires, no bytes shall be returned. If the timer does not expire, the only way the read can be  
 7272 satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely  
 7273 waiting for a byte; if no byte is received within TIME\*0.1 seconds after the read is initiated, the  
 7274 *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the  
 7275 *read()*, the timer shall be started as if data has been received immediately after the *read()*.

7276 **Case D: MIN=0, TIME=0**

7277 The minimum of either the number of bytes requested or the number of bytes currently  
 7278 available shall be returned without waiting for more bytes to be input. If no characters are  
 7279 available, *read()* shall return a value of zero, having read no data.

7280 **11.1.8 Writing Data and Output Processing**

7281 When a process writes one or more bytes to a terminal device file, they are processed according  
 7282 to the *c\_oflag* field (see [Section 11.2.3](#), on page 207). The implementation may provide a  
 7283 buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have  
 7284 been scheduled for transmission to the device, but the transmission has not necessarily  
 7285 completed. See *write()* for the effects of O\_NONBLOCK on *write()*.

7286 **11.1.9 Special Characters**

7287 Certain characters have special functions on input or output or both. These functions are  
 7288 summarized as follows:

7289 **INTR** Special character on input, which is recognized if the ISIG flag is set. Generates a  
 7290 SIGINT signal which is sent to all processes in the foreground process group for which  
 7291 the terminal is the controlling terminal. If ISIG is set, the INTR character shall be  
 7292 discarded when processed.

7293 **QUIT** Special character on input, which is recognized if the ISIG flag is set. Generates a  
 7294 SIGQUIT signal which is sent to all processes in the foreground process group for  
 7295 which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be  
 7296 discarded when processed.

7297 **ERASE** Special character on input, which is recognized if the ICANON flag is set. Erases the  
 7298 last character in the current line; see [Section 11.1.6](#) (on page 202). It shall not erase  
 7299 beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is  
 7300 set, the ERASE character shall be discarded when processed.

7301 **KILL** Special character on input, which is recognized if the ICANON flag is set. Deletes the  
 7302 entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL  
 7303 character shall be discarded when processed.

7304	EOF	Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a <newline>, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the <i>read()</i> , representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.
7305		
7306		
7307		
7308		
7309		
7310	NL	Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter <newline>. It cannot be changed.
7311		
7312	EOL	Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.
7313		
7314	SUSP	If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.
7315		
7316		
7317	STOP	Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing before it can be read. If IXON is set, the STOP character shall be discarded when processed.
7318		
7319		
7320		
7321	START	Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.
7322		
7323		
7324		
7325	CR	Special character on input, which is recognized if the ICANON flag is set; it is the <carriage-return> character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character. It cannot be changed.
7326		
7327		
7328		
7329		The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with changeable special control characters can be disabled individually.
7330		
7331		
7332		
7333		If two or more special characters have the same value, the function performed when that character is received is undefined.
7334		
7335		A special character is recognized not only by its value, but also by its context; for example, an implementation may support multi-byte sequences that have a meaning different from the meaning of the bytes when considered individually. Implementations may also support additional single-byte functions. These implementation-defined multi-byte or single-byte functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without interpretation, except as required to recognize the special characters defined in this section.
7336		
7337		
7338		
7339		
7340		
7341	XSI	If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding <backslash> character, in which case no special function shall occur.
7342		

7343 **11.1.10 Modem Disconnect**

7344 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if  
 7345 CLOCAL is not set in the *c\_cflag* field for the terminal (see Section 11.2.4, on page 209), the  
 7346 SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling  
 7347 terminal. Unless other arrangements have been made, this shall cause the controlling process to  
 7348 terminate (see *exit()*). Any subsequent read from the terminal device shall return the value of  
 7349 zero, indicating end-of-file; see *read()*. Thus, processes that read a terminal file and test for end-  
 7350 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read()*  
 7351 also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent  
 7352 *write()* to the terminal device shall return  $-1$ , with *errno* set to [EIO], until the device is closed.

7353 **11.1.11 Closing a Terminal Device File**

7354 The last process to close a terminal device file shall cause any output to be sent to the device and  
 7355 shall cause any input to be discarded. If HUPCL is set in the control modes and the  
 7356 communications port supports a disconnect function, the terminal device shall perform a  
 7357 disconnect.

7358 **11.2 Parameters that Can be Set**7359 **11.2.1 The termios Structure**

7360 Routines that need to control certain terminal I/O characteristics shall do so by using the  
 7361 **termios** structure as defined in the [<termios.h>](#) header.

7362 Since the **termios** structure may include additional members, and the standard members may  
 7363 include both standard and non-standard modes, the structure should never be initialized  
 7364 directly by the application as this may cause the terminal to behave in a non-conforming  
 7365 manner. When opening a terminal device (other than a pseudo-terminal) that is not already open  
 7366 in any process, it should be opened with the O\_TTY\_INIT flag before initializing the structure  
 7367 using *tcgetattr()* to ensure that any non-standard elements of the **termios** structure are set to  
 7368 values that result in conforming behavior of the terminal interface.

7369 The members of the **termios** structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
<b>tcflag_t</b>		<i>c_iflag</i>	Input modes.
<b>tcflag_t</b>		<i>c_oflag</i>	Output modes.
<b>tcflag_t</b>		<i>c_cflag</i>	Control modes.
<b>tcflag_t</b>		<i>c_lflag</i>	Local modes.
<b>cc_t</b>	NCCS	<i>c_cc[]</i>	Control characters.

7377 The **tcflag\_t** and **cc\_t** types are defined in the [<termios.h>](#) header. They shall be unsigned  
 7378 integer types.

7379 **11.2.2 Input Modes**

7380 Values of the *c\_iflag* field describe the basic terminal input control, and are composed of the  
7381 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name  
7382 symbols in this table are defined in `<termios.h>`:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

7396 In the context of asynchronous serial data transmission, a break condition shall be defined as a  
7397 sequence of zero-valued bits that continues for more than the time to send one byte. The entire  
7398 sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a  
7399 time equivalent to more than one byte. In contexts other than asynchronous serial data  
7400 transmission, the definition of a break condition is implementation-defined.

7401 If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the  
7402 input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the  
7403 break condition shall flush the input and output queues, and if the terminal is the controlling  
7404 terminal of a foreground process group, the break condition shall generate a single SIGINT  
7405 signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break  
7406 condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

7407 If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

7408 If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than  
7409 break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is  
7410 a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid  
7411 ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff  
7412 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be  
7413 given to the application as a single byte 0x00.

7414 If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking  
7415 shall be disabled, allowing output parity generation without input parity errors. Note that  
7416 whether input parity checking is enabled or disabled is independent of whether parity detection  
7417 is enabled or disabled (see [Section 11.2.4](#), on page 209). If parity detection is enabled but input  
7418 parity checking is disabled, the hardware to which the terminal is connected shall recognize the  
7419 parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

7420 If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits  
7421 shall be processed.

7422 If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a  
7423 received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a  
7424 received CR character shall be translated into an NL character.

7425 If IXANY is set, any input character shall restart output that has been suspended.

7426 If IXON is set, start/stop output control shall be enabled. A received STOP character shall  
7427 suspend output and a received START character shall restart output. When IXON is set, START  
7428 and STOP characters are not read, but merely perform flow control functions. When IXON is not  
7429 set, the START and STOP characters shall be read.

7430 If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP  
7431 characters, which are intended to cause the terminal device to stop transmitting data, as needed  
7432 to prevent the input queue from overflowing and causing implementation-defined behavior,  
7433 and shall transmit START characters, which are intended to cause the terminal device to resume  
7434 transmitting data, as soon as the device can continue transmitting data without risk of  
7435 overflowing the input queue. The precise conditions under which STOP and START characters  
7436 are transmitted are implementation-defined.

7437 The initial input control value after *open()* is implementation-defined.

### 7438 11.2.3 Output Modes

7439 The *c\_oflag* field specifies the terminal interface's treatment of output, and is composed of the  
7440 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name  
7441 symbols in the following table are defined in `<termios.h>`:

	Mask Name	Description	
7442	OPOST	Perform output processing.	
7443	XSI	ONLCR	Map NL to CR-NL on output.
7444		OCRNL	Map CR to NL on output.
7445		ONOCR	No CR output at column 0.
7446		ONLRET	NL performs CR function.
7447		OFILL	Use fill characters for delay.
7448		OFDEL	Fill is DEL, else NUL.
7449		NLDLY	Select newline delays:
7450		NL0	Newline character type 0.
7451		NL1	Newline character type 1.
7452		CRDLY	Select carriage-return delays:
7453		CR0	Carriage-return delay type 0.
7454		CR1	Carriage-return delay type 1.
7455		CR2	Carriage-return delay type 2.
7456		CR3	Carriage-return delay type 3.
7457		TABDLY	Select horizontal-tab delays:
7458		TAB0	Horizontal-tab delay type 0.
7459		TAB1	Horizontal-tab delay type 1.
7460		TAB2	Horizontal-tab delay type 2.
7461		TAB3	Expand tabs to spaces.
7462		BSDLY	Select backspace delays:
7463		BS0	Backspace-delay type 0.
7464	BS1	Backspace-delay type 1.	
7465	VTDLY	Select vertical-tab delays:	
7466	VT0	Vertical-tab delay type 0.	
7467	VT1	Vertical-tab delay type 1.	
7468	FFDLY	Select form-feed delays:	
7469	FF0	Form-feed delay type 0.	
7470	FF1	Form-feed delay type 1.	
7471			

7472 If OPOST is set, output data shall be post-processed as described below, so that lines of text are  
7473 modified to appear appropriately on the terminal device; otherwise, characters shall be  
7474 transmitted without change.

7475 XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is  
7476 set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character  
7477 shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is  
7478 assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays  
7479 specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed  
7480 function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the  
7481 CR character is actually transmitted.

7482 The delay bits specify how long transmission stops to allow for mechanical or other movement  
7483 when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If  
7484 OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful  
7485 for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character  
7486 shall be DEL; otherwise, NUL.

7487 If a <form-feed> or <vertical-tab> delay is specified, it shall last for about 2 seconds.

7488 Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be  
7489 used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

7490 Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

7491 about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall  
7492 transmit two fill characters, and type 2 four fill characters.

7493 Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be  
7494 about 0.10 seconds. Type 3 specifies that <tab> characters shall be expanded into <space>  
7495 characters. If OFILL is set, two fill characters shall be transmitted for any delay.

7496 Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be  
7497 transmitted.

7498 The actual delays depend on line speed and system load.

7499 The initial output control value after *open()* is implementation-defined.

#### 7500 11.2.4 Control Modes

7501 The *c\_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-  
7502 inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in  
7503 this table are defined in <[termios.h](#)>; not all values specified are required to be supported by the  
7504 underlying hardware (if any). If the terminal is a pseudo-terminal, it is unspecified whether non-  
7505 default values are unsupported, or are supported and emulated in software, or are handled by  
7506 *tcsetattr()*, *tcgetattr()*, and the *stty* utility as if they are supported but have no effect on the  
7507 behavior of the terminal interface.

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

7520 In addition, the input and output baud rates are stored in the **termios** structure. The symbols in  
7521 the following table are defined in <[termios.h](#)>. Not all values specified are required to be  
7522 supported by the underlying hardware (if any). For pseudo-terminals, the input and output  
7523 baud rates set in the **termios** structure need not affect the speed of data transmission through the  
7524 terminal interface.

7525 **Note:** The term “baud” is used historically here, but is not technically correct. This is properly “bits  
7526 per second”, which may not be the same as baud. However, the term is used because of the  
7527 historical usage and understanding.

7528  
7529  
7530  
7531  
7532  
7533  
7534  
7535  
7536

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

7537  
7538  
7539  
7540

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, and *cfsetospeed()*. The effects on the terminal device shall not become effective and not all errors need be detected until the *tcsetattr()* function is successfully called.

7541  
7542  
7543  
7544  
7545

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used; otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

7546

If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

7547  
7548  
7549

If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity shall be used.

7550  
7551  
7552

If HUPCL is set, the modem control lines for the port shall be lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

7553  
7554

If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

7555  
7556  
7557

Under normal circumstances, a call to the *open()* function shall wait for the modem connection to complete. However, if the O\_NONBLOCK flag is set (see *open()*) or if CLOCAL has been set, the *open()* function shall return immediately without waiting for the connection.

7558  
7559  
7560  
7561

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate need not be set on the connection between that terminal and the machine to which it is directly connected.

7562

The initial hardware control value after *open()* is implementation-defined.

7563 **11.2.5 Local Modes**7564  
7565  
7566

The *c\_iflag* field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in [<termios.h>](#).

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

7577 If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input  
7578 characters shall not be echoed.

7579 If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if  
7580 possible, the last character in the current line from the display. If there is no character to erase, an  
7581 implementation may echo an indication that this was the case, or do nothing.

7582 If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the  
7583 line from the display or shall echo the <newline> character after the KILL character.

7584 If ECHONL and ICANON are set, the <newline> character shall be echoed even if ECHO is not  
7585 set.

7586 If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit  
7587 functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as  
7588 described in [Section 11.1.6](#) (on page 202).

7589 If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall  
7590 not be satisfied until at least MIN bytes have been received or the timeout value TIME expired  
7591 between bytes. The time value represents tenths of a second. See [Section 11.1.7](#) (on page 202) for  
7592 more details.

7593 If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is  
7594 implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF.  
7595 If IEXTEN is not set, implementation-defined functions shall not be recognized and the  
7596 corresponding input characters are processed as described for ICANON, ISIG, IXON, and  
7597 IXOFF.

7598 If ISIG is set, each input character shall be checked against the special control characters INTR,  
7599 QUIT, and SUSP. If an input character matches one of these control characters, the function  
7600 associated with that character shall be performed. If ISIG is not set, no checking shall be done.  
7601 Thus these special input functions are possible only if ISIG is set.

7602 If NOFLSH is set, the normal flush of the input and output queues associated with the INTR,  
7603 QUIT, and SUSP characters shall not be done.

7604 If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to  
7605 write to its controlling terminal if it is not in the foreground process group for that terminal. This  
7606 signal, by default, stops the members of the process group. Otherwise, the output generated by  
7607 that process shall be output to the current output stream. If the writing process is ignoring the  
7608 SIGTTOU signal or the writing thread is blocking the SIGTTOU signal, the process is allowed to  
7609 produce output, and the SIGTTOU signal shall not be sent.

7610 The initial local control value after *open()* is implementation-defined.

7611 **11.2.6 Special Control Characters**

7612 The special control character values shall be defined by the array *c\_cc*. The subscript name and  
 7613 description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

7628 The subscript values are unique, except that the VMIN and VTIME subscripts may have the  
 7629 same values as the VEOF and VEOL subscripts, respectively.

7630 Implementations that do not support changing the START and STOP characters may ignore the  
 7631 character values in the *c\_cc* array indexed by the VSTART and VSTOP subscripts when  
 7632 *tcsetattr()* is called, but shall return the value in use when *tcgetattr()* is called.

7633 The initial values of all control characters are implementation-defined.

7634 If the value of one of the changeable special control characters (see [Section 11.1.9](#), on page 203) is  
 7635 `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the  
 7636 disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special  
 7637 meaning for the VMIN and VTIME entries of the *c\_cc* array.

# Utility Conventions

## 7640 12.1 Utility Argument Syntax

7641 This section describes the argument syntax of the standard utilities and introduces terminology  
7642 used throughout POSIX.1-2024 for describing the arguments processed by the utilities.

7643 Within POSIX.1-2024, a special notation is used for describing the syntax of a utility's  
7644 arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated  
7645 by this example (see XCU Section 2.9.1, on page 2500):

```
7646 utility_name [-a] [-b] [-c option_argument]
7647             [-d|-e] [-f[option_argument]] [operand...]
```

7648 The notation used for the SYNOPSIS sections imposes requirements on the implementors of the  
7649 standard utilities and provides a simple reference for the application developer or system user.

- 7650 1. The utility in the example is named *utility\_name*. It is followed by options, option-  
7651 arguments, and operands. The arguments that consist of <hyphen-minus> characters  
7652 and single letters or digits, such as 'a', are known as "options" (or, historically, "flags").  
7653 Certain options are followed by an "option-argument", as shown with [-c  
7654 *option\_argument*]. The arguments following the last options and option-arguments are  
7655 named "operands".
- 7656 2. Option-arguments are shown separated from their options by <blank> characters, except  
7657 when the option-argument is enclosed in the '[' and ']' notation to indicate that it is  
7658 optional. This reflects the situation in which an optional option-argument (if present) is  
7659 included within the same argument string as the option; for a mandatory option-  
7660 argument, it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page  
7661 215) require that the option be a separate argument from its option-argument and that  
7662 option-arguments not be optional, but there are some exceptions in POSIX.1-2024 to  
7663 provide for continued operation of historical applications:
  - 7664 a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-  
7665 argument (as with [-c *option\_argument*] in the example), a conforming application  
7666 shall use separate arguments for that option and its option-argument. However, a  
7667 conforming implementation shall also permit applications to specify the option  
7668 and option-argument in the same argument string without intervening <blank>  
7669 characters.
  - 7670 b. If the SYNOPSIS shows an optional option-argument (as with  
7671 [-f[*option\_argument*]] in the example), a conforming application shall place any  
7672 option-argument for that option directly adjacent to the option in the same  
7673 argument string, without intervening <blank> characters. If the utility receives an  
7674 argument containing only the option, it shall behave as specified in its description  
7675 for an omitted option-argument; it shall not treat the next argument (if any) as the  
7676 option-argument for that option.

- 7677 3. Options are usually listed in alphabetical order unless this would make the utility  
7678 description more confusing. There are no implied relationships between the options  
7679 based upon the order in which they appear, unless otherwise stated in the OPTIONS  
7680 section, or unless the exception in Guideline 11 of [Section 12.2](#) (on page 215) applies. If an  
7681 option that does not have option-arguments is repeated, the results are undefined, unless  
7682 otherwise stated.
- 7683 4. Frequently, names of parameters that require substitution by actual values are shown  
7684 with embedded <underscore> characters. Alternatively, parameters are shown as follows:  
7685  
`<parameter name>`  
7686  
The angle brackets are used for the symbolic grouping of a phrase representing a single  
7687 parameter and conforming applications shall not include them in data submitted to the  
7688 utility.
- 7689 5. When a utility has only a few permissible options, they are sometimes shown  
7690 individually, as in the example. Utilities with many flags generally show all of the  
7691 individual flags (that do not take option-arguments) grouped, as in:  
7692  
`utility_name [-abcDxyz] [-p arg] [operand]`  
7693  
Utilities with very complex arguments may be shown as follows:  
7694  
`utility_name [options] [operands]`
- 7695 6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a  
7696 numeric value:  
7697  
  - The number is interpreted as a decimal integer.
  - Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
  - When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range -2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
  - When the utility description states that the number is a file size-related value (such as a file size or offset, line number, or block count), numerals in the range 0 to the maximum file size supported by the implementation are syntactically recognized as numeric values (see [XCU Section 1.5](#), on page 2469). Where negative values are permitted, any value in the range -(maximum file size) to the maximum file size is accepted.
  - Ranges greater than those listed here are allowed.
- 7710 This does not mean that all numbers within the allowable range are necessarily  
7711 semantically correct. A standard utility that accepts an option-argument or operand that  
7712 is to be interpreted as a number, and for which a range of values smaller than that shown  
7713 above is permitted by the POSIX.1-2024, describes that smaller range along with the  
7714 description of the option-argument or operand. If an error is generated, the utility's  
7715 diagnostic message shall indicate that the value is out of the supported range, not that it  
7716 is syntactically incorrect.
- 7717 7. Arguments or option-arguments enclosed in the '[' and ']' notation are optional and  
7718 can be omitted. Conforming applications shall not include the '[' and ']' symbols in  
7719 data submitted to the utility.

7720 8. Arguments separated by the '|' (<vertical-line>) bar notation are mutually-exclusive.  
 7721 Conforming applications shall not include the '|' symbol in data submitted to the utility.  
 7722 Alternatively, mutually-exclusive options and operands may be listed with multiple  
 7723 synopsis lines.

7724 For example:

```
7725 utility_name -d [-a] [-c option_argument] [operand...]
```

```
7726 utility_name [-a] [-b] [operand...]
```

7727 When multiple synopsis lines are given for a utility, it is an indication that the utility has  
 7728 mutually-exclusive arguments. These mutually-exclusive arguments alter the  
 7729 functionality of the utility so that only certain other arguments are valid in combination  
 7730 with one of the mutually-exclusive arguments. Only one of the mutually-exclusive  
 7731 arguments is allowed for invocation of the utility. Unless otherwise stated in an  
 7732 accompanying OPTIONS section, the relationships between arguments depicted in the  
 7733 SYNOPSIS sections are mandatory requirements placed on conforming applications. The  
 7734 use of conflicting mutually-exclusive arguments produces undefined results, unless a  
 7735 utility description specifies otherwise. When an option is shown without the '[' and  
 7736 ']' brackets, it means that option is required for that version of the SYNOPSIS. However,  
 7737 it is not required to be the first argument, as shown in the example above, unless  
 7738 otherwise stated.

7739 9. Ellipses ("...") are used to denote that one or more occurrences of an operand are  
 7740 allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero  
 7741 or more options or operands can be specified. The form:

```
7742 utility_name [-g option_argument]... [operand...]
```

7743 indicates that multiple occurrences of the option and its option-argument preceding the  
 7744 ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See  
 7745 also Guideline 11 in [Section 12.2](#).)

7746 The form:

```
7747 utility_name -f option_argument [-f option_argument]... [operand...]
```

7748 indicates that the -f option is required to appear at least once and may appear multiple  
 7749 times.

7750 10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities  
 7751 volume of POSIX.1-2024, the indented lines following the initial line are continuation  
 7752 lines. An actual use of the command would appear on a single logical line.

## 7753 12.2 Utility Syntax Guidelines

7754 The following guidelines are established for the naming of utilities and for the specification of  
 7755 options, option-arguments, and operands. The *getopt()* function in the System Interfaces  
 7756 volume of POSIX.1-2024 assists utilities in handling options and operands that conform to these  
 7757 guidelines.

7758 Operands and option-arguments can contain characters not specified in the portable character  
 7759 set.

7760 The guidelines are intended to provide guidance to the authors of future utilities, such as those  
 7761 written specific to a local system or that are components of a larger application. Some of the  
 7762 standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections  
 7763 describe the deviations.

- 7764       **Guideline 1:**     Utility names should be between two and nine characters, inclusive.
- 7765       **Guideline 2:**     Utility names should include lowercase letters (the **lower** character  
7766                           classification) and digits only from the portable character set.
- 7767       **Guideline 3:**     Each option name should be a single alphanumeric character (the **alnum**  
7768                           character classification) from the portable character set. The **-W** (capital-W)  
7769                           option shall be reserved for vendor options.
- 7770                           Multi-digit options should not be allowed.
- 7771       **Guideline 4:**     All options should be preceded by the '-' delimiter character.
- 7772       **Guideline 5:**     One or more options without option-arguments, followed by at most one  
7773                           option that takes an option-argument, should be accepted when grouped  
7774                           behind one '-' delimiter.
- 7775       **Guideline 6:**     Each option and option-argument should be a separate argument, except as  
7776                           noted in [Section 12.1](#) (on page 213), item (2).
- 7777       **Guideline 7:**     Option-arguments should not be optional.
- 7778       **Guideline 8:**     When multiple option-arguments are specified to follow a single option, they  
7779                           should be presented as a single argument, using <comma> characters within  
7780                           that argument or <blank> characters within that argument to separate them.
- 7781       **Guideline 9:**     All options should precede operands on the command line.
- 7782       **Guideline 10:**    The first -- argument that is not an option-argument should be accepted as a  
7783                           delimiter indicating the end of options. Any following arguments should be  
7784                           treated as operands, even if they begin with the '-' character.
- 7785       **Guideline 11:**    The order of different options relative to one another should not matter, unless  
7786                           the options are documented as mutually-exclusive and such an option is  
7787                           documented to override any incompatible options preceding it. If an option  
7788                           that has option-arguments is repeated, the option and option-argument  
7789                           combinations should be interpreted in the order specified on the command  
7790                           line.
- 7791       **Guideline 12:**    The order of operands may matter and position-related interpretations should  
7792                           be determined on a utility-specific basis.
- 7793       **Guideline 13:**    For utilities that use operands to represent files to be opened for either reading  
7794                           or writing, the '-' operand should be used to mean only standard input (or  
7795                           standard output when it is clear from context that an output file is being  
7796                           specified) or a file named -.
- 7797       **Guideline 14:**    If an argument can be identified according to Guidelines 3 through 10 as an  
7798                           option, or as a group of options without option-arguments behind one '-'  
7799                           delimiter, then it should be treated as such.
- 7800       The utilities in the Shell and Utilities volume of POSIX.1-2024 that claim conformance to these  
7801       guidelines shall conform completely to these guidelines as if these guidelines contained the term  
7802       "shall" instead of "should". On some implementations, the utilities accept usage in violation of  
7803       these guidelines for backwards-compatibility as well as accepting the required form.
- 7804       Where a utility described in the Shell and Utilities volume of POSIX.1-2024 as conforming to  
7805       these guidelines is required to accept, or not to accept, the operand '-' to mean standard input  
7806       or output, this usage is explained in the OPERANDS section. Otherwise, if such a utility uses  
7807       operands to represent files, it is implementation-defined whether the operand '-' stands for  
7808       standard input (or standard output), or for a file named -.

7809           It is recommended that all future utilities and applications use these guidelines to enhance user  
7810 portability. The fact that some historical utilities could not be changed (to avoid breaking  
7811 existing applications) should not deter this future goal.

7812

Chapter 13

7813

## *Namespace and Future Directions*

7814

In order to prevent future versions of this standard from introducing features that could cause older applications to fail, the prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by this standard for any name (e.g. function, variable, utility, etc.). Neither implementations nor applications shall introduce objects in this namespace.

7815

7816

7817

# Headers

7820 This chapter describes the contents of headers.

7821 Headers contain function prototypes, the definition of symbolic constants, common structures,  
7822 preprocessor macros, and defined types. Each function in the System Interfaces volume of  
7823 POSIX.1-2024 specifies the headers that an application shall include in order to use that function.  
7824 In most cases, only one header is required. These headers are present on an application  
7825 development system; they need not be present on the target execution system.

## 7826 **Format of Entries**

7827 The entries in this chapter are based on a common format as follows. The only sections relating  
7828 to conformance are the SYNOPSIS and DESCRIPTION.

### 7829 **NAME**

7830 This section gives the name or names of the entry and briefly states its purpose.

### 7831 **SYNOPSIS**

7832 This section summarizes the use of the entry being described.

### 7833 **DESCRIPTION**

7834 This section describes the functionality of the header.

### 7835 **APPLICATION USAGE**

7836 This section is informative. This section gives warnings and advice to application  
7837 developers about the entry. In the event of conflict between warnings and advice and a  
7838 normative part of this volume of POSIX.1-2024, the normative material is to be taken as  
7839 correct.

### 7840 **RATIONALE**

7841 This section is informative. This section contains historical information concerning the  
7842 contents of this volume of POSIX.1-2024 and why features were included or discarded  
7843 by the standard developers.

### 7844 **FUTURE DIRECTIONS**

7845 This section is informative. This section provides comments which should be used as a  
7846 guide to current thinking; there is not necessarily a commitment to adopt these future  
7847 directions.

### 7848 **SEE ALSO**

7849 This section is informative. This section gives references to related information.

### 7850 **CHANGE HISTORY**

7851 This section is informative. This section shows the derivation of the entry and any  
7852 significant changes that have been made to it.

7853 **NAME**

7854 aio.h — asynchronous input and output

7855 **SYNOPSIS**

7856 #include &lt;aio.h&gt;

7857 **DESCRIPTION**7858 The **<aio.h>** header shall define the **aio\_cb** structure, which shall include at least the following  
7859 members:

7860	int	aio_fildes	File descriptor.
7861	off_t	aio_offset	File offset.
7862	volatile void *	aio_buf	Location of buffer.
7863	size_t	aio_nbytes	Length of transfer.
7864	int	aio_reqprio	Request priority offset.
7865	struct sigevent	aio_sigevent	Signal number and value.
7866	int	aio_lio_opcode	Operation to be performed.

7867 The **<aio.h>** header shall define the **off\_t**, **pthread\_attr\_t**, **size\_t**, and **ssize\_t** types as described  
7868 in **<sys/types.h>**.7869 The **<aio.h>** header shall define the **struct timespec** structure as described in **<time.h>**.7870 The **<aio.h>** header shall define the **sigevent** structure and **sigval** union as described in  
7871 **<signal.h>**.7872 The **<aio.h>** header shall define the following symbolic constants:7873 **AIO\_ALLDONE** A return value indicating that none of the requested operations could be  
7874 canceled since they are already complete.7875 **AIO\_CANCELED** A return value indicating that all requested operations have been  
7876 canceled.7877 **AIO\_NOTCANCELED**  
7878 A return value indicating that some of the requested operations could not  
7879 be canceled since they are in progress.7880 **LIO\_NOP** A *lio\_listio()* element operation option indicating that no transfer is  
7881 requested.7882 **LIO\_NOWAIT** A *lio\_listio()* synchronization operation indicating that the calling thread  
7883 is to continue execution while the *lio\_listio()* operation is being  
7884 performed, and no notification is given when the operation is complete.7885 **LIO\_READ** A *lio\_listio()* element operation option requesting a read.7886 **LIO\_WAIT** A *lio\_listio()* synchronization operation indicating that the calling thread  
7887 is to suspend until the *lio\_listio()* operation is complete.7888 **LIO\_WRITE** A *lio\_listio()* element operation option requesting a write.7889 The following shall be declared as functions and may also be defined as macros. Function  
7890 prototypes shall be provided.

7891	int	aio_cancel(int, struct aio_cb *);
7892	int	aio_error(const struct aio_cb *);
7893	FSC SIO int	aio_fsync(int, struct aio_cb *);
7894	int	aio_read(struct aio_cb *);
7895	ssize_t	aio_return(struct aio_cb *);
7896	int	aio_suspend(const struct aio_cb *const [], int,

```

7897         const struct timespec *);
7898     int     aio_write(struct aiocb *);
7899     int     lio_listio(int, struct aiocb *restrict const [restrict], int,
7900                struct sigevent *restrict);

```

7901 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>, <signal.h>, and <time.h>.

#### 7903 APPLICATION USAGE

7904 None.

#### 7905 RATIONALE

7906 None.

#### 7907 FUTURE DIRECTIONS

7908 None.

#### 7909 SEE ALSO

7910 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>

7911 XSH *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_suspend()*, *aio\_write()*,  
7912 *fsync()*, *lio\_listio()*, *lseek()*, *read()*, *write()*

#### 7913 CHANGE HISTORY

7914 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 7915 Issue 6

7916 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7917 The description of the constants is expanded.

7918 The **restrict** keyword is added to the prototype for *lio\_listio()*.

#### 7919 Issue 7

7920 The <aio.h> header is moved from the Asynchronous Input and Output option to the Base.

7921 This reference page is clarified with respect to macros and symbolic constants, and type and structure declarations are added.

7923 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0038 [98] is applied.

7924 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0058 [579] is applied.

**7925 NAME**

7926           arpa/inet.h — definitions for internet operations

**7927 SYNOPSIS**

7928           #include <arpa/inet.h>

**7929 DESCRIPTION**

7930           The **<arpa/inet.h>** header shall define the **in\_port\_t** and **in\_addr\_t** types as described in **<netinet/in.h>** and the **socklen\_t** type as defined in **<sys/socket.h>**.

7932           The **<arpa/inet.h>** header shall define the **in\_addr** structure as described in **<netinet/in.h>**.

7933 IP6        The **<arpa/inet.h>** header shall define the **INET\_ADDRSTRLEN** and **INET6\_ADDRSTRLEN** macros as described in **<netinet/in.h>**.

7935           The following shall be declared as functions, or defined as macros, or both. If functions are declared, function prototypes shall be provided.

```
7937           uint32_t htonl(uint32_t);
7938           uint16_t htons(uint16_t);
7939           uint32_t ntohl(uint32_t);
7940           uint16_t ntohs(uint16_t);
```

7941           The **<arpa/inet.h>** header shall define the **uint32\_t** and **uint16\_t** types as described in **<inttypes.h>**.

7943           The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
7945 OB        in_addr_t     inet_addr(const char *);
7946           char         *inet_ntoa(struct in_addr);
7947           const char   *inet_ntop(int, const void *restrict, char *restrict,
7948                         socklen_t);
7949           int          inet_pton(int, const char *restrict, void *restrict);
```

7950           Inclusion of the **<arpa/inet.h>** header may also make visible all symbols from **<netinet/in.h>** and **<inttypes.h>**.

**7952 APPLICATION USAGE**

7953           None.

**7954 RATIONALE**

7955           None.

**7956 FUTURE DIRECTIONS**

7957           None.

**7958 SEE ALSO**

7959           **<endian.h>**, **<inttypes.h>**, **<netinet/in.h>**

7960           XSH *htonl()*, *inet\_addr()*, *inet\_ntop()*

**7961 CHANGE HISTORY**

7962           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7963           The **restrict** keyword is added to the prototypes for *inet\_ntop()* and *inet\_pton()*.

**7964 Issue 7**

7965           SD5-XBD-ERN-6 is applied.

7966 **Issue 8**

7967 Austin Group Defect 162 is applied, adding <endian.h> to the SEE ALSO section.

7968 Austin Group Defects 1101 and 1102 are applied, marking *inet\_addr()* and *inet\_ntoa()* as  
7969 obsolescent.

7970 Austin Group Defect 1290 is applied, adding a requirement for <arpa/inet.h> to define the  
7971 **socklen\_t** type.

7972 **NAME**7973 `assert.h` — verify program assertion7974 **SYNOPSIS**7975 `#include <assert.h>`7976 **DESCRIPTION**

7977 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
7978 conflict between the requirements described here and the ISO C standard is unintentional. This  
7979 volume of POSIX.1-2024 defers to the ISO C standard.

7980 The **<assert.h>** header shall define the `assert()` macro. It refers to the macro `NDEBUG` which is  
7981 not defined in the header. If `NDEBUG` is defined as a macro name before the inclusion of this  
7982 header, the `assert()` macro shall be defined simply as:

7983 

```
#define assert(ignore) ((void) 0)
```

7984 Otherwise, the macro behaves as described in `assert()`.

7985 The `assert()` macro shall be redefined according to the current state of `NDEBUG` each time  
7986 **<assert.h>** is included.

7987 The `assert()` macro shall be implemented as a macro, not as a function. If the macro definition is  
7988 suppressed in order to access an actual function, the behavior is undefined.

7989 **APPLICATION USAGE**

7990 None.

7991 **RATIONALE**

7992 None.

7993 **FUTURE DIRECTIONS**

7994 None.

7995 **SEE ALSO**7996 XSH [assert\(\)](#)7997 **CHANGE HISTORY**

7998 First released in Issue 1. Derived from Issue 1 of the SVID.

7999 **Issue 6**

8000 The definition of the `assert()` macro is changed for alignment with the ISO/IEC 9899:1999  
8001 standard.

8002 **NAME**  
 8003 complex.h — complex arithmetic

8004 **SYNOPSIS**  
 8005 #include <complex.h>

8006 **DESCRIPTION**

8007 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 8008 conflict between the requirements described here and the ISO C standard is unintentional. This  
 8009 volume of POSIX.1-2024 defers to the ISO C standard.

8010 Implementations shall not define the macro `__STDC_NO_COMPLEX__`, except for profile  
 8011 implementations that define `_POSIX_SUBPROFILE` (see [Section 2.1.5.1](#), on page 20) in  
 8012 `<unistd.h>`, which may define `__STDC_NO_COMPLEX__` and, if they do so, need not provide  
 8013 this header nor support any of its facilities.

8014 The `<complex.h>` header shall define the following macros:

- 8015 `complex` Expands to `_Complex`.
- 8016 `_Complex_I` Expands to a constant expression of type `const float _Complex`, with the value  
 8017 of the imaginary unit (that is, a number  $i$  such that  $i^2=-1$ ).
- 8018 `imaginary` Expands to `_Imaginary`.
- 8019 `_Imaginary_I` Expands to a constant expression of type `const float _Imaginary` with the  
 8020 value of the imaginary unit.
- 8021 `I` Expands to either `_Imaginary_I` or `_Complex_I`. If `_Imaginary_I` is not defined,  
 8022 `I` expands to `_Complex_I`.

8023 The macros `imaginary` and `_Imaginary_I` shall be defined if and only if the implementation  
 8024 MXC supports imaginary types. Implementations that support the IEC 60559 Complex Floating-Point  
 8025 option shall define the macros `imaginary` and `_Imaginary_I`, and the macro `I` shall expand to  
 8026 `_Imaginary_I`.

8027 An application may undefine and then, perhaps, redefine the `complex`, `imaginary`, and `I` macros.

8028 The following shall be defined as macros.

```
8029 double complex      Cmplx(double x, double y);
8030 float complex      Cmplxf(float x, float y);
8031 long double complex Cmplxl(long double x, long double y);
```

8032 The following shall be declared as functions and may also be defined as macros. Function  
 8033 prototypes shall be provided.

```
8034 double      cabs(double complex);
8035 float      cabsf(float complex);
8036 long double cabsl(long double complex);
8037 double complex cacos(double complex);
8038 float complex cacosf(float complex);
8039 double complex cacosh(double complex);
8040 float complex cacoshf(float complex);
8041 long double complex cacoshl(long double complex);
8042 long double complex cacosl(long double complex);
8043 double      carg(double complex);
8044 float      cargf(float complex);
8045 long double cargl(long double complex);
8046 double complex casin(double complex);
```

```
8047     float complex      casinl(float complex);
8048     double complex     casinh(double complex);
8049     float complex      casinhf(float complex);
8050     long double complex casinhl(long double complex);
8051     long double complex casinl(long double complex);
8052     double complex     catan(double complex);
8053     float complex      catanf(float complex);
8054     double complex     catanh(double complex);
8055     float complex      catanhf(float complex);
8056     long double complex catanhl(long double complex);
8057     long double complex catanl(long double complex);
8058     double complex     ccos(double complex);
8059     float complex      ccosf(float complex);
8060     double complex     ccosh(double complex);
8061     float complex      ccoshf(float complex);
8062     long double complex ccoshl(long double complex);
8063     long double complex ccosl(long double complex);
8064     double complex     cexp(double complex);
8065     float complex      cexpf(float complex);
8066     long double complex cexpl(long double complex);
8067     double             cimag(double complex);
8068     float             cimagf(float complex);
8069     long double       cimagl(long double complex);
8070     double complex     clog(double complex);
8071     float complex      clogf(float complex);
8072     long double complex clogl(long double complex);
8073     double complex     conj(double complex);
8074     float complex      conjf(float complex);
8075     long double complex conjl(long double complex);
8076     double complex     cpow(double complex, double complex);
8077     float complex      cpowf(float complex, float complex);
8078     long double complex cpowl(long double complex, long double complex);
8079     double complex     cproj(double complex);
8080     float complex      cprojf(float complex);
8081     long double complex cprojl(long double complex);
8082     double             creal(double complex);
8083     float             crealf(float complex);
8084     long double       creall(long double complex);
8085     double complex     csin(double complex);
8086     float complex      csinf(float complex);
8087     double complex     csinh(double complex);
8088     float complex      csinhf(float complex);
8089     long double complex csinhl(long double complex);
8090     long double complex csinl(long double complex);
8091     double complex     csqrt(double complex);
8092     float complex      csqrtf(float complex);
8093     long double complex csqrtl(long double complex);
8094     double complex     ctan(double complex);
8095     float complex      ctanf(float complex);
8096     double complex     ctanh(double complex);
8097     float complex      ctanhf(float complex);
8098     long double complex ctanhl(long double complex);
```

8099           long double complex   ctanl(long double complex);

8100 **APPLICATION USAGE**

8101           The <complex.h> header is optional in the ISO C standard but is mandated by POSIX.1-2024.  
8102           Note however that subprofiles can choose to make this header optional (see Section 2.1.5.1, on  
8103           page 20), and therefore application portability to subprofile implementations would benefit from  
8104           checking whether `__STDC_NO_COMPLEX__` is defined before inclusion of <complex.h>.

8105           Values are interpreted as radians, not degrees.

8106 **RATIONALE**

8107           The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the  
8108           identifier *i* for other purposes. The application can use a different identifier, say *j*, for the  
8109           imaginary unit by following the inclusion of the <complex.h> header with:

```
8110           #undef I
8111           #define j _Imaginary_I
```

8112           An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a  
8113           sufficiently convenient and more generally useful notation for imaginary terms. The  
8114           corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or  
8115           notational convenience will not result in widening types.

8116           On systems with imaginary types, the application has the ability to control whether use of the  
8117           macro `I` introduces an imaginary type, by explicitly defining `I` to be `_Imaginary_I` or `_Complex_I`.  
8118           Disallowing imaginary types is useful for some applications intended to run on  
8119           implementations without support for such types.

8120           The macro `_Imaginary_I` provides a test for whether imaginary types are supported.

8121           The *cis*(*x*) function ( $\cos(x) + I\sin(x)$ ) was considered but rejected because its implementation is  
8122           easy and straightforward, even though some implementations could compute sine and cosine  
8123           more efficiently in tandem.

8124 **FUTURE DIRECTIONS**

8125           The following function names and the same names suffixed with *f* or *l* are reserved for future  
8126           use, and may be added to the declarations in the <complex.h> header.

```
8127           cerf()    cexpm1()  clog2()
8128           cerfc()  clog10()  clgamma()
8129           cexp2()  clog1p()  ctgamma()
```

8133 **CHANGE HISTORY**

8134           First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

8135 **Issue 8**

8136           Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

8137 **NAME**

8138 cpio.h — cpio archive values

8139 **SYNOPSIS**

8140 #include &lt;cpio.h&gt;

8141 **DESCRIPTION**8142 The **<cpio.h>** header shall define the symbolic constants needed by the *c\_mode* field of the *cpio*  
8143 archive format, with the names and values given in the following table:

8144	Name	Description	Value (Octal)
8145	C_IRUSR	Read by owner.	0000400
8146	C_IWUSR	Write by owner.	0000200
8147	C_IXUSR	Execute by owner.	0000100
8148	C_IRGRP	Read by group.	0000040
8149	C_IWGRP	Write by group.	0000020
8150	C_IXGRP	Execute by group.	0000010
8151	C_IROTH	Read by others.	0000004
8152	C_IWOTH	Write by others.	0000002
8153	C_IXOTH	Execute by others.	0000001
8154	C_ISUID	Set user ID.	0004000
8155	C_ISGID	Set group ID.	0002000
8156	C_ISVTX	On directories, restricted deletion flag.	0001000
8157	C_ISDIR	Directory.	0040000
8158	C_ISFIFO	FIFO.	0010000
8159	C_ISREG	Regular file.	0100000
8160	C_ISBLK	Block special.	0060000
8161	C_ISCHR	Character special.	0020000
8162	C_ISCTG	Reserved.	0110000
8163	C_ISLNK	Symbolic link.	0120000
8164	C_ISSOCK	Socket.	0140000

8165 The **<cpio.h>** header shall define the following symbolic constant as a string:

8166 MAGIC "070707"

8167 **APPLICATION USAGE**

8168 None.

8169 **RATIONALE**

8170 None.

8171 **FUTURE DIRECTIONS**

8172 None.

8173 **SEE ALSO**8174 XCU *pax*8175 **CHANGE HISTORY**8176 First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988  
8177 standard.8178 **Issue 6**8179 The SEE ALSO is updated to refer to *pax*.

8180 **Issue 7**

8181 The <cpio.h> header is moved from the XSI option to the Base.

8182 This reference page is clarified with respect to macros and symbolic constants.

8183 **NAME**8184 `ctype.h` — character types8185 **SYNOPSIS**8186 `#include <ctype.h>`8187 **DESCRIPTION**

8188 CX Some of the functionality described on this reference page extends the ISO C standard.  
8189 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 496) to  
8190 enable the visibility of these symbols in this header.

8191 The **<ctype.h>** header shall define the **locale\_t** type as described in **<locale.h>**, representing a  
8192 locale object.

8193 The following shall be declared as functions and may also be defined as macros. Function  
8194 prototypes shall be provided for use with ISO C standard compilers.

```
8195 int isalnum(int);  
8196 CX int isalnum_l(int, locale_t);  
8197 int isalpha(int);  
8198 CX int isalpha_l(int, locale_t);  
8199 int isblank(int);  
8200 CX int isblank_l(int, locale_t);  
8201 int iscntrl(int);  
8202 CX int iscntrl_l(int, locale_t);  
8203 int isdigit(int);  
8204 CX int isdigit_l(int, locale_t);  
8205 int isgraph(int);  
8206 CX int isgraph_l(int, locale_t);  
8207 int islower(int);  
8208 CX int islower_l(int, locale_t);

**8234 CHANGE HISTORY**

8235 First released in Issue 1. Derived from Issue 1 of the SVID.

**8236 Issue 6**

8237 Extensions beyond the ISO C standard are marked.

**8238 Issue 7**

8239 SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for  
8240 consistency.

8241 The \*\_I() functions are added from The Open Group Technical Standard, 2006, Extended API Set  
8242 Part 4.

**8243 Issue 8**

8244 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

8264 First released in Issue 8. Derived from POSIX.26.

8265 **NAME**

8266 dirent.h — format of directory entries

8267 **SYNOPSIS**

8268 #include <dirent.h>

8269 **DESCRIPTION**

8270 The internal format of directories is unspecified.

8271 The <dirent.h> header shall define the following type:

8272 **DIR** A type representing a directory stream. The **DIR** type may be an incomplete type.

8273 It shall also define the structure **dirent** which shall include the following members:

8274 ino\_t d\_ino File serial number.  
8275 char d\_name[] Filename string of entry.

8276 and the structure **posix\_dent** which shall include the following members:

8277 ino\_t d\_ino File serial number.  
8278 reflen\_t d\_reflen Length of this entry, including trailing  
8279 padding if necessary. See *posix\_getdents()*.  
8280 unsigned char d\_type File type or unknown-file-type indication.  
8281 char d\_name[] Filename string of this entry.

8282 The array *d\_name* in each of these structures is of unspecified size, but shall contain a filename of  
8283 at most {NAME\_MAX} bytes followed by a terminating null byte.

8284 The <dirent.h> header shall define the **ino\_t**, **reflen\_t**, **size\_t**, and **ssize\_t** types as described in  
8285 <sys/types.h>.

8286 The <dirent.h> header shall define the following symbolic constants for the file types and  
8287 unknown-file-type indicator returned in the *d\_type* member of the **posix\_dent** structure. The  
8288 values shall be distinct and shall be suitable for use in **#if** preprocessing directives:

8289 DT\_BLK Block special.  
8290 DT\_CHR Character special.  
8291 DT\_DIR Directory.  
8292 DT\_FIFO FIFO special.  
8293 DT\_LNK Symbolic link.  
8294 DT\_REG Regular.  
8295 DT\_SOCKET Socket.  
8296 DT\_UNKNOWN  
8297 Unknown file type.

8298 **TYM** The implementation may implement message queues, semaphores, shared memory objects or  
8299 typed memory objects as distinct file types. The following macros shall be provided to represent  
8300 these types. The values shall be distinct from each other and from the above symbolic constants  
8301 beginning with DT\_, except when a distinct file type is not implemented, in which case the  
8302 corresponding constant shall have a value that is never returned in *d\_type* by *posix\_getdents()*.  
8303 The values shall be suitable for use in **#if** preprocessing directives:

8304 DT\_MQ Message queue.

```

8305         DT_SEM    Semaphore.
8306         DT_SHM    Shared memory object.
8307 TYM    DT_TMO    Typed memory object.
8308         The following shall be declared as functions and may also be defined as macros. Function
8309         prototypes shall be provided.
8310         int        alphasort(const struct dirent **, const struct dirent **);
8311         int        closedir(DIR *);
8312         int        dirfd(DIR *);
8313         DIR        *fdopendir(int);
8314         DIR        *opendir(const char *);
8315         ssize_t    posix_getdents(int, void *, size_t, int);
8316         struct dirent *readdir(DIR *);
8317 OB      int        readdir_r(DIR *restrict, struct dirent *restrict,
8318         struct dirent **restrict);
8319         void        rewinddir(DIR *);
8320         int        scandir(const char *, struct dirent ***,
8321         int (*)(const struct dirent *),
8322         int (*)(const struct dirent **),
8323         const struct dirent **);
8324 XSI     void        seekdir(DIR *, long);
8325         long       telldir(DIR *);

```

**APPLICATION USAGE**

None.

**RATIONALE**

Information similar to that in the **<dirent.h>** header is contained in a file **<sys/dir.h>** in 4.2 BSD and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of POSIX.1-2024 is **struct direct**. The filename was changed because the name **<sys/dir.h>** was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of POSIX.1-2024 does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The **posix\_dent** structure was based on existing structures used by traditional *getdents()* functions, but the name was changed because the existing structures differed in name and in their members. Some used the **dirent** structure but this is not required to include a *d\_type* member, which is the main advantage of using *posix\_getdents()* over *readdir()*. The *d\_reclen* member was included, even though some implementations return fixed-length entries and therefore do not need it, as almost all existing code that used *getdents()* used *d\_reclen* to iterate through the returned entries. Implementations that return fixed-length entries can simply set *d\_reclen* to that length in *posix\_getdents()*. The type **reclen\_t** for *d\_reclen* was introduced, instead of using **unsigned short**, so as not to create a requirement that  $\{\text{NAME\_MAX}\}$  cannot be greater than (a value somewhat smaller than)  $\{\text{SHRT\_MAX}\}$ .

Implementations are encouraged to define a **DT\_FORCE\_TYPE** symbolic constant for use in the *flags* argument to *posix\_getdents()*. See the RATIONALE for *posix\_getdents()*.

The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:

```
sizeof(d_name)
```

8350 is incorrect; use:  
8351 `strlen(d_name)`  
8352 instead.

8353 The array of **char** *d\_name* cannot be assumed to have a fixed size. Implementations may define  
8354 the *d\_name* array in the **dirent** and **posix\_dent** structures to have size 1, or size greater than  
8355 {NAME\_MAX}, or use a flexible array member, but in all cases the actual number of characters  
8356 used for *d\_name* is at least the length of the filename string including the terminating NUL byte.

8357 **FUTURE DIRECTIONS**  
8358 A future version of this standard may add a DT\_FORCE\_TYPE symbolic constant for use as  
8359 described in the RATIONALE for *posix\_getdents()*.

8362 XSH *alphasort()*, *closedir()*, *dirfd()*, *fdopendir()*, *posix\_getdents()*, *readdir()*, *rewinddir()*, *seekdir()*,  
8363 *telldir()*

8364 **CHANGE HISTORY**  
8365 First released in Issue 2.

8366 **Issue 5**  
8367 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

8368 **Issue 6**  
8369 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.  
8370 The **restrict** keyword is added to the prototype for *readdir\_r()*.

8371 **Issue 7**  
8372 The *alphasort()*, *dirfd()*, and *scandir()* functions are added from The Open Group Technical  
8373 Standard, 2006, Extended API Set Part 1.  
8374 The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API  
8375 Set Part 2.  
8376 Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the **DIR**  
8377 type.  
8378 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0039 [291], XBD/TC1-2008/0040 [291],  
8379 XBD/TC1-2008/0041 [291], and XBD/TC1-2008/0042 [206] are applied.

8380 **Issue 8**  
8381 Austin Group Defect 696 is applied, making *readdir\_r()* obsolescent.  
8382 Austin Group Defect 697 is applied, adding *posix\_getdents()*.

8383 **NAME**8384 `dlfcn.h` — dynamic linking8385 **SYNOPSIS**8386 `#include <dlfcn.h>`8387 **DESCRIPTION**8388 The **<dlfcn.h>** header shall define the **Dl\_info\_t** structure type, which shall include at least the  
8389 following members:

8390	<code>const char *dli_fname</code>	Pathname of mapped object file.
8391	<code>void *dli_fbase</code>	Base of mapped address range.
8392	<code>const char *dli_sname</code>	Symbol name or null pointer.
8393	<code>void *dli_saddr</code>	Symbol address or null pointer.

8394 The **<dlfcn.h>** header shall define at least the following symbolic constants for use in the  
8395 construction of a `dlopen()` *mode* argument:

8396	<code>RTLD_LAZY</code>	Relocations are performed at an implementation-defined time.
8397	<code>RTLD_NOW</code>	Relocations are performed when the object is loaded.
8398	<code>RTLD_GLOBAL</code>	All symbols are available for relocation processing of other modules.
8399	<code>RTLD_LOCAL</code>	All symbols are not made available for relocation processing by other 8400 modules.

8401 The following shall be declared as functions and may also be defined as macros. Function  
8402 prototypes shall be provided.

```
8403 int dladdr(const void *restrict, Dl_info_t *restrict);
8404 int dlclose(void *);
8405 char *dlderror(void);
8406 void *dlopen(const char *, int);
8407 void *dlsym(void *restrict, const char *restrict);
```

8408 **APPLICATION USAGE**

8409 None.

8410 **RATIONALE**

8411 None.

8412 **FUTURE DIRECTIONS**

8413 None.

8414 **SEE ALSO**8415 XSH `dladdr()`, `dlclose()`, `dlderror()`, `dlopen()`, `dlsym()`8416 **CHANGE HISTORY**

8417 First released in Issue 5.

8418 **Issue 6**8419 The **restrict** keyword is added to the prototype for `dlsym()`.8420 **Issue 7**8421 The **<dlfcn.h>** header is moved from the XSI option to the Base.

8422 This reference page is clarified with respect to macros and symbolic constants.

8423 **Issue 8**  
8424

Austin Group Defect 993 is applied, adding *dladdr()*.

8425 **NAME**8426            **endian.h** — system endianness8427 **SYNOPSIS**

8428            #include &lt;endian.h&gt;

8429 **DESCRIPTION**8430            The **<endian.h>** header shall define at least the following macros for use in determining host  
8431            byte order for integer types.8432            **BYTE\_ORDER**    This macro shall have a value equal to one of the \*\_ENDIAN macros in this  
8433            header.8434            **LITTLE\_ENDIAN**8435                    If **BYTE\_ORDER == LITTLE\_ENDIAN**, the host byte order is from least  
8436                    significant to most significant.8437            **BIG\_ENDIAN**    If **BYTE\_ORDER == BIG\_ENDIAN**, the host byte order is from most  
8438                    significant to least significant.8439            These macros shall be suitable for use in **#if** preprocessing directives. The macros **BIG\_ENDIAN**  
8440            and **LITTLE\_ENDIAN** shall have distinct values. Implementations may define other macros  
8441            with the **\_ENDIAN** suffix.8442            The following shall be declared as functions, or defined as macros, or both. If functions are  
8443            declared, function prototypes shall be provided.

8444            uint16\_t    be16toh(uint16\_t);

8445            uint32\_t    be32toh(uint32\_t);

8446            uint64\_t    be64toh(uint64\_t);

8447            uint16\_t    htobe16(uint16\_t);

8448            uint32\_t    htobe32(uint32\_t);

8449            uint64\_t    htobe64(uint64\_t);

8450            uint16\_t    htole16(uint16\_t);

8451            uint32\_t    htole32(uint32\_t);

8452            uint64\_t    htole64(uint64\_t);

8453            uint16\_t    le16toh(uint16\_t);

8454            uint32\_t    le32toh(uint32\_t);

8455            uint64\_t    le64toh(uint64\_t);

8456            The **<endian.h>** header shall define the **uint16\_t**, **uint32\_t**, and **uint64\_t** types as described in  
8457            **<stdint.h>**.8458            Inclusion of the **<endian.h>** header may also make visible all symbols from **<stdint.h>**.8459 **APPLICATION USAGE**

8460            None.

8461 **RATIONALE**8462            Many implementations also include **PDP\_ENDIAN** to indicate a byte ordering where each pair  
8463            of bytes is swapped. If **BIG\_ENDIAN** is defined as 4321, **PDP\_ENDIAN** would be 3412.  
8464            However, this scheme is not universal, and derives its name from an obsolete processor.8465 **FUTURE DIRECTIONS**

8466            None.

8467 **SEE ALSO**

8469 XSH [be16toh\(\)](#), [htonl\(\)](#), [swab\(\)](#)

8470 **CHANGE HISTORY**

8471 First released in Issue 8.

8472 **NAME**8473 `errno.h` — system error numbers8474 **SYNOPSIS**8475 `#include <errno.h>`8476 **DESCRIPTION**

8477 CX Some of the functionality described on this reference page extends the ISO C standard. Any  
8478 conflict between the requirements described here and the ISO C standard is unintentional. This  
8479 volume of POSIX.1-2024 defers to the ISO C standard.

8480 The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

8481 The **<errno.h>** header shall provide a definition for the macro *errno*, which shall expand to a  
8482 modifiable lvalue of type **int** and thread local storage duration. If the macro definition is  
8483 suppressed in order to access an actual object, or a program defines an identifier with the name  
8484 *errno*, the behavior is undefined.

8485 The **<errno.h>** header shall define the following macros which shall expand to integer constant  
8486 expressions with type **int**, distinct positive values (except as noted below), and which shall be  
8487 suitable for use in **#if** preprocessing directives:

8488	[E2BIG]	Argument list too long.
8489	[EACCES]	Permission denied.
8490	[EADDRINUSE]	Address in use.
8491	[EADDRNOTAVAIL]	Address not available.
8492	[EAFNOSUPPORT]	Address family not supported.
8493	[EAGAIN]	Resource unavailable, try again (may be the same value as
8494		[EWOULDBLOCK]).
8495	[EALREADY]	Connection already in progress.
8496	[EBADF]	Bad file descriptor.
8497	[EBADMSG]	Bad message.
8498	[EBUSY]	Device or resource busy.
8499	[ECANCELED]	Operation canceled.
8500	[ECHILD]	No child processes.
8501	[ECONNABORTED]	Connection aborted.
8502	[ECONNREFUSED]	Connection refused.
8503	[ECONNRESET]	Connection reset.
8504	[EDEADLK]	Resource deadlock would occur.
8505	[EDESTADDRREQ]	Destination address required.
8506	[EDOM]	Mathematics argument out of domain of function.
8507	[EDQUOT]	Reserved.
8508	[EEXIST]	File exists.

8509	[EFAULT]	Bad address.
8510	[EFBIG]	File too large.
8511	[EHOSTUNREACH]	Host is unreachable.
8512	[EIDRM]	Identifier removed.
8513	[EILSEQ]	Illegal byte sequence.
8514	[EINPROGRESS]	Operation in progress.
8515	[EINTR]	Interrupted function.
8516	[EINVAL]	Invalid argument.
8517	[EIO]	I/O error.
8518	[EISCONN]	Socket is connected.
8519	[EISDIR]	Is a directory.
8520	[ELOOP]	Too many levels of symbolic links.
8521	[EMFILE]	File descriptor value too large.
8522	[EMLINK]	Too many hard links.
8523	[EMSGSIZE]	Message too large.
8524	[EMULTIHOP]	Reserved.
8525	[ENAMETOOLONG]	Filename too long.
8526	[ENETDOWN]	Network is down.
8527	[ENETRESET]	Connection aborted by network.
8528	[ENETUNREACH]	Network unreachable.
8529	[ENFILE]	Too many files open in system.
8530	[ENOBUFS]	No buffer space available.
8531	[ENODEV]	No such device.
8532	[ENOENT]	No such file or directory.
8533	[ENOEXEC]	Executable file format error.
8534	[ENOLCK]	No locks available.
8535	[ENOLINK]	Reserved.
8536	[ENOMEM]	Not enough space.
8537	[ENOMSG]	No message of the desired type.
8538	[ENOPROTOOPT]	Protocol not available.
8539	[ENOSPC]	No space left on device.
8540	[ENOSYS]	Functionality not supported.
8541	[ENOTCONN]	The socket is not connected.

8542	[ENOTDIR]	Not a directory or a symbolic link to a directory.
8543	[ENOTEMPTY]	Directory not empty.
8544	[ENOTRECOVERABLE]	
8545		State not recoverable.
8546	[ENOTSOCK]	Not a socket.
8547	[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).
8548	[ENOTTY]	Inappropriate I/O control operation.
8549	[ENXIO]	No such device or address.
8550	[EOPNOTSUPP]	Operation not supported on socket (may be the same value as
8551		[ENOTSUP]).
8552	[EOVERFLOW]	Value too large to be stored in data type.
8553	[EOWNERDEAD]	Previous owner died.
8554	[EPERM]	Operation not permitted.
8555	[EPIPE]	Broken pipe.
8556	[EPROTO]	Protocol error.
8557	[EPROTONOSUPPORT]	
8558		Protocol not supported.
8559	[EPROTOTYPE]	Protocol wrong type for socket.
8560	[ERANGE]	Result too large.
8561	[EROFS]	Read-only file system.
8562	[ESOCKTNOSUPPORT]	
8563		Socket type not supported.
8564	[ESPIPE]	Invalid seek.
8565	[ESRCH]	No such process.
8566	[ESTALE]	Reserved.
8567	[ETIMEDOUT]	Connection timed out.
8568	[ETXTBSY]	Text file busy.
8569	[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
8570	[EXDEV]	Improper hard link.

8571 **APPLICATION USAGE**

8572 Additional error numbers may be defined on conforming systems; see the System Interfaces  
8573 volume of POSIX.1-2024.

8574 **RATIONALE**

8575 None.

8576 **FUTURE DIRECTIONS**

8577 None.

8578 **SEE ALSO**8579 XSH [Section 2.3](#) (on page 507)8580 **CHANGE HISTORY**

8581 First released in Issue 1. Derived from Issue 1 of the SVID.

8582 **Issue 5**

8583 Updated for alignment with the POSIX Realtime Extension.

8584 **Issue 6**8585 The following new requirements on POSIX implementations derive from alignment with the  
8586 Single UNIX Specification:

- 8587
- The majority of the error conditions previously marked as extensions are now mandatory,  
8588 except for the STREAMS-related error conditions.

8589 Values for *errno* are now required to be distinct positive values rather than non-zero values. This  
8590 change is for alignment with the ISO/IEC 9899: 1999 standard.8591 **Issue 7**8592 Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and  
8593 [EOPNOTSUPP] to be the same values.8594 The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group  
8595 Technical Standard, 2006, Extended API Set Part 2.

8596 Functionality relating to the XSI STREAMS option is marked obsolescent.

8597 Functionality relating to the Threads option is moved to the Base.

8598 This reference page is clarified with respect to macros and symbolic constants.

8599 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0043 [324] is applied.

8600 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0059 [496] is applied.

8601 **Issue 8**

8602 Austin Group Defect 1067 is applied, adding [ESOCKTNOSUPPORT].

8603 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899: 2018 standard.

8604 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

8605 Austin Group Defect 1380 is applied, changing the descriptions of [EMLINK] and [EXDEV].

8606 **NAME**8607 `fcntl.h` — file control options8608 **SYNOPSIS**8609 `#include <fcntl.h>`8610 **DESCRIPTION**8611 The **<fcntl.h>** header shall define the `f_owner_ex` structure, which shall include at least the  
8612 following members:8613 `int type` Discriminator for `pid`.  
8614 `pid_t pid` Process ID or process group ID.8615 The **<fcntl.h>** header shall define the `flock` structure describing a file lock. It shall include the  
8616 following members:8617 `short l_type` Type of lock; `F_RDLCK`, `F_WRLCK`, `F_UNLCK`.  
8618 `short l_whence` Flag for starting offset.  
8619 `off_t l_start` Relative offset in bytes.  
8620 `off_t l_len` Size; if 0 then until EOF.  
8621 `pid_t l_pid` For a process-owned file lock, ignored on input or the process ID of the  
8622 owning process on output; for an OFD-owned file lock, zero on input or  
8623 `(pid_t)-1` on output.8624 The **<fcntl.h>** header shall define the `mode_t`, `off_t`, and `pid_t` types as described in  
8625 **<sys/types.h>**.8626 The **<fcntl.h>** header shall define the following symbolic constants for the `cmd` argument used  
8627 by `fcntl()`. The values shall be unique and shall be suitable for use in `#if` preprocessing  
8628 directives.8629 `F_DUPFD` Duplicate file descriptor.  
8630 `F_DUPFD_CLOEXEC`  
8631 Duplicate file descriptor with the close-on-*exec* flag `FD_CLOEXEC` set.  
8632 `F_DUPFD_CLOFORK`  
8633 Duplicate file descriptor with the close-on-*fork* flag `FD_CLOFORK` set.  
8634 `F_GETFD` Get file descriptor flags.  
8635 `F_SETFD` Set file descriptor flags.  
8636 `F_GETFL` Get file status flags and file access modes.  
8637 `F_SETFL` Set file status flags.  
8638 `F_GETLK` Get information about file locks.  
8639 `F_SETLK` Set a process-owned file lock.  
8640 `F_SETLKW` Set a process-owned file lock; wait if blocked.  
8641 `F_OFD_GETLK` Get information about file locks.  
8642 `F_OFD_SETLK` Set an OFD-owned file lock.  
8643 `F_OFD_SETLKW`  
8644 Set an OFD-owned file lock; wait if blocked.  
8645 `F_GETOWN` Get process or process group ID to receive SIGURG signals, via `int` type.

8646 F\_GETOWN\_EX Get process or process group ID to receive SIGURG signals, via `pid_t` type.

8647 F\_SETOWN Set process or process group ID to receive SIGURG signals, via `int` type.

8648 F\_SETOWN\_EX Set process or process group ID to receive SIGURG signals, via `pid_t` type.

8649 The <fcntl.h> header shall define the following symbolic constants used for the `fcntl()` file  
 8650 descriptor flags. The values shall be bitwise-distinct and shall be suitable for use in `#if`  
 8651 preprocessing directives.

8652 SPN FD\_CLOEXEC Close the file descriptor upon execution of an `exec` family function and in the  
 8653 new process image created by `posix_spawn()` or `posix_spawnnp()`.

8654 FD\_CLOFORK Close the file descriptor in any child process created from a process that has  
 8655 the file descriptor open; that is, the child shall not inherit the file descriptor.

8656 The <fcntl.h> header shall also define the following symbolic constants for the `l_type` argument  
 8657 used for record locking with `fcntl()`. The values shall be unique and shall be suitable for use in  
 8658 `#if` preprocessing directives.

8659 F\_RDLCK Shared or read lock.

8660 F\_UNLCK Unlock.

8661 F\_WRLCK Exclusive or write lock.

8662 The <fcntl.h> header shall also define the following symbolic constants for the `type` member of  
 8663 the `f_owner_ex` structure. The values shall be unique.

8664 F\_OWNER\_PID The `pid` member of `f_owner_ex` holds a process ID.

8665 F\_OWNER\_PGRP  
 8666 The `pid` member of `f_owner_ex` holds a process group ID.

8667 The <fcntl.h> header shall define the values used for `l_whence`, `SEEK_SET`, `SEEK_CUR`, and  
 8668 `SEEK_END` as described in <stdio.h>.

8669 The <fcntl.h> header shall define the following symbolic constants as file creation flags for use  
 8670 in the `oflag` value to `open()` and `openat()`. The values shall be bitwise-distinct and shall be  
 8671 suitable for use in `#if` preprocessing directives.

8672 O\_CLOEXEC Atomically set the FD\_CLOEXEC flag on the new file descriptor.

8673 O\_CLOFORK Atomically set the FD\_CLOFORK flag on the new file descriptor.

8674 O\_CREAT Create file if it does not exist.

8675 O\_DIRECTORY Fail if file is a non-directory file.

8676 O\_EXCL Exclusive use flag.

8677 O\_NOCTTY Do not assign controlling terminal.

8678 O\_NOFOLLOW Do not follow symbolic links.

8679 O\_TRUNC Truncate flag.

8680 O\_TTY\_INIT Set the `termios` structure terminal parameters to a state that provides  
 8681 conforming behavior; see Section 11.2 (on page 205).

8682 The O\_TTY\_INIT flag can have the value zero and in this case it need not be bitwise-distinct  
 8683 from the other flags.

8684 The <fcntl.h> header shall define the following symbolic constants for use as file status flags for

8685 *open()*, *openat()*, and *fcntl()*. The values shall be suitable for use in **#if** preprocessing directives.

8686 **O\_APPEND** Set append mode.

8687 SIO **O\_DSYNC** Write according to synchronized I/O data integrity completion.

8688 **O\_NONBLOCK** Non-blocking mode.

8689 SIO **O\_RSYNC** Synchronized read I/O operations.

8690 **O\_SYNC** Write according to synchronized I/O file integrity completion.

8691 The **<fcntl.h>** header shall define the following symbolic constant for use as the mask for file  
8692 access modes. The value shall be suitable for use in **#if** preprocessing directives.

8693 **O\_ACCMODE** Mask for file access modes.

8694 The **<fcntl.h>** header shall define the following symbolic constants for use as the file access  
8695 modes for *open()*, *openat()*, and *fcntl()*. The values shall be unique, except that **O\_EXEC** and  
8696 **O\_SEARCH** may have equal values. The values shall be suitable for use in **#if** preprocessing  
8697 directives.

8698 **O\_EXEC** Open for execute only (non-directory files). The result is unspecified if this  
8699 flag is applied to a directory.

8700 **O\_RDONLY** Open for reading only.

8701 **O\_RDWR** Open for reading and writing.

8702 **O\_SEARCH** Open directory for search only. The result is unspecified if this flag is applied  
8703 to a non-directory file.

8704 **O\_WRONLY** Open for writing only.

8705 The **<fcntl.h>** header shall define the symbolic constants for file modes for use as values of  
8706 **mode\_t** as described in **<sys/stat.h>**.

8707 The **<fcntl.h>** header shall define the following symbolic constant as a special value used in  
8708 place of a file descriptor for the *\*at()* functions which take a directory file descriptor as a  
8709 parameter:

8710 **AT\_FDCWD** Use the current working directory to determine the target of relative file paths.

8711 The **<fcntl.h>** header shall define the following symbolic constant as a value for the *flag* used by  
8712 *faccessat()*:

8713 **AT\_EACCESS** Check access using effective user and group ID.

8714 The **<fcntl.h>** header shall define the following symbolic constant as a value for the *flag* used by  
8715 *fstatat()*, *fchmodat()*, *fchownat()*, and *utimensat()*:

8716 **AT\_SYMLINK\_NOFOLLOW**  
8717 Do not follow symbolic links.

8718 The **<fcntl.h>** header shall define the following symbolic constant as a value for the *flag* used by  
8719 *linkat()*:

8720 **AT\_SYMLINK\_FOLLOW**  
8721 Follow symbolic link.

8722 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by  
 8723 *unlinkat()*:

8724 AT\_REMOVEDIR  
 8725 Remove directory instead of file.

8726 ADV The <fcntl.h> header shall define the following symbolic constants for the *advice* argument used  
 8727 by *posix\_fadvise()*:

8728 POSIX\_FADV\_DONTNEED  
 8729 The application expects that it will not access the specified data in the near future.

8730 POSIX\_FADV\_NOREUSE  
 8731 The application expects to access the specified data once and then not reuse it thereafter.

8732 POSIX\_FADV\_NORMAL  
 8733 The application has no advice to give on its behavior with respect to the specified data. It is  
 8734 the default characteristic if no advice is given for an open file.

8735 POSIX\_FADV\_RANDOM  
 8736 The application expects to access the specified data in a random order.

8737 POSIX\_FADV\_SEQUENTIAL  
 8738 The application expects to access the specified data sequentially from lower offsets to higher  
 8739 offsets.

8740 POSIX\_FADV\_WILLNEED  
 8741 The application expects to access the specified data in the near future.

8742 The following shall be declared as functions and may also be defined as macros. Function  
 8743 prototypes shall be provided.

```
8744 int creat(const char *, mode_t);
8745 int fcntl(int, int, ...);
8746 int open(const char *, int, ...);
8747 int openat(int, const char *, int, ...);
8748 ADV int posix_fadvise(int, off_t, off_t, int);
8749 int posix_fallocate(int, off_t, off_t);
```

8750 Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and  
 8751 <unistd.h>.

8752 **APPLICATION USAGE**

8753 Although no existing implementation defines AT\_SYMLINK\_FOLLOW and  
 8754 AT\_SYMLINK\_NOFOLLOW as the same numeric value, POSIX.1-2024 does not prohibit that as  
 8755 the two constants are not used with the same interfaces.

8756 **RATIONALE**

8757 While many of the symbolic constants introduced in the <fcntl.h> header do not strictly need to  
 8758 be used in #if preprocessor directives, widespread historic practice has defined them as macros  
 8759 that are usable in such constructs, and examination of existing applications has shown that they  
 8760 are occasionally used in such a way. Therefore it was decided to retain this requirement on an  
 8761 implementation in POSIX.1-2024.

**8762 FUTURE DIRECTIONS**

8763 A future version of this standard may add an O\_NOCLOBBER file creation flag. See the  
8764 FUTURE DIRECTIONS section for *open()*.

**8765 SEE ALSO**

8766 [<stdio.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#), [<unistd.h>](#)

8767 XSH *creat()*, *exec*, *fcntl()*, *futimens()*, *open()*, *posix\_fadvise()*, *posix\_fallocate()*, *posix\_madvise()*

**8768 CHANGE HISTORY**

8769 First released in Issue 1. Derived from Issue 1 of the SVID.

**8770 Issue 5**

8771 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

**8772 Issue 6**

8773 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

8774 • O\_DSYNC and O\_RSYNC are marked as part of the Synchronized Input and Output  
8775 option.

8776 The following new requirements on POSIX implementations derive from alignment with the  
8777 Single UNIX Specification:

8778 • The definition of the **mode\_t**, **off\_t**, and **pid\_t** types is mandated.

8779 The F\_GETOWN and F\_SETOWN values are added for sockets.

8780 The *posix\_fadvise()*, *posix\_fallocate()*, and *posix\_madvise()* functions are added for alignment with  
8781 IEEE Std 1003.1d-1999.

8782 IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for *posix\_madvise()* to  
8783 [<sys/mman.h>](#).

8784 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for  
8785 *posix\_fadvise()* and *posix\_fallocate()* to be large file-aware, using **off\_t** instead of **size\_t**.

**8786 Issue 7**

8787 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O\_TTY\_INIT flag.

8788 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
8789 FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.

8790 The *openat()* function is added from The Open Group Technical Standard, 2006, Extended API  
8791 Set Part 2.

8792 Additional flags are added to support *faccessat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*,  
8793 *open()*, *openat()*, and *unlinkat()*.

8794 This reference page is clarified with respect to macros and symbolic constants.

8795 Changes are made related to support for finegrained timestamps.

8796 Changes are made to allow a directory to be opened for searching.

8797 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0044 [274] and XBD/TC1-2008/0045  
8798 [78,432] are applied.

8799 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0060 [847] is applied.

8800 **Issue 8**

8801 Austin Group Defect 768 is applied, adding OFD-owned file locks.

8802 Austin Group Defect 1016 is applied, changing the FUTURE DIRECTIONS section.

8803 Austin Group Defect 1274 is applied, adding the **f\_owner\_ex** structure and related symbolic constants.

8805 Austin Group Defect 1318 is applied, adding FD\_CLOFORK and O\_CLOFORK, and changing O\_CLOEXEC.

8807 Austin Group Defect 1351 is applied, adding F\_DUPFD\_CLOFORK.

8808 **NAME**8809 `fenv.h` — floating-point environment8810 **SYNOPSIS**8811 `#include <fenv.h>`8812 **DESCRIPTION**

8813 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 8814 conflict between the requirements described here and the ISO C standard is unintentional. This  
 8815 volume of POSIX.1-2024 defers to the ISO C standard.

8816 The **<fenv.h>** header shall define the following data types through **typedef**:

8817 **fenv\_t** Represents the entire floating-point environment. The floating-point environment  
 8818 refers collectively to any floating-point status flags and control modes supported  
 8819 by the implementation.

8820 **fexcept\_t** Represents the floating-point status flags collectively, including any status the  
 8821 implementation associates with the flags. A floating-point status flag is a system  
 8822 variable whose value is set (but never cleared) when a floating-point exception is  
 8823 raised, which occurs as a side-effect of exceptional floating-point arithmetic to  
 8824 provide auxiliary information. A floating-point control mode is a system variable  
 8825 whose value may be set by the user to affect the subsequent behavior of floating-  
 8826 point arithmetic.

8827 The **<fenv.h>** header shall define each of the following macros if and only if the implementation  
 8828 supports the floating-point exception by means of the floating-point functions *feclearexcept()*,  
 8829 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. The defined macros shall  
 8830 expand to integer constant expressions with values that are bitwise-distinct.

8831 `FE_DIVBYZERO`  
 8832 `FE_INEXACT`  
 8833 `FE_INVALID`  
 8834 `FE_OVERFLOW`  
 8835 `FE_UNDERFLOW`

8836 MX If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be  
 8837 defined. Additional implementation-defined floating-point exceptions with macros beginning  
 8838 with `FE_` and an uppercase letter may also be specified by the implementation.

8839 The **<fenv.h>** header shall define the macro `FE_ALL_EXCEPT` as the bitwise-inclusive OR of all  
 8840 floating-point exception macros defined by the implementation, if any. If no such macros are  
 8841 defined, then the macro `FE_ALL_EXCEPT` shall be defined as zero.

8842 The **<fenv.h>** header shall define each of the following macros if and only if the implementation  
 8843 supports getting and setting the represented rounding direction by means of the *fegetround()*  
 8844 and *fesetround()* functions. The defined macros shall expand to integer constant expressions  
 8845 whose values are distinct non-negative values.

8846 `FE_DOWNWARD`  
 8847 `FE_TONEAREST`  
 8848 `FE_TOWARDZERO`  
 8849 `FE_UPWARD`

8850 MX If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be  
 8851 defined. Additional implementation-defined rounding directions with macros beginning with  
 8852 `FE_` and an uppercase letter may also be specified by the implementation.

8853 The <fenv.h> header shall define the following macro, which represents the default floating-  
 8854 point environment (that is, the one installed at program startup) and has type pointer to const-  
 8855 qualified **fenv\_t**. It can be used as an argument to the functions within the <fenv.h> header that  
 8856 manage the floating-point environment.

8857 `FE_DFL_ENV`

8858 The following shall be declared as functions and may also be defined as macros. Function  
 8859 prototypes shall be provided.

```
8860 int feclearexcept(int);
8861 int fegetenv(fenv_t *);
8862 int fegetexceptflag(fexcept_t *, int);
8863 int fegetround(void);
8864 int feholdexcept(fenv_t *);
8865 int feraiseexcept(int);
8866 int fesetenv(const fenv_t *);
8867 int fesetexceptflag(const fexcept_t *, int);
8868 int fesetround(int);
8869 int fetestexcept(int);
8870 int feupdateenv(const fenv_t *);
```

8871 The `FENV_ACCESS` pragma provides a means to inform the implementation when an  
 8872 application might access the floating-point environment to test floating-point status flags or run  
 8873 under non-default floating-point control modes. The pragma shall occur either outside external  
 8874 declarations or preceding all explicit declarations and statements inside a compound statement.  
 8875 When outside external declarations, the pragma takes effect from its occurrence until another  
 8876 `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a  
 8877 compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS`  
 8878 pragma is encountered (including within a nested compound statement), or until the end of the  
 8879 compound statement; at the end of a compound statement the state for the pragma is restored to  
 8880 its condition just before the compound statement. If this pragma is used in any other context, the  
 8881 behavior is undefined. If part of an application tests floating-point status flags, sets floating-  
 8882 point control modes, or runs under non-default mode settings, but was translated with the state  
 8883 for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for  
 8884 the pragma is implementation-defined. (When execution passes from a part of the application  
 8885 translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the  
 8886 floating-point status flags is unspecified and the floating-point control modes have their default  
 8887 settings.)

8888 **APPLICATION USAGE**

8889 This header is designed to support the floating-point exception status flags and directed-  
 8890 rounding control modes required by the IEC 60559:1989 standard, and other similar floating-  
 8891 point state information. Also it is designed to facilitate code portability among all systems.

8892 Certain application programming conventions support the intended model of use for the  
 8893 floating-point environment:

- 8894 • A function call does not alter its caller’s floating-point control modes, clear its caller’s  
 8895 floating-point status flags, nor depend on the state of its caller’s floating-point status flags  
 8896 unless the function is so documented.
- 8897 • A function call is assumed to require default floating-point control modes, unless its  
 8898 documentation promises otherwise.

8899           • A function call is assumed to have the potential for raising floating-point exceptions,  
8900           unless its documentation promises otherwise.

8901           With these conventions, an application can safely assume default floating-point control modes  
8902           (or be unaware of them). The responsibilities associated with accessing the floating-point  
8903           environment fall on the application that does so explicitly.

8904           Even though the rounding direction macros may expand to constants corresponding to the  
8905           values of FLT\_ROUNDS, they are not required to do so.

8906           For example:

```
8907           #include <fenv.h>
8908           void f(double x)
8909           {
8910               #pragma STDC FENV_ACCESS ON
8911               void g(double);
8912               void h(double);
8913               /* ... */
8914               g(x + 1);
8915               h(x + 1);
8916               /* ... */
8917           }
```

8918           If the function *g()* might depend on status flags set as a side-effect of the first *x+1*, or if the  
8919           second *x+1* might depend on control modes set as a side-effect of the call to function *g()*, then  
8920           the application shall contain an appropriately placed invocation as follows:

```
8921           #pragma STDC FENV_ACCESS ON
```

## 8922   **RATIONALE**

### 8923   **The `feexcept_t` Type**

8924           **`feexcept_t`** does not have to be an integer type. Its values must be obtained by a call to  
8925           *fegetexceptflag()*, and cannot be created by logical operations from the exception macros. An  
8926           implementation might simply implement **`feexcept_t`** as an **`int`** and use the representations  
8927           reflected by the exception macros, but is not required to; other representations might contain  
8928           extra information about the exceptions. **`feexcept_t`** might be a **`struct`** with a member for each  
8929           exception (that might hold the address of the first or last floating-point instruction that caused  
8930           that exception). The ISO C standard makes no claims about the internals of an **`feexcept_t`**, and so  
8931           the user cannot inspect it.

### 8932   **Exception and Rounding Macros**

8933           Macros corresponding to unsupported modes and rounding directions are not defined by the  
8934           implementation and must not be defined by the application. An application might use **`#ifndef`**  
8935           to test for this.

## 8936   **FUTURE DIRECTIONS**

8937           None.

## 8938   **SEE ALSO**

8939           XSH *feclearexcept()*, *fegetenv()*, *fegetexceptflag()*, *fegetround()*, *feholdexcept()*, *feraiseexcept()*,  
8940           *fetestexcept()*, *feupdateenv()*

8941 **CHANGE HISTORY**

8942 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

8943 The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*,  
8944 *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the  
8945 ISO/IEC 9899:1999 standard, Defect Report 202.

8946 **Issue 7**

8947 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #37 (SD5-XBD-ERN-49) is applied.

8948 ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #36 is applied.

8949 SD5-XBD-ERN-48 and SD5-XBD-ERN-69 are applied.

8950 This reference page is clarified with respect to macros and symbolic constants.

8951 **NAME**

8952 float.h — floating types

8953 **SYNOPSIS**

8954 #include &lt;float.h&gt;

8955 **DESCRIPTION**

8956 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 8957 conflict between the requirements described here and the ISO C standard is unintentional. This  
 8958 volume of POSIX.1-2024 defers to the ISO C standard.

8959 The characteristics of floating types are defined in terms of a model that describes a  
 8960 representation of floating-point numbers and values that provide information about an  
 8961 implementation's floating-point arithmetic.

8962 The following parameters are used to define the model for each floating-point type:

8963 *s* Sign ( $\pm 1$ ).

8964 *b* Base or radix of exponent representation (an integer  $> 1$ ).

8965 *e* Exponent (an integer between a minimum  $e_{\min}$  and a maximum  $e_{\max}$ ).

8966 *p* Precision (the number of base-*b* digits in the significand).

8967  $f_k$  Non-negative integers less than *b* (the significand digits).

8968 A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^p f_k b^{-k}, e_{\min} \leq e \leq e_{\max}$$

8969 In addition to normalized floating-point numbers ( $f_1 > 0$  if  $x \neq 0$ ), floating types may be able to  
 8970 contain other kinds of floating-point numbers, such as subnormal floating-point numbers ( $x \neq 0$ ,  
 8971  $e = e_{\min}$ ,  $f_1 = 0$ ) and unnormalized floating-point numbers ( $x \neq 0$ ,  $e > e_{\min}$ ,  $f_1 = 0$ ), and values that are  
 8972 not floating-point numbers, such as infinities and NaNs. A *NaN* is an encoding signifying Not-a-  
 8973 Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a  
 8974 floating-point exception; a *signaling NaN* generally raises a floating-point exception when  
 8975 occurring as an arithmetic operand.

8976 An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign,  
 8977 or may leave them unsigned. Wherever such values are unsigned, any requirement in  
 8978 POSIX.1-2024 to retrieve the sign shall produce an unspecified sign and any requirement to set  
 8979 the sign shall be ignored.

8980 The accuracy of the floating-point operations ('+', '-', '\*', '/') and of the functions in  
 8981 **<math.h>** and **<complex.h>** that return floating-point results is implementation-defined, as is  
 8982 the accuracy of the conversion between floating-point internal representations and string  
 8983 representations performed by the functions in **<stdio.h>**, **<stdlib.h>**, and **<wchar.h>**. The  
 8984 implementation may state that the accuracy is unknown.

8985 All integer values in the **<float.h>** header, except FLT\_ROUNDS, shall be constant expressions  
 8986 suitable for use in **#if** preprocessing directives; all floating values shall be constant expressions.  
 8987 All except DECIMAL\_DIG, FLT\_EVAL\_METHOD, FLT\_RADIX, and FLT\_ROUNDS have  
 8988 separate names for all three floating-point types. The floating-point model representation is  
 8989 provided for all values except FLT\_EVAL\_METHOD and FLT\_ROUNDS.

8990 The rounding mode for floating-point addition is characterized by the implementation-defined

8991 value of FLT\_ROUNDS:

8992 -1 Indeterminable.

8993 0 Toward zero.

8994 1 To nearest.

8995 2 Toward positive infinity.

8996 3 Toward negative infinity.

8997 All other values for FLT\_ROUNDS characterize implementation-defined rounding behavior.

8998 The values of operations with floating operands and values subject to the usual arithmetic

8999 conversions and of floating constants are evaluated to a format whose range and precision may

9000 be greater than required by the type. The use of evaluation formats is characterized by the

9001 implementation-defined value of FLT\_EVAL\_METHOD:

9002 -1 Indeterminable.

9003 0 Evaluate all operations and constants just to the range and precision of the type.

9004 1 Evaluate operations and constants of type **float** and **double** to the range and precision of

9005 the **double** type; evaluate **long double** operations and constants to the range and precision

9006 of the **long double** type.

9007 2 Evaluate all operations and constants to the range and precision of the **long double** type.

9008 All other negative values for FLT\_EVAL\_METHOD characterize implementation-defined

9009 behavior.

9010 The presence or absence of subnormal numbers is characterized by the implementation-defined

9011 values of FLT\_HAS\_SUBNORM, DBL\_HAS\_SUBNORM, and LDBL\_HAS\_SUBNORM:

9012 -1 Indeterminable.

9013 0 Absent (type does not support subnormal numbers).

9014 1 Present (type does support subnormal numbers).

9015 **Note:** Characterization as indeterminable is intended if floating-point operations do not consistently

9016 interpret subnormal representations as zero, nor as non-zero. Characterization as absent is

9017 intended if no floating-point operations produce subnormal results from non-subnormal inputs,

9018 even if the type format includes representations of subnormal numbers.

9019 The <float.h> header shall define the following values as constant expressions with

9020 implementation-defined values that are greater or equal in magnitude (absolute value) to those

9021 shown, with the same sign.

9022 • Radix of exponent representation,  $b$ .

9023 FLT\_RADIX 2

9024 • Number of base-FLT\_RADIX digits in the floating-point significand,  $p$ .

9025 FLT\_MANT\_DIG

9026 DBL\_MANT\_DIG

9027 LDBL\_MANT\_DIG

9028 • Number of decimal digits,  $n$ , such that any floating-point number with  $p$  radix  $b$  digits can

9029 be rounded to a floating-point number with  $n$  decimal digits and back again without

9030 change to the value.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \lceil 1 + p \log_{10} b \rceil & \text{otherwise} \end{cases}$$

9031 FLT\_DECIMAL\_DIG 6  
 9032 DBL\_DECIMAL\_DIG 10  
 9033 LDBL\_DECIMAL\_DIG 10

- Number of decimal digits,  $n$ , such that any floating-point number in the widest supported floating type with  $p_{\max}$  radix  $b$  digits can be rounded to a floating-point number with  $n$  decimal digits and back again without change to the value.

$$\begin{cases} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \lceil 1 + p_{\max} \log_{10} b \rceil & \text{otherwise} \end{cases}$$

9037 DECIMAL\_DIG 10

- Number of decimal digits,  $q$ , such that any floating-point number with  $q$  decimal digits can be rounded into a floating-point number with  $p$  radix  $b$  digits and back again without change to the  $q$  decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \lceil (p - 1) \log_{10} b \rceil & \text{otherwise} \end{cases}$$

9041 FLT\_DIG 6  
 9042 DBL\_DIG 10  
 9043 LDBL\_DIG 10

- Minimum negative integer such that FLT\_RADIX raised to that power minus 1 is a normalized floating-point number,  $e_{\min}$ .

9046 FLT\_MIN\_EXP  
 9047 DBL\_MIN\_EXP  
 9048 LDBL\_MIN\_EXP

- Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers.

$$\lceil \log_{10} b^{e_{\min} - 1} \rceil$$

9051 FLT\_MIN\_10\_EXP -37  
 9052 DBL\_MIN\_10\_EXP -37  
 9053 LDBL\_MIN\_10\_EXP -37  
 9054 • Maximum integer such that FLT\_RADIX raised to that power minus 1 is a representable  
 9055 finite floating-point number,  $e_{\max}$ .  
 9056 FLT\_MAX\_EXP  
 9057 DBL\_MAX\_EXP  
 9058 LDBL\_MAX\_EXP  
 9059 CX Additionally, FLT\_MAX\_EXP shall be at least as large as FLT\_MANT\_DIG,  
 9060 DBL\_MAX\_EXP shall be at least as large as DBL\_MANT\_DIG, and LDBL\_MAX\_EXP shall  
 9061 be at least as large as LDBL\_MANT\_DIG; which has the effect that FLT\_MAX, DBL\_MAX,  
 9062 and LDBL\_MAX are integral.  
 9063 • Maximum integer such that 10 raised to that power is in the range of representable finite  
 9064 floating-point numbers.

$$\left\lfloor \log_{10}((1 - b^{-p}) b^{e_{\max}}) \right\rfloor$$

9065 FLT\_MAX\_10\_EXP +37  
 9066 DBL\_MAX\_10\_EXP +37  
 9067 LDBL\_MAX\_10\_EXP +37

9068 The <float.h> header shall define the following values as constant expressions with  
 9069 implementation-defined values that are greater than or equal to those shown:

- 9070 • Maximum representable finite floating-point number.

$$(1 - b^{-p}) b^{e_{\max}}$$

9071 FLT\_MAX 1E+37  
 9072 DBL\_MAX 1E+37  
 9073 LDBL\_MAX 1E+37

9074 The <float.h> header shall define the following values as constant expressions with  
 9075 implementation-defined (positive) values that are less than or equal to those shown:

- 9076 • The difference between 1 and the least value greater than 1 that is representable in the  
 9077 given floating-point type,  $b^{1-p}$ .

9078 FLT\_EPSILON 1E-5  
 9079 DBL\_EPSILON 1E-9  
 9080 LDBL\_EPSILON 1E-9

- 9081 • Minimum normalized positive floating-point number,  $b^{e_{\min} - 1}$ .

9082 FLT\_MIN 1E-37

9083 DBL\_MIN 1E-37

9084 LDBL\_MIN 1E-37

9085 • Minimum positive floating-point number.

9086 FLT\_TRUE\_MIN 1E-37

9087 DBL\_TRUE\_MIN 1E-37

9088 LDBL\_TRUE\_MIN 1E-37

9089 **Note:** If the presence or absence of subnormal numbers is indeterminable, then the value is  
9090 intended to be a positive number no greater than the minimum normalized positive  
9091 number for the type.

## 9092 APPLICATION USAGE

9093 None.

## 9094 RATIONALE

9095 All known hardware floating-point formats satisfy the property that the exponent range is larger  
9096 than the number of digits in the significand. The ISO C standard permits a floating-point format  
9097 where this property is not true, such that the largest finite value would not be integral; however,  
9098 it is unlikely that there will ever be hardware support for such a floating-point format, and it  
9099 introduces boundary cases that portable programs should not have to be concerned with (for  
9100 example, a non-integral DBL\_MAX means that *ceil()* would have to worry about overflow).  
9101 Therefore, this standard imposes an additional requirement that the largest representable finite  
9102 value is integral.

## 9103 FUTURE DIRECTIONS

9104 The formula for calculating FLT\_MAX, DBL\_MAX, and LDBL\_MAX is expected to change in the  
9105 next revision of the ISO C standard such that it only applies if the values are normalized.

## 9106 SEE ALSO

9107 [<complex.h>](#), [<math.h>](#), [<stdio.h>](#), [<stdlib.h>](#), [<wchar.h>](#)

## 9108 CHANGE HISTORY

9109 First released in Issue 4. Derived from the ISO C standard.

### 9110 Issue 6

9111 The description of the operations with floating-point values is updated for alignment with the  
9112 ISO/IEC 9899:1999 standard.

### 9113 Issue 7

9114 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #4 (SD5-XBD-ERN-50) and #5  
9115 (SD5-XBD-ERN-51) are applied.

9116 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0046 [346] and XBD/TC1-2008/0047  
9117 [346] are applied.

### 9118 Issue 8

9119 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

9120 Austin Group Defect 1752 is applied, changing “the number of mantissa digits” to “the number  
9121 of digits in the significand”.

9122 Austin Group Defect 1754 is applied, changing the FUTURE DIRECTIONS section.

9123 **NAME**

9124 `fmtmsg.h` — message display structures

9125 **SYNOPSIS**

9126 XSI `#include <fmtmsg.h>`

9127 **DESCRIPTION**

9128 The <fmtmsg.h> header shall define the following symbolic constants:

- 9129 `MM_HARD`           Source of the condition is hardware.
- 9130 `MM_SOFT`           Source of the condition is software.
- 9131 `MM_FIRM`           Source of the condition is firmware.
- 9132 `MM_APPL`           Condition detected by application.
- 9133 `MM_UTIL`           Condition detected by utility.
- 9134 `MM_OPSYS`          Condition detected by operating system.
- 9135 `MM_RECOVER`       Recoverable error.
- 9136 `MM_NRECOV`       Non-recoverable error.
- 9137 `MM_HALT`           Error causing application to halt.
- 9138 `MM_ERROR`          Application has encountered a non-fatal fault.
- 9139 `MM_WARNING`       Application has detected unusual non-error condition.
- 9140 `MM_INFO`           Informative message.
- 9141 `MM_NOSEV`          No severity level provided for the message.
- 9142 `MM_PRINT`          Display message on standard error.
- 9143 `MM_CONSOLE`       Display message on system console.

9144 The table below indicates the null values and identifiers for *fmtmsg()* arguments. The  
 9145 <fmtmsg.h> header shall define the symbolic constants in the **Identifier** column, which shall  
 9146 have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
<i>label</i>	<b>char *</b>	(char*)0	MM_NULLLBL
<i>severity</i>	<b>int</b>	0	MM_NULLSEV
<i>class</i>	<b>long</b>	0L	MM_NULLMC
<i>text</i>	<b>char *</b>	(char*)0	MM_NULLTXT
<i>action</i>	<b>char *</b>	(char*)0	MM_NULLACT
<i>tag</i>	<b>char *</b>	(char*)0	MM_NULLTAG

9154 The <fmtmsg.h> header shall also define the following symbolic constants for use as return  
 9155 values for *fmtmsg()*:

- 9156 `MM_OK`            The function succeeded.
- 9157 `MM_NOTOK`        The function failed completely.
- 9158 `MM_NOMSG`        The function was unable to generate a message on standard error, but  
 9159 otherwise succeeded.

9160           MM\_NOCON           The function was unable to generate a console message, but otherwise  
9161                                   succeeded.

9162           The following shall be declared as a function and may also be defined as a macro. A function  
9163           prototype shall be provided.

```
9164           int fmtmsg(long, const char *, int,  
9165           const char *, const char *, const char *);
```

9166   **APPLICATION USAGE**

9167           None.

9168   **RATIONALE**

9169           None.

9170   **FUTURE DIRECTIONS**

9171           None.

9172   **SEE ALSO**

9173           XSH *fmtmsg()*

9174   **CHANGE HISTORY**

9175           First released in Issue 4, Version 2.

9176   **Issue 7**

9177           This reference page is clarified with respect to macros and symbolic constants.

9178 **NAME**

9179 fnmatch.h — filename-matching types

9180 **SYNOPSIS**

9181 #include <fnmatch.h>

9182 **DESCRIPTION**

9183 The <fnmatch.h> header shall define the following symbolic constants:

9184 FNM\_NOMATCH The string does not match the specified pattern.

9185 FNM\_PATHNAME <slash> in *string* only matches <slash> in *pattern*.

9186 FNM\_PERIOD Leading <period> in *string* only matches <period> in *pattern*.

9187 FNM\_NOESCAPE Disable backslash escaping.

9188 FNM\_CASEFOLD Compare *string* and *pattern* in a case-insensitive manner. See [Section 4.1](#)  
9189 (on page 95).

9190 FNM\_IGNORECASE Equivalent to FNM\_CASEFOLD.

9191 The following shall be declared as a function and may also be defined as a macro. A function  
9192 prototype shall be provided.

9193 int fnmatch(const char \*, const char \*, int);

9194 **APPLICATION USAGE**

9195 None.

9196 **RATIONALE**

9197 None.

9198 **FUTURE DIRECTIONS**

9199 None.

9200 **SEE ALSO**

9201 XSH [fnmatch\(\)](#)

9202 **CHANGE HISTORY**

9203 First released in Issue 4. Derived from the ISO POSIX-2 standard.

9204 **Issue 6**

9205 The FNM\_NOSYS constant is marked obsolescent.

9206 **Issue 7**

9207 The obsolescent FNM\_NOSYS constant is removed.

9208 This reference page is clarified with respect to macros and symbolic constants.

9209 **Issue 8**

9210 Austin Group Defect 1031 is applied, adding FNM\_CASEFOLD and FNM\_IGNORECASE.

9211 The description of FNM\_PERIOD is updated to eliminate the use of “must”.

9212 **NAME**

9213 ftw.h — file tree traversal

9214 **SYNOPSIS**9215 XSI `#include <ftw.h>`9216 **DESCRIPTION**9217 The **<ftw.h>** header shall define the **FTW** structure, which shall include at least the following  
9218 members:9219 `int base`  
9220 `int level`9221 The **<ftw.h>** header shall define the following symbolic constants for use as values of the third  
9222 argument to the application-supplied function that is passed as the second argument to *nftw()*:9223 **FTW\_F** Non-directory file.  
9224 **FTW\_D** Directory.  
9225 **FTW\_DNR** Directory without read permission.  
9226 **FTW\_DP** Directory with subdirectories visited.  
9227 **FTW\_NS** Unknown type; *stat()* failed.  
9228 **FTW\_SL** Symbolic link.  
9229 **FTW\_SLN** Symbolic link that names a nonexistent file.9230 The **<ftw.h>** header shall define the following symbolic constants for use as values of the fourth  
9231 argument to *nftw()*:9232 **FTW\_PHYS** Physical walk, does not follow symbolic links. Otherwise, *nftw()* follows  
9233 links but does not walk down any path that crosses itself.  
9234 **FTW\_MOUNT** The walk only reports files that have the same device ID as the starting  
9235 directory and does not descend below directories that have a different  
9236 device ID than the starting directory.  
9237 **FTW\_XDEV** The walk does not descend below directories that have a different device  
9238 ID than the starting directory.  
9239 **FTW\_DEPTH** All subdirectories are visited before the directory itself.  
9240 **FTW\_CHDIR** The walk changes to each directory before reading it.9241 The following shall be declared as a function and may also be defined as a macro. A function  
9242 prototype shall be provided.9243 `int nftw(const char *, int (*)(const char *, const struct stat *,`  
9244 `int, struct FTW *), int, int);`9245 The **<ftw.h>** header shall define the **stat** structure and the symbolic names for *st\_mode* and the  
9246 file type test macros as described in **<sys/stat.h>**.9247 Inclusion of the **<ftw.h>** header may also make visible all symbols from **<sys/stat.h>**.

9248 **APPLICATION USAGE**

9249 None.

9250 **RATIONALE**

9251 None.

9252 **FUTURE DIRECTIONS**

9253 None.

9254 **SEE ALSO**9255 [<sys/stat.h>](#)9256 XSH *nftw()*9257 **CHANGE HISTORY**

9258 First released in Issue 1. Derived from Issue 1 of the SVID.

9259 **Issue 5**

9260 A description of FTW\_DP is added.

9261 **Issue 7**9262 The *ftw()* function is marked obsolescent.

9263 This reference page is clarified with respect to macros and symbolic constants.

9264 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0048 [403] is applied.

9265 **Issue 8**

9266 Austin Group Defect 1133 is applied, adding FTW\_XDEV.

9267 Austin Group Defect 1210 is applied, changing the description of FTW\_MOUNT.

9268 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

9269 **NAME**

9270 glob.h — pathname pattern-matching types

9271 **SYNOPSIS**

9272 #include &lt;glob.h&gt;

9273 **DESCRIPTION**9274 The **<glob.h>** header shall define the structures and symbolic constants used by the *glob()*  
9275 function.9276 The **<glob.h>** header shall define the **glob\_t** structure type, which shall include at least the  
9277 following members:9278 size\_t gl\_pathc Count of paths matched by *pattern*.  
9279 char \*\*gl\_pathv Pointer to a list of matched pathnames.  
9280 size\_t gl\_offs Slots to reserve at the beginning of *gl\_pathv*.9281 The **<glob.h>** header shall define the **size\_t** type as described in **<sys/types.h>**.9282 The **<glob.h>** header shall define the following symbolic constants as values for the *flags*  
9283 argument:9284 GLOB\_APPEND Append generated pathnames to those previously obtained.  
9285 GLOB\_DOOFFS Specify how many null pointers to add to the beginning of *gl\_pathv*.  
9286 GLOB\_ERR Cause *glob()* to return on error.  
9287 GLOB\_MARK Each pathname that is a directory that matches *pattern* has a <slash>  
9288 appended.  
9289 GLOB\_NOCHECK If *pattern* does not match any pathname, then return a list consisting of  
9290 only *pattern*.  
9291 GLOB\_NOESCAPE Disable backslash escaping.  
9292 GLOB\_NOSORT Do not sort the pathnames returned.9293 The **<glob.h>** header shall define the following symbolic constants as error return values:9294 GLOB\_ABORTED The scan was stopped because GLOB\_ERR was set or (\*errfunc)()  
9295 returned non-zero.  
9296 GLOB\_NOMATCH The pattern does not match any existing pathname, and  
9297 GLOB\_NOCHECK was not set in *flags*.  
9298 GLOB\_NOSPACE An attempt to allocate memory failed.9299 The following shall be declared as functions and may also be defined as macros. Function  
9300 prototypes shall be provided.9301 int glob(const char \*restrict, int, int (\*)(const char \*, int),  
9302 glob\_t \*restrict);  
9303 void globfree(glob\_t \*);

9304 **APPLICATION USAGE**

9305 None.

9306 **RATIONALE**

9307 None.

9308 **FUTURE DIRECTIONS**

9309 None.

9310 **SEE ALSO**9311 [<sys/types.h>](#)9312 XSH *glob()*9313 **CHANGE HISTORY**

9314 First released in Issue 4. Derived from the ISO POSIX-2 standard.

9315 **Issue 6**9316 The **restrict** keyword is added to the prototype for *glob()*.

9317 The GLOB\_NOSYS constant is marked obsolescent.

9318 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob()*  
9319 prototype definition by removing the **restrict** qualifier from the function pointer argument.9320 **Issue 7**9321 SD5-XBD-ERN-56 is applied, adding a reference to [<sys/types.h>](#) for the **size\_t**

9322 The obsolescent GLOB\_NOSYS constant is removed.

9323 This reference page is clarified with respect to macros and symbolic constants.

9324 **NAME**

9325       grp.h — group structure

9326 **SYNOPSIS**

9327       #include &lt;grp.h&gt;

9328 **DESCRIPTION**9329       The **<grp.h>** header shall declare the **group** structure, which shall include the following  
9330       members:

9331       char     \*gr\_name   The name of the group.  
 9332       gid\_t    gr\_gid     Numerical group ID.  
 9333       char    \*\*gr\_mem    Pointer to a null-terminated array of character  
 9334       pointers to member names.

9335       The **<grp.h>** header shall define the **gid\_t** and **size\_t** types as described in **<sys/types.h>**.9336       The following shall be declared as functions and may also be defined as macros. Function  
9337       prototypes shall be provided.

```

9338 XSI     void            endgrent(void);
9339         struct group   *getgrent(void);
9340         struct group   *getgrgid(gid_t);
9341         int            getgrgid_r(gid_t, struct group *, char *,
9342                         size_t, struct group **);
9343         struct group   *getgrnam(const char *);
9344         int            getgrnam_r(const char *, struct group *, char *,
9345                         size_t , struct group **);
9346 XSI     void            setgrent(void);

```

9347 **APPLICATION USAGE**

9348       None.

9349 **RATIONALE**

9350       None.

9351 **FUTURE DIRECTIONS**

9352       None.

9353 **SEE ALSO**9354       [<sys/types.h>](#)9355       XSH *endgrent()*, *getgrgid()*, *getgrnam()*9356 **CHANGE HISTORY**

9357       First released in Issue 1.

9358 **Issue 5**

9359       The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

9360 **Issue 6**9361       The following new requirements on POSIX implementations derive from alignment with the  
9362       Single UNIX Specification:

- 9363       • The definition of **gid\_t** is mandated.
- 9364       • The *getgrgid\_r()* and *getgrnam\_r()* functions are marked as part of the Thread-Safe  
9365        Functions option.

9366 **Issue 7**

9367 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

9368 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0049 [24] is applied.

9369 **NAME**

9370 iconv.h — codeset conversion facility

9371 **SYNOPSIS**

9372 #include &lt;iconv.h&gt;

9373 **DESCRIPTION**9374 The **<iconv.h>** header shall define the following types:9375 **iconv\_t** Identifies the conversion from one codeset to another.9376 **size\_t** As described in **<sys/types.h>**.9377 The following shall be declared as functions and may also be defined as macros. Function  
9378 prototypes shall be provided.9379 size\_t iconv(iconv\_t, char \*\*restrict, size\_t \*restrict,  
9380 char \*\*restrict, size\_t \*restrict);  
9381 int iconv\_close(iconv\_t);  
9382 iconv\_t iconv\_open(const char \*, const char \*);9383 **APPLICATION USAGE**

9384 None.

9385 **RATIONALE**

9386 None.

9387 **FUTURE DIRECTIONS**

9388 None.

9389 **SEE ALSO**9390 [<sys/types.h>](#)9391 XSH [iconv\(\)](#), [iconv\\_close\(\)](#), [iconv\\_open\(\)](#)9392 **CHANGE HISTORY**

9393 First released in Issue 4.

9394 **Issue 6**9395 The **restrict** keyword is added to the prototype for [iconv\(\)](#).9396 **Issue 7**9397 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size\_t** type.9398 The **<iconv.h>** header is moved from the XSI option to the Base.

9399 **NAME**

9400 inttypes.h — fixed size integer types

9401 **SYNOPSIS**

9402 #include <inttypes.h>

9403 **DESCRIPTION**

9404 CX Some of the functionality described on this reference page extends the ISO C standard.  
 9405 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 9406 enable the visibility of these symbols in this header.

9407 The <inttypes.h> header shall include the <stdint.h> header.

9408 The <inttypes.h> header shall define at least the following types:

9409 **imaxdiv\_t** Structure type that is the type of the value returned by the *imaxdiv()* function.

9410 CX **wchar\_t** As described in <stddef.h>.

9411 The <inttypes.h> header shall define the following macros. Each expands to a character string  
 9412 literal containing a conversion specifier, possibly modified by a length modifier, suitable for use  
 9413 within the *format* argument of a formatted input/output function when converting the  
 9414 corresponding integer type. These macros have the general form of PRI (character string literals  
 9415 for the *fprintf()* and *fwprintf()* family of functions) or SCN (character string literals for the  
 9416 *fscanf()* and *fwscanf()* family of functions), followed by the conversion specifier, followed by a  
 9417 name corresponding to a similar type name in <stdint.h>. In these names, *N* represents the  
 9418 width of the type as described in <stdint.h>. For example, *PRIdFAST32* can be used in a format  
 9419 string to print the value of an integer of type **int\_fast32\_t**.

9420 The *fprintf()* macros for signed integers are:

9421	PRIdN	PRIdLEASTN	PRIdFASTN	PRIdMAX	PRIdPTR
9422	PRiN	PRiLEASTN	PRiFASTN	PRiMAX	PRiPTR

9423 The *fprintf()* macros for unsigned integers are:

9424	PRIoN	PRIoLEASTN	PRIoFASTN	PRIoMAX	PRIoPTR
9425	PRiUN	PRiULEASTN	PRiUFASTN	PRiUMAX	PRiUPTR
9426	PRiXN	PRiXLEASTN	PRiXFASTN	PRiXMAX	PRiXPTR
9427	PRiXN	PRiXLEASTN	PRiXFASTN	PRiXMAX	PRiXPTR

9428 The *fscanf()* macros for signed integers are:

9429	SCNdN	SCNdLEASTN	SCNdFASTN	SCNdMAX	SCNdPTR
9430	SCNiN	SCNiLEASTN	SCNiFASTN	SCNiMAX	SCNiPTR

9431 The *fscanf()* macros for unsigned integers are:

9432	SCNoN	SCNoLEASTN	SCNoFASTN	SCNoMAX	SCNoPTR
9433	SCNuN	SCNuLEASTN	SCNuFASTN	SCNuMAX	SCNuPTR
9434	SCNxN	SCNxLEASTN	SCNxFASTN	SCNxMAX	SCNxPTR

9435 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and  
 9436 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be  
 9437 defined unless the implementation does not have a suitable modifier for the type.

9438 The following shall be declared as functions and may also be defined as macros. Function  
 9439 prototypes shall be provided.

```
9440     intmax_t  imaxabs(intmax_t);
9441     imaxdiv_t imaxdiv(intmax_t, intmax_t);
9442     intmax_t  strtoumax(const char *restrict, char **restrict, int);
9443     uintmax_t strtoumax(const char *restrict, char **restrict, int);
9444     intmax_t  wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
9445     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
```

**9446 EXAMPLES**

```
9447     #include <inttypes.h>
9448     #include <wchar.h>
9449     int main(void)
9450     {
9451         uintmax_t i = UINTMAX_MAX; // This type always exists.
9452         wprintf(L"The largest integer value is %020"
9453             PRIxMAX "\n", i);
9454         return 0;
9455     }
```

**9456 APPLICATION USAGE**

9457 The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent  
9458 across machines and independent of operating systems and other implementation  
9459 idiosyncrasies. It defines, through **typedef**, integer types of various sizes. Implementations are  
9460 free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent  
9461 use of this header will greatly increase the portability of applications across platforms.

**9462 RATIONALE**

9463 The ISO/IEC 9899:1990 standard specified that the language should support four signed and  
9464 unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on  
9465 their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and  
9466 not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits  
9467 to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to  
9468 assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems  
9469 for users who migrate from one system to another which assigns different sizes to integer types,  
9470 because the ISO C standard integer promotion rule can produce silent changes unexpectedly.  
9471 The need for defining an extended integer type increased with the introduction of 64-bit  
9472 systems.

**9473 FUTURE DIRECTIONS**

9474 Macro names beginning with PRI or SCN followed by any lowercase letter or 'x' may be added  
9475 to the macros defined in the **<inttypes.h>** header.

**9479 CHANGE HISTORY**

9480 First released in Issue 5.

**9481 Issue 6**

9482 The Open Group Base Resolution bwg97-006 is applied.

9483 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

9484 **Issue 7**  
9485

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0050 [211] is applied.

9486 **NAME**

9487       iso646.h — alternative spellings

9488 **SYNOPSIS**

9489       #include &lt;iso646.h&gt;

9490 **DESCRIPTION**

9491 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
9492 conflict between the requirements described here and the ISO C standard is unintentional. This  
9493 volume of POSIX.1-2024 defers to the ISO C standard.

9494       The **<iso646.h>** header shall define the following eleven macros (on the left) that expand to the  
9495 corresponding tokens (on the right):

9496       and        &amp;&amp;

9497       and\_eq     &amp;=

9498       bitand     &amp;

9499       bitor      |

9500       compl     ~

9501       not        !

9502       not\_eq    !=

9503       or         ||

9504       or\_eq     |=

9505       xor       ^

9506       xor\_eq    ^=

9507 **APPLICATION USAGE**

9508       None.

9509 **RATIONALE**

9510       None.

9511 **FUTURE DIRECTIONS**

9512       None.

9513 **SEE ALSO**

9514       None.

9515 **CHANGE HISTORY**

9516       First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

9517 **NAME**

9518 langinfo.h — language information constants

9519 **SYNOPSIS**

9520 #include <langinfo.h>

9521 **DESCRIPTION**

9522 The <langinfo.h> header shall define the symbolic constants used to identify items of *langinfo*  
 9523 data (see *nl\_langinfo()*).

9524 The <langinfo.h> header shall define the **locale\_t** type as described in <locale.h>.

9525 The <langinfo.h> header shall define the **nl\_item** type as described in <nl\_types.h>.

9526 The <langinfo.h> header shall define the following symbolic constants with type **nl\_item**. The  
 9527 entries under **Category** indicate in which *setlocale()* category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	Codeset name.
D_T_FMT	LC_TIME	String for formatting date and time.
D_FMT	LC_TIME	Date format string.
T_FMT	LC_TIME	Time format string.
T_FMT_AMPM	LC_TIME	Time format string using 12-hour clock format, if supported in the locale; if the 12-hour format is not supported, this shall be either an empty string or a string specifying a 24-hour clock format.
AM_STR	LC_TIME	Ante-meridiem affix; if AM_STR and PM_STR are both empty strings, the 12-hour format is not supported in the locale.
PM_STR	LC_TIME	Post-meridiem affix; if AM_STR and PM_STR are both empty strings, the 12-hour format is not supported in the locale.
DAY_1	LC_TIME	Name of the first day of the week (for example, Sunday).
DAY_2	LC_TIME	Name of the second day of the week (for example, Monday).
DAY_3	LC_TIME	Name of the third day of the week (for example, Tuesday).
DAY_4	LC_TIME	Name of the fourth day of the week (for example, Wednesday).
DAY_5	LC_TIME	Name of the fifth day of the week (for example, Thursday).
DAY_6	LC_TIME	Name of the sixth day of the week (for example, Friday).
DAY_7	LC_TIME	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	LC_TIME	Abbreviated name of the first day of the week.
ABDAY_2	LC_TIME	Abbreviated name of the second day of the week.
ABDAY_3	LC_TIME	Abbreviated name of the third day of the week.
ABDAY_4	LC_TIME	Abbreviated name of the fourth day of the week.
ABDAY_5	LC_TIME	Abbreviated name of the fifth day of the week.
ABDAY_6	LC_TIME	Abbreviated name of the sixth day of the week.
ABDAY_7	LC_TIME	Abbreviated name of the seventh day of the week.
MON_1	LC_TIME	Name of the first month of the year.
MON_2	LC_TIME	Name of the second month.
MON_3	LC_TIME	Name of the third month.
MON_4	LC_TIME	Name of the fourth month.
MON_5	LC_TIME	Name of the fifth month.
MON_6	LC_TIME	Name of the sixth month.

	Constant	Category	Meaning
9565			
9566	MON_7	LC_TIME	Name of the seventh month.
9567	MON_8	LC_TIME	Name of the eighth month.
9568	MON_9	LC_TIME	Name of the ninth month.
9569	MON_10	LC_TIME	Name of the tenth month.
9570	MON_11	LC_TIME	Name of the eleventh month.
9571	MON_12	LC_TIME	Name of the twelfth month.
9572	ALTMON_1	LC_TIME	Name of the alternative appropriate first month of the year.
9573	ALTMON_2	LC_TIME	Name of the alternative appropriate second month.
9574	ALTMON_3	LC_TIME	Name of the alternative appropriate third month.
9575	ALTMON_4	LC_TIME	Name of the alternative appropriate fourth month.
9576	ALTMON_5	LC_TIME	Name of the alternative appropriate fifth month.
9577	ALTMON_6	LC_TIME	Name of the alternative appropriate sixth month.
9578	ALTMON_7	LC_TIME	Name of the alternative appropriate seventh month.
9579	ALTMON_8	LC_TIME	Name of the alternative appropriate eighth month.
9580	ALTMON_9	LC_TIME	Name of the alternative appropriate ninth month.
9581	ALTMON_10	LC_TIME	Name of the alternative appropriate tenth month.
9582	ALTMON_11	LC_TIME	Name of the alternative appropriate eleventh month.
9583	ALTMON_12	LC_TIME	Name of the alternative appropriate twelfth month.
9584	ABMON_1	LC_TIME	Abbreviated name of the first month.
9585	ABMON_2	LC_TIME	Abbreviated name of the second month.
9586	ABMON_3	LC_TIME	Abbreviated name of the third month.
9587	ABMON_4	LC_TIME	Abbreviated name of the fourth month.
9588	ABMON_5	LC_TIME	Abbreviated name of the fifth month.
9589	ABMON_6	LC_TIME	Abbreviated name of the sixth month.
9590	ABMON_7	LC_TIME	Abbreviated name of the seventh month.
9591	ABMON_8	LC_TIME	Abbreviated name of the eighth month.
9592	ABMON_9	LC_TIME	Abbreviated name of the ninth month.
9593	ABMON_10	LC_TIME	Abbreviated name of the tenth month.
9594	ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
9595	ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
9596	ABALTMON_1	LC_TIME	Abbreviated alternative name of the first month of the year.
9597	ABALTMON_2	LC_TIME	Abbreviated alternative name of the second month.
9598	ABALTMON_3	LC_TIME	Abbreviated alternative name of the third month.
9599	ABALTMON_4	LC_TIME	Abbreviated alternative name of the fourth month.
9600	ABALTMON_5	LC_TIME	Abbreviated alternative name of the fifth month.
9601	ABALTMON_6	LC_TIME	Abbreviated alternative name of the sixth month.
9602	ABALTMON_7	LC_TIME	Abbreviated alternative name of the seventh month.
9603	ABALTMON_8	LC_TIME	Abbreviated alternative name of the eighth month.
9604	ABALTMON_9	LC_TIME	Abbreviated alternative name of the ninth month.
9605	ABALTMON_10	LC_TIME	Abbreviated alternative name of the tenth month.
9606	ABALTMON_11	LC_TIME	Abbreviated alternative name of the eleventh month.
9607	ABALTMON_12	LC_TIME	Abbreviated alternative name of the twelfth month.
9608	ERA	LC_TIME	Era description segments.
9609	ERA_D_FMT	LC_TIME	Era date format string.
9610	ERA_D_T_FMT	LC_TIME	Era date and time format string.
9611	ERA_T_FMT	LC_TIME	Era time format string.
9612	ALT_DIGITS	LC_TIME	Alternative symbols for digits.
9613	RADIXCHAR	LC_NUMERIC	Radix character.
9614	THOUSEP	LC_NUMERIC	Separator for thousands.
9615	YESEXPR	LC_MESSAGES	Affirmative response expression.

Constant	Category	Meaning
NOEXPR	LC_MESSAGES	Negative response expression.
CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '-' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").

If the locale's values for **p\_cs\_precedes** and **n\_cs\_precedes** do not match, the value of *nl\_langinfo(CRNCYSTR)* and *nl\_langinfo\_l(CRNCYSTR,loc)* is unspecified.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
char *nl_langinfo(nl_item);
char *nl_langinfo_l(nl_item, locale_t);
```

Inclusion of the <langinfo.h> header may also make visible all symbols from <nl\_types.h>.

**APPLICATION USAGE**

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the *strftime()* function should be used to access date and time information defined in category *LC\_TIME*. The *localeconv()* function should be used to access information corresponding to *RADIXCHAR*, *THOUSEP*, and *CRNCYSTR*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

Chapter 7 (on page 127), <locale.h>, <nl\_types.h>

XSH *nl\_langinfo()*, *localeconv()*, *strfmon()*, *strftime()*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The constants *YESSTR* and *NOSTR* are marked *LEGACY*.

**Issue 6**

The constants *YESSTR* and *NOSTR* are removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/9 is applied, adding a sentence to the "Meaning" column entry for the *CRNCYSTR* constant. This change is to accommodate historic practice.

**Issue 7**

The <langinfo.h> header is moved from the XSI option to the Base.

The *nl\_langinfo\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the *locale\_t* type is added.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0051 [107] is applied.

9659 **Issue 8**

9660 Austin Group Defects 258 and 1166 are applied, adding the ALTMON\_*x* and ABALTMON\_*x*  
9661 symbolic constants.

9662 Austin Group Defect 1307 is applied, changing the AM\_STR, PM\_STR, and T\_FMT\_AMP  
9663 constants in relation to locales that do not support the 12-hour clock format.

9664 **NAME**  
9665 libgen.h — definitions for pattern matching functions

9666 **SYNOPSIS**

9667 XSI `#include <libgen.h>`

9668 **DESCRIPTION**

9669 The following shall be declared as functions and may also be defined as macros. Function  
9670 prototypes shall be provided.

9671 `char *basename(char *);`  
9672 `char *dirname(char *);`

9673 **APPLICATION USAGE**

9674 None.

9675 **RATIONALE**

9676 None.

9677 **FUTURE DIRECTIONS**

9678 None.

9679 **SEE ALSO**

9680 XSH *basename()*, *dirname()*

9681 **CHANGE HISTORY**

9682 First released in Issue 4, Version 2.

9683 **Issue 5**

9684 The function prototypes for *basename()* and *dirname()* are changed to indicate that the first  
9685 argument is of type **char \*** rather than **const char \***.

9686 **Issue 6**

9687 The `__loc1` symbol and the *regcmp()* and *regex()* functions are removed.

9688 **NAME**

9689 libintl.h — international messaging

9690 **SYNOPSIS**

9691 #include &lt;libintl.h&gt;

9692 **DESCRIPTION**9693 The **<libintl.h>** header may define the macro TEXTDOMAINMAX. If defined, it shall have the  
9694 same value as {TEXTDOMAIN\_MAX} in **<limits.h>**.9695 The **<libintl.h>** header shall define the **locale\_t** type as described in **<locale.h>**.9696 The following shall be declared as functions and may also be defined as macros. Function  
9697 prototypes shall be provided.

```
9698 char *bindtextdomain(const char *, const char *);
9699 char *bind_textdomain_codeset(const char *, const char *);
9700 char *dcgettext(const char *, const char *, int);
9701 char *dcgettext_l(const char *, const char *, int, locale_t);
9702 char *dcngettext(const char *, const char *, const char *,
9703                 unsigned long int, int);
9704 char *dcngettext_l(const char *, const char *, const char *,
9705                   unsigned long int, int, locale_t);
9706 char *dgettext(const char *, const char *);
9707 char *dgettext_l(const char *, const char *, locale_t);
9708 char *dngettext(const char *, const char *, const char *,
9709                unsigned long int);
9710 char *dngettext_l(const char *, const char *, const char *,
9711                  unsigned long int, locale_t);
9712 char *gettext(const char *);
9713 char *gettext_l(const char *, locale_t);
9714 char *ngettext(const char *, const char *, unsigned long int);
9715 char *ngettext_l(const char *, const char *,
9716                 unsigned long int, locale_t);
9717 char *textdomain(const char *);
```

9718 **APPLICATION USAGE**

9719 None.

9720 **RATIONALE**9721 Some historical implementations defined TEXTDOMAINMAX in this header. This standard  
9722 instead defines {TEXTDOMAIN\_MAX} in **<limits.h>**. This was done to allow the maximum  
9723 length of a text domain name to vary depending on the filesystem type used to store message  
9724 catalogs. Implementations are allowed to continue to define TEXTDOMAINMAX in this header  
9725 as an extension to the standard (see XSH [Section 2.2.2](#), on page 498).9726 **FUTURE DIRECTIONS**

9727 None.

9728 **SEE ALSO**9729 [<locale.h>](#)9730 XSH *gettext*, *bindtextdomain()*

9731 **CHANGE HISTORY**  
9732 First released in Issue 8.

9733 **NAME**9734 `limits.h` — implementation-defined constants9735 **SYNOPSIS**9736 `#include <limits.h>`9737 **DESCRIPTION**

9738 CX Some of the functionality described on this reference page extends the ISO C standard.  
9739 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
9740 enable the visibility of these symbols in this header.

9741 Many of the symbols listed here are not defined by the ISO C standard. Such symbols are not  
9742 shown as CX shaded, except under the heading “Numerical Limits”.

9743 The **<limits.h>** header shall define macros and symbolic constants for various limits. Different  
9744 categories of limits are described below, representing various limits on resources that the  
9745 implementation imposes on applications. All macros and symbolic constants defined in this  
9746 header shall be suitable for use in **#if** preprocessing directives.

9747 Implementations may choose any appropriate value for each limit, provided it is not more  
9748 restrictive than the Minimum Acceptable Values listed below. Symbolic constant names  
9749 beginning with `_POSIX` may be found in **<unistd.h>**.

9750 Applications should not assume any particular value for a limit. To achieve maximum  
9751 portability, an application should not require more resource than the Minimum Acceptable  
9752 Value quantity. However, an application wishing to avail itself of the full amount of a resource  
9753 available on an implementation may make use of the value given in **<limits.h>** on that  
9754 particular implementation, by using the macros and symbolic constants listed below. It should  
9755 be noted, however, that many of the listed limits are not invariant, and at runtime, the value of  
9756 the limit may differ from those given in this header, for the following reasons:

- 9757 • The limit is pathname-dependent.
- 9758 • The limit differs between the compile and runtime machines.
- 9759 • The limit has been changed at runtime by an application (see `setrlimit()`).

9760 For these reasons, an application can use the `fpathconf()`, `getrlimit()`, `pathconf()`, and `sysconf()`  
9761 functions to determine the actual value of a limit at runtime.

9762 The items in the list ending in `_MIN` give the most negative values that the mathematical types  
9763 are guaranteed to be capable of representing. Numbers of a more negative value may be  
9764 supported on some implementations, as indicated by the **<limits.h>** header on the  
9765 implementation, but applications requiring such numbers are not guaranteed to be portable to  
9766 all implementations. For positive constants ending in `_MIN`, this indicates the minimum  
9767 acceptable value.

9768 **Runtime Invariant Values (Possibly Indeterminate)**

9769 A definition of one of the symbolic constants in the following list shall be omitted from  
9770 **<limits.h>** on specific implementations where the corresponding value is equal to or greater  
9771 than the stated minimum, but is unspecified.

9772 This indetermination might depend on the amount of available memory space on a specific  
9773 instance of a specific implementation. The actual value supported by a specific instance shall be  
9774 provided by the `sysconf()` function.

9775 {AIO\_LISTIO\_MAX}  
 9776 Maximum number of I/O operations in a single list I/O call supported by the  
 9777 implementation.  
 9778 Minimum Acceptable Value: {\_POSIX\_AIO\_LISTIO\_MAX}

9779 {AIO\_MAX}  
 9780 Maximum number of outstanding asynchronous I/O operations supported by the  
 9781 implementation.  
 9782 Minimum Acceptable Value: {\_POSIX\_AIO\_MAX}

9783 {AIO\_PRIO\_DELTA\_MAX}  
 9784 The maximum amount by which a process can decrease its asynchronous I/O priority level  
 9785 from its own scheduling priority.  
 9786 Minimum Acceptable Value: 0

9787 {ARG\_MAX}  
 9788 Maximum length of argument to the *exec* functions including environment data.  
 9789 Minimum Acceptable Value: {\_POSIX\_ARG\_MAX}

9790 {ATEXIT\_MAX}  
 9791 Maximum number of functions that can be registered with *atexit()* or *at\_quick\_exit()*. The  
 9792 limit shall apply independently to each function.  
 9793 Minimum Acceptable Value: 32

9794 {CHILD\_MAX}  
 9795 Maximum number of simultaneous processes per real user ID.  
 9796 Minimum Acceptable Value: {\_POSIX\_CHILD\_MAX}

9797 {DELAYTIMER\_MAX}  
 9798 Maximum number of timer expiration overruns.  
 9799 Minimum Acceptable Value: {\_POSIX\_DELAYTIMER\_MAX}

9800 {HOST\_NAME\_MAX}  
 9801 Maximum length of a host name (not including the terminating null) as returned from the  
 9802 *gethostname()* function.  
 9803 Minimum Acceptable Value: {\_POSIX\_HOST\_NAME\_MAX}

9804 XSI {IOV\_MAX}  
 9805 Maximum number of *iovec* structures that one process has available for use with *readv()* or  
 9806 *writev()*.  
 9807 Minimum Acceptable Value: {\_XOPEN\_IOV\_MAX}

9808 {LOGIN\_NAME\_MAX}  
 9809 Maximum length of a login name.  
 9810 Minimum Acceptable Value: {\_POSIX\_LOGIN\_NAME\_MAX}

9811 MSG {MQ\_OPEN\_MAX}  
 9812 The maximum number of open message queue descriptors a process may hold.  
 9813 Minimum Acceptable Value: {\_POSIX\_MQ\_OPEN\_MAX}

9814 MSG {MQ\_PRIO\_MAX}  
 9815 The maximum number of message priorities supported by the implementation.  
 9816 Minimum Acceptable Value: {\_POSIX\_MQ\_PRIO\_MAX}

9817 {OPEN\_MAX}  
 9818 A value one greater than the maximum value that the system may assign to a newly-created  
 9819 file descriptor.  
 9820 Minimum Acceptable Value: {\_POSIX\_OPEN\_MAX}

9821           {PAGESIZE}  
9822            Size in bytes of a page.  
9823            Minimum Acceptable Value: 1

9824 XSI        {PAGE\_SIZE}  
9825            Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE\_SIZE} is defined, the other is  
9826            defined with the same value.

9827           {PTHREAD\_DESTRUCTOR\_ITERATIONS}  
9828            Maximum number of attempts made to destroy a thread's thread-specific data values on  
9829            thread exit.  
9830            Minimum Acceptable Value: {\_POSIX\_THREAD\_DESTRUCTOR\_ITERATIONS}

9831           {PTHREAD\_KEYS\_MAX}  
9832            Maximum number of data keys that can be created by a process.  
9833            Minimum Acceptable Value: {\_POSIX\_THREAD\_KEYS\_MAX}

9834           {PTHREAD\_STACK\_MIN}  
9835            Minimum size in bytes of thread stack storage.  
9836            Minimum Acceptable Value: 0

9837           {PTHREAD\_THREADS\_MAX}  
9838            Maximum number of threads that can be created per process.  
9839            Minimum Acceptable Value: {\_POSIX\_THREAD\_THREADS\_MAX}

9840           {RTSIG\_MAX}  
9841            Maximum number of realtime signals reserved for application use in this implementation.  
9842            Minimum Acceptable Value: {\_POSIX\_RTSIG\_MAX}

9843           {SEM\_NSEMS\_MAX}  
9844            Maximum number of semaphores that a process may have.  
9845            Minimum Acceptable Value: {\_POSIX\_SEM\_NSEMS\_MAX}

9846           {SEM\_VALUE\_MAX}  
9847            The maximum value a semaphore may have.  
9848            Minimum Acceptable Value: {\_POSIX\_SEM\_VALUE\_MAX}

9849           {SIGQUEUE\_MAX}  
9850            Maximum number of queued signals that a process may send and have pending at the  
9851            receiver(s) at any time.  
9852            Minimum Acceptable Value: {\_POSIX\_SIGQUEUE\_MAX}

9853 SS|TSP     {SS\_REPL\_MAX}  
9854            The maximum number of replenishment operations that may be simultaneously pending  
9855            for a particular sporadic server scheduler.  
9856            Minimum Acceptable Value: {\_POSIX\_SS\_REPL\_MAX}

9857           {STREAM\_MAX}  
9858            Maximum number of streams that one process can have open at one time. If defined, it has  
9859            the same value as {FOPEN\_MAX} (see <stdio.h>).  
9860            Minimum Acceptable Value: {\_POSIX\_STREAM\_MAX}

9861           {SYMLOOP\_MAX}  
9862            Maximum number of symbolic links that can be reliably traversed in the resolution of a  
9863            pathname in the absence of a loop.  
9864            Minimum Acceptable Value: {\_POSIX\_SYMLOOP\_MAX}

9865 {TIMER\_MAX}  
 9866 Maximum number of timers per process supported by the implementation.  
 9867 Minimum Acceptable Value: {\_POSIX\_TIMER\_MAX}

9868 {TTY\_NAME\_MAX}  
 9869 Maximum length of terminal device name.  
 9870 Minimum Acceptable Value: {\_POSIX\_TTY\_NAME\_MAX}

9871 {TZNAME\_MAX}  
 9872 Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).  
 9873 Minimum Acceptable Value: {\_POSIX\_TZNAME\_MAX}

9874 **Note:** The length given by {TZNAME\_MAX} does not include the quoting characters mentioned in  
 9875 [Section 8.3](#) (on page 174).

9876 **Pathname Variable Values**

9877 The values in the following list may be constants within an implementation or may vary from  
 9878 one pathname to another. For example, file systems or directories may have different  
 9879 characteristics.

9880 A definition of one of the symbolic constants in the following list shall be omitted from the  
 9881 <limits.h> header on specific implementations where the corresponding value is equal to or  
 9882 greater than the stated minimum, but where the value can vary depending on the file to which it  
 9883 is applied. The actual value supported for a specific pathname shall be provided by the  
 9884 *pathconf()* function.

9885 {FILESIZEBITS}  
 9886 Minimum number of bits needed to represent, as a signed integer value, the maximum size  
 9887 of a regular file allowed in the specified directory.  
 9888 Minimum Acceptable Value: 32

9889 {LINK\_MAX}  
 9890 Maximum number of links to a single file.  
 9891 Minimum Acceptable Value: {\_POSIX\_LINK\_MAX}

9892 {MAX\_CANON}  
 9893 Maximum number of bytes in a terminal canonical input line.  
 9894 Minimum Acceptable Value: {\_POSIX\_MAX\_CANON}

9895 {MAX\_INPUT}  
 9896 Minimum number of bytes for which space is available in a terminal input queue; therefore,  
 9897 the maximum number of bytes a conforming application may require to be typed as input  
 9898 before reading them.  
 9899 Minimum Acceptable Value: {\_POSIX\_MAX\_INPUT}

9900 {NAME\_MAX}  
 9901 Maximum number of bytes in a filename (not including the terminating null of a filename  
 9902 string).  
 9903 Minimum Acceptable Value: {\_POSIX\_NAME\_MAX}  
 9904 XSI Minimum Acceptable Value: {\_XOPEN\_NAME\_MAX}

9905 {PATH\_MAX}  
 9906 Maximum number of bytes the implementation stores as a pathname in a user-supplied  
 9907 buffer of unspecified size, including the terminating null character. Minimum number the  
 9908 implementation shall accept as the maximum number of bytes in a pathname.  
 9909 Minimum Acceptable Value: {\_POSIX\_PATH\_MAX}

9910	XSI	<b>Minimum Acceptable Value: {_XOPEN_PATH_MAX}</b>
9911		{PIPE_BUF}
9912		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
9913		Minimum Acceptable Value: {_POSIX_PIPE_BUF}
9914	ADV	<b>{POSIX_ALLOC_SIZE_MIN}</b>
9915		Minimum number of bytes of storage actually allocated for any portion of a file.
9916		Minimum Acceptable Value: Not specified.
9917	ADV	<b>{POSIX_REC_INCR_XFER_SIZE}</b>
9918		Recommended increment for file transfer sizes between the
9919		{POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
9920		Minimum Acceptable Value: Not specified.
9921	ADV	<b>{POSIX_REC_MAX_XFER_SIZE}</b>
9922		Maximum recommended file transfer size.
9923		Minimum Acceptable Value: Not specified.
9924	ADV	<b>{POSIX_REC_MIN_XFER_SIZE}</b>
9925		Minimum recommended file transfer size.
9926		Minimum Acceptable Value: Not specified.
9927	ADV	<b>{POSIX_REC_XFER_ALIGN}</b>
9928		Recommended file transfer buffer alignment.
9929		Minimum Acceptable Value: Not specified.
9930		{SYMLINK_MAX}
9931		Maximum number of bytes in a symbolic link.
9932		Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}
9933		{TEXTDOMAIN_MAX}
9934		Maximum length of a text domain name, not including the terminating null byte.
9935		Minimum Acceptable Value: {_POSIX_NAME_MAX} – 3
9936	XSI	<b>Minimum Acceptable Value: {_XOPEN_NAME_MAX} – 3</b>

### 9937 Runtime Inceasable Values

9938 The magnitude limitations in the following list shall be fixed by specific implementations. An  
 9939 application should assume that the value of the symbolic constant defined by **<limits.h>** in a  
 9940 specific implementation is the minimum that pertains whenever the application is run under  
 9941 that implementation. A specific instance of a specific implementation may increase the value  
 9942 relative to that supplied by **<limits.h>** for that implementation. The actual value supported by a  
 9943 specific instance shall be provided by the *sysconf()* function.

9944		<b>{BC_BASE_MAX}</b>
9945		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
9946		Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}
9947		<b>{BC_DIM_MAX}</b>
9948		Maximum number of elements permitted in an array by the <i>bc</i> utility.
9949		Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}
9950		<b>{BC_SCALE_MAX}</b>
9951		Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
9952		Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

9953 {BC\_STRING\_MAX}  
 9954 Maximum length of a string constant accepted by the *bc* utility.  
 9955 Minimum Acceptable Value: {\_POSIX2\_BC\_STRING\_MAX}

9956 {CHARCLASS\_NAME\_MAX}  
 9957 Maximum number of bytes in a character class name.  
 9958 Minimum Acceptable Value: {\_POSIX2\_CHARCLASS\_NAME\_MAX}

9959 {COLL\_WEIGHTS\_MAX}  
 9960 Maximum number of weights that can be assigned to an entry of the *LC\_COLLATE* **order**  
 9961 keyword in the locale definition file; see [Chapter 7](#) (on page 127).  
 9962 Minimum Acceptable Value: {\_POSIX2\_COLL\_WEIGHTS\_MAX}

9963 {EXPR\_NEST\_MAX}  
 9964 Maximum number of expressions that can be nested within parentheses by the *expr* utility.  
 9965 Minimum Acceptable Value: {\_POSIX2\_EXPR\_NEST\_MAX}

9966 {LINE\_MAX}  
 9967 Unless otherwise noted, the maximum length, in bytes, of a utility’s input line (either  
 9968 standard input or another file), when the utility is described as processing text files. The  
 9969 length includes room for the trailing <newline>.  
 9970 Minimum Acceptable Value: {\_POSIX2\_LINE\_MAX}

9971 {NGROUPS\_MAX}  
 9972 Maximum number of simultaneous supplementary group IDs per process.  
 9973 Minimum Acceptable Value: {\_POSIX\_NGROUPS\_MAX}

9974 {RE\_DUP\_MAX}  
 9975 Maximum number of repeated occurrences of a BRE or ERE interval expression; see [Section](#)  
 9976 [9.3.6](#) (on page 185) and [Section 9.4.6](#) (on page 189).  
 9977 Minimum Acceptable Value: {\_POSIX\_RE\_DUP\_MAX}

9978 **Maximum Values**

9979 The <limits.h> header shall define the following symbolic constants with the values shown.  
 9980 These are the most restrictive values for certain features on an implementation. A conforming  
 9981 implementation shall provide values no larger than these values. A conforming application shall  
 9982 not require a smaller value for correct operation.

9983 {\_POSIX\_CLOCKRES\_MIN}  
 9984 The resolution of the CLOCK\_REALTIME and CLOCK\_MONOTONIC clocks, in  
 9985 nanoseconds.  
 9986 Value: 20 000 000

9987 **Minimum Values**

9988 The <limits.h> header shall define the following symbolic constants with the values shown.  
 9989 These are the most restrictive values for certain features on an implementation conforming to  
 9990 this volume of POSIX.1-2024. Related symbolic constants are defined elsewhere in this volume  
 9991 of POSIX.1-2024 which reflect the actual implementation and which need not be as restrictive.  
 9992 For each of these limits, a conforming implementation shall provide a value at least this large or  
 9993 shall have no limit. A strictly conforming application shall not require a larger value for correct  
 9994 operation.

9995 {\_POSIX\_AIO\_LISTIO\_MAX}  
 9996 The number of I/O operations that can be specified in a list I/O call.  
 9997 Value: 2

9998		{_POSIX_AIO_MAX}
9999		The number of outstanding asynchronous I/O operations.
10000		Value: 1
10001		{_POSIX_ARG_MAX}
10002		Maximum length of argument to the <i>exec</i> functions including environment data.
10003		Value: 4 096
10004		{_POSIX_CHILD_MAX}
10005		Maximum number of simultaneous processes per real user ID.
10006		Value: 25
10007		{_POSIX_DELAYTIMER_MAX}
10008		The number of timer expiration overruns.
10009		Value: 32
10010		{_POSIX_HOST_NAME_MAX}
10011		Maximum length of a host name (not including the terminating null) as returned from the <i>gethostname()</i> function.
10012		Value: 255
10013		
10014		{_POSIX_LINK_MAX}
10015		Maximum number of links to a single file.
10016		Value: 8
10017		{_POSIX_LOGIN_NAME_MAX}
10018		The size of the storage required for a login name, in bytes (including the terminating null).
10019		Value: 9
10020		{_POSIX_MAX_CANON}
10021		Maximum number of bytes in a terminal canonical input queue.
10022		Value: 255
10023		{_POSIX_MAX_INPUT}
10024		Maximum number of bytes allowed in a terminal input queue.
10025		Value: 255
10026	MSG	{_POSIX_MQ_OPEN_MAX}
10027		The number of message queues that can be open for a single process.
10028		Value: 8
10029	MSG	{_POSIX_MQ_PRIO_MAX}
10030		The maximum number of message priorities supported by the implementation.
10031		Value: 32
10032		{_POSIX_NAME_MAX}
10033		Maximum number of bytes in a filename (not including the terminating null of a filename string).
10034		Value: 14
10035		
10036		{_POSIX_NGROUPS_MAX}
10037		Maximum number of simultaneous supplementary group IDs per process.
10038		Value: 8
10039		{_POSIX_OPEN_MAX}
10040		A value one greater than the maximum value that the system may assign to a newly-created file descriptor.
10041		Value: 20
10042		

10043		{_POSIX_PATH_MAX}
10044		Minimum number the implementation shall accept as the maximum number of bytes in a
10045		pathname.
10046		Value: 256
10047		{_POSIX_PIPE_BUF}
10048		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
10049		Value: 512
10050		{_POSIX_RE_DUP_MAX}
10051		Maximum number of repeated occurrences of a BRE or ERE interval expression; see <a href="#">Section</a>
10052		<a href="#">9.3.6</a> (on page 185) and <a href="#">Section 9.4.6</a> (on page 189).
10053		Value: 255
10054		{_POSIX_RTSIG_MAX}
10055		The number of realtime signal numbers reserved for application use.
10056		Value: 8
10057		{_POSIX_SEM_NSEMS_MAX}
10058		The number of semaphores that a process may have.
10059		Value: 256
10060		{_POSIX_SEM_VALUE_MAX}
10061		The maximum value a semaphore may have.
10062		Value: 32 767
10063		{_POSIX_SIGQUEUE_MAX}
10064		The number of queued signals that a process may send and have pending at the receiver(s)
10065		at any time.
10066		Value: 32
10067		{_POSIX_SSIZE_MAX}
10068		The value that can be stored in an object of type <b>ssize_t</b> .
10069		Value: 32 767
10070	SS TSP	{_POSIX_SS_REPL_MAX}
10071		The number of replenishment operations that may be simultaneously pending for a
10072		particular sporadic server scheduler.
10073		Value: 4
10074		{_POSIX_STREAM_MAX}
10075		The number of streams that one process can have open at one time.
10076		Value: 8
10077		{_POSIX_SYMLINK_MAX}
10078		The number of bytes in a symbolic link.
10079		Value: 255
10080		{_POSIX_SYMLINK_MAX}
10081		The number of symbolic links that can be traversed in the resolution of a pathname in the
10082		absence of a loop.
10083		Value: 8
10084		{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
10085		The number of attempts made to destroy a thread's thread-specific data values on thread
10086		exit.
10087		Value: 4

10088	{_POSIX_THREAD_KEYS_MAX}
10089	The number of data keys per process.
10090	Value: 128
10091	{_POSIX_THREAD_THREADS_MAX}
10092	The number of threads per process.
10093	Value: 64
10094	{_POSIX_TIMER_MAX}
10095	The per-process number of timers.
10096	Value: 32
10097	{_POSIX_TTY_NAME_MAX}
10098	The size of the storage required for a terminal device name, in bytes (including the terminating null).
10099	
10100	Value: 9
10101	{_POSIX_TZNAME_MAX}
10102	Maximum number of bytes supported for the name of a timezone (not of the <i>TZ</i> variable).
10103	Value: 6
10104	<b>Note:</b> The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters
10105	mentioned in <a href="#">Section 8.3</a> (on page 174).
10106	{_POSIX2_BC_BASE_MAX}
10107	Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
10108	Value: 99
10109	{_POSIX2_BC_DIM_MAX}
10110	Maximum number of elements permitted in an array by the <i>bc</i> utility.
10111	Value: 2 048
10112	{_POSIX2_BC_SCALE_MAX}
10113	Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
10114	Value: 99
10115	{_POSIX2_BC_STRING_MAX}
10116	Maximum length of a string constant accepted by the <i>bc</i> utility.
10117	Value: 1 000
10118	{_POSIX2_CHARCLASS_NAME_MAX}
10119	Maximum number of bytes in a character class name.
10120	Value: 14
10121	{_POSIX2_COLL_WEIGHTS_MAX}
10122	Maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b>
10123	keyword in the locale definition file; see <a href="#">Chapter 7</a> (on page 127).
10124	Value: 2
10125	{_POSIX2_EXPR_NEST_MAX}
10126	Maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.
10127	Value: 32
10128	{_POSIX2_LINE_MAX}
10129	Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
10130	standard input or another file), when the utility is described as processing text files. The
10131	length includes room for the trailing <newline>.
10132	Value: 2 048

10133            {`_POSIX2_RE_DUP_MAX`}

10134            Maximum number of repeated occurrences of a BRE or ERE interval expression; see [Section 9.3.6](#) (on page 185) and [Section 9.4.6](#) (on page 189).

10135            Value: 255

10136

10137 XSI         {`_XOPEN_IOV_MAX`}

10138            Maximum number of `iovec` structures that one process has available for use with `readv()` or `writev()`.

10139            Value: 16

10140

10141 XSI         {`_XOPEN_NAME_MAX`}

10142            Maximum number of bytes in a filename (not including the terminating null of a filename string).

10143            Value: 255

10144

10145 XSI         {`_XOPEN_PATH_MAX`}

10146            Minimum number the implementation shall accept as the maximum number of bytes in a pathname.

10147            Value: 1 024

10148

10149         **Numerical Limits**

10150         The <limits.h> header shall define the following macros and, except for {CHAR\_BIT}, {LONG\_BIT}, {MB\_LEN\_MAX}, and {WORD\_BIT}, they shall be replaced by expressions that have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions.

10151

10152         If an object of type `char` can hold negative values, the value of {CHAR\_MIN} shall be the same as that of {SCHAR\_MIN} and the value of {CHAR\_MAX} shall be the same as that of {SCHAR\_MAX}. Otherwise, the value of {CHAR\_MIN} shall be 0 and the value of {CHAR\_MAX} shall be the same as that of {UCHAR\_MAX}.

10153

10154         {CHAR\_BIT}

10155            Number of bits in a type `char`.

10156            Value: 8

10157

10158         {CHAR\_MAX}

10159            Maximum value for an object of type `char`.

10160            Value: {UCHAR\_MAX} or {SCHAR\_MAX}

10161

10162         {CHAR\_MIN}

10163            Minimum value for an object of type `char`.

10164            Value: {SCHAR\_MIN} or 0

10165

10166         {INT\_MAX}

10167            Maximum value for an object of type `int`.

10168            Minimum Acceptable Value: 2 147 483 647

10169

10170         {INT\_MIN}

10171            Minimum value for an object of type `int`.

10172            Maximum Acceptable Value: -2 147 483 648

10173

10174         {LLONG\_MAX}

10175            Maximum value for an object of type `long long`.

10176            Minimum Acceptable Value: +9 223 372 036 854 775 807

10176		{LLONG_MIN}
10177		Minimum value for an object of type <b>long long</b> .
10178	CX	Maximum Acceptable Value: -9 223 372 036 854 775 808
10179	CX	{LONG_BIT}
10180		Number of bits in an object of type <b>long</b> .
10181		Minimum Acceptable Value: 32
10182		{LONG_MAX}
10183		Maximum value for an object of type <b>long</b> .
10184		Minimum Acceptable Value: +2 147 483 647
10185		{LONG_MIN}
10186		Minimum value for an object of type <b>long</b> .
10187	CX	Maximum Acceptable Value: -2 147 483 648
10188		{MB_LEN_MAX}
10189		Maximum number of bytes in a character, for any supported locale.
10190		Minimum Acceptable Value: 1
10191		{SCHAR_MAX}
10192		Maximum value for an object of type <b>signed char</b> .
10193	CX	Value: +127
10194		{SCHAR_MIN}
10195		Minimum value for an object of type <b>signed char</b> .
10196	CX	Value: -128
10197		{SHRT_MAX}
10198		Maximum value for an object of type <b>short</b> .
10199		Minimum Acceptable Value: +32 767
10200		{SHRT_MIN}
10201		Minimum value for an object of type <b>short</b> .
10202	CX	Maximum Acceptable Value: -32 768
10203	CX	{SSIZE_MAX}
10204		Maximum value for an object of type <b>ssize_t</b> .
10205		Minimum Acceptable Value: {_POSIX_SSIZE_MAX}
10206		{UCHAR_MAX}
10207		Maximum value for an object of type <b>unsigned char</b> .
10208	CX	Value: 255
10209		{UINT_MAX}
10210		Maximum value for an object of type <b>unsigned</b> .
10211	CX	Minimum Acceptable Value: 4 294 967 295
10212		{ULLONG_MAX}
10213		Maximum value for an object of type <b>unsigned long long</b> .
10214		Minimum Acceptable Value: 18 446 744 073 709 551 615
10215		{ULONG_MAX}
10216		Maximum value for an object of type <b>unsigned long</b> .
10217		Minimum Acceptable Value: 4 294 967 295
10218		{USHRT_MAX}
10219		Maximum value for an object of type <b>unsigned short</b> .
10220		Minimum Acceptable Value: 65 535

10221	CX	<b>{WORD_BIT}</b>
10222		Number of bits in an object of type <b>int</b> .
10223		Minimum Acceptable Value: 32
10224		<b>Other Invariant Values</b>
10225		The <limits.h> header shall define the following symbolic constants:
10226		<b>{GETENTROPY_MAX}</b>
10227		The maximum value of the <i>length</i> argument in calls to the <i>getentropy()</i> function.
10228		Minimum Acceptable Value: 256
10229		<b>{NL_ARGMAX}</b>
10230		Maximum value of <i>n</i> in conversion specifications using the "%n\$" sequence in calls to the <i>printf()</i> and <i>scanf()</i> families of functions.
10231		
10232		Minimum Acceptable Value: 9
10233	XSI	<b>{NL_LANGMAX}</b>
10234		Maximum number of bytes in a <i>LANG</i> name.
10235		Minimum Acceptable Value: 14
10236		<b>{NL_MSGMAX}</b>
10237		Maximum message number.
10238		Minimum Acceptable Value: 32 767
10239		<b>{NL_SETMAX}</b>
10240		Maximum set number.
10241		Minimum Acceptable Value: 255
10242		<b>{NL_TEXTMAX}</b>
10243		Maximum number of bytes in a message string.
10244		Minimum Acceptable Value: {_POSIX2_LINE_MAX}
10245		<b>{NSIG_MAX}</b>
10246		Maximum possible return value of <i>sysconf(_SC_NSIG)</i> . See XSH <i>sysconf()</i> . The value of
10247		{NSIG_MAX} shall be no greater than the number of signals that the <b>sigset_t</b> type (see
10248		<signal.h>) is capable of representing, ignoring any restrictions imposed by <i>sigfillset()</i> or
10249		<i>sigaddset()</i> .
10250	XSI	<b>{NZERO}</b>
10251		Default process priority.
10252		Minimum Acceptable Value: 20

10253 **APPLICATION USAGE**

10254 None.

10255 **RATIONALE**

10256 A request was made to reduce the value of {\_POSIX\_LINK\_MAX} from the value of 8 specified  
 10257 for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request  
 10258 for several reasons:

- 10259 • They wanted to avoid making any changes to the standard that could break conforming  
 10260 applications, and the requested change could have that effect.
- 10261 • The use of multiple hard links to a file cannot always be replaced with use of symbolic  
 10262 links. Symbolic links are semantically different from hard links in that they associate a  
 10263 pathname with another pathname rather than a pathname with a file. This has  
 10264 implications for access control, file permanence, and transparency.

10265 • The original standard developers had considered the issue of allowing for  
10266 implementations that did not in general support hard links, and decided that this would  
10267 reduce consensus on the standard.

10268 Systems that support historical versions of the development option of the ISO POSIX-2 standard  
10269 retain the name `{_POSIX2_RE_DUP_MAX}` as an alias for `{_POSIX_RE_DUP_MAX}`.

10270 `{NSIG_MAX}`

10271 Some historical implementations provided compile-time constants `NSIG` or `SIGMAX` to  
10272 define the maximum number of signals the implementation supported, but these values did  
10273 not necessarily reflect the number of signals that could be handled using a `sigset_t`. With  
10274 the addition of real-time signals and the desire by some applications to be able to allocate  
10275 additional real-time signals at run-time, neither of these constants provided a useable,  
10276 portable value. `{NSIG_MAX}` was added to the standard to allow applications to determine  
10277 the maximum number of signals that an implementation will support based on the size of  
10278 the `sigset_t` type (defined in **<signal.h>**).

10279 `{PATH_MAX}`

10280 IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the  
10281 definition of `pathname` and the description of `{PATH_MAX}`, allowing application  
10282 developers to allocate either `{PATH_MAX}` or `{PATH_MAX}+1` bytes. The inconsistency has  
10283 been removed by correction to the `{PATH_MAX}` definition to include the null character.  
10284 With this change, applications that previously allocated `{PATH_MAX}` bytes will continue to  
10285 succeed.

10286 `{SYMLINK_MAX}`

10287 This symbol refers to space for data that is stored in the file system, as opposed to  
10288 `{PATH_MAX}` which is the length of a name that can be passed to a function. In some  
10289 existing implementations, the pathnames pointed to by symbolic links are stored in the  
10290 *inodes* of the links, so it is important that `{SYMLINK_MAX}` not be constrained to be as large  
10291 as `{PATH_MAX}`.

10292 The maximum values for `{SCHAR_MIN}`, `{SHRT_MIN}`, `{LONG_MIN}` and `{LLONG_MIN}`  
10293 differ from the ISO C standard because POSIX.1 requires two's complement representation for  
10294 the corresponding integer types. The maximum value for `{INT_MIN}` differs both for that reason  
10295 and because POSIX.1 requires that `int` has a width of at least 32 bits. See also the RATIONALE  
10296 section for **<stdint.h>**.

#### 10297 **FUTURE DIRECTIONS**

10298 None.

#### 10299 **SEE ALSO**

10300 [Chapter 7](#) (on page 127), **<stdint.h>**, **<stdio.h>**, **<unistd.h>**

10301 [XSH Section 2.2](#) (on page 496), `fpathconf()`, `getrlimit()`, `sysconf()`

#### 10302 **CHANGE HISTORY**

10303 First released in Issue 1.

#### 10304 **Issue 5**

10305 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
10306 Threads Extension.

10307 `{FILESIZEBITS}` is added for the Large File Summit extensions.

10308 The minimum acceptable values for `{INT_MAX}`, `{INT_MIN}`, and `{UINT_MAX}` are changed to  
10309 make 32-bit values the minimum requirement.

10310 The entry is restructured to improve readability.

10311 **Issue 6**

10312 The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR\_MIN},  
 10313 {INT\_MIN}, {LONG\_MIN}, {SCHAR\_MIN}, and {SHRT\_MIN} that these are maximum  
 10314 acceptable values.

10315 The following new requirements on POSIX implementations derive from alignment with the  
 10316 Single UNIX Specification:

- 10317 • The minimum value for {CHILD\_MAX} is 25. This is a FIPS requirement.
- 10318 • The minimum value for {OPEN\_MAX} is 20. This is a FIPS requirement.
- 10319 • The minimum value for {NGROUPS\_MAX} is 8. This is also a FIPS requirement.

10320 Symbolic constants are added for {\_POSIX\_SYMLINK\_MAX}, {\_POSIX\_SYMLOOP\_MAX},  
 10321 {\_POSIX\_RE\_DUP\_MAX}, {RE\_DUP\_MAX}, {SYMLOOP\_MAX}, and {SYMLINK\_MAX}.

10322 The following values are added for alignment with IEEE Std 1003.1d-1999:

10323 {\_POSIX\_SS\_REPL\_MAX}  
 10324 {SS\_REPL\_MAX}  
 10325 {POSIX\_ALLOC\_SIZE\_MIN}  
 10326 {POSIX\_REC\_INCR\_XFER\_SIZE}  
 10327 {POSIX\_REC\_MAX\_XFER\_SIZE}  
 10328 {POSIX\_REC\_MIN\_XFER\_SIZE}  
 10329 {POSIX\_REC\_XFER\_ALIGN}

10330 Reference to CLOCK\_MONOTONIC is added in the description of {\_POSIX\_CLOCKRES\_MIN}  
 10331 for alignment with IEEE Std 1003.1j-2000.

10332 The constants {LLONG\_MIN}, {LLONG\_MAX}, and {ULLONG\_MAX} are added for alignment  
 10333 with the ISO/IEC 9899:1999 standard.

10334 The following values are added for alignment with IEEE Std 1003.1q-2000:

10335 {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}  
 10336 {\_POSIX\_TRACE\_NAME\_MAX}  
 10337 {\_POSIX\_TRACE\_SYS\_MAX}  
 10338 {\_POSIX\_TRACE\_USER\_EVENT\_MAX}  
 10339 {TRACE\_EVENT\_NAME\_MAX}  
 10340 {TRACE\_NAME\_MAX}  
 10341 {TRACE\_SYS\_MAX}  
 10342 {TRACE\_USER\_EVENT\_MAX}

10343 The new limits {\_XOPEN\_NAME\_MAX} and {\_XOPEN\_PATH\_MAX} are added as minimum  
 10344 values for {PATH\_MAX} and {NAME\_MAX} limits on XSI-conformant systems.

10345 The LEGACY symbols {PASS\_MAX} and {TMP\_MAX} are removed.

10346 The values for the limits {CHAR\_BIT}, {SCHAR\_MAX}, and {UCHAR\_MAX} are now required  
 10347 to be 8, +127, and 255, respectively.

10348 The value for the limit {CHAR\_MAX} is now {UCHAR\_MAX} or {SCHAR\_MAX}.

10349 The value for the limit {CHAR\_MIN} is now {SCHAR\_MIN} or zero.

10350 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of  
 10351 {\_POSIX\_CHILD\_MAX} from 6 to 25. This is for FIPS 151-2 alignment.

10352 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for  
10353 {INT\_MAX}, {UINT\_MAX}, and {INT\_MIN} to be CX extensions over the ISO C standard, and  
10354 correcting {WORD\_BIT} from 16 to 32.

10355 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing  
10356 {CHARCLASS\_NAME\_MAX} from the “Other Invariant Values” section (it also occurs under  
10357 “Runtime Increaseable Values”).

**Issue 7**

10358 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

10360 Austin Group Interpretation 1003.1-2001 #173 is applied, updating the descriptions of  
10361 {TRACE\_EVENT\_NAME\_MAX} and {TRACE\_NAME\_MAX} to not include the terminating  
10362 null.

10363 SD5-XBD-ERN-36 is applied, changing the description of {RE\_DUP\_MAX}.

10364 SD5-XBD-ERN-90 is applied.

10365 {NL\_NMAX} is removed; it should have been removed in Issue 6.

10366 The Trace option values are marked obsolescent.

10367 The {ATEXIT\_MAX}, {LONG\_BIT}, {NL\_MSGMAX}, {NL\_SETMAX}, {NL\_TEXTMAX}, and  
10368 {WORD\_BIT} values are moved from the XSI option to the Base.

10369 The AIO\_\* and \_POSIX\_AIO\_\* values are moved from the Asynchronous Input and Output  
10370 option to the Base.

10371 The {\_POSIX\_RTSIG\_MAX}, {\_POSIX\_SIGQUEUE\_MAX}, {RTSIG\_MAX}, and  
10372 {SIGQUEUE\_MAX} values are moved from the Realtime Signals Extension option to the Base.

10373 Functionality relating to the Threads and Timers options is moved to the Base.

10374 This reference page is clarified with respect to macros and symbolic constants.

10375 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0052 [108], XBD/TC1-2008/0053 [291],  
10376 XBD/TC1-2008/0054 [182,427], XBD/TC1-2008/0055 [291], XBD/TC1-2008/0056 [371],  
10377 XBD/TC1-2008/0057 [291], XBD/TC1-2008/0058 [108], and XBD/TC1-2008/0059 [291] are  
10378 applied.

10379 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0061 [666] is applied.

**Issue 8**

10380 Austin Group Defect 741 is applied, adding {NSIG\_MAX}.

10382 Austin Group Defect 1108 is applied, changing the maximum allowed value for all signed  
10383 integer minimum limits.

10384 Austin Group Defect 1122 is applied, adding {TEXTDOMAIN\_MAX}.

10385 Austin Group Defect 1134 is applied, adding {GETENTROPY\_MAX}.

10386 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

10387 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

10388 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

10389 Austin Group Defect 1446 is applied, changing the introductory paragraphs of the  
10390 DESCRIPTION to include mention of *setrlimit()* and *getrlimit()*.

10391 **NAME**

10392 locale.h — category macros

10393 **SYNOPSIS**

10394 #include <locale.h>

10395 **DESCRIPTION**

10396 CX Some of the functionality described on this reference page extends the ISO C standard.  
 10397 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 496) to  
 10398 enable the visibility of these symbols in this header.

10399 The <locale.h> header shall define the **Iconv** structure, which shall include at least the following  
 10400 members. (See the definitions of *LC\_MONETARY* in [Section 7.3.3](#) (on page 147) and [Section 7.3.4](#)  
 10401 (on page 151).)

- 10402 char \*currency\_symbol
- 10403 char \*decimal\_point
- 10404 char frac\_digits
- 10405 char \*grouping
- 10406 char \*int\_curr\_symbol
- 10407 char int\_frac\_digits
- 10408 char int\_n\_cs\_precedes
- 10409 char int\_n\_sep\_by\_space
- 10410 char int\_n\_sign\_posn
- 10411 char int\_p\_cs\_precedes
- 10412 char int\_p\_sep\_by\_space
- 10413 char int\_p\_sign\_posn
- 10414 char \*mon\_decimal\_point
- 10415 char \*mon\_grouping
- 10416 char \*mon\_thousands\_sep
- 10417 char \*negative\_sign
- 10418 char n\_cs\_precedes
- 10419 char n\_sep\_by\_space
- 10420 char n\_sign\_posn
- 10421 char \*positive\_sign
- 10422 char p\_cs\_precedes
- 10423 char p\_sep\_by\_space
- 10424 char p\_sign\_posn
- 10425 char \*thousands\_sep

10426 The <locale.h> header shall define NULL (as described in <stddef.h>) and at least the following  
 10427 as macros:

- 10428 LC\_ALL
- 10429 LC\_COLLATE
- 10430 LC\_CTYPE
- 10431 CX LC\_MESSAGES
- 10432 LC\_MONETARY
- 10433 LC\_NUMERIC
- 10434 LC\_TIME

10435 which shall expand to integer constant expressions with distinct values for use as the first  
 10436 argument to the *setlocale()* function.

10437 Additional macro definitions, beginning with the characters *LC\_* and an uppercase letter, may  
 10438 also be specified by the implementation.

10439 CX The **<locale.h>** header shall contain at least the following macros representing bitmasks for use  
 10440 with the *newlocale()* function for each supported locale category:

10441 LC\_COLLATE\_MASK  
 10442 LC\_CTYPE\_MASK  
 10443 LC\_MESSAGES\_MASK  
 10444 LC\_MONETARY\_MASK  
 10445 LC\_NUMERIC\_MASK  
 10446 LC\_TIME\_MASK

10447 In addition, a macro to set the bits for all categories set shall be defined:

10448 LC\_ALL\_MASK

10449 The **<locale.h>** header shall define LC\_GLOBAL\_LOCALE, a special locale object descriptor  
 10450 used by the *duplocale()* and *uselocale()* functions.

10451 The **<locale.h>** header shall define the **locale\_t** type, representing a locale object.

10452 The following shall be declared as functions and may also be defined as macros. Function  
 10453 prototypes shall be provided for use with ISO C standard compilers.

```
10454 CX locale_t      duplocale(locale_t);
10455 void          freelocale(locale_t);
10456 const char    *getlocalename_l(int, locale_t);
10457 struct lconv  *localeconv(void);
10458 CX locale_t    newlocale(int, const char *, locale_t);
10459 char          *setlocale(int, const char *);
10460 CX locale_t    uselocale (locale_t);
```

#### 10461 APPLICATION USAGE

10462 None.

#### 10463 RATIONALE

10464 It is suggested that each category macro name for use in *setlocale()* have a corresponding macro  
 10465 name ending in *\_MASK* for use in *newlocale()*.

#### 10466 FUTURE DIRECTIONS

10467 None.

#### 10468 SEE ALSO

10469 [Chapter 8](#) (on page 167), **<stddef.h>**

10470 XSH *duplocale()*, *freelocale()*, *getlocalename\_l()*, *localeconv()*, *newlocale()*, *setlocale()*, *uselocale()*

#### 10471 CHANGE HISTORY

10472 First released in Issue 3.

10473 Included for alignment with the ISO C standard.

#### 10474 Issue 6

10475 The **lconv** structure is expanded with new members (**int\_n\_cs\_precedes**, **int\_n\_sep\_by\_space**,  
 10476 **int\_n\_sign\_posn**, **int\_p\_cs\_precedes**, **int\_p\_sep\_by\_space**, and **int\_p\_sign\_posn**) for alignment  
 10477 with the ISO/IEC 9899:1999 standard.

10478 Extensions beyond the ISO C standard are marked.

10479 **Issue 7**

10480 The *duplocale()*, *freelocale()*, *newlocale()*, and *uselocale()* functions are added from The Open  
10481 Group Technical Standard, 2006, Extended API Set Part 4.

10482 This reference page is clarified with respect to macros and symbolic constants.

10483 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0060 [301,427] is applied.

10484 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0062 [781] is applied.

10485 **Issue 8**

10486 Austin Group Defect 1220 is applied, adding *getlocalename\_1()*.

10487 **NAME**

10488           math.h — mathematical declarations

10489 **SYNOPSIS**

10490           #include &lt;math.h&gt;

10491 **DESCRIPTION**

10492 CX       Some of the functionality described on this reference page extends the ISO C standard.  
10493       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 496) to  
10494       enable the visibility of these symbols in this header.

10495       The **<math.h>** header shall define at least the following types:

10496       **float\_t**           A real-floating type at least as wide as **float**.

10497       **double\_t**          A real-floating type at least as wide as **double**, and at least as wide as **float\_t**.

10498       If FLT\_EVAL\_METHOD equals 0, **float\_t** and **double\_t** shall be **float** and **double**, respectively; if  
10499       FLT\_EVAL\_METHOD equals 1, they shall both be **double**; if FLT\_EVAL\_METHOD equals 2,  
10500       they shall both be **long double**; for other values of FLT\_EVAL\_METHOD, they are otherwise  
10501       implementation-defined.

10502       The **<math.h>** header shall define the following macros, where real-floating indicates that the  
10503       argument shall be an expression of real-floating type:

```
10504       int fpclassify(real-floating x);  
10505       int isfinite(real-floating x);  
10506       int isgreater(real-floating x, real-floating y);  
10507       int isgreaterequal(real-floating x, real-floating y);  
10508       int isinf(real-floating x);  
10509       int isless(real-floating x, real-floating y);  
10510       int islessequal(real-floating x, real-floating y);  
10511       int islessgreater(real-floating x, real-floating y);  
10512       int isnan(real-floating x);  
10513       int isnormal(real-floating x);  
10514       int isunordered(real-floating x, real-floating y);  
10515       int signbit(real-floating x);
```

10516 XSI      The **<math.h>** header shall define the following symbolic constants. Where the constant name  
10517      ends in 'l' (lower case ell), the values shall have type **long double**; otherwise the values shall  
10518      have type **double**. The values shall be accurate to the precision of their type. If the  
10519      implementation supports FLT\_EVAL\_METHOD values other than 0 or 1, the values shall either  
10520      include an explicit cast for that type, or be expressed as hexadecimal floating constants.

	Double	Long Double	Value
10521	M_E	M_El	Value of $e$
10522	M_EGAMMA	M_EGAMMAl	Value of $\gamma$ , Euler-Mascheroni constant
10523	M_LOG2E	M_LOG2El	Value of $\log_2 e$
10524	M_LOG10E	M_LOG10El	Value of $\log_{10} e$
10525	M_LN2	M_LN2l	Value of $\log_e 2$
10526	M_LN10	M_LN10l	Value of $\log_e 10$
10527	M_PHI	M_PHIl	Value of $\phi$ , $(1 + \sqrt{5})/2$ , golden ratio constant
10528	M_PI	M_PIl	Value of $\pi$
10529	M_PI_2	M_PI_2l	Value of $\pi/2$
10530	M_PI_4	M_PI_4l	Value of $\pi/4$
10531	M_1_PI	M_1_PIl	Value of $1/\pi$
10532	M_1_SQRTPI	M_1_SQRTPIl	Value of $1/\sqrt{\pi}$
10533	M_2_PI	M_2_PIl	Value of $2/\pi$
10534	M_2_SQRTPI	M_2_SQRTPIl	Value of $2/\sqrt{\pi}$
10535	M_SQRT2	M_SQRT2l	Value of $\sqrt{2}$
10536	M_SQRT3	M_SQRT3l	Value of $\sqrt{3}$
10537	M_SQRT1_2	M_SQRT1_2l	Value of $1/\sqrt{2}$
10538	M_SQRT1_3	M_SQRT1_3l	Value of $1/\sqrt{3}$
10539			

10540 The <math.h> header shall define the following macros:

- 10541 HUGE\_VAL      A positive **double** constant expression, not necessarily representable as a
- 10542                    **float**. Used as an error value returned by the mathematics library.
- 10543                    HUGE\_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.
  
- 10544 HUGE\_VALF      A positive **float** constant expression. Used as an error value returned by the
- 10545                    mathematics library. HUGE\_VALF evaluates to +infinity on systems
- 10546                    supporting IEEE Std 754-1985.
  
- 10547 HUGE\_VALL      A positive **long double** constant expression. Used as an error value returned
- 10548                    by the mathematics library. HUGE\_VALL evaluates to +infinity on systems
- 10549                    supporting IEEE Std 754-1985.
  
- 10550 INFINITY        A constant expression of type **float** representing positive or unsigned infinity,
- 10551                    if available; else a positive constant of type **float** that overflows at translation
- 10552                    time.
  
- 10553 NAN             A constant expression of type **float** representing a quiet NaN. This macro is
- 10554                    only defined if the implementation supports quiet NaNs for the **float** type.

10555 The following macros shall be defined for number classification. They represent the mutually-  
 10556 exclusive kinds of floating-point values. They expand to integer constant expressions with  
 10557 distinct values. Additional implementation-defined floating-point classifications, with macro  
 10558 definitions beginning with FP\_ and an uppercase letter, may also be specified by the  
 10559 implementation.

- 10560                    FP\_INFINITE
- 10561                    FP\_NAN
- 10562                    FP\_NORMAL
- 10563                    FP\_SUBNORMAL
- 10564                    FP\_ZERO

10565 The following optional macros indicate whether the *fma()* family of functions are fast compared

10566 with direct code:

```
10567     FP_FAST_FMA
10568     FP_FAST_FMAF
10569     FP_FAST_FMAL
```

10570 If defined, the `FP_FAST_FMA` macro shall expand to the integer constant 1 and shall indicate  
 10571 that the `fma()` function generally executes about as fast as, or faster than, a multiply and an add  
 10572 of **double** operands. If undefined, the speed of execution is unspecified. The other macros have  
 10573 the equivalent meaning for the **float** and **long double** versions.

10574 The following macros shall expand to integer constant expressions whose values are returned by  
 10575 `ilogb(x)` if  $x$  is zero or NaN, respectively. The value of `FP_ILOGB0` shall be either `{INT_MIN}` or  
 10576 `-{INT_MAX}`. The value of `FP_ILOGBNAN` shall be either `{INT_MAX}` or `{INT_MIN}`.

```
10577     FP_ILOGB0
10578     FP_ILOGBNAN
```

10579 The following macros shall expand to the integer constants 1 and 2, respectively;

```
10580     MATH_ERRNO
10581     MATH_ERREXCEPT
```

10582 The following macro shall expand to an expression that has type **int** and the value  
 10583 `MATH_ERRNO`, `MATH_ERREXCEPT`, or the bitwise-inclusive OR of both:

```
10584     math_errhandling
```

10585 The value of `math_errhandling` is constant for the duration of the program. It is unspecified  
 10586 whether `math_errhandling` is a macro or an identifier with external linkage. If a macro definition  
 10587 is suppressed or a program defines an identifier with the name `math_errhandling`, the behavior  
 10588 is undefined. If the expression `(math_errhandling & MATH_ERREXCEPT)` can be non-zero, the  
 10589 implementation shall define the macros `FE_DIVBYZERO`, `FE_INVALID`, and `FE_OVERFLOW` in  
 10590 **<fenv.h>**.

10591 The following shall be declared as functions and may also be defined as macros. Function  
 10592 prototypes shall be provided.

```
10593     double      acos(double);
10594     float       acosf(float);
10595     double      acosh(double);
10596     float       acoshf(float);
10597     long double acoshl(long double);
10598     long double acosl(long double);
10599     double      asin(double);
10600     float       asinf(float);
10601     double      asinh(double);
10602     float       asinhf(float);
10603     long double asinhl(long double);
10604     long double asinl(long double);
10605     double      atan(double);
10606     double      atan2(double, double);
10607     float       atan2f(float, float);
10608     long double atan2l(long double, long double);
10609     float       atanf(float);
```

```
10610     double      atanh(double);
10611     float       atanhf(float);
10612     long double  atanhl(long double);
10613     long double  atanl(long double);
10614     double      cbrt(double);
10615     float       cbrtf(float);
10616     long double  cbrtl(long double);
10617     double      ceil(double);
10618     float       ceilf(float);
10619     long double  ceill(long double);
10620     double      copysign(double, double);
10621     float       copysignf(float, float);
10622     long double  copysignl(long double, long double);
10623     double      cos(double);
10624     float       cosf(float);
10625     double      cosh(double);
10626     float       coshf(float);
10627     long double  coshl(long double);
10628     long double  cosl(long double);
10629     double      erf(double);
10630     double      erfc(double);
10631     float       erfcf(float);
10632     long double  erfcl(long double);
10633     float       erff(float);
10634     long double  erfl(long double);
10635     double      exp(double);
10636     double      exp2(double);
10637     float       exp2f(float);
10638     long double  exp2l(long double);
10639     float       expf(float);
10640     long double  expl(long double);
10641     double      expm1(double);
10642     float       expm1f(float);
10643     long double  expm1l(long double);
10644     double      fabs(double);
10645     float       fabsf(float);
10646     long double  fabsl(long double);
10647     double      fdim(double, double);
10648     float       fdimf(float, float);
10649     long double  fdiml(long double, long double);
10650     double      floor(double);
10651     float       floorf(float);
10652     long double  floorl(long double);
10653     double      fma(double, double, double);
10654     float       fmaf(float, float, float);
10655     long double  fmal(long double, long double, long double);
10656     double      fmax(double, double);
10657     float       fmaxf(float, float);
10658     long double  fmaxl(long double, long double);
10659     double      fmin(double, double);
10660     float       fminf(float, float);
10661     long double  fminl(long double, long double);
```

```

10662     double      fmod(double, double);
10663     float       fmodf(float, float);
10664     long double  fmodl(long double, long double);
10665     double      frexp(double, int *);

10734 double rint(double);
10735 float rintf(float);
10736 long double rintl(long double);
10737 double round(double);
10738 float roundf(float);
10739 long double roundl(long double);
10740 double scalbn(double, long);
10741 float scalbnf(float, long);
10742 long double scalbnl(long double, long);
10743 double scalbn(double, int);
10744 float scalbnf(float, int);
10745 long double scalbnl(long double, int);
10746 double sin(double);
10747 float sinf(float);
10748 double sinh(double);
10749 float sinhlf(float);
10750 long double sinhl(long double);
10751 long double sinl(long double);
10752 double sqrt(double);
10753 float sqrtf(float);
10754 long double sqrtl(long double);
10755 double tan(double);
10756 float tanf(float);
10757 double tanh(double);
10758 float tanhlf(float);
10759 long double tanhl(long double);
10760 long double tanl(long double);
10761 double tgamma(double);
10762 float tgammaf(float);
10763 long double tgamma1(long double);
10764 double trunc(double);
10765 float truncf(float);

```

```

10766     long double trunc1(long double);
10767 XSI     double      y0(double);
10768     double      y1(double);
10769     double      yn(int, double);

```

10770 The following external variable shall be defined:

```

10771 XSI     extern int  signgam;

```

10772 The behavior of each of the functions defined in **<math.h>** is specified in the System Interfaces  
 10773 volume of POSIX.1-2024 for all representable values of its input arguments, except where stated  
 10774 otherwise. Each function shall execute as if it were a single operation without generating any  
 10775 externally visible exceptional conditions.

#### 10776 APPLICATION USAGE

10777 The FP\_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is  
 10778 off) the implementation to contract expressions. Each pragma can occur either outside external  
 10779 declarations or preceding all explicit declarations and statements inside a compound statement.  
 10780 When outside external declarations, the pragma takes effect from its occurrence until another  
 10781 FP\_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a  
 10782 compound statement, the pragma takes effect from its occurrence until another FP\_CONTRACT  
 10783 pragma is encountered (including within a nested compound statement), or until the end of the  
 10784 compound statement; at the end of a compound statement the state for the pragma is restored to  
 10785 its condition just before the compound statement. If this pragma is used in any other context, the  
 10786 behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

#### 10787 RATIONALE

10788 Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type  
 10789 **double**. All the names formed by appending 'f' or 'l' to a name in **<math.h>** were reserved  
 10790 to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999  
 10791 standard provided for all three versions of math functions.

10792 The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their  
 10793 capability is available through *sprintf()*.

10794 The requirement for an explicit cast or representation via hexadecimal floating constants is to  
 10795 guarantee that even when FLT\_EVAL\_METHOD is neither 0 nor 1, the expression  
 10796 (double)M\_PI == M\_PI will always hold true. Earlier versions of this standard did not make  
 10797 this requirement, because they lacked the 'l' (lower case ell) versions of the constants and were  
 10798 allowed to provide M\_PI with long double precision depending on FLT\_EVAL\_METHOD.

#### 10799 FUTURE DIRECTIONS

10800 None.

10809 **CHANGE HISTORY**

10810 First released in Issue 1.

10811 **Issue 6**

10812 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

10813 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the  
10814 meaning of the FP\_FAST\_FMA macro is unspecified if the macro is undefined.10815 **Issue 7**10816 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #47 (SD5-XBD-ERN-52) is applied,  
10817 clarifying the wording of the FP\_FAST\_FMA macro.

10818 The MAXFLOAT constant is marked obsolescent.

10819 This reference page is clarified with respect to macros and symbolic constants.

10820 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0063 [801] and XBD/TC2-2008/0064  
10821 [801] are applied.10822 **Issue 8**10823 Austin Group Defect 828 is applied, adding **long double** counterparts with names ending in  
10824 'l' to the **double** constants whose names begin with "M\_", and changing the representation  
10825 requirements for those constants.

10826 Austin Group Defect 1302 is applied, changing ``provides'' to ``provided''.

10827 Austin Group Defect 1330 is applied, removing the obsolescent MAXFLOAT.

10828 Austin Group Defect 1503 is applied, adding M\_1\_SQRTPI, M\_EGAMMA, M\_PHI, M\_SQRT1\_3,  
10829 and M\_SQRT3.

10830 **NAME**

10831           monetary.h — monetary types

10832 **SYNOPSIS**

10833           #include &lt;monetary.h&gt;

10834 **DESCRIPTION**10835           The **<monetary.h>** header shall define the **locale\_t** type as described in **<locale.h>**.10836           The **<monetary.h>** header shall define the **size\_t** type as described in **<stddef.h>**.10837           The **<monetary.h>** header shall define the **ssize\_t** type as described in **<sys/types.h>**.10838           The following shall be declared as functions and may also be defined as macros. Function  
10839           prototypes shall be provided for use with ISO C standard compilers.

10840           ssize\_t strfmon(char \*restrict, size\_t, const char \*restrict, ...);

10841           ssize\_t strfmon\_l(char \*restrict, size\_t, locale\_t,

10842                         const char \*restrict, ...);

10843 **APPLICATION USAGE**

10844           None.

10845 **RATIONALE**

10846           None.

10847 **FUTURE DIRECTIONS**

10848           None.

10849 **SEE ALSO**10850           [<locale.h>](#), [<stddef.h>](#), [<sys/types.h>](#)10851           XSH *strfmon()*10852 **CHANGE HISTORY**

10853           First released in Issue 4.

10854 **Issue 6**10855           The **restrict** keyword is added to the prototype for *strfmon()*.10856 **Issue 7**10857           The **<monetary.h>** header is moved from the XSI option to the Base.10858           The *strfmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
10859           Set Part 4.10860           A declaration for the **locale\_t** type is added.

10861 **NAME**10862           mqueue.h — message queues (**REALTIME**)10863 **SYNOPSIS**

10864 MSG       #include &lt;mqueue.h&gt;

10865 **DESCRIPTION**10866           The <mqueue.h> header shall define the **mqd\_t** type, which is used for message queue  
10867 descriptors. This is not an array type.10868           The <mqueue.h> header shall define the **size\_t** and **ssize\_t** types as described in <sys/types.h>.10869           The <mqueue.h> header shall define the **struct timespec** structure as described in <time.h>.10870           The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
10871 are described in the <signal.h> header.10872           The <mqueue.h> header shall define the **mq\_attr** structure, which is used in getting and setting  
10873 the attributes of a message queue. Attributes are initially set when the message queue is created.  
10874 An **mq\_attr** structure shall have at least the following fields:

10875	long	mq_flags	Message queue flags.
10876	long	mq_maxmsg	Maximum number of messages.
10877	long	mq_msgsize	Maximum message size.
10878	long	mq_curmsgs	Number of messages currently queued.

10879           The <mqueue.h> header shall define **O\_RDONLY**, **O\_WRONLY**, **O\_RDWR**, **O\_CREAT**, **O\_EXCL**,  
10880 and **O\_NONBLOCK** as described in <fcntl.h>.10881           The following shall be declared as functions and may also be defined as macros. Function  
10882 prototypes shall be provided.

```

10883 int      mq_close(mqd_t);
10884 int      mq_getattr(mqd_t, struct mq_attr *);
10885 int      mq_notify(mqd_t, const struct sigevent *);
10886 mqd_t    mq_open(const char *, int, ...);
10887 ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
10888 int      mq_send(mqd_t, const char *, size_t, unsigned);
10889 int      mq_setattr(mqd_t, const struct mq_attr *restrict,
10890                   struct mq_attr *restrict);
10891 ssize_t  mq_timedreceive(mqd_t, char *restrict, size_t,
10892                        unsigned *restrict, const struct timespec *restrict);
10893 int      mq_timedsend(mqd_t, const char *, size_t, unsigned,
10894                     const struct timespec *);
10895 int      mq_unlink(const char *);

```

10896           Inclusion of the <mqueue.h> header may make visible symbols defined in the headers  
10897 <fcntl.h>, <signal.h>, and <time.h>.

**10898 APPLICATION USAGE**

10899 None.

**10900 RATIONALE**

10901 None.

**10902 FUTURE DIRECTIONS**

10903 None.

**10904 SEE ALSO**

10905 [<fcntl.h>](#), [<signal.h>](#), [<sys/types.h>](#), [<time.h>](#)

10907 [mq\\_unlink\(\)](#)

**10908 CHANGE HISTORY**

10909 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**10910 Issue 6**

10911 The **<mqueue.h>** header is marked as part of the Message Passing option.

10912 The [mq\\_timedreceive\(\)](#) and [mq\\_timedsend\(\)](#) functions are added for alignment with IEEE Std  
10913 1003.1d-1999.

10914 The **restrict** keyword is added to the prototypes for [mq\\_setattr\(\)](#) and [mq\\_timedreceive\(\)](#).

**10915 Issue 7**

10916 Type and structure declarations are added.

**10917 Issue 8**

10918 Austin Group Defect 593 is applied, adding **O\_RDONLY**, **O\_WRONLY**, **O\_RDWR**, **O\_CREAT**,  
10919 **O\_EXCL**, and **O\_NONBLOCK**.

10920 Austin Group Defect 1282 is applied, removing the requirement for **<mqueue.h>** to define  
10921 **pthread\_attr\_t**.

10922 **NAME**

10923 ndbm.h — definitions for ndbm database operations

10924 **SYNOPSIS**10925 XSI `#include <ndbm.h>`10926 **DESCRIPTION**10927 The <ndbm.h> header shall define the **datum** type as a structure, which shall include at least the  
10928 following members:10929 `void *dptr` A pointer to the application's data.  
10930 `size_t dsize` The size of the object pointed to by *dptr*.10931 The <ndbm.h> header shall define the **size\_t** type as described in <stddef.h>.10932 The <ndbm.h> header shall define the **DBM** type.10933 The <ndbm.h> header shall define the following symbolic constants as possible values for the  
10934 *store\_mode* argument to *dbm\_store()*:10935 **DBM\_INSERT** Insertion of new entries only.10936 **DBM\_REPLACE** Allow replacing existing entries.10937 The following shall be declared as functions and may also be defined as macros. Function  
10938 prototypes shall be provided.10939 `int dbm_clearerr(DBM *);`  
10940 `void dbm_close(DBM *);`  
10941 `int dbm_delete(DBM *, datum);`  
10942 `int dbm_error(DBM *);`  
10943 `datum dbm_fetch(DBM *, datum);`  
10944 `datum dbm_firstkey(DBM *);`  
10945 `datum dbm_nextkey(DBM *);`  
10946 `DBM *dbm_open(const char *, int, mode_t);`  
10947 `int dbm_store(DBM *, datum, datum, int);`10948 The <ndbm.h> header shall define the **mode\_t** type through **typedef**, as described in  
10949 <sys/types.h>.10950 **APPLICATION USAGE**

10993 **Issue 7**

10994 This reference page is clarified with respect to macros and symbolic constants.

10995 **NAME**

10996 netdb.h — definitions for network database operations

10997 **SYNOPSIS**

10998 #include &lt;netdb.h&gt;

10999 **DESCRIPTION**11000 The **<netdb.h>** header shall define the **hostent** structure, which shall include at least the  
11001 following members:

11002	char	*h_name	Official name of the host.
11003	char	**h_aliases	A pointer to an array of pointers to 11004 alternative host names, terminated by a 11005 null pointer.
11006	int	h_addrtype	Address type.
11007	int	h_length	The length, in bytes, of the address.
11008	char	**h_addr_list	A pointer to an array of pointers to network 11009 addresses (in network byte order) for the host, 11010 terminated by a null pointer.

11011 The **<netdb.h>** header shall define the **netent** structure, which shall include at least the  
11012 following members:

11013	char	*n_name	Official, fully-qualified (including the 11014 domain) name of the host.
11015	char	**n_aliases	A pointer to an array of pointers to 11016 alternative network names, terminated by a 11017 null pointer.
11018	int	n_addrtype	The address type of the network.
11019	uint32_t	n_net	The network number, in host byte order.

11020 The **<netdb.h>** header shall define the **uint32\_t** type as described in **<inttypes.h>**.11021 The **<netdb.h>** header shall define the **protoent** structure, which shall include at least the  
11022 following members:

11023	char	*p_name	Official name of the protocol.
11024	char	**p_aliases	A pointer to an array of pointers to 11025 alternative protocol names, terminated by 11026 a null pointer.
11027	int	p_proto	The protocol number.

11028 The **<netdb.h>** header shall define the **servent** structure, which shall include at least the  
11029 following members:

11030	char	*s_name	Official name of the service.
11031	char	**s_aliases	A pointer to an array of pointers to 11032 alternative service names, terminated by 11033 a null pointer.
11034	int	s_port	A value which, when converted to <b>uint16_t</b> , 11035 yields the port number in network byte order 11036 at which the service resides.
11037	char	*s_proto	The name of the protocol to use when 11038 contacting the service.

11039 The **<netdb.h>** header shall define the **IPPORT\_RESERVED** symbolic constant with the value of  
11040 the highest reserved Internet port number.

11041 **Address Information Structure**

11042 The <netdb.h> header shall define the **addrinfo** structure, which shall include at least the  
 11043 following members:

11044	int	ai_flags	Input flags.
11045	int	ai_family	Address family of socket.
11046	int	ai_socktype	Socket type.
11047	int	ai_protocol	Protocol of socket.
11048	socklen_t	ai_addrlen	Length of socket address.
11049	struct sockaddr	*ai_addr	Socket address of socket.
11050	char	*ai_canonname	Canonical name of service location.
11051	struct addrinfo	*ai_next	Pointer to next in list.

11052 The **addrinfo** structure shall not include any additional members which have a floating-point  
 11053 type if an object of that type with an all-bits-zero representation does not have the value 0.0.

11054 MX Implementations that define `__STDC_IEC_559__` are required to treat the all-zero bit pattern for  
 11055 a floating point object as a representation of 0.0, and may therefore have floating-point type  
 11056 members.

11057 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
 11058 distinct integer constants for use in the *ai\_flags* field of the **addrinfo** structure:

11059	AI_PASSIVE	Socket address is intended for <i>bind()</i> .
11060	AI_CANONNAME	Request for canonical name.
11061	AI_NUMERICHOST	Return numeric host address as name.
11062	AI_NUMERICSERV	Inhibit service name resolution.
11063	AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them 11064 to the caller as IPv4-mapped IPv6 addresses.
11065	AI_ALL	Query for both IPv4 and IPv6 addresses.
11066	AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query 11067 for IPv6 addresses only when an IPv6 address is configured.

11068 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
 11069 distinct integer constants for use in the *flags* argument to *getnameinfo()*:

11070	NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
11071	NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
11072	NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
11073	NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
11074	NI_NUMERICSCOPE	
11075		For IPv6 addresses, the numeric form of the scope identifier is returned 11076 instead of its name.
11077	NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

11078 **Address Information Errors**

11079 The **<netdb.h>** header shall define the following symbolic constants for use as error values for  
 11080 *getaddrinfo()* and *getnameinfo()*. The values shall be suitable for use in **#if** preprocessing  
 11081 directives.

11082 **EAI\_AGAIN** The name could not be resolved at this time. Future attempts may  
 11083 succeed.

11084 **EAI\_BADFLAGS** The flags had an invalid value.

11085 **EAI\_FAIL** A non-recoverable error occurred.

11086 **EAI\_FAMILY** The address family was not recognized or the address length was invalid  
 11087 for the specified family.

11088 **EAI\_MEMORY** There was a memory allocation failure.

11089 **EAI\_NONAME** The name does not resolve for the supplied parameters.

11090 **NI\_NAMEREQD** is set and the host's name cannot be located, or both  
 11091 *nodename* and *servertime* were null.

11092 **EAI\_SERVICE** The service passed was not recognized for the specified socket type.

11093 **EAI\_SOCKTYPE** The intended socket type was not recognized.

11094 **EAI\_SYSTEM** A system error occurred. The error code can be found in *errno*.

11095 **EAI\_OVERFLOW** An argument buffer overflowed.

11096 The following shall be declared as functions and may also be defined as macros. Function  
 11097 prototypes shall be provided.

```

11098 void          endhostent(void);
11099 void          endnetent(void);
11100 void          endprotoent(void);
11101 void          endservent(void);
11102 void          freeaddrinfo(struct addrinfo *);
11103 const char    *gai_strerror(int);
11104 int           getaddrinfo(const char *restrict, const char *restrict,
11105                          const struct addrinfo *restrict,
11106                          struct addrinfo **restrict);
11107 struct hostent *gethostent(void);
11108 int           getnameinfo(const struct sockaddr *restrict, socklen_t,
11109                          char *restrict, socklen_t, char *restrict,
11110                          socklen_t, int);
11111 struct netent *getnetbyaddr(uint32_t, int);
11112 struct netent *getnetbyname(const char *);
11113 struct netent *getnetent(void);
11114 struct protoent *getprotobyname(const char *);
11115 struct protoent *getprotobynumber(int);
11116 struct protoent *getprotoent(void);
11117 struct servent *getservbyname(const char *, const char *);
11118 struct servent *getservbyport(int, const char *);
11119 struct servent *getservent(void);
11120 void          sethostent(int);
11121 void          setnetent(int);
11122 void          setprotoent(int);

```

11123           void                           setserverent(int);

11124           The <netdb.h> header shall define the **socklen\_t** type through **typedef**, as described in  
11125           <sys/socket.h>.

11126           Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,  
11127           <sys/socket.h>, and <inttypes.h>.

#### 11128 APPLICATION USAGE

11129           The requirement that **addrinfo** does not include any additional members which have a floating-  
11130           point type if an object of that type with an all-bits-zero representation does not have the value  
11131           0.0 is to allow initialization of an **addrinfo** *hints* structure (see XSH *freeaddrinfo()*) using:

```
11132           struct addrinfo hints;  
11133           memset(&hints, 0, sizeof hints);
```

11134           as an alternative to the use of default initialization.

#### 11135 RATIONALE

11136           None.

#### 11137 FUTURE DIRECTIONS

11138           None.

#### 11139 SEE ALSO

11140           <inttypes.h>, <netinet/in.h>, <sys/socket.h>

11141           XSH *bind()*, *endhostent()*, *endnetent()*, *endprotoent()*, *endservent()*, *freeaddrinfo()*, *gai\_strerror()*,  
11142           *getnameinfo()*

#### 11143 CHANGE HISTORY

11144           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

11145           The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for  
11146           *gai\_strerror()* from **char \*** to **const char \***. This is for coordination with the IPnG Working Group.

11147           IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the  
11148           NI\_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes  
11149           are for alignment with IPv6.

#### 11150 Issue 7

11151           SD5-XBD-ERN-14 is applied, changing the description of the *s\_port* member of the **servent**  
11152           structure.

11153           The obsolescent *h\_errno* external integer, and the obsolescent *gethostbyaddr()* and *gethostbyname()*  
11154           functions are removed, along with the HOST\_NOT\_FOUND, NO\_DATA, NO\_RECOVERY, and  
11155           TRY\_AGAIN macros.

11156           This reference page is clarified with respect to macros and symbolic constants.

#### 11157 Issue 8

11158           Austin Group Defect 940 is applied, requiring that the **addrinfo** structure does not include any  
11159           additional members which have a floating-point type if an object of that type with an all-bits-  
11160           zero representation does not have the value 0.0.

11161           Austin Group Defect 1289 is applied, removing some redundant text from the DESCRIPTION.

11162           Austin Group Defect 1327 is applied, changing ``flags'' to ``ai\_flags''.

11163 **NAME**

11164           netinet/in.h — Internet address family

11165 **SYNOPSIS**

11166       #include <netinet/in.h>

11167 **DESCRIPTION**

11168       The <netinet/in.h> header shall define the following types:

11169       **in\_port\_t**   Equivalent to the type **uint16\_t** as described in <inttypes.h>.

11170       **in\_addr\_t**   Equivalent to the type **uint32\_t** as described in <inttypes.h>.

11171       The <netinet/in.h> header shall define the **sa\_family\_t** type as described in <sys/socket.h>.

11172       The <netinet/in.h> header shall define the **uint8\_t** and **uint32\_t** types as described in <inttypes.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from <inttypes.h> and <sys/socket.h>.

11175       The <netinet/in.h> header shall define the **in\_addr** structure, which shall include at least the following member:

11177       in\_addr\_t   s\_addr

11178       The <netinet/in.h> header shall define the **sockaddr\_in** structure, which shall include at least the following members:

11180	sa_family_t	sin_family	AF_INET.
11181	in_port_t	sin_port	Port number.
11182	struct in_addr	sin_addr	IP address.

11183       The *sin\_port* and *sin\_addr* members shall be in network byte order. If the *sin\_port* value passed to *bind()* is zero, the port number bound to the socket shall be one chosen by the implementation from an implementation-defined port range to produce an unused local address.

11186       The **sockaddr\_in** structure is used to store addresses for the Internet address family. Pointers to this type shall be cast by applications to **struct sockaddr \*** for use with socket functions.

11188 IP6       The <netinet/in.h> header shall define the **in6\_addr** structure, which shall include at least the following member:

11190       uint8\_t s6\_addr[16]

11191       This array is used to contain a 128-bit IPv6 address, stored in network byte order.

11192       The <netinet/in.h> header shall define the **sockaddr\_in6** structure, which shall include at least the following members:

11194	sa_family_t	sin6_family	AF_INET6.
11195	in_port_t	sin6_port	Port number.
11196	uint32_t	sin6_flowinfo	IPv6 traffic class and flow information.
11197	struct in6_addr	sin6_addr	IPv6 address.
11198	uint32_t	sin6_scope_id	Set of interfaces for a scope.

11199       The **sockaddr\_in6** structure shall not include any additional members which have a floating-point type if an object of that type with an all-bits-zero representation does not have the value 0.0.

11202 IP6 MX       Implementations that define `__STDC_IEC_559__` are required to treat the all-zero bit pattern for a floating point object as a representation of 0.0, and may therefore have floating-point type members.

11205 IP6 The *sin6\_port* and *sin6\_addr* members shall be in network byte order. If the *sin6\_port* value  
 11206 passed to *bind()* is zero, the port number bound to the socket shall be one chosen by the  
 11207 implementation from an implementation-defined port range to produce an unused local  
 11208 address.

11209 Prior to calling a function in this standard which reads values from a **sockaddr\_in6** structure (for  
 11210 example, *bind()* or *connect()*), the application shall ensure that all members of the structure,  
 11211 including any additional non-standard members, if any, are initialized. If the **sockaddr\_in6**  
 11212 structure has a non-standard member, and that member has a value other than the value that  
 11213 would result from default initialization, the behavior of any function in this standard that reads  
 11214 values from the **sockaddr\_in6** structure is implementation-defined. All functions in this  
 11215 standard that return data in a **sockaddr\_in6** structure (for example, *getaddrinfo()* or *accept()*)  
 11216 shall initialize the structure in a way that meets the above requirements, and shall ensure that  
 11217 each non-standard member, if any, has a value that produces the same behavior as default  
 11218 initialization would in all functions in this standard which read values from a **sockaddr\_in6**  
 11219 structure.

11220 The *sin6\_scope\_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the  
 11221 scope of the address carried in the *sin6\_addr* field. For a link scope *sin6\_addr*, the application  
 11222 shall ensure that *sin6\_scope\_id* is a link index. For a site scope *sin6\_addr*, the application shall  
 11223 ensure that *sin6\_scope\_id* is a site index. The mapping of *sin6\_scope\_id* to an interface or set of  
 11224 interfaces is implementation-defined.

11225 The <netinet/in.h> header shall declare the following external variable:

```
11226 const struct in6_addr in6addr_any
```

11227 This variable is initialized by the system to contain the wildcard IPv6 address. The  
 11228 <netinet/in.h> header also defines the IN6ADDR\_ANY\_INIT macro. This macro shall be  
 11229 constant at compile time and can be used to initialize a variable of type **struct in6\_addr** to the  
 11230 IPv6 wildcard address.

11231 The <netinet/in.h> header shall declare the following external variable:

```
11232 const struct in6_addr in6addr_loopback
```

11233 This variable is initialized by the system to contain the loopback IPv6 address. The  
 11234 <netinet/in.h> header also defines the IN6ADDR\_LOOPBACK\_INIT macro. This macro shall be  
 11235 constant at compile time and can be used to initialize a variable of type **struct in6\_addr** to the  
 11236 IPv6 loopback address.

11237 The <netinet/in.h> header shall define the **ipv6\_mreq** structure, which shall include at least the  
 11238 following members:

```
11239 struct in6_addr  ipv6mr_multiaddr  IPv6 multicast address.  

    11240 unsigned        ipv6mr_interface  Interface index.
```

11241 The <netinet/in.h> header shall define the following symbolic constants for use as values of the  
 11242 *level* argument of *getsockopt()* and *setsockopt()*:

11243	IPPROTO_IP	Internet protocol.
11244 IP6	IPPROTO_IPV6	Internet Protocol Version 6.
11245	IPPROTO_ICMP	Control message protocol.

11246	RS	IPPROTO_RAW	Raw IP Packets Protocol.
11247		IPPROTO_TCP	Transmission control protocol.
11248		IPPROTO_UDP	User datagram protocol.
11249		The <netinet/in.h> header shall define the following symbolic constant for use as a local address in the structure passed to <i>bind()</i> :	
11250			
11251		INADDR_ANY	IPv4 wildcard address.
11252		The <netinet/in.h> header shall define the following symbolic constant for use as a destination address in the structures passed to <i>connect()</i> , <i>sendmsg()</i> , and <i>sendto()</i> :	
11253			
11254		INADDR_BROADCAST	IPv4 broadcast address.
11255		The <netinet/in.h> header shall define the following symbolic constant, with the value specified, to help applications declare buffers of the proper size to store IPv4 addresses in string form:	
11256			
11257			
11258		INET_ADDRSTRLEN	16. Length of the string form for IP.
11259		The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as described in <arpa/inet.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from <arpa/inet.h>.	
11260			
11261			
11262	IP6	The <netinet/in.h> header shall define the following symbolic constant, with the value specified, to help applications declare buffers of the proper size to store IPv6 addresses in string form:	
11263			
11264			
11265		INET6_ADDRSTRLEN	46. Length of the string form for IPv6.
11266	IP6	The <netinet/in.h> header shall define the following symbolic constants, with distinct integer values, for use in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at protocol level IPPROTO_IPV6:	
11267			
11268			
11269		IPV6_JOIN_GROUP	Join a multicast group.
11270		IPV6_LEAVE_GROUP	Quit a multicast group.
11271		IPV6_MULTICAST_HOPS	
11272			Multicast hop limit.
11273		IPV6_MULTICAST_IF	Interface to use for outgoing multicast packets.
11274		IPV6_MULTICAST_LOOP	
11275			Multicast packets are delivered back to the local application.
11276		IPV6_UNICAST_HOPS	Unicast hop limit.
11277		IPV6_V6ONLY	Restrict AF_INET6 socket to IPv6 communications only.
11278		The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses. Each macro is of type <b>int</b> and takes a single argument of type <b>const struct in6_addr *</b> :	
11279			
11280		IN6_IS_ADDR_UNSPECIFIED	
11281			Unspecified address.
11282		IN6_IS_ADDR_LOOPBACK	
11283			Loopback address.

11284	<b>IN6_IS_ADDR_MULTICAST</b>
11285	Multicast address.
11286	<b>IN6_IS_ADDR_LINKLOCAL</b>
11287	Unicast link-local address.
11288	<b>IN6_IS_ADDR_SITELOCAL</b>
11289	Unicast site-local address.
11290	<b>IN6_IS_ADDR_V4MAPPED</b>
11291	IPv4 mapped address.
11292	<b>IN6_IS_ADDR_V4COMPAT</b>
11293	IPv4-compatible address.
11294	<b>IN6_IS_ADDR_MC_NODELOCAL</b>
11295	Multicast node-local address.
11296	<b>IN6_IS_ADDR_MC_LINKLOCAL</b>
11297	Multicast link-local address.
11298	<b>IN6_IS_ADDR_MC_SITELOCAL</b>
11299	Multicast site-local address.
11300	<b>IN6_IS_ADDR_MC_ORGLOCAL</b>
11301	Multicast organization-local address.
11302	<b>IN6_IS_ADDR_MC_GLOBAL</b>
11303	Multicast global address.

#### 11304 **APPLICATION USAGE**

11305 Although applications are required to initialize all members (including any non-standard ones)  
 11306 of a **sockaddr\_in6** structure, the same is not required for the **sockaddr\_in** structure, since  
 11307 historically many applications only initialized the standard members. Despite this, applications  
 11308 are encouraged to initialize **sockaddr\_in** structures in a manner similar to the required  
 11309 initialization of **sockaddr\_in6** structures.

11310 The requirement that **sockaddr\_in6** does not include any additional members which have a  
 11311 floating-point type if an object of that type with an all-bits-zero representation does not have the  
 11312 value 0.0 is to allow initialization of a **sockaddr\_in6** structure using:

```
11313 struct sockaddr_in6 sa;  
11314 memset(&sa, 0, sizeof sa);
```

11315 as an alternative to the use of default initialization.

#### 11316 **RATIONALE**

11317 The INADDR\_ANY and INADDR\_BROADCAST values are byte-order-neutral and thus their  
 11318 byte order is not specified. Many implementations have additional constants as extensions, such  
 11319 as INADDR\_LOOPBACK, that are not byte-order-neutral. Traditionally, these constants are in  
 11320 host byte order, requiring the use of *htonl()* when using them in a **sockaddr\_in** structure.

#### 11321 **FUTURE DIRECTIONS**

11322 None.

11323 **SEE ALSO**

11324 Section 4.13 (on page 99), <arpa/inet.h>, <inttypes.h>, <sys/socket.h>  
11325 XSH *bind()*, *connect()*, *getsockopt()*, *htonl()*, *sendmsg()*, *sendto()*, *setsockopt()*

11326 **CHANGE HISTORY**

11327 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.  
11328 The *sin\_zero* member was removed from the **sockaddr\_in** structure as per The Open Group Base  
11329 Resolution bwg2001-004.  
11330 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/12 is applied, adding **const** qualifiers to  
11331 the *in6addr\_any* and *in6addr\_loopback* external variables.  
11332 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/22 is applied, making it clear which  
11333 structure members are in network byte order.

11334 **Issue 7**

11335 This reference page is clarified with respect to macros and symbolic constants.  
11336 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0061 [355] is applied.  
11337 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0065 [934], XBD/TC2-2008/0066 [952],  
11338 XBD/TC2-2008/0067 [934], and XBD/TC2-2008/0068 [952] are applied.

11339 **Issue 8**

11340 Austin Group Defect 940 is applied, requiring that the **sockaddr\_in6** structure does not include  
11341 any additional members which have a floating-point type if an object of that type with an all-  
11342 bits-zero representation does not have the value 0.0.  
11343 Austin Group Defect 1068 is applied, specifying how a *sin\_port* or *sin6\_port* value of zero is  
11344 handled by *bind()*.  
11345 Austin Group Defect 1299 is applied, changing <netinet\_in.h> to <netinet/in.h>.

11346 **NAME**

11347           netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

11348 **SYNOPSIS**

11349           #include <netinet/tcp.h>

11350 **DESCRIPTION**

11351           The <netinet/tcp.h> header shall define the following symbolic constant for use as a socket option at the IPPROTO\_TCP level:

11353           TCP\_NODELAY   Avoid coalescing of small segments.

11354           The implementation need not allow the value of the option to be set via *setsockopt()* or retrieved via *getsockopt()*.

11356 **APPLICATION USAGE**

11357           None.

11358 **RATIONALE**

11359           None.

11360 **FUTURE DIRECTIONS**

11361           None.

11362 **SEE ALSO**

11365 **CHANGE HISTORY**

11366           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

11367 **Issue 7**

11368           This reference page is clarified with respect to macros and symbolic constants.

11369 **NAME**11370 `nl_types.h` — data types11371 **SYNOPSIS**11372 `#include <nl_types.h>`11373 **DESCRIPTION**11374 The **<nl\_types.h>** header shall define at least the following types:11375 **nl\_catd** Used by the message catalog functions `catopen()`, `catgets()`, and `catclose()`  
11376 to identify a catalog descriptor.11377 **nl\_item** Used by `nl_langinfo()` to identify items of `langinfo` data. Values of objects  
11378 of type **nl\_item** are defined in **<langinfo.h>**.11379 The **<nl\_types.h>** header shall define at least the following symbolic constants:11380 **NL\_SETD** Used by `gencat` when no `$set` directive is specified in a message text source  
11381 file. This constant can be passed as the value of `set_id` on subsequent calls  
11382 to `catgets()` (that is, to retrieve messages from the default message set).  
11383 The value of **NL\_SETD** is implementation-defined.11384 **NL\_CAT\_LOCALE** Value that can be passed as the `oflag` argument to `catopen()` to request that  
11385 message catalog selection depends on the `LC_MESSAGES` locale category,  
11386 rather than directly on the `LANG` environment variable.11387 The following shall be declared as functions and may also be defined as macros. Function  
11388 prototypes shall be provided.11389 `int catclose(nl_catd);`  
11390 `char *catgets(nl_catd, int, int, const char *);`  
11391 `nl_catd catopen(const char *, int);`11392 **APPLICATION USAGE**

11393 None.

11394 **RATIONALE**

11395 None.

11396 **FUTURE DIRECTIONS**

11397 None.

11398 **SEE ALSO**11399 [<langinfo.h>](#)11400 XSH `catclose()`, `catgets()`, `catopen()`, `nl_langinfo()`11401 XCU `gencat`11402 **CHANGE HISTORY**

11403 First released in Issue 2.

11404 **Issue 7**11405 The **<nl\_types.h>** header is moved from the XSI option to the Base.

11406 This reference page is clarified with respect to macros and symbolic constants.

11407 **Issue 8**11408 The description of **NL\_CAT\_LOCALE** is updated to eliminate the use of “`must”.

11409 **NAME**

11410 poll.h — definitions for the poll() function

11411 **SYNOPSIS**

11412 #include <poll.h>

11413 **DESCRIPTION**

11414 The <poll.h> header shall define the **pollfd** structure, which shall include at least the following  
11415 members:

11416 int fd The following descriptor being polled.  
11417 short events The input event flags (see below).  
11418 short revents The output event flags (see below).

11419 The <poll.h> header shall define the following type through **typedef**:

11420 **nfds\_t** An unsigned integer type used for the number of file descriptors.

11421 The implementation shall support one or more programming environments in which the width  
11422 of **nfds\_t** is no greater than the width of type **long**. The names of these programming  
11423 environments can be obtained using the *confstr()* function or the *getconf* utility.

11424 The <poll.h> header shall define the **sigset\_t** type as described in <signal.h>.

11425 The <poll.h> header shall define the **timespec** structure as described in <time.h>.

11426 The <poll.h> header shall define the following symbolic constants, zero or more of which may  
11427 be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

11428 POLLIN Data other than high-priority data may be read without blocking.  
11429 POLLRDNORM Normal data may be read without blocking.  
11430 POLLRDBAND Priority data may be read without blocking.  
11431 POLLPRI High priority data may be read without blocking.  
11432 POLLOUT Normal data may be written without blocking.  
11433 POLLWRNORM Equivalent to POLLOUT.  
11434 POLLWRBAND Priority data may be written.  
11435 POLLERR An error has occurred (*revents* only).  
11436 POLLHUP Device has been disconnected (*revents* only).  
11437 POLLNVAL Invalid *fd* member (*revents* only).

11438 The significance and semantics of normal, priority, and high-priority data are file and device-  
11439 specific.

11440 The following shall be declared as functions and may also be defined as macros. Function  
11441 prototypes shall be provided.

```
11442 int poll(struct pollfd [], nfds_t, int);
11443 int ppoll(struct pollfd [], nfds_t, const struct timespec *restrict,
11444           const sigset_t *restrict);
```

11445 Inclusion of the <poll.h> header may make visible all symbols from the headers <signal.h> and  
11446 <time.h>.

11447 **APPLICATION USAGE**

11448 None.

11449 **RATIONALE**

11450 None.

11451 **FUTURE DIRECTIONS**

11452 None.

11453 **SEE ALSO**11454 XSH *confstr()*, *poll()*11455 XCU *getconf*11456 **CHANGE HISTORY**

11457 First released in Issue 4, Version 2.

11458 **Issue 6**11459 The description of the symbolic constants is updated to match the *poll()* function.11460 Text related to STREAMS has been moved to the *poll()* reference page.11461 A note is added to the DESCRIPTION regarding the significance and semantics of normal,  
11462 priority, and high-priority data.11463 **Issue 7**11464 The **<poll.h>** header is moved from the XSI option to the Base.11465 **Issue 8**11466 Austin Group Defect 1263 is applied, adding *ppoll()*, requiring **<poll.h>** to define **sigset\_t** and  
11467 **struct timespec**, and allowing **<poll.h>** to make visible all symbols from **<signal.h>** and  
11468 **<time.h>**.

11469 **NAME**

11470 pthread.h — threads

11471 **SYNOPSIS**

11472 #include <pthread.h>

11473 **DESCRIPTION**

11474 The <pthread.h> header shall define the following symbolic constants:

- 11475 PTHREAD\_BARRIER\_SERIAL\_THREAD
- 11476 PTHREAD\_CANCEL\_ASYNCHRONOUS
- 11477 PTHREAD\_CANCEL\_ENABLE
- 11478 PTHREAD\_CANCEL\_DEFERRED
- 11479 PTHREAD\_CANCEL\_DISABLE
- 11480 PTHREAD\_CANCELED
- 11481 PTHREAD\_CREATE\_DETACHED
- 11482 PTHREAD\_CREATE\_JOINABLE
- 11483 TPS PTHREAD\_EXPLICIT\_SCHED
- 11484 PTHREAD\_INHERIT\_SCHED
- 11485 PTHREAD\_MUTEX\_DEFAULT
- 11486 PTHREAD\_MUTEX\_ERRORCHECK
- 11487 PTHREAD\_MUTEX\_NORMAL
- 11488 PTHREAD\_MUTEX\_RECURSIVE
- 11489 PTHREAD\_MUTEX\_ROBUST
- 11490 PTHREAD\_MUTEX\_STALLED
- 11491 PTHREAD\_ONCE\_INIT
- 11492 RPI|TPI PTHREAD\_PRIO\_INHERIT
- 11493 MC1 PTHREAD\_PRIO\_NONE
- 11494 RPP|TPP PTHREAD\_PRIO\_PROTECT
- 11495 PTHREAD\_PROCESS\_SHARED
- 11496 PTHREAD\_PROCESS\_PRIVATE
- 11497 TPS PTHREAD\_SCOPE\_PROCESS
- 11498 PTHREAD\_SCOPE\_SYSTEM

11499 The <pthread.h> header shall define the following compile-time constant expressions valid as  
 11500 initializers for the following types:

	Name	Initializer for Type
11501	PTHREAD_COND_INITIALIZER	pthread_cond_t
11502	PTHREAD_MUTEX_INITIALIZER	pthread_mutex_t
11503	PTHREAD_RWLOCK_INITIALIZER	pthread_rwlock_t
11504		

11505 The <pthread.h> header shall define the following compile-time constant expression, valid as an  
 11506 initializer for **pthread\_t**, representing a value that shall not compare equal to the thread ID of  
 11507 any existing thread:

11508 PTHREAD\_NULL

11509 The <pthread.h> header shall define the **pthread\_attr\_t**, **pthread\_barrier\_t**,  
 11510 **pthread\_barrierattr\_t**, **pthread\_cond\_t**, **pthread\_condattr\_t**, **pthread\_key\_t**, **pthread\_mutex\_t**,  
 11511 **pthread\_mutexattr\_t**, **pthread\_once\_t**, **pthread\_rwlock\_t**, **pthread\_rwlockattr\_t**,  
 11512 **pthread\_spinlock\_t**, and **pthread\_t** types as described in <sys/types.h>.

11513 The following shall be declared as functions and may also be defined as macros. Function  
 11514 prototypes shall be provided.

```

11515 OB      int  pthread_atfork(void (*) (void), void (*) (void),
11516          void (*) (void));
11517      int  pthread_attr_destroy(pthread_attr_t *);
11518      int  pthread_attr_getdetachstate(const pthread_attr_t *, int *);
11519      int  pthread_attr_getguardsize(const pthread_attr_t *restrict,
11520          size_t *restrict);
11521 TPS      int  pthread_attr_getinheritsched(const pthread_attr_t *restrict,
11522          int *restrict);
11523      int  pthread_attr_getschedparam(const pthread_attr_t *restrict,
11524          struct sched_param *restrict);
11525 TPS      int  pthread_attr_getschedpolicy(const pthread_attr_t *restrict,
11526          int *restrict);
11527      int  pthread_attr_getscope(const pthread_attr_t *restrict,
11528          int *restrict);
11529 TSA TSS   int  pthread_attr_getstack(const pthread_attr_t *restrict,
11530          void **restrict, size_t *restrict);
11531 TSS      int  pthread_attr_getstacksize(const pthread_attr_t *restrict,
11532          size_t *restrict);
11533      int  pthread_attr_init(pthread_attr_t *);

11651     int   pthread_spin_trylock(pthread_spinlock_t *);
11652     int   pthread_spin_unlock(pthread_spinlock_t *);
11653     void  pthread_testcancel(void);

```

11654 The following may be declared as functions, or defined as macros, or both. If functions are  
11655 declared, function prototypes shall be provided.

```

11656         pthread_cleanup_pop()
11657         pthread_cleanup_push()

```

11658 Inclusion of the **<pthread.h>** header shall make symbols defined in the headers **<sched.h>** and  
11659 **<time.h>** visible.

11660 **APPLICATION USAGE**

11661 None.

11662 **RATIONALE**

11663 Since **pthread\_t** is an opaque type, a definition of PTHREAD\_NULL was added to allow for a  
 11664 null value of that type. Some conforming definitions of PTHREAD\_NULL could be:

11665 For a pointer type:

11666 #define PTHREAD\_NULL ((pthread\_t) NULL)

11667 For an integer type:

11668 #define PTHREAD\_NULL ((pthread\_t) -42)

11669 For a struct type:

11670 #define PTHREAD\_NULL ((const pthread\_t){ .\_\_foo = -1 })

11671 **FUTURE DIRECTIONS**

11672 None.

11673 **SEE ALSO**

11674 &lt;sched.h&gt;, &lt;sys/types.h&gt;, &lt;time.h&gt;

 11692 *pthread\_spin\_lock()*, *pthread\_spin\_unlock()*

11693 **CHANGE HISTORY**

11694 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

11695 **Issue 6**

11696 The RTT margin markers are broken out into their POSIX options.

11697 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
 11698 *pthread\_cond\_wait()* function.

11699 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the  
 11700 *pthread\_setschedparam()* function so that its second argument is of type **int**.

11701 The *pthread\_getcpuclockid()* and *pthread\_mutex\_timedlock()* functions are added for alignment  
 11702 with IEEE Std 1003.1d-1999.

11703 The following functions are added for alignment with IEEE Std 1003.1j-2000:

11704 *pthread\_barrier\_destroy()*, *pthread\_barrier\_init()*, *pthread\_barrier\_wait()*,  
 11705 *pthread\_barrierattr\_destroy()*, *pthread\_barrierattr\_getpshared()*, *pthread\_barrierattr\_init()*,  
 11706 *pthread\_barrierattr\_setpshared()*, *pthread\_condattr\_getclock()*, *pthread\_condattr\_setclock()*,  
 11707 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_spin\_destroy()*,  
 11708 *pthread\_spin\_init()*, *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, and *pthread\_spin\_unlock()*.

11709 PTHREAD\_RWLOCK\_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

11710 Functions previously marked as part of the Read-Write Locks option are now moved to the  
 11711 Threads option.

11712 The **restrict** keyword is added to the prototypes for *pthread\_attr\_getguardsize()*,  
 11713 *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedparam()*, *pthread\_attr\_getschedpolicy()*,  
 11714 *pthread\_attr\_getscope()*, *pthread\_attr\_getstackaddr()*, *pthread\_attr\_getstacksize()*,  
 11715 *pthread\_attr\_setschedparam()*, *pthread\_barrier\_init()*, *pthread\_barrierattr\_getpshared()*,  
 11716 *pthread\_cond\_init()*, *pthread\_cond\_signal()*, *pthread\_cond\_timedwait()*, *pthread\_cond\_wait()*,  
 11717 *pthread\_condattr\_getclock()*, *pthread\_condattr\_getpshared()*, *pthread\_create()*,  
 11718 *pthread\_getschedparam()*, *pthread\_mutex\_getprioceiling()*, *pthread\_mutex\_init()*,  
 11719 *pthread\_mutex\_setprioceiling()*, *pthread\_mutexattr\_getprioceiling()*, *pthread\_mutexattr\_getprotocol()*,  
 11720 *pthread\_mutexattr\_getpshared()*, *pthread\_mutexattr\_gettype()*, *pthread\_rwlock\_init()*,  
 11721 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlockattr\_getpshared()*, and  
 11722 *pthread\_sigmask()*.

11723 IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and  
 11724 <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI option.

11725 IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for  
 11726 the *pthread\_kill()* and *pthread\_sigmask()* functions. These are required to be in the <signal.h>  
 11727 header. They are allowed here through the name space rules.

11728 IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread\_setschedprio()* function.

11729 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors  
 11730 that were in contradiction with the System Interfaces volume of POSIX.1-2024.

11731 **Issue 7**

11732 SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread\_mutex\_timedlock()*  
 11733 function prototype.

11734 SD5-XBD-ERN-62 is applied.

11735 Austin Group Interpretation 1003.1-2001 #048 is applied, reinstating the  
 11736 PTHREAD\_RWLOCK\_INITIALIZER symbol.

11737 The <pthread.h> header is moved from the Threads option to the Base.

11738 The following extended mutex types are moved from the XSI option to the Base:

```
11739     PTHREAD_MUTEX_NORMAL
11740     PTHREAD_MUTEX_ERRORCHECK
11741     PTHREAD_MUTEX_RECURSIVE
11742     PTHREAD_MUTEX_DEFAULT
```

11743 The PTHREAD\_MUTEX\_ROBUST and PTHREAD\_MUTEX\_STALLED symbols and the  
 11744 *pthread\_mutex\_consistent()*, *pthread\_mutexattr\_getrobust()*, and *pthread\_mutexattr\_setrobust()*  
 11745 functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

11746 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options  
 11747 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex

- 11748 or Robust Mutex Priority Inheritance, respectively.
- 11749 This reference page is clarified with respect to macros and symbolic constants.
- 11750 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0069 [624] is applied.
- 11751 **Issue 8**
- 11752 Austin Group Defect 599 is applied, adding the PTHREAD\_NULL constant.
- 11753 Austin Group Defect 851 is applied, marking *pthread\_atfork()* as obsolescent.
- 11754 Austin Group Defect 1216 is applied, adding *pthread\_cond\_clockwait()*, *pthread\_mutex\_clocklock()*,  
11755 *pthread\_rwlock\_clockrdlock()*, and *pthread\_rwlock\_clockwrlock()*.
- 11756 Austin Group Defect 1302 is applied, adding *\_Noreturn* to *pthread\_exit()*.
- 11757 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

11758 **NAME**

11759           pwd.h — password structure

11760 **SYNOPSIS**

11761           #include &lt;pwd.h&gt;

11762 **DESCRIPTION**11763           The **<pwd.h>** header shall define the **struct passwd**, structure, which shall include at least the  
11764           following members:

11765	char	*pw_name	User's login name.
11766	uid_t	pw_uid	Numerical user ID.
11767	gid_t	pw_gid	Numerical group ID.
11768	char	*pw_dir	Initial working directory.
11769	char	*pw_shell	Program to use as shell.

11770           The **<pwd.h>** header shall define the **gid\_t**, **uid\_t**, and **size\_t** types as described in  
11771           **<sys/types.h>**.11772           The following shall be declared as functions and may also be defined as macros. Function  
11773           prototypes shall be provided.

```

11774 XSI void          endpwent(void);
11775     struct passwd *getpwent(void);
11776     struct passwd *getpwnam(const char *);
11777     int           getpwnam_r(const char *, struct passwd *, char *,
11778                             size_t, struct passwd **);
11779     struct passwd *getpwuid(uid_t);
11780     int           getpwuid_r(uid_t, struct passwd *, char *,
11781                             size_t, struct passwd **);
11782 XSI void          setpwent(void);

```

11783 **APPLICATION USAGE**

11784           None.

11785 **RATIONALE**

11786           None.

11787 **FUTURE DIRECTIONS**

11788           None.

11789 **SEE ALSO**11790           **<sys/types.h>**11791           XSH *endpwent()*, *getpwnam()*, *getpwuid()*11792 **CHANGE HISTORY**

11793           First released in Issue 1.

11794 **Issue 5**

11795           The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

11796 **Issue 6**11797           The following new requirements on POSIX implementations derive from alignment with the  
11798           Single UNIX Specification:

- 11799
- The **gid\_t** and **uid\_t** types are mandated.

11800                   • The *getpwnam\_r()* and *getpwuid\_r()* functions are marked as part of the Thread-Safe  
11801                    Functions option.

11802 **Issue 7**

11803                   SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

11804 **NAME**

11805           regex.h — regular expression matching types

11806 **SYNOPSIS**

11807       #include &lt;regex.h&gt;

11808 **DESCRIPTION**11809       The **<regex.h>** header shall define the structures and symbolic constants used by the *regcomp()*,  
11810 *regexexec()*, *regerror()*, and *regfree()* functions.11811       The **<regex.h>** header shall define the **regex\_t** structure type, which shall include at least the  
11812 following member:

11813       size\_t     re\_nsub     Number of parenthesized subexpressions.

11814       The **<regex.h>** header shall define the **size\_t** type as described in **<sys/types.h>**.11815       The **<regex.h>** header shall define the **regoff\_t** type as a signed integer type that can hold the  
11816 largest value that can be stored in either a **ptrdiff\_t** type or a **ssize\_t** type.11817       The **<regex.h>** header shall define the **regmatch\_t** structure type, which shall include at least the  
11818 following members:11819       regoff\_t    rm\_so     Byte offset from start of string  
11820                             to start of substring.11821       regoff\_t    rm\_eo     Byte offset from start of string of the  
11822                             first character after the end of substring.11823       The **<regex.h>** header shall define the following symbolic constants for the *cflags* parameter to  
11824 the *regcomp()* function:

11825       REG\_EXTENDED     Use Extended Regular Expressions.

11826       REG\_ICASE         Perform pattern matching in a case-insensitive manner.

11827       REG\_MINIMAL     Change default matching behavior to leftmost shortest possible match.  
11828                         Only applicable to REG\_EXTENDED regular expressions.11829       REG\_NOSUB        Report only success or fail in *regexexec()*.

11830       REG\_NEWLINE     Change the handling of &lt;newline&gt;.

11831       The **<regex.h>** header shall define the following symbolic constants for the *eflags* parameter to  
11832 the *regexexec()* function:11833       REG\_NOTBOL       The <circumflex> character ('^'), when taken as a special character, does  
11834                         not match the beginning of *string*.11835       REG\_NOTEOL       The <dollar-sign> ('\$'), when taken as a special character, does not  
11836                         match the end of *string*.11837       The **<regex.h>** header shall define the following symbolic constants as error return values:11838       REG\_NOMATCH     *regexexec()* failed to match.

11839       REG\_BADPAT       Invalid regular expression.

11840       REG\_ECOLLATE     Invalid collating element referenced.

11841       REG\_ETYPE        Invalid character class type referenced.

11842       REG\_EESCAPE     Trailing &lt;backslash&gt; character in pattern.

11843	REG_ESUBREG	Number in <i>\digit</i> invalid or in error.
11844	REG_EBRACK	"[]" imbalance.
11845	REG_EPAREN	"\(\)" or "()" imbalance.
11846	REG_EBRACE	"\{\}" imbalance.
11847	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than
11848		two numbers, first larger than second.
11849	REG_ERANGE	Invalid endpoint in range expression.
11850	REG_ESPACE	Out of memory.
11851	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
11852		The following shall be declared as functions and may also be defined as macros. Function
11853		prototypes shall be provided.
11854		<code>int regcomp(regex_t *restrict, const char *restrict, int);</code>
11855		<code>size_t regerror(int, const regex_t *restrict, char *restrict, size_t);</code>
11856		<code>int regexec(const regex_t *restrict, const char *restrict, size_t,</code>
11857		<code>regmatch_t [restrict], int);</code>
11858		<code>void regfree(regex_t *);</code>
11859		The implementation may define additional macros or constants using names beginning with
11860		REG_.

#### 11861 APPLICATION USAGE

11862 None.

#### 11863 RATIONALE

11864 None.

#### 11865 FUTURE DIRECTIONS

11866 None.

#### 11867 SEE ALSO

11868 [<sys/types.h>](#)

11869 XSH *regcomp()*

#### 11870 CHANGE HISTORY

11871 First released in Issue 4.

11872 Originally derived from the ISO POSIX-2 standard.

#### 11873 Issue 6

11874 The REG\_ENOSYS constant is marked obsolescent.

11875 The **restrict** keyword is added to the prototypes for *regcomp()*, *regerror()*, and *regexec()*.

11876 A statement is added that the **size\_t** type is defined as described in [<sys/types.h>](#).

#### 11877 Issue 7

11878 SD5-XBD-ERN-60 is applied.

11879 The obsolescent REG\_ENOSYS constant is removed.

11880 This reference page is clarified with respect to macros and symbolic constants.

11881 **Issue 8**

11882 Austin Group Defect 793 is applied, adding REG\_MINIMAL.

11883 Austin Group Defect 1031 is applied, changing the description of REG\_ICASE.

11884 **NAME**  
 11885 sched.h — execution scheduling

11886 **SYNOPSIS**  
 11887 #include <sched.h>

11888 **DESCRIPTION**

11889 PS The <sched.h> header shall define the **pid\_t** type as described in <sys/types.h>.

11890 SS|TSP The <sched.h> header shall define the **time\_t** type as described in <sys/types.h>.

11891 The <sched.h> header shall define the **timespec** structure as described in <time.h>.

11892 The <sched.h> header shall define the **sched\_param** structure, which shall include the  
 11893 scheduling parameters required for implementation of each supported scheduling policy. This  
 11894 structure shall include at least the following member:

11895 int sched\_priority Process or thread execution scheduling priority.

11896 SS|TSP The **sched\_param** structure defined in <sched.h> shall include the following members in  
 11897 addition to those specified above:

11898	int	sched_ss_low_priority	Low scheduling priority for
11899			sporadic server.
11900	struct timespec	sched_ss_repl_period	Replenishment period for
11901			sporadic server.
11902	struct timespec	sched_ss_init_budget	Initial budget for sporadic server.
11903	int	sched_ss_max_repl	Maximum pending replenishments for
11904			sporadic server.

11905 Each process or thread is controlled by an associated scheduling policy and priority. Associated  
 11906 with each policy is a priority range. Each policy definition specifies the minimum priority range  
 11907 for that policy. The priority ranges for each policy may overlap the priority ranges of other  
 11908 policies.

11909 Four scheduling policies are defined; others may be defined by the implementation. The four  
 11910 standard policies are indicated by the values of the following symbolic constants:

11911 PS|TPS **SCHED\_FIFO** First in-first out (FIFO) scheduling policy.

11912 PS|TPS **SCHED\_RR** Round robin scheduling policy.

11913 SS|TSP **SCHED\_SPORADIC** Sporadic server scheduling policy.

11914 PS|TPS **SCHED\_OTHER** Another scheduling policy.

11915 The values of these constants are distinct.

11916 The following shall be declared as functions and may also be defined as macros. Function  
 11917 prototypes shall be provided.

```

11918 PS|TPS int sched_get_priority_max(int);
11919 int sched_get_priority_min(int);
11920 PS int sched_getparam(pid_t, struct sched_param *);
11921 int sched_getscheduler(pid_t);
11922 PS|TPS int sched_rr_get_interval(pid_t, struct timespec *);
11923 PS int sched_setparam(pid_t, const struct sched_param *);
11924 int sched_setscheduler(pid_t, int, const struct sched_param *);
11925 int sched_yield(void);
    
```

- 11926 Inclusion of the **<sched.h>** header may make visible all symbols from the **<time.h>** header.
- 11927 **APPLICATION USAGE**
- 11928 None.
- 11929 **RATIONALE**
- 11930 None.
- 11931 **FUTURE DIRECTIONS**
- 11932 None.
- 11933 **SEE ALSO**
- 11934 **<sys/types.h>**, **<time.h>**

11936 *sched\_setparam()*, *sched\_setscheduler()*, *sched\_yield()*
- 11937 **CHANGE HISTORY**
- 11938 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
- 11939 **Issue 6**
- 11940 The **<sched.h>** header is marked as part of the Process Scheduling option.
- 11941 Sporadic server members are added to the **sched\_param** structure, and the SCHED\_SPORADIC  
11942 scheduling policy is added for alignment with IEEE Std 1003.1d-1999.
- 11943 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched\_param** structure whose  
11944 members *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* should be type **struct timespec** and not  
11945 **timespec**.
- 11946 Symbols from **<time.h>** may be made visible when **<sched.h>** is included.
- 11947 IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied,  
11948 aligning the function prototype shading and margin codes with the System Interfaces volume of  
11949 IEEE Std 1003.1-2001.
- 11950 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/23 is applied, updating the  
11951 DESCRIPTION to differentiate between thread and process execution.
- 11952 **Issue 7**
- 11953 SD5-XBD-ERN-13 is applied.
- 11954 Austin Group Interpretation 1003.1-2001 #064 is applied, correcting the options markings.
- 11955 The **<sched.h>** headers is moved from the Threads option to the Base.
- 11956 Declarations for the **pid\_t** and **time\_t** types and the **timespec** structure are added.

11957 **NAME**

11958 search.h — search tables

11959 **SYNOPSIS**

11960 XSI `#include <search.h>`

11961 **DESCRIPTION**

11962 The <search.h> header shall define the **ENTRY** type for structure **entry** which shall include the  
11963 following members:

11964 char \*key  
11965 void \*data

11966 and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as  
11967 follows:

11968 enum { FIND, ENTER } ACTION;  
11969 enum { preorder, postorder, endorder, leaf } VISIT;

11970 The <search.h> header shall define the **size\_t** type as described in <sys/types.h>.

11971 The <search.h> header shall define via **typedef** the **posix\_tnode** type as an alias for **void**.

11972 The following shall be declared as functions and may also be defined as macros. Function  
11973 prototypes shall be provided.

```
11974 int      hcreate(size_t);
11975 void     hdestroy(void);
11976 ENTRY   *hsearch(ENTRY, ACTION);
11977 void     insque(void *, void *);
11978 void     *lfind(const void *, const void *, size_t *,
11979               size_t, int (*)(const void *, const void *));
11980 void     *lsearch(const void *, void *, size_t *,
11981                 size_t, int (*)(const void *, const void *));
11982 void     remque(void *);
11983 void     *tdelete(const void *restrict, posix_tnode **restrict,
11984                  int (*)(const void *, const void *));
11985 posix_tnode *tfind(const void *, posix_tnode *const *,
11986                  int (*)(const void *, const void *));
11987 posix_tnode *tsearch(const void *, posix_tnode **,
11988                     int (*)(const void *, const void *));
11989 void     twalk(const posix_tnode *,
11990               void (*)(const posix_tnode *, VISIT, int));
```

11991 **APPLICATION USAGE**

11992 None.

11993 **RATIONALE**

11994 Earlier versions of this standard explicitly used **void** for both node and key references where this  
11995 version now uses **posix\_tnode** for nodes and keeps **void** in the text referring only to keys. In  
11996 order to preserve backwards compatibility, this version defines **posix\_tnode** as an alias for **void**.  
11997 The change was made to make the function prototypes more easily understandable.

11998 **FUTURE DIRECTIONS**

11999 None.

12000 **SEE ALSO**

12001        [<sys/types.h>](#)

12002        XSH *hcreate()*, *insque()*, *lsearch()*, *tdelete()*

12003 **CHANGE HISTORY**

12004        First released in Issue 1. Derived from Issue 1 of the SVID.

12005 **Issue 6**

12006        The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and  
12007        *tsearch()*.

12008        The **restrict** keyword is added to the prototype for *tdelete()*.

12009 **Issue 8**

12010        Austin Group Defect 1011 is applied, adding the **posix\_tnode** type and changing some  
12011        prototypes to use it instead of **void**.

12012 **NAME**

12013 semaphore.h — semaphores

12014 **SYNOPSIS**

12015 #include &lt;semaphore.h&gt;

12016 **DESCRIPTION**

12017 The <semaphore.h> header shall define the **sem\_t** type, used in performing semaphore  
 12018 operations. The semaphore may be implemented using a file descriptor, in which case  
 12019 applications are able to open up at least a total of {OPEN\_MAX} files and semaphores.

12020 The <semaphore.h> header shall define the **timespec** structure as described in <time.h>.

12021 The <semaphore.h> header shall define the symbolic constant SEM\_FAILED which shall have  
 12022 type **sem\_t** \*.

12023 The <semaphore.h> header shall define O\_CREAT and O\_EXCL as described in <fcntl.h>.

12024 The following shall be declared as functions and may also be defined as macros. Function  
 12025 prototypes shall be provided.

```

12026 int      sem_clockwait(sem_t *restrict, clockid_t,
12027                      const struct timespec *restrict);
12028 int      sem_close(sem_t *);
12029 int      sem_destroy(sem_t *);
12030 int      sem_getvalue(sem_t *restrict, int *restrict);
12031 int      sem_init(sem_t *, int, unsigned);
12032 sem_t *sem_open(const char *, int, ...);
12033 int      sem_post(sem_t *);
12034 int      sem_timedwait(sem_t *restrict, const struct timespec *restrict);
12035 int      sem_trywait(sem_t *);
12036 int      sem_unlink(const char *);
12037 int      sem_wait(sem_t *);

```

12038 Inclusion of the <semaphore.h> header may make visible symbols defined in the <fcntl.h> and  
 12039 <time.h> headers.

12040 **APPLICATION USAGE**

12041 None.

12042 **RATIONALE**

12043 None.

12044 **FUTURE DIRECTIONS**

12045 None.

12046 **SEE ALSO**

12047 &lt;fcntl.h&gt;, &lt;sys/types.h&gt;, &lt;time.h&gt;

12048 XSH *sem\_clockwait()*, *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*, *sem\_open()*,  
 12049 *sem\_post()*, *sem\_trywait()*, *sem\_unlink()*

12050 **CHANGE HISTORY**

12051 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

12052 **Issue 6**

12053 The &lt;semaphore.h&gt; header is marked as part of the Semaphores option.

12054 The Open Group Corrigendum U021/3 is applied, adding a description of SEM\_FAILED.

12055 The *sem\_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.

- 12056 The **restrict** keyword is added to the prototypes for *sem\_getvalue()* and *sem\_timedwait()*.
- 12057 **Issue 7**
- 12058 SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the **<time.h>**
- 12059 header.
- 12060 The **<semaphore.h>** header is moved from the Semaphores option to the Base.
- 12061 This reference page is clarified with respect to macros and symbolic constants.
- 12062 **Issue 8**
- 12063 Austin Group Defect 592 is applied, requiring **<semaphore.h>** to define the **timespec** structure.
- 12064 Austin Group Defect 593 is applied, adding **O\_CREAT** and **O\_EXCL**.
- 12065 Austin Group Defect 1216 is applied, adding *sem\_clockwait()*.

12066 **NAME**  
 12067 setjmp.h — stack environment declarations

12068 **SYNOPSIS**  
 12069 #include <setjmp.h>

12070 **DESCRIPTION**  
 12071 CX Some of the functionality described on this reference page extends the ISO C standard.  
 12072 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 12073 enable the visibility of these symbols in this header.

12074 CX The <setjmp.h> header shall define the array types **jmp\_buf** and **sigjmp\_buf**.  
 12075 The following shall be declared as functions and may also be defined as macros. Function  
 12076 prototypes shall be provided.

12077 \_Noreturn void longjmp(jmp\_buf, int);  
 12078 CX \_Noreturn void siglongjmp(sigjmp\_buf, int);

12079 The following may be declared as functions, or defined as macros, or both. If functions are  
 12080 declared, function prototypes shall be provided.

12081 int setjmp(jmp\_buf);  
 12082 CX int sigsetjmp(sigjmp\_buf, int);

12083 **APPLICATION USAGE**  
 12084 None.

12085 **RATIONALE**  
 12086 None.

12087 **FUTURE DIRECTIONS**  
 12088 None.

12089 **SEE ALSO**  
 12090 XSH Section 2.2 (on page 496), *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*

12091 **CHANGE HISTORY**  
 12092 First released in Issue 1.

12093 **Issue 6**  
 12094 Extensions beyond the ISO C standard are marked.

12095 **Issue 7**  
 12096 SD5-XBD-ERN-6 is applied.

12097 **Issue 8**  
 12098 Austin Group Defect 1302 is applied, adding *\_Noreturn* to *longjmp()* and *siglongjmp()*.  
 12099 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

12139 The **signal** union shall be defined as:

12140 `int sival_int` Integer signal value.

12141 `void *sival_ptr` Pointer signal value.

12142 The <**signal.h**> header shall declare the SIGRTMIN and SIGRTMAX macros, which shall expand to positive integer expressions with type **int**, but which need not be constant expressions. These macros specify a range of signal numbers that are reserved for application use and for which the realtime signal behavior specified in this volume of POSIX.1-2024 is supported. The signal numbers in this range do not overlap any of the signals specified in the following table.

12143

12144

12145

12146

12147 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG\_MAX} signal numbers. The value of SIGRTMAX shall be less than the value returned by `sysconf(_SC_NSIG)`.

12148

12149 It is implementation-defined whether realtime signal behavior is supported for other signals.

12150 The <**signal.h**> header shall define the following symbolic constant. The value shall be suitable for use in **#if** preprocessing directives:

12151

12152 SIG2STR\_MAX Maximum size of a signal name returned by `sig2str()`, including the terminating null byte.

12153

12154 The <**signal.h**> header shall define the following macros that are used to refer to the signals that occur in the system. Signals defined here begin with the letters SIG followed by an uppercase letter. The macros shall expand to positive integer constant expressions with type **int** and distinct values less than the value of {NSIG\_MAX} defined in <**limits.h**>. The value 0 is reserved for use as the null signal (see `kill()`). Additional implementation-defined signals may occur in the system.

12155

12156

12157 CX

12158

12159

12160 The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT, SIGSEGV, and SIGTERM to be defined. An implementation need not generate any of these six signals, except as a result of explicit use of interfaces that generate signals, such as `raise()`, `kill()`, the General Terminal Interface (see Section 11.1.9, on page 203), and the `kill` utility, unless otherwise stated (see, for example, XSH Section 2.8.3.3, on page 530).

12161

12162 CX

12163

12164

12165 The following signals shall be supported on all implementations (default actions are explained below the table):

12166

	Signal	Default Action	Description
12167	SIGABRT	A	Process abort signal.
12168	SIGALRM	T	Alarm clock.
12169	SIGBUS	A	Access to an undefined portion of a memory object.
12170	SIGCHLD	I	Child process terminated, stopped,
12171			or continued.
12172 XSI	SIGCONT	C	Continue executing, if stopped.
12173	SIGFPE	A	Erroneous arithmetic operation.
12174	SIGHUP	T	Hangup.
12175	SIGILL	A	Illegal instruction.
12176	SIGINT	T	Terminal interrupt signal.
12177	SIGKILL	T	Kill (cannot be caught or ignored).
12178	SIGPIPE	T	Write on a pipe with no one to read it.
12179	SIGQUIT	A	Terminal quit signal.
12180	SIGSEGV	A	Invalid memory reference.
12181	SIGSTOP	S	Stop executing (cannot be caught or ignored).
12182	SIGTERM	T	Termination signal.
12183	SIGTSTP	S	Terminal stop signal.
12184	SIGTTIN	S	Background process attempting read.
12185	SIGTTOU	S	Background process attempting write.
12186	SIGUSR1	T	User-defined signal 1.
12187	SIGUSR2	T	User-defined signal 2.
12188	SIGWINCH	I	Terminal window size changed.
12189	SIGSYS	A	Bad system call.
12190 XSI	SIGTRAP	A	Trace/breakpoint trap.
12191	SIGURG	I	High bandwidth data is available at a socket.
12192	SIGVTALRM	T	Virtual timer expired.
12193 XSI	SIGXCPU	A	CPU time limit exceeded.
12194	SIGXFSZ	A	File size limit exceeded.
12195			

12196 The default actions are as follows:

- 12197 T Abnormal termination of the process.
- 12198 A Abnormal termination of the process with additional actions.
- 12199 I Ignore the signal.
- 12200 S Stop the process.
- 12201 C Continue the process, if it is stopped; otherwise, ignore the signal.

12202 The effects on the process in each case are described in XSH Section 2.4.3 (on page 516).

12203 CX The <signal.h> header shall declare the **sigaction** structure, which shall include at least the following members:

```

12205 void (*sa_handler)(int) Pointer to a signal-catching function
12206 or one of the SIG_IGN or SIG_DFL.
12207 sigset_t sa_mask Set of signals to be blocked during execution
12208 of the signal handling function.
12209 int sa_flags Special flags.
12210 void (*sa_sigaction)(int, siginfo_t *, void *)
12211 Pointer to a signal-catching function.
```

12212	CX	The storage occupied by <i>sa_handler</i> and <i>sa_sigaction</i> may overlap, and a conforming application shall not use both simultaneously.	
12213			
12214		The <signal.h> header shall define the following macros which shall expand to integer constant expressions that need not be usable in #if preprocessing directives:	
12215			
12216	CX	<b>SIG_BLOCK</b>	The resulting set is the union of the current set and the signal set pointed to by the argument <i>set</i> .
12217			
12218	CX	<b>SIG_UNBLOCK</b>	The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument <i>set</i> .
12219			
12220	CX	<b>SIG_SETMASK</b>	The resulting set is the signal set pointed to by the argument <i>set</i> .
12221		The <signal.h> header shall also define the following symbolic constants:	
12222	CX	<b>SA_NOCLDSTOP</b>	Do not generate SIGCHLD when children stop
12223	XSI		or stopped children continue.
12224	XSI	<b>SA_ONSTACK</b>	Causes signal delivery to occur on an alternate stack.
12225	CX	<b>SA_RESETHAND</b>	Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.
12226			
12227	CX	<b>SA_RESTART</b>	Causes certain functions to become restartable.
12228	CX	<b>SA_SIGINFO</b>	Causes extra information to be passed to signal handlers at the time of receipt of a signal.
12229			
12230	XSI	<b>SA_NOCLDWAIT</b>	Causes implementations not to create zombie processes or status information on child termination. See <i>sigaction()</i> .
12231			
12232	CX	<b>SA_NODEFER</b>	Causes signal not to be automatically blocked on entry to signal handler.
12233	XSI	<b>SS_ONSTACK</b>	Process is executing on an alternate signal stack.
12234	XSI	<b>SS_DISABLE</b>	Alternate signal stack is disabled.
12235	XSI	<b>MINSIGSTKSZ</b>	Minimum stack size for a signal handler.
12236	XSI	<b>SIGSTKSZ</b>	Default size in bytes for the alternate signal stack.
12237	CX	The <signal.h> header shall define the <b>mcontext_t</b> type through <b>typedef</b> .	
12238	CX	The <signal.h> header shall define the <b>ucontext_t</b> type as a structure that shall include at least the following members:	
12239			
12240		<code>ucontext_t *uc_link</code>	Pointer to the context that is resumed when this context returns.
12241			
12242		<code>sigset_t uc_sigmask</code>	The set of signals that are blocked when this context is active.
12243			
12244		<code>stack_t uc_stack</code>	The stack used by this context.
12245		<code>mcontext_t uc_mcontext</code>	A machine-specific representation of the saved context.
12246			
12247		The <signal.h> header shall define the <b>stack_t</b> type as a structure, which shall include at least the following members:	
12248			
12249		<code>void *ss_sp</code>	Stack base or pointer.
12250		<code>size_t ss_size</code>	Stack size.
12251		<code>int ss_flags</code>	Flags.

12252 CX The <signal.h> header shall define the **siginfo\_t** type as a structure, which shall include at least  
12253 the following members:

12254	CX	int	si_signo	Signal number.
12255		int	si_code	Signal code.
12256	XSI	int	si_errno	If non-zero, an <i>errno</i> value associated with 12257 this signal, as described in <errno.h>.
12258	CX	pid_t	si_pid	Sending process ID.
12259		uid_t	si_uid	Real user ID of sending process.
12260		void	*si_addr	Address that caused fault.
12261		int	si_status	Exit value or signal.
12262		union sigval	si_value	Signal value.

12263 CX The <signal.h> header shall define the symbolic constants in the **Code** column of the following  
12264 table for use as values of *si\_code* that are signal-specific or non-signal-specific reasons why the  
12265 signal was generated.

	Signal	Code	Reason
12266	SIGILL	ILL_ILLOPC	Illegal opcode.
12267 CX		ILL_ILLOPN	Illegal operand.
12268		ILL_ILLADR	Illegal addressing mode.
12269		ILL_ILLTRP	Illegal trap.
12270		ILL_PRVOPC	Privileged opcode.
12271		ILL_PRVREG	Privileged register.
12272		ILL_COPROC	Coprocessor error.
12273		ILL_BADSTK	Internal stack error.
12274	SIGFPE	FPE_INTDIV	Integer divide by zero.
12275		FPE_INTOVF	Integer overflow.
12276		FPE_FLTDIV	Floating-point divide by zero.
12277		FPE_FLTOVF	Floating-point overflow.
12278		FPE_FLTUND	Floating-point underflow.
12279		FPE_FLTRES	Floating-point inexact result.
12280		FPE_FLTINV	Invalid floating-point operation.
12281		FPE_FLTSUB	Subscript out of range.
12282	SIGSEGV	SEGV_MAPERR	Address not mapped to object.
12283		SEGV_ACCERR	Invalid permissions for mapped object.
12284	SIGBUS	BUS_ADRALN	Invalid address alignment.
12285		BUS_ADRERR	Nonexistent physical address.
12286		BUS_OBJERR	Object-specific hardware error.
12287	SIGTRAP	TRAP_BRKPT	Process breakpoint.
12288 XSI		TRAP_TRACE	Process trace trap.
12289	SIGCHLD	CLD_EXITED	Child has exited.
12290 CX		CLD_KILLED	Child has terminated abnormally with no additional actions.
12291		CLD_DUMPED	Child has terminated abnormally and additional actions may have been taken.
12292		CLD_TRAPPED	Traced child has trapped.
12293		CLD_STOPPED	Child has stopped.
12294		CLD_CONTINUED	Stopped child has continued.
12295	Any	SI_USER	Signal sent by <i>kill()</i> .
12296		SI_QUEUE	Signal sent by <i>sigqueue()</i> .
12297		SI_TIMER	Signal generated by expiration of a timer set by <i>timer_settime()</i> .
12298		SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
12299		SI_MESGQ	Signal generated by arrival of a message on an empty message queue
12300			
12301			
12302			
12303			
12304 CX	Implementations may support additional <i>si_code</i> values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.		
12305			
12306			
12307			
12308			

12309 CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	<b>void * <i>si_addr</i></b>	Address of faulting instruction.
SIGSEGV SIGBUS	<b>void * <i>si_addr</i></b>	Address of faulting memory reference.
SIGCHLD	<b>pid_t <i>si_pid</i></b> <b>int <i>si_status</i></b>	Child process ID. If <i>si_code</i> is equal to CLD_EXITED, then <i>si_status</i> holds the exit value of the process; otherwise, it is equal to the signal that caused the process to change state. The exit value in <i>si_status</i> shall be equal to the full exit value (that is, the value passed to <i>_exit()</i> , <i>_Exit()</i> , or <i>exit()</i> , or returned from <i>main()</i> ); it shall not be limited to the least significant eight bits of the value.
	<b>uid_t <i>si_uid</i></b>	Real user ID of the process that sent the signal.

12323 For some implementations, the value of *si\_addr* may be inaccurate.

12324 The following shall be declared as functions and may also be defined as macros. Function  
12325 prototypes shall be provided.

```

12326 CX int kill(pid_t, int);
12327 XSI int killpg(pid_t, int);
12328 CX void psiginfo(const siginfo_t *, const char *);
12329 void psignal(int, const char *);
12330 int pthread_kill(pthread_t, int);
12331 int pthread_sigmask(int, const sigset_t *restrict,
12332 sigset_t *restrict);
12333 int raise(int);
12334 CX int sig2str(int, char *);
12335 int sigaction(int, const struct sigaction *restrict,
12336 struct sigaction *restrict);
12337 int sigaddset(sigset_t *, int);
12338 XSI int sigaltstack(const stack_t *restrict, stack_t *restrict);
12339 CX int sigdelset(sigset_t *, int);
12340 int sigemptyset(sigset_t *);
12341 int sigfillset(sigset_t *);
12342 int sigismember(const sigset_t *, int);
12343 void (*signal(int, void (*)(int)))(int);
12344 CX int sigpending(sigset_t *);
12345 int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
12346 int sigqueue(pid_t, int, union sigval);
12347 int sigsuspend(const sigset_t *);
12348 int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
12349 const struct timespec *restrict);
12350 int sigwait(const sigset_t *restrict, int *restrict);
12351 int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);
12352 int str2sig(const char *restrict, int *restrict);

```

12353 CX Inclusion of the <signal.h> header may make visible all symbols from the <time.h> header.

12354 **APPLICATION USAGE**

12355 On systems not supporting the XSI option, the *si\_pid* and *si\_uid* members of **siginfo\_t** are only  
 12356 required to be valid when *si\_code* is SI\_USER or SI\_QUEUE. On XSI-conforming systems, they  
 12357 are also valid for all *si\_code* values less than or equal to 0; however, it is unspecified whether  
 12358 SI\_USER and SI\_QUEUE have values less than or equal to zero, and therefore XSI applications  
 12359 should check whether *si\_code* has the value SI\_USER or SI\_QUEUE or is less than or equal to 0 to  
 12360 tell whether *si\_pid* and *si\_uid* are valid.

12361 **RATIONALE**

12362 None.

12363 **FUTURE DIRECTIONS**

12364 None.

12365 **SEE ALSO**

12371 XCU *kill*

12372 **CHANGE HISTORY**

12373 First released in Issue 1.

12374 **Issue 5**

12375 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 12376 Threads Extension.

12377 The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is  
 12378 removed.

12379 **Issue 6**

12380 The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for  
 12381 abnormal termination is clarified.

12382 The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()*  
 12383 function.

12384 The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev\_notify\_function*  
 12385 function member of the **sigevent** structure.

12386 The following new requirements on POSIX implementations derive from alignment with the  
 12387 Single UNIX Specification:

- 12388 • The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now  
 12389 mandated. This is also a FIPS requirement.
- 12390 • The **pid\_t** definition is mandated.

12391 The RT markings are changed to RTS to denote that the semantics are part of the Realtime  
 12392 Signals Extension option.

12393 The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*,  
 12394 *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

12395 IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from  
 12396 <time.h> may be made visible when <signal.h> is included.

- 12397 Extensions beyond the ISO C standard are marked.
- 12398 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive  
12399 text for members of the **sigaction** structure.
- 12400 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of  
12401 the *sa\_sigaction* member of the **sigaction** structure.
- 12402 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of  
12403 the **siginfo\_t** type structure in the DESCRIPTION. This is an editorial change and no normative  
12404 change is intended.
- 12405 **Issue 7**
- 12406 SD5-XBD-ERN-5 is applied.
- 12407 SD5-XBD-ERN-39 is applied, removing the **sigstack** structure which should have been removed  
12408 at the same time as the LEGACY *sigstack()* function.
- 12409 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size\_t** type.
- 12410 Austin Group Interpretation 1003.1-2001 #034 is applied.
- 12411 The **ucontext\_t** and **mcontext\_t** structures are added here from the obsolescent **<ucontext.h>**  
12412 header.
- 12413 The *psiginfo()* and *psignal()* functions are added from The Open Group Technical Standard, 2006,  
12414 Extended API Set Part 1.
- 12415 The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked  
12416 obsolescent.
- 12417 The SA\_RESETHAND, SA\_RESTART, SA\_SIGINFO, SA\_NOCLDWAIT, and SA\_NODEFER  
12418 constants are moved from the XSI option to the Base.
- 12419 Functionality relating to the Realtime Signals Extension option is moved to the Base.
- 12420 This reference page is clarified with respect to macros and symbolic constants, and declarations  
12421 for the **pthread\_attr\_t**, **pthread\_t**, and **uid\_t** types and the **timespec** structure are added.
- 12422 SIGRTMIN and SIGRTMAX are required to be positive integer expressions.
- 12423 The APPLICATION USAGE section is updated to describe the *si\_pid* and *si\_uid* members of  
12424 **siginfo\_t**.
- 12425 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0062 [208], XBD/TC1-2008/0063 [80],  
12426 and XBD/TC1-2008/0064 [157] are applied.
- 12427 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0070 [536], XBD/TC2-2008/0071 [690],  
12428 XBD/TC2-2008/0072 [594], XBD/TC2-2008/0073 [844], and XBD/TC2-2008/0074 [536] are  
12429 applied.
- 12430 **Issue 8**
- 12431 Austin Group Defect 741 is applied, restricting the value of SIGRTMAX to less than the value  
12432 returned by *sysconf(\_SC\_NSIG)* and the value of macros that are used to refer to the signals to  
12433 less than {NSIG\_MAX}.
- 12434 Austin Group Defect 1138 is applied, adding *sig2str()* and *str2sig()*.
- 12435 Austin Group Defect 1141 is applied, changing the descriptions of CLD\_KILLED and  
12436 CLD\_DUMPED.
- 12437 Austin Group Defect 1151 is applied, adding SIGWINCH.

12438 Austin Group Defect 1215 is applied, removing XSI shading from text relating to abnormal  
12439 process termination with additional actions.

12440 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

12441 Austin Group Defect 1775 is applied, changing the description of the *si\_addr* member of  
12442 **siginfo\_t**.

12443 **NAME**

12444 spawn.h — spawn (ADVANCED REALTIME)

12445 **SYNOPSIS**12446 SPN `#include <spawn.h>`12447 **DESCRIPTION**12448 The **<spawn.h>** header shall define the **posix\_spawnattr\_t** and **posix\_spawn\_file\_actions\_t**  
12449 types used in performing spawn operations.12450 The **<spawn.h>** header shall define the **mode\_t** and **pid\_t** types as described in **<sys/types.h>**.12451 The **<spawn.h>** header shall define the **sigset\_t** type as described in **<signal.h>**.12452 The tag **sched\_param** shall be declared as naming an incomplete structure type, the contents of  
12453 which are described in the **<sched.h>** header.12454 The **<spawn.h>** header shall define the following symbolic constants for use as the flags that  
12455 may be set in a **posix\_spawnattr\_t** object using the *posix\_spawnattr\_setflags()* function:

12456 POSIX\_SPAWN\_RESETIDS

12457 POSIX\_SPAWN\_SETPGROUP

12458 PS POSIX\_SPAWN\_SETSCHEDPARAM

12459 POSIX\_SPAWN\_SETSCHEDULER

12460 POSIX\_SPAWN\_SETSID

12461 POSIX\_SPAWN\_SETSIGDEF

12462 POSIX\_SPAWN\_SETSIGMASK

12463 The following shall be declared as functions and may also be defined as macros. Function  
12464 prototypes shall be provided.

```

12465 int    posix_spawn(pid_t *restrict, const char *restrict,
12466                  const posix_spawn_file_actions_t *restrict,
12467                  const posix_spawnattr_t *restrict, char *const [restrict],
12468                  char *const [restrict]);
12469 int    posix_spawn_file_actions_addchdir(posix_spawn_file_actions_t
12470                  *restrict, const char *restrict);
12471 int    posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
12472                  int);
12473 int    posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
12474                  int, int);
12475 int    posix_spawn_file_actions_addfchdir(posix_spawn_file_actions_t *,
12476                  int);
12477 int    posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
12478                  *restrict, int, const char *restrict, int, mode_t);
12479 int    posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
12480 int    posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
12481 int    posix_spawnattr_destroy(posix_spawnattr_t *);
12482 int    posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
12483                  short *restrict);
12484 int    posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
12485                  pid_t *restrict);
12486 PS int    posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
12487                  struct sched_param *restrict);
12488 int    posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
12489                  int *restrict);

```

```

12490     int    posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
12491                                         sigset_t *restrict);
12492     int    posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
12493                                       sigset_t *restrict);
12494     int    posix_spawnattr_init(posix_spawnattr_t *);
12495     int    posix_spawnattr_setflags(posix_spawnattr_t *, short);
12496     int    posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
12497 PS     int    posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
12498                                             const struct sched_param *restrict);
12499     int    posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
12500     int    posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
12501                                         sigset_t *restrict);
12502     int    posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
12503                                       sigset_t *restrict);
12504     int    posix_spawn(pid_t *restrict, const char *restrict,
12505                       const posix_spawn_file_actions_t *restrict,
12506                       const posix_spawnattr_t *restrict,
12507                       char *const [restrict], char *const [restrict]);

```

12508 Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h> and  
 12509 <signal.h> headers.

#### 12510 APPLICATION USAGE

12511 None.

#### 12512 RATIONALE

 12528 [posix\\_spawnattr\\_setsigmask\(\)](#), and [posix\\_spawn\(\)](#).

#### 12529 Issue 7

12530 This reference page is clarified with respect to macros and symbolic constants, and declarations  
 12531 for the **mode\_t**, **pid\_t**, and **sigset\_t** types are added.

#### 12532 Issue 8

12533 Austin Group Defect 1044 is applied, adding POSIX\_SPAWN\_SETSID.

12534 Austin Group Defect 1208 is applied, adding [posix\\_spawn\\_file\\_actions\\_addchdir\(\)](#) and  
 12535 [posix\\_spawn\\_file\\_actions\\_addfchdir\(\)](#).

12536  
12537

Austin Group Defect 1328 is applied, adding the **restrict** keyword to the third parameter of *posix\_spawn()* and *posix\_spawnp()*.

12538 **NAME**

12539           stdalign.h — alignment macros

12540 **SYNOPSIS**

12541           #include &lt;stdalign.h&gt;

12542 **DESCRIPTION**

12543 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
12544       conflict between the requirements described here and the ISO C standard is unintentional. This  
12545       volume of POSIX.1-2024 defers to the ISO C standard.

12546       The &lt;stdalign.h&gt; header shall define the following macros:

12547       alignas       Expands to **\_Alignas**12548       alignof       Expands to **\_Alignof**

12549       \_\_alignas\_is\_defined

12550               Expands to the integer constant 1

12551       \_\_alignof\_is\_defined

12552               Expands to the integer constant 1

12553       The `__alignas_is_defined` and `__alignof_is_defined` macros shall be suitable for use in `#if`  
12554       preprocessing directives.

12555 **APPLICATION USAGE**

12556       None.

12557 **RATIONALE**

12558       None.

12559 **FUTURE DIRECTIONS**

12560       None.

12561 **SEE ALSO**

12562       None.

12563 **CHANGE HISTORY**

12564       First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

12565 **NAME**

12566           stdatomic.h — atomics

12567 **SYNOPSIS**

12568           #include &lt;stdatomic.h&gt;

12569 **DESCRIPTION**

12570 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
12571           conflict between the requirements described here and the ISO C standard is unintentional. This  
12572           volume of POSIX.1-2024 defers to the ISO C standard.

12573           Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide this header  
12574           nor support any of its facilities.

12575           The **<stdatomic.h>** header shall define the **atomic\_flag** type as a structure type. This type  
12576           provides the classic test-and-set functionality. It shall have two states, set and clear. Operations  
12577           on an object of type **atomic\_flag** shall be lock free.

12578           The **<stdatomic.h>** header shall define each of the atomic integer types in the following table as  
12579           a type that has the same representation and alignment requirements as the corresponding direct  
12580           type.

12581           **Note:**       The same representation and alignment requirements are meant to imply interchangeability as  
12582           arguments to functions, return values from functions, and members of unions.

	Atomic type name	Direct type
12583		
12584	<code>atomic_bool</code>	<code>_Atomic_Bool</code>
12585	<code>atomic_char</code>	<code>_Atomic char</code>
12586	<code>atomic_schar</code>	<code>_Atomic signed char</code>
12587	<code>atomic_uchar</code>	<code>_Atomic unsigned char</code>
12588	<code>atomic_short</code>	<code>_Atomic short</code>
12589	<code>atomic_ushort</code>	<code>_Atomic unsigned short</code>
12590	<code>atomic_int</code>	<code>_Atomic int</code>
12591	<code>atomic_uint</code>	<code>_Atomic unsigned int</code>
12592	<code>atomic_long</code>	<code>_Atomic long</code>
12593	<code>atomic_ulong</code>	<code>_Atomic unsigned long</code>
12594	<code>atomic_llong</code>	<code>_Atomic long long</code>
12595	<code>atomic_ullong</code>	<code>_Atomic unsigned long long</code>
12596	<code>atomic_char16_t</code>	<code>_Atomic char16_t</code>
12597	<code>atomic_char32_t</code>	<code>_Atomic char32_t</code>
12598	<code>atomic_wchar_t</code>	<code>_Atomic wchar_t</code>
12599	<code>atomic_int_least8_t</code>	<code>_Atomic int_least8_t</code>
12600	<code>atomic_uint_least8_t</code>	<code>_Atomic uint_least8_t</code>
12601	<code>atomic_int_least16_t</code>	<code>_Atomic int_least16_t</code>
12602	<code>atomic_uint_least16_t</code>	<code>_Atomic uint_least16_t</code>
12603	<code>atomic_int_least32_t</code>	<code>_Atomic int_least32_t</code>
12604	<code>atomic_uint_least32_t</code>	<code>_Atomic uint_least32_t</code>
12605	<code>atomic_int_least64_t</code>	<code>_Atomic int_least64_t</code>
12606	<code>atomic_uint_least64_t</code>	<code>_Atomic uint_least64_t</code>
12607	<code>atomic_int_fast8_t</code>	<code>_Atomic int_fast8_t</code>
12608	<code>atomic_uint_fast8_t</code>	<code>_Atomic uint_fast8_t</code>
12609	<code>atomic_int_fast16_t</code>	<code>_Atomic int_fast16_t</code>
12610	<code>atomic_uint_fast16_t</code>	<code>_Atomic uint_fast16_t</code>
12611	<code>atomic_int_fast32_t</code>	<code>_Atomic int_fast32_t</code>
12612	<code>atomic_uint_fast32_t</code>	<code>_Atomic uint_fast32_t</code>
12613	<code>atomic_int_fast64_t</code>	<code>_Atomic int_fast64_t</code>
12614	<code>atomic_uint_fast64_t</code>	<code>_Atomic uint_fast64_t</code>
12615	<code>atomic_intptr_t</code>	<code>_Atomic intptr_t</code>
12616	<code>atomic_uintptr_t</code>	<code>_Atomic uintptr_t</code>
12617	<code>atomic_size_t</code>	<code>_Atomic size_t</code>
12618	<code>atomic_ptrdiff_t</code>	<code>_Atomic ptrdiff_t</code>
12619	<code>atomic_intmax_t</code>	<code>_Atomic intmax_t</code>
12620	<code>atomic_uintmax_t</code>	<code>_Atomic uintmax_t</code>

12621 The <stdatomic.h> header shall define the `memory_order` type as an enumerated type whose  
 12622 enumerators shall include at least the following:

- 12623 `memory_order_relaxed`
- 12624 `memory_order_consume`
- 12625 `memory_order_acquire`
- 12626 `memory_order_release`
- 12627 `memory_order_acq_rel`
- 12628 `memory_order_seq_cst`

12629 The <stdatomic.h> header shall define the following atomic lock-free macros:

- 12630 `ATOMIC_BOOL_LOCK_FREE`
- 12631 `ATOMIC_CHAR_LOCK_FREE`
- 12632 `ATOMIC_CHAR16_T_LOCK_FREE`

```

12633     ATOMIC_CHAR32_T_LOCK_FREE
12634     ATOMIC_WCHAR_T_LOCK_FREE
12635     ATOMIC_SHORT_LOCK_FREE
12636     ATOMIC_INT_LOCK_FREE
12637     ATOMIC_LONG_LOCK_FREE
12638     ATOMIC_LLONG_LOCK_FREE
12639     ATOMIC_POINTER_LOCK_FREE

```

12640 which shall expand to constant expressions suitable for use in **#if** preprocessing directives and  
 12641 which shall indicate the lock-free property of the corresponding atomic types (both signed and  
 12642 unsigned). A value of 0 shall indicate that the type is never lock-free; a value of 1 shall indicate  
 12643 that the type is sometimes lock-free; a value of 2 shall indicate that the type is always lock-free.

12644 The <stdatomic.h> header shall define the macro `ATOMIC_FLAG_INIT` which shall expand to  
 12645 an initializer for an object of type `atomic_flag`. This macro shall initialize an `atomic_flag` to the  
 12646 clear state. An `atomic_flag` that is not explicitly initialized with `ATOMIC_FLAG_INIT` is initially  
 12647 in an indeterminate state.

12648 OB The <stdatomic.h> header shall define the macro `ATOMIC_VAR_INIT(value)` which shall  
 12649 expand to a token sequence suitable for initializing an atomic object of a type that is  
 12650 initialization-compatible with the non-atomic type of its *value* argument. An atomic object with  
 12651 automatic storage duration that is not explicitly initialized is initially in an indeterminate state.

12652 The <stdatomic.h> header shall define the macro `kill_dependency()` which shall behave as  
 12653 described in *kill\_dependency()*.

12654 The <stdatomic.h> header shall declare the following generic functions, where *A* refers to an  
 12655 atomic type, *C* refers to its corresponding non-atomic type, and *M* is *C* for atomic integer types  
 12656 or `ptrdiff_t` for atomic pointer types.

```

12657     _Bool    atomic_compare_exchange_strong(volatile A *, C *, C);
12658     _Bool    atomic_compare_exchange_strong_explicit(volatile A *,
12659             C *, C, memory_order, memory_order);
12660     _Bool    atomic_compare_exchange_weak(volatile A *, C *, C);
12661     _Bool    atomic_compare_exchange_weak_explicit(volatile A *, C *,
12662             C, memory_order, memory_order);
12663     C        atomic_exchange(volatile A *, C);
12664     C        atomic_exchange_explicit(volatile A *, C, memory_order);
12665     C        atomic_fetch_add(volatile A *, M);
12666     C        atomic_fetch_add_explicit(volatile A *, M,
12667             memory_order);
12668     C        atomic_fetch_and(volatile A *, M);
12669     C        atomic_fetch_and_explicit(volatile A *, M,
12670             memory_order);
12671     C        atomic_fetch_or(volatile A *, M);
12672     C        atomic_fetch_or_explicit(volatile A *, M, memory_order);
12673     C        atomic_fetch_sub(volatile A *, M);
12674     C        atomic_fetch_sub_explicit(volatile A *, M,
12675             memory_order);
12676     C        atomic_fetch_xor(volatile A *, M);
12677     C        atomic_fetch_xor_explicit(volatile A *, M,
12678             memory_order);
12679     void     atomic_init(volatile A *, C);
12680     _Bool    atomic_is_lock_free(const volatile A *);
12681     C        atomic_load(const volatile A *);

```

```

12682     C      atomic_load_explicit(const volatile A *, memory_order);
12683     void    atomic_store(volatile A *, C);
12684     void    atomic_store_explicit(volatile A *, C, memory_order);

```

12685 It is unspecified whether any generic function declared in <stdatomic.h> is a macro or an  
 12686 identifier declared with external linkage. If a macro definition is suppressed in order to access an  
 12687 actual function, or a program defines an external identifier with the name of a generic function,  
 12688 the behavior is undefined.

12689 The following shall be declared as functions and may also be defined as macros. Function  
 12690 prototypes shall be provided.

```

12691     void    atomic_flag_clear(volatile atomic_flag *);
12692     void    atomic_flag_clear_explicit(volatile atomic_flag *,
12693                                     memory_order);
12694     _Bool   atomic_flag_test_and_set(volatile atomic_flag *);
12695     _Bool   atomic_flag_test_and_set_explicit(
12696                                     volatile atomic_flag *, memory_order);
12697     void    atomic_signal_fence(memory_order);
12698     void    atomic_thread_fence(memory_order);

```

#### 12699 APPLICATION USAGE

12700 None.

#### 12701 RATIONALE

12702 Since operations on the **atomic\_flag** type are lock free, the operations should also be address-  
 12703 free. No other type requires lock-free operations, so the **atomic\_flag** type is the minimum  
 12704 hardware-implemented type needed to conform to this standard. The remaining types can be  
 12705 emulated with **atomic\_flag**, though with less than ideal properties.

12706 The representation of atomic integer types need not have the same size as their corresponding  
 12707 regular types. They should have the same size whenever possible, as it eases effort required to  
 12708 port existing code.

#### 12709 FUTURE DIRECTIONS

12710 The ISO C standard states that the macro `ATOMIC_VAR_INIT` is an obsolescent feature. This  
 12711 macro may be removed in a future version of this standard.

#### 12717 CHANGE HISTORY

12718 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

12719 **NAME**12720         **stdarg.h** — handle variable argument list12721 **SYNOPSIS**

```
12722         #include <stdarg.h>
12723         void va_start(va_list ap, argN);
12724         void va_copy(va_list dest, va_list src);
12725         type va_arg(va_list ap, type);
12726         void va_end(va_list ap);
```

12727 **DESCRIPTION**

12728 CX         The functionality described on this reference page is aligned with the ISO C standard. Any  
12729         conflict between the requirements described here and the ISO C standard is unintentional. This  
12730         volume of POSIX.1-2024 defers to the ISO C standard.

12731         The **<stdarg.h>** header shall contain a set of macros which allows portable functions that accept  
12732         variable argument lists to be written. Functions that have variable argument lists (such as  
12733         *printf()*) but do not use these macros are inherently non-portable, as different systems use  
12734         different argument-passing conventions.

12735         The **<stdarg.h>** header shall define the **va\_list** type for variables used to traverse the list.

12736         The *va\_start()* macro is invoked to initialize *ap* to the beginning of the list before any calls to  
12737         *va\_arg()*.

12738         The *va\_copy()* macro initializes *dest* as a copy of *src*, as if the *va\_start()* macro had been applied  
12739         to *dest* followed by the same sequence of uses of the *va\_arg()* macro as had previously been used  
12740         to reach the present state of *src*. Neither the *va\_copy()* nor *va\_start()* macro shall be invoked to  
12741         reinitialize *dest* without an intervening invocation of the *va\_end()* macro for the same *dest*.

12742         The object *ap* may be passed as an argument to another function; if that function invokes the  
12743         *va\_arg()* macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall  
12744         be passed to the *va\_end()* macro prior to any further reference to *ap*. The parameter *argN* is the  
12745         identifier of the rightmost parameter in the variable parameter list in the function definition (the  
12746         one just before the *...*). If the parameter *argN* is declared with the **register** storage class, with a  
12747         function type or array type, or with a type that is not compatible with the type that results after  
12748         application of the default argument promotions, the behavior is undefined.

12749         The *va\_arg()* macro shall return the next argument in the list pointed to by *ap*. Each invocation  
12750         of *va\_arg()* modifies *ap* so that the values of successive arguments are returned in turn. The *type*  
12751         parameter shall be a type name specified such that the type of a pointer to an object that has the  
12752         specified type can be obtained simply by postfixing a '\*' to type. If there is no actual next  
12753         argument, or if *type* is not compatible with the type of the actual next argument (as promoted  
12754         according to the default argument promotions), the behavior is undefined, except for the  
12755         following cases:

- 12756                 • One type is a signed integer type, the other type is the corresponding unsigned integer  
12757                 type, and the value is representable in both types.
- 12758                 • One type is a pointer to **void** and the other is a pointer to a character type.
- 12759 XSI            • Both types are pointers.

12760         Different types can be mixed, but it is up to the routine to know what type of argument is  
12761         expected.

12762         The *va\_end()* macro is used to clean up; it invalidates *ap* for use (unless *va\_start()* or *va\_copy()* is  
12763         invoked again).

12764 Each invocation of the *va\_start()* and *va\_copy()* macros shall be matched by a corresponding  
 12765 invocation of the *va\_end()* macro in the same function.

12766 Multiple traversals, each bracketed by *va\_start()* ... *va\_end()*, are possible.

#### 12767 EXAMPLES

12768 This example is a possible implementation of *execl()*:

```
12769 #include <stdarg.h>
12770 #define MAXARGS 31
12771 /*
12772  * execl is called by
12773  * execl(file, arg1, arg2, ..., (char *) (0));
12774  */
12775 int execl(const char *file, const char *args, ...)
12776 {
12777     va_list ap;
12778     char *array[MAXARGS + 1];
12779     int argno = 0;
12780
12781     va_start(ap, args);
12782     while (args != 0 && argno < MAXARGS)
12783     {
12784         array[argno++] = args;
12785         args = va_arg(ap, const char *);
12786     }
12787     array[argno] = (char *) 0;
12788     va_end(ap);
12789     return execv(file, array);
12790 }
```

#### 12790 APPLICATION USAGE

12791 It is up to the calling routine to communicate to the called routine how many arguments there  
 12792 are, since it is not always possible for the called routine to determine this in any other way. For  
 12793 example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell  
 12794 how many arguments are there by the *format* argument.

#### 12795 RATIONALE

12796 None.

#### 12797 FUTURE DIRECTIONS

12798 None.

#### 12799 SEE ALSO

12800 XSH *exec*, *fprintf()*

#### 12801 CHANGE HISTORY

12802 First released in Issue 4. Derived from the ANSI C standard.

#### 12803 Issue 6

12804 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

12805 **NAME**

12806           stdbool.h — boolean type and values

12807 **SYNOPSIS**

12808           #include &lt;stdbool.h&gt;

12809 **DESCRIPTION**

12810 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
12811       conflict between the requirements described here and the ISO C standard is unintentional. This  
12812       volume of POSIX.1-2024 defers to the ISO C standard.

12813       The **<stdbool.h>** header shall define the following macros:12814       bool     Expands to **\_Bool**.

12815       true     Expands to the integer constant 1.

12816       false    Expands to the integer constant 0.

12817       \_\_bool\_true\_false\_are\_defined

12818           Expands to the integer constant 1.

12819       The macros true, false and \_\_bool\_true\_false\_are\_defined shall be suitable for use in **#if**  
12820       preprocessing directives.

12821 OB       An application can undefine and then possibly redefine the macros bool, true, and false.

12822 **APPLICATION USAGE**

12823       None.

12824 **RATIONALE**

12825       None.

12826 **FUTURE DIRECTIONS**

12827       The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature  
12828       and may be removed in a future version.

12829 **SEE ALSO**

12830       None.

12831 **CHANGE HISTORY**

12832       First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

12833 **Issue 8**

12834       Austin Group Defect 1257 is applied, correcting a mismatch with the ISO C standard by adding  
12835       the requirement for the integer-valued macros to be suitable for use in **#if** preprocessing  
12836       directives.

12837       Austin Group Defect 1302 is applied, adding OB shading to the statement that an application  
12838       can “undefine and then possibly redefine the macros bool, true, and false”.

12839 **NAME**  
 12840         stddef.h — standard type definitions

12841 **SYNOPSIS**  
 12842         #include <stddef.h>

12843 **DESCRIPTION**  
 12844 CX         The functionality described on this reference page is aligned with the ISO C standard. Any  
 12845             conflict between the requirements described here and the ISO C standard is unintentional. This  
 12846             volume of POSIX.1-2024 defers to the ISO C standard.

12847         The <stddef.h> header shall define the following macros:

12848 CX         **NULL**         Null pointer constant. The macro shall expand to an integer constant expression  
 12849             with the value 0 cast to type **void \***. Additionally, any pointer object whose  
 12850             representation has all bits set to zero, perhaps by *memset()* to 0 or by *calloc()*, shall  
 12851             be treated as a null pointer.

12852             *offsetof(type, member-designator)*  
 12853             Integer constant expression of type **size\_t**, the value of which is the offset in bytes  
 12854             to the structure member (*member-designator*), from the beginning of its structure  
 12855             (*type*).

12856         The <stddef.h> header shall define the following types:

12857         **max\_align\_t** Object type whose alignment is the greatest fundamental alignment.

12858         **ptrdiff\_t**         Signed integer type of the result of subtracting two pointers.

12859         **wchar\_t**         Integer type whose range of values can represent distinct codes for all members of  
 12860             the largest extended character set specified among the supported locales; the null  
 12861             character shall have the code value zero. Each member of the basic character set  
 12862             shall have a code value equal to its value when used as the lone character in an  
 12863             integer character constant if an implementation does not define  
 12864             \_\_STDC\_MB\_MIGHT\_NEQ\_WC\_\_.

12865         **size\_t**             Unsigned integer type of the result of the *sizeof* operator.

12866         The implementation shall support one or more programming environments in which the widths  
 12867         of **ptrdiff\_t**, **size\_t**, and **wchar\_t** are no greater than the width of type **long**. The names of these  
 12868         programming environments can be obtained using the *confstr()* function or the *getconf* utility.

12869 **APPLICATION USAGE**  
 12870         None.

12871 **RATIONALE**  
 12872         The ISO C standard does not require the **NULL** macro to include the cast to type **void \*** and  
 12873         specifies that the **NULL** macro be implementation-defined. POSIX.1-2024 requires the cast and  
 12874         therefore need not be implementation-defined.

12875         Likewise, the ISO C standard does not require a pointer object whose representation has all bits  
 12876         set to zero to be treated as a null pointer. While there has been historical hardware where non-  
 12877         zero patterns were more efficient for use as the canonical null pointer, no known POSIX system  
 12878         has tried to target such hardware. However, though unlikely in modern hardware, a compiler is  
 12879         still allowed to treat more than one bit pattern as a representation of the null pointer (all such  
 12880         patterns will compare equal to one another, and unequal to any pointer to any other object).  
 12881         Thus, applications should not assume that a pointer object with non-zero representation is not a  
 12882         null pointer.

12883 **FUTURE DIRECTIONS**

12884       None.

12885 **SEE ALSO**

12889 **CHANGE HISTORY**

12890       First released in Issue 4. Derived from the ANSI C standard.

12891 **Issue 7**

12892       This reference page is clarified with respect to macros and symbolic constants.

12893       SD5-XBD-ERN-53 is applied, updating the definition of **wchar\_t** to align with  
12894       ISO/IEC 9899:1999 standard, Technical Corrigendum 3.

12895 **Issue 8**

12896       Austin Group Defect 940 is applied, adding a requirement that any pointer object whose  
12897       representation has all bits set to zero is interpreted as a null pointer.

12898       Austin Group Defect 1302 is applied, adding **max\_align\_t**.

12899 **NAME**

12900           stdint.h — integer types

12901 **SYNOPSIS**

12902           #include <stdint.h>

12903 **DESCRIPTION**

12904 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 12905       Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 12906       enable the visibility of these symbols in this header.

12907       The <stdint.h> header shall declare sets of integer types having specified widths, and shall  
 12908       define corresponding sets of macros. It shall also define macros that specify limits of integer  
 12909       types corresponding to types defined in other standard headers.

12910       **Note:**     The “width” of an integer type is the number of bits used to store its value in a pure binary  
 12911       system; the actual type may use more bits than that (for example, a 28-bit type could be stored  
 12912       in 32 bits of actual storage). An  $N$ -bit signed type in two’s complement representation has  
 12913       values in the range  $-2^{N-1}$  to  $2^{N-1}-1$ , while an  $N$ -bit unsigned type has values in the range 0 to  
 12914        $2^N-1$ . While the ISO C standard also permits signed integers in sign-magnitude or one’s  
 12915       complement form, this standard requires an implementation to use two’s complement  
 12916       representation for the standard integer types.

12917       Types are defined in the following categories:

- 12918           • Integer types having certain exact widths
- 12919           • Integer types having at least certain specified widths
- 12920           • Fastest integer types having at least certain specified widths
- 12921           • Integer types wide enough to hold pointers to objects
- 12922           • Integer types having greatest width

12923       (Some of these types may denote the same type.)

12924       Corresponding macros specify limits of the declared types and construct suitable constants.

12925       For each type described herein that the implementation provides, the <stdint.h> header shall  
 12926       declare that **typedef** name and define the associated macros. Conversely, for each type described  
 12927       herein that the implementation does not provide, the <stdint.h> header shall not declare that  
 12928       **typedef** name, nor shall it define the associated macros. An implementation shall provide those  
 12929       types described as required, but need not provide any of the others (described as optional).

12930 **Integer Types**

12931       When **typedef** names differing only in the absence or presence of the initial  $u$  are defined, they  
 12932       shall denote corresponding signed and unsigned types as described in the ISO C standard,  
 12933       Section 6.2.5; an implementation providing one of these corresponding types shall also provide  
 12934       the other.

12935       In the following descriptions, the symbol  $N$  represents an unsigned decimal integer with no  
 12936       leading zeros (for example, 8 or 24, but not 04 or 048).

- 12937           • Exact-width integer types

12938           The **typedef** name **intN\_t** designates a signed integer type with width  $N$ , no padding bits,  
 12939           and a two’s-complement representation. Thus, **int8\_t** denotes such a signed integer type  
 12940           with a width of exactly 8 bits.

12941           The **typedef** name **uintN\_t** designates an unsigned integer type with width  $N$  and no

12942 padding bits. Thus, **uint24\_t** denotes such an unsigned integer type with a width of exactly  
12943 24 bits.

12944 CX The following types are required:  
12945 **int8\_t**  
12946 **int16\_t**  
12947 **int32\_t**  
12948 **uint8\_t**  
12949 **uint16\_t**  
12950 **uint32\_t**

12951 If an implementation provides integer types with width 64 that meet these requirements,  
12952 then the following types are required:

12953 **int64\_t**  
12954 **uint64\_t**

12955 CX In particular, this is the case if any of the following are true:  
12956 — The implementation supports the `_POSIX_V8_ILP32_OFFBIG` programming  
12957 environment and the application is being built in the `_POSIX_V8_ILP32_OFFBIG`  
12958 programming environment (see the Shell and Utilities volume of POSIX.1-2024, *c17*,  
12959 Programming Environments).  
12960 — The implementation supports the `_POSIX_V8_LP64_OFF64` programming  
12961 environment and the application is being built in the `_POSIX_V8_LP64_OFF64`  
12962 programming environment.  
12963 — The implementation supports the `_POSIX_V8_LPBIG_OFFBIG` programming  
12964 environment and the application is being built in the `_POSIX_V8_LPBIG_OFFBIG`  
12965 programming environment.

12966 If the representation of any of the standard types **short**, **int**, **long** or **long long** is not the  
12967 same as one of the above required types, an **intN\_t** type with that representation shall be  
12968 defined along with its **uintN\_t** counterpart.

12969 All other types of this form are optional.

12970 • Minimum-width integer types

12971 The **typedef** name **int\_leastN\_t** designates a signed integer type with a width of at least *N*,  
12972 such that no signed integer type with lesser size has at least the specified width. Thus,  
12973 **int\_least32\_t** denotes a signed integer type with a width of at least 32 bits.

12974 The **typedef** name **uint\_leastN\_t** designates an unsigned integer type with a width of at  
12975 least *N*, such that no unsigned integer type with lesser size has at least the specified width.  
12976 Thus, **uint\_least16\_t** denotes an unsigned integer type with a width of at least 16 bits.

12977 The following types are required:

12978 **int\_least8\_t**  
 12979 **int\_least16\_t**  
 12980 **int\_least32\_t**  
 12981 **int\_least64\_t**  
 12982 **uint\_least8\_t**  
 12983 **uint\_least16\_t**  
 12984 **uint\_least32\_t**  
 12985 **uint\_least64\_t**

12986 All other types of this form are optional.

- 12987 • Fastest minimum-width integer types

12988 Each of the following types designates an integer type that is usually fastest to operate  
 12989 with among all integer types that have at least the specified width.

12990 The designated type is not guaranteed to be fastest for all purposes; if the implementation  
 12991 has no clear grounds for choosing one type over another, it may simply pick some integer  
 12992 type satisfying the signedness and width requirements.

12993 The **typedef** name **int\_fastN\_t** designates the fastest signed integer type with a width of at  
 12994 least *N*. The **typedef** name **uint\_fastN\_t** designates the fastest unsigned integer type with  
 12995 a width of at least *N*.

12996 The following types are required:

12997 **int\_fast8\_t**  
 12998 **int\_fast16\_t**  
 12999 **int\_fast32\_t**  
 13000 **int\_fast64\_t**  
 13001 **uint\_fast8\_t**  
 13002 **uint\_fast16\_t**  
 13003 **uint\_fast32\_t**  
 13004 **uint\_fast64\_t**

13005 All other types of this form are optional.

- 13006 • Integer types capable of holding object pointers

13007 The following type designates a signed integer type with the property that any valid  
 13008 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
 13009 the result shall compare equal to the original pointer:

13010 **intptr\_t**

13011 The following type designates an unsigned integer type with the property that any valid  
 13012 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
 13013 the result shall compare equal to the original pointer:

13014 **uintptr\_t**

13015 XSI On XSI-conformant systems, the **intptr\_t** and **uintptr\_t** types are required; otherwise, they  
 13016 are optional.

- 13017 • Greatest-width integer types

13018 CX The following type designates a signed integer type using two's complement  
 13019 representation capable of representing any value of any signed integer type:

13020 **intmax\_t**

13021 The following type designates an unsigned integer type capable of representing any value  
13022 of any unsigned integer type:

13023 **uintmax\_t**

13024 These types are required.

13025 **Note:** Applications can test for optional types by using the corresponding limit macro from [Limits of](#)  
13026 [Specified-Width Integer Types](#).

13027 **Limits of Specified-Width Integer Types**

13028 The following macros specify the minimum and maximum limits of the types declared in the  
13029 <stdint.h> header. Each macro name corresponds to a similar type name in [Integer Types](#) (on  
13030 page 369).

13031 Each instance of any defined macro shall be replaced by a constant expression suitable for use in  
13032 #if preprocessing directives, and this expression shall have the same type as would an  
13033 expression that is an object of the corresponding type converted according to the integer  
13034 promotions. Its implementation-defined value shall be equal to or greater in magnitude  
13035 (absolute value) than the corresponding value given below, with the same sign, except where  
13036 stated to be exactly the given value.

13037 • Limits of exact-width integer types

13038 — Minimum values of exact-width signed integer types:

13039 {INTN\_MIN} Exactly  $-(2^{N-1})$

13040 — Maximum values of exact-width signed integer types:

13041 {INTN\_MAX} Exactly  $2^{N-1} - 1$

13042 — Maximum values of exact-width unsigned integer types:

13043 {UINTN\_MAX} Exactly  $2^N - 1$

13044 • Limits of minimum-width integer types

13045 — Minimum values of minimum-width signed integer types:

13046 CX {INT\_LEASTN\_MIN}  $-(2^{N-1})$

13047 — Maximum values of minimum-width signed integer types:

13048 {INT\_LEASTN\_MAX}  $2^{N-1} - 1$

13049 — Maximum values of minimum-width unsigned integer types:

13050 {UINT\_LEASTN\_MAX}  $2^N - 1$

13051 • Limits of fastest minimum-width integer types

13052 — Minimum values of fastest minimum-width signed integer types:

13053 CX {INT\_FASTN\_MIN}  $-(2^{N-1})$

13054 — Maximum values of fastest minimum-width signed integer types:

- 13055                    {INT\_FASTN\_MAX}         $2^{N-1} - 1$
- 13056                    — Maximum values of fastest minimum-width unsigned integer types:
- 13057                    {UINT\_FASTN\_MAX}         $2^N - 1$
- 13058                    • Limits of integer types capable of holding object pointers
- 13059                    — Minimum value of pointer-holding signed integer type:
- 13060 CX                    {INTPTR\_MIN}             $-(2^{15})$
- 13061                    — Maximum value of pointer-holding signed integer type:
- 13062                    {INTPTR\_MAX}             $2^{15} - 1$
- 13063                    — Maximum value of pointer-holding unsigned integer type:
- 13064                    {UINTPTR\_MAX}            $2^{16} - 1$
- 13065                    • Limits of greatest-width integer types
- 13066                    — Minimum value of greatest-width signed integer type:
- 13067 CX                    {INTMAX\_MIN}             $-(2^{63})$
- 13068                    — Maximum value of greatest-width signed integer type:
- 13069                    {INTMAX\_MAX}             $2^{63} - 1$
- 13070                    — Maximum value of greatest-width unsigned integer type:
- 13071                    {UINTMAX\_MAX}            $2^{64} - 1$

**Limits of Other Integer Types**

The following macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros shall be replaced by a constant expression suitable for use in #if preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

- 13080                    • Limits of **ptrdiff\_t**:
- 13081 CX                    {PTRDIFF\_MIN}            $-65\,536$
- 13082                    {PTRDIFF\_MAX}            $+65\,535$
- 13083                    • Limits of **sig\_atomic\_t**:
- 13084                    {SIG\_ATOMIC\_MIN}        See below.
- 13085                    {SIG\_ATOMIC\_MAX}        See below.
- 13086                    • Limit of **size\_t**:
- 13087                    {SIZE\_MAX}                $65\,535$
- 13088                    • Limits of **wchar\_t**:
- 13089                    {WCHAR\_MIN}             See below.

13090 {WCHAR\_MAX} See below.

13091 • Limits of **wint\_t**:

13092 {WINT\_MIN} See below.

13093 {WINT\_MAX} See below.

13094 If **sig\_atomic\_t** (see the **<signal.h>** header) is defined as a signed integer type, the value of  
 13095 {SIG\_ATOMIC\_MIN} shall be no greater than  $-127$  and the value of {SIG\_ATOMIC\_MAX} shall  
 13096 be no less than  $127$ ; otherwise, **sig\_atomic\_t** shall be defined as an unsigned integer type, and  
 13097 the value of {SIG\_ATOMIC\_MIN} shall be  $0$  and the value of {SIG\_ATOMIC\_MAX} shall be no  
 13098 less than  $255$ .

13099 If **wchar\_t** (see the **<stddef.h>** header) is defined as a signed integer type, the value of  
 13100 {WCHAR\_MIN} shall be no greater than  $-127$  and the value of {WCHAR\_MAX} shall be no less  
 13101 than  $127$ ; otherwise, **wchar\_t** shall be defined as an unsigned integer type, and the value of  
 13102 {WCHAR\_MIN} shall be  $0$  and the value of {WCHAR\_MAX} shall be no less than  $255$ .

13103 If **wint\_t** (see the **<wchar.h>** header) is defined as a signed integer type, the value of  
 13104 {WINT\_MIN} shall be no greater than  $-32767$  and the value of {WINT\_MAX} shall be no less  
 13105 than  $32767$ ; otherwise, **wint\_t** shall be defined as an unsigned integer type, and the value of  
 13106 {WINT\_MIN} shall be  $0$  and the value of {WINT\_MAX} shall be no less than  $65535$ .

### 13107 **Macros for Integer Constant Expressions**

13108 The following macros expand to integer constant expressions suitable for initializing objects that  
 13109 have integer types corresponding to types defined in the **<stdint.h>** header. Each macro name  
 13110 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*  
 13111 *integer types*.

13112 Each invocation of one of these macros shall expand to an integer constant expression suitable  
 13113 for use in **#if** preprocessing directives. The type of the expression shall have the same type as  
 13114 would an expression that is an object of the corresponding type converted according to the  
 13115 integer promotions. The value of the expression shall be that of the argument.

13116 The argument in any instance of these macros shall be an unsuffixed integer constant with a  
 13117 value that does not exceed the limits for the corresponding type.

13118 • Macros for minimum-width integer constant expressions

13119 The macro **INTN\_C(value)** shall expand to an integer constant expression corresponding to  
 13120 the type **int\_leastN\_t**. The macro **UINTN\_C(value)** shall expand to an integer constant  
 13121 expression corresponding to the type **uint\_leastN\_t**. For example, if **uint\_least64\_t** is a  
 13122 name for the type **unsigned long long**, then **UINT64\_C(0x123)** might expand to the integer  
 13123 constant **0x123ULL**.

13124 • Macros for greatest-width integer constant expressions

13125 The following macro expands to an integer constant expression having the value specified  
 13126 by its argument and the type **intmax\_t**:

13127 **INTMAX\_C(value)**

13128 The following macro expands to an integer constant expression having the value specified  
 13129 by its argument and the type **uintmax\_t**:

13130 **UINTMAX\_C(value)**

13131 **APPLICATION USAGE**

13132 None.

13133 **RATIONALE**

13134 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in  
13135 freestanding environments, which might not support the formatted I/O functions. In some  
13136 environments, if the formatted conversion support is not wanted, using this header instead of  
13137 the <inttypes.h> header avoids defining such a large number of macros.

13138 As a consequence of adding **int8\_t**, the following are true:

- 13139 • A byte is exactly 8 bits.
- 13140 • {CHAR\_BIT} has the value 8, {SCHAR\_MAX} has the value 127, {SCHAR\_MIN} has the  
13141 value -128, and {UCHAR\_MAX} has the value 255.

13142 Since the POSIX.1 standard explicitly requires 8-bit **char** with two's complement arithmetic, it is  
13143 easier for application writers if the same two's complement guarantees are extended to all of the  
13144 other standard integer types. Furthermore, in programming environments with a 32-bit **long**,  
13145 some POSIX.1 interfaces, such as *mrnd48()*, cannot be implemented if **long** does not use a two's  
13146 complement representation.

13147 **FUTURE DIRECTIONS**

13148 **typedef** names beginning with **int** or **uint** and ending with **\_t** may be added to the types defined  
13149 in the <stdint.h> header. Macro names beginning with **INT** or **UINT** and ending with **\_MAX**,  
13150 **\_MIN**, or **\_C** may be added to the macros defined in the <stdint.h> header.

13151 **SEE ALSO**

13152 &lt;inttypes.h&gt;, &lt;signal.h&gt;, &lt;stddef.h&gt;, &lt;wchar.h&gt;

13153 XSH Section 2.2 (on page 496)

13154 **CHANGE HISTORY**

13155 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

13156 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is applied.

13157 **Issue 7**

13158 ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #40 is applied.

13159 SD5-XBD-ERN-67 is applied.

13160 **Issue 8**13161 Austin Group Defect 1108 is applied, changing the maximum allowed value for all signed  
13162 integer minimum limits.

13163 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

13164 Austin Group Defect 1330 is applied, changing ``\_V7\_'' to ``\_V8\_''.

13165 **NAME**

13166           stdio.h — standard buffered input/output

13167 **SYNOPSIS**

13168           #include &lt;stdio.h&gt;

13169 **DESCRIPTION**

13170 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 13171       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 496) to  
 13172       enable the visibility of these symbols in this header.

13173       The **<stdio.h>** header shall define the following data types through **typedef**:

13174       **FILE**                A type containing information about a file. The **FILE** type may be an  
 13175       incomplete type.

13176       **fpos\_t**             A complete object type, other than an array type, capable of recording all  
 13177       the information needed to specify uniquely every position within a file.

13178       **off\_t**              As described in **<sys/types.h>**.

13179       **size\_t**             As described in **<stddef.h>**.

13180 CX       **ssize\_t**         As described in **<sys/types.h>**.

13181 CX       **va\_list**         As described in **<stdarg.h>**.

13182       The **<stdio.h>** header shall define the following macros which shall expand to integer constant  
 13183       expressions:

13184 CX       **BUFSIZ**         Size of **<stdio.h>** buffers. This shall expand to a positive value.

13185 CX       **L\_ctermid**       Maximum size of character array to hold *ctermid()* output.

13186 OB       **L\_tmpnam**        Maximum size of character array to hold *tmpnam()* output.

13187       The **<stdio.h>** header shall define the following macros which shall expand to integer constant  
 13188       expressions with distinct values:

13189       **\_IOFBF**            Input/output fully buffered.

13190       **\_IOLBF**            Input/output line buffered.

13191       **\_IONBF**            Input/output unbuffered.

13192       The **<stdio.h>** header shall define the following macros which shall expand to integer constant  
 13193       expressions with distinct values:

13194       **SEEK\_CUR**         Seek relative to current position.

13195       **SEEK\_END**         Seek relative to end-of-file.

13196       **SEEK\_SET**         Seek relative to start-of-file.

13197       The **<stdio.h>** header shall define the following macros which shall expand to integer constant  
 13198       expressions denoting implementation limits:

13199       **{FILENAME\_MAX}**    Maximum size in bytes of the longest pathname that the implementation  
 13200       guarantees can be opened.

13201       **{FOPEN\_MAX}**       Number of streams which the implementation guarantees can be open  
 13202       simultaneously. The value is at least eight.

13203 OB {TMP\_MAX} Minimum number of unique filenames generated by *tmpnam()*.  
 13204 Maximum number of times an application can call *tmpnam()* reliably. The  
 13205 value of {TMP\_MAX} is at least 25.

13206 OB XSI On XSI-conformant systems, the value of {TMP\_MAX} is at least 10 000.

13207 The <stdio.h> header shall define the following macro which shall expand to an integer constant  
 13208 expression with type **int** and a negative value:

13209 EOF End-of-file return value.

13210 The <stdio.h> header shall define NULL as described in <stddef.h>.

13211 The <stdio.h> header shall define the following macros which shall expand to expressions of  
 13212 type “pointer to FILE” that point to the FILE objects associated, respectively, with the standard  
 13213 error, input, and output streams:

13214 *stderr* Standard error output stream.  
 13215 *stdin* Standard input stream.  
 13216 *stdout* Standard output stream.

13217 The following shall be declared as functions and may also be defined as macros. Function  
 13218 prototypes shall be provided.

13219 void clearerr(FILE \*);  
 13220 CX char \*ctermid(char \*);  
 13221 int dprintf(int, const char \*restrict, ...)  
 13222 int fclose(FILE \*);  
 13223 CX FILE \*fdopen(int, const char \*);  
 13224 int feof(FILE \*);  
 13225 int ferror(FILE \*);  
 13226 int fflush(FILE \*);  
 13227 int fgetc(FILE \*);  
 13228 int fgetpos(FILE \*restrict, fpos\_t \*restrict);  
 13229 char \*fgets(char \*restrict, int, FILE \*restrict);  
 13230 CX int fileno(FILE \*);  
 13231 void flockfile(FILE \*);  
 13232 FILE \*fmemopen(void \*restrict, size\_t, const char \*restrict);  
 13233 FILE \*fopen(const char \*restrict, const char \*restrict);  
 13234 int fprintf(FILE \*restrict, const char \*restrict, ...);  
 13235 int fputc(int, FILE \*);  
 13236 int fputs(const char \*restrict, FILE \*restrict);  
 13237 size\_t fread(void \*restrict, size\_t, size\_t, FILE \*restrict);  
 13238 FILE \*freopen(const char \*restrict, const char \*restrict,  
 13239 FILE \*restrict);  
 13240 int fscanf(FILE \*restrict, const char \*restrict, ...);  
 13241 int fseek(FILE \*, long, int);  
 13242 CX int fseeko(FILE \*, off\_t, int);  
 13243 int fsetpos(FILE \*, const fpos\_t \*);  
 13244 long ftell(FILE \*);  
 13245 CX off\_t ftello(FILE \*);  
 13246 int ftrylockfile(FILE \*);  
 13247 void funlockfile(FILE \*);  
 13248 size\_t fwrite(const void \*restrict, size\_t, size\_t, FILE \*restrict);  
 13249 int getc(FILE \*);

```

13250     int      getchar(void);
13251 CX   int     getc_unlocked(FILE *);
13252     int      getchar_unlocked(void);
13253     ssize_t  getdelim(char **restrict, size_t *restrict, int,
13254                   FILE *restrict);
13255     ssize_t  getline(char **restrict, size_t *restrict, FILE *restrict);
13256     FILE *   *open_memstream(char **, size_t *);
13257     int      pclose(FILE *);
13258     void     perror(const char *);
13259 CX   FILE *   *popen(const char *, const char *);
13260     int      printf(const char *restrict, ...);
13261     int      putchar(int, FILE *);
13262     int      putchar(int);
13263 CX   int      putchar_unlocked(int, FILE *);
13264     int      putchar_unlocked(int);
13265     int      puts(const char *);
13266     int      remove(const char *);
13267     int      rename(const char *, const char *);
13268 CX   int      renameat(int, const char *, int, const char *);
13269     void     rewind(FILE *);
13270     int      scanf(const char *restrict, ...);
13271     void     setbuf(FILE *restrict, char *restrict);
13272     int      setvbuf(FILE *restrict, char *restrict, int, size_t);
13273     int      snprintf(char *restrict, size_t, const char *restrict, ...);
13274     int      sprintf(char *restrict, const char *restrict, ...);
13275     int      sscanf(const char *restrict, const char *restrict, ...);
13276     FILE *   *tmpfile(void);
13277 OB   char *   *tmpnam(char *);
13278     int      ungetc(int, FILE *);
13279 CX   int      vdprintf(int, const char *restrict, va_list);
13280     int      vfprintf(FILE *restrict, const char *restrict, va_list);
13281     int      vfscanf(FILE *restrict, const char *restrict, va_list);
13282     int      vprintf(const char *restrict, va_list);
13283     int      vscanf(const char *restrict, va_list);
13284     int      vsnprintf(char *restrict, size_t, const char *restrict,
13285                   va_list);
13286     int      vsprintf(char *restrict, const char *restrict, va_list);
13287     int      vsscanf(const char *restrict, const char *restrict, va_list);
13288 CX   Inclusion of the <stdio.h> header may also make visible all symbols from <stddef.h>.

```

**13289 APPLICATION USAGE**

13290 Since standard I/O streams may use an underlying file descriptor to access the file associated  
13291 with a stream, application developers need to be aware that {FOPEN\_MAX} streams may not be  
13292 available if file descriptors are being used to access files that are not associated with streams.

13293 Since the latest revision of the ISO C standard allows **FILE** to be an incomplete type (and POSIX  
13294 also allows it), portable applications can no longer allocate or copy an object of type **FILE**; only  
13295 pointers to objects of type **FILE** can be allocated.

13296 **RATIONALE**

13297 None.

13298 **FUTURE DIRECTIONS**

13299 None.

13300 **SEE ALSO**

13301 <stdarg.h>, <stddef.h>, <sys/types.h>

13308 **CHANGE HISTORY**

13309 First released in Issue 1. Derived from Issue 1 of the SVID.

13310 **Issue 5**

13311 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

13312 Large File System extensions are added.

13313 The constant *L\_cuserid* and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as  
 13314 extensions and LEGACY.

13315 The *cuserid()* and *getopt()* functions are marked LEGACY.

13316 **Issue 6**

13317 The constant *L\_cuserid* and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed  
 13318 as they were previously marked LEGACY.

13319 The *cuserid()*, *getopt()*, and *getw()* functions are removed as they were previously marked  
 13320 LEGACY.

13321 Several functions are marked as part of the Thread-Safe Functions option.

13322 This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the  
 13323 description of the **fpos\_t** type is now explicitly updated to exclude array types.

13324 Extensions beyond the ISO C standard are marked.

13325 **Issue 7**

13326 Austin Group Interpretation 1003.1-2001 #172 is applied, adding rationale about a conflict for the  
 13327 definition of {TMP\_MAX} with the ISO C standard.

13328 SD5-XBD-ERN-99 is applied, adding APPLICATION USAGE.

13329 The *dprintf()*, *fmemopen()*, *getdelim()*, *getline()*, *open\_memstream()*, and *vdprintf()* functions are  
 13330 added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

13331 The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 13332 Set Part 2.

13333 The *gets()*, *tmpnam()*, and *tempnam()* functions and the *L\_tmpnam* macro are marked  
 13334 obsolescent.

13335 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 13336 for the **off\_t** type is added.

13337 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0065 [291,427] is applied.

13338 **Issue 8**

13339 Austin Group Defect 1054 is applied, allowing **FILE** to be an incomplete type.

13340 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

13341 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

13342 **NAME**  
 13343        stdlib.h — standard library definitions

13344 **SYNOPSIS**  
 13345        #include <stdlib.h>

13346 **DESCRIPTION**  
 13347 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 13348        Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 13349        enable the visibility of these symbols in this header.

13350        The <stdlib.h> header shall define the following macros which shall expand to integer constant  
 13351        expressions:

13352 CX       EXIT\_FAILURE   Unsuccessful termination for *exit()*; the value shall be between 1 and 125  
 13353                            inclusive.

13354        EXIT\_SUCCESS   Successful termination for *exit()*; the value shall be 0.

13355        {RAND\_MAX}    Maximum value returned by *rand()*; at least 32 767.

13356        The <stdlib.h> header shall define the following macro which shall expand to a positive integer  
 13357        expression with type **size\_t**:

13358        {MB\_CUR\_MAX} Maximum number of bytes in a character specified by the current locale  
 13359                            (category *LC\_CTYPE*).

13360 CX       In the POSIX locale the value of {MB\_CUR\_MAX} shall be 1.

13361        The <stdlib.h> header shall define NULL as described in <stddef.h>.

13362        The <stdlib.h> header shall define the following data types through **typedef**:

13363        **div\_t**            Structure type returned by the *div()* function.

13364        **ldiv\_t**          Structure type returned by the *ldiv()* function.

13365        **lldiv\_t**         Structure type returned by the *lldiv()* function.

13366        **size\_t**          As described in <stddef.h>.

13367        **wchar\_t**         As described in <stddef.h>.

13368 CX       In addition, the <stdlib.h> header shall define the following symbolic constants and macros as  
 13369        described in <sys/wait.h>:

13370        WCOREDUMP  
 13371        WEXITSTATUS  
 13372        WIFEXITED  
 13373        WIFSIGNALED  
 13374        WIFSTOPPED  
 13375        WNOHANG  
 13376        WSTOPSIG  
 13377        WTERMSIG  
 13378        WUNTRACED

13379 CX       The <stdlib.h> header shall define the following symbolic constants as described in <fcntl.h>:

13380        O\_APPEND  
 13381        O\_CLOEXEC  
 13382        O\_CLOFORK

```

13383 SIO  O_DSYNC
13384 XSI  O_NOCTTY
13385     O_RDWR
13386 SIO  O_RSYNC
13387 CX   O_SYNC

```

13388 The following shall be declared as functions and may also be defined as macros. Function  
13389 prototypes shall be provided.

```

13390     _Noreturn void  _Exit(int);
13391 XSI  long          a64l(const char *);
13392     _Noreturn void  abort(void);
13393     int             abs(int);
13394     void            *aligned_alloc(size_t, size_t);
13395     int             at_quick_exit(void (*)(void));
13396     int             atexit(void (*)(void));
13397     double          atof(const char *);
13398     int             atoi(const char *);
13399     long            atol(const char *);
13400     long long       atoll(const char *);
13401     void            *bsearch(const void *, const void *, size_t, size_t,
13402                             int (*)(const void *, const void *));
13403     void            *calloc(size_t, size_t);
13404     div_t           div(int, int);
13405 XSI  double        drand48(void);
13406     double          erand48(unsigned short [3]);
13407     _Noreturn void  exit(int);
13408     void            free(void *);
13409     char            *getenv(const char *);
13410 CX   int           getsubopt(char **restrict, char *const *restrict,
13411                             char **restrict);
13412 XSI  int           grantpt(int);
13413     char            *initstate(unsigned, char *, size_t);
13414     long            jrand48(unsigned short [3]);
13415     char            *l64a(long);
13416     long            labs(long);
13417 XSI  void          lcong48(unsigned short [7]);
13418     ldiv_t          ldiv(long, long);
13419     long long       llabs(long long);
13420     lldiv_t         lldiv(long long, long long);
13421 XSI  long          lrand48(void);
13422     void            *malloc(size_t);
13423     int             mblen(const char *, size_t);
13424     size_t          mbstowcs(wchar_t *restrict, const char *restrict,
13425                             size_t);
13426     int             mbtowc(wchar_t *restrict, const char *restrict, size_t);
13427 CX   char            *mkdtemp(char *);
13428     int             mkostemp(char *, int);
13429     int             mkstemp(char *);
13430 XSI  long          mrand48(void);
13431     long            nrand48(unsigned short [3]);

```

```

13432 ADV int posix_memalign(void **, size_t, size_t);
13433 XSI int posix_openpt(int);
13434 char *ptsname(int);
13435 int ptsname_r(int, char *, size_t);
13436 int putenv(char *);
13437 void qsort(void *, size_t, size_t, int (*)(const void *,
13438 const void *));
13439 _Noreturn void quick_exit(int);
13440 CX void qsort_r(void *, size_t, size_t, int (*)(const void *,
13441 const void *, void *), void *);
13442 int rand(void);
13443 XSI long random(void);
13444 void *realloc(void *, size_t);
13445 CX void *reallocarray(void *, size_t, size_t);
13446 char *realpath(const char *restrict, char *restrict);
13447 char *secure_getenv(const char *);
13448 XSI unsigned short *seed48(unsigned short [3]);
13449 CX int setenv(const char *, const char *, int);
13450 OB XSI void setkey(const char *);
13451 XSI char *setstate(char *);
13452 void srand(unsigned);
13453 XSI void srand48(long);
13454 void *srandom(unsigned);
13455 double strtod(const char *restrict, char **restrict);
13456 float strtof(const char *restrict, char **restrict);
13457 long strtol(const char *restrict, char **restrict, int);
13458 long double strtold(const char *restrict, char **restrict);
13459 long long strtoll(const char *restrict, char **restrict, int);
13460 unsigned long strtoul(const char *restrict, char **restrict, int);
13461 unsigned long long strtoull(const char *restrict, char **restrict, int);
13462 int system(const char *);
13464 XSI int unlockpt(int);
13465 CX int unsetenv(const char *);
13466 size_t wcstombs(char *restrict, const wchar_t *restrict,
13467 size_t);
13468 int wctomb(char *, wchar_t);

13469 CX Inclusion of the <stdlib.h> header may also make visible all symbols from <fcntl.h>, <limits.h>,
13470 <math.h>, <stddef.h>, and <sys/wait.h>.

```

**APPLICATION USAGE**

None.

**RATIONALE**

The ISO C standard requires that `exit(EXIT_FAILURE)` returns “unsuccessful termination status” to the host environment. In a POSIX host environment this means that the lower 8 bits of `EXIT_FAILURE` must have at least one bit set. The standard developers decided to further restrict the allowed values for the following reasons:

- Exit statuses of 126 and greater are ambiguous in certain circumstances because they have special meanings in the shell (see XCU Section 2.8.2 (on page 2499) and the EXIT STATUS section of *sh*).

- 13481 • The *xargs* utility quits when a command execution exits with status 255 (see XCU *xargs*).
- 13482 • Calling *exit()* with a value greater than 255 or less than 0 is something that only programs
- 13483 which are specifically designed to have their exit status obtained by *waitid()* should do
- 13484 (since it does not truncate the exit status to 8 bits). “Pure ISO C” programs that call
- 13485 *exit* (`EXIT_FAILURE`) do not meet this design criterion.

13486 The requirement that the value of `EXIT_SUCCESS` is 0 is not shaded CX because this matches the  
 13487 requirement in the ISO C standard that *exit* (`EXIT_SUCCESS`) returns “successful termination  
 13488 status” to the host environment (when the host environment is a POSIX implementation).

13489 **FUTURE DIRECTIONS**

13490 None.

13491 **SEE ALSO**

13492 <limits.h>, <math.h>, <stddef.h>, <sys/types.h>, <sys/wait.h>

13498 **CHANGE HISTORY**

13499 First released in Issue 3.

13500 **Issue 5**

13501 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

13502 The *ttyslot()* and *valloc()* functions are marked LEGACY.

13503 The type of the third argument to *initstate()* is changed from **int** to **size\_t**. The type of the return  
 13504 value from *setstate()* is changed from **char** to **char \***, and the type of the first argument is  
 13505 changed from **char \*** to **const char \***.

13506 **Issue 6**

13507 The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath()* to be  
 13508 consistent with the reference page.

13509 The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv()* to be  
 13510 consistent with the reference page.

13511 The *rand\_r()* function is marked as part of the Thread-Safe Functions option.

13512 Function prototypes for *setenv()* and *unsetenv()* are added.

13513 The *posix\_memalign()* function is added for alignment with IEEE Std 1003.1d-1999.

13514 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

13515 The *ecvt()*, *fcvt()*, *gcvt()*, and *mktemp()* functions are marked LEGACY.

13516 The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.

13517 Extensions beyond the ISO C standard are marked.

13518 **Issue 7**

13519 SD5-XBD-ERN-79 and SD5-XBD-ERN-105 are applied.

13520 The LEGACY functions are removed.

13521 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API

- 13522 Set Part 1.
- 13523 The *rand\_r()* function is marked obsolescent.
- 13524 This reference page is clarified with respect to macros and symbolic constants.
- 13525 The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.
- 13526 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0066 [197] is applied.
- 13527 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0075 [663] is applied.
- 13528 **Issue 8**
- 13529 Austin Group Defect 411 is applied, adding *mkostemp()*.
- 13530 Austin Group Defect 444 is applied, adding the **restrict** keyword to the *getsubopt()* prototype.
- 13531 Austin Group Defect 508 is applied, adding the *ptsname\_r()* function.
- 13532 Austin Group Defects 593 and 1350 are applied, adding some *O\_\** symbolic constants and  
13533 allowing **<stdlib.h>** to make visible all symbols from **<fcntl.h>**.
- 13534 Austin Group Defect 900 is applied, adding the *qsort\_r()* function.
- 13535 Austin Group Defect 922 is applied, adding the *secure\_getenv()* function.
- 13536 Austin Group Defect 1141 is applied, adding WCOREDUMP.
- 13537 Austin Group Defect 1192 is applied, marking the *setkey()* function as obsolescent.
- 13538 Austin Group Defect 1218 is applied, adding *reallocarray()*.
- 13539 Austin Group Defect 1229 is applied, changing the descriptions of EXIT\_FAILURE and  
13540 EXIT\_SUCCESS, and the RATIONALE section.
- 13541 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.
- 13542 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 13543 Austin Group Defect 1629 is applied, changing the RATIONALE section.
- 13544 Austin Group Defect 1663 is applied, removing XSI shading from *realpath()*.

13545 **NAME**

13546           stdnoreturn.h — noreturn macro

13547 **SYNOPSIS**

13548           #include &lt;stdnoreturn.h&gt;

13549 **DESCRIPTION**

13550 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
13551           conflict between the requirements described here and the ISO C standard is unintentional. This  
13552           volume of POSIX.1-2024 defers to the ISO C standard.

13553           The **<stdnoreturn.h>** header shall define the macro `noreturn` which shall expand to `_Noreturn`.13554 **APPLICATION USAGE**

13555           None.

13556 **RATIONALE**

13557           None.

13558 **FUTURE DIRECTIONS**

13559           None.

13560 **SEE ALSO**

13561           None.

13562 **CHANGE HISTORY**

13563           First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

13564 **NAME**

13565 string.h — string operations

13566 **SYNOPSIS**

13567 #include <string.h>

13568 **DESCRIPTION**

13569 CX Some of the functionality described on this reference page extends the ISO C standard.  
 13570 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 13571 enable the visibility of these symbols in this header.

13572 The <string.h> header shall define NULL and `size_t` as described in <stddef.h>.

13573 CX The <string.h> header shall define the `locale_t` type as described in <locale.h>.

13574 The following shall be declared as functions and may also be defined as macros. Function  
 13575 prototypes shall be provided for use with ISO C standard compilers.

```

13576 XSI void *memcpy(void *restrict, const void *restrict, int, size_t);
13577 void *memchr(const void *, int, size_t);
13578 int memcmp(const void *, const void *, size_t);
13579 void *memcpy(void *restrict, const void *restrict, size_t);
13580 CX void *memmem(const void *, size_t, const void *, size_t);
13581 void *memmove(void *, const void *, size_t);
13582 void *memset(void *, int, size_t);
13583 CX char *strcpy(char *restrict, const char *restrict);
13584 char *stpncpy(char *restrict, const char *restrict, size_t);
13585 char *strcat(char *restrict, const char *restrict);
13586 char *strchr(const char *, int);
13587 int strcmp(const char *, const char *);
13588 int strcoll(const char *, const char *);
13589 CX int strcoll_l(const char *, const char *, locale_t);
13590 char *strcpy(char *restrict, const char *restrict);
13591 size_t strcspn(const char *, const char *);
13592 CX char *strdup(const char *);
13593 char *strerror(int);
13594 CX char *strerror_l(int, locale_t);
13595 int strerror_r(int, char *, size_t);
13596 size_t strlcat(char *restrict, const char *restrict, size_t);
13597 size_t strlcpy(char *restrict, const char *restrict, size_t);
13598 size_t strlen(const char *);
13599 char *strncat(char *restrict, const char *restrict, size_t);
13600 int strncmp(const char *, const char *, size_t);
13601 char *strncpy(char *restrict, const char *restrict, size_t);
13602 CX char *strndup(const char *, size_t);
13603 size_t strnlen(const char *, size_t);
13604 char *strpbrk(const char *, const char *);
13605 char *strrchr(const char *, int);
13606 CX char *strsignal(int);
13607 size_t strspn(const char *, const char *);
13608 char *strstr(const char *, const char *);
13609 char *strtok(char *restrict, const char *restrict);
13610 CX char *strtok_r(char *restrict, const char *restrict, char **restrict);
13611 size_t strxfrm(char *restrict, const char *restrict, size_t);
    
```

```
13612 CX      size_t  strxfrm_l(char *restrict, const char *restrict,  
13613          size_t, locale_t);
```

13614 CX Inclusion of the **<string.h>** header may also make visible all symbols from **<stddef.h>**.

#### 13615 APPLICATION USAGE

13616 None.

#### 13617 RATIONALE

13618 None.

#### 13619 FUTURE DIRECTIONS

13620 None.

#### 13621 SEE ALSO

#### 13627 CHANGE HISTORY

13628 First released in Issue 1. Derived from Issue 1 of the SVID.

##### 13629 Issue 5

13630 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

##### 13631 Issue 6

13632 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.

13633 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

13634 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.

##### 13635 Issue 7

13636 SD5-XBD-ERN-15 is applied, correcting the prototype for the *strerror\_r()* function.

13637 The *stpncpy()*, *stpncpy()*, *strndup()*, *strlen()*, and *strsignal()* functions are added from The Open  
13638 Group Technical Standard, 2006, Extended API Set Part 1.

13639 The *strcoll\_l()*, *strerror\_l()*, and *strxfrm\_l()* functions are added from The Open Group Technical  
13640 Standard, 2006, Extended API Set Part 4.

13641 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
13642 for the **locale\_t** type is added.

##### 13643 Issue 8

13644 Austin Group Defect 986 is applied, adding *strlcat()* and *strlcpy()*.

13645 Austin Group Defect 1061 is applied, adding *memmem()*.

13646 **NAME**

13647 strings.h — string operations

13648 **SYNOPSIS**

13649 #include <strings.h>

13650 **DESCRIPTION**

13651 The following shall be declared as functions and may also be defined as macros. Function  
13652 prototypes shall be provided for use with ISO C standard compilers.

```
13653 XSI int ffs(int);
13654 int ffs1(long);
13655 int ffs11(long long);
13656 int strcasecmp(const char *, const char *);
13657 int strcasecmp_l(const char *, const char *, locale_t);
13658 int strncasecmp(const char *, const char *, size_t);
13659 int strncasecmp_l(const char *, const char *, size_t, locale_t);
```

13660 The <strings.h> header shall define the **locale\_t** type as described in <locale.h>.

13661 The <strings.h> header shall define the **size\_t** type as described in <sys/types.h>.

13662 **APPLICATION USAGE**

13663 None.

13664 **RATIONALE**

13665 None.

13666 **FUTURE DIRECTIONS**

13667 None.

13668 **SEE ALSO**

13669 <locale.h>, <sys/types.h>

13670 XSH *ffs()*, *strcasecmp()*

13671 **CHANGE HISTORY**

13672 First released in Issue 4, Version 2.

13673 **Issue 6**

13674 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index()* to be  
13675 consistent with the reference page.

13676 The *bcmp()*, *bcopy()*, *bzero()*, *index()*, and *rindex()* functions are marked LEGACY.

13677 **Issue 7**

13678 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

13679 The LEGACY functions are removed.

13680 The <strings.h> header is moved from the XSI option to the Base.

13681 The *strcasecmp\_l()* and *strncasecmp\_l()* functions are added from The Open Group Technical  
13682 Standard, 2006, Extended API Set Part 4.

13683 A declaration for the **locale\_t** type is added.

13684 **Issue 8**

13685 Austin Group Defect 617 is applied, adding *ffsl()* and *ffsll()*.

13686 **NAME**13687 `sys/ipc.h` — XSI interprocess communication access structure13688 **SYNOPSIS**13689 XSI `#include <sys/ipc.h>`13690 **DESCRIPTION**

13691 The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC):  
13692 messages, semaphores, and shared memory. All use a common structure type, **ipc\_perm**, to pass  
13693 information used in determining permission to perform an IPC operation.

13694 The **<sys/ipc.h>** header shall define the **ipc\_perm** structure, which shall include the following  
13695 members:

13696	<code>uid_t</code>	<code>uid</code>	Owner's user ID.
13697	<code>gid_t</code>	<code>gid</code>	Owner's group ID.
13698	<code>uid_t</code>	<code>cuid</code>	Creator's user ID.
13699	<code>gid_t</code>	<code>cgid</code>	Creator's group ID.
13700	<code>mode_t</code>	<code>mode</code>	Read/write permission.

13701 The **<sys/ipc.h>** header shall define the **uid\_t**, **gid\_t**, **mode\_t**, and **key\_t** types as described in  
13702 **<sys/types.h>**.

13703 The **<sys/ipc.h>** header shall define the following symbolic constants.

13704 Mode bits:

13705	<code>IPC_CREAT</code>	Create entry if key does not exist.
13706	<code>IPC_EXCL</code>	Fail if key exists.
13707	<code>IPC_NOWAIT</code>	Error if request would need to wait.

13708 Keys:

13709	<code>IPC_PRIVATE</code>	Private key.
-------	--------------------------	--------------

13710 Control commands:

13711	<code>IPC_RMID</code>	Remove identifier.
13712	<code>IPC_SET</code>	Set options.
13713	<code>IPC_STAT</code>	Get options.

13714 The following shall be declared as a function and may also be defined as a macro. A function  
13715 prototype shall be provided.

13716 `key_t ftok(const char *, int);`

13717 **APPLICATION USAGE**

13718 None.

13719 **RATIONALE**

13720 None.

13721 **FUTURE DIRECTIONS**

13722 None.

13723 **SEE ALSO**13724        [<sys/types.h>](#)13725        XSH *ftok()*13726 **CHANGE HISTORY**

13727        First released in Issue 2. Derived from System V Release 2.0.

13728 **Issue 7**

13729        This reference page is clarified with respect to macros and symbolic constants.

13730 **Issue 8**

13731        The description of IPC\_NOWAIT is updated to eliminate the use of ``must''.

13732 **NAME**

13733 sys/mman.h — memory management declarations

13734 **SYNOPSIS**

13735 #include <sys/mman.h>

13736 **DESCRIPTION**

13737 The <sys/mman.h> header shall define the following symbolic constants for use as protection  
13738 options:

13739 PROT\_EXEC Page can be executed.

13740 PROT\_NONE Page cannot be accessed.

13741 PROT\_READ Page can be read.

13742 PROT\_WRITE Page can be written.

13743 The <sys/mman.h> header shall define the following symbolic constants for use as flag options:

13744 MAP\_ANON Synonym for MAP\_ANONYMOUS. MAP\_ANON shall have the same  
13745 value as MAP\_ANONYMOUS.

13746 MAP\_ANONYMOUS Map anonymous memory.

13747 MAP\_FIXED Interpret *addr* exactly.

13748 MAP\_PRIVATE Changes are private.

13749 MAP\_SHARED Share changes.

13750 XSI|SIO The <sys/mman.h> header shall define the following symbolic constants for the *msync()*  
13751 function:

13752 MS\_ASYNC Perform asynchronous writes.

13753 MS\_INVALIDATE Invalidate mappings.

13754 MS\_SYNC Perform synchronous writes.

13755 ML The <sys/mman.h> header shall define the following symbolic constants for the *mlockall()*  
13756 function:

13757 MCL\_CURRENT Lock currently mapped pages.

13758 MCL\_FUTURE Lock pages that become mapped.

13759 The <sys/mman.h> header shall define the symbolic constant MAP\_FAILED which shall have  
13760 type **void \*** and shall be used to indicate a failure from the *mmap()* function .

13761 ADV If the Advisory Information option is supported, the <sys/mman.h> header shall define  
13762 symbolic constants for the *advice* argument to the *posix\_madvise()* function as follows:

13763 POSIX\_MADV\_DONTNEED

13764 The application expects that it will not access the specified range in the near future.

13765 POSIX\_MADV\_NORMAL

13766 The application has no advice to give on its behavior with respect to the specified range. It  
13767 is the default characteristic if no advice is given for a range of memory.

13768 POSIX\_MADV\_RANDOM  
 13769 The application expects to access the specified range in a random order.

13770 POSIX\_MADV\_SEQUENTIAL  
 13771 The application expects to access the specified range sequentially from lower addresses to  
 13772 higher addresses.

13773 POSIX\_MADV\_WILLNEED  
 13774 The application expects to access the specified range in the near future.

13775 TYM The <sys/mman.h> header shall define the following symbolic constants for use as flags for the  
 13776 *posix\_typed\_mem\_open()* function:

13777 POSIX\_TYPED\_MEM\_ALLOCATE  
 13778 Allocate on *mmap()*.

13779 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG  
 13780 Allocate contiguously on *mmap()*.

13781 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE  
 13782 Map on *mmap()*, without affecting allocatability.

13783 The <sys/mman.h> header shall define the **mode\_t**, **off\_t**, and **size\_t** types as described in  
 13784 <sys/types.h>.

13785 TYM The <sys/mman.h> header shall define the **posix\_typed\_mem\_info** structure, which shall  
 13786 include at least the following member:

13787 `size_t posix_tmi_length` Maximum length which may be allocated  
 13788 from a typed memory object.

13789 The <sys/mman.h> header shall define the following symbolic constants as described in  
 13790 <fcntl.h>:

13791 SHM|TYM O\_RDONLY  
 13792 O\_RDWR  
 13793 TYM O\_WRONLY  
 13794 O\_CLOEXEC  
 13795 O\_CLOFORK  
 13796 SHM O\_CREAT  
 13797 O\_EXCL  
 13798 O\_TRUNC

13799 The following shall be declared as functions and may also be defined as macros. Function  
 13800 prototypes shall be provided.

13801 MLR `int mlock(const void *, size_t);`  
 13802 ML `int mlockall(int);`  
 13803 `void *mmap(void *, size_t, int, int, int, off_t);`  
 13804 `int mprotect(void *, size_t, int);`  
 13805 XSI|SIO `int msync(void *, size_t, int);`  
 13806 MLR `int munlock(const void *, size_t);`  
 13807 ML `int munlockall(void);`  
 13808 `int munmap(void *, size_t);`

```

13809 ADV      int      posix_madvise(void *, size_t, int);
13810 TYM      int      posix_mem_offset(const void *restrict, size_t, off_t *restrict,
13811           size_t *restrict, int *restrict);
13812           int      posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
13813           int      posix_typed_mem_open(const char *, int, int);
13814 SHM      int      shm_open(const char *, int, mode_t);
13815           int      shm_unlink(const char *);

```

13816 Inclusion of the <sys/mman.h> header may make visible all symbols from the <fcntl.h> header.

### 13817 APPLICATION USAGE

### 13828 CHANGE HISTORY

13829 First released in Issue 4, Version 2.

#### 13830 Issue 5

13831 Updated for alignment with the POSIX Realtime Extension.

#### 13832 Issue 6

13833 The <sys/mman.h> header is marked as dependent on support for either the Memory Mapped  
13834 Files, Process Memory Locking, or Shared Memory Objects options.

13835 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 13836 • The TYM margin code is added to the list of margin codes for the <sys/mman.h> header  
13837 line, as well as for other lines.
- 13838 • The POSIX\_TYPED\_MEM\_ALLOCATE, POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG,  
13839 and POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flags are added.
- 13840 • The **posix\_tmi\_length** structure is added.
- 13841 • The *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, and *posix\_typed\_mem\_open()* functions  
13842 are added.

13843 The **restrict** keyword is added to the prototype for *posix\_mem\_offset()*.

13844 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for *posix\_madvise()*.

13845 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and  
13846 shading errors for the *mlock()* and *munlock()* functions.

13847 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code  
13848 for the *mmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM).

13849 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code

- 13850 for the *munmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM).
- 13851 **Issue 7**
- 13852 SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.
- 13853 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to
- 13854 the Base.
- 13855 This reference page is clarified with respect to macros and symbolic constants.
- 13856 **Issue 8**
- 13857 Austin Group Defect 593 is applied, adding O\_RDONLY, O\_RDWR, O\_WRONLY, O\_CLOEXEC,
- 13858 O\_CLOFORK, O\_CREAT, O\_EXCL, and O\_TRUNC, and allowing <sys/mman.h> to make
- 13859 visible all symbols from <fcntl.h>.
- 13860 Austin Group Defect 850 is applied, adding MAP\_ANON and MAP\_ANONYMOUS.

13861 **NAME**

13862 sys/msg.h — XSI message queue structures

13863 **SYNOPSIS**13864 XSI `#include <sys/msg.h>`13865 **DESCRIPTION**13866 The <sys/msg.h> header shall define the following data types through **typedef**:13867 **msgqnum\_t** Used for the number of messages in the message queue.13868 **msglen\_t** Used for the number of bytes allowed in a message queue.13869 These types shall be unsigned integer types that are able to store values at least as large as a type  
13870 **unsigned short**.13871 The <sys/msg.h> header shall define the following symbolic constant as a message operation  
13872 flag:13873 **MSG\_NOERROR** No error if big message.13874 The <sys/msg.h> header shall define the **msqid\_ds** structure, which shall include the following  
13875 members:

13876	<code>struct ipc_perm</code>	<code>msg_perm</code>	Operation permission structure.
13877	<code>msgqnum_t</code>	<code>msg_qnum</code>	Number of messages currently on queue.
13878	<code>msglen_t</code>	<code>msg_qbytes</code>	Maximum number of bytes allowed on queue.
13879	<code>pid_t</code>	<code>msg_lspid</code>	Process ID of last <i>msgsnd()</i> .
13880	<code>pid_t</code>	<code>msg_lrpid</code>	Process ID of last <i>msgrcv()</i> .
13881	<code>time_t</code>	<code>msg_stime</code>	Time of last <i>msgsnd()</i> .
13882	<code>time_t</code>	<code>msg_rtime</code>	Time of last <i>msgrcv()</i> .
13883	<code>time_t</code>	<code>msg_ctime</code>	Time of last change.

13884 The <sys/msg.h> header shall define the **pid\_t**, **size\_t**, **ssize\_t**, and **time\_t** types as described in  
13885 <sys/types.h>.13886 The following shall be declared as functions and may also be defined as macros. Function  
13887 prototypes shall be provided.

```

13888 int      msgctl(int, int, struct msqid_ds *);
13889 int      msgget(key_t, int);
13890 ssize_t  msgrcv(int, void *, size_t, long, int);
13891 int      msgsnd(int, const void *, size_t, int);

```

13892 In addition, the &lt;sys/msg.h&gt; header shall include the &lt;sys/ipc.h&gt; header.

13893 **APPLICATION USAGE**

13902 **CHANGE HISTORY**

13903 First released in Issue 2. Derived from System V Release 2.0.

13904 **Issue 7**

13905 Austin Group Interpretation 1003.1-2001 #179 is applied.

13906 This reference page is clarified with respect to macros and symbolic constants.

13907 **NAME**  
13908 sys/resource.h — definitions for resource operations

13909 **SYNOPSIS**  
13910 #include <sys/resource.h>

13911 **DESCRIPTION**

13912 XSI The <sys/resource.h> header shall define the following symbolic constants as possible values of  
13913 the *which* argument of *getpriority()* and *setpriority()*:  
13914 PRIO\_PROCESS Identifies the *who* argument as a process ID.  
13915 PRIO\_PGRP Identifies the *who* argument as a process group ID.  
13916 PRIO\_USER Identifies the *who* argument as a user ID.

13917 The <sys/resource.h> header shall define the following type through **typedef**:

13918 **rlim\_t** Unsigned integer type used for limit values.

13919 The <sys/resource.h> header shall define the following symbolic constants, which shall have  
13920 values suitable for use in **#if** preprocessing directives:

13921 RLIM\_INFINITY A value of **rlim\_t** indicating no limit.  
13922 RLIM\_SAVED\_MAX A value of type **rlim\_t** indicating an unrepresentable saved hard  
13923 limit.  
13924 RLIM\_SAVED\_CUR A value of type **rlim\_t** indicating an unrepresentable saved soft limit.

13925 On implementations where all resource limits are representable in an object of type **rlim\_t**,  
13926 RLIM\_SAVED\_MAX and RLIM\_SAVED\_CUR need not be distinct from RLIM\_INFINITY.

13927 XSI The <sys/resource.h> header shall define the following symbolic constants as possible values of  
13928 the *who* parameter of *getrusage()*:  
13929 RUSAGE\_SELF Returns information about the current process.  
13930 RUSAGE\_CHILDREN Returns information about children of the current process.

13931 The <sys/resource.h> header shall define the **rlimit** structure, which shall include at least the  
13932 following members:

13933 rlim\_t rlim\_cur The current (soft) limit.  
13934 rlim\_t rlim\_max The hard limit.

13935 XSI The <sys/resource.h> header shall define the **rusage** structure, which shall include at least the  
13936 following members:

13937 struct timeval ru\_utime User time used.  
13938 struct timeval ru\_stime System time used.

13939 The <sys/resource.h> header shall define the **timeval** structure as described in <sys/time.h>.

13940 The <sys/resource.h> header shall define the following symbolic constants as possible values for  
13941 the *resource* argument of *getrlimit()* and *setrlimit()*:

13942 RLIMIT\_CORE Limit on size of core image.  
13943 XSI RLIMIT\_CPU Limit on CPU time per process.

13944 RLIMIT\_DATA Limit on data segment size.

13945 RLIMIT\_FSIZE Limit on file size.

13946 RLIMIT\_NOFILE Limit on number of open files.

13947 RLIMIT\_STACK Limit on stack size.

13948 RLIMIT\_AS Limit on address space size.

13949 The following shall be declared as functions and may also be defined as macros. Function  
 13950 prototypes shall be provided.

13951 XSI `int getpriority(int, id_t);`

13952 `int getrlimit(int, struct rlimit *);`

13953 XSI `int getrusage(int, struct rusage *);`

13954 `int setpriority(int, id_t, int);`

13955 `int setrlimit(int, const struct rlimit *);`

13956 XSI The <sys/resource.h> header shall define the `id_t` type through `typedef`, as described in  
 13957 <sys/types.h>.

13958 Inclusion of the <sys/resource.h> header may also make visible all symbols from <sys/time.h>.

13959 **APPLICATION USAGE**

13960 None.

13961 **RATIONALE**

13962 None.

13967 XSH `getpriority()`, `getrlimit()`, `getrusage()`

13968 **CHANGE HISTORY**

13969 First released in Issue 4, Version 2.

13970 **Issue 5**

13971 Large File System extensions are added.

13972 **Issue 7**

13973 This reference page is clarified with respect to macros and symbolic constants.

13974 **Issue 8**

13975 Austin Group Defects 51 and 1669 are applied, moving the `getrlimit()` and `setrlimit()` functions,  
 13976 excluding the RLIMIT\_CPU limit, from the XSI option to the Base.

13977 Austin Group Defect 1141 is applied, changing the description of RLIMIT\_CORE.

**13978 NAME**

13979 sys/select.h — select types

**13980 SYNOPSIS**

13981 #include <sys/select.h>

**13982 DESCRIPTION**

13983 The **<sys/select.h>** header shall define the **timeval** structure, which shall include at least the  
13984 following members:

13985 time\_t tv\_sec Seconds.

13986 suseconds\_t tv\_usec Microseconds.

13987 The **<sys/select.h>** header shall define the **time\_t** and **suseconds\_t** types as described in  
13988 **<sys/types.h>**.

13989 The **<sys/select.h>** header shall define the **sigset\_t** type as described in **<signal.h>**.

13990 The **<sys/select.h>** header shall define the **timespec** structure as described in **<time.h>**.

13991 The **<sys/select.h>** header shall define the **fd\_set** type as a structure.

13992 The **<sys/select.h>** header shall define the following symbolic constant, which shall have a value  
13993 suitable for use in **#if** preprocessing directives:

13994 FD\_SETSIZE Maximum number of file descriptors in an **fd\_set** structure.

13995 The following shall be declared as functions, defined as macros, or both. If functions are  
13996 declared, function prototypes shall be provided.

13997 void FD\_CLR(int, fd\_set \*);

13998 int FD\_ISSET(int, const fd\_set \*);

13999 void FD\_SET(int, fd\_set \*);

14000 void FD\_ZERO(fd\_set \*);

14001 If implemented as macros, these may evaluate their arguments more than once, so applications  
14002 should ensure that the arguments they supply are never expressions with side-effects.

14003 The following shall be declared as functions and may also be defined as macros. Function  
14004 prototypes shall be provided.

14005 int pselect(int, fd\_set \*restrict, fd\_set \*restrict, fd\_set \*restrict,  
14006 const struct timespec \*restrict, const sigset\_t \*restrict);

14007 int select(int, fd\_set \*restrict, fd\_set \*restrict, fd\_set \*restrict,  
14008 struct timeval \*restrict);

14009 Inclusion of the **<sys/select.h>** header may make visible all symbols from the headers  
14010 **<signal.h>** and **<time.h>**.

**14011 APPLICATION USAGE**

14012 None.

**14013 RATIONALE**

14014 None.

**14015 FUTURE DIRECTIONS**

14016 None.

14017 **SEE ALSO**

14018       &lt;signal.h&gt;, &lt;sys/time.h&gt;, &lt;sys/types.h&gt;, &lt;time.h&gt;

14019       XSH *pselect()*14020 **CHANGE HISTORY**

14021       First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

14022       The requirement for the **fd\_set** structure to have a member *fds\_bits* has been removed as per The  
14023       Open Group Base Resolution bwg2001-005.14024 **Issue 7**

14025       SD5-XBD-ERN-6 is applied, reordering the DESCRIPTION.

14026       This reference page is clarified with respect to macros and symbolic constants.

14027 **Issue 8**14028       Austin Group Defect 220 is applied, adding `const` to the second parameter of *FD\_ISSET()*.

14029 **NAME**

14030 sys/sem.h — XSI semaphore facility

14031 **SYNOPSIS**14032 XSI `#include <sys/sem.h>`14033 **DESCRIPTION**14034 The **<sys/sem.h>** header shall define the following symbolic constant for use as a semaphore  
14035 operation flag:

14036 SEM\_UNDO Set up adjust on exit entry.

14037 The **<sys/sem.h>** header shall define the following symbolic constants for use as commands for  
14038 the *semctl()* function:14039 GETNCNT Get *semncnt*.14040 GETPID Get *sempid*.14041 GETVAL Get *semval*.14042 GETALL Get all cases of *semval*.14043 GETZCNT Get *semzcnt*.14044 SETVAL Set *semval*.14045 SETALL Set all cases of *semval*.14046 The **<sys/sem.h>** header shall define the **semid\_ds** structure, which shall include the following  
14047 members:

14048 struct ipc\_perm sem\_perm Operation permission structure.

14049 unsigned short sem\_nsems Number of semaphores in set.

14050 time\_t sem\_otime Last *semop()* time.14051 time\_t sem\_ctime Last time changed by *semctl()*.14052 The **<sys/sem.h>** header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
14053 **<sys/types.h>**.14054 A semaphore shall be represented by an anonymous structure, which shall include the following  
14055 members:

14056 unsigned short semval Semaphore value.

14057 pid\_t sempid Process ID of last operation.

14058 unsigned short semncnt Number of processes waiting for *semval*  
14059 to become greater than current value.14060 unsigned short semzcnt Number of processes waiting for *semval*  
14061 to become 0.14062 The **<sys/sem.h>** header shall define the **sembuf** structure, which shall include the following  
14063 members:

14064 unsigned short sem\_num Semaphore number.

14065 short sem\_op Semaphore operation.

14066 short sem\_flg Operation flags.

14067 The following shall be declared as functions and may also be defined as macros. Function  
14068 prototypes shall be provided.

14069 int semctl(int, int, int, ...);

```
14070     int    semget(key_t, int, int);
14071     int    semop(int, struct sembuf *, size_t);
```

14072 In addition, the <sys/sem.h> header shall include the <sys/ipc.h> header.

#### 14073 **APPLICATION USAGE**

14074 None.

14085 Austin Group Interpretation 1003.1-2001 #179 is applied.

14086 This reference page is clarified with respect to macros and symbolic constants.

14087 **NAME**

14088 sys/shm.h — XSI shared memory facility

14089 **SYNOPSIS**

14090 XSI #include <sys/shm.h>

14091 **DESCRIPTION**

14092 The <sys/shm.h> header shall define the following symbolic constants:

14093 SHM\_RDONLY Attach read-only (else read-write).

14094 SHM\_RND Round attach address to SHMLBA.

14095 SHMLBA Segment low boundary address multiple.

14096 The <sys/shm.h> header shall define the symbolic constant SHM\_FAILED which shall evaluate  
14097 to the same value as ((void\*)(intptr\_t)-1).

14098 The <sys/shm.h> header shall define the type **intptr\_t** as described in <stdint.h>.

14099 The <sys/shm.h> header shall define the following data type through **typedef**:

14100 **shmatt\_t** Unsigned integer used for the number of current attaches that shall be able to  
14101 store values at least as large as a type **unsigned short**.

14102 The <sys/shm.h> header shall define the **shmids** structure, which shall include the following  
14103 members:

14104	struct ipc_perm	shm_perm	Operation permission structure.
14105	size_t	shm_segsz	Size of segment in bytes.
14106	pid_t	shm_lpid	Process ID of last shared memory operation.
14107	pid_t	shm_cpid	Process ID of creator.
14108	shmatt_t	shm_nattch	Number of current attaches.
14109	time_t	shm_atime	Time of last <i>shmat</i> ().
14110	time_t	shm_dtime	Time of last <i>shmdt</i> ().
14111	time_t	shm_ctime	Time of last change by <i>shmctl</i> ().

14112 The <sys/shm.h> header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
14113 <sys/types.h>.

14114 The following shall be declared as functions and may also be defined as macros. Function  
14115 prototypes shall be provided.

```
14116 void *shmat(int, const void *, int);  
14117 int shmctl(int, int, struct shmids *);  
14118 int shmdt(const void *);  
14119 int shmget(key_t, size_t, int);
```

14120 In addition, the <sys/shm.h> header shall include the <sys/ipc.h> header.

14121 **APPLICATION USAGE**

14122 None.

14123 **RATIONALE**

14124 None.

14125 **FUTURE DIRECTIONS**

14126 None.

14127 **SEE ALSO**14128 [<sys/ipc.h>](#), [<sys/types.h>](#)14129 XSH [shmat\(\)](#), [shmctl\(\)](#), [shmdt\(\)](#), [shmget\(\)](#)14130 **CHANGE HISTORY**

14131 First released in Issue 2. Derived from System V Release 2.0.

14132 **Issue 5**14133 The type of *shm\_segsz* is changed from **int** to **size\_t**.14134 **Issue 7**

14135 Austin Group Interpretation 1003.1-2001 #179 is applied.

14136 This reference page is clarified with respect to macros and symbolic constants.

14137 **Issue 8**14138 Austin Group Defect 1239 is applied, adding SHM\_FAILED and requiring [<sys/shm.h>](#) to  
14139 define **intptr\_t**.

14140 **NAME**

14141 sys/socket.h — main sockets header

14142 **SYNOPSIS**

14143 #include &lt;sys/socket.h&gt;

14144 **DESCRIPTION**14145 The **<sys/socket.h>** header shall define the **socklen\_t** type, which is an integer type of width of  
14146 at least 32 bits; see APPLICATION USAGE.14147 The **<sys/socket.h>** header shall define the **sa\_family\_t** unsigned integer type.14148 The **<sys/socket.h>** header shall define the **sockaddr** structure, which shall include at least the  
14149 following members:14150 sa\_family\_t sa\_family Address family.  
14151 char sa\_data[] Socket address (variable-length data).14152 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,  
14153 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.14154 The **<sys/socket.h>** header shall define the **sockaddr\_storage** structure, which shall be:

- 14155 • Large enough to accommodate all supported protocol-specific address structures
- 
- 14156 • Aligned at an appropriate boundary so that pointers to it can be cast as pointers to
- 
- 14157 protocol-specific address structures and used to access the fields of those structures
- 
- 14158 without alignment problems

14159 The **sockaddr\_storage** structure shall include at least the following members:

14160 sa\_family\_t ss\_family

14161 When a pointer to a **sockaddr\_storage** structure is converted to a pointer to a **sockaddr**  
14162 structure, or vice versa, the *ss\_family* member of the **sockaddr\_storage** structure shall map onto  
14163 the *sa\_family* member of the **sockaddr** structure. When a pointer to a **sockaddr\_storage** structure  
14164 is converted to a pointer to a protocol-specific address structure, or vice versa, the *ss\_family*  
14165 member shall map onto a member of that structure that is of type **sa\_family\_t** that identifies the  
14166 protocol's address family. When a pointer to a **sockaddr** structure is converted to a pointer to a  
14167 protocol-specific address structure, or vice versa, the *sa\_family* member shall map onto a member  
14168 of that structure that is of type **sa\_family\_t** that identifies the protocol's address family.  
14169 Additionally, the structures shall be defined in such a way that the compiler treats an access to  
14170 the stored value of the **sa\_family\_t** member of any of these structures, via an lvalue expression  
14171 whose type involves any other one of these structures, as permissible, despite the more  
14172 restrictive expression rules on stored value access as stated in the ISO C standard. Similarly,  
14173 when a pointer to a **sockaddr\_storage** or **sockaddr** structure is converted to a pointer to a  
14174 protocol-specific address structure, the compiler shall treat an access (using this converted  
14175 pointer) to the stored value of any member of the protocol-specific structure as permissible. The  
14176 application shall ensure that the protocol-specific address structure corresponds to the family  
14177 indicated by the member with type **sa\_family\_t** of that structure and the pointed-to object has  
14178 sufficient memory for addressing all members of the protocol-specific structure.14179 The **<sys/socket.h>** header shall define the **msghdr** structure, which shall include at least the  
14180 following members:14181 void \*msg\_name Optional address.  
14182 socklen\_t msg\_namelen Size of address.  
14183 struct iovec \*msg\_iov Scatter/gather array.  
14184 int msg\_iovlen Members in *msg\_iov*.

14185 void \*msg\_control Ancillary data; see below.  
 14186 socklen\_t msg\_controllen Ancillary data buffer *len*.  
 14187 int msg\_flags Flags on received message.

14188 The **msghdr** structure is used to reduce the number of directly supplied parameters to the  
 14189 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the  
 14190 *recvmsg()* function and *value* only for the *sendmsg()* function.

14191 The <sys/socket.h> header shall define the **iovec** structure as described in <sys/uio.h>.

14192 The <sys/socket.h> header shall define the **cmsghdr** structure, which shall include at least the  
 14193 following members:

14194 socklen\_t cmsg\_len Data byte count, including the **cmsghdr**.  
 14195 int cmsg\_level Originating protocol.  
 14196 int cmsg\_type Protocol-specific type.

14197 The **cmsghdr** structure is used for storage of ancillary data object information.

14198 Ancillary data consists of a sequence of pairs, each consisting of a **cmsghdr** structure followed  
 14199 by a data array. The data array contains the ancillary data message, and the **cmsghdr** structure  
 14200 contains descriptive information that allows an application to correctly parse the data.

14201 The values for *cmsg\_level* shall be legal values for the *level* argument to the *getsockopt()* and  
 14202 *setsockopt()* functions. The system documentation shall specify the *cmsg\_type* definitions for the  
 14203 supported protocols.

14204 Ancillary data is also possible at the socket level. The <sys/socket.h> header shall define the  
 14205 following symbolic constant for use as the *cmsg\_type* value when *cmsg\_level* is SOL\_SOCKET:

14206 SCM\_RIGHTS Indicates that the data array contains the access rights to be sent or  
 14207 received.

14208 The <sys/socket.h> header shall define the following macros to gain access to the data arrays in  
 14209 the ancillary data associated with a message header:

14210 CMSG\_DATA(*cmsg*)

14211 If the argument is a pointer to a **cmsghdr** structure, this macro shall return an unsigned  
 14212 character pointer to the data array associated with the **cmsghdr** structure.

14213 CMSG\_NXTHDR(*mhdr,cmsg*)

14214 If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer  
 14215 to a **cmsghdr** structure in the ancillary data pointed to by the *msg\_control* field of that  
 14216 **msghdr** structure, this macro shall return a pointer to the next **cmsghdr** structure, or a null  
 14217 pointer if the second argument points to the last **cmsghdr** and data array pair in the  
 14218 ancillary data. If the ancillary data contains another **cmsghdr** structure after this one but the  
 14219 *cmsg\_len* value in that structure is such that the data array following that structure would  
 14220 extend beyond the end of the ancillary data, it is unspecified whether this macro returns a  
 14221 pointer to that **cmsghdr** structure or returns a null pointer.

14222 If the first argument is a pointer to a **msghdr** structure and the second argument is a null  
 14223 pointer, this macro shall be equivalent to CMSG\_FIRSTHDR(*mhdr*).

14224 CMSG\_FIRSTHDR(*mhdr*)

14225 If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the  
 14226 first **cmsghdr** structure in the ancillary data associated with this **msghdr** structure, or a null  
 14227 pointer if either there is no ancillary data associated with the **msghdr** structure  
 14228 (*msg\_controllen* is zero) or there is insufficient room in the ancillary data for a complete  
 14229 **cmsghdr** structure (*msg\_controllen* is non-zero but less than `sizeof(struct cmsghdr)`).

14230 CMSG\_SPACE(*length*)  
 14231 If the argument has a type such that its value can be assigned to an object of type **socklen\_t**,  
 14232 this macro shall return the space required by an ancillary data object of the specified length  
 14233 and its **cmsghdr** structure, including any padding needed to satisfy alignment  
 14234 requirements. This macro can be used, for example, to allocate space dynamically for the  
 14235 ancillary data. This macro should not be used to initialize the *msg\_len* member of a  
 14236 **cmsghdr** structure. If the argument is an integer constant expression, this macro shall  
 14237 expand to an integer constant expression.

14238 CMSG\_LEN(*length*)  
 14239 If the argument has a type such that its value can be assigned to an object of type **socklen\_t**,  
 14240 this macro shall return the value to store in the *msg\_len* member of the **cmsghdr** structure  
 14241 for an ancillary data object of the specified length, taking into account any padding needed  
 14242 to satisfy alignment requirements. If the argument is an integer constant expression, this  
 14243 macro shall expand to an integer constant expression.

14244 The <sys/socket.h> header shall define the **linger** structure, which shall include at least the  
 14245 following members:

14246 int l\_onoff Indicates whether linger option is enabled.  
 14247 int l\_linger Linger time, in seconds.

14248 The <sys/socket.h> header shall define the following socket types (see XSH Section 2.10.6, on  
 14249 page 550) as symbolic constants with distinct values:

14250 SOCK\_DGRAM Datagram socket.

14251 RS SOCK\_RAW Raw Protocol Interface.

14252 SOCK\_SEQPACKET Sequenced-packet socket.

14253 SOCK\_STREAM Byte-stream socket.

14254 Implementations may provide additional socket types.

14255 The header shall define the following socket creation flags, for use in *socket()*, *socketpair()*, and  
 14256 *accept4()*. These flags shall be symbolic constants with values that are bitwise distinct from each  
 14257 other and from all SOCK\_\* constants representing socket types:

14258 SOCK\_NONBLOCK Create a socket file descriptor with the O\_NONBLOCK flag atomically set  
 14259 on the new open file description.

14260 SOCK\_CLOEXEC Create a socket file descriptor with the FD\_CLOEXEC flag atomically set  
 14261 on that file descriptor.

14262 SOCK\_CLOFORK Create a socket file descriptor with the FD\_CLOFORK flag atomically set  
 14263 on that file descriptor.

14264 Implementations may provide additional socket creation flags.

14265 The <sys/socket.h> header shall define the following symbolic constant for use as the *level*  
 14266 argument of *setsockopt()* and *getsockopt()*.

14267 SOL\_SOCKET Options to be accessed at socket level, not protocol level.

14268 The <sys/socket.h> header shall define the following symbolic constants with distinct values for  
 14269 use as the *option\_name* argument in *getsockopt()* or *setsockopt()* calls (see XSH Section 2.10.16, on  
 14270 page 554):

14271	SO_ACCEPTCONN	Socket is accepting connections.
14272	SO_BROADCAST	Transmission of broadcast messages is supported.
14273	SO_DEBUG	Debugging information is being recorded.
14274	SO_DOMAIN	Socket domain.
14275	SO_DONTROUTE	Bypass normal routing.
14276	SO_ERROR	Socket error status.
14277	SO_KEEPALIVE	Connections are kept alive with periodic messages.
14278	SO_LINGER	Socket lingers on close.
14279	SO_OOINLINE	Out-of-band data is transmitted in line.
14280	SO_PROTOCOL	Socket protocol.
14281	SO_RCVBUF	Receive buffer size.
14282	SO_RCVLOWAT	Receive ``low water mark``.
14283	SO_RCVTIMEO	Receive timeout.
14284	SO_REUSEADDR	Reuse of local addresses is supported.
14285	SO_SNDBUF	Send buffer size.
14286	SO_SNDLOWAT	Send ``low water mark``.
14287	SO_SNDTIMEO	Send timeout.
14288	SO_TYPE	Socket type.
14289	The <sys/socket.h> header shall define the following symbolic constant for use as the maximum	
14290	<i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
14291	SOMAXCONN	The maximum <i>backlog</i> queue length.
14292	The <sys/socket.h> header shall define the following symbolic constants with distinct values for	
14293	use as the valid values for the <i>msg_flags</i> field in the <b>msghdr</b> structure, or the <i>flags</i> parameter in	
14294	<i>recv()</i> , <i>recvfrom()</i> , <i>recvmsg()</i> , <i>send()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
14295	MSG_CMSG_CLOEXEC	
14296		Atomically set the FD_CLOEXEC flag on any file descriptors created via
14297		SCM_RIGHTS during <i>recvmsg()</i> .
14298	MSG_CMSG_CLOFORK	
14299		Atomically set the FD_CLOFORK flag on any file descriptors created via
14300		SCM_RIGHTS during <i>recvmsg()</i> .
14301	MSG_CTRUNC	Control data truncated.
14302	MSG_DONTROUTE	Send without using routing tables.
14303	MSG_EOR	Terminates a record (if supported by the protocol).
14304	MSG_OOB	Out-of-band data.
14305	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-
14306		oriented socket that is no longer connected.

14307 MSG\_PEEK Leave received data in queue.

14308 MSG\_TRUNC Normal data truncated.

14309 MSG\_WAITALL Attempt to fill the read buffer.

14310 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

14311 AF\_INET Internet domain sockets for use with IPv4 addresses.

14312 IP6 AF\_INET6 Internet domain sockets for use with IPv6 addresses.

14313 AF\_UNIX UNIX domain sockets.

14314 AF\_UNSPEC Unspecified.

14315 The value of AF\_UNSPEC shall be 0.

14316 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

14317 SHUT\_RD Disables further receive operations.

14318 SHUT\_RDWR Disables further send and receive operations.

14319 SHUT\_WR Disables further send operations.

14320 The **<sys/socket.h>** header shall define the **size\_t** and **ssize\_t** types as described in

14321 **<sys/types.h>**.

14322 The following shall be declared as functions and may also be defined as macros. Function

14323 prototypes shall be provided.

```

14324 int accept(int, struct sockaddr *restrict, socklen_t *restrict);
14325 int accept4(int, struct sockaddr *restrict, socklen_t *restrict,
14326 int);
14327 int bind(int, const struct sockaddr *, socklen_t);
14328 int connect(int, const struct sockaddr *, socklen_t);
14329 int getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
14330 int getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
14331 int getsockopt(int, int, int, void *restrict, socklen_t *restrict);
14332 int listen(int, int);
14333 ssize_t recv(int, void *, size_t, int);
14334 ssize_t recvfrom(int, void *restrict, size_t, int,
14335 struct sockaddr *restrict, socklen_t *restrict);
14336 ssize_t recvmsg(int, struct msghdr *, int);
14337 ssize_t send(int, const void *, size_t, int);
14338 ssize_t sendmsg(int, const struct msghdr *, int);
14339 ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
14340 socklen_t);
14341 int setsockopt(int, int, int, const void *, socklen_t);
14342 int shutdown(int, int);
14343 int socketatmark(int);
14344 int socket(int, int, int);
14345 int socketpair(int, int, int, int [2]);

```

14346 Inclusion of **<sys/socket.h>** may also make visible all symbols from **<sys/uio.h>**.

## 14347 APPLICATION USAGE

14348 To forestall portability problems, it is recommended that applications not use values larger than  
14349  $2^{31} - 1$  for the `socklen_t` type.

14350 The `sockaddr_storage` structure solves the problem of declaring storage for automatic variables  
14351 which is both large enough and aligned enough for storing the socket address data structure of  
14352 any family. For example, code with a file descriptor and without the context of the address  
14353 family can pass a pointer to a variable of this type, where a pointer to a socket address structure  
14354 is expected in calls such as `getpeername()`, and determine the address family by accessing the  
14355 received content after the call.

14356 The example below illustrates a data structure which aligns on a 64-bit boundary. An  
14357 implementation-defined field `_ss_align` following `_ss_pad1` is used to force a 64-bit alignment  
14358 which covers proper alignment good enough for needs of at least `sockaddr_in6` (IPv6) and  
14359 `sockaddr_in` (IPv4) address data structures. The size of padding field `_ss_pad1` depends on the  
14360 chosen alignment boundary. The size of padding field `_ss_pad2` depends on the value of overall  
14361 size chosen for the total size of the structure. This size and alignment are represented in the  
14362 above example by implementation-defined (not required) constants `_SS_MAXSIZE` (chosen  
14363 value 128) and `_SS_ALIGNMENT` (with chosen value 8). Constants `_SS_PAD1SIZE` (derived  
14364 value 6) and `_SS_PAD2SIZE` (derived value 112) are also for illustration and not required. The  
14365 implementation-defined definitions and structure field names above start with an <underscore>  
14366 to denote implementation private name space. Portable code is not expected to access or  
14367 reference those fields or constants. Note that this example only deals with size and alignment;  
14368 see RATIONALE for additional issues related to these structures.

```
14369 /*
14370  * Desired design of maximum size and alignment.
14371  */
14372 #define _SS_MAXSIZE 128
14373     /* Implementation-defined maximum size. */
14374 #define _SS_ALIGNSIZE (sizeof(int64_t))
14375     /* Implementation-defined desired alignment. */
14376 /*
14377  * Definitions used for sockaddr_storage structure paddings design.
14378  */
14379 #define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
14380 #define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t) + \
14381     _SS_PAD1SIZE + _SS_ALIGNSIZE))
14382 struct sockaddr_storage {
14383     sa_family_t ss_family; /* Address family. */
14384 /*
14385  * Following fields are implementation-defined.
14386  */
14387     char _ss_pad1[_SS_PAD1SIZE];
14388     /* 6-byte pad; this is to make implementation-defined
14389     pad up to alignment field that follows explicit in
14390     the data structure. */
14391     int64_t _ss_align; /* Field to force desired structure
14392     storage alignment. */
14393     char _ss_pad2[_SS_PAD2SIZE];
14394     /* 112-byte pad to achieve desired size,
14395     _SS_MAXSIZE value minus size of ss_family
14396     _ss_pad1, _ss_align fields is 112. */
```

14397 } ;

14398 Portable applications need to account for the alternative behaviors of the CMSG\_NXTHDR  
14399 macro as follows:

- 14400 • When constructing ancillary data in a **msghdr** structure, ensure that all locations within  
14401 the ancillary data that might be returned by CMSG\_NXTHDR contain a *cmsg\_len* value of  
14402 zero (typically this is achieved by using *memset()* to initialize the entire *msg\_control* buffer  
14403 to null bytes before populating the first **cmsghdr** structure).
- 14404 • When extracting ancillary data from a received **msghdr** structure, check that the data array  
14405 following the last **cmsghdr** structure does not extend beyond the end of the ancillary data.

#### 14406 RATIONALE

14407 Note that defining the **sockaddr\_storage** and **sockaddr** structures using only mechanisms  
14408 defined in early editions of the ISO C standard may produce aliasing diagnostics when  
14409 applications use casting between pointers to the various socket address structures. Because of  
14410 the large body of existing code utilizing sockets in a way that could trigger undefined behavior  
14411 due to strict aliasing rules, this standard mandates that these structures can alias each other for  
14412 accessing the **sa\_family\_t** member of the structures (or other members for protocol-specific  
14413 structure references), so as to preserve well-defined semantics. An implementation's header files  
14414 may need to use anonymous unions, or even an implementation-specific extension, to comply  
14415 with the requirements of this standard.

#### 14416 FUTURE DIRECTIONS

14417 None.

#### 14418 SEE ALSO

14419 [<sys/types.h>](#), [<sys/uio.h>](#)

14420 XSH *accept()*, *bind()*, *connect()*, *getpeername()*, *getsockname()*, *getsockopt()*, *listen()*, *recv()*,  
14421 *recvfrom()*, *recvmsg()*, *send()*, *sendmsg()*, *sendto()*, *setsockopt()*, *shutdown()*, *socketmark()*, *socket()*,  
14422 *socketpair()*

#### 14423 CHANGE HISTORY

14424 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

14425 The **restrict** keyword is added to the prototypes for *accept()*, *getpeername()*, *getsockname()*,  
14426 *getsockopt()*, and *recvfrom()*.

#### 14427 Issue 7

14428 SD5-XBD-ERN-56 is applied, adding a reference to [<sys/types.h>](#) for the **ssize\_t** type.

14429 SD5-XBD-ERN-62 is applied.

14430 The MSG\_NOSIGNAL symbolic constant is added from The Open Group Technical Standard,  
14431 2006, Extended API Set Part 2.

14432 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
14433 for the **size\_t** type is added.

14434 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0067 [355] is applied.

14435 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0077 [934] is applied.

#### 14436 Issue 8

14437 Austin Group Defects 411 and 1318 are applied, adding SOCK\_NONBLOCK, SOCK\_CLOEXEC,  
14438 SOCK\_CLOFORK, MSG\_CMSG\_CLOEXEC, MSG\_CMSG\_CLOFORK, and *accept4()*.

14439 Austin Group Defect 840 is applied, adding SO\_DOMAIN and SO\_PROTOCOL.

14440 Austin Group Defect 978 is applied, adding CMSG\_SPACE and CMSG\_LEN, and clarifying the  
14441 behavior of CMSG\_NXTHDR when the second argument is a null pointer.

14442 Austin Group Defect 1056 is applied, clarifying the conditions under which CMSG\_NXTHDR  
14443 and CMSG\_FIRSTHDR return a null pointer, and adding a new paragraph to APPLICATION  
14444 USAGE.

14445 Austin Group Defect 1641 is applied, clarifying the requirements for conversions between  
14446 pointers to **sockaddr\_storage** and **storage** structures and between pointers to those structures  
14447 and pointers to protocol-specific address structures.

14448 **NAME**

14449 sys/stat.h — data returned by the stat() function

14450 **SYNOPSIS**

14451 #include <sys/stat.h>

14452 **DESCRIPTION**

14453 The <sys/stat.h> header shall define the structure of the data returned by the *fstat()*, *lstat()*, and  
14454 *stat()* functions.

14455 The <sys/stat.h> header shall define the **stat** structure, which shall include at least the following  
14456 members:

14457	dev_t st_dev	Device ID of device containing file.
14458	ino_t st_ino	File serial number.
14459	mode_t st_mode	Mode of file (see below).
14460	nlink_t st_nlink	Number of hard links to the file.
14461	uid_t st_uid	User ID of file.
14462	gid_t st_gid	Group ID of file.
14463 XSI	dev_t st_rdev	Device ID (if file is character or block special).
14464	off_t st_size	For regular files, the file size in bytes.
14465		For symbolic links, the length in bytes of the
14466		pathname contained in the symbolic link.
14467 SHM		For a shared memory object, the length in bytes.
14468 TYM		For a typed memory object, the length in bytes.
14469		For other file types, the use of this field is
14470		unspecified.
14471	struct timespec st_atim	Last data access timestamp.
14472	struct timespec st_mtim	Last data modification timestamp.
14473	struct timespec st_ctim	Last file status change timestamp.
14474 XSI	blksize_t st_blksize	A file system-specific preferred I/O block size
14475		for this object. In some file system types, this
14476		may vary from file to file.
14477	blkcnt_t st_blocks	Number of blocks allocated for this object.

14478 A *file identity* is uniquely determined by the combination of *st\_dev* and *st\_ino*. At any given time  
14479 in a system, distinct files shall have distinct file identities; hard links to the same file shall have  
14480 the same file identity. Over time, these file identities can be reused for different files. For  
14481 example, the *st\_ino* value can be reused after the last link to a file is unlinked and the space  
14482 occupied by the file has been freed, and the *st\_dev* value associated with a file system can be  
14483 reused if that file system is detached (“unmounted”) and another is attached (“mounted”).

14484 The *st\_nlink* value shall be the number of hard links to the file within the file system in which the  
14485 file resides.

14486 **Note:** The number of links to the file that can be found by traversing the file hierarchy can differ from  
14487 *st\_nlink*. For example, it can be less than *st\_nlink* if a link to the file cannot be reached because it  
14488 is below a directory that has been overlaid with a mount point for a different file system, and it  
14489 can be greater than *st\_nlink* on implementations that allow a file system (or part of one) to be  
14490 duplicated at additional mount points.

14491 XSI The <sys/stat.h> header shall define the **blkcnt\_t**, **blksize\_t**, **dev\_t**, **ino\_t**, **mode\_t**, **nlink\_t**,  
14492 **uid\_t**, **gid\_t**, **off\_t**, and **time\_t** types as described in <sys/types.h>.

14493 The <sys/stat.h> header shall define the **timespec** structure as described in <time.h>. Times  
14494 shall be given in seconds since the Epoch.

14495 Which structure members have meaningful values depends on the type of file. For further  
 14496 information, see the descriptions of *fstat()*, *lstat()*, and *stat()* in the System Interfaces volume of  
 14497 POSIX.1-2024.

14498 For compatibility with earlier versions of this standard, the *st\_atime* macro shall be defined with  
 14499 the value *st\_atim.tv\_sec*. Similarly, *st\_ctime* and *st\_mtime* shall be defined as macros with the  
 14500 values *st\_ctim.tv\_sec* and *st\_mtim.tv\_sec*, respectively.

14501 The <sys/stat.h> header shall define the following symbolic constants for the file types encoded  
 14502 in type **mode\_t**. The values shall be suitable for use in **#if** preprocessing directives:

14503	XSI	<b>S_IFMT</b>	Type of file.
14504		<b>S_IFBLK</b>	Block special.
14505		<b>S_IFCHR</b>	Character special.
14506		<b>S_IFIFO</b>	FIFO special.
14507		<b>S_IFREG</b>	Regular.
14508		<b>S_IFDIR</b>	Directory.
14509		<b>S_IFLNK</b>	Symbolic link.
14510		<b>S_IFSOCK</b>	Socket.

14511 The <sys/stat.h> header shall define the following symbolic constants for the file mode bits  
 14512 encoded in type **mode\_t**, with the indicated numeric values. These macros shall expand to an  
 14513 expression which has a type that allows them to be used, either singly or OR'ed together, as the  
 14514 third argument to *open()* without the need for a **mode\_t** cast. The values shall be suitable for use  
 14515 in **#if** preprocessing directives.

Name	Numeric Value	Description
S_IRWXU	0700	Read, write, execute/search by owner.
S_IRUSR	0400	Read permission, owner.
S_IWUSR	0200	Write permission, owner.
S_IXUSR	0100	Execute/search permission, owner.
S_IRWXG	070	Read, write, execute/search by group.
S_IRGRP	040	Read permission, group.
S_IWGRP	020	Write permission, group.
S_IXGRP	010	Execute/search permission, group.
S_IRWXO	07	Read, write, execute/search by others.
S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
S_ISVTX	01000	On directories, restricted deletion flag.

14532 The following macros shall be provided to test whether a file is of the specified type. The value  
 14533 *m* supplied to the macros is the value of *st\_mode* from a **stat** structure. The macro shall evaluate  
 14534 to a non-zero value if the test is true; 0 if the test is false.

14535 **S\_ISBLK(*m*)** Test for a block special file.

14536		S_ISCHR( <i>m</i> )	Test for a character special file.
14537		S_ISDIR( <i>m</i> )	Test for a directory.
14538		S_ISFIFO( <i>m</i> )	Test for a pipe or FIFO special file.
14539		S_ISREG( <i>m</i> )	Test for a regular file.
14540		S_ISLNK( <i>m</i> )	Test for a symbolic link.
14541		S_ISSOCK( <i>m</i> )	Test for a socket.
14542		The implementation may implement message queues, semaphores, or shared memory objects as distinct file types, in which case these file types need not be encoded in type <b>mode_t</b> . The following macros shall be provided to test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
14543			
14544			
14545			
14546			
14547			
14548			
14549		S_TYPEISMQ( <i>buf</i> )	Test for a message queue.
14550		S_TYPEISSEM( <i>buf</i> )	Test for a semaphore.
14551		S_TYPEISSHM( <i>buf</i> )	Test for a shared memory object.
14552	TYM	The implementation may implement typed memory objects as a distinct file type, in which case this file type need not be encoded in type <b>mode_t</b> . The following macro shall test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
14553			
14554			
14555			
14556			
14557			
14558		S_TYPEISTMO( <i>buf</i> )	Test macro for a typed memory object.
14559		The <sys/stat.h> header shall define the following symbolic constants as distinct integer values outside of the range [0,999 999 999], for use with the <i>futimens()</i> and <i>utimensat()</i> functions:	
14560			
14561		UTIME_NOW	
14562		UTIME_OMIT	
14563		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.	
14564			
14565		int chmod(const char *, mode_t);	
14566		int fchmod(int, mode_t);	
14567		int fchmodat(int, const char *, mode_t, int);	
14568		int fstat(int, struct stat *);	
14569		int fstatat(int, const char *restrict, struct stat *restrict, int);	
14570		int futimens(int, const struct timespec [2]);	
14571		int lstat(const char *restrict, struct stat *restrict);	
14572		int mkdir(const char *, mode_t);	
14573		int mkdirat(int, const char *, mode_t);	
14574		int mkfifo(const char *, mode_t);	
14575		int mkfifoat(int, const char *, mode_t);	
14576	XSI	int mknod(const char *, mode_t, dev_t);	
14577		int mknodat(int, const char *, mode_t, dev_t);	
14578		int stat(const char *restrict, struct stat *restrict);	

```
14579     mode_t umask(mode_t);
14580     int    utimensat(int, const char *, const struct timespec [2], int);
```

14581 Inclusion of the <sys/stat.h> header may make visible all symbols from the <time.h> header.

#### 14582 APPLICATION USAGE

14583 Use of the macros is recommended for determining the type of a file.

#### 14584 RATIONALE

14585 A conforming C-language application must include <sys/stat.h> for functions that have  
14586 arguments or return values of type **mode\_t**, so that symbolic values for that type can be used.  
14587 An alternative would be to require that these constants are also defined by including  
14588 <sys/types.h>.

14589 The S\_ISUID and S\_ISGID bits may be cleared on any write, not just on *open()*, as some  
14590 historical implementations do.

14591 System calls that update the time entry fields in the **stat** structure must be documented by the  
14592 implementors. POSIX-conforming systems should not update the time entry fields for functions  
14593 listed in the System Interfaces volume of POSIX.1-2024 unless the standard requires that they do,  
14594 except in the case of documented extensions to the standard.

14595 Upon assignment, file timestamps are immediately converted to the resolution of the file system  
14596 by truncation (i.e., the recorded time can be older than the actual time). For example, if the file  
14597 system resolution is 1 microsecond, then a conforming *stat()* must always return an  
14598 *st\_mtim.tv\_nsec* that is a multiple of 1000. Some older implementations returned higher-  
14599 resolution timestamps while the *inode* information was cached, and then spontaneously  
14600 truncated the *tv\_nsec* fields when they were stored to and retrieved from disk, but this behavior  
14601 does not conform.

14602 Note that *st\_dev* must be unique within a Local Area Network (LAN) in a “system” made up of  
14603 multiple computers’ file systems connected by a LAN.

14604 Networked implementations of a POSIX-conforming system must guarantee that all files visible  
14605 within the file tree (including parts of the tree that may be remotely mounted from other  
14606 machines on the network) on each individual processor are uniquely identified by the  
14607 combination of the *st\_ino* and *st\_dev* fields.

14608 The unit for the *st\_blocks* member of the **stat** structure is not defined within POSIX.1-2024. In  
14609 some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation  
14610 between values of the *st\_blocks* and *st\_blksize*, and the *f\_bsize* (from <sys/statvfs.h>) structure  
14611 members.

14612 Traditionally, some implementations defined the multiplier for *st\_blocks* in <sys/param.h> as the  
14613 symbol DEV\_BSIZE.

14614 Some earlier versions of this standard did not specify values for the file mode bit macros. The  
14615 expectation was that some implementors might choose to use a different encoding for these bits  
14616 than the traditional one, and that new applications would use symbolic file modes instead of  
14617 numeric. This version of the standard specifies the traditional encoding, in recognition that  
14618 nearly 20 years after the first publication of this standard numeric file modes are still in  
14619 widespread use by application developers, and that all conforming implementations still use the  
14620 traditional encoding.

14621 **FUTURE DIRECTIONS**

14622 No new S\_IFMT symbolic names for the file type values of **mode\_t** will be defined by  
 14623 POSIX.1-2024; if new file types are required, they will only be testable through *S\_ISxx()* or  
 14624 *S\_TYPEISxxx()* macros instead.

14628 **CHANGE HISTORY**

14629 First released in Issue 1. Derived from Issue 1 of the SVID.

14630 **Issue 5**

14631 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

14632 The type of *st\_blksize* is changed from **long** to **blksize\_t**; the type of *st\_blocks* is changed from  
 14633 **long** to **blkcnt\_t**.

14634 **Issue 6**

14635 The *S\_TYPEISMQ()*, *S\_TYPEISSEM()*, and *S\_TYPEISSHM()* macros are unconditionally  
 14636 mandated.

14637 The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize\_t**  
 14638 and **blkcnt\_t** have been described.

14639 The following new requirements on POSIX implementations derive from alignment with the  
 14640 Single UNIX Specification:

- 14641 • The **dev\_t**, **ino\_t**, **mode\_t**, **nlink\_t**, **uid\_t**, **gid\_t**, **off\_t**, and **time\_t** types are mandated.

14642 *S\_IFSOCK* and *S\_ISSOCK* are added for sockets.

14643 The description of **stat** structure members is changed to reflect contents when file type is a  
 14644 symbolic link.

14645 The test macro *S\_TYPEISTMO* is added for alignment with IEEE Std 1003.1j-2000.

14646 The **restrict** keyword is added to the prototypes for *lstat()* and *stat()*.

14647 The *lstat()* function is made mandatory.

14648 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the  
 14649 *st\_blocks* member of the **stat** structure to the RATIONALE.

14650 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the  
 14651 DESCRIPTION that the **timespec** structure may be defined as described in the [<time.h>](#) header.

14652 **Issue 7**

14653 SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the  
 14654 interfaces should be consulted in order to determine which structure members have meaningful  
 14655 values.

14656 The *fchmodat()*, *fstatat()*, *mkdirat()*, *mkfifoat()*, *mknodat()*, and *utimensat()* functions are added  
 14657 from The Open Group Technical Standard, 2006, Extended API Set Part 2.

14658 The *futimens()* function is added.

14659 This reference page is clarified with respect to macros and symbolic constants.

14660 Changes are made related to support for finegrained timestamps and the *UTIME\_NOW* and  
 14661 *UTIME\_OMIT* symbolic constants are added.

14662 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0068 [207] is applied.

14663 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0078 [531] is applied.

14664 **Issue 8**

14665 Austin Group Defect 732 is applied, clarifying that if message queues, semaphores, shared  
14666 memory objects, or typed memory objects are implemented as distinct file types, they need not  
14667 be encoded in type **mode\_t**.

14668 Austin Group Defect 1314 is applied, clarifying how the *st\_dev* and *st\_ino* values identify files.

14669 Austin Group Defect 1323 is applied, clarifying how the *st\_nlink* value relates to the number of  
14670 links to the file that can be found by traversing the file hierarchy.

14671 **NAME**

14672 sys/statvfs.h — VFS File System information structure

14673 **SYNOPSIS**

14674 #include <sys/statvfs.h>

14675 **DESCRIPTION**

14676 The <sys/statvfs.h> header shall define the **statvfs** structure, which shall include at least the  
14677 following members:

- 14678 unsigned long f\_bsize File system block size.
- 14679 unsigned long f\_frsize Fundamental file system block size.
- 14680 fsblkcnt\_t f\_blocks Total number of blocks on file system in units of *f\_frsize*.
- 14681 fsblkcnt\_t f\_bfree Total number of free blocks.
- 14682 fsblkcnt\_t f\_bavail Number of free blocks available to non-privileged process.
- 14683 fsfilcnt\_t f\_files Total number of file serial numbers.
- 14684 fsfilcnt\_t f\_ffree Total number of free file serial numbers.
- 14685 fsfilcnt\_t f\_favail Number of file serial numbers available to non-privileged process.
- 14686 fsfilcnt\_t f\_favail
- 14687
- 14688 unsigned long f\_fsid File system ID.
- 14689 unsigned long f\_flag Bit mask of *f\_flag* values.
- 14690 unsigned long f\_namemax Maximum filename length.

14691 The <sys/statvfs.h> header shall define the **fsblkcnt\_t** and **fsfilcnt\_t** types as described in  
14692 <sys/types.h>.

14693 The <sys/statvfs.h> header shall define the following symbolic constants for the *f\_flag* member:

- 14694 ST\_RDONLY Read-only file system.
- 14695 ST\_NOSUID Does not support the semantics of the ST\_ISUID and ST\_ISGID file mode bits.

14696 The following shall be declared as functions and may also be defined as macros. Function  
14697 prototypes shall be provided.

```
14698 int fstatvfs(int, struct statvfs *);
14699 int statvfs(const char *restrict, struct statvfs *restrict);
```

14700 **APPLICATION USAGE**

14701 None.

14702 **RATIONALE**

14703 None.

14704 **FUTURE DIRECTIONS**

14705 None.

14706 **SEE ALSO**

14707 <sys/types.h>

14708 XSH *fstatvfs()*

14709 **CHANGE HISTORY**

14710 First released in Issue 4, Version 2.

14711 **Issue 5**

14712 The type of *f\_blocks*, *f\_bfree*, and *f\_bavail* is changed from **unsigned long** to **fsblkcnt\_t**; the type of  
14713 *f\_files*, *f\_ffree*, and *f\_favail* is changed from **unsigned long** to **fsfilcnt\_t**.

14714 **Issue 6**

14715 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types `fsblkcnt_t`  
14716 and `fsfilcnt_t` have been described.

14717 The **restrict** keyword is added to the prototype for `statvfs()`.

14718 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of  
14719 ST\_NOSUID from “Does not support `setuid()/setgid()` semantics” to “Does not support the  
14720 semantics of the ST\_ISUID and ST\_ISGID file mode bits”.

14721 **Issue 7**

14722 The `<sys/statvfs.h>` header is moved from the XSI option to the Base.

14723 This reference page is clarified with respect to macros and symbolic constants.

14724 **NAME**

14725 sys/time.h — time types

14726 **SYNOPSIS**14727 XSI `#include <sys/time.h>`14728 **DESCRIPTION**14729 The **<sys/time.h>** header shall define the **fd\_set** type and the **timeval** structure, as described in  
14730 **<sys/select.h>**.14731 The **<sys/time.h>** header shall define the **time\_t** and **suseconds\_t** types as described in  
14732 **<sys/types.h>**.14733 The **<sys/time.h>** header shall define the following as described in **<sys/select.h>**:14734 `FD_CLR()`  
14735 `FD_ISSET()`  
14736 `FD_SET()`  
14737 `FD_ZERO()`  
14738 `FD_SETSIZE`14739 The following shall be declared as functions and may also be defined as macros. Function  
14740 prototypes shall be provided.14741 `int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,`  
14742 `struct timeval *restrict);`  
14743 `int utimes(const char *, const struct timeval [2]);`14744 Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>**  
14745 header.14746 **APPLICATION USAGE**

14747 None.

14748 **RATIONALE**14749 The **<sys/time.h>** header refers to **<sys/select.h>** for the definition of the **timeval** structure,  
14750 instead of the other way round, because **<sys/time.h>** is an optional (XSI) header whereas  
14751 **<sys/select.h>** is mandatory.14752 **FUTURE DIRECTIONS**

14753 None.

**14796 CHANGE HISTORY**

14797 First released in Issue 1. Derived from Issue 1 of the SVID.

14798	<b>NAME</b>	
14799		sys/types.h — data types
14800	<b>SYNOPSIS</b>	
14801		#include <sys/types.h>
14802	<b>DESCRIPTION</b>	
14803		The <sys/types.h> header shall define at least the following types:
14804	<b>blkcnt_t</b>	Used for file block counts.
14805	<b>blksize_t</b>	Used for block sizes.
14806	<b>clock_t</b>	Used for system times in clock ticks or CLOCKS_PER_SEC; see
14807		<time.h>.
14808	<b>clockid_t</b>	Used for clock ID type in the clock and timer functions.
14809	<b>dev_t</b>	Used for device IDs.
14810	<b>fsblkcnt_t</b>	Used for file system block counts.
14811	<b>fsfilcnt_t</b>	Used for file system file counts.
14812	<b>gid_t</b>	Used for group IDs.
14813	<b>id_t</b>	Used as a general identifier; can be used to contain at least a <b>pid_t</b> ,
14814		<b>uid_t</b> , or <b>gid_t</b> .
14815	<b>ino_t</b>	Used for file serial numbers.
14816	XSI <b>key_t</b>	Used for XSI interprocess communication.
14817	<b>mode_t</b>	Used for some file attributes.
14818	<b>nlink_t</b>	Used for link counts.
14819	<b>off_t</b>	Used for file sizes.
14820	<b>pid_t</b>	Used for process IDs and process group IDs.
14821	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
14822	<b>pthread_barrier_t</b>	Used to identify a barrier.
14823	<b>pthread_barrierattr_t</b>	Used to define a barrier attributes object.
14824	<b>pthread_cond_t</b>	Used for condition variables.
14825	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
14826	<b>pthread_key_t</b>	Used for thread-specific data keys.
14827	<b>pthread_mutex_t</b>	Used for mutexes.
14828	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
14829	<b>pthread_once_t</b>	Used for dynamic package initialization.
14830	<b>pthread_rwlock_t</b>	Used for read-write locks.
14831	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
14832	<b>pthread_spinlock_t</b>	Used to identify a spin lock.

14833	<b>pthread_t</b>	Used to identify a thread.
14834	<b>reclen_t</b>	Used for directory entry lengths.
14835	<b>size_t</b>	Used for sizes of objects.
14836	<b>ssize_t</b>	Used for a count of bytes or an error indication.
14837	<b>suseconds_t</b>	Used for time in microseconds.
14838	<b>time_t</b>	Used for time in seconds.
14839	<b>timer_t</b>	Used for timer ID returned by <i>timer_create()</i> .
14840	<b>uid_t</b>	Used for user IDs.
14841	All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:	
14842		
14843	<b>pthread_attr_t</b>	
14844	<b>pthread_barrier_t</b>	
14845	<b>pthread_barrierattr_t</b>	
14846	<b>pthread_cond_t</b>	
14847	<b>pthread_condattr_t</b>	
14848	<b>pthread_key_t</b>	
14849	<b>pthread_mutex_t</b>	
14850	<b>pthread_mutexattr_t</b>	
14851	<b>pthread_once_t</b>	
14852	<b>pthread_rwlock_t</b>	
14853	<b>pthread_rwlockattr_t</b>	
14854	<b>pthread_spinlock_t</b>	
14855	<b>pthread_t</b>	
14856	<b>timer_t</b>	
14857	Additionally:	
14858	• <b>mode_t</b> shall be an integer type.	
14859	• <b>dev_t</b> shall be an integer type.	
14860	• <b>nlink_t</b> , <b>uid_t</b> , <b>gid_t</b> , and <b>id_t</b> shall be integer types.	
14861	• <b>blkcnt_t</b> and <b>off_t</b> shall be signed integer types.	
14862	• <b>fsblkcnt_t</b> , <b>fsfilcnt_t</b> , <b>reclen_t</b> , and <b>ino_t</b> shall be defined as unsigned integer types.	
14863	• <b>size_t</b> shall be an unsigned integer type.	
14864	• <b>blksize_t</b> , <b>pid_t</b> , and <b>ssize_t</b> shall be signed integer types.	
14865	• <b>clock_t</b> shall be an integer or real-floating type.	
14866	CX	• <b>time_t</b> shall be an integer type with a width (see <stdint.h>) of at least 64 bits.
14867	The type <b>ssize_t</b> shall be capable of storing values at least in the range $[-1, \{\text{SSIZE\_MAX}\}]$ .	
14868	XSI	The type <b>suseconds_t</b> shall be a signed integer type capable of storing values at least in the range $[-1, 1\,000\,000]$ .
14869		
14870	The implementation shall support one or more programming environments in which the widths of <b>blksize_t</b> , <b>pid_t</b> , <b>size_t</b> , <b>ssize_t</b> , and <b>suseconds_t</b> are no greater than the width of type <b>long</b> .	
14871		
14872	The names of these programming environments can be obtained using the <i>confstr()</i> function or the <i>getconf</i> utility.	
14873		

14874 There are no defined comparison or assignment operators for the following types:

- 14875 **pthread\_attr\_t**
- 14876 **pthread\_barrier\_t**
- 14877 **pthread\_barrierattr\_t**
- 14878 **pthread\_cond\_t**
- 14879 **pthread\_condattr\_t**
- 14880 **pthread\_mutex\_t**
- 14881 **pthread\_mutexattr\_t**
- 14882 **pthread\_rwlock\_t**
- 14883 **pthread\_rwlockattr\_t**
- 14884 **pthread\_spinlock\_t**
- 14885 **timer\_t**

14886 **APPLICATION USAGE**

14887 None.

14888 **RATIONALE**

14889 None.

14890 **FUTURE DIRECTIONS**

14891 None.

14896 **CHANGE HISTORY**

14897 First released in Issue 1. Derived from Issue 1 of the SVID.

14898 **Issue 5**

14899 The **clockid\_t** and **timer\_t** types are defined for alignment with the POSIX Realtime Extension.

14900 The types **blkcnt\_t**, **blksize\_t**, **fsblkcnt\_t**, **fsfilcnt\_t**, and **suseconds\_t** are added.

14901 Large File System extensions are added.

14902 Updated for alignment with the POSIX Threads Extension.

14903 **Issue 6**

14904 The **pthread\_barrier\_t**, **pthread\_barrierattr\_t**, and **pthread\_spinlock\_t** types are added for alignment with IEEE Std 1003.1j-2000.

14906 The margin code is changed from XSI to THR for the **pthread\_rwlock\_t** and **pthread\_rwlockattr\_t** types as Read-Write Locks have been absorbed into the POSIX Threads option. The threads types are marked THR.

14909 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread\_t** to the list of types that are not required to be arithmetic types, thus allowing **pthread\_t** to be defined as a structure.

14912 **Issue 7**

14913 Austin Group Interpretation 1003.1-2001 #033 is applied, requiring **key\_t** to be an arithmetic type.

14915 The Trace option types are marked obsolescent.

14916 The **clock\_t** and **id\_t** types are moved from the XSI option to the Base.

14917 The **pthread\_barrier\_t** and **pthread\_barrierattr\_t** types are moved from the Barriers option to  
14918 the Base.

14919 The **pthread\_spinlock\_t** type is moved from the Spin Locks option to the Base.

14920 Functionality relating to the Timers and Threads options is moved to the Base.

14921 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0069 [210], XBD/TC1-2008/0070 [28],  
14922 XBD/TC1-2008/0071 [376], XBD/TC1-2008/0072 [210], and XBD/TC1-2008/0073 [327] are  
14923 applied.

14924 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0079 [856] and XBD/TC2-2008/0080  
14925 [659] are applied.

14926 **Issue 8**

14927 Austin Group Defect 697 is applied, adding **reclen\_t**.

14928 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

14929 Austin Group Defect 1462 is applied, changing **time\_t** to have a width of at least 64 bits.

14930 **NAME**

14931 sys/uio.h — definitions for vector I/O operations

14932 **SYNOPSIS**14933 XSI `#include <sys/uio.h>`14934 **DESCRIPTION**14935 The <sys/uio.h> header shall define the **iovec** structure, which shall include at least the  
14936 following members:14937 `void *iov_base` Base address of a memory region for input or output.14938 `size_t iov_len` The size of the memory pointed to by *iov\_base*.14939 The <sys/uio.h> header uses the **iovec** structure for scatter/gather I/O.14940 The <sys/uio.h> header shall define the **ssize\_t** and **size\_t** types as described in <sys/types.h>.14941 The following shall be declared as functions and may also be defined as macros. Function  
14942 prototypes shall be provided.14943 `ssize_t readv(int, const struct iovec *, int);`14944 `ssize_t writev(int, const struct iovec *, int);`14945 **APPLICATION USAGE**14946 The implementation can put a limit on the number of scatter/gather elements which can be  
14947 processed in one call. The symbol {IOV\_MAX} defined in <limits.h> should always be used to  
14948 learn about the limits instead of assuming a fixed value.14949 **RATIONALE**14950 Traditionally, the maximum number of scatter/gather elements the system can process in one  
14951 call were described by the symbolic value {UIO\_MAXIOV}. In IEEE Std 1003.1-2001 this value is  
14952 replaced by the constant {IOV\_MAX} which can be found in <limits.h>.14953 **FUTURE DIRECTIONS**

14954 None.

14955 **SEE ALSO**

14956 &lt;limits.h&gt;, &lt;sys/types.h&gt;

14957 XSH *read()*, *readv()*, *write()*, *writev()*14958 **CHANGE HISTORY**

14959 First released in Issue 4, Version 2.

14960 **Issue 6**

14961 Text referring to scatter/gather I/O is added to the DESCRIPTION.

14962 **NAME**

14963 sys/un.h — definitions for UNIX domain sockets

14964 **SYNOPSIS**

14965 #include &lt;sys/un.h&gt;

14966 **DESCRIPTION**14967 The <sys/un.h> header shall define the **sockaddr\_un** structure, which shall include at least the  
14968 following members:14969 sa\_family\_t sun\_family Address family.  
14970 char sun\_path[size] Socket pathname storage.14971 The *sun\_path* member shall be the last member of the **sockaddr\_un** structure, where *size* shall be  
14972 an implementation-provided constant size of at least 92 bytes. This *size* value need not be  
14973 accessible as a constant available for use in the application namespace.14974 The **sockaddr\_un** structure is used to store addresses for UNIX domain sockets. Pointers to this  
14975 type shall be cast by applications to **struct sockaddr \*** for use with socket functions.14976 The <sys/un.h> header shall define the **sa\_family\_t** type as described in <sys/socket.h>.14977 **APPLICATION USAGE**14978 The size of *sun\_path* is required to be constant, but intentionally does not have a specified name  
14979 for that constant. Historically, different implementations used different sizes. For example, 4.3  
14980 BSD used a size of 108, and 4.4 BSD used a size of 104. Since most implementations originate  
14981 from BSD versions, the size is typically in the range 92 to 108. An application can deduce the size  
14982 by using `sizeof(((struct sockaddr_un *)0)->sun_path)`.14983 Applications should not assume a particular length for *sun\_path* or assume that it can hold  
14984 `{_POSIX_PATH_MAX}` bytes (256).14985 Although applications are required to initialize all members (including any non-standard ones)  
14986 of a **sockaddr\_in6** structure (see <netinet/in.h>, on page 318), the same is not required for the  
14987 **sockaddr\_un** structure, since historically many applications only initialized the standard  
14988 members. Despite this, applications are encouraged to initialize **sockaddr\_un** structures in a  
14989 manner similar to the required initialization of **sockaddr\_in6** structures.14990 **RATIONALE**14991 Some implementations expose a macro `SUN_LEN` for the size of a pathname stored in *sun\_path*.  
14992 However, this was not widely adopted, and differences on how a terminating null byte is  
14993 interpreted between implementations did not make it worth standardizing.14994 **FUTURE DIRECTIONS**

14995 None.

14996 **SEE ALSO**

14997 &lt;netinet/in.h&gt;, &lt;sys/socket.h&gt;

14998 XSH *bind()*, *socket()*, *socketpair()*14999 **CHANGE HISTORY**

15000 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

15001 **Issue 7**15002 The value for `{_POSIX_PATH_MAX}` is updated to 256.

15003 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0074 [355] is applied.

15004 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0081 [934] is applied.

15005 **Issue 8**

15006

15007

Austin Group Defect 561 is applied, changing the requirements for the *sun\_path* member of the **sockaddr\_un** structure.

**15008 NAME**

15009           sys/utsname.h — system name structure

**15010 SYNOPSIS**

15011           #include <sys/utsname.h>

**15012 DESCRIPTION**

15013           The **<sys/utsname.h>** header shall define the structure **utsname** which shall include at least the  
15014           following members:

15015           char   sysname[]   Name of this implementation of the operating system.  
15016           char   nodename[]   Name of this node within the communications  
15017                                  network to which this node is attached, if any.  
15018           char   release[]   Current release level of this implementation.  
15019           char   version[]   Current version level of this release.  
15020           char   machine[]   Name of the hardware type on which the system is running.

15021           The character arrays are of unspecified size, but the data stored in them shall be terminated by a  
15022           null byte.

15023           The following shall be declared as a function and may also be defined as a macro:

15024           int  uname(struct utsname \*);

**15025 APPLICATION USAGE**

15026           None.

**15027 RATIONALE**

15028           None.

**15029 FUTURE DIRECTIONS**

15030           None.

**15031 SEE ALSO**

15032           XSH *uname()*

**15033 CHANGE HISTORY**

15034           First released in Issue 1. Derived from Issue 1 of the SVID.

**15035 Issue 6**

15036           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of  
15037           *nodename* within the **utsname** structure from “an implementation-defined communications  
15038           network” to “the communications network to which this node is attached, if any”.

15039 **NAME**

15040 sys/wait.h — declarations for waiting

15041 **SYNOPSIS**

15042 #include <sys/wait.h>

15043 **DESCRIPTION**

15044 The <sys/wait.h> header shall define the following symbolic constants for use with *waitpid()*:

- 15045 XSI **WCONTINUED** Report status of continued child process.
- 15046 **WNOHANG** Do not hang if no status is available; return immediately.
- 15047 **WUNTRACED** Report status of stopped child process.

15048 The <sys/wait.h> header shall define the following macros for analysis of process status values:

- 15049 **WCOREDUMP** True if **WIFSIGNALED** is true and creation of a core image was
- 15050 attempted.

15051 **Note:** The use of the word “attempted” here means that the process terminated abnormally with  
 15052 additional actions (see **SIG\_DFL** in XSH Section 2.4.3, on page 516). A core image might or  
 15053 might not have been produced. Some implementations do not set this bit if a core image was not  
 15054 produced, but this is not a requirement.

- 15055 **WEXITSTATUS** Return exit status.
- 15056 XSI **WIFCONTINUED** True if child has been continued.
- 15057 **WIFEXITED** True if child exited normally.
- 15058 **WIFSIGNALED** True if child exited due to uncaught signal.
- 15059 **WIFSTOPPED** True if child stopped due to uncaught signal.
- 15060 **WSTOPSIG** Return signal number that caused process to stop.
- 15061 **WTERMSIG** Return signal number that caused process to terminate.

15062 The <sys/wait.h> header shall define the following symbolic constants as possible values for the  
 15063 *options* argument to *waitid()*:

- 15064 **WEXITED** Wait for processes that have terminated.
- 15065 **WNOWAIT** Keep the process whose status is returned in *infop* in a waitable state.
- 15066 **WSTOPPED** Status is returned for any child that has stopped upon receipt of a signal.

15067 XSI The **WCONTINUED** and **WNOHANG** constants, described above for *waitpid()*, can also be  
 15068 used with *waitid()*.

15069 The type **idtype\_t** shall be defined as an enumeration type whose possible values shall include  
 15070 at least the following:

- 15071 **P\_ALL**
- 15072 **P\_PGID**
- 15073 **P\_PID**

15074 The <sys/wait.h> header shall define the **id\_t** and **pid\_t** types as described in <sys/types.h>.

15075 The <sys/wait.h> header shall define the **siginfo\_t** type and the **sigval** union as described in  
 15076 <signal.h>.

15077 Inclusion of the <sys/wait.h> header may also make visible all symbols from <signal.h>.

15078           The following shall be declared as functions and may also be defined as macros. Function  
15079           prototypes shall be provided.

```
15080       pid_t  wait(int *);  
15081       int    waitid(idtype_t, id_t, siginfo_t *, int);  
15082       pid_t  waitpid(pid_t, int *, int);
```

**15083 APPLICATION USAGE**

15084           None.

**15085 RATIONALE**

15086           None.

**15087 FUTURE DIRECTIONS**

15088           None.

**15089 SEE ALSO**

15090           [<signal.h>](#), [<sys/resource.h>](#), [<sys/types.h>](#)

15091           XSH *wait()*, *waitid()*

**15092 CHANGE HISTORY**

15093           First released in Issue 3.

15094           Included for alignment with the POSIX.1-1988 standard.

**15095 Issue 6**

15096           The *wait3()* function is removed.

**15097 Issue 7**

15098           The *waitid()* function and symbolic constants for its *options* argument are moved to the Base.

15099           The description of the WNOHANG constant is clarified.

15100           The requirement for **<sys/wait.h>** to define the **rusage** structure as described in  
15101 **<sys/resource.h>** is removed, and **<sys/wait.h>** is no longer allowed to make visible all symbols  
15102 from **<sys/resource.h>**.

15103           POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0082 [579] and XBD/TC2-2008/0083  
15104 [564] are applied.

**15105 Issue 8**

15106           Austin Group Defect 1141 is applied, adding WCOREDUMP and changing the description of  
15107 WIFSTOPPED.

15108           Austin Group Defect 1332 is applied, changing the description of WEXITED.

15109 **NAME**

15110            syslog.h — definitions for system error logging

15111 **SYNOPSIS**

15112 XSI        #include <syslog.h>

15113 **DESCRIPTION**

15114        The <syslog.h> header shall define the following symbolic constants, zero or more of which  
15115        may be OR'ed together to form the *logopt* option of *openlog()*:

15116        LOG\_PID            Log the process ID with each message.

15117        LOG\_CONS          Log to the system console on error.

15118        LOG\_NDELAY         Connect to syslog daemon immediately.

15119        LOG\_ODELAY         Delay open until *syslog()* is called.

15120        LOG\_NOWAIT         Do not wait for child processes.

15121        The <syslog.h> header shall define the following symbolic constants for use as the *facility*  
15122        argument to *openlog()*:

15123        LOG\_KERN          Reserved for message generated by the system.

15124        LOG\_USER          Message generated by a process.

15125        LOG\_MAIL          Reserved for message generated by mail system.

15126        LOG\_NEWS         Reserved for message generated by news system.

15127        LOG\_UUCP         Reserved for message generated by UUCP system.

15128        LOG\_DAEMON        Reserved for message generated by system daemon.

15129        LOG\_AUTH         Reserved for message generated by authorization daemon.

15130        LOG\_CRON         Reserved for message generated by clock daemon.

15131        LOG\_LPR          Reserved for message generated by printer system.

15132        LOG\_LOCAL0        Reserved for local use.

15133        LOG\_LOCAL1        Reserved for local use.

15134        LOG\_LOCAL2        Reserved for local use.

15135        LOG\_LOCAL3        Reserved for local use.

15136        LOG\_LOCAL4        Reserved for local use.

15137        LOG\_LOCAL5        Reserved for local use.

15138        LOG\_LOCAL6        Reserved for local use.

15139        LOG\_LOCAL7        Reserved for local use.

15140        The <syslog.h> header shall define the following macros for constructing the *maskpri* argument  
15141        to *setlogmask()*. The following macros expand to an expression of type **int** when the argument  
15142        *pri* is an expression of type **int**:

15143        LOG\_MASK(*pri*)     A mask for priority *pri*.

15144 LOG\_UPTO(*pri*) A mask for all priorities from LOG\_EMERG through *pri* inclusive in the  
15145 order listed in the list of priority symbolic constants below. Any  
15146 additional implementation-defined priorities not included in the list  
15147 below shall not be included in the mask.

15148 The **<syslog.h>** header shall define the following symbolic constants for use as the severity level  
15149 portion of the *priority* argument of *syslog()* and the *pri* argument of the LOG\_MASK(*pri*) and  
15150 LOG\_UPTO(*pri*) macros:

15151 LOG\_EMERG A panic condition was reported to all processes.  
15152 LOG\_ALERT A condition that should be corrected immediately.  
15153 LOG\_CRIT A critical condition.  
15154 LOG\_ERR An error message.  
15155 LOG\_WARNING A warning message.  
15156 LOG\_NOTICE A condition requiring special handling.  
15157 LOG\_INFO A general information message.  
15158 LOG\_DEBUG A message useful for debugging programs.

15159 The following shall be declared as functions and may also be defined as macros. Function  
15160 prototypes shall be provided.

```
15161 void closelog(void);  
15162 void openlog(const char *, int, int);  
15163 int setlogmask(int);  
15164 void syslog(int, const char *, ...);
```

15180 Austin Group Defect 1033 is applied, adding the LOG\_UPTO macro.

15181 **NAME**  
 15182 tar.h — extended tar definitions

15183 **SYNOPSIS**  
 15184 #include <tar.h>

15185 **DESCRIPTION**  
 15186 The <tar.h> header shall define the following symbolic constants with the indicated values.  
 15187 General definitions:

Name	Value	Description
TMAGIC	"ustar"	Used in the magic field in the <b>ustar</b> header block, including the trailing null byte.
TMAGLEN	6	Length in octets of the magic field.
TVERSION	"00"	Used in the version field in the <b>ustar</b> header block, excluding the trailing null byte.
TVERSLEN	2	Length in octets of the version field.

15195 *Typeflag* field definitions:

Name	Value	Description
REGTYPE	' 0'	Regular file.
AREGTYPE	' \0'	Regular file.
LNKTYPE	' 1'	Hard Link.
SYMTYPE	' 2'	Symbolic link.
CHRTYPE	' 3'	Character special.
BLKTYPE	' 4'	Block special.
DIRTYPE	' 5'	Directory.
FIFOTYPE	' 6'	FIFO special.
CONTTYPE	' 7'	Reserved.

15206 *Mode* field bit definitions (octal):

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

15229 First released in Issue 3. Derived from the POSIX.1-1988 standard.

15230 **Issue 6**

15231 The SEE ALSO section is updated to refer to *pax*.

15232 **Issue 7**

15233 This reference page is clarified with respect to macros and symbolic constants.

15234 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0084 [707] is applied.

15235 **Issue 8**

15236 Austin Group Defect 1380 is applied, changing the description of LNKTYPE.

15237 **NAME**

15238 `termios.h` — define values for `termios`

15239 **SYNOPSIS**

15240 `#include <termios.h>`

15241 **DESCRIPTION**

15242 The **<termios.h>** header shall contain the definitions used by the terminal I/O interfaces (see  
15243 [Chapter 11](#) (on page 199) for the structures and names defined).

15244 **The `termios` Structure**

15245 The **<termios.h>** header shall define the following data types through **typedef**:

15246 **cc\_t** Used for terminal special characters.

15247 **speed\_t** Used for terminal baud rates.

15248 **tcflag\_t** Used for terminal modes.

15249 The above types shall be all unsigned integer types.

15250 The implementation shall support one or more programming environments in which the widths  
15251 of **cc\_t**, **speed\_t**, and **tcflag\_t** are no greater than the width of type **long**. The names of these  
15252 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

15253 The **<termios.h>** header shall define the **termios** structure, which shall include at least the  
15254 following members:

- 15255 `tcflag_t c_iflag` Input modes.
- 15256 `tcflag_t c_oflag` Output modes.
- 15257 `tcflag_t c_cflag` Control modes.
- 15258 `tcflag_t c_lflag` Local modes.
- 15259 `cc_t c_cc[NCCS]` Control characters.

15260 The **<termios.h>** header shall define the following symbolic constant:

15261 **NCCS** Size of the array `c_cc` for control characters.

15262 The **<termios.h>** header shall define the following symbolic constants for use as subscripts for  
15263 the array `c_cc`:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF		EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR	VINTR	INTR character.
VKILL		KILL character.
	VMIN	MIN value.
VQUIT	VQUIT	QUIT character.
VSTART	VSTART	START character.
VSTOP	VSTOP	STOP character.
VSUSP	VSUSP	SUSP character.
	VTIME	TIME value.

15277 The subscript values shall be suitable for use in **#if** preprocessing directives and shall be distinct,  
15278 except that the **VMIN** and **VTIME** subscripts may have the same values as the **VEOF** and **VEOL**  
15279 subscripts, respectively.

15280 **Input Modes**

15281 The <termios.h> header shall define the following symbolic constants for use as flags in the  
15282 *c\_iflag* field. The *c\_iflag* field describes the basic terminal input control.

- 15283 BRKINT Signal interrupt on break.
- 15284 ICRNL Map CR to NL on input.
- 15285 IGNBRK Ignore break condition.
- 15286 IGNCR Ignore CR.
- 15287 IGNPAR Ignore characters with parity errors.
- 15288 INLCR Map NL to CR on input.
- 15289 INPCK Enable input parity check.
- 15290 ISTRIP Strip character.
- 15291 IXANY Enable any character to restart output.
- 15292 IXOFF Enable start/stop input control.
- 15293 IXON Enable start/stop output control.
- 15294 PARMRK Mark parity errors.

15295 **Output Modes**

15296 The <termios.h> header shall define the following symbolic constants for use as flags in the  
15297 *c\_oflag* field. The *c\_oflag* field specifies the system treatment of output.

- 15298 OPOST Post-process output.
- 15299 XSI ONLCR Map NL to CR-NL on output.
- 15300 XSI OCRNL Map CR to NL on output.
- 15301 XSI ONOCR No CR output at column 0.
- 15302 XSI ONLRET NL performs CR function.
- 15303 XSI OFDEL Fill is DEL.
- 15304 XSI OFILL Use fill characters for delay.
- 15305 XSI NLDLY Select newline delays:
  - 15306 NL0 Newline type 0.
  - 15307 NL1 Newline type 1.
- 15308 XSI CRDLY Select carriage-return delays:
  - 15309 CR0 Carriage-return delay type 0.
  - 15310 CR1 Carriage-return delay type 1.
  - 15311 CR2 Carriage-return delay type 2.
  - 15312 CR3 Carriage-return delay type 3.

15313	XSI	<b>TABDLY</b>	Select horizontal-tab delays:
15314		TAB0	Horizontal-tab delay type 0.
15315		TAB1	Horizontal-tab delay type 1.
15316		TAB2	Horizontal-tab delay type 2.
15317		TAB3	Expand tabs to spaces.

15318	XSI	<b>BSDLY</b>	Select backspace delays:
15319		BS0	Backspace-delay type 0.
15320		BS1	Backspace-delay type 1.

15321	XSI	<b>VTDLY</b>	Select vertical-tab delays:
15322		VT0	Vertical-tab delay type 0.
15323		VT1	Vertical-tab delay type 1.

15324	XSI	<b>FFDLY</b>	Select form-feed delays:
15325		FF0	Form-feed delay type 0.
15326		FF1	Form-feed delay type 1.

15327      **Baud Rate Selection**

15328      The <termios.h> header shall define the following symbolic constants for use as values of  
 15329      objects of type **speed\_t**.

15330      The input and output baud rates are stored in the **termios** structure. These are the valid values  
 15331      for objects of type **speed\_t**. Not all baud rates need be supported by the underlying hardware.

15332	B0	Hang up
15333	B50	50 baud
15334	B75	75 baud
15335	B110	110 baud
15336	B134	134.5 baud
15337	B150	150 baud
15338	B200	200 baud
15339	B300	300 baud
15340	B600	600 baud
15341	B1200	1 200 baud
15342	B1800	1 800 baud
15343	B2400	2 400 baud

15344	B4800	4 800 baud
15345	B9600	9 600 baud
15346	B19200	19 200 baud
15347	B38400	38 400 baud

### 15348 **Control Modes**

15349 The **<termios.h>** header shall define the following symbolic constants for use as flags in the  
 15350 *c\_cflag* field. The *c\_cflag* field describes the hardware control of the terminal; not all values  
 15351 specified are required to be supported by the underlying hardware.

15352	CSIZE	Character size:
15353		CS5 5 bits
15354		CS6 6 bits
15355		CS7 7 bits
15356		CS8 8 bits
15357	CSTOPB	Send two stop bits, else one.
15358	CREAD	Enable receiver.
15359	PARENB	Parity enable.
15360	PARODD	Odd parity, else even.
15361	HUPCL	Hang up on last close.
15362	CLOCAL	Ignore modem status lines.

15363 The implementation shall support the functionality associated with the symbols CS7, CS8,  
 15364 CSTOPB, PARODD, and PARENB.

### 15365 **Local Modes**

15366 The **<termios.h>** header shall define the following symbolic constants for use as flags in the  
 15367 *c\_lflag* field. The *c\_lflag* field of the argument structure is used to control various terminal  
 15368 functions.

15369	ECHO	Enable echo.
15370	ECHOE	Echo erase character as error-correcting backspace.
15371	ECHOK	Echo KILL.
15372	ECHONL	Echo NL.
15373	ICANON	Canonical input (erase and kill processing).
15374	IEXTEN	Enable extended input character processing.
15375	ISIG	Enable signals.
15376	NOFLSH	Disable flush after interrupt or quit.
15377	TOSTOP	Send SIGTTOU for background output.

15378       **The winsize Structure**

15379       The <termios.h> header shall define the **winsize** structure, which shall include at least the  
 15380       following members:

15381       unsigned short ws\_row        Rows, in characters.  
 15382       unsigned short ws\_col       Columns, in characters.

15383       **Attribute Selection**

15384       The <termios.h> header shall define the following symbolic constants for use with *tcsetattr()*:

15385       TCSANOW       Change attributes immediately.  
 15386       TCSADRAIN      Change attributes when output has drained.  
 15387       TCSAFLUSH     Change attributes when output has drained; also flush pending input.

15388       **Line Control**

15389       The <termios.h> header shall define the following symbolic constants for use with *tcflush()*:

15390       TCIFLUSH      Flush pending input.  
 15391       TCIOFLUSH     Flush both pending input and untransmitted output.  
 15392       TCOFLUSH      Flush untransmitted output.

15393       The <termios.h> header shall define the following symbolic constants for use with *tcflow()*:

15394       TCIOFF        Transmit a STOP character, intended to suspend input data.  
 15395       TCION          Transmit a START character, intended to restart input data.  
 15396       TCOOFF        Suspend output.  
 15397       TCOON         Restart output.

15398       The <termios.h> header shall define the **pid\_t** type as described in <sys/types.h>.

15399       The following shall be declared as functions and may also be defined as macros. Function  
 15400       prototypes shall be provided.

```

15401       speed_t cfgetispeed(const struct termios *);
15402       speed_t cfgetospeed(const struct termios *);
15403       int       cfsetispeed(struct termios *, speed_t);
15404       int       cfsetospeed(struct termios *, speed_t);
15405       int       tcdrain(int);
15406       int       tcflow(int, int);
15407       int       tcflush(int, int);
15408       int       tcgetattr(int, struct termios *);
15409       pid_t     tcgetsid(int);
15410       int       tcgetwinsize(int, struct winsize *);
15411       int       tcsendbreak(int, int);
15412       int       tcsetattr(int, int, const struct termios *);
15413       int       tcsetwinsize(int, const struct winsize *);

```

15414 **APPLICATION USAGE**

15415 The following names are reserved for XSI-conformant systems to use as an extension to the  
15416 above; therefore strictly conforming applications shall not use them:

15417	CBAUD	EXTB	VDSUSP
15418	DEFECHO	FLUSHO	VLNEXT
15419	ECHOCTL	LOBLK	VREPRINT
15420	ECHOKE	PENDIN	VSTATUS
15421	ECHOPRT	SWTCH	VWERASE
15422	EXTA	VDISCARD	

15423 **RATIONALE**

15424 None.

15425 **FUTURE DIRECTIONS**

15426 None.

15432 **CHANGE HISTORY**

15433 First released in Issue 3.

15434 Included for alignment with the ISO POSIX-1 standard.

15435 **Issue 6**

15436 The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.

15437 FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are  
15438 reaffirmed.

15439 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to  
15440 ECHOKE in the APPLICATION USAGE section.

15441 **Issue 7**

15442 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the  
15443 IXANY symbol from the XSI option to the Base.

15444 SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.

15445 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
15446 for the `pid_t` type is added.

15447 **Issue 8**

15448 Austin Group Defects 1151 and 1484 are applied, adding the `winsize` structure and the  
15449 `tcgetwinsize()` and `tcsetwinsize()` functions.

15450 **NAME**

15451 tgmath.h — type-generic macros

15452 **SYNOPSIS**

15453 #include <tgmath.h>

15454 **DESCRIPTION**

15455 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 15456 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15457 volume of POSIX.1-2024 defers to the ISO C standard.

15458 The <tgmath.h> header shall include the headers <math.h> and <complex.h> and shall define  
 15459 several type-generic macros.

15460 Of the functions contained within the <math.h> and <complex.h> headers without an *f* (**float**)  
 15461 or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is  
 15462 XSI **double**. For each such function, except *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, there shall  
 15463 be a corresponding type-generic macro. The parameters whose corresponding real type is  
 15464 **double** in the function synopsis are generic parameters. Use of the macro invokes a function  
 15465 whose corresponding real type and type domain are determined by the arguments for the  
 15466 generic parameters.

15467 Use of the macro invokes a function whose generic parameters have the corresponding real type  
 15468 determined as follows:

- 15469 • First, if any argument for generic parameters has type **long double**, the type determined is  
 15470 **long double**.
- 15471 • Otherwise, if any argument for generic parameters has type **double** or is of integer type,  
 15472 the type determined is **double**.
- 15473 • Otherwise, the type determined is **float**.

15474 For each unsuffixed function in the <math.h> header for which there is a function in the  
 15475 <complex.h> header with the same name except for a *c* prefix, the corresponding type-generic  
 15476 macro (for both functions) has the same name as the function in the <math.h> header. The  
 15477 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

	<math.h> Function	<complex.h> Function	Type-Generic Macro
15478			
15479	<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
15480	<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
15481	<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
15482	<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
15483	<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
15484	<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
15485	<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
15486	<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
15487	<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
15488	<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
15489	<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
15490	<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
15491	<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
15492	<i>log()</i>	<i>clog()</i>	<i>log()</i>
15493	<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
15494	<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
15495	<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>

15496 If at least one argument for a generic parameter is complex, then use of the macro invokes a  
 15497 complex function; otherwise, use of the macro invokes a real function.

15498 For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the  
 15499 XSI **<complex.h>** header, except for *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, the corresponding  
 15500 type-generic macro has the same name as the function. These type-generic macros are:

15501	<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
15502	<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
15503	<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
15504	<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
15505	<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbln()</i>
15506	<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbn()</i>
15507	<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
15508	<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
15509	<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
15510	<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

15511 If all arguments for generic parameters are real, then use of the macro invokes a real function;  
 15512 otherwise, use of the macro results in undefined behavior.

15513 For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a  
 15514 function in the **<math.h>** header, the corresponding type-generic macro has the same name as  
 15515 the function. These type-generic macros are:

15516	<i>carg()</i>
15517	<i>cimag()</i>
15518	<i>conj()</i>
15519	<i>cproj()</i>
15520	<i>creal()</i>

15521 Use of the macro with any real or complex argument invokes a complex function.

15522 MXC Type-generic macros that accept complex arguments shall also accept imaginary arguments. If  
 15523 an argument is imaginary, the macro shall expand to an expression whose type is real,  
 15524 imaginary, or complex, as appropriate for the particular function: if the argument is imaginary,  
 15525 then the types of *cos()*, *cosh()*, *fabs()*, *carg()*, *cimag()*, and *creal()* shall be real; the types of *sin()*,  
 15526 *tan()*, *sinh()*, *tanh()*, *asin()*, *atan()*, *asinh()*, and *atanh()* shall be imaginary; and the types of the  
 15527 others shall be complex.

15528 Given an imaginary argument, each of the type-generic macros *cos()*, *sin()*, *tan()*, *cosh()*, *sinh()*,  
 15529 *tanh()*, *asin()*, *atan()*, *asinh()*, and *atanh()* is specified by a formula in terms of real functions:

15530	<i>cos(iy)</i>	=	<i>cosh(y)</i>
15531	<i>sin(iy)</i>	=	<i>i sinh(y)</i>
15532	<i>tan(iy)</i>	=	<i>i tanh(y)</i>
15533	<i>cosh(iy)</i>	=	<i>cos(y)</i>
15534	<i>sinh(iy)</i>	=	<i>i sin(y)</i>
15535	<i>tanh(iy)</i>	=	<i>i tan(y)</i>
15536	<i>asin(iy)</i>	=	<i>i asinh(y)</i>
15537	<i>atan(iy)</i>	=	<i>i atanh(y)</i>
15538	<i>asinh(iy)</i>	=	<i>i asin(y)</i>
15539	<i>atanh(iy)</i>	=	<i>i atan(y)</i>

15540 **APPLICATION USAGE**

15541 With the declarations:

```
15542 #include <tgmath.h>
15543 int n;
15544 float f;
15545 double d;
15546 long double ld;
15547 float complex fc;
15548 double complex dc;
15549 long double complex ldc;
```

15550 functions invoked by use of type-generic macros are shown in the following table:

	Macro	Use Invokes
15551		
15552	<i>exp(n)</i>	<i>exp(n)</i> , the function
15553	<i>acosh(f)</i>	<i>acoshf(f)</i>
15554	<i>sin(d)</i>	<i>sin(d)</i> , the function
15555	<i>atan(ld)</i>	<i>atanl(ld)</i>
15556	<i>log(fc)</i>	<i>clogf(fc)</i>
15557	<i>sqrt(dc)</i>	<i>csqrt(dc)</i>
15558	<i>pow(ldc,f)</i>	<i>cpowl(ldc, f)</i>
15559	<i>remainder(n,n)</i>	<i>remainder(n, n)</i> , the function
15560	<i>nextafter(d,f)</i>	<i>nextafter(d, f)</i> , the function
15561	<i>nexttoward(f,ld)</i>	<i>nexttowardf(f, ld)</i>
15562	<i>copysign(n,ld)</i>	<i>copysignl(n, ld)</i>
15563	<i>ceil(fc)</i>	Undefined behavior
15564	<i>rint(dc)</i>	Undefined behavior
15565	<i>fmax(ldc,ld)</i>	Undefined behavior
15566	<i>carg(n)</i>	<i>carg(n)</i> , the function
15567	<i>cproj(f)</i>	<i>cprojf(f)</i>
15568	<i>creal(d)</i>	<i>creal(d)</i> , the function
15569	<i>cimag(ld)</i>	<i>cimagl(ld)</i>
15570	<i>cabs(fc)</i>	<i>cabsf(fc)</i>
15571	<i>carg(dc)</i>	<i>carg(dc)</i> , the function
15572	<i>cproj(ldc)</i>	<i>cprojl(ldc)</i>

15573 **RATIONALE**

15574 Type-generic macros allow calling a function whose type is determined by the argument type, as  
 15575 is the case for C operators such as '+' and '\*'. For example, with a type-generic *cos()* macro,  
 15576 the expression *cos((float)x)* will have type **float**. This feature enables writing more portably  
 15577 efficient code and alleviates need for awkward casting and suffixing in the process of porting or  
 15578 adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

15579 The only arguments that affect the type resolution are the arguments corresponding to the  
 15580 parameters that have type **double** in the synopsis. Hence the type of a type-generic call to  
 15581 *nexttoward()*, whose second parameter is **long double** in the synopsis, is determined solely by  
 15582 the type of the first argument.

15583 The term "type-generic" was chosen over the proposed alternatives of intrinsic and overloading.  
 15584 The term is more specific than intrinsic, which already is widely used with a more general  
 15585 meaning, and reflects a closer match to Fortran's generic functions than to C++ overloading.

15586 The macros are placed in their own header in order not to silently break old programs that

15587 include the **<math.h>** header; for example, with:

```
15588 printf ("%e", sin(x))
```

15589 *modf(double, double \*)* is excluded because no way was seen to make it safe without  
15590 complicating the type resolution.

15591 The implementation might, as an extension, endow appropriate ones of the macros that  
15592 POSIX.1-2024 specifies only for real arguments with the ability to invoke the complex functions.

15593 POSIX.1-2024 does not prescribe any particular implementation mechanism for generic macros.  
15594 It could be implemented simply with built-in macros. The generic macro for *sqrt()*, for example,  
15595 could be implemented with:

```
15596 #undef sqrt  
15597 #define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

15598 Generic macros are designed for a useful level of consistency with C++ overloaded math  
15599 functions.

15600 The great majority of existing C programs are expected to be unaffected when the **<tgmath.h>**  
15601 header is included instead of the **<math.h>** or **<complex.h>** headers. Generic macros are similar  
15602 to the ISO C standard library masking macros, though the semantic types of return values differ.

15603 The ability to overload on integer as well as floating types would have been useful for some  
15604 functions; for example, *copysign()*. Overloading with different numbers of arguments would  
15605 have allowed reusing names; for example, *remainder()* for *remquo()*. However, these facilities  
15606 would have complicated the specification; and their natural consistent use, such as for a floating  
15607 *abs()* or a two-argument *atan()*, would have introduced further inconsistencies with the  
15608 ISO/IEC 9899:1999 standard for insufficient benefit.

15609 The ISO C standard in no way limits the implementation's options for efficiency, including  
15610 inlining library functions.

#### 15611 **FUTURE DIRECTIONS**

15612 None.

#### 15613 **SEE ALSO**

15614 **<math.h>**, **<complex.h>**

15615 XSH *cabs()*, *fabs()*, *modf()*

#### 15616 **CHANGE HISTORY**

15617 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

#### 15618 **Issue 7**

15619 Austin Group Interpretation 1003.1-2001 #184 is applied, clarifying the functions for which a  
15620 corresponding type-generic macro exists with the same name as the function.

15621 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0075 [357,427] is applied.

#### 15622 **Issue 8**

15623 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

15624 **NAME**

15625 threads.h — ISO C threads

15626 **SYNOPSIS**

15627 #include <threads.h>

15628 **DESCRIPTION**

15629 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 15630 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15631 volume of POSIX.1-2024 defers to the ISO C standard.

15632 Implementations shall not define the macro `__STDC_NO_THREADS__`, except for profile  
 15633 implementations that define `_POSIX_SUBPROFILE` (see [Section 2.1.5.1](#), on page 20) in  
 15634 `<unistd.h>`, which may define `__STDC_NO_THREADS__` and, if they do so, need not provide  
 15635 this header nor support any of its facilities.

15636 The `<threads.h>` header shall define the following macros:

15637 `thread_local` Expands to `_Thread_local`.

15638 `ONCE_FLAG_INIT` Expands to a value that can be used to initialize an object of type  
 15639 `once_flag`.

15640 `TSS_DTOR_ITERATIONS`

15641 Expands to an integer constant expression representing the maximum  
 15642 number of times that destructors will be called when a thread terminates  
 15643 and shall be suitable for use in `#if` preprocessing directives.

15644 CX If `{PTHREAD_DESTRUCTOR_ITERATIONS}` is defined in `<limits.h>`, the value of  
 15645 `TSS_DTOR_ITERATIONS` shall be equal to `{PTHREAD_DESTRUCTOR_ITERATIONS}`;  
 15646 otherwise, the value of `TSS_DTOR_ITERATIONS` shall be greater than or equal to the value of  
 15647 `{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}` and shall be less than or equal to the  
 15648 maximum positive value that can be returned by a call to  
 15649 `sysconf(_SC_THREAD_DESTRUCTOR_ITERATIONS)` in any process.

15650 The `<threads.h>` header shall define the types `cnd_t`, `mtx_t`, `once_flag`, `thrd_t`, and `tss_t` as  
 15651 complete object types, the type `thrd_start_t` as the function pointer type `int (*)(void*)`, and the  
 15652 CX type `tss_dtor_t` as the function pointer type `void (*)(void*)`. The type `thrd_t` shall be defined to  
 15653 be the same type that `pthread_t` is defined to be in `<pthread.h>`.

15654 The `<threads.h>` header shall define the enumeration constants `mtx_plain`, `mtx_recursive`,  
 15655 `mtx_timed`, `thrd_busy`, `thrd_error`, `thrd_nomem`, `thrd_success` and `thrd_timedout`.

15656 The following shall be declared as functions and may also be defined as macros. Function  
 15657 prototypes shall be provided.

```

15658 void      call_once(once_flag *, void (*)(void));
15659 int       cnd_broadcast(cnd_t *);
15660 void      cnd_destroy(cnd_t *);
15661 int       cnd_init(cnd_t *);
15662 int       cnd_signal(cnd_t *);
15663 int       cnd_timedwait(cnd_t * restrict, mtx_t * restrict,
15664                        const struct timespec * restrict);
15665 int       cnd_wait(cnd_t *, mtx_t *);
15666 void      mtx_destroy(mtx_t *);
15667 int       mtx_init(mtx_t *, int);
15668 int       mtx_lock(mtx_t *);
15669 int       mtx_timedlock(mtx_t * restrict,
```

```

15670             const struct timespec * restrict);
15671     int         mtx_trylock(mtx_t *);
15672     int         mtx_unlock(mtx_t *);
15673     int         thrd_create(thrd_t *, thrd_start_t, void *);
15674     thrd_t     thrd_current(void);
15675     int         thrd_detach(thrd_t);
15676     int         thrd_equal(thrd_t, thrd_t);
15677     _Noreturn void thrd_exit(int);
15678     int         thrd_join(thrd_t, int *);
15679     int         thrd_sleep(const struct timespec *, struct timespec *);
15680     void        thrd_yield(void);
15681     int         tss_create(tss_t *, tss_dtor_t);
15682     void        tss_delete(tss_t);
15683     void        *tss_get(tss_t);
15684     int         tss_set(tss_t, void *);

```

15685 Inclusion of the **<threads.h>** header shall make symbols defined in the header **<time.h>** visible.

#### 15686 APPLICATION USAGE

15687 The **<threads.h>** header is optional in the ISO C standard but is mandated by POSIX.1-2024.  
 15688 Note however that subprofiles can choose to make this header optional (see [Section 2.1.5.1](#), on  
 15689 page 20), and therefore application portability to subprofile implementations would benefit from  
 15690 checking whether `__STDC_NO_THREADS__` is defined before inclusion of **<threads.h>**.

15691 The features provided by **<threads.h>** are not as extensive as those provided by **<pthread.h>**. It  
 15692 is present on POSIX.1 implementations in order to facilitate porting of ISO C programs that use  
 15693 it. It is recommended that applications intended for use on POSIX.1 implementations use  
 15694 **<pthread.h>** rather than **<threads.h>** even if none of the additional features are needed initially,  
 15695 to save the need to convert should the need to use them arise later in the application's lifecycle.

#### 15696 RATIONALE

15697 Although the **<threads.h>** header is optional in the ISO C standard, it is mandated by  
 15698 POSIX.1-2024 because **<pthread.h>** is mandatory and the interfaces in **<threads.h>** can easily be  
 15699 implemented as a thin wrapper for interfaces in **<pthread.h>**.

15700 The type `thrd_t` is required to be defined as the same type that `pthread_t` is defined to be in  
 15701 **<pthread.h>** because `thrd_current()` and `pthread_self()` need to return the same thread ID when  
 15702 called from the initial thread. However, these types are not fully interchangeable (that is, it is  
 15703 not always possible to pass a thread ID obtained as a `thrd_t` to a function that takes a `pthread_t`,  
 15704 and vice versa) because threads created using `thrd_create()` have a different exit status than  
 15705 `pthread_create()` threads, which is reflected in differences between the prototypes for `thrd_create()` and  
 15706 `pthread_create()`, `thrd_exit()` and `pthread_exit()`, and `thrd_join()` and `pthread_join()`; also,  
 15707 `thrd_join()` has no way to indicate that a thread was cancelled.

15708 The standard developers considered making it implementation-defined whether the types  
 15709 `cond_t`, `mtx_t` and `tss_t` are interchangeable with the corresponding types `pthread_cond_t`,  
 15710 `pthread_mutex_t` and `pthread_key_t` defined in **<pthread.h>** (that is, whether any function that  
 15711 can be called with a valid `cond_t` can also be called with a valid `pthread_cond_t`, and vice versa,  
 15712 and likewise for the other types). However, this would have meant extending `mtx_lock()` to  
 15713 provide a way for it to indicate that the owner of a mutex has terminated (equivalent to  
 15714 `[EOWNERDEAD]`). It was felt that such an extension would be invention. Although there was  
 15715 no similar concern for `cond_t` and `tss_t`, they were treated the same way as `mtx_t` for consistency.  
 15716 See also the RATIONALE for `mtx_lock()` concerning the inability of `mtx_t` to contain information  
 15717 about whether or not a mutex supports timeout if it is the same type as `pthread_mutex_t`.

15718 **FUTURE DIRECTIONS**

15719 None.

15725 **CHANGE HISTORY**

15726 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

15727 **NAME**

15728 time.h — time types

15729 **SYNOPSIS**

15730 #include &lt;time.h&gt;

15731 **DESCRIPTION**

15732 CX Some of the functionality described on this reference page extends the ISO C standard.  
 15733 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 15734 enable the visibility of these symbols in this header.

15735 The **<time.h>** header shall define the **clock\_t**, **size\_t**, **time\_t**, types as described in  
 15736 **<sys/types.h>**.

15737 CX The **<time.h>** header shall define the **clockid\_t** and **timer\_t** types as described in **<sys/types.h>**.

15738 The **<time.h>** header shall define the **locale\_t** type as described in **<locale.h>**.

15739 CPT The **<time.h>** header shall define the **pid\_t** type as described in **<sys/types.h>**.

15740 CX The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
 15741 are described in the **<signal.h>** header.

15742 The **<time.h>** header shall declare the **tm** structure, which shall include at least the following  
 15743 members:

15744	int	tm_sec	Seconds [0,60].
15745	int	tm_min	Minutes [0,59].
15746	int	tm_hour	Hour [0,23].
15747	int	tm_mday	Day of month [1,31].
15748	int	tm_mon	Month of year [0,11].
15749	int	tm_year	Years since 1900.
15750	int	tm_wday	Day of week [0,6] (Sunday =0).
15751	int	tm_yday	Day of year [0,365].
15752	int	tm_isdst	Daylight Saving flag.
15753	long	tm_gmtoff	Seconds east of UTC.
15754	const char *	tm_zone	Timezone abbreviation.

15755 When *tm\_isdst* is set by an interface defined in this standard, its value shall be positive if  
 15756 CX Daylight Saving Time (DST) is in effect and 0 if DST is not in effect. It shall not be set to a  
 15757 negative value by any interface defined in this standard. When *tm\_isdst* is passed to the *mktime()*  
 15758 function, it specifies how *mktime()* is to handle DST when calculating the time since the Epoch  
 15759 value; see *mktime()*.

15760 CX If the value of *tm\_zone* is accessed after the value of *TZ* is subsequently modified, and the  
 15761 *tm\_zone* value was not set by a call to *gmtime()* or *gmtime\_r()*, the behavior is undefined.

15762 The **<time.h>** header shall declare the **timespec** structure, which shall include at least the  
 15763 following members:

15764	time_t	tv_sec	Whole seconds.
15765	long	tv_nsec	Nanoseconds [0, 999 999 999].

15766 CX The **<time.h>** header shall also declare the **itimerspec** structure, which shall include at least the  
 15767 following members:

15768	struct timespec	it_interval	Timer period.
15769	struct timespec	it_value	Timer expiration.

15770 The <time.h> header shall define the following macros:

15771 NULL As described in <stddef.h>.

15772 CLOCKS\_PER\_SEC A number used to convert the value returned by the *clock()* function into  
 15773 XSI seconds. The value shall be an expression with type **clock\_t**. The value of  
 15774 CLOCKS\_PER\_SEC shall be 1 million on XSI-conformant systems.  
 15775 However, it may be variable on other systems, and it should not be  
 15776 assumed that CLOCKS\_PER\_SEC is a compile-time constant.

15777 TIME\_UTC An integer constant greater than 0 that designates the UTC time base in  
 15778 calls to *timespec\_get()*. The value shall be suitable for use in **#if**  
 15779 preprocessing directives.

15780 CX The <time.h> header shall define the following symbolic constants. The values shall have a type  
 15781 that is assignment-compatible with **clockid\_t**.

15782 CX CLOCK\_MONOTONIC  
 15783 The identifier for the system-wide monotonic clock, which is defined as a  
 15784 clock measuring real time, whose value cannot be set via *clock\_settime()*  
 15785 and which cannot have negative clock jumps. The maximum possible  
 15786 clock jump shall be implementation-defined.

15787 CPT CLOCK\_PROCESS\_CPUTIME\_ID  
 15788 The identifier of the CPU-time clock associated with the process making a  
 15789 *clock\*()* or *timer\*()* function call.

15790 CX CLOCK\_REALTIME The identifier of the system-wide clock measuring real time.

15791 TCT CLOCK\_THREAD\_CPUTIME\_ID  
 15792 The identifier of the CPU-time clock associated with the thread making a  
 15793 *clock\*()* or *timer\*()* function call.

15794 CX The <time.h> header shall define the following symbolic constant:

15795 TIMER\_ABSTIME Flag indicating time is absolute. For functions taking timer objects, this  
 15796 refers to the clock associated with the timer.

15797 XSI The <time.h> header shall provide a declaration or definition for *getdate\_err*. The *getdate\_err*  
 15798 symbol shall expand to an expression of type **int**. It is unspecified whether *getdate\_err* is a macro  
 15799 or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a  
 15800 macro definition is suppressed in order to access an actual object, or a program defines an  
 15801 identifier with the name *getdate\_err*, the behavior is undefined.

15802 The following shall be declared as functions and may also be defined as macros. Function  
 15803 prototypes shall be provided.

15804 OB `char *asctime(const struct tm *);`  
 15805 `clock_t clock(void);`  
 15806 CPT `int clock_getcpuclockid(pid_t, clockid_t *);`  
 15807 CX `int clock_getres(clockid_t, struct timespec *);`  
 15808 `int clock_gettime(clockid_t, struct timespec *);`  
 15809 `int clock_nanosleep(clockid_t, int, const struct timespec *,`  
 15810 `struct timespec *);`  
 15811 `int clock_settime(clockid_t, const struct timespec *);`  
 15812 OB `char *ctime(const time_t *);`  
 15813 `double difftime(time_t, time_t);`

```

15814 XSI struct tm *getdate(const char *);
15815 struct tm *gmtime(const time_t *);
15816 CX struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
15817 struct tm *localtime(const time_t *);
15818 CX struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
15819 time_t mktime(struct tm *);
15820 CX int nanosleep(const struct timespec *, struct timespec *);
15821 size_t strftime(char *restrict, size_t, const char *restrict,
15822 const struct tm *restrict);
15823 CX size_t strftime_l(char *restrict, size_t, const char *restrict,
15824 const struct tm *restrict, locale_t);
15825 XSI char *strptime(const char *restrict, const char *restrict,
15826 struct tm *restrict);
15827 time_t time(time_t *);
15828 CX int timer_create(clockid_t, struct sigevent *restrict,
15829 timer_t *restrict);
15830 int timer_delete(timer_t);
15831 int timer_getoverrun(timer_t);
15832 int timer_gettime(timer_t, struct itimerspec *);
15833 int timer_settime(timer_t, int, const struct itimerspec *restrict,
15834 struct itimerspec *restrict);
15835 int timespec_get(struct timespec *, int);
15836 CX void tzset(void);

```

15837 The **<time.h>** header shall declare the following as variables:

```

15838 XSI extern int daylight;
15839 extern long timezone;
15840 CX extern char *tzname[];

```

15841 CX Inclusion of the **<time.h>** header may make visible all symbols from the **<signal.h>** header.

## 15842 APPLICATION USAGE

15843 The range [0,60] for *tm\_sec* allows for the occasional leap second.

15844 *tm\_year* is a signed value; therefore, years before 1900 may be represented.

15845 To obtain the number of clock ticks per second returned by the *times()* function, applications  
 15846 should call *sysconf(\_SC\_CLK\_TCK)*.

## 15847 RATIONALE

15848 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of  
 15849 UTC does not permit double leap seconds, so all mention of double leap seconds has been  
 15850 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this  
 15851 standard.

## 15852 FUTURE DIRECTIONS

15853 None.

## 15861 CHANGE HISTORY

15862 First released in Issue 1. Derived from Issue 1 of the SVID.

### 15863 Issue 5

15864 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 15865 Threads Extension.

### 15866 Issue 6

15867 The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid\_t**  
 15868 and **timer\_t** have been described.

15869 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 15870 • The POSIX timer-related functions are marked as part of the Timers option.

15871 The symbolic name CLK\_TCK is removed. Application usage is added describing how its  
 15872 equivalent functionality can be obtained using *sysconf()*.

15873 The *clock\_getcpuclockid()* function and manifest constants CLOCK\_PROCESS\_CPUTIME\_ID and  
 15874 CLOCK\_THREAD\_CPUTIME\_ID are added for alignment with IEEE Std 1003.1d-1999.

15875 The manifest constant CLOCK\_MONOTONIC and the *clock\_nanosleep()* function are added for  
 15876 alignment with IEEE Std 1003.1j-2000.

15877 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 15878 • The range for seconds is changed from [0,61] to [0,60].
- 15879 • The **restrict** keyword is added to the prototypes for *asctime\_r()*, *gmtime\_r()*, *localtime\_r()*,  
 15880 *strftime()*, *strptime()*, *timer\_create()*, and *timer\_settime()*.

15881 IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the  
 15882 <signal.h> header may be made visible when the <time.h> header is included.

15883 Extensions beyond the ISO C standard are marked.

### 15884 Issue 7

15885 Austin Group Interpretation 1003.1-2001 #111 is applied.

15886 SD5-XBD-ERN-74 is applied.

15887 The *strftime\_1()* function is added from The Open Group Technical Standard, 2006, Extended API  
 15888 Set Part 4.

15889 Functionality relating to the Timers option is moved to the Base.

15890 This reference page is clarified with respect to macros and symbolic constants, and declarations  
 15891 for the **locale\_t** and **pid\_t** types and the **sigevent** structure are added.

15892 The description of the *getdate\_err* value is expanded.

15893 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0076 [212] and XBD/TC1-2008/0077  
 15894 [212] are applied.

### 15895 Issue 8

15896 Austin Group Defect 1253 is applied, changing “Daylight Savings” to “Daylight Saving”.

15897 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

15898 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

- 15899 Austin Group Defect 1410 is applied, removing the *asctime\_r()* and *ctime\_r()* functions.
- 15900 Austin Group Defect 1533 is applied, adding *tm\_gmtoff* and *tm\_zone* to the **tm** structure.
- 15901 Austin Group Defect 1597 is applied, changing *clock()* to *clock\*()* in the descriptions of
- 15902 CLOCK\_PROCESS\_CPUTIME\_ID and CLOCK\_THREAD\_CPUTIME\_ID.
- 15903 Austin Group Defect 1614 is applied, clarifying the requirements for the *tm\_isdst* member of the
- 15904 **tm** structure.

15905 **NAME**

15906           uchar.h — Unicode character handling

15907 **SYNOPSIS**

15908           #include &lt;uchar.h&gt;

15909 **DESCRIPTION**

15910 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 15911 conflict between the requirements described here and the ISO C standard is unintentional. This  
 15912 volume of POSIX.1-2024 defers to the ISO C standard.

15913       The &lt;uchar.h&gt; header shall define the following types:

15914       **mbstate\_t**   As described in <wchar.h>.15915       **size\_t**       As described in <stddef.h>.15916       **char16\_t**   The same type as **uint\_least16\_t**, described in <stdint.h>.15917       **char32\_t**   The same type as **uint\_least32\_t**, described in <stdint.h>.

15918       The following shall be declared as functions and may also be defined as macros. Function  
 15919 prototypes shall be provided.

```
15920       size_t  c16rtomb(char *restrict, char16_t, mbstate_t *restrict);
15921       size_t  c32rtomb(char *restrict, char32_t, mbstate_t *restrict);
15922       size_t  mbrtoc16(char16_t *restrict, const char *restrict, size_t,
15923                        mbstate_t *restrict);
15924       size_t  mbrtoc32(char32_t *restrict, const char *restrict, size_t,
15925                        mbstate_t *restrict);
```

15926 CX       Inclusion of the <uchar.h> header may make visible all symbols from the headers <stddef.h>,  
 15927 <stdint.h>, and <wchar.h>.

15928 **APPLICATION USAGE**

15929       None.

15930 **RATIONALE**

15931       None.

15932 **FUTURE DIRECTIONS**

15933       None.

15934 **SEE ALSO**

15935       &lt;stddef.h&gt;, &lt;stdint.h&gt;, &lt;wchar.h&gt;

15936       XSH *c16rtomb()*, *mbrtoc16()*15937 **CHANGE HISTORY**

15938       First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

**15939 NAME**

15940 unistd.h — standard symbolic constants and types

**15941 SYNOPSIS**

15942 #include <unistd.h>

**15943 DESCRIPTION**

15944 The **<unistd.h>** header defines miscellaneous symbolic constants and types, and declares  
 15945 miscellaneous functions. The actual values of the constants are unspecified except as shown. The  
 15946 contents of this header are shown below.

**15947 Version Test Macros**

15948 The **<unistd.h>** header shall define the following symbolic constants. The values shall be  
 15949 suitable for use in **#if** preprocessing directives.

**15950 \_POSIX\_VERSION**

15951 Integer value indicating version of this standard (C-language binding) to which the  
 15952 implementation conforms. For implementations conforming to POSIX.1-2024, the value  
 15953 shall be 202405L.

**15954 \_POSIX2\_VERSION**

15955 Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the  
 15956 implementation conforms. For implementations conforming to POSIX.1-2024, the value  
 15957 shall be 202405L. For profile implementations that define `_POSIX_SUBPROFILE` (see  
 15958 [Section 2.1.5.1](#)) in **<unistd.h>**, `_POSIX2_VERSION` may be left undefined or be defined with  
 15959 the value `-1` to indicate that the Shell and Utilities volume of POSIX.1 is not supported. In  
 15960 this case, a call to `sysconf(_SC_2_VERSION)` shall return either 202405L or `-1` indicating that  
 15961 the Shell and Utilities volume of POSIX.1 is or is not, respectively, supported at runtime.

15962 The **<unistd.h>** header shall define the following symbolic constant only if the implementation  
 15963 supports the XSI option; see [Section 2.1.4](#) (on page 19). If defined, its value shall be suitable for  
 15964 use in **#if** preprocessing directives.

**15965 XSI \_XOPEN\_VERSION**

15966 Integer value indicating version of the X/Open Portability Guide to which the  
 15967 implementation conforms. The value shall be 800.

**15968 Constants for Options and Option Groups**

15969 The following symbolic constants, if defined in **<unistd.h>**, shall have a value of `-1`, `0`, or  
 15970 greater, unless otherwise specified below. For profile implementations that define  
 15971 `_POSIX_SUBPROFILE` (see [Section 2.1.5.1](#)) in **<unistd.h>**, constants described below as always  
 15972 having a value greater than zero need not be defined and, if defined, may have a value of `-1`, `0`,  
 15973 or greater. The values shall be suitable for use in **#if** preprocessing directives.

15974 If a symbolic constant is not defined or is defined with the value `-1`, the option is not supported  
 15975 for compilation. If it is defined with a value greater than zero, the option shall always be  
 15976 supported when the application is executed. If it is defined with the value zero, the option shall  
 15977 be supported for compilation and might or might not be supported at runtime. See [Section 2.1.6](#)  
 15978 (on page 25) for further information about the conformance requirements of these three  
 15979 categories of support.

**15980 ADV \_POSIX\_ADVISORY\_INFO**

15981 The implementation supports the Advisory Information option. If this symbol is defined in  
 15982 **<unistd.h>**, it shall be defined to be `-1`, `0`, or 202405L. The value of this symbol reported by  
 15983 `sysconf()` shall either be `-1` or 202405L.

15984		<code>_POSIX_ASYNCHRONOUS_IO</code>
15985		The implementation supports asynchronous input and output. This symbol shall always be
15986		set to the value 202405L.
15987		<code>_POSIX_BARRIERS</code>
15988		The implementation supports barriers. This symbol shall always be set to the value
15989		202405L.
15990		<code>_POSIX_CHOWN_RESTRICTED</code>
15991		The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
15992		to changing the group ID of a file only to the effective group ID of the process or to one of
15993		its supplementary group IDs. This symbol shall be defined with a value other than -1.
15994		<code>_POSIX_CLOCK_SELECTION</code>
15995		The implementation supports clock selection. This symbol shall always be set to the value
15996		202405L.
15997	CPT	<code>_POSIX_CPUTIME</code>
15998		The implementation supports the Process CPU-Time Clocks option. If this symbol is
15999		defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol
16000		reported by <i>sysconf()</i> shall either be -1 or 202405L.
16001	DC	<code>_POSIX_DEVICE_CONTROL</code>
16002		The implementation supports the device control option. If this symbol is defined in
16003		<unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by
16004		<i>sysconf()</i> shall either be -1 or 202405L.
16005	FSC	<code>_POSIX_FSYNC</code>
16006		The implementation supports the File Synchronization option. If this symbol is defined in
16007		<unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by
16008		<i>sysconf()</i> shall either be -1 or 202405L.
16009	IP6	<code>_POSIX_IPV6</code>
16010		The implementation supports the IPv6 option. If this symbol is defined in <unistd.h>, it
16011		shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall
16012		either be -1 or 202405L.
16013		<code>_POSIX_JOB_CONTROL</code>
16014		The implementation supports job control. This symbol shall always be set to a value greater
16015		than zero.
16016		<code>_POSIX_MAPPED_FILES</code>
16017		The implementation supports memory mapped Files. This symbol shall always be set to the
16018		value 202405L.
16019	ML	<code>_POSIX_MEMLOCK</code>
16020		The implementation supports the Process Memory Locking option. If this symbol is defined
16021		in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported
16022		by <i>sysconf()</i> shall either be -1 or 202405L.
16023	MLR	<code>_POSIX_MEMLOCK_RANGE</code>
16024		The implementation supports the Range Memory Locking option. If this symbol is defined
16025		in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported
16026		by <i>sysconf()</i> shall either be -1 or 202405L.
16027		<code>_POSIX_MEMORY_PROTECTION</code>
16028		The implementation supports memory protection. This symbol shall always be set to the
16029		value 202405L.

16030 MSG **\_POSIX\_MESSAGE\_PASSING**  
 16031 The implementation supports the Message Passing option. If this symbol is defined in  
 16032 <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by  
 16033 *sysconf()* shall either be -1 or 202405L.

16034 **\_POSIX\_MONOTONIC\_CLOCK**  
 16035 The implementation supports a monotonic clock. This symbol shall always be set to the  
 16036 value 202405L.

16037 **\_POSIX\_NO\_TRUNC**  
 16038 Pathname components longer than {NAME\_MAX} generate an error. This symbol shall be  
 16039 defined with a value other than -1.

16040 PIO **\_POSIX\_PRIORITIZED\_IO**  
 16041 The implementation supports the Prioritized Input and Output option. If this symbol is  
 16042 defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol  
 16043 reported by *sysconf()* shall either be -1 or 202405L.

16044 PS **\_POSIX\_PRIORITY\_SCHEDULING**  
 16045 The implementation supports the Process Scheduling option. If this symbol is defined in  
 16046 <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by  
 16047 *sysconf()* shall either be -1 or 202405L.

16048 RS **\_POSIX\_RAW\_SOCKETS**  
 16049 The implementation supports the Raw Sockets option. If this symbol is defined in  
 16050 <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by  
 16051 *sysconf()* shall either be -1 or 202405L.

16052 **\_POSIX\_READER\_WRITER\_LOCKS**  
 16053 The implementation supports read-write locks. This symbol shall always be set to the value  
 16054 202405L.

16055 **\_POSIX\_REALTIME\_SIGNALS**  
 16056 The implementation supports realtime signals. This symbol shall always be set to the value  
 16057 202405L.

16058 **\_POSIX\_REGEX**  
 16059 The implementation supports the Regular Expression Handling option. This symbol shall  
 16060 always be set to a value greater than zero.

16061 **\_POSIX\_SAVED\_IDS**  
 16062 Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be  
 16063 set to a value greater than zero.

16064 **\_POSIX\_SEMAPHORES**  
 16065 The implementation supports semaphores. This symbol shall always be set to the value  
 16066 202405L.

16067 SHM **\_POSIX\_SHARED\_MEMORY\_OBJECTS**  
 16068 The implementation supports the Shared Memory Objects option. If this symbol is defined  
 16069 in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported  
 16070 by *sysconf()* shall either be -1 or 202405L.

16071 **\_POSIX\_SHELL**  
 16072 The implementation supports the POSIX shell. This symbol shall always be set to a value  
 16073 greater than zero.

16074	SPN	<b>_POSIX_SPAWN</b>	The implementation supports the Spawn option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16075			
16076			
16077			
16078		<b>_POSIX_SPIN_LOCKS</b>	The implementation supports spin locks. This symbol shall always be set to the value 202405L.
16079			
16080			
16081	SS	<b>_POSIX_SPORADIC_SERVER</b>	The implementation supports the Process Sporadic Server option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16082			
16083			
16084			
16085	SIO	<b>_POSIX_SYNCHRONIZED_IO</b>	The implementation supports the Synchronized Input and Output option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16086			
16087			
16088			
16089	TSA	<b>_POSIX_THREAD_ATTR_STACKADDR</b>	The implementation supports the Thread Stack Address Attribute option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16090			
16091			
16092			
16093	TSS	<b>_POSIX_THREAD_ATTR_STACKSIZE</b>	The implementation supports the Thread Stack Size Attribute option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16094			
16095			
16096			
16097	TCT	<b>_POSIX_THREAD_CPU_TIME</b>	The implementation supports the Thread CPU-Time Clocks option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16098			
16099			
16100			
16101	TPI	<b>_POSIX_THREAD_PRIO_INHERIT</b>	The implementation supports the Non-Robust Mutex Priority Inheritance option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16102			
16103			
16104			
16105	TPP	<b>_POSIX_THREAD_PRIO_PROTECT</b>	The implementation supports the Non-Robust Mutex Priority Protection option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16106			
16107			
16108			
16109	TPS	<b>_POSIX_THREAD_PRIORITY_SCHEDULING</b>	The implementation supports the Thread Execution Scheduling option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16110			
16111			
16112			
16113	TSH	<b>_POSIX_THREAD_PROCESS_SHARED</b>	The implementation supports the Thread Process-Shared Synchronization option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16114			
16115			
16116			
16117	RPI	<b>_POSIX_THREAD_ROBUST_PRIO_INHERIT</b>	The implementation supports the Robust Mutex Priority Inheritance option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol
16118			
16119			

16120 reported by *sysconf()* shall either be `-1` or `202405L`.

16121 RPP `_POSIX_THREAD_ROBUST_PRIO_PROTECT`

16122 The implementation supports the Robust Mutex Priority Protection option. If this symbol is

16123 defined in `<unistd.h>`, it shall be defined to be `-1`, `0`, or `202405L`. The value of this symbol

16124 reported by *sysconf()* shall either be `-1` or `202405L`.

16125 `_POSIX_THREAD_SAFE_FUNCTIONS`

16126 The implementation supports thread-safe functions. This symbol shall always be set to the

16127 value `202405L`.

16128 TSP `_POSIX_THREAD_SPORADIC_SERVER`

16129 The implementation supports the Thread Sporadic Server option. If this symbol is defined

16130 in `<unistd.h>`, it shall be defined to be `-1`, `0`, or `202405L`. The value of this symbol reported

16131 by *sysconf()* shall either be `-1` or `202405L`.

16132 `_POSIX_THREADS`

16133 The implementation supports threads. This symbol shall always be set to the value

16134 `202405L`.

16135 `_POSIX_TIMEOUTS`

16136 The implementation supports timeouts. This symbol shall always be set to the value

16137 `202405L`.

16138 `_POSIX_TIMERS`

16139 The implementation supports timers. This symbol shall always be set to the value `202405L`.

16140 TYM `_POSIX_TYPED_MEMORY_OBJECTS`

16141 The implementation supports the Typed Memory Objects option. If this symbol is defined

16142 in `<unistd.h>`, it shall be defined to be `-1`, `0`, or `202405L`. The value of this symbol reported

16143 by *sysconf()* shall either be `-1` or `202405L`.

16144 OB `_POSIX_V7_ILP32_OFF32`

16145 The implementation provides a C-language compilation environment with 32-bit `int`, `long`,

16146 `off_t`, and all pointer types.

16147 OB `_POSIX_V7_ILP32_OFFBIG`

16148 The implementation provides a C-language compilation environment with 32-bit `int`, `long`,

16149 and all pointer types, and an `off_t` type using at least 64 bits.

16150 OB `_POSIX_V7_LP64_OFF64`

16151 The implementation provides a C-language compilation environment with a 32-bit `int` type

16152 and 64-bit `long`, `off_t`, and all pointer types.

16153 OB `_POSIX_V7_LP64_OFFBIG`

16154 The implementation provides a C-language compilation environment with an `int` type

16155 using at least 32 bits and `long`, `off_t`, and all pointer types using at least 64 bits.

16156 `_POSIX_V8_ILP32_OFF32`

16157 The implementation provides a C-language compilation environment with 32-bit `int`, `long`,

16158 `off_t`, and all pointer types.

16159 `_POSIX_V8_ILP32_OFFBIG`

16160 The implementation provides a C-language compilation environment with 32-bit `int`, `long`,

16161 and all pointer types, and an `off_t` type using at least 64 bits.

16162 `_POSIX_V8_LP64_OFF64`

16163 The implementation provides a C-language compilation environment with a 32-bit `int` type

16164 and 64-bit `long`, `off_t`, and all pointer types.

16165		<code>_POSIX_V8_LPBIG_OFFBIG</code>	
16166			The implementation provides a C-language compilation environment with an <b>int</b> type using at least 32 bits and <b>long</b> , <b>off_t</b> , and all pointer types using at least 64 bits.
16167			
16168		<code>_POSIX2_C_BIND</code>	
16169			The implementation supports the C-Language Binding option. This symbol shall always have the value 202405L.
16170			
16171	CD	<code>_POSIX2_C_DEV</code>	
16172			The implementation supports the C-Language Development Utilities option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16173			
16174			
16175		<code>_POSIX2_CHAR_TERM</code>	
16176			The implementation supports the Terminal Characteristics option. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or a value greater than zero.
16177			
16178	FR	<code>_POSIX2_FORT_RUN</code>	
16179			The implementation supports the FORTRAN Runtime Utilities option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16180			
16181			
16182		<code>_POSIX2_LOCALEDEF</code>	
16183			The implementation supports the creation of locales by the <i>localedef</i> utility. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16184			
16185			
16186	SD	<code>_POSIX2_SW_DEV</code>	
16187			The implementation supports the Software Development Utilities option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16188			
16189			
16190	UP	<code>_POSIX2_UPE</code>	
16191			The implementation supports the User Portability Utilities option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by <i>sysconf()</i> shall either be -1 or 202405L.
16192			
16193			
16194	XSI	<code>_XOPEN_CRYPT</code>	
16195			The implementation supports the X/Open Encryption Option Group.
16196		<code>_XOPEN_ENH_I18N</code>	
16197			The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option Group. This symbol shall always be set to a value other than -1.
16198			
16199		<code>_XOPEN_REALTIME</code>	
16200			The implementation supports the X/Open Realtime Option Group.
16201		<code>_XOPEN_REALTIME_THREADS</code>	
16202			The implementation supports the X/Open Realtime Threads Option Group.
16203		<code>_XOPEN_SHM</code>	
16204			The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This symbol shall always be set to a value other than -1.
16205			
16206		<code>_XOPEN_UNIX</code>	
16207			The implementation supports the XSI option.

16208 UU **\_XOPEN\_UUCP**  
 16209 The implementation supports the UUCP Utilities option. If this symbol is defined in  
 16210 <unistd.h>, it shall be defined to be -1, 0, or 202405L. The value of this symbol reported by  
 16211 *sysconf()* shall be either -1 or 202405L.

16212 **Execution-Time Symbolic Constants**

16213 If any of the following symbolic constants are not defined in the <unistd.h> header, the value  
 16214 shall vary depending on the file to which it is applied. If defined, they shall have values suitable  
 16215 for use in #if preprocessing directives.

16216 If any of the following symbolic constants are defined to have value -1 in the <unistd.h> header,  
 16217 the implementation shall not provide the option on any file; if any are defined to have a value  
 16218 other than -1 in the <unistd.h> header, the implementation shall provide the option on all  
 16219 applicable files.

16220 All of the following values, whether defined as symbolic constants in <unistd.h> or not, may be  
 16221 queried with respect to a specific file using the *pathconf()* or *fpathconf()* functions:

16222 **\_POSIX\_ASYNC\_IO**  
 16223 Asynchronous input or output operations may be performed for the associated file.

16224 **\_POSIX\_FALLOC**  
 16225 The *posix\_fallocate()* function is supported by the associated file.

16226 **\_POSIX\_PRIO\_IO**  
 16227 Prioritized input or output operations may be performed for the associated file.

16228 **\_POSIX\_SYNC\_IO**  
 16229 Synchronized input or output operations may be performed for the associated file.

16230 If the following symbolic constants are defined in the <unistd.h> header, they apply to files and  
 16231 all paths in all file systems on the implementation:

16232 **\_POSIX\_TIMESTAMP\_RESOLUTION**  
 16233 The resolution in nanoseconds for all file timestamps.

16234 **\_POSIX2\_SYMLINKS**  
 16235 Symbolic links can be created.

16236 **Constants for Functions**

16237 The <unistd.h> header shall define NULL as described in <stddef.h>.

16238 The <unistd.h> header shall define the symbolic constants O\_CLOEXEC and O\_CLOFORK as  
 16239 described in <fcntl.h>.

16240 The <unistd.h> header shall define the following symbolic constants for use with the *access()*  
 16241 function. The values shall be suitable for use in #if preprocessing directives.

16242 **F\_OK** Test for existence of file.

16243 **R\_OK** Test for read permission.

16244 **W\_OK** Test for write permission.

16245 **X\_OK** Test for execute (search) permission.

16246 The constants F\_OK, R\_OK, W\_OK, and X\_OK and the expressions R\_OK | W\_OK, R\_OK | X\_OK,  
 16247 and R\_OK | W\_OK | X\_OK shall all have distinct values.

16248 The <unistd.h> header shall define the following symbolic constants for the *confstr()* function:

16249 `_CS_PATH`  
 16250 This is the value for the *PATH* environment variable that finds all of the standard utilities  
 16251 that are provided in a manner accessible via the *exec* family of functions.

16252 `_CS_POSIX_V8_ILP32_OFF32_CFLAGS`  
 16253 If *sysconf*(`_SC_V8_ILP32_OFF32`) returns `-1`, the meaning of this value is unspecified.  
 16254 Otherwise, this value is the set of initial options to be given to the *c17* utility to build an  
 16255 application using a programming model with 32-bit **int**, **long**, **off\_t**, and all pointer types.

16256 `_CS_POSIX_V8_ILP32_OFF32_LDFLAGS`  
 16257 If *sysconf*(`_SC_V8_ILP32_OFF32`) returns `-1`, the meaning of this value is unspecified.  
 16258 Otherwise, this value is the set of final options to be given to the *c17* utility to build an  
 16259 application using a programming model with 32-bit **int**, **long**, **off\_t**, and all pointer types.

16260 `_CS_POSIX_V8_ILP32_OFF32_LIBS`  
 16261 If *sysconf*(`_SC_V8_ILP32_OFF32`) returns `-1`, the meaning of this value is unspecified.  
 16262 Otherwise, this value is the set of libraries to be given to the *c17* utility to build an  
 16263 application using a programming model with 32-bit **int**, **long**, **off\_t**, and all pointer types.

16264 `_CS_POSIX_V8_ILP32_OFFBIG_CFLAGS`  
 16265 If *sysconf*(`_SC_V8_ILP32_OFFBIG`) returns `-1`, the meaning of this value is unspecified.  
 16266 Otherwise, this value is the set of initial options to be given to the *c17* utility to build an  
 16267 application using a programming model with 32-bit **int**, **long**, and all pointer types, and an  
 16268 **off\_t** type using at least 64 bits.

16269 `_CS_POSIX_V8_ILP32_OFFBIG_LDFLAGS`  
 16270 If *sysconf*(`_SC_V8_ILP32_OFFBIG`) returns `-1`, the meaning of this value is unspecified.  
 16271 Otherwise, this value is the set of final options to be given to the *c17* utility to build an  
 16272 application using a programming model with 32-bit **int**, **long**, and all pointer types, and an  
 16273 **off\_t** type using at least 64 bits.

16274 `_CS_POSIX_V8_ILP32_OFFBIG_LIBS`  
 16275 If *sysconf*(`_SC_V8_ILP32_OFFBIG`) returns `-1`, the meaning of this value is unspecified.  
 16276 Otherwise, this value is the set of libraries to be given to the *c17* utility to build an  
 16277 application using a programming model with 32-bit **int**, **long**, and all pointer types, and an  
 16278 **off\_t** type using at least 64 bits.

16279 `_CS_POSIX_V8_LP64_OFF64_CFLAGS`  
 16280 If *sysconf*(`_SC_V8_LP64_OFF64`) returns `-1`, the meaning of this value is unspecified.  
 16281 Otherwise, this value is the set of initial options to be given to the *c17* utility to build an  
 16282 application using a programming model with a 32-bit **int** type and 64-bit **long**, **off\_t**, and all  
 16283 pointer types.

16284 `_CS_POSIX_V8_LP64_OFF64_LDFLAGS`  
 16285 If *sysconf*(`_SC_V8_LP64_OFF64`) returns `-1`, the meaning of this value is unspecified.  
 16286 Otherwise, this value is the set of final options to be given to the *c17* utility to build an  
 16287 application using a programming model with a 32-bit **int** type and 64-bit **long**, **off\_t**, and all  
 16288 pointer types.

16289 `_CS_POSIX_V8_LP64_OFF64_LIBS`  
 16290 If *sysconf*(`_SC_V8_LP64_OFF64`) returns `-1`, the meaning of this value is unspecified.  
 16291 Otherwise, this value is the set of libraries to be given to the *c17* utility to build an  
 16292 application using a programming model with a 32-bit **int** type and 64-bit **long**, **off\_t**, and all  
 16293 pointer types.

16294 `_CS_POSIX_V8_LPBIG_OFFBIG_CFLAGS`  
 16295 If `sysconf(_SC_V8_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 16296 Otherwise, this value is the set of initial options to be given to the `c17` utility to build an  
 16297 application using a programming model with an `int` type using at least 32 bits and `long`,  
 16298 `off_t`, and all pointer types using at least 64 bits.

16299 `_CS_POSIX_V8_LPBIG_OFFBIG_LDFLAGS`  
 16300 If `sysconf(_SC_V8_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 16301 Otherwise, this value is the set of final options to be given to the `c17` utility to build an  
 16302 application using a programming model with an `int` type using at least 32 bits and `long`,  
 16303 `off_t`, and all pointer types using at least 64 bits.

16304 `_CS_POSIX_V8_LPBIG_OFFBIG_LIBS`  
 16305 If `sysconf(_SC_V8_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 16306 Otherwise, this value is the set of libraries to be given to the `c17` utility to build an  
 16307 application using a programming model with an `int` type using at least 32 bits and `long`,  
 16308 `off_t`, and all pointer types using at least 64 bits.

16309 `_CS_POSIX_V8_THREADS_CFLAGS`  
 16310 This value is the set of initial options to be given to the `c17` utility to build a multi-threaded  
 16311 application. These flags are in addition to those associated with any of the other  
 16312 `_CS_POSIX_V8*_CFLAGS` values used to specify particular type size programming  
 16313 environments.

16314 `_CS_POSIX_V8_THREADS_LDFLAGS`  
 16315 This value is the set of final options to be given to the `c17` utility to build a multi-threaded  
 16316 application. These flags are in addition to those associated with any of the other  
 16317 `_CS_POSIX_V8*_LDFLAGS` values used to specify particular type size programming  
 16318 environments.

16319 `_CS_POSIX_V8_WIDTH_RESTRICTED_ENVS`  
 16320 This value is a <newline>-separated list of names of programming environments supported  
 16321 by the implementation in which the widths of the `blksize_t`, `cc_t`, `mode_t`, `nfds_t`, `pid_t`,  
 16322 `ptrdiff_t`, `size_t`, `speed_t`, `ssize_t`, `suseconds_t`, `tcflag_t`, `wchar_t`, and `wint_t` types are no  
 16323 greater than the width of type `long`. The format of each name shall be suitable for use with  
 16324 the `getconf -v` option.

16325 `_CS_V8_ENV`  
 16326 This is the value that provides the environment variable information (other than that  
 16327 provided by `_CS_PATH`) that is required by the implementation to create a conforming  
 16328 environment, as described in the implementation's conformance documentation.

16329 OB The following symbolic constants are reserved for compatibility with Issue 7:

- 16330 `_CS_POSIX_V7_ILP32_OFF32_CFLAGS`
- 16331 `_CS_POSIX_V7_ILP32_OFF32_LDFLAGS`
- 16332 `_CS_POSIX_V7_ILP32_OFF32_LIBS`
- 16333 `_CS_POSIX_V7_ILP32_OFFBIG_CFLAGS`
- 16334 `_CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS`
- 16335 `_CS_POSIX_V7_ILP32_OFFBIG_LIBS`
- 16336 `_CS_POSIX_V7_LP64_OFF64_CFLAGS`
- 16337 `_CS_POSIX_V7_LP64_OFF64_LDFLAGS`
- 16338 `_CS_POSIX_V7_LP64_OFF64_LIBS`
- 16339 `_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS`
- 16340 `_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS`
- 16341 `_CS_POSIX_V7_LPBIG_OFFBIG_LIBS`

```

16342 _CS_POSIX_V7_THREADS_CFLAGS
16343 _CS_POSIX_V7_THREADS_LDFLAGS
16344 _CS_POSIX_V7_WIDTH_RESTRICTED_ENVS
16345 _CS_V7_ENV
    
```

16346 The implementation may define additional symbolic constants beginning with `_CS_` for use by  
 16347 `confstr()`.

16348 The <unistd.h> header shall define `SEEK_CUR`, `SEEK_END`, and `SEEK_SET` as described in  
 16349 <stdio.h>.

16350 Additionally, it shall define the following macros which shall expand to integer constant  
 16351 expressions with values that are distinct from each other and from `SEEK_CUR`, `SEEK_END`, and  
 16352 `SEEK_SET`:

```

16353 SEEK_HOLE    Seek forwards from offset relative to start-of-file for a position within a hole.
16354 SEEK_DATA    Seek forwards from offset relative to start-of-file for a position not within a
16355              hole
    
```

16356 XSI The <unistd.h> header shall define the following symbolic constants as possible values for the  
 16357 *function* argument to the `lockf()` function:

```

16358 F_LOCK      Lock a section for exclusive use.
16359 F_TEST      Test section for locks by other processes.
16360 F_TLOCK     Test and lock a section for exclusive use.
16361 F_ULOCK     Unlock locked sections.
    
```

16362 The <unistd.h> header shall define the following symbolic constants for `pathconf()`:

```

16363 _PC_2_SYMLINKS
16364 _PC_ALLOC_SIZE_MIN
16365 _PC_ASYNC_IO
16366 _PC_CHOWN_RESTRICTED
16367 _PC_FALLOC
16368 _PC_FILESIZEBITS
16369 _PC_LINK_MAX
16370 _PC_MAX_CANON
16371 _PC_MAX_INPUT
16372 _PC_NAME_MAX
16373 _PC_NO_TRUNC
16374 _PC_PATH_MAX
16375 _PC_PIPE_BUF
16376 _PC_PRIO_IO
16377 _PC_REC_INCR_XFER_SIZE
16378 _PC_REC_MAX_XFER_SIZE
16379 _PC_REC_MIN_XFER_SIZE
16380 _PC_REC_XFER_ALIGN
16381 _PC_SYMLINK_MAX
16382 _PC_SYNC_IO
16383 _PC_TEXTDOMAIN_MAX
16384 _PC_TIMESTAMP_RESOLUTION
16385 _PC_VDISABLE
    
```

16386 The implementation may define additional symbolic constants beginning with `_PC_` for use by  
16387 `pathconf()`.

16388 The **<unistd.h>** header shall define the following symbolic constants for `sysconf()`:

16389 `_SC_2_C_BIND`  
16390 `_SC_2_C_DEV`  
16391 `_SC_2_CHAR_TERM`  
16392 `_SC_2_FORT_RUN`  
16393 `_SC_2_LOCALEDEF`  
16394 `_SC_2_SW_DEV`  
16395 `_SC_2_UPE`  
16396 `_SC_2_VERSION`  
16397 `_SC_ADVISORY_INFO`  
16398 `_SC_AIO_LISTIO_MAX`  
16399 `_SC_AIO_MAX`  
16400 `_SC_AIO_PRIO_DELTA_MAX`  
16401 `_SC_ARG_MAX`  
16402 `_SC_ASYNCHRONOUS_IO`  
16403 `_SC_ATEXIT_MAX`  
16404 `_SC_BARRIERS`  
16405 `_SC_BC_BASE_MAX`  
16406 `_SC_BC_DIM_MAX`  
16407 `_SC_BC_SCALE_MAX`  
16408 `_SC_BC_STRING_MAX`  
16409 `_SC_CHILD_MAX`

 16488 \_SC\_V8\_LP64\_OFFBIG

```

16489 OB  _SC_V7_ILP32_OFF32
16490      _SC_V7_ILP32_OFFBIG
16491      _SC_V7_LP64_OFF64
16492      _SC_V7_LPBIG_OFFBIG
16493      _SC_VERSION
16494      _SC_XOPEN_CRYPT
16495      _SC_XOPEN_ENH_I18N
16496      _SC_XOPEN_REALTIME
16497      _SC_XOPEN_REALTIME_THREADS
16498      _SC_XOPEN_SHM
16499      _SC_XOPEN_UNIX
16500      _SC_XOPEN_UUCP
16501      _SC_XOPEN_VERSION

```

16502 The two constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` may be defined to have the same value.

16503 The implementation may define additional symbolic constants beginning with `_SC_` for use by  
16504 `sysconf()`.

16505 The <unistd.h> header shall define the following symbolic constants for file streams:

- 16506 `STDERR_FILENO` File number of `stderr`; 2.
- 16507 `STDIN_FILENO` File number of `stdin`; 0.
- 16508 `STDOUT_FILENO` File number of `stdout`; 1.

16509 The <unistd.h> header shall define the following symbolic constant for terminal special  
16510 character handling:

- 16511 `_POSIX_VDISABLE` This symbol shall be defined to be the value of a character that shall  
16512 disable terminal special character handling as described in [Section 11.2.6](#)  
16513 (on page 212). This symbol shall always be set to a value other than `-1`.

16514 The <unistd.h> header shall define the following symbolic constant as a value for the flag used  
16515 by `posix_close()`:

- 16516 `POSIX_CLOSE_RESTART`  
16517 Allows restarts if a signal interrupts a close operation. This constant shall  
16518 not be 0 unless `posix_close()` never returns `-1` with `errno` set to `[EINTR]`.

### 16519 Type Definitions

16520 The <unistd.h> header shall define the `size_t`, `ssize_t`, `uid_t`, `gid_t`, `off_t`, and `pid_t` types as  
16521 described in <sys/types.h>.

16522 The <unistd.h> header shall define the `intptr_t` type as described in <stdint.h>.

### 16523 Declarations

16524 The following shall be declared as functions and may also be defined as macros. Function  
16525 prototypes shall be provided.

```

16526 int      access(const char *, int);
16527 unsigned alarm(unsigned);
16528 int      chdir(const char *);
16529 int      chown(const char *, uid_t, gid_t);
16530 int      close(int);
16531 size_t   confstr(int, char *, size_t);

```

16607 XSI      void    swab(const void *restrict, void *restrict, ssize_t);
16608      int     symlink(const char *, const char *);
16609      int     symlinkat(const char *, int, const char *);
16610 XSI      void    sync(void);
16611      long   sysconf(int);
16612      pid_t   tcgetpgrp(int);
16613      int     tcsetpgrp(int, pid_t);
16614      int     truncate(const char *, off_t);
16615      char    *ttyname(int);
16616      int     ttyname_r(int, char *, size_t);
16617      int     unlink(const char *);
16618      int     unlinkat(int, const char *, int);
16619      ssize_t  write(int, const void *, size_t);

```

16620 The **<unistd.h>** header shall declare the following external variables:

```

16621 extern char *optarg;
16622 extern int  opterr, optind, optopt;

```

16623 Inclusion of the **<unistd.h>** header may make visible all symbols from the headers **<fcntl.h>**,  
16624 **<stddef.h>**, **<stdint.h>**, and **<stdio.h>**.

16625 **APPLICATION USAGE**

16626 POSIX.1-2024 only describes the behavior of systems that claim conformance to it. However,  
 16627 application developers who want to write applications that adapt to other versions of this  
 16628 standard (or to systems that do not conform to any POSIX standard) may find it useful to code  
 16629 them so as to conditionally compile different code depending on the value of  
 16630 `_POSIX_VERSION`, for example:

```
16631 #if _POSIX_VERSION >= 200112L
16632 /* Use the newer function that copes with large files. */
16633 off_t pos=ftello(fp);
16634 #else
16635 /* Either this is an old version of POSIX, or _POSIX_VERSION is
16636    not even defined, so use the traditional function. */
16637 long pos=ftell(fp);
16638 #endif
```

16639 Earlier versions of POSIX.1-2024 and of the Single UNIX Specification can be identified by the  
 16640 following macros:

16641 POSIX.1-1988 standard  
 16642 `_POSIX_VERSION == 198808L`

16643 POSIX.1-1990 standard  
 16644 `_POSIX_VERSION == 199009L`

16645 POSIX.1-1996 standard  
 16646 `_POSIX_VERSION == 199506L`

16647 Single UNIX Specification, Version 1  
 16648 `_XOPEN_UNIX` and `_XOPEN_VERSION == 4`

16649 Single UNIX Specification, Version 2  
 16650 `_XOPEN_UNIX` and `_XOPEN_VERSION == 500`

16651 POSIX.1-2001 and Single UNIX Specification, Version 3  
 16652 `_POSIX_VERSION == 200112L`, plus (if the XSI option is supported) `_XOPEN_UNIX` and  
 16653 `_XOPEN_VERSION == 600`

16654 POSIX.1-2008, POSIX.1-2017, and Single UNIX Specification, Version 4  
 16655 `_POSIX_VERSION == 200809L`, plus (if the XSI option is supported) `_XOPEN_UNIX` and  
 16656 `_XOPEN_VERSION == 700`

16657 Note that `_POSIX_VERSION` did not change in POSIX.1-2017 as it was technically identical to  
 16658 POSIX.1-2008 with its two technical corrigenda applied.

16659 POSIX.1-2024 does not make any attempt to define application binary interaction with the  
 16660 underlying operating system. However, application developers may find it useful to query  
 16661 `_SC_VERSION` at runtime via `sysconf()` to determine whether the current version of the  
 16662 operating system supports the necessary functionality as in the following program fragment:

```
16663 if (sysconf(_SC_VERSION) < 202405L) {
16664     fprintf(stderr, "POSIX.1-2024 system required, terminating \n");
16665     exit(1);
16666 }
```

16667 Implementations may support multiple programming environments with some of them  
 16668 conforming to this standard and some not conforming. The `_POSIX_Vn_ILP*` and  
 16669 `_POSIX_Vn_LP*` constants, and corresponding `sysconf()` and `getconf` calls, only indicate whether

16670 each programming environment is supported; they do not indicate anything about conformance  
16671 of the environments that are supported. For example, an implementation may support the  
16672 ILP32\_OFF32 environment for legacy reasons with a 32-bit `time_t`, whereas in a conforming  
16673 environment `time_t` is required to have a width of at least 64 bits. Application writers should  
16674 consult an implementation's POSIX Conformance Document for information about the  
16675 conformance of each supported programming environment.

16676 New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.

#### 16677 RATIONALE

16678 As POSIX.1-2024 evolved, certain options became sufficiently standardized that it was  
16679 concluded that simply requiring one of the option choices was simpler than retaining the option.  
16680 However, for backwards-compatibility, the option flags (with required constant values) are  
16681 retained.

#### 16682 Version Test Macros

16683 The standard developers considered altering the definition of `_POSIX_VERSION` and removing  
16684 `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed  
16685 by some to be minimal, and since the implementation of the functionality is potentially  
16686 problematic. However, they recognized that support for existing application binaries is a  
16687 concern to manufacturers, application developers, and the users of implementations conforming  
16688 to POSIX.1-2024.

16689 While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide  
16690 the greatest degree of imaginable utility to the application developer or user, it is arguably better  
16691 than the production of a core image or some other equally obscure result. (It is also possible for  
16692 implementations to encode and recognize application binaries compiled in various  
16693 POSIX.1-conforming environments, and modify the semantics of the underlying system to  
16694 conform to the expectations of the application.) For the reasons outlined in the preceding  
16695 paragraphs and in the APPLICATION USAGE section, the standard developers elected to retain  
16696 the `_POSIX_VERSION` and `_SC_VERSION` functionality.

#### 16697 Compile-Time Symbolic Constants for System-Wide Options

16698 POSIX.1-2024 includes support in certain areas for the newly adopted policy governing options  
16699 and stubs.

16700 This policy provides flexibility for implementations in how they support options. It also  
16701 specifies how conforming applications can adapt to different implementations that support  
16702 different sets of options. It allows the following:

- 16703 1. If an implementation has no interest in supporting an option, it does not have to provide  
16704 anything associated with that option beyond the announcement that it does not support  
16705 it.
- 16706 2. An implementation can support a partial or incompatible version of an option (as a non-  
16707 standard extension) as long as it does not claim to support the option.
- 16708 3. An application can determine whether the option is supported. A strictly conforming  
16709 application must check this announcement mechanism before first using anything  
16710 associated with the option.

16711 There is an important implication of this policy. POSIX.1-2024 cannot dictate the behavior of  
16712 interfaces associated with an option when the implementation does not claim to support the  
16713 option. In particular, it cannot require that a function associated with an unsupported option  
16714 will fail if it does not perform as specified. However, this policy does not prevent a standard

16715 from requiring certain functions to always be present, but that they shall always fail on some  
 16716 implementations. The `setpgid()` function in the POSIX.1-1990 standard, for example, is  
 16717 considered appropriate.

16718 The POSIX standards include various options, and the C-language binding support for an  
 16719 option implies that the implementation must supply data types and function interfaces. An  
 16720 application must be able to discover whether the implementation supports each option.

16721 Any application must consider the following three cases for each option:

16722 1. Option never supported.

16723 The implementation advertises at compile time that the option will never be supported.  
 16724 In this case, it is not necessary for the implementation to supply any of the data types or  
 16725 function interfaces that are provided only as part of the option. The implementation  
 16726 might provide data types and functions that are similar to those defined by POSIX.1-2024,  
 16727 but there is no guarantee for any particular behavior.

16728 2. Option always supported.

16729 The implementation advertises at compile time that the option will always be supported.  
 16730 In this case, all data types and function interfaces shall be available and shall operate as  
 16731 specified.

16732 3. Option might or might not be supported.

16733 Some implementations might not provide a mechanism to specify support of options at  
 16734 compile time. In addition, the implementation might be unable or unwilling to specify  
 16735 support or non-support at compile time. In either case, any application that might use the  
 16736 option at runtime must be able to compile and execute. The implementation must  
 16737 provide, at compile time, all data types and function interfaces that are necessary to allow  
 16738 this. In this situation, there must be a mechanism that allows the application to query, at  
 16739 runtime, whether the option is supported. If the application attempts to use the option  
 16740 when it is not supported, the result is unspecified unless explicitly specified otherwise in  
 16741 POSIX.1-2024.

## 16742 FUTURE DIRECTIONS

16743 None.

## 16754 CHANGE HISTORY

16755 First released in Issue 1. Derived from Issue 1 of the SVID.

## 16756 Issue 5

16757 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 16758 Threads Extension.

16759 The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added.

16760 `_POSIX2_C_BIND`, `_XOPEN_ENH_I18N`, and `_XOPEN_SHM` must now be set to a value other  
16761 than `-1` by a conforming implementation.

16762 Large File System extensions are added.

16763 The type of the argument to `sbrk()` is changed from `int` to `intptr_t`.

16764 `_XBS_` constants are added to the list of constants for Options and Option Groups, to the list of  
16765 constants for the `confstr()` function, and to the list of constants to the `sysconf()` function. These  
16766 are all marked EX.

#### 16767 Issue 6

16768 `_POSIX2_C_VERSION` is removed.

16769 The Open Group Corrigendum U026/4 is applied, adding the prototype for `fdatasync()`.

16770 The Open Group Corrigendum U026/1 is applied, adding the symbols `_SC_XOPEN_LEGACY`,  
16771 `_SC_XOPEN_REALTIME`, and `_SC_XOPEN_REALTIME_THREADS`.

16772 The symbols `_XOPEN_STREAMS` and `_SC_XOPEN_STREAMS` are added to support the XSI  
16773 STREAMS Option Group.

16774 Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in  
16775 IEEE Std 1003.1-2001.

16776 The LEGACY symbol `_SC_PASS_MAX` is removed.

16777 The following new requirements on POSIX implementations derive from alignment with the  
16778 Single UNIX Specification:

- 16779 • The `_CS_POSIX_*` and `_CS_XBS5_*` constants are added for the `confstr()` function.
- 16780 • The `_SC_XBS5_*` constants are added for the `sysconf()` function.
- 16781 • The symbolic constants `F_ULOCK`, `F_LOCK`, `F_TLOCK`, and `F_TEST` are added.
- 16782 • The `uid_t`, `gid_t`, `off_t`, `pid_t`, and `useconds_t` types are mandated.

16783 The `gethostname()` prototype is added for sockets.

16784 A new section is added for System-Wide Options.

16785 Function prototypes for `setegid()` and `seteuid()` are added.

16786 Option symbolic constants are added for `_POSIX_ADVISORY_INFO`, `_POSIX_CPUTIME`,  
16787 `_POSIX_SPAWN`, `_POSIX_SPORADIC_SERVER`, `_POSIX_THREAD_CPUTIME`,  
16788 `_POSIX_THREAD_SPORADIC_SERVER`, and `_POSIX_TIMEOUTS`, and `pathconf()` variables are  
16789 added for `_PC_ALLOC_SIZE_MIN`, `_PC_REC_INCR_XFER_SIZE`, `_PC_REC_MAX_XFER_SIZE`,  
16790 `_PC_REC_MIN_XFER_SIZE`, and `_PC_REC_XFER_ALIGN` for alignment with IEEE Std  
16791 1003.1d-1999.

16792 The following are added for alignment with IEEE Std 1003.1j-2000:

- 16793 • Option symbolic constants `_POSIX_BARRIERS`, `_POSIX_CLOCK_SELECTION`,  
16794 `_POSIX_MONOTONIC_CLOCK`, `_POSIX_READER_WRITER_LOCKS`,  
16795 `_POSIX_SPIN_LOCKS`, and `_POSIX_TYPED_MEMORY_OBJECTS`
- 16796 • `sysconf()` variables `_SC_BARRIERS`, `_SC_CLOCK_SELECTION`,  
16797 `_SC_MONOTONIC_CLOCK`, `_SC_READER_WRITER_LOCKS`, `_SC_SPIN_LOCKS`, and  
16798 `_SC_TYPED_MEMORY_OBJECTS`

16799 The `_SC_XBS5` macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY,  
16800 and new equivalent `_SC_V6` macros associated with the ISO/IEC 9899:1999 standard are

16801 introduced.

16802 The `getwd()` function is marked LEGACY.

16803 The **restrict** keyword is added to the prototypes for `readlink()` and `swab()`.

16804 Constants for options are now harmonized, so when supported they take the year of approval of  
16805 IEEE Std 1003.1-2001 as the value.

16806 The following are added for alignment with IEEE Std 1003.1q-2000:

- 16807 • Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`,  
16808 `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`
- 16809 • The `sysconf()` symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`,  
16810 `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`

16811 The `brk()` and `sbrk()` LEGACY functions are removed.

16812 The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning  
16813 information.

16814 The Open Group Base Resolution bwg2001-008 is applied, changing the `namelen` parameter for  
16815 `gethostname()` from `socklen_t` to `size_t`.

16816 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack  
16817 Address Size” to “Thread Stack Size Attribute”.

16818 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`,  
16819 `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.

16820 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description  
16821 in “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`,  
16822 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.

16823 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for  
16824 the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.

16825 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the  
16826 `_PC_SYMLINK_MAX` and `_SC_SYMLINK_MAX` constants.

16827 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and  
16828 margin code for the `fsync()` function.

16829 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to  
16830 the APPLICATION USAGE section: “New applications should not use `_XOPEN_SHM` or  
16831 `_XOPEN_ENH_I18N`.”.

16832 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements  
16833 for when constants for Options and Option Groups can be defined or undefined.

16834 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the  
16835 `_V6_ILP32_OFF32`, `_V6_ILP32_OFFBIG`, `_V6_LP64_OFF64`, and `_V6_LP64_OFFBIG` symbols to  
16836 `_POSIX_V6_ILP32_OFF32`, `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, and  
16837 `_POSIX_V6_LP64_OFFBIG`, respectively. This is for consistency with the `sysconf()` and `c99`  
16838 reference pages.

16839 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of  
16840 names of programming environments can be obtained using the `getconf -v` option.

16841 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the  
16842 `_SC_FILE_LOCKING`, `_SC_2_C_VERSION`, and `_SC_XOPEN_XCU_VERSION` constants.

16843 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding  
16844 `_SC_SS_REPL_MAX`, `_SC_TRACE_EVENT_NAME_MAX`, `_SC_TRACE_NAME_MAX`,  
16845 `_SC_TRACE_SYS_MAX`, and `_SC_TRACE_USER_EVENT_MAX` to the list of symbolic constants  
16846 for `sysconf()`.

16847 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for  
16848 the `symlink()` function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.

16849 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding `_PC_2_SYMLINKS`  
16850 to the symbolic constants list for `pathconf()`. This corresponds to the definition of  
16851 `POSIX2_SYMLINKS` in the Shell and Utilities volume of IEEE Std 1003.1-2001.

## 16852 Issue 7

16853 Austin Group Interpretations 1003.1-2001 #026 and #047 are applied.

16854 Austin Group Interpretation 1003.1-2001 #166 is applied to permit an additional compiler flag to  
16855 enable threads.

16856 Austin Group Interpretation 1003.1-2001 #178 is applied, clarifying the values allowed for  
16857 `_POSIX2_CHAR_TERM`.

16858 SD5-XBD-ERN-41 is applied, adding the `_POSIX2_SYMLINKS` constant.

16859 SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied.

16860 Symbols to support the UUCP Utilities option are added.

16861 The variables for the supported programming environments are updated to be V7.

16862 The LEGACY and obsolescent symbols are removed.

16863 The `faccessat()`, `fchownat()`, `fexecve()`, `linkat()`, `readlinkat()`, `symlinkat()`, and `unlinkat()` functions  
16864 are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

16865 The `_POSIX_TRACE*` constants from the Trace option are marked obsolescent.

16866 The `_POSIX2_PBS*` constants from the Batch Environment Services and Utilities option are  
16867 marked obsolescent.

16868 Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory  
16869 Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks,  
16870 Threads, Timeouts, and Timers options is moved to the Base.

16871 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options  
16872 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex  
16873 or Robust Mutex Priority Inheritance, respectively.

16874 This reference page is clarified with respect to macros and symbolic constants.

16875 Changes are made related to support for finegrained timestamps and the  
16876 `_POSIX_TIMESTAMP_RESOLUTION` constant is added.

16877 The `_SC_THREAD_ROBUST_PRIO_INHERIT` and `_SC_THREAD_ROBUST_PRIO_PROTECT`  
16878 symbolic constants are added.

16879 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0078 [311], XBD/TC1-2008/0079 [209],  
16880 and XBD/TC1-2008/0080 [360] are applied.

16881 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0085 [783], XBD/TC2-2008/0086 [911],  
16882 and XBD/TC2-2008/0087 [566] are applied.

16883 **Issue 8**

- 16884 Austin Group Defect 62 is applied, adding the `_Fork()` function.
- 16885 Austin Group Defect 339 is applied, adding `_SC_NPROCESSORS_CONF` and  
16886 `_SC_NPROCESSORS_ONLN`.
- 16887 Austin Group Defects 411 and 598 are applied, adding `dup3()` and `pipe2()`.
- 16888 Austin Group Defects 415 and 1357 are applied, adding `SEEK_HOLE` and `SEEK_DATA`.
- 16889 Austin Group Defect 529 is applied, adding the `POSIX_CLOSE_RESTART` symbolic constant  
16890 and the `posix_close()` function.
- 16891 Austin Group Defect 687 is applied, adding `_POSIX_FALLOC` and `_PC_FALLOC`.
- 16892 Austin Group Defect 729 is applied, adding `_POSIX_DEVICE_CONTROL` and  
16893 `_SC_DEVICE_CONTROL`.
- 16894 Austin Group Defect 741 is applied, adding `_SC_NSIG`.
- 16895 Austin Group Defects 1074 and 1116 are applied, changing the descriptions of  
16896 `_CS_POSIX_V8_THREADS_CFLAGS` and `_CS_POSIX_V8_THREADS_LDFLAGS`.
- 16897 Austin Group Defect 1122 is applied, adding `_PC_TEXTDOMAIN_MAX`.
- 16898 Austin Group Defect 1134 is applied, adding `getentropy()`.
- 16899 Austin Group Defect 1141 is applied, changing the RATIONALE section.
- 16900 Austin Group Defect 1192 is applied, marking the `encrypt()` function as obsolescent.
- 16901 Austin Group Defect 1302 is applied, adding `_Noreturn` to `_exit()`.
- 16902 Austin Group Defects 1330 and 1595 are applied, removing obsolescent interfaces and changing  
16903 ```_V7``` to ```_V8``` and ```_V6``` to ```_V7```.
- 16904 Austin Group Defects 1344 and 1666 are applied, adding `getresgid()`, `getresuid()`, `setresgid()`, and  
16905 `setresuid()`.
- 16906 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.
- 16907 Austin Group Defect 1456 is applied, clarifying the reservation of symbolic constants with the  
16908 prefix `_CS_`, `_PC_`, and `_SC_`.
- 16909 Austin Group Defect 1462 is applied, adding a paragraph to APPLICATION USAGE about  
16910 conformance of supported programming environments.
- 16911 Austin Group Defect 1473 is applied, updating the list of earlier versions of this standard in the  
16912 APPLICATION USAGE section.
- 16913 Austin Group Defect 1518 is applied, correcting the spelling of ```programming```.
- 16914 Austin Group Defect 1569 is applied, changing references to a **pointer** type to ```all pointer  
16915 types```.

16916 **NAME**

16917 utmpx.h — user accounting database definitions

16918 **SYNOPSIS**16919 XSI `#include <utmpx.h>`16920 **DESCRIPTION**16921 The **<utmpx.h>** header shall define the **utmpx** structure that shall include at least the following  
16922 members:

16923	char	ut_user[]	User login name.
16924	char	ut_id[]	Unspecified initialization process identifier.
16925	char	ut_line[]	Device name.
16926	pid_t	ut_pid	Process ID.
16927	short	ut_type	Type of entry.
16928	struct timeval	ut_tv	Time entry was made.

16929 The **<utmpx.h>** header shall define the **pid\_t** type through **typedef**, as described in  
16930 **<sys/types.h>**.16931 The **<utmpx.h>** header shall define the **timeval** structure as described in **<sys/time.h>**.16932 Inclusion of the **<utmpx.h>** header may also make visible all symbols from **<sys/time.h>**.16933 The **<utmpx.h>** header shall define the following symbolic constants as possible values for the  
16934 *ut\_type* member of the **utmpx** structure:

16935	EMPTY	No valid user accounting information.
16936	BOOT_TIME	Identifies time of system boot.
16937	OLD_TIME	Identifies time when system clock changed.
16938	NEW_TIME	Identifies time after system clock changed.
16939	USER_PROCESS	Identifies a process.
16940	INIT_PROCESS	Identifies a process spawned by the init process.
16941	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
16942	DEAD_PROCESS	Identifies a session leader who has exited.

16943 The following shall be declared as functions and may also be defined as macros. Function  
16944 prototypes shall be provided.

```

16945 void          endutxent(void);
16946 struct utmpx *getutxent(void);
16947 struct utmpx *getutxid(const struct utmpx *);
16948 struct utmpx *getutxline(const struct utmpx *);
16949 struct utmpx *pututxline(const struct utmpx *);
16950 void          setutxent(void);

```

- 16951 **APPLICATION USAGE**

- 16960 **CHANGE HISTORY**  
16961       First released in Issue 4, Version 2.

16962 **NAME**16963            **wchar.h** — wide-character handling16964 **SYNOPSIS**

16965            #include &lt;wchar.h&gt;

16966 **DESCRIPTION**

16967 CX        Some of the functionality described on this reference page extends the ISO C standard.  
 16968            Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 16969            enable the visibility of these symbols in this header.

16970            The &lt;wchar.h&gt; header shall define the following types:

16971 CX        **FILE**            As described in <stdio.h>.16972 CX        **locale\_t**        As described in <locale.h>.

16973            **mbstate\_t**        A complete object type other than an array type that can hold the conversion  
 16974            state information necessary to convert between sequences of (possibly multi-  
 16975 CX            byte) characters and wide characters. If a codeset is being used such that an  
 16976            **mbstate\_t** needs to preserve more than two levels of reserved state, the results  
 16977            are unspecified.

16978            **size\_t**            As described in <stddef.h>.16979 CX        **va\_list**        As described in <stdarg.h>.16980            **wchar\_t**        As described in <stddef.h>.16981            **wint\_t**        An integer type capable of storing any valid value of **wchar\_t** or WEOF.

16982            The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are  
 16983            described in the <time.h> header.

16984            The implementation shall support one or more programming environments in which the width  
 16985            of **wint\_t** is no greater than the width of type **long**. The names of these programming  
 16986            environments can be obtained using the *confstr()* function or the *getconf* utility.

16987            The &lt;wchar.h&gt; header shall define the following macros:

16988            **WCHAR\_MAX**        As described in <stdint.h>.16989            **WCHAR\_MIN**        As described in <stdint.h>.

16990            **WEOF**            Constant expression of type **wint\_t** that is returned by several WP functions to  
 16991            indicate end-of-file.

16992            **NULL**            As described in <stddef.h>.

16993 CX        Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>,  
 16994            <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

16995            The following shall be declared as functions and may also be defined as macros. Function  
 16996            prototypes shall be provided for use with ISO C standard compilers. Arguments to functions in  
 16997            this list can point to arrays containing **wchar\_t** values that do not correspond to members of the  
 16998            character set of the current locale. Such values shall be processed according to the specified  
 16999            semantics, unless otherwise stated.

```
17000        wint_t            btowc (int);
17001        wint_t            fgetwc (FILE *);
17002        wchar_t        *fgetws (wchar_t *restrict, int, FILE *restrict);
17003        wint_t            fputwc (wchar_t, FILE *);
```

```

17004     int          fputws(const wchar_t *restrict, FILE *restrict);
17005     int          fwide(FILE *, int);
17006     int          fwprintf(FILE *restrict, const wchar_t *restrict, ...);
17007     int          fwscanf(FILE *restrict, const wchar_t *restrict, ...);
17008     wint_t       getwc(FILE *);
17009     wint_t       getwchar(void);
17010     size_t       mbrlen(const char *restrict, size_t, mbstate_t *restrict);
17011     size_t       mbrtowc(wchar_t *restrict, const char *restrict, size_t,
17012                 mbstate_t *restrict);
17013     int          mbsinit(const mbstate_t *);
17014     CX size_t     mbsnrtowcs(wchar_t *restrict, const char **restrict,
17015                             size_t, size_t, mbstate_t *restrict);
17016     size_t       mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
17017                             mbstate_t *restrict);
17018     CX FILE      *open_wmemstream(wchar_t **, size_t *);
17019     wint_t       putwc(wchar_t, FILE *);
17020     wint_t       putwchar(wchar_t);
17021     int          swprintf(wchar_t *restrict, size_t,
17022                          const wchar_t *restrict, ...);
17023     int          swscanf(const wchar_t *restrict,
17024                          const wchar_t *restrict, ...);
17025     wint_t       ungetwc(wint_t, FILE *);
17026     int          vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
17027     int          vfwscanf(FILE *restrict, const wchar_t *restrict, va_list);
17028     int          vswprintf(wchar_t *restrict, size_t,
17029                          const wchar_t *restrict, va_list);
17030     int          vswscanf(const wchar_t *restrict, const wchar_t *restrict,
17031                          va_list);
17032     int          vwprintf(const wchar_t *restrict, va_list);
17033     int          vwscanf(const wchar_t *restrict, va_list);
17034     CX wchar_t   *wcpcpy(wchar_t *restrict, const wchar_t *restrict);
17035     wchar_t     *wcpncpy(wchar_t *restrict, const wchar_t *restrict, size_t);
17036     size_t       wcrtoomb(char *restrict, wchar_t, mbstate_t *restrict);
17037     CX int       wcscasecmp(const wchar_t *, const wchar_t *);
17038     int         wcscasecmp_l(const wchar_t *, const wchar_t *, locale_t);
17039     wchar_t     *wcscat(wchar_t *restrict, const wchar_t *restrict);
17040     wchar_t     *wcschr(const wchar_t *, wchar_t);
17041     int         wcscmp(const wchar_t *, const wchar_t *);
17042     int         wscoll(const wchar_t *, const wchar_t *);
17043     CX int       wscoll_l(const wchar_t *, const wchar_t *, locale_t);
17044     wchar_t     *wcscpy(wchar_t *restrict, const wchar_t *restrict);
17045     size_t       wcsncpy(const wchar_t *, const wchar_t *);
17046     CX wchar_t   *wcsdup(const wchar_t *);
17047     size_t       wcsftime(wchar_t *restrict, size_t,
17048                          const wchar_t *restrict, const struct tm *restrict);
17049     CX size_t     wcsncat(wchar_t *restrict, const wchar_t *restrict,
17050                          size_t);
17051     size_t       wcsncpy(wchar_t *restrict, const wchar_t *restrict,
17052                          size_t);
17053     size_t       wcslen(const wchar_t *);
17054     CX int       wcsncasecmp(const wchar_t *, const wchar_t *, size_t);
17055     int         wcsncasecmp_l(const wchar_t *, const wchar_t *, size_t,

```

```

17056         locale_t);
17057 wchar_t    *wcsncat(wchar_t *restrict, const wchar_t *restrict, size_t);
17058 int        wcsncmp(const wchar_t *, const wchar_t *, size_t);
17059 wchar_t    *wcsncpy(wchar_t *restrict, const wchar_t *restrict, size_t);

## 17111 CHANGE HISTORY

17112 First released in Issue 4.

### 17113 Issue 5

17114 Aligned with the ISO/IEC 9899:1990/Amendment 1:1995 (E).

### 17115 Issue 6

17116 The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth()* and  
 17117 *wcwidth()* are marked as extensions.

17118 The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit()*  
 17119 function.

17120 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 17121 • Various function prototypes are updated to add the **restrict** keyword.
- 17122 • The functions *vwscanf()*, *vwscanf()*, *wcstof()*, *wcstold()*, *wcstoll()*, and *wcstoull()* are  
 17123 added.

17124 The type **wctype\_t**, the *isw\*()*, *to\*()*, and *wctype()* functions are marked as XSI extensions.

17125 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION  
 17126 USAGE section.

### 17127 Issue 7

17128 The *mbsnrtowcs()*, *open\_wmemstream()*, *wcpcpy()*, *wcpncpy()*, *wscasecmp()*, *wcsdup()*,  
 17129 *wcsncasecmp()*, *wcsnlen()*, and *wcsnrtombs()* functions are added from The Open Group  
 17130 Technical Standard, 2006, Extended API Set Part 1.

17131 The *wscasecmp\_l()*, *wcsncasecmp\_l()*, *wscoll\_l()*, and *wcsxfrm\_l()* functions are added from The  
 17132 Open Group Technical Standard, 2006, Extended API Set Part 4.

17133 The **wctype\_t** type, and the *isw\*()*, *towlower()*, and *towupper()* functions are marked obsolescent  
 17134 in <wchar.h> since the ISO C standard requires the declarations to be in <wctype.h>.

17135 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 17136 for the **locale\_t** type is added.

17137 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0081 [380] is applied.

17138 POSIX.1-2008, Technical Corrigendum 2, XBD/TC2-2008/0088 [73] is applied.

### 17139 Issue 8

17140 Austin Group Defect 986 is applied, adding *wcslcat()* and *wcslcpy()*.

17141 Austin Group Defect 1302 is applied, aligning this header with the ISO/IEC 9899:2018 standard.

17142 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

17143 Austin Group Defect 1352 is applied, changing the APPLICATION USAGE and RATIONALE  
 17144 sections.

17145 **NAME**

17146 wctype.h — wide-character classification and mapping utilities

17147 **SYNOPSIS**

17148 #include &lt;wctype.h&gt;

17149 **DESCRIPTION**

17150 CX Some of the functionality described on this reference page extends the ISO C standard.  
 17151 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 496) to  
 17152 enable the visibility of these symbols in this header.

17153 The &lt;wctype.h&gt; header shall define the following types:

17154 **wint\_t** As described in <wchar.h>.

17155 **wctrans\_t** A scalar type that can hold values which represent locale-specific character  
 17156 mappings.

17157 **wctype\_t** A scalar type of a data object that can hold values which represent locale-  
 17158 specific character classification.

17159 CX The <wctype.h> header shall define the **locale\_t** type as described in <locale.h>.

17160 The &lt;wctype.h&gt; header shall define the following macro:

17161 WEOF As described in &lt;wchar.h&gt;.

17162 For all functions described in this header that accept an argument of type **wint\_t**, the value is  
 17163 representable as a **wchar\_t** or equals the value of WEOF. If this argument has any other value,  
 17164 the behavior is undefined.

17165 The behavior of these functions shall be affected by the *LC\_CTYPE* category of the current locale.

17166 CX Inclusion of the <wctype.h> header may make visible all symbols from the headers <ctype.h>,  
 17167 <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>.

17168 The following shall be declared as functions and may also be defined as macros. Function  
 17169 prototypes shall be provided for use with ISO C standard compilers.

```

17170 int iswalnum(wint_t);
17171 CX int iswalnum_l(wint_t, locale_t);
17172 int iswalpha(wint_t);
17173 CX int iswalpha_l(wint_t, locale_t);
17174 int iswblank(wint_t);
17175 CX int iswblank_l(wint_t, locale_t);
17176 int iswcntrl(wint_t);
17177 CX int iswcntrl_l(wint_t, locale_t);
17178 int iswctype(wint_t, wctype_t);
17179 CX int iswctype_l(wint_t, wctype_t, locale_t);
17180 int iswdigit(wint_t);
17181 CX int iswdigit_l(wint_t, locale_t);
17182 int iswgraph(wint_t);
17183 CX int iswgraph_l(wint_t, locale_t);
17184 int iswlower(wint_t);
17185 CX int iswlower_l(wint_t, locale_t);
17186 int iswprint(wint_t);
17187 CX int iswprint_l(wint_t, locale_t);
17188 int iswpunct(wint_t);

```

```

17189 CX      int      iswpunct_l(wint_t, locale_t);
17190        int      iswspace(wint_t);
17191 CX      int      iswspace_l(wint_t, locale_t);
17192        int      iswupper(wint_t);
17193 CX      int      iswupper_l(wint_t, locale_t);
17194        int      iswxdigit(wint_t);
17195 CX      int      iswxdigit_l(wint_t, locale_t);
17196        wint_t    towctrans(wint_t, wctrans_t);
17197 CX      wint_t    towctrans_l(wint_t, wctrans_t, locale_t);
17198        wint_t    towlower(wint_t);
17199 CX      wint_t    towlower_l(wint_t, locale_t);
17200        wint_t    towupper(wint_t);
17201 CX      wint_t    towupper_l(wint_t, locale_t);
17202        wctrans_t wctrans(const char *);
17203 CX      wctrans_t wctrans_l(const char *, locale_t);
17204        wctype_t  wctype(const char *);
17205 CX      wctype_t  wctype_l(const char *, locale_t);

```

17217       *setlocale()*, *towctrans()*, *towlower()*, *towupper()*, *wctrans()*, *wctype()*

17218 **CHANGE HISTORY**

17219       First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

17220 **Issue 6**

17221       The *iswblank()* function is added for alignment with the ISO/IEC 9899:1999 standard.

17222 **Issue 7**

17223       SD5-XBD-ERN-6 is applied.

17224       The *\*\_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set  
17225       Part 4.

17226       This reference page is clarified with respect to macros and symbolic constants.

17227 **Issue 8**

17228       Austin Group Defect 1330 is applied, moving the description of **wctype\_t** from <wchar.h> to  
17229       <wctype.h>.

17230 **NAME**

17231 wordexp.h — word-expansion types

17232 **SYNOPSIS**

17233 #include &lt;wordexp.h&gt;

17234 **DESCRIPTION**17235 The **<wordexp.h>** header shall define the structures and symbolic constants used by the  
17236 *wordexp()* and *wordfree()* functions.17237 The **<wordexp.h>** header shall define the **wordexp\_t** structure type, which shall include at least  
17238 the following members:

17239	size_t	we_wordc	Count of words matched by <i>words</i> .
17240	char	**we_wordv	Pointer to list of expanded words.
17241	size_t	we_offs	Slots to reserve at the beginning of <i>we_wordv</i> .

17242 The **<wordexp.h>** header shall define the following symbolic constants for use as flags for the  
17243 *wordexp()* function:

17244	WRDE_APPEND	Append words to those previously generated.
17245	WRDE_DOOFFS	Number of null pointers to prepend to <i>we_wordv</i> .
17246	WRDE_NOCMD	Fail if command substitution is requested.
17247	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result is the same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> without WRDE_REUSE.

17251 WRDE\_SHOWERR Do not redirect *stderr* to **/dev/null**.

17252 WRDE\_UNDEF Report error on an attempt to expand an undefined shell variable.

17253 The **<wordexp.h>** header shall define the following symbolic constants as error return values:

17254	WRDE_BADCHAR	One of the unquoted characters—<newline>, ' ', '&', ';', '<', '>', 17255 '(', ')', '{', '}'—appears in <i>words</i> in an inappropriate context.
17256	WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
17257	WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
17258	WRDE_NOSPACE	Attempt to allocate memory failed.
17259	WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated 17260 string.

17261 The **<wordexp.h>** header shall define the **size\_t** type as described in **<stddef.h>**.17262 The following shall be declared as functions and may also be defined as macros. Function  
17263 prototypes shall be provided.

```
17264 int wordexp(const char *restrict, wordexp_t *restrict, int);
17265 void wordfree(wordexp_t *);
```

17266 **APPLICATION USAGE**

17267 None.

17268 **RATIONALE**

17269 None.

17270 **FUTURE DIRECTIONS**

17271 None.

17272 **SEE ALSO**

17273 &lt;stddef.h&gt;

**System Interfaces, Issue 8**

17288

*The Open Group*

17289

*The Institute of Electrical and Electronics Engineers, Inc.*

17292 The System Interfaces volume of POSIX.1-2024 describes the interfaces offered to application  
17293 programs by POSIX-conformant systems.

## 17294 **1.1 Relationship to Other Formal Standards**

17295 This volume of POSIX.1-2024 is aligned with the following standards, except where stated  
17296 otherwise:

17297 ISO C (C17)

17298 ISO/IEC 9899:2018, Programming Languages — C.

17299 Parts of the ISO/IEC 9899:2018 standard (hereinafter referred to as the ISO C standard) are  
17300 referenced to describe requirements also mandated by this volume of POSIX.1-2024. Some  
17301 functions and headers included within this volume of POSIX.1-2024 have a version in the ISO C  
17302 standard; in this case CX markings are added as appropriate to show where the ISO C standard  
17303 has been extended (see [Section 1.8.1](#), on page 7). Any conflict between this volume of  
17304 POSIX.1-2024 and the ISO C standard is unintentional, except where stated otherwise.

17305 This volume of POSIX.1-2024 also allows, but does not require, mathematics functions to  
17306 support IEEE Std 754-1985 and IEEE Std 854-1987.

## 17307 **1.2 Format of Entries**

17308 The entries in [Chapter 3](#) are based on a common format as follows. The only sections relating to  
17309 conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

17310 **NAME**

17311 This section gives the name or names of the entry and briefly states its purpose.

17312 **SYNOPSIS**

17313 This section summarizes the use of the entry being described. If it is necessary to  
17314 include a header to use this function, the names of such headers are shown, for  
17315 example:

```
17316 #include <stdio.h>
```

17317 **DESCRIPTION**

17318 This section describes the functionality of the function or header.

17319 **RETURN VALUE**

17320 This section indicates the possible return values, if any.

17321 If the implementation can detect errors, “successful completion” means that no error  
17322 has been detected during execution of the function. If the implementation does detect  
17323 an error, the error is indicated.

17324 For functions where no errors are defined, “successful completion” means that if the

17325 implementation checks for errors, no error has been detected. If the implementation can  
17326 detect errors, and an error is detected, the indicated return value is returned and *errno*  
17327 may be set.

#### 17328 **ERRORS**

17329 This section gives the symbolic names of the error values returned by a function or  
17330 stored into a variable accessed through the symbol *errno* if an error occurs.

17331 “No errors are defined” means that error values returned by a function or stored into a  
17332 variable accessed through the symbol *errno*, if any, depend on the implementation.

#### 17333 **EXAMPLES**

17334 This section is informative.

17335 This section gives examples of usage, where appropriate. In the event of conflict  
17336 between an example and a normative part of this volume of POSIX.1-2024, the  
17337 normative material is to be taken as correct.

#### 17338 **APPLICATION USAGE**

17339 This section is informative.

17340 This section gives warnings and advice to application developers about the entry. In the  
17341 event of conflict between warnings and advice and a normative part of this volume of  
17342 POSIX.1-2024, the normative material is to be taken as correct.

#### 17343 **RATIONALE**

17344 This section is informative.

17345 This section contains historical information concerning the contents of this volume of  
17346 POSIX.1-2024 and why features were included or discarded by the standard  
17347 developers.

#### 17348 **FUTURE DIRECTIONS**

17349 This section is informative.

17350 This section provides comments which should be used as a guide to current thinking;  
17351 there is not necessarily a commitment to adopt these future directions.

#### 17352 **SEE ALSO**

17353 This section is informative.

17354 This section gives references to related information.

#### 17355 **CHANGE HISTORY**

17356 This section is informative.

17357 This section shows the derivation of the entry and any significant changes that have  
17358 been made to it.

# General Information

This chapter covers information that is relevant to all the functions specified in [Chapter 3](#) and [XBD Chapter 14](#) (on page 221).

## 2.1 Use and Implementation of Interfaces

### 2.1.1 Use and Implementation of Functions

Each of the following statements shall apply to all functions unless explicitly stated otherwise in the detailed descriptions that follow:

1. If an argument to a function has an invalid value, such as a value outside the domain of the function, a pointer to an object whose lifetime has ended (even if a new object now has the same address), a pointer outside the address space of the program, or a null pointer, the behavior is undefined.

2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the <left-parenthesis> that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.

3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments.

4. For functions from the ISO C standard only, provided that the function can be declared without reference to any type defined in a header from the ISO C standard, it is also permissible to declare the function explicitly and use it without including its associated header.

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

6. Functions shall prevent data races as follows: A function shall not directly or indirectly access objects accessible by threads other than the current thread unless the objects are accessed directly or indirectly via the function's arguments. A function shall not directly or indirectly modify objects accessible by threads other than the current thread unless the objects are accessed directly or indirectly via the function's non-const arguments. Implementations may share their own internal objects between threads if the objects are not visible to applications and are protected against data races.

- 17395 7. Functions shall perform all operations solely within the current thread if those operations  
17396 have effects that are visible to applications.

## 17397 2.1.2 Use and Implementation of Macros

17398 Each of the following statements shall apply to all macros unless explicitly stated otherwise:

- 17399 1. Any definition of an object-like macro in a header shall expand to code that is fully  
17400 protected by parentheses where necessary, so that it groups in an arbitrary expression as  
17401 if it were a single identifier.
- 17402 2. All object-like macros listed as expanding to integer constant expressions shall  
17403 additionally be suitable for use in **#if** preprocessing directives.
- 17404 3. Any definition of a function-like macro in a header shall expand to code that evaluates  
17405 each of its arguments exactly once, fully protected by parentheses where necessary, so  
17406 that it is generally safe to use arbitrary expressions as arguments.
- 17407 4. Any definition of a function-like macro in a header can be invoked in an expression  
17408 anywhere a function with a compatible return type could be called.

## 17409 2.2 The Compilation Environment

### 17410 2.2.1 POSIX.1 Symbols

17411 Certain symbols in this volume of POSIX.1-2024 are defined in headers (see XBD [Chapter 14](#), on  
17412 page 221). Some of those headers could also define symbols other than those defined by  
17413 POSIX.1-2024, potentially conflicting with symbols used by the application. Also, POSIX.1-2024  
17414 defines symbols that are not permitted by other standards to appear in those headers without  
17415 some control on the visibility of those symbols.

17416 Symbols called “feature test macros” are used to control the visibility of symbols that might be  
17417 included in a header. Implementations, future versions of this standard, and other standards  
17418 may define additional feature test macros.

17419 In the compilation of an application that **#defines** a feature test macro specified by  
17420 POSIX.1-2024, no header defined by POSIX.1-2024 shall be included prior to the definition of the  
17421 feature test macro. This restriction also applies to any implementation-provided header in  
17422 which these feature test macros are used. If the definition of the macro does not precede the  
17423 **#include**, the result is undefined.

17424 Feature test macros shall begin with the <underscore> character ('\_').

#### 17425 2.2.1.1 *The `_POSIX_C_SOURCE` Feature Test Macro*

17426 A POSIX-conforming application shall ensure that the feature test macro `_POSIX_C_SOURCE` is  
17427 defined before inclusion of any header.

17428 When an application includes a header described by POSIX.1-2024, and when this feature test  
17429 macro is defined to have the value 202405L:

- 17430 1. All symbols required by POSIX.1-2024 to appear when the header is included shall be  
17431 made visible.
- 17432 2. Symbols that are explicitly permitted, but not required, by POSIX.1-2024 to appear in that  
17433 header (including those in reserved name spaces) may be made visible.
- 17434 3. Additional symbols not required or explicitly permitted by POSIX.1-2024 to be in that  
17435 header shall not be made visible, except when enabled by another feature test macro.
- 17436 Identifiers in POSIX.1-2024 may only be undefined using the **#undef** directive as described in  
17437 [Section 2.1](#) (on page 495) or [Section 2.2.2](#) (on page 498). These **#undef** directives shall follow all  
17438 **#include** directives of any header in POSIX.1-2024.
- 17439 **Note:** The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been  
17440 superseded by `_POSIX_C_SOURCE`.

17441 2.2.1.2 *The `_XOPEN_SOURCE` Feature Test Macro*

- 17442 XSI An XSI-conforming application shall ensure that the feature test macro `_XOPEN_SOURCE` is  
17443 defined with the value 800 before inclusion of any header. This is needed to enable the  
17444 functionality described in [Section 2.2.1.1](#) (on page 496) and to ensure that the XSI option is  
17445 enabled.
- 17446 Since this volume of POSIX.1-2024 is aligned with the ISO C standard, and since all functionality  
17447 enabled by `_POSIX_C_SOURCE` set equal to 202405L is enabled by `_XOPEN_SOURCE` set equal  
17448 to 800, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so  
17449 defined. Therefore, if `_XOPEN_SOURCE` is set equal to 800 and `_POSIX_C_SOURCE` is set equal  
17450 to 202405L, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to  
17451 800. However, should `_POSIX_C_SOURCE` be set to a value greater than 202405L, the behavior  
17452 is unspecified.
- 17453 If `_XOPEN_SOURCE` is defined with the value 800 and `_POSIX_C_SOURCE` is undefined before  
17454 inclusion of any header, then the header may define the `_POSIX_C_SOURCE` macro with the  
17455 value 202405L.

17456 2.2.1.3 *The `__STDC_WANT_LIB_EXT1__` Feature Test Macro*

- 17457 XSI A POSIX-conforming or XSI-conforming application can define the feature test macro  
17458 `__STDC_WANT_LIB_EXT1__` before inclusion of any header.
- 17459 When an application includes a header described by POSIX.1-2024, and when this feature test  
17460 macro is defined to have the value 1, the header may make visible those symbols specified for  
17461 the header in Annex K of the ISO C standard that are not already explicitly permitted by  
17462 POSIX.1-2024 to be made visible in the header. These symbols are listed in [Section 2.2.2](#) below.
- 17463 When an application includes a header described by POSIX.1-2024, and when this feature test  
17464 macro is either undefined or defined to have the value 0, the header shall not make any  
17465 additional symbols visible that are not already made visible by the feature test macro  
17466 XSI `_POSIX_C_SOURCE` or `_XOPEN_SOURCE` as described above, except when enabled by  
17467 another feature test macro.

17468 **2.2.2 The Name Space**

17469 All identifiers in this volume of POSIX.1-2024, except *environ*, are defined in at least one of the  
17470 XSI headers, as shown in XBD [Chapter 14](#) (on page 221). When `_XOPEN_SOURCE` or  
17471 `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially  
17472 conflicting with identifiers used by the application. The set of identifiers visible to the  
17473 application consists of precisely those identifiers from the header pages of the included headers,  
17474 as well as additional identifiers reserved for the implementation. In addition, some headers may  
17475 make visible identifiers from other headers as indicated on the relevant header pages.

17476 Implementations may also add members to a structure or union without controlling the  
17477 visibility of those members with a feature test macro, as long as a user-defined macro with the  
17478 same name cannot interfere with the correct interpretation of the program. The identifiers  
17479 reserved for use by the implementation are described below:

- 17480 1. Each identifier with external linkage described in the header section is reserved for use as  
17481 an identifier with external linkage if the header is included.
- 17482 2. Each macro described in the header section is reserved for any use if the header is  
17483 included.
- 17484 3. Each identifier with file scope described in the header section is reserved for use as a  
17485 macro name and as an identifier with file scope in the same name space if the header is  
17486 included.

17487 As described in [Chapter 13](#) (on page 219), the prefixes `posix_`, `POSIX_`, and `_POSIX_` are  
17488 reserved for use by POSIX.1-2024 and other POSIX standards. Implementations may add  
17489 symbols to the headers shown in the following table, provided the identifiers for those symbols  
17490 either:

- 17491 1. Begin with the corresponding reserved prefixes in the table, or
- 17492 2. Have one of the corresponding complete names in the table, or
- 17493 3. End in the string indicated as a reserved suffix in the table and do not use the reserved  
17494 prefixes `posix_`, `POSIX_`, or `_POSIX_`, as long as the reserved suffix is in that part of the  
17495 name considered significant by the implementation.

17496 Symbols that use the reserved prefix `_POSIX_` may be made visible by implementations in any  
17497 header defined by POSIX.1-2024.

	Header	Prefix	Suffix	Complete Name
17498	< aio.h >	aio_, lio_, AIO_, LIO_		
17499	<arpa/inet.h>	inet_

17564				
17565	XSI <utmpx.h>	ut_	_LVL, _PROCESS, _TIME	
17566				
17567	<wchar.h>	wcs[a-z]		
17568	<wctype.h>	is[a-z], to[a-z]		
17569	<wordexp.h>	we_, WRDE_		
17570	CX ANY header		_t	

17571 **Note:** The notation [0-9] indicates any digit. The notation [A-Z] indicates any uppercase letter in the  
 17572 portable character set. The notation [a-z] indicates any lowercase letter in the portable character  
 17573 set. Commas and spaces in the lists of prefixes and complete names in the above table are not  
 17574 part of any prefix or complete name. The ISO C standard reserves int[0-9a-z]\*\_t and uint[0-9a-  
 17575 z]\*\_t in <stdint.h>; this is not included in the table above because it is covered by the reserved  
 17576 \_t suffix for any header.

17577 Additional symbolic constants with the prefix \_CS\_, \_PC\_, and \_SC\_ may be defined by the  
 17578 inclusion of <unistd.h>, but as these are already reserved for the implementation, they are not  
 17579 included in the table above. Extensions with these prefixes should be compatible with use by  
 17580 *confstr()*, *pathconf()*, and *sysconf()*, respectively.

17581 Implementations may also add symbols to the <complex.h> header with the following complete  
 17582 names or the same names suffixed with 'f' or 'l':

17583	cerf	cerfc	cexp2
17584	cexpm1	clog10	clog1p
17585	clog2	clgamma	ctgamma

17586 If any header in the following table is included, macros with the prefixes or suffixes shown may  
 17587 be defined. After the last inclusion of a given header, an application may use identifiers with the  
 17588 corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the  
 17589 corresponding macro.

Header	Prefix	Suffix
17590 <endian.h>		_ENDIAN
17591 <errno.h>	E[0-9], E[A-Z]	
17592 <fcntl.h>	F_, O_	
17593 <fenv.h>	FE_[A-Z]	
17594 <inttypes.h>	PRI[Xa-z], SCN[Xa-z]	
17595 <locale.h>	LC_[A-Z]	
17596 <math.h>	FP_[A-Z]	
17597 <netinet/in.h>	IMPLINK_, IN_, IP_, IPPORT_, SOCK_,	
17598	IN6_	
17599 IP6 <signal.h>	SIG_, SIG[A-Z],	
17600	SV_	
17601 XSI <stdatomic.h>	ATOMIC_[A-Z]	
17602		
17603 CX <stdio.h>	SEEK_	
17604 XSI <sys/resource.h>	RLIM_	
17605 XSI <sys/socket.h>	CMSG_	
17606 <sys/stat.h>	S_	
17607 XSI <sys/uio.h>	IOV_	
17608 <termios.h>	I, O, V (See below.)	
17609 <time.h>	TIME_[A-Z]	
17610 <unistd.h>	SEEK_	

17611 The following are used to reserve complete names for the **<stdint.h>** header:

```

17612     INT[0-9A-Za-z-]*_MIN
17613     INT[0-9A-Za-z-]*_MAX
17614     INT[0-9A-Za-z-]*_C
17615     UINT[0-9A-Za-z-]*_MIN
17616     UINT[0-9A-Za-z-]*_MAX
17617     UINT[0-9A-Za-z-]*_C
  
```

17618 **Note:** The notation [0-9] indicates any digit. The notation [A-Z] indicates any uppercase letter in the  
 17619 portable character set. The notation [Xa-z] indicates the character 'x' or any lowercase letter  
 17620 in the portable character set. The notation [0-9A-Za-z-]\* indicates zero or more occurrences of  
 17621 any of the following: a digit, an uppercase or lowercase letter in the portable character set, or an  
 17622 <underscore>.

17623 XSI The following reserved names are used as exact matches for **<termios.h>**:

17624 CBAUD	EXTB	VDSUSP
17625 DEFECHO	FLUSHO	VLNEXT
17626 ECHOCTL	LOBLK	VREPRINT
17627 ECHOK	PENDIN	VSTATUS
17628 ECHOPRT	SWTCH	VWERASE
17629 EXTA	VDISCARD	

17630 When the feature test macro `_STDC_WANT_LIB_EXT1__` is defined with the value 1 (see  
 17631 [Section 2.2.1](#), on page 496), implementations may add symbols to the headers shown in the  
 17632 following table provided the identifiers for those symbols have one of the corresponding

17633 complete names in the table.

Header	Complete Name
<stdio.h>	fopen_s, fprintf_s, freopen_s, fscanf_s, gets_s, printf_s, scanf_s, snprintf_s, sprintf_s, sscanf_s, tmpfile_s, tmpnam_s, vfprintf_s, vfscanf_s, vprintf_s, vscanf_s, vsnprintf_s, vsprintf_s, vsscanf_s
<stdlib.h>	abort_handler_s, bsearch_s, getenv_s, ignore_handler_s, mbstowcs_s, qsort_s, set_constraint_handler_s, wcstombs_s, wctomb_s
<time.h>	asctime_s, ctime_s, gmtime_s, localtime_s
<wchar.h>	fwprintf_s, fwscanf_s, mbsrtowcs_s, snwprintf_s, swprintf_s, swscanf_s, vfwprintf_s, vfwscanf_s, vsnwprintf_s, vswprintf_s, vswscanf_s, vwprintf_s, vwscanf_s, wcrctomb_s, wmemcpy_s, wmemmove_s, wprintf_s, wscanf_s

17646 When the feature test macro `__STDC_WANT_LIB_EXT1__` is defined with the value 1 (see  
 17647 [Section 2.2.1](#), on page 496), if any header in the following table is included, macros with the  
 17648 complete names shown may be defined.

Header	Complete Name
<stdint.h>	RSIZE_MAX
<stdio.h>	L_tmpnam_s, TMP_MAX_S

17652 **Note:** The above two tables only include those symbols from Annex K of the ISO C standard that are  
 17653 not already allowed to be visible by entries in earlier tables in this section.

- 17654 The following identifiers are reserved regardless of the inclusion of headers:
- 17655 1. With the exception of identifiers beginning with the prefix `_POSIX_` and those identifiers  
17656 which are lexically identical to keywords defined by the ISO C standard (for example  
17657 `_Bool`), all identifiers that begin with an `<underscore>` and either an uppercase letter or  
17658 another `<underscore>` are always reserved for any use by the implementation.
- 17659 2. All identifiers that begin with an `<underscore>` are always reserved for use as identifiers  
17660 with file scope in both the ordinary identifier and tag name spaces.
- 17661 3. All identifiers in the table below are reserved for use as identifiers with external linkage.  
17662 Some of these identifiers do not appear in this volume of POSIX.1-2024, but are reserved for  
17663 future use by the ISO C standard.
- 17664 4. All functions and external identifiers defined in XBD [Chapter 14](#) (on page 221) are reserved  
17665 for use as identifiers with external linkage.
- 17666 5. All the identifiers defined in this volume of POSIX.1-2024 that have external linkage and  
17667 *errno* are always reserved for use as identifiers with external linkage.
- 17668 **Note:** The notation `[a-z]` indicates any lowercase letter in the portable character set. The notation `'*'`  
17669 indicates any combination of digits, letters in the portable character set, or `<underscore>`.
- 17670 No other identifiers are reserved.

17799	scalbnl	tanhf	ungetwc	wprintf
17800	scanf	tanhl	va_copy	wscanf
17801	setbuf	tanl	va_end	

17802       **Note:**       The notation [a–z] indicates any lowercase letter in the portable character set. The notation '\*'  
17803                   indicates any sequence of zero or more characters that are valid in identifiers with external  
17804                   linkage.

17805       Applications shall not declare or define identifiers with the same name as an identifier reserved  
17806       in the same context. Since macro names are replaced whenever found, independent of scope and  
17807       name space, macro names matching any of the reserved identifier names shall not be defined by  
17808       an application if any associated header is included.

17809       Except that the effect of each inclusion of `<assert.h>` depends on the definition of `NDEBUG`,  
17810       headers may be included in any order, and each may be included more than once in a given  
17811       scope, with no difference in effect from that of being included only once.

17812       If used, the application shall ensure that a header is included outside of any external declaration  
17813       or definition, and it shall be first included before the first reference to any type or macro it  
17814       defines, or to any function or object it declares. However, if an identifier is declared or defined in  
17815       more than one header, the second and subsequent associated headers may be included after the  
17816       initial reference to the identifier. Prior to the inclusion of a header, or when any macro defined in  
17817       the header is expanded, the application shall not define any macros with names lexically  
17818       identical to symbols defined by that header.

17819 **2.3 Error Numbers**

17820 Most functions can provide an error number. The means by which each function provides its  
17821 error numbers is specified in its description.

17822 Some functions provide the error number in a variable accessed through the symbol *errno*,  
17823 defined by including the `<errno.h>` header. The value of *errno* should only be examined when it  
17824 is indicated to be valid by a function's return value. No function in this volume of POSIX.1-2024  
17825 shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by  
17826 function calls or assignments to *errno* by other threads.

17827 Some functions return an error number directly as the function value. These functions return a  
17828 value of zero to indicate success.

17829 If more than one error occurs in processing a function call, any one of the possible errors may be  
17830 returned, as the order of detection is undefined.

17831 Implementations may support additional errors not included in this list, may generate errors  
17832 included in this list under circumstances other than those described here, or may contain  
17833 extensions or limitations that prevent some errors from occurring.

17834 The ERRORS section on each reference page specifies which error conditions shall be detected  
17835 by all implementations ("shall fail") and which may be optionally detected by an  
17836 implementation ("may fail"). If no error condition is detected, the action requested shall be  
17837 successful. If an error condition is detected, the action requested may have been partially  
17838 performed, unless otherwise stated.

17839 Implementations may generate error numbers listed here under circumstances other than those  
17840 described, if and only if all those error conditions can always be treated identically to the error  
17841 conditions as described in this volume of POSIX.1-2024. Implementations shall not generate a  
17842 different error number from one required by this volume of POSIX.1-2024 for an error condition  
17843 described in this volume of POSIX.1-2024, but may generate additional errors unless explicitly  
17844 disallowed for a particular function.

17845 Each implementation shall document, in the conformance document, situations in which each of  
17846 the optional conditions defined in POSIX.1-2024 is detected. The conformance document may  
17847 also contain statements that one or more of the optional error conditions are not detected.

17848 Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this  
17849 applies it is stated in the ERRORS section on the individual function pages.

17850 The following macro names identify the possible error numbers, in the context of the functions  
17851 specifically defined in this volume of POSIX.1-2024; these general descriptions are more  
17852 precisely defined in the ERRORS sections of the functions that return them. Only these macro  
17853 names should be used in programs, since the actual value of the error number is unspecified. All  
17854 values listed in this section shall be unique, except as noted below. The values for all these  
17855 macros shall be found in the `<errno.h>` header defined in the Base Definitions volume of  
17856 POSIX.1-2024. The actual values are unspecified by this volume of POSIX.1-2024.

17857 [E2BIG]

17858 Argument list too long. The sum of the number of bytes used by the new process image's  
17859 argument list and environment list is greater than the system-imposed limit of {ARG\_MAX}  
17860 bytes.

17861 or:

17862 Lack of space in an output buffer.

17863 or:

17864	Argument is greater than the system-imposed maximum.
17865	[EACCES]
17866	Permission denied. An attempt was made to access a file in a way forbidden by its file
17867	access permissions.
17868	[EADDRINUSE]
17869	Address in use. The specified address is in use.
17870	[EADDRNOTAVAIL]
17871	Address not available. The specified address is not available from the local system.
17872	[EAFNOSUPPORT]
17873	Address family not supported. The implementation does not support the specified address
17874	family, or the specified address is not a valid address for the address family of the specified
17875	socket.
17876	[EAGAIN]
17877	Resource temporarily unavailable. This is a temporary condition and later calls to the same
17878	routine may complete normally.
17879	[EALREADY]
17880	Connection already in progress. A connection request is already in progress for the specified
17881	socket.
17882	[EBADF]
17883	Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
17884	read (write) request is made to a file that is only open for writing (reading).
17885	[EBADMSG]
17886	Bad Message. The implementation has detected a corrupted message.
17887	[EBUSY]
17888	Resource busy. An attempt was made to make use of a system resource that is not currently
17889	available, as it is being used by another process in a manner that would have conflicted
17890	with the request being made by this process.
17891	[ECANCELED]
17892	Operation canceled. The associated asynchronous operation was canceled before
17893	completion.
17894	[ECHILD]
17895	No child process. A <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> function was executed by a process that
17896	had no existing or unwaited-for child process.
17897	[ECONNABORTED]
17898	Connection aborted. The connection has been aborted.
17899	[ECONNREFUSED]
17900	Connection refused. An attempt to connect to a socket was refused because there was no
17901	process listening or because the queue of connection requests was full and the underlying
17902	protocol does not support retransmissions.
17903	[ECONNRESET]
17904	Connection reset. The connection was forcibly closed by the peer.
17905	[EDEADLK]
17906	Resource deadlock would occur. An attempt was made to lock a system resource that would
17907	have resulted in a deadlock situation.

17908	[EDESTADDRREQ]
17909	Destination address required. No bind address was established.
17910	[EDOM]
17911	Domain error. An input argument is outside the defined domain of the mathematical
17912	function (defined in the ISO C standard).
17913	[EDQUOT]
17914	Reserved.
17915	[EEXIST]
17916	File exists. An existing file was mentioned in an inappropriate context; for example, as a
17917	new link name in the <i>link()</i> function.
17918	[EFAULT]
17919	Bad address. The system detected an invalid address in attempting to use an argument of a
17920	call. The reliable detection of this error cannot be guaranteed, and when not detected may
17921	result in the generation of a signal, indicating an address violation, which is sent to the
17922	process.
17923	[EFBIG]
17924	File too large. The size of a file would exceed the implementation's maximum file size, the
17925	file size limit of the process, or the offset maximum established in the corresponding open
17926	file description.
17927	[EHOSTUNREACH]
17928	Host is unreachable. The destination host cannot be reached (probably because the host is
17929	down or a remote router cannot reach it).
17930	[EIDRM]
17931	Identifier removed. Returned during XSI interprocess communication if an identifier has
17932	been removed from the system.
17933	[EILSEQ]
17934	Illegal byte sequence. A wide-character code has been detected that does not correspond to
17935	a valid character, or a byte sequence does not form a valid wide-character code (defined in
17936	the ISO C standard).
17937	[EINPROGRESS]
17938	Operation in progress. This code is used to indicate that an asynchronous operation has not
17939	yet completed.
17940	or:
17941	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
17942	immediately established.
17943	[EINTR]
17944	Interrupted function call. An asynchronous signal was caught by the process during the
17945	execution of an interruptible function. If the signal handler performs a normal return, the
17946	interrupted function call may return this condition (see the Base Definitions volume of
17947	POSIX.1-2024, <signal.h>).
17948	[EINVAL]
17949	Invalid argument. Some invalid argument was supplied; for example, specifying an
17950	undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
17951	[EIO]
17952	Input/output error. Some physical input or output error has occurred. This error may be
17953	reported on a subsequent operation on the same file descriptor. Any other error-causing

17954		operation on the same file descriptor may cause the [EIO] error indication to be lost.
17955		[EISCONN]
17956		Socket is connected. The specified socket is already connected.
17957		[EISDIR]
17958		Is a directory. An attempt was made to open a directory with write mode specified.
17959		[ELOOP]
17960		Symbolic link loop. A loop exists in symbolic links encountered during pathname resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links are encountered during pathname resolution.
17961		
17962		
17963		[EMFILE]
17964		File descriptor value too large or too many open streams. An attempt was made to open a
17965	XSI	file descriptor with a value greater than or equal to {OPEN_MAX}, or greater than or equal
17966		to the soft limit RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}); or an
17967		attempt was made to open more than the maximum number of streams allowed in the
17968		process.
17969		[EMLINK]
17970		Too many hard links. An attempt was made to have the link count of a single file exceed
17971		{LINK_MAX}.
17972		[EMSGSIZE]
17973		Message too large. A message sent on a transport provider was larger than an internal
17974		message buffer or some other network limit.
17975		or:
17976		Inappropriate message buffer length.
17977		[EMULTIHOP]
17978		Reserved.
17979		[ENAMETOOLONG]
17980		Filename too long. The length of a pathname exceeds {PATH_MAX} and the
17981		implementation considers this to be an error, or a pathname component is longer than
17982		{NAME_MAX}. This error may also occur when pathname substitution, as a result of
17983		encountering a symbolic link during pathname resolution, results in a pathname string the
17984		size of which exceeds {PATH_MAX}.
17985		[ENETDOWN]
17986		Network is down. The local network interface used to reach the destination is down.
17987		[ENETRESET]
17988		The connection was aborted by the network.
17989		[ENETUNREACH]
17990		Network unreachable. No route to the network is present.
17991		[ENFILE]
17992		Too many files open in system. Too many files are currently open in the system. The system
17993		has reached its predefined limit for simultaneously open files and temporarily cannot
17994		accept requests to open another one.
17995		[ENOBUFS]
17996		No buffer space available. Insufficient buffer resources were available in the system to
17997		perform the socket operation.

17998	[ENODEV]
17999	No such device. An attempt was made to apply an inappropriate function to a device; for
18000	example, trying to read a write-only device such as a printer.
18001	[ENOENT]
18002	No such file or directory. A component of a specified pathname does not exist, or the
18003	pathname is an empty string.
18004	[ENOEXEC]
18005	Executable file format error. A request is made to execute a file that, although it has
18006	appropriate privileges, is not in the format required by the implementation for executable
18007	files.
18008	[ENOLCK]
18009	No locks available. A system-imposed limit on the number of simultaneous file and record
18010	locks has been reached and no more are currently available.
18011	[ENOLINK]
18012	Reserved.
18013	[ENOMEM]
18014	Not enough space. The new process image requires more memory than is allowed by the
18015	hardware or system-imposed memory management constraints.
18016	[ENOMSG]
18017	No message of the desired type. The message queue does not contain a message of the
18018	required type during XSI interprocess communication.
18019	[ENOPROTOOPT]
18020	Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
18021	implementation.
18022	[ENOSPC]
18023	No space left on a device. During the <i>write()</i> function on a regular file or when extending a
18024	directory, there is no free space left on the device.
18025	[ENOSYS]
18026	Functionality not supported. An attempt was made to use optional functionality that is not
18027	supported in this implementation.
18028	[ENOTCONN]
18029	Socket not connected. The socket is not connected.
18030	[ENOTDIR]
18031	Not a directory. A component of the specified pathname exists, but it is not a directory,
18032	when a directory was expected; or an attempt was made to create a non-directory file, and
18033	the specified pathname contains at least one non- <i>&lt;/i&gt;slash<i>&gt;</i> character and ends with one or</i>
18034	more trailing <i>&lt;/i&gt;slash<i>&gt;</i> characters.</i>
18035	[ENOTEMPTY]
18036	Directory not empty. A directory other than an empty directory was supplied when an
18037	empty directory was expected.
18038	[ENOTRECOVERABLE]
18039	State not recoverable. The state protected by a robust mutex is not recoverable.
18040	[ENOTSOCK]
18041	Not a socket. The file descriptor does not refer to a socket.

18042	[ENOTSUP]
18043	Not supported. The implementation does not support the requested feature or value.
18044	[ENOTTY]
18045	Inappropriate I/O control operation. A control function has been attempted for a file or
18046	special file for which the operation is inappropriate.
18047	[ENXIO]
18048	No such device or address. Input or output on a special file refers to a device that does not
18049	exist, or makes a request beyond the capabilities of the device. It may also occur when, for
18050	example, a tape drive is not on-line.
18051	[EOPNOTSUPP]
18052	Operation not supported on socket. The type of socket (address family or protocol) does not
18053	support the requested operation. A conforming implementation may assign the same values
18054	for [EOPNOTSUPP] and [ENOTSUP].
18055	[EOVERFLOW]
18056	Value too large to be stored in data type. An operation was attempted which would
18057	generate a value that is outside the range of values that can be represented in the relevant
18058	data type or that are allowed for a given data item.
18059	[EOWNERDEAD]
18060	Previous owner died. The owner of a robust mutex terminated while holding the mutex
18061	lock.
18062	[EPERM]
18063	Operation not permitted. An attempt was made to perform an operation limited to
18064	processes with appropriate privileges or to the owner of a file or other resource.
18065	[EPIPE]
18066	Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
18067	to read the data.
18068	[EPROTO]
18069	Protocol error. Some protocol error occurred. This error is device-specific, but is generally
18070	not related to a hardware failure.
18071	[EPROTONOSUPPORT]
18072	Protocol not supported. The protocol is not supported by the address family, or the protocol
18073	is not supported by the implementation.
18074	[EPROTOTYPE]
18075	Protocol wrong type for socket. The socket type is not supported by the protocol.
18076	[ERANGE]
18077	Result too large or too small. The result of the function is too large (overflow) or too small
18078	(underflow) to be represented in the available space (defined in the ISO C standard).
18079	[EROFS]
18080	Read-only file system. An attempt was made to modify a file or directory on a file system
18081	that is read-only.
18082	[ESOCKTNOSUPPORT]
18083	Socket type not supported. The socket type is not supported by the address family, or the
18084	socket type is not supported by the implementation.
18085	[ESPIPE]
18086	Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.

18087	[ESRCH]
18088	No such process. No process can be found corresponding to that specified by the given
18089	process ID.
18090	[ESTALE]
18091	Reserved.
18092	[ETIMEDOUT]
18093	Connection timed out. The connection to a remote machine has timed out. If the connection
18094	timed out during execution of the function that reported this error (as opposed to timing
18095	out prior to the function being called), it is unspecified whether the function has completed
18096	some or all of the documented behavior associated with a successful completion of the
18097	function.
18098	or:
18099	Operation timed out. The time limit associated with the operation was exceeded before the
18100	operation completed.
18101	[ETXTBSY]
18102	Text file busy. An attempt was made to execute a pure-procedure program that is currently
18103	open for writing, or an attempt has been made to open for writing a pure-procedure
18104	program that is being executed.
18105	[EWOULDBLOCK]
18106	Operation would block. An operation on a socket marked as non-blocking has encountered
18107	a situation such as no data available that otherwise would have caused the function to
18108	suspend execution.
18109	A conforming implementation may assign the same values for [EWOULDBLOCK] and
18110	[EAGAIN].
18111	[EXDEV]
18112	Improper hard link. Creation of a hard link to a file on another file system was attempted.

### 18113 2.3.1 Additional Error Numbers

18114 Additional implementation-defined error numbers may be defined in `<errno.h>`.

## 18115 2.4 Signal Concepts

### 18116 2.4.1 Signal Generation and Delivery

18117 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes  
 18118 the signal first occurs. Examples of such events include detection of hardware faults, timer  
 18119 expiration, signals generated via the `sigevent` structure and terminal activity, as well as  
 18120 invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event  
 18121 generates signals for multiple processes.

18122 At the time of generation, a determination shall be made whether the signal has been generated  
 18123 for the process or for a specific thread within the process. Signals which are generated by some  
 18124 action attributable to a particular thread, such as a hardware fault, shall be generated for the  
 18125 thread that caused the signal to be generated. Signals that are generated in association with a

18126 process ID or process group ID or an asynchronous event, such as terminal activity, shall be  
18127 generated for the process.

18128 Each process has an action to be taken in response to each signal defined by the system (see  
18129 [Section 2.4.3](#)). A signal is said to be “delivered” to a process when the appropriate action for the  
18130 process and signal is taken. A signal is said to be “accepted” by a process when the signal is  
18131 selected and returned by one of the *sigwait()* functions.

18132 During the time between the generation of a signal and its delivery or acceptance, the signal is  
18133 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a  
18134 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal  
18135 is anything other than to ignore the signal, and if that signal is generated for the thread, the  
18136 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned  
18137 by a call to the *sigwait()* function, or the action associated with it is set to ignore the signal.  
18138 Signals generated for the process shall be delivered to exactly one of those threads within the  
18139 process which is in a call to a *sigwait()* function selecting that signal or has not blocked delivery  
18140 of the signal. If there are no threads in a call to a *sigwait()* function selecting that signal, and if all  
18141 threads within the process block delivery of the signal, the signal shall remain pending on the  
18142 process until a thread calls a *sigwait()* function selecting that signal, a thread unblocks delivery  
18143 of the signal, or the action associated with the signal is set to ignore the signal. If the action  
18144 associated with a blocked signal is to ignore the signal and if that signal is generated for the  
18145 process, it is unspecified whether the signal is discarded immediately upon generation or  
18146 remains pending.

18147 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery  
18148 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,  
18149 or from the corresponding thread in the parent process if the thread was created as the result of a  
18150 call to *fork()*. The *pthread\_sigmask()*, *sigaction()*, *sigprocmask()*, and *sigsuspend()* functions control  
18151 the manipulation of the signal mask.

18152 The determination of which action is taken in response to a signal is made at the time the signal  
18153 is delivered, allowing for any changes since the time of generation. This determination is  
18154 independent of the means by which the signal was originally generated. If a subsequent  
18155 occurrence of a pending signal is generated, it is implementation-defined as to whether the  
18156 signal is delivered or accepted more than once in circumstances other than those in which  
18157 queuing is required. The order in which multiple, simultaneously pending signals outside the  
18158 range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

18159 When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process or  
18160 thread, all pending SIGCONT signals for that process or any of the threads within that process  
18161 shall be discarded. Conversely, when SIGCONT is generated for a process or thread, all pending  
18162 stop signals for that process or any of the threads within that process shall be discarded. When  
18163 SIGCONT is generated for a process that is stopped, the process shall be continued, even if the  
18164 SIGCONT signal is ignored by the process or is blocked by all threads within the process and  
18165 there are no threads in a call to a *sigwait()* function selecting SIGCONT. If SIGCONT is blocked  
18166 by all threads within the process, there are no threads in a call to a *sigwait()* function selecting  
18167 SIGCONT, and SIGCONT is not ignored by the process, the SIGCONT signal shall remain  
18168 pending on the process until it is either unblocked by a thread or a thread calls a *sigwait()*  
18169 function selecting SIGCONT, or a stop signal is generated for the process or any of the threads  
18170 within the process.

18171 An implementation shall document any condition not specified by this volume of POSIX.1-2024  
18172 under which the implementation generates signals.

## 18173 2.4.2 Realtime Signal Generation and Delivery

18174 This section describes functionality to support realtime signal generation and delivery.

18175 Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O  
 18176 completion, interprocess message arrival, and the *sigqueue()* function, support the specification  
 18177 of an application-defined value, either explicitly as a parameter to the function or in a **sigevent**  
 18178 structure parameter. The **sigevent** structure is defined in `<signal.h>` and contains at least the  
 18179 following members:

Member Type	Member Name	Description
<b>int</b>	<i>sigev_notify</i>	Notification type.
<b>int</b>	<i>sigev_signo</i>	Signal number.
<b>union signal</b>	<i>sigev_value</i>	Signal value.
<b>void*(*) (union signal)</b>	<i>sigev_notify_function</i>	Notification function.
<b>(pthread_attr_t*)</b>	<i>sigev_notify_attributes</i>	Notification attributes.

18186 The *sigev\_notify* member specifies the notification mechanism to use when an asynchronous  
 18187 event occurs. This volume of POSIX.1-2024 defines the following values for the *sigev\_notify*  
 18188 member:

18189 SIGEV\_NONE No asynchronous notification shall be delivered when the event of  
 18190 interest occurs.

18191 SIGEV\_SIGNAL The signal specified in *sigev\_signo* shall be generated for the process when  
 18192 the event of interest occurs. If the SA\_SIGINFO flag is set for that signal  
 18193 number, then the signal shall be queued to the process and the value  
 18194 specified in *sigev\_value* shall be the *si\_value* component of the generated  
 18195 signal. If SA\_SIGINFO is not set for that signal number, it is unspecified  
 18196 whether the signal is queued and what value, if any, is sent.

18197 SIGEV\_THREAD A notification function shall be called to perform notification.

18198 An implementation may define additional notification mechanisms.

18199 The *sigev\_signo* member specifies the signal to be generated. The *sigev\_value* member is the  
 18200 application-defined value to be passed to the signal-catching function at the time of the signal  
 18201 delivery or to be returned at signal acceptance as the *si\_value* member of the **siginfo\_t** structure.

18202 The **signal** union is defined in `<signal.h>` and contains at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>sival_int</i>	Integer signal value.
<b>void*</b>	<i>sival_ptr</i>	Pointer signal value.

18206 The *sival\_int* member shall be used when the application-defined value is of type **int**; the  
 18207 *sival\_ptr* member shall be used when the application-defined value is a pointer.

18208 When a signal is generated by the *sigqueue()* function or any signal-generating function that  
 18209 supports the specification of an application-defined value, the signal shall be marked pending  
 18210 and, if the SA\_SIGINFO flag is set for that signal, the signal shall be queued to the process along  
 18211 with the application-specified signal value. Multiple occurrences of signals so generated are  
 18212 queued in FIFO order. It is unspecified whether signals so generated are queued when the  
 18213 SA\_SIGINFO flag is not set for that signal.

18214 Signals generated by the *kill()* function or other events that cause signals to occur, such as  
 18215 detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the  
 18216 implementation does not support queuing, shall have no effect on signals already queued for the

18217 same signal number.

18218 When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the  
18219 behavior shall be as if the implementation delivers the pending unblocked signal with the  
18220 lowest signal number within that range. No other ordering of signal delivery is specified.

18221 If, when a pending signal is delivered, there are additional signals queued to that signal number,  
18222 the signal shall remain pending. Otherwise, the pending indication shall be reset.

18223 Multi-threaded programs can use an alternate event notification mechanism. When a  
18224 notification is processed, and the *sigev\_notify* member of the **sigevent** structure has the value  
18225 SIGEV\_THREAD, the function *sigev\_notify\_function* is called with parameter *sigev\_value*.

18226 The function shall be executed in a newly created thread as if it were the *start\_routine* for a call to  
18227 *pthread\_create()* with the thread attributes specified by *sigev\_notify\_attributes*. If  
18228 *sigev\_notify\_attributes* is NULL, the behavior shall be as if the thread were created with the  
18229 *detachstate* attribute set to PTHREAD\_CREATE\_DETACHED. Supplying an attributes structure  
18230 with a *detachstate* attribute of PTHREAD\_CREATE\_JOINABLE results in undefined behavior. It  
18231 is implementation-defined whether the signal mask of this thread has all signals except SIGKILL  
18232 and SIGSTOP blocked, or is the same as the mask that was in effect for the thread which  
18233 installed the **sigevent** notification handler at the time of the call that installed the handler.

### 18234 2.4.3 Signal Actions

18235 There are three types of action that can be associated with a signal: SIG\_DFL, SIG\_IGN, or a  
18236 pointer to a function. Initially, all signals shall be set to SIG\_DFL or SIG\_IGN prior to entry of  
18237 the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows.

#### 18238 SIG\_DFL

18239 Signal-specific default action.

18240 The default actions for the signals defined in this volume of POSIX.1-2024 are specified under  
18241 **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX  
18242 shall be to terminate the process abnormally.

18243 If the default action is to terminate the process abnormally, the process is terminated as if by a  
18244 call to *\_exit()*, except that the status made available to *wait()*, *waitid()*, and *waitpid()* indicates  
18245 abnormal termination by the signal. If the default action is to terminate the process abnormally  
18246 with additional actions, implementation-defined abnormal termination actions, such as creation  
18247 of a core image, may also occur.

18248 If the default action is to stop the process, the execution of that process is temporarily  
18249 suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process,  
18250 unless the parent process has set the SA\_NOCLDSTOP flag. While a process is stopped, any  
18251 additional signals that are sent to the process shall not be delivered until the process is  
18252 continued, except SIGKILL which always terminates the receiving process. A process that is a  
18253 member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP,  
18254 SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a  
18255 process, the signal shall be discarded.

18256 If the default action is to ignore the signal, delivery of the signal shall have no effect on the  
18257 process.

18258 Setting a signal action to SIG\_DFL for a signal that is pending, and whose default action is to  
18259 ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded,  
18260 whether or not it is blocked. Any queued values pending shall be discarded and the resources

18261 used to queue them shall be released and returned to the system for other use.  
 18262 The default action for SIGCONT is to resume execution at the point where the process was  
 18263 stopped, after first handling any pending unblocked signals.

18264 XSI When a stopped process is continued, a SIGCHLD signal may be generated for its parent  
 18265 process, unless the parent process has set the SA\_NOCLDSTOP flag.

## 18266 SIG\_IGN

18267 Ignore signal.

18268 Delivery of the signal shall have no effect on the process. The behavior of a process is undefined  
 18269 after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by *kill()*,  
 18270 *sigqueue()*, or *raise()*.

18271 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG\_IGN.

18272 Setting a signal action to SIG\_IGN for a signal that is pending shall cause the pending signal to  
 18273 be discarded, whether or not it is blocked.

18274 If a process sets the action for the SIGCHLD signal to SIG\_IGN, the behavior is unspecified,  
 18275 XSI except as specified under “Consequences of Process Termination” in the description of the  
 18276 *\_Exit()* function (see XSH *\_Exit()*, on page 568).

18277 Any queued values pending shall be discarded and the resources used to queue them shall be  
 18278 released and made available to queue other signals.

## 18279 Pointer to a Function

18280 Catch signal.

18281 On delivery of the signal, the receiving process is to execute the signal-catching function at the  
 18282 specified address. After returning from the signal-catching function, the receiving process shall  
 18283 resume execution at the point at which it was interrupted.

18284 If the SA\_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as  
 18285 a C-language function call as follows:

```
18286 void func(int signo);
```

18287 If the SA\_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-  
 18288 language function call as follows:

```
18289 void func(int signo, siginfo_t *info, void *context);
```

18290 where *func* is the specified signal-catching function, *signo* is the signal number of the signal  
 18291 being delivered, and *info* is a pointer to a **siginfo\_t** structure defined in **<signal.h>** containing at  
 18292 least the following members:

18293	Member Type	Member Name	Description
18294	<b>int</b>	<i>si_signo</i>	Signal number.
18295	<b>int</b>	<i>si_code</i>	Cause of the signal.
18296	<b>pid_t</b>	<i>si_pid</i>	Sending process ID.
18297	<b>uid_t</b>	<i>si_uid</i>	Real user ID of sending process.
18298	<b>void *</b>	<i>si_addr</i>	Address of faulting instruction.
18299	<b>int</b>	<i>si_status</i>	Exit value or signal.
18300	<b>union signal</b>	<i>si_value</i>	Signal value.

18301 The *si\_signo* member shall contain the signal number. This shall be the same as the *signo*  
 18302 parameter. The *si\_code* member shall contain a code identifying the cause of the signal. The

18303 following non-signal-specific values are defined for *si\_code*:

18304 SI\_USER The signal was sent by the *kill()* function. The implementation may set *si\_code*  
18305 to SI\_USER if the signal was sent by the *raise()* or *abort()* functions or any  
18306 similar functions provided as implementation extensions.

18307 SI\_QUEUE The signal was sent by the *sigqueue()* function.

18308 SI\_TIMER The signal was generated by the expiration of a timer set by *timer\_settime()*.

18309 SI\_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

18310 MSG SI\_MESGQ The signal was generated by the arrival of a message on an empty message  
18311 queue.

18312 Signal-specific values for *si\_code* are also defined, as described in XBD <signal.h>.

18313 If the signal was not generated by one of the functions or events listed above, *si\_code* shall be set  
18314 either to one of the signal-specific values described in XBD <signal.h>, or to an implementation-  
18315 defined value that is not equal to any of the values defined above.

18316 XSI If *si\_code* is SI\_USER or SI\_QUEUE, or any value less than or equal to 0, then the signal was  
18317 generated by a process and *si\_pid* and *si\_uid* shall be set to the process ID and the real user ID of  
18318 the sender, respectively.

18319 In addition, *si\_addr*, *si\_pid*, *si\_status*, and *si\_uid* shall be set for certain signal-specific values of  
18320 *si\_code*, as described in XBD <signal.h>.

18321 If *si\_code* is one of SI\_QUEUE, SI\_TIMER, SI\_ASYNCIO, or SI\_MESGQ, then *si\_value* shall  
18322 contain the application-specified signal value. Otherwise, the contents of *si\_value* are undefined.

18323 The behavior of a process is undefined after it returns normally from a signal-catching function  
18324 for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by *kill()*, *sigqueue()*,  
18325 or *raise()*.

18326 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

18327 If a process establishes a signal-catching function for the SIGCHLD signal while it has a  
18328 terminated child process for which it has not waited, it is unspecified whether a SIGCHLD  
18329 signal is generated to indicate that child process.

18330 If the process is multi-threaded, or if the process is single-threaded and a signal handler is  
18331 executed other than as the result of:

- 18332 • The process calling *abort()*, *raise()*, *kill()*, *pthread\_kill()*, or *sigqueue()* to generate a signal  
18333 that is not blocked
- 18334 • A pending signal being unblocked and being delivered before the call that unblocked it  
18335 returns

18336 the behavior is undefined if:

- 18337 • The signal handler refers to any object other than *errno* with static or thread storage  
18338 duration that is not a lock-free atomic object, and not a non-modifiable object (for example,  
18339 string literals, objects that were defined with a const-qualified type, and objects in memory  
18340 that is mapped read-only), other than by assigning a value to an object declared as **volatile**  
18341 **sig\_atomic\_t**, unless the previous modification (if any) to the object happens before the  
18342 signal handler is called and the return from the signal handler happens before the next  
18343 modification (if any) to the object.

- 18344 • The signal handler calls any function or function-like macro defined in this standard other  
18345 than one of the functions and macros specified below as being `async-signal-safe`.

18346 The following table defines a set of functions and function-like macros that shall be `async-signal-`  
18347 `safe`. Therefore, applications can call them, without restriction, from `signal-catching` functions.  
18348 Note that, although there is no restriction on the calls themselves, for certain functions there are  
18349 restrictions on subsequent behavior after the function is called from a `signal-catching` function  
18350 (see `longjmp()`).

18408	<i>tcsetwinsize()</i>	<i>va_start()</i>	<i>wcsncmp()</i>	

18409 In addition, the functions in `<stdatomic.h>` other than *atomic\_init()* shall be async-signal-safe  
 18410 when the atomic arguments are lock-free, and the *atomic\_is\_lock\_free()* function shall be async-  
 18411 signal-safe when called with an atomic argument.

18412 All other functions (including generic functions) and function-like macros may be unsafe with  
 18413 respect to signals. It is implementation-defined which additional interfaces, if any, are also  
 18414 async-signal-safe. In the presence of signals, all functions defined by this volume of  
 18415 POSIX.1-2024 shall behave as defined when called from or interrupted by a signal-catching  
 18416 function, with the exception that when a signal interrupts an unsafe function or function-like  
 18417 macro, or equivalent (such as the processing equivalent to *exit()* performed after a return from  
 18418 the initial call to *main()*), and the signal-catching function calls an unsafe function or function-  
 18419 like macro, the behavior is undefined. Additional exceptions are specified in the descriptions of  
 18420 individual functions such as *longjmp()*.

18421 Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be  
 18422 async-signal-safe, provided that the signal-catching function saves the value of *errno* upon entry  
 18423 and restores it before it returns.

18424 When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or  
 18425 continue, the entire process shall be terminated, stopped, or continued, respectively.

#### 18426 2.4.4 Signal Effects on Other Functions

18427 Signals affect the behavior of certain functions defined by this volume of POSIX.1-2024 if  
 18428 delivered to a process while it is executing such a function. If the action of the signal is to  
 18429 terminate the process, the process shall be terminated and the function shall not return. If the  
 18430 action of the signal is to stop the process, the process shall stop until continued or terminated.  
 18431 Generation of a SIGCONT signal for the process shall cause the process to be continued, and the  
 18432 original function shall continue at the point the process was stopped. If the action of the signal is  
 18433 to invoke a signal-catching function, the signal-catching function shall be invoked; in this case  
 18434 the original function is said to be “interrupted” by the signal. If the signal-catching function  
 18435 executes a **return** statement, the behavior of the interrupted function shall be as described  
 18436 individually for that function, except as noted for unsafe functions. After returning from a  
 18437 signal-catching function, the value of *errno* is unspecified if the signal-catching function or any  
 18438 function it called assigned a value to *errno* and the signal-catching function did not save and  
 18439 restore the original value of *errno*. Signals that are ignored shall not affect the behavior of any  
 18440 function; signals that are blocked shall not affect the behavior of any function until they are  
 18441 unblocked and then delivered, except as specified for the *sigpending()* and *sigwait()* functions.

## 18442 2.5 Standard I/O Streams

18443 CX A stream is associated with an external file (which may be a physical device) or memory buffer  
 18444 CX by “opening” a file or buffer. This may involve “creating” a new file. Creating an existing file  
 18445 causes its former contents to be discarded if necessary. If a file can support positioning requests  
 18446 (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the  
 18447 stream is positioned at the start (byte number 0) of the file, unless the file is opened with append  
 18448 mode, in which case it is implementation-defined whether the file position indicator is initially  
 18449 positioned at the beginning or end of the file. The file position indicator is maintained by  
 18450 subsequent reads, writes, and positioning requests, to facilitate an orderly progression through  
 18451 the file.

18452 The wide-character input functions shall read characters from the stream and convert them to  
 18453 wide characters as if they were read by successive calls to the *fgetwc()* function. Each conversion  
 18454 shall occur as if by a call to the *mbrtowc()* function, with the conversion state described by the  
 18455 stream’s own **mbstate\_t** object (see Section 2.5.2, on page 524). The byte input functions shall  
 18456 read characters from the stream as if by successive calls to the *fgetc()* function.

18457 The wide-character output functions shall convert wide characters to characters and write them  
 18458 to the stream as if they were written by successive calls to the *fputwc()* function. Each conversion  
 18459 shall occur as if by a call to the *wcrtomb()* function, with the conversion state described by the  
 18460 stream’s own **mbstate\_t** object (see Section 2.5.2, on page 524). The byte output functions shall  
 18461 write characters to the stream as if by successive calls to the *fputc()* function.

18462 The *perror()*, *psiginfo()*, and *psignal()* functions shall behave as described above for the byte  
 18463 output functions if the stream is already byte-oriented, and shall behave as described above for  
 18464 the wide-character output functions if the stream is already wide-oriented. If the stream has no  
 18465 orientation, they shall behave as described for the byte output functions except that they shall  
 18466 not change the orientation of the stream.

18467 Functions other than *perror()*, *psiginfo()*, and *psignal()* that write to streams but are neither wide-  
 18468 character output nor byte output functions (*getopt()* and *wordexp()*), shall behave as described  
 18469 above for the byte output functions, except that if the stream has no orientation, it is unspecified  
 18470 whether they set the stream to byte orientation or leave it with no orientation.

18471 When a stream is “unbuffered”, bytes are intended to appear from the source or at the  
 18472 destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a  
 18473 block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a  
 18474 buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block  
 18475 when a <newline> byte is encountered. Furthermore, bytes are intended to be transmitted as a  
 18476 block when a buffer is filled, when input is requested on an unbuffered stream, or when input is  
 18477 requested on a line-buffered stream that requires the transmission of bytes. Support for these  
 18478 characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

18479 A file may be disassociated from a controlling stream by “closing” the file. Output streams are  
 18480 flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from  
 18481 the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed  
 18482 (including the standard streams).

18483 A file may be subsequently reopened, by the same or another program execution, and its  
 18484 contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function  
 18485 returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all  
 18486 output streams are flushed) before program termination. Other paths to program termination,  
 18487 such as calling *abort()*, need not close all files properly.

18488 The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE**  
 18489 object need not necessarily serve in place of the original.

18490 At program start-up, three streams shall be predefined and already open: *stdin* (standard input,  
 18491 for conventional input) for reading, *stdout* (standard output, for conventional output) for  
 18492 writing, and *stderr* (standard error, for diagnostic output) for writing. When opened, *stderr* shall  
 18493 CX not be fully buffered; *stdin* and *stdout* shall be fully buffered if and only if the file descriptor  
 18494 associated with the stream is determined not to be associated with an interactive device.

18495 Each stream shall have an associated lock that is used to prevent data races when multiple  
 18496 threads of execution access a stream, and to restrict the interleaving of stream operations  
 18497 performed by multiple threads. Only one thread can hold this lock at a time. The lock shall be  
 18498 reentrant: a single thread can hold the lock multiple times at a given time. All functions that  
 18499 CX read, write, position, or query the position of a stream, except those with names ending  
 18500 CX *\_unlocked*, shall lock the stream as if by a call to *flockfile()* before accessing it and release the  
 18501 CX lock as if by a call to *funlockfile()* when the access is complete.

18502 CX If the lock is not immediately available, the function shall wait for it to become available, except  
 18503 in the following circumstances. If the stream is line buffered and is open for writing or for  
 18504 update, and the reason the function is attempting to lock the stream is because it is going to  
 18505 request input on another stream that is unbuffered, or is line buffered and requires the  
 18506 transmission of characters from the host environment (see above), then the function shall  
 18507 attempt to determine whether a deadlock situation exists. If a deadlock situation is found to  
 18508 exist, the function shall fail. If the function is able to establish that a deadlock situation does not  
 18509 exist, it shall wait for the lock to become available. If the function does not establish whether or  
 18510 not a deadlock situation exists, it shall continue as if it had already locked the stream, found its  
 18511 buffer to be empty, and released the lock.

18512 CX A stream associated with a memory buffer shall have the same operations for text files that a  
 18513 stream associated with an external file would have. In addition, the stream orientation shall be  
 18514 determined in exactly the same fashion.

18515 Input and output operations on a stream associated with a memory buffer by a call to  
 18516 *fmemopen()* shall be constrained by the implementation to take place within the bounds of the  
 18517 memory buffer. In the case of a stream opened by *open\_memstream()* or *open\_wmemstream()*, the  
 18518 memory area shall grow dynamically to accommodate write operations as necessary. For output,  
 18519 if the stream is fully buffered or line buffered, data shall be moved from the stream's internal  
 18520 buffer, or a buffer provided by *setvbuf()*, to the memory buffer during a flush or close operation.  
 18521 For input, it is unspecified whether a buffer provided by *setvbuf()* is used or whether read  
 18522 operations read directly from the memory buffer provided to or allocated by *fmemopen()*.

18523 When a standard I/O stream has an associated memory buffer (whether allocated internally,  
 18524 supplied to *setvbuf()*, or supplied to *fmemopen()*), the behavior is undefined if that buffer  
 18525 overlaps with the destination buffer passed to a call that reads from the stream or with the  
 18526 source buffer passed to a call that writes to the stream.

## 18527 2.5.1 Interaction of File Descriptors and Standard I/O Streams

18528 CX This section describes the interaction of file descriptors and standard I/O streams. The  
 18529 functionality described in this section is an extension to the ISO C standard (and the rest of this  
 18530 section is not further CX shaded).

18531 An open file description may be accessed through a file descriptor, which is created using  
 18532 functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as  
 18533 *fopen()* or *popen()*. Either a file descriptor or a stream is called a "handle" on the open file  
 18534 description to which it refers; an open file description may have several handles.

18535 Handles can be created or destroyed by explicit user action, without affecting the underlying  
 18536 open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*,

18537 and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

18538 A file descriptor that is never used in an operation that could affect the file offset (for example,  
18539 *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to  
18540 one (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include  
18541 the file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is  
18542 not used directly by the application to affect the file offset. The *read()* and *write()* functions  
18543 implicitly affect the file offset; *lseek()* explicitly affects it.

18544 The result of function calls involving any one handle (the “active handle”) is defined elsewhere  
18545 in this volume of POSIX.1-2024, but if two or more handles are used, and any one of them is a  
18546 stream, the application shall ensure that their actions are coordinated as described below. If this  
18547 is not done, the result is undefined.

18548 A handle which is a stream is considered to be closed when either an *fclose()*, or *freopen()* with  
18549 non-null filename, is executed on it (for *freopen()* with a null filename, it is implementation-  
18550 defined whether a new handle is created or the existing one reused), or when the process  
18551 owning that stream terminates with *exit()*, *abort()*, or due to a signal. Several functions close file  
18552 descriptors, including *close()*, *dup2()*, *\_exit()*, the *exec* functions when *FD\_CLOEXEC* is set on a  
18553 file descriptor, *fork()* when *FD\_CLOFORK* is set on a file descriptor, and *posix\_spawn()* when  
18554 either *FD\_CLOEXEC* or *FD\_CLOFORK* is set.

18555 For a handle to become the active handle, the application shall ensure that the actions below are  
18556 performed between the last use of the handle (the current active handle) and the first use of the  
18557 second handle (the future active handle). The second handle then becomes the active handle. All  
18558 activity by the application affecting the file offset on the first handle shall be suspended until it  
18559 again becomes the active file handle. (If a stream function has as an underlying function one that  
18560 affects the file offset, the stream function shall be considered to affect the file offset.)

18561 The handles need not be in the same process for these rules to apply.

18562 Note that after a *fork()*, two handles exist where one existed before. The application shall ensure  
18563 that, if both handles can ever be accessed, they are both in a state where the other could become  
18564 the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of  
18565 active handle. (If the only action performed by one of the processes is one of the *exec* functions or  
18566 *\_exit()* (not *exit()*), the handle is never accessed in that process.)

18567 For the first handle, the first applicable condition below applies. After the actions required  
18568 below are taken, if the handle is still open, the application can close it.

- 18569 • If it is a file descriptor, no action is required.
- 18570 • If the only further action to be performed on any handle to this open file descriptor is to  
18571 close it, no action need be taken.
- 18572 • If it is a stream which is unbuffered, no action need be taken.
- 18573 • If it is a stream which is line buffered, and the last byte written to the stream was a  
18574 <newline> (that is, as if a:

```
18575         putchar('\n')
```

18576 was the most recent operation on that stream), no action need be taken.

- 18577 • If it is a stream which is open for writing or appending (but not also open for reading), the  
18578 application shall either perform an *fflush()*, or the stream shall be closed.

18579 • If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need  
18580 be taken.

18581 • If the stream is open with a mode that allows reading and the underlying open file  
18582 description refers to a device that is capable of seeking, the application shall either perform  
18583 an *fflush()*, or the stream shall be closed.

18584 For the second handle:

18585 • If any previous active handle has been used by a function that explicitly changed the file  
18586 offset, except as required above for the first handle, the application shall perform an *lseek()*  
18587 or *fseek()* (as appropriate to the type of handle) to an appropriate location.

18588 If the active handle ceases to be accessible before the requirements on the first handle, above,  
18589 have been met, the state of the open file description becomes undefined. This might occur  
18590 during functions such as a *fork()* or *\_exit()*.

18591 The *exec* functions make inaccessible all streams that are open at the time they are called,  
18592 independent of which streams or file descriptors may be available to the new process image.

18593 When these rules are followed, regardless of the sequence of handles used, no data shall be lost  
18594 or duplicated when writing, and all data shall be written in order, except as requested by seeks.  
18595 It is implementation-defined whether, and under what conditions, all input is seen exactly once.

18596 Each function that operates on a stream is said to have zero or more “underlying functions”.  
18597 This means that the stream function shares certain traits with the underlying functions, but does  
18598 not require that there be any relation between the implementations of the stream function and its  
18599 underlying functions.

## 18600 2.5.2 Stream Orientation and Encoding Rules

18601 The definition of a stream includes an “orientation”. After a stream is associated with an  
18602 external file, but before any operations are performed on it, the stream is without orientation.  
18603 Once a wide-character input/output function has been applied to a stream without orientation,  
18604 the stream shall become “wide-oriented”. Similarly, once a byte input/output function has been  
18605 applied to a stream without orientation, the stream shall become “byte-oriented”. Only a call to  
18606 the *freopen()* function or the *fwide()* function can otherwise alter the orientation of a stream.

18607 A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard*  
18608 *input*, *standard output*, and *standard error* shall be unoriented at program start-up.

18609 Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character  
18610 input/output functions cannot be applied to a byte-oriented stream. The remaining stream  
18611 operations shall not affect and shall not be affected by a stream’s orientation, except for the  
18612 following additional restriction:

18613 • For wide-oriented streams, after a successful call to a file-positioning function that leaves  
18614 the file position indicator prior to the end-of-file, a wide-character output function can  
18615 overwrite a partial character; any file contents beyond the byte(s) written are henceforth  
18616 undefined.

18617 CX Each wide-oriented stream that was not opened with *open\_wmemstream()* has an associated  
18618 **mbstate\_t** object that stores the current parse state of the stream. A successful call to *fgetpos()*  
18619 shall store a representation of the value of this **mbstate\_t** object as part of the value of the **fpos\_t**  
18620 object. A later successful call to *fsetpos()* using the same stored **fpos\_t** value shall restore the  
18621 value of the associated **mbstate\_t** object as well as the position within the controlled stream.

18622 Implementations that support multiple encoding rules associate an encoding rule with the

18623 stream. The encoding rule shall be determined by the setting of the `LC_CTYPE` category in the  
 18624 current locale at the time when the stream becomes wide-oriented. As with the stream's  
 18625 orientation, the encoding rule associated with a stream cannot be changed once it has been set,  
 18626 except by a successful call to `freopen()` which clears the encoding rule and resets the orientation  
 18627 to unoriented.

18628 Although wide-oriented streams are conceptually sequences of wide characters, the external file  
 18629 CX associated with a wide-oriented stream that was not opened with `open_wmemstream()` is a  
 18630 sequence of (possibly multi-byte) characters generalized as follows:

- 18631 • Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte  
 18632 encodings valid for use internal to the program).
- 18633 • A file need not begin nor end in the initial shift state.

18634 Moreover, the encodings used for characters may differ among files. Both the nature and choice  
 18635 of such encodings are implementation-defined.

18636 CX On streams that were not opened with `open_wmemstream()`, the wide-character input functions  
 18637 read characters from the stream and convert them to wide characters as if they were read by  
 18638 successive calls to the `fgetwc()` function. Each conversion shall occur as if by a call to the  
 18639 CX `mbrtowc()` function, with the conversion state described by the stream's own `mbstate_t` object,  
 18640 except the encoding rule associated with the stream is used instead of the encoding rule implied  
 18641 by the `LC_CTYPE` category of the current locale.

18642 CX On streams that were not opened with `open_wmemstream()`, the wide-character output functions  
 18643 convert wide characters to (possibly multi-byte) characters and write them to the stream as if  
 18644 they were written by successive calls to the `fputwc()` function. Each conversion shall occur as if  
 18645 by a call to the `wcrtomb()` function, with the conversion state described by the stream's own  
 18646 CX `mbstate_t` object, except the encoding rule associated with the stream is used instead of the  
 18647 encoding rule implied by the `LC_CTYPE` category of the current locale.

18648 An "encoding error" shall occur if the character sequence presented to the underlying `mbrtowc()`  
 18649 function does not form a valid (generalized) character, or if the code value passed to the  
 18650 underlying `wcrtomb()` function does not correspond to a valid (generalized) character. The wide-  
 18651 character input/output functions and the byte input/output functions store the value of the  
 18652 macro `[EILSEQ]` in `errno` if and only if an encoding error occurs.

## 18653 2.6 File Descriptor Allocation

18654 All functions that open one or more file descriptors shall, unless specified otherwise, atomically  
 18655 allocate the lowest numbered available (that is, not already open in the calling process) file  
 18656 descriptor at the time of each allocation. Where a single function allocates two file descriptors  
 18657 (for example, `pipe()` or `socketpair()`), the allocations may be independent and therefore  
 18658 applications should not expect them to have adjacent values or depend on which has the higher  
 18659 value.

## 18660 2.7 XSI Interprocess Communication

18661 XSI This section describes extensions to support interprocess communication. The functionality  
18662 described in this section shall be provided on implementations that support the XSI option (and  
18663 the rest of this section is not further shaded).

18664 The following message passing, semaphore, and shared memory services form an XSI  
18665 interprocess communication facility. Certain aspects of their operation are common, and are  
18666 defined as follows.

18667 IPC Functions		
18668 <i>msgctl()</i>	<i>semctl()</i>	<i>shmat()</i>
18669 <i>msgget()</i>	<i>semget()</i>	<i>shmctl()</i>
18670 <i>msgrcv()</i>	<i>semop()</i>	<i>shmdt()</i>
18671 <i>msgsnd()</i>		<i>shmget()</i>

18672 Another interprocess communication facility is provided by functions in the Realtime Option  
18673 Group; see Section 2.8 (on page 527).

### 18674 2.7.1 IPC General Description

18675 Each individual shared memory segment, message queue, and semaphore set shall be identified  
18676 by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore  
18677 identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls  
18678 to *shmget()*, *semget()*, and *msgget()*, respectively.

18679 Associated with each identifier is a data structure which contains data related to the operations  
18680 which may be or may have been performed; see the Base Definitions volume of POSIX.1-2024,  
18681 <sys/shm.h>, <sys/sem.h>, and <sys/msg.h> for their descriptions.

18682 Each of the data structures contains both ownership information and an **ipc\_perm** structure (see  
18683 the Base Definitions volume of POSIX.1-2024, <sys/ipc.h>) which are used in conjunction to  
18684 determine whether or not read/write (read/alter for semaphores) permissions should be  
18685 granted to processes using the IPC facilities. The *mode* member of the **ipc\_perm** structure acts as  
18686 a bit field which determines the permissions.

18687 The values of the bits are given below in octal notation along with the symbolic constants  
18688 defined in <sys/stat.h> that can be used to represent them.

18689 Octal Value	<sys/stat.h> Symbolic Constant	18690 Meaning
18691 0400	S_IRUSR	Read by user.
18692 0200	S_IWUSR	Write (for shared memory & message queues) or 18693 alter (for semaphores) by user.
18694 0040	S_IRGRP	Read by group.
18695 0020	S_IWGRP	Write or alter by group.
18696 0004	S_IROTH	Read by others.
18697 0002	S_IWOTH	Write or alter by others.

18698 The name of the **ipc\_perm** structure is *shm\_perm*, *sem\_perm*, or *msg\_perm*, depending on which  
18699 service is being used. In each case, read and write/alter permissions shall be granted to a  
18700 process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as  
18701 appropriate):

- 18702 • The process has appropriate privileges.
- 18703 • The effective user ID of the process matches *xxx\_perm.cuid* or *xxx\_perm.uid* in the data
- 18704 structure associated with the IPC identifier, and the appropriate bit of the *user* field in
- 18705 *xxx\_perm.mode* is set.
- 18706 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* but the
- 18707 effective group ID of the process matches *xxx\_perm.cgid* or *xxx\_perm.gid* in the data
- 18708 structure associated with the IPC identifier, and the appropriate bit of the *group* field in
- 18709 *xxx\_perm.mode* is set.
- 18710 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* and the
- 18711 effective group ID of the process does not match *xxx\_perm.cgid* or *xxx\_perm.gid* in the data
- 18712 structure associated with the IPC identifier, but the appropriate bit of the *other* field in
- 18713 *xxx\_perm.mode* is set.
- 18714 Otherwise, the permission shall be denied.
- 18715 In addition to the **ipc\_perm** structure, each associated data structure includes several **time\_t**
- 18716 fields for recording timestamps of particular operations. When an operation is described as
- 18717 setting a timestamp to the current time, that particular timestamp member of the associated data
- 18718 structure shall be set to the largest **time\_t** value which is not greater than the current time.

## 18719 2.8 Realtime

18720 This section defines functions to support the source portability of applications with realtime  
 18721 requirements. The presence of some of these functions is dependent on support for  
 18722 implementation options described in the text.

18723 The specific functional areas included in this section and their scope include the following. Full  
 18724 definitions of these terms can be found in XBD [Chapter 3](#) (on page 31).

- 18725 • Semaphores
- 18726 • Process Memory Locking
- 18727 • Memory Mapped Files and Shared Memory Objects
- 18728 • Priority Scheduling
- 18729 • Realtime Signal Extension
- 18730 • Timers
- 18731 • Interprocess Communication
- 18732 • Synchronized Input and Output
- 18733 • Asynchronous Input and Output

18734 All the realtime functions defined in this volume of POSIX.1-2024 are portable, although some of  
 18735 the numeric parameters used by an implementation may have hardware dependencies.

18736 **2.8.1 Realtime Signals**18737 See [Section 2.4.2](#) (on page 515).18738 **2.8.2 Asynchronous I/O**

18739 An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O  
 18740 functions. It is defined in the Base Definitions volume of POSIX.1-2024, **<aio.h>** and has at least  
 18741 the following members:

Member Type	Member Name	Description
<b>int</b>	<i>aio_fildes</i>	File descriptor.
<b>off_t</b>	<i>aio_offset</i>	File offset.
<b>volatile void*</b>	<i>aio_buf</i>	Location of buffer.
<b>size_t</b>	<i>aio_nbytes</i>	Length of transfer.
<b>int</b>	<i>aio_reqprio</i>	Request priority offset.
<b>struct sigevent</b>	<i>aio_sigevent</i>	Signal number and value.
<b>int</b>	<i>aio_lio_opcode</i>	Operation to be performed.

18750 The *aio\_fildes* element is the file descriptor on which the asynchronous operation is performed.

18751 If `O_APPEND` is not set for the file descriptor *aio\_fildes* and if *aio\_fildes* is associated with a  
 18752 device that is capable of seeking, then the requested operation takes place at the absolute  
 18753 position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to the  
 18754 operation with an *offset* argument equal to *aio\_offset* and a *whence* argument equal to `SEEK_SET`.  
 18755 If `O_APPEND` is set for the file descriptor, or if *aio\_fildes* is associated with a device that is  
 18756 incapable of seeking, write operations append to the file in the same order as the calls were  
 18757 made, with the following exception: under implementation-defined circumstances, such as  
 18758 operation on a multi-processor or when requests of differing priorities are submitted at the same  
 18759 time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming  
 18760 application to determine whether this relaxation applies, all strictly conforming applications  
 18761 which rely on ordering of output shall be written in such a way that they operate correctly if the  
 18762 relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value  
 18763 of the file offset for the file is unspecified. The *aio\_nbytes* and *aio\_buf* elements are the same as the  
 18764 *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

18765 If `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, then  
 18766 asynchronous I/O is queued in priority order, with the priority of each asynchronous operation  
 18767 based on the current scheduling priority of the calling process. The *aio\_reqprio* member can be  
 18768 used to lower (but not raise) the asynchronous I/O operation priority and is within the range  
 18769 zero through `{AIO_PRIO_DELTA_MAX}`, inclusive. Unless both `_POSIX_PRIORITIZED_IO` and  
 18770 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing asynchronous I/O  
 18771 requests is unspecified. When both `_POSIX_PRIORITIZED_IO` and  
 18772 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing of requests submitted  
 18773 by processes whose schedulers are not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is  
 18774 unspecified. The priority of an asynchronous request is computed as (process scheduling  
 18775 priority) minus *aio\_reqprio*. The priority assigned to each asynchronous I/O request is an  
 18776 indication of the desired order of execution of the request relative to other asynchronous I/O  
 18777 requests for this file. If `_POSIX_PRIORITIZED_IO` is defined, requests issued with the same  
 18778 priority to a character special file are processed by the underlying device in FIFO order; the  
 18779 order of processing of requests of the same priority issued to files that are not character special  
 18780 files is unspecified. Numerically higher priority values indicate requests of higher priority. The  
 18781 value of *aio\_reqprio* has no effect on process scheduling priority. When prioritized asynchronous  
 18782 I/O requests to the same file are blocked waiting for a resource required for that I/O operation,

18783 the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests  
 18784 are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is  
 18785 implementation-defined. If `_POSIX_PRIORITIZED_IO` is defined, the implementation shall  
 18786 define for which files I/O prioritization is supported.

18787 The `aiio_sigevent` determines how the calling process shall be notified upon I/O completion, as  
 18788 specified in Section 2.4.1 (on page 513). If `aiio_sigevent.sigev_notify` is `SIGEV_NONE`, then no  
 18789 signal shall be posted upon I/O completion, but the error status for the operation and the return  
 18790 status for the operation shall be set appropriately.

18791 The `aiio_lio_opcode` field is used only by the `lio_listio()` call. The `lio_listio()` call allows multiple  
 18792 asynchronous I/O operations to be submitted at a single time. The function takes as an  
 18793 argument an array of pointers to `aiocb` structures. Each `aiocb` structure indicates the operation to  
 18794 be performed (read or write) via the `aiio_lio_opcode` field.

18795 The address of the `aiocb` structure is used as a handle for retrieving the error status and return  
 18796 status of the asynchronous operation while it is in progress.

18797 The `aiocb` structure and the data buffers associated with the asynchronous I/O operation are  
 18798 being used by the system for asynchronous I/O while, and only while, the error status of the  
 18799 asynchronous operation is equal to `[EINPROGRESS]`. Applications shall not modify the `aiocb`  
 18800 structure while the structure is being used by the system for asynchronous I/O.

18801 The return status of the asynchronous operation is the number of bytes transferred by the I/O  
 18802 operation. If the error status is set to indicate an error completion, then the return status is set to  
 18803 the return value that the corresponding `read()`, `write()`, or `fsync()` call would have returned.  
 18804 When the error status is not equal to `[EINPROGRESS]`, the return status shall reflect the return  
 18805 status of the corresponding synchronous operation.

## 18806 2.8.3 Memory Management

### 18807 2.8.3.1 Memory Locking

18808 MLR Range memory locking operations are defined in terms of pages. Implementations may restrict  
 18809 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,  
 18810 is the value of the configurable system variable `{PAGESIZE}`. If an implementation has no  
 18811 restrictions on size or alignment, it may specify a 1-byte page size.

18812 ML|MLR Memory locking guarantees the residence of portions of the address space. It is implementation-  
 18813 defined whether locking memory guarantees fixed translation between virtual addresses (as  
 18814 seen by the process) and physical addresses. Per-process memory locks are not inherited across a  
 18815 `fork()`, and all memory locks owned by a process are unlocked upon `exec` or process termination.  
 18816 Unmapping of an address range removes any memory locks established on that address range  
 18817 by this process.

### 18818 2.8.3.2 Memory Mapped Files

18819 Range memory mapping operations are defined in terms of pages. Implementations may  
 18820 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,  
 18821 in bytes, is the value of the configurable system variable `{PAGESIZE}`. If an implementation has  
 18822 no restrictions on size or alignment, it may specify a 1-byte page size.

18823 Memory mapped files provide a mechanism that allows a process to access files by directly

18824 incorporating file data into its address space. Once a file is mapped into a process address space,  
 18825 the data can be manipulated as memory. If more than one process maps a file, its contents are  
 18826 shared among them. If the mappings allow shared write access, then data written into the  
 18827 memory object through the address space of one process appears in the address spaces of all  
 18828 processes that similarly map the same portion of the memory object.

18829 SHM Shared memory objects are named regions of storage that may be independent of the file system  
 18830 and can be mapped into the address space of one or more processes to allow them to share the  
 18831 associated memory.

18832 SHM An *unlink()* of a file or *shm\_unlink()* of a shared memory object, while causing the removal of  
 18833 the name, does not unmap any mappings established for the object. Once the name has been  
 18834 removed, the contents of the memory object are preserved as long as it is referenced. The  
 18835 memory object remains referenced as long as a process has the memory object open or has some  
 18836 area of the memory object mapped.

### 18837 2.8.3.3 Memory Protection

18838 When an object is mapped, various application accesses to the mapped region may result in  
 18839 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and  
 18840 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 18841 • A mapping may be restricted to disallow some types of access.
- 18842 • Write attempts to memory that was mapped without write access, or any access to  
 18843 memory mapped PROT\_NONE, shall result in a SIGSEGV signal.
- 18844 • References to unmapped addresses shall result in a SIGSEGV signal.
- 18845 • Reference to whole pages within the mapping, but beyond the current length of the object,  
 18846 shall result in a SIGBUS signal.
- 18847 • The size of the object is unaffected by access beyond the end of the object (even if a  
 18848 SIGBUS is not generated).

### 18849 2.8.3.4 Typed Memory Objects

18850 TYM The functionality described in this section shall be provided on implementations that support  
 18851 the Typed Memory Objects option (and the rest of this section is not further shaded for this  
 18852 option).

18853 Implementations may support the Typed Memory Objects option independently of support for  
 18854 memory mapped files or shared memory objects. Typed memory objects are implementation-  
 18855 configurable named storage pools accessible from one or more processors in a system, each via  
 18856 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid  
 18857 combination of a storage pool and a port is identified through a name that is defined at system  
 18858 configuration time, in an implementation-defined manner; the name may be independent of the  
 18859 file system. Using this name, a typed memory object can be opened and mapped into process  
 18860 address space. For a given storage pool and port, it is necessary to support both dynamic  
 18861 allocation from the pool as well as mapping at an application-supplied offset within the pool;  
 18862 when dynamic allocation has been performed, subsequent deallocation shall be supported.  
 18863 Lastly, accessing typed memory objects from different ports requires a method for obtaining the  
 18864 offset and length of contiguous storage of a region of typed memory (dynamically allocated or  
 18865 not); this allows typed memory to be shared among processes and/or processors while being  
 18866 accessed from the desired port.

**18867 2.8.4 Process Scheduling**

18868 PS The functionality described in this section shall be provided on implementations that support  
18869 the Process Scheduling option (and the rest of this section is not further shaded for this option).

**18870 Scheduling Policies**

18871 The scheduling semantics described in this volume of POSIX.1-2024 are defined in terms of a  
18872 conceptual model that contains a set of thread lists. No implementation structures are  
18873 necessarily implied by the use of this conceptual model. It is assumed that no time elapses  
18874 during operations described using this model, and therefore no simultaneous operations are  
18875 possible. This model discusses only processor scheduling for runnable threads, but it should be  
18876 noted that greatly enhanced predictability of realtime applications results if the sequencing of  
18877 other resources takes processor scheduling policy into account.

18878 There is, conceptually, one thread list for each priority. A runnable thread shall be on the thread  
18879 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty  
18880 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose  
18881 of a scheduling policy is to define the allowable operations on this set of lists (for example,  
18882 moving threads between and within lists).

18883 The POSIX model treats a "process" as an aggregation of system resources, including one or  
18884 more threads that may be scheduled by the operating system on the processor(s) it controls.  
18885 Although a process has its own set of scheduling attributes, these have an indirect effect (if any)  
18886 on the scheduling behavior of individual threads as described below.

18887 Each thread shall be controlled by an associated scheduling policy and priority. These  
18888 parameters may be specified by explicit application execution of the *pthread\_setschedparam()*  
18889 function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may  
18890 be changed by application execution of the *pthread\_setschedprio()* function.

18891 Each process shall be controlled by an associated scheduling policy and priority. These  
18892 parameters may be specified by explicit application execution of the *sched\_setscheduler()* or  
18893 *sched\_setparam()* functions.

18894 The effect of the process scheduling attributes on individual threads in the process is dependent  
18895 on the scheduling contention scope of the threads (see [Section 2.9.4](#), on page 540):

- 18896 • For threads with system scheduling contention scope, the process scheduling attributes  
18897 shall have no effect on the scheduling attributes or behavior either of the thread or an  
18898 underlying kernel scheduling entity dedicated to that thread.
- 18899 • For threads with process scheduling contention scope, the process scheduling attributes  
18900 shall have no effect on the scheduling attributes of the thread. However, any underlying  
18901 kernel scheduling entity used by these threads shall at all times behave as specified by the  
18902 scheduling attributes of the containing process, and this behavior may affect the  
18903 scheduling behavior of the process contention scope threads. For example, a process  
18904 contention scope thread with scheduling policy *SCHED\_FIFO* and the system maximum  
18905 priority *H* (the value returned by *sched\_get\_priority\_max(SCHED\_FIFO)*) in a process with  
18906 scheduling policy *SCHED\_RR* and system minimum priority *L* (the value returned by  
18907 *sched\_get\_priority\_min(SCHED\_RR)*) shall be subject to timeslicing and to preemption by  
18908 any thread with an effective priority higher than *L*.

18909 Associated with each policy is a priority range. Each policy definition shall specify the minimum  
18910 priority range for that policy. The priority ranges for each policy may but need not overlap the  
18911 priority ranges of other policies.

18912 A conforming implementation shall select the thread that is defined as being at the head of the

18913 highest priority non-empty thread list to become a running thread, regardless of its associated  
18914 policy. This thread is then removed from its thread list.

18915 Four scheduling policies are specifically required. Other implementation-defined scheduling  
18916 policies may be defined. The following symbols are defined in the Base Definitions volume of  
18917 POSIX.1-2024, <**sched.h**>:

18918 SCHED\_FIFO First in, first out (FIFO) scheduling policy.

18919 SCHED\_RR Round robin scheduling policy.

18920 SS SCHED\_SPORADIC Sporadic server scheduling policy.

18921 SCHED\_OTHER Another scheduling policy.

18922 The values of these symbols shall be distinct.

### 18923 SCHED\_FIFO

18924 Conforming implementations shall include a scheduling policy called the FIFO scheduling  
18925 policy.

18926 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its  
18927 threads have been on the list without being executed; generally, the head of the list is the thread  
18928 that has been on the list the longest time, and the tail is the thread that has been on the list the  
18929 shortest time.

18930 Under the SCHED\_FIFO policy, the modification of the definitional thread lists is as follows:

- 18931 1. When a running thread becomes a preempted thread, it becomes the head of the thread  
18932 list for its priority.
- 18933 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list  
18934 for its priority.
- 18935 3. When a running thread calls the *sched\_setscheduler()* function, the process specified in the  
18936 function call is modified to the specified policy and the priority specified by the *param*  
18937 argument.
- 18938 4. When a running thread calls the *sched\_setparam()* function, the priority of the process  
18939 specified in the function call is modified to the priority specified by the *param* argument.
- 18940 5. When a running thread calls the *pthread\_setschedparam()* function, the thread specified in  
18941 the function call is modified to the specified policy and the priority specified by the *param*  
18942 argument.
- 18943 6. When a running thread calls the *pthread\_setschedprio()* function, the thread specified in the  
18944 function call is modified to the priority specified by the *prio* argument.
- 18945 7. If a thread whose policy or priority has been modified other than by *pthread\_setschedprio()*  
18946 is a running thread or is runnable, it then becomes the tail of the thread list for its new  
18947 priority.
- 18948 8. If a thread whose priority has been modified by *pthread\_setschedprio()* is a running thread  
18949 or is runnable, the effect on its position in the thread list depends on the direction of the  
18950 modification, as follows:
  - 18951 a. If the priority is raised, the thread becomes the tail of the thread list.
  - 18952 b. If the priority is unchanged, the thread does not change position in the thread list.

- 18953 c. If the priority is lowered, the thread becomes the head of the thread list.
- 18954 9. When a running thread issues the *sched\_yield()* or *thrd\_yield()* function, the thread
- 18955 becomes the tail of the thread list for its priority.
- 18956 10. At no other time is the position of a thread with this scheduling policy within the thread
- 18957 lists affected.

18958 While a thread is executing at a temporarily elevated priority as a consequence of owning a

18959 mutex initialized with the PTHREAD\_PRIO\_INHERIT or PTHREAD\_PRIO\_PROTECT protocol

18960 (see *pthread\_mutexattr\_getprotocol()*), the effects of the above requirements on thread priority

18961 shall apply only to the thread's normal priority, not to its elevated priority, and those of the

18962 above requirements that describe the thread being placed on any thread list as a result of a

18963 priority change shall not apply. Likewise, when such a thread reverts to its normal priority as a

18964 consequence of unlocking such a mutex, those of the above requirements that describe the

18965 thread being placed on any thread list as a result of a priority change shall not apply.

18966 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*

18967 and *sched\_get\_priority\_min()* functions when SCHED\_FIFO is provided as the parameter.

18968 Conforming implementations shall provide a priority range of at least 32 priorities for this

18969 policy.

## 18970 SCHED\_RR

18971 Conforming implementations shall include a scheduling policy called the "round robin"

18972 scheduling policy. This policy shall be identical to the SCHED\_FIFO policy with the additional

18973 condition that when the implementation detects that a running thread has been executing as a

18974 running thread for a time period of the length returned by the *sched\_rr\_get\_interval()* function or

18975 longer, the thread shall become the tail of its thread list and the head of that thread list shall be

18976 removed and made a running thread.

18977 The effect of this policy is to ensure that if there are multiple SCHED\_RR threads at the same

18978 priority, one of them does not monopolize the processor. An application should not rely only on

18979 the use of SCHED\_RR to ensure application progress among multiple threads if the application

18980 includes threads using the SCHED\_FIFO policy at the same or higher priority levels or

18981 SCHED\_RR threads at a higher priority level.

18982 A thread under this policy that is preempted and subsequently resumes execution as a running

18983 thread completes the unexpired portion of its round robin interval time period.

18984 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*

18985 and *sched\_get\_priority\_min()* functions when SCHED\_RR is provided as the parameter.

18986 Conforming implementations shall provide a priority range of at least 32 priorities for this

18987 policy.

## 18988 SCHED\_SPORADIC

18989 SS|TSP The functionality described in this section shall be provided on implementations that support

18990 the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not

18991 further shaded for these options).

18992 If `_POSIX_SPORADIC_SERVER` or `_POSIX_THREAD_SPORADIC_SERVER` is defined, the

18993 implementation shall include a scheduling policy identified by the value SCHED\_SPORADIC.

18994 The sporadic server policy is based primarily on two time parameters: the replenishment period

18995 and the available execution capacity. The replenishment period is given by the

18996 *sched\_ss\_repl\_period* member of the **sched\_param** structure. The available execution capacity is

18997 initialized to the value given by the *sched\_ss\_init\_budget* member of the same parameter. The

18998 sporadic server policy is identical to the SCHED\_FIFO policy with some additional conditions  
 18999 that cause the thread's assigned priority to be switched between the values specified by the  
 19000 *sched\_priority* and *sched\_ss\_low\_priority* members of the **sched\_param** structure.

19001 The priority assigned to a thread using the sporadic server scheduling policy is determined in  
 19002 the following manner: if the available execution capacity is greater than zero and the number of  
 19003 pending replenishment operations is strictly less than *sched\_ss\_max\_repl*, the thread is assigned  
 19004 the priority specified by *sched\_priority*; otherwise, the assigned priority shall be  
 19005 *sched\_ss\_low\_priority*. If the value of *sched\_priority* is less than or equal to the value of  
 19006 *sched\_ss\_low\_priority*, the results are undefined. When active, the thread shall belong to the  
 19007 thread list corresponding to its assigned priority level, according to the mentioned priority  
 19008 assignment. The modification of the available execution capacity and, consequently of the  
 19009 assigned priority, is done as follows:

- 19010 1. When the thread at the head of the *sched\_priority* list becomes a running thread, its  
 19011 execution time shall be limited to at most its available execution capacity, plus the  
 19012 resolution of the execution time clock used for this scheduling policy. This resolution shall  
 19013 be implementation-defined.
- 19014 2. Each time the thread is inserted at the tail of the list associated with *sched\_priority*—  
 19015 because as a blocked thread it became runnable with priority *sched\_priority* or because a  
 19016 replenishment operation was performed—the time at which this operation is done is  
 19017 posted as the *activation\_time*.
- 19018 3. When the running thread with assigned priority equal to *sched\_priority* becomes a  
 19019 preempted thread, it becomes the head of the thread list for its priority, and the execution  
 19020 time consumed is subtracted from the available execution capacity. If the available  
 19021 execution capacity would become negative by this operation, it shall be set to zero.
- 19022 4. When the running thread with assigned priority equal to *sched\_priority* becomes a blocked  
 19023 thread, the execution time consumed is subtracted from the available execution capacity,  
 19024 and a replenishment operation is scheduled, as described in 6 and 7. If the available  
 19025 execution capacity would become negative by this operation, it shall be set to zero.
- 19026 5. When the running thread with assigned priority equal to *sched\_priority* reaches the limit  
 19027 imposed on its execution time, it becomes the tail of the thread list for  
 19028 *sched\_ss\_low\_priority*, the execution time consumed is subtracted from the available  
 19029 execution capacity (which becomes zero), and a replenishment operation is scheduled, as  
 19030 described in 6 and 7.
- 19031 6. Each time a replenishment operation is scheduled, the amount of execution capacity to be  
 19032 replenished, *replenish\_amount*, is set equal to the execution time consumed by the thread  
 19033 since the *activation\_time*. The replenishment is scheduled to occur at *activation\_time* plus  
 19034 *sched\_ss\_repl\_period*. If the scheduled time obtained is before the current time, the  
 19035 replenishment operation is carried out immediately. Several replenishment operations  
 19036 can be pending at the same time, each of which shall be serviced at its respective  
 19037 scheduled time. With the above rules, the number of replenishment operations  
 19038 simultaneously pending for a given thread that is scheduled under the sporadic server  
 19039 policy shall not be greater than *sched\_ss\_max\_repl*.
- 19040 7. A replenishment operation consists of adding the corresponding *replenish\_amount* to the  
 19041 available execution capacity at the scheduled time. If, as a consequence of this operation,  
 19042 the execution capacity would become larger than *sched\_ss\_initial\_budget*, it shall be  
 19043 rounded down to a value equal to *sched\_ss\_initial\_budget*. Additionally, if the thread was  
 19044 runnable or running, and had assigned priority equal to *sched\_ss\_low\_priority*, then it  
 19045 becomes the tail of the thread list for *sched\_priority*.

19046 Execution time is defined in XBD [Section 3.90](#) (on page 44).  
 19047 For this policy, changing the value of a CPU-time clock via `clock_settime()` shall have no effect on  
 19048 its behavior.  
 19049 For this policy, valid priorities shall be within the range returned by the `sched_get_priority_min()`  
 19050 and `sched_get_priority_max()` functions when `SCHED_SPORADIC` is provided as the parameter.  
 19051 Conforming implementations shall provide a priority range of at least 32 distinct priorities for  
 19052 this policy.  
 19053 If the scheduling policy of the target process is either `SCHED_FIFO` or `SCHED_RR`, the  
 19054 `sched_ss_low_priority`, `sched_ss_repl_period`, and `sched_ss_init` budget members of the `param`  
 19055 argument shall have no effect on the scheduling behavior. If the scheduling policy of this process  
 19056 is not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC`, the effects of these members are  
 19057 implementation-defined; this case includes the `SCHED_OTHER` policy.

19058 **SCHED\_OTHER**

19059 Conforming implementations shall include one scheduling policy identified as `SCHED_OTHER`  
 19060 (which may execute identically with either the FIFO or round robin scheduling policy). The  
 19061 effect of scheduling threads with the `SCHED_OTHER` policy in a system in which other threads  
 19062 SS are executing under `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is implementation-  
 19063 defined.  
 19064 This policy is defined to allow strictly conforming applications to be able to indicate in a  
 19065 portable manner that they no longer need a realtime scheduling policy.  
 19066 For threads executing under this policy, the implementation shall use only priorities within the  
 19067 range returned by the `sched_get_priority_max()` and `sched_get_priority_min()` functions when  
 19068 `SCHED_OTHER` is provided as the parameter.

19069 **2.8.5 Clocks and Timers**

19070 The `<time.h>` header defines the types and manifest constants used by the timing facility.

19071 **Time Value Specification Structures**

19072 Many of the timing facility functions accept or return time value specifications. A time value  
 19073 structure `timespec` specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
<code>time_t</code>	<code>tv_sec</code>	Seconds.
<code>long</code>	<code>tv_nsec</code>	Nanoseconds.

19077 The `tv_nsec` member is only valid if greater than or equal to zero, and less than the number of  
 19078 nanoseconds in a second (1 000 million). The time interval described by this structure is  $(tv\_sec * 10^9 + tv\_nsec)$  nanoseconds.  
 19079

19080 A time value structure `itimerspec` specifies an initial timer value and a repetition interval for use  
 19081 by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
<code>struct timespec</code>	<code>it_interval</code>	Timer period.
<code>struct timespec</code>	<code>it_value</code>	Timer expiration.

19085 If the value described by `it_value` is non-zero, it indicates the time to or time of the next timer  
 19086 expiration (for relative and absolute timer values, respectively). If the value described by `it_value`

19087 is zero, the timer shall be disarmed.

19088 If the value described by *it\_interval* is non-zero, it specifies an interval which shall be used in  
 19089 reloading the timer when it expires; that is, a periodic timer is specified. If the value described  
 19090 by *it\_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is  
 19091 specified.

### 19092 **Timer Event Notification Control Block**

19093 Per-process timers may be created that notify the process of timer expirations by queuing a  
 19094 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of  
 19095 POSIX.1-2024, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the  
 19096 signal number and an application-specific data value which shall be used when notifying the  
 19097 calling process of timer expiration events.

### 19098 **Manifest Constants**

19099 The following constants are defined in the Base Definitions volume of POSIX.1-2024, **<time.h>**:

19100 **CLOCK\_REALTIME** The identifier for the system-wide realtime clock.

19101 **TIMER\_ABSTIME** Flag indicating time is absolute with respect to the clock associated  
 19102 with a timer.

19103 **CLOCK\_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined  
 19104 as a clock whose value cannot be set via *clock\_settime()* and which  
 19105 cannot have backward clock jumps. The maximum possible clock  
 19106 jump is implementation-defined.

19107 The maximum allowable resolution for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC** clocks  
 19108 and all time services based on these clocks is represented by **{\_POSIX\_CLOCKRES\_MIN}** and  
 19109 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of  
 19110 resolution for these clocks to provide finer granularity time bases. The actual resolution  
 19111 supported by an implementation for a specific clock is obtained using the *clock\_getres()* function.  
 19112 If the actual resolution supported for a time service based on one of these clocks differs from the  
 19113 resolution supported for that clock, the implementation shall document this difference.

19114 The minimum allowable maximum value for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC**  
 19115 clocks and all absolute time services based on them is the same as that defined by the ISO C  
 19116 standard for the **time\_t** type. If the maximum value supported by a time service based on one of  
 19117 these clocks differs from the maximum value supported by that clock, the implementation shall  
 19118 document this difference.

### 19119 **Execution Time Monitoring**

19120 CPT If **\_POSIX\_CPUTIME** is defined, process CPU-time clocks shall be supported in addition to the  
 19121 clocks described in [Manifest Constants](#).

19122 TCT If **\_POSIX\_THREAD\_CPUTIME** is defined, thread CPU-time clocks shall be supported.

19123 CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in XBD [Section 3.90](#) (on page  
 19124 44). The mechanism used to measure execution time is described in XBD [Section 4.14](#) (on page  
 19125 99).

19126 CPT If **\_POSIX\_CPUTIME** is defined, the following constant of the type **clockid\_t** is defined in  
 19127 **<time.h>**:

19128 **CLOCK\_PROCESS\_CPUTIME\_ID**  
 19129 When this value of the type **clockid\_t** is used in a *clock()* or *timer\*()* function call, it is  
 19130 interpreted as the identifier of the CPU-time clock associated with the process making the  
 19131 function call.

19132 TCT If **\_POSIX\_THREAD\_CPUTIME** is defined, the following constant of the type **clockid\_t** is  
 19133 defined in **<time.h>**:

19134 **CLOCK\_THREAD\_CPUTIME\_ID**  
 19135 When this value of the type **clockid\_t** is used in a *clock()* or *timer\*()* function call, it is  
 19136 interpreted as the identifier of the CPU-time clock associated with the thread making the  
 19137 function call.

## 19138 2.9 Threads

19139 This section defines functionality to support multiple flows of control, called “threads”, within a  
 19140 process. For the definition of threads, see XBD [Section 3.388](#) (on page 88).

19141 The specific functional areas covered by threads and their scope include:

- 19142 • Thread management: the creation, control, and termination of multiple flows of control in  
 19143 the same process under the assumption of a common shared address space
- 19144 • Synchronization primitives optimized for tightly coupled operation of multiple control  
 19145 flows in a common, shared address space

### 19146 2.9.1 Thread-Safety

19147 All functions defined by this volume of POSIX.1-2024 shall be thread-safe, except that the  
 19148 following functions<sup>8</sup> need not be thread-safe.

---

19149 8. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

19150	<i>asctime()</i>	<i>endutxent()</i>	<i>getservent()</i>	<i>putenv()</i>
19151	<i>atomic_init()</i>	<i>getdate()</i>	<i>getutxent()</i>	<i>pututxline()</i>
19152	<i>catgets()</i>	<i>getgrent()</i>	<i>getutxid()</i>	<i>rand()</i>

19169 The *ctermid()* and *tmpnam()* functions need not be thread-safe if passed a null pointer argument.  
 19170 The *c16rtomb()*, *c32rtomb()*, *mbrlen()*, *mbrtoc16()*, *mbrtoc32()*, *mbrtowc()*, *mbsnrtoombs()*,  
 19171 *mbsrtombs()*, *wcrtomb()*, *wcsnrtoombs()*, and *wcsrtombs()* functions need not be thread-safe if  
 19172 passed a null *ps* argument. The *lgamma()*, *lgammaf()*, and *lgammal()* functions shall be thread-  
 19173 safe **except that they need not avoid data races when storing a value in the *signgam* variable.**  
 19174 The *getc\_unlocked()*, *getchar\_unlocked()*, *putc\_unlocked()*, and *putchar\_unlocked()* functions need  
 19175 not be thread-safe unless the invoking thread owns the (**FILE \***) object accessed by the call, as is  
 19176 the case after a successful call to the *flockfile()* or *ftrylockfile()* functions. The *readdir()* function  
 19177 need not be thread-safe if concurrent calls are made for the same directory stream.

19178 Some functions that are not required to be thread-safe are nevertheless required to avoid data  
 19179 races with either all or some other functions, as specified on their individual reference pages.

19180 Implementations shall provide internal synchronization as necessary in order to satisfy thread-  
 19181 safety requirements.

19182 Since multi-threaded applications are not allowed to use the *environ* variable to access or modify  
 19183 any environment variable while any other thread is concurrently modifying any environment  
 19184 variable, the *getenv()* and *secure\_getenv()* functions and any function dependent on any  
 19185 environment variable are not thread-safe if another thread modifies the environment; see XSH  
 19186 *exec* (on page 866).

## 19187 2.9.2 Thread IDs

19188 Although implementations may have thread IDs that are unique in a system, applications  
 19189 should only assume that thread IDs are usable and unique within a single process. The effect of  
 19190 calling any of the functions defined in this volume of POSIX.1-2024 and passing as an argument  
 19191 the thread ID of a thread from another process is unspecified. The lifetime of a thread ID ends  
 19192 after the later of thread termination (see [Section 3.392](#), on page 89) and the point when the  
 19193 thread is no longer joinable (see [Section 3.183](#), on page 58). A conforming implementation is free  
 19194 to reuse a thread ID after its lifetime has ended. If an application attempts to use a thread ID  
 19195 whose lifetime has ended, the behavior is undefined.

19196 If a thread is detached, its thread ID is invalid for use as an argument in a call to  
 19197 *pthread\_detach()*, *pthread\_join()*, *thrd\_detach()*, or *thrd\_join()*.

19198 **2.9.3 Thread Mutexes**

19199 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same  
 19200 processing resources from eventually making forward progress in its execution. Eligibility for  
 19201 processing resources is determined by the scheduling policy.

19202 A thread shall become the owner of a mutex, *m*, of type **pthread\_mutex\_t** when one of the  
 19203 following occurs:

- 19204 • It calls *pthread\_mutex\_clocklock()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_timedlock()*, or  
 19205 *pthread\_mutex\_trylock()* with *m* as the *mutex* argument and the call returns zero or  
 19206 [EOWNERDEAD].
- 19207 • It calls *pthread\_mutex\_setprioceiling()* with *m* as the *mutex* argument and the call returns  
 19208 [EOWNERDEAD].
- 19209 • It calls *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or *pthread\_cond\_wait()* with *m* as  
 19210 the *mutex* argument and the call returns zero or certain error numbers (see  
 19211 *pthread\_cond\_clockwait()*).

19212 The thread shall remain the owner of *m* until one of the following occurs:

- 19213 • It executes *pthread\_mutex\_unlock()* with *m* as the *mutex* argument
- 19214 • It blocks in a call to *pthread\_cond\_clockwait()*, *pthread\_cond\_timedwait()*, or  
 19215 *pthread\_cond\_wait()* with *m* as the *mutex* argument.

19216 A thread shall become the owner of a mutex, *m*, of type **mtx\_t** when one of the following occurs:

- 19217 • It calls *mtx\_lock()* with *m* as the *mtx* argument and the call returns `thrd_success`.
- 19218 • It calls *mtx\_trylock()* with *m* as the *mtx* argument and the call returns `thrd_success`.
- 19219 • It calls *mtx\_timedlock()* with *m* as the *mtx* argument and the call returns `thrd_success`.
- 19220 • It calls *cond\_wait()* with *m* as the *mtx* argument and the call returns `thrd_success`.
- 19221 • It calls *cond\_timedwait()* with *m* as the *mtx* argument and the call returns `thrd_success` or  
 19222 `thrd_timedout`.

19223 The thread shall remain the owner of *m* until one of the following occurs:

- 19224 • It executes *mtx\_unlock()* with *m* as the *mtx* argument.
- 19225 • It blocks in a call to *cond\_wait()* with *m* as the *mtx* argument.
- 19226 • It blocks in a call to *cond\_timedwait()* with *m* as the *mtx* argument.

19227 The implementation shall behave as if at all times there is at most one owner of any mutex.

19228 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex  
 19229 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have  
 19230 “released” the mutex and the mutex is said to have become “unlocked”.

19231 A problem can occur if a process terminates while one of its threads holds a mutex lock.  
 19232 Depending on the mutex type, it might be possible for another thread to unlock the mutex and  
 19233 recover the state of the mutex. However, it is difficult to perform this recovery reliably.

19234 Robust mutexes provide a means to enable the implementation to notify other threads in the  
 19235 event of a process terminating while one of its threads holds a lock on a mutex of type  
 19236 **pthread\_mutex\_t**. The next thread that acquires the mutex is notified about the termination by  
 19237 the return value [EOWNERDEAD] from the locking function. The notified thread can then  
 19238 attempt to recover the state protected by the mutex, and if successful mark the state protected by  
 19239 the mutex as consistent by a call to *pthread\_mutex\_consistent()*. If the notified thread is unable to

19240 recover the state, it can declare the state as not recoverable by a call to `pthread_mutex_unlock()`  
19241 without a prior call to `pthread_mutex_consistent()`.

19242 Whether or not the state protected by a mutex can be recovered is dependent solely on the  
19243 application using robust mutexes. The robust mutex support provided in the implementation  
19244 provides notification only that a mutex owner has terminated while holding a lock, or that the  
19245 state of the mutex is not recoverable.

## 19246 2.9.4 Thread Scheduling

19247 TPS The functionality described in this section shall be provided on implementations that support  
19248 the Thread Execution Scheduling option (and the rest of this section is not further shaded for  
19249 this option).

### 19250 Thread Scheduling Attributes

19251 In support of the scheduling function, threads have attributes which are accessed through the  
19252 **pthread\_attr\_t** thread creation attributes object.

19253 The *contentionscope* attribute defines the scheduling contention scope of the thread to be either  
19254 PTHREAD\_SCOPE\_PROCESS or PTHREAD\_SCOPE\_SYSTEM.

19255 The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling  
19256 attributes of the creating thread or to have its scheduling values set according to the other  
19257 scheduling attributes in the **pthread\_attr\_t** object.

19258 The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute  
19259 defines the scheduling parameters for the thread. The interaction of threads having different  
19260 policies within a process is described as part of the definition of those policies.

19261 If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one  
19262 of the priority-based policies defined under this option, the *schedparam* attribute contains the  
19263 scheduling priority of the thread. A conforming implementation ensures that the priority value  
19264 in *schedparam* is in the range associated with the scheduling policy when the thread attributes  
19265 object is used to create a thread, or when the scheduling attributes of a thread are dynamically  
19266 modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

19267 TSP If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four  
19268 new members that are used for the sporadic server scheduling policy. These members are  
19269 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and *sched\_ss\_max\_repl*. The  
19270 meaning of these attributes is the same as in the definitions that appear under [Section 2.8.4](#) (on  
19271 page 531).

19272 When a process is created, its single thread has a scheduling policy and associated attributes  
19273 equal to the policy and attributes of the process. The default scheduling contention scope value  
19274 is implementation-defined. The default values of other scheduling attributes are  
19275 implementation-defined.

## 19276 Thread Scheduling Contention Scope

19277 The scheduling contention scope of a thread defines the set of threads with which the thread  
19278 competes for use of the processing resources. The scheduling operation selects at most one  
19279 thread to execute on each processor at any point in time and the thread's scheduling attributes  
19280 (for example, *priority*), whether under process scheduling contention scope or system scheduling  
19281 contention scope, are the parameters used to determine the scheduling decision.

19282 The scheduling contention scope, in the context of scheduling a mixed scope environment,  
19283 affects threads as follows:

- 19284 • A thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope contends  
19285 for resources with all other threads in the same scheduling allocation domain relative to  
19286 their system scheduling attributes. The system scheduling attributes of a thread created  
19287 with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope are the scheduling  
19288 attributes with which the thread was created. The system scheduling attributes of a thread  
19289 created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope are the  
19290 implementation-defined mapping into system attribute space of the scheduling attributes  
19291 with which the thread was created.
- 19292 • Threads created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope contend  
19293 directly with other threads within their process that were created with  
19294 `PTHREAD_SCOPE_PROCESS` scheduling contention scope. The contention is resolved  
19295 based on the threads' scheduling attributes and policies. It is unspecified how such threads  
19296 are scheduled relative to threads in other processes or threads with  
19297 `PTHREAD_SCOPE_SYSTEM` scheduling contention scope.
- 19298 • Conforming implementations shall support the `PTHREAD_SCOPE_PROCESS` scheduling  
19299 contention scope, the `PTHREAD_SCOPE_SYSTEM` scheduling contention scope, or both.

## 19300 Scheduling Allocation Domain

19301 Implementations shall support scheduling allocation domains containing one or more  
19302 processors. It should be noted that the presence of multiple processors does not automatically  
19303 indicate a scheduling allocation domain size greater than one. Conforming implementations on  
19304 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation  
19305 domains, and could define these scheduling allocation domains on a per-thread, per-process, or  
19306 per-system basis, depending on the types of applications intended to be supported by the  
19307 implementation. The scheduling allocation domain is independent of scheduling contention  
19308 scope, as the scheduling contention scope merely defines the set of threads with which a thread  
19309 contends for processor resources, while scheduling allocation domain defines the set of  
19310 processors for which it contends. The semantics of how this contention is resolved among  
19311 threads for processors is determined by the scheduling policies of the threads.

19312 The choice of scheduling allocation domain size and the level of application control over  
19313 scheduling allocation domains is implementation-defined. Conforming implementations may  
19314 change the size of scheduling allocation domains and the binding of threads to scheduling  
19315 allocation domains at any time.

19316 For application threads with scheduling allocation domains of size equal to one, the scheduling  
19317 rules defined for `SCHED_FIFO` and `SCHED_RR` shall be used; see [Scheduling Policies](#) (on page  
19318 531). All threads with system scheduling contention scope, regardless of the processes in which  
19319 they reside, compete for the processor according to their priorities. Threads with process  
19320 scheduling contention scope compete only with other threads with process scheduling  
19321 contention scope within their process.

19322 For application threads with scheduling allocation domains of size greater than one, the rules

19323 TSP defined for SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC shall be used in an  
 19324 implementation-defined manner. Each thread with system scheduling contention scope  
 19325 competes for the processors in its scheduling allocation domain in an implementation-defined  
 19326 manner according to its priority. Threads with process scheduling contention scope are  
 19327 scheduled relative to other threads within the same scheduling contention scope in the process.

19328 TSP If \_POSIX\_THREAD\_SPORADIC\_SERVER is defined, the rules defined for SCHED\_SPORADIC  
 19329 in [Scheduling Policies](#) (on page 531) shall be used in an implementation-defined manner for  
 19330 application threads whose scheduling allocation domain size is greater than one.

### 19331 Scheduling Documentation

19332 If \_POSIX\_PRIORITY\_SCHEDULING is defined, then any scheduling policies beyond  
 19333 TSP SCHED\_OTHER, SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC, as well as the effects of  
 19334 the scheduling policies indicated by these other values, and the attributes required in order to  
 19335 support such a policy, are implementation-defined. Furthermore, the implementation shall  
 19336 document the effect of all processor scheduling allocation domain values supported for these  
 19337 policies.

## 19338 2.9.5 Thread Cancellation

19339 The thread cancellation mechanism allows a thread to terminate the execution of any other  
 19340 thread in the process, except for threads created using *thrd\_create()*, in a controlled manner. The  
 19341 target thread (that is, the one that is being canceled) is allowed to hold cancellation requests  
 19342 pending in a number of ways and to perform application-specific cleanup processing when the  
 19343 notice of cancellation is acted upon.

19344 Cancellation is controlled by the cancellation control functions. Each thread maintains its own  
 19345 cancelability state. Cancellation may only occur at cancellation points or when the thread is  
 19346 asynchronously cancelable.

19347 The thread cancellation mechanism described in this section depends upon programs having set  
 19348 *deferred* cancelability state, which is specified as the default. Applications shall also carefully  
 19349 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp()*,  
 19350 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary  
 19351 scope pop operation results in undefined behavior.

19352 Use of asynchronous cancelability while holding resources which potentially need to be released  
 19353 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated  
 19354 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

### 19355 2.9.5.1 Cancelability States

19356 The cancelability state of a thread determines the action taken upon receipt of a cancellation  
 19357 request. The thread may control cancellation in a number of ways.

19358 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 19359 1. Cancelability-Enable: When cancelability is PTHREAD\_CANCEL\_DISABLE (as defined  
 19360 in the Base Definitions volume of POSIX.1-2024, [<pthread.h>](#)), cancellation requests  
 19361 against the target thread are held pending. By default, cancelability is set to  
 19362 PTHREAD\_CANCEL\_ENABLE (as defined in [<pthread.h>](#)).
- 19363 2. Cancelability Type: When cancelability is enabled and the cancelability type is  
 19364 PTHREAD\_CANCEL\_ASYNCHRONOUS (as defined in [<pthread.h>](#)), new or pending  
 19365 cancellation requests may be acted upon at any time. When cancelability is enabled and

19366 the cancelability type is PTHREAD\_CANCEL\_DEFERRED (as defined in `<pthread.h>`),  
 19367 cancellation requests are held pending until a cancellation point (see below) is reached. If  
 19368 cancelability is disabled, the setting of the cancelability type has no immediate effect as all  
 19369 cancellation requests are held pending; however, once cancelability is enabled again the  
 19370 new type is in effect. The cancelability type is PTHREAD\_CANCEL\_DEFERRED in all  
 19371 newly created threads including the thread in which `main()` was first invoked.

#### 19372 2.9.5.2 Cancellation Points

19373 Cancellation points shall occur when a thread is executing the following functions:

19374	<code>accept()</code>	<code>msync()</code>	<code>recvfrom()</code>
19375	<code>accept4()</code>	<code>nanosleep()</code>	<code>recvmsg()</code>
19376	<code>aio_suspend()</code>	<code>open()</code>	<code>select()</code>
19377	<code>clock_nanosleep()</code>	<code>openat()</code>	<code>send()</code>
19378	<code>close()</code>	<code>pause()</code>	<code>sendmsg()</code>
19379	<code>cond_timedwait()</code>	<code>poll()</code>	<code>sendto()</code>
19380	<code>cond_wait()</code>	<code>posix_close()</code>	<code>sigsuspend()</code>
19381	<code>connect()</code>	<code>ppoll()</code>	<code>sigtimedwait()</code>
19382	<code>creat()</code>	<code>pread()</code>	<code>sigwait()</code>
19383	<code>fcntl()†</code>	<code>pselect()</code>	<code>sigwaitinfo()</code>
19384	<code>fdatasync()</code>	<code>pthread_cond_clockwait()</code>	<code>sleep()</code>
19385	<code>fsync()</code>	<code>pthread_cond_timedwait()</code>	<code>tcdrain()</code>
19386	<code>lockf()††</code>	<code>pthread_cond_wait()</code>	<code>thrd_join()</code>
19387	<code>mq_receive()</code>	<code>pthread_join()</code>	<code>thrd_sleep()</code>
19388	<code>mq_send()</code>	<code>pthread_testcancel()</code>	<code>wait()</code>
19389	<code>mq_timedreceive()</code>	<code>pwrite()</code>	<code>waitid()</code>
19390	<code>mq_timedsend()</code>	<code>read()</code>	<code>waitpid()</code>
19391	<code>msgrcv()</code>	<code>readv()</code>	<code>write()</code>
19392	<code>msgsnd()</code>	<code>recv()</code>	<code>writew()</code>

19393 A cancellation point may also occur when a thread is executing the following functions:

---

19394 † When the `cmd` argument is `F_SETLKW` or `F_OFD_SETLKW`.

19395 †† When the `function` argument is `F_LOCK`.

19396	<i>access()</i>	<i>endservent()</i>	<i>freopen()</i>
19397	<i>bindtextdomain()</i>	<i>faccessat()</i>	<i>fscanf()</i>
19398	<i>catclose()</i>	<i>fchmod()</i>	<i>fseek()</i>
19399	<i>catopen()</i>	<i>fchmodat()</i>	<i>fseeko()</i>
19400	<i>chmod()</i>	<i>fchown()</i>	<i>fsetpos()</i>
19401	<i>chown()</i>	<i>fchownat()</i>	<i>fstat()</i>
19402	<i>closedir()</i>	<i>fclose()</i>	<i>fstatat()</i>
19403	<i>closelog()</i>	<i>fcntl()†††</i>	<i>ftell()</i>
19404	<i>ctermid()</i>	<i>fflush()</i>	<i>ftello()</i>
19405	<i>dcgettext()</i>	<i>fgetc()</i>	<i>futimens()</i>
19406	<i>dcgettext_l()</i>	<i>fgetpos()</i>	<i>fwprintf()</i>
19407	<i>dcngettext()</i>	<i>fgets()</i>	<i>fwrite()</i>
19408	<i>dcngettext_l()</i>	<i>fgetwc()</i>	<i>fwscanf()</i>
19409	<i>dgettext()</i>	<i>fgetws()</i>	<i>getaddrinfo()</i>
19410	<i>dgettext_l()</i>	<i>fntmsg()</i>	<i>getc()</i>
19411	<i>dlclose()</i>	<i>fopen()</i>	<i>getc_unlocked()</i>
19412	<i>dlopen()</i>	<i>fpathconf()</i>	<i>getchar()</i>
19413	<i>dngettext()</i>	<i>fprintf()</i>	<i>getchar_unlocked()</i>
19414	<i>dngettext_l()</i>	<i>fputc()</i>	<i>getcwd()</i>
19415	<i>dprintf()</i>	<i>fputs()</i>	<i>getdelim()</i>
19416	<i>endhostent()</i>	<i>fputwc()</i>	<i>getgrgid_r()</i>
19417	<i>endnetent()</i>	<i>fputws()</i>	<i>getgrnam_r()</i>
19418	<i>endprotoent()</i>	<i>fread()</i>	<i>gethostid()</i>

---

19441	<i>mkdirat()</i>	<i>putchar()</i>	<i>ungetc()</i>
19442	<i>mkdtemp()</i>	<i>putchar_unlocked()</i>	<i>ungetwc()</i>
19443	<i>mkfifo()</i>	<i>puts()</i>	<i>unlink()</i>
19444	<i>mkfifoat()</i>	<i>putwc()</i>	<i>unlinkat()</i>
19445	<i>mknod()</i>	<i>putwchar()</i>	<i>utimensat()</i>
19446	<i>mknodat()</i>	<i>readdir_r()</i>	<i>utimes()</i>
19447	<i>mkstemp()</i>	<i>readlink()</i>	<i>vdprintf()</i>
19448	<i>mktime()</i>	<i>readlinkat()</i>	<i>vfprintf()</i>
19449	<i>ngettext()</i>	<i>remove()</i>	<i>vfwprintf()</i>
19450	<i>ngettext_l()</i>	<i>rename()</i>	<i>vprintf()</i>
19451	<i>opendir()</i>	<i>renameat()</i>	<i>vwprintf()</i>
19452	<i>openlog()</i>	<i>rewind()</i>	<i>wcsftime()</i>
19453	<i>pathconf()</i>	<i>rewinddir()</i>	<i>wordexp()</i>
19454	<i>perror()</i>	<i>scandir()</i>	<i>wprintf()</i>
19455	<i>popen()</i>	<i>scanf()</i>	<i>wscanf()</i>
19456	<i>posix_devctl()</i>	<i>seekdir()</i>	

19457 In addition, a cancellation point may occur when a thread is executing any function that this  
 19458 standard does not require to be thread-safe but the implementation documents as being thread-  
 19459 safe. If a thread is cancelled while executing a non-thread-safe function, the behavior is  
 19460 undefined.

19461 An implementation shall not introduce cancellation points into any other functions specified in  
 19462 this volume of POSIX.1-2024.

19463 The side-effects of acting upon a cancellation request while suspended during a call of a function  
 19464 are the same as the side-effects that may be seen in a single-threaded program when a call to a  
 19465 function is interrupted by a signal and the given function returns [EINTR]. Any such side-  
 19466 effects occur before any cancellation cleanup handlers are called. For functions that are explicitly  
 19467 required not to return when interrupted (for example, *pclose()*), if a thread is canceled while  
 19468 executing the function, the behavior is undefined.

19469 Whenever a thread has cancelability enabled and a cancellation request has been made with that  
 19470 thread as the target, and the thread then calls any function that is a cancellation point (such as

19471 *pthread\_testcancel()* or *read()*, the cancellation request shall be acted upon before the function  
 19472 returns. If a thread has cancelability enabled and a cancellation request is made with the thread  
 19473 as a target while the thread is suspended at a cancellation point, the thread shall be awakened  
 19474 and the cancellation request shall be acted upon. It is unspecified whether the cancellation  
 19475 request is acted upon or whether the cancellation request remains pending and the thread  
 19476 resumes normal execution if the thread is suspended at a cancellation point and either:

- 19477 • The event for which it is waiting occurs
  - 19478 • A specified timeout expires
- 19479 before the cancellation request is acted upon.

### 19480 2.9.5.3 Thread Cancellation Cleanup Handlers

19481 Each thread that was not created using *thrd\_create()* maintains a list of cancellation cleanup  
 19482 handlers. The programmer uses the *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions  
 19483 to place routines on and remove routines from this list.

19484 When a cancellation request is acted upon, or when a thread calls *pthread\_exit()*, the thread first  
 19485 disables cancellation by setting its cancelability state to `PTHREAD_CANCEL_DISABLE` and its  
 19486 cancelability type to `PTHREAD_CANCEL_DEFERRED`. The cancelability state shall remain set  
 19487 to `PTHREAD_CANCEL_DISABLE` until the thread has terminated. The behavior is undefined if  
 19488 a cancellation cleanup handler or thread-specific data destructor routine changes the  
 19489 cancelability state to `PTHREAD_CANCEL_ENABLE`.

19490 The routines in the thread's list of cancellation cleanup handlers shall be invoked one by one in  
 19491 LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked  
 19492 (First Out). When the cancellation cleanup handler for a scope is invoked, the storage for that  
 19493 scope remains valid. If the last cancellation cleanup handler returns, thread-specific data  
 19494 destructors (if any) associated with thread-specific data keys for which the thread has non-  
 19495 NULL values shall be run, in unspecified order, as described for *pthread\_key\_create()* and  
 19496 *tss\_create()*.

19497 After all cancellation cleanup handlers and thread-specific data destructors have returned,  
 19498 thread execution is terminated. If the thread has terminated because of a call to *pthread\_exit()*,  
 19499 the *value\_ptr* argument is made available to any threads joining with the target. If the thread has  
 19500 terminated by acting on a cancellation request, a status of `PTHREAD_CANCELED` is made  
 19501 available to any threads joining with the target. The symbolic constant `PTHREAD_CANCELED`  
 19502 expands to a constant expression of type `(void *)` whose value matches no pointer to an object in  
 19503 memory nor the value `NULL`.

19504 A side-effect of acting upon a cancellation request while in a condition variable wait is that the  
 19505 mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread  
 19506 is no longer considered to be waiting for the condition and the thread shall not have consumed  
 19507 any pending condition signals on the condition.

19508 A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

### 19509 2.9.5.4 Async-Cancel Safety

19510 The *pthread\_cancel()*, *pthread\_setcancelstate()*, and *pthread\_setcanceltype()* functions are defined to  
 19511 be async-cancel safe.

19512 No other functions in this volume of POSIX.1-2024 are required to be async-cancel-safe.

19513 If a thread has asynchronous cancellation enabled and is cancelled during execution of a

19514 function that is not async-cancel-safe, the behavior is undefined.

19515 If a thread has deferred cancellation enabled, a signal-catching function is called in that thread  
 19516 during execution of a function that is not async-cancel-safe, and the signal-catching function  
 19517 calls any function that is a cancellation point while a cancellation is pending for the thread,  
 19518 without first disabling cancellation, the behavior is undefined.

## 19519 2.9.6 Thread Read-Write Locks

19520 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous  
 19521 read-only access to data while allowing only one thread to have exclusive write access at any  
 19522 given time. They are typically used to protect data that is read more frequently than it is  
 19523 changed.

19524 One or more readers acquire read access to the resource by performing a read lock operation on  
 19525 the associated read-write lock. A writer acquires exclusive write access by performing a write  
 19526 lock operation. Basically, all readers exclude any writers and a writer excludes all readers and  
 19527 any other writers.

19528 A thread that has blocked on a read-write lock (for example, has not yet returned from a  
 19529 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_wrlock()* call) shall not prevent any unblocked thread  
 19530 that is eligible to use the same processing resources from eventually making forward progress in  
 19531 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

19532 Read-write locks can be used to synchronize threads in the current process and other processes if  
 19533 they are allocated in memory that is writable and shared among the cooperating processes and  
 19534 have been initialized for this behavior.

## 19535 2.9.7 Thread Interactions with File Operations

19536 All of the following functions shall be atomic with respect to each other in the effects specified in  
 19537 POSIX.1-2024 when they operate on files in the file hierarchy:

19538	<i>chmod()</i>	<i>fchownat()</i>	<i>link()</i>	<i>readlinkat()</i>	<i>truncate()</i>
19539	<i>chown()</i>	<i>fstat()</i>	<i>linkat()</i>	<i>rename()</i>	<i>unlink()</i>
19540	<i>creat()</i>	<i>fstatat()</i>	<i>lstat()</i>	<i>renameat()</i>	<i>unlinkat()</i>
19541	<i>fchmod()</i>	<i>ftruncate()</i>	<i>open()</i>	<i>stat()</i>	<i>utimensat()</i>
19542	<i>fchmodat()</i>	<i>futimens()</i>	<i>openat()</i>	<i>symlink()</i>	<i>utimes()</i>
19543	<i>fchown()</i>	<i>lchown()</i>	<i>readlink()</i>	<i>symlinkat()</i>	

19544 If two threads each call one of these functions, each call shall either see all of the specified effects  
 19545 of the other call, or none of them.

19546 Except where specified otherwise, all of the following functions shall be atomic with respect to  
 19547 each other in the effects specified in POSIX.1-2024 when they operate on file descriptors that are  
 19548 open, or being opened, to files in the file hierarchy:

19549	<i>close()</i>	<i>fstat()</i>	<i>lseek()</i>	<i>read()</i>	<i>writev()</i>
19550	<i>dup2()</i>	<i>fstatat()</i>	<i>open()</i>	<i>readv()</i>	
19551	<i>dup3()</i>	<i>ftruncate()</i>	<i>openat()</i>	<i>pwrite()</i>	
19552	<i>fcntl()</i>	<i>futimens()</i>	<i>pread()</i>	<i>write()</i>	

19553 If two threads each call one of these functions, each call shall either see all of the specified effects  
 19554 of the other call, or none of them. The requirement on the *close()* function shall also apply  
 19555 whenever a file descriptor is successfully closed, however caused (for example, as a consequence

19556 of calling *close()*, calling *dup2()*, or of process termination).

## 19557 2.9.8 Use of Application-Managed Thread Stacks

19558 An “application-managed thread stack” is a region of memory allocated by the application—for  
 19559 example, memory returned by the *malloc()* or *mmap()* functions—and designated as a stack  
 19560 through the act of passing the address and size of the stack, respectively, as the *stackaddr* and  
 19561 *stacksize* arguments to *pthread\_attr\_setstack()*. Application-managed stacks allow the application  
 19562 to precisely control the placement and size of a stack.

19563 The application grants to the implementation permanent ownership of and control over the  
 19564 application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has  
 19565 been set is used, either by presenting that attribute’s object as the *attr* argument in a call to  
 19566 *pthread\_create()* that completes successfully, or by storing a pointer to the attributes object in the  
 19567 *sigev\_notify\_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function  
 19568 accepting such argument that completes successfully. The application may thereafter utilize the  
 19569 memory within the stack only within the normal context of stack usage within or properly  
 19570 synchronized with a thread that has been scheduled by the implementation with stack pointer  
 19571 value(s) that are within the range of that stack. In particular, the region of memory cannot be  
 19572 freed, nor can it be later specified as the stack for another thread.

19573 When specifying an attributes object with an application-managed stack through the  
 19574 *sigev\_notify\_attributes* member of a **struct sigevent**, the results are undefined if the requested  
 19575 signal is generated multiple times (as for a repeating timer).

19576 Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the  
 19577 application retains ownership of and control over the memory allocated to the stack. It may free  
 19578 or reuse the memory as long as it either deletes the attributes object, or before using the  
 19579 attributes object replaces the stack by making an additional call to *pthread\_attr\_setstack()*, that  
 19580 was used originally to designate the stack. There is no mechanism to retract the reference to an  
 19581 application-managed stack by an existing attributes object.

19582 Once an attributes object with an application-managed stack has been used, that attributes object  
 19583 cannot be used again by a subsequent call to *pthread\_create()* or any function accepting a **struct**  
 19584 **sigevent** with *sigev\_notify\_attributes* containing a pointer to the attributes object, without  
 19585 designating an unused application-managed stack by making an additional call to  
 19586 *pthread\_attr\_setstack()*.

## 19587 2.9.9 Synchronization Object Copies and Alternative Mappings

19588 TSH For barriers, condition variables, mutexes, and read-write locks, if the process-shared attribute  
 19589 is set to `PTHREAD_PROCESS_PRIVATE`, only the synchronization object at the address used to  
 19590 initialize it can be used for performing synchronization. The effect of referring to another  
 19591 TSH mapping of the same object when locking, unlocking, or destroying the object is undefined. If  
 19592 the process-shared attribute is set to `PTHREAD_PROCESS_SHARED`, only the synchronization  
 19593 object itself can be used for performing synchronization; however, it need not be referenced at  
 19594 the address used to initialize it (that is, another mapping of the same object can be used). The  
 19595 effect of referring to a copy of the object when locking, unlocking, or destroying it is undefined.

19596 For spin locks, the above requirements shall apply as if spin locks have a process-shared  
 19597 attribute that is set from the *pshared* argument to *pthread\_spin\_init()*. For semaphores, the above  
 19598 requirements shall apply as if semaphores have a process-shared attribute that is set to  
 19599 `PTHREAD_PROCESS_PRIVATE` if the *pshared* argument to *sem\_init()* is zero and set to  
 19600 `PTHREAD_PROCESS_SHARED` if *pshared* is non-zero.

19601 For ISO C functions declared in `<threads.h>`, the above requirements shall apply as if condition  
19602 variables of type `cond_t` and mutexes of type `mtx_t` have a process-shared attribute that is set to  
19603 `PTHREAD_PROCESS_PRIVATE`.

## 19604 2.10 Sockets

19605 A socket is an endpoint for communication using the facilities described in this section. A socket  
19606 is created with a specific socket type, described in [Section 2.10.6](#) (on page 550), and is associated  
19607 with a specific protocol, detailed in [Section 2.10.3](#). A socket is accessed via a file descriptor  
19608 obtained when the socket is created.

### 19609 2.10.1 Address Families

19610 All network protocols are associated with a specific address family. An address family provides  
19611 basic services to the protocol implementation to allow it to function within a specific network  
19612 environment. These services may include packet fragmentation and reassembly, routing,  
19613 addressing, and basic transport. An address family is normally comprised of a number of  
19614 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not  
19615 required that an address family support all socket types. An address family may contain  
19616 multiple protocols supporting the same socket abstraction.

19617 [Section 2.10.17](#) (on page 557), [Section 2.10.19](#) (on page 558), and [Section 2.10.20](#) (on page 558),  
19618 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based  
19619 on IPv4, and for Internet protocols based on IPv6.

### 19620 2.10.2 Addressing

19621 An address family defines the format of a socket address. All network addresses are described  
19622 using a general structure, called a `sockaddr`, as defined in the Base Definitions volume of  
19623 POSIX.1-2024, `<sys/socket.h>`. However, each address family imposes finer and more specific  
19624 structure, generally defining a structure with fields specific to the address family. The field  
19625 `sa_family` in the `sockaddr` structure contains the address family identifier, specifying the format  
19626 of the `sa_data` area. The size of the `sa_data` area is unspecified.

### 19627 2.10.3 Protocols

19628 A protocol supports one of the socket abstractions detailed in [Section 2.10.6](#) (on page 550).  
19629 Selecting a protocol involves specifying the address family, socket type, and protocol number to  
19630 the `socket()` function. Certain semantics of the basic socket abstractions are protocol-specific. All  
19631 protocols are expected to support the basic model for their particular socket type, but may, in  
19632 addition, provide non-standard facilities or extensions to a mechanism.

**19633 2.10.4 Routing**

19634 Sockets provides packet routing facilities. A routing information database is maintained, which  
19635 is used in selecting the appropriate network interface when transmitting packets.

**19636 2.10.5 Interfaces**

19637 Each network interface in a system corresponds to a path through which messages can be sent  
19638 and received. A network interface usually has a hardware device associated with it, though  
19639 certain interfaces such as the loopback interface, do not.

**19640 2.10.6 Socket Types**

19641 A socket is created with a specific type, which defines the communication semantics and which  
19642 allows the selection of an appropriate communication protocol. Four types are defined:  
19643 RS SOCK\_DGRAM, SOCK\_RAW, SOCK\_SEQPACKET, and SOCK\_STREAM. Implementations  
19644 may specify additional socket types.

19645 The SOCK\_STREAM socket type provides reliable, sequenced, full-duplex octet streams  
19646 between the socket and a peer to which the socket is connected. A socket of type  
19647 SOCK\_STREAM needs to be in a connected state before any data can be sent or received. Record  
19648 boundaries are not maintained; data sent on a stream socket using output operations of one size  
19649 can be received using input operations of smaller or larger sizes without loss of data. Data may  
19650 be buffered; successful return from an output function does not imply that the data has been  
19651 delivered to the peer or even transmitted from the local system. If data cannot be successfully  
19652 transmitted within a given time then the connection is considered broken, and subsequent  
19653 operations shall fail. A SIGPIPE signal is raised if a thread attempts to send data on a broken  
19654 stream (one that is no longer connected), except that the signal is suppressed if the  
19655 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Support for an out-of-  
19656 band data transmission facility is protocol-specific.

19657 The SOCK\_SEQPACKET socket type is similar to the SOCK\_STREAM type, and is also  
19658 connection-oriented. The only difference between these types is that record boundaries are  
19659 maintained using the SOCK\_SEQPACKET type. A record can be sent using one or more output  
19660 operations and received using one or more input operations, but a single operation never  
19661 transfers parts of more than one record. Record boundaries are visible to the receiver via the  
19662 MSG\_EOR flag in the received message flags returned by the *recvmsg()* function. It is protocol-  
19663 specific whether a maximum record size is imposed.

19664 The SOCK\_DGRAM socket type supports connectionless data transfer which is not necessarily  
19665 acknowledged or reliable. Datagrams can be sent to the address specified (possibly multicast or  
19666 broadcast) in each output operation, and incoming datagrams can be received from multiple  
19667 sources. The source address of each datagram is available when receiving the datagram. An  
19668 application can also pre-specify a peer address, in which case calls to output functions that do  
19669 not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only  
19670 datagrams from that peer shall be received. A datagram shall be sent in a single output  
19671 operation, and needs to be received in a single input operation. The maximum size of a  
19672 datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output  
19673 datagrams may be buffered within the system; thus, a successful return from an output function  
19674 does not guarantee that a datagram is actually sent or received. However, implementations  
19675 should attempt to detect any errors possible before the return of an output function, reporting  
19676 any error by an unsuccessful return value.

19677 RS The SOCK\_RAW socket type is similar to the SOCK\_DGRAM type. It differs in that it is  
19678 normally used with communication providers that underlie those used for the other socket  
19679 types. For this reason, the creation of a socket with type SOCK\_RAW shall require appropriate  
19680 privileges. The format of datagrams sent and received with this socket type generally include  
19681 specific protocol headers, and the formats are protocol-specific and implementation-defined.

### 19682 2.10.7 Socket I/O Mode

19683 The I/O mode of a socket is described by the O\_NONBLOCK file status flag which pertains to  
19684 the open file description for the socket. This flag is initially off when a socket is created, but may  
19685 be set and cleared by the use of the F\_SETFL command of the *fcntl()* function.

19686 When the O\_NONBLOCK flag is set, certain functions that would normally block until they are  
19687 complete shall return immediately.

19688 The *bind()* function initiates an address assignment and shall return without blocking when  
19689 O\_NONBLOCK is set; if the socket address cannot be assigned immediately, *bind()* shall return  
19690 the [EINPROGRESS] error to indicate that the assignment was initiated successfully, but that it  
19691 has not yet completed.

19692 The *connect()* function initiates a connection and shall return without blocking when  
19693 O\_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection  
19694 was initiated successfully, but that it has not yet completed.

19695 Data transfer operations (the *read()*, *write()*, *send()*, and *recv()* functions) shall complete  
19696 immediately, transfer only as much as is available, and then return without blocking, or return  
19697 an error indicating that no transfer could be made without blocking.

### 19698 2.10.8 Socket Owner

19699 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or  
19700 process group ID using the F\_SETOWN command of the *fcntl()* function.

### 19701 2.10.9 Socket Queue Limits

19702 The transmit and receive queue sizes for a socket are set when the socket is created. The default  
19703 sizes used are both protocol-specific and implementation-defined. The sizes may be changed  
19704 using the *setsockopt()* function.

### 19705 2.10.10 Pending Error

19706 Errors may occur asynchronously, and be reported to the socket in response to input from the  
19707 network protocol. The socket stores the pending error to be reported to a user of the socket at the  
19708 next opportunity. The error is returned in response to a subsequent *send()*, *recv()*, or *getsockopt()*  
19709 operation on the socket, and the pending error is then cleared.

### 19710 2.10.11 Socket Receive Queue

19711 A socket has a receive queue that buffers data when it is received by the system until it is  
19712 removed by a receive call. Depending on the type of the socket and the communication provider,  
19713 the receive queue may also contain ancillary data such as the addressing and other protocol data  
19714 associated with the normal data in the queue, and may contain out-of-band or expedited data.  
19715 The limit on the queue size includes any normal, out-of-band data, datagram source addresses,  
19716 and ancillary data in the queue. The description in this section applies to all sockets, even  
19717 though some elements cannot be present in some instances.

19718 The contents of a receive buffer are logically structured as a series of data segments with  
19719 associated ancillary data and other information. A data segment may contain normal data or  
19720 out-of-band data, but never both. A data segment may complete a record if the protocol  
19721 supports records (always true for types SOCK\_SEQPACKET and SOCK\_DGRAM). A record  
19722 may be stored as more than one segment; the complete record might never be present in the  
19723 receive buffer at one time, as a portion might already have been returned to the application, and  
19724 another portion might not yet have been received from the communications provider. A data  
19725 segment may contain ancillary protocol data, which is logically associated with the segment.  
19726 Ancillary data is received as if it were queued along with the first normal data octet in the  
19727 segment (if any). A segment may contain ancillary data only, with no normal or out-of-band  
19728 data. For the purposes of this section, a datagram is considered to be a data segment that  
19729 terminates a record, and that includes a source address as a special type of ancillary data. Data  
19730 segments are placed into the queue as data is delivered to the socket by the protocol. Normal  
19731 data segments are placed at the end of the queue as they are delivered. If a new segment  
19732 contains the same type of data as the preceding segment and includes no ancillary data, and if  
19733 the preceding segment does not terminate a record, the segments are logically merged into a  
19734 single segment.

19735 The receive queue is logically terminated if an end-of-file indication has been received or a  
19736 connection has been terminated. A segment shall be considered to be terminated if another  
19737 segment follows it in the queue, if the segment completes a record, or if an end-of-file or other  
19738 connection termination has been reported. The last segment in the receive queue shall also be  
19739 considered to be terminated while the socket has a pending error to be reported.

19740 A receive operation shall never return data or ancillary data from more than one segment.

### 19741 2.10.12 Socket Out-of-Band Data State

19742 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed  
19743 in the socket receive queue, either at the end of the queue or before all normal data in the queue.  
19744 In this case, out-of-band data is returned to an application program by a normal receive call.  
19745 Out-of-band data may also be queued separately rather than being placed in the socket receive  
19746 queue, in which case it shall be returned only in response to a receive call that requests out-of-  
19747 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive  
19748 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An  
19749 out-of-band data mark is logically an empty data segment that cannot be merged with other  
19750 segments in the queue. An out-of-band data mark is never returned in response to an input  
19751 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the  
19752 first element in the queue. If an out-of-band data mark is the first element in the queue when an  
19753 input function is called without the MSG\_PEEK option, the mark is removed from the queue  
19754 and the following data (if any) is processed as if the mark had not been present.

### 19755 2.10.13 Connection Indication Queue

19756 Sockets that are used to accept incoming connections maintain a queue of outstanding  
19757 connection indications. This queue is a list of connections that are awaiting acceptance by the  
19758 application; see *listen()*.

### 19759 2.10.14 Signals

19760 One category of event at the socket interface is the generation of signals. These signals report  
19761 protocol events or process errors relating to the state of the socket. The generation or delivery of  
19762 a signal does not change the state of the socket, although the generation of the signal may have  
19763 been caused by a state change.

19764 The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no  
19765 longer able to send (one that is no longer connected), except that the signal is suppressed if the  
19766 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Regardless of whether  
19767 the generation of the signal is suppressed, the send operation shall fail with the [EPIPE] error.

19768 If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified  
19769 of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the  
19770 status of the socket is specified in [Section 2.10.17](#) (on page 557), [Section 2.10.19](#) (on page 558),  
19771 and [Section 2.10.20](#) (on page 558). Depending on the protocol, the expedited data may or may  
19772 not have arrived at the time of signal generation.

### 19773 2.10.15 Asynchronous Errors

19774 If any of the following conditions occur asynchronously for a socket, the corresponding value  
19775 listed below shall become the pending error for the socket:

19776 [ECONNABORTED]

19777 The connection was aborted locally.

19778 [ECONNREFUSED]

19779 For a connection-mode socket attempting a non-blocking connection, the attempt to connect  
19780 was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram  
19781 was forcefully rejected.

19782 [ECONNRESET]

19783 The peer has aborted the connection.

19784 [EHOSTUNREACH]

19785 The destination host is not reachable.

19786 [EMSGSIZE]

19787 For a connectionless-mode socket, the size of a previously sent datagram prevented  
19788 delivery.

19789 [ENETDOWN]

19790 The local network connection is not operational.

19791 [ENETRESET]

19792 The connection was aborted by the network.

19793 [ENETUNREACH]

19794 The destination network is not reachable.

19795 **2.10.16 Use of Options**

19796 There are a number of socket options which either specialize the behavior of a socket or provide  
 19797 useful information. These options may be set at different protocol levels and are always present  
 19798 at the uppermost “socket” level.

19799 Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions  
 19800 allow an application program to customize the behavior and characteristics of a socket to  
 19801 provide the desired effect.

19802 All of the options usable with *setsockopt()* have defaults. For each option where a default value is  
 19803 listed as implementation-defined, the implementation also controls whether a socket created by  
 19804 *accept()* or *accept4()* starts with the option reset to the original default value, or inherited as the  
 19805 value previously customized on the original listening socket. The type and meaning of these  
 19806 values is defined by the protocol level to which they apply. Instead of using the default values,  
 19807 an application program may choose to customize one or more of the options. However, in the  
 19808 bulk of cases, the default values are sufficient for the application.

19809 Some of the options are used to enable or disable certain behavior within the protocol modules  
 19810 (for example, turn on debugging) while others may be used to set protocol-specific information  
 19811 (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is  
 19812 introduced, its effect on the underlying protocol modules is described.

19813 [Table 2-1](#) shows the value for the socket level.

19814 **Table 2-1** Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

19817 [Table 2-2](#) (on page 555) lists those options present at the socket level; that is, when the *level*  
 19818 parameter of the *getsockopt()* or *setsockopt()* function is SOL\_SOCKET, the types of the option  
 19819 value parameters associated with each option, and a brief synopsis of the meaning of the option  
 19820 value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with  
 19821 *setsockopt()* on all types of socket. Options at other protocol levels vary in format and name.

19822

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_ACCEPTCONN	int	Non-zero indicates that socket listening is enabled ( <i>getsockopt()</i> only).
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DOMAIN	int	Identify socket domain ( <i>getsockopt()</i> only).
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket ( <i>getsockopt()</i> only).
SO_KEEPAIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsend data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_PROTOCOL	int	Identify socket protocol ( <i>getsockopt()</i> only).
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type ( <i>getsockopt()</i> only).

19855 The SO\_ACCEPTCONN option is used only on *getsockopt()*. When this option is specified,  
 19856 *getsockopt()* shall report whether socket listening is enabled for the socket. A value of zero shall  
 19857 indicate that socket listening is disabled; non-zero that it is enabled. SO\_ACCEPTCONN has no  
 19858 default value.

19859 The SO\_BROADCAST option requests permission to send broadcast datagrams on the socket.  
 19860 Support for SO\_BROADCAST is protocol-specific. The default for SO\_BROADCAST is that the  
 19861 ability to send broadcast datagrams on a socket is disabled.

19862 The SO\_DEBUG option enables debugging in the underlying protocol modules. This can be  
 19863 useful for tracing the behavior of the underlying protocol modules during normal system  
 19864 operation. The semantics of the debug reports are implementation-defined. The default value for  
 19865 SO\_DEBUG is for debugging to be turned off.

19866 The SO\_DOMAIN option is used only on *getsockopt()*. When this option is specified,  
 19867 *getsockopt()* shall return the domain of the socket (for example, AF\_INET6). SO\_DOMAIN has  
 19868 no default value.

19869 The SO\_DONTROUTE option requests that outgoing messages bypass the standard routing

19870 facilities. The destination needs to be on a directly-connected network, and messages are  
19871 directed to the appropriate network interface according to the destination address. It is protocol-  
19872 specific whether this option has any effect and how the outgoing network interface is chosen.  
19873 Support for this option with each protocol is implementation-defined.

19874 The `SO_ERROR` option is used only on `getsockopt()`. When this option is specified, `getsockopt()`  
19875 shall return any pending error on the socket and clear the error status. It shall return a value of 0  
19876 if there is no pending error. `SO_ERROR` may be used to check for asynchronous errors on  
19877 connected connectionless-mode sockets or for other types of asynchronous errors. `SO_ERROR`  
19878 has no default value.

19879 The `SO_KEEPALIVE` option enables the periodic transmission of messages on a connected  
19880 socket. The behavior of this option is protocol-specific. On a connection-mode socket for which a  
19881 connection has been established, if `SO_KEEPALIVE` is enabled and the connected socket fails to  
19882 respond to the keep-alive messages, the connection shall be broken. The default value for  
19883 `SO_KEEPALIVE` is zero, specifying that this capability is turned off.

19884 The `SO_LINGER` option controls the action of the interface when unsent messages are queued  
19885 on a socket and a `close()` is performed. The details of this option are protocol-specific. If  
19886 `SO_LINGER` is enabled, the system shall block the calling thread during `close()` until it can  
19887 transmit the data or until the end of the interval indicated by the `l_linger` member, whichever  
19888 comes first. If `SO_LINGER` is not specified, and `close()` is issued, the system handles the call in a  
19889 way that allows the calling thread to continue as quickly as possible. The default value for  
19890 `SO_LINGER` is zero, or off, for the `l_onoff` element of the option value and zero seconds for the  
19891 linger time specified by the `l_linger` element.

19892 The `SO_OOBINLINE` option is valid only on protocols that support out-of-band data. The  
19893 `SO_OOBINLINE` option requests that out-of-band data be placed in the normal data input  
19894 queue as received; it is then accessible using the `read()` or `recv()` functions without the  
19895 `MSG_OOB` flag set. The default for `SO_OOBINLINE` is off; that is, for out-of-band data not to be  
19896 placed in the normal data input queue.

19897 The `SO_PROTOCOL` option is used only on `getsockopt()`. When this option is specified,  
19898 `getsockopt()` shall return the socket protocol (for example, `IPPROTO_TCP`). `SO_PROTOCOL` has  
19899 no default value.

19900 The `SO_RCVBUF` option requests that the buffer space allocated for receive operations on this  
19901 socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer  
19902 size for high volume connections, or may decrease buffer size to limit the possible backlog of  
19903 incoming data. The default value for the `SO_RCVBUF` option value is implementation-defined,  
19904 and may vary by protocol.

19905 The `SO_RCVLOWAT` option sets the minimum number of bytes to process for socket input  
19906 operations. In general, receive calls block until any (non-zero) amount of data is received, then  
19907 return the smaller of the amount available or the amount requested. The default value for  
19908 `SO_RCVLOWAT` is 1, and does not affect the general case. If `SO_RCVLOWAT` is set to a larger  
19909 value, blocking receive calls normally wait until they have received the smaller of the low water  
19910 mark value or the requested amount. Receive calls may still return less than the low water mark  
19911 if an error occurs, a signal is caught, or the type of data next in the receive queue is different  
19912 from that returned (for example, out-of-band data). As mentioned previously, the default value  
19913 for `SO_RCVLOWAT` is 1 byte. It is implementation-defined whether the `SO_RCVLOWAT` option  
19914 can be set.

19915 The `SO_RCVTIMEO` option is an option to set a timeout value for input operations. It accepts a  
19916 **timeval** structure with the number of seconds and microseconds specifying the limit on how  
19917 long to wait for an input operation to complete. If a receive operation has blocked for this much  
19918 time without receiving additional data, it shall return with a partial count or `errno` shall be set to

19919 [EAGAIN] or [EWOULDBLOCK] if no data were received. The default for this option is the  
 19920 value zero, which indicates that a receive operation will not time out. It is implementation-  
 19921 defined whether the SO\_RCVTIMEO option can be set.

19922 The SO\_REUSEADDR option indicates that the rules used in validating addresses supplied in a  
 19923 *bind()* should allow reuse of local addresses. Operation of this option is protocol-specific. The  
 19924 default value for SO\_REUSEADDR is off; that is, reuse of local addresses is not permitted.

19925 The SO\_SNDBUF option requests that the buffer space allocated for send operations on this  
 19926 socket be set to the value, in bytes, of the option value. The default value for the SO\_SNDBUF  
 19927 option value is implementation-defined, and may vary by protocol.

19928 The SO\_SNDLOWAT option sets the minimum number of bytes to process for socket output  
 19929 operations. Most output operations process all of the data supplied by the call, delivering data to  
 19930 the protocol for transmission and blocking as necessary for flow control. Non-blocking output  
 19931 operations process as much data as permitted subject to flow control without blocking, but  
 19932 process no data if flow control does not allow the smaller of the send low water mark value or  
 19933 the entire request to be processed. A *select()* operation testing the ability to write to a socket shall  
 19934 return true only if the send low water mark could be processed. The default value for  
 19935 SO\_SNDLOWAT is implementation-defined and protocol-specific. It is implementation-defined  
 19936 whether the SO\_SNDLOWAT option can be set.

19937 The SO\_SNDTIMEO option is an option to set a timeout value for the amount of time that an  
 19938 output function shall block because flow control prevents data from being sent. As noted in  
 19939 [Table 2-2](#) (on page 555), the option value is a **timeval** structure with the number of seconds and  
 19940 microseconds specifying the limit on how long to wait for an output operation to complete. If a  
 19941 send operation has blocked for this much time, it shall return with a partial count or *errno* set to  
 19942 [EAGAIN] or [EWOULDBLOCK] if no data were sent. The default for this option is the value  
 19943 zero, which indicates that a send operation will not time out. It is implementation-defined  
 19944 whether the SO\_SNDTIMEO option can be set.

19945 The SO\_TYPE option is used only on *getsockopt()*. When this option is specified, *getsockopt()*  
 19946 shall return the type of the socket (for example, SOCK\_STREAM). This option is useful to  
 19947 servers that inherit sockets on start-up. SO\_TYPE has no default value.

## 19948 2.10.17 Use of Sockets for Local UNIX Connections

19949 Support for UNIX domain sockets is mandatory.

19950 UNIX domain sockets provide process-to-process communication in a single system.

### 19951 2.10.17.1 Headers

19952 The symbolic constant AF\_UNIX defined in the `<sys/socket.h>` header is used to identify the  
 19953 UNIX domain address family. The `<sys/un.h>` header contains other definitions used in  
 19954 connection with UNIX domain sockets. See XBD [Chapter 14](#) (on page 221).

19955 The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to  
 19956 accommodate a **sockaddr\_un** structure (see the `<sys/un.h>` header defined in XBD [Chapter 14](#),  
 19957 on page 221) and shall be aligned at an appropriate boundary so that pointers to it can be cast as  
 19958 pointers to **sockaddr\_un** structures and used to access the fields of those structures without  
 19959 alignment problems. When a **sockaddr\_storage** structure is cast as a **sockaddr\_un** structure, the  
 19960 *ss\_family* field maps onto the *sun\_family* field.

## 19961 2.10.18 Use of Sockets over Internet Protocols

19962 When a socket is created in the Internet family with a protocol value of zero, the implementation  
19963 shall use the protocol listed below for the type of socket created.

19964 SOCK\_STREAM IPPROTO\_TCP.

19965 SOCK\_DGRAM IPPROTO\_UDP.

19966 RS SOCK\_RAW IPPROTO\_RAW.

19967 SOCK\_SEQPACKET Unspecified.

19968 RS A raw interface to IP is available by creating an Internet socket of type SOCK\_RAW. The default  
19969 protocol for type SOCK\_RAW shall be identified in the IP header with the value  
19970 IPPROTO\_RAW. Applications should not use the default protocol when creating a socket with  
19971 type SOCK\_RAW, but should identify a specific protocol by value. The ICMP control protocol is  
19972 accessible from a raw socket by specifying a value of IPPROTO\_ICMP for protocol.

## 19973 2.10.19 Use of Sockets over Internet Protocols Based on IPv4

19974 Support for sockets over Internet protocols based on IPv4 is mandatory. IPv4 is described in  
19975 RFC 791.

### 19976 2.10.19.1 Headers

19977 The symbolic constant AF\_INET defined in the `<sys/socket.h>` header is used to identify the  
19978 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in  
19979 connection with IPv4 Internet sockets. See XBD [Chapter 14](#) (on page 221).

19980 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
19981 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in XBD [Chapter](#)  
19982 [14](#), on page 221) and shall be aligned at an appropriate boundary so that pointers to it can be  
19983 cast as pointers to `sockaddr_in` structures and used to access the fields of those structures  
19984 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in`  
19985 structure, the `ss_family` field maps onto the `sin_family` field.

## 19986 2.10.20 Use of Sockets over Internet Protocols Based on IPv6

19987 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The  
19988 functionality described in this section shall be provided on implementations that support the  
19989 IPV6 option (and the rest of this section is not further shaded for this option).

19990 IPv6 is described in RFC 8200.

19991 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain  
19992 circumstances, also be used in connection with IPv4; see [Section 2.10.20.2](#) (on page 559).

### 19993 2.10.20.1 Addressing

19994 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead  
19995 of 32-bit addresses. The IPv6 address architecture is described in RFC 4291.

19996 There are three kinds of IPv6 address:

- 19997 Unicast  
19998 Identifies a single interface.
- 19999 A unicast address can be global, link-local (designed for use on a single link), or site-local  
20000 (designed for systems not connected to the Internet). Link-local and site-local addresses  
20001 need not be globally unique.
- 20002 Anycast  
20003 Identifies a set of interfaces such that a packet sent to the address can be delivered to any  
20004 member of the set.
- 20005 An anycast address is similar to a unicast address; the nodes to which an anycast address is  
20006 assigned need to be explicitly configured to know that it is an anycast address.
- 20007 Multicast  
20008 Identifies a set of interfaces such that a packet sent to the address should be delivered to  
20009 every member of the set.
- 20010 An application can send multicast datagrams by simply specifying an IPv6 multicast  
20011 address in the *address* argument of *sendto()*. To receive multicast datagrams, an application  
20012 needs to join the multicast group (using *setsockopt()* with `IPV6_JOIN_GROUP`) and bind to  
20013 the socket the UDP port on which datagrams are to be received. Some applications should  
20014 also bind the multicast group address to the socket, to prevent other datagrams destined to  
20015 that port from being delivered to the socket.
- 20016 A multicast address can be global, node-local, link-local, site-local, or organization-local.
- 20017 The following special IPv6 addresses are defined:
- 20018 Unspecified  
20019 An address that is not assigned to any interface and is used to indicate the absence of an  
20020 address.
- 20021 Loopback  
20022 A unicast address that is not assigned to any interface and can be used by a node to send  
20023 packets to itself.
- 20024 Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:
- 20025 IPv4-compatible addresses  
20026 These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled”  
20027 through IPv4.
- 20028 IPv4-mapped addresses  
20029 These are used to represent IPv4 addresses in IPv6 address format; see [Section 2.10.20.2](#).
- 20030 The unspecified address and the loopback address shall not be treated as IPv4-compatible  
20031 addresses.
- 20032 **2.10.20.2 Compatibility with IPv4**
- 20033 The API provides the ability for IPv6 applications to interoperate with applications using IPv4,  
20034 by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the  
20035 *getaddrinfo()* function when the specified host has only IPv4 addresses.
- 20036 Applications can use `AF_INET6` sockets to open TCP connections to IPv4 nodes, or send UDP  
20037 packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped  
20038 IPv6 address, and passing that address, within a `sockaddr_in6` structure, in the *connect()*,  
20039 *sendto()*, or *sendmsg()* function. When applications use `AF_INET6` sockets to accept TCP  
20040 connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return

20041 the peer's address to the application in the *accept()*, *accept4()*, *recvfrom()*, *recvmsg()*, or  
 20042 *getpeername()* function using a **sockaddr\_in6** structure encoded this way. If a node has an IPv4  
 20043 address, then the implementation shall allow applications to communicate using that address  
 20044 via an AF\_INET6 socket. In such a case, the address shall be represented at the API by the  
 20045 corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF\_INET6  
 20046 socket bound to **in6addr\_any** to receive inbound connections and packets destined to one of the  
 20047 node's IPv4 addresses.

20048 An application can use AF\_INET6 sockets to bind to a node's IPv4 address by specifying the  
 20049 address as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure in the *bind()* function. For  
 20050 an AF\_INET6 socket bound to a node's IPv4 address, the system shall return the address in the  
 20051 *getsockname()* function as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure.

### 20052 2.10.20.3 Interface Identification

20053 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;  
 20054 zero is not used. There may be gaps so that there is no current interface for a particular positive  
 20055 index. Each interface also has a unique implementation-defined name.

### 20056 2.10.20.4 Options

20057 The following options apply at the IPPROTO\_IPV6 level:

#### 20058 IPV6\_JOIN\_GROUP

20059 When set via *setsockopt()*, it joins the application to a multicast group on an interface  
 20060 (identified by its index) and addressed by a given multicast address, enabling packets sent  
 20061 to that address to be read via the socket. If the interface index is specified as zero, the  
 20062 system selects the interface (for example, by looking up the address in a routing table and  
 20063 using the resulting interface).

20064 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

20065 The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

#### 20066 IPV6\_LEAVE\_GROUP

20067 When set via *setsockopt()*, it removes the application from the multicast group on an  
 20068 interface (identified by its index) and addressed by a given multicast address.

20069 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

20070 The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

#### 20071 IPV6\_MULTICAST\_HOPS

20072 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the  
 20073 socket. Its possible values are the same as those of IPV6\_UNICAST\_HOPS. If the  
 20074 IPV6\_MULTICAST\_HOPS option is not set, a value of 1 is assumed. This option can be set  
 20075 via *setsockopt()* and read via *getsockopt()*.

20076 The parameter type of this option is a pointer to an **int**. (Default value: 1)

#### 20077 IPV6\_MULTICAST\_IF

20078 The index of the interface to be used for outgoing multicast packets. It can be set via  
 20079 *setsockopt()* and read via *getsockopt()*. If the interface index is specified as zero, the system  
 20080 selects the interface (for example, by looking up the address in a routing table and using the  
 20081 resulting interface).

20082 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

20083 IPV6\_MULTICAST\_LOOP  
 20084 This option controls whether outgoing multicast packets should be delivered back to the  
 20085 local application when the sending interface is itself a member of the destination multicast  
 20086 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an  
 20087 [EINVAL] error. This option can be set via *setsockopt()* and read via *getsockopt()*.

20088 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean  
 20089 value. (Default value: 1)

20090 IPV6\_UNICAST\_HOPS  
 20091 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the  
 20092 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to  
 20093 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can  
 20094 be set via *setsockopt()* and read via *getsockopt()*.

20095 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

20096 IPV6\_V6ONLY  
 20097 This socket option restricts AF\_INET6 sockets to IPv6 communications only. AF\_INET6  
 20098 sockets may be used for both IPv4 and IPv6 communications. Some applications may want  
 20099 to restrict their use of an AF\_INET6 socket to IPv6 communications only. For these  
 20100 applications, the IPV6\_V6ONLY socket option is defined. When this option is turned on, the  
 20101 socket can be used to send and receive IPv6 packets only. This is an IPPROTO\_IPV6-level  
 20102 option.

20103 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.  
 20104 (Default value: 0)

20105 An [EOPNOTSUPP] error shall result if IPV6\_JOIN\_GROUP or IPV6\_LEAVE\_GROUP is used  
 20106 with *getsockopt()*.

#### 20107 2.10.20.5 Headers

20108 The symbolic constant AF\_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6  
 20109 Internet address family. See XBD [Chapter 14](#) (on page 221).

20110 The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to  
 20111 accommodate a **sockaddr\_in6** structure (see the `<netinet/in.h>` header defined in XBD [Chapter](#)  
 20112 [14](#), on page 221) and shall be aligned at an appropriate boundary so that pointers to it can be  
 20113 cast as pointers to **sockaddr\_in6** structures and used to access the fields of those structures  
 20114 without alignment problems. When a **sockaddr\_storage** structure is cast as a **sockaddr\_in6**  
 20115 structure, the *ss\_family* field maps onto the *sin6\_family* field.

20116 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in  
 20117 connection with IPv6 Internet sockets; see XBD [Chapter 14](#) (on page 221).

## 20118 2.11 Data Types

20119 **2.11.1 Defined Types**

20120 All of the data types used by various functions are defined by the implementation. The  
 20121 following table describes some of these types. Other types referenced in the description of a  
 20122 function, not mentioned here, can be found in the appropriate header for that function.

20123	Defined Type	Description
20124	<b>cc_t</b>	Type used for terminal special characters.
20125	<b>clock_t</b>	Integer or real-floating type used for processor times, as defined in the ISO C standard.
20126		
20127	<b>clockid_t</b>	Used for clock ID type in some timer functions.
20128	<b>dev_t</b>	Integer type used for device numbers.
20129	<b>DIR</b>	Type representing a directory stream.
20130	<b>div_t</b>	Structure type returned by the <i>div()</i> function.
20131	<b>FILE</b>	Structure containing information about a file.
20132	<b>glob_t</b>	Structure type used in pathname pattern matching.
20133	<b>fpos_t</b>	Type containing all information needed to specify uniquely every position within a file.
20134		
20135	<b>gid_t</b>	Integer type used for group IDs.
20136	<b>iconv_t</b>	Type used for conversion descriptors.
20137	<b>id_t</b>	Integer type used as a general identifier; can be used to contain at least the largest of a <b>pid_t</b> , <b>uid_t</b> , or <b>gid_t</b> .
20138		
20139	<b>ino_t</b>	Unsigned integer type used for file serial numbers.
20140	<b>key_t</b>	Arithmetic type used for XSI interprocess communication.
20141	<b>ldiv_t</b>	Structure type returned by the <i>ldiv()</i> function.
20142	<b>mode_t</b>	Integer type used for file attributes.
20143	<b>mqd_t</b>	Used for message queue descriptors.
20144	<b>nfds_t</b>	Integer type used for the number of file descriptors.
20145	<b>nlink_t</b>	Integer type used for link counts.
20146	<b>off_t</b>	Signed integer type used for file sizes.
20147	<b>pid_t</b>	Signed integer type used for process and process group IDs.
20148	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
20149	<b>pthread_cond_t, cnd_t</b>	Used for condition variables.
20150	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
20151	<b>pthread_key_t, tss_t</b>	Used for thread-specific data keys.
20152	<b>pthread_mutex_t, mtx_t</b>	Used for mutexes.
20153	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
20154	<b>pthread_once_t, once_flag</b>	Used for dynamic package initialization.
20155	<b>pthread_rwlock_t</b>	Used for read-write locks.
20156	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
20157	<b>pthread_t, thrd_t</b>	Used to identify a thread.
20158	<b>ptrdiff_t</b>	Signed integer type of the result of subtracting two pointers.
20159	<b>reclen_t</b>	Unsigned integer type used for directory entry lengths.
20160	<b>regex_t</b>	Structure type used in regular expression matching.
20161	<b>regmatch_t</b>	Structure type used in regular expression matching.
20162	<b>rlim_t</b>	Unsigned integer type used for limit values, to which objects of type <b>int</b> and <b>off_t</b> can be cast without loss of value.
20163		
20164	<b>sem_t</b>	Type used in performing semaphore operations.
20165	<b>sig_atomic_t</b>	Possibly volatile-qualified integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
20166		
20167		
20168	<b>sigset_t</b>	Integer or structure type of an object used to represent sets

Defined Type	Description
	of signals.
<b>size_t</b>	Unsigned integer type used for size of objects.
<b>speed_t</b>	Type used for terminal baud rates.
<b>ssize_t</b>	Signed integer type used for a count of bytes or an error indication.
<b>suseconds_t</b>	Signed integer type used for time in microseconds.
<b>tcflag_t</b>	Type used for terminal modes.
<b>time_t</b>	Integer type used for time in seconds, as defined in the ISO C standard.
<b>timer_t</b>	Used for timer ID returned by the <i>timer_create()</i> function.
<b>uid_t</b>	Integer type used for user IDs.
<b>va_list</b>	Type used for traversing variable argument lists.
<b>wchar_t</b>	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
<b>wctype_t</b>	Scalar type which represents a character class descriptor.
<b>wint_t</b>	Integer type capable of storing any valid value of <b>wchar_t</b> or WEOF.
<b>wordexp_t</b>	Structure type used in word expansion.

### 2.11.2 The char Type

The type **char** is defined as a single byte; see XBD Chapter 3 (on page 31) (Byte and Character).

## 2.12 Status Information

Status information is data associated with a process detailing a change in the state of the process. It shall consist of:

- The state the process transitioned into (*stopped*, *continued*, or *terminated*)
- The information necessary to populate the **siginfo\_t** structure provided by *waitid()*
- If the new state is *terminated*:
  - The low-order 8 bits of the status argument that the process passed to *\_Exit()*, *\_exit()*, or *exit()*, or the low-order 8 bits of the value the process returned from *main()*
  - Note that these 8 bits are part of the complete value that is used to set the *si\_status* member of the **siginfo\_t** structure provided by *waitid()*
  - Whether the process terminated due to the receipt of a signal that was not caught and, if so, the number of the signal that caused the termination of the process
- If the new state is *stopped*:
  - The number of the signal that caused the process to stop

A process might not have any status information (such as immediately after a process has started).

Status information for a process shall be generated (made available to the parent process) when the process stops, continues, or terminates except in the following case:

- 20209
- 20210
- 20211
- 20212
- If the parent process sets the action for the SIGCHLD signal to SIG\_IGN, or if the parent sets the SA\_NOCLDWAIT flag for the SIGCHLD signal action, process termination shall not generate new status information but shall cause any existing status information for the process to be discarded.

20213

20214

If new status information is generated, and the process already had status information, the existing status information shall be discarded and replaced with the new status information.

20215

20216

20217

20218

20219

Only the process' parent process can obtain the process' status information. The parent obtains a child's status information by calling *wait()*, *waitid()*, or *waitpid()*. Except when *waitid()* is called with the WNOWAIT flag set in the *options* argument, the status information obtained by a wait function shall be consumed (discarded) by that wait function; no two calls to *wait()*, *waitid()* (without WNOWAIT), or *waitpid()* shall obtain the same status information.

20220

20221

20222

When status information becomes available to the parent process and more than one thread in the parent process is waiting for the status information (blocked in a call to *wait()*, *waitid()*, or *waitpid()* with arguments that would match the status information):

- 20223
- 20224
- If none of the matching threads is in a call to *waitid()* with the WNOWAIT flag set in the *options* argument, the thread that obtains the status information is unspecified.
- 20225
- Otherwise (at least one of the matching threads is in a call to *waitid()* with the WNOWAIT flag set), the matching thread or threads that obtain the status information is unspecified except that at least one of the matching threads shall obtain the status information and at most one of the matching threads that are not calling *waitid()* with the WNOWAIT flag set shall obtain it.
- 20226
- 20227
- 20228
- 20229

20230

Chapter 3

20231

# *System Interfaces*

20232

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

20233

20234 **NAME**

20235 CMPLX, CMPLXF, CMPLXL — make a complex value

20236 **SYNOPSIS**

```
20237 #include <complex.h>
20238 double complex    CMPLX(double x, double y);
20239 float complex    CMPLXF(float x, float y);
20240 long double complex CMPLXL(long double x, long double y);
```

20241 **DESCRIPTION**

20242 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20243 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20244 volume of POSIX.1-2024 defers to the ISO C standard.

20245 The CMPLX macros shall expand to an expression of the specified complex type, with the real  
 20246 part having the (converted) value of  $x$  and the imaginary part having the (converted) value of  $y$ .  
 20247 The resulting expression shall be suitable for use as an initializer for an object with static or  
 20248 thread storage duration, provided both arguments are likewise suitable.

20249 **RETURN VALUE**20250 The CMPLX macros return the complex value  $x + iy$  (where  $i$  is the imaginary unit).

20251 These macros shall behave as if the implementation supported imaginary types and the  
 20252 definitions were:

```
20253 #define CMPLX(x, y) ((double complex)((double)(x) + \
20254 _Imaginary_I * (double)(y)))
20255 #define CMPLXF(x, y) ((float complex)((float)(x) + \
20256 _Imaginary_I * (float)(y)))
20257 #define CMPLXL(x, y) ((long double complex)((long double)(x) + \
20258 _Imaginary_I * (long double)(y)))
```

20259 **ERRORS**

20260 No errors are defined.

20261 **EXAMPLES**

20262 None.

20263 **APPLICATION USAGE**

20264 None.

20265 **RATIONALE**

20266 None.

20267 **FUTURE DIRECTIONS**

20268 None.

20269 **SEE ALSO**20270 XBD [<complex.h>](#)20271 **CHANGE HISTORY**

20272 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

20273 **NAME**

20274 FD\_CLR — macros for synchronous I/O multiplexing

20275 **SYNOPSIS**

```
20276     #include <sys/select.h>
20277     void FD_CLR(int fd, fd_set *fdset);
20278     int FD_ISSET(int fd, fd_set *fdset);
20279     void FD_SET(int fd, fd_set *fdset);
20280     void FD_ZERO(fd_set *fdset);
```

20281 **DESCRIPTION**20282 Refer to *pselect()*.

**20283 NAME**

20284 `_Exit, _exit` — terminate a process

**20285 SYNOPSIS**

```
20286 #include <stdlib.h>
20287 _Noreturn void _Exit(int status);
20288 #include <unistd.h>
20289 _Noreturn void _exit(int status);
```

**20290 DESCRIPTION**

20291 CX For `_Exit()`: The functionality described on this reference page is aligned with the ISO C  
20292 standard. Any conflict between the requirements described here and the ISO C standard is  
20293 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

20294 CX The value of *status* may be 0, `EXIT_SUCCESS`, `EXIT_FAILURE`, or any other value, though only  
20295 the least significant 8 bits (that is, *status* & 0377) shall be available from `wait()` and `waitpid()`; the  
20296 full value shall be available from `waitid()` and in the `siginfo_t` passed to a signal handler for  
20297 `SIGCHLD`.

20298 CX The `_Exit()` and `_exit()` functions shall be functionally equivalent.

20299 CX The `_Exit()` and `_exit()` functions shall not call functions registered with `atexit()` nor  
20300 CX `at_quick_exit()`, nor any registered signal handlers. Open streams shall not be flushed. Whether  
20301 open streams are closed (without flushing) is implementation-defined. Finally, the calling  
20302 process shall be terminated with the consequences described below.

**20303 Consequences of Process Termination**

20304 CX Process termination caused by any reason shall have the following consequences:

20305 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.  
20306 However, functionality relating to the XSI option is shaded.

20307 • All of the file descriptors, directory streams, conversion descriptors, and message catalog  
20308 descriptors open in the calling process shall be closed.

20309 XSI • If the parent process of the calling process has set its `SA_NOCLDWAIT` flag or has set the  
20310 action for the `SIGCHLD` signal to `SIG_IGN`:

20311 — The process' status information (see [Section 2.12](#), on page 563), if any, shall be  
20312 discarded.

20313 — The lifetime of the calling process shall end immediately. If `SA_NOCLDWAIT` is set,  
20314 it is implementation-defined whether a `SIGCHLD` signal is sent to the parent process.

20315 — If a thread in the parent process of the calling process is blocked in `wait()`, `waitpid()`,  
20316 or `waitid()`, and the parent process has no remaining child processes in the set of  
20317 waited-for children, the `wait()`, `waitid()`, or `waitpid()` function shall fail and set `errno`  
20318 to `[ECHILD]`.

20319 **Otherwise:**

20320 — Status information (see [Section 2.12](#), on page 563) shall be generated.

20321 — The calling process shall be transformed into a zombie process. Its status information  
20322 shall be made available to the parent process until the process' lifetime ends.

- 20323 — The process' lifetime shall end once its parent obtains the process' status information  
20324 via a currently-blocked or future call to *wait()*, *waitid()* (without *WNOWAIT*), or  
20325 *waitpid()*.
- 20326 — If one or more threads in the parent process of the calling process is blocked in a call  
20327 to *wait()*, *waitid()*, or *waitpid()* awaiting termination of the process, one (or, if any are  
20328 calling *waitid()* with *WNOWAIT*, possibly more) of these threads shall obtain the  
20329 process' status information as specified in [Section 2.12](#) (on page 563) and become  
20330 unblocked.
- 20331 — A *SIGCHLD* shall be sent to the parent process.
- 20332 • Termination of a process does not directly terminate its children. The sending of a  
20333 *SIGHUP* signal as described below indirectly terminates children in some circumstances.
  - 20334 • The parent process ID of all of the existing child processes and zombie processes of the  
20335 calling process shall be set to the process ID of an implementation-defined system process.  
20336 That is, these processes shall be inherited by a special system process.
  - 20337 XSI • Each attached shared-memory segment is detached and the value of *shm\_nattch* (see  
20338 *shmget()*) in the data structure associated with its shared memory ID shall be decremented  
20339 by 1.
  - 20340 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop()*), that  
20341 value shall be added to the *semval* of the specified semaphore.
  - 20342 • If the process is a controlling process, the *SIGHUP* signal shall be sent to each process in  
20343 the foreground process group of the controlling terminal belonging to the calling process.
  - 20344 • If the process is a controlling process, the controlling terminal associated with the session  
20345 shall be disassociated from the session, allowing it to be acquired by a new controlling  
20346 process.
  - 20347 • If the exit of the process causes a process group to become orphaned, and if any member of  
20348 the newly-orphaned process group is stopped, then a *SIGHUP* signal followed by a  
20349 *SIGCONT* signal shall be sent to each process in the newly-orphaned process group.
  - 20350 • All open named semaphores in the calling process shall be closed as if by appropriate calls  
20351 to *sem\_close()*. All open unnamed semaphores in the calling process shall be destroyed as  
20352 if by appropriate calls to *sem\_destroy()*.
  - 20353 ML • Any memory locks established by the process via calls to *mlockall()* or *mlock()* shall be  
20354 removed. If locked pages in the address space of the calling process are also mapped into  
20355 the address spaces of other processes and are locked by those processes, the locks  
20356 established by the other processes shall be unaffected by the call by this process to *\_Exit()*  
20357 or *\_exit()*.
  - 20358 • Memory mappings that were created in the process shall be unmapped before the process  
20359 is destroyed.
  - 20360 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,  
20361 as if *munmap()* was implicitly called to unmap them.
  - 20362 MSG • All open message queue descriptors in the calling process shall be closed as if by  
20363 appropriate calls to *mq\_close()*.
  - 20364 • Any outstanding cancelable asynchronous I/O operations may be canceled. Those  
20365 asynchronous I/O operations that are not canceled shall complete as if the *\_Exit()* or  
20366 *\_exit()* operation had not yet occurred, but any associated signal notifications shall be

20367 suppressed. The `_Exit()` or `_exit()` operation may block awaiting such I/O completion.  
20368 Whether any I/O is canceled, and which I/O may be canceled upon `_Exit()` or `_exit()`, is  
20369 implementation-defined.

- 20370 • Threads terminated by a call to `_Exit()` or `_exit()` shall not invoke their cancellation  
20371 cleanup handlers or per-thread data destructors.

## 20372 **RETURN VALUE**

20373 These functions do not return.

## 20374 **ERRORS**

20375 No errors are defined.

## 20376 **EXAMPLES**

20377 None.

## 20378 **APPLICATION USAGE**

20379 Normally applications should use `exit()` rather than `_Exit()` or `_exit()`.

20380 Exit statuses of 126 and greater are ambiguous in certain circumstances because they have  
20381 special meanings in the shell (see [Section 2.8.2](#) (on page 2499) and the EXIT STATUS section of  
20382 *sh*).

## 20383 **RATIONALE**

### 20384 **Process Termination**

20385 Early proposals drew a distinction between normal and abnormal process termination.  
20386 Abnormal termination was caused only by certain signals and resulted in implementation-  
20387 defined “actions”, as discussed below. Subsequent proposals distinguished three types of  
20388 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and  
20389 *abnormal termination with actions*. Again the distinction between the two types of abnormal  
20390 termination was that they were caused by different signals and that implementation-defined  
20391 actions would result in the latter case. Given that these actions were completely implementation-  
20392 defined, the early proposals were only saying when the actions could occur and how their  
20393 occurrence could be detected, but not what they were. This was of little or no use to conforming  
20394 applications, and thus the distinction is not made in this volume of POSIX.1-2024.

20395 The implementation-defined actions usually include, in most historical implementations, the  
20396 creation of a file named **core** in the current working directory of the process. This file contains an  
20397 image of the memory of the process, together with descriptive information about the process,  
20398 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

20399 There is a potential security problem in creating a **core** file if the process was set-user-ID and the  
20400 current user is not the owner of the program, if the process was set-group-ID and none of the  
20401 user’s groups match the group of the program, or if the user does not have permission to write  
20402 in the current directory. In this situation, an implementation either should not create a **core** file  
20403 or should make it unreadable by the user.

20404 Despite the silence of this volume of POSIX.1-2024 on this feature, applications are advised not  
20405 to create files named **core** because of potential conflicts in many implementations. Some  
20406 implementations use a name other than **core** for the file; for example, by appending the process  
20407 ID to the filename.

20408 **Terminating a Process**

20409 It is important that the consequences of process termination as described occur regardless of  
20410 whether the process called `_exit()` (perhaps indirectly through `exit()`) or instead was terminated  
20411 due to a signal or for some other reason. Note that in the specific case of `exit()` this means that  
20412 the `status` argument to `exit()` is treated in the same way as the `status` argument to `_exit()`.

20413 A language other than C may have other termination primitives than the C-language `exit()`  
20414 function, and programs written in such a language should use its native termination primitives,  
20415 but those should have as part of their function the behavior of `_exit()` as described.  
20416 Implementations in languages other than C are outside the scope of this version of this volume  
20417 of POSIX.1-2024, however.

20418 As required by the ISO C standard, using **return** from `main()` has the same behavior (other than  
20419 with respect to language scope issues) as calling `exit()` with the returned value. Reaching the end  
20420 of the `main()` function has the same behavior as calling `exit(0)`.

20421 A value of zero (or `EXIT_SUCCESS`, which is required to be zero) for the argument `status`  
20422 conventionally indicates successful termination. This corresponds to the specification for `exit()`  
20423 in the ISO C standard. The convention is followed by utilities such as `make` and various shells,  
20424 which interpret a zero status from a child process as success. For this reason, applications should  
20425 not call `exit(0)` or `_exit(0)` when they terminate unsuccessfully; for example, in signal-catching  
20426 functions.

20427 Historically, the implementation-defined process that inherits children whose parents have  
20428 terminated without waiting on them is called `init` and has a process ID of 1.

20429 The sending of a `SIGHUP` to the foreground process group when a controlling process  
20430 terminates corresponds to somewhat different historical implementations. In System V, the  
20431 kernel sends a `SIGHUP` on termination of (essentially) a controlling process. In 4.2 BSD, the  
20432 kernel does not send `SIGHUP` in a case like this, but the termination of a controlling process is  
20433 usually noticed by a system daemon, which arranges to send a `SIGHUP` to the foreground  
20434 process group with the `vhangup()` function. However, in 4.2 BSD, due to the behavior of the  
20435 shells that support job control, the controlling process is usually a shell with no other processes  
20436 in its process group. Thus, a change to make `_exit()` behave this way in such systems should not  
20437 cause problems with existing applications.

20438 The termination of a process may cause a process group to become orphaned in either of two  
20439 ways. The connection of a process group to its parent(s) outside of the group depends on both  
20440 the parents and their children. Thus, a process group may be orphaned by the termination of the  
20441 last connecting parent process outside of the group or by the termination of the last direct  
20442 descendant of the parent process(es). In either case, if the termination of a process causes a  
20443 process group to become orphaned, processes within the group are disconnected from their job  
20444 control shell, which no longer has any information on the existence of the process group.  
20445 Stopped processes within the group would languish forever. In order to avoid this problem,  
20446 newly orphaned process groups that contain stopped processes are sent a `SIGHUP` signal and a  
20447 `SIGCONT` signal to indicate that they have been disconnected from their session. The `SIGHUP`  
20448 signal causes the process group members to terminate unless they are catching or ignoring  
20449 `SIGHUP`. Under most circumstances, all of the members of the process group are stopped if any  
20450 of them are stopped.

20451 The action of sending a `SIGHUP` and a `SIGCONT` signal to members of a newly orphaned  
20452 process group is similar to the action of 4.2 BSD, which sends `SIGHUP` and `SIGCONT` to each  
20453 stopped child of an exiting process. If such children exit in response to the `SIGHUP`, any  
20454 additional descendants receive similar treatment at that time. In this volume of POSIX.1-2024,  
20455 the signals are sent to the entire process group at the same time. Also, in this volume of

20456 POSIX.1-2024, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a  
20457 process group that is not orphaned; therefore, the action taken at `_exit()` must consider processes  
20458 other than child processes.

20459 It is possible for a process group to be orphaned by a call to `setpgid()` or `setsid()`, as well as by  
20460 process termination. This volume of POSIX.1-2024 does not require sending SIGHUP and  
20461 SIGCONT in those cases, because, unlike process termination, those cases are not caused  
20462 accidentally by applications that are unaware of job control. An implementation can choose to  
20463 send SIGHUP and SIGCONT in those cases as an extension; such an extension must be  
20464 documented as required in **<signal.h>**.

20465 The ISO/IEC 9899:1999 standard added the `_Exit()` function that results in immediate program  
20466 termination without triggering signals or `atexit()`-registered functions. In POSIX.1-2024, this is  
20467 equivalent to the `_exit()` function.

## 20468 **FUTURE DIRECTIONS**

20469 None.

## 20470 **SEE ALSO**

## 20474 **CHANGE HISTORY**

20475 First released in Issue 1. Derived from Issue 1 of the SVID.

### 20476 **Issue 5**

20477 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
20478 Threads Extension.

20479 Interactions with the SA\_NOCLDWAIT flag and SIGCHLD signal are further clarified.

20480 The values of *status* from `exit()` are better described.

### 20481 **Issue 6**

20482 Extensions beyond the ISO C standard are marked.

20483 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
20484 for typed memory.

20485 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 20486 • The `_Exit()` function is included.
- 20487 • The DESCRIPTION is updated.

20488 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

20489 References to the `wait3()` function are removed.

20490 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the  
20491 DESCRIPTION.

### 20492 **Issue 7**

20493 Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the  
20494 `exit()` function.

20495 Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of  
20496 streams and closing of temporary files.

20497 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and

- 20498 Semaphores options is moved to the Base.
- 20499 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0033 [594] and XSH/TC2-2008/0034  
20500 [594,690] are applied.
- 20501 **Issue 8**
- 20502 Austin Group Defect 368 is applied, adding a requirement for unnamed semaphores to be  
20503 destroyed.
- 20504 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
20505 standard.
- 20506 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 20507 Austin Group Defect 1629 is applied, changing the APPLICATION USAGE section.

20508 **NAME**

20509 `_Fork` — create a new process

20510 **SYNOPSIS**

20511 `#include <unistd.h>`

20512 `pid_t _Fork(void);`

20513 **DESCRIPTION**

20514 Refer to *fork()*.

20515 **NAME**

20516 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

20517 **SYNOPSIS**

```
20518 XSI #include <stdlib.h>
20519 long a64l(const char *s);
20520 char *l64a(long value);
```

20521 **DESCRIPTION**

20522 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by  
 20523 which 32-bit integers can be represented by up to six characters; each character represents a digit  
 20524 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall  
 20525 be used for these operations.

20526 The characters used to represent digits are '.' (dot) for 0, '/' for 1, '0' through '9' for [2,11],  
 20527 'A' through 'Z' for [12,37], and 'a' through 'z' for [38,63].

20528 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the  
 20529 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains  
 20530 more than six characters, *a64l()* shall use the first six. If the first six characters of the string  
 20531 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The  
 20532 *a64l()* function shall scan the character string from left to right with the least significant digit on  
 20533 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than  
 20534 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null  
 20535 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

20536 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding  
 20537 radix-64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

20538 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may  
 20539 overwrite the buffer.

20540 The *l64a()* function need not be thread-safe.

20541 **RETURN VALUE**

20542 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the  
 20543 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

20544 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall  
 20545 return a pointer to an empty string.

20546 **ERRORS**

20547 No errors are defined.

20548 **EXAMPLES**

20549 None.

20550 **APPLICATION USAGE**

20551 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

20552 **RATIONALE**

20553 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

20554 **FUTURE DIRECTIONS**

20555 None.

20556 **SEE ALSO**20557 [strtol\(\)](#)20558 XBD [<stdlib.h>](#)20559 XCU [uuencode](#)20560 **CHANGE HISTORY**

20561 First released in Issue 4, Version 2.

20562 **Issue 5**

20563 Moved from X/OPEN UNIX extension to BASE.

20564 Normative text previously in the APPLICATION USAGE section is moved to the  
20565 DESCRIPTION.20566 A note indicating that the *l64a()* function need not be reentrant is added to the DESCRIPTION.20567 **Issue 7**

20568 Austin Group Interpretation 1003.1-2001 #156 is applied.

20569 **NAME**

20570 abort — generate an abnormal process abort

20571 **SYNOPSIS**

20572 #include &lt;stdlib.h&gt;

20573 \_Noreturn void abort(void);

20574 **DESCRIPTION**

20575 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20576 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20577 volume of POSIX.1-2024 defers to the ISO C standard.

20578 The *abort()* function shall cause abnormal process termination to occur, unless a SIGABRT signal  
 20579 that it generates is caught and the signal handler does not return.

20580 CX The abnormal termination processing shall include the default actions defined for SIGABRT and  
 20581 may include an attempt to effect *fclose()* on all open streams.

20582 CX The SIGABRT signal shall be sent to the calling thread as if by means of *raise()* with the  
 20583 CX argument SIGABRT. If this signal does not terminate the process (for example, if the signal is  
 20584 caught and the handler returns), *abort()* may change the disposition of SIGABRT to SIG\_DFL  
 20585 and send the signal (in the same way) again. If a second signal is sent and it does not terminate  
 20586 the process, the behavior is unspecified, except that the *abort()* call shall not return.

20587 CX The status made available to *wait()*, *waitid()*, or *waitpid()* by *abort()* shall be that of a process  
 20588 terminated by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the  
 20589 SIGABRT signal.

20590 **RETURN VALUE**20591 The *abort()* function shall not return.20592 **ERRORS**

20593 No errors are defined.

20594 **EXAMPLES**

20595 None.

20596 **APPLICATION USAGE**

20597 Catching the signal is intended to provide the application developer with a portable means to  
 20598 abort processing, free from possible interference from any implementation-supplied functions.

20599 **RATIONALE**

20600 Historically, *abort()* has been implemented by calling other signal manipulation functions such  
 20601 as *raise()*, *sigaction()*, and *pthread\_sigmask()*. This means that its operation can be affected by  
 20602 concurrent actions in other threads. For example, if *abort()* attempts to terminate the process by  
 20603 calling *sigaction()* to change the disposition for SIGABRT to SIG\_DFL and then calling *raise()*,  
 20604 another thread could change the disposition in between those two calls, resulting in the process  
 20605 not being terminated. If this happens, the only requirement is that *abort()* does not return. An  
 20606 implementation could call those functions in a loop (which could in theory then execute  
 20607 indefinitely), or could terminate the process by calling *\_exit()* (which would ensure termination  
 20608 but result in the wrong wait status). To avoid these issues, implementations are encouraged to  
 20609 implement *abort()* in a manner such that its operation cannot be affected by concurrent actions  
 20610 in other threads. For example, it could first halt the execution of all other threads, or it could  
 20611 terminate the process using a “terminate as if by a signal” system call instead of by raising (a  
 20612 second) SIGABRT.

20613 The ISO/IEC 9899:1999 standard required (and the current standard still requires) the *abort()*  
 20614 function to be async-signal-safe. Since POSIX.1-2024 defers to the ISO C standard, this required a

20615 change to the DESCRIPTION from “shall include the effect of *fclose()*” to “may include an  
20616 attempt to effect *fclose()*.”

20617 The revised wording permits some backwards-compatibility and avoids a potential deadlock  
20618 situation.

20619 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded  
20620 paragraph from the DESCRIPTION:

20621 “On XSI-conformant systems, in addition the abnormal termination processing shall include the  
20622 effect of *fclose()* on message catalog descriptors.”

20623 There were several reasons to remove this paragraph:

- 20624 • No special processing of open message catalogs needs to be performed prior to abnormal  
20625 process termination.
- 20626 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open  
20627 streams is to flush output queued on the stream. Message catalogs in this context are read-  
20628 only and, therefore, do not need to be flushed.
- 20629 • The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog  
20630 descriptors are allowed, but not required to be implemented using a file descriptor, but  
20631 there is no mention in POSIX.1-2024 of a message catalog descriptor using a standard I/O  
20632 stream FILE object as would be expected by *fclose()*.

#### 20633 FUTURE DIRECTIONS

20634 A future version of this standard may require *abort()* to be implemented in a manner such that  
20635 its operation cannot be affected by concurrent actions in other threads.

#### 20636 SEE ALSO

20637 *exit()*, *kill()*, *raise()*, *signal()*, *wait()*, *waitid()*

20638 XBD <stdlib.h>

#### 20639 CHANGE HISTORY

20640 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 20641 Issue 6

20642 Extensions beyond the ISO C standard are marked.

20643 Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

20644 The Open Group Base Resolution bwg2002-003 is applied.

20645 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the  
20646 DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

20647 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing “implementation-  
20648 defined functions” to “implementation-supplied functions” in the APPLICATION USAGE  
20649 section.

#### 20650 Issue 8

20651 Austin Group Defect 906 is applied, clarifying how the behavior of *abort()* may be affected by  
20652 concurrent actions in other threads.

20653 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
20654 standard.

20655 **NAME**

20656 abs — return an integer absolute value

20657 **SYNOPSIS**

20658 #include &lt;stdlib.h&gt;

20659 int abs(int i);

20660 **DESCRIPTION**

20661 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
20662 conflict between the requirements described here and the ISO C standard is unintentional. This  
20663 volume of POSIX.1-2024 defers to the ISO C standard.

20664 The *abs()* function shall compute the absolute value of its integer operand, *i*. If the result cannot  
20665 be represented, the behavior is undefined.

20666 **RETURN VALUE**20667 The *abs()* function shall return the absolute value of its integer operand.20668 **ERRORS**

20669 No errors are defined.

20670 **EXAMPLES**

20671 None.

20672 **APPLICATION USAGE**

20673 Since POSIX.1 requires a two's complement representation of **int**, the absolute value of the  
20674 negative integer with the largest magnitude {INT\_MIN} is not representable, thus *abs*(INT\_MIN)  
20675 is undefined.

20676 **RATIONALE**

20677 None.

20678 **FUTURE DIRECTIONS**

20679 None.

20680 **SEE ALSO**20681 *fabs()*, *labs()*

20682 XBD &lt;stdlib.h&gt;

20683 **CHANGE HISTORY**

20684 First released in Issue 1. Derived from Issue 1 of the SVID.

20685 **Issue 6**

20686 Extensions beyond the ISO C standard are marked.

20687 **Issue 8**

20688 Austin Group Defect 1108 is applied, changing the APPLICATION USAGE section.

20689 **NAME**

20690 accept, accept4 — accept a new connection on a socket

20691 **SYNOPSIS**

```
20692 #include <sys/socket.h>
20693 int accept(int socket, struct sockaddr *restrict address,
20694           socklen_t *restrict address_len);
20695 int accept4(int socket, struct sockaddr *restrict address,
20696            socklen_t *restrict address_len, int flag);
```

20697 **DESCRIPTION**

20698 The *accept()* function shall extract the first connection on the queue of pending connections, create a new socket with the same socket type protocol and address family as the specified socket, and allocate a new file descriptor for that socket. The file descriptor shall be allocated as described in [Section 2.6](#) (on page 525).

20702 The *accept()* function takes the following arguments:

20703	<i>socket</i>	Specifies a socket that was created with <i>socket()</i> , has been bound to an address with <i>bind()</i> , and has issued a successful call to <i>listen()</i> .
20705	<i>address</i>	Either a null pointer, or a pointer to a <b>sockaddr</b> structure where the address of the connecting socket shall be returned.
20707	<i>address_len</i>	Either a null pointer, if <i>address</i> is a null pointer, or a pointer to a <b>socklen_t</b> object which on input specifies the length of the supplied <b>sockaddr</b> structure, and on output specifies the length of the address of the connecting socket.

20710 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in the object pointed to by *address\_len*.

20713 If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

20715 If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

20717 If the listen queue is empty of connection requests and `O_NONBLOCK` is not set on the file descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is empty of connection requests and `O_NONBLOCK` is set on the file descriptor for the socket, *accept()* shall fail and set *errno* to `[EAGAIN]` or `[EWOULDBLOCK]`.

20721 The accepted socket cannot itself accept more connections. The original socket remains open and can accept more connections.

20723 If `O_NONBLOCK` is set on the file description for *socket*, it is implementation-defined whether `O_NONBLOCK` will be set on the file description created by *accept()*. `FD_CLOEXEC` and `FD_CLOFORK` for the new file descriptor shall be clear, regardless of how they are currently set for *socket*.

20727 It is implementation-defined which socket options, if any, on the accepted socket will have a default value determined by a value previously customized by *setsockopt()* on *socket*, rather than the default value used for other new sockets.

20730 The *accept4()* function shall be equivalent to the *accept()* function, except that the state of `O_NONBLOCK` on the new file description, and `FD_CLOEXEC` and `FD_CLOFORK` on the returned file descriptor shall be determined solely by the *flag* argument, which can be constructed from a bitwise-inclusive OR of flags from the following list:

- 20734 SOCK\_CLOEXEC Atomically set the FD\_CLOEXEC flag on the new file descriptor.
- 20735 SOCK\_CLOFORK Atomically set the FD\_CLOFORK flag on the new file descriptor.
- 20736 SOCK\_NONBLOCK Set the O\_NONBLOCK file status flag on the new file description.
- 20737 Implementations may define additional flags.

#### 20738 RETURN VALUE

- 20739 Upon successful completion, *accept()* and *accept4()* shall return the non-negative file descriptor of the accepted socket. Otherwise, *-1* shall be returned, *errno* shall be set to indicate the error, and any object pointed to by *address\_len* shall remain unchanged.

#### 20742 ERRORS

- 20743 The *accept()* and *accept4()* functions shall fail if:
- 20744 [EAGAIN] or [EWOULDBLOCK]  
20745 O\_NONBLOCK is set for the socket file descriptor and no connections are  
20746 present to be accepted.
- 20747 [EBADF] The *socket* argument is not a valid file descriptor.
- 20748 [ECONNABORTED]  
20749 A connection has been aborted.
- 20750 [EINTR] The *accept()* function was interrupted by a signal that was caught before a  
20751 valid connection arrived.
- 20752 [EINVAL] The *socket* is not accepting connections.
- 20753 [EMFILE] All file descriptors available to the process are currently open.
- 20754 [ENFILE] The maximum number of file descriptors in the system are already open.
- 20755 [ENOBUFS] No buffer space is available.
- 20756 [ENOMEM] There was insufficient memory available to complete the operation.
- 20757 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 20758 [EOPNOTSUPP] The socket type of the specified socket does not support accepting  
20759 connections.

20760 The *accept()* and *accept4()* functions may fail if:

- 20761 [EPROTO] A protocol error has occurred.
- 20762 The *accept4()* function may fail if:
- 20763 [EINVAL] The value of the *flag* argument is invalid.

#### 20764 EXAMPLES

- 20765 None.

#### 20766 APPLICATION USAGE

- 20767 When a connection is available, *select()* indicates that the file descriptor for the socket is ready  
20768 for reading.

- 20769 Many socket options are described as having implementation-defined default values, which  
20770 may differ according to the protocol in use by the socket. Existing practice differs on whether  
20771 socket options such as SO\_SNDBUF that were customized on the original listening socket will  
20772 impact the corresponding option on the newly returned socket. Implementations are permitted  
20773 to allow inheritance of customized settings where it makes sense, although the most portable

20774 approach for applications is to limit *setsockopt()* customizations to only the accepted socket.

20775 For AF\_UNIX sockets, it is recommended that *address* points to a buffer of length greater than  
 20776 `sizeof(struct sockaddr_un)` which has been initialized with null bytes. That way, even if  
 20777 the implementation supports the use of all bytes of *sun\_path* without a terminating null byte, the  
 20778 larger buffer guarantees that the *sun\_path* member can then be passed to other interfaces that  
 20779 expect a null-terminated string. If no truncation occurred based on the input value of *address\_len*,  
 20780 it is unspecified whether the returned *address\_len* will be `sizeof(struct sockaddr_un)`, or  
 20781 merely a value at least as large as `offsetof(struct sockaddr_un, sun_path)` plus the  
 20782 number of non-null bytes stored in *sun\_path*.

#### 20783 RATIONALE

20784 The SOCK\_CLOEXEC and SOCK\_CLOFORK flags of *accept4()* are necessary to avoid a data  
 20785 race in multi-threaded applications. Without SOCK\_CLOFORK, a file descriptor is leaked into a  
 20786 child process created by one thread in the window between another thread creating a file  
 20787 descriptor with *accept()* and then using *fcntl()* to set the FD\_CLOFORK flag. Without  
 20788 SOCK\_CLOEXEC, a file descriptor intentionally inherited by child processes is similarly leaked  
 20789 into an executed program if FD\_CLOEXEC is not set atomically.

20790 Two designs often used for network servers are multi-threaded servers with a pre-created pool  
 20791 of worker threads, where the thread that accepts the connection request hands over the new file  
 20792 descriptor to a worker thread for servicing, and pre-fork servers with a pre-created pool of  
 20793 worker processes, where the process that accepts the connection request passes the new file  
 20794 descriptor (for example via *sendmsg()*) to a worker process. In both of these designs, *accept4()*  
 20795 should be used with the SOCK\_CLOFORK flag set. Simpler designs are also sometimes used  
 20796 that do not pre-create a pool. For a multi-threaded server that creates a thread to handle each  
 20797 request, SOCK\_CLOFORK should still be used. For a forking server that creates a child to  
 20798 service each request, clearly SOCK\_CLOFORK cannot be used if the child is to inherit the file  
 20799 descriptor to be serviced, and therefore this type of server needs to use an alternative method of  
 20800 indicating the end of communications, for example using *shutdown()*, to ensure the client sees  
 20801 end-of-file, rather than just closing the socket. Such child processes should set FD\_CLOFORK on  
 20802 the inherited file descriptor before they attempt to start any additional child processes to avoid  
 20803 leakage into those children.

20804 The SOCK\_NONBLOCK flag is for convenience in avoiding additional *fcntl()* calls, as well as  
 20805 providing specific control over the O\_NONBLOCK flag, since traditional implementations of  
 20806 *accept()* differ on whether O\_NONBLOCK is inherited from the *socket* argument.

#### 20807 FUTURE DIRECTIONS

20808 None.

#### 20809 SEE ALSO

20810 [Section 2.6](#) (on page 525), *bind()*, *connect()*, *listen()*, *socket()*

20811 XBD [<sys/socket.h>](#)

#### 20812 CHANGE HISTORY

20813 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

20814 The **restrict** keyword is added to the *accept()* prototype for alignment with the  
 20815 ISO/IEC 9899:1999 standard.

#### 20816 Issue 7

20817 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

20818 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS]  
 20819 and [ENOMEM] errors to become “shall fail” errors.

- 20820            Functionality relating to XSI STREAMS is marked obsolescent.
- 20821            POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0018 [464] is applied.
- 20822            POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0035 [835] and XSH/TC2-2008/0036  
20823            [836] are applied.
- 20824    **Issue 8**
- 20825            Austin Group Defects 411 and 1318 are applied, adding *accept4()*, requiring FD\_CLOEXEC and  
20826            FD\_CLOFORK to be clear for the file descriptor returned by *accept()*, and clarifying the  
20827            requirements for O\_NONBLOCK on the file description created by *accept()*.
- 20828            Austin Group Defect 561 is applied, adding a paragraph about *sun\_path* to APPLICATION  
20829            USAGE.
- 20830            Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 20831            Austin Group Defect 1337 is applied, clarifying socket option default values.
- 20832            Austin Group Defect 1565 is applied, changing the description of *address\_len*.

20833 **NAME**

20834 access, faccessat — determine accessibility of a file descriptor

20835 **SYNOPSIS**

20836 #include &lt;unistd.h&gt;

20837 int access(const char \*path, int amode);

20838 OH #include &lt;fcntl.h&gt;

20839 int faccessat(int fd, const char \*path, int amode, int flag);

20840 **DESCRIPTION**

20841 The `access()` function shall check the file named by the pathname pointed to by the `path`  
 20842 argument for accessibility according to the bit pattern contained in `amode`. The checks for  
 20843 accessibility (including directory permissions checked during pathname resolution) shall be  
 20844 performed using the real user ID in place of the effective user ID and the real group ID in place  
 20845 of the effective group ID.

20846 The value of `amode` is either the bitwise-inclusive OR of the access permissions to be checked  
 20847 (R\_OK, W\_OK, X\_OK) or the existence test (F\_OK).

20848 If any access permissions are checked, each shall be checked individually, as described in XBD  
 20849 [Section 4.7](#) (on page 97), except that where that description refers to execute permission for a  
 20850 process with appropriate privileges, an implementation may indicate success for X\_OK even if  
 20851 execute permission is not granted to any user.

20852 The `faccessat()` function, when called with a `flag` value of zero, shall be equivalent to the `access()`  
 20853 function, except in the case where `path` specifies a relative path. In this case the file whose  
 20854 accessibility is to be determined shall be located relative to the directory associated with the file  
 20855 descriptor `fd` instead of the current working directory. If the access mode of the open file  
 20856 description associated with the file descriptor is not O\_SEARCH, the function shall check  
 20857 whether directory searches are permitted using the current permissions of the directory  
 20858 underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not perform  
 20859 the check.

20860 If `faccessat()` is passed the special value AT\_FDCWD in the `fd` parameter, the current working  
 20861 directory shall be used and, if `flag` is zero, the behavior shall be identical to a call to `access()`.

20862 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 20863 in <fcntl.h>:

20864 AT\_EACCESS The checks for accessibility (including directory permissions checked during  
 20865 pathname resolution) shall be performed using the effective user ID and  
 20866 group ID instead of the real user ID and group ID as required in a call to  
 20867 `access()`.

20868 **RETURN VALUE**

20869 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 20870 return -1 and set `errno` to indicate the error.

20871 **ERRORS**

20872 These functions shall fail if:

20873 [EACCES] Permission bits of the file mode do not permit the requested access, or search  
 20874 permission is denied on a component of the path prefix.

20875 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
 20876 argument.

20877	[ENAMETOOLONG]	
20878		The length of a component of a pathname is longer than {NAME_MAX}.
20879	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
20880	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
20881		
20882		
20883		
20884		
20885	[EROFS]	Write access is requested for a file on a read-only file system.
20886		The <i>faccessat()</i> function shall fail if:
20887	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not <code>O_SEARCH</code> and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
20888		
20889		
20890	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.
20891		
20892	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
20893		
20894		These functions may fail if:
20895	[EINVAL]	The value of the <i>amode</i> argument is invalid.
20896	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
20897		
20898	[ENAMETOOLONG]	
20899		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
20900		
20901		
20902	[ETXTBSY]	Write access is requested for a pure procedure (shared text) file that is being executed.
20903		
20904		The <i>faccessat()</i> function may fail if:
20905	[EINVAL]	The value of the <i>flag</i> argument is not valid.

## 20906 EXAMPLES

### 20907 Testing for the Existence of a File

20908 The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```

20909 #include <unistd.h>
20910 ...
20911 int result;
20912 const char *pathname = "/tmp/myfile";
20913 result = access (pathname, F_OK);

```

## 20914 APPLICATION USAGE

20915 Use of these functions is discouraged since by the time the returned information is acted upon, it  
 20916 is out-of-date. (That is, acting upon the information always leads to a time-of-check-to-time-of-  
 20917 use race condition.) An application should instead attempt the action itself and handle the  
 20918 [EACCES] error that occurs if the file is not accessible (with a change of effective user and group  
 20919 IDs beforehand, and perhaps a change back afterwards, in the case where *access()* or *faccessat()*  
 20920 without AT\_EACCESS would have been used.)

20921 Historically, one of the uses of *access()* was in set-user-ID root programs to check whether the  
 20922 user running the program had access to a file. This relied on “super-user” privileges which were  
 20923 granted based on the effective user ID being zero, so that when *access()* used the real user ID to  
 20924 check accessibility those privileges were not taken into account. On newer systems where  
 20925 privileges can be assigned which have no association with user or group IDs, if a program with  
 20926 such privileges calls *access()*, the change of IDs has no effect on the privileges and therefore they  
 20927 are taken into account in the accessibility checks. Thus, *access()* (and *faccessat()* with flag zero)  
 20928 cannot be used for this historical purpose in such programs. Likewise, if a system provides any  
 20929 additional or alternate file access control mechanisms that are not user ID-based, they will still  
 20930 be taken into account.

20931 If a relative pathname is used, no account is taken of whether the current directory (or the  
 20932 directory associated with the file descriptor *fd*) is accessible via any absolute pathname.  
 20933 Applications using *access()*, or *faccessat()* without AT\_EACCESS, may consequently act as if the  
 20934 file would be accessible to a user with the real user ID and group ID of the process when such a  
 20935 user would not in practice be able to access the file because access would be denied at some  
 20936 point above the current directory (or the directory associated with the file descriptor *fd*) in the  
 20937 file hierarchy.

20938 If *access()* or *faccessat()* is used with W\_OK to check for write access to a directory which has the  
 20939 S\_ISVTX bit set, a return value indicating the directory is writable can be misleading since some  
 20940 operations on files in the directory would not be permitted based on the ownership of those files  
 20941 (see XBD Section 4.5, on page 96).

20942 Additional values of *amode* other than the set defined in the description may be valid; for  
 20943 example, if a system has extended access controls.

20944 The use of the AT\_EACCESS value for *flag* enables functionality not available in *access()*.

## 20945 RATIONALE

20946 In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()*  
 20947 function because:

- 20948 1. Historical implementations of *access()* do not test file access correctly when the process’  
 20949 real user ID is superuser. In particular, they always return zero when testing execute  
 20950 permissions without regard to whether the file is executable.
- 20951 2. The superuser has complete access to all files on a system. As a consequence, programs  
 20952 started by the superuser and switched to the effective user ID with lesser privileges  
 20953 cannot use *access()* to test their file access permissions.

20954 However, the historical model of *eaccess()* does not resolve problem (1), so this volume of  
 20955 POSIX.1-2024 now allows *access()* to behave in the desired way because several implementations  
 20956 have corrected the problem. It was also argued that problem (2) is more easily solved by using  
 20957 *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the error, rather  
 20958 than creating a new function that would not be as reliable. Therefore, *eaccess()* is not included in  
 20959 this volume of POSIX.1-2024.

20960 The sentence concerning appropriate privileges and execute permission bits reflects the two

20961 possibilities implemented by historical implementations when checking superuser access for  
20962 X\_OK.

20963 New implementations are discouraged from returning X\_OK unless at least one execution  
20964 permission bit is set.

20965 The purpose of the *faccessat()* function is to enable the checking of the accessibility of files in  
20966 directories other than the current working directory without exposure to race conditions. Any  
20967 part of the path of a file could be changed in parallel to a call to *access()*, resulting in unspecified  
20968 behavior. By opening a file descriptor for the target directory and using the *faccessat()* function it  
20969 can be guaranteed that the file tested for accessibility is located relative to the desired directory.

#### 20970 **FUTURE DIRECTIONS**

20971 These functions may be formally deprecated (for example, by shading them OB) in a future  
20972 version of this standard.

#### 20973 **SEE ALSO**

20974 *chmod()*, *fstatat()*

20975 XBD Section 4.7 (on page 97), *<fcntl.h>*, *<unistd.h>*

#### 20976 **CHANGE HISTORY**

20977 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 20978 **Issue 6**

20979 The following new requirements on POSIX implementations derive from alignment with the  
20980 Single UNIX Specification:

- 20981 • The [ELOOP] mandatory error condition is added.
- 20982 • A second [ENAMETOOLONG] is added as an optional error condition.
- 20983 • The [ETXTBSY] optional error condition is added.

20984 The following changes were made to align with the IEEE P1003.1a draft standard:

- 20985 • The [ELOOP] optional error condition is added.

#### 20986 **Issue 7**

20987 Austin Group Interpretations 1003.1-2001 #046 and #143 are applied.

20988 The *faccessat()* function is added from The Open Group Technical Standard, 2006, Extended API  
20989 Set Part 2.

20990 Changes are made to allow a directory to be opened for searching.

20991 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
20992 pathname exists but is not a directory or a symbolic link to a directory.

20993 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0019 [461], XSH/TC1-2008/0020 [324],  
20994 XSH/TC1-2008/0021 [278], XSH/TC1-2008/0022 [278], and XSH/TC1-2008/0023 [291] are  
20995 applied.

20996 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0037 [873], XSH/TC2-2008/0038 [591],  
20997 XSH/TC2-2008/0039 [838], XSH/TC2-2008/0040 [817], XSH/TC2-2008/0041 [487],  
20998 XSH/TC2-2008/0042 [838], XSH/TC2-2008/0043 [817], and XSH/TC2-2008/0044 [838] are  
20999 applied.

21000 **NAME**

21001           acos, acosf, acosl — arc cosine functions

21002 **SYNOPSIS**

```
21003       #include <math.h>
21004       double acos(double x);
21005       float acosf(float x);
21006       long double acosl(long double x);
```

21007 **DESCRIPTION**

21008 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21009 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21010 volume of POSIX.1-2024 defers to the ISO C standard.

21011       These functions shall compute the principal value of the arc cosine of their argument  $x$ . The  
 21012 value of  $x$  should be in the range  $[-1,1]$ .

21013       An application wishing to check for error situations should set *errno* to zero and call  
 21014 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21015 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21016 zero, an error has occurred.

21017 **RETURN VALUE**

21018       Upon successful completion, these functions shall return the arc cosine of  $x$ , in the range  $[0,\pi]$   
 21019 radians.

21020 MX       For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 21021 supported), or an implementation-defined value shall be returned.

21022 MX       If  $x$  is NaN, a NaN shall be returned.

21023       If  $x$  is +1, +0 shall be returned.

21024       If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

21025 **ERRORS**

21026       These functions shall fail if:

21027 MX       Domain Error    The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm\text{Inf}$ .

21028       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21029 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 21030 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 21031 shall be raised.

21032 **EXAMPLES**

21033       None.

21034 **APPLICATION USAGE**

21035       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 21036 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21037 **RATIONALE**

21038       None.

21039 **FUTURE DIRECTIONS**

21040       None.

21041 **SEE ALSO**21042 *cos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*21043 XBD Section 4.23 (on page 109), **<math.h>**21044 **CHANGE HISTORY**

21045 First released in Issue 1. Derived from Issue 1 of the SVID.

21046 **Issue 5**21047 The DESCRIPTION is updated to indicate how an application should check for an error. This  
21048 text was previously published in the APPLICATION USAGE section.21049 **Issue 6**21050 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.21051 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21052 revised to align with the ISO/IEC 9899:1999 standard.21053 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
21054 marked.21055 **Issue 7**

21056 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0024 [320] is applied.

21057 **NAME**

21058 acosh, acoshf, acoshl — inverse hyperbolic cosine functions

21059 **SYNOPSIS**

```
21060 #include <math.h>
21061 double acosh(double x);
21062 float acoshf(float x);
21063 long double acoshl(long double x);
```

21064 **DESCRIPTION**

21065 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21066 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21067 volume of POSIX.1-2024 defers to the ISO C standard.

21068 These functions shall compute the inverse hyperbolic cosine of their argument  $x$ .

21069 An application wishing to check for error situations should set *errno* to zero and call  
 21070 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21071 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21072 zero, an error has occurred.

21073 **RETURN VALUE**

21074 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their  
 21075 argument.

21076 MX For finite values of  $x < 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 21077 implementation-defined value shall be returned.

21078 MX If  $x$  is NaN, a NaN shall be returned.

21079 If  $x$  is +1, +0 shall be returned.

21080 If  $x$  is +Inf, +Inf shall be returned.

21081 If  $x$  is -Inf, a domain error shall occur, and a NaN shall be returned.

21082 **ERRORS**

21083 These functions shall fail if:

21084 MX Domain Error The  $x$  argument is finite and less than +1.0, or is -Inf.

21085 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21086 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 21087 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 21088 shall be raised.

21089 **EXAMPLES**

21090 None.

21091 **APPLICATION USAGE**

21092 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 21093 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21094 **RATIONALE**

21095 None.

21096 **FUTURE DIRECTIONS**

21097 None.

21102 First released in Issue 4, Version 2.

21103 **Issue 5**

21104 Moved from X/OPEN UNIX extension to BASE.

21105 **Issue 6**21106 The *acosh()* function is no longer marked as an extension.21107 The *acoshf()* and *acoshl()* functions are added for alignment with the ISO/IEC 9899:1999  
21108 standard.21109 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21110 revised to align with the ISO/IEC 9899:1999 standard.21111 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
21112 marked.21113 **Issue 7**

21114 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0025 [320] is applied.

21115 **NAME**

21116           acosl — arc cosine functions

21117 **SYNOPSIS**

21118           #include &lt;math.h&gt;

21119           long double acosl(long double *x*);21120 **DESCRIPTION**21121           Refer to *acos()*.

21122 **NAME**

21123 aio\_cancel — cancel an asynchronous I/O request

21124 **SYNOPSIS**

21125 #include &lt;aio.h&gt;

21126 int aio\_cancel(int *fildev*, struct aiocb \**aiocbp*);21127 **DESCRIPTION**

21128 The *aio\_cancel()* function shall attempt to cancel one or more asynchronous I/O requests  
 21129 currently outstanding against file descriptor *fildev*. The *aiocbp* argument points to the  
 21130 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then  
 21131 all outstanding cancelable asynchronous I/O requests against *fildev* shall be canceled.

21132 Normal asynchronous notification shall occur for asynchronous I/O operations that are  
 21133 successfully canceled. If there are requests that cannot be canceled, then the normal  
 21134 asynchronous completion process shall take place for those requests when they are completed.

21135 For requested operations that are successfully canceled, the associated error status shall be set to  
 21136 [ECANCELED] and the return status shall be -1. For requested operations that are not  
 21137 successfully canceled, the *aiocbp* shall not be modified by *aio\_cancel()*.

21138 If *aiocbp* is not NULL, then if *fildev* does not have the same value as the file descriptor with which  
 21139 the asynchronous operation was initiated, unspecified results occur.

21140 Which operations are cancelable is implementation-defined.

21141 **RETURN VALUE**

21142 The *aio\_cancel()* function shall return the value AIO\_CANCELED if the requested operation(s)  
 21143 were canceled. The value AIO\_NOTCANCELED shall be returned if at least one of the  
 21144 requested operation(s) cannot be canceled because it is in progress. In this case, the state of the  
 21145 other operations, if any, referenced in the call to *aio\_cancel()* is not indicated by the return value  
 21146 of *aio\_cancel()*. The application may determine the state of affairs for these operations by using  
 21147 *aio\_error()*. The value AIO\_ALLDONE is returned if all of the operations have already  
 21148 completed. Otherwise, the function shall return -1 and set *errno* to indicate the error.

21149 **ERRORS**

21150 The *aio\_cancel()* function shall fail if:

21151 [EBADF] The *fildev* argument is not a valid file descriptor.

21152 **EXAMPLES**

21153 None.

21154 **APPLICATION USAGE**

21155 None.

21156 **RATIONALE**

21157 None.

21163 **CHANGE HISTORY**

21164 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21165 **Issue 6**

21166 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
21167 implementation does not support the Asynchronous Input and Output option.

21168 The APPLICATION USAGE section is added.

21169 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/10 is applied, removing the words “to the  
21170 calling process” in the RETURN VALUE section. The term was unnecessary and precluded  
21171 threads.

21172 **Issue 7**

21173 The *aio\_cancel()* function is moved from the Asynchronous Input and Output option to the Base.

21174 **NAME**

21175 aio\_error — retrieve errors status for an asynchronous I/O operation

21176 **SYNOPSIS**

21177 #include &lt;aio.h&gt;

21178 int aio\_error(const struct aiocb \*aiocbp);

21179 **DESCRIPTION**

21180 The *aio\_error()* function shall return the error status associated with the **aiocb** structure  
 21181 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the  
 21182 SIO *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()*  
 21183 operation. If the operation has not yet completed, then the error status shall be equal to  
 21184 [EINPROGRESS].

21185 If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been  
 21186 scheduled, the results are undefined.

21187 **RETURN VALUE**

21188 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the  
 21189 asynchronous operation has completed unsuccessfully, then the error status, as described for  
 21190 SIO *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has  
 21191 not yet completed, then [EINPROGRESS] shall be returned.

21192 If the *aio\_error()* function fails, it shall return  $-1$  and set *errno* to indicate the error.

21193 **ERRORS**21194 The *aio\_error()* function may fail if:

21195 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
 21196 return status has not yet been retrieved.

21197 **EXAMPLES**

21198 None.

21199 **APPLICATION USAGE**

21200 None.

21201 **RATIONALE**

21202 None.

21209 **CHANGE HISTORY**

21210 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21211 **Issue 6**

21212 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 21213 implementation does not support the Asynchronous Input and Output option.

21214 The APPLICATION USAGE section is added.

21215 **Issue 7**

21216 Austin Group Interpretation 1003.1-2001 #045 is applied.

21217 SD5-XSH-ERN-148 is applied.

21218 The *aio\_error()* function is moved from the Asynchronous Input and Output option to the Base.

21219 **NAME**

21220 aio\_fsync — asynchronous file synchronization

21221 **SYNOPSIS**

```
21222 FSC|SIO #include <aio.h>
21223 int aio_fsync(int op, struct aiocb *aiocbp);
```

21224 **DESCRIPTION**

21225 The *aio\_fsync()* function shall asynchronously perform a file synchronization operation, as  
 21226 specified by the *op* argument, for I/O operations associated with the file indicated by the file  
 21227 descriptor *aio\_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument and  
 21228 queued at the time of the call to *aio\_fsync()*. The function call shall return when the  
 21229 synchronization request has been initiated or queued to the file or device (even when the data  
 21230 cannot be synchronized immediately).

21231 SIO If *op* is *O\_DSYNC*, all currently queued I/O operations shall be completed as if by a call to  
 21232 *fdatsync()*; that is, as defined for synchronized I/O data integrity completion.

21233 FSC If *op* is *O\_SYNC*, all currently queued I/O operations shall be completed as if by a call to *fsync()*;  
 21234 FSC SIO that is, as defined for synchronized I/O file integrity completion. If the *aio\_fsync()* function  
 21235 fails, or if the operation queued by *aio\_fsync()* fails, then outstanding I/O operations are not  
 21236 guaranteed to have been completed.

21237 If *aio\_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to  
 21238 *aio\_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of  
 21239 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized  
 21240 fashion.

21241 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used  
 21242 as an argument to *aio\_error()* and *aio\_return()* in order to determine the error status and return  
 21243 status, respectively, of the asynchronous operation while it is proceeding. When the request is  
 21244 queued, the error status for the operation is [EINPROGRESS]. When all data has been  
 21245 successfully transferred, the error status shall be reset to reflect the success or failure of the  
 21246 operation. If the operation does not complete successfully, the error status for the operation shall  
 21247 be set to indicate the error. The *aio\_sigevent* member determines the asynchronous notification to  
 21248 occur as specified in Section 2.4.1 (on page 513) when all operations have achieved synchronized  
 21249 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the  
 21250 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 21251 completion, then the behavior is undefined.

21252 If the *aio\_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to  
 21253 have been successfully transferred.

21254 **RETURN VALUE**

21255 The *aio\_fsync()* function shall return the value 0 if the I/O operation is successfully queued;  
 21256 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

21257 **ERRORS**

21258 The *aio\_fsync()* function shall fail if:

21259 [EAGAIN] The requested asynchronous operation was not queued due to temporary  
 21260 resource limitations.

21261 [EBADF] The *aio\_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument  
 21262 is not a valid file descriptor.

- 21263 SIO [EINVAL] This implementation does not support synchronized I/O for this file.
- 21264 FSC [EINVAL] The *aio\_fildes* member of the *aiocb* structure refers to a file on which an *fsync()* operation is not possible.
- 21265
- 21266 [EINVAL] A value of *op* other than O\_DSYNC or O\_SYNC was specified, or O\_DSYNC was specified and the implementation does not provide runtime support for the Synchronized Input and Output option, or O\_SYNC was specified and the implementation does not provide runtime support for the File Synchronization option.
- 21267
- 21268
- 21269
- 21270
- 21271 In the event that any of the queued I/O operations fail, *aio\_fsync()* shall return the error condition defined for *read()* and *write()*. The error is returned in the error status for the asynchronous operation, which can be retrieved using *aio\_error()*.
- 21272
- 21273

#### 21274 EXAMPLES

21275 None.

#### 21276 APPLICATION USAGE

21277 Note that even if the file descriptor is not open for writing, if there are any pending write requests on the underlying file, then that I/O will be completed prior to the return of a call to *aio\_error()* or *aio\_return()* indicating that the operation has completed.

21278

21295

21296

#### 21297 Issue 7

21298 The *aio\_fsync()* function is moved from the Asynchronous Input and Output option to the Base.

21299 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0026 [98] and XSH/TC1-2008/0027 [98] are applied.

21300

21301 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0045 [671] is applied.

21302 **Issue 8**  
21303

Austin Group Defect 672 is applied, changing the APPLICATION USAGE section.

21304 **NAME**

21305 aio\_read — asynchronous read from a file

21306 **SYNOPSIS**

21307 #include &lt;aio.h&gt;

21308 int aio\_read(struct aiocb \*aiocbp);

21309 **DESCRIPTION**

21310 The *aio\_read()* function shall read *aiocbp->aio\_nbytes* from the file associated with  
 21311 *aiocbp->aio\_fildes* into the buffer pointed to by *aiocbp->aio\_buf*. The function call shall return  
 21312 when the read request has been initiated or queued to the file or device (even when the data  
 21313 cannot be delivered immediately).

21314 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 21315 at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
 21316 Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 21317 PIO TPS otherwise, the base scheduling priority is that of the calling thread.

21318 The *aiocbp* value may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 21319 determine the error status and return status, respectively, of the asynchronous operation while it  
 21320 is proceeding. If an error condition is encountered during queuing, the function call shall return  
 21321 without having initiated or queued the request. The requested operation takes place at the  
 21322 absolute position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to  
 21323 the operation with an *offset* equal to *aio\_offset* and a *whence* equal to *SEEK\_SET*. After a  
 21324 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file  
 21325 is unspecified.

21326 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

21327 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_read()*.

21328 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 21329 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 21330 completion, then the behavior is undefined.

21331 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

21332 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 21333 function shall be according to the definitions of synchronized I/O data integrity completion and  
 21334 synchronized I/O file integrity completion.

21335 For any system action that changes the process memory space while an asynchronous I/O is  
 21336 outstanding to the address range being changed, the result of that action is undefined.

21337 For regular files, no data transfer shall occur past the offset maximum established in the open  
 21338 file description associated with *aiocbp->aio\_fildes*.

21339 **RETURN VALUE**

21340 The *aio\_read()* function shall return the value zero if the I/O operation is successfully queued;  
 21341 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

21342 **ERRORS**

21343 The *aio\_read()* function shall fail if:

21344 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
 21345 resource limitations.

21346 Each of the following conditions may be detected synchronously at the time of the call to  
 21347 *aio\_read()*, or asynchronously. If any of the conditions below are detected synchronously, the

21348 *aio\_read()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
 21349 conditions below are detected asynchronously, the return status of the asynchronous operation  
 21350 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.

21351 [EBADF] The *aiocbp->aio\_fildes* argument is not a valid file descriptor open for reading.

21352 [EINVAL] The file offset value implied by *aiocbp->aio\_offset* would be invalid,  
 21353 PIO *aiocbp->aio\_reqprio* is not a valid value, or *aiocbp->aio\_nbytes* is an invalid  
 21354 value.

21355 In the case that the *aio\_read()* successfully queues the I/O operation but the operation is  
 21356 subsequently canceled or encounters an error, the return status of the asynchronous operation is  
 21357 one of the values normally returned by the *read()* function call. In addition, the error status of  
 21358 the asynchronous operation is set to one of the error statuses normally set by the *read()* function  
 21359 call, or one of the following values:

21360 [EBADF] The *aiocbp->aio\_fildes* argument is not a valid file descriptor open for reading.

21361 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 21362 *aio\_cancel()* request.

21363 [EINVAL] The file offset value implied by *aiocbp->aio\_offset* would be invalid.

21364 The following condition may be detected synchronously or asynchronously:

21365 [EOVERFLOW] The file is a regular file, *aiocbp->aio\_nbytes* is greater than 0, and the starting  
 21366 offset in *aiocbp->aio\_offset* is before the end-of-file and is at or beyond the  
 21367 offset maximum in the open file description associated with *aiocbp->aio\_fildes*.

#### 21380 CHANGE HISTORY

21381 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21382 Large File Summit extensions are added.

#### 21383 Issue 6

21384 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 21385 implementation does not support the Asynchronous Input and Output option.

21386 The APPLICATION USAGE section is added.

21387 The following new requirements on POSIX implementations derive from alignment with the  
21388 Single UNIX Specification:

21389 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
21390 file description. This change is to support large files.

21391 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
21392 large files.

21393 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/12 is applied, rewording the  
21394 DESCRIPTION when prioritized I/O is supported to account for threads, and removing the  
21395 words “to the calling process” in the RETURN VALUE section.

21396 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/13 is applied, updating the [EINVAL]  
21397 error, so that detection of an [EINVAL] error for an invalid value of *aiocbp*→*aio\_reqprio* is only  
21398 required if the Prioritized Input and Output option is supported.

21399 **Issue 7**

21400 Austin Group Interpretation 1003.1-2001 #082 is applied.

21401 The *aio\_read()* function is moved from the Asynchronous Input and Output option to the Base.

21402 **NAME**

21403 aio\_return — retrieve return status of an asynchronous I/O operation

21404 **SYNOPSIS**

```
21405 #include <aio.h>
21406 ssize_t aio_return(struct aiocb *aiocbp);
```

21407 **DESCRIPTION**

21408 The *aio\_return()* function shall return the return status associated with the **aiocb** structure  
 21409 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the  
 21410 value that would be returned by the corresponding *read()*, *write()*, or *fsync()* function call. If the  
 21411 error status for the operation is equal to [EINPROGRESS], then the return status for the  
 21412 operation is undefined. The *aio\_return()* function may be called exactly once to retrieve the  
 21413 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in  
 21414 a call to *aio\_return()* or *aio\_error()*, an error may be returned. When the **aiocb** structure referred  
 21415 to by *aiocbp* is used to submit another asynchronous operation, then *aio\_return()* may be  
 21416 successfully used to retrieve the return status of that operation.

21417 **RETURN VALUE**

21418 If the asynchronous I/O operation has completed, then the return status, as described for *read()*,  
 21419 *write()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed,  
 21420 the results of *aio\_return()* are undefined.

21421 If the *aio\_return()* function fails, it shall return `-1` and set *errno* to indicate the error.

21422 **ERRORS**

21423 The *aio\_return()* function may fail if:

21424 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
 21425 return status has not yet been retrieved.

21426 **EXAMPLES**

21427 None.

21428 **APPLICATION USAGE**

21429 None.

21430 **RATIONALE**

21431 None.

21432 **FUTURE DIRECTIONS**

21433 None.

21434 **SEE ALSO**

21435 *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_write()*, *close()*, *exec*, *exit()*, *fork()*, *lio\_listio()*,  
 21436 *lseek()*, *read()*

21437 XBD [<aio.h>](#)

21438 **CHANGE HISTORY**

21439 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21440 **Issue 6**

21441 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 21442 implementation does not support the Asynchronous Input and Output option.

21443 The APPLICATION USAGE section is added.

21444 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

21445 **Issue 7**

21446 SD5-XSH-ERN-148 is applied.

21447 The *aio\_return()* function is moved from the Asynchronous Input and Output option to the Base.

21448 **NAME**

21449 aio\_suspend — wait for an asynchronous I/O request

21450 **SYNOPSIS**

```
21451 #include <aio.h>
21452 int aio_suspend(const struct aiocb *const list[], int nent,
21453               const struct timespec *timeout);
```

21454 **DESCRIPTION**

21455 The *aio\_suspend()* function shall suspend the calling thread until at least one of the asynchronous  
 21456 I/O operations referenced by the *list* argument has completed, until a signal interrupts the  
 21457 function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any  
 21458 of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is,  
 21459 the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the  
 21460 function shall return without suspending the calling thread. The *list* argument is an array of  
 21461 pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of  
 21462 elements in the array. Each **aiocb** structure pointed to has been used in initiating an  
 21463 asynchronous I/O request via *aio\_read()*, *aio\_write()*, or *lio\_listio()*. This array may contain null  
 21464 pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have  
 21465 not been used in submitting asynchronous I/O, the effect is undefined.

21466 If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of  
 21467 the I/O operations referenced by *list* are completed, then *aio\_suspend()* shall return with an error.  
 21468 The clock that is used to measure this time interval shall be the CLOCK\_MONOTONIC clock.

21469 **RETURN VALUE**

21470 If the *aio\_suspend()* function returns after one or more asynchronous I/O operations have  
 21471 completed, the function shall return zero. Otherwise, the function shall return a value of -1 and  
 21472 set *errno* to indicate the error.

21473 The application may determine which asynchronous I/O completed by scanning the associated  
 21474 error and return status using *aio\_error()* and *aio\_return()*, respectively.

21475 **ERRORS**

21476 The *aio\_suspend()* function shall fail if:

21477 [EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the  
 21478 time interval indicated by *timeout*.

21479 [EINTR] A signal interrupted the *aio\_suspend()* function. Note that, since each  
 21480 asynchronous I/O operation may possibly provoke a signal when it  
 21481 completes, this error return may be caused by the completion of one (or more)  
 21482 of the very I/O operations being awaited.

21490 None.

21491 **SEE ALSO**21492 [aio\\_read\(\)](#), [aio\\_write\(\)](#), [lio\\_listio\(\)](#)21493 XBD <[aio.h](#)>21494 **CHANGE HISTORY**

21495 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21496 **Issue 6**21497 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
21498 implementation does not support the Asynchronous Input and Output option.

21499 The APPLICATION USAGE section is added.

21500 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
21501 CLOCK\_MONOTONIC clock, if supported, is used.21502 **Issue 7**21503 The *aio\_suspend()* function is moved from the Asynchronous Input and Output option to the  
21504 Base.21505 **Issue 8**

21506 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

21507 **NAME**

21508 aio\_write — asynchronous write to a file

21509 **SYNOPSIS**

21510 #include &lt;aio.h&gt;

21511 int aio\_write(struct aiocb \*aiocbp);

21512 **DESCRIPTION**

21513 The *aio\_write()* function shall write *aiocbp->aio\_nbytes* to the file associated with  
 21514 *aiocbp->aio\_fildes* from the buffer pointed to by *aiocbp->aio\_buf*. The function shall return when  
 21515 the write request has been initiated or, at a minimum, queued to the file or device.

21516 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 21517 at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
 21518 Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 21519 PIO TPS otherwise, the base scheduling priority is that of the calling thread.

21520 The *aiocbp* argument may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 21521 determine the error status and return status, respectively, of the asynchronous operation while it  
 21522 is proceeding.

21523 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 21524 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 21525 completion, then the behavior is undefined.

21526 If O\_APPEND is not set for the file descriptor *aio\_fildes*, then the requested operation shall take  
 21527 place at the absolute position in the file as given by *aio\_offset*, as if *lseek()* were called  
 21528 immediately prior to the operation with an *offset* equal to *aio\_offset* and a *whence* equal to  
 21529 SEEK\_SET. If O\_APPEND is set for the file descriptor, or if *aio\_fildes* is associated with a device  
 21530 that is incapable of seeking, write operations append to the file in the same order as the calls  
 21531 were made, except under circumstances described in Section 2.8.2. After a successful call to  
 21532 enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified.

21533 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

21534 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_write()*.

21535 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

21536 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 21537 function shall be according to the definitions of synchronized I/O data integrity completion, and  
 21538 synchronized I/O file integrity completion.

21539 For any system action that changes the process memory space while an asynchronous I/O is  
 21540 outstanding to the address range being changed, the result of that action is undefined.

21541 For regular files, no data transfer shall occur past the offset maximum established in the open  
 21542 file description associated with *aiocbp->aio\_fildes*.

21543 If the request would cause the file size to exceed the soft file size limit for the process and there  
 21544 XSI is no room for any bytes to be written, the request shall fail and the implementation shall  
 21545 generate a SIGXFSZ signal for the thread.

21546 **RETURN VALUE**

21547 The *aio\_write()* function shall return the value zero if the I/O operation is successfully queued;  
 21548 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

21549 **ERRORS**21550 The *aio\_write()* function shall fail if:21551 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
21552 resource limitations.21553 Each of the following conditions may be detected synchronously at the time of the call to  
21554 *aio\_write()*, or asynchronously. If any of the conditions below are detected synchronously, the  
21555 *aio\_write()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
21556 conditions below are detected asynchronously, the return status of the asynchronous operation  
21557 shall be set to `-1`, and the error status of the asynchronous operation is set to the corresponding  
21558 value.21559 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for writing.21560 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid,  
21561 PIO *aioctx->aio\_reqprio* is not a valid value, or *aioctx->aio\_nbytes* is an invalid  
21562 value.21563 In the case that the *aio\_write()* successfully queues the I/O operation, the return status of the  
21564 asynchronous operation shall be one of the values normally returned by the *write()* function call.  
21565 If the operation is successfully queued but is subsequently canceled or encounters an error, the  
21566 error status for the asynchronous operation contains one of the values normally set by the  
21567 *write()* function call, or one of the following:21568 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for writing.21569 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid.21570 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
21571 *aio\_cancel()* request.

21572 The following condition may be detected synchronously or asynchronously:

21573 [EFBIG] The file is a regular file, *aioctx->aio\_nbytes* is greater than 0, and the starting  
21574 position is greater than or equal to the offset maximum in the open file  
21575 description associated with *aioctx->aio\_fildes*.21576 [EFBIG] The file is a regular file, *aioctx->aio\_nbytes* is greater than 0, and there is no  
21577 room for any bytes to be written at the starting position without exceeding the  
21578 XSI file size limit for the process. A SIGXFSZ signal shall also be generated for  
21579 the thread.21580 [EFBIG] The file is a regular file, *aioctx->aio\_nbytes* is greater than 0, and there is no  
21581 room for any bytes to be written at the starting position without exceeding the  
21582 implementation-defined maximum file size.21583 **EXAMPLES**

21585 **APPLICATION USAGE**

21586 None.

21587 **RATIONALE**

21588 None.

21589 **FUTURE DIRECTIONS**

21590 None.

21591 **SEE ALSO**21592 Section 2.8.2 (on page 528), *aio\_cancel()*, *aio\_error()*, *aio\_read()*, *aio\_return()*, *close()*, *exec*, *exit()*,  
21593 *fork()*, *lio\_listio()*, *lseek()*, *write()*21594 XBD <**aio.h**>21595 **CHANGE HISTORY**

21596 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

21597 Large File Summit extensions are added.

21598 **Issue 6**21599 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
21600 implementation does not support the Asynchronous Input and Output option.

21601 The APPLICATION USAGE section is added.

21602 The following new requirements on POSIX implementations derive from alignment with the  
21603 Single UNIX Specification:

- 21604 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
21605 past the offset maximum established in the open file description associated with  
21606 *aioctx->aio\_fildes*.
- 21607 • The [EFBIG] error is added as part of the large file support extensions.

21608 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the  
21609 DESCRIPTION when prioritized I/O is supported to account for threads, and removing the  
21610 words “to the calling process” in the RETURN VALUE section.21611 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL]  
21612 error, so that detection of an [EINVAL] error for an invalid value of *aioctx->aio\_reqprio* is only  
21613 required if the Prioritized Input and Output option is supported.21614 **Issue 7**

21615 Austin Group Interpretation 1003.1-2001 #082 is applied.

21616 The *aio\_write()* function is moved from the Asynchronous Input and Output option to the Base.

21617 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0028 [317] is applied.

21618 **Issue 8**

21619 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.

21620 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
21621 relating to the file size limit for the process.

21622 **NAME**

21623 alarm — schedule an alarm signal

21624 **SYNOPSIS**

21625 #include &lt;unistd.h&gt;

21626 unsigned alarm(unsigned *seconds*);21627 **DESCRIPTION**

21628 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after  
 21629 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays  
 21630 may prevent the process from handling the signal as soon as it is generated.

21631 If *seconds* is 0, a pending alarm request, if any, is canceled.

21632 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.  
 21633 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time  
 21634 at which the SIGALRM signal is generated.

21635 **RETURN VALUE**

21636 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value  
 21637 that is the number of seconds until the previous request would have generated a SIGALRM  
 21638 signal. Otherwise, *alarm()* shall return 0.

21639 **ERRORS**

21640 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

21641 **EXAMPLES**

21642 None.

21643 **APPLICATION USAGE**

21644 The *fork()* function clears pending alarms in the child process. A new process image created by  
 21645 one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

21646 Application developers should note that the type of the argument *seconds* and the return value of  
 21647 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces  
 21648 Application cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX},  
 21649 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting  
 21650 its portability. A different type was considered, but historical implementations, including those  
 21651 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

21652 Application developers should be aware of possible interactions when the same process uses  
 21653 both the *alarm()* and *sleep()* functions.

21654 **RATIONALE**

21655 Many historical implementations (including Version 7 and System V) allow an alarm to occur up  
 21656 to a second early. Other implementations allow alarms up to half a second or one clock tick  
 21657 early or do not allow them to occur early at all. The latter is considered most appropriate, since it  
 21658 gives the most predictable behavior, especially since the signal can always be delayed for an  
 21659 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument  
 21660 as the minimum amount of time they wish to have elapse before the signal.

21661 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time  
 21662 as common English usage, and has nothing to do with “realtime operating systems”. It is in  
 21663 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

21664 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are  
 21665 silently rounded down to an implementation-specific maximum value. This maximum is large  
 21666 enough (to the order of several months) that the effect is not noticeable.

21667 There were two possible choices for alarm generation in multi-threaded applications: generation  
21668 for the calling thread or generation for the process. The first option would not have been  
21669 particularly useful since the alarm state is maintained on a per-process basis and the alarm that  
21670 is established by the last invocation of *alarm()* is the only one that would be active.

21671 Furthermore, allowing generation of an asynchronous signal for a thread would have  
21672 introduced an exception to the overall signal model. This requires a compelling reason in order  
21673 to be justified.

#### 21674 **FUTURE DIRECTIONS**

21675 None.

#### 21676 **SEE ALSO**

21677 *alarm()*, *exec*, *fork()*, *pause()*, *sigaction()*, *sleep()*, *timer\_create()*

21678 XBD [<signal.h>](#), [<unistd.h>](#)

#### 21679 **CHANGE HISTORY**

21680 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 21681 **Issue 6**

21682 The following new requirements on POSIX implementations derive from alignment with the  
21683 Single UNIX Specification:

- 21684 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*,  
21685 and *usleep()* functions are unspecified.

21686 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing “an  
21687 implementation-defined maximum value” with “an implementation-specific maximum value”  
21688 in the RATIONALE.

#### 21689 **Issue 8**

21690 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

21691 **NAME**

21692 aligned\_alloc — allocate memory with a specified alignment

21693 **SYNOPSIS**

21694 #include &lt;stdlib.h&gt;

21695 void \*aligned\_alloc(size\_t alignment, size\_t size);

21696 **DESCRIPTION**

21697 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21698 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21699 volume of POSIX.1-2024 defers to the ISO C standard.

21700 The *aligned\_alloc()* function shall allocate unused space for an object whose alignment is  
 21701 specified by *alignment*, whose size in bytes is specified by *size*, and whose value is indeterminate.

21702 The order and contiguity of storage allocated by successive calls to *aligned\_alloc()* is unspecified.  
 21703 Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer  
 21704 returned shall point to the start (lowest byte address) of the allocated space. If the value of  
 21705 *alignment* is not a valid alignment supported by the implementation, a null pointer shall be  
 21706 returned. If the space cannot be allocated, a null pointer shall be returned. If the size of the space  
 21707 requested is 0, the behavior is implementation-defined: either a null pointer shall be returned to  
 21708 indicate an error, or the behavior shall be as if the size were some non-zero value, except that the  
 21709 behavior is undefined if the returned pointer is used to access an object.

21710 For purposes of determining the existence of a data race, *aligned\_alloc()* shall behave as though it  
 21711 accessed only memory locations accessible through its arguments and not other static duration  
 21712 storage. The function may, however, visibly modify the storage that it allocates. Calls to  
 21713 ADV *aligned\_alloc()*, *calloc()*, *free()*, *malloc()*, *posix\_memalign()*,  
 21714 CX *reallocarray()*, and *realloc()* that allocate or deallocate a particular region of memory shall occur  
 21715 in a single total order (see [Section 4.15.1](#), on page 100), and each such deallocation call shall  
 21716 synchronize with the next allocation (if any) in this order.

21717 **RETURN VALUE**

21718 Upon successful completion, *aligned\_alloc()* shall return a pointer to the allocated space; if *size* is  
 21719 0, the application shall ensure that the pointer is not used to access an object.

21720 CX Otherwise, it shall return a null pointer and set *errno* to indicate the error.

21721 **ERRORS**

21722 The *aligned\_alloc()* function shall fail if:

21723 CX [EINVAL] The value of *alignment* is not a valid alignment supported by the  
 21724 implementation.

21725 CX [ENOMEM] Insufficient storage space is available.

21726 The *aligned\_alloc()* function may fail if:

21727 CX [EINVAL] *size* is 0 and the implementation does not support 0 sized allocations.

21728 **EXAMPLES**

21729 None.

21730 **APPLICATION USAGE**

21731 None.

21732 **RATIONALE**21733 See the RATIONALE for *malloc()*.21734 **FUTURE DIRECTIONS**

21735 None.

21736 **SEE ALSO**21737 *calloc()*, *free()*, *getrlimit()*, *malloc()*, *posix\_memalign()*, *realloc()*

21738 XBD &lt;stdlib.h&gt;

21739 **CHANGE HISTORY**

21740 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

21741 **NAME**

21742           alphasort, scandir — scan a directory

21743 **SYNOPSIS**

```
21744       #include <dirent.h>
21745       int alphasort(const struct dirent **d1, const struct dirent **d2);
21746       int scandir(const char *dir, struct dirent ***namelist,
21747                   int (*sel)(const struct dirent *),
21748                   int (*compar)(const struct dirent **, const struct dirent **));
```

21749 **DESCRIPTION**

21750       The *alphasort()* function can be used as the comparison function for the *scandir()* function to sort  
 21751       the directory entries, *d1* and *d2*, into alphabetical order. Sorting happens as if by calling the  
 21752       *strcoll()* function on the *d\_name* element of the **dirent** structures passed as the two parameters. If  
 21753       the *strcoll()* function fails, the return value of *alphasort()* is unspecified.

21754       The *alphasort()* function shall not change the setting of *errno* if successful. Since no return value  
 21755       is reserved to indicate an error, an application wishing to check for error situations should set  
 21756       *errno* to 0, then call *alphasort()*, then check *errno*.

21757       The *scandir()* function shall scan the directory *dir*, calling the function referenced by *sel* on each  
 21758       directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored  
 21759       in strings allocated as if by a call to *malloc()*, and sorted as if by a call to *qsort()* with the  
 21760       comparison function *compar*, except that *compar* need not provide total ordering. The strings are  
 21761       collected in array *namelist* which shall be allocated as if by a call to *malloc()*. If *sel* is a null  
 21762       pointer, all entries shall be selected. If the comparison function *compar* does not provide total  
 21763       ordering, the order in which the directory entries are stored is unspecified.

21764 **RETURN VALUE**

21765       Upon successful completion, the *alphasort()* function shall return an integer greater than, equal  
 21766       to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is  
 21767       lexically greater than, equal to, or less than the directory pointed to by *d2* when both are  
 21768       interpreted as appropriate to the current locale. There is no return value reserved to indicate an  
 21769       error.

21770       Upon successful completion, the *scandir()* function shall return the number of entries in the  
 21771       array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir()*  
 21772       function shall return -1.

21773 **ERRORS**21774       The *scandir()* function shall fail if:

21775       [EACCES]       Search permission is denied for the component of the path prefix of *dir* or read  
 21776       permission is denied for *dir*.

21777       [ELOOP]        A loop exists in symbolic links encountered during resolution of the *dir*  
 21778       argument.

21779       [ENAMETOOLONG]       The length of a component of a pathname is longer than {NAME\_MAX}.

21781       [ENOENT]        A component of *dir* does not name an existing directory or *dir* is an empty  
 21782       string.

21783       [ENOMEM]        Insufficient storage space is available.

21784	[ENOTDIR]	A component of <i>dir</i> names an existing file that is neither a directory nor a symbolic link to a directory.
21785		
21786	[EOVERFLOW]	One of the values to be returned or passed to a callback function cannot be represented correctly.
21787		
21788		The <i>scandir()</i> function may fail if:
21789	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>dir</i> argument.
21790		
21791	[EMFILE]	All file descriptors available to the process are currently open.
21792	[ENAMETOOLONG]	
21793		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
21794		
21795		
21796	[ENFILE]	Too many files are currently open in the system.

**EXAMPLES**

An example to print the files in the current directory:

```

21799 #include <dirent.h>
21800 #include <stdio.h>
21801 #include <stdlib.h>
21802 ...
21803 struct dirent **namelist;
21804 int i,n;

21805     n = scandir(".", &namelist, 0, alphasort);
21806     if (n < 0)
21807         perror("scandir");
21808     else {
21809         for (i = 0; i < n; i++) {
21810             printf("%s\n", namelist[i]->d_name);
21811             free(namelist[i]);
21812         }
21813     }
21814     free(namelist);
21815     ...

```

**APPLICATION USAGE**

If *dir* contains filenames that do not form character strings, or which contain characters outside the domain of the collating sequence of the current locale, the *alphasort()* function need not provide a total ordering. This condition is not possible if all filenames within the directory consist only of characters from the portable filename character set.

The *scandir()* function may allocate dynamic storage during its operation. If *scandir()* is forcibly terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *sel* or *compar*, or by an interrupt routine, *scandir()* does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, then wait until *scandir()* returns to act on the interrupt.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *scandir()*, this is *namelist* (including all of the individual strings in *namelist*).

21829 **RATIONALE**

21830       None.

21831 **FUTURE DIRECTIONS**

21832       None.

21833 **SEE ALSO**21834       *qsort()*, *strcoll()*21835       XBD <**dirent.h**>21836 **CHANGE HISTORY**

21837       First released in Issue 7.

21838       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0029 [324], XSH/TC1-2008/0030 [404],  
21839       XSH/TC1-2008/0031 [393], and XSH/TC1-2008/0032 [291] are applied.

21840 **NAME**

21841 asctime — convert date and time to a string

21842 **SYNOPSIS**

```
21843 OB #include <time.h>
21844 char *asctime(const struct tm *timeptr);
```

21845 **DESCRIPTION**

21846 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21847 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21848 volume of POSIX.1-2024 defers to the ISO C standard.

21849 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*  
 21850 into a string in the form:

```
21851 Sun Sep 16 01:03:52 1973\n\0
```

21852 using the equivalent of the following algorithm:

```
21853 char *asctime(const struct tm *timeptr)
21854 {
21855     static char wday_name[7][3] = {
21856         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
21857     };
21858     static char mon_name[12][3] = {
21859         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
21860         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
21861     };
21862     static char result[26];
21863     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
21864         wday_name[timeptr->tm_wday],
21865         mon_name[timeptr->tm_mon],
21866         timeptr->tm_mday, timeptr->tm_hour,
21867         timeptr->tm_min, timeptr->tm_sec,
21868         1900 + timeptr->tm_year);
21869     return result;
21870 }
```

21871 If any of the members of the broken-down time contain values that are outside their normal  
 21872 ranges (see XBD [<time.h>](#)), the behavior of the *asctime()* function is undefined. Likewise, if the  
 21873 calculated year exceeds four digits or is less than the year 1000, the behavior is undefined.

21874 The **tm** structure is defined in the [<time.h>](#) header.

21875 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 21876 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 21877 functions that return a pointer to one of these object types may overwrite the information in any  
 21878 object of the same type pointed to by the value returned from any previous call to any of them.

21879 The *asctime()* function need not be thread-safe; however, *asctime()* shall avoid data races with all  
 21880 functions other than itself, *ctime()*, *gmtime()*, and *localtime()*.

21881 **RETURN VALUE**

21882 CX Upon successful completion, *asctime()* shall return a pointer to the string. If the function is  
21883 unsuccessful, it shall return NULL.

21884 **ERRORS**

21885 No errors are defined.

21886 **EXAMPLES**

21887 None.

21888 **APPLICATION USAGE**

21889 This function is included only for compatibility with older implementations. It has undefined  
21890 behavior if the resulting string would be too long, so the use of this function should be  
21891 discouraged. On implementations that do not detect output string length overflow, it is possible  
21892 to overflow the output buffer in such a way as to cause applications to fail, or possible system  
21893 security violations. Also, this function does not support localized date and time formats. To  
21894 avoid these problems, applications should use *strftime()* to generate strings from broken-down  
21895 times.

21896 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

21897 **RATIONALE**

21898 The standard developers decided to mark the *asctime()* function obsolescent even though it is in  
21899 the ISO C standard due to the possibility of buffer overflow. The ISO C standard also provides  
21900 the *strftime()* function which can be used to avoid these problems.

21901 **FUTURE DIRECTIONS**

21902 This function may be removed in a future version, but not until after it has been removed from  
21903 the ISO C standard.

21904 **SEE ALSO**

21905 *clock()*, *ctime()*, *difftime()*, *futimens()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*

21906 XBD <time.h>

21907 **CHANGE HISTORY**

21908 First released in Issue 1. Derived from Issue 1 of the SVID.

21909 **Issue 5**

21910 Normative text previously in the APPLICATION USAGE section is moved to the  
21911 DESCRIPTION.

21912 The *asctime\_r()* function is included for alignment with the POSIX Threads Extension.

21913 A note indicating that the *asctime()* function need not be reentrant is added to the  
21914 DESCRIPTION.

21915 **Issue 6**

21916 The *asctime\_r()* function is marked as part of the Thread-Safe Functions option.

21917 Extensions beyond the ISO C standard are marked.

21918 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
21919 its avoidance of possibly using a static data area.

21920 The DESCRIPTION of *asctime\_r()* is updated to describe the format of the string returned.

21921 The **restrict** keyword is added to the *asctime\_r()* prototype for alignment with the  
21922 ISO/IEC 9899:1999 standard

- 21923 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in  
21924 the RETURN VALUE section requiring that if the *asctime()* function is unsuccessful it returns  
21925 NULL.
- 21926 **Issue 7**
- 21927 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.
- 21928 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 21929 The *asctime\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 21930 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0033 [86,429] is applied.
- 21931 **Issue 8**
- 21932 Austin Group Defect 469 is applied, clarifying the conditions under which the behavior of  
21933 *asctime()* is undefined.
- 21934 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
21935 standard.
- 21936 Austin Group Defect 1330 is applied, changing the FUTURE DIRECTIONS section.
- 21937 Austin Group Defect 1376 is applied, removing CX shading from some text derived from the  
21938 ISO C standard and updating it to match the ISO C standard.
- 21939 Austin Group Defect 1410 is applied, removing the *asctime\_r()* function.

21940 **NAME**

21941 asin, asinf, asinl — arc sine function

21942 **SYNOPSIS**

```
21943 #include <math.h>
21944 double asin(double x);
21945 float asinf(float x);
21946 long double asinl(long double x);
```

21947 **DESCRIPTION**

21948 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21949 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21950 volume of POSIX.1-2024 defers to the ISO C standard.

21951 These functions shall compute the principal value of the arc sine of their argument  $x$ . The value  
 21952 of  $x$  should be in the range  $[-1,1]$ .

21953 An application wishing to check for error situations should set *errno* to zero and call  
 21954 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21955 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21956 zero, an error has occurred.

21957 **RETURN VALUE**

21958 Upon successful completion, these functions shall return the arc sine of  $x$ , in the range  
 21959  $[-\pi/2, \pi/2]$  radians.

21960 MX For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 21961 supported), or an implementation-defined value shall be returned.

21962 MX If  $x$  is NaN, a NaN shall be returned.

21963 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

21964 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

21965 MXX If  $x$  is subnormal,  $x$  should be returned.

21966 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *asin()*, *asinf()*, and *asinl()*  
 21967 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 21968 FLT\_MIN, and LDBL\_MIN, respectively.

21969 **ERRORS**

21970 These functions shall fail if:

21971 MX **Domain Error** The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm\text{Inf}$ .

21972 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21973 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 21974 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 21975 shall be raised.

21976 These functions may fail if:

21977 MX **Range Error** The value of  $x$  is subnormal.

21978 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21979 then *errno* shall be set to [ERANGE]. If the integer expression  
 21980 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 21981 floating-point exception shall be raised.

21982 **EXAMPLES**

21983 None.

21984 **APPLICATION USAGE**

21985 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
21986 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21987 **RATIONALE**

21988 None.

21989 **FUTURE DIRECTIONS**

21990 None.

21991 **SEE ALSO**21992 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#), [sin\(\)](#)21993 XBD Section 4.23 (on page 109), [<math.h>](#)21994 **CHANGE HISTORY**

21995 First released in Issue 1. Derived from Issue 1 of the SVID.

21996 **Issue 5**

21997 The DESCRIPTION is updated to indicate how an application should check for an error. This  
21998 text was previously published in the APPLICATION USAGE section.

21999 **Issue 6**22000 The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

22001 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
22002 revised to align with the ISO/IEC 9899:1999 standard.

22003 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
22004 marked.

22005 **Issue 7**

22006 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0034 [320] and XSH/TC1-2008/0035  
22007 [68] are applied.

22008 **Issue 8**

22009 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when *x* is  
22010 subnormal to avoid the need for two shading changes.

22011 **NAME**

22012 asinh, asinhf, asinhl — inverse hyperbolic sine functions

22013 **SYNOPSIS**

```
22014 #include <math.h>
22015 double asinh(double x);
22016 float asinhf(float x);
22017 long double asinhl(long double x);
```

22018 **DESCRIPTION**

22019 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22020 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22021 volume of POSIX.1-2024 defers to the ISO C standard.

22022 These functions shall compute the inverse hyperbolic sine of their argument  $x$ .

22023 An application wishing to check for error situations should set *errno* to zero and call  
 22024 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22025 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22026 zero, an error has occurred.

22027 **RETURN VALUE**

22028 Upon successful completion, these functions shall return the inverse hyperbolic sine of their  
 22029 argument.

22030 MX If  $x$  is NaN, a NaN shall be returned.

22031 If  $x$  is  $\pm 0$ , or  $\pm\text{Inf}$ ,  $x$  shall be returned.

22032 MXX If  $x$  is subnormal,  $x$  should be returned.

22033 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *asinh()*, *asinhf()*, and *asinhl()*  
 22034 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 22035 FLT\_MIN, and LDBL\_MIN, respectively.

22036 **ERRORS**

22037 These functions may fail if:

22038 MX **Range Error** The value of  $x$  is subnormal.

22039 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 22040 then *errno* shall be set to [ERANGE]. If the integer expression  
 22041 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 22042 floating-point exception shall be raised.

22043 **EXAMPLES**

22044 None.

22045 **APPLICATION USAGE**

22046 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 22047 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22048 **RATIONALE**

22049 None.

22050 **FUTURE DIRECTIONS**

22051 None.

22052 **SEE ALSO**22053 *feclearexcept()*, *fetestexcept()*, *sinh()*

22054 XBD Section 4.23 (on page 109), &lt;math.h&gt;

22055 **CHANGE HISTORY**

22056 First released in Issue 4, Version 2.

22057 **Issue 5**

22058 Moved from X/OPEN UNIX extension to BASE.

22059 **Issue 6**22060 The *asinh()* function is no longer marked as an extension.22061 The *asinhf()* and *asinhll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

22063 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

22065 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

22067 **Issue 7**

22068 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0036 [68] is applied.

22069 **Issue 8**22070 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when *x* is subnormal to avoid the need for two shading changes.

22072 **NAME**22073        **asinl** — arc sine function22074 **SYNOPSIS**

22075        #include &lt;math.h&gt;

22076        long double asinl(long double *x*);22077 **DESCRIPTION**22078        Refer to *asin()*.

22079 **NAME**

22080       asprintf — print formatted output

22081 **SYNOPSIS**

22082       #include &lt;stdio.h&gt;

22083       int asprintf(char \*\*restrict *ptr*, const char \*restrict *format*, ...);22084 **DESCRIPTION**22085       Refer to *fprintf()*.

22086 **NAME**

22087       assert — insert program diagnostics

22088 **SYNOPSIS**

22089       #include &lt;assert.h&gt;

22090       void assert(*scalar expression*);22091 **DESCRIPTION**

22092 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 22093 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22094 volume of POSIX.1-2024 defers to the ISO C standard.

22095       The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.  
 22096 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal  
 22097 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call  
 22098 *abort()*.

22099       The information written about the call that failed shall include the text of the argument, the  
 22100 name of the source file, the source file line number, and the name of the enclosing function; the  
 22101 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of  
 22102 the identifier `__func__`.

22103       Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the  
 22104 preprocessor control statement `#define NDEBUG` ahead of the `#include <assert.h>` statement,  
 22105 shall stop assertions from being compiled into the program.

22106 **RETURN VALUE**22107       The *assert()* macro shall not return a value.22108 **ERRORS**

22109       No errors are defined.

22110 **EXAMPLES**

22111       None.

22112 **APPLICATION USAGE**

22113       None.

22114 **RATIONALE**

22115       None.

22116 **FUTURE DIRECTIONS**

22117       None.

22118 **SEE ALSO**22119       *abort()*, *stdin*

22120       XBD &lt;assert.h&gt;

22121 **CHANGE HISTORY**

22122       First released in Issue 1. Derived from Issue 1 of the SVID.

22123 **Issue 6**

22124       The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment  
 22125 with the ISO/IEC 9899:1999 standard.

22126       The DESCRIPTION of *assert()* is updated for alignment with the ISO/IEC 9899:1999 standard.

22127 **NAME**

22128           at\_quick\_exit — register a function to to be called from *quick\_exit()*

22129 **SYNOPSIS**

22130           #include <stdlib.h>

22131           int at\_quick\_exit(void (\*func)(void));

22132 **DESCRIPTION**

22133 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
22134 conflict between the requirements described here and the ISO C standard is unintentional. This  
22135 volume of POSIX.1-2024 defers to the ISO C standard.

22136       The *at\_quick\_exit()* function shall register the function pointed to by *func*, to be called without  
22137 arguments should *quick\_exit()* be called. It is unspecified whether a call to the *at\_quick\_exit()*  
22138 function that does not happen before the *quick\_exit()* function is called will succeed.

22139       At least 32 functions can be registered with *at\_quick\_exit()*.

22140 **RETURN VALUE**

22141       Upon successful completion, *at\_quick\_exit()* shall return 0; otherwise, it shall return a non-zero  
22142 value.

22143 **ERRORS**

22144       No errors are defined.

22145 **EXAMPLES**

22146       None.

22147 **APPLICATION USAGE**

22148       The *at\_quick\_exit()* function registrations are distinct from the *atexit()* registrations, so  
22149 applications might need to call both registration functions with the same argument.

22150       The functions registered by a call to *at\_quick\_exit()* must return to ensure that all registered  
22151 functions are called.

22152       The application should call *sysconf()* to obtain the value of {ATEXIT\_MAX}, the number of  
22153 functions that can be registered. There is no way for an application to tell how many functions  
22154 have already been registered with *at\_quick\_exit()*.

22155       Since the behavior is undefined if the *quick\_exit()* function is called more than once, portable  
22156 applications calling *at\_quick\_exit()* must ensure that the *quick\_exit()* function is not called when  
22157 the functions registered by the *at\_quick\_exit()* function are called.

22158       If a function registered by the *at\_quick\_exit()* function is called and a portable application needs  
22159 to stop further *quick\_exit()* processing, it must call the *\_exit()* function or the *\_Exit()* function or  
22160 one of the functions which cause abnormal process termination.

22161 **RATIONALE**

22162       None.

22163 **FUTURE DIRECTIONS**

22164       None.

22165 **SEE ALSO**

22166       *atexit()*, *exec*, *exit()*, *quick\_exit()*, *sysconf()*

22167       XBD <stdlib.h>

22168 **CHANGE HISTORY**

22169 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22170 **NAME**

22171 atan, atanf, atanl — arc tangent function

22172 **SYNOPSIS**

```
22173 #include <math.h>
22174 double atan(double x);
22175 float atanf(float x);
22176 long double atanl(long double x);
```

22177 **DESCRIPTION**

22178 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22179 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22180 volume of POSIX.1-2024 defers to the ISO C standard.

22181 These functions shall compute the principal value of the arc tangent of their argument  $x$ .

22182 An application wishing to check for error situations should set *errno* to zero and call  
 22183 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22184 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22185 zero, an error has occurred.

22186 **RETURN VALUE**

22187 Upon successful completion, these functions shall return the arc tangent of  $x$  in the range  
 22188  $[-\pi/2, \pi/2]$  radians.

22189 MX If  $x$  is NaN, a NaN shall be returned.

22190 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

22191 If  $x$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.

22192 MXX If  $x$  is subnormal,  $x$  should be returned.

22193 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *atan()*, *atanf()*, and *atanl()*  
 22194 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 22195 FLT\_MIN, and LDBL\_MIN, respectively.

22196 **ERRORS**

22197 These functions may fail if:

22198 MX **Range Error** The value of  $x$  is subnormal.

22199 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 22200 then *errno* shall be set to [ERANGE]. If the integer expression  
 22201 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 22202 floating-point exception shall be raised.

22203 **EXAMPLES**

22204 None.

22205 **APPLICATION USAGE**

22206 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 22207 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22208 **RATIONALE**

22209 None.

22210 **FUTURE DIRECTIONS**

22211 None.

22212 **SEE ALSO**22213 [atan2\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#), [tan\(\)](#)22214 XBD [Section 4.23](#) (on page 109), [<math.h>](#)22215 **CHANGE HISTORY**

22216 First released in Issue 1. Derived from Issue 1 of the SVID.

22217 **Issue 5**22218 The DESCRIPTION is updated to indicate how an application should check for an error. This  
22219 text was previously published in the APPLICATION USAGE section.22220 **Issue 6**22221 The [atanf\(\)](#) and [atanl\(\)](#) functions are added for alignment with the ISO/IEC 9899:1999 standard.22222 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
22223 revised to align with the ISO/IEC 9899:1999 standard.22224 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
22225 marked.22226 **Issue 7**

22227 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0037 [68] is applied.

22228 **Issue 8**22229 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when  $x$  is  
22230 subnormal to avoid the need for two shading changes.

22231 **NAME**

22232 atan2, atan2f, atan2l — arc tangent functions

22233 **SYNOPSIS**

22234 #include &lt;math.h&gt;

22235 double atan2(double y, double x);

22236 float atan2f(float y, float x);

22237 long double atan2l(long double y, long double x);

22238 **DESCRIPTION**

22239 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22240 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22241 volume of POSIX.1-2024 defers to the ISO C standard.

22242 These functions shall compute the principal value of the arc tangent of  $y/x$ , using the signs of  
 22243 both arguments to determine the quadrant of the return value.

22244 An application wishing to check for error situations should set *errno* to zero and call  
 22245 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 22246 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 22247 zero, an error has occurred.

22248 **RETURN VALUE**

22249 Upon successful completion, these functions shall return the arc tangent of  $y/x$  in the range  
 22250  $[-\pi, \pi]$  radians.

22251 If  $y$  is  $\pm 0$  and  $x$  is  $< 0$ ,  $\pm\pi$  shall be returned.22252 If  $y$  is  $\pm 0$  and  $x$  is  $> 0$ ,  $\pm 0$  shall be returned.22253 If  $y$  is  $< 0$  and  $x$  is  $\pm 0$ ,  $-\pi/2$  shall be returned.22254 If  $y$  is  $> 0$  and  $x$  is  $\pm 0$ ,  $\pi/2$  shall be returned.22255 If  $x$  is 0, a pole error shall not occur.22256 MX If either  $x$  or  $y$  is NaN, a NaN shall be returned.

22257 If the correct value would cause underflow, a range error may occur, and *atan*(*y*), *atan2f*(*y*), and  
 22258 *atan2l*(*y*) shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 22259 MXX FLT\_MIN, and LDBL\_MIN, respectively. If the IEC 60559 Floating-Point option is supported,  
 22260  $y/x$  should be returned.

22261 MX If  $y$  is  $\pm 0$  and  $x$  is  $-0$ ,  $\pm\pi$  shall be returned.22262 If  $y$  is  $\pm 0$  and  $x$  is  $+0$ ,  $\pm 0$  shall be returned.22263 For finite values of  $\pm y > 0$ , if  $x$  is  $-\text{Inf}$ ,  $\pm\pi$  shall be returned.22264 For finite values of  $\pm y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $\pm 0$  shall be returned.22265 For finite values of  $x$ , if  $y$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.22266 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $-\text{Inf}$ ,  $\pm 3\pi/4$  shall be returned.22267 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $+\text{Inf}$ ,  $\pm\pi/4$  shall be returned.

22268 If both arguments are 0, a domain error shall not occur.

22269 **ERRORS**

22270 These functions may fail if:

22271 MX **Range Error** The result underflows.

22272 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 22273 then *errno* shall be set to [ERANGE]. If the integer expression  
 22274 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 22275 floating-point exception shall be raised.

22276 **EXAMPLES**22277 **Converting Cartesian to Polar Coordinates System**

22278 The function below uses *atan2()* to convert a 2d vector expressed in cartesian coordinates (*x,y*) to  
 22279 the polar coordinates (*rho,theta*). There are other ways to compute the angle *theta*, using *asin()*  
 22280 *acos()*, or *atan()*. However, *atan2()* presents here two advantages:

- 22281 • The angle's quadrant is automatically determined.
- 22282 • The singular cases (0,*y*) are taken into account.

22283 Finally, this example uses *hypot()* rather than *sqrt()* since it is better for special cases; see *hypot()*  
 22284 for more information.

```
22285 #include <math.h>
22286
22287 void
22288 cartesian_to_polar(const double x, const double y,
22289                  double *rho, double *theta
22290                  )
22291 {
22292     *rho = hypot (x,y); /* better than sqrt(x*x+y*y) */
22293     *theta = atan2 (y,x);
22294 }
```

22294 **APPLICATION USAGE**

22295 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 22296 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22297 **RATIONALE**

22298 None.

22299 **FUTURE DIRECTIONS**

22300 None.

22301 **SEE ALSO**22302 [acos\(\)](#), [asin\(\)](#), [atan\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [hypot\(\)](#), [isnan\(\)](#), [sqrt\(\)](#), [tan\(\)](#)22303 XBD Section 4.23 (on page 109), [<math.h>](#)22304 **CHANGE HISTORY**

22305 First released in Issue 1. Derived from Issue 1 of the SVID.

22306 **Issue 5**

22307 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 22308 text was previously published in the APPLICATION USAGE section.

22309 **Issue 6**

22310 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999  
22311 standard.

22312 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
22313 revised to align with the ISO/IEC 9899:1999 standard, and the IEC 60559:1989 standard  
22314 floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

22315 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/18 is applied, adding to the EXAMPLES  
22316 section.

22317 **Issue 7**

22318 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0038 [68,428] is applied.

22319 **Issue 8**

22320 Austin Group Defect 1178 is applied, removing MX shading from a paragraph in the RETURN  
22321 VALUE section and joining it with the following paragraph.

22322 **NAME**

22323           atanf — arc tangent function

22324 **SYNOPSIS**

22325           #include <math.h>

22326           float atanf(float x);

22327 **DESCRIPTION**

22328           Refer to *atan()*.

22329 **NAME**

22330           atanh, atanhf, atanh1 — inverse hyperbolic tangent functions

22331 **SYNOPSIS**

```
22332       #include <math.h>
22333       double atanh(double x);
22334       float atanhf(float x);
22335       long double atanh1(long double x);
```

22336 **DESCRIPTION**

22337 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
22338 conflict between the requirements described here and the ISO C standard is unintentional. This  
22339 volume of POSIX.1-2024 defers to the ISO C standard.

22340       These functions shall compute the inverse hyperbolic tangent of their argument  $x$ .

22341       An application wishing to check for error situations should set *errno* to zero and call  
22342 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
22343 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
22344 zero, an error has occurred.

22345 **RETURN VALUE**

22346       Upon successful completion, these functions shall return the inverse hyperbolic tangent of their  
22347 argument.

22348       If  $x$  is  $\pm 1$ , a pole error shall occur, and *atanh*( $x$ ), *atanhf*( $x$ ), and *atanh1*( $x$ ) shall return the value of the  
22349 macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively, with the same sign as the  
22350 correct value of the function.

22351 MX       For finite  $|x| > 1$ , a domain error shall occur, and either a NaN (if supported), or an  
22352 implementation-defined value shall be returned.

22353 MX       If  $x$  is NaN, a NaN shall be returned.

22354       If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

22355       If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

22356 MXX      If  $x$  is subnormal,  $x$  should be returned.

22357 MX       If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *atanh*( $x$ ), *atanhf*( $x$ ), and *atanh1*( $x$ )  
22358 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
22359 FLT\_MIN, and LDBL\_MIN, respectively.

22360 **ERRORS**

22361       These functions shall fail if:

22362 MX       Domain Error    The  $x$  argument is finite and not in the range  $[-1, 1]$ , or is  $\pm \text{Inf}$ .

22363           If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
22364 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
22365 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
22366 shall be raised.

22367       Pole Error        The  $x$  argument is  $\pm 1$ .

22368           If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
22369 then *errno* shall be set to [ERANGE]. If the integer expression  
22370 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
22371 floating-point exception shall be raised.

22372 These functions may fail if:

22373 MX **Range Error** The value of  $x$  is subnormal.

22374 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 22375 then *errno* shall be set to [ERANGE]. If the integer expression  
 22376 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 22377 floating-point exception shall be raised.

#### 22378 EXAMPLES

22379 None.

#### 22380 APPLICATION USAGE

22381 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 22382 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 22383 RATIONALE

22384 None.

#### 22385 FUTURE DIRECTIONS

22386 None.

#### 22387 SEE ALSO

22388 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [tanh\(\)](#)

22389 XBD Section 4.23 (on page 109), [<math.h>](#)

#### 22390 CHANGE HISTORY

22391 First released in Issue 4, Version 2.

#### 22392 Issue 5

22393 Moved from X/OPEN UNIX extension to BASE.

#### 22394 Issue 6

22395 The *atanh()* function is no longer marked as an extension.

22396 The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999  
 22397 standard.

22398 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 22399 revised to align with the ISO/IEC 9899:1999 standard.

22400 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 22401 marked.

#### 22402 Issue 7

22403 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0039 [320] and XSH/TC1-2008/0040  
 22404 [680] are applied.

#### 22405 Issue 8

22406 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when  $x$  is  
 22407 subnormal to avoid the need for two shading changes.

22408 **NAME**

22409           atanl — arc tangent function

22410 **SYNOPSIS**

22411           #include <math.h>

22412           long double atanl(long double x);

22413 **DESCRIPTION**

22414           Refer to *atan()*.

22415 **NAME**

22416 atexit — register a function to be called from *exit()* or after return from *main()*

22417 **SYNOPSIS**

22418 #include <stdlib.h>

22419 int atexit(void (\*func)(void));

22420 **DESCRIPTION**

22421 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22422 conflict between the requirements described here and the ISO C standard is unintentional. This  
22423 volume of POSIX.1-2024 defers to the ISO C standard.

22424 The *atexit()* function shall register the function pointed to by *func*, to be called without  
22425 arguments from *exit()*, or after return from the initial call to *main()*, or on the last thread  
22426 termination. If the *exit()* function is called, it is unspecified whether a call to the *atexit()* function  
22427 that does not happen before *exit()* is called will succeed.

22428 At least 32 functions can be registered with *atexit()*.

22429 **RETURN VALUE**

22430 Upon successful completion, *atexit()* shall return 0; otherwise, it shall return a non-zero value.

22431 **ERRORS**

22432 No errors are defined.

22433 **EXAMPLES**

22434 None.

22435 **APPLICATION USAGE**

22436 The *atexit()* function registrations are distinct from the *at\_quick\_exit()* registrations, so  
22437 applications might need to call both registration functions with the same argument.

22438 The functions registered by a call to *atexit()* must return to ensure that all registered functions  
22439 are called.

22440 The application should call *sysconf()* to obtain the value of {ATEXIT\_MAX}, the number of  
22441 functions that can be registered. There is no way for an application to tell how many functions  
22442 have already been registered with *atexit()*.

22443 Since the behavior is undefined if the *exit()* function is called more than once, portable  
22444 applications calling *atexit()* must ensure that the *exit()* function is not called when the functions  
22445 registered by the *atexit()* function are called.

22446 If a function registered by the *atexit()* function is called and a portable application needs to stop  
22447 further *exit()* processing, it must call the *\_exit()* function or the *\_Exit()* function or one of the  
22448 functions which cause abnormal process termination.

22449 **RATIONALE**

22450 None.

22451 **FUTURE DIRECTIONS**

22452 None.

22453 **SEE ALSO**

22454 [at\\_quick\\_exit\(\)](#), [exec](#), [exit\(\)](#), [sysconf\(\)](#)

22455 XBD [<stdlib.h>](#)

22456 **CHANGE HISTORY**

22457 First released in Issue 4. Derived from the ANSI C standard.

22458 **Issue 6**

22459 Extensions beyond the ISO C standard are marked.

22460 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

22461 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification  
22462 to the APPLICATION USAGE section.

22463 **Issue 8**

22464 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
22465 standard.

22466 Austin Group Defect 1646 is applied, removing redundant text relating to the *exec* family of  
22467 functions.

22468 **NAME**

22469            atof — convert a string to a double-precision number

22470 **SYNOPSIS**

22471            #include &lt;stdlib.h&gt;

22472            double atof(const char \*str);

22473 **DESCRIPTION**

22474 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
22475            conflict between the requirements described here and the ISO C standard is unintentional. This  
22476            volume of POSIX.1-2024 defers to the ISO C standard.

22477            The call *atof(str)* shall be equivalent to:

22478            strtod(str, (char \*\*) NULL),

22479            except that the handling of errors may differ. If the value cannot be represented, the behavior is  
22480            undefined.

22481 **RETURN VALUE**22482            The *atof()* function shall return the converted value if the value can be represented.22483 **ERRORS**

22484            No errors are defined.

22485 **EXAMPLES**

22486            None.

22487 **APPLICATION USAGE**

22488            The *atof()* function is subsumed by *strtod()* but is retained because it is used extensively in  
22489            existing code. If the number is not known to be in range, *strtod()* should be used because *atof()*  
22490            is not required to perform any error checking.

22491 **RATIONALE**

22492            None.

22493 **FUTURE DIRECTIONS**

22494            None.

22495 **SEE ALSO**22496            [strtod\(\)](#)22497            XBD [<stdlib.h>](#)22498 **CHANGE HISTORY**

22499            First released in Issue 1. Derived from Issue 1 of the SVID.

22500 **NAME**

22501            atoi — convert a string to an integer

22502 **SYNOPSIS**

22503            #include &lt;stdlib.h&gt;

22504            int atoi(const char \*str);

22505 **DESCRIPTION**

22506 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
22507            conflict between the requirements described here and the ISO C standard is unintentional. This  
22508            volume of POSIX.1-2024 defers to the ISO C standard.

22509        The call *atoi(str)* shall be equivalent to:

22510            (int) strtol(str, (char \*\*)NULL, 10)

22511        except that the handling of errors may differ. If the value cannot be represented, the behavior is  
22512        undefined.22513 **RETURN VALUE**22514        The *atoi()* function shall return the converted value if the value can be represented.22515 **ERRORS**

22516        No errors are defined.

22517 **EXAMPLES**22518            **Converting an Argument**

22519        The following example checks for proper usage of the program. If there is an argument and the  
22520        decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program  
22521        has a valid number of minutes to wait for an event.

22522            #include &lt;stdlib.h&gt;

22523            #include &lt;stdio.h&gt;

22524            ...

22525            int minutes\_to\_event;

22526            ...

22527            if (argc < 2 || (minutes\_to\_event = atoi (argv[1])) <= 0) {  
22528                fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);

22529            }

22530            ...

22531 **APPLICATION USAGE**

22532        The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in  
22533        existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is  
22534        not required to perform any error checking.

22535 **RATIONALE**

22536        None.

22537 **FUTURE DIRECTIONS**

22538        None.

22539 **SEE ALSO**22540            [strtol\(\)](#)22541            XBD [<stdlib.h>](#)

22542 **CHANGE HISTORY**

22543 First released in Issue 1. Derived from Issue 1 of the SVID.

22544 **Issue 8**

22545 Austin Group Defect 1541 is applied, changing the EXAMPLES section.

22546 **NAME**

22547 atol, atoll — convert a string to a long integer

22548 **SYNOPSIS**

22549 #include &lt;stdlib.h&gt;

22550 long atol(const char \*nptr);

22551 long long atoll(const char \*nptr);

22552 **DESCRIPTION**

22553 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22554 conflict between the requirements described here and the ISO C standard is unintentional. This  
22555 volume of POSIX.1-2024 defers to the ISO C standard.

22556 Except as noted below, the call *atol(nptr)* shall be equivalent to:22557 `strtol(nptr, (char **)NULL, 10)`22558 Except as noted below, the call to *atoll(nptr)* shall be equivalent to:22559 `strtoll(nptr, (char **)NULL, 10)`

22560 The handling of errors may differ. If the value cannot be represented, the behavior is undefined.

22561 **RETURN VALUE**

22562 These functions shall return the converted value if the value can be represented.

22563 **ERRORS**

22564 No errors are defined.

22565 **EXAMPLES**

22566 None.

22567 **APPLICATION USAGE**

22568 If the number is not known to be in range, *strtol()* or *strtoll()* should be used because *atol()* and  
22569 *atoll()* are not required to perform any error checking.

22570 **RATIONALE**

22571 None.

22572 **FUTURE DIRECTIONS**

22573 None.

22574 **SEE ALSO**22575 [strtol\(\)](#)22576 XBD [<stdlib.h>](#)22577 **CHANGE HISTORY**

22578 First released in Issue 1. Derived from Issue 1 of the SVID.

22579 **Issue 6**22580 The *atoll()* function is added for alignment with the ISO/IEC 9899:1999 standard.22581 **Issue 7**22582 SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of *atoll()*.

22583 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0046 [892] is applied.

22584 **NAME**

22585 atomic\_compare\_exchange\_strong, atomic\_compare\_exchange\_strong\_explicit,  
 22586 atomic\_compare\_exchange\_weak, atomic\_compare\_exchange\_weak\_explicit — atomically  
 22587 compare and exchange the values of two objects

22588 **SYNOPSIS**

```
22589 #include <stdatomic.h>
22590 _Bool atomic_compare_exchange_strong(volatile A *object,
22591     C *expected, C desired);
22592 _Bool atomic_compare_exchange_strong_explicit(volatile A *object,
22593     C *expected, C desired, memory_order success, memory_order failure);
22594 _Bool atomic_compare_exchange_weak(volatile A *object,
22595     C *expected, C desired);
22596 _Bool atomic_compare_exchange_weak_explicit(volatile A *object,
22597     C *expected, C desired, memory_order success, memory_order failure);
```

22598 **DESCRIPTION**

22599 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 22600 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22601 volume of POSIX.1-2024 defers to the ISO C standard.

22602 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
 22603 `<stdatomic.h>` header nor support these generic functions.

22604 The `atomic_compare_exchange_strong_explicit()` generic function shall atomically compare the  
 22605 contents of the memory pointed to by *object* for equality with that pointed to by *expected*, and if  
 22606 true, shall replace the contents of the memory pointed to by *object* with *desired*, and if false, shall  
 22607 update the contents of the memory pointed to by *expected* with that pointed to by *object*. This  
 22608 operation shall be an atomic read-modify-write operation (see XBD Section 4.15.1, on page 100).  
 22609 If the comparison is true, *memory* shall be affected according to the value of *success*, and if the  
 22610 comparison is false, *memory* shall be affected according to the value of *failure*. The application  
 22611 shall ensure that *failure* is not `memory_order_release` nor `memory_order_acq_rel`, and  
 22612 shall ensure that *failure* is no stronger than *success*.

22613 The `atomic_compare_exchange_strong()` generic function shall be equivalent to  
 22614 `atomic_compare_exchange_strong_explicit()` called with *success* and *failure* both set to  
 22615 `memory_order_seq_cst`.

22616 The `atomic_compare_exchange_weak_explicit()` generic function shall be equivalent to  
 22617 `atomic_compare_exchange_strong_explicit()`, except that the compare-and-exchange operation may  
 22618 fail spuriously. That is, even when the contents of *memory* referred to by *expected* and *object* are  
 22619 equal, it may return zero and store back to *expected* the same memory contents that were  
 22620 originally there.

22621 The `atomic_compare_exchange_weak()` generic function shall be equivalent to  
 22622 `atomic_compare_exchange_weak_explicit()` called with *success* and *failure* both set to  
 22623 `memory_order_seq_cst`.

22624 **RETURN VALUE**

22625 These generic functions shall return the result of the comparison.

22626 **ERRORS**

22627 No errors are defined.

22628 **EXAMPLES**

22629 None.

22630 **APPLICATION USAGE**

22631 A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be  
22632 in a loop. For example:

```
22633     exp = atomic_load(&cur);  
22634     do {  
22635         des = function(exp);  
22636     } while (!atomic_compare_exchange_weak(&cur, &exp, des));
```

22637 When a compare-and-exchange is in a loop, the weak version will yield better performance on  
22638 some platforms. When a weak compare-and-exchange would require a loop and a strong one  
22639 would not, the strong one is preferable.

22640 **RATIONALE**

22641 None.

22642 **FUTURE DIRECTIONS**

22643 None.

22644 **SEE ALSO**22645 [XBD Section 4.15.1](#), [<stdatomic.h>](#)22646 **CHANGE HISTORY**

22647 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22648 **NAME**

22649 atomic\_exchange, atomic\_exchange\_explicit — atomically exchange the value of an object

22650 **SYNOPSIS**

22651 #include &lt;stdatomic.h&gt;

22652 C atomic\_exchange(volatile A \*object, C desired);

22653 C atomic\_exchange\_explicit(volatile A \*object, C desired,

22654 memory\_order order);

22655 **DESCRIPTION**22656 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22657 conflict between the requirements described here and the ISO C standard is unintentional. This  
22658 volume of POSIX.1-2024 defers to the ISO C standard.22659 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22660 `<stdatomic.h>` header nor support these generic functions.22661 The `atomic_exchange_explicit()` generic function shall atomically replace the value pointed to by  
22662 `object` with `desired`. This operation shall be an atomic read-modify-write operation (see XBD  
22663 [Section 4.15.1](#), on page 100). Memory shall be affected according to the value of `order`.22664 The `atomic_exchange()` generic function shall be equivalent to `atomic_exchange_explicit()` called  
22665 with `order` set to `memory_order_seq_cst`.22666 **RETURN VALUE**22667 These generic functions shall return the value pointed to by `object` immediately before the effects.22668 **ERRORS**

22669 No errors are defined.

22670 **EXAMPLES**

22671 None.

22672 **APPLICATION USAGE**

22673 None.

22674 **RATIONALE**

22675 None.

22676 **FUTURE DIRECTIONS**

22677 None.

22678 **SEE ALSO**22679 XBD [Section 4.15.1](#), `<stdatomic.h>`22680 **CHANGE HISTORY**

22681 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22682 **NAME**

22683 atomic\_fetch\_add, atomic\_fetch\_add\_explicit, atomic\_fetch\_and, atomic\_fetch\_and\_explicit,  
 22684 atomic\_fetch\_or, atomic\_fetch\_or\_explicit, atomic\_fetch\_sub, atomic\_fetch\_sub\_explicit,  
 22685 atomic\_fetch\_xor, atomic\_fetch\_xor\_explicit — atomically replace the value of an object with the  
 22686 result of a computation

22687 **SYNOPSIS**

```
22688 #include <stdatomic.h>
22689 C atomic_fetch_add(volatile A *object, M operand);
22690 C atomic_fetch_add_explicit(volatile A *object, M operand,
22691 memory_order order);
22692 C atomic_fetch_and(volatile A *object, M operand);
22693 C atomic_fetch_and_explicit(volatile A *object, M operand,
22694 memory_order order);
22695 C atomic_fetch_or(volatile A *object, M operand);
22696 C atomic_fetch_or_explicit(volatile A *object, M operand,
22697 memory_order order);
22698 C atomic_fetch_sub(volatile A *object, M operand);
22699 C atomic_fetch_sub_explicit(volatile A *object, M operand,
22700 memory_order order);
22701 C atomic_fetch_xor(volatile A *object, M operand);
22702 C atomic_fetch_xor_explicit(volatile A *object, M operand,
22703 memory_order order);
```

22704 **DESCRIPTION**

22705 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22706 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22707 volume of POSIX.1-2024 defers to the ISO C standard.

22708 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
 22709 `<stdatomic.h>` header nor support these generic functions.

22710 The `atomic_fetch_add_explicit()` generic function shall atomically replace the value pointed to by  
 22711 `object` with the result of adding `operand` to this value. This operation shall be an atomic read-  
 22712 modify-write operation (see XBD Section 4.15.1, on page 100). Memory shall be affected  
 22713 according to the value of `order`.

22714 The `atomic_fetch_add()` generic function shall be equivalent to `atomic_fetch_add_explicit()` called  
 22715 with `order` set to `memory_order_seq_cst`.

22716 The other `atomic_fetch_*`() generic functions shall be equivalent to `atomic_fetch_add_explicit()` if  
 22717 their name ends with `explicit`, or to `atomic_fetch_add()` if it does not, respectively, except that they  
 22718 perform the computation indicated in their name, instead of addition:

22719 *sub* subtraction

22720 *or* bitwise inclusive OR

22721 *xor* bitwise exclusive OR

22722 *and* bitwise AND

22723 For addition and subtraction, the application shall ensure that `A` is an atomic integer type or an  
 22724 atomic pointer type and is not `atomic_bool`. For the other operations, the application shall  
 22725 ensure that `A` is an atomic integer type and is not `atomic_bool`.

22726 For signed integer types, the computation shall silently wrap around on overflow; there are no  
 22727 undefined results. For pointer types, the result can be an undefined address, but the

22728 computations otherwise have no undefined behavior.

22729 **RETURN VALUE**

22730 These generic functions shall return the value pointed to by *object* immediately before the effects.

22731 **ERRORS**

22732 No errors are defined.

22733 **EXAMPLES**

22734 None.

22735 **APPLICATION USAGE**

22736 The operation of these generic functions is nearly equivalent to the operation of the  
22737 corresponding compound assignment operators +=, -=, etc. The only differences are that the  
22738 compound assignment operators are not guaranteed to operate atomically, and the value yielded  
22739 by a compound assignment operator is the updated value of the object, whereas the value  
22740 returned by these generic functions is the previous value of the atomic object.

22741 **RATIONALE**

22742 None.

22743 **FUTURE DIRECTIONS**

22744 None.

22745 **SEE ALSO**

22746 XBD Section 4.15.1, [<stdatomic.h>](#)

22747 **CHANGE HISTORY**

22748 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22749 **NAME**

22750 atomic\_flag\_clear, atomic\_flag\_clear\_explicit — clear an atomic flag

22751 **SYNOPSIS**

22752 #include &lt;stdatomic.h&gt;

22753 void atomic\_flag\_clear(volatile atomic\_flag \*object);

22754 void atomic\_flag\_clear\_explicit(volatile atomic\_flag \*object,

22755 memory\_order order);

22756 **DESCRIPTION**

22757 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22758 conflict between the requirements described here and the ISO C standard is unintentional. This  
22759 volume of POSIX.1-2024 defers to the ISO C standard.

22760 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22761 `<stdatomic.h>` header nor support these generic functions.

22762 The `atomic_flag_clear_explicit()` function shall atomically place the atomic flag pointed to by *object*  
22763 into the clear state. Memory shall be affected according to the value of *order*, which the  
22764 application shall ensure is not `memory_order_acquire` nor `memory_order_acq_rel`.

22765 The `atomic_flag_clear()` function shall be equivalent to `atomic_flag_clear_explicit()` called with  
22766 *order* set to `memory_order_seq_cst`.

22767 **RETURN VALUE**

22768 These functions shall not return a value.

22769 **ERRORS**

22770 No errors are defined.

22771 **EXAMPLES**

22772 None.

22773 **APPLICATION USAGE**

22774 None.

22775 **RATIONALE**

22776 None.

22777 **FUTURE DIRECTIONS**

22778 None.

22779 **SEE ALSO**22780 XBD Section 4.15.1, `<stdatomic.h>`22781 **CHANGE HISTORY**

22782 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22783 **NAME**

22784 atomic\_flag\_test\_and\_set, atomic\_flag\_test\_and\_set\_explicit — test and set an atomic flag

22785 **SYNOPSIS**

```
22786 #include <stdatomic.h>
22787 _Bool atomic_flag_test_and_set(volatile atomic_flag *object);
22788 _Bool atomic_flag_test_and_set_explicit(volatile atomic_flag *object,
22789 memory_order order);
```

22790 **DESCRIPTION**

22791 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22792 conflict between the requirements described here and the ISO C standard is unintentional. This  
22793 volume of POSIX.1-2024 defers to the ISO C standard.

22794 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22795 `<stdatomic.h>` header nor support these generic functions.

22796 The `atomic_flag_test_and_set_explicit()` function shall atomically place the atomic flag pointed to  
22797 by `object` into the set state and return the value corresponding to the immediately preceding  
22798 state. This operation shall be an atomic read-modify-write operation (see [Section 4.15.1](#), on page  
22799 100). Memory shall be affected according to the value of `order`.

22800 The `atomic_flag_test_and_set()` function shall be equivalent to `atomic_flag_test_and_set_explicit()`  
22801 called with `order` set to `memory_order_seq_cst`.

22802 **RETURN VALUE**

22803 These functions shall return the value that corresponds to the state of the atomic flag  
22804 immediately before the effects. The return value true shall correspond to the set state and the  
22805 return value false shall correspond to the clear state.

22806 **ERRORS**

22807 No errors are defined.

22808 **EXAMPLES**

22809 None.

22810 **APPLICATION USAGE**

22811 None.

22812 **RATIONALE**

22813 None.

22814 **FUTURE DIRECTIONS**

22815 None.

22816 **SEE ALSO**22817 [XBD Section 4.15.1](#), `<stdatomic.h>`22818 **CHANGE HISTORY**

22819 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22820 **NAME**

22821 atomic\_init — initialize an atomic object

22822 **SYNOPSIS**

22823 #include &lt;stdatomic.h&gt;

22824 void atomic\_init(volatile A \*obj, C value);

22825 **DESCRIPTION**

22826 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22827 conflict between the requirements described here and the ISO C standard is unintentional. This  
22828 volume of POSIX.1-2024 defers to the ISO C standard.

22829 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22830 `<stdatomic.h>` header nor support these generic functions.

22831 The `atomic_init()` generic function shall initialize the atomic object pointed to by *obj* to the value  
22832 *value*, while also initializing any additional state that the implementation might need to carry for  
22833 the atomic object.

22834 Although this function initializes an atomic object, it does not avoid data races; concurrent  
22835 access to the variable being initialized, even via an atomic operation, constitutes a data race.

22836 **RETURN VALUE**22837 The `atomic_init()` generic function shall not return a value.22838 **ERRORS**

22839 No errors are defined.

22840 **EXAMPLES**

```
22841 atomic_int guide;  
22842 atomic_init(&guide, 42);
```

22843 **APPLICATION USAGE**

22844 None.

22845 **RATIONALE**

22846 None.

22847 **FUTURE DIRECTIONS**

22848 None.

22849 **SEE ALSO**22850 XBD [<stdatomic.h>](#)22851 **CHANGE HISTORY**

22852 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22853 **NAME**

22854 atomic\_is\_lock\_free — indicate whether or not atomic operations are lock-free

22855 **SYNOPSIS**

22856 #include &lt;stdatomic.h&gt;

22857 \_Bool atomic\_is\_lock\_free(const volatile A \*obj);

22858 **DESCRIPTION**

22859 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22860 conflict between the requirements described here and the ISO C standard is unintentional. This  
22861 volume of POSIX.1-2024 defers to the ISO C standard.

22862 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22863 `<stdatomic.h>` header nor support these generic functions.

22864 The `atomic_is_lock_free()` generic function shall indicate whether or not atomic operations on  
22865 objects of the type pointed to by `obj` are lock-free; `obj` can be a null pointer.

22866 **RETURN VALUE**

22867 The `atomic_is_lock_free()` generic function shall return a non-zero value if and only if atomic  
22868 operations on objects of the type pointed to by `obj` are lock-free. During the lifetime of the calling  
22869 process, the result of the lock-free query shall be consistent for all pointers of the same type.

22870 **ERRORS**

22871 No errors are defined.

22872 **EXAMPLES**

22873 None.

22874 **APPLICATION USAGE**

22875 None.

22876 **RATIONALE**

22877 Operations that are lock-free should also be address-free. That is, atomic operations on the same  
22878 memory location via two different addresses will communicate atomically. The implementation  
22879 should not depend on any per-process state. This restriction enables communication via memory  
22880 mapped into a process more than once and memory shared between two processes.

22881 **FUTURE DIRECTIONS**

22882 None.

22883 **SEE ALSO**22884 XBD [<stdatomic.h>](#)22885 **CHANGE HISTORY**

22886 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22887 **NAME**

22888 atomic\_load, atomic\_load\_explicit — atomically obtain the value of an object

22889 **SYNOPSIS**

22890 #include &lt;stdatomic.h&gt;

22891 C atomic\_load(const volatile A \*object);

22892 C atomic\_load\_explicit(const volatile A \*object, memory\_order order);

22893 **DESCRIPTION**22894 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22895 conflict between the requirements described here and the ISO C standard is unintentional. This  
22896 volume of POSIX.1-2024 defers to the ISO C standard.22897 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22898 `<stdatomic.h>` header nor support these generic functions.22899 The `atomic_load_explicit()` generic function shall atomically obtain the value pointed to by `object`.  
22900 Memory shall be affected according to the value of `order`, which the application shall ensure is  
22901 not `memory_order_release` nor `memory_order_acq_rel`.22902 The `atomic_load()` generic function shall be equivalent to `atomic_load_explicit()` called with `order`  
22903 set to `memory_order_seq_cst`.22904 **RETURN VALUE**22905 These generic functions shall return the value pointed to by `object`.22906 **ERRORS**

22907 No errors are defined.

22908 **EXAMPLES**

22909 None.

22910 **APPLICATION USAGE**

22911 None.

22912 **RATIONALE**

22913 None.

22914 **FUTURE DIRECTIONS**

22915 None.

22916 **SEE ALSO**22917 XBD Section 4.15.1, `<stdatomic.h>`22918 **CHANGE HISTORY**

22919 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22920 **NAME**

22921 atomic\_signal\_fence, atomic\_thread\_fence — fence operations

22922 **SYNOPSIS**

22923 #include &lt;stdatomic.h&gt;

22924 void atomic\_signal\_fence(memory\_order order);

22925 void atomic\_thread\_fence(memory\_order order);

22926 **DESCRIPTION**

22927 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22928 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22929 volume of POSIX.1-2024 defers to the ISO C standard.

22930 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
 22931 `<stdatomic.h>` header nor support these generic functions.

22932 The `atomic_signal_fence()` and `atomic_thread_fence()` functions provide synchronization primitives  
 22933 called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire  
 22934 semantics is called an *acquire fence*; a fence with release semantics is called a *release fence*.

22935 A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*,  
 22936 both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is  
 22937 sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in  
 22938 the hypothetical release sequence *X* would head if it were a release operation.

22939 A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation  
 22940 on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X*  
 22941 modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the  
 22942 hypothetical release sequence *X* would head if it were a release operation.

22943 An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an  
 22944 acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B*  
 22945 and reads the value written by *A* or a value written by any side effect in the release sequence  
 22946 headed by *A*.

22947 Depending on the value of *order*, the operation performed by `atomic_thread_fence()` shall:

- 22948 • have no effects, if *order* is equal to `memory_order_relaxed`;
- 22949 • be an acquire fence, if *order* is equal to `memory_order_acquire` or  
 22950 `memory_order_consume`;
- 22951 • be a release fence, if *order* is equal to `memory_order_release`;
- 22952 • be both an acquire fence and a release fence, if *order* is equal to `memory_order_acq_rel`;
- 22953 • be a sequentially consistent acquire and release fence, if *order* is equal to  
 22954 `memory_order_seq_cst`.

22955 The `atomic_signal_fence()` function shall be equivalent to `atomic_thread_fence()`, except that the  
 22956 resulting ordering constraints shall be established only between a thread and a signal handler  
 22957 executed in the same thread.

22958 **RETURN VALUE**

22959 These functions shall not return a value.

**22960 ERRORS**

22961 No errors are defined.

**22962 EXAMPLES**

22963 None.

**22964 APPLICATION USAGE**

22965 The *atomic\_signal\_fence()* function can be used to specify the order in which actions performed  
22966 by the thread become visible to the signal handler. Implementation reorderings of loads and  
22967 stores are inhibited in the same way as with *atomic\_thread\_fence()*, but the hardware fence  
22968 instructions that *atomic\_thread\_fence()* would have inserted are not emitted.

**22969 RATIONALE**

22970 None.

**22971 FUTURE DIRECTIONS**

22972 None.

**22973 SEE ALSO**

22974 [XBD Section 4.15.1, <stdatomic.h>](#)

**22975 CHANGE HISTORY**

22976 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

22977 **NAME**

22978 atomic\_store, atomic\_store\_explicit — atomically store a value in an object

22979 **SYNOPSIS**

22980 #include <stdatomic.h>

22981 void atomic\_store(volatile A \*object, C desired);

22982 void atomic\_store\_explicit(volatile A \*object, C desired,

22983 memory\_order order);

22984 **DESCRIPTION**

22985 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22986 conflict between the requirements described here and the ISO C standard is unintentional. This  
22987 volume of POSIX.1-2024 defers to the ISO C standard.

22988 Implementations that define the macro `__STDC_NO_ATOMICS__` need not provide the  
22989 `<stdatomic.h>` header nor support these generic functions.

22990 The `atomic_store_explicit()` generic function shall atomically replace the value pointed to by *object*  
22991 with *desired*. Memory shall be affected according to the value of *order*, which the application  
22992 shall ensure is not `memory_order_acquire`, `memory_order_consume`, nor  
22993 `memory_order_acq_rel`.

22994 The `atomic_store()` generic function shall be equivalent to `atomic_store_explicit()` called with *order*  
22995 set to `memory_order_seq_cst`.

22996 **RETURN VALUE**

22997 These generic functions shall not return a value.

22998 **ERRORS**

22999 No errors are defined.

23000 **EXAMPLES**

23001 None.

23002 **APPLICATION USAGE**

23003 None.

23009 XBD Section 4.15.1, [<stdatomic.h>](#)

23010 **CHANGE HISTORY**

23011 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

23012 **NAME**

23013            basename — return the last component of a pathname

23014 **SYNOPSIS**

```
23015 XSI        #include <libgen.h>
23016            char *basename(char *path);
```

23017 **DESCRIPTION**

23018            The *basename()* function shall take the pathname pointed to by *path* and return a pointer to the  
23019            final component of the pathname, deleting any trailing '/' characters.

23020            If the string pointed to by *path* consists entirely of the '/' character, *basename()* shall return a  
23021            pointer to the string "/", except that if the string pointed to by *path* is exactly "/", it is  
23022            implementation-defined whether "/" or "/" is returned.

23023            If *path* is a null pointer or points to an empty string, *basename()* shall return a pointer to the  
23024            string ".".

23025            The *basename()* function may modify the string pointed to by *path*, and may return a pointer into  
23026            the input string. The returned pointer might be invalidated if the input string is subsequently  
23027            modified or freed. If *path* is a null pointer or points to an empty string, or if the string pointed to  
23028            by *path* consists entirely of the '/' character, the returned pointer may point to constant data  
23029            that cannot be modified.

23030 **RETURN VALUE**

23031            The *basename()* function shall return a pointer to the final component of *path*.

23032            The *basename()* function shall always be successful and no return value is reserved to indicate an  
23033            error.

23034 **ERRORS**

23035            No errors are defined.

23036 **EXAMPLES**23037            **Using basename()**

23038            The following program fragment returns a pointer to the value *lib*, which is the base name of  
23039            */usr/lib*.

```
23040            #include <libgen.h>
23041            ...
23042            char name[] = "/usr/lib";
23043            char *base;
23044            base = basename(name);
23045            ...
```

Sample Input and Output Strings for the `basename()` and `dirname()` Functions and the `basename` and `dirname` Utilities

basename() and dirname() Functions path Argument	String Returned by basename()	String Returned by dirname()	basename and dirname Utilities string Operand	Output Written by basename Utility	Output Written by dirname Utility
"usr"	"usr"	". "	usr	usr	.
"usr/"	"usr"	". "	usr/	usr	.
" "	". "	". "	empty string	. or empty string	.
"/"	"/"	"/"	/	/	/
"/"	"/" or "/" (see note 1)	"/" or "/" (see note 1)	//	/ or // (see note 1)	/ or // (see note 1)
"/"	"/"	"/" or "/" (see note 1)	///	/	/ or ///
"/usr/"	"usr"	"/"	/usr/	usr	/
"/usr/lib"	"lib"	"/usr"	/usr/lib	lib	/usr
"/usr/lib/"	"lib"	"/usr" or "/usr" (see note 1)	///usr///lib//	lib	///usr or /usr (see note 1)
"/home//dwc//test"	"test"	"/home//dwc" or "/home/dwc"	/home//dwc//test	test	/home//dwc or /home/dwc
"/home/.../test"	"test"	"/home/.../" or "/home/.."	/home/.../test	test	/home/... or /home/..
"/home/dwc/."	". "	"/home/dwc"	/home/dwc/.	.	/home/dwc

**Note**

- Whether leading // can be converted to / depends on the implementation-defined behavior of // (see XBD Section 4.16 (on page 105); although the `basename()` and `dirname()` functions, and `basename` and `dirname` utilities, do not themselves perform pathname resolution, their results can be passed to a function or utility which does).

**APPLICATION USAGE**

Note that in some circumstances (in particular, when the returned string is required to be "/" or ". "), the returned pointer might point into constant data. Therefore, if the application needs to modify the returned data, it should be copied first.

**RATIONALE**

Earlier versions of this standard seemed to allow thread-safe and non-thread-safe implementations of `basename()` and `dirname()`, but did not allow implementations to return a null pointer and require that `errno` be set when that happened. The standard now requires thread-safe behavior for both of these functions and clearly states that they are always successful.

**FUTURE DIRECTIONS**

None.

23090 **CHANGE HISTORY**

23091 First released in Issue 4, Version 2.

23092 **Issue 5**

23093 Moved from X/OPEN UNIX extension to BASE.

23094 Normative text previously in the APPLICATION USAGE section is moved to the  
23095 DESCRIPTION.

23096 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

23097 **Issue 6**

23098 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

23099 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the  
23100 DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.

23101 **Issue 7**

23102 Austin Group Interpretation 1003.1-2001 #156 is applied.

23103 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0041 [75] is applied.

23104 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0047 [656], XSH/TC2-2008/0048 [928],  
23105 and XSH/TC2-2008/0049 [612] are applied.

23106 **Issue 8**

23107 Austin Group Defects 1064 and 1358 are applied, requiring *basename()* to be thread-safe and  
23108 allowing it to return a pointer to constant data under certain conditions.

23109 Austin Group Defect 1073 is applied, changing the EXAMPLES section.

23110 Austin Group Defect 1396 is applied, changing the EXAMPLES section.

23111 **NAME**

23112           be16toh, be32toh, be64toh, htobe16, htobe32, htobe64, htole16, htole32, htole64, le16toh, le32toh,  
23113           le64toh — convert values between host and specified byte order

23114 **SYNOPSIS**

```
23115       #include <endian.h>

23116       uint16_t be16toh(uint16_t big_endian_16bits);
23117       uint32_t be32toh(uint32_t big_endian_32bits);
23118       uint64_t be64toh(uint64_t big_endian_64bits);

23119       uint16_t htobe16(uint16_t host_16bits);
23120       uint32_t htobe32(uint32_t host_32bits);
23121       uint64_t htobe64(uint64_t host_64bits);

23122       uint16_t htole16(uint16_t host_16bits);
23123       uint32_t htole32(uint32_t host_32bits);
23124       uint64_t htole64(uint64_t host_64bits);

23125       uint16_t le16toh(uint16_t little_endian_16bits);
23126       uint32_t le32toh(uint32_t little_endian_32bits);
23127       uint64_t le64toh(uint64_t little_endian_64bits);
```

23128 **DESCRIPTION**

23129           These functions shall convert integer values of various sizes between host representations and  
23130           representations in a specified order.

23131           On some implementations, these functions are defined as macros.

23132           A little-endian representation of an integer has the least significant byte stored as the first byte,  
23133           with the significance of the bytes increasing as the byte address increases. A big-endian  
23134           representation has the most significant byte as the first byte, with the significance of the bytes  
23135           reducing as the byte address increases.

23136           **Note:**     Network byte order is big-endian.

23137           For example, the **uint32\_t** value 0x01020304 is represented as the four bytes 0x04, 0x03, 0x02,  
23138           0x01 on a little-endian host, and as 0x01, 0x02, 0x03, 0x04 on a big-endian host.

23139           For each of the sizes 16, 32 and 64, the *htobeSIZE()* function shall convert from whatever order  
23140           the host uses to big-endian representation, *htoleSIZE()* shall convert to little-endian  
23141           representation, *beSIZEtoh()* shall convert from big-endian to host order, and *leSIZEtoh()* shall  
23142           convert from little-endian to host order.

23143 **RETURN VALUE**

23144           These functions shall return an unsigned integer of the appropriate size and representation.

23145 **ERRORS**

23146           No errors are defined.

23147 **EXAMPLES**

```
23148       #include <endian.h>
23149       #include <stdio.h>
23150       #include <stdlib.h>

23151       int main(int argc, char *argv[])
23152       {
23153           uint32_t val;
23154           if (argc > 1) {
```

```

23155     val = (uint32_t)strtoul(argv[1], NULL, 0);
23156     printf("Value: %08x\n", val);

23157     printf("As bytes:\n");
23158     union {
23159         uint32_t asint;
23160         unsigned char asbytes[sizeof(uint32_t)];
23161     } u;
23162     printf("Little endian: ");
23163     u.asint = htobe32(val);
23164     for (int i = 0; i < sizeof(uint32_t); i++) {
23165         printf("%02x ", u.asbytes[i]);
23166     }
23167     printf("\n");

23168     printf("Big endian   : ");
23169     u.asint = htobe32(val);
23170     for (int i = 0; i < sizeof(uint32_t); i++) {
23171         printf("%02x ", u.asbytes[i]);
23172     }
23173     printf("\n");
23174 }
23175 return 0;
23176 }

```

**APPLICATION USAGE**

Since network order is defined as big-endian, the following functions are equivalent if `<arpa/inet.h>` is included:

23180  
23181  
23182  
23183  
23184

<code>&lt;endian.h&gt;</code>	<code>&lt;arpa/inet.h&gt;</code>
<i>htobe32</i>	<i>htonl</i>
<i>htobe16</i>	<i>htons</i>
<i>be32toh</i>	<i>ntohl</i>
<i>be16toh</i>	<i>ntohs</i>

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 8.

23194 **NAME**

23195 bind — bind a name to a socket

23196 **SYNOPSIS**

```
23197 #include <sys/socket.h>
23198 int bind(int socket, const struct sockaddr *address,
23199         socklen_t address_len);
```

23200 **DESCRIPTION**

23201 The *bind()* function shall assign a local socket address *address* to a socket identified by descriptor  
 23202 *socket* that has no local socket address assigned. Sockets created with the *socket()* function are  
 23203 initially unnamed; they are identified only by their address family.

23204 The *bind()* function takes the following arguments:

23205	<i>socket</i>	Specifies the file descriptor of the socket to be bound.
23206	<i>address</i>	Points to a <b>sockaddr</b> structure containing the address to be bound to the socket. The length and format of the address depend on the address family of the socket.
23207		
23208		
23209	<i>address_len</i>	Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i> argument.
23210		

23211 The socket specified by *socket* may require the process to have appropriate privileges to use the  
 23212 *bind()* function.

23213 If the address family of the socket is AF\_UNIX, the application shall ensure that a null  
 23214 terminator after the pathname is included in the *sun\_path* member of *address* as a **sockaddr\_un**  
 23215 structure, and that *address\_len* is at least `offsetof(struct sockaddr_un, sun_path) +`  
 23216 `1` plus the length of the pathname. If the pathname in the *sun\_path* member of *address* names an  
 23217 existing file, including a symbolic link, *bind()* shall treat the address as already in use; see  
 23218 ERRORS below.

23219 If the socket address cannot be assigned immediately and O\_NONBLOCK is set for the file  
 23220 descriptor for the socket, *bind()* shall fail and set *errno* to [EINPROGRESS], but the assignment  
 23221 request shall not be aborted, and the assignment shall be completed asynchronously. Subsequent  
 23222 calls to *bind()* for the same socket, before the assignment is completed, shall fail and set *errno* to  
 23223 [EALREADY].

23224 When the assignment has been performed asynchronously, *pselect()*, *select()*, *poll()*, and *ppoll()*  
 23225 shall indicate that the file descriptor for the socket is ready for reading and writing.

23226 **RETURN VALUE**

23227 Upon successful completion, *bind()* shall return 0; otherwise, `-1` shall be returned and *errno* set  
 23228 to indicate the error.

23229 **ERRORS**

23230 The *bind()* function shall fail if:

23231 [EADDRINUSE] The specified address is already in use.

23232 [EADDRNOTAVAIL]

23233 The specified address is not available from the local machine.

23234 [EAFNOSUPPORT]

23235 The specified address is not a valid address for the address family of the  
 23236 specified socket.

23237	[EALREADY]	An assignment request is already in progress for the specified socket.
23238	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
23239	[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the assignment cannot be immediately performed; the assignment shall be performed asynchronously.
23240		
23241		
23242	[EINVAL]	The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.
23243		
23244	[ENOBUFS]	Insufficient resources were available to complete the call.
23245	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
23246	[EOPNOTSUPP]	The socket type of the specified socket does not support binding to an address.
23247		If the address family of the socket is AF_UNIX, then <i>bind()</i> shall fail if:
23248	[EACCES]	A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.
23249		
23250		
23251	[EDESTADDRREQ] or [EISDIR]	
23252		The <i>address</i> argument is a null pointer.
23253	[EILSEQ]	The last pathname component is not a portable filename, and cannot be created in the target directory.
23254		
23255	[EIO]	An I/O error occurred.
23256	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in <i>address</i> .
23257		
23258	[ENAMETOOLONG]	
23259		The length of a component of a pathname is longer than {NAME_MAX}.
23260	[ENOENT]	A component of the path prefix of the pathname in <i>address</i> does not name an existing file or the pathname is an empty string.
23261		
23262	[ENOENT] or [ENOTDIR]	
23263		The pathname in <i>address</i> contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters. If the pathname without the trailing <code>&lt;slash&gt;</code> characters would name an existing file, an [ENOENT] error shall not occur.
23264		
23265		
23266		
23267	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> names an existing file that is neither a directory nor a symbolic link to a directory, or the pathname in <i>address</i> contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
23268		
23269		
23270		
23271		
23272		
23273	[EROFS]	The name would reside on a read-only file system.
23274		The <i>bind()</i> function may fail if:
23275	[EACCES]	The specified address is protected and the current user does not have permission to bind to it.
23276		

23277	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family.
23278	[EISCONN]	The socket is already connected.
23279	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .
23280		
23281	[ENAMETOOLONG]	
23282		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
23283		
23284		

### 23285 EXAMPLES

23286 The following code segment shows how to create a socket and bind it to a name in the AF\_UNIX domain.

```

23288 #define MY_SOCKET_PATH "/somepath"
23289
23289 int sfd;
23290 struct sockaddr_un my_addr;
23291
23291 sfd = socket(AF_UNIX, SOCK_STREAM, 0);
23292 if (sfd == -1)
23293     /* Handle error */;
23294
23294 memset(&my_addr, '\0', sizeof(struct sockaddr_un));
23295                               /* Clear structure */
23296 my_addr.sun_family = AF_UNIX;
23297 strncpy(my_addr.sun_path, MY_SOCKET_PATH, sizeof(my_addr.sun_path) - 1);
23298
23298 if (bind(sfd, (struct sockaddr *) &my_addr,
23299         sizeof(struct sockaddr_un)) == -1)
23300     /* Handle error */;

```

### 23301 APPLICATION USAGE

23302 An application program can retrieve the assigned socket name with the *getsockname()* function.

23303 For AF\_UNIX sockets, some implementations support an extension where *address\_len* does not have to include a null terminator for the pathname stored in *sun\_path*, which in turn allows a pathname to be one byte longer. However, such usage is not portable, and carries a risk of accessing beyond the intended bounds of the pathname length.

### 23307 RATIONALE

23308 Implementations are encouraged to have *bind()* report an [EILSEQ] error if the last component of the address to be bound to an AF\_UNIX family socket contains any bytes that have the encoded value of a <newline> character.

### 23311 FUTURE DIRECTIONS

23312 None.

### 23313 SEE ALSO

### 23316 CHANGE HISTORY

23317 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

23318 **Issue 7**

23319 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the ``may fail'' [ENOBUFS]  
23320 error to become a ``shall fail'' error.

23321 Austin Group Interpretation 1003.1-2001 #143 is applied.

23322 SD5-XSH-ERN-185 is applied.

23323 An example is added.

23324 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0042 [146], XSH/TC1-2008/0043 [146],  
23325 and XSH/TC1-2008/0044 [324] are applied.

23326 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0050 [822] is applied.

23327 **Issue 8**

23328 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
23329 filenames containing any bytes that have the encoded value of a <newline> character.

23330 Austin Group Defects 293 and 1482 are applied, adding the [EILSEQ] error.

23331 Austin Group Defect 561 is applied, changing the requirements for the *sun\_path* member of the  
23332 **sockaddr\_un** structure.

23333 Austin Group Defect 1263 is applied, adding *ppoll()*.

23334 Austin Group Defect 1605 is applied, clarifying how the [EADDRINUSE] error applies to  
23335 AF\_UNIX sockets.

23336 **NAME**

23337 bindtextdomain, bind\_textdomain\_codeset, textdomain — text domain manipulation functions

23338 **SYNOPSIS**

```
23339 #include <libintl.h>
23340 char *bindtextdomain(const char *domainname, const char *dirname);
23341 char *bind_textdomain_codeset(const char *domainname,
23342     const char *codeset);
23343 char *textdomain(const char *domainname);
```

23344 **DESCRIPTION**

23345 The *textdomain()* function shall set or query the name of the current text domain of the calling  
 23346 process. The application shall ensure that the *domainname* argument is either a null pointer  
 23347 (when querying), an empty string, or a string that, when used by the *gettext* family of functions  
 23348 to construct a pathname to a messages object, results in a valid pathname. For portable  
 23349 applications, it should only contain characters from the portable filename character set.

23350 The text domain setting made by the last successful call to *textdomain()* shall remain in effect  
 23351 across subsequent calls to *setlocale()*, *uselocale()*, and the *gettext* family of functions.

23352 Applications should not use text domains whose names begin with the strings "SYS\_" or  
 23353 "libc". These prefixes are reserved for implementation use.

23354 The current setting of the text domain can be queried without affecting the current state of the  
 23355 domain by calling *textdomain()* with *domainname* set to a null pointer. Calling *textdomain()* with a  
 23356 *domainname* argument of an empty string shall set the text domain to the default domain,  
 23357 "messages".

23358 The *bindtextdomain()* function shall set or query the binding of a text domain to a *dirname* that is  
 23359 used by the *gettext* family of functions to construct a pathname to a messages object in the text  
 23360 domain:

- 23361 • If *domainname* is a null pointer or an empty string, *bindtextdomain()* shall make no changes  
 23362 and return a null pointer without changing *errno*.
- 23363 • Otherwise, if *dirname* is a non-empty string:
  - 23364 — If *domainname* is not already bound, *bindtextdomain()* shall bind the text domain  
 23365 specified by *domainname* to the pathname pointed to by *dirname* and return the bound  
 23366 directory pathname on success or a null pointer on failure.
  - 23367 — If *domainname* is already bound, *bindtextdomain()* shall replace the existing binding  
 23368 with the pathname pointed to by *dirname* and return the bound directory pathname  
 23369 on success or a null pointer on failure. On failure, the existing binding shall remain  
 23370 unchanged.

23371 It is unspecified whether the *bindtextdomain()* function performs pathname resolution on  
 23372 *dirname*, or whether that is done by the *gettext* family of functions.

- 23373 • Otherwise, if *dirname* is a null pointer:
  - 23374 — If *domainname* is bound, the function shall return the bound directory pathname.
  - 23375 — If *domainname* is not bound, the function shall return the implementation-defined  
 23376 default directory pathname used by the *gettext* family of functions.
- 23377 • Otherwise, *dirname* is an empty string and the behavior is unspecified.

23378 If a text domain is bound to a relative pathname and the current working directory is changed  
 23379 after the binding is established, the pathnames used by the *gettext* family of functions to locate

23380 messages objects for that text domain are unspecified.

23381 The *bind\_textdomain\_codeset()* function shall set or query the binding of a text domain to the  
23382 output codeset used by the *gettext* family of functions for message strings retrieved from  
23383 messages objects for the text domain specified by *domainname*:

- 23384 • If *domainname* is a null pointer or an empty string, *bind\_textdomain\_codeset()* shall make no  
23385 changes and return a null pointer without changing *errno*.
- 23386 • Otherwise, if *codeset* is a non-empty string:
  - 23387 — If *domainname* is not already bound, *bind\_textdomain\_codeset()* shall bind the text  
23388 domain specified by *domainname* to the codeset pointed to by *codeset* and return the  
23389 newly bound codeset on success or a null pointer on failure.
  - 23390 — If *domainname* is already bound, *bind\_textdomain\_codeset()* shall replace the existing  
23391 binding with the codeset pointed to by *codeset* and return the newly bound codeset  
23392 on success or a null pointer on failure. On failure, the existing binding shall remain  
23393 unchanged.

23394 The application shall ensure that the *codeset* argument, if non-empty, is a valid codeset  
23395 name that can be used as the *tocode* argument of the *iconv\_open()* function, and that in the  
23396 codeset it specifies, the <NUL> character corresponds to a single null byte.

- 23397 • Otherwise, if *codeset* is a null pointer:
  - 23398 — If *domainname* is bound, the function shall return the bound codeset.
  - 23399 — If *domainname* is not bound, the function shall return the implementation-defined  
23400 default codeset used by the *gettext* family of functions.
- 23401 • Otherwise, *codeset* is an empty string and the behavior is unspecified.

23402 If *codeset* is a null pointer and *domainname* is a non-empty string, *bind\_textdomain\_codeset()* shall  
23403 return the current codeset for the named domain, or a null pointer if a codeset has not yet been  
23404 set. The *bind\_textdomain\_codeset()* function can be called multiple times. If successfully called  
23405 multiple times with the same *domainname* argument, the last such call shall override the setting  
23406 made by the previous such call.

#### 23407 RETURN VALUE

23408 The return value from a successful *textdomain()* call shall be a pointer to a string containing the  
23409 current setting of the text domain. If *domainname* is a null pointer, *textdomain()* shall return a  
23410 pointer to the string containing the current text domain. If *textdomain()* was not previously  
23411 called and *domainname* is a null string, the name of the default text domain shall be returned.  
23412 The name of the default text domain shall be the string "messages". If *textdomain()* fails, a null  
23413 pointer shall be returned and *errno* shall be set to indicate the error.

23414 For *bindtextdomain()* return values see the DESCRIPTION. When *bindtextdomain()* is called with  
23415 a non-empty *domainname* and returns a null pointer, it shall set *errno* to indicate the error. When  
23416 *bindtextdomain()* returns a pathname for a bound text domain, the return value shall be a pointer  
23417 to a copy of the *dirname* string passed to the *bindtextdomain()* call that created the binding. The  
23418 returned string shall remain valid until the next successful call to *bindtextdomain()* with a non-  
23419 empty *dirname* and same *domainname*. The application shall ensure that it does not modify the  
23420 returned string.

23421 A call to the *bind\_textdomain\_codeset()* function with a non-empty *domainname* argument shall  
23422 return one of the following:

- 23423 • The currently bound codeset name for that text domain if *codeset* is a null pointer
- 23424 • The newly bound codeset if *codeset* is non-empty
- 23425 • A null pointer without changing *errno* if no codeset has yet been bound for that text
- 23426 domain

23427 The application shall ensure that it does not modify the returned string. A subsequent call to  
 23428 *bind\_textdomain\_codeset()* with a non-empty *domainname* argument might invalidate the returned  
 23429 pointer or overwrite the string content. The returned pointer might also be invalidated if the  
 23430 calling thread is terminated. If *bind\_textdomain\_codeset()* fails, a null pointer shall be returned  
 23431 and *errno* shall be set to indicate the error.

#### 23432 ERRORS

23433 For the conditions under which *bindtextdomain()*—if it performs pathname resolution—fails and  
 23434 may fail, refer to *open()*.

23435 In addition, the *textdomain()*, *bindtextdomain()*, and *bind\_textdomain\_codeset()* functions may fail  
 23436 if:

23437 [ENOMEM]      Insufficient memory available.

#### 23438 EXAMPLES

23439 See the examples for *gettext*.

#### 23440 APPLICATION USAGE

23441 A text *domainname* is limited to {TEXTDOMAIN\_MAX} bytes.

23442 Application developers are responsible for ensuring that the text domain used is not used by  
 23443 other applications. To minimize the chances of collision, developers can prefix text domains with  
 23444 their company or application name (or both) and an underscore. For example, if your  
 23445 application name was "foo" and you wanted to use the text domain "errors", you could  
 23446 instead use the text domain "foo\_errors". Note that if an application can be installed with a  
 23447 configurable name, a text domain prefix based on the application name should change with the  
 23448 application name.

23449 Specifying a relative pathname to the *bindtextdomain()* function should be avoided, since it may  
 23450 result in messages objects being searched for in a directory relative to the current working  
 23451 directory of the calling process; if the process calls the *chdir()* function, the directory searched for  
 23452 may also be changed.

23453 Since pathname resolution of *dirname* might not be performed by *bindtextdomain()*, but could be  
 23454 performed later by the *gettext* family of functions, and since the latter have no way to report an  
 23455 error, applications should verify, using for example *stat()*, that the directory is accessible if this is  
 23456 desired.

#### 23457 RATIONALE

23458 Although the return type of these functions ought to be **const char \***, it is **char \*** to match  
 23459 historical practice.

23460 Pathname resolution of the *dirname* argument passed to *bindtextdomain()* may be performed by  
 23461 *bindtextdomain()* itself or by the *gettext* family of functions. If pathname resolution fails in one of  
 23462 the *gettext* family of functions, it is neither allowed to modify *errno* nor to return an error, but if  
 23463 pathname resolution fails in *bindtextdomain()*, it is required to report an error and set *errno* just  
 23464 like *open()* does.

23465 Historically, *bindtextdomain()* did not perform pathname resolution. However, the standard  
 23466 developers decided to allow this as an option so that future implementations can, if desired,  
 23467 open a file descriptor for that directory in *bindtextdomain()* and then use that file descriptor with

23468 *openat()* in the *gettext* family of functions.

23469 The *dirname* parameter to *bindtextdomain()* may need to be copied to avoid the possibility of the  
23470 application releasing the memory used by the argument while the *gettext* family of functions  
23471 may still need to reference it.

23472 When *bindtextdomain()* is called with a non-empty *domainname* and an empty *dirname*, historical  
23473 implementations of the *gettext* family of functions use the empty string for the *dirname* part of  
23474 the messages object pathname, resulting in an absolute pathname of the form  
23475 */localename/categoryname/textdomainname.mo*. The standard developers did not believe this  
23476 behavior to be useful. Using the empty *dirname* case as a way to remove an existing binding  
23477 seemed to be a more useful behavior, and would be consistent with the behavior of *textdomain()*.  
23478 However, because no historical implementations behave this way, the behavior is left  
23479 unspecified.

23480 Some implementations set *errno* to [EAGAIN] to signal memory allocation failures that might  
23481 succeed if retried and [ENOMEM] for failures that are unlikely to ever succeed, for example due  
23482 to configured limits. Section 2.3 (on page 507) permits this behavior; when multiple error  
23483 conditions are simultaneously true there is no precedence between them.

#### 23484 FUTURE DIRECTIONS

23485 A future version of this standard may require implementations to prefix implementation-  
23486 provided text domains with either "SYS\_" or a prefix related to the implementor's company  
23487 name to avoid namespace collisions.

23488 A future version of this standard may require *bindtextdomain()* to remove any binding for  
23489 *domainname* when called with a non-empty *domainname* and an empty *dirname*.

#### 23490 SEE ALSO

23492 XBD <libintl.h>, <limits.h>

23493 XCU *msgfmt*, *xgettext*

#### 23494 CHANGE HISTORY

23495 First released in Issue 8.

```

23540     char *string;
23541     int length;
23542 };
23543 struct node table[TABSIZE];    /* Table to be searched. */
23544     .
23545     .
23546     .
23547 {
23548     struct node *node_ptr, node;
23549     /* Routine to compare 2 nodes. */
23550     int node_compare(const void *, const void *);
23551     .
23552     .
23553     .
23554     while (scanf("%ms", &node.string) != EOF) {
23555         node_ptr = (struct node *)bsearch((void *)(&node),
23556             (void *)table, TABSIZE,
23557             sizeof(struct node), node_compare);
23558         if (node_ptr != NULL) {
23559             (void)printf("string = %20s, length = %d\n",
23560                 node_ptr->string, node_ptr->length);
23561         } else {
23562             (void)printf("not found: %s\n", node.string);
23563         }
23564         free(node.string);
23565     }
23566 }
23567 /*
23568     This routine compares two nodes based on an
23569     alphabetical ordering of the string field.
23570 */
23571 int
23572 node_compare(const void *node1, const void *node2)
23573 {
23574     return strcoll(((const struct node *)node1)->string,
23575         ((const struct node *)node2)->string);
23576 }

```

### 23577 APPLICATION USAGE

23578 The pointers to the key and the element at the base of the table should be of type pointer-to-  
23579 element.

23580 The comparison function need not compare every byte, so arbitrary data may be contained in  
23581 the elements in addition to the values being compared.

23582 In practice, the array is usually sorted according to the comparison function.

### 23583 RATIONALE

23584 The requirement that the second argument (hereafter referred to as *p*) to the comparison function  
23585 is a pointer to an element of the array implies that for every call all of the following expressions  
23586 are non-zero:

```

23587     ( (char *)p - (char *)base ) % width == 0
23588     (char *)p >= (char *)base

```

23589 (char \*)p < (char \*)base + nel \* width

23590 **FUTURE DIRECTIONS**

23591 None.

23592 **SEE ALSO**

23593 *hcreate(), lsearch(), qsort(), tdelete()*

23594 XBD <stdlib.h>

23595 **CHANGE HISTORY**

23596 First released in Issue 1. Derived from Issue 1 of the SVID.

23597 **Issue 6**

23598 The normative text is updated to avoid use of the term “must” for application requirements.

23599 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the  
23600 DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three  
23601 paragraphs. The RATIONALE section is also updated. These changes are for alignment with the  
23602 ISO C standard.

23603 **Issue 7**

23604 The EXAMPLES section is revised.

23605 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0051 [756] is applied.

23606 **NAME**

23607 btowc — single byte to wide character conversion

23608 **SYNOPSIS**

23609 #include &lt;stdio.h&gt;

23610 #include &lt;wchar.h&gt;

23611 wint\_t btowc(int c);

23612 **DESCRIPTION**

23613 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23614 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23615 volume of POSIX.1-2024 defers to the ISO C standard.

23616 The *btowc()* function shall determine whether *c* constitutes a valid (one-byte) character in the  
 23617 initial shift state.

23618 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

23619 **RETURN VALUE**

23620 The *btowc()* function shall return WEOF if *c* has the value EOF or if (**unsigned char**) *c* does not  
 23621 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the  
 23622 wide-character representation of that character.

23623 CX In the POSIX locale, *btowc()* shall not return WEOF if *c* has a value in the range 0 to 255  
 23624 inclusive.

23625 **ERRORS**

23626 No errors are defined.

23627 **EXAMPLES**

23628 None.

23629 **APPLICATION USAGE**

23630 None.

23631 **RATIONALE**

23632 None.

23633 **FUTURE DIRECTIONS**

23634 None.

23635 **SEE ALSO**23636 [wctob\(\)](#)23637 XBD [<stdio.h>](#), [<wchar.h>](#)23638 **CHANGE HISTORY**

23639 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 23640 (E).

23641 **Issue 7**

23642 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0052 [663] is applied.

23643 **NAME**

23644 c16rtomb, c32rtomb — convert a Unicode character code to a character (restartable)

23645 **SYNOPSIS**

23646 #include &lt;uchar.h&gt;

23647 size\_t c16rtomb(char \*restrict s, char16\_t c16, mbstate\_t \*restrict ps);

23648 size\_t c32rtomb(char \*restrict s, char32\_t c32, mbstate\_t \*restrict ps);

23649 **DESCRIPTION**

23650 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23651 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23652 volume of POSIX.1-2024 defers to the ISO C standard.

23653 If *s* is a null pointer, the *c16rtomb()* function shall be equivalent to the call:

23654 c16rtomb(buf, L'\0', ps)

23655 where *buf* is an internal buffer.

23656 If *s* is not a null pointer, the *c16rtomb()* function shall determine the number of bytes needed to  
 23657 represent the character that corresponds to the wide character given by *c16* (including any shift  
 23658 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At  
 23659 most {MB\_CUR\_MAX} bytes shall be stored. If *c16* is a null wide character, a null byte shall be  
 23660 stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state  
 23661 described shall be the initial conversion state.

23662 If *ps* is a null pointer, the *c16rtomb()* function shall use its own internal **mbstate\_t** object, which  
 23663 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t**  
 23664 object pointed to by *ps* shall be used to completely describe the current conversion state of the  
 23665 associated character sequence.

23666 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.

23667 The *mbrtoc16()* function shall not change the setting of *errno* if successful.

23668 The *c32rtomb()* function shall behave the same way as *c16rtomb()* except that the second  
 23669 parameter shall be an object of type **char32\_t** instead of **char16\_t**. References to *c16* in the above  
 23670 description shall apply as if they were *c32* when they are being read as describing *c32rtomb()*.

23671 If called with a null *ps* argument, the *c16rtomb()* function need not be thread-safe; however, such  
 23672 calls shall avoid data races with calls to *c16rtomb()* with a non-null argument and with calls to  
 23673 all other functions.

23674 If called with a null *ps* argument, the *c32rtomb()* function need not be thread-safe; however, such  
 23675 calls shall avoid data races with calls to *c32rtomb()* with a non-null argument and with calls to  
 23676 all other functions.

23677 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 23678 *c16rtomb()* or *c32rtomb()* with a null pointer for *ps*.

23679 **RETURN VALUE**

23680 These functions shall return the number of bytes stored in the array object (including any shift  
 23681 sequences). When *c16* or *c32* is not a valid wide character, an encoding error shall occur. In this  
 23682 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size\_t**)−1;  
 23683 the conversion state is unspecified.

23684 **ERRORS**

23685 These functions shall fail if:

23686 [EILSEQ] An invalid wide-character code is detected.

23687 These functions may fail if:

23688 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.23689 **EXAMPLES**

23690 None.

23691 **APPLICATION USAGE**

23692 None.

23702 **NAME**

23703 cabs, cabsf, cabsl — return a complex absolute value

23704 **SYNOPSIS**

```
23705 #include <complex.h>
23706 double cabs(double complex z);
23707 float cabsf(float complex z);
23708 long double cabsl(long double complex z);
```

23709 **DESCRIPTION**

23710 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23711 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23712 volume of POSIX.1-2024 defers to the ISO C standard.

23713 These functions shall compute the complex absolute value (also called norm, modulus, or  
 23714 magnitude) of  $z$ .

23715 **RETURN VALUE**

23716 These functions shall return the complex absolute value.

23717 MXC  $cabs(x + iy)$ ,  $cabs(y + ix)$ , and  $cabs(x - iy)$  shall return exactly the same value.23718 If  $z$  is  $\pm 0 \pm i0$ ,  $+0$  shall be returned.23719 If the real or imaginary part of  $z$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned, even if the other part is NaN.23720 If the real or imaginary part of  $z$  is NaN and the other part is not  $\pm\text{Inf}$ , NaN shall be returned.23721 **ERRORS**

23722 No errors are defined.

 23737 standard.

23738 **NAME**

23739           acos, acosf, acosl — complex arc cosine functions

23740 **SYNOPSIS**

```
23741       #include <complex.h>
23742       double complex acos(double complex z);
23743       float complex acosf(float complex z);
23744       long double complex acosl(long double complex z);
```

23745 **DESCRIPTION**

23746 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
23747       conflict between the requirements described here and the ISO C standard is unintentional. This  
23748       volume of POSIX.1-2024 defers to the ISO C standard.

23749       These functions shall compute the complex arc cosine of  $z$ , with branch cuts outside the interval  
23750        $[-1, +1]$  along the real axis.

23751 **RETURN VALUE**

23752       These functions shall return the complex arc cosine value, in the range of a strip mathematically  
23753       unbounded along the imaginary axis and in the interval  $[0, \pi]$  along the real axis.

23754 MXC      *acos(conj(z))*, *acosf(conjf(z))*, and *acosl(conjl(z))* shall return exactly the same value as  
23755      *conj(acos(z))*, *conjf(acosf(z))*, and *conjl(acosl(z))*, respectively, including for the special values of  
23756       $z$  below.

23757      If  $z$  is  $\pm 0 + i0$ ,  $\pi/2 - i0$  shall be returned.

23758      If  $z$  is  $\pm 0 + iNaN$ ,  $\pi/2 + iNaN$  shall be returned.

23759      If  $z$  is  $x + iInf$  where  $x$  is finite,  $\pi/2 - iInf$  shall be returned.

23760      If  $z$  is  $x + iNaN$  where  $x$  is non-zero and finite,  $NaN + iNaN$  shall be returned and the invalid  
23761      floating-point exception may be raised.

23762      If  $z$  is  $-Inf + iy$  where  $y$  is positive-signed and finite,  $\pi - iInf$  shall be returned.

23763      If  $z$  is  $+Inf + iy$  where  $y$  is positive-signed and finite,  $+0 - iInf$  shall be returned.

23764      If  $z$  is  $-Inf + iInf$ ,  $3\pi/4 - iInf$  shall be returned.

23765      If  $z$  is  $+Inf + iInf$ ,  $\pi/4 - iInf$  shall be returned.

23766      If  $z$  is  $\pm Inf + iNaN$ ,  $NaN \pm iInf$  shall be returned; the sign of the imaginary part of the result is  
23767      unspecified.

23768      If  $z$  is  $NaN + iy$  where  $y$  is finite,  $NaN + iNaN$  shall be returned and the invalid floating-point  
23769      exception may be raised.

23770      If  $z$  is  $NaN + iInf$ ,  $NaN - iInf$  shall be returned.

23771      If  $z$  is  $NaN + iNaN$ ,  $NaN - iNaN$  shall be returned.

23772 **ERRORS**

23773       No errors are defined.

23774 **EXAMPLES**

23775 None.

23776 **APPLICATION USAGE**

23777 None.

23778 **RATIONALE**

23779 None.

23789 standard.

23790 **NAME**

23791 cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

23792 **SYNOPSIS**

23793 #include &lt;complex.h&gt;

23794 double complex cacosh(double complex z);

23795 float complex cacoshf(float complex z);

23796 long double complex cacoshl(long double complex z);

23797 **DESCRIPTION**

23798 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23799 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23800 volume of POSIX.1-2024 defers to the ISO C standard.

23801 These functions shall compute the complex arc hyperbolic cosine of  $z$ , with a branch cut at  
 23802 values less than 1 along the real axis.

23803 **RETURN VALUE**

23804 These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip  
 23805 of non-negative values along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary axis.

23806 MXC  $\text{cacosh}(\text{conj}(z))$ ,  $\text{cacoshf}(\text{conj}(z))$ , and  $\text{cacoshl}(\text{conj}(z))$  shall return exactly the same value as  
 23807  $\text{conj}(\text{cacosh}(z))$ ,  $\text{conj}(\text{cacoshf}(z))$ , and  $\text{conj}(\text{cacoshl}(z))$ , respectively, including for the special  
 23808 values of  $z$  below.

23809 If  $z$  is  $\pm 0 + i0$ ,  $+0 + i\pi/2$  shall be returned.23810 If  $z$  is  $x + i\text{Inf}$  where  $x$  is finite,  $+\text{Inf} + i\pi/2$  shall be returned.

23811 If  $z$  is  $0 + i\text{NaN}$ ,  $\text{NaN} \pm i\pi/2$  shall be returned; the sign of the imaginary part of the result is  
 23812 unspecified.

23813 If  $z$  is  $x + i\text{NaN}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 23814 floating-point exception may be raised.

23815 If  $z$  is  $-\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+\text{Inf} + i\pi$  shall be returned.23816 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+\text{Inf} + i0$  shall be returned.23817 If  $z$  is  $-\text{Inf} + i\text{Inf}$ ,  $+\text{Inf} + i3\pi/4$  shall be returned.23818 If  $z$  is  $+\text{Inf} + i\text{Inf}$ ,  $+\text{Inf} + i\pi/4$  shall be returned.23819 If  $z$  is  $\pm\text{Inf} + i\text{NaN}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

23820 If  $z$  is  $\text{NaN} + iy$  where  $y$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 23821 exception may be raised.

23822 If  $z$  is  $\text{NaN} + i\text{Inf}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.23823 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.23824 **ERRORS**

23825 No errors are defined.

23826 **EXAMPLES**

23827 None.

23828 **APPLICATION USAGE**

23829 None.

23830 **RATIONALE**

23831 None.

23832 **FUTURE DIRECTIONS**

23833 None.

23834 **SEE ALSO**23835 [ccosh\(\)](#)23836 XBD [<complex.h>](#)23837 **CHANGE HISTORY**

23838 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23839 **Issue 8**23840 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
23841 standard.

23842 **NAME**

23843           cacosl — complex arc cosine functions

23844 **SYNOPSIS**

23845           #include &lt;complex.h&gt;

23846           long double complex cacosl(long double complex z);

23847 **DESCRIPTION**23848           Refer to *acos()*.

23849 **NAME**

23850 call\_once — dynamic package initialization

23851 **SYNOPSIS**

23852 #include &lt;threads.h&gt;

23853 void call\_once(once\_flag \*flag, void (\*init\_routine)(void));

23854 once\_flag flag = ONCE\_FLAG\_INIT;

23855 **DESCRIPTION**

23856 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23857 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23858 volume of POSIX.1-2024 defers to the ISO C standard.

23859 The *call\_once()* function shall use the **once\_flag** pointed to by *flag* to ensure that *init\_routine* is  
 23860 called exactly once, the first time the *call\_once()* function is called with that value of *flag*.  
 23861 Completion of an effective call to the *call\_once()* function shall synchronize with all subsequent  
 23862 calls to the *call\_once()* function with the same value of *flag*.

23863 CX The *call\_once()* function is not a cancellation point. However, if *init\_routine* is a cancellation point  
 23864 and is canceled, the effect on *flag* shall be as if *call\_once()* was never called.

23865 If the call to *init\_routine* is terminated by a call to *longjmp()* or *siglongjmp()*, the behavior is  
 23866 undefined.

23867 The behavior of *call\_once()* is undefined if *flag* has automatic storage duration or is not  
 23868 initialized by ONCE\_FLAG\_INIT.

23869 The *call\_once()* function shall not be affected if the calling thread executes a signal handler  
 23870 during the call.

23871 **RETURN VALUE**23872 The *call\_once()* function shall not return a value.23873 **ERRORS**

23874 No errors are defined.

23875 **EXAMPLES**

23876 None.

23877 **APPLICATION USAGE**

23878 If *init\_routine* recursively calls *call\_once()* with the same *flag*, the recursive call will not call the  
 23879 specified *init\_routine*, and thus the specified *init\_routine* will not complete, and thus the recursive  
 23880 call to *call\_once()* will not return. Use of *longjmp()* or *siglongjmp()* within an *init\_routine* to jump  
 23881 to a point outside of *init\_routine* prevents *init\_routine* from returning.

23882 **RATIONALE**

23883 For dynamic library initialization in a multi-threaded process, if an initialization flag is used the  
 23884 flag needs to be protected against modification by multiple threads simultaneously calling into  
 23885 the library. This can be done by using a statically-initialized mutex. However, the better solution  
 23886 is to use *call\_once()* or *pthread\_once()* which are designed for exactly this purpose, for example:

23887 #include &lt;threads.h&gt;

23888 static once\_flag random\_is\_initialized = ONCE\_FLAG\_INIT;

23889 extern void initialize\_random(void);

23890 int random\_function()

23891 {

23892 call\_once(&amp;random\_is\_initialized, initialize\_random);

23893 ...

```
23894         /* Operations performed after initialization. */
23895     }
```

23896 The `call_once()` function is not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#) (on page 3742).  
23897

23898 **FUTURE DIRECTIONS**

23899 None.

23900 **SEE ALSO**

23901 [pthread\\_once\(\)](#)

23902 XBD [Section 4.15.2](#), [<threads.h>](#)

23903 **CHANGE HISTORY**

23904 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

23905 **NAME**

23906            calloc — a memory allocator

23907 **SYNOPSIS**

23908            #include &lt;stdlib.h&gt;

23909            void \*calloc(size\_t *nelem*, size\_t *elsize*);23910 **DESCRIPTION**

23911 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 23912 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23913 volume of POSIX.1-2024 defers to the ISO C standard.

23914        The `calloc()` function shall allocate unused space for an array of *nelem* elements each of whose  
 23915 size in bytes is *elsize*. The space shall be initialized to all bits 0.

23916        The order and contiguity of storage allocated by successive calls to `calloc()` is unspecified. The  
 23917 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 23918 a pointer to any type of object with a fundamental alignment requirement and then used to  
 23919 access such an object or an array of such objects in the space allocated (until the space is  
 23920 explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint  
 23921 from any other object. The pointer returned shall point to the start (lowest byte address) of the  
 23922 allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the  
 23923 space requested is 0, the behavior is implementation-defined: either a null pointer shall be  
 23924 returned, or the behavior shall be as if the size were some non-zero value, except that the  
 23925 behavior is undefined if the returned pointer is used to access an object.

23926        For purposes of determining the existence of a data race, `calloc()` shall behave as though it  
 23927 accessed only memory locations accessible through its arguments and not other static duration  
 23928 storage. The function may, however, visibly modify the storage that it allocates. Calls to  
 23929 ADV `aligned_alloc()`, `calloc()`, `free()`, `malloc()`, `posix_memalign()`,  
 23930 CX `reallocarray()`, and `realloc()` that allocate or deallocate a particular region of memory shall occur  
 23931 in a single total order (see [Section 4.15.1](#), on page 100), and each such deallocation call shall  
 23932 synchronize with the next allocation (if any) in this order.

23933 **RETURN VALUE**

23934        Upon successful completion, `calloc()` shall return a pointer to the allocated space; if either *nelem*  
 23935 or *elsize* is 0, the application shall ensure that the pointer is not used to access an object.

23936 CX        Otherwise, it shall return a null pointer and set `errno` to indicate the error.

23937 **ERRORS**

23938        The `calloc()` function shall fail if:

23939 CX        [ENOMEM]        Insufficient memory is available, including the case when *nelem* \* *elsize* would  
 23940 overflow.

23941        The `calloc()` function may fail if:

23942 CX        [EINVAL]        *nelem* or *elsize* is 0 and the implementation does not support 0 sized  
 23943 allocations.

23944 **EXAMPLES**

23945 None.

23946 **APPLICATION USAGE**23947 There is now no requirement for the implementation to support the inclusion of `<malloc.h>`.23948 **RATIONALE**23949 See the RATIONALE for `malloc()`.23950 **FUTURE DIRECTIONS**

23951 None.

23952 **SEE ALSO**23953 `aligned_alloc()`, `free()`, `malloc()`, `realloc()`23954 XBD `<stdlib.h>`23955 **CHANGE HISTORY**

23956 First released in Issue 1. Derived from Issue 1 of the SVID.

23957 **Issue 6**

23958 Extensions beyond the ISO C standard are marked.

23959 The following new requirements on POSIX implementations derive from alignment with the  
23960 Single UNIX Specification:

- 23961
- The setting of `errno` and the [ENOMEM] error condition are mandatory if an insufficient  
23962 memory condition occurs.

23963 **Issue 7**

23964 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0053 [526] is applied.

23965 **Issue 8**23966 Austin Group Defect 374 is applied, changing the RETURN VALUE and ERRORS sections in  
23967 relation to 0 sized allocations.

23968 Austin Group Defect 1218 is applied, changing the [ENOMEM] error.

23969 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
23970 standard.

23971 Austin Group Defect 1387 is applied, changing the RATIONALE section.

23972 **NAME**

23973           carg, cargf, cargl — complex argument functions

23974 **SYNOPSIS**

```
23975       #include <complex.h>
23976       double carg(double complex z);
23977       float cargf(float complex z);
23978       long double cargl(long double complex z);
```

23979 **DESCRIPTION**

23980 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 23981           conflict between the requirements described here and the ISO C standard is unintentional. This  
 23982           volume of POSIX.1-2024 defers to the ISO C standard.

23983           These functions shall compute the argument (also called phase angle) of  $z$ , with a branch cut  
 23984           along the negative real axis.

23985 **RETURN VALUE**23986           These functions shall return the value of the argument in the interval  $[-\pi, +\pi]$ .23987 MXC       If  $z$  is  $-0 \pm i0$ ,  $\pm\pi$  shall be returned.23988           If  $z$  is  $+0 \pm i0$ ,  $\pm 0$  shall be returned.23989           If  $z$  is  $x \pm i0$  where  $x$  is negative,  $\pm\pi$  shall be returned.23990           If  $z$  is  $x \pm i0$  where  $x$  is positive,  $\pm 0$  shall be returned.23991           If  $z$  is  $\pm 0 + iy$  where  $y$  is negative,  $-\pi/2$  shall be returned.23992           If  $z$  is  $\pm 0 + iy$  where  $y$  is positive,  $\pi/2$  shall be returned.23993           If  $z$  is  $-\text{Inf} \pm iy$  where  $y$  is positive and finite,  $\pm\pi$  shall be returned.23994           If  $z$  is  $+\text{Inf} \pm iy$  where  $y$  is positive and finite,  $\pm 0$  shall be returned.23995           If  $z$  is  $x \pm i\text{Inf}$  where  $x$  is finite,  $\pm\pi/2$  shall be returned.23996           If  $z$  is  $-\text{Inf} \pm i\text{Inf}$ ,  $\pm 3\pi/4$  shall be returned.23997           If  $z$  is  $+\text{Inf} \pm i\text{Inf}$ ,  $\pm\pi/4$  shall be returned.23998           If the real or imaginary part of  $z$  is NaN, NaN shall be returned.23999 **ERRORS**

24000           No errors are defined.

24001 **EXAMPLES**

24002           None.

24003 **APPLICATION USAGE**

24004           None.

24012 **CHANGE HISTORY**

24013 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24014 **Issue 8**24015 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
24016 standard.

24017 **NAME**

24018 casin, casinf, casinl — complex arc sine functions

24019 **SYNOPSIS**

```
24020 #include <complex.h>
24021 double complex casin(double complex z);
24022 float complex casinf(float complex z);
24023 long double complex casinl(long double complex z);
```

24024 **DESCRIPTION**

24025 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24026 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24027 volume of POSIX.1-2024 defers to the ISO C standard.

24028 These functions shall compute the complex arc sine of  $z$ , with branch cuts outside the interval  
 24029  $[-1, +1]$  along the real axis.

24030 **RETURN VALUE**

24031 These functions shall return the complex arc sine value, in the range of a strip mathematically  
 24032 unbounded along the imaginary axis and in the interval  $[-\pi/2, +\pi/2]$  along the real axis.

24033 MXC *casin(conj(iz))*, *casinf(conj(iz))*, and *casinl(conjl(iz))* shall return exactly the same value as  
 24034 *conj(casin(iz))*, *conj(casinf(iz))*, and *conjl(casinl(iz))*, respectively, and *casin(-iz)*, *casinf(-iz)*, and  
 24035 *casinl(-iz)* shall return exactly the same value as  $-casin(iz)$ ,  $-casinf(iz)$ , and  $-casinl(iz)$ ,  
 24036 respectively, including for the special values of  $iz$  below.

24037 If  $iz$  is  $+0 + i0$ ,  $-i(0 + i0)$  shall be returned.

24038 If  $iz$  is  $x + i\text{Inf}$  where  $x$  is positive-signed and finite,  $-i(+\text{Inf} + i\pi/2)$  shall be returned.

24039 If  $iz$  is  $x + i\text{NaN}$  where  $x$  is finite,  $-i(\text{NaN} + i\text{NaN})$  shall be returned and the invalid floating-  
 24040 point exception may be raised.

24041 If  $iz$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $-i(+\text{Inf} + i0)$  shall be returned.

24042 If  $iz$  is  $+\text{Inf} + i\text{Inf}$ ,  $-i(+\text{Inf} + i\pi/4)$  shall be returned.

24043 If  $iz$  is  $+\text{Inf} + i\text{NaN}$ ,  $-i(+\text{Inf} + i\text{NaN})$  shall be returned.

24044 If  $iz$  is  $\text{NaN} + i0$ ,  $-i(\text{NaN} + i0)$  shall be returned.

24045 If  $iz$  is  $\text{NaN} + iy$  where  $y$  is non-zero and finite,  $-i(\text{NaN} + i\text{NaN})$  shall be returned and the  
 24046 invalid floating-point exception may be raised.

24047 If  $iz$  is  $\text{NaN} + i\text{Inf}$ ,  $-i(\pm\text{Inf} + i\text{NaN})$  shall be returned; the sign of the imaginary part of the result  
 24048 is unspecified.

24049 If  $iz$  is  $\text{NaN} + i\text{NaN}$ ,  $-i(\text{NaN} + i\text{NaN})$  shall be returned.

24128 **NAME**

24129           catan, catanf, catanl — complex arc tangent functions

24130 **SYNOPSIS**

24131           #include &lt;complex.h&gt;

24132           double complex catan(double complex z);

24133           float complex catanf(float complex z);

24134           long double complex catanl(long double complex z);

24135 **DESCRIPTION**

24136 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 24137 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24138 volume of POSIX.1-2024 defers to the ISO C standard.

24139       These functions shall compute the complex arc tangent of  $z$ , with branch cuts outside the  
 24140 interval  $[-i, +i]$  along the imaginary axis.

24141 **RETURN VALUE**

24142       These functions shall return the complex arc tangent value, in the range of a strip  
 24143 mathematically unbounded along the imaginary axis and in the interval  $[-\pi/2, +\pi/2]$  along the  
 24144 real axis.

24145 MXC       $\text{catan}(\text{conj}(iz))$ ,  $\text{catanf}(\text{conj}(iz))$ , and  $\text{catanl}(\text{conj}(iz))$  shall return exactly the same value as  
 24146  $\text{conj}(\text{catan}(iz))$ ,  $\text{conj}(\text{catanf}(iz))$ , and  $\text{conj}(\text{catanl}(iz))$ , respectively, and  $\text{catan}(-iz)$ ,  $\text{catanf}(-iz)$ , and  
 24147  $\text{catanl}(-iz)$  shall return exactly the same value as  $-\text{catan}(iz)$ ,  $-\text{catanf}(iz)$ , and  $-\text{catanl}(iz)$ ,  
 24148 respectively, including for the special values of  $iz$  below.

24149       If  $iz$  is  $+0 + i0$ ,  $-i (+0 + i0)$  shall be returned.

24150       If  $iz$  is  $+0 + i\text{NaN}$ ,  $-i (+0 + i\text{NaN})$  shall be returned.

24151       If  $iz$  is  $+1 + i0$ ,  $-i (+\text{Inf} + i0)$  shall be returned and the divide-by-zero floating-point exception  
 24152 shall be raised.

24153       If  $iz$  is  $x + i\text{Inf}$  where  $x$  is positive-signed and finite,  $-i (+0 + i\pi/2)$  shall be returned.

24154       If  $iz$  is  $x + i\text{NaN}$  where  $x$  is non-zero and finite,  $-i (\text{NaN} + i\text{NaN})$  shall be returned and the  
 24155 invalid floating-point exception may be raised.

24156       If  $iz$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $-i (+0 + i\pi/2)$  shall be returned.

24157       If  $iz$  is  $+\text{Inf} + i\text{Inf}$ ,  $-i (+0 + i\pi/2)$  shall be returned.

24158       If  $iz$  is  $+\text{Inf} + i\text{NaN}$ ,  $-i (+0 + i\text{NaN})$  shall be returned.

24159       If  $iz$  is  $\text{NaN} + iy$  where  $y$  is finite,  $-i (\text{NaN} + i\text{NaN})$  shall be returned and the invalid floating-  
 24160 point exception may be raised.

24161       If  $iz$  is  $\text{NaN} + i\text{Inf}$ ,  $-i (\pm 0 + i\pi/2)$  shall be returned; the sign of the imaginary part of the result is  
 24162 unspecified.

24163       If  $iz$  is  $\text{NaN} + i\text{NaN}$ ,  $-i (\text{NaN} + i\text{NaN})$  shall be returned.

24164 **ERRORS**

24165       No errors are defined.

24166 **EXAMPLES**

24182 standard.

24183 **NAME**

24184 catanh, catanhf, catanhl — complex arc hyperbolic tangent functions

24185 **SYNOPSIS**

```
24186 #include <complex.h>
24187 double complex catanh(double complex z);
24188 float complex catanhf(float complex z);
24189 long double complex catanhl(long double complex z);
```

24190 **DESCRIPTION**

24191 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24192 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24193 volume of POSIX.1-2024 defers to the ISO C standard.

24194 These functions shall compute the complex arc hyperbolic tangent of  $z$ , with branch cuts outside  
 24195 the interval  $[-1, +1]$  along the real axis.

24196 **RETURN VALUE**

24197 These functions shall return the complex arc hyperbolic tangent value, in the range of a strip  
 24198 mathematically unbounded along the real axis and in the interval  $[-i\pi/2, +i\pi/2]$  along the  
 24199 imaginary axis.

24200 MXC *catanh(conj(z))*, *catanhf(conjf(z))*, and *catanhl(conjl(z))* shall return exactly the same value as  
 24201 *conj(catanh(z))*, *conjf(catanhf(z))*, and *conjl(catanhl(z))*, respectively, and *catanh(-z)*, *catanhf(-z)*,  
 24202 and *catanhl(-z)* shall return exactly the same value as  $-catanh(z)$ ,  $-catanhf(z)$ , and  $-catanhl(z)$ ,  
 24203 respectively, including for the special values of  $z$  below.

24204 If  $z$  is  $+0 + i0$ ,  $+0 + i0$  shall be returned.

24205 If  $z$  is  $+0 + iNaN$ ,  $+0 + iNaN$  shall be returned.

24206 If  $z$  is  $+1 + i0$ ,  $+Inf + i0$  shall be returned and the divide-by-zero floating-point exception shall be  
 24207 raised.

24208 If  $z$  is  $x + iInf$  where  $x$  is positive-signed and finite,  $+0 + i\pi/2$  shall be returned.

24209 If  $z$  is  $x + iNaN$  where  $x$  is non-zero and finite,  $NaN + iNaN$  shall be returned and the invalid  
 24210 floating-point exception may be raised.

24211 If  $z$  is  $+Inf + iy$  where  $y$  is positive-signed and finite,  $+0 + i\pi/2$  shall be returned.

24212 If  $z$  is  $+Inf + iInf$ ,  $+0 + i\pi/2$  shall be returned.

24213 If  $z$  is  $+Inf + iNaN$ ,  $+0 + iNaN$  shall be returned.

24214 If  $z$  is  $NaN + iy$  where  $y$  is finite,  $NaN + iNaN$  shall be returned and the invalid floating-point  
 24215 exception may be raised.

24216 If  $z$  is  $NaN + iInf$ ,  $\pm 0 + i\pi/2$  shall be returned; the sign of the real part of the result is unspecified.

24217 If  $z$  is  $NaN + iNaN$ ,  $NaN + iNaN$  shall be returned.

24218 **ERRORS**

24219 No errors are defined.

24235 standard.

24236 **NAME**

24237           catanl — complex arc tangent functions

24238 **SYNOPSIS**

24239           #include &lt;complex.h&gt;

24240           long double complex catanl(long double complex z);

24241 **DESCRIPTION**24242           Refer to *catan()*.

24243 **NAME**

24244 catclose — close a message catalog descriptor

24245 **SYNOPSIS**

24246 #include &lt;nl\_types.h&gt;

24247 int catclose(nl\_catd catd);

24248 **DESCRIPTION**24249 The *catclose()* function shall close the message catalog identified by *catd*. If a file descriptor is  
24250 used to implement the type **nl\_catd**, that file descriptor shall be closed.24251 **RETURN VALUE**24252 Upon successful completion, *catclose()* shall return 0; otherwise, -1 shall be returned, and *errno*  
24253 set to indicate the error.24254 **ERRORS**24255 The *catclose()* function may fail if:

24256 [EBADF] The catalog descriptor is not valid.

24257 [EINTR] The *catclose()* function was interrupted by a signal.24258 **EXAMPLES**

24259 None.

24260 **APPLICATION USAGE**

24261 None.

24262 **RATIONALE**

24263 None.

24266 **SEE ALSO**24267 *catgets()*, *catopen()*

24268 XBD &lt;nl\_types.h&gt;

24269 **CHANGE HISTORY**

24270 First released in Issue 2.

24271 **Issue 7**24272 The *catclose()* function is moved from the XSI option to the Base.

24273 **NAME**24274 `catgets` — read a program message24275 **SYNOPSIS**24276 `#include <nl_types.h>`24277 `char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);`24278 **DESCRIPTION**

24279 The `catgets()` function shall attempt to read message `msg_id`, in set `set_id`, from the message  
 24280 catalog identified by `catd`. The `catd` argument is a message catalog descriptor returned from an  
 24281 earlier call to `catopen()`. The results are undefined if `catd` is not a value returned by `catopen()` for  
 24282 a message catalog still open in the process. The `s` argument points to a default message string  
 24283 which shall be returned by `catgets()` if it cannot retrieve the identified message.

24284 The `catgets()` function need not be thread-safe.24285 **RETURN VALUE**

24286 If the identified message is retrieved successfully, `catgets()` shall return a pointer to an internal  
 24287 buffer area containing the null-terminated message string. If the call is unsuccessful for any  
 24288 reason, `s` shall be returned and `errno` shall be set to indicate the error.

24289 **ERRORS**24290 The `catgets()` function shall fail if:

24291 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 24292 was transferred.

24293 [ENOMSG] The message identified by `set_id` and `msg_id` is not in the message catalog.

24294 The `catgets()` function may fail if:

24295 [EBADF] The `catd` argument is not a valid message catalog descriptor open for reading.

24296 [EBADMSG] The message identified by `set_id` and `msg_id` in the specified message catalog  
 24297 did not satisfy implementation-defined security criteria.

24298 [EINVAL] The message catalog identified by `catd` is corrupted.

24299 **EXAMPLES**

24300 None.

24301 **APPLICATION USAGE**

24302 None.

24303 **RATIONALE**

24304 None.

24305 **FUTURE DIRECTIONS**

24306 None.

24307 **SEE ALSO**24308 `catclose()`, `catopen()`24309 XBD `<nl_types.h>`24310 **CHANGE HISTORY**

24311 First released in Issue 2.

24312 **Issue 5**

24313 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

24314 **Issue 6**

24315 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24316 **Issue 7**

24317 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [EINTR] and [ENOMSG] errors to become “shall fail” errors, updating the RETURN VALUE section, and updating the DESCRIPTION to note that: “The results are undefined if *catd* is not a value returned by *catopen()* for a message catalog still open in the process.”

24321 The *catgets()* function is moved from the XSI option to the Base.

24322 **NAME**

24323 catopen — open a message catalog

24324 **SYNOPSIS**

24325 #include &lt;nl\_types.h&gt;

24326 nl\_catd catopen(const char \*name, int oflag);

24327 **DESCRIPTION**

24328 The *catopen()* function shall open a message catalog and return a message catalog descriptor.  
 24329 The *name* argument specifies the name of the message catalog to be opened. If *name* contains a  
 24330 XSI `'/'`, then *name* specifies a pathname for the message catalog. Otherwise, the environment  
 24331 variable *NLSPATH* is used with *name* substituted for the `%N` conversion specification (see XBD  
 24332 Chapter 8, on page 167); if *NLSPATH* exists in the environment when the process starts, then if  
 24333 the process has appropriate privileges, the behavior of *catopen()* is undefined. If *NLSPATH* does  
 24334 not exist in the environment, or if a message catalog cannot be found in any of the components  
 24335 specified by *NLSPATH*, then an implementation-defined default path shall be used. This default  
 24336 may be affected by the setting of *LC\_MESSAGES* if the value of *oflag* is *NL\_CAT\_LOCALE*, or  
 24337 XSI the *LANG* environment variable if *oflag* is 0. When searching *NLSPATH*, *catopen()* shall ignore  
 24338 any files it finds that are not valid message catalog files.

24339 A message catalog descriptor shall remain valid in a process until that process closes it, or a  
 24340 successful call to one of the *exec* functions. A change in the setting of the *LC\_MESSAGES*  
 24341 category may invalidate existing open catalogs.

24342 If a file descriptor is used to implement message catalog descriptors, the *FD\_CLOEXEC* flag  
 24343 shall be set; see <*fcntl.h*>.

24344 If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the  
 24345 catalog without regard to the *LC\_MESSAGES* category. If the *oflag* argument is  
 24346 *NL\_CAT\_LOCALE*, the *LC\_MESSAGES* category is used to locate the message catalog (see XBD  
 24347 Section 8.2, on page 169).

24348 **RETURN VALUE**

24349 Upon successful completion, *catopen()* shall return a message catalog descriptor for use on  
 24350 subsequent calls to *catgets()* and *catclose()*. Otherwise, *catopen()* shall return (*nl\_catd*) -1 and set  
 24351 *errno* to indicate the error.

24352 **ERRORS**24353 The *catopen()* function may fail if:

24354 [EACCES] Search permission is denied for the component of the path prefix of the  
 24355 message catalog or read permission is denied for the message catalog.

24356 [EMFILE] All file descriptors available to the process are currently open.

24357 [ENAMETOOLONG]

24358 The length of a component of a pathname is longer than {NAME\_MAX}.

24359 [ENAMETOOLONG]

24360 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 24361 symbolic link produced an intermediate result with a length that exceeds  
 24362 {PATH\_MAX}.

24363 [ENFILE] Too many files are currently open in the system.

24364 [ENOENT] The *name* argument contains a `'/'` and does not name an existing message  
 24365 XSI catalog, the *name* argument does not contain a `'/'` and searching *NLSPATH* (if  
 24366 set) and then the implementation-defined default path for a message catalog

24367 with that name failed, one or more files exist but all are of an invalid format,  
24368 or the *name* argument points to an empty string.

24369 [ENOMEM] Insufficient storage space is available.

24370 [ENOTDIR] A component of the path prefix of the message catalog names an existing file  
24371 that is neither a directory nor a symbolic link to a directory, or the pathname  
24372 of the message catalog contains at least one non-`<slash>` character and ends  
24373 with one or more trailing `<slash>` characters and the last pathname  
24374 component names an existing file that is neither a directory nor a symbolic  
24375 link to a directory.

#### 24376 EXAMPLES

24377 None.

#### 24378 APPLICATION USAGE

24379 Some implementations of *catopen()* use *malloc()* to allocate space for internal buffer areas. The  
24380 *catopen()* function may fail if there is insufficient storage space available to accommodate these  
24381 buffers.

24382 Conforming applications must assume that message catalog descriptors are not valid after a call  
24383 to one of the *exec* functions.

24384 Application developers should be aware that guidelines for the location of message catalogs  
24385 have not yet been developed. Therefore they should take care to avoid conflicting with catalogs  
24386 used by other applications and the standard utilities.

24387 To be sure that messages produced by an application running with appropriate privileges cannot  
24388 be used by an attacker setting an unexpected value for *NLSPATH* in the environment to confuse  
24389 a system administrator, such applications should use pathnames containing a `'/'` to get defined  
24390 behavior when using *catopen()* to open a message catalog.

#### 24391 RATIONALE

24392 None.

#### 24393 FUTURE DIRECTIONS

24394 None.

24397 XBD Chapter 8 (on page 167), `<fcntl.h>`, `<nl_types.h>`,

#### 24398 CHANGE HISTORY

24399 First released in Issue 2.

#### 24400 Issue 7

24401 Austin Group Interpretation 1003.1-2001 #143 is applied.

24402 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

24403 The *catopen()* function is moved from the XSI option to the Base.

24404 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0045 [324] is applied.

24405 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0054 [645], XSH/TC2-2008/0055 [497],  
24406 and XSH/TC2-2008/0056 [497] are applied.

24407 **Issue 8**

24408 Austin Group Defect 1122 is applied, clarifying that *catopen()* ignores files that are not valid  
24409 message catalog files when performing an *NLSPATH* search.

24410 Austin Group Defect 1516 is applied, adding XSI shading to text relating to *NLSPATH*.

24411 **NAME**

24412 cbrt, cbrtf, cbrtl — cube root functions

24413 **SYNOPSIS**

```
24414 #include <math.h>
24415 double cbrt(double x);
24416 float cbrtf(float x);
24417 long double cbrtl(long double x);
```

24418 **DESCRIPTION**

24419 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24420 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24421 volume of POSIX.1-2024 defers to the ISO C standard.

24422 These functions shall compute the real cube root of their argument  $x$ .24423 **RETURN VALUE**24424 Upon successful completion, these functions shall return the cube root of  $x$ .24425 MX If  $x$  is NaN, a NaN shall be returned.24426 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.24427 **ERRORS**

24428 No errors are defined.

24429 **EXAMPLES**

24430 None.

24431 **APPLICATION USAGE**

24432 None.

24433 **RATIONALE**

24434 For some applications, a true cube root function, which returns negative results for negative  
 24435 arguments, is more appropriate than  $\text{pow}(x, 1.0/3.0)$ , which returns a NaN for  $x$  less than 0.

24436 **FUTURE DIRECTIONS**

24437 None.

24438 **SEE ALSO**24439 XBD [<math.h>](#)24440 **CHANGE HISTORY**

24441 First released in Issue 4, Version 2.

24442 **Issue 5**

24443 Moved from X/OPEN UNIX extension to BASE.

24444 **Issue 6**24445 The `cbrt()` function is no longer marked as an extension.24446 The `cbrtf()` and `cbrtl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

24447 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 24448 revised to align with the ISO/IEC 9899:1999 standard.

24449 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 24450 marked.

24451 **NAME**24452 `ccos, ccosf, ccosl` — complex cosine functions24453 **SYNOPSIS**24454 `#include <complex.h>`24455 `double complex ccos(double complex z);`24456 `float complex ccosf(float complex z);`24457 `long double complex ccosl(long double complex z);`24458 **DESCRIPTION**

24459 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24460 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24461 volume of POSIX.1-2024 defers to the ISO C standard.

24462 These functions shall compute the complex cosine of  $z$ .24463 **RETURN VALUE**

24464 These functions shall return the complex cosine value.

24465 MXC `ccos(conj(iz))`, `ccosf(conj(iz))`, and `ccosl(conj(iz))` shall return exactly the same value as  
 24466 `conj(ccos(iz))`, `conjf(ccosf(iz))`, and `conjl(ccosl(iz))`, respectively, and `ccos(-iz)`, `ccosf(-iz)`, and  
 24467 `ccosl(-iz)` shall return exactly the same value as `ccos(iz)`, `ccosf(iz)`, and `ccosl(iz)`, respectively,  
 24468 including for the special values of  $iz$  below.

24469 If  $iz$  is  $+0 + i0$ ,  $1 + i0$  shall be returned.

24470 If  $iz$  is  $+0 + i\text{Inf}$ ,  $\text{NaN} \pm i0$  shall be returned and the invalid floating-point exception shall be  
 24471 raised; the sign of the imaginary part of the result is unspecified.

24472 If  $iz$  is  $+0 + i\text{NaN}$ ,  $\text{NaN} \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 24473 unspecified.

24474 If  $iz$  is  $x + i\text{Inf}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24475 floating-point exception shall be raised.

24476 If  $iz$  is  $x + i\text{NaN}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24477 floating-point exception may be raised.

24478 If  $iz$  is  $+\text{Inf} + i0$ ,  $+\text{Inf} + i0$  shall be returned.24479 If  $iz$  is  $+\text{Inf} + iy$  where  $y$  is non-zero and finite,  $+\text{Inf} (\cos(y) + i \sin(y))$  shall be returned.

24480 If  $iz$  is  $+\text{Inf} + i\text{Inf}$ ,  $\pm\text{Inf} + i\text{NaN}$  shall be returned and the invalid floating-point exception shall be  
 24481 raised; the sign of the real part of the result is unspecified.

24482 If  $iz$  is  $+\text{Inf} + i\text{NaN}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

24483 If  $iz$  is  $\text{NaN} + i0$ ,  $\text{NaN} \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 24484 unspecified.

24485 If  $iz$  is  $\text{NaN} + iy$  where  $y$  is any non-zero number,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24486 floating-point exception may be raised.

24487 If  $iz$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.24488 **ERRORS**

24489 No errors are defined.

24490 **EXAMPLES**

24491 None.

24492 **APPLICATION USAGE**

24493 None.

24494 **RATIONALE**

24495 The MXC special cases for `ccos()` are derived from those for `ccosh()` by applying the formula  
24496  $ccos(z) = ccosh(iz)$ .

24497 **FUTURE DIRECTIONS**

24498 None.

24499 **SEE ALSO**24500 [ccosh\(\)](#), [cacos\(\)](#)24501 XBD [<complex.h>](#)24502 **CHANGE HISTORY**

24503 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24504 **Issue 8**

24505 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
24506 standard.

24507 **NAME**

24508 ccosh, ccoshf, ccoshl — complex hyperbolic cosine functions

24509 **SYNOPSIS**

24510 #include &lt;complex.h&gt;

24511 double complex ccosh(double complex z);

24512 float complex ccoshf(float complex z);

24513 long double complex ccoshl(long double complex z);

24514 **DESCRIPTION**

24515 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24516 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24517 volume of POSIX.1-2024 defers to the ISO C standard.

24518 These functions shall compute the complex hyperbolic cosine of  $z$ .24519 **RETURN VALUE**

24520 These functions shall return the complex hyperbolic cosine value.

24521 MXC  $ccosh(conj(z))$ ,  $ccoshf(conjf(z))$ , and  $ccoshl(conjl(z))$  shall return exactly the same value as  
 24522  $conj(ccosh(z))$ ,  $conjf(ccoshf(z))$ , and  $conjl(ccoshl(z))$ , respectively, and  $ccosh(-z)$ ,  $ccoshf(-z)$ , and  
 24523  $ccoshl(-z)$  shall return exactly the same value as  $ccosh(z)$ ,  $ccoshf(z)$ , and  $ccoshl(z)$ , respectively,  
 24524 including for the special values of  $z$  below.

24525 If  $z$  is  $+0 + i0$ ,  $1 + i0$  shall be returned.

24526 If  $z$  is  $+0 + i\text{Inf}$ ,  $\text{NaN} \pm i0$  shall be returned and the invalid floating-point exception shall be  
 24527 raised; the sign of the imaginary part of the result is unspecified.

24528 If  $z$  is  $+0 + i\text{NaN}$ ,  $\text{NaN} \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 24529 unspecified.

24530 If  $z$  is  $x + i\text{Inf}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24531 floating-point exception shall be raised.

24532 If  $z$  is  $x + i\text{NaN}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24533 floating-point exception may be raised.

24534 If  $z$  is  $+\text{Inf} + i0$ ,  $+\text{Inf} + i0$  shall be returned.24535 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is non-zero and finite,  $+\text{Inf} (\cos(y) + i \sin(y))$  shall be returned.

24536 If  $z$  is  $+\text{Inf} + i\text{Inf}$ ,  $\pm\text{Inf} + i\text{NaN}$  shall be returned and the invalid floating-point exception shall be  
 24537 raised; the sign of the real part of the result is unspecified.

24538 If  $z$  is  $+\text{Inf} + i\text{NaN}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

24539 If  $z$  is  $\text{NaN} + i0$ ,  $\text{NaN} \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 24540 unspecified.

24541 If  $z$  is  $\text{NaN} + iy$  where  $y$  is any non-zero number,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24542 floating-point exception may be raised.

24543 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.24544 **ERRORS**

24545 No errors are defined.

24546 **EXAMPLES**

24547 None.

24548 **APPLICATION USAGE**

24549 None.

24550 **RATIONALE**

24551 None.

24552 **FUTURE DIRECTIONS**

24553 None.

24554 **SEE ALSO**24555 [cacosh\(\)](#)24556 XBD [<complex.h>](#)24557 **CHANGE HISTORY**

24558 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24559 **Issue 8**24560 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
24561 standard.

24562 **NAME**

24563           ccosl — complex cosine functions

24564 **SYNOPSIS**

24565           #include <complex.h>

24566           long double complex ccosl(long double complex z);

24567 **DESCRIPTION**

24568           Refer to *ccos()*.

24569 **NAME**

24570           ceil, ceilf, ceill — ceiling value function

24571 **SYNOPSIS**

```
24572       #include <math.h>
24573       double ceil(double x);
24574       float ceilf(float x);
24575       long double ceill(long double x);
```

24576 **DESCRIPTION**

24577 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 24578       conflict between the requirements described here and the ISO C standard is unintentional. This  
 24579       volume of POSIX.1-2024 defers to the ISO C standard.

24580       These functions shall compute the smallest integral value not less than  $x$ .

24581 MX       These functions may raise the inexact floating-point exception for finite non-integer arguments.

24582 **RETURN VALUE**

24583 MX       The returned value shall be independent of the current rounding direction mode and shall have  
 24584       the same sign as  $x$ .

24585       Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not  
 24586       less than  $x$ , expressed as a type **double**, **float**, or **long double**, respectively.

24587 MX       If  $x$  is NaN, a NaN shall be returned.

24588       If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

24589 **ERRORS**

24590       No errors are defined.

24591 **EXAMPLES**

24592       None.

24593 **APPLICATION USAGE**

24594       The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
 24595       return value should be tested before assigning it to an integer type to avoid the undefined  
 24596       results of an integer overflow.

24597 **RATIONALE**

24598       None.

24599 **FUTURE DIRECTIONS**

24600       None.

24601 **SEE ALSO**

24602       *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*

24603       XBD Section 4.23 (on page 109), **<math.h>**

24604 **CHANGE HISTORY**

24605       First released in Issue 1. Derived from Issue 1 of the SVID.

24606 **Issue 5**

24607       The DESCRIPTION is updated to indicate how an application should check for an error. This  
 24608       text was previously published in the APPLICATION USAGE section.

24609 **Issue 6**

24610 The *ceilf()* and *ceil()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

24611 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
24612 revised to align with the ISO/IEC 9899:1999 standard.

24613 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
24614 marked.

24615 **Issue 7**

24616 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0046 [346] is applied.

24617 **Issue 8**

24618 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
24619 standard.

24620 **NAME**

24621 cexp, cexpf, cexpl — complex exponential functions

24622 **SYNOPSIS**

24623 #include &lt;complex.h&gt;

24624 double complex cexp(double complex z);

24625 float complex cexpf(float complex z);

24626 long double complex cexpl(long double complex z);

24627 **DESCRIPTION**

24628 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24629 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24630 volume of POSIX.1-2024 defers to the ISO C standard.

24631 These functions shall compute the complex exponent of  $z$ , defined as  $e^z$ .24632 **RETURN VALUE**24633 These functions shall return the complex exponential value of  $z$ .

24634 MXC  $cexp(conj(z))$ ,  $cexpf(conjf(z))$ , and  $cexpl(conjl(z))$  shall return exactly the same value as  
 24635  $conj(cexp(z))$ ,  $conjf(cexpf(z))$ , and  $conjl(cexpl(z))$ , respectively, including for the special values of  $z$   
 24636 below.

24637 If  $z$  is  $\pm 0 + i0$ ,  $1 + i0$  shall be returned.

24638 If  $z$  is  $x + i\text{Inf}$  where  $x$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 24639 exception shall be raised.

24640 If  $z$  is  $x + i\text{NaN}$  where  $x$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 24641 exception may be raised.

24642 If  $z$  is  $+\text{Inf} + i0$ ,  $+\text{Inf} + i0$  shall be returned.24643 If  $z$  is  $-\text{Inf} + iy$  where  $y$  is finite,  $+0 (\cos(y) + i \sin(y))$  shall be returned.24644 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is non-zero and finite,  $+\text{Inf} (\cos(y) + i \sin(y))$  shall be returned.

24645 If  $z$  is  $-\text{Inf} + i\text{Inf}$ ,  $\pm 0 \pm i0$  shall be returned; the signs of the real and imaginary parts of the result  
 24646 are unspecified.

24647 If  $z$  is  $+\text{Inf} + i\text{Inf}$ ,  $\pm\text{Inf} + i\text{NaN}$  shall be returned and the invalid floating-point exception shall be  
 24648 raised; the sign of the real part of the result is unspecified.

24649 If  $z$  is  $-\text{Inf} + i\text{NaN}$ ,  $\pm 0 \pm i0$  shall be returned; the signs of the real and imaginary parts of the  
 24650 result are unspecified.

24651 If  $z$  is  $+\text{Inf} + i\text{NaN}$ ,  $\pm\text{Inf} + i\text{NaN}$  shall be returned; the sign of the real part of the result is  
 24652 unspecified.

24653 If  $z$  is  $\text{NaN} + i0$ ,  $\text{NaN} + i0$  shall be returned.

24654 If  $z$  is  $\text{NaN} + iy$  where  $y$  is any non-zero number,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 24655 floating-point exception may be raised.

24656 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.24657 **ERRORS**

24658 No errors are defined.

24659 **EXAMPLES**

24660 None.

24661 **APPLICATION USAGE**

24662 None.

24663 **RATIONALE**

24664 None.

24665 **FUTURE DIRECTIONS**

24666 None.

24667 **SEE ALSO**24668 [clog\(\)](#)24669 XBD [<complex.h>](#)24670 **CHANGE HISTORY**

24671 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24674 standard.

24675 **NAME**

24676 cfgetispeed — get input baud rate

24677 **SYNOPSIS**

24678 #include &lt;termios.h&gt;

24679 speed\_t cfgetispeed(const struct termios \*termios\_p);

24680 **DESCRIPTION**24681 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which  
24682 the *termios\_p* argument points.24683 This function shall return exactly the value in the **termios** data structure, without interpretation.24684 **RETURN VALUE**24685 Upon successful completion, *cfgetispeed()* shall return a value of type **speed\_t** representing the  
24686 input baud rate.24687 **ERRORS**

24688 No errors are defined.

24689 **EXAMPLES**

24690 None.

24691 **APPLICATION USAGE**

24692 None.

24693 **RATIONALE**24694 The term “baud” is used historically here, but is not technically correct. This is properly “bits per  
24695 second”, which may not be the same as baud. However, the term is used because of the  
24696 historical usage and understanding.24697 The *cfgetispeed()*, *cfsetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as  
24698 numbers, but rather as symbolic names. There are two reasons for this:

- 24699 1. Historically, numbers were not used because of the way the rate was stored in the data
- 
- 24700 structure. This is retained even though a function is now used.
- 
- 24701 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
- 
- 24702 the application to that set.

24703 There is nothing to prevent an implementation accepting as an extension a number (such as 126),  
24704 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid  
24705 introducing ambiguity.24706 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications  
24707 in this volume of POSIX.1-2024 have made it possible to determine whether split rates are  
24708 supported and to support them without having to treat zero as a special case. Since this  
24709 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is  
24710 the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-2024 does not  
24711 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit  
24712 from the two being equivalent. This volume of POSIX.1-2024 does not fully specify whether the  
24713 previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as zero. Therefore,  
24714 conforming applications should always set both the input speed and output speed when setting  
24715 either.24716 In historical implementations, the baud rate information is traditionally kept in **c\_cflag**.  
24717 Applications should be written to presume that this might be the case (and thus not blindly copy  
24718 **c\_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c\_cflag**  
24719 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

24720 unused parts of the flag fields might be used by the implementation and should not be blindly  
24721 copied from the descriptions of one terminal device to another.

24722 **FUTURE DIRECTIONS**

24723 None.

24824 **CHANGE HISTORY**

24825 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

24826 **Issue 6**24827 The following new requirements on POSIX implementations derive from alignment with the  
24828 Single UNIX Specification:

- 24829
- The optional setting of *errno* and the [EINVAL] error conditions are added.

24830 **NAME**

24831 chdir — change working directory

24832 **SYNOPSIS**

```
24833 #include <unistd.h>
24834 int chdir(const char *path);
```

24835 **DESCRIPTION**

24836 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*  
 24837 argument to become the current working directory; that is, the starting point for path searches  
 24838 for pathnames not beginning with '/ '.

24839 **RETURN VALUE**

24840 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current  
 24841 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

24842 **ERRORS**

24843 The *chdir()* function shall fail if:

- 24844 [EACCES] Search permission is denied for any component of the pathname.
- 24845 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
24846 argument.
- 24847 [ENAMETOOLONG]  
24848 The length of a component of a pathname is longer than {NAME\_MAX}.
- 24849 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty  
24850 string.
- 24851 [ENOTDIR] A component of the pathname names an existing file that is neither a directory  
24852 nor a symbolic link to a directory.

24853 The *chdir()* function may fail if:

- 24854 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
24855 resolution of the *path* argument.
- 24856 [ENAMETOOLONG]  
24857 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
24858 symbolic link produced an intermediate result with a length that exceeds  
24859 {PATH\_MAX}.

24860 **EXAMPLES**24861 **Changing the Current Working Directory**

24862 The following example makes the value pointed to by **directory**, */tmp*, the current working  
 24863 directory.

```
24864 #include <unistd.h>
24865 ...
24866 char *directory = "/tmp";
24867 int ret;
24868 ret = chdir (directory);
```

**24869 APPLICATION USAGE**

24870 None.

**24871 RATIONALE**

24872 The *chdir()* function only affects the working directory of the current process.

**24873 FUTURE DIRECTIONS**

24874 None.

**24875 SEE ALSO**

24876 [\*getcwd\(\)\*](#)

24877 XBD [\*\*<unistd.h>\*\*](#)

**24878 CHANGE HISTORY**

24879 First released in Issue 1. Derived from Issue 1 of the SVID.

**24880 Issue 6**

24881 The APPLICATION USAGE section is added.

24882 The following new requirements on POSIX implementations derive from alignment with the  
24883 Single UNIX Specification:

- 24884 • The [ELOOP] mandatory error condition is added.
- 24885 • A second [ENAMETOOLONG] is added as an optional error condition.

24886 The following changes were made to align with the IEEE P1003.1a draft standard:

- 24887 • The [ELOOP] optional error condition is added.

**24888 Issue 7**

24889 Austin Group Interpretation 1003.1-2001 #143 is applied.

24890 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0047 [324] is applied.

24891 **NAME**

24892 chmod, fchmodat — change mode of a file

24893 **SYNOPSIS**

24894 #include &lt;sys/stat.h&gt;

24895 int chmod(const char \*path, mode\_t mode);

24896 OH #include &lt;fcntl.h&gt;

24897 int fchmodat(int fd, const char \*path, mode\_t mode, int flag);

24898 **DESCRIPTION**

24899 XSI The `chmod()` function shall change S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits of  
 24900 the file named by the pathname pointed to by the `path` argument to the corresponding bits in the  
 24901 `mode` argument. If any bits that can be set in the `st_mode` value returned by `lstat()` or `stat()` but  
 24902 cannot be changed using `chmod()`, such as the bits that are used to encode the file type, are set in  
 24903 the `mode` argument, these *read-only st\_mode bits* shall be ignored.

24904 If the effective user ID of the process does not match the owner of the file and the process does  
 24905 not have appropriate privileges, the `chmod()` function shall fail.

24906 XSI S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits are described in <sys/stat.h>.

24907 If the calling process does not have appropriate privileges, and if the group ID of the file does  
 24908 not match the effective group ID or one of the supplementary group IDs and if the file is a  
 24909 regular file, bit S\_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon  
 24910 successful return from `chmod()`.

24911 Additional implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits in  
 24912 XSI `mode` to be ignored, and may cause the S\_ISVTX bit in `mode` to be ignored for non-directory files.

24913 Upon successful completion, `chmod()` shall mark for update the last file status change timestamp  
 24914 of the file.

24915 The `fchmodat()` function shall be equivalent to the `chmod()` function except in the case where `path`  
 24916 specifies a relative path. In this case the file to be changed is determined relative to the directory  
 24917 associated with the file descriptor `fd` instead of the current working directory. If the access mode  
 24918 of the open file description associated with the file descriptor is not O\_SEARCH, the function  
 24919 shall check whether directory searches are permitted using the current permissions of the  
 24920 directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not  
 24921 perform the check.

24922 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 24923 in <fcntl.h>:

24924 AT\_SYMLINK\_NOFOLLOW

24925 If `path` names a symbolic link, then the mode of the symbolic link is changed.

24926 If `fchmodat()` is passed the special value AT\_FDCWD in the `fd` parameter, the current working  
 24927 directory shall be used. If also `flag` is zero, the behavior shall be identical to a call to `chmod()`.

24928 **RETURN VALUE**

24929 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 24930 return -1 and set `errno` to indicate the error. If -1 is returned, no change to the file mode occurs.

24931 **ERRORS**

24932 These functions shall fail if:

- 24933 [EACCES] Search permission is denied on a component of the path prefix.
- 24934 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
24935 argument.
- 24936 [ENAMETOOLONG]  
24937 The length of a component of a pathname is longer than {NAME\_MAX}.
- 24938 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 24939 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
24940 directory nor a symbolic link to a directory, or the *path* argument contains at  
24941 least one non-`<slash>` character and ends with one or more trailing `<slash>`  
24942 characters and the last pathname component names an existing file that is  
24943 neither a directory nor a symbolic link to a directory.
- 24944 [EPERM] The effective user ID does not match the owner of the file and the process does  
24945 not have appropriate privileges.
- 24946 [EROFS] The named file resides on a read-only file system.

24947 The *fchmodat()* function shall fail if:

- 24948 [EACCES] The access mode of the open file description associated with *fd* is not  
24949 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
24950 directory searches.
- 24951 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
24952 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.
- 24953 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
24954 with a non-directory file.

24955 These functions may fail if:

- 24956 [EINTR] A signal was caught during execution of the function.
- 24957 [EINVAL] The value of the *mode* argument, ignoring *read-only st\_mode bits* (see the  
24958 DESCRIPTION), is invalid.
- 24959 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
24960 resolution of the *path* argument.
- 24961 [ENAMETOOLONG]  
24962 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
24963 symbolic link produced an intermediate result with a length that exceeds  
24964 {PATH\_MAX}.

24965 The *fchmodat()* function may fail if:

- 24966 [EINVAL] The value of the *flag* argument is invalid.
- 24967 [EOPNOTSUPP] The AT\_SYMLINK\_NOFOLLOW bit is set in the *flag* argument, *path* names a  
24968 symbolic link, and the system does not support changing the mode of a  
24969 symbolic link.

24970 **EXAMPLES**24971 **Setting Read Permissions for User, Group, and Others**

24972 The following example sets read permissions for the owner, group, and others.

```
24973 #include <sys/stat.h>
24974 const char *path;
24975 ...
24976 chmod(path, S_IRUSR | S_IRGRP | S_IROTH);
```

24977 **Setting Read, Write, and Execute Permissions for the Owner Only**

24978 The following example sets read, write, and execute permissions for the owner, and no  
24979 permissions for group and others.

```
24980 #include <sys/stat.h>
24981 const char *path;
24982 ...
24983 chmod(path, S_IRWXU);
```

24984 **Setting Different Permissions for Owner, Group, and Other**

24985 The following example sets owner permissions for CHANGEFILE to read, write, and execute,  
24986 group permissions to read and execute, and other permissions to read.

```
24987 #include <sys/stat.h>
24988 #define CHANGEFILE "/etc/myfile"
24989 ...
24990 chmod(CHANGEFILE, S_IRWXU | S_IRGRP | S_IXGRP | S_IROTH);
```

24991 **Modifying File Permissions**

24992 The following example adds group write permission to the existing permission bits for a file if  
24993 that bit is not already set.

```
24994 #include <sys/stat.h>
24995 struct stat sbuf;
24996 ...
24997 if (stat(path, &sbuf) == 0 && (sbuf.st_mode & S_IWGRP) == 0)
24998     chmod(path, sbuf.st_mode | S_IWGRP);
```

24999 **Setting and Checking File Permissions**

25000 The following example sets the file permission bits for a file named `/home/cnd/mod1`, then calls  
25001 the `stat()` function to verify the permissions.

```
25002 #include <sys/types.h>
25003 #include <sys/stat.h>
25004 int status;
25005 struct stat buffer
25006 ...
```

```

25007     chmod("/home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
25008     status = stat("/home/cnd/mod1", &buffer);

```

### 25009 APPLICATION USAGE

25010 In order to ensure that the S\_ISUID and S\_ISGID bits are set, an application requiring this  
 25011 should use *stat()* after a successful *chmod()* to verify this.

25012 Any file descriptors currently open by any process on the file could possibly become invalid if  
 25013 the mode of the file is changed to a value which would deny access to that process. One  
 25014 situation where this could occur is on a stateless file system. This behavior will not occur in a  
 25015 conforming environment.

### 25016 RATIONALE

25017 This volume of POSIX.1-2024 specifies that the S\_ISGID bit is cleared by *chmod()* on a regular file  
 25018 under certain conditions. This is specified on the assumption that regular files may be executed,  
 25019 and the system should prevent users from making executable *setgid()* files perform with  
 25020 privileges that the caller does not have. On implementations that support execution of other file  
 25021 types, the S\_ISGID bit should be cleared for those file types under the same circumstances.

25022 Implementations that use the S\_ISUID bit to indicate some other function (for example,  
 25023 mandatory record locking) on non-executable files need not clear this bit on writing. They  
 25024 should clear the bit for executable files and any other cases where the bit grants special powers  
 25025 to processes that change the file contents. Similar comments apply to the S\_ISGID bit.

25026 The purpose of the *fchmodat()* function is to enable changing the mode of files in directories  
 25027 other than the current working directory without exposure to race conditions. Any part of the  
 25028 path of a file could be changed in parallel to a call to *chmod()*, resulting in unspecified behavior.  
 25029 By opening a file descriptor for the target directory and using the *fchmodat()* function it can be  
 25030 guaranteed that the changed file is located relative to the desired directory. Some  
 25031 implementations might allow changing the mode of symbolic links. This is not supported by the  
 25032 interfaces in the POSIX specification. Systems with such support provide an interface named  
 25033 *lchmod()*. To support such implementations *fchmodat()* has a *flag* parameter.

### 25034 FUTURE DIRECTIONS

25035 None.

### 25039 CHANGE HISTORY

25040 First released in Issue 1. Derived from Issue 1 of the SVID.

### 25041 Issue 6

25042 The following new requirements on POSIX implementations derive from alignment with the  
 25043 Single UNIX Specification:

- 25044 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 25045 required for conforming implementations of previous POSIX specifications, it was not  
 25046 required for UNIX applications.
- 25047 • The [EINVAL] and [EINTR] optional error conditions are added.
- 25048 • A second [ENAMETOOLONG] is added as an optional error condition.

25049 The following changes were made to align with the IEEE P1003.1a draft standard:

- 25050           • The [ELOOP] optional error condition is added.
- 25051           The normative text is updated to avoid use of the term “must” for application requirements.
- 25052 **Issue 7**
- 25053           Austin Group Interpretation 1003.1-2001 #143 is applied.
- 25054           The *chmodat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
- 25055
- 25056           Changes are made related to support for finegrained timestamps.
- 25057           Changes are made to allow a directory to be opened for searching.
- 25058           The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
- 25059           pathname exists but is not a directory or a symbolic link to a directory.
- 25060           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0048 [300], XSH/TC1-2008/0049 [461],
- 25061           XSH/TC1-2008/0050 [324], XSH/TC1-2008/0051 [278], and XSH/TC1-2008/0052 [278] are
- 25062           applied.
- 25063           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0057 [873], XSH/TC2-2008/0058 [591],
- 25064           XSH/TC2-2008/0059 [817], XSH/TC2-2008/0060 [817], and XSH/TC2-2008/0061 [893] are
- 25065           applied.
- 25066 **Issue 8**
- 25067           Austin Group Defect 1024 is applied, allowing the S\_ISVTX bit to be ignored for non-directory
- 25068           files.
- 25069           Austin Group Defect 1283 is applied, clarifying that *chmod()* ignores *read-only st\_mode bits* in the
- 25070           *mode* argument.

25071 **NAME**

25072 chown, fchownat — change owner and group of a file

25073 **SYNOPSIS**

25074 #include &lt;unistd.h&gt;

25075 int chown(const char \*path, uid\_t owner, gid\_t group);

25076 OH #include &lt;fcntl.h&gt;

25077 int fchownat(int fd, const char \*path, uid\_t owner, gid\_t group,

25078 int flag);

25079 **DESCRIPTION**25080 The *chown()* function shall change the user and group ownership of a file.25081 The *path* argument points to a pathname naming a file. The user ID and group ID of the named  
25082 file shall be set to the numeric values contained in *owner* and *group*, respectively.25083 Only processes with an effective user ID equal to the user ID of the file or with appropriate  
25084 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for  
25085 *path*:

- 25086 • Changing the user ID is restricted to processes with appropriate privileges.
- 25087 • Changing the group ID is permitted to a process with an effective user ID equal to the user  
25088 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's  
25089 user ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to  
25090 one of its supplementary group IDs.

25091 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of  
25092 the file mode are set, and the process does not have appropriate privileges, the set-user-ID  
25093 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful  
25094 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,  
25095 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is  
25096 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*  
25097 function is successfully invoked on a file that is not a regular file and one or more of the  
25098 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID  
25099 bits may be cleared.

25100 If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the  
25101 file shall not be changed.

25102 Upon successful completion, *chown()* shall mark for update the last file status change timestamp  
25103 of the file, except that if *owner* is `(uid_t)-1` and *group* is `(gid_t)-1`, the file status change  
25104 timestamp need not be marked for update.

25105 The *fchownat()* function shall be equivalent to the *chown()* and *lchown()* functions except in the  
25106 case where *path* specifies a relative path. In this case the file to be changed is determined relative  
25107 to the directory associated with the file descriptor *fd* instead of the current working directory. If  
25108 the access mode of the open file description associated with the file descriptor is not  
25109 `O_SEARCH`, the function shall check whether directory searches are permitted using the current  
25110 permissions of the directory underlying the file descriptor. If the access mode is `O_SEARCH`, the  
25111 function shall not perform the check.

25112 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
25113 in `<fcntl.h>`:

25114 AT\_SYMLINK\_NOFOLLOW  
 25115 If *path* names a symbolic link, ownership of the symbolic link is changed.

25116 If *fchownat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 25117 directory shall be used and the behavior shall be identical to a call to *chown()* or *lchown()*  
 25118 respectively, depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in the *flag*  
 25119 argument.

25120 **RETURN VALUE**  
 25121 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 25122 return  $-1$  and set *errno* to indicate the error. If  $-1$  is returned, no changes are made in the user ID  
 25123 and group ID of the file.

25124 **ERRORS**  
 25125 These functions shall fail if:

25126 [EACCES] Search permission is denied on a component of the path prefix.

25127 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 25128 argument.

25129 [ENAMETOOLONG]  
 25130 The length of a component of a pathname is longer than {NAME\_MAX}.

25131 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

25132 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 25133 directory nor a symbolic link to a directory, or the *path* argument contains at  
 25134 least one non-`<slash>` character and ends with one or more trailing `<slash>`  
 25135 characters and the last pathname component names an existing file that is  
 25136 neither a directory nor a symbolic link to a directory.

25137 [EPERM] The effective user ID does not match the owner of the file, or the calling  
 25138 process does not have appropriate privileges and  
 25139 \_POSIX\_CHOWN\_RESTRICTED indicates that such privilege is required.

25140 [EROFS] The named file resides on a read-only file system.

25141 The *fchownat()* function shall fail if:

25142 [EACCES] The access mode of the open file description associated with *fd* is not  
 25143 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
 25144 directory searches.

25145 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 25146 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

25147 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
 25148 with a non-directory file.

25149 These functions may fail if:

25150 [EIO] An I/O error occurred while reading or writing to the file system.

25151 [EINTR] The *chown()* function was interrupted by a signal which was caught.

25152 [EINVAL] The owner or group ID supplied is not a value supported by the  
 25153 implementation.

25154 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
25155 resolution of the *path* argument.

25156 [ENAMETOOLONG]  
25157 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
25158 symbolic link produced an intermediate result with a length that exceeds  
25159 {PATH\_MAX}.

25160 The *fchownat()* function may fail if:

25161 [EINVAL] The value of the *flag* argument is not valid.

#### 25162 EXAMPLES

25163 None.

#### 25164 APPLICATION USAGE

25165 Although *chown()* can be used on some implementations by the file owner to change the owner  
25166 and group to any desired values, the only portable use of this function is to change the group of  
25167 a file to the effective GID of the calling process or to a member of its group set.

#### 25168 RATIONALE

25169 System III and System V allow a user to give away files; that is, the owner of a file may change  
25170 its user ID to anything. This is a serious problem for implementations that are intended to meet  
25171 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the  
25172 user ID of a file. Some government agencies (usually not ones concerned directly with security)  
25173 find this limitation too confining. This volume of POSIX.1-2024 uses *may* to permit secure  
25174 implementations while not disallowing System V.

25175 System III and System V allow the owner of a file to change the group ID to anything. Version 7  
25176 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to  
25177 change the group ID of a file to its effective group ID or to any of the groups in the list of  
25178 supplementary group IDs, but to no others.

25179 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate  
25180 privileged process clear the S\_ISGID and the S\_ISUID bits for regular files, and permits them to  
25181 be cleared for other types of files. This is so that changes in accessibility do not accidentally  
25182 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-  
25183 executable data files also clears the mandatory file locking bit (shared with S\_ISGID), which is  
25184 an extension on many implementations (it first appeared in System V). These bits should only be  
25185 required to be cleared on regular files that have one or more of their execute bits set.

25186 The purpose of the *fchownat()* function is to enable changing ownership of files in directories  
25187 other than the current working directory without exposure to race conditions. Any part of the  
25188 path of a file could be changed in parallel to a call to *chown()* or *lchown()*, resulting in  
25189 unspecified behavior. By opening a file descriptor for the target directory and using the  
25190 *fchownat()* function it can be guaranteed that the changed file is located relative to the desired  
25191 directory.

#### 25192 FUTURE DIRECTIONS

25193 None.

#### 25194 SEE ALSO

25195 [\*chmod\(\)\*](#), [\*fpathconf\(\)\*](#), [\*lchown\(\)\*](#)

25197 **CHANGE HISTORY**

25198 First released in Issue 1. Derived from Issue 1 of the SVID.

25199 **Issue 6**

25200 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 25201 • The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is  
25202 restored.
- 25203 • The `[EPERM]` error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`.  
25204 This is since its operand is a pathname and applications should be aware that the error  
25205 may not occur for that pathname if the file system does not support  
25206 `_POSIX_CHOWN_RESTRICTED`.

25207 The following new requirements on POSIX implementations derive from alignment with the  
25208 Single UNIX Specification:

- 25209 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
25210 required for conforming implementations of previous POSIX specifications, it was not  
25211 required for UNIX applications.
- 25212 • The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the  
25213 group ID only. A corresponding change is made for group.
- 25214 • The `[ELOOP]` mandatory error condition is added.
- 25215 • The `[EIO]` and `[EINTR]` optional error conditions are added.
- 25216 • A second `[ENAMETOOLONG]` is added as an optional error condition.

25217 The following changes were made to align with the IEEE P1003.1a draft standard:

- 25218 • Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when  
25219 the process has appropriate privileges.
- 25220 • The `[ELOOP]` optional error condition is added.

25221 **Issue 7**

25222 Austin Group Interpretation 1003.1-2001 #143 is applied.

25223 The `fchownat()` function is added from The Open Group Technical Standard, 2006, Extended API  
25224 Set Part 2.

25225 Changes are made related to support for finegrained timestamps.

25226 Changes are made to allow a directory to be opened for searching.

25227 The `[ENOTDIR]` error condition is clarified to cover the condition where the last component of a  
25228 pathname exists but is not a directory or a symbolic link to a directory.25229 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0053 [461], XSH/TC1-2008/0054 [324],  
25230 XSH/TC1-2008/0055 [278], and XSH/TC1-2008/0056 [278] are applied.25231 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0062 [873], XSH/TC2-2008/0063 [591],  
25232 XSH/TC2-2008/0064 [485], XSH/TC2-2008/0065 [817], and XSH/TC2-2008/0066 [817] are  
25233 applied.

25234 **NAME**

25235 cimag, cimagf, cimagl — complex imaginary functions

25236 **SYNOPSIS**

```
25237 #include <complex.h>
25238 double cimag(double complex z);
25239 float cimagf(float complex z);
25240 long double cimagl(long double complex z);
```

25241 **DESCRIPTION**

25242 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
25243 conflict between the requirements described here and the ISO C standard is unintentional. This  
25244 volume of POSIX.1-2024 defers to the ISO C standard.

25245 These functions shall compute the imaginary part of *z*.25246 **RETURN VALUE**

25247 These functions shall return the imaginary part value (as a real).

25248 **ERRORS**

25249 No errors are defined.

25250 **EXAMPLES**

25251 None.

25252 **APPLICATION USAGE**25253 For a variable *z* of complex type:25254 `z == creal(z) + cimag(z)*I`25255 **RATIONALE**

25256 None.

25257 **FUTURE DIRECTIONS**

25258 None.

25264 **NAME**

25265 clearerr — clear indicators on a stream

25266 **SYNOPSIS**

25267 #include &lt;stdio.h&gt;

25268 void clearerr(FILE \*stream);

25269 **DESCRIPTION**

25270 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
25271 conflict between the requirements described here and the ISO C standard is unintentional. This  
25272 volume of POSIX.1-2024 defers to the ISO C standard.

25273 The `clearerr()` function shall clear the end-of-file and error indicators for the stream to which  
25274 `stream` points.

25275 CX The `clearerr()` function shall not change the setting of `errno` if `stream` is valid.

25276 **RETURN VALUE**25277 The `clearerr()` function shall not return a value.25278 **ERRORS**

25279 No errors are defined.

25280 **EXAMPLES**

25281 None.

25282 **APPLICATION USAGE**

25283 None.

25284 **RATIONALE**

25285 None.

25286 **FUTURE DIRECTIONS**

25287 None.

25291 First released in Issue 1. Derived from Issue 1 of the SVID.

25292 **Issue 7**

25293 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0057 [401] is applied.

25294 **NAME**

25295 clock — report CPU time used

25296 **SYNOPSIS**

25297 #include &lt;time.h&gt;

25298 clock\_t clock(void);

25299 **DESCRIPTION**

25300 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 25301 conflict between the requirements described here and the ISO C standard is unintentional. This  
 25302 volume of POSIX.1-2024 defers to the ISO C standard.

25303 The *clock()* function shall return the implementation's best approximation to the processor time  
 25304 used by the process since the beginning of an implementation-defined era related only to the  
 25305 process invocation.

25306 **RETURN VALUE**

25307 To determine the time in seconds, the value returned by *clock()* should be divided by the value  
 25308 XSI of the macro `CLOCKS_PER_SEC`. `CLOCKS_PER_SEC` is defined to be one million in `<time.h>`.  
 25309 If the processor time used is not available or its value cannot be represented, the function shall  
 25310 return the value `(clock_t)-1`.

25311 **ERRORS**25312 The *clock()* function shall fail if:25313 CX `[EOVERFLOW]` The processor time used cannot be represented in an object of type `clock_t`.25314 **EXAMPLES**

25315 None.

25316 **APPLICATION USAGE**

25317 In programming environments where `clock_t` is a 32-bit integer type and `CLOCKS_PER_SEC` is  
 25318 one million, *clock()* will start failing in less than 36 minutes of processor time for signed `clock_t`,  
 25319 or 72 minutes for unsigned `clock_t`. Applications intended to be portable to such environments  
 25320 should use *times()* instead (or *clock\_gettime()* with `CLOCK_PROCESS_CPUTIME_ID`, if  
 25321 supported).

25322 In order to measure the time spent in a program, *clock()* should be called at the start of the  
 25323 program and its return value subtracted from the value returned by subsequent calls. The value  
 25324 returned by *clock()* is defined for compatibility across systems that have clocks with different  
 25325 resolutions. The resolution on any particular system need not be to microsecond accuracy.

25326 **RATIONALE**

25327 None.

25328 **FUTURE DIRECTIONS**

25329 None.

25335 First released in Issue 1. Derived from Issue 1 of the SVID.

25336 **Issue 7**

25337 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0067 [686] is applied.

25338 **Issue 8**

25339 Austin Group Defect 703 is applied, adding the [Eoverflow] error.

25340 **NAME**25341 clock\_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)25342 **SYNOPSIS**

```
25343 CPT #include <time.h>
25344 int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

25345 **DESCRIPTION**

25346 The *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process  
 25347 specified by *pid*. If the process described by *pid* exists and the calling process has permission, the  
 25348 clock ID of this clock shall be returned in *clock\_id*.

25349 If *pid* is zero, the *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of  
 25350 the process making the call, in *clock\_id*.

25351 The conditions under which one process has permission to obtain the CPU-time clock ID of  
 25352 other processes are implementation-defined.

25353 **RETURN VALUE**

25354 Upon successful completion, *clock\_getcpuclockid()* shall return zero; otherwise, an error number  
 25355 shall be returned to indicate the error.

25356 **ERRORS**

25357 The *clock\_getcpuclockid()* function shall fail if:

25358 [EPERM] The requesting process does not have permission to access the CPU-time clock  
 25359 for the process.

25360 The *clock\_getcpuclockid()* function may fail if:

25361 [ESRCH] No process can be found corresponding to the process specified by *pid*.

25362 **EXAMPLES**

25363 None.

25364 **APPLICATION USAGE**

25365 The *clock\_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not be  
 25366 provided on all implementations.

25367 **RATIONALE**

25368 None.

25369 **FUTURE DIRECTIONS**

25370 None.

25371 **SEE ALSO**

25372 [clock\\_getres\(\)](#), [timer\\_create\(\)](#)

25373 XBD [<time.h>](#)

25374 **CHANGE HISTORY**

25375 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

25376 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

25377 **NAME**

25378 clock\_getres, clock\_gettime, clock\_settime — clock and timer functions

25379 **SYNOPSIS**

```
25380 CX #include <time.h>
25381 int clock_getres(clockid_t clock_id, struct timespec *res);
25382 int clock_gettime(clockid_t clock_id, struct timespec *tp);
25383 int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

25384 **DESCRIPTION**

25385 The *clock\_getres()* function shall return the resolution of any clock. Clock resolutions are  
 25386 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the  
 25387 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,  
 25388 the clock resolution is not returned. If the *time* argument of *clock\_settime()* is not a multiple of *res*,  
 25389 then the value is truncated to a multiple of *res*.

25390 The *clock\_gettime()* function shall return the current value *tp* for the specified clock, *clock\_id*.

25391 The *clock\_settime()* function shall set the specified clock, *clock\_id*, to the value specified by *tp*.  
 25392 Time values that are between two consecutive non-negative integer multiples of the resolution of  
 25393 the specified clock shall be truncated down to the smaller multiple of the resolution.

25394 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that  
 25395 is meaningful only within a process). All implementations shall support a *clock\_id* of  
 25396 CLOCK\_REALTIME as defined in **<time.h>**. This clock represents the clock measuring real time  
 25397 for the system. For this clock, the values returned by *clock\_gettime()* and specified by  
 25398 *clock\_settime()* represent the amount of time (in seconds and nanoseconds) since the Epoch. An  
 25399 implementation may also support additional clocks. The interpretation of time values for these  
 25400 clocks is unspecified.

25401 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 25402 shall be used to determine the time of expiration for absolute time services based upon the  
 25403 CLOCK\_REALTIME clock. This applies to the time at which armed absolute timers expire. If the  
 25404 absolute time requested at the invocation of such a time service is before the new value of the  
 25405 clock, the time service shall expire immediately as if the clock had reached the requested time  
 25406 normally.

25407 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on  
 25408 threads that are blocked waiting for a relative time service based upon this clock, including the  
 25409 *nanosleep()* and *thrd\_sleep()* functions; nor on the expiration of relative timers based upon this  
 25410 clock. Consequently, these time services shall expire when the requested relative interval  
 25411 elapses, independently of the new or old value of the clock.

25412 All implementations shall support a *clock\_id* of CLOCK\_MONOTONIC defined in **<time.h>**.  
 25413 This clock represents the monotonic clock for the system. For this clock, the value returned by  
 25414 *clock\_gettime()* represents the amount of time (in seconds and nanoseconds) since an unspecified  
 25415 point in the past (for example, system start-up time, or the Epoch). This point does not change  
 25416 after system start-up time. The value of the CLOCK\_MONOTONIC clock cannot be set via  
 25417 *clock\_settime()*. This function shall fail if it is invoked with a *clock\_id* argument of  
 25418 CLOCK\_MONOTONIC.

25419 The effect of setting a clock via *clock\_settime()* on armed per-process timers associated with a  
 25420 clock other than CLOCK\_REALTIME is implementation-defined.

25421 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 25422 shall be used to determine the time at which the system shall awaken a thread blocked on an

25423 absolute *clock\_nanosleep()* call based upon the CLOCK\_REALTIME clock. If the absolute time  
 25424 requested at the invocation of such a time service is before the new value of the clock, the call  
 25425 shall return immediately as if the clock had reached the requested time normally.

25426 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on any  
 25427 thread that is blocked on a relative *clock\_nanosleep()* call. Consequently, the call shall return  
 25428 when the requested relative interval elapses, independently of the new or old value of the clock.

25429 Appropriate privileges to set a particular clock are implementation-defined.

25430 CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by  
 25431 invoking *clock\_getcpuclockid()*, which represent the CPU-time clock of a given process.  
 25432 Implementations shall also support the special `clockid_t` value  
 25433 `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process  
 25434 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 25435 returned by *clock\_gettime()* and specified by *clock\_settime()* represent the amount of execution  
 25436 time of the process associated with the clock. Changing the value of a CPU-time clock via  
 25437 *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see  
 25438 [Scheduling Policies](#)).

25439 TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values  
 25440 obtained by invoking *pthread\_getcpuclockid()*, which represent the CPU-time clock of a given  
 25441 thread. Implementations shall also support the special `clockid_t` value  
 25442 `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread  
 25443 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 25444 returned by *clock\_gettime()* and specified by *clock\_settime()* shall represent the amount of  
 25445 execution time of the thread associated with the clock. Changing the value of a CPU-time clock  
 25446 via *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy  
 25447 (see [Scheduling Policies](#)).

#### 25448 RETURN VALUE

25449 A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that  
 25450 an error occurred, and *errno* shall be set to indicate the error.

#### 25451 ERRORS

25452 The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions shall fail if:

25453 [EINVAL] The *clock\_id* argument does not specify a known clock.

25454 The *clock\_gettime()* function shall fail if:

25455 [EOVERFLOW] The number of seconds will not fit in an object of type `time_t`.

25456 The *clock\_settime()* function shall fail if:

25457 [EINVAL] The *tp* argument to *clock\_settime()* is outside the range for the given clock ID.

25458 [EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or  
 25459 equal to 1 000 million.

25460 [EINVAL] The value of the *clock\_id* argument is `CLOCK_MONOTONIC`.

25461 The *clock\_settime()* function may fail if:

25462 [EPERM] The requesting process does not have appropriate privileges to set the  
 25463 specified clock.

25464 **EXAMPLES**

25465 None.

25466 **APPLICATION USAGE**

25467 Note that the absolute value of the monotonic clock is meaningless (because its origin is  
 25468 arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the  
 25469 fact that the value of this clock is never set and, therefore, that time intervals measured with this  
 25470 clock will not be affected by calls to *clock\_settime()*.

25471 **RATIONALE**

25472 None.

25473 **FUTURE DIRECTIONS**

25474 None.

25475 **SEE ALSO**

25476 [Scheduling Policies](#) (on page 531), *clock\_getcpuclockid()*, *clock\_nanosleep()*, *ctime()*, *mq\_receive()*,

25479 XBD <[time.h](#)>25480 **CHANGE HISTORY**

25481 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25482 **Issue 6**

25483 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 25484 implementation does not support the Timers option.

25485 The APPLICATION USAGE section is added.

25486 The following changes were made to align with the IEEE P1003.1a draft standard:

- 25487 • Clarification is added of the effect of resetting the clock resolution.

25488 CPU-time clocks and the *clock\_getcpuclockid()* function are added for alignment with IEEE Std  
 25489 1003.1d-1999.

25490 The following changes are added for alignment with IEEE Std 1003.1j-2000:

- 25491 • The DESCRIPTION is updated as follows:
  - 25492 — The value returned by *clock\_gettime()* for CLOCK\_MONOTONIC is specified.
  - 25493 — The *clock\_settime()* function failing for CLOCK\_MONOTONIC is specified.
  - 25494 — The effects of *clock\_settime()* on the *clock\_nanosleep()* function with respect to  
 25495 CLOCK\_REALTIME are specified.
- 25496 • An [EINVAL] error is added to the ERRORS section, indicating that *clock\_settime()* fails for  
 25497 CLOCK\_MONOTONIC.
- 25498 • The APPLICATION USAGE section notes that the CLOCK\_MONOTONIC clock need not  
 25499 and shall not be set by *clock\_settime()* since the absolute value of the  
 25500 CLOCK\_MONOTONIC clock is meaningless.
- 25501 • The *clock\_nanosleep()*, *mq\_timedreceive()*, *mq\_timedsend()*, *pthread\_mutex\_timedlock()*,  
 25502 *sem\_timedwait()*, *timer\_create()*, and *timer\_settime()* functions are added to the SEE ALSO  
 25503 section.

25504 **Issue 7**

25505           Functionality relating to the Clock Selection option is moved to the Base.

25506           The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions are moved from the Timers  
25507           option to the Base.

25508           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0058 [106] is applied.

25509 **Issue 8**

25510           Austin Group Defect 1302 is applied, changing “the *nanosleep()* function” to “the *nanosleep()* and  
25511           *thrd\_sleep()* functions”.

25512           Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

25513 **NAME**

25514 clock\_nanosleep — high resolution sleep with specifiable clock

25515 **SYNOPSIS**

```
25516 CX #include <time.h>
25517 int clock_nanosleep(clockid_t clock_id, int flags,
25518     const struct timespec *rqtp, struct timespec *rmtp);
```

25519 **DESCRIPTION**

25520 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the `clock_nanosleep()` function shall  
 25521 cause the current thread to be suspended from execution until either the time interval specified  
 25522 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to  
 25523 invoke a signal-catching function, or the process is terminated. The clock used to measure the  
 25524 time shall be the clock specified by *clock\_id*.

25525 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the `clock_nanosleep()` function shall  
 25526 cause the current thread to be suspended from execution until either the time value of the clock  
 25527 specified by *clock\_id* reaches the absolute time specified by the *rqtp* argument, or a signal is  
 25528 delivered to the calling thread and its action is to invoke a signal-catching function, or the  
 25529 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or  
 25530 equal to the time value of the specified clock, then `clock_nanosleep()` shall return immediately  
 25531 and the calling process shall not be suspended.

25532 The suspension time caused by this function may be longer than requested because the  
 25533 argument value is rounded up to an integer multiple of the sleep resolution, or because of the  
 25534 scheduling of other activity by the system. But, except for the case of being interrupted by a  
 25535 signal, the suspension time for the relative `clock_nanosleep()` function (that is, with the  
 25536 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as  
 25537 measured by the corresponding clock. The suspension for the absolute `clock_nanosleep()` function  
 25538 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the  
 25539 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being  
 25540 interrupted by a signal.

25541 The use of the `clock_nanosleep()` function shall have no effect on the action or blockage of any  
 25542 signal.

25543 The `clock_nanosleep()` function shall fail if the *clock\_id* argument refers to the CPU-time clock of  
 25544 the calling thread. It is unspecified whether *clock\_id* values of other CPU-time clocks are allowed.

25545 **RETURN VALUE**

25546 If the `clock_nanosleep()` function returns because the requested time has elapsed, its return value  
 25547 shall be zero.

25548 If the `clock_nanosleep()` function returns because it has been interrupted by a signal, it shall  
 25549 return the corresponding error value. For the relative `clock_nanosleep()` function, if the *rmtp*  
 25550 argument is non-NULL, the `timespec` structure referenced by it shall be updated to contain the  
 25551 amount of time remaining in the interval (the requested time minus the time actually slept). The  
 25552 *rqtp* and *rmtp* arguments can point to the same object. If the *rmtp* argument is NULL, the  
 25553 remaining time is not returned. The absolute `clock_nanosleep()` function has no effect on the  
 25554 structure referenced by *rmtp*.

25555 If `clock_nanosleep()` fails, it shall return the corresponding error value.

25556 **ERRORS**25557 The *clock\_nanosleep()* function shall fail if:25558 [EINTR] The *clock\_nanosleep()* function was interrupted by a signal.25559 [EINVAL] The *rqt* argument specified a nanosecond value less than zero or greater than  
25560 or equal to 1 000 million; or the `TIMER_ABSTIME` flag was specified in *flags*  
25561 and the *rqt* argument is outside the range for the clock specified by *clock\_id*;  
25562 or the *clock\_id* argument does not specify a known clock, or specifies the CPU-  
25563 time clock of the calling thread.25564 [ENOTSUP] The *clock\_id* argument specifies a clock for which *clock\_nanosleep()* is not  
25565 supported, such as a CPU-time clock.25566 **EXAMPLES**

25567 None.

25568 **APPLICATION USAGE**25569 Calling *clock\_nanosleep()* with the value `TIMER_ABSTIME` not set in the *flags* argument and with  
25570 a *clock\_id* of `CLOCK_REALTIME` is equivalent to calling *nanosleep()* with the same *rqt* and *rmt*  
25571 arguments.25572 **RATIONALE**25573 The *nanosleep()* function specifies that the system-wide clock `CLOCK_REALTIME` is used to  
25574 measure the elapsed time for this time service. However, with the introduction of the monotonic  
25575 clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to  
25576 take advantage of the special characteristics of this clock.25577 There are many applications in which a process needs to be suspended and then activated  
25578 multiple times in a periodic way; for example, to poll the status of a non-interrupting device or  
25579 to refresh a display device. For these cases, it is known that precise periodic activation cannot be  
25580 achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic  
25581 process that is activated at time  $T_0$ , executes for a while, and then wants to suspend itself until  
25582 time  $T_0+T$ , the period being  $T$ . If this process wants to use the *nanosleep()* function, it must first  
25583 call *clock\_gettime()* to get the current time, then calculate the difference between the current time  
25584 and  $T_0+T$  and, finally, call *nanosleep()* using the computed interval. However, the process could  
25585 be preempted by a different process between the two function calls, and in this case the interval  
25586 computed would be wrong; the process would wake up later than desired. This problem would  
25587 not occur with the absolute *clock\_nanosleep()* function, since only one function call would be  
25588 necessary to suspend the process until the desired time. In other cases, however, a relative sleep  
25589 is needed, and that is why both functionalities are required.25590 Although it is possible to implement periodic processes using the timers interface, this  
25591 implementation would require the use of signals, and the reservation of some signal numbers. In  
25592 this regard, the reasons for including an absolute version of the *clock\_nanosleep()* function in  
25593 POSIX.1-2024 are the same as for the inclusion of the relative *nanosleep()*.25594 It is also possible to implement precise periodic processes using *pthread\_cond\_timedwait()*, in  
25595 which an absolute timeout is specified that takes effect if the condition variable involved is never  
25596 signaled. However, the use of this interface is unnatural, and involves performing other  
25597 operations on mutexes and condition variables that imply an unnecessary overhead.  
25598 Furthermore, *pthread\_cond\_timedwait()* is not available in implementations that do not support  
25599 threads.25600 Although the interface of the relative and absolute versions of the new high resolution sleep  
25601 service is the same *clock\_nanosleep()* function, the *rmt* argument is only used in the relative  
25602 sleep. This argument is needed in the relative *clock\_nanosleep()* function to reissue the function

25603 call if it is interrupted by a signal, but it is not needed in the absolute *clock\_nanosleep()* function  
25604 call; if the call is interrupted by a signal, the absolute *clock\_nanosleep()* function can be invoked  
25605 again with the same *rqtp* argument used in the interrupted call.

25606 **FUTURE DIRECTIONS**

25607 None.

25608 **SEE ALSO**

25611 **CHANGE HISTORY**

25612 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

25613 **Issue 7**

25614 The *clock\_nanosleep()* function is moved from the Clock Selection option to the Base.

25615 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0068 [909] is applied.

25616 **NAME**

25617 clock\_settime — clock and timer functions

25618 **SYNOPSIS**

```
25619 CX #include <time.h>  
25620 int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

25621 **DESCRIPTION**

25622 Refer to [clock\\_getres\(\)](#).

25623 **NAME**

25624 clog, clogf, clogl — complex natural logarithm functions

25625 **SYNOPSIS**

```
25626 #include <complex.h>
25627 double complex clog(double complex z);
25628 float complex clogf(float complex z);
25629 long double complex clogl(long double complex z);
```

25630 **DESCRIPTION**

25631 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 25632 conflict between the requirements described here and the ISO C standard is unintentional. This  
 25633 volume of POSIX.1-2024 defers to the ISO C standard.

25634 These functions shall compute the complex natural (base  $e$ ) logarithm of  $z$ , with a branch cut  
 25635 along the negative real axis.

25636 **RETURN VALUE**

25637 These functions shall return the complex natural logarithm value, in the range of a strip  
 25638 mathematically unbounded along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary  
 25639 axis.

25640 MXC  $clog(conj(z))$ ,  $clogf(conjf(z))$ , and  $clogl(conjl(z))$  shall return exactly the same value as  $conj(clog(z))$ ,  
 25641  $conjf(clogf(z))$ , and  $conjl(clogl(z))$ , respectively, including for the special values of  $z$  below.

25642 If  $z$  is  $-0 + i0$ ,  $-\text{Inf} + i\pi$  shall be returned and the divide-by-zero floating-point exception shall be  
 25643 raised.

25644 If  $z$  is  $+0 + i0$ ,  $-\text{Inf} + i0$  shall be returned and the divide-by-zero floating-point exception shall be  
 25645 raised.

25646 If  $z$  is  $x + i\text{Inf}$  where  $x$  is finite,  $+\text{Inf} + i\pi/2$  shall be returned.

25647 If  $z$  is  $x + i\text{NaN}$  where  $x$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 25648 exception may be raised.

25649 If  $z$  is  $-\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+\text{Inf} + i\pi$  shall be returned.

25650 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+\text{Inf} + i0$  shall be returned.

25651 If  $z$  is  $-\text{Inf} + i\text{Inf}$ ,  $+\text{Inf} + i3\pi/4$  shall be returned.

25652 If  $z$  is  $+\text{Inf} + i\text{Inf}$ ,  $+\text{Inf} + i\pi/4$  shall be returned.

25653 If  $z$  is  $\pm\text{Inf} + i\text{NaN}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

25654 If  $z$  is  $\text{NaN} + iy$  where  $y$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 25655 exception may be raised.

25656 If  $z$  is  $\text{NaN} + i\text{Inf}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

25657 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.

25658 **ERRORS**

25659 No errors are defined.

25660 **EXAMPLES**

25661 None.

25662 **APPLICATION USAGE**

25663 None.

25664 **RATIONALE**

25665 None.

25666 **FUTURE DIRECTIONS**

25667 None.

25668 **SEE ALSO**25669 [cexp\(\)](#)25670 XBD [<complex.h>](#)25671 **CHANGE HISTORY**

25672 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

25673 **Issue 8**25674 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
25675 standard.

25676 **NAME**

25677 close, posix\_close — close a file descriptor

25678 **SYNOPSIS**

```
25679 #include <unistd.h>
25680 int close(int fd);
25681 int posix_close(int fd, int flag);
```

25682 **DESCRIPTION**

25683 The `close()` function shall deallocate the file descriptor indicated by *fd*. To deallocate means to  
 25684 make the file descriptor available for return by subsequent calls to `open()` or other functions that  
 25685 allocate file descriptors. All process-owned file locks that the calling process owns on the file  
 25686 associated with the file descriptor shall be unlocked.

25687 If `close()` is interrupted by a signal that is to be caught, then it is unspecified whether it returns  
 25688 `-1` with *errno* set to `[EINTR]` and *fd* remaining open, or returns `-1` with *errno* set to  
 25689 `[EINPROGRESS]` and *fd* being closed, or returns `0` to indicate successful completion; except  
 25690 that if `POSIX_CLOSE_RESTART` is defined as `0`, then the option of returning `-1` with *errno* set to  
 25691 `[EINTR]` and *fd* remaining open shall not occur. If `close()` returns `-1` with *errno* set to `[EINTR]`,  
 25692 it is unspecified whether *fd* can subsequently be passed to any function except `close()` or  
 25693 `posix_close()` without error. For all other error situations (except for `[EBADF]` where *fd* was  
 25694 invalid), *fd* shall be closed. If *fd* was closed even though the close operation is incomplete,  
 25695 the close operation shall continue asynchronously and the process shall have no further ability  
 25696 to track the completion or final status of the close operation.

25697 When all file descriptors associated with a pipe or FIFO special file are closed, any data  
 25698 remaining in the pipe or FIFO shall be discarded.

25699 When all file descriptors associated with an open file description have been closed, the open file  
 25700 description shall be freed.

25701 If the link count of the file is `0`, when all file descriptors associated with the file are closed, the  
 25702 space occupied by the file shall be freed and the file shall no longer be accessible.

25703 XSI If *fd* refers to the manager side of a pseudo-terminal, and this is the last close, a `SIGHUP`  
 25704 signal shall be sent to the controlling process, if any, for which the subsidiary side of the pseudo-  
 25705 terminal is the controlling terminal. It is unspecified whether closing the manager side of the  
 25706 pseudo-terminal flushes all queued input and output.

25707 When there is an outstanding cancelable asynchronous I/O operation against *fd* when `close()`  
 25708 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes  
 25709 as if the `close()` operation had not yet occurred. All operations that are not canceled shall  
 25710 complete as if the `close()` blocked until the operations completed. The `close()` operation itself  
 25711 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and  
 25712 which I/O operation may be canceled upon `close()`, is implementation-defined.

25713 SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is,  
 25714 a process has it mapped), then the entire contents of the memory object shall persist until the  
 25715 SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a  
 25716 shared memory object and the close results in the memory object becoming unreferenced, and  
 25717 the memory object has been unlinked, then the memory object shall be removed.

25718 When all file descriptors associated with a socket have been closed, the socket shall be  
 25719 destroyed. If the socket is in connection-mode, and the `SO_LINGER` option is set for the socket  
 25720 with non-zero linger time, and the socket has untransmitted data, then `close()` shall block for up  
 25721 to the current linger interval until all data is transmitted.

25722 The `posix_close()` function shall be equivalent to the `close()` function, except with the  
 25723 modifications based on the `flag` argument as described below. If `flag` is 0, then `posix_close()` shall  
 25724 not return `-1` with `errno` set to `[EINTR]`, which implies that `fildev` will always be closed (except for  
 25725 `[EBADF]`, where `fildev` was invalid). If `flag` includes `POSIX_CLOSE_RESTART` and  
 25726 `POSIX_CLOSE_RESTART` is defined as a non-zero value, and `posix_close()` is interrupted by a  
 25727 signal that is to be caught, then `posix_close()` may return `-1` with `errno` set to `[EINTR]`, in which  
 25728 case `fildev` shall be left open; however, it is unspecified whether `fildev` can subsequently be passed  
 25729 to any function except `close()` or `posix_close()` without error. If `flag` is invalid, `posix_close()` may  
 25730 fail with `errno` set to `[EINVAL]`, but shall otherwise behave as if `flag` had been 0 and close `fildev`.

#### 25731 RETURN VALUE

25732 Upon successful completion, 0 shall be returned; otherwise, `-1` shall be returned and `errno` set to  
 25733 indicate the error.

#### 25734 ERRORS

25735 The `close()` and `posix_close()` functions shall fail if:

25736 `[EBADF]` The `fildev` argument is not a open file descriptor.

25737 `[EINPROGRESS]` The function was interrupted by a signal and `fildev` was closed but the close  
 25738 operation is continuing asynchronously.

25739 The `close()` and `posix_close()` functions may fail if:

25740 `[EINTR]` The function was interrupted by a signal, `POSIX_CLOSE_RESTART` is defined  
 25741 as non-zero, and (in the case of `posix_close()`) the `flag` argument included  
 25742 `POSIX_CLOSE_RESTART`, in which case `fildev` is still open.

25743 `[EIO]` An I/O error occurred while reading from or writing to the file system.

25744 The `posix_close()` function may fail if:

25745 `[EINVAL]` The value of the `flag` argument is invalid.

25746 The `close()` and `posix_close()` functions shall not return an `[EAGAIN]` or `[EWOULDBLOCK]`  
 25747 error. If `POSIX_CLOSE_RESTART` is zero, the `close()` function shall not return an `[EINTR]` error.  
 25748 The `posix_close()` function shall not return an `[EINTR]` error unless `flag` includes a non-zero  
 25749 `POSIX_CLOSE_RESTART`.

#### 25750 EXAMPLES

##### 25751 Reassigning a File Descriptor

25752 The following example closes the file descriptor associated with standard output for the current  
 25753 process, re-assigns standard output to a new file descriptor, and closes the original file descriptor  
 25754 to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard  
 25755 input) is not closed.

```
25756 #include <unistd.h>
25757 ...
25758 int pfd;
25759 ...
25760 close(1);
25761 dup(pfd);
25762 close(pfd);
25763 ...
```

25764 Incidentally, this is exactly what could be achieved using:

```
25765     dup2 (pfd, 1);
25766     close (pfd);
```

### 25767 Closing a File Descriptor

25768 In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is  
25769 made to associate that file descriptor with a stream.

```
25770     #include <stdio.h>
25771     #include <unistd.h>
25772     #include <stdlib.h>

25773     #define LOCKFILE "/etc/ptmp"
25774     ...
25775     int pfd;
25776     FILE *fpfd;
25777     ...
25778     if ((fpfd = fdopen (pfd, "w")) == NULL) {
25779         close (pfd);
25780         unlink (LOCKFILE);
25781         exit (1);
25782     }
25783     ...
```

### 25784 APPLICATION USAGE

25785 An application that had used the *stdio* routine *fopen()* to open a file should use the  
25786 corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no  
25787 longer exists, since the integer corresponding to it no longer refers to a file.

25788 Implementations may use file descriptors that must be inherited into child processes for the  
25789 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
25790 an application that calls *close()* on an arbitrary integer risks non-conforming behavior, and  
25791 *close()* can only portably be used on file descriptor values that the application has obtained  
25792 through explicit actions, as well as the three file descriptors corresponding to the standard file  
25793 streams. In multi-threaded parent applications, the practice of calling *close()* in a loop after *fork()*  
25794 and before an *exec* call in order to avoid a race condition of leaking an unintended file descriptor  
25795 into a child process, is therefore unsafe, and the race should instead be combatted by opening all  
25796 file descriptors with the *FD\_CLOEXEC* bit set unless the file descriptor is intended to be  
25797 inherited across *exec*.

25798 Usage of *close()* on file descriptors *STDIN\_FILENO*, *STDOUT\_FILENO*, or *STDERR\_FILENO*  
25799 should immediately be followed by an operation to reopen these file descriptors. Unexpected  
25800 behavior will result if any of these file descriptors is left in a closed state (for example, an  
25801 [EBADF] error from *perror()*) or if an unrelated *open()* or similar call later in the application  
25802 accidentally allocates a file to one of these well-known file descriptors. Furthermore, a *close()*  
25803 followed by a reopen operation (e.g., *open()*, *dup()*, etc.) is not atomic; *dup2()* should be used to  
25804 change standard file descriptors.

### 25805 RATIONALE

25806 The use of interruptible device close routines should be discouraged to avoid problems with the  
25807 implicit closes of file descriptors, such as by *exec*, process termination, or *dup2()*. This volume of  
25808 POSIX.1-2024 only intends to permit such behavior by specifying the [EINTR] error condition  
25809 for *close()* and *posix\_close()* with non-zero *POSIX\_CLOSE\_RESTART*, to allow applications a  
25810 portable way to resume waiting for an event associated with the close operation (for example, a  
25811 tape drive rewinding) after receiving an interrupt. This standard also permits implementations

25812 to define `POSIX_CLOSE_RESTART` to 0 if they do not choose to provide a way to restart an  
25813 interrupted close action. Although the file descriptor is left open on `[EINTR]`, it might no longer  
25814 be usable; that is, passing it to any function except `close()` or `posix_close()` might result in an error  
25815 such as `[EIO]`. If an application must guarantee that data will not be lost, it is recommended that  
25816 the application use `fsync()` or `fdatasync()` prior to the close operation, rather than leaving the  
25817 close operation to deal with pending I/O and risk an interrupt.

25818 Earlier versions of this standard left the state of *files* unspecified after errors such as `[EINTR]`  
25819 and `[EIO]`; and implementations differed on whether `close()` left *files* open after `[EINTR]`. This  
25820 was unsatisfactory once threads were introduced, since multi-threaded applications need to  
25821 know whether *files* has been closed. Applications cannot blindly call `close()` again, because if  
25822 *files* was closed by the first call another thread could have been allocated a file descriptor with  
25823 the same value as *files*, which must not be closed by the first thread. On the other hand, the  
25824 alternative of never retrying `close()` would lead to a file descriptor leak in implementations  
25825 where `close()` did not close *files*, although such a leak may be harmless if the process is about to  
25826 exit or the file descriptor is marked `FD_CLOEXEC` and the process is about to be replaced by  
25827 `exec`. This standard introduced `posix_close()` with a *flag* argument that allows a choice between  
25828 the two possible error behaviors, and leaves it unspecified which of the two behaviors is  
25829 implemented by `close()` (although it is guaranteed to be one of the two behaviors of `posix_close()`,  
25830 rather than leaving things completely unspecified as in earlier versions of the standard).

25831 Note that the standard requires that `close()` and `posix_close()` must leave *files* open after `[EINTR]`  
25832 (in the cases where `[EINTR]` is permitted) and must close the file descriptor regardless of all  
25833 other errors (except `[EBADF]`, where *files* is already invalid). In general, portable applications  
25834 should only retry a `close()` after checking for `[EINTR]` (and on implementations where  
25835 `POSIX_CLOSE_RESTART` is defined to be zero, this retry loop will be dead code), and risk a file  
25836 descriptor leak if a retry loop is not attempted. It should also be noted that `[EINTR]` is only  
25837 possible if `close()` can be interrupted; if no signal handlers are installed, then `close()` will not be  
25838 interrupted. Conversely, if a single-threaded application can guarantee that no file descriptors  
25839 are opened or closed in signal handlers, then a retry loop without checking for `[EINTR]` will be  
25840 harmless (since the retry will fail with `[EBADF]`), but guaranteeing that no external libraries  
25841 introduce the use of threading can be difficult. There are additional guarantees for applications  
25842 which will only ever be used on systems where `POSIX_CLOSE_RESTART` is defined as 0. These  
25843 observations should help in determining whether an application needs to have its `close()` calls  
25844 audited for replacement with `posix_close()`.

25845 It should also be noted that the requirement for `posix_close()` with a *flag* of 0 to always close *files*,  
25846 even if an error is reported, is similar to the requirements on `fclose()` to always release the  
25847 stream, even if an error is encountered while flushing data.

25848 Implementations that previously always closed *files* can meet the new requirements by  
25849 translating `[EINTR]` to `[EINPROGRESS]` in `close()`; and may define `POSIX_CLOSE_RESTART` to  
25850 0 rather than having to add restart semantics. On the other hand, implementations that  
25851 previously left *files* open on `[EINTR]` can map that to `posix_close()` with  
25852 `POSIX_CLOSE_RESTART`, and must add the semantics of `posix_close()` when *flag* is 0; one  
25853 possibility is by calling the original `close()` implementation, checking for failure, and on `[EINTR]`,  
25854 using actions similar to `dup2()` to replace the incomplete close operation with another file  
25855 descriptor that can be closed immediately by another call to the original `close()`, all before  
25856 returning to the application. Either way, `close()` should always map to one of the two behaviors  
25857 of `posix_close()`, and implementations are encouraged to keep the behavior of `close()` unchanged  
25858 so as not to break implementation-specific expectations of older applications that were relying  
25859 on behavior not specified by older versions of this standard.

25860 The standard developers considered introducing a thread-local variable that `close()` would set to

25861 indicate whether it had closed *filides* when returning `-1`. However, this was rejected in favor of  
 25862 the simpler solution of tightening `close()` to guarantee that *filides* is closed except for [EINTR],  
 25863 and exposing a choice of whether to expect [EINTR] by adding `posix_close()`. Additionally, while  
 25864 the name `posix_close()` is new to this standard, it is reminiscent of at least one implementation  
 25865 that introduced an alternate system call named `close_nocancel()` in order to allow an application  
 25866 to choose whether restart semantics were desired.

25867 Another consideration was whether implementations might return [EAGAIN] as an extension  
 25868 and whether `close()` should be required to leave the file descriptor open in this case, since  
 25869 [EAGAIN] normally implies an operation should be retried. It seemed very unlikely that any  
 25870 implementation would have a legitimate reason to return [EAGAIN] or [EWOULDBLOCK], and  
 25871 therefore this requirement would mean applications have to include code for an error case that  
 25872 will never be used. Therefore `close()` is now forbidden from returning [EAGAIN] and  
 25873 [EWOULDBLOCK] errors.

25874 Note that the requirement for `close()` on a socket to block for up to the current linger interval is  
 25875 not conditional on the `O_NONBLOCK` setting.

25876 The standard developers rejected a proposal to add `closefrom()` to the standard. Because the  
 25877 standard permits implementations to use inherited file descriptors as a means of providing a  
 25878 conforming environment for the child process, it is not possible to standardize an interface that  
 25879 closes arbitrary file descriptors above a certain value while still guaranteeing a conforming  
 25880 environment.

#### 25881 FUTURE DIRECTIONS

25882 None.

#### 25883 SEE ALSO

25885 XBD `<unistd.h>`

#### 25886 CHANGE HISTORY

25887 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 25888 Issue 5

25889 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

#### 25890 Issue 6

25891 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of  
 25892 the XSI STREAMS Option Group.

25893 The following new requirements on POSIX implementations derive from alignment with the  
 25894 Single UNIX Specification:

- 25895 • The [EIO] error condition is added as an optional error.
- 25896 • The DESCRIPTION is updated to describe the state of the *filides* file descriptor as  
 25897 unspecified if an I/O error occurs and an [EIO] error condition is returned.

25898 Text referring to sockets is added to the DESCRIPTION.

25899 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 25900 shared memory objects and memory mapped files (and not typed memory objects) are the types  
 25901 of memory objects to which the paragraph on last closes applies.

25902 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded  
 25903 text relating to the manager side of a pseudo-terminal. The reason for the change is that the  
 25904 behavior of pseudo-terminals and regular terminals should be as much alike as possible in this  
 25905 case; the change achieves that and matches historical behavior.

25906 **Issue 7**

25907

Functionality relating to the XSI STREAMS option is marked obsolescent.

25908

25909

Functionality relating to the Asynchronous Input and Output and Memory Mapped Files options is moved to the Base.

25910

25911

25912

Austin Group Interpretation 1003.1-2001 #139 is applied, clarifying that the requirement for *close()* on a socket to block for up to the current linger interval is not conditional on the `O_NONBLOCK` setting.

25913

25914

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0059 [419], XSH/TC1-2008/0060 [149], and XSH/TC1-2008/0061 [149] are applied.

25915

POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0069 [555] is applied.

25916 **Issue 8**

25917

25918

Austin Group Defect 529 is applied, adding the *posix\_close()* function and changing requirements for the *close()* function relating to `[EINTR]`.

25919

Austin Group Defect 768 is applied, adding OFD-owned file locks.

25920

Austin Group Defect 1330 is applied, removing obsolescent interfaces.

25921

25922

Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal devices.

25923

25924

Austin Group Defect 1525 is applied, clarifying that a socket is not destroyed until all file descriptors associated with it have been closed.

25925 **NAME**

25926 closedir — close a directory stream

25927 **SYNOPSIS**

25928 #include &lt;dirent.h&gt;

25929 int closedir(DIR \*dirp);

25930 **DESCRIPTION**

25931 The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon  
 25932 return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If there is a  
 25933 file descriptor associated with the stream (whether opened by *opendir()* or *dirfd()*, or passed to  
 25934 *fdopendir()* when creating the stream), that file descriptor shall be closed by *closedir()*.

25935 **RETURN VALUE**

25936 Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*  
 25937 set to indicate the error.

25938 **ERRORS**25939 The *closedir()* function may fail if:25940 [EBADF] The *dirp* argument does not refer to an open directory stream.25941 [EINTR] The *closedir()* function was interrupted by a signal.25942 **EXAMPLES**25943 **Closing a Directory Stream**25944 The following program fragment demonstrates how the *closedir()* function is used.

```

25945 ...
25946     DIR *dir;
25947     struct dirent *dp;
25948 ...
25949     if ((dir = opendir(".")) == NULL) {
25950 ...
25951     }
25952
25953     while ((dp = readdir(dir)) != NULL) {
25954 ...
25955     }
25956     closedir(dir);
25957 ...

```

25957 **APPLICATION USAGE**

25958 None.

25959 **RATIONALE**

25960 None.

25961 **FUTURE DIRECTIONS**

25962 None.

25963 **SEE ALSO**25964 [dirfd\(\)](#), [fdopendir\(\)](#)25965 XBD [<dirent.h>](#)

25966 **CHANGE HISTORY**

25967 First released in Issue 2.

25968 **Issue 6**25969 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.25970 The following new requirements on POSIX implementations derive from alignment with the  
25971 Single UNIX Specification:25972 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
25973 required for conforming implementations of previous POSIX specifications, it was not  
25974 required for UNIX applications.

25975 • The [EINTR] error condition is added as an optional error condition.

25976 **Issue 8**25977 Austin Group Defect 1360 is applied, clarifying that type **DIR** always has the ability to store a  
25978 file descriptor; what is optional is whether one is opened by `opendir()`.

25979 **NAME**

25980 closelog, openlog, setlogmask, syslog — control system log

25981 **SYNOPSIS**

```
25982 XSI #include <syslog.h>
25983 void closelog(void);
25984 void openlog(const char *ident, int logopt, int facility);
25985 int setlogmask(int maskpri);
25986 void syslog(int priority, const char *message, ... /* arguments */);
```

25987 **DESCRIPTION**

25988 The *syslog()* function shall send a message to an implementation-defined logging facility, which  
 25989 may log it in an implementation-defined system log, write it to the system console, forward it to  
 25990 a list of users, or forward it to the logging facility on another host over the network. The logged  
 25991 message shall include a message header and a message body. The message header contains at  
 25992 least a timestamp and a tag string.

25993 The message body is generated from the *message* and following arguments in the same manner  
 25994 as if these were arguments to *printf()*, except that the additional conversion specification *%m*  
 25995 shall be recognized; it shall convert no arguments, shall cause the output of the error message  
 25996 string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument  
 25997 specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion  
 25998 specifier character is not just *%m*, the behavior is undefined. A trailing <newline> may be added  
 25999 if needed.

26000 Values of the *priority* argument are formed by OR'ing together a severity-level value and an  
 26001 optional facility value. If no facility value is specified, the current default facility value is used.

26002 Possible values of severity level include:

26003	LOG_EMERG	A panic condition.
26004	LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system database.
26005		
26006	LOG_CRIT	Critical conditions, such as hard device errors.
26007	LOG_ERR	Errors.
26008	LOG_WARNING	
26009		Warning messages.
26010	LOG_NOTICE	Conditions that are not error conditions, but that may require special handling.
26011		
26012	LOG_INFO	Informational messages.
26013	LOG_DEBUG	Messages that contain information normally of use only when debugging a program.
26014		

26015 The facility indicates the application or system component generating the message. Possible  
 26016 facility values include:

26017	LOG_USER	Messages generated by arbitrary processes. This is the default facility identifier if none is specified.
26018		
26019	LOG_LOCAL0	Reserved for local use.

26020	LOG_LOCAL1	Reserved for local use.
26021	LOG_LOCAL2	Reserved for local use.
26022	LOG_LOCAL3	Reserved for local use.
26023	LOG_LOCAL4	Reserved for local use.
26024	LOG_LOCAL5	Reserved for local use.
26025	LOG_LOCAL6	Reserved for local use.
26026	LOG_LOCAL7	Reserved for local use.
26027	The <i>openlog()</i> function shall set process attributes that affect subsequent calls to <i>syslog()</i> . The	
26028	<i>ident</i> argument is a pointer to a null-terminated identifier that shall be prepended (without the	
26029	null terminator) to every message. The application shall ensure that the string pointed to by <i>ident</i>	
26030	remains valid during the <i>syslog()</i> calls that will prepend this identifier; however, it is unspecified	
26031	whether changes made to the string will change the identifier prepended by later <i>syslog()</i> calls.	
26032	The <i>logopt</i> argument indicates logging options. Values for <i>logopt</i> are constructed by a bitwise-	
26033	inclusive OR of zero or more of the following:	
26034	LOG_PID	Log the process ID with each message. This is useful for identifying specific
26035		processes.
26036	LOG_CONS	Write messages to the system console if they cannot be sent to the logging
26037		facility. The <i>syslog()</i> function ensures that the process does not acquire the
26038		console as a controlling terminal in the process of writing the message.
26039	LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is
26040		delayed until the first message is logged. This is useful for programs that need
26041		to manage the order in which file descriptors are allocated.
26042	LOG_ODELAY	Delay open until <i>syslog()</i> is called.
26043	LOG_NOWAIT	Do not wait for child processes that may have been created during the course
26044		of logging the message. This option should be used by processes that enable
26045		notification of child termination using SIGCHLD, since <i>syslog()</i> may
26046		otherwise block waiting for a child whose exit status has already been
26047		collected.
26048	The <i>facility</i> argument encodes a default facility to be assigned to all messages that do not have an	
26049	explicit facility already encoded. The initial default facility is LOG_USER.	
26050	The <i>openlog()</i> and <i>syslog()</i> functions may allocate a file descriptor. It is not necessary to call	
26051	<i>openlog()</i> prior to calling <i>syslog()</i> . If a file descriptor is allocated, the FD_CLOEXEC flag shall be	
26052	set; see <fcntl.h>.	
26053	The <i>closelog()</i> function shall close any open file descriptors allocated by previous calls to	
26054	<i>openlog()</i> or <i>syslog()</i> .	
26055	The <i>setlogmask()</i> function shall set the log priority mask for the current process to <i>maskpri</i> and	
26056	return the previous mask. If the <i>maskpri</i> argument is 0, the current log mask is not modified.	
26057	Calls by the current process to <i>syslog()</i> with a priority not set in <i>maskpri</i> shall be rejected. The	
26058	default log mask allows all priorities to be logged. A call to <i>openlog()</i> is not required prior to	
26059	calling <i>setlogmask()</i> .	
26060	The LOG_MASK( <i>pri</i> ) and LOG_UPTO( <i>pri</i> ) macros can be used to ensure a value or range of	
26061	severity levels is properly encoded for the <i>setlogmask()</i> <i>maskpri</i> argument in a portable manner.	
26062	The masks produced by these macros can be OR'ed or AND'ed with other priority masks (for	

26063 example,  
 26064 LOG\_UPTO (LOG\_WARNING) | LOG\_MASK (LOG\_DEBUG)  
 26065 and  
 26066 LOG\_UPTO (LOG\_DEBUG) & ~ ( (LOG\_MASK (LOG\_NOTICE) | LOG\_MASK (LOG\_INFO) )  
 26067 would produce the same priority mask).  
 26068 Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are  
 26069 defined in the `<syslog.h>` header.

#### 26070 RETURN VALUE

26071 The *setlogmask()* function shall return the previous log priority mask. The *closelog()*, *openlog()*,  
 26072 and *syslog()* functions shall not return a value.

#### 26073 ERRORS

26074 The *openlog()* and *syslog()* functions may fail if:

- 26075 [EMFILE] All file descriptors available to the process are currently open.
- 26076 [ENFILE] The maximum allowable number of files is currently open in the system.

#### 26077 EXAMPLES

##### 26078 Using openlog()

26079 The following example causes subsequent calls to *syslog()* to log the process ID with each  
 26080 message, and to write messages to the system console if they cannot be sent to the logging  
 26081 facility.

```
26082 #include <syslog.h>
26083 char *ident = "Process demo";
26084 int logopt = LOG_PID | LOG_CONS;
26085 int facility = LOG_USER;
26086 ...
26087 openlog(ident, logopt, facility);
```

##### 26088 Using setlogmask()

26089 The following example causes subsequent calls to *syslog()* to accept error messages, and to reject  
 26090 all other messages.

```
26091 #include <syslog.h>
26092 int result;
26093 int mask = LOG_MASK (LOG_ERR);
26094 ...
26095 result = setlogmask(mask);
```

**26096 Using syslog**

26097 The following example sends the message "This is a message" to the default logging  
26098 facility, marking the message as an error message generated by random processes.

```
26099 #include <syslog.h>
26100 char *message = "This is a message";
26101 int priority = LOG_ERR | LOG_USER;
26102 ...
26103 syslog(priority, message);
```

**26104 APPLICATION USAGE**

**26113 CHANGE HISTORY**

26114 First released in Issue 4, Version 2.

**26115 Issue 5**

26116 Moved from X/OPEN UNIX extension to BASE.

**26117 Issue 6**

26118 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/13 is applied, correcting the EXAMPLES  
26119 section.

**26120 Issue 8**

26121 Austin Group Defect 368 is applied, adding a requirement for FD\_CLOEXEC to be set if a file  
26122 descriptor is allocated, and adding the [EMFILE] and [ENFILE] errors.

26123 Austin Group Defect 1033 is applied, adding the LOG\_UPTO macro.

26124 Austin Group Defect 1244 is applied, clarifying the handling of the *ident* argument.

26125 **NAME**

26126 cnd\_broadcast, cnd\_signal — broadcast or signal a condition

26127 **SYNOPSIS**

```
26128 #include <threads.h>
26129 int cnd_broadcast(cnd_t *cond);
26130 int cnd_signal(cnd_t *cond);
```

26131 **DESCRIPTION**

26132 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26133 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26134 volume of POSIX.1-2024 defers to the ISO C standard.

26135 CX The *cnd\_broadcast()* function shall, as a single atomic operation, determine which threads, if  
 26136 any, are blocked on the condition variable pointed to by *cond* and unblock all of these threads.

26137 CX The *cnd\_signal()* function shall, as a single atomic operation, determine which threads, if any,  
 26138 are blocked on the condition variable pointed to by *cond* and unblock at least one of these  
 26139 threads.

26140 If these functions determine that there are no threads blocked on the condition variable pointed  
 26141 to by *cond*, they shall have no effect and shall return *thrd\_success*.

26142 CX If more than one thread is blocked on a condition variable, the scheduling policy shall determine  
 26143 the order in which threads are unblocked. When each thread unblocked as a result of a  
 26144 *cnd\_broadcast()* or *cnd\_signal()* returns from its call to *cnd\_wait()* or *cnd\_timedwait()*, the thread  
 26145 shall own the mutex with which it called *cnd\_wait()* or *cnd\_timedwait()*. The thread(s) that are  
 26146 unblocked shall contend for the mutex according to the scheduling policy (if applicable), and as  
 26147 if each had called *mtx\_lock()*.

26148 The *cnd\_broadcast()* and *cnd\_signal()* functions can be called by a thread whether or not it  
 26149 currently owns the mutex that threads calling *cnd\_wait()* or *cnd\_timedwait()* have associated  
 26150 with the condition variable during their waits; however, if predictable scheduling behavior is  
 26151 required, then that mutex shall be locked by the thread calling *cnd\_broadcast()* or *cnd\_signal()*.

26152 These functions shall not be affected if the calling thread executes a signal handler during the  
 26153 call.

26154 The behavior is undefined if the value specified by the *cond* argument to *cnd\_broadcast()* or  
 26155 *cnd\_signal()* does not refer to an initialized condition variable.

26156 **RETURN VALUE**

26157 These functions shall return *thrd\_success* on success, or *thrd\_error* if the request could  
 26158 not be honored.

26159 **ERRORS**

26160 No errors are defined.

26161 **EXAMPLES**

26162 None.

26163 **APPLICATION USAGE**

26164 See the APPLICATION USAGE section for *pthread\_cond\_broadcast()*, substituting *cnd\_broadcast()*  
 26165 for *pthread\_cond\_broadcast()* and *cnd\_signal()* for *pthread\_cond\_signal()*.

**26166 RATIONALE**

26167 As for *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()*, spurious wakeups may occur with  
26168 *cnd\_broadcast()* and *cnd\_signal()*, necessitating that applications code a predicate-testing-loop  
26169 around the condition wait. (See the RATIONALE section for *pthread\_cond\_broadcast()*.)

26170 These functions are not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#)  
26171 (on page 3742).

**26172 FUTURE DIRECTIONS**

26173 None.

**26174 SEE ALSO**

**26177 CHANGE HISTORY**

26178 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

26179 **NAME**

26180 cnd\_destroy, cnd\_init — destroy and initialize condition variables

26181 **SYNOPSIS**

```
26182 #include <threads.h>
26183 void cnd_destroy(cnd_t *cond);
26184 int cnd_init(cnd_t *cond);
```

26185 **DESCRIPTION**

26186 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26187 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26188 volume of POSIX.1-2024 defers to the ISO C standard.

26189 The *cnd\_destroy()* function shall release all resources used by the condition variable pointed to  
 26190 by *cond*. It shall be safe to destroy an initialized condition variable upon which no threads are  
 26191 currently blocked. Attempting to destroy a condition variable upon which other threads are  
 26192 currently blocked results in undefined behavior. A destroyed condition variable object can be  
 26193 reinitialized using *cnd\_init()*; the results of otherwise referencing the object after it has been  
 26194 destroyed are undefined. The behavior is undefined if the value specified by the *cond* argument  
 26195 to *cnd\_destroy()* does not refer to an initialized condition variable.

26196 The *cnd\_init()* function shall initialize a condition variable. If it succeeds it shall set the variable  
 26197 pointed to by *cond* to a value that uniquely identifies the newly initialized condition variable.  
 26198 Attempting to initialize an already initialized condition variable results in undefined behavior. A  
 26199 thread that calls *cnd\_wait()* on a newly initialized condition variable shall block.

26200 CX See [Section 2.9.9](#) (on page 548) for further requirements.

26201 These functions shall not be affected if the calling thread executes a signal handler during the  
 26202 call.

26203 **RETURN VALUE**

26204 The *cnd\_destroy()* function shall not return a value.

26205 The *cnd\_init()* function shall return *thrd\_success* on success, or *thrd\_nomem* if no memory  
 26206 could be allocated for the newly created condition variable, or *thrd\_error* if the request could  
 26207 not be honored.

26208 **ERRORS**

26209 See RETURN VALUE.

26210 **EXAMPLES**

26211 None.

26212 **APPLICATION USAGE**

26213 None.

26214 **RATIONALE**

26215 These functions are not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#)  
 26216 (on page 3742).

26217 **FUTURE DIRECTIONS**

26218 None.

26222 **CHANGE HISTORY**

26223 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

26224 **NAME**

26225 cnd\_timedwait, cnd\_wait — wait on a condition

26226 **SYNOPSIS**

```
26227 #include <threads.h>
26228 int cnd_timedwait(cnd_t * restrict cond, mtx_t * restrict mtx,
26229                 const struct timespec * restrict ts);
26230 int cnd_wait(cnd_t *cond, mtx_t *mtx);
```

26231 **DESCRIPTION**

26232 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26233 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26234 volume of POSIX.1-2024 defers to the ISO C standard.

26235 The *cnd\_timedwait()* function shall atomically unlock the mutex pointed to by *mtx* and block  
 26236 until the condition variable pointed to by *cond* is signaled by a call to *cnd\_signal()* or to  
 26237 *cnd\_broadcast()*, or until after the TIME\_UTC-based calendar time pointed to by *ts*, or until it is  
 26238 unblocked due to an unspecified reason.

26239 The *cnd\_wait()* function shall atomically unlock the mutex pointed to by *mtx* and block until the  
 26240 condition variable pointed to by *cond* is signaled by a call to *cnd\_signal()* or to *cnd\_broadcast()*, or  
 26241 until it is unblocked due to an unspecified reason.

26242 CX Atomically here means “atomically with respect to access by another thread to the mutex and  
 26243 then the condition variable”. That is, if another thread is able to acquire the mutex after the  
 26244 about-to-block thread has released it, then a subsequent call to *cnd\_broadcast()* or *cnd\_signal()* in  
 26245 that thread shall behave as if it were issued after the about-to-block thread has blocked.

26246 When the calling thread becomes unblocked, these functions shall lock the mutex pointed to by  
 26247 *mtx* before they return. The application shall ensure that the mutex pointed to by *mtx* is locked  
 26248 by the calling thread before it calls these functions.

26249 When using condition variables there is always a Boolean predicate involving shared variables  
 26250 associated with each condition wait that is true if the thread should proceed. Spurious wakeups  
 26251 from the *cnd\_timedwait()* and *cnd\_wait()* functions may occur. Since the return from  
 26252 *cnd\_timedwait()* or *cnd\_wait()* does not imply anything about the value of this predicate, the  
 26253 predicate should be re-evaluated upon such return.

26254 When a thread waits on a condition variable, having specified a particular mutex to either the  
 26255 *cnd\_timedwait()* or the *cnd\_wait()* operation, a dynamic binding is formed between that mutex  
 26256 and condition variable that remains in effect as long as at least one thread is blocked on the  
 26257 condition variable. During this time, the effect of an attempt by any thread to wait on that  
 26258 condition variable using a different mutex is undefined. Once all waiting threads have been  
 26259 unblocked (as by the *cnd\_broadcast()* operation), the next wait operation on that condition  
 26260 variable shall form a new dynamic binding with the mutex specified by that wait operation.  
 26261 Even though the dynamic binding between condition variable and mutex might be removed or  
 26262 replaced between the time a thread is unblocked from a wait on the condition variable and the  
 26263 time that it returns to the caller or begins cancellation cleanup, the unblocked thread shall  
 26264 always re-acquire the mutex specified in the condition wait operation call from which it is  
 26265 returning.

26266 CX A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a  
 26267 thread is set to PTHREAD\_CANCEL\_DEFERRED, a side-effect of acting upon a cancellation  
 26268 request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first  
 26269 cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up  
 26270 to the point of returning from the call to *cnd\_timedwait()* or *cnd\_wait()*, but at that point notices

26271 the cancellation request and instead of returning to the caller of *cnd\_timedwait()* or *cnd\_wait()*,  
 26272 starts the thread cancellation activities, which includes calling cancellation cleanup handlers.

26273 A thread that has been unblocked because it has been canceled while blocked in a call to  
 26274 *cnd\_timedwait()* or *cnd\_wait()* shall not consume any condition signal that may be directed  
 26275 concurrently at the condition variable if there are other threads blocked on the condition  
 26276 variable.

26277 When *cnd\_timedwait()* times out, it shall nonetheless release and re-acquire the mutex referenced  
 26278 by *mtx*, and may consume a condition signal directed concurrently at the condition variable.

26279 CX These functions shall not be affected if the calling thread executes a signal handler during the  
 26280 call, except that if a signal is delivered to a thread waiting for a condition variable, upon return  
 26281 from the signal handler either the thread shall resume waiting for the condition variable as if it  
 26282 was not interrupted, or it shall return *thrd\_success* due to spurious wakeup.

26283 The behavior is undefined if the value specified by the *cond* or *mtx* argument to these functions  
 26284 does not refer to an initialized condition variable or an initialized mutex object, respectively.

#### 26285 RETURN VALUE

26286 The *cnd\_timedwait()* function shall return *thrd\_success* upon success, or *thrd\_timedout* if  
 26287 the time specified in the call was reached without acquiring the requested resource, or  
 26288 *thrd\_error* if the request could not be honored.

26289 The *cnd\_wait()* function shall return *thrd\_success* upon success or *thrd\_error* if the  
 26290 request could not be honored.

#### 26291 ERRORS

26292 See RETURN VALUE.

#### 26293 EXAMPLES

26294 None.

#### 26295 APPLICATION USAGE

26296 None.

#### 26297 RATIONALE

26298 These functions are not affected by signal handlers (except as stated in the DESCRIPTION) for  
 26299 the reasons stated in XRAT Section B.2.3 (on page 3742).

#### 26300 FUTURE DIRECTIONS

26301 None.

#### 26305 CHANGE HISTORY

26306 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

26307 **NAME**

26308 confstr — get configurable variables

26309 **SYNOPSIS**

26310 #include &lt;unistd.h&gt;

26311 size\_t confstr(int name, char \*buf, size\_t len);

26312 **DESCRIPTION**26313 The *confstr()* function shall return configuration-defined string values. Its use and purpose are  
26314 similar to *sysconf()*, but it is used where string values rather than numeric values are returned.26315 The *name* argument represents the system variable to be queried. The implementation shall  
26316 support the following name values, defined in <unistd.h>. It may support others:

26317 \_CS\_PATH  
 26318 \_CS\_POSIX\_V8\_ILP32\_OFF32\_CFLAGS  
 26319 \_CS\_POSIX\_V8\_ILP32\_OFF32\_LDFLAGS  
 26320 \_CS\_POSIX\_V8\_ILP32\_OFF32\_LIBS  
 26321 \_CS\_POSIX\_V8\_ILP32\_OFFBIG\_CFLAGS  
 26322 \_CS\_POSIX\_V8\_ILP32\_OFFBIG\_LDFLAGS  
 26323 \_CS\_POSIX\_V8\_ILP32\_OFFBIG\_LIBS  
 26324 \_CS\_POSIX\_V8\_LP64\_OFF64\_CFLAGS  
 26325 \_CS\_POSIX\_V8\_LP64\_OFF64\_LDFLAGS  
 26326 \_CS\_POSIX\_V8\_LP64\_OFF64\_LIBS  
 26327 \_CS\_POSIX\_V8\_LPBIG\_OFFBIG\_CFLAGS  
 26328 \_CS\_POSIX\_V8\_LPBIG\_OFFBIG\_LDFLAGS  
 26329 \_CS\_POSIX\_V8\_LPBIG\_OFFBIG\_LIBS  
 26330 \_CS\_POSIX\_V8\_THREADS\_CFLAGS  
 26331 \_CS\_POSIX\_V8\_THREADS\_LDFLAGS  
 26332 \_CS\_POSIX\_V8\_WIDTH\_RESTRICTED\_ENVS  
 26333 \_CS\_V8\_ENV  
 26334 OB \_CS\_POSIX\_V7\_ILP32\_OFF32\_CFLAGS  
 26335 \_CS\_POSIX\_V7\_ILP32\_OFF32\_LDFLAGS  
 26336 \_CS\_POSIX\_V7\_ILP32\_OFF32\_LIBS  
 26337 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_CFLAGS  
 26338 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_LDFLAGS  
 26339 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_LIBS  
 26340 \_CS\_POSIX\_V7\_LP64\_OFF64\_CFLAGS  
 26341 \_CS\_POSIX\_V7\_LP64\_OFF64\_LDFLAGS  
 26342 \_CS\_POSIX\_V7\_LP64\_OFF64\_LIBS  
 26343 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_CFLAGS  
 26344 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_LDFLAGS  
 26345 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_LIBS  
 26346 \_CS\_POSIX\_V7\_THREADS\_CFLAGS  
 26347 \_CS\_POSIX\_V7\_THREADS\_LDFLAGS  
 26348 \_CS\_POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS  
 26349 \_CS\_V7\_ENV

26350 If *len* is not 0, and if *name* has a configuration-defined value, *confstr()* shall copy that value into  
 26351 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,  
 26352 including the terminating null, then *confstr()* shall truncate the string to *len*-1 bytes and null-  
 26353 terminate the result. The application can detect that the string was truncated by comparing the  
 26354 value returned by *confstr()* with *len*.

26355 If *len* is 0 and *buf* is a null pointer, then *confstr()* shall still return the integer value as defined  
 26356 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is  
 26357 unspecified.

26358 After a call to:

```
26359 confstr(_CS_V8_ENV, buf, sizeof(buf))
```

26360 the string stored in *buf* shall contain a <space>-separated list of the variable=value environment  
 26361 variable pairs an implementation requires as part of specifying a conforming environment, as  
 26362 described in the implementations' conformance documentation.

26363 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

```
26364 confstr(_CS_PATH, buf, sizeof(buf))
```

26365 can be used as a value of the *PATH* environment variable that accesses all of the standard  
 26366 utilities of POSIX.1-2024, that are provided in a manner accessible via the *exec* family of  
 26367 functions, if the return value is less than or equal to *sizeof(buf)*.

#### 26368 RETURN VALUE

26369 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be  
 26370 needed to hold the entire configuration-defined value including the terminating null. If this  
 26371 return value is greater than *len*, the string returned in *buf* is truncated.

26372 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

26373 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*  
 26374 unchanged.

#### 26375 ERRORS

26376 The *confstr()* function shall fail if:

26377 [EINVAL] The value of the *name* argument is invalid.

#### 26378 EXAMPLES

26379 None.

#### 26380 APPLICATION USAGE

26381 An application can distinguish between an invalid *name* parameter value and one that  
 26382 corresponds to a configurable variable that has no configuration-defined value by checking if  
 26383 *errno* is modified. This mirrors the behavior of *sysconf()*.

26384 The original need for this function was to provide a way of finding the configuration-defined  
 26385 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to  
 26386 include directories that could contain utilities replacing the standard utilities in the Shell and  
 26387 Utilities volume of POSIX.1-2024, applications need a way to determine the system-supplied  
 26388 *PATH* environment variable value that contains the correct search path for the standard utilities.

26389 An application could use:

```
26390 confstr(name, (char *)NULL, (size_t)0)
```

26391 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to  
 26392 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,  
 26393 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use  
 26394 *malloc()* to allocate a larger buffer if it finds that this is too small.

26395 **RATIONALE**

26396 Application developers can normally determine any configuration variable by means of reading  
26397 from the stream opened by a call to:

```
26398 popen("command -p getconf variable", "r");
```

26399 The *confstr()* function with a *name* argument of `_CS_PATH` returns a string that can be used as a  
26400 *PATH* environment variable setting that will reference the standard shell and utilities as  
26401 described in the Shell and Utilities volume of POSIX.1-2024.

26402 The *confstr()* function copies the returned string into a buffer supplied by the application instead  
26403 of returning a pointer to a string. This allows a cleaner function in some implementations (such  
26404 as those with lightweight threads) and resolves questions about when the application must copy  
26405 the string returned.

26406 **FUTURE DIRECTIONS**

26407 None.

26408 **SEE ALSO**

26409 *exec*, *fpathconf()*, *sysconf()*

26410 XBD [<unistd.h>](#)

26411 XCU *c17*

26412 **CHANGE HISTORY**

26413 First released in Issue 4. Derived from the ISO POSIX-2 standard.

26414 **Issue 5**

26415 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those  
26416 marked EX are new in this version.

26417 **Issue 6**

26418 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the  
26419 size of the buffer now explicitly states that this includes the terminating null.

26420 The following new requirements on POSIX implementations derive from alignment with the  
26421 Single UNIX Specification:

- 26422 • The DESCRIPTION is updated with new arguments which can be used to determine  
26423 configuration strings for C compiler flags, linker/loader flags, and libraries for each  
26424 different supported programming environment. This is a change to support data size  
26425 neutrality.

26426 The following changes were made to align with the IEEE P1003.1a draft standard:

- 26427 • The DESCRIPTION is updated to include text describing how `_CS_PATH` can be used to  
26428 obtain a *PATH* to access the standard utilities.

26429 The macros associated with the *c89* programming models are marked LEGACY and new  
26430 equivalent macros associated with *c99* are introduced.

26431 **Issue 7**

26432 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the `_CS_V7_ENV` variable.

26433 Austin Group Interpretations 1003.1-2001 #166 is applied to permit an additional compiler flag  
26434 to enable threads.

26435 The V6 variables for the supported programming environments are marked obsolescent.

26436 The variables for the supported programming environments are updated to be V7.

- 26437 The LEGACY variables and obsolescent values are removed.
- 26438 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0070 [810] and XSH/TC2-2008/0071  
26439 [911] are applied.
- 26440 **Issue 8**
- 26441 Austin Group Defect 1330 is applied, changing ``\_V7\_'' to ``\_V8\_'' and ``\_V6\_'' to ``\_V7\_''.

26442 **NAME**

26443 conj, conjf, conjl — complex conjugate functions

26444 **SYNOPSIS**

26445 #include &lt;complex.h&gt;

26446 double complex conj(double complex z);

26447 float complex conjf(float complex z);

26448 long double complex conjl(long double complex z);

26449 **DESCRIPTION**

26450 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
26451 conflict between the requirements described here and the ISO C standard is unintentional. This  
26452 volume of POSIX.1-2024 defers to the ISO C standard.

26453 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary  
26454 part.

26455 **RETURN VALUE**

26456 These functions return the complex conjugate value.

26457 **ERRORS**

26458 No errors are defined.

26459 **EXAMPLES**

26460 None.

26461 **APPLICATION USAGE**

26462 None.

26463 **RATIONALE**

26464 None.

26472 **NAME**

26473 connect — connect a socket

26474 **SYNOPSIS**

26475 #include &lt;sys/socket.h&gt;

```
26476 int connect(int socket, const struct sockaddr *address,
26477            socklen_t address_len);
```

26478 **DESCRIPTION**

26479 The *connect()* function shall attempt to make a connection on a connection-mode socket or to set  
 26480 or reset the peer address of a connectionless-mode socket. The function takes the following  
 26481 arguments:

26482	<i>socket</i>	Specifies the file descriptor associated with the socket.
26483	<i>address</i>	Points to a <b>sockaddr</b> structure containing the peer address. The length and format of the address depend on the address family of the socket.
26485	<i>address_len</i>	Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i> argument.

26487 If the address family of the socket is AF\_UNIX, the application shall ensure that a null terminator after the pathname is included in the *sun\_path* member of *address* as a **sockaddr\_un** structure, and that *address\_len* is at least `offsetof(struct sockaddr_un, sun_path) + 1` plus the length of the pathname.

26491 If the socket has not already been bound to a local address, *connect()* shall bind it to an address which, unless the socket's address family is AF\_UNIX, is an unused local address.

26493 If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address, and no connection is made. For SOCK\_DGRAM sockets, the peer address identifies where all datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent *recv()* functions. If the *sa\_family* member of *address* is AF\_UNSPEC, the socket's peer address shall be reset. Note that despite no connection being made, the term "connected" is used to describe a connectionless-mode socket for which a peer address has been set.

26499 If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection to the address specified by the *address* argument. If the connection cannot be established immediately and O\_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall block for up to an unspecified timeout interval until the connection is established. If the timeout interval expires before the connection is established, *connect()* shall fail and the connection attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be established asynchronously.

26507 If the connection cannot be established immediately and O\_NONBLOCK is set for the file descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection request shall not be aborted, and the connection shall be established asynchronously. Subsequent calls to *connect()* for the same socket, before the connection is established, shall fail and set *errno* to [EALREADY].

26512 When the connection has been established asynchronously, *pselect()*, *select()*, *poll()*, and *ppoll()* shall indicate that the file descriptor for the socket is ready for writing.

26514 The socket in use may require the process to have appropriate privileges to use the *connect()* function.

26516 **RETURN VALUE**

26517 Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno*  
 26518 set to indicate the error.

26519 **ERRORS**

26520 The *connect()* function shall fail if:

26521 [EADDRNOTAVAIL]

26522 The specified address is not available from the local machine.

26523 [EAFNOSUPPORT]

26524 The specified address is not a valid address for the address family of the  
 26525 specified socket.

26526 [EALREADY] A connection request is already in progress for the specified socket.

26527 [EBADF] The *socket* argument is not a valid file descriptor.

26528 [ECONNREFUSED]

26529 The target address was not listening for connections or refused the connection  
 26530 request.

26531 [EINPROGRESS] O\_NONBLOCK is set for the file descriptor for the socket and the connection  
 26532 cannot be immediately established; the connection shall be established  
 26533 asynchronously.

26534 [EINTR] The attempt to establish a connection was interrupted by delivery of a signal  
 26535 that was caught; the connection shall be established asynchronously.

26536 [EISCONN] The specified socket is connection-mode and is already connected.

26537 [ENETUNREACH]

26538 No route to the network is present.

26539 [ENOTSOCK] The *socket* argument does not refer to a socket.

26540 [EPROTOTYPE] The specified address has a different type than the socket bound to the  
 26541 specified peer address.

26542 [ETIMEDOUT] The attempt to connect timed out before a connection was made.

26543 If the address family of the socket is AF\_UNIX, then *connect()* shall fail if:

26544 [EIO] An I/O error occurred while reading from or writing to the file system.

26545 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
 26546 in *address*.

26547 [ENAMETOOLONG]

26548 The length of a component of a pathname is longer than {NAME\_MAX}.

26549 [ENOENT] A component of the pathname does not name an existing file or the pathname  
 26550 is an empty string.

26551 [ENOTDIR]

26552 A component of the path prefix of the pathname in *address* names an existing  
 26553 file that is neither a directory nor a symbolic link to a directory, or the  
 26554 pathname in *address* contains at least one non-*</i>slash*>* character and ends with  
 26555 one or more trailing *</i>slash*>* characters and the last pathname component  
 26556 names an existing file that is neither a directory nor a symbolic link to a  
 directory.**

26557 The *connect()* function may fail if:

26558	[EACCES]	Search permission is denied for a component of the path prefix; or write access to the named socket is denied.
26559		
26560	[EADDRINUSE]	Attempt to establish a connection that uses addresses that are already in use.
26561	[ECONNRESET]	Remote host reset the connection request.
26562	[EHOSTUNREACH]	
26563		The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).
26564		
26565	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family; or invalid address family in the <b>sockaddr</b> structure.
26566		
26567	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .
26568		
26569	[ENAMETOOLONG]	
26570		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
26571		
26572		
26573	[ENETDOWN]	The local network interface used to reach the destination is down.
26574	[ENOBUFS]	No buffer space is available.
26575	[EOPNOTSUPP]	The socket is listening and cannot be connected.

**EXAMPLES**

26576 None.

**APPLICATION USAGE**

26578 If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the file descriptor and create a new socket before attempting to reconnect.

26581 For AF\_UNIX sockets, some implementations support an extension where *address\_len* does not have to include a null terminator for the pathname stored in *sun\_path*, which in turn allows a pathname to be one byte longer. However, such usage is not portable, and carries a risk of accessing beyond the intended bounds of the pathname length.

**RATIONALE**

26585 None.

**FUTURE DIRECTIONS**

26587 None.

**CHANGE HISTORY**

26592 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

26594 The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

**Issue 7**

26597 Austin Group Interpretation 1003.1-2001 #035 is applied, clarifying the description of connected sockets.

26599 Austin Group Interpretation 1003.1-2001 #143 is applied.

- 26600 Austin Group Interpretation 1003.1-2001 #188 is applied, changing the method used to reset a peer address for a datagram socket.
- 26601
- 26602 SD5-XSH-ERN-185 is applied.
- 26603 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0062 [324] is applied.
- 26604 **Issue 8**
- 26605 Austin Group Defect 561 is applied, changing the requirements for the *sun\_path* member of the **sockaddr\_un** structure.
- 26606
- 26607 Austin Group Defect 1263 is applied, adding *ppoll()*.

26608 **NAME**

26609 copysign, copysignf, copysignl — number manipulation function

26610 **SYNOPSIS**

```
26611 #include <math.h>
26612 double copysign(double x, double y);
26613 float copysignf(float x, float y);
26614 long double copysignl(long double x, long double y);
```

26615 **DESCRIPTION**

26616 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26617 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26618 volume of POSIX.1-2024 defers to the ISO C standard.

26619 These functions shall produce a value with the magnitude of  $x$  and the sign of  $y$ . On  
 26620 implementations that represent a signed zero but do not treat negative zero consistently in  
 26621 arithmetic operations, these functions regard the sign of zero as positive.

26622 **RETURN VALUE**

26623 Upon successful completion, these functions shall return a value with the magnitude of  $x$  and  
 26624 the sign of  $y$ .

26625 MX The returned value shall be exact and shall be independent of the current rounding direction  
 26626 mode.

26627 **ERRORS**

26628 No errors are defined.

26629 **EXAMPLES**

26630 None.

26631 **APPLICATION USAGE**

26632 None.

26633 **RATIONALE**

26634 None.

26635 **FUTURE DIRECTIONS**

26636 None.

26637 **SEE ALSO**26638 [signbit\(\)](#)26639 XBD [<math.h>](#)26640 **CHANGE HISTORY**

26641 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26642 **Issue 8**

26643 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
 26644 standard.

26645 **NAME**

26646 cos, cosf, cosl — cosine function

26647 **SYNOPSIS**

```
26648 #include <math.h>
26649 double cos(double x);
26650 float cosf(float x);
26651 long double cosl(long double x);
```

26652 **DESCRIPTION**

26653 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26654 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26655 volume of POSIX.1-2024 defers to the ISO C standard.

26656 These functions shall compute the cosine of their argument  $x$ , measured in radians.

26657 An application wishing to check for error situations should set *errno* to zero and call  
 26658 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26659 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26660 zero, an error has occurred.

26661 **RETURN VALUE**

26662 Upon successful completion, these functions shall return the cosine of  $x$ .

26663 MX If  $x$  is NaN, a NaN shall be returned.

26664 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.

26665 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

26666 **ERRORS**

26667 These functions shall fail if:

26668 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ .

26669 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26670 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 26671 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 26672 shall be raised.

26673 **EXAMPLES**26674 **Taking the Cosine of a 45-Degree Angle**

```
26675 #include <math.h>
26676 ...
26677 double radians = 45 * M_PI / 180;
26678 double result;
26679 ...
26680 result = cos(radians);
```

26681 **APPLICATION USAGE**

26682 These functions may lose accuracy when their argument is near an odd multiple of  $\pi/2$  or is far  
 26683 from 0.

26684 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 26685 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

26686 **RATIONALE**

26687 None.

26688 **FUTURE DIRECTIONS**

26689 None.

26690 **SEE ALSO**26691 *acos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, *tan()*26692 XBD Section 4.23 (on page 109), **<math.h>**26693 **CHANGE HISTORY**

26694 First released in Issue 1. Derived from Issue 1 of the SVID.

26695 **Issue 5**26696 The DESCRIPTION is updated to indicate how an application should check for an error. This  
26697 text was previously published in the APPLICATION USAGE section.26698 **Issue 6**26699 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.26700 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
26701 revised to align with the ISO/IEC 9899:1999 standard.26702 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
26703 marked.26704 **Issue 7**

26705 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0063 [320] is applied.

26706 **NAME**

26707 cosh, coshf, coshl — hyperbolic cosine functions

26708 **SYNOPSIS**

```
26709 #include <math.h>
26710 double cosh(double x);
26711 float coshf(float x);
26712 long double coshl(long double x);
```

26713 **DESCRIPTION**

26714 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26715 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26716 volume of POSIX.1-2024 defers to the ISO C standard.

26717 These functions shall compute the hyperbolic cosine of their argument  $x$ .

26718 An application wishing to check for error situations should set *errno* to zero and call  
 26719 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26720 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26721 zero, an error has occurred.

26722 **RETURN VALUE**

26723 Upon successful completion, these functions shall return the hyperbolic cosine of  $x$ .

26724 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and  
 26725 *coshl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 26726 respectively.

26727 MX If  $x$  is NaN, a NaN shall be returned.

26728 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.

26729 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

26730 **ERRORS**

26731 These functions shall fail if:

26732 Range Error The result would cause an overflow.

26733 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26734 then *errno* shall be set to [ERANGE]. If the integer expression  
 26735 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 26736 floating-point exception shall be raised.

26737 **EXAMPLES**

26738 None.

26739 **APPLICATION USAGE**

26740 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 26741 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

26742 **RATIONALE**

26743 None.

26744 **FUTURE DIRECTIONS**

26745 None.

26746 **SEE ALSO**26747 *acosh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sinh()*, *tanh()*26748 XBD Section 4.23 (on page 109), **<math.h>**26749 **CHANGE HISTORY**

26750 First released in Issue 1. Derived from Issue 1 of the SVID.

26751 **Issue 5**26752 The DESCRIPTION is updated to indicate how an application should check for an error. This  
26753 text was previously published in the APPLICATION USAGE section.26754 **Issue 6**26755 The *coshf()* and *coshl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.26756 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
26757 revised to align with the ISO/IEC 9899:1999 standard.26758 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
26759 marked.26760 **Issue 7**

26761 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0072 [630] is applied.

26762 **NAME**

26763           cosl — cosine function

26764 **SYNOPSIS**

26765           #include <math.h>

26766           long double cosl(long double *x*);

26767 **DESCRIPTION**

26768           Refer to *cos()*.

26769 **NAME**

26770 cpow, cpowf, cpowl — complex power functions

26771 **SYNOPSIS**

26772 #include &lt;complex.h&gt;

26773 double complex cpow(double complex *x*, double complex *y*);26774 float complex cpowf(float complex *x*, float complex *y*);26775 long double complex cpowl(long double complex *x*,26776 long double complex *y*);26777 **DESCRIPTION**

26778 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26779 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26780 volume of POSIX.1-2024 defers to the ISO C standard.

26781 These functions shall compute the complex power function  $x^y$ , with a branch cut for the first  
 26782 parameter along the negative real axis.

26783 MXC These functions shall raise floating-point exceptions if appropriate for the calculation of the parts  
 26784 of the result, and may also raise spurious floating-point exceptions.

26785 **RETURN VALUE**

26786 These functions shall return the complex power function value.

26787 **ERRORS**

26788 No errors are defined.

26789 **EXAMPLES**

26790 None.

26791 **APPLICATION USAGE**

26792 None.

26793 **RATIONALE**

26794 Permitting spurious floating-point exceptions allows  $cpow(z, c)$  to be implemented as  
 26795  $cexp(c \log(z))$  without precluding implementations that treat special cases more carefully.

26796 **FUTURE DIRECTIONS**

26797 None.

26798 **SEE ALSO**26799 [cabs\(\)](#), [csqrt\(\)](#)26800 XBD [<complex.h>](#)26801 **CHANGE HISTORY**

26803 **Issue 8**

26804 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
 26805 standard.

26806 **NAME**

26807 cproj, cprojf, cprojl — complex projection functions

26808 **SYNOPSIS**

```
26809 #include <complex.h>
26810 double complex cproj(double complex z);
26811 float complex cprojf(float complex z);
26812 long double complex cprojl(long double complex z);
```

26813 **DESCRIPTION**

26814 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26815 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26816 volume of POSIX.1-2024 defers to the ISO C standard.

26817 These functions shall compute a projection of  $z$  onto the Riemann sphere:  $z$  projects to  $z$ , except  
 26818 that all complex infinities (even those with one infinite part and one NaN part) project to  
 26819 positive infinity on the real axis. If  $z$  has an infinite part, then  $cproj(z)$  shall be equivalent to:

```
26820 INFINITY + I * copysign(0.0, cimag(z))
```

26821 **RETURN VALUE**

26822 These functions shall return the value of the projection onto the Riemann sphere.

26823 **ERRORS**

26824 No errors are defined.

26825 **EXAMPLES**

26826 None.

26827 **APPLICATION USAGE**

26828 None.

26829 **RATIONALE**

26830 Two topologies are commonly used in complex mathematics: the complex plane with its  
 26831 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is  
 26832 better suited for transcendental functions, the Riemann sphere for algebraic functions. The  
 26833 complex types with their multiplicity of infinities provide a useful (though imperfect) model for  
 26834 the complex plane. The  $cproj()$  function helps model the Riemann sphere by mapping all  
 26835 infinities to one, and should be used just before any operation, especially comparisons, that  
 26836 might give spurious results for any of the other infinities. Note that a complex value with one  
 26837 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is  
 26838 infinite, the complex value is infinite independent of the value of the other part. For the same  
 26839 reason,  $cabs()$  returns an infinity if its argument has an infinite part and a NaN part.

26840 **FUTURE DIRECTIONS**

26841 None.

26842 **SEE ALSO**26843 *carg()*, *cimag()*, *conj()*, *creal()*26844 XBD [<complex.h>](#)26845 **CHANGE HISTORY**

26874 XBD &lt;complex.h&gt;

26875 **CHANGE HISTORY**

26876 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26877 **NAME**

26878 creat — create a new file or rewrite an existing one

26879 **SYNOPSIS**

```
26880 OH #include <sys/stat.h>
26881 #include <fcntl.h>
26882 int creat(const char *path, mode_t mode);
```

26883 **DESCRIPTION**26884 The *creat()* function shall behave as if it is implemented as follows:

```
26885 int creat(const char *path, mode_t mode)
26886 {
26887     return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);
26888 }
```

26889 **RETURN VALUE**26890 Refer to *open()*.26891 **ERRORS**26892 Refer to *open()*.26893 **EXAMPLES**26894 **Creating a File**

26895 The following example creates the file **/tmp/file** with read and write permissions for the file  
26896 owner and read permission for group and others. The resulting file descriptor is assigned to the  
26897 *fd* variable.

```
26898 #include <fcntl.h>
26899 ...
26900 int fd;
26901 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
26902 char *pathname = "/tmp/file";
26903 ...
26904 fd = creat(pathname, mode);
26905 ...
```

26906 **APPLICATION USAGE**

26907 In multi-threaded applications, the *creat()* function can leak file descriptors into child processes.  
26908 Applications should instead use *open()* with the *O\_CLOEXEC* and *O\_CLOFORK* flags to avoid  
26909 the leak.

26910 **RATIONALE**

26911 The *creat()* function is redundant. Its services are also provided by the *open()* function. It has  
26912 been included primarily for historical purposes since many existing applications depend on it. It  
26913 is best considered a part of the C binding rather than a function that should be provided in other  
26914 languages.

26915 **FUTURE DIRECTIONS**

26916 None.

26917 **SEE ALSO**26918 *mknod()*, *open()*26919 XBD *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>*

26920 **CHANGE HISTORY**

26921 First released in Issue 1. Derived from Issue 1 of the SVID.

26922 **Issue 6**

26923 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

26924 The following new requirements on POSIX implementations derive from alignment with the  
26925 Single UNIX Specification:

- 26926 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
26927 required for conforming implementations of previous POSIX specifications, it was not  
26928 required for UNIX applications.

26929 **Issue 7**

26930 SD5-XSH-ERN-186 is applied.

26931 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0064 [291] is applied.

26932 **Issue 8**

26933 Austin Group Defects 411 and 1318 are applied, changing the APPLICATION USAGE section.

26934 **NAME**26935 crypt — password hashing function (**CRYPT**)26936 **SYNOPSIS**

```
26937 XSI      #include <unistd.h>
26938 char *crypt(const char *key, const char *salt);
```

26939 **DESCRIPTION**

26940 The *crypt()* function hashes a password for storage in the user database. The algorithm is  
 26941 implementation-defined.

26942 The *key* argument points to a password to be hashed. The *salt* argument shall be a string of at  
 26943 least two bytes in length not including the null character chosen from the set:

```
26944 a b c d e f g h i j k l m n o p q r s t u v w x y z
26945 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
26946 0 1 2 3 4 5 6 7 8 9 . /
```

26947 The first two bytes of this string may be used to perturb the encoding algorithm.

26948 The return value of *crypt()* points to static data that is overwritten by each call.

26949 The *crypt()* function need not be thread-safe.

26950 **RETURN VALUE**

26951 Upon successful completion, *crypt()* shall return a pointer to the hashed password; the first two  
 26952 bytes of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null  
 26953 pointer and set *errno* to indicate the error.

26954 **ERRORS**

26955 The *crypt()* function shall fail if:

26956 [ENOSYS] The functionality is not supported on this implementation.

26957 **EXAMPLES**26958 **Encoding Passwords**

26959 The following example finds a user database entry matching a particular user name and changes  
 26960 the current password to a new password. The *crypt()* function generates an encoded version of  
 26961 each password. The first call to *crypt()* produces an encoded version of the old password; that  
 26962 encoded password is then compared to the password stored in the user database. The second  
 26963 call to *crypt()* encodes the new password before it is stored.

26964 The *putpwent()* function, used in the following example, is not part of POSIX.1-2024.

```
26965 #include <unistd.h>
26966 #include <pwd.h>
26967 #include <string.h>
26968 #include <stdio.h>
26969 ...
26970 int valid_change;
26971 int pfd; /* Integer for file descriptor returned by open(). */
26972 FILE *fpfd; /* File pointer for use in putpwent(). */
26973 struct passwd *p;
26974 char user[100];
26975 char oldpasswd[100];
26976 char newpasswd[100];
```

```

26977     char savepasswd[100];
26978     ...
26979     valid_change = 0;
26980     while ((p = getpwent()) != NULL) {
26981         /* Change entry if found. */
26982         if (strcmp(p->pw_name, user) == 0) {
26983             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
26984                 strcpy(savepasswd, crypt(newpasswd, user));
26985                 p->pw_passwd = savepasswd;
26986                 valid_change = 1;
26987             }
26988             else {
26989                 fprintf(stderr, "Old password is not valid\n");
26990             }
26991         }
26992         /* Put passwd entry into ptmp. */
26993         putpwent(p, fpfd);
26994     }

```

#### 26995 APPLICATION USAGE

26996 The values returned by this function need not be portable among XSI-conformant systems.

26997 Several implementations offer extensions via characters outside of the set specified for the *salt*  
 26998 argument for specifying alternative algorithms; while not portable, these extensions may offer  
 26999 better security. The use of *crypt()* for anything other than password hashing is not  
 27000 recommended.

#### 27001 RATIONALE

27002 None.

#### 27003 FUTURE DIRECTIONS

27004 None.

#### 27005 SEE ALSO

27006 [encrypt\(\)](#), [setkey\(\)](#)

27007 XBD [<unistd.h>](#)

#### 27008 CHANGE HISTORY

27009 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 27010 Issue 5

27011 Normative text previously in the APPLICATION USAGE section is moved to the  
 27012 DESCRIPTION.

#### 27013 Issue 7

27014 Austin Group Interpretation 1003.1-2001 #156 is applied.

27015 SD5-XSH-ERN-178 is applied.

27016 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0073 [899] is applied.

#### 27017 Issue 8

27018 Austin Group Defect 1192 is applied, clarifying that *crypt()* is intended for password hashing,  
 27019 not for general string encoding.

27020 **NAME**

27021 csin, csinf, csinl — complex sine functions

27022 **SYNOPSIS**

27023 #include &lt;complex.h&gt;

27024 double complex csin(double complex z);

27025 float complex csinf(float complex z);

27026 long double complex csinl(long double complex z);

27027 **DESCRIPTION**

27028 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27029 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27030 volume of POSIX.1-2024 defers to the ISO C standard.

27031 These functions shall compute the complex sine of  $z$ .27032 **RETURN VALUE**

27033 These functions shall return the complex sine value.

27034 MXC  $csin(conj(iz))$ ,  $csinf(conj(iz))$ , and  $csinl(conj(iz))$  shall return exactly the same value as  
 27035  $conj(csin(iz))$ ,  $conj(csinf(iz))$ , and  $conj(csinl(iz))$ , respectively, and  $csin(-iz)$ ,  $csinf(-iz)$ , and  
 27036  $csinl(-iz)$  shall return exactly the same value as  $-csin(iz)$ ,  $-csinf(iz)$ , and  $-csinl(iz)$ , respectively,  
 27037 including for the special values of  $iz$  below.

27038 If  $iz$  is  $+0 + i0$ ,  $-i (+0 + i0)$  shall be returned.

27039 If  $iz$  is  $+0 + iInf$ ,  $-i (\pm 0 + iNaN)$  shall be returned and the invalid floating-point exception shall be  
 27040 raised; the sign of the imaginary part of the result is unspecified.

27041 If  $iz$  is  $+0 + iNaN$ ,  $-i (\pm 0 + iNaN)$  shall be returned; the sign of the imaginary part of the result is  
 27042 unspecified.

27043 If  $iz$  is  $x + iInf$  where  $x$  is positive and finite,  $-i (NaN + iNaN)$  shall be returned and the invalid  
 27044 floating-point exception shall be raised.

27045 If  $iz$  is  $x + iNaN$  where  $x$  is non-zero and finite,  $-i (NaN + iNaN)$  shall be returned and the  
 27046 invalid floating-point exception may be raised.

27047 If  $iz$  is  $+Inf + i0$ ,  $-i (+Inf + i0)$  shall be returned.27048 If  $iz$  is  $+Inf + iy$  where  $y$  is positive and finite,  $-iInf (\cos(y) + i \sin(y))$  shall be returned.

27049 If  $iz$  is  $+Inf + iInf$ ,  $-i (\pm Inf + iNaN)$  shall be returned and the invalid floating-point exception  
 27050 shall be raised; the sign of the imaginary part of the result is unspecified.

27051 If  $iz$  is  $+Inf + iNaN$ ,  $-i (\pm Inf + iNaN)$  shall be returned; the sign of the imaginary part of the  
 27052 result is unspecified.

27053 If  $iz$  is  $NaN + i0$ ,  $-i (NaN + i0)$  shall be returned.

27054 If  $iz$  is  $NaN + iy$  where  $y$  is any non-zero number,  $-i (NaN + iNaN)$  shall be returned and the  
 27055 invalid floating-point exception may be raised.

27056 If  $iz$  is  $NaN + iNaN$ ,  $-i (NaN + iNaN)$  shall be returned.27057 **ERRORS**

27058 No errors are defined.

27059 **EXAMPLES**

27060 None.

27061 **APPLICATION USAGE**

27062 None.

27063 **RATIONALE**

27064 The MXC special cases for *csin()* are derived from those for *csinh()* by applying the formula  
27065  $csin(z) = -i csinh(iz)$ .

27066 **FUTURE DIRECTIONS**

27067 None.

27130 standard.

27131 **NAME**

27132           csinl — complex sine functions

27133 **SYNOPSIS**

27134           #include &lt;complex.h&gt;

27135           long double complex csinl(long double complex z);

27136 **DESCRIPTION**27137           Refer to *csin()*.

27138 **NAME**

27139 csqrt, csqrtf, csqrtl — complex square root functions

27140 **SYNOPSIS**

```
27141 #include <complex.h>
27142 double complex csqrt(double complex z);
27143 float complex csqrtf(float complex z);
27144 long double complex csqrtl(long double complex z);
```

27145 **DESCRIPTION**

27146 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27147 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27148 volume of POSIX.1-2024 defers to the ISO C standard.

27149 These functions shall compute the complex square root of  $z$ , with a branch cut along the negative  
 27150 real axis.

27151 **RETURN VALUE**

27152 These functions shall return the complex square root value, in the range of the right half-plane  
 27153 (including the imaginary axis).

27154 MXC *csqrt(conj(z))*, *csqrtf(conjf(z))*, and *csqrtl(conjl(z))* shall return exactly the same value as  
 27155 *conj(csqrt(z))*, *conjf(csqrtf(z))*, and *conjl(csqrtl(z))*, respectively, including for the special values of  
 27156  $z$  below.

27157 If  $z$  is  $\pm 0 + i0$ ,  $+0 + i0$  shall be returned.

27158 If the imaginary part of  $z$  is  $\text{Inf}$ ,  $+\text{Inf} + i\text{Inf}$  shall be returned.

27159 If  $z$  is  $x + i\text{NaN}$  where  $x$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 27160 exception may be raised.

27161 If  $z$  is  $-\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+0 + i\text{Inf}$  shall be returned.

27162 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $+\text{Inf} + i0$  shall be returned.

27163 If  $z$  is  $-\text{Inf} + i\text{NaN}$ ,  $\text{NaN} \pm i\text{Inf}$  shall be returned; the sign of the imaginary part of the result is  
 27164 unspecified.

27165 If  $z$  is  $+\text{Inf} + i\text{NaN}$ ,  $+\text{Inf} + i\text{NaN}$  shall be returned.

27166 If  $z$  is  $\text{NaN} + iy$  where  $y$  is finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid floating-point  
 27167 exception may be raised.

27168 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.

27240 **NAME**

27241 ctanh, ctanhf, ctanhl — complex hyperbolic tangent functions

27242 **SYNOPSIS**

```
27243 #include <complex.h>
27244 double complex ctanh(double complex z);
27245 float complex ctanhf(float complex z);
27246 long double complex ctanhl(long double complex z);
```

27247 **DESCRIPTION**

27248 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27249 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27250 volume of POSIX.1-2024 defers to the ISO C standard.

27251 These functions shall compute the complex hyperbolic tangent of  $z$ .27252 **RETURN VALUE**

27253 These functions shall return the complex hyperbolic tangent value.

27254 MXC  $ctanh(conj(z))$ ,  $ctanhf(conjf(z))$ , and  $ctanhl(conjl(z))$  shall return exactly the same value as  
 27255  $conj(ctanh(z))$ ,  $conjf(ctanhf(z))$ , and  $conjl(ctanhl(z))$ , respectively, and  $ctanh(-z)$ ,  $ctanhf(-z)$ , and  
 27256  $ctanhl(-z)$  shall return exactly the same value as  $-ctanh(z)$ ,  $-ctanhf(z)$ , and  $-ctanhl(z)$ ,  
 27257 respectively, including for the special values of  $z$  below.

27258 If  $z$  is  $+0 + i0$ ,  $+0 + i0$  shall be returned.27259 If  $z$  is  $0 + i\text{Inf}$ ,  $0 + i\text{NaN}$  shall be returned and the invalid floating-point exception shall be raised.

27260 If  $z$  is  $x + i\text{Inf}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 27261 floating-point exception shall be raised.

27262 If  $z$  is  $0 + i\text{NaN}$ ,  $0 + i\text{NaN}$  shall be returned.

27263 If  $z$  is  $x + i\text{NaN}$  where  $x$  is non-zero and finite,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 27264 floating-point exception may be raised.

27265 If  $z$  is  $+\text{Inf} + iy$  where  $y$  is positive-signed and finite,  $1 + i0 \sin(2y)$  shall be returned.

27266 If  $z$  is  $+\text{Inf} + i\text{Inf}$ ,  $1 \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 27267 unspecified.

27268 If  $z$  is  $+\text{Inf} + i\text{NaN}$ ,  $1 \pm i0$  shall be returned; the sign of the imaginary part of the result is  
 27269 unspecified.

27270 If  $z$  is  $\text{NaN} + i0$ ,  $\text{NaN} + i0$  shall be returned.

27271 If  $z$  is  $\text{NaN} + iy$  where  $y$  is any non-zero number,  $\text{NaN} + i\text{NaN}$  shall be returned and the invalid  
 27272 floating-point exception may be raised.

27273 If  $z$  is  $\text{NaN} + i\text{NaN}$ ,  $\text{NaN} + i\text{NaN}$  shall be returned.27274 **ERRORS**

27275 No errors are defined.

27277 None.

27278 **APPLICATION USAGE**

27279 None.

27280 **RATIONALE**

27281 None.

27282 **FUTURE DIRECTIONS**

27283 None.

27284 **SEE ALSO**27285 [catanh\(\)](#)27286 XBD [<complex.h>](#)27287 **CHANGE HISTORY**

27288 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

27289 **Issue 8**27290 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
27291 standard.

27292 **NAME**

27293           ctanl — complex tangent functions

27294 **SYNOPSIS**

27295           #include &lt;complex.h&gt;

27296           long double complex ctanl(long double complex z);

27297 **DESCRIPTION**27298           Refer to *ctan()*.

27299 **NAME**

27300 ctermid — generate a pathname for the controlling terminal

27301 **SYNOPSIS**

```
27302 CX #include <stdio.h>
27303 char *ctermid(char *s);
```

27304 **DESCRIPTION**

27305 The *ctermid()* function shall generate a string that, when used as a pathname, refers to the  
 27306 current controlling terminal for the current process. If *ctermid()* returns a pathname, access to the  
 27307 file is not guaranteed.

27308 The *ctermid()* function need not be thread-safe if called with a NULL parameter.

27309 **RETURN VALUE**

27310 If *s* is a null pointer, the string shall be generated in an area that may be static, the address of  
 27311 which shall be returned. The application shall not modify the string returned. The returned  
 27312 pointer might be invalidated or the string content might be overwritten by a subsequent call to  
 27313 *ctermid()*. The returned pointer might also be invalidated if the calling thread is terminated. If *s*  
 27314 is not a null pointer, *s* is assumed to point to a character array of at least `L_ctermid` bytes; the  
 27315 string is placed in this array and the value of *s* shall be returned. The symbolic constant  
 27316 `L_ctermid` is defined in `<stdio.h>`, and shall have a value greater than 0.

27317 The *ctermid()* function shall return an empty string if the pathname that would refer to the  
 27318 controlling terminal cannot be determined, or if the function is unsuccessful.

27319 **ERRORS**

27320 No errors are defined.

27321 **EXAMPLES**27322 **Determining the Controlling Terminal for the Current Process**

27323 The following example returns a pointer to a string that identifies the controlling terminal for the  
 27324 current process. The pathname for the terminal is stored in the array pointed to by the *ptr*  
 27325 argument, which has a size of `L_ctermid` bytes, as indicated by the *term* argument.

```
27326 #include <stdio.h>
27327 ...
27328 char term[L_ctermid];
27329 char *ptr;
27330 ptr = ctermid(term);
```

27331 **APPLICATION USAGE**

27332 The difference between *ctermid()* and *ttyname()* is that *ttyname()* must be handed a file  
 27333 descriptor and return a path of the terminal associated with that file descriptor, while *ctermid()*  
 27334 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a  
 27335 pathname.

27336 **RATIONALE**

27337 `L_ctermid` must be defined appropriately for a given implementation and must be greater than  
 27338 zero so that array declarations using it are accepted by the compiler. The value includes the  
 27339 terminating null byte.

27340 Conforming applications that use multiple threads cannot call *ctermid()* with NULL as the  
 27341 parameter. If *s* is not NULL, the *ctermid()* function generates a string that, when used as a

27342 pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the  
27343 return value of *ctermid()* is undefined.

27344 There is no additional burden on the programmer—changing to use a hypothetical thread-safe  
27345 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a  
27346 buffer. Application code should not assume that the returned string is short, as some  
27347 implementations have more than two pathname components before reaching a logical device  
27348 name.

#### 27349 **FUTURE DIRECTIONS**

27350 None.

#### 27354 **CHANGE HISTORY**

27355 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 27356 **Issue 5**

27357 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 27358 **Issue 6**

27359 The normative text is updated to avoid use of the term “must” for application requirements.

#### 27360 **Issue 7**

27361 Austin Group Interpretation 1003.1-2001 #148 is applied, updating the RATIONALE.

27362 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0065 [75,428] is applied.

27363 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0074 [656] is applied.

27364 **NAME**

27365 ctime — convert a time value to a date and time string

27366 **SYNOPSIS**

```
27367 OB #include <time.h>
27368 char *ctime(const time_t *clock);
```

27369 **DESCRIPTION**

27370 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27371 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27372 volume of POSIX.1-2024 defers to the ISO C standard.

27373 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds  
 27374 since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
27375 asctime(localtime(clock))
```

27376 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 27377 objects: a broken-down time structure and an array of **char**. Execution of any of the functions  
 27378 that return a pointer to one of these object types may overwrite the information in any object of  
 27379 the same type pointed to by the value returned from any previous call to any of them.

27380 The *ctime()* function need not be thread-safe; however, *ctime()* shall avoid data races with all  
 27381 functions other than itself, *asctime()*, *gmtime()*, and *localtime()*.

27382 **RETURN VALUE**

27383 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time  
 27384 as an argument.

27385 **ERRORS**

27386 No errors are defined.

27387 **EXAMPLES**

27388 None.

27389 **APPLICATION USAGE**

27390 This function is included only for compatibility with older implementations. It has undefined  
 27391 behavior if the resulting string would be too long, so the use of this function should be  
 27392 discouraged. On implementations that do not detect output string length overflow, it is possible  
 27393 to overflow the output buffer in such a way as to cause applications to fail, or possible system  
 27394 security violations. Also, this function does not support localized date and time formats. To  
 27395 avoid these problems, applications should use *strftime()* to generate strings from broken-down  
 27396 times.

27397 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

27398 Attempts to use *ctime()* for times before the Epoch or for times beyond the year 9999 produce  
 27399 undefined results. Refer to *asctime()* (on page 617).

27400 **RATIONALE**

27401 The standard developers decided to mark the *ctime()* function obsolescent even though it is in  
 27402 the ISO C standard due to the possibility of buffer overflow. The ISO C standard also provides  
 27403 the *strftime()* function which can be used to avoid these problems.

27404 **FUTURE DIRECTIONS**

27405 This function may be removed in a future version, but not until after it has been removed from  
27406 the ISO C standard.

27407 **SEE ALSO**

27408 *asctime()*, *clock()*, *difftime()*, *futimens()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*,  
27409 *time()*

27410 XBD <[time.h](#)>

27411 **CHANGE HISTORY**

27412 First released in Issue 1. Derived from Issue 1 of the SVID.

27413 **Issue 5**

27414 Normative text previously in the APPLICATION USAGE section is moved to the  
27415 DESCRIPTION.

27416 The *ctime\_r()* function is included for alignment with the POSIX Threads Extension.

27417 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.

27418 **Issue 6**

27419 Extensions beyond the ISO C standard are marked.

27420 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

27421 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
27422 its avoidance of possibly using a static data area.

27423 **Issue 7**

27424 Austin Group Interpretation 1003.1-2001 #156 is applied.

27425 SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

27426 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

27427 The *ctime\_r()* function is moved from the Thread-Safe Functions option to the Base.

27428 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0066 [321,428] is applied.

27429 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0075 [664] is applied.

27430 **Issue 8**

27431 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
27432 standard.

27433 Austin Group Defect 1330 is applied, changing the FUTURE DIRECTIONS section.

27434 Austin Group Defect 1376 is applied, removing CX shading from some text derived from the  
27435 ISO C standard and updating it to match the ISO C standard.

27436 Austin Group Defect 1410 is applied, removing the *ctime\_r()* function.

27437 **NAME**

27438 daylight — daylight saving time flag

27439 **SYNOPSIS**

```
27440 XSI #include <time.h>  
27441 extern int daylight;
```

27442 **DESCRIPTION**27443 Refer to [tzset\(\)](#).

27444 **NAME**

27445 dbm\_clearerr, dbm\_close, dbm\_delete, dbm\_error, dbm\_fetch, dbm\_firstkey, dbm\_nextkey,  
27446 dbm\_open, dbm\_store — database functions

27447 **SYNOPSIS**

```
27448 XSI #include <ndbm.h>
27449
27449 int dbm_clearerr(DBM *db);
27450 void dbm_close(DBM *db);
27451 int dbm_delete(DBM *db, datum key);
27452 int dbm_error(DBM *db);
27453 datum dbm_fetch(DBM *db, datum key);
27454 datum dbm_firstkey(DBM *db);
27455 datum dbm_nextkey(DBM *db);
27456 DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
27457 int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

27458 **DESCRIPTION**

27459 These functions create, access, and modify a database.

27460 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object  
27461 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in  
27462 the object pointed to by *dptr*.

27463 A database shall be stored in one or two files. When one file is used, the name of the database  
27464 file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm\_open()*. When  
27465 two files are used, the names of the database files shall be formed by appending the suffixes **.dir**  
27466 and **.pag** respectively to the *file* argument.

27467 The *dbm\_open()* function shall open a database. The *file* argument to the function is the  
27468 pathname of the database. Values for the *open\_flags* argument are constructed by a bitwise-  
27469 inclusive OR of flags from the following list, defined in **<fcntl.h>**. Applications shall specify  
27470 exactly one of the first three values (file access modes) below in the value of *open\_flags*:

27471 **O\_RDONLY** Open the database, and the underlying file(s) used to store the database,  
27472 for reading only.

27473 **O\_RDWR** Open the database, and the underlying file(s) used to store the database,  
27474 for reading and writing.

27475 **O\_WRONLY** Open the database for writing only. The underlying file(s) used to store  
27476 the database shall be opened for reading and writing.

27477 Any combination of the following can be used:

27478 **O\_CLOEXEC** If set, the **FD\_CLOEXEC** flag for the new file descriptor(s) used to open  
27479 the underlying file(s) shall be set.

27480 **O\_CREAT** If the database exists, this flag has no effect except as noted under  
27481 **O\_EXCL** below. Otherwise, the database shall be created; the user ID of  
27482 the underlying file(s) shall be set to the effective user ID of the process;  
27483 the group ID of the underlying file(s) shall be set to the group ID of the  
27484 file's parent directory or to the effective group ID of the process.  
27485 Implementations shall provide a way to initialize the group ID to the  
27486 group ID of the parent directory. Implementations may, but need not,  
27487 provide an implementation-defined way to initialize the group ID to the  
27488 effective group ID of the calling process.

27489	SIO	O_DSYNC	Write I/O operations on the file(s) used to store the database shall complete as defined by synchronized I/O data integrity completion.
27490			
27491		O_EXCL	If O_CREAT and O_EXCL are set, <i>dbm_open()</i> shall fail if the database exists according to the following criteria. If the database is stored in a file with a <b>.db</b> suffix, a check for the existence of the file and the creation of the file if it does not exist shall be performed as a single atomic operation. If the database is stored in files with <b>.pag</b> and <b>.dir</b> suffixes, this atomic existence check and creation operation shall be performed for each file, but it is unspecified which file is first. If the first file is successfully created and the second file is found to exist, the first file should be removed before <i>dbm_open()</i> returns.
27492			
27493			
27494			
27495			
27496			
27497			
27498			
27499			
27500			If O_EXCL is set and O_CREAT is not set, the result is undefined.
27501	SIO	O_RSYNC	Read I/O operations on the file(s) used to store the database shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in oflag, all I/O operations on the file(s) shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file(s) shall complete as defined by synchronized I/O file integrity completion.
27502			
27503			
27504			
27505			
27506			
27507			
27508		O_SYNC	Write I/O operations on the file(s) used to store the database shall complete as defined by synchronized I/O file integrity completion.
27509			
27510		O_TRUNC	If the database exists and is successfully opened O_RDWR or O_WRONLY, it shall be emptied, and the mode and owner of the underlying file(s) shall be unchanged. The result of using O_TRUNC without either O_RDWR or O_WRONLY is undefined.
27511			
27512			
27513			
27514			The behaviour of other flags described for the <i>flags</i> argument of <i>open()</i> is unspecified.
27515			The <i>file_mode</i> argument has the same meaning as the third argument of <i>open()</i> and shall apply to the underlying file(s) used to store the database.
27516			
27517			The <i>dbm_open()</i> function need not accept pathnames longer than {PATH_MAX}-4 bytes (including the terminating null), or pathnames with a last component longer than {NAME_MAX}-4 bytes (excluding the terminating null).
27518			
27519			
27520			The <i>dbm_close()</i> function shall close a database. The application shall ensure that argument <i>db</i> is a pointer to a <b>dbm</b> structure that has been returned from a call to <i>dbm_open()</i> .
27521			
27522			These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.
27523			
27524			The <i>dbm_fetch()</i> function shall read a record from a database. The argument <i>db</i> is a pointer to a database structure that has been returned from a call to <i>dbm_open()</i> . The argument <i>key</i> is a <b>datum</b> that has been initialized by the application to the value of the key that matches the key of the record the program is fetching.
27525			
27526			
27527			
27528			The <i>dbm_store()</i> function shall write a record to a database. The argument <i>db</i> is a pointer to a database structure that has been returned from a call to <i>dbm_open()</i> . The argument <i>key</i> is a <b>datum</b> that has been initialized by the application to the value of the key that identifies (for subsequent reading, writing, or deleting) the record the application is writing. The argument <i>content</i> is a <b>datum</b> that has been initialized by the application to the value of the record the program is writing. The argument <i>store_mode</i> controls whether <i>dbm_store()</i> replaces any pre-existing record that has the same key that is specified by the <i>key</i> argument. The application shall
27529			
27530			
27531			
27532			
27533			
27534			

27535 set *store\_mode* to either DBM\_INSERT or DBM\_REPLACE. If the database contains a record that  
 27536 matches the *key* argument and *store\_mode* is DBM\_REPLACE, the existing record shall be  
 27537 replaced with the new record. If the database contains a record that matches the *key* argument  
 27538 and *store\_mode* is DBM\_INSERT, the existing record shall be left unchanged and the new record  
 27539 ignored. If the database does not contain a record that matches the *key* argument and *store\_mode*  
 27540 is either DBM\_INSERT or DBM\_REPLACE, the new record shall be inserted in the database.

27541 If the sum of a key/content pair exceeds the internal block size, the result is unspecified.  
 27542 Moreover, the application shall ensure that all key/content pairs that hash together fit on a  
 27543 single block. The *dbm\_store()* function shall return an error in the event that a disk block fills  
 27544 with inseparable data.

27545 The *dbm\_delete()* function shall delete a record and its key from the database. The argument *db* is  
 27546 a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument  
 27547 *key* is a **datum** that has been initialized by the application to the value of the key that identifies  
 27548 the record the program is deleting.

27549 The *dbm\_firstkey()* function shall return the first key in the database. The argument *db* is a  
 27550 pointer to a database structure that has been returned from a call to *dbm\_open()*.

27551 The *dbm\_nextkey()* function shall return the next key in the database. The argument *db* is a  
 27552 pointer to a database structure that has been returned from a call to *dbm\_open()*. The application  
 27553 shall ensure that the *dbm\_firstkey()* function is called before calling *dbm\_nextkey()*. Subsequent  
 27554 calls to *dbm\_nextkey()* return the next key until all of the keys in the database have been  
 27555 returned.

27556 The *dbm\_error()* function shall return the error condition of the database. The argument *db* is a  
 27557 pointer to a database structure that has been returned from a call to *dbm\_open()*.

27558 The *dbm\_clearerr()* function shall clear the error condition of the database. The argument *db* is a  
 27559 pointer to a database structure that has been returned from a call to *dbm\_open()*.

27560 The *dptr* pointers returned by these functions may point into static storage that may be changed  
 27561 by subsequent calls.

27562 These functions need not be thread-safe.

#### 27563 RETURN VALUE

27564 The *dbm\_store()* and *dbm\_delete()* functions shall return 0 when they succeed and a negative  
 27565 value when they fail.

27566 The *dbm\_store()* function shall return 1 if it is called with a *flags* value of DBM\_INSERT and the  
 27567 function finds an existing record with the same key.

27568 The *dbm\_error()* function shall return 0 if the error condition is not set and return a non-zero  
 27569 value if the error condition is set.

27570 The return value of *dbm\_clearerr()* is unspecified.

27571 The *dbm\_firstkey()* and *dbm\_nextkey()* functions shall return a key **datum**. When the end of the  
 27572 database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr*  
 27573 member of the key shall be a null pointer and the error condition of the database shall be set.

27574 The *dbm\_fetch()* function shall return a content **datum**. If no record in the database matches the  
 27575 key or if an error condition has been detected in the database, the *dptr* member of the content  
 27576 shall be a null pointer.

27577 The *dbm\_open()* function shall return a pointer to a database structure. If an error is detected  
 27578 during the operation, *dbm\_open()* shall return a (DBM \*)0.

27579 **ERRORS**

27580 No errors are defined.

27581 **EXAMPLES**

27582 None.

27583 **APPLICATION USAGE**

27584 The following code can be used to traverse the database:

27585 

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

27586 The *dbm\_\** functions provided in this library should not be confused in any way with those of a  
 27587 general-purpose database management system. These functions do not provide for multiple  
 27588 search keys per entry, they do not protect against multi-user access (in other words they do not  
 27589 lock records or files), and they do not provide the many other useful database functions that are  
 27590 found in more robust database management systems. Creating and updating databases by use of  
 27591 these functions is relatively slow because of data copies that occur upon hash collisions. These  
 27592 functions are useful for applications requiring fast lookup of relatively static information that is  
 27593 to be indexed by a single key.

27594 Note that a strictly conforming application is extremely limited by these functions: since there is  
 27595 no way to determine that the keys in use do not all hash to the same value (although that would  
 27596 be rare), a strictly conforming application cannot be guaranteed that it can store more than one  
 27597 block's worth of data in the database. As long as a key collision does not occur, additional data  
 27598 may be stored, but because there is no way to determine whether an error is due to a key  
 27599 collision or some other error condition (*dbm\_error()* being effectively a Boolean), once an error is  
 27600 detected, the application is effectively limited to guessing what the error might be if it wishes to  
 27601 continue using these functions.

27602 The *dbm\_delete()* function need not physically reclaim file space, although it does make it  
 27603 available for reuse by the database.

27604 After calling *dbm\_store()* or *dbm\_delete()* during a pass through the keys by *dbm\_firstkey()* and  
 27605 *dbm\_nextkey()*, the application should reset the database by calling *dbm\_firstkey()* before again  
 27606 calling *dbm\_nextkey()*. The contents of these files are unspecified and may not be portable.

27607 Applications should take care that database pathname arguments specified to *dbm\_open()* are  
 27608 not prefixes of unrelated files. This might be done, for example, by placing databases in a  
 27609 separate directory.

27610 Since some implementations use three characters for a suffix and others use four characters for a  
 27611 suffix, applications should ensure that the maximum portable pathname length passed to  
 27612 *dbm\_open()* is no greater than {PATH\_MAX}-4 bytes, with the last component of the pathname  
 27613 no greater than {NAME\_MAX}-4 bytes.

27614 **RATIONALE**

27615 Previously the standard required the database to be stored in two files, one file being a directory  
 27616 containing a bitmap of keys and having *.dir* as its suffix. The second file containing all data and  
 27617 having *.pag* as its suffix. This has been changed not to specify the use of the files and to allow  
 27618 newer implementations of the Berkeley DB interface using a single file that have evolved while  
 27619 remaining compatible with the application programming interface. The standard developers  
 27620 considered removing the specific suffixes altogether but decided to retain them so as not to  
 27621 pollute the application file name space more than necessary and to allow for portable backups of  
 27622 the database.

27623 **FUTURE DIRECTIONS**

27624 A future revision of this standard may mandate the file removal that is currently recommended  
27625 (by the use of ``should'') in the description of O\_EXCL.

27692 First released in Issue 4. Derived from the ISO C standard.

27693 **NAME**27694 `dirfd` — extract the file descriptor used by a DIR stream27695 **SYNOPSIS**

```
27696 #include <dirent.h>
27697 int dirfd(DIR *dirp);
```

27698 **DESCRIPTION**

27699 If the directory stream referenced by *dirp* has an associated file descriptor, *dirfd()* shall return  
 27700 that file descriptor. Otherwise, *dirfd()* shall open a new file description referring to the directory  
 27701 associated with the directory stream as if by calling:

```
27702 open(DirectoryName, O_RDONLY | O_DIRECTORY | O_CLOEXEC);
```

27703 except that no pathname for use as *DirectoryName* need exist or be accessible. It shall then  
 27704 associate the new file descriptor with the directory stream, and return that file descriptor.

27705 Upon successful return from *dirfd()*, the file descriptor is under the control of the system, and if  
 27706 any attempt is made to close the file descriptor, or to modify the state of the associated  
 27707 XSI description, other than by means of *closedir()*, *readdir()*, *readdir\_r()*, *rewinddir()*, or *seekdir()*, the  
 27708 behavior is undefined. Upon calling *closedir()* the file descriptor shall be closed.

27709 **RETURN VALUE**

27710 Upon successful completion, the *dirfd()* function shall return an integer which contains a file  
 27711 descriptor for the stream pointed to by *dirp*. Otherwise, it shall return `-1` and shall set *errno* to  
 27712 indicate the error.

27713 **ERRORS**

27714 The *dirfd()* function shall fail if:

27715 [EMFILE] A new file descriptor is required and all file descriptors available to the  
 27716 process are currently open.

27717 [ENFILE] A new file descriptor is required and the maximum allowable number of files  
 27718 is currently open in the system.

27719 The *dirfd()* function may fail if:

27720 [EINVAL] The *dirp* argument does not refer to a valid directory stream.

27721 **EXAMPLES**

27722 None.

27723 **APPLICATION USAGE**

27724 The *dirfd()* function is intended to be a mechanism by which an application may obtain a file  
 27725 descriptor to use for the *fchdir()* function.

27726 **RATIONALE**

27727 This interface was introduced because the Base Definitions volume of POSIX.1-2024 does not  
 27728 make public the **DIR** data structure. Applications tend to use the *fchdir()* function on the file  
 27729 descriptor returned by this interface, and this has proven useful for security reasons; in  
 27730 particular, it is a better technique than others where directory names might change.

27731 On an implementation where reading from a directory stream does not use a file descriptor,  
 27732 *opendir()* need not allocate one to be returned by *dirfd()*. The implementation can instead delay  
 27733 the allocation of a suitable file descriptor until the first time *dirfd()* is called for the stream. A file  
 27734 descriptor allocated by *dirfd()* must be closed by *closedir()*.

27735 **FUTURE DIRECTIONS**

27736 None.

27737 **SEE ALSO**27738 *closedir()*, *fchdir()*, *fdopendir()*, *fileno()*, *open()*, *readdir()*27739 XBD <**dirent.h**>27740 **CHANGE HISTORY**

27741 First released in Issue 7.

27742 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0067 [422] is applied.

27743 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0076 [572] is applied.

27744 **Issue 8**27745 Austin Group Defects 391 and 1359 are applied, changing the DESCRIPTION and RATIONALE  
27746 sections, and adding the [EMFILE] and [ENFILE] errors.

27747 **NAME**

27748           dirname — report the parent directory name of a file pathname

27749 **SYNOPSIS**

```
27750 XSI      #include <libgen.h>
27751      char *dirname(char *path);
```

27752 **DESCRIPTION**

27753       The *dirname()* function shall take a pointer to a character string that contains a pathname, and  
 27754       return a pointer to a string that is a pathname of the directory containing the entry of the final  
 27755       pathname component. The *dirname()* function shall not perform pathname resolution; the result  
 27756       shall not be affected by whether or not *path* exists or by its file type. Trailing '/' characters in  
 27757       the pathname that are not also leading '/' characters shall not be counted as part of the  
 27758       pathname.

27759       If the pathname does not contain a '/', then *dirname()* shall return a pointer to the string ".".  
 27760       If *path* is a null pointer or points to an empty string, *dirname()* shall return a pointer to the string  
 27761       ".".

27762       It is unspecified whether redundant '/' characters and '.' pathname components in *path* are  
 27763       removed after determining the pathname to output. However, ".." pathname components  
 27764       occurring prior to the final component shall not be removed.

27765       The *dirname()* function may modify the string pointed to by *path*, and may return a pointer into  
 27766       the input string. The returned pointer might be invalidated if the input string is subsequently  
 27767       modified or freed. If *path* does not contain a '/', is a null pointer, or points to an empty string  
 27768       the returned pointer may point to constant data that cannot be modified.

27769 **RETURN VALUE**27770       The *dirname()* function shall return a pointer to a string as described above.

27771       The *dirname()* function shall always be successful and no return value is reserved to indicate an  
 27772       error.

27773 **ERRORS**

27774       No errors are defined.

27775 **EXAMPLES**

27776       The following code fragment reads a pathname, changes the current working directory to the  
 27777       parent directory, and opens the file.

```
27778      char *path = NULL, *pathcopy;
27779      size_t buflen = 0;
27780      ssize_t linelen = 0;
27781      int fd;

27782      linelen = getline(&path, &buflen, stdin);

27783      path[linelen-1] = 0;
27784      pathcopy = strdup(path);
27785      if (chdir(dirname(pathcopy)) < 0) {
27786          ...
27787      }
27788      if ((fd = open(basename(path), O_RDONLY)) >= 0) {
27789          ...
27790          close (fd);
27791      }
```

```

27792     ...
27793     free (pathcopy);
27794     free (path);

```

27795 The EXAMPLES section of the *basename()* function (see *basename()*) includes a table showing  
 27796 examples of the results of processing several sample pathnames by the *basename()* and *dirname()*  
 27797 functions and by the *basename* and *dirname* utilities.

#### 27798 APPLICATION USAGE

27799 The *dirname()* and *basename()* functions together yield a complete pathname. The expression  
 27800 *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

27801 Since the meaning of the leading `"/"` is implementation-defined, *dirname("//foo")* may return  
 27802 either `"/"` or `"/"` (but nothing else).

27803 Note that in some circumstances, the returned pointer might point into constant data. Therefore,  
 27804 if the application needs to modify the returned data, it should be copied first.

#### 27805 RATIONALE

27806 An implementation should prefer the shortest output possible; however, this is not required, in  
 27807 part because earlier versions of the standard did not mention whether elision of redundant  
 27808 `<slash>` characters or dot (`"."`) components was permitted. Removal of the dot-dot (`".."`)  
 27809 pathname component is not permitted, because eliding it correctly would require performing  
 27810 pathname resolution to ensure the resulting string would still point to the correct pathname if  
 27811 the original string resolved as a pathname. On implementations where pathname `"/"` has an  
 27812 implementation-defined meaning distinct from the pathname `"/"`, the *dirname* of `"/"` will be  
 27813 `"/"`.

27814 Earlier versions of this standard seemed to allow thread-safe and non-thread-safe  
 27815 implementations of *basename()* and *dirname()*, but did not allow implementations to return a  
 27816 null pointer and require that *errno* be set when that happened. The standard now requires  
 27817 thread-safe behavior for both of these functions and clearly states that they are always  
 27818 successful.

#### 27819 FUTURE DIRECTIONS

27820 None.

#### 27821 SEE ALSO

27822 *basename()*

27824 XCU *basename*, *dirname*

#### 27825 CHANGE HISTORY

27826 First released in Issue 4, Version 2.

#### 27827 Issue 5

27828 Moved from X/OPEN UNIX extension to BASE.

27829 Normative text previously in the APPLICATION USAGE section is moved to the  
 27830 DESCRIPTION.

27831 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

#### 27832 Issue 7

27833 Austin Group Interpretation 1003.1-2001 #156 is applied.

27834 The EXAMPLES section is revised.

- 27835 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0068 [75] is applied.
- 27836 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0077 [830], XSH/TC2-2008/0078 [612],  
27837 XSH/TC2-2008/0079 [830], XSH/TC2-2008/0080 [656], and XSH/TC2-2008/0081 [612] are  
27838 applied.
- 27839 **Issue 8**
- 27840 Austin Group Defect 1064 is applied, requiring *dirname()* to be thread-safe and allowing it to  
27841 return a pointer to constant data under certain conditions.
- 27842 Austin Group Defect 1073 is applied, changing “parent directory of that file” to “directory  
27843 containing the entry of the final pathname component” and clarifying that redundant '/'  
27844 characters and '.' pathname components may be removed after determining the pathname to  
27845 output.

27846 **NAME**

27847 div — compute the quotient and remainder of an integer division

27848 **SYNOPSIS**

27849 #include &lt;stdlib.h&gt;

27850 div\_t div(int *numer*, int *denom*);27851 **DESCRIPTION**

27852 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
27853 conflict between the requirements described here and the ISO C standard is unintentional. This  
27854 volume of POSIX.1-2024 defers to the ISO C standard.

27855 The *div()* function shall compute the quotient and remainder of the division of the numerator  
27856 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer  
27857 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be  
27858 represented, the behavior is undefined; otherwise, *quot\*denom+rem* shall equal *numer*.

27859 **RETURN VALUE**

27860 The *div()* function shall return a structure of type **div\_t**, comprising both the quotient and the  
27861 remainder. The structure includes the following members, in any order:

```
27862 int quot; /* quotient */  
27863 int rem; /* remainder */
```

27864 **ERRORS**

27865 No errors are defined.

27866 **EXAMPLES**

27867 None.

27868 **APPLICATION USAGE**

27869 None.

27870 **RATIONALE**

27871 None.

27872 **FUTURE DIRECTIONS**

27873 None.

27874 **SEE ALSO**27875 [ldiv\(\)](#)27876 XBD [<stdlib.h>](#)27877 **CHANGE HISTORY**

27878 First released in Issue 4. Derived from the ISO C standard.

27879 **NAME**

27880 dladdr — get information relating to an address

27881 **SYNOPSIS**

27882 #include &lt;dlfcn.h&gt;

27883 int dladdr(const void \*restrict addr, Dl\_info\_t \*restrict dlip);

27884 **DESCRIPTION**

27885 The *dladdr()* function shall determine whether the address specified by *addr* is located within the  
 27886 address range occupied by a mapped object. The mapped objects examined shall include any  
 27887 executable object files that have previously been loaded by a call to *dlopen()* and for which  
 27888 *dlclose()* has not subsequently been called, and any shared library files that were loaded as  
 27889 dependencies of the executable file from which the current process image was loaded; they may  
 27890 also include any executable object files that have previously been loaded by a call to *dlopen()*  
 27891 and for which *dlclose()* has subsequently been called, the executable file from which the current  
 27892 process image was loaded, and implementation-defined additional mapped objects (for  
 27893 example, all regular files mapped using *mmap()* might be included). If the specified address is  
 27894 within the mapped address range of one of these mapped objects and the object contains a  
 27895 symbol table, the symbol table shall be searched for a symbol (a function identifier or a data  
 27896 object identifier) that has the largest address less than or equal to the specified address.

27897 If the address specified by *addr* is within the mapped address range of one of the examined  
 27898 mapped objects, the structure pointed to by *dliip* shall be populated as follows:

- 27899 • The value of the *dli\_fname* member shall be set to point to the pathname of the mapped  
 27900 object. (This might no longer resolve to the file that was mapped, for example if it was a  
 27901 link that has subsequently been removed or renamed.)
- 27902 • The value of the *dli\_fbase* member shall be set to the base of the address range occupied by  
 27903 the mapped object.
- 27904 • The value of the *dli\_sname* member shall be set to point to the name of the symbol that has  
 27905 the largest address less than or equal to the specified address, or to a null pointer if no such  
 27906 symbol was found.
- 27907 • If *dli\_sname* is set to a null pointer, the value of the *dli\_saddr* member shall also be set to a  
 27908 null pointer. Otherwise, if *dli\_sname* names a function identifier, *dli\_saddr* shall be set to the  
 27909 address of the function converted from type pointer to function to type pointer to **void**;  
 27910 otherwise, *dli\_saddr* shall be set to the address of the data object named by *dli\_sname*  
 27911 converted from a pointer to the type of the data object to a pointer to **void**.

27912 **RETURN VALUE**

27913 Upon successful completion, a non-zero value shall be returned. If the specified address is not  
 27914 located within the address range occupied by an examined mapped object, or if an error occurs,  
 27915 zero shall be returned. More detailed diagnostic information shall be available through *dlderror()*.

27916 **ERRORS**

27917 No errors are defined.

27918 **EXAMPLES**

27919 None.

27920 **APPLICATION USAGE**

27921 The **DI\_info\_t** members may point to addresses within the mapped object. These pointers can  
27922 become invalid if the object is unmapped (for example, loaded executable objects may be  
27923 unloaded by *dlclose()*).

27924 If *dli\_sname* names a function identifier, the value of *dli\_saddr* can be converted back to type  
27925 pointer to function using a cast in the manner shown in the *dlsym()* **EXAMPLES** section. Note  
27926 that this conversion is not defined by the ISO C standard. This standard requires this conversion  
27927 to work correctly on conforming implementations.

27928 **RATIONALE**

27929 None.

27930 **FUTURE DIRECTIONS**

27931 None.

27932 **SEE ALSO**27933 *dlclose()*, *dLError()*, *dlopen()*, *dlsym()*27934 XBD <**dlfcn.h**>27935 **CHANGE HISTORY**

27936 First released in Issue 8.

27937 **NAME**27938 `dlclose` — close a symbol table handle27939 **SYNOPSIS**

```
27940 #include <dlfcn.h>
27941 int dlclosel(void *handle);
```

27942 **DESCRIPTION**

27943 The `dlclose()` function shall inform the system that the symbol table handle specified by *handle* is  
27944 no longer needed by the application.

27945 An application writer may use `dlclose()` to make a statement of intent on the part of the process,  
27946 but this statement does not create any requirement upon the implementation. When the symbol  
27947 table handle is closed, the implementation may unload the executable object files that were  
27948 loaded by `dlopen()` when the symbol table handle was opened and those that were loaded by  
27949 `dlsym()` when using the symbol table handle identified by *handle*.

27950 Once a symbol table handle has been closed, an application should assume that any symbols  
27951 (function identifiers and data object identifiers) made visible using *handle*, are no longer  
27952 available to the process.

27953 Although a `dlclose()` operation is not required to remove any functions or data objects from the  
27954 address space, neither is an implementation prohibited from doing so. The only restriction on  
27955 such a removal is that no function nor data object shall be removed to which references have  
27956 been relocated, until or unless all such references are removed. For instance, an executable object  
27957 file that had been loaded with a `dlopen()` operation specifying the `RTLD_GLOBAL` flag might  
27958 provide a target for dynamic relocations performed in the processing of other relocatable  
27959 objects—in such environments, an application may assume that no relocation, once made, shall  
27960 be undone or remade unless the executable object file containing the relocated object has itself  
27961 been removed.

27962 **RETURN VALUE**

27963 If the referenced symbol table handle was successfully closed, `dlclose()` shall return 0. If *handle*  
27964 does not refer to an open symbol table handle or if the symbol table handle could not be closed,  
27965 `dlclose()` shall return a non-zero value. More detailed diagnostic information shall be available  
27966 through `dlerror()`.

27967 **ERRORS**

27968 No errors are defined.

27969 **EXAMPLES**27970 The following example illustrates use of `dlopen()` and `dlclose()`:

```
27971 #include <dlfcn.h>
27972 int eret;
27973 void *mylib;
27974 ...
27975 /* Open a dynamic library and then close it ... */
27976 mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
27977 ...
27978 eret = dlclosel(mylib);
27979 ...
```

27980 **APPLICATION USAGE**

27981 A conforming application should employ a symbol table handle returned from a *dlopen()*  
27982 invocation only within a given scope bracketed by a *dlopen()* operation and the corresponding  
27983 *dlclose()* operation. Implementations are free to use reference counting or other techniques such  
27984 that multiple calls to *dlopen()* referencing the same executable object file may return a pointer to  
27985 the same data object as the symbol table handle.

27986 Implementations are also free to re-use a handle. For these reasons, the value of a handle must  
27987 be treated as an opaque data type by the application, used only in calls to *dlsym()* and *dlclose()*.

27988 **RATIONALE**

27989 None.

27990 **FUTURE DIRECTIONS**

27991 None.

27992 **SEE ALSO**

27995 **CHANGE HISTORY**

27996 First released in Issue 5.

27997 **Issue 6**

27998 The DESCRIPTION is updated to say that the referenced object is closed “if this is the last  
27999 reference to it”.

28000 **Issue 7**

28001 The *dlopen()* function is moved from the XSI option to Base.

28002 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0069 [74] is applied.

28003 **Issue 8**

28004 Austin Group Defect 993 is applied, adding *dladdr()* to the SEE ALSO section.

28005 **NAME**

28006 dlerror — get diagnostic information

28007 **SYNOPSIS**

```
28008 #include <dlfcn.h>
28009 char *dlerror(void);
```

28010 **DESCRIPTION**

28011 The *dlerror()* function shall return a null-terminated character string (with no trailing  
 28012 <newline>) that describes the last error that occurred during dynamic linking processing. If no  
 28013 dynamic linking errors have occurred since the last invocation of *dlerror()*, *dlerror()* shall return  
 28014 NULL. Thus, invoking *dlerror()* a second time, immediately following a prior invocation, shall  
 28015 result in NULL being returned.

28016 It is implementation-defined whether or not the *dlerror()* function is thread-safe. A thread-safe  
 28017 implementation shall return only errors that occur on the current thread.

28018 **RETURN VALUE**

28019 If successful, *dlerror()* shall return a null-terminated character string; otherwise, NULL shall be  
 28020 returned.

28021 The application shall not modify the string returned. The returned pointer might be invalidated  
 28022 or the string content might be overwritten by a subsequent call to *dlerror()* in the same thread (if  
 28023 *dlerror()* is thread-safe) or in any thread (if *dlerror()* is not thread-safe). The returned pointer  
 28024 might also be invalidated if the calling thread is terminated.

28025 **ERRORS**

28026 No errors are defined.

28027 **EXAMPLES**

28028 The following example prints out the last dynamic linking error:

```
28029 ...
28030 #include <dlfcn.h>
28031 char *errstr;
28032 errstr = dlerror();
28033 if (errstr != NULL)
28034     printf ("A dynamic linking error occurred: (%s)\n", errstr);
28035 ...
```

28036 **APPLICATION USAGE**

28037 Depending on the application environment with respect to asynchronous execution events, such  
 28038 as signals or other asynchronous computation sharing the address space, conforming  
 28039 applications should use a critical section to retrieve the error pointer and buffer.

28040 **RATIONALE**

28041 None.

28042 **FUTURE DIRECTIONS**

28043 None.

28047 **CHANGE HISTORY**

28048 First released in Issue 5.

28049 **Issue 6**

28050 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

28051 **Issue 7**

28052 Austin Group Interpretation 1003.1-2001 #156 is applied.

28053 The *dlerror()* function is moved from the XSI option to the Base.28054 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0070 [75], XSH/TC1-2008/0071 [97],  
28055 and XSH/TC1-2008/0072 [133] are applied.

28056 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0082 [656] is applied.

28057 **Issue 8**28058 Austin Group Defect 993 is applied, adding *dladdr()* to the SEE ALSO section.

28059 **NAME**

28060 dlopen — open a symbol table handle

28061 **SYNOPSIS**

28062 #include &lt;dlfcn.h&gt;

28063 void \*dlopen(const char \*file, int mode);

28064 **DESCRIPTION**28065 The *dlopen()* function shall make the symbols (function identifiers and data object identifiers) in  
28066 the executable object file specified by *file* available to the calling program.28067 The class of executable object files eligible for this operation and the manner of their  
28068 construction are implementation-defined, though typically such files are shared libraries or  
28069 programs.28070 Implementations may permit the construction of embedded dependencies in executable object  
28071 files. In such cases, a *dlopen()* operation shall load those dependencies in addition to the  
28072 executable object file specified by *file*. Implementations may also impose specific constraints on  
28073 the construction of programs that can employ *dlopen()* and its related services.28074 A successful *dlopen()* shall return a symbol table handle which the caller may use on subsequent  
28075 calls to *dlsym()* and *dlclose()*.

28076 The value of this symbol table handle should not be interpreted in any way by the caller.

28077 The *file* argument is used to construct a pathname to the executable object file. If *file* contains a  
28078 <slash> character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in  
28079 an implementation-defined manner to yield a pathname.28080 If *file* is a null pointer, *dlopen()* shall return a global symbol table handle for the currently  
28081 running process image. This symbol table handle shall provide access to the symbols from an  
28082 ordered set of executable object files consisting of the original program image file, any  
28083 executable object files loaded at program start-up as specified by that process file (for example,  
28084 shared libraries), and the set of executable object files loaded using *dlopen()* operations with the  
28085 RTLD\_GLOBAL flag. As the latter set of executable object files can change during execution, the  
28086 set of symbols made available by this symbol table handle can also change dynamically.28087 Only a single copy of an executable object file shall be brought into the address space, even if  
28088 *dlopen()* is invoked multiple times in reference to the executable object file, and even if different  
28089 pathnames are used to reference the executable object file.28090 The *mode* parameter describes how *dlopen()* shall operate upon *file* with respect to the processing  
28091 of relocations and the scope of visibility of the symbols provided within *file*. When an  
28092 executable object file is brought into the address space of a process, it may contain references to  
28093 symbols whose addresses are not known until the executable object file is loaded.28094 These references shall be relocated before the symbols can be accessed. The *mode* parameter  
28095 governs when these relocations take place and may have the following values:28096 **RTLD\_LAZY** Relocations shall be performed at an implementation-defined time, ranging  
28097 from the time of the *dlopen()* call until the first reference to a given symbol  
28098 occurs. Specifying **RTLD\_LAZY** should improve performance on  
28099 implementations supporting dynamic symbol binding since a process might  
28100 not reference all of the symbols in an executable object file. And, for systems  
28101 supporting dynamic symbol resolution for normal process execution, this  
28102 behavior mimics the normal handling of process execution.

28103 RTLD\_NOW All necessary relocations shall be performed when the executable object file is  
 28104 first loaded. This may waste some processing if relocations are performed for  
 28105 symbols that are never referenced. This behavior may be useful for  
 28106 applications that need to know that all symbols referenced during execution  
 28107 will be available before *dlopen()* returns.

28108 Any executable object file loaded by *dlopen()* that requires relocations against global symbols  
 28109 can reference the symbols in the original process image file, any executable object files loaded at  
 28110 program start-up, from the initial process image itself, from any other executable object file  
 28111 included in the same *dlopen()* invocation, and any executable object files that were loaded in any  
 28112 *dlopen()* invocation and which specified the RTLD\_GLOBAL flag. To determine the scope of  
 28113 visibility for the symbols loaded with a *dlopen()* invocation, the *mode* parameter should be a  
 28114 bitwise-inclusive OR with one of the following values:

28115 RTLD\_GLOBAL The executable object file's symbols shall be made available for relocation  
 28116 processing of any other executable object file. In addition, symbol lookup  
 28117 using *dlopen(NULL,mode)* and an associated *dlsym()* allows executable object  
 28118 files loaded with this mode to be searched.

28119 RTLD\_LOCAL The executable object file's symbols shall not be made available for relocation  
 28120 processing of any other executable object file.

28121 If neither RTLD\_GLOBAL nor RTLD\_LOCAL is specified, the default behavior is unspecified.

28122 If an executable object file is specified in multiple *dlopen()* invocations, *mode* is interpreted at  
 28123 each invocation.

28124 If RTLD\_NOW has been specified, all relocations shall have been completed rendering further  
 28125 RTLD\_NOW operations redundant and any further RTLD\_LAZY operations irrelevant.

28126 If RTLD\_GLOBAL has been specified, the executable object file shall maintain the  
 28127 RTLD\_GLOBAL status regardless of any previous or future specification of RTLD\_LOCAL, as  
 28128 long as the executable object file remains in the address space (see *dlclose()*). If there was a  
 28129 previous specification of RTLD\_LOCAL, it is unspecified whether relocations after the new  
 28130 specification of RTLD\_GLOBAL are made as if the previous specification had been  
 28131 RTLD\_GLOBAL or as if the executable object file had not previously been loaded.

28132 Symbols introduced into the process image through calls to *dlopen()* may be used in relocation  
 28133 activities. Symbols so introduced may duplicate symbols already defined by the program or  
 28134 previous *dlopen()* operations. To resolve the ambiguities such a situation might present, the  
 28135 resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two  
 28136 such resolution orders are defined: load order and dependency order. Load order establishes an  
 28137 ordering among symbol definitions, such that the first definition loaded (including definitions  
 28138 from the process image file and any dependent executable object files loaded with it) has priority  
 28139 over executable object files added later (by *dlopen()*). Load ordering is used in relocation  
 28140 processing. Dependency ordering uses a breadth-first order starting with a given executable  
 28141 object file, then all of its dependencies, then any dependents of those, iterating until all  
 28142 dependencies are satisfied. With the exception of the global symbol table handle obtained via a  
 28143 *dlopen()* operation with a null pointer as the *file* argument, dependency ordering is used by the  
 28144 *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol table  
 28145 handle.

28146 When an executable object file is first made accessible via *dlopen()*, it and its dependent  
 28147 executable object files are added in dependency order. Once all the executable object files are  
 28148 added, relocations are performed using load order. Note that if an executable object file or its  
 28149 dependencies had been previously loaded, the load and dependency orders may yield different

28150 resolutions.

28151 The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum  
28152 those which are exported as identifiers of global scope by the executable object file. Typically,  
28153 such identifiers shall be those that were specified in (for example) C source code as having  
28154 **extern** linkage. The precise manner in which an implementation constructs the set of exported  
28155 symbols for an executable object file is implementation-defined.

28156 **RETURN VALUE**  
28157 Upon successful completion, *dlopen()* shall return a symbol table handle. If *file* cannot be found,  
28158 cannot be opened for reading, is not of an appropriate executable object file format for  
28159 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its  
28160 symbolic references, *dlopen()* shall return a null pointer. More detailed diagnostic information  
28161 shall be available through *dLError()*.

28162 **ERRORS**  
28163 No errors are defined.

28164 **EXAMPLES**  
28165 Refer to *dlsym()*.

28166 **APPLICATION USAGE**  
28167 None.

28168 **RATIONALE**  
28169 None.

28175 **CHANGE HISTORY**  
28176 First released in Issue 5.

28177 **Issue 6**  
28178 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/21 is applied, changing the default  
28179 behavior in the DESCRIPTION when neither RTLD\_GLOBAL nor RTLD\_LOCAL are specified  
28180 from implementation-defined to unspecified.

28181 **Issue 7**  
28182 The *dlopen()* function is moved from the XSI option to the Base.  
28183 The EXAMPLES section is updated to refer to *dlsym()*.  
28184 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0073 [74] is applied.

28185 **Issue 8**  
28186 Austin Group Defect 982 is applied, clarifying the requirements when changing from  
28187 RTLD\_LOCAL to RTLD\_GLOBAL.  
28188 Austin Group Defect 993 is applied, adding *dladdr()* to the SEE ALSO section.

28189 **NAME**28190 `dlsym` — get the address of a symbol from a symbol table handle28191 **SYNOPSIS**28192 `#include <dlfcn.h>`28193 `void *dlsym(void *restrict handle, const char *restrict name);`28194 **DESCRIPTION**

28195 The `dlsym()` function shall obtain the address of a symbol (a function identifier or a data object  
 28196 identifier) defined in the symbol table identified by the `handle` argument. The `handle` argument is  
 28197 a symbol table handle returned from a call to `dlopen()` (and which has not since been released by  
 28198 a call to `dlclose()`), and `name` is the symbol's name as a character string. The return value from  
 28199 `dlsym()`, converted from type pointer to **void** to a pointer to the type of the named symbol, can  
 28200 be used to call (in the case of a function) or access the contents of (in the case of a data object) the  
 28201 named symbol.

28202 The `dlsym()` function shall search for the named symbol in the symbol table referenced by `handle`.  
 28203 If the symbol table was created with lazy loading (see `RTLD_LAZY` in `dlopen()`), load ordering  
 28204 shall be used in `dlsym()` operations to relocate executable object files needed to resolve the  
 28205 symbol. The symbol resolution algorithm used shall be dependency order as described in  
 28206 `dlopen()`.

28207 The `RTLD_DEFAULT` and `RTLD_NEXT` symbolic constants (which may be defined in  
 28208 `<dlfcn.h>`) are reserved for future use as special values that applications may be allowed to use  
 28209 for `handle`.

28210 **RETURN VALUE**

28211 Upon successful completion, if `name` names a function identifier, `dlsym()` shall return the address  
 28212 of the function converted from type pointer to function to type pointer to **void**; otherwise,  
 28213 `dlsym()` shall return the address of the data object associated with the data object identifier  
 28214 named by `name` converted from a pointer to the type of the data object to a pointer to **void**. If  
 28215 `handle` does not refer to a valid symbol table handle or if the symbol named by `name` cannot be  
 28216 found in the symbol table associated with `handle`, `dlsym()` shall return a null pointer.

28217 More detailed diagnostic information shall be available through `dLError()`.

28218 **ERRORS**

28219 No errors are defined.

28220 **EXAMPLES**

28221 The following example shows how `dlopen()` and `dlsym()` can be used to access either a function  
 28222 or a data object. For simplicity, error checking has been omitted.

```
28223 void *handle;
28224 int (*fptr)(int), *iptr, result;
28225 /* open the needed symbol table */
28226 handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);
28227 /* find the address of the function my_function */
28228 fptr = (int (*)(int))dlsym(handle, "my_function");
28229 /* find the address of the data object my_object */
28230 iptr = (int *)dlsym(handle, "my_OBJ");
28231 /* invoke my_function, passing the value of my_OBJ as the parameter */
28232 result = (*fptr)(*iptr);
```

28233 **APPLICATION USAGE**

28234 The following special purpose values for *handle* are reserved for future use and have the  
28235 indicated meanings:

28236 **RTLD\_DEFAULT** The identifier lookup happens in the normal global scope; that is, a search for  
28237 an identifier using *handle* would find the same definition as a direct use of this  
28238 identifier in the program code.

28239 **RTLD\_NEXT** Specifies the next executable object file after this one that defines *name*. This  
28240 one refers to the executable object file containing the invocation of *dlsym()*.  
28241 The next executable object file is the one found upon the application of a load  
28242 order symbol resolution algorithm (see *dlopen()*). The next symbol is either  
28243 one of global scope (because it was introduced as part of the original process  
28244 image or because it was added with a *dlopen()* operation including the  
28245 **RTLD\_GLOBAL** flag), or is in an executable object file that was included in the  
28246 same *dlopen()* operation that loaded this one.

28247 The **RTLD\_NEXT** flag is useful to navigate an intentionally created hierarchy of multiply-  
28248 defined symbols created through interposition. For example, if a program wished to create an  
28249 implementation of *malloc()* that embedded some statistics gathering about memory allocations,  
28250 such an implementation could use the real *malloc()* definition to perform the memory allocation  
28251 — and itself only embed the necessary logic to implement the statistics gathering function.

28252 Note that conversion from a **void \*** pointer to a function pointer as in:

```
28253 fptr = (int (*)(int))dlsym(handle, "my_function");
```

28254 is not defined by the ISO C standard. This standard requires this conversion to work correctly on  
28255 conforming implementations.

28256 **RATIONALE**

28257 None.

28258 **FUTURE DIRECTIONS**

28259 None.

28260 **SEE ALSO**

28263 **CHANGE HISTORY**

28264 First released in Issue 5.

28265 **Issue 6**

28266 The **restrict** keyword is added to the *dlsym()* prototype for alignment with the  
28267 ISO/IEC 9899:1999 standard.

28268 The **RTLD\_DEFAULT** and **RTLD\_NEXT** flags are reserved for future use.

28269 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/14 is applied, correcting an example, and  
28270 adding text to the **RATIONALE** describing issues related to conversion of pointers to functions  
28271 and back again.

28272 **Issue 7**

28273 The *dlsym()* function is moved from the XSI option to the Base.

28274 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0074 [74] is applied.

28275 **Issue 8**

28276 Austin Group Defect 993 is applied, adding *dladdr()* to the SEE ALSO section.

28277 Austin Group Defect 1644 is applied, clarifying that the return value from *dlsym()* can be  
28278 converted from type pointer to **void** to a pointer to the type of the named symbol using any  
28279 valid conversion method, not just casting.

28280 **NAME**

28281 dngettext, dngettext\_l — message handling functions

28282 **SYNOPSIS**

28283 #include &lt;libintl.h&gt;

```
28284 char *dngettext(const char *domainname, const char *msgid,  
28285                const char *msgid_plural, unsigned long int n);  
28286 char *dngettext_l(const char *domainname, const char *msgid,  
28287                  const char *msgid_plural, unsigned long int n,  
28288                  locale_t locale);
```

28289 **DESCRIPTION**28290 Refer to *gettext*.

28291 **NAME**

28292           dprintf — print formatted output

28293 **SYNOPSIS**

```
28294 CX       #include <stdio.h>  
28295       int dprintf(int filides, const char *restrict format, ...);
```

28296 **DESCRIPTION**

28297       Refer to *fprintf()*.

28298 **NAME**

28299 drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate  
 28300 uniformly distributed pseudo-random numbers

28301 **SYNOPSIS**

```
28302 XSI #include <stdlib.h>
28303 double drand48(void);
28304 double erand48(unsigned short xsubi[3]);
28305 long jrand48(unsigned short xsubi[3]);
28306 void lcong48(unsigned short param[7]);
28307 long lrand48(void);
28308 long mrand48(void);
28309 long nrand48(unsigned short xsubi[3]);
28310 unsigned short *seed48(unsigned short seed16v[3]);
28311 void srand48(long seedval);
```

28312 **DESCRIPTION**

28313 This family of functions shall generate pseudo-random numbers using a linear congruential  
 28314 algorithm and 48-bit integer arithmetic.

28315 The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-  
 28316 point values, uniformly distributed over the interval [0.0,1.0).

28317 The *lrnd48()* and *nrnd48()* functions shall return non-negative, long integers, uniformly  
 28318 distributed over the interval  $[0, 2^{31})$ .

28319 The *mrnd48()* and *jrnd48()* functions shall return signed long integers uniformly distributed  
 28320 over the interval  $[-2^{31}, 2^{31})$ .

28321 The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which  
 28322 should be invoked before either *drand48()*, *lrnd48()*, or *mrnd48()* is called. (Although it is not  
 28323 recommended practice, constant default initializer values shall be supplied automatically if  
 28324 *drand48()*, *lrnd48()*, or *mrnd48()* is called without a prior call to an initialization entry point.)  
 28325 The *erand48()*, *nrnd48()*, and *jrnd48()* functions do not require an initialization entry point to  
 28326 be called first.

28327 All the routines work by generating a sequence of 48-bit integer values,  $X_i$ , according to the  
 28328 linear congruential formula:

$$28329 X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

28330 The parameter  $m = 2^{48}$ ; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked,  
 28331 the multiplier value  $a$  and the addend value  $c$  are given by:

$$28332 a = 5\text{DEECE66D}_{16} = 273673163155_8$$

$$28333 c = \text{B}_{16} = 13_8$$

28334 The value returned by any of the *drand48()*, *erand48()*, *jrnd48()*, *lrnd48()*, *mrnd48()*, or  
 28335 *nrnd48()* functions is computed by first generating the next 48-bit  $X_i$  in the sequence.  $X_i$  is then  
 28336 converted to the return value as follows:

- 28337 • For *drand48()* and *erand48()* the value shall be  $2^{-48}$  times  $X_i$ .
- 28338 • For *jrnd48()* and *mrnd48()* the value shall be the largest integer not greater than  $2^{-16}$   
 28339 times  $X_i$ .

28340           • For *lrand48()* and *nrand48()* the value shall be the largest integer not greater than  $2^{-17}$   
28341           times  $X_i$ .

28342           The *drand48()*, *lrand48()*, and *mrnd48()* functions store the last 48-bit  $X_i$  generated in an  
28343           internal buffer; that is why the application shall ensure that these are initialized prior to being  
28344           invoked. The *erand48()*, *nrand48()*, and *jrnd48()* functions require the calling program to  
28345           provide storage for the successive  $X_i$  values in the array specified as an argument when the  
28346           functions are invoked. That is why these routines do not have to be initialized; the calling  
28347           program merely has to place the desired initial value of  $X_i$  into the array and pass it as an  
28348           argument. By using different arguments, *erand48()*, *nrand48()*, and *jrnd48()* allow separate  
28349           modules of a large program to generate several *independent* streams of pseudo-random numbers;  
28350           that is, the sequence of numbers in each stream shall *not* depend upon how many times the  
28351           routines are called to generate numbers for the other streams.

28352           The initializer function *srand48()* sets the high-order 32 bits of  $X_i$  to the low-order 32 bits  
28353           contained in its argument. The low-order 16 bits of  $X_i$  are set to the arbitrary value  $330E_{16}$ .

28354           The initializer function *seed48()* sets the value of  $X_i$  to the 48-bit value specified in the argument  
28355           array. The low-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16  
28356           bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of  $X_i$  are set to the  
28357           low-order 16 bits of *seed16v*[2]. In addition, the previous value of  $X_i$  is copied into a 48-bit  
28358           internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by  
28359           *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is  
28360           to be restarted from a given point at some future time—use the pointer to get at and store the  
28361           last  $X_i$  value, and then use this value to reinitialize via *seed48()* when the program is restarted.

28362           The initializer function *lcong48()* allows the user to specify the initial  $X_i$ , the multiplier value  $a$ ,  
28363           and the addend value  $c$ . Argument array elements *param*[0-2] specify  $X_i$ , *param*[3-5] specify the  
28364           multiplier  $a$ , and *param*[6] specifies the 16-bit addend  $c$ . After *lcong48()* is called, a subsequent  
28365           call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values,  $a$  and  
28366            $c$ , specified above.

28367           The *drand48()*, *lrand48()*, and *mrnd48()* functions need not be thread-safe.

#### 28368 RETURN VALUE

28369           As described in the DESCRIPTION above.

#### 28370 ERRORS

28371           No errors are defined.

#### 28372 EXAMPLES

28373           The following program tests that the required pseudo-random number generator is used by  
28374           these functions.

```
28375           #include <assert.h>
28376           #include <stdlib.h>
28377           int main() {
28378                {
28379                   unsigned short xsubi[3] = {37174, 64810, 11603};
28380                   double d = erand48(xsubi);
28381                   assert(d >= 0.896);
28382                   assert(d <= 0.897);
28383                   assert(xsubi[0] == 22537);
28384                   assert(xsubi[1] == 47966);
28385                   assert(xsubi[2] == 58735);
28386                   d = erand48(xsubi);
```

```
28387     assert(d >= 0.337);
28388     assert(d <= 0.338);
28389     assert(xsubi[0] == 37344);
28390     assert(xsubi[1] == 32911);
28391     assert(xsubi[2] == 22119);
28392     d = erand48(xsubi);
28393     assert(d >= 0.647);
28394     assert(d <= 0.648);
28395     assert(xsubi[0] == 23659);
28396     assert(xsubi[1] == 29872);
28397     assert(xsubi[2] == 42445);
28398     d = erand48(xsubi);
28399     assert(d >= 0.500);
28400     assert(d <= 0.501);
28401     assert(xsubi[0] == 31642);
28402     assert(xsubi[1] == 7875);
28403     assert(xsubi[2] == 32802);
28404     d = erand48(xsubi);
28405     assert(d >= 0.506);
28406     assert(d <= 0.507);
28407     assert(xsubi[0] == 64669);
28408     assert(xsubi[1] == 14399);
28409     assert(xsubi[2] == 33170);
28410 }

28411 {
28412     unsigned short xsubi[3] = {25175, 11052, 45015};
28413     assert(jrand48(xsubi) == 1699503220);
28414     assert(xsubi[0] == 2326);
28415     assert(xsubi[1] == 23668);
28416     assert(xsubi[2] == 25932);
28417     assert(jrand48(xsubi) == -992276007);
28418     assert(xsubi[0] == 41577);
28419     assert(xsubi[1] == 4569);
28420     assert(xsubi[2] == 50395);
28421     assert(jrand48(xsubi) == -19535776);
28422     assert(xsubi[0] == 31936);
28423     assert(xsubi[1] == 59488);
28424     assert(xsubi[2] == 65237);
28425     assert(jrand48(xsubi) == 79438377);
28426     assert(xsubi[0] == 40395);
28427     assert(xsubi[1] == 8745);
28428     assert(xsubi[2] == 1212);
28429     assert(jrand48(xsubi) == -1258917728);
28430     assert(xsubi[0] == 37242);
28431     assert(xsubi[1] == 28832);
28432     assert(xsubi[2] == 46326);
28433 }

28434 {
28435     unsigned short xsubi[3] = {546, 33817, 23389};
28436     assert(nrand48(xsubi) == 914920692);
28437     assert(xsubi[0] == 29829);
```

```

28438         assert(xsubi[1] == 10728);
28439         assert(xsubi[2] == 27921);
28440         assert(nrand48(xsubi) == 754104482);
28441         assert(xsubi[0] == 6828);
28442         assert(xsubi[1] == 28997);
28443         assert(xsubi[2] == 23013);
28444         assert(nrand48(xsubi) == 609453945);
28445         assert(xsubi[0] == 58183);
28446         assert(xsubi[1] == 3826);
28447         assert(xsubi[2] == 18599);
28448         assert(nrand48(xsubi) == 1878644360);
28449         assert(xsubi[0] == 36678);
28450         assert(xsubi[1] == 44304);
28451         assert(xsubi[2] == 57331);
28452         assert(nrand48(xsubi) == 2114923686);
28453         assert(xsubi[0] == 58585);
28454         assert(xsubi[1] == 22861);
28455         assert(xsubi[2] == 64542);
28456     }
28457 }

```

#### 28458 APPLICATION USAGE

28459 These functions should be avoided whenever non-trivial requirements (including safety) have to  
 28460 be fulfilled, unless seeded using *getentropy()*.

#### 28461 RATIONALE

28462 None.

#### 28463 FUTURE DIRECTIONS

28464 None.

#### 28465 SEE ALSO

28466 *getentropy()*, *initstate()*, *rand()*

28467 XBD <stdlib.h>

#### 28468 CHANGE HISTORY

28469 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 28470 Issue 5

28471 A note indicating that the *drand48()*, *lrand48()*, and *mrnd48()* functions need not be reentrant is  
 28472 added to the DESCRIPTION.

#### 28473 Issue 6

28474 The normative text is updated to avoid use of the term “must” for application requirements.

#### 28475 Issue 7

28476 Austin Group Interpretation 1003.1-2001 #156 is applied.

28477 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0083 [743] is applied.

#### 28478 Issue 8

28479 Austin Group Defect 1107 is applied, clarifying how the return value is calculated from  $X_i$  for  
 28480 each function.

28481 Austin Group Defect 1134 is applied, adding *getentropy()*.

28482 **NAME**

28483 dup, dup2, dup3 — duplicate an open file descriptor

28484 **SYNOPSIS**

```
28485 #include <unistd.h>
28486 int dup(int filde);
28487 int dup2(int filde, int filde2);
28488 int dup3(int filde, int filde2, int flag);
```

28489 **DESCRIPTION**

28490 The *dup()* function provides an alternative interface to the service provided by *fcntl()* using the  
 28491 *F\_DUPFD* command. The call *dup(filde)* shall be equivalent to:

```
28492 fcntl(filde, F_DUPFD, 0);
```

28493 The *dup2()* function shall cause the file descriptor *filde2* to refer to the same open file  
 28494 description as the file descriptor *filde* and to share any locks, and shall return *filde2*. If *filde2* is  
 28495 already a valid open file descriptor, it shall be closed first, unless *filde* is equal to *filde2* in which  
 28496 case *dup2()* shall return *filde2* without closing it. If the close operation fails to close *filde2*,  
 28497 *dup2()* shall return  $-1$  without changing the open file description to which *filde2* refers. If *filde*  
 28498 is not a valid file descriptor, *dup2()* shall return  $-1$  and shall not close *filde2*. If *filde2* is less than  
 28499 0 or greater than or equal to  $\{\text{OPEN\_MAX}\}$ , *dup2()* shall return  $-1$  with *errno* set to  $[\text{EBADF}]$ .

28500 Upon successful completion, if *filde* is not equal to *filde2*, the *FD\_CLOEXEC* and  
 28501 *FD\_CLOFORK* flags associated with *filde2* shall be cleared. If *filde* is equal to *filde2*, the  
 28502 *FD\_CLOEXEC* and *FD\_CLOFORK* flags associated with *filde2* shall not be changed.

28503 The *dup3()* function shall be equivalent to the *dup2()* function, except that it shall be an error if  
 28504 *filde* is equal to *filde2*, and the state of *FD\_CLOEXEC* and *FD\_CLOFORK* on the *filde2* file  
 28505 descriptor shall be determined solely by the *flag* argument, which can be constructed from a  
 28506 bitwise-inclusive OR of flags from the following list:

28507 *O\_CLOEXEC*      Atomically set the *FD\_CLOEXEC* flag on *filde2*.

28508 *O\_CLOFORK*     Atomically set the *FD\_CLOFORK* flag on *filde2*.

28509 **TYP**      If *filde* refers to a typed memory object, the result of the *dup2()* or *dup3()* functions is  
 28510 unspecified.

28511 **RETURN VALUE**

28512 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;  
 28513 otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

28514 **ERRORS**

28515 The *dup()* function shall fail if:

28516  $[\text{EBADF}]$       The *filde* argument is not a valid open file descriptor.

28517  $[\text{EMFILE}]$      All file descriptors available to the process are currently open.

28518 The *dup2()* and *dup3()* functions shall fail if:

28519  $[\text{EBADF}]$       The *filde* argument is not a valid open file descriptor or the argument *filde2* is  
 28520 negative or greater than or equal to  $\{\text{OPEN\_MAX}\}$ .

28521  $[\text{EINTR}]$       The function was interrupted by a signal.

28522 The *dup3()* function shall fail if:

- 28523 [EINVAL] The *fildest* and *fildest2* arguments are equal.
- 28524 The *dup2()* and *dup3()* functions may fail if:
- 28525 [EIO] An I/O error occurred while attempting to close *fildest2*.
- 28526 The *dup3()* function may fail if:
- 28527 [EINVAL] The value of the *flag* argument is invalid.

## 28528 EXAMPLES

### 28529 Redirecting Standard Output to a File

28530 The following example closes standard output for the current processes, re-assigns standard  
28531 output to go to the file referenced by *pfdest*, and closes the original file descriptor to clean up.

```
28532 #include <unistd.h>
28533 ...
28534 int pfdest;
28535 ...
28536 close(1);
28537 dup(pfdest);
28538 close(pfdest);
28539 ...
```

### 28540 Redirecting Error Messages

28541 The following example redirects messages from *stderr* to *stdout*.

```
28542 #include <unistd.h>
28543 ...
28544 dup2(1, 2);
28545 ...
```

## 28546 APPLICATION USAGE

28547 Implementations may use file descriptors that must be inherited into child processes for the  
28548 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
28549 an application that calls *dup2()* with an arbitrary integer for *fildest2* risks non-conforming  
28550 behavior, and *dup2()* can only portably be used to overwrite file descriptor values that the  
28551 application has obtained through explicit actions, or for the three file descriptors corresponding  
28552 to the standard file streams. In order to avoid a race condition of leaking an unintended file  
28553 descriptor into a child process or executed program, an application should consider opening all  
28554 file descriptors with the *FD\_CLOFORK* or *FD\_CLOEXEC* flag, or both flags, set unless the file  
28555 descriptor is intended to be inherited by child processes or executed programs, respectively.

## 28556 RATIONALE

28557 The *dup()* function is redundant. Its services are also provided by the *fcntl()* function. It has been  
28558 included in this volume of POSIX.1-2024 primarily for historical reasons, since many existing  
28559 applications use it. On the other hand, the *dup2()* function provides unique services, as no other  
28560 interface is able to atomically replace an existing file descriptor.

28561 The *dup2()* function is not marked obsolescent because it presents a type-safe version of  
28562 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

28563 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

28564 In the description of [EBADF], the case of *fildest* being out of range is covered by the given case of

28565 *fildev* not being valid. The descriptions for *fildev* and *fildev2* are different because the only kind of  
28566 invalidity that is relevant for *fildev2* is whether it is out of range; that is, it does not matter  
28567 whether *fildev2* refers to an open file when the *dup2()* call is made.

28568 The *dup3()* function with the `O_CLOEXEC` and `O_CLOFORK` flags is necessary to avoid a data  
28569 race in multi-threaded applications. Without `O_CLOFORK`, a file descriptor is leaked into a  
28570 child process created by one thread in the window between another thread creating a file  
28571 descriptor with *dup2()* and then using *fcntl()* to set the `FD_CLOFORK` flag. Without  
28572 `O_CLOEXEC`, a file descriptor intentionally inherited by child processes is similarly leaked into  
28573 an executed program if `FD_CLOEXEC` is not set atomically. The safe counterpart for avoiding  
28574 the same race with *dup()* is the use of the `F_DUPFD_CLOFORK` or `F_DUPFD_CLOEXEC` action  
28575 of the *fcntl()* function.

#### 28576 **FUTURE DIRECTIONS**

28577 None.

#### 28578 **SEE ALSO**

28579 *close()*, *fcntl()*, *open()*

28580 XBD <[unistd.h](#)>

#### 28581 **CHANGE HISTORY**

28582 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 28583 **Issue 7**

28584 SD5-XSH-ERN-187 is applied.

28585 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0075 [149,428] and  
28586 XSH/TC1-2008/0076 [149] are applied.

#### 28587 **Issue 8**

28588 Austin Group Defects 411, 1318, 1483, and 1577 are applied, adding *dup3()* and `FD_CLOFORK`.

28589 **NAME**

28590 duplocale — duplicate a locale object

28591 **SYNOPSIS**

```
28592 CX #include <locale.h>
28593 locale_t duplocale(locale_t locobj);
```

28594 **DESCRIPTION**

28595 The *duplocale()* function shall create a duplicate copy of the locale object referenced by the *locobj*  
 28596 argument.

28597 If the *locobj* argument is `LC_GLOBAL_LOCALE`, *duplocale()* shall create a new locale object  
 28598 containing a copy of the global locale determined by the *setlocale()* function.

28599 The behavior is undefined if the *locobj* argument is not a valid locale object handle.

28600 **RETURN VALUE**

28601 Upon successful completion, the *duplocale()* function shall return a handle for a new locale  
 28602 object. Otherwise, *duplocale()* shall return `(locale_t)0` and set *errno* to indicate the error.

28603 **ERRORS**

28604 The *duplocale()* function shall fail if:

28605 [ENOMEM] There is not enough memory available to create the locale object or load the  
 28606 locale data.

28607 **EXAMPLES**28608 **Constructing an Altered Version of an Existing Locale Object**

28609 The following example shows a code fragment to create a slightly altered version of an existing  
 28610 locale object. The function takes a locale object and a locale name and it replaces the `LC_TIME`  
 28611 category data in the locale object with that from the named locale.

```
28612 #include <locale.h>
28613 ...
28614 locale_t
28615 with_changed_lc_time (locale_t obj, const char *name)
28616 {
28617     locale_t retval = duplocale (obj);
28618     if (retval != (locale_t) 0)
28619     {
28620         locale_t changed = newlocale (LC_TIME_MASK, name, retval);
28621         if (changed == (locale_t) 0)
28622             /* An error occurred. Free all allocated resources. */
28623             freelocale (retval);
28624         retval = changed;
28625     }
28626     return retval;
28627 }
```

**28628 APPLICATION USAGE**

28629 The use of the *duplocale()* function is recommended for situations where a locale object is being  
28630 used in multiple places, and it is possible that the lifetime of the locale object might end before  
28631 all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is  
28632 needed. This can be achieved by a call to *newlocale()* following the *duplocale()* call.

28633 As with the *newlocale()* function, handles for locale objects created by the *duplocale()* function  
28634 should be released by a corresponding call to *freelocale()*.

28635 The *duplocale()* function can also be used in conjunction with *uselocale((locale\_t)0)*. This returns  
28636 the locale in effect for the calling thread, but can have the value LC\_GLOBAL\_LOCALE. Passing  
28637 LC\_GLOBAL\_LOCALE to functions such as *isalnum\_l()* results in undefined behavior, but  
28638 applications can convert it into a usable locale object by using *duplocale()*.

**28639 RATIONALE**

28640 None.

**28641 FUTURE DIRECTIONS**

28642 None.

**28643 SEE ALSO**

28644 *freelocale()*, *newlocale()*, *uselocale()*

28645 XBD <locale.h>

**28646 CHANGE HISTORY**

28647 First released in Issue 7.

28648 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0077 [283,301], XSH/TC1-2008/0078  
28649 [283], and XSH/TC1-2008/0079 [301] are applied.

28650 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0084 [753] is applied.

28651 **NAME**28652 encrypt — encoding function (**CRYPT**)28653 **SYNOPSIS**

```
28654 OB XSI #include <unistd.h>
28655 void encrypt(char block[64], int edflag);
```

28656 **DESCRIPTION**

28657 The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.  
 28658 The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

28659 The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes  
 28660 with values of 0 and 1. The array is modified in place to a similar array using the key set by  
 28661 *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see  
 28662 the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to  
 28663 [ENOSYS].

28664 The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing  
 28665 to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on  
 28666 return, an error has occurred.

28667 The *encrypt()* function need not be thread-safe.

28668 **RETURN VALUE**

28669 The *encrypt()* function shall not return a value.

28670 **ERRORS**

28671 The *encrypt()* function shall fail if:

28672 [ENOSYS] The functionality is not supported on this implementation.

28673 **EXAMPLES**

28674 None.

28675 **APPLICATION USAGE**

28676 The *encrypt()* function historically used the DES block cipher, which is no longer considered  
 28677 secure.

28678 In some environments, decoding might not be implemented. This is related to some Government  
 28679 restrictions on encryption and decryption routines. Historical practice has been to ship a  
 28680 different version of the encryption library without the decryption feature in the routines  
 28681 supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

28682 **RATIONALE**

28683 None.

28684 **FUTURE DIRECTIONS**

28685 The *encrypt()* function may be removed in a future version.

28686 **SEE ALSO**

28687 [crypt\(\)](#), [setkey\(\)](#)

28689 **CHANGE HISTORY**

28690 First released in Issue 1. Derived from Issue 1 of the SVID.

- 28691 **Issue 5**  
28692 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 28693 **Issue 6**  
28694 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
- 28695 **Issue 7**  
28696 Austin Group Interpretation 1003.1-2001 #156 is applied.  
28697 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0085 [899] is applied.
- 28698 **Issue 8**  
28699 Austin Group Defect 1192 is applied, marking the *encrypt()* function as obsolescent.

28700 **NAME**

28701 endgrent, getgrent, setgrent — group database entry functions

28702 **SYNOPSIS**

```
28703 XSI #include <grp.h>
28704 void endgrent(void);
28705 struct group *getgrent(void);
28706 void setgrent(void);
```

28707 **DESCRIPTION**

28708 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an  
 28709 entry in the group database. If the group database is not already open, *getgrent()* shall open it  
 28710 and return a pointer to a **group** structure containing the first entry in the database. Thereafter, it  
 28711 shall return a pointer to a **group** structure containing the next **group** structure in the group  
 28712 database, so successive calls may be used to search the entire database.

28713 An implementation that provides extended security controls may impose further  
 28714 implementation-defined restrictions on accessing the group database. In particular, the system  
 28715 may deny the existence of some or all of the group database entries associated with groups other  
 28716 than those groups associated with the caller and may omit users other than the caller from the  
 28717 list of members of groups in database entries that are returned.

28718 The *setgrent()* function shall rewind the group database so that the next *getgrent()* call returns  
 28719 the first entry, allowing repeated searches.

28720 The *endgrent()* function shall close the group database.

28721 The *setgrent()* and *endgrent()* functions shall not change the setting of *errno* if successful.

28722 On error, the *setgrent()* and *endgrent()* functions shall set *errno* to indicate the error.

28723 Since no value is returned by the *setgrent()* and *endgrent()* functions, an application wishing to  
 28724 check for error situations should set *errno* to 0, then call the function, then check *errno*.

28725 These functions need not be thread-safe.

28726 **RETURN VALUE**

28727 On successful completion, *getgrent()* shall return a pointer to a **group** structure. On end-of-file,  
 28728 *getgrent()* shall return a null pointer and shall not change the setting of *errno*. On error,  
 28729 *getgrent()* shall return a null pointer and *errno* shall be set to indicate the error.

28730 The application shall not modify the structure to which the return value points, nor any storage  
 28731 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
 28732 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
 28733 subsequent call to *getgrgid()*, *getgrnam()*, or *getgrent()*. The returned pointer, and pointers  
 28734 within the structure, might also be invalidated if the calling thread is terminated.

28735 **ERRORS**

28736 These functions may fail if:

28737 [EINTR] A signal was caught during the operation.

28738 [EIO] An I/O error has occurred.

28739 In addition, the *getgrent()* and *setgrent()* functions may fail if:

28740 [EMFILE] All file descriptors available to the process are currently open.

- 28741 [ENFILE] The maximum allowable number of files is currently open in the system.
- 28742 **EXAMPLES**
- 28743 None.
- 28744 **APPLICATION USAGE**
- 28745 These functions are provided due to their historical usage. Applications should avoid
- 28746 dependencies on fields in the group database, whether the database is a single file, or where in
- 28747 the file system name space the database resides. Applications should use *getgrnam()* and
- 28748 *getgrgid()* whenever possible because it avoids these dependencies.
- 28749 **RATIONALE**
- 28750 None.
- 28751 **FUTURE DIRECTIONS**
- 28752 None.
- 28753 **SEE ALSO**
- 28754 *endpwent()*, *getgrgid()*, *getgrnam()*, *getlogin()*
- 28755 XBD <grp.h>
- 28756 **CHANGE HISTORY**
- 28757 First released in Issue 4, Version 2.
- 28758 **Issue 5**
- 28759 Moved from X/OPEN UNIX extension to BASE.
- 28760 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
- 28761 VALUE section.
- 28762 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.
- 28763 **Issue 6**
- 28764 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
- 28765 **Issue 7**
- 28766 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 28767 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 28768 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0080 [75] is applied.
- 28769 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0086 [493], XSH/TC2-2008/0087 [656],
- 28770 and XSH/TC2-2008/0088 [493] are applied.

28771 **NAME**

28772 endhostent, gethostent, sethostent — network host database functions

28773 **SYNOPSIS**

```
28774 #include <netdb.h>
28775 void endhostent(void);
28776 struct hostent *gethostent(void);
28777 void sethostent(int stayopen);
```

28778 **DESCRIPTION**

28779 These functions shall retrieve information about hosts. This information is considered to be  
28780 stored in a database that can be accessed sequentially or randomly. The implementation of this  
28781 database is unspecified.

28782 **Note:** In many cases this database is implemented by the Domain Name System, as documented in  
28783 RFC 1034, RFC 1035, and RFC 3596.

28784 The *sethostent()* function shall open a connection to the database and set the next entry for  
28785 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection  
28786 shall not be closed by a call to *gethostent()*, and the implementation may maintain an open file  
28787 descriptor. If a file descriptor is opened, the FD\_CLOEXEC flag shall be set; see <fcntl.h>.

28788 The *gethostent()* function shall read the next entry in the database, opening and closing a  
28789 connection to the database as necessary.

28790 Entries shall be returned in **hostent** structures.

28791 The *endhostent()* function shall close the connection to the database, releasing any open file  
28792 descriptor.

28793 These functions need not be thread-safe.

28794 **RETURN VALUE**

28795 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**  
28796 structure if the requested entry was found, and a null pointer if the end of the database was  
28797 reached or the requested entry was not found.

28798 The application shall not modify the structure to which the return value points, nor any storage  
28799 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
28800 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
28801 subsequent call to *gethostent()*. The returned pointer, and pointers within the structure, might  
28802 also be invalidated if the calling thread is terminated.

28803 **ERRORS**

28804 The *gethostent()* and *sethostent()* functions may fail if:

28805 [EMFILE] All file descriptors available to the process are currently open.

28806 [ENFILE] The maximum allowable number of files is currently open in the system.

28807 **EXAMPLES**

28808 None.

28809 **APPLICATION USAGE**

28810 None.

28811 **RATIONALE**

28812 None.

28813 **FUTURE DIRECTIONS**

28814 None.

28815 **SEE ALSO**28816 *endservent()*28817 XBD [<fcntl.h>](#), [<netdb.h>](#)28818 **CHANGE HISTORY**

28819 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

28820 **Issue 7**

28821 Austin Group Interpretation 1003.1-2001 #156 is applied.

28822 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0081 [75,428] and  
28823 XSH/TC1-2008/0082 [75] are applied.

28824 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0089 [656] is applied.

28825 **Issue 8**28826 Austin Group Defect 368 is applied, adding a requirement for FD\_CLOEXEC to be set if a file  
28827 descriptor is opened, and adding the [EMFILE] and [ENFILE] errors.

28828 Austin Group Defect 1685 is applied, updating RFC references.

28829 **NAME**

28830 endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

28831 **SYNOPSIS**

```
28832 #include <netdb.h>
28833 void endnetent(void);
28834 struct netent *getnetbyaddr(uint32_t net, int type);
28835 struct netent *getnetbyname(const char *name);
28836 struct netent *getnetent(void);
28837 void setnetent(int stayopen);
```

28838 **DESCRIPTION**

28839 These functions shall retrieve information about networks. This information is considered to be  
 28840 stored in a database that can be accessed sequentially or randomly. The implementation of this  
 28841 database is unspecified.

28842 The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-  
 28843 zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either  
 28844 directly, or indirectly through one of the other *getnet\**(*)* functions), and the implementation may  
 28845 maintain an open file descriptor to the database. If a file descriptor is used, the *FD\_CLOEXEC*  
 28846 flag shall be set; see <*fcntl.h*>.

28847 The *getnetent()* function shall read the next entry of the database, opening and closing a  
 28848 connection to the database as necessary.

28849 The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry  
 28850 for which the address family specified by *type* matches the *n\_addrtype* member and the network  
 28851 number *net* matches the *n\_net* member, opening and closing a connection to the database as  
 28852 necessary. The *net* argument shall be the network number in host byte order.

28853 The *getnetbyname()* function shall search the database from the beginning and find the first entry  
 28854 for which the network name specified by *name* matches the *n\_name* member, opening and  
 28855 closing a connection to the database as necessary.

28856 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a  
 28857 **netent** structure, the members of which shall contain the fields of an entry in the network  
 28858 database.

28859 The *endnetent()* function shall close the database, releasing any open file descriptor.

28860 These functions need not be thread-safe.

28861 **RETURN VALUE**

28862 Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a  
 28863 pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the  
 28864 database was reached or the requested entry was not found. Otherwise, a null pointer shall be  
 28865 returned.

28866 The application shall not modify the structure to which the return value points, nor any storage  
 28867 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
 28868 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
 28869 subsequent call to *getnetbyaddr()*, *getnetbyname()*, or *getnetent()*. The returned pointer, and  
 28870 pointers within the structure, might also be invalidated if the calling thread is terminated.

**28871 ERRORS**

28872 The `getnetbyaddr()`, `getnetbyname()`, `getnetent()`, and `setnetent()` functions may fail if:

28873 [EMFILE] All file descriptors available to the process are currently open.

28874 [ENFILE] The maximum allowable number of files is currently open in the system.

28894

28895 **NAME**

28896 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol  
28897 database functions

28898 **SYNOPSIS**

```
28899 #include <netdb.h>
28900 void endprotoent(void);
28901 struct protoent *getprotobyname(const char *name);
28902 struct protoent *getprotobynumber(int proto);
28903 struct protoent *getprotoent(void);
28904 void setprotoent(int stayopen);
```

28905 **DESCRIPTION**

28906 These functions shall retrieve information about protocols. This information is considered to be  
28907 stored in a database that can be accessed sequentially or randomly. The implementation of this  
28908 database is unspecified.

28909 The *setprotoent()* function shall open a connection to the database, and set the next entry to the  
28910 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database  
28911 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the  
28912 other *getproto\**(*)* functions), and the implementation may maintain an open file descriptor for  
28913 the database. If a file descriptor is used, the FD\_CLOEXEC flag shall be set; see <fcntl.h>.

28914 The *getprotobyname()* function shall search the database from the beginning and find the first  
28915 entry for which the protocol name specified by *name* matches the *p\_name* member, opening and  
28916 closing a connection to the database as necessary.

28917 The *getprotobynumber()* function shall search the database from the beginning and find the first  
28918 entry for which the protocol number specified by *proto* matches the *p\_proto* member, opening  
28919 and closing a connection to the database as necessary.

28920 The *getprotoent()* function shall read the next entry of the database, opening and closing a  
28921 connection to the database as necessary.

28922 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer  
28923 to a **protoent** structure, the members of which shall contain the fields of an entry in the network  
28924 protocol database.

28925 The *endprotoent()* function shall close the connection to the database, releasing any open file  
28926 descriptor.

28927 These functions need not be thread-safe.

28928 **RETURN VALUE**

28929 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a  
28930 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of  
28931 the database was reached or the requested entry was not found. Otherwise, a null pointer is  
28932 returned.

28933 The application shall not modify the structure to which the return value points, nor any storage  
28934 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
28935 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
28936 subsequent call to *getprotobyname()*, *getprotobynumber()*, or *getprotoent()*. The returned pointer,  
28937 and pointers within the structure, might also be invalidated if the calling thread is terminated.

**28938 ERRORS**

28939 The *getprotobyname()*, *getprotobynumber()*, *getprotoent()*, and *setprotoent()* functions may fail if:

28940 [EMFILE] All file descriptors available to the process are currently open.

28941 [ENFILE] The maximum allowable number of files is currently open in the system.

**28942 EXAMPLES**

28943 None.

**28944 APPLICATION USAGE**

28945 None.

**28959 Issue 8**

28960 Austin Group Defect 368 is applied, adding a requirement for FD\_CLOEXEC to be set if a file descriptor is used, and adding the [EMFILE] and [ENFILE] errors.

28961

28962 **NAME**

28963 endpwent, getpwent, setpwent — user database functions

28964 **SYNOPSIS**

```
28965 XSI #include <pwd.h>
28966 void endpwent(void);
28967 struct passwd *getpwent(void);
28968 void setpwent(void);
```

28969 **DESCRIPTION**

28970 These functions shall retrieve information about users.

28971 The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of  
 28972 an entry in the user database. Each entry in the user database contains a **passwd** structure. If the  
 28973 user database is not already open, *getpwent()* shall open it and return a pointer to a **passwd**  
 28974 structure containing the first entry in the database. Thereafter, it shall return a pointer to a  
 28975 **passwd** structure containing the next entry in the user database. Successive calls can be used to  
 28976 search the entire user database.

28977 If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

28978 An implementation that provides extended security controls may impose further  
 28979 implementation-defined restrictions on accessing the user database. In particular, the system  
 28980 may deny the existence of some or all of the user database entries associated with users other  
 28981 than the caller.

28982 The *setpwent()* function shall rewind the user database so that the next *getpwent()* call returns  
 28983 the first entry, allowing repeated searches.

28984 The *endpwent()* function shall close the user database.28985 The *setpwent()* and *endpwent()* functions shall not change the setting of *errno* if successful.28986 On error, the *setpwent()* and *endpwent()* functions shall set *errno* to indicate the error.

28987 Since no value is returned by the *setpwent()* and *endpwent()* functions, an application wishing to  
 28988 check for error situations should set *errno* to 0, then call the function, then check *errno*.

28989 These functions need not be thread-safe.

28990 **RETURN VALUE**

28991 On successful completion, *getpwent()* shall return a pointer to a **passwd** structure. On end-of-  
 28992 file, *getpwent()* shall return a null pointer and shall not change the setting of *errno*. On error,  
 28993 *getpwent()* shall return a null pointer and *errno* shall be set to indicate the error.

28994 The application shall not modify the structure to which the return value points, nor any storage  
 28995 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
 28996 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
 28997 subsequent call to *getpwuid()*, *getpwnam()*, or *getpwent()*. The returned pointer, and pointers  
 28998 within the structure, might also be invalidated if the calling thread is terminated.

28999 **ERRORS**

29000 These functions may fail if:

29001 [EINTR] A signal was caught during the operation.

29002 [EIO] An I/O error has occurred.

29003 In addition, *getpwent()* and *setpwent()* may fail if:

- 29004 [EMFILE] All file descriptors available to the process are currently open.
- 29005 [ENFILE] The maximum allowable number of files is currently open in the system.

## 29006 EXAMPLES

### 29007 Searching the User Database

29008 The following example uses the *getpwent()* function to get successive entries in the user  
 29009 database, returning a pointer to a **passwd** structure that contains information about each user.  
 29010 The call to *endpwent()* closes the user database and cleans up.

```

29011 #include <pwd.h>
29012 #include <stdio.h>

29013 void printname(uid_t uid)
29014 {
29015     struct passwd *pwd;

29016     setpwent();
29017     while((pwd = getpwent()) != NULL) {
29018         if (pwd->pw_uid == uid) {
29019             printf("name=%s\n", pwd->pw_name);
29020             break;
29021         }
29022     }
29023     endpwent();
29024 }
```

## 29025 APPLICATION USAGE

29026 These functions are provided due to their historical usage. Applications should avoid  
 29027 dependencies on fields in the password database, whether the database is a single file, or where  
 29028 in the file system name space the database resides. Applications should use *getpwuid()*  
 29029 whenever possible because it avoids these dependencies.

## 29030 RATIONALE

29031 None.

## 29037 CHANGE HISTORY

29038 First released in Issue 4, Version 2.

### 29039 Issue 5

29040 Moved from X/OPEN UNIX extension to BASE.

29041 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 29042 VALUE section.

29043 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

29044 **Issue 6**

29045 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

29046 **Issue 7**

29047 Austin Group Interpretation 1003.1-2001 #156 is applied.

29048 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

29049 The EXAMPLES section is revised.

29050 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0087 [75] is applied.

29051 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0092 [493], XSH/TC2-2008/0093 [656],  
29052 and XSH/TC2-2008/0094 [493] are applied.

29053 **NAME**

29054 endservent, getservbyname, getservbyport, getservent, setservent — network services database  
29055 functions

29056 **SYNOPSIS**

```
29057 #include <netdb.h>
29058 void endservent(void);
29059 struct servent *getservbyname(const char *name, const char *proto);
29060 struct servent *getservbyport(int port, const char *proto);
29061 struct servent *getservent(void);
29062 void setservent(int stayopen);
```

29063 **DESCRIPTION**

29064 These functions shall retrieve information about network services. This information is  
29065 considered to be stored in a database that can be accessed sequentially or randomly. The  
29066 implementation of this database is unspecified.

29067 The *setservent()* function shall open a connection to the database, and set the next entry to the  
29068 first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each  
29069 call to the *getservent()* function (either directly, or indirectly through one of the other *getserv\**(  
29070 functions), and the implementation may maintain an open file descriptor for the database. If a  
29071 file descriptor is used, the FD\_CLOEXEC flag shall be set; see <fcntl.h>.

29072 The *getservent()* function shall read the next entry of the database, opening and closing a  
29073 connection to the database as necessary.

29074 The *getservbyname()* function shall search the database from the beginning and find the first  
29075 entry for which the service name specified by *name* matches the *s\_name* member and the protocol  
29076 name specified by *proto* matches the *s\_proto* member, opening and closing a connection to the  
29077 database as necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be  
29078 matched.

29079 The *getservbyport()* function shall search the database from the beginning and find the first entry  
29080 for which the port specified by *port* matches the *s\_port* member and the protocol name specified  
29081 by *proto* matches the *s\_proto* member, opening and closing a connection to the database as  
29082 necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be matched. The *port*  
29083 argument shall be a value obtained by converting a **uint16\_t** in network byte order to **int**.

29084 The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a  
29085 **servent** structure, the members of which shall contain the fields of an entry in the network  
29086 services database.

29087 The *endservent()* function shall close the database, releasing any open file descriptor.

29088 These functions need not be thread-safe.

29089 **RETURN VALUE**

29090 Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to  
29091 a **servent** structure if the requested entry was found, and a null pointer if the end of the database  
29092 was reached or the requested entry was not found. Otherwise, a null pointer is returned.

29093 The application shall not modify the structure to which the return value points, nor any storage  
29094 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
29095 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
29096 subsequent call to *getservbyname()*, *getservbyport()*, or *getservent()*. The returned pointer, and  
29097 pointers within the structure, might also be invalidated if the calling thread is terminated.

29098 **ERRORS**29099 The *getserbyname()*, *getserbyport()*, *getservent()*, and *setservent()* functions may fail if:

29100 [EMFILE] All file descriptors available to the process are currently open.

29101 [ENFILE] The maximum allowable number of files is currently open in the system.

29102 **EXAMPLES**

29103 None.

29104 **APPLICATION USAGE**29105 The *port* argument of *getserbyport()* need not be compatible with the port values of all address  
29106 families.29107 **RATIONALE**

29108 None.

29109 **FUTURE DIRECTIONS**

29110 None.

29111 **SEE ALSO**29112 *endhostent()*, *endprotoent()*, *htonl()*, *inet\_addr()*29113 XBD <[fcntl.h](#)>, <[netdb.h](#)>29114 **CHANGE HISTORY**

29115 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

29116 **Issue 7**

29117 Austin Group Interpretation 1003.1-2001 #156 is applied.

29118 SD5-XBD-ERN-14 is applied.

29119 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0088 [75] and XSH/TC1-2008/0089  
29120 [75] are applied.

29121 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0095 [656] is applied.

29122 **Issue 8**29123 Austin Group Defect 368 is applied, adding a requirement for `FD_CLOEXEC` to be set if a file  
29124 descriptor is used, and adding the [EMFILE] and [ENFILE] errors.

29125 **NAME**

29126 endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database  
 29127 functions

29128 **SYNOPSIS**

```
29129 XSI #include <utmpx.h>
29130 void endutxent(void);
29131 struct utmpx *getutxent(void);
29132 struct utmpx *getutxid(const struct utmpx *id);
29133 struct utmpx *getutxline(const struct utmpx *line);
29134 struct utmpx *pututxline(const struct utmpx *utmpx);
29135 void setutxent(void);
```

29136 **DESCRIPTION**

29137 These functions shall provide access to the user accounting database.

29138 The *getutxent()* function shall read the next entry from the user accounting database. If the  
 29139 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

29140 The *getutxid()* function shall search forward from the current point in the database. If the  
 29141 *ut\_type* value of the **utmpx** structure pointed to by *id* is *BOOT\_TIME*, *OLD\_TIME*, or  
 29142 *NEW\_TIME*, then it shall stop when it finds an entry with a matching *ut\_type* value. If the  
 29143 *ut\_type* value is *INIT\_PROCESS*, *LOGIN\_PROCESS*, *USER\_PROCESS*, or *DEAD\_PROCESS*,  
 29144 then it shall stop when it finds an entry whose type is one of these four and whose *ut\_id* member  
 29145 matches the *ut\_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is  
 29146 reached without a match, *getutxid()* shall fail.

29147 The *getutxline()* function shall search forward from the current point in the database until it  
 29148 finds an entry of the type *LOGIN\_PROCESS* or *USER\_PROCESS* which also has a *ut\_line* value  
 29149 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached  
 29150 without a match, *getutxline()* shall fail.

29151 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to  
 29152 search for multiple occurrences, the application shall zero out the static data after each success,  
 29153 or *getutxline()* may return a pointer to the same **utmpx** structure.

29154 There is one exception to the rule about clearing the structure before further reads are done. The  
 29155 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user  
 29156 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or  
 29157 *getutxline()*, if the application has modified this structure and passed the pointer back to  
 29158 *pututxline()*.

29159 For all entries that match a request, the *ut\_type* member indicates the type of the entry. Other  
 29160 members of the entry shall contain meaningful data based on the value of the *ut\_type* member as  
 29161 follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	<i>ut_tv</i>
OLD_TIME	<i>ut_tv</i>
NEW_TIME	<i>ut_tv</i>
USER_PROCESS	<i>ut_id</i> , <i>ut_user</i> (login name of the user), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
INIT_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>
LOGIN_PROCESS	<i>ut_id</i> , <i>ut_user</i> (implementation-defined name of the login process), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
DEAD_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall search for a record as if by *getutxid()* that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.
