59862 The **restrict** keyword is added to the *pthread\_rwlockattr\_getpshared()* prototype for alignment  
59863 with the ISO/IEC 9899:1999 standard.

59864 **Issue 7**

59865 The *pthread\_rwlockattr\_getpshared()* and *pthread\_rwlockattr\_setpshared()* functions are marked  
59866 only as part of the Thread Process-Shared Synchronization option as the Threads option is now  
59867 part of the Base.

59868 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this  
59869 condition results in undefined behavior.

59870 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0292 [972] and XSH/TC2-2008/0293  
59871 [757] are applied.

59872 **NAME**

59873 pthread\_rwlockattr\_init — initialize the read-write lock attributes object

59874 **SYNOPSIS**

59875 #include <pthread.h>

59876 int pthread\_rwlockattr\_init(pthread\_rwlockattr\_t \*attr);

59877 **DESCRIPTION**

59878 Refer to *pthread\_rwlockattr\_destroy()*.

59879 **NAME**

59880 pthread\_rwlockattr\_setpshared — set the process-shared attribute of the read-write lock  
59881 attributes object

59882 **SYNOPSIS**

```
59883 TSH #include <pthread.h>  
59884 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,  
59885 int pshared);
```

59886 **DESCRIPTION**

59887 Refer to [pthread\\_rwlockattr\\_getpshared\(\)](#).

59888 **NAME**

59889 pthread\_self — get the calling thread ID

59890 **SYNOPSIS**

59891 #include &lt;pthread.h&gt;

59892 pthread\_t pthread\_self(void);

59893 **DESCRIPTION**59894 The *pthread\_self()* function shall return the thread ID of the calling thread.59895 **RETURN VALUE**59896 The *pthread\_self()* function shall always be successful and no return value is reserved to indicate  
59897 an error.59898 **ERRORS**

59899 No errors are defined.

59900 **EXAMPLES**

59901 None.

59902 **APPLICATION USAGE**

59903 None.

59904 **RATIONALE**59905 The *pthread\_self()* function provides a capability similar to the *getpid()* function for processes  
59906 and the rationale is the same: the creation call does not provide the thread ID to the created  
59907 thread.59908 **FUTURE DIRECTIONS**

59909 None.

59910 **SEE ALSO**59911 *pthread\_create()*, *pthread\_equal()*

59912 XBD &lt;pthread.h&gt;

59913 **CHANGE HISTORY**

59914 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

59915 **Issue 6**59916 The *pthread\_self()* function is marked as part of the Threads option.59917 **Issue 7**

59918 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

59919 The *pthread\_self()* function is moved from the Threads option to the Base.

59920 **NAME**

59921 pthread\_setcancelstate, pthread\_setcanceltype, pthread\_testcancel — set cancelability state

59922 **SYNOPSIS**

```
59923 #include <pthread.h>
59924 int pthread_setcancelstate(int state, int *oldstate);
59925 int pthread_setcanceltype(int type, int *oldtype);
59926 void pthread_testcancel(void);
```

59927 **DESCRIPTION**

59928 The *pthread\_setcancelstate()* function shall atomically both set the calling thread's cancelability state to the indicated *state* and return the previous cancelability state at the location referenced by *oldstate*. Legal values for *state* are PTHREAD\_CANCEL\_ENABLE and PTHREAD\_CANCEL\_DISABLE.

59932 The *pthread\_setcanceltype()* function shall atomically both set the calling thread's cancelability type to the indicated *type* and return the previous cancelability type at the location referenced by *oldtype*. Legal values for *type* are PTHREAD\_CANCEL\_DEFERRED and PTHREAD\_CANCEL\_ASYNCCHRONOUS.

59936 The cancelability state and type of any newly created threads, including the thread in which *main()* was first invoked, shall be PTHREAD\_CANCEL\_ENABLE and PTHREAD\_CANCEL\_DEFERRED respectively.

59939 The *pthread\_testcancel()* function shall create a cancellation point in the calling thread. The *pthread\_testcancel()* function shall have no effect if cancelability is disabled.

59941 The *pthread\_setcancelstate()* function shall be async-signal-safe.

59942 **RETURN VALUE**

59943 If successful, the *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

59945 **ERRORS**

59946 The *pthread\_setcancelstate()* function may fail if:

59947 [EINVAL] The specified state is not PTHREAD\_CANCEL\_ENABLE or  
59948 PTHREAD\_CANCEL\_DISABLE.

59949 The *pthread\_setcanceltype()* function may fail if:

59950 [EINVAL] The specified type is not PTHREAD\_CANCEL\_DEFERRED or  
59951 PTHREAD\_CANCEL\_ASYNCCHRONOUS.

59952 These functions shall not return an error code of [EINTR].

59953 **EXAMPLES**

59954 None.

59955 **APPLICATION USAGE**

59956 In order to write a signal handler for an asynchronous signal which can run safely in a cancellable thread, *pthread\_setcancelstate()* must be used to disable cancellation for the duration of any calls that the signal handler makes which are cancellation points. However, earlier versions of the standard did not permit strictly conforming applications to call *pthread\_setcancelstate()* from a signal handler since it was not required to be async-signal-safe. On non-conforming implementations where *pthread\_setcancelstate()* is not async-signal-safe, alternatives are to ensure either that the corresponding signals are blocked during execution of functions that are not async-cancel-safe or that cancellation is disabled during times when those signals could be delivered.

**59965 RATIONALE**

59966 The `pthread_setcancelstate()` and `pthread_setcanceltype()` functions control the points at which a  
59967 thread may be asynchronously canceled. For cancellation control to be usable in modular  
59968 fashion, some rules need to be followed.

59969 An object can be considered to be a generalization of a procedure. It is a set of procedures and  
59970 global variables written as a unit and called by clients not known by the object. Objects may  
59971 depend on other objects.

59972 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On  
59973 exit from an object, the cancelability state should always be restored to its value on entry to the  
59974 object.

59975 This follows from a modularity argument: if the client of an object (or the client of an object that  
59976 uses that object) has disabled cancelability, it is because the client does not want to be concerned  
59977 about cleaning up if the thread is canceled while executing some sequence of actions. If an object  
59978 is called in such a state and it enables cancelability and a cancellation request is pending for that  
59979 thread, then the thread is canceled, contrary to the wish of the client that disabled.

59980 Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry  
59981 to an object. But as with the cancelability state, on exit from an object the cancelability type  
59982 should always be restored to its value on entry to the object.

59983 Finally, only functions that are cancel-safe may be called from a thread that is asynchronously  
59984 cancelable.

**59985 FUTURE DIRECTIONS**

59986 None.

**59987 SEE ALSO**

**59990 CHANGE HISTORY**

59991 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**59992 Issue 6**

59993 The `pthread_setcancelstate()`, `pthread_setcanceltype()`, and `pthread_testcancel()` functions are marked  
59994 as part of the Threads option.

**59995 Issue 7**

59996 The `pthread_setcancelstate()`, `pthread_setcanceltype()`, and `pthread_testcancel()` functions are moved  
59997 from the Threads option to the Base.

59998 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0294 [622] and XSH/TC2-2008/0295  
59999 [615] are applied.

**60000 Issue 8**

60001 Austin Group Defect 841 is applied, requiring `pthread_setcancelstate()` to be async-signal-safe.

60002 **NAME**

60003 pthread\_setschedparam — dynamic thread scheduling parameters access (**REALTIME**  
60004 **THREADS**)

60005 **SYNOPSIS**

```
60006 TPS #include <pthread.h>  
60007 int pthread_setschedparam(pthread_t thread, int policy,  
60008     const struct sched_param *param);
```

60009 **DESCRIPTION**

60010 Refer to [pthread\\_getschedparam\(\)](#).

60011 **NAME**

60012 pthread\_setschedprio — dynamic thread scheduling parameters access (**REALTIME**  
60013 **THREADS**)

60014 **SYNOPSIS**

```
60015 TPS #include <pthread.h>  
60016 int pthread_setschedprio(pthread_t thread, int prio);
```

60017 **DESCRIPTION**

60018 The *pthread\_setschedprio()* function shall set the scheduling priority for the thread whose thread  
60019 ID is given by *thread* to the value given by *prio*. See [Scheduling Policies](#) (on page 531) for a  
60020 description on how this function call affects the ordering of the thread in the thread list for its  
60021 new priority.

60022 If the *pthread\_setschedprio()* function fails, the scheduling priority of the target thread shall not be  
60023 changed.

60024 **RETURN VALUE**

60025 If successful, the *pthread\_setschedprio()* function shall return zero; otherwise, an error number  
60026 shall be returned to indicate the error.

60027 **ERRORS**

60028 The *pthread\_setschedprio()* function may fail if:

60029 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

60030 [EPERM] The caller does not have appropriate privileges to set the scheduling priority  
60031 of the specified thread.

60032 The *pthread\_setschedprio()* function shall not return an error code of [EINTR].

60033 **EXAMPLES**

60034 None.

60035 **APPLICATION USAGE**

60036 None.

60037 **RATIONALE**

60038 The *pthread\_setschedprio()* function provides a way for an application to temporarily raise its  
60039 priority and then lower it again, without having the undesired side-effect of yielding to other  
60040 threads of the same priority. This is necessary if the application is to implement its own  
60041 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This  
60042 capability is especially important if the implementation does not support the Thread Priority  
60043 Protection or Thread Priority Inheritance options, but even if those options are supported it is  
60044 needed if the application is to bound priority inheritance for other resources, such as  
60045 semaphores.

60046 The standard developers considered that while it might be preferable conceptually to solve this  
60047 problem by modifying the specification of *pthread\_setschedparam()*, it was too late to make such a  
60048 change, as there may be implementations that would need to be changed. Therefore, this new  
60049 function was introduced.

60050 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
60051 that the function should fail and report an [ESRCH] error.

60052 **FUTURE DIRECTIONS**

60053 None.

60054 **SEE ALSO**

60055 [Scheduling Policies](#) (on page 531), [pthread\\_getschedparam\(\)](#)

60056 XBD [<pthread.h>](#)

60057 **CHANGE HISTORY**

60058 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

60059 **Issue 7**

60060 The `pthread_setschedprio()` function is marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

60062 Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPERM] error.

60063 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

60064 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0466 [314] is applied.

60065 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0296 [757] is applied.

60066 **NAME**

60067 pthread\_setspecific — thread-specific data management

60068 **SYNOPSIS**

60069 #include &lt;pthread.h&gt;

60070 int pthread\_setspecific(pthread\_key\_t *key*, const void \**value*);60071 **DESCRIPTION**60072 Refer to *pthread\_getspecific()*.

60073 **NAME**

60074 pthread\_sigmask, sigprocmask — examine and change blocked signals

60075 **SYNOPSIS**

```
60076 CX #include <signal.h>
60077 int pthread_sigmask(int how, const sigset_t *restrict set,
60078 sigset_t *restrict oset);
60079 int sigprocmask(int how, const sigset_t *restrict set,
60080 sigset_t *restrict oset);
```

60081 **DESCRIPTION**60082 The *pthread\_sigmask()* function shall examine or change (or both) the calling thread's signal  
60083 mask.60084 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the  
60085 currently blocked set.60086 The argument *how* indicates the way in which the set is changed, and the application shall  
60087 ensure it consists of one of the following values:60088 SIG\_BLOCK The resulting set shall be the union of the current set and the signal set  
60089 pointed to by *set*.60090 SIG\_SETMASK The resulting set shall be the signal set pointed to by *set*.60091 SIG\_UNBLOCK The resulting set shall be the intersection of the current set and the  
60092 complement of the signal set pointed to by *set*.60093 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location  
60094 pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the  
60095 thread's signal mask shall be unchanged; thus the call can be used to enquire about currently  
60096 blocked signals.60097 If the argument *set* is not a null pointer, after *pthread\_sigmask()* changes the currently blocked set  
60098 of signals it shall determine whether there are any pending unblocked signals; if there are any,  
60099 then at least one of those signals shall be delivered before the call to *pthread\_sigmask()* returns.60100 It is not possible to block those signals which cannot be ignored. This shall be enforced by the  
60101 system without causing an error to be indicated.60102 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked,  
60103 the result is undefined, unless the signal was generated by the action of another process, or by  
60104 one of the functions *kill()*, *pthread\_kill()*, *raise()*, or *sigqueue()*.60105 If *pthread\_sigmask()* fails, the thread's signal mask shall not be changed.60106 The *sigprocmask()* function shall be equivalent to *pthread\_sigmask()*, except that its behavior is  
60107 unspecified if called from a multi-threaded process, and on error it returns  $-1$  and sets *errno* to  
60108 the error number instead of returning the error number directly.60109 **RETURN VALUE**60110 Upon successful completion, *pthread\_sigmask()* shall return 0; otherwise, it shall return the  
60111 corresponding error number.60112 Upon successful completion, *sigprocmask()* shall return 0; otherwise,  $-1$  shall be returned and  
60113 *errno* shall be set to indicate the error.

60114 **ERRORS**

60115 These functions shall fail if:

60116 [EINVAL] The *set* argument is not a null pointer and the value of the *how* argument is not  
 60117 equal to one of the defined values.

60118 These functions shall not return an error code of [EINTR].

60119 **EXAMPLES**60120 **Signaling in a Multi-Threaded Process**

60121 This example shows the use of *pthread\_sigmask()* in order to deal with signals in a multi-  
 60122 threaded process. It provides a fairly general framework that could be easily adapted/extended.

```

60123 #include <stdio.h>
60124 #include <stdlib.h>
60125 #include <pthread.h>
60126 #include <signal.h>
60127 #include <string.h>
60128 #include <errno.h>
60129 ...
60130 static sigset_t  signal_mask; /* signals to block          */
60131 int main (int argc, char *argv[])
60132 {
60133     pthread_t  sig_thr_id;      /* signal handler thread ID */
60134     int        rc;              /* return code               */
60135     sigemptyset (&signal_mask);
60136     sigaddset (&signal_mask, SIGINT);
60137     sigaddset (&signal_mask, SIGTERM);
60138     rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
60139     if (rc != 0) {
60140         /* handle error */
60141         ...
60142     }
60143     /* any newly created threads inherit the signal mask */
60144     rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
60145     if (rc != 0) {
60146         /* handle error */
60147         ...
60148     }
60149     /* APPLICATION CODE */
60150     ...
60151 }
60152 void *signal_thread (void *arg)
60153 {
60154     int        sig_caught;      /* signal caught            */
60155     int        rc;              /* returned code            */
60156     rc = sigwait (&signal_mask, &sig_caught);
60157     if (rc != 0) {
60158         /* handle error */

```

```

60159     }
60160     switch (sig_caught)
60161     {
60162     case SIGINT:      /* process SIGINT */
60163         ...
60164         break;
60165     case SIGTERM:    /* process SIGTERM */
60166         ...
60167         break;
60168     default:         /* should normally not happen */
60169         fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
60170         break;
60171     }
60172 }

```

### 60173 APPLICATION USAGE

60174 Although *pthread\_sigmask()* has to deliver at least one of any pending unblocked signals that  
60175 exist after it has changed the currently blocked set of signals, there is no requirement that the  
60176 delivered signal(s) include any that were unblocked by the change. If one or more signals that  
60177 were already unblocked become pending (see [Section 2.4.1](#), on page 513) during the period the  
60178 *pthread\_setmask()* call is executing, the signal(s) delivered before the call returns might include  
60179 only those signals.

### 60180 RATIONALE

60181 When a thread's signal mask is changed in a signal-catching function that is installed by  
60182 *sigaction()*, the restoration of the signal mask on return from the signal-catching function  
60183 overrides that change (see *sigaction()*). If the signal-catching function was installed with  
60184 *signal()*, it is unspecified whether this occurs.

60185 See *kill()* for a discussion of the requirement on delivery of signals.

### 60186 FUTURE DIRECTIONS

60187 None.

### 60188 SEE ALSO

60189 *exec*, *kill()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*,  
60190 *sigpending()*, *sigqueue()*, *sigsuspend()*

### 60192 CHANGE HISTORY

60193 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 60194 Issue 5

60195 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

60196 The *pthread\_sigmask()* function is added for alignment with the POSIX Threads Extension.

#### 60197 Issue 6

60198 The *pthread\_sigmask()* function is marked as part of the Threads option.

60199 The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this  
60200 function in the [<signal.h>](#) header is an extension to the ISO C standard.

60201 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

60202           • The DESCRIPTION is updated to explicitly state the functions which may generate the  
60203           signal.

60204           The normative text is updated to avoid use of the term “must” for application requirements.

60205           The **restrict** keyword is added to the *pthread\_sigmask()* and *sigprocmask()* prototypes for  
60206           alignment with the ISO/IEC 9899:1999 standard.

60207           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating “process’ signal  
60208           mask” to “thread’s signal mask” in the DESCRIPTION and RATIONALE sections.

60209           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the  
60210           EXAMPLES section.

60211   **Issue 7**

60212           The *pthread\_sigmask()* function is moved from the Threads option to the Base.

60213           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0467 [319] is applied.

60214   **Issue 8**

60215           Austin Group Defect 1132 is applied, clarifying the [EINVAL] error.

60216           Austin Group Defect 1636 is applied, clarifying the exceptions to the equivalence of  
60217           *pthread\_sigmask()* and *sigprocmask()*.

60218           Austin Group Defect 1731 is applied, clarifying that although *pthread\_sigmask()* has to deliver at  
60219           least one of any pending unblocked signals that exist after it has changed the currently blocked  
60220           set of signals, there is no requirement that the delivered signal(s) include any that were  
60221           unblocked by the change.

60222 **NAME**

60223 pthread\_spin\_destroy, pthread\_spin\_init — destroy or initialize a spin lock object

60224 **SYNOPSIS**

60225 #include &lt;pthread.h&gt;

60226 int pthread\_spin\_destroy(pthread\_spinlock\_t \*lock);

60227 int pthread\_spin\_init(pthread\_spinlock\_t \*lock, int pshared);

60228 **DESCRIPTION**

60229 The *pthread\_spin\_destroy()* function shall destroy the spin lock referenced by *lock* and release any  
 60230 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is  
 60231 reinitialized by another call to *pthread\_spin\_init()*. The results are undefined if  
 60232 *pthread\_spin\_destroy()* is called when a thread holds the lock, or if this function is called with an  
 60233 uninitialized thread spin lock.

60234 The *pthread\_spin\_init()* function shall allocate any resources required to use the spin lock  
 60235 referenced by *lock* and initialize the lock to an unlocked state.

60236 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
 60237 PTHREAD\_PROCESS\_SHARED, the implementation shall permit the spin lock to be operated  
 60238 upon by any thread that has access to the memory where the spin lock is allocated, even if it is  
 60239 allocated in memory that is shared by multiple processes.

60240 See [Section 2.9.9](#) (on page 548) for further requirements.

60241 The results are undefined if *pthread\_spin\_init()* is called specifying an already initialized spin  
 60242 lock. The results are undefined if a spin lock is used without first being initialized.

60243 If the *pthread\_spin\_init()* function fails, the lock is not initialized and the contents of *lock* are  
 60244 undefined.

60245 Only the object referenced by *lock* may be used for performing synchronization.

60246 The result of referring to copies of that object in calls to *pthread\_spin\_destroy()*,  
 60247 *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, or *pthread\_spin\_unlock()* is undefined.

60248 **RETURN VALUE**

60249 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 60250 be returned to indicate the error.

60251 **ERRORS**

60252 The *pthread\_spin\_init()* function shall fail if:

60253 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

60254 [ENOMEM] Insufficient memory exists to initialize the lock.

60255 These functions shall not return an error code of [EINTR].

60256 **EXAMPLES**

60257 None.

60258 **APPLICATION USAGE**

60259 None.

60260 **RATIONALE**

60261 If an implementation detects that the value specified by the *lock* argument to  
 60262 *pthread\_spin\_destroy()* does not refer to an initialized spin lock object, it is recommended that the  
 60263 function should fail and report an [EINVAL] error.

60264 If an implementation detects that the value specified by the *lock* argument to

60265 *pthread\_spin\_destroy()* or *pthread\_spin\_init()* refers to a locked spin lock object, or detects that the  
60266 value specified by the *lock* argument to *pthread\_spin\_init()* refers to an already initialized spin  
60267 lock object, it is recommended that the function should fail and report an [EBUSY] error.

60268 **FUTURE DIRECTIONS**

60269 None.

60270 **SEE ALSO**

60271 *pthread\_spin\_lock()*, *pthread\_spin\_unlock()*

60272 XBD <pthread.h>

60273 **CHANGE HISTORY**

60274 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

60275 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

60276 **Issue 7**

60277 The *pthread\_spin\_destroy()* and *pthread\_spin\_init()* functions are moved from the Spin Locks  
60278 option to the Base.

60279 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
60280 undefined behavior.

60281 The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is  
60282 removed; this condition results in undefined behavior.

60283 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0297 [972] is applied.

60284 **NAME**

60285 pthread\_spin\_lock, pthread\_spin\_trylock — lock a spin lock object

60286 **SYNOPSIS**

60287 #include &lt;pthread.h&gt;

60288 int pthread\_spin\_lock(pthread\_spinlock\_t \*lock);

60289 int pthread\_spin\_trylock(pthread\_spinlock\_t \*lock);

60290 **DESCRIPTION**

60291 The *pthread\_spin\_lock()* function shall lock the spin lock referenced by *lock*. The calling thread  
60292 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,  
60293 shall not return from the *pthread\_spin\_lock()* call) until the lock becomes available. The results are  
60294 undefined if the calling thread holds the lock at the time the call is made. The  
60295 *pthread\_spin\_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any  
60296 thread. Otherwise, the function shall fail.

60297 The results are undefined if any of these functions is called with an uninitialized spin lock.

60298 **RETURN VALUE**

60299 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
60300 be returned to indicate the error.

60301 **ERRORS**

60302 The *pthread\_spin\_lock()* function may fail if:

60303 [EDEADLK] A deadlock condition was detected.

60304 The *pthread\_spin\_trylock()* function shall fail if:

60305 [EBUSY] A thread currently holds the lock.

60306 These functions shall not return an error code of [EINTR].

60307 **EXAMPLES**

60308 None.

60309 **APPLICATION USAGE**

60310 Applications using this function may be subject to priority inversion, as discussed in XBD  
60311 [Section 3.275](#) (on page 72).

60312 **RATIONALE**

60313 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
60314 or *pthread\_spin\_trylock()* does not refer to an initialized spin lock object, it is recommended that  
60315 the function should fail and report an [EINVAL] error.

60316 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
60317 refers to a spin lock object for which the calling thread already holds the lock, it is recommended  
60318 that the function should fail and report an [EDEADLK] error.

60319 **FUTURE DIRECTIONS**

60320 None.

60321 **SEE ALSO**

60322 [pthread\\_spin\\_destroy\(\)](#), [pthread\\_spin\\_unlock\(\)](#)

60323 XBD [Section 3.275](#) (on page 72), [Section 4.15.2](#) (on page 104), [<pthread.h>](#)

60324 **CHANGE HISTORY**

60325 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

60326 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

60327 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS  
60328 section so that the [EDEADLK] error includes detection of a deadlock condition.

60329 **Issue 7**

60330 The `pthread_spin_lock()` and `pthread_spin_trylock()` functions are moved from the Spin Locks  
60331 option to the Base.

60332 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
60333 undefined behavior.

60334 The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is  
60335 removed; this condition results in undefined behavior.

60336 **NAME**

60337 pthread\_spin\_unlock — unlock a spin lock object

60338 **SYNOPSIS**

60339 #include &lt;pthread.h&gt;

60340 int pthread\_spin\_unlock(pthread\_spinlock\_t \*lock);

60341 **DESCRIPTION**60342 The *pthread\_spin\_unlock()* function shall release the spin lock referenced by *lock* which was  
60343 locked via the *pthread\_spin\_lock()* or *pthread\_spin\_trylock()* functions.

60344 The results are undefined if the lock is not held by the calling thread.

60345 If there are threads spinning on the lock when *pthread\_spin\_unlock()* is called, the lock becomes  
60346 available and an unspecified spinning thread shall acquire the lock.

60347 The results are undefined if this function is called with an uninitialized thread spin lock.

60348 **RETURN VALUE**60349 Upon successful completion, the *pthread\_spin\_unlock()* function shall return zero; otherwise, an  
60350 error number shall be returned to indicate the error.60351 **ERRORS**

60352 This function shall not return an error code of [EINTR].

60353 **EXAMPLES**

60354 None.

60355 **APPLICATION USAGE**

60356 None.

60357 **RATIONALE**60358 If an implementation detects that the value specified by the *lock* argument to  
60359 *pthread\_spin\_unlock()* does not refer to an initialized spin lock object, it is recommended that the  
60360 function should fail and report an [EINVAL] error.60361 If an implementation detects that the value specified by the *lock* argument to  
60362 *pthread\_spin\_unlock()* refers to a spin lock object for which the current thread does not hold the  
60363 lock, it is recommended that the function should fail and report an [EPERM] error.60364 **FUTURE DIRECTIONS**

60365 None.

60366 **SEE ALSO**60367 *pthread\_spin\_destroy()*, *pthread\_spin\_lock()*

60368 XBD Section 4.15.2 (on page 104), &lt;pthread.h&gt;

60369 **CHANGE HISTORY**

60370 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

60371 In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

60372 **Issue 7**60373 The *pthread\_spin\_unlock()* function is moved from the Spin Locks option to the Base.60374 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
60375 undefined behavior.

60376  
60377

The [EPERM] error for a spin lock object for which the current thread does not hold the lock is removed; this condition results in undefined behavior.

60378 **NAME**

60379 pthread\_testcancel — set cancelability state

60380 **SYNOPSIS**

60381 #include <pthread.h>

60382 void pthread\_testcancel(void);

60383 **DESCRIPTION**

60384 Refer to *pthread\_setcancelstate()*.

60385 **NAME**

60386 ptsname, ptsname\_r — get name of the subsidiary pseudo-terminal device

60387 **SYNOPSIS**

```
60388 XSI      #include <stdlib.h>
60389      char *ptsname(int fildes);
60390      int ptsname_r(int fildes, char *name, size_t namesize);
```

60391 **DESCRIPTION**

60392 The *ptsname()* function shall return the name of the subsidiary pseudo-terminal device  
 60393 associated with a manager pseudo-terminal device. The *fildes* argument is a file descriptor that  
 60394 refers to the manager device. The *ptsname()* function shall return a pointer to a string containing  
 60395 the pathname of the corresponding subsidiary device.

60396 The *ptsname()* function need not be thread-safe.

60397 The *ptsname\_r()* function shall store the name of the subsidiary pseudo-terminal device  
 60398 corresponding to *fildes* in the character array referenced by *name*. The array is *namesize*  
 60399 characters long and should have space for the name and the terminating null character. The  
 60400 maximum length of the terminal name shall be {TTY\_NAME\_MAX}.

60401 **RETURN VALUE**

60402 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the  
 60403 pseudo-terminal subsidiary device. Upon failure, *ptsname()* shall return a null pointer and may  
 60404 set *errno*. This could occur if *fildes* is an invalid file descriptor or if the subsidiary device name  
 60405 does not exist in the file system.

60406 The application shall not modify the string returned. The returned pointer might be invalidated  
 60407 or the string content might be overwritten by a subsequent call to *ptsname()*. The returned  
 60408 pointer and the string content might also be invalidated if the calling thread is terminated.

60409 If successful, the *ptsname\_r()* function shall return zero. Otherwise, an error number shall be  
 60410 returned to indicate the error.

60411 **ERRORS**

60412 The *ptsname\_r()* function shall fail if:

60413 [EBADF] The *fildes* argument is not a valid file descriptor.

60414 [EINVAL] The *name* argument is a null pointer.

60415 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned  
 60416 including the terminating null character.

60417 The *ptsname()* function may fail if:

60418 [EBADF] The *fildes* argument is not a valid file descriptor.

60419 The *ptsname()* and *ptsname\_r()* functions may fail if:

60420 [EINVAL] or [ENOTTY]

60421 The file associated with the *fildes* argument is not a manager pseudo-terminal  
 60422 device.

60423 **EXAMPLES**

60424 None.

60425 **APPLICATION USAGE**

60426 None.

60427 **RATIONALE**

60428 The *ptsname\_r()* function is required to make it possible for a multi-threaded program to safely  
60429 determine the name of a subsidiary device. Although the name of the device is constrained by  
60430 {TTY\_NAME\_MAX}, this value might not be a compile-time constant, so an application can rely  
60431 on repeated calls with successively larger buffers until the result is no longer [ERANGE] as an  
60432 alternative for properly sizing the buffer.

60433 Historically, some versions of *ptsname()* did not set *errno* even when returning a null pointer.  
60434 However, *ptsname\_r()* is required to either populate the buffer with a valid name or return an  
60435 error value.

60436 See also the RATIONALE section for *posix\_openpt()*.60437 **FUTURE DIRECTIONS**

60438 None.

60439 **SEE ALSO**60440 *grantpt()*, *open()*, *posix\_openpt()*, *ttyname()*, *unlockpt()*

60441 XBD &lt;stdlib.h&gt;

60442 **CHANGE HISTORY**

60443 First released in Issue 4, Version 2.

60444 **Issue 5**

60445 Moved from X/OPEN UNIX extension to BASE.

60446 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

60447 **Issue 7**

60448 Austin Group Interpretation 1003.1-2001 #156 is applied.

60449 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0468 [75] and XSH/TC1-2008/0469  
60450 [96] are applied.

60451 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0298 [503], XSH/TC2-2008/0299 [656],  
60452 and XSH/TC2-2008/0300 [503] are applied.

60453 **Issue 8**60454 Austin Group Defect 508 is applied, adding the *ptsname\_r()* function.

60455 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
60456 devices.

60457 **NAME**

60458       putc — put a byte on a stream

60459 **SYNOPSIS**

60460       #include &lt;stdio.h&gt;

60461       int putc(int *c*, FILE \**stream*);60462 **DESCRIPTION**

60463 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
60464 conflict between the requirements described here and the ISO C standard is unintentional. This  
60465 volume of POSIX.1-2024 defers to the ISO C standard.

60466       The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it  
60467 may evaluate *stream* more than once, so the argument should never be an expression with side-  
60468 effects.

60469 **RETURN VALUE**60470       Refer to *fputc()*.60471 **ERRORS**60472       Refer to *fputc()*.60473 **EXAMPLES**

60474       None.

60475 **APPLICATION USAGE**

60476       Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side-effects  
60477 incorrectly. In particular, *putc(c,\*f++)* does not necessarily work correctly. Therefore, use of this  
60478 function is not recommended in such situations; *fputc()* should be used instead.

60479 **RATIONALE**

60480       None.

60481 **FUTURE DIRECTIONS**

60482       None.

60483 **SEE ALSO**60484       Section 2.5 (on page 521), *fputc()*

60485       XBD &lt;stdio.h&gt;

60486 **CHANGE HISTORY**

60487       First released in Issue 1. Derived from Issue 1 of the SVID.

60488 **Issue 7**

60489       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0470 [14] is applied.

60490 **NAME**

60491       putc\_unlocked — stdio with explicit client locking

60492 **SYNOPSIS**

```
60493 CX       #include <stdio.h>
60494       int putc_unlocked(int c, FILE *stream);
```

60495 **DESCRIPTION**

60496       Refer to [getc\\_unlocked\(\)](#).

60497 **NAME**

60498            putchar — put a byte on a stdout stream

60499 **SYNOPSIS**

60500            #include &lt;stdio.h&gt;

60501            int putchar(int c);

60502 **DESCRIPTION**

60503 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
60504        conflict between the requirements described here and the ISO C standard is unintentional. This  
60505        volume of POSIX.1-2024 defers to the ISO C standard.

60506        The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.60507 **RETURN VALUE**60508        Refer to *fputc()*.60509 **ERRORS**60510        Refer to *fputc()*.60511 **EXAMPLES**

60512        None.

60513 **APPLICATION USAGE**

60514        None.

60515 **RATIONALE**

60516        None.

60517 **FUTURE DIRECTIONS**

60518        None.

60519 **SEE ALSO**60520        [Section 2.5](#) (on page 521), *putc()*60521        XBD [<stdio.h>](#)60522 **CHANGE HISTORY**

60523        First released in Issue 1. Derived from Issue 1 of the SVID.

60524 **Issue 7**

60525        POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0471 [14] is applied.

60526 **NAME**

60527 putchar\_unlocked — stdio with explicit client locking

60528 **SYNOPSIS**

60529 CX `#include <stdio.h>`

60530 `int putchar_unlocked(int c);`

60531 **DESCRIPTION**

60532 Refer to [getc\\_unlocked\(\)](#).

60533 **NAME**

60534 putenv — change or add a value to an environment

60535 **SYNOPSIS**

```
60536 XSI      #include <stdlib.h>
60537         int putenv(char *string);
```

60538 **DESCRIPTION**60539 The *putenv()* function shall use the *string* argument to set, or optionally unset, an environment  
60540 variable value:

- 60541 • If the *string* argument points to a string of the form "*name=value*", where *name* is a valid  
60542 name, the *putenv()* function shall make the value of the environment variable with that  
60543 name equal to *value* by altering an existing variable or creating a new one. In either case,  
60544 the string pointed to by *string* shall become part of the environment, so altering the string  
60545 shall change the environment.
- 60546 • If the *string* argument points to a string containing a valid name, the *putenv()* function  
60547 shall either remove the environment variable with that name (if it exists) from the  
60548 environment or fail with *errno* set to [EINVAL].
- 60549 • Otherwise, the behavior is unspecified.

60550 The *putenv()* function need not be thread-safe.60551 **RETURN VALUE**60552 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value  
60553 and set *errno* to indicate the error.60554 **ERRORS**60555 The *putenv()* function may fail if:

- 60556 [EINVAL] The *string* argument points to a string that is not of the form "*name=value*",  
60557 where *name* is a valid name.
- 60558 [ENOMEM] Insufficient memory was available.

60559 **EXAMPLES**60560 **Changing the Value of an Environment Variable**60561 The following example changes the value of the *HOME* environment variable to the value  
60562 */usr/home*.

```
60563 #include <stdlib.h>
60564 ...
60565 static char *var = "HOME=/usr/home";
60566 int ret;
60567
60567 ret = putenv(var);
```

60568 **APPLICATION USAGE**60569 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in  
60570 conjunction with *getenv()*.60571 See *exec()* for restrictions on changing the environment in multi-threaded applications.60572 This routine may use *malloc()* to enlarge the environment.60573 A potential error is to call *putenv()* with an automatic variable as the argument, then return from

60574 the calling function while *string* is still part of the environment.

60575 Although the space used by *string* is no longer used once a new string which defines *name* is  
60576 passed to *putenv()*, if any thread in the application has used *getenv()* to retrieve a pointer to this  
60577 variable, it should not be freed by calling *free()*. If the changed environment variable is one  
60578 known by the system (such as the locale environment variables) the application should never  
60579 free the buffer used by earlier calls to *putenv()* for the same variable.

60580 The *setenv()* function is preferred over this function. One reason is that *putenv()* is optional and  
60581 therefore less portable. Another is that using *putenv()* can slow down environment searches, as  
60582 explained in the RATIONALE section for *getenv()*.

60583 **RATIONALE**

60584 Refer to the RATIONALE section in *setenv()*.

60585 **FUTURE DIRECTIONS**

60586 None.

60587 **SEE ALSO**

60588 *exec*, *free()*, *getenv()*, *malloc()*, *setenv()*

60589 XBD <stdlib.h>

60590 **CHANGE HISTORY**

60591 First released in Issue 1. Derived from Issue 1 of the SVID.

60592 **Issue 5**

60593 The type of the argument to this function is changed from **const char \*** to **char \***. This was  
60594 indicated as a FUTURE DIRECTION in previous issues.

60595 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

60596 **Issue 6**

60597 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the  
60598 DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to  
60599 *exec*.

60600 **Issue 7**

60601 Austin Group Interpretation 1003.1-2001 #156 is applied.

60602 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0472 [167], XSH/TC1-2008/0473 [167],  
60603 XSH/TC1-2008/0474 [273,438], and XSH/TC1-2008/0475 [273] are applied.

60604 **Issue 8**

60605 Austin Group Defect 1598 is applied, specifying the allowed behaviors when the *string* argument  
60606 points to a string containing a valid name.

60607 **NAME**

60608 puts — put a string on standard output

60609 **SYNOPSIS**

```
60610 #include <stdio.h>
60611 int puts(const char *s);
```

60612 **DESCRIPTION**

60613 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 60614 conflict between the requirements described here and the ISO C standard is unintentional. This  
 60615 volume of POSIX.1-2024 defers to the ISO C standard.

60616 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the  
 60617 standard output stream *stdout*. The terminating null byte shall not be written.

60618 CX The last data modification and last file status change timestamps of the file shall be marked for  
 60619 update between the successful execution of *puts()* and the next successful completion of a call to  
 60620 *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

60621 **RETURN VALUE**

60622 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall  
 60623 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

60624 **ERRORS**60625 Refer to *fputc()*.60626 **EXAMPLES**60627 **Printing to Standard Output**

60628 The following example gets the current time, converts it to a string using *localtime()* and  
 60629 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to  
 60630 an event for which it is waiting.

```
60631 #include <time.h>
60632 #include <stdio.h>
60633 ...
60634 time_t now;
60635 int minutes_to_event;
60636 ...
60637 time(&now);
60638 printf("The time is ");
60639 puts(asctime(localtime(&now)));
60640 printf("There are %d minutes to the event.\n",
60641     minutes_to_event);
60642 ...
```

60643 **APPLICATION USAGE**60644 The *puts()* function appends a <newline>, while *fputs()* does not.

60645 This volume of POSIX.1-2024 requires that successful completion simply return a non-negative  
 60646 integer. There are at least three known different implementation conventions for this  
 60647 requirement:

- 60648 • Return a constant value.

60649           • Return the last character written.

60650           • Return the number of bytes written. Note that this implementation convention cannot be  
60651           adhered to for strings longer than {INT\_MAX} bytes as the value would not be  
60652           representable in the return type of the function. For backwards compatibility,  
60653           implementations can return the number of bytes for strings of up to {INT\_MAX} bytes, and  
60654           return {INT\_MAX} for all longer strings.

60655   **RATIONALE**  
60656           None.

60657   **FUTURE DIRECTIONS**  
60658           None.

60659   **SEE ALSO**  
60660           [Section 2.5](#) (on page 521), [fopen\(\)](#), [fputs\(\)](#), [putc\(\)](#)

60662   **CHANGE HISTORY**  
60663           First released in Issue 1. Derived from Issue 1 of the SVID.

60664   **Issue 6**  
60665           Extensions beyond the ISO C standard are marked.

60666   **Issue 7**  
60667           Changes are made related to support for finegrained timestamps.

60668           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0476 [174,412] and  
60669           XSH/TC1-2008/0477 [14] are applied.

60670 **NAME**

60671 pututxline — put an entry into the user accounting database

60672 **SYNOPSIS**

```
60673 XSI #include <utmpx.h>  
60674 struct utmpx *pututxline(const struct utmpx *utmpx);
```

60675 **DESCRIPTION**60676 Refer to *endutxent()*.

60677 **NAME**

60678 putwc — put a wide character on a stream

60679 **SYNOPSIS**

60680 #include &lt;stdio.h&gt;

60681 #include &lt;wchar.h&gt;

60682 wint\_t putwc(wchar\_t *wc*, FILE \**stream*);60683 **DESCRIPTION**60684 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
60685 conflict between the requirements described here and the ISO C standard is unintentional. This  
60686 volume of POSIX.1-2024 defers to the ISO C standard.60687 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro  
60688 it may evaluate *stream* more than once, so the argument should never be an expression with  
60689 side-effects.60690 **RETURN VALUE**60691 Refer to *fputwc()*.60692 **ERRORS**60693 Refer to *fputwc()*.60694 **EXAMPLES**

60695 None.

60696 **APPLICATION USAGE**60697 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side-effects  
60698 incorrectly. In particular, *putwc(wc,\*f++)* need not work correctly. Therefore, use of this function  
60699 is not recommended; *fputwc()* should be used instead.60700 **RATIONALE**

60701 None.

60702 **FUTURE DIRECTIONS**

60703 None.

60707 **CHANGE HISTORY**

60708 First released as a World-wide Portability Interface in Issue 4.

60709 **Issue 5**60710 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
60711 is changed from **wint\_t** to **wchar\_t**.

60712 The Optional Header (OH) marking is removed from &lt;stdio.h&gt;.

60713 **Issue 7**

60714 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0478 [14] is applied.

60715 **NAME**

60716 putwchar — put a wide character on a stdout stream

60717 **SYNOPSIS**

60718 #include &lt;wchar.h&gt;

60719 wint\_t putwchar(wchar\_t wc);

60720 **DESCRIPTION**

60721 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
60722 conflict between the requirements described here and the ISO C standard is unintentional. This  
60723 volume of POSIX.1-2024 defers to the ISO C standard.

60724 The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.60725 **RETURN VALUE**60726 Refer to *fputwc()*.60727 **ERRORS**60728 Refer to *fputwc()*.60729 **EXAMPLES**

60730 None.

60731 **APPLICATION USAGE**

60732 None.

60733 **RATIONALE**

60734 None.

60735 **FUTURE DIRECTIONS**

60736 None.

60737 **SEE ALSO**60738 [Section 2.5](#) (on page 521), *fputwc()*, *putwc()*60739 XBD [<wchar.h>](#)60740 **CHANGE HISTORY**

60741 First released in Issue 4.

60742 **Issue 5**

60743 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
60744 is changed from **wint\_t** to **wchar\_t**.

60745 **Issue 7**

60746 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0479 [14] is applied.

60747 **NAME**

60748       pwrite — write on a file

60749 **SYNOPSIS**

60750       #include <unistd.h>

60751       ssize\_t pwrite(int *fd*, const void \**buf*, size\_t *nbyte*,  
60752                   off\_t *offset*);

60753 **DESCRIPTION**

60754       Refer to *write()*.

60755 **NAME**

60756 qsort, qsort\_r — sort a table of data

60757 **SYNOPSIS**

60758 #include &lt;stdlib.h&gt;

60759 void qsort(void \*base, size\_t nel, size\_t width,  
60760 int (\*compar)(const void \*, const void \*));60761 CX void qsort\_r(void \*base, size\_t nel, size\_t width,  
60762 int (\*compar)(const void \*, const void \*, void \*), void \*arg);60763 **DESCRIPTION**60764 CX For *qsort()*: The functionality described on this reference page is aligned with the ISO C  
60765 standard. Any conflict between the requirements described here and the ISO C standard is  
60766 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.60767 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by  
60768 *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has  
60769 the value zero, the comparison function pointed to by *compar* shall not be called and no  
60770 rearrangement shall take place.60771 The application shall ensure that the comparison function pointed to by *compar* does not alter the  
60772 contents of the array. The implementation may reorder elements of the array between calls to the  
60773 comparison function, but shall not alter the contents of any individual element.60774 When the same objects (consisting of *width* bytes, irrespective of their current positions in the  
60775 array) are passed more than once to the comparison function, the results shall be consistent with  
60776 one another. That is, they shall define a total ordering on the array.60777 The contents of the array shall be sorted in ascending order according to a comparison function.  
60778 The *compar* argument is a pointer to the comparison function, which is called with two  
60779 arguments that point to the elements being compared. The application shall ensure that the  
60780 function returns an integer less than, equal to, or greater than 0, if the first argument is  
60781 considered respectively less than, equal to, or greater than the second. If two members compare  
60782 as equal, their order in the sorted array is unspecified.60783 CX The *qsort\_r()* function shall be identical to *qsort()* except that the comparison function *compar*  
60784 takes a third argument. The *arg* opaque pointer passed to *qsort\_r()* shall in turn be passed as the  
60785 third argument to the comparison function.60786 **RETURN VALUE**

60787 These functions shall not return a value.

60788 **ERRORS**

60789 No errors are defined.

60790 **EXAMPLES**

60791 None.

60792 **APPLICATION USAGE**60793 The comparison function need not compare every byte, so arbitrary data may be contained in  
60794 the elements in addition to the values being compared.60795 If the *compar* callback function requires any additional state outside of the items being sorted, it  
60796 can only access this state through global variables, making it potentially unsafe to use *qsort()*  
60797 with the same *compar* function from separate threads at the same time. The *qsort\_r()* function  
60798 was added with the ability to pass through arbitrary arguments to the comparator, which avoids  
60799 the need to access global variables and thus making it possible to safely share a stateful

60800 comparator across threads.

60801 **RATIONALE**

60802 The requirement that each argument (hereafter referred to as *p*) to the comparison function is a  
60803 pointer to elements of the array implies that for every call, for each argument separately, all of  
60804 the following expressions are non-zero:

60805 `((char *)p - (char *)base) % width == 0`

60806 `(char *)p >= (char *)base`

60807 `(char *)p < (char *)base + nel * width`

60808 **FUTURE DIRECTIONS**

60809 None.

60810 **SEE ALSO**

60811 [\*alphasort\(\)\*](#)

60812 XBD [`<stdlib.h>`](#)

60813 **CHANGE HISTORY**

60814 First released in Issue 1. Derived from Issue 1 of the SVID.

60815 **Issue 6**

60816 The normative text is updated to avoid use of the term “must” for application requirements.

60817 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to  
60818 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The  
60819 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

60820 **Issue 8**

60821 Austin Group Defect 900 is applied, adding the *qsort\_r()* function.

60822 **NAME**

60823 quick\_exit — terminate a process

60824 **SYNOPSIS**

60825 #include &lt;stdlib.h&gt;

60826 \_Noreturn void quick\_exit(int status);

60827 **DESCRIPTION**

60828 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
60829 conflict between the requirements described here and the ISO C standard is unintentional. This  
60830 volume of POSIX.1-2024 defers to the ISO C standard.

60831 The *quick\_exit()* function shall cause normal process termination to occur. It shall not call  
60832 functions registered with *atexit()* nor any registered signal handlers. If a process calls the  
60833 *quick\_exit()* function more than once, or calls the *exit()* function in addition to the *quick\_exit()*  
60834 function, the behavior is undefined. If a signal is raised while the *quick\_exit()* function is  
60835 executing, the behavior is undefined.

60836 The *quick\_exit()* function shall first call all functions registered by *at\_quick\_exit()*, in the reverse  
60837 order of their registration, except that a function is called after any previously registered  
60838 functions that had already been called at the time it was registered. If, during the call to any such  
60839 CX function, a call to the *longjmp()* or *siglongjmp()* function is made that would terminate the call  
60840 to the registered function, the behavior is undefined.

60841 If a function registered by a call to *at\_quick\_exit()* fails to return, the remaining registered  
60842 functions shall not be called and the rest of the *quick\_exit()* processing shall not be completed.

60843 Finally, the *quick\_exit()* function shall terminate the process as if by a call to *\_Exit(status)*.

60844 **RETURN VALUE**60845 The *quick\_exit()* function does not return.60846 **ERRORS**

60847 No errors are defined.

60848 **EXAMPLES**

60849 None.

60850 **APPLICATION USAGE**

60851 None.

60852 **RATIONALE**

60853 None.

60854 **FUTURE DIRECTIONS**

60855 None.

60859 **CHANGE HISTORY**

60860 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

60861 **NAME**

60862 raise — send a signal to the executing process

60863 **SYNOPSIS**

60864 #include &lt;signal.h&gt;

60865 int raise(int sig);

60866 **DESCRIPTION**60867 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
60868 conflict between the requirements described here and the ISO C standard is unintentional. This  
60869 volume of POSIX.1-2024 defers to the ISO C standard.60870 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal  
60871 handler is called, the *raise()* function shall not return until after the signal handler does.60872 CX The effect of the *raise()* function shall be equivalent to calling:

60873 pthread\_kill(pthread\_self(), sig);

60874 **RETURN VALUE**60875 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned  
60876 and *errno* shall be set to indicate the error.60877 **ERRORS**60878 The *raise()* function shall fail if:60879 CX [EINVAL] The value of the *sig* argument is an invalid signal number.60880 **EXAMPLES**

60881 None.

60882 **APPLICATION USAGE**

60883 None.

60884 **RATIONALE**

60885 The term “thread” is an extension to the ISO C standard.

60886 **FUTURE DIRECTIONS**

60887 None.

60888 **SEE ALSO**60889 [kill\(\)](#), [sigaction\(\)](#)60890 XBD [<signal.h>](#), [<sys/types.h>](#)60891 **CHANGE HISTORY**

60892 First released in Issue 4. Derived from the ANSI C standard.

60893 **Issue 5**

60894 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

60895 **Issue 6**

60896 Extensions beyond the ISO C standard are marked.

60897 The following new requirements on POSIX implementations derive from alignment with the  
60898 Single UNIX Specification:

- 60899
- In the RETURN VALUE section, the requirement to set *errno* on error is added.

60900

- The [EINVAL] error condition is added.

60901 **Issue 7**

60902

Functionality relating to the Threads option is moved to the Base.

60903 **NAME**

60904 rand, srand — pseudo-random number generator

60905 **SYNOPSIS**

```
60906 #include <stdlib.h>
60907 int rand(void);
60908 void srand(unsigned seed);
```

60909 **DESCRIPTION**

60910 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 60911 conflict between the requirements described here and the ISO C standard is unintentional. This  
 60912 volume of POSIX.1-2024 defers to the ISO C standard.

60913 The *rand()* function shall compute a sequence of pseudo-random integers in the range  
 60914 XSI [0,{RAND\_MAX}] with a period of at least  $2^{32}$ .

60915 The *rand()* function need not be thread-safe; however, *rand()* shall avoid data races with all  
 60916 functions other than non-thread-safe pseudo-random sequence generation functions.

60917 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random  
 60918 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same  
 60919 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before  
 60920 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first  
 60921 called with a seed value of 1.

60922 The *srand()* function need not be thread-safe; however, *srand()* shall avoid data races with all  
 60923 functions other than non-thread-safe pseudo-random sequence generation functions.

60924 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 60925 *rand()* or *srand()*.

60926 **RETURN VALUE**60927 The *rand()* function shall return the next pseudo-random number in the sequence.60928 The *srand()* function shall not return a value.60929 **ERRORS**

60930 No errors are defined.

60931 **EXAMPLES**60932 **Generating a Pseudo-Random Number Sequence**

60933 The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
60934 #include <stdio.h>
60935 #include <stdlib.h>
60936 ...
60937     long count, i;
60938     char *keyst;
60939     int elementlen, len;
60940     char c;
60941     ...
60942 /* Initial random number generator. */
60943     srand(1);
60944
60945     /* Create keys using only lowercase characters */
60946     len = 0;
60947     for (i=0; i<count; i++) {
```

```

60947         while (len < elementlen) {
60948             c = (char) (rand() % 128);
60949             if (islower(c))
60950                 keystr[len++] = c;
60951         }
60952         keystr[len] = '\0';
60953         printf("%s Element%0*ld\n", keystr, elementlen, i);
60954         len = 0;
60955     }

```

### 60956 **Generating the Same Sequence on Different Machines**

60957 The following code defines a pair of functions that could be incorporated into applications  
60958 wishing to ensure that the same sequence of numbers is generated across different machines.

```

60959 static unsigned long next = 1;
60960 int myrand(void) /* RAND_MAX assumed to be 32767. */
60961 {
60962     next = next * 1103515245 + 12345;
60963     return((unsigned) (next/65536) % 32768);
60964 }
60965 void mysrand(unsigned seed)
60966 {
60967     next = seed;
60968 }

```

### 60969 **APPLICATION USAGE**

60970 These functions should be avoided whenever non-trivial requirements (including safety) have to  
60971 be fulfilled, unless seeded using *getentropy()*.

60972 The *drand48()* and *random()* functions provide much more elaborate pseudo-random number  
60973 generators.

### 60974 **RATIONALE**

60975 The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams  
60976 shared by all threads. Those two functions need not change, but there has to be mutual-  
60977 exclusion that prevents interference between two threads concurrently accessing the random  
60978 number generator.

60979 With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded  
60980 program:

- 60981 1. A single per-process sequence of pseudo-random numbers that is shared by all threads  
60982 that call *rand()*
- 60983 2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

60984 This is provided by the modified thread-safe function based on whether the seed value is global  
60985 to the entire process or local to each thread.

60986 This does not address the known deficiencies of the *rand()* function implementations, which  
60987 have been approached by maintaining more state. In effect, this specifies new thread-safe forms  
60988 of a deficient function.

60989 **FUTURE DIRECTIONS**

60990 None.

60991 **SEE ALSO**60992 *drand48()*, *getentropy()*, *initstate()*

60993 XBD &lt;stdlib.h&gt;

60994 **CHANGE HISTORY**

60995 First released in Issue 1. Derived from Issue 1 of the SVID.

60996 **Issue 5**60997 The *rand\_r()* function is included for alignment with the POSIX Threads Extension.60998 A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.60999 **Issue 6**

61000 Extensions beyond the ISO C standard are marked.

61001 The *rand\_r()* function is marked as part of the Thread-Safe Functions option.61002 **Issue 7**

61003 Austin Group Interpretation 1003.1-2001 #156 is applied.

61004 The *rand\_r()* function is marked obsolescent.

61005 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0301 [743] is applied.

61006 **Issue 8**61007 Austin Group Defect 1134 is applied, adding *getentropy()*.

61008 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018 standard.

61010 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

61011 **NAME**

61012 random — generate pseudo-random number

61013 **SYNOPSIS**61014 XSI `#include <stdlib.h>`61015 `long random(void);`61016 **DESCRIPTION**61017 Refer to *initstate()*.

61018 **NAME**

61019           pread, read — read from a file

61020 **SYNOPSIS**

61021       #include &lt;unistd.h&gt;

61022       ssize\_t pread(int *fildes*, void \**buf*, size\_t *nbyte*, off\_t *offset*);61023       ssize\_t read(int *fildes*, void \**buf*, size\_t *nbyte*);61024 **DESCRIPTION**

61025       The *read()* function shall attempt to read *nbyte* bytes from the file associated with the open file  
 61026       descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on  
 61027       the same pipe, FIFO, or terminal device is unspecified.

61028       Before any action described below is taken, and if *nbyte* is zero, the *read()* function may detect  
 61029       and return errors as described below. In the absence of errors, or if error detection is not  
 61030       performed, the *read()* function shall return zero and have no other results.

61031       On files that support seeking (for example, a regular file), the *read()* shall start at a position in  
 61032       the file given by the file offset associated with *fildes*. The file offset shall be incremented by the  
 61033       number of bytes actually read.

61034       Files that do not support seeking—for example, terminals—always read from the current  
 61035       position. The value of a file offset associated with such a file is undefined.

61036       No data transfer shall occur past the current end-of-file. If the starting position is at or after the  
 61037       end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent  
 61038       *read()* requests is implementation-defined.

61039       If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

61040       When attempting to read from an empty pipe or FIFO:

- 61041           • If no process has the pipe open for writing, *read()* shall return 0 to indicate end-of-file.
- 61042           • If some process has the pipe open for writing and O\_NONBLOCK is set, *read()* shall return  
 61043            -1 and set *errno* to [EAGAIN].
- 61044           • If some process has the pipe open for writing and O\_NONBLOCK is clear, *read()* shall  
 61045            block the calling thread until some data is written or the pipe is closed by all processes that  
 61046            had the pipe open for writing.

61047       When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and  
 61048       has no data currently available:

- 61049           • If O\_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- 61050           • If O\_NONBLOCK is clear, *read()* shall block the calling thread until some data becomes  
 61051            available.
- 61052           • The use of the O\_NONBLOCK flag has no effect if there is some data available.

61053       The *read()* function reads data previously written to a file. If any portion of a regular file prior to  
 61054       the end-of-file has not been written, *read()* shall return bytes with value 0. For example, *lseek()*  
 61055       allows the file offset to be set beyond the end of existing data in the file. If data is later written at  
 61056       this point, subsequent reads in the gap between the previous end of data and the newly written  
 61057       data shall return bytes with value 0 until data is written into the gap.

61058       Upon successful completion, where *nbyte* is greater than 0, *read()* shall mark for update the last  
 61059       data access timestamp of the file, and shall return the number of bytes read. This number shall  
 61060       never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

61061		left in the file is less than <i>nbyte</i> , if the <i>read()</i> request was interrupted by a signal, or if the file is a pipe or FIFO or special file and has fewer than <i>nbyte</i> bytes immediately available for reading. For example, a <i>read()</i> from a file associated with a terminal may return one typed line of data.
61062		
61063		
61064		If a <i>read()</i> is interrupted by a signal before it reads any data, it shall return $-1$ with <i>errno</i> set to [EINTR].
61065		
61066		If a <i>read()</i> is interrupted by a signal after it has successfully read some data, it shall return the number of bytes read.
61067		
61068		For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with <i>fildev</i> .
61069		
61070		If <i>fildev</i> refers to a socket, <i>read()</i> shall be equivalent to <i>recv()</i> with no flags set.
61071	SIO	If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
61072		
61073		
61074		
61075	SHM	If <i>fildev</i> refers to a shared memory object, the result of the <i>read()</i> function is unspecified.
61076	TYM	If <i>fildev</i> refers to a typed memory object, the result of the <i>read()</i> function is unspecified.
61077		The <i>pread()</i> function shall be equivalent to <i>read()</i> , except that it shall read from a given position in the file without changing the file offset. The first three arguments to <i>pread()</i> are the same as <i>read()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file. An attempt to perform a <i>pread()</i> on a file that is incapable of seeking shall result in an error.
61078		
61079		
61080		
61081		<b>RETURN VALUE</b>
61082		Upon successful completion, these functions shall return a non-negative integer indicating the number of bytes actually read. Otherwise, the functions shall return $-1$ and set <i>errno</i> to indicate the error.
61083		
61084		
61085		<b>ERRORS</b>
61086		These functions shall fail if:
61087	[EAGAIN]	The file is neither a pipe, nor a FIFO, nor a socket, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the read operation.
61088		
61089		
61090	[EBADF]	The <i>fildev</i> argument is not a valid file descriptor open for reading.
61091	[EINTR]	The read operation was terminated due to the receipt of a signal, and no data was transferred.
61092		
61093	[EIO]	The process is a member of a background process group attempting to read from its controlling terminal, and either the calling thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process group of the process is orphaned. This error may also be generated for implementation-defined reasons.
61094		
61095		
61096		
61097		
61098	XSI	[EISDIR] The <i>fildev</i> argument refers to a directory and the implementation does not allow the directory to be read using <i>read()</i> or <i>pread()</i> . The <i>readdir()</i> function should be used instead.
61099		
61100		
61101	[EOVERFLOW]	The file is a regular file, <i>nbyte</i> is greater than 0, the starting position is before the end-of-file, and the starting position is greater than or equal to the offset maximum established in the open file description associated with <i>fildev</i> .
61102		
61103		

- 61104 The *pread()* function shall fail if:
- 61105 [EINVAL] The file is a regular file or block special file, and the *offset* argument is  
61106 negative. The file offset shall remain unchanged.
- 61107 [ESPIPE] The file is incapable of seeking.
- 61108 The *read()* function shall fail if:
- 61109 [EAGAIN] The file is a pipe or FIFO, the O\_NONBLOCK flag is set for the file descriptor,  
61110 and the thread would be delayed in the read operation.
- 61111 [EAGAIN] or [EWOULDBLOCK]  
61112 The file is a socket, the O\_NONBLOCK flag is set for the file descriptor, and  
61113 the thread would be delayed in the read operation.
- 61114 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by  
61115 its peer.
- 61116 [ENOTCONN] A read was attempted on a socket that is not connected.
- 61117 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.
- 61118 These functions may fail if:
- 61119 [EIO] A physical I/O error has occurred.
- 61120 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 61121 [ENOMEM] Insufficient memory was available to fulfill the request.
- 61122 [ENXIO] A request was made of a nonexistent device, or the request was outside the  
61123 capabilities of the device.

#### 61124 EXAMPLES

##### 61125 Reading Data into a Buffer

61126 The following example reads data from the file associated with the file descriptor *fd* into the  
61127 buffer pointed to by *buf*.

```
61128 #include <sys/types.h>
61129 #include <unistd.h>
61130 ...
61131 char buf[20];
61132 size_t nbytes;
61133 ssize_t bytes_read;
61134 int fd;
61135 ...
61136 nbytes = sizeof(buf);
61137 bytes_read = read(fd, buf, nbytes);
61138 ...
```

#### 61139 APPLICATION USAGE

61140 None.

#### 61141 RATIONALE

61142 This volume of POSIX.1-2024 does not specify the value of the file offset after an error is  
61143 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
61144 meaningless since no file is involved. For errors that are detected immediately, such as  
61145 [EAGAIN], clearly the offset should not change. After an interrupt or hardware error, however,  
61146 an updated value would be very useful and is the behavior of many implementations.

61147 Note that a `read()` of zero bytes does not modify the last data access timestamp. A `read()` that  
61148 requests more than zero bytes, but returns zero, is required to modify the last data access  
61149 timestamp.

61150 Implementations are allowed, but not required, to perform error checking for `read()` requests of  
61151 zero bytes.

## 61152 **Input and Output**

61153 The use of I/O with large byte counts has always presented problems. Ideas such as `lread()` and  
61154 `lwrite()` (using and returning **longs**) were considered at one time. The current solution is to use  
61155 abstract types on the ISO C standard function to `read()` and `write()`. The abstract types can be  
61156 declared so that existing functions work, but can also be declared so that larger types can be  
61157 represented in future implementations. It is presumed that whatever constraints limit the  
61158 maximum range of **size\_t** also limit portable I/O requests to the same range. This volume of  
61159 POSIX.1-2024 also limits the range further by requiring that the byte count be limited so that a  
61160 signed return value remains meaningful. Since the return type is also a (signed) abstract type,  
61161 the byte count can be defined by the implementation to be larger than an **int** can hold.

61162 The standard developers considered adding atomicity requirements to a pipe or FIFO, but  
61163 recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of  
61164 reads of {PIPE\_BUF} or any other size that would be an aid to applications portability.

61165 This volume of POSIX.1-2024 requires that no action be taken for `read()` or `write()` when *nbyte* is  
61166 zero. This is not intended to take precedence over detection of errors (such as invalid buffer  
61167 pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-2024, but  
61168 the phrasing here could be misread to require detection of the zero case before any other errors.  
61169 A value of zero is to be considered a correct value, for which the semantics are a no-op.

61170 I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the  
61171 bytes from a single operation that started out together end up together, without interleaving  
61172 from other I/O operations. It is a known attribute of terminals that this is not honored, and  
61173 terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified.  
61174 The behavior for other device types is also left unspecified, but the wording is intended to imply  
61175 that future standards might choose to specify atomicity (or not).

61176 There were recommendations to add format parameters to `read()` and `write()` in order to handle  
61177 networked transfers among heterogeneous file system and base hardware types. Such a facility  
61178 may be required for support by the OSI presentation of layer services. However, it was  
61179 determined that this should correspond with similar C-language facilities, and that is beyond  
61180 the scope of this volume of POSIX.1-2024. The concept was suggested to the developers of the  
61181 ISO C standard for their consideration as a possible area for future work.

61182 In 4.3 BSD, a `read()` or `write()` that is interrupted by a signal before transferring any data does  
61183 not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth  
61184 Edition, there is an additional function, `select()`, whose purpose is to pause until specified  
61185 activity (data to read, space to write, and so on) is detected on specified file descriptors. It is  
61186 common in applications written for those systems for `select()` to be used before `read()` in  
61187 situations (such as keyboard input) where interruption of I/O due to a signal is desired.

61188 The issue of which files or file types are interruptible is considered an implementation design  
61189 issue. This is often affected primarily by hardware and reliability issues.

61190 There are no references to actions taken following an “unrecoverable error”. It is considered  
61191 beyond the scope of this volume of POSIX.1-2024 to describe what happens in the case of  
61192 hardware errors.

61193 Earlier versions of this standard allowed two very different behaviors with regard to the  
 61194 handling of interrupts. In order to minimize the resulting confusion, it was decided that  
 61195 POSIX.1-2024 should support only one of these behaviors. Historical practice on AT&T-derived  
 61196 systems was to have *read()* and *write()* return  $-1$  and set *errno* to [EINTR] when interrupted after  
 61197 some, but not all, of the data requested had been transferred. However, the US Department of  
 61198 Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read()* and  
 61199 *write()* return the number of bytes actually transferred before the interrupt. If  $-1$  is returned  
 61200 when any data is transferred, it is difficult to recover from the error on a seekable device and  
 61201 impossible on a non-seekable device. Most new implementations support this behavior. The  
 61202 behavior required by POSIX.1-2024 is to return the number of bytes transferred.

61203 POSIX.1-2024 does not specify when an implementation that buffers *read()*s actually moves the  
 61204 data into the user-supplied buffer, so an implementation may choose to do this at the latest  
 61205 possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a  
 61206 partial byte count, but rather to return  $-1$  and set *errno* to [EINTR].

61207 Consideration was also given to combining the two previous options, and setting *errno* to  
 61208 [EINTR] while returning a short count. However, not only is there no existing practice that  
 61209 implements this, it is also contradictory to the idea that when *errno* is set, the function  
 61210 responsible shall return  $-1$ .

61211 This volume of POSIX.1-2024 intentionally does not specify any *pread()* errors related to pipes,  
 61212 FIFOs, and sockets other than [ESPIPE].

#### 61213 FUTURE DIRECTIONS

61214 None.

#### 61215 SEE ALSO

61216 *fcntl()*, *lseek()*, *open()*, *pipe()*, *readv()*

#### 61218 CHANGE HISTORY

61219 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 61220 Issue 5

61221 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 61222 Threads Extension.

61223 Large File Summit extensions are added.

61224 The *pread()* function is added.

#### 61225 Issue 6

61226 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
 61227 marked as part of the XSI STREAMS Option Group.

61228 The following new requirements on POSIX implementations derive from alignment with the  
 61229 Single UNIX Specification:

- 61230 • The DESCRIPTION now states that if *read()* is interrupted by a signal after it has  
 61231 successfully read some data, it returns the number of bytes read. In Issue 3, it was optional  
 61232 whether *read()* returned the number of bytes read, or whether it returned  $-1$  with *errno* set  
 61233 to [EINTR]. This is a FIPS requirement.
- 61234 • In the DESCRIPTION, text is added to indicate that for regular files, no data transfer  
 61235 occurs past the offset maximum established in the open file description associated with  
 61236 *files*. This change is to support large files.

- 61237           • The [Eoverflow] mandatory error condition is added.
- 61238           • The [ENXIO] optional error condition is added.
- 61239           Text referring to sockets is added to the DESCRIPTION.
- 61240           The following changes were made to align with the IEEE P1003.1a draft standard:
- 61241           • The effect of reading zero bytes is clarified.
- 61242           The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *read()* results are unspecified for typed memory objects.
- 61243
- 61244           New RATIONALE is added to explain the atomicity requirements for input and output operations.
- 61245
- 61246           The following error conditions are added for operations on sockets: [EAGAIN], [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].
- 61247
- 61248           The [EIO] error is made optional.
- 61249           The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].
- 61250
- 61251           The *readv()* function is split out into a separate reference page.
- 61252           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.
- 61253
- 61254
- 61255           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial correction in the RATIONALE section.
- 61256
- 61257   **Issue 7**
- 61258           The *pread()* function is moved from the XSI option to the Base.
- 61259           Functionality relating to the XSI STREAMS option is marked obsolescent.
- 61260           Changes are made related to support for finegrained timestamps.
- 61261           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0480 [218], XSH/TC1-2008/0481 [79], XSH/TC1-2008/0482 [218], XSH/TC1-2008/0483 [218], XSH/TC1-2008/0484 [218], and XSH/TC1-2008/0485 [218,428] are applied.
- 61262
- 61263
- 61264           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0302 [710] and XSH/TC2-2008/0303 [676,710] are applied.
- 61265
- 61266   **Issue 8**
- 61267           Austin Group Defect 1330 is applied, removing obsolescent interfaces.

61268 **NAME**

61269 readdir, readdir\_r — read a directory

61270 **SYNOPSIS**

61271 #include &lt;dirent.h&gt;

61272 struct dirent \*readdir(DIR \*dirp);

61273 OB int readdir\_r(DIR \*restrict dirp, struct dirent \*restrict entry,  
61274 struct dirent \*\*restrict result);61275 **DESCRIPTION**

61276 The type **DIR**, which is defined in the <dirent.h> header, represents a *directory stream*, which is  
 61277 an ordered sequence of all the directory entries in a particular directory. Directory entries  
 61278 represent files; files may be removed from a directory or added to a directory asynchronously to  
 61279 the operation of *readdir()*.

61280 The *readdir()* function shall return a pointer to a structure representing the directory entry at the  
 61281 current position in the directory stream specified by the argument *dirp*, and position the  
 61282 directory stream at the next entry. It shall return a null pointer upon reaching the end of the  
 61283 directory stream. The structure **dirent** defined in the <dirent.h> header describes a directory  
 61284 entry. The value of the structure's *d\_ino* member shall be set to the file serial number of the file  
 61285 named by the *d\_name* member. If the *d\_name* member names a symbolic link, the value of the  
 61286 *d\_ino* member shall be set to the file serial number of the symbolic link itself. The *d\_name*  
 61287 member shall be a filename string, and (if not dot or dot-dot) shall contain the same byte  
 61288 sequence as the last pathname component of the string used to create the directory entry, plus  
 61289 the terminating <NUL> byte.

61290 The *readdir()* function shall not return directory entries containing empty names. If entries for  
 61291 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-  
 61292 dot; otherwise, they shall not be returned.

61293 The application shall not modify the structure to which the return value of *readdir()* points, nor  
 61294 any storage areas pointed to by pointers within the structure. The returned pointer, and pointers  
 61295 within the structure, might be invalidated or the structure or the storage areas might be  
 61296 overwritten by a subsequent call to *readdir()* on the same directory stream. They shall not be  
 61297 affected by a call to *readdir()* on a different directory stream. The returned pointer, and pointers  
 61298 within the structure, might also be invalidated if the calling thread is terminated.

61299 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
 61300 *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

61301 The *readdir()* function may buffer several directory entries per actual read operation; *readdir()*  
 61302 shall mark for update the last data access timestamp of the directory each time the directory is  
 61303 actually read.

61304 After a call to *fork()*, either the parent or child (but not both) may continue processing the  
 61305 XSI directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes  
 61306 use these functions, the result is undefined.

61307 The *readdir()* function need not be thread-safe if concurrent calls are made for the same directory  
 61308 stream.

61309 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If  
 61310 *errno* is set to non-zero on return, an error occurred.

61311 OB The *readdir\_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the  
 61312 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer

61313 to this structure at the location referenced by *result*, and position the directory stream at the next  
61314 entry.

61315 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d\_name*  
61316 members containing at least {NAME\_MAX}+1 elements.

61317 Upon successful return, the pointer returned at *\*result* shall have the same value as the argument  
61318 *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

61319 The *readdir\_r()* function shall not return directory entries containing empty names.

61320 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
61321 *rewinddir()*, whether a subsequent call to *readdir\_r()* returns an entry for that file is unspecified.

61322 The *readdir\_r()* function may buffer several directory entries per actual read operation;  
61323 *readdir\_r()* shall mark for update the last data access timestamp of the directory each time the  
61324 directory is actually read.

#### 61325 RETURN VALUE

61326 Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**.  
61327 When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate  
61328 the error. When the end of the directory is encountered, a null pointer shall be returned and  
61329 *errno* is not changed.

61330 OB If successful, the *readdir\_r()* function shall return zero; otherwise, an error number shall be  
61331 returned to indicate the error.

#### 61332 ERRORS

61333 OB The *readdir()* and *readdir\_r()* functions shall fail if:

61334 [EOVERFLOW] One of the values in the structure to be returned cannot be represented  
61335 correctly.

61336 [ENOMEM] Insufficient memory is available.

61337 OB The *readdir()* and *readdir\_r()* functions may fail if:

61338 [EBADF] The *dirp* argument does not refer to an open directory stream.

61339 [ENOENT] The current position of the directory stream is invalid.

#### 61340 EXAMPLES

61341 The following sample program searches the current directory for each of the arguments supplied  
61342 on the command line.

```
61343 #include <dirent.h>
61344 #include <errno.h>
61345 #include <stdio.h>
61346 #include <string.h>

61347 static void lookup(const char *arg)
61348 {
61349     DIR *dirp;
61350     struct dirent *dp;

61351     if ((dirp = opendir(".")) == NULL) {
61352         perror("couldn't open '.');
61353         return;
61354     }
61355     do {
```

```

61356         errno = 0;
61357         if ((dp = readdir(dirp)) != NULL) {
61358             if (strcmp(dp->d_name, arg) != 0)
61359                 continue;
61360
61361             (void) printf("found %s\n", arg);
61362             (void) closedir(dirp);
61363             return;
61364         }
61365     } while (dp != NULL);
61366
61367     if (errno != 0)
61368         perror("error reading directory");
61369     else
61370         (void) printf("failed to find %s\n", arg);
61371     (void) closedir(dirp);
61372     return;
61373 }
61374
61375 int main(int argc, char *argv[])
61376 {
61377     int i;
61378     for (i = 1; i < argc; i++)
61379         lookup(argv[i]);
61380     return (0);
61381 }

```

#### 61379 APPLICATION USAGE

61380 The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to  
61381 examine the contents of the directory.

61382 The *readdir\_r()* function returns values in a user-supplied buffer, but does not allow the size of  
61383 the buffer to be specified by the caller. If `[NAME_MAX]` is indeterminate, there is no way for an  
61384 application to know how large the buffer needs to be and *readdir\_r()* cannot safely be used.

#### 61385 RATIONALE

61386 The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be  
61387 inferred.

61388 Historical implementations of *readdir()* obtain multiple directory entries on a single read  
61389 operation, which permits subsequent *readdir()* operations to operate from the buffered  
61390 information. Any wording that required each successful *readdir()* operation to mark the  
61391 directory last data access timestamp for update would disallow such historical performance-  
61392 oriented implementations.

61393 When returning a directory entry for the root of a mounted file system, some historical  
61394 implementations of *readdir()* returned the file serial number of the underlying mount point,  
61395 rather than of the root of the mounted file system. This behavior is considered to be a bug, since  
61396 the underlying file serial number has no significance to applications.

61397 Since *readdir()* returns NULL when it detects an error and when the end of the directory is  
61398 encountered, an application that needs to tell the difference must set *errno* to zero before the call  
61399 and check it if NULL is returned. Since the function must not change *errno* in the second case  
61400 and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL  
61401 indicates end-of-directory; otherwise, an error.

61402 Routines to deal with this problem more directly were proposed:

```
61403 int derror (dirp)
```

```
61404 DIR *dirp;
```

```
61405 void clearderr (dirp)
```

```
61406 DIR *dirp;
```

61407 The first would indicate whether an error had occurred, and the second would clear the error  
61408 indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()*  
61409 not change *errno* when end-of-directory is encountered.

61410 An error or signal indicating that a directory has changed while open was considered but  
61411 rejected.

61412 Historically, *readdir()* returned a pointer to an internal static buffer that was overwritten by each  
61413 call. The *readdir\_r()* function was added as a thread-safe alternative that returns values in a user-  
61414 supplied buffer. However, it does not allow the size of the buffer to be specified by the caller,  
61415 and so is only usable if {NAME\_MAX} is a compile-time constant or *fpathconf()* with  
61416 *\_SC\_NAME\_MAX* returns a value other than -1. If {NAME\_MAX} is indeterminate (indicated  
61417 by *fpathconf()* returning -1), there is no way to reliably allocate a buffer large enough to hold a  
61418 filename being returned by *readdir\_r()*. Therefore, *readdir\_r()* has been marked obsolescent and  
61419 *readdir()* is now required to be thread safe as long as there are no concurrent calls to it on a  
61420 single directory stream.

61421 Conforming file systems are required to store filenames unaltered from how they were created  
61422 (via *open()*, *link()*, *mkdir()*, *mkfifo()*, *rename()*, etc.). By definition, a filename string does not  
61423 include a <slash>, even if a trailing <slash> was present in the pathname presented to *mkdir()*  
61424 when creating a sub-directory.

61425 However, there are non-conforming file systems where filenames are converted to a canonical  
61426 representation before a directory entry is created, such that it is possible to create a file using one  
61427 string, then perform *opendir()* and a *readdir()* loop and not encounter the same string, because  
61428 *readdir()* returns the canonical form of the string instead. Such non-conforming file systems also  
61429 have the issue that multiple filenames can resolve to the same directory entry, with potentially  
61430 confusing results. This standard cannot mandate the behavior of non-conforming file systems,  
61431 and strictly conforming applications need not worry about dealing with such file systems, but it  
61432 is a concern for developers of portable applications. Therefore, this standard recommends that  
61433 file system implementations that perform canonicalization of filenames should reject attempts to  
61434 create a directory entry with a non-canonical filename using the [EILSEQ] error. However, if a  
61435 directory entry already exists, it is reasonable for a file system to permit accessing that file via a  
61436 non-canonical filename.

#### 61437 FUTURE DIRECTIONS

61438 The *readdir\_r()* function may be removed in a future version.

#### 61439 SEE ALSO

#### 61442 CHANGE HISTORY

61443 First released in Issue 2.

61444 **Issue 5**

61445 Large File Summit extensions are added.

61446 The *readdir\_r()* function is included for alignment with the POSIX Threads Extension.

61447 A note indicating that the *readdir()* function need not be reentrant is added to the  
61448 DESCRIPTION.

61449 **Issue 6**

61450 The *readdir\_r()* function is marked as part of the Thread-Safe Functions option.

61451 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.

61452 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful  
61453 return for the *readdir\_r()* function.

61454 The following new requirements on POSIX implementations derive from alignment with the  
61455 Single UNIX Specification:

61456 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
61457 required for conforming implementations of previous POSIX specifications, it was not  
61458 required for UNIX applications.

61459 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in  
61460 **struct dirent** when an entry refers to a symbolic link.

61461 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
61462 files.

61463 • The [ENOENT] optional error condition is added.

61464 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
61465 its avoidance of possibly using a static data area.

61466 The **restrict** keyword is added to the *readdir\_r()* prototype for alignment with the  
61467 ISO/IEC 9899:1999 standard.

61468 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES  
61469 section with a new example.

61470 **Issue 7**

61471 Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

61472 Austin Group Interpretation 1003.1-2001 #156 is applied.

61473 The *readdir\_r()* function is moved from the Thread-Safe Functions option to the Base.

61474 Changes are made related to support for finegrained timestamps.

61475 The value of the *d\_ino* member is no longer unspecified for symbolic links.

61476 SD5-XSH-ERN-193 is applied.

61477 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0486 [75] is applied.

61478 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0304 [656] is applied.

61479 **Issue 8**

61480 Austin Group Defect 293 is applied, adding a requirement that *d\_name* contains the same byte  
61481 sequence as the last pathname component of the string used to create the directory entry.

61482 Austin Group Defects 696 and 1664 are applied, making *readdir\_r()* obsolescent, requiring  
61483 *readdir()* to be thread-safe except when concurrent calls are made for the same directory stream,

61484

and adding the [ENOMEM] error.

61485

Austin Group Defect 697 is applied, adding *posix\_getdents()* to the SEE ALSO section.

61486 **NAME**

61487 readlink, readlinkat — read the contents of a symbolic link

61488 **SYNOPSIS**

61489 #include &lt;unistd.h&gt;

61490 ssize\_t readlink(const char \*restrict path, char \*restrict buf,  
61491 size\_t bufsize);

61492 OH #include &lt;fcntl.h&gt;

61493 ssize\_t readlinkat(int fd, const char \*restrict path,  
61494 char \*restrict buf, size\_t bufsize);61495 **DESCRIPTION**61496 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the  
61497 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,  
61498 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to  
61499 contain the link content, the first *bufsize* bytes shall be placed in *buf*.61500 If the value of *bufsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.61501 Upon successful completion, *readlink()* shall mark for update the last data access timestamp of  
61502 the symbolic link.61503 The *readlinkat()* function shall be equivalent to the *readlink()* function except in the case where  
61504 *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the  
61505 directory associated with the file descriptor *fd* instead of the current working directory. If the  
61506 access mode of the open file description associated with the file descriptor is not O\_SEARCH,  
61507 the function shall check whether directory searches are permitted using the current permissions  
61508 of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function  
61509 shall not perform the check.61510 If *readlinkat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
61511 directory shall be used and the behavior shall be identical to a call to *readlink()*.61512 **RETURN VALUE**61513 Upon successful completion, these functions shall return the count of bytes placed in the buffer.  
61514 Otherwise, these functions shall return a value of -1, leave the buffer unchanged, and set *errno* to  
61515 indicate the error.61516 **ERRORS**

61517 These functions shall fail if:

61518 [EACCES] Search permission is denied for a component of the path prefix of *path*.61519 [EINVAL] The *path* argument names a file that is not a symbolic link.

61520 [EIO] An I/O error occurred while reading from the file system.

61521 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
61522 argument.

61523 [ENAMETOOLONG]

61524 The length of a component of a pathname is longer than {NAME\_MAX}.

61525 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.61526 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
61527 directory nor a symbolic link to a directory, or the *path* argument contains at  
61528 least one non-*<slash>* character and ends with one or more trailing *<slash>*

61529 characters and the last pathname component names an existing file that is  
61530 neither a directory nor a symbolic link to a directory.

61531 The *readlinkat()* function shall fail if:

61532 [EACCES] The access mode of the open file description associated with *fd* is not  
61533 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
61534 directory searches.

61535 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
61536 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

61537 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
61538 with a non-directory file.

61539 These functions may fail if:

61540 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
61541 resolution of the *path* argument.

61542 [ENAMETOOLONG]  
61543 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
61544 symbolic link produced an intermediate result with a length that exceeds  
61545 {PATH\_MAX}.

## 61546 EXAMPLES

### 61547 Reading the Name of a Symbolic Link

61548 The following example shows how to read the name of a symbolic link named */modules/pass1*.

```
61549 #include <unistd.h>
61550 char buf[1024];
61551 ssize_t len;
61552 ...
61553 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
61554     buf[len] = '\0';
```

### 61555 APPLICATION USAGE

61556 Conforming applications should not assume that the returned contents of the symbolic link are  
61557 null-terminated.

### 61558 RATIONALE

61559 The type associated with *bufsiz* is a **size\_t** in order to be consistent with both the ISO C standard  
61560 and the definition of *read()*. The behavior specified for *readlink()* when *bufsiz* is zero represents  
61561 historical practice. For this case, the standard developers considered a change whereby *readlink()*  
61562 would return the number of non-null bytes contained in the symbolic link with the buffer *buf*  
61563 remaining unchanged; however, since the **stat** structure member *st\_size* value can be used to  
61564 determine the size of buffer necessary to contain the contents of the symbolic link as returned by  
61565 *readlink()*, this proposal was rejected, and the historical practice retained.

61566 The purpose of the *readlinkat()* function is to read the content of symbolic links in directories  
61567 other than the current working directory without exposure to race conditions. Any part of the  
61568 path of a file could be changed in parallel to a call to *readlink()*, resulting in unspecified behavior.  
61569 By opening a file descriptor for the target directory and using the *readlinkat()* function it can be  
61570 guaranteed that the symbolic link read is located relative to the desired directory.

61571 **FUTURE DIRECTIONS**

61572 None.

61573 **SEE ALSO**61574 *fstatat()*, *symlink()*61575 XBD [<fcntl.h>](#), [<unistd.h>](#)61576 **CHANGE HISTORY**

61577 First released in Issue 4, Version 2.

61578 **Issue 5**

61579 Moved from X/OPEN UNIX extension to BASE.

61580 **Issue 6**61581 The return type is changed to **ssize\_t**, to align with the IEEE P1003.1a draft standard.61582 The following new requirements on POSIX implementations derive from alignment with the  
61583 Single UNIX Specification:

- 61584 • This function is made mandatory.
- 61585 • In this function it is possible for the return value to exceed the range of the type **ssize\_t**  
61586 (since **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the  
61587 size of the **size\_t** object is added to the description to resolve this conflict.

61588 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 61589 • The FUTURE DIRECTIONS section is changed to None.

61590 The following changes were made to align with the IEEE P1003.1a draft standard:

- 61591 • The [ELOOP] optional error condition is added.

61592 The **restrict** keyword is added to the *readlink()* prototype for alignment with the  
61593 ISO/IEC 9899: 1999 standard.61594 **Issue 7**

61595 Austin Group Interpretation 1003.1-2001 #143 is applied.

61596 SD5-XSH-ERN-189 is applied, updating the ERRORS section.

61597 The *readlinkat()* function is added from The Open Group Technical Standard, 2006, Extended  
61598 API Set Part 2.

61599 The [EACCES] error is removed from the “may fail” error conditions.

61600 Changes are made to allow a directory to be opened for searching.

61601 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
61602 pathname exists but is not a directory or a symbolic link to a directory.61603 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0487 [120], XSH/TC1-2008/0488 [461],  
61604 XSH/TC1-2008/0489 [143], XSH/TC1-2008/0490 [324], XSH/TC1-2008/0491 [278],  
61605 XSH/TC1-2008/0492 [278], XSH/TC1-2008/0493 [455], and XSH/TC1-2008/0494 [151,231] are  
61606 applied.61607 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0305 [591], XSH/TC2-2008/0306 [817],  
61608 XSH/TC2-2008/0307 [817], and XSH/TC2-2008/0308 [591] are applied.

61609 **NAME**

61610 readv — read a vector

61611 **SYNOPSIS**

```
61612 XSI #include <sys/uio.h>
61613      ssize_t readv(int fd, const struct iovec *iov, int iovcnt);
```

61614 **DESCRIPTION**

61615 The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()*  
 61616 function shall place the input data into the *iovcnt* buffers specified by the members of the *iov*  
 61617 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*-1]. The *iovcnt* argument is valid if greater than 0 and less than  
 61618 or equal to {IOV\_MAX}.

61619 Each *iovec* entry specifies the base address and length of an area in memory where data should  
 61620 be placed. The *readv()* function shall always fill an area completely before proceeding to the  
 61621 next.

61622 Upon successful completion, *readv()* shall mark for update the last data access timestamp of the  
 61623 file.

61624 **RETURN VALUE**61625 Refer to *read()*.61626 **ERRORS**61627 Refer to *read()*.61628 In addition, the *readv()* function shall fail if:61629 [EINVAL] The sum of the *iov\_len* values in the *iov* array overflowed an *ssize\_t*.61630 The *readv()* function may fail if:61631 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.61632 **EXAMPLES**61633 **Reading Data into an Array**

61634 The following example reads data from the file associated with the file descriptor *fd* into the  
 61635 buffers specified by members of the *iov* array.

```
61636 #include <sys/types.h>
61637 #include <sys/uio.h>
61638 #include <unistd.h>
61639 ...
61640 ssize_t bytes_read;
61641 int fd;
61642 char buf0[20];
61643 char buf1[30];
61644 char buf2[40];
61645 int iovcnt;
61646 struct iovec iov[3];

61647 iov[0].iov_base = buf0;
61648 iov[0].iov_len = sizeof(buf0);
61649 iov[1].iov_base = buf1;
61650 iov[1].iov_len = sizeof(buf1);
61651 iov[2].iov_base = buf2;
```

```
61652     iov[2].iov_len = sizeof(buf2);
61653     ...
61654     iovcnt = sizeof(iov) / sizeof(struct iovec);
61655     bytes_read = readv(fd, iov, iovcnt);
61656     ...
```

**61657 APPLICATION USAGE**

61658 None.

**61659 RATIONALE**

61660 Refer to *read()*.

61665 XBD <sys/uio.h>

**61666 CHANGE HISTORY**

61667 First released in Issue 4, Version 2.

**61668 Issue 6**

61669 Split out from the *read()* reference page.

**61670 Issue 7**

61671 Changes are made related to support for finegrained timestamps.

61672 **NAME**

61673 realloc, reallocarray — memory reallocators

61674 **SYNOPSIS**

61675 #include &lt;stdlib.h&gt;

61676 void \*realloc(void \*ptr, size\_t size);

61677 CX void \*reallocarray(void \*ptr, size\_t nelem, size\_t elsize);

61678 **DESCRIPTION**

61679 CX For `realloc()`: The functionality described on this reference page is aligned with the ISO C  
 61680 standard. Any conflict between the requirements described here and the ISO C standard is  
 61681 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

61682 The `realloc()` function shall deallocate the old object pointed to by `ptr` and return a pointer to a  
 61683 new object that has the size specified by `size`. The contents of the new object shall be the same as  
 61684 that of the old object prior to deallocation, up to the lesser of the new and old sizes. Any bytes in  
 61685 the new object beyond the size of the old object have indeterminate values.

61686 CX The `reallocarray()` function shall be equivalent to the call `realloc(ptr, nelem * elsize)`  
 61687 except that overflow in the multiplication shall be an error.

61688 CX If `ptr` is a null pointer, `realloc()` or `reallocarray()` shall be equivalent to `malloc()` for the specified  
 61689 size. Otherwise, if `ptr` does not match a pointer earlier returned by `aligned_alloc()`, `calloc()`,  
 61690 ADV `malloc()`, `posix_memalign()`, `realloc()`,  
 61691 CX `reallocarray()`, or a function in POSIX.1-2024 that allocates memory as if by `malloc()`, or if the  
 61692 CX space has been deallocated by a call to `free()`, `reallocarray()`, or `realloc()`, the behavior is  
 61693 undefined.

61694 If `size` is non-zero and memory for the new object is not allocated, the old object shall not be  
 61695 deallocated.

61696 CX The order and contiguity of storage allocated by successive calls to `realloc()` or `reallocarray()` is  
 61697 unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it  
 61698 may be assigned to a pointer to any type of object with a fundamental alignment requirement  
 61699 and then used to access such an object in the space allocated (until the space is explicitly freed or  
 61700 reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object.  
 61701 The pointer returned shall point to the start (lowest byte address) of the allocated space. If the  
 61702 space cannot be allocated, a null pointer shall be returned.

61703 CX For purposes of determining the existence of a data race, `realloc()` and `reallocarray()` shall each  
 61704 behave as though it accessed only memory locations accessible through its argument and not  
 61705 other static duration storage. The function may, however, visibly modify the storage that it  
 61706 ADV allocates. Calls to `aligned_alloc()`, `calloc()`, `free()`, `malloc()`, `posix_memalign()`,  
 61707 CX `reallocarray()`, and `realloc()` that allocate or deallocate a particular region of memory shall occur  
 61708 in a single total order (see [Section 4.15.1](#), on page 100), and each such deallocation call shall  
 61709 synchronize with the next allocation (if any) in this order.

61710 **RETURN VALUE**

61711 CX Upon successful completion, `realloc()` and `reallocarray()` shall return a pointer to the new object  
 61712 (which can have the same value as a pointer to the old object), or a null pointer if the new object  
 61713 has not been allocated.

61714 OB If `size` is 0,61715 OB CX or either `nelem` or `elsize` is 0,

61716 OB either:

- 61717 OB • A null pointer shall be returned
- 61718 OB CX and, if *ptr* is not a null pointer, *errno* shall be set to [EINVAL].
- 61719 OB • A pointer to the allocated space shall be returned, and the memory object pointed to by *ptr*
- 61720 shall be freed. The application shall ensure that the pointer is not used to access an object.
- 61721 CX If there is not enough available memory, *realloc()* and *reallocarray()* shall return a null pointer
- 61722 CX and set *errno* to [ENOMEM].
- 61723 **ERRORS**
- 61724 CX The *realloc()* and *reallocarray()* functions shall fail if:
- 61725 CX [ENOMEM] Insufficient memory is available.
- 61726 CX The *reallocarray()* function shall fail if:
- 61727 [ENOMEM] The calculation *nelem \* elsize* would overflow.
- 61728 CX The *realloc()* and *reallocarray()* functions may fail if:
- 61729 CX [EINVAL] The requested allocation size is 0 and the implementation does not support 0
- 61730 sized allocations.
- 61731 **EXAMPLES**
- 61732 None.
- 61733 **APPLICATION USAGE**
- 61734 The ISO C standard makes it implementation-defined whether a call to *realloc(p, 0)* frees the
- 61735 space pointed to by *p* if it returns a null pointer because memory for the new object was not
- 61736 allocated. POSIX.1 instead requires that implementations set *errno* if a null pointer is returned
- 61737 and the space has not been freed, and POSIX applications should only free the space if *errno* was
- 61738 changed.
- 61739 **RATIONALE**
- 61740 See the RATIONALE for *malloc()*.
- 61741 **FUTURE DIRECTIONS**
- 61742 The ISO C standard states that invoking *realloc()* with a *size* argument equal to zero is an
- 61743 obsolescent feature. This feature may be removed in a future version of this standard.
- 61744 **SEE ALSO**
- 61745 *aligned\_alloc()*, *calloc()*, *free()*, *malloc()*
- 61746 XBD <stdlib.h>
- 61747 **CHANGE HISTORY**
- 61748 First released in Issue 1. Derived from Issue 1 of the SVID.
- 61749 **Issue 6**
- 61750 Extensions beyond the ISO C standard are marked.
- 61751 The following new requirements on POSIX implementations derive from alignment with the
- 61752 Single UNIX Specification:
- 61753 • In the RETURN VALUE section, if there is not enough available memory, the setting of
- 61754 *errno* to [ENOMEM] is added.
- 61755 • The [ENOMEM] error condition is added.

61756 **Issue 7**

61757 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0495 [400], XSH/TC1-2008/0496 [400],  
61758 XSH/TC1-2008/0497 [400], and XSH/TC1-2008/0498 [400] are applied.

61759 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0309 [526] and XSH/TC2-2008/0310  
61760 [526,688] are applied.

61761 **Issue 8**

61762 Austin Group Defect 374 is applied, adding the [EINVAL] error.

61763 Austin Group Defect 1218 is applied, adding *reallocarray()*.

61764 Austin Group Defect 1302 is applied, aligning the *realloc()* function with the ISO/IEC 9899:2018  
61765 standard.

61766 Austin Group Defect 1387 is applied, changing the RATIONALE section.

61767 **NAME**

61768            realpath — resolve a pathname

61769 **SYNOPSIS**

61770            #include &lt;stdlib.h&gt;

61771            char \*realpath(const char \*restrict *file\_name*,  
61772                            char \*restrict *resolved\_name*);61773 **DESCRIPTION**

61774            The *realpath()* function shall derive, from the pathname pointed to by *file\_name*, an absolute  
61775            pathname that resolves to the same directory entry, whose resolution does not involve '.',  
61776            '..', or symbolic links. If *resolved\_name* is a null pointer, the generated pathname shall be  
61777            stored as a null-terminated string in a buffer allocated as if by a call to *malloc()*. Otherwise, if  
61778            {PATH\_MAX} is defined as a constant in the <limits.h> header, then the generated pathname  
61779            shall be stored as a null-terminated string, up to a maximum of {PATH\_MAX} bytes, in the  
61780            buffer pointed to by *resolved\_name*.

61781            If *resolved\_name* is not a null pointer and {PATH\_MAX} is not defined as a constant in the  
61782            <limits.h> header, the behavior is undefined.

61783 **RETURN VALUE**

61784            Upon successful completion, *realpath()* shall return a pointer to the buffer containing the  
61785            resolved name. Otherwise, *realpath()* shall return a null pointer and set *errno* to indicate the  
61786            error.

61787            If the *resolved\_name* argument is a null pointer, the pointer returned by *realpath()* can be passed  
61788            to *free()*.

61789            If the *resolved\_name* argument is not a null pointer and the *realpath()* function fails, the contents  
61790            of the buffer pointed to by *resolved\_name* are undefined.

61791 **ERRORS**61792            The *realpath()* function shall fail if:61793            [EACCES]            Search permission was denied for a component of the path prefix of *file\_name*.61794            [EINVAL]            The *file\_name* argument is a null pointer.

61795            [EIO]                An error occurred while reading from the file system.

61796            [ELOOP]            A loop exists in symbolic links encountered during resolution of the *file\_name*  
61797            argument.

61798            [ENAMETOOLONG]

61799                            The length of a component of a pathname is longer than {NAME\_MAX}.

61800            [ENOENT]            A component of *file\_name* does not name an existing file or *file\_name* points to  
61801            an empty string.61802            [ENOTDIR]           A component of the path prefix names an existing file that is neither a  
61803            directory nor a symbolic link to a directory, or the *file\_name* argument contains  
61804            at least one non-<slash> character and ends with one or more trailing <slash>  
61805            characters and the last pathname component names an existing file that is  
61806            neither a directory nor a symbolic link to a directory.

- 61807 The *realpath()* function may fail if:
- 61808 [EACCES] The *file\_name* argument does not begin with a <slash> and none of the
  - 61809 symbolic links (if any) processed during pathname resolution of *file\_name* had
  - 61810 contents that began with a <slash>, and either search permission was denied
  - 61811 for the current directory or read or search permission was denied for a
  - 61812 directory above the current directory in the file hierarchy.
  - 61813 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during
  - 61814 resolution of the *file\_name* argument.
  - 61815 [ENAMETOOLONG]
  - 61816 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a
  - 61817 symbolic link produced an intermediate result with a length that exceeds
  - 61818 {PATH\_MAX}.
  - 61819 [ENOMEM] Insufficient storage space is available.

## 61820 EXAMPLES

### 61821 Generating an Absolute Pathname

61822 The following example generates an absolute pathname for the file identified by the *symlinkpath*

61823 argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
61824 #include <stdlib.h>
61825 ...
61826 char *symlinkpath = "/tmp/symlink/file";
61827 char *actualpath;
61828
61829 actualpath = realpath(symlinkpath, NULL);
61830 if (actualpath != NULL)
61831 {
61832     ... use actualpath ...
61833     free(actualpath);
61834 }
61835 else
61836 {
61837     ... handle error ...
61838 }
```

## 61838 APPLICATION USAGE

61839 For functions that allocate memory as if by *malloc()*, the application should release such memory

61840 when it is no longer required by a call to *free()*. For *realpath()*, this is the return value.

## 61841 RATIONALE

61842 Since *realpath()* has no *length* argument, if {PATH\_MAX} is not defined as a constant in

61843 <limits.h>, applications have no way of determining how large a buffer they need to allocate for

61844 it to be safe to pass to *realpath()*. A {PATH\_MAX} value obtained from a prior *pathconf()* call is

61845 out-of-date by the time *realpath()* is called. Hence the only reliable way to use *realpath()* when

61846 {PATH\_MAX} is not defined in <limits.h> is to pass a null pointer for *resolved\_name* so that

61847 *realpath()* will allocate a buffer of the necessary size.

61848 **FUTURE DIRECTIONS**

61849 None.

61850 **SEE ALSO**61851 *fpathconf()*, *free()*, *getcwd()*, *sysconf()*

61852 XBD &lt;limits.h&gt;, &lt;stdlib.h&gt;

61853 **CHANGE HISTORY**

61854 First released in Issue 4, Version 2.

61855 **Issue 5**

61856 Moved from X/OPEN UNIX extension to BASE.

61857 **Issue 6**61858 The **restrict** keyword is added to the *realpath()* prototype for alignment with the  
61859 ISO/IEC 9899:1999 standard.61860 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
61861 [ELOOP] error condition is added.61862 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the  
61863 DESCRIPTION for the case when *resolved\_name* is a null pointer, changing the [EINVAL] error  
61864 text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.61865 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS  
61866 section to refer to the *file\_name* argument, rather than a nonexistent *path* argument.61867 **Issue 7**

61868 Austin Group Interpretation 1003.1-2001 #143 is applied.

61869 This function is updated for passing a null pointer to *realpath()* for the *resolved\_name* argument.61870 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
61871 *malloc()*.61872 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0499 [353], XSH/TC1-2008/0500 [324],  
61873 and XSH/TC1-2008/0501 [353] are applied.61874 **Issue 8**61875 Austin Group Defect 1663 is applied, removing XSI shading from *realpath()*.

61876 **NAME**

61877       recv — receive a message from a connected socket

61878 **SYNOPSIS**

61879       #include &lt;sys/socket.h&gt;

61880       ssize\_t recv(int *socket*, void \**buffer*, size\_t *length*, int *flags*);61881 **DESCRIPTION**

61882       The *recv()* function shall receive a message from a connection-mode or connectionless-mode  
 61883       socket. It is normally used with connected sockets because it does not permit the application to  
 61884       retrieve the source address of received data.

61885       The *recv()* function takes the following arguments:

61886       *socket*       Specifies the socket file descriptor.

61887       *buffer*       Points to a buffer where the message should be stored.

61888       *length*       Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

61889       *flags*       Specifies the type of message reception. Values of this argument are formed by  
 61890       logically OR'ing zero or more of the following values:

61891               MSG\_PEEK       Peeks at an incoming message. The data is treated as unread and  
 61892               the next *recv()* or similar function shall still return this data.

61893               MSG\_OOB       Requests out-of-band data. The significance and semantics of  
 61894               out-of-band data are protocol-specific.

61895               MSG\_WAITALL   On SOCK\_STREAM sockets this requests that the function block  
 61896               until the full amount of data can be returned. The function may  
 61897               return the smaller amount of data if the socket is a message-  
 61898               based socket, if a signal is caught, if the connection is terminated,  
 61899               if MSG\_PEEK was specified, or if an error is pending for the  
 61900               socket.

61901       The *recv()* function shall return the length of the message written to the buffer pointed to by the  
 61902       *buffer* argument. For message-based sockets, such as SOCK\_DGRAM and SOCK\_SEQPACKET,  
 61903       the entire message shall be read in a single operation. If a message is too long to fit in the  
 61904       supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess bytes shall be  
 61905       discarded. For stream-based sockets, such as SOCK\_STREAM, message boundaries shall be  
 61906       ignored. In this case, data shall be returned to the user as soon as it becomes available, and no  
 61907       data shall be discarded.

61908       If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 61909       message.

61910       If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 61911       descriptor, *recv()* shall block until a message arrives or a timeout occurs (see SO\_RCVTIMEO in  
 61912       Section 2.10.16, on page 554). If no messages are available at the socket and O\_NONBLOCK is  
 61913       set on the socket's file descriptor, *recv()* shall fail and set *errno* to [EAGAIN] or  
 61914       [EWOULDBLOCK].

61915 **RETURN VALUE**

61916       Upon successful completion, *recv()* shall return the length of the message in bytes. If no  
 61917       messages are available to be received and the peer has performed an orderly shutdown, *recv()*  
 61918       shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

61919 **ERRORS**61920 The *recv()* function shall fail if:

61921 [EAGAIN] or [EWOULDBLOCK]

61922 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
61923 to be received; or MSG\_OOB is set and no out-of-band data is available and  
61924 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
61925 not support blocking to await out-of-band data. See also SO\_RCVTIMEO in  
61926 [Section 2.10.16](#) (on page 554).61927 [EBADF] The *socket* argument is not a valid file descriptor.

61928 [ECONNRESET] A connection was forcibly closed by a peer.

61929 [EINTR] The *recv()* function was interrupted by a signal that was caught, before any  
61930 data was available.

61931 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

61932 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

61933 [ENOTSOCK] The *socket* argument does not refer to a socket.

61934 [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.

61935 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
61936 transmission timeout on active connection.61937 The *recv()* function may fail if:

61938 [EIO] An I/O error occurred while reading from or writing to the file system.

61939 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

61940 [ENOMEM] Insufficient memory was available to fulfill the request.

61941 **EXAMPLES**

61942 None.

61943 **APPLICATION USAGE**61944 The *recv()* function is equivalent to *recvfrom()* with null pointer *address* and *address\_len*  
61945 arguments, and to *read()* if the *socket* argument refers to a socket and the *flags* argument is 0.61946 The *select()* and *poll()* functions can be used to determine when data is available to be received.61947 **RATIONALE**

61948 None.

61949 **FUTURE DIRECTIONS**

61950 None.

61951 **SEE ALSO**61952 [poll\(\)](#), [pselect\(\)](#), [read\(\)](#), [recvmsg\(\)](#), [recvfrom\(\)](#), [send\(\)](#), [sendmsg\(\)](#), [sendto\(\)](#), [setsockopt\(\)](#), [shutdown\(\)](#),  
61953 [socket\(\)](#), [write\(\)](#)61954 XBD [<sys/socket.h>](#)61955 **CHANGE HISTORY**

61956 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

61957 **Issue 7**

61958 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0502 [462] is applied.

61959 **Issue 8**

61960 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
61961 [Section 2.10.16](#) (on page 554).

61962 **NAME**

61963 recvfrom — receive a message from a socket

61964 **SYNOPSIS**

```
61965 #include <sys/socket.h>
61966 ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
61967                 int flags, struct sockaddr *restrict address,
61968                 socklen_t *restrict address_len);
```

61969 **DESCRIPTION**

61970 The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode  
 61971 socket. It is normally used with connectionless-mode sockets because it permits the application  
 61972 to retrieve the source address of received data.

61973 The *recvfrom()* function takes the following arguments:

61974	<i>socket</i>	Specifies the socket file descriptor.
61975	<i>buffer</i>	Points to the buffer where the message should be stored.
61976	<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
61977	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by 61978 logically OR'ing zero or more of the following values:
61979	MSG_PEEK	Peeks at an incoming message. The data is treated as unread 61980 and the next <i>recvfrom()</i> or similar function shall still return 61981 this data.
61982	MSG_OOB	Requests out-of-band data. The significance and semantics 61983 of out-of-band data are protocol-specific.
61984	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function 61985 block until the full amount of data can be returned. The 61986 function may return the smaller amount of data if the socket 61987 is a message-based socket, if a signal is caught, if the 61988 connection is terminated, if MSG_PEEK was specified, or if 61989 an error is pending for the socket.
61990	<i>address</i>	A null pointer, or points to a <b>sockaddr</b> structure in which the sending address 61991 is to be stored. The length and format of the address depend on the address 61992 family of the socket.
61993	<i>address_len</i>	Either a null pointer, if <i>address</i> is a null pointer, or a pointer to a <b>socklen_t</b> 61994 object which on input specifies the length of the supplied <b>sockaddr</b> structure, 61995 and on output specifies the length of the sending address.

61996 The *recvfrom()* function shall return the length of the message written to the buffer pointed to by  
 61997 RS the *buffer* argument. For message-based sockets, such as **SOCK\_RAW**, **SOCK\_DGRAM**, and  
 61998 **SOCK\_SEQPACKET**, the entire message shall be read in a single operation. If a message is too  
 61999 long to fit in the supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess  
 62000 bytes shall be discarded. For stream-based sockets, such as **SOCK\_STREAM**, message  
 62001 boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes  
 62002 available, and no data shall be discarded.

62003 If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 62004 message.

62005 Not all protocols provide the source address for messages. If the *address* argument is not a null

62006 pointer and the protocol provides the source address of messages, the source address of the  
 62007 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,  
 62008 and the length of this address shall be stored in the object pointed to by the *address\_len*  
 62009 argument.

62010 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
 62011 the stored address shall be truncated.

62012 If the *address* argument is not a null pointer and the protocol does not provide the source address  
 62013 of messages, the value stored in the object pointed to by *address* is unspecified.

62014 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 62015 descriptor, *recvfrom()* shall block until a message arrives or a timeout occurs (see  
 62016 SO\_RCVTIMEO in Section 2.10.16, on page 554). If no messages are available at the socket and  
 62017 O\_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno* to  
 62018 [EAGAIN] or [EWOULDBLOCK].

#### 62019 RETURN VALUE

62020 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no  
 62021 messages are available to be received and the peer has performed an orderly shutdown,  
 62022 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the  
 62023 error.

#### 62024 ERRORS

62025 The *recvfrom()* function shall fail if:

62026 [EAGAIN] or [EWOULDBLOCK]

62027 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 62028 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 62029 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 62030 not support blocking to await out-of-band data. See also SO\_RCVTIMEO in  
 62031 Section 2.10.16 (on page 554).

62032 [EBADF] The *socket* argument is not a valid file descriptor.

62033 [ECONNRESET] A connection was forcibly closed by a peer.

62034 [EINTR] A signal interrupted *recvfrom()* before any data was available.

62035 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

62036 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

62037 [ENOTSOCK] The *socket* argument does not refer to a socket.

62038 [EOPNOTSUPP] The specified flags are not supported for this socket type.

62039 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 62040 transmission timeout on active connection.

62041 The *recvfrom()* function may fail if:

62042 [EIO] An I/O error occurred while reading from or writing to the file system.

62043 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62044 [ENOMEM] Insufficient memory was available to fulfill the request.

62045 **EXAMPLES**

62046 None.

62047 **APPLICATION USAGE**62048 The *select()* and *poll()* functions can be used to determine when data is available to be received.

62049 For AF\_UNIX sockets, it is recommended that *address* points to a buffer of length greater than  
62050 `sizeof(struct sockaddr_un)` which has been initialized with null bytes. That way, even if  
62051 the implementation supports the use of all bytes of *sun\_path* without a terminating null byte, the  
62052 larger buffer guarantees that the *sun\_path* member can then be passed to other interfaces that  
62053 expect a null-terminated string. If no truncation occurred based on the input value of *address\_len*,  
62054 it is unspecified whether the returned *address\_len* will be `sizeof(struct sockaddr_un)`, or  
62055 merely a value at least as large as `offsetof(struct sockaddr_un, sun_path)` plus the  
62056 number of non-null bytes stored in *sun\_path*.

62057 **RATIONALE**

62058 None.

62059 **FUTURE DIRECTIONS**

62060 None.

62061 **SEE ALSO**

62062 *poll()*, *pselect()*, *read()*, *recv()*, *recvmsg()*, *send()*, *sendmsg()*, *sendto()*, *setsockopt()*, *shutdown()*,

62067 **Issue 7**

62068 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0503 [464] is applied.

62069 **Issue 8**

62070 Austin Group Defect 561 is applied, adding a paragraph about *sun\_path* to APPLICATION  
62071 USAGE.

62072 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
62073 [Section 2.10.16](#) (on page 554).

62074 Austin Group Defect 1565 is applied, changing the description of *address\_len*.

62075 **NAME**

62076       recvmsg — receive a message from a socket

62077 **SYNOPSIS**

62078       #include &lt;sys/socket.h&gt;

62079       ssize\_t recvmsg(int socket, struct msghdr \*message, int flags);

62080 **DESCRIPTION**62081       The *recvmsg()* function shall receive a message from a connection-mode or connectionless-mode  
62082 socket. It is normally used with connectionless-mode sockets because it permits the application  
62083 to retrieve the source address of received data.62084       The *recvmsg()* function takes the following arguments:62085       *socket*               Specifies the socket file descriptor.62086       *message*             Points to a **msghdr** structure, containing both the buffer to store the source  
62087 address and the buffers for the incoming message. The length and format of  
62088 the address depend on the address family of the socket. The *msg\_flags* member  
62089 is ignored on input, but may contain meaningful values on output.62090       *flags*               Specifies the type of message reception. Values of this argument are formed by  
62091 logically OR'ing zero or more of the following values:62092               MSG\_OOB       Requests out-of-band data. The significance and semantics  
62093 of out-of-band data are protocol-specific.

62094               MSG\_PEEK      Peeks at the incoming message.

62095               MSG\_WAITALL On SOCK\_STREAM sockets this requests that the function  
62096 block until the full amount of data can be returned. The  
62097 function may return the smaller amount of data if the socket  
62098 is a message-based socket, if a signal is caught, if the  
62099 connection is terminated, if MSG\_PEEK was specified, or if  
62100 an error is pending for the socket.

62101               MSG\_CMSG\_CLOEXEC

62102               On sockets that permit a *cmsg\_type* of SCM\_RIGHTS in the  
62103 *msg\_control* ancillary data as a means of copying file  
62104 descriptors into the process, the file descriptors shall be  
62105 created with the FD\_CLOEXEC flag atomically set.

62106               MSG\_CMSG\_CLOFORK

62107               On sockets that permit a *cmsg\_type* of SCM\_RIGHTS in the  
62108 *msg\_control* ancillary data as a means of copying file  
62109 descriptors into the process, the file descriptors shall be  
62110 created with the FD\_CLOFORK flag atomically set.62111       The *recvmsg()* function shall receive messages from unconnected or connected sockets and shall  
62112 return the length of the message.62113       The *recvmsg()* function shall return the total length of the message. For message-based sockets,  
62114 such as SOCK\_DGRAM and SOCK\_SEQPACKET, the entire message shall be read in a single  
62115 operation. If a message is too long to fit in the supplied buffers, and MSG\_PEEK is not set in the  
62116 *flags* argument, the excess bytes shall be discarded, and MSG\_TRUNC shall be set in the  
62117 *msg\_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK\_STREAM,  
62118 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it  
62119 becomes available, and no data shall be discarded.

62120 If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
62121 message.

62122 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
62123 descriptor, *recvmsg()* shall block until a message arrives or a timeout occurs (see SO\_RCVTIMEO  
62124 in Section 2.10.16, on page 554). If no messages are available at the socket and O\_NONBLOCK  
62125 is set on the socket's file descriptor, the *recvmsg()* function shall fail and set *errno* to [EAGAIN]  
62126 or [EWOULDBLOCK].

62127 In the **msghdr** structure, the *msg\_name* member may be a null pointer if the source address is not  
62128 required. Otherwise, if the socket is unconnected, the *msg\_name* member points to a **sockaddr**  
62129 structure in which the source address is to be stored, and the *msg\_namelen* member on input  
62130 specifies the length of the supplied **sockaddr** structure and on output specifies the length of the  
62131 source address. If the actual length of the address is greater than the length of the supplied  
62132 **sockaddr** structure, the stored address shall be truncated. If the socket is connected, the  
62133 *msg\_name* and *msg\_namelen* members shall be ignored. The *msg\_iov* and *msg\_iovlen* fields are  
62134 used to specify where the received data shall be stored. The *msg\_iov* member points to an array  
62135 of **iovec** structures; the *msg\_iovlen* member shall be set to the dimension of this array. In each  
62136 **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field gives its size in  
62137 bytes. Each storage area indicated by *msg\_iov* is filled with received data in turn until all of the  
62138 received data is stored or all of the areas have been filled.

62139 Upon successful completion, the *msg\_flags* member of the message header shall be the bitwise-  
62140 inclusive OR of all of the following flags that indicate conditions detected for the received  
62141 message:

62142 MSG\_EOR        End-of-record was received (if supported by the protocol).

62143 MSG\_OOB        Out-of-band data was received.

62144 MSG\_TRUNC      Normal data was truncated.

62145 MSG\_CTRUNC    Control data was truncated.

#### 62146 RETURN VALUE

62147 Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no  
62148 messages are available to be received and the peer has performed an orderly shutdown,  
62149 *recvmsg()* shall return 0. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

#### 62150 ERRORS

62151 The *recvmsg()* function shall fail if:

62152 [EAGAIN] or [EWOULDBLOCK]

62153        The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
62154        to be received; or MSG\_OOB is set and no out-of-band data is available and  
62155        either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
62156        not support blocking to await out-of-band data. See also SO\_RCVTIMEO in  
62157        Section 2.10.16 (on page 554).

62158 [EBADF]        The *socket* argument is not a valid open file descriptor.

62159 [ECONNRESET]   A connection was forcibly closed by a peer.

62160 [EINTR]        This function was interrupted by a signal before any data was available.

62161 [EINVAL]        The sum of the *iov\_len* values overflows a **ssize\_t**, or the MSG\_OOB flag is set  
62162        and no out-of-band data is available.

- 62163 [EMSGSIZE] The *msg\_iovlen* member of the **msg\_hdr** structure pointed to by *message* is less  
62164 than or equal to 0, or is greater than {IOV\_MAX}.
- 62165 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.
- 62166 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 62167 [EOPNOTSUPP] The specified flags are not supported for this socket type.
- 62168 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
62169 transmission timeout on active connection.

62170 The *recvmsg()* function may fail if:

- 62171 [EIO] An I/O error occurred while reading from or writing to the file system.
- 62172 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 62173 [ENOMEM] Insufficient memory was available to fulfill the request.

#### 62174 EXAMPLES

62175 None.

#### 62176 APPLICATION USAGE

62177 The *select()* and *poll()* functions can be used to determine when data is available to be received.

#### 62178 RATIONALE

62179 The use of the MSG\_CMSG\_CLOEXEC and MSG\_CMSG\_CLOFORK flags to *recvmsg()* when  
62180 using SCM\_RIGHTS to receive file descriptors via ancillary data is necessary to avoid a data race  
62181 in multi-threaded applications. Without MSG\_CMSG\_CLOFORK, a file descriptor is leaked into  
62182 a child process created by one thread in the window between another thread calling *recvmsg()*  
62183 and using *fcntl()* to set the FD\_CLOFORK flag. Without MSG\_CMSG\_CLOEXEC, a file  
62184 descriptor intentionally inherited by child processes is similarly leaked into an executed  
62185 program if FD\_CLOEXEC is not set atomically.

#### 62186 FUTURE DIRECTIONS

62187 None.

#### 62188 SEE ALSO

62189 *poll()*, *pselect()*, *recv()*, *recvfrom()*, *send()*, *sendmsg()*, *sendto()*, *setsockopt()*, *shutdown()*, *socket()*

62190 XBD <sys/socket.h>

#### 62191 CHANGE HISTORY

62192 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

#### 62193 Issue 7

62194 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0504 [464] is applied.

#### 62195 Issue 8

62196 Austin Group Defects 411 and 1318 are applied, adding MSG\_CMSG\_CLOEXEC and  
62197 MSG\_CMSG\_CLOFORK.

62198 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
62199 [Section 2.10.16](#) (on page 554).

62200 Austin Group Defect 1565 is applied, changing the description of *msg\_namelen*.

62201 **NAME**  
 62202 regcomp, regerror, regex, regfree — regular expression matching

62203 **SYNOPSIS**  
 62204 #include <regex.h>  
 62205 int regcomp(regex\_t \*restrict preg, const char \*restrict pattern,  
 62206 int cflags);  
 62207 size\_t regerror(int errcode, const regex\_t \*restrict preg,  
 62208 char \*restrict errbuf, size\_t errbuf\_size);  
 62209 int regex(const regex\_t \*restrict preg, const char \*restrict string,  
 62210 size\_t nmatch, regmatch\_t pmatch[restrict], int eflags);  
 62211 void regfree(regex\_t \*preg);

62212 **DESCRIPTION**  
 62213 These functions interpret *basic* and *extended* regular expressions as described in XBD [Chapter 9](#)  
 62214 (on page 179).

62215 The **regex\_t** structure is defined in <regex.h> and contains at least the following member:

Member Type	Member Name	Description
size_t	re_nsub	Number of parenthesized subexpressions.

62219 The **regmatch\_t** structure is defined in <regex.h> and contains at least the following members:

Member Type	Member Name	Description
regoff_t	rm_so	Byte offset from start of <i>string</i> to start of substring.
regoff_t	rm_eo	Byte offset from start of <i>string</i> of the first character after the end of substring.

62225 The *regcomp()* function shall compile the regular expression contained in the string pointed to by  
 62226 the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags*  
 62227 argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in  
 62228 the <regex.h> header:

- 62229 REG\_EXTENDED Use Extended Regular Expressions.
- 62230 REG\_ICASE Perform matching in a case-insensitive manner (see XBD [Section 9.2](#), on  
 62231 page 180).
- 62232 REG\_MINIMAL Change the matching behavior for duplication symbols to the leftmost  
 62233 shortest possible match, and invert the behavior of the repetition modifier  
 62234 '?' (<question-mark>) to match the longest possible match instead of the  
 62235 shortest. Only applicable to REG\_EXTENDED regular expressions.
- 62236 REG\_NOSUB Report only success/fail in *regex()*.
- 62237 REG\_NEWLINE Change the handling of <newline> characters, as described in the text.

62238 The default regular expression type for *pattern* is a Basic Regular Expression. The application can  
 62239 specify Extended Regular Expressions using the REG\_EXTENDED *cflags* flag.

62240 If the REG\_NOSUB flag was not set in *cflags*, then *regcomp()* shall set *re\_nsub* to the number of  
 62241 parenthesized subexpressions (delimited by "\(\)" in basic regular expressions or "()" in  
 62242 extended regular expressions) found in *pattern*.

62243 The *regex()* function compares the null-terminated string specified by *string* with the compiled

62244 regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regexec()*  
 62245 shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The  
 62246 *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are  
 62247 defined in the `<regex.h>` header:

62248 REG\_NOTBOL        The first character of the string pointed to by *string* is not the beginning of  
 62249 the line. Therefore, the `<circumflex>` character ('^'), when taken as a  
 62250 special character, shall not match the beginning of *string*.

62251 REG\_NOTEOL        The last character of the string pointed to by *string* is not the end of the  
 62252 line. Therefore, the `<dollar-sign>` ('\$'), when taken as a special character,  
 62253 shall not match the end of *string*.

62254 If *nmatch* is 0 or REG\_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexec()* shall  
 62255 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument  
 62256 points to an array with at least *nmatch* elements, and *regexec()* shall fill in the elements of that  
 62257 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions  
 62258 of *pattern*: *pmatch[i].rm\_so* shall be the byte offset of the beginning and *pmatch[i].rm\_eo* shall be  
 62259 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th  
 62260 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that  
 62261 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*  
 62262 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself  
 62263 counts as a subexpression), then *regexec()* shall still do the match, but shall record only the first  
 62264 *nmatch* substrings.

62265 When matching a basic or extended regular expression, any given parenthesized subexpression  
 62266 of *pattern* might participate in the match of several different substrings of *string*, or it might not  
 62267 match any substring even though the pattern as a whole did match. The following rules shall be  
 62268 used to determine which substrings to report in *pmatch* when matching regular expressions:

62269        1. If subexpression *i* in a regular expression is not contained within another subexpression,  
 62270        and it participated in the match several times, then the byte offsets in *pmatch[i]* shall  
 62271        delimit the last such match.

62272        2. If subexpression *i* is not contained within another subexpression, and it did not  
 62273        participate in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A  
 62274        subexpression does not participate in the match when:

62275                '\*' or "\{\}" appears immediately after the subexpression in a basic regular  
 62276                expression, or '\*', '?', or "{ }" appears immediately after the subexpression in  
 62277                an extended regular expression, and the subexpression did not match (matched 0  
 62278                times)

62279        or:

62280                '| ' is used in an extended regular expression to select this subexpression or  
 62281                another, and the other subexpression matched.

62282        3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained  
 62283        within any other subexpression that is contained within *j*, and a match of subexpression *j*  
 62284        is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in  
 62285        *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in  
 62286        *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start  
 62287        of *string*.

- 62288 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are  $-1$ ,  
 62289 then the pointers in *pmatch[i]* shall also be  $-1$ .
- 62290 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be  
 62291 the byte offset of the character or null terminator immediately following the zero-length  
 62292 string.

62293 If, when *regexexec()* is called, the locale is different from when the regular expression was  
 62294 compiled, the result is undefined.

62295 If REG\_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an  
 62296 ordinary character. If REG\_NEWLINE is set, then <newline> shall be treated as an ordinary  
 62297 character except as follows:

- 62298 1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or  
 62299 by any form of a non-matching list (see XBD Chapter 9, on page 179).
- 62300 2. A <circumflex> ('^') in *pattern*, when used to specify expression anchoring (see XBD  
 62301 Section 9.3.8, on page 186), shall match the zero-length string immediately after a  
 62302 <newline> in *string*, regardless of the setting of REG\_NOTBOL.
- 62303 3. A <dollar-sign> ('\$') in *pattern*, when used to specify expression anchoring, shall match  
 62304 the zero-length string immediately before a <newline> in *string*, regardless of the setting  
 62305 of REG\_NOTEOL.

62306 The *regfree()* function shall free any memory allocated by *regcomp()* associated with *preg*. The  
 62307 *regfree()* function shall not modify *errno* if *preg* was previously returned by *regcomp()* and not yet  
 62308 freed.

62309 The following constants are defined as the minimum set of error return values, although other  
 62310 errors listed as implementation extensions in <regex.h> are possible:

62311	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than
62312		two numbers, first larger than second.
62313	REG_BADPAT	Invalid regular expression.
62314	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
62315	REG_EBRACE	"\{\}" imbalance.
62316	REG_EBRACK	"[]" imbalance.
62317	REG_ECOLLATE	Invalid collating element referenced.
62318	REG_ECTYPE	Invalid character class type referenced.
62319	REG_EESCAPE	Trailing <backslash> character in pattern.
62320	REG_EPAREN	"\(\)" or "()" imbalance.
62321	REG_ERANGE	Invalid endpoint in range expression.
62322	REG_ESPACE	Out of memory.
62323	REG_ESUBREG	Number in "\digit" invalid or in error.
62324	REG_NOMATCH	<i>regexexec()</i> failed to match.

62325 If more than one error occurs in processing a function call, any one of the possible constants may  
 62326 be returned, as the order of detection is unspecified.

62327 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and

62328 *regexec()* to unspecified printable strings. It generates a string corresponding to the value of the  
 62329 *errcode* argument, which the application shall ensure is the last non-zero value returned by  
 62330 *regcomp()* or *regexec()* with the given value of *preg*. If *errcode* is not such a value, the content of  
 62331 the generated string is unspecified.

62332 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec()* or *regcomp()*,  
 62333 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not  
 62334 be as detailed under some implementations.

62335 If the *errbuf\_size* argument is not 0, *regerror()* shall place the generated string into the buffer of  
 62336 size *errbuf\_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit  
 62337 in the buffer, *regerror()* shall truncate the string and null-terminate the result.

62338 If *errbuf\_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer  
 62339 needed to hold the generated string.

62340 If the *preg* argument to *regexec()* or *regfree()* is not a compiled regular expression returned by  
 62341 *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression  
 62342 after it is given to *regfree()*.

#### 62343 RETURN VALUE

62344 Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an  
 62345 integer value indicating an error as described in <**regex.h**>, and the content of *preg* is undefined.  
 62346 If a code is returned, the interpretation shall be as given in <**regex.h**>.

62347 If *regcomp()* detects an invalid RE, it may return REG\_BADPAT, or it may return one of the error  
 62348 codes that more precisely describes the error.

62349 Upon successful completion, the *regexec()* function shall return 0. Otherwise, it shall return  
 62350 REG\_NOMATCH to indicate no match.

62351 Upon successful completion, the *regerror()* function shall return the number of bytes needed to  
 62352 hold the entire generated string, including the null termination. If the return value is greater  
 62353 than *errbuf\_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

62354 The *regfree()* function shall not return a value.

#### 62355 ERRORS

62356 No errors are defined.

#### 62357 EXAMPLES

```
62358 #include <regex.h>
62359 /*
62360  * Match string against the extended regular expression in
62361  * pattern, treating errors as no match.
62362  *
62363  * Return 1 for match, 0 for no match.
62364  */
62365 int
62366 match(const char *string, char *pattern)
62367 {
62368     int    status;
62369     regex_t re;
62370     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
62371         return(0);    /* Report error. */

```

```

62372     }
62373     status = regexec(&re, string, (size_t) 0, NULL, 0);
62374     regfree(&re);
62375     if (status != 0) {
62376         return(0);        /* Report error. */
62377     }
62378     return(1);
62379 }

```

62380 The following demonstrates how the REG\_NOTBOL flag could be used with *regexec()* to find all  
62381 substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very  
62382 little error checking is done.)

```

62383 (void) regcomp (&re, pattern, 0);
62384 /* This call to regexec() finds the first match on the line. */
62385 error = regexec (&re, &buffer[0], 1, &pm, 0);
62386 while (error == 0) { /* While matches found. */
62387     /* Substring found between pm.rm_so and pm.rm_eo. */
62388     /* This call to regexec() finds the next match. */
62389     error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
62390 }

```

#### 62391 APPLICATION USAGE

62392 An application could use:

```
62393 regerror(code, preg, (char *)NULL, (size_t)0)
```

62394 to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the  
62395 string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed,  
62396 static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger  
62397 buffer if it finds that this is too small.

62398 To match a pattern as described in XCU [Section 2.14](#) (on page 2523), use the *fnmatch()* function.

#### 62399 RATIONALE

62400 The *regexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are  
62401 supplied by the application, even if some elements of *pmatch* do not correspond to  
62402 subexpressions in *pattern*. The application developer should note that there is probably no  
62403 reason for using a value of *nmatch* that is larger than *preg->re\_nsub*+1.

62404 The REG\_NEWLINE flag supports a use of RE matching that is needed in some applications like  
62405 text editors. In such applications, the user supplies an RE asking the application to find a line  
62406 that matches the given expression. An anchor in such an RE anchors at the beginning or end of  
62407 any line. Such an application can pass a sequence of <newline>-separated lines to *regexec()* as a  
62408 single long string and specify REG\_NEWLINE to *regcomp()* to get the desired behavior. The  
62409 application must ensure that there are no explicit <newline> characters in *pattern* if it wants to  
62410 ensure that any match occurs entirely within a single line.

62411 The REG\_NEWLINE flag affects the behavior of *regexec()*, but it is in the *cflags* parameter to  
62412 *regcomp()* to allow flexibility of implementation. Some implementations will want to generate  
62413 the same compiled RE in *regcomp()* regardless of the setting of REG\_NEWLINE and have  
62414 *regexec()* handle anchors differently based on the setting of the flag. Other implementations will  
62415 generate different compiled REs based on the REG\_NEWLINE.

62416 The REG\_ICASE flag supports the operations taken by the *grep -i* option and the historical  
62417 implementations of *ex* and *vi*. Including this flag will make it easier for application code to be  
62418 written that does the same thing as these utilities.

62419 The substrings reported in *pmatch*[] are defined using offsets from the start of the string rather  
62420 than pointers. This allows type-safe access to both constant and non-constant strings.

62421 The type **regoff\_t** is used for the elements of *pmatch*[] to ensure that the application can  
62422 represent large arrays in memory (important for an application conforming to the Shell and  
62423 Utilities volume of POSIX.1-2024).

62424 The 1992 edition of this standard required **regoff\_t** to be at least as wide as **off\_t**, to facilitate  
62425 future extensions in which the string to be searched is taken from a file. However, these future  
62426 extensions have not appeared. The requirement rules out popular implementations with 32-bit  
62427 **regoff\_t** and 64-bit **off\_t**, so it has been removed.

62428 The standard developers rejected the inclusion of a *regsub*() function that would be used to do  
62429 substitutions for a matched RE. While such a routine would be useful to some applications, its  
62430 utility would be much more limited than the matching function described here. Both RE parsing  
62431 and substitution are possible to implement without support other than that required by the  
62432 ISO C standard, but matching is much more complex than substituting. The only difficult part of  
62433 substitution, given the information supplied by *regexexec*(), is finding the next character in a string  
62434 when there can be multi-byte characters. That is a much larger issue, and one that needs a more  
62435 general solution.

62436 The *errno* variable has not been used for error returns to avoid filling the *errno* name space for  
62437 this feature.

62438 The interface is defined so that the matched substrings *rm\_sp* and *rm\_ep* are in a separate  
62439 **regmatch\_t** structure instead of in **regex\_t**. This allows a single compiled RE to be used  
62440 simultaneously in several contexts; in *main*() and a signal handler, perhaps, or in multiple  
62441 threads of lightweight processes. (The *preg* argument to *regexexec*() is declared with type **const**, so  
62442 the implementation is not permitted to use the structure to store intermediate results.) It also  
62443 allows an application to request an arbitrary number of substrings from an RE. The number of  
62444 subexpressions in the RE is reported in *re\_nsub* in *preg*. With this change to *regexexec*(),  
62445 consideration was given to dropping the REG\_NOSUB flag since the user can now specify this  
62446 with a zero *nmatch* argument to *regexexec*(). However, keeping REG\_NOSUB allows an  
62447 implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp*() that  
62448 no subexpressions need be reported. The implementation is only required to fill in *pmatch* if  
62449 *nmatch* is not zero and if REG\_NOSUB is not specified. Note that the **size\_t** type, as defined in  
62450 the ISO C standard, is unsigned, so the description of *regexexec*() does not need to address  
62451 negative values of *nmatch*.

62452 REG\_NOTBOL was added to allow an application to do repeated searches for the same pattern  
62453 in a line. If the pattern contains a <circumflex> character that should match the beginning of a  
62454 line, then the pattern should only match when matched against the beginning of the line.  
62455 Without the REG\_NOTBOL flag, the application could rewrite the expression for subsequent  
62456 matches, but in the general case this would require parsing the expression. The need for  
62457 REG\_NOTEOL is not as clear; it was added for symmetry.

62458 The addition of the *regerror*() function addresses the historical need for conforming application  
62459 programs to have access to error information more than “Function failed to compile/match your  
62460 RE for unknown reasons”.

62461 This interface provides for two different methods of dealing with error conditions. The specific  
62462 error codes (REG\_EBRACE, for example), defined in <**regex.h**>, allow an application to recover  
62463 from an error if it is so able. Many applications, especially those that use patterns supplied by a  
62464 user, will not try to deal with specific error cases, but will just use *regerror*() to obtain a human-  
62465 readable error message to present to the user.

62466 The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating  
 62467 memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was  
 62468 considered unacceptable since it creates difficulties for multi-threaded applications.

62469 The *preg* argument is provided to *regerror()* to allow an implementation to generate a more  
 62470 descriptive message than would be possible with *errcode* alone. An implementation might, for  
 62471 example, save the character offset of the offending character of the pattern in a field of *preg*, and  
 62472 then include that in the generated message string. The implementation may also ignore *preg*.

62473 A REG\_FILENAME flag was considered, but omitted. This flag caused *regexec()* to match  
 62474 patterns as described in XCU Section 2.14 (on page 2523) instead of REs. This service is now  
 62475 provided by the *fnmatch()* function.

62476 Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and  
 62477 POSIX.1-2024 in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says  
 62478 that many bad constructs “produce undefined results”, or that “the interpretation is undefined”.  
 62479 POSIX.1-2024, however, says that the interpretation of such REs is unspecified. The term  
 62480 “undefined” means that the action by the application is an error, of similar severity to passing a  
 62481 bad pointer to a function.

62482 The *regcomp()* and *regexec()* functions are required to accept any null-terminated string as the  
 62483 *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is  
 62484 “unspecified”. POSIX.1-2024 does not specify how the functions will interpret the pattern; they  
 62485 might return error codes, or they might do pattern matching in some completely unexpected  
 62486 way, but they should not do something like abort the process.

#### 62487 FUTURE DIRECTIONS

62488 None.

62492 XCU Section 2.14 (on page 2523)

#### 62493 CHANGE HISTORY

62494 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 62495 Issue 5

62496 Moved from POSIX2 C-language Binding to BASE.

#### 62497 Issue 6

62498 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

62499 The following new requirements on POSIX implementations derive from alignment with the  
 62500 Single UNIX Specification:

- 62501 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 62502 required for conforming implementations of previous POSIX specifications, it was not  
 62503 required for UNIX applications.

62504 The normative text is updated to avoid use of the term “must” for application requirements.

62505 The REG\_ENOSYS constant is removed.

62506 The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexec()* prototypes for  
 62507 alignment with the ISO/IEC 9899:1999 standard.

62508 **Issue 7**

62509 Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error  
62510 occurs in processing a function call, any one of the possible constants may be returned.

62511 SD5-XBD-ERN-60 is applied.

62512 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0505 [305] is applied.

62513 **Issue 8**

62514 Austin Group Defect 385 is applied, adding a requirement that *regfree()* does not modify *errno*  
62515 when passed a pointer to a **regex\_t** that can be freed.

62516 Austin Group Defects 793 and 1329 are applied, adding REG\_MINIMAL.

62517 Austin Group Defect 1031 is applied, changing the description of REG\_ICASE.

62518 **NAME**

62519 remainder, remainderf, remainderl — remainder function

62520 **SYNOPSIS**

62521 #include &lt;math.h&gt;

62522 double remainder(double *x*, double *y*);62523 float remainderf(float *x*, float *y*);62524 long double remainderl(long double *x*, long double *y*);62525 **DESCRIPTION**

62526 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62527 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62528 volume of POSIX.1-2024 defers to the ISO C standard.

62529 These functions shall return the floating-point remainder  $r=x-ny$  when  $y$  is non-zero. The value  
 62530  $n$  is the integral value nearest the exact value  $x/y$ . When  $|n-x/y|=\frac{1}{2}$ , the value  $n$  is chosen to  
 62531 be even.

62532 The behavior of *remainder()* shall be independent of the rounding mode.

62533 **RETURN VALUE**

62534 Upon successful completion, these functions shall return the floating-point remainder  $r=x-ny$   
 62535 when  $y$  is non-zero.

62536 MX When subnormal results are supported, the returned value shall be exact.

62537 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
 62538 implementation-defined whether a domain error occurs or zero is returned.

62539 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

62540 If  $x$  is infinite or  $y$  is 0 and the other is non-NaN, a domain error shall occur, and a NaN shall be  
 62541 returned.

62542 **ERRORS**

62543 These functions shall fail if:

62544 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
 62545 NaN.

62546 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62547 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62548 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 62549 shall be raised.

62550 These functions may fail if:

62551 **Domain Error** The  $y$  argument is zero.

62552 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62553 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62554 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 62555 shall be raised.

**62556 EXAMPLES**

62557 None.

**62558 APPLICATION USAGE**

62559 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
62560 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**62561 RATIONALE**

62562 None.

**62563 FUTURE DIRECTIONS**

62564 None.

**62568 CHANGE HISTORY**

62569 First released in Issue 4, Version 2.

**62570 Issue 5**

62571 Moved from X/OPEN UNIX extension to BASE.

**62572 Issue 6**

62573 The *remainder()* function is no longer marked as an extension.

62574 The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999  
62575 standard.

62576 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
62577 revised to align with the ISO/IEC 9899:1999 standard.

62578 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
62579 marked.

**62580 Issue 7**

62581 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

62582 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0506 [320] is applied.

**62583 Issue 8**

62584 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
62585 standard.

62586 **NAME**

62587 remove — remove a file

62588 **SYNOPSIS**

62589 #include &lt;stdio.h&gt;

62590 int remove(const char \*path);

62591 **DESCRIPTION**

62592 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
62593 conflict between the requirements described here and the ISO C standard is unintentional. This  
62594 volume of POSIX.1-2024 defers to the ISO C standard.

62595 The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no  
62596 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,  
62597 unless it is created anew.

62598 CX If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

62599 If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

62600 **RETURN VALUE**62601 CX Refer to *rmdir()* or *unlink()*.62602 **ERRORS**62603 CX Refer to *rmdir()* or *unlink()*.62604 **EXAMPLES**62605 **Removing Access to a File**62606 The following example shows how to remove access to a file named `/home/cnd/old_mods`.

```
62607 #include <stdio.h>
62608 int status;
62609 ...
62610 status = remove("/home/cnd/old_mods");
```

62611 **APPLICATION USAGE**

62612 None.

62613 **RATIONALE**

62614 None.

62615 **FUTURE DIRECTIONS**

62616 None.

62617 **SEE ALSO**62618 *rmdir()*, *unlink()*

62619 XBD &lt;stdio.h&gt;

62620 **CHANGE HISTORY**

62621 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C  
62622 standard.

62623 **Issue 6**

62624 Extensions beyond the ISO C standard are marked.

62625  
62626

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

62627  
62628  
62629

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

62630 **NAME**

62631 remque — remove an element from a queue

62632 **SYNOPSIS**

62633 XSI `#include <search.h>`

62634 `void remque(void *element);`

62635 **DESCRIPTION**

62636 Refer to *insque()*.

62637 **NAME**

62638 remquo, remquof, remquol — remainder functions

62639 **SYNOPSIS**

62640 #include &lt;math.h&gt;

62641 double remquo(double *x*, double *y*, int \**quo*);62642 float remquof(float *x*, float *y*, int \**quo*);62643 long double remquol(long double *x*, long double *y*, int \**quo*);62644 **DESCRIPTION**

62645 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62646 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62647 volume of POSIX.1-2024 defers to the ISO C standard.

62648 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the  
 62649 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by *quo*,  
 62650 they store a value whose sign is the sign of  $x/y$  and whose magnitude is congruent modulo  $2^n$  to  
 62651 the magnitude of the integral quotient of  $x/y$ , where  $n$  is an implementation-defined integer  
 62652 greater than or equal to 3. If  $y$  is zero, the value stored in the object pointed to by *quo* is  
 62653 unspecified.

62654 An application wishing to check for error situations should set *errno* to zero and call  
 62655 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 62656 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 62657 zero, an error has occurred.

62658 **RETURN VALUE**62659 These functions shall return  $x \text{ REM } y$ .

62660 MX When subnormal results are supported, the returned value shall be exact.

62661 If NaN is supported and a NaN is returned, the value stored in the object pointed to by *quo* is  
 62662 unspecified.

62663 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
 62664 implementation-defined whether a domain error occurs or zero is returned.

62665 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

62666 If  $x$  is  $\pm\text{Inf}$  or  $y$  is zero and the other argument is non-NaN, a domain error shall occur, and a  
 62667 NaN shall be returned.

62668 **ERRORS**

62669 These functions shall fail if:

62670 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
 62671 NaN.

62672 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62673 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62674 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 62675 shall be raised.

62676 These functions may fail if:

62677 **Domain Error** The  $y$  argument is zero.

62678 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62679 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62680 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception

62681 shall be raised.

62682 **EXAMPLES**

62683 None.

62684 **APPLICATION USAGE**

62685 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
62686 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

62687 **RATIONALE**

62688 These functions are intended for implementing argument reductions which can exploit a few  
62689 low-order bits of the quotient. Note that *x* may be so large in magnitude relative to *y* that an  
62690 exact representation of the quotient is not practical.

62691 **FUTURE DIRECTIONS**

62692 None.

62693 **SEE ALSO**

62694 *feclearexcept()*, *fetestexcept()*, *remainder()*

62695 XBD Section 4.23 (on page 109), <math.h>

62696 **CHANGE HISTORY**

62697 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

62698 **Issue 7**

62699 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #56 (SD5-XSH-ERN-83) is applied.

62700 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0507 [320] is applied.

62701 **Issue 8**

62702 Austin Group Defect 713 is applied, clarifying the behavior when a NaN is returned.

62703 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
62704 standard.

62705 **NAME**

62706 rename, renameat — rename file

62707 **SYNOPSIS**

62708 #include &lt;stdio.h&gt;

62709 int rename(const char \*old, const char \*new);

62710 OH CX #include &lt;fcntl.h&gt;

62711 CX int renameat(int oldfd, const char \*old, int newfd,  
62712 const char \*new);62713 **DESCRIPTION**62714 CX For *rename()*: The functionality described on this reference page is aligned with the ISO C  
62715 standard. Any conflict between the requirements described here and the ISO C standard is  
62716 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.62717 The *rename()* function shall change the name of a file. The *old* argument points to the pathname  
62718 CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new*  
62719 argument does not resolve to an existing directory entry for a file of type directory and the *new*  
62720 argument contains at least one non-`</code>slash> character and ends with one or more trailing  
62721 </code>slash> characters after all symbolic links have been processed, rename() shall fail.`62722 If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic  
62723 link itself, and shall not resolve the last component of the argument. If the *old* argument and the  
62724 *new* argument resolve to either the same existing directory entry or different directory entries for  
62725 the same existing file, *rename()* shall return successfully and perform no other action.62726 If the *old* argument names a file that is not a directory and the *new* argument names a directory,  
62727 or *old* names a directory and *new* names a file that is not a directory, or *new* names a directory  
62728 that is not empty, *rename()* shall fail. Otherwise, if the directory entry named by *new* exists, it  
62729 shall be removed and *old* renamed to *new*. In this case, a directory entry named *new* shall remain  
62730 visible to other threads throughout the renaming operation and refer either to the file referred to  
62731 by *new* or *old* before the operation began.62732 If either *pathname* argument refers to a path whose final component is either dot or dot-dot,  
62733 *rename()* shall fail.62734 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.  
62735 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.62736 The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access  
62737 permission is required for the directory containing *old* and the directory containing *new*. If the  
62738 *old* argument points to the pathname of a directory, write access permission may be required for  
62739 the directory named by *old*, and, if it exists, the directory named by *new*.62740 If the *new* argument names an existing file and the file's link count becomes 0 when it is  
62741 removed and no process has the file open, the space occupied by the file shall be freed and the  
62742 file shall no longer be accessible. If one or more processes have the file open when the last link is  
62743 removed, the link shall be removed before *rename()* returns, but the removal of the file contents  
62744 shall be postponed until all references to the file are closed.62745 Upon successful completion, *rename()* shall mark for update the last data modification and last  
62746 file status change timestamps of the parent directory of each file.62747 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be  
62748 unaffected.

62749 The *renameat()* function shall be equivalent to the *rename()* function except in the case where  
 62750 either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located  
 62751 relative to the directory associated with the file descriptor *oldfd* instead of the current working  
 62752 directory. If *new* is a relative path, the same happens only relative to the directory associated  
 62753 with *newfd*. If the access mode of the open file description associated with the file descriptor is  
 62754 not `O_SEARCH`, the function shall check whether directory searches are permitted using the  
 62755 current permissions of the directory underlying the file descriptor. If the access mode is  
 62756 `O_SEARCH`, the function shall not perform the check.

62757 If *renameat()* is passed the special value `AT_FDCWD` in the *oldfd* or *newfd* parameter, the current  
 62758 working directory shall be used in the determination of the file for the respective *path* parameter.

#### 62759 RETURN VALUE

62760 CX Upon successful completion, the *rename()* function shall return 0. Otherwise, it shall return `-1`,  
 62761 *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by  
 62762 *new* shall be changed or created.

62763 CX Upon successful completion, the *renameat()* function shall return 0. Otherwise, it shall return `-1`  
 62764 and set *errno* to indicate the error.

#### 62765 ERRORS

62766 CX The *rename()* and *renameat()* functions shall fail if:

62767 CX `[EACCES]` A component of either path prefix denies search permission; or one of the  
 62768 directories containing *old* or *new* denies write permissions; or, write  
 62769 permission is required and is denied for a directory pointed to by the *old* or  
 62770 *new* arguments.

62771 CX `[EBUSY]` The directory named by *old* or *new* is currently in use by the system or another  
 62772 process, and the implementation considers this an error.

62773 CX `[EEXIST]` or `[ENOTEMPTY]`

62774 The *new* argument names a directory that is not empty.

62775 CX `[EILSEQ]` The last pathname component of the new pathname is not a portable filename,  
 62776 and cannot be created in the target directory.

62777 CX `[EINVAL]` The *old* pathname names an ancestor directory of the *new* pathname, or either  
 62778 pathname argument contains a final component that is dot or dot-dot.

62779 CX `[EIO]` A physical I/O error has occurred.

62780 CX `[EISDIR]` The *new* argument points to a directory and the *old* argument points to a file  
 62781 that is not a directory.

62782 CX `[ELOOP]` A loop exists in symbolic links encountered during resolution of the *old* or *new*  
 62783 argument.

62784 CX `[EMLINK]` The file named by *old* is a directory, and the link count of the parent directory  
 62785 of *new* would exceed `{LINK_MAX}`.

62786 CX `[ENAMETOOLONG]`

62787 The length of a component of a pathname is longer than `{NAME_MAX}`.

62788 CX `[ENOENT]` The *old* argument does not name an existing file, a component of the path  
 62789 prefix of *new* does not exist, or either *old* or *new* points to an empty string.

62790	CX	[ENOSPC]	The directory that would contain <i>new</i> cannot be extended.
62791	CX	[ENOTDIR]	A component of either path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names a directory and the <i>new</i> argument names a non-directory file; or the <i>old</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names an existing non-directory file and the <i>new</i> argument names a nonexistent file, contains at least one non- <code>&lt;slash&gt;</code> character, and ends with one or more trailing <code>&lt;slash&gt;</code> characters; or the <i>new</i> argument names an existing non-directory file, contains at least one non- <code>&lt;slash&gt;</code> character, and ends with one or more trailing <code>&lt;slash&gt;</code> characters.
62802	XSI	[EPERM] or [EACCES]	The <code>S_ISVTX</code> flag is set on the directory containing the file referred to by <i>old</i> and the process does not satisfy the criteria specified in XBD Section 4.5 (on page 96) with respect to <i>old</i> ; or <i>new</i> refers to an existing file, the <code>S_ISVTX</code> flag is set on the directory containing this file, and the process does not satisfy the criteria specified in XBD Section 4.5 with respect to this file.
62808	CX	[EROFS]	The requested operation requires writing in a directory on a read-only file system.
62810	CX	[EXDEV]	The file named by <i>old</i> and the directory in which the directory entry named by <i>new</i> is to be created or replaced are on different file systems and the implementation does not support hard links between file systems.
62813	CX	In addition, the <i>renameat()</i> function shall fail if:	
62814		[EACCES]	The access mode of the open file description associated with <i>oldfd</i> or <i>newfd</i> is not <code>O_SEARCH</code> and the permissions of the directory underlying <i>oldfd</i> or <i>newfd</i> , respectively, do not permit directory searches.
62817		[EBADF]	The <i>old</i> argument does not specify an absolute path and the <i>oldfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching, or the <i>new</i> argument does not specify an absolute path and the <i>newfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.
62822		[ENOTDIR]	The <i>old</i> or <i>new</i> argument is not an absolute path and <i>oldfd</i> or <i>newfd</i> , respectively, is a file descriptor associated with a non-directory file.
62824	CX	The <i>rename()</i> and <i>renameat()</i> functions may fail if:	
62825	CX	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>old</i> or <i>new</i> argument.
62827	CX	[ENAMETOOLONG]	The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .
62831	CX	[ETXTBSY]	The file named by <i>new</i> exists and is the last directory entry to a pure procedure (shared text) file that is being executed.

62833 **EXAMPLES**62834 **Renaming a File**

62835 The following example shows how to rename a file named `/home/cnd/mod1` to  
62836 `/home/cnd/mod2`.

```
62837 #include <stdio.h>
62838 int status;
62839 ...
62840 status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

62841 **APPLICATION USAGE**

62842 Some implementations mark for update the last file status change timestamp of renamed files  
62843 and some do not. Applications which make use of the last file status change timestamp may  
62844 behave differently with respect to renamed files unless they are designed to allow for either  
62845 behavior.

62846 **RATIONALE**

62847 This `rename()` function is equivalent for regular files to that defined by the ISO C standard. Its  
62848 inclusion here expands that definition to include actions on directories and specifies behavior  
62849 when the *new* parameter names a file that already exists. That specification requires that the  
62850 action of the function be atomic.

62851 One of the reasons for introducing this function was to have a means of renaming directories  
62852 while permitting implementations to prohibit the use of `link()` and `unlink()` with directories,  
62853 thus constraining links to directories to those made by `mkdir()`.

62854 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
62855 rename("x", "x");
62856 does not remove the file.
```

62857 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

62858 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in `rmdir()` and [EBUSY] in  
62859 `unlink()`. For a discussion of [EXDEV], see `link()`.

62860 The purpose of the `renameat()` function is to rename files in directories other than the current  
62861 working directory without exposure to race conditions. Any part of the path of a file could be  
62862 changed in parallel to a call to `rename()`, resulting in unspecified behavior. By opening file  
62863 descriptors for the source and target directories and using the `renameat()` function it can be  
62864 guaranteed that that renamed file is located correctly and the resulting file is in the desired  
62865 directory.

62866 Implementations are encouraged to have `rename()` and `renameat()` report an [EILSEQ] error if the  
62867 file named by *new* does not already exist and the last component of that pathname contains any  
62868 bytes that have the encoded value of a <newline> character.

62869 **FUTURE DIRECTIONS**

62870 None.

62871 **SEE ALSO**

62872 [link\(\)](#), [rmdir\(\)](#), [symlink\(\)](#), [unlink\(\)](#)

62873 XBD Section 4.5 (on page 96), [<fcntl.h>](#), [<stdio.h>](#)

62874 **CHANGE HISTORY**

62875 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62876 **Issue 5**

62877 The [EBUSY] error is added to the optional part of the ERRORS section.

62878 **Issue 6**

62879 Extensions beyond the ISO C standard are marked.

62880 The following new requirements on POSIX implementations derive from alignment with the  
62881 Single UNIX Specification:

- 62882 • The [EIO] mandatory error condition is added.
- 62883 • The [ELOOP] mandatory error condition is added.
- 62884 • A second [ENAMETOOLONG] is added as an optional error condition.
- 62885 • The [ETXTBSY] optional error condition is added.

62886 The following changes were made to align with the IEEE P1003.1a draft standard:

- 62887 • Details are added regarding the treatment of symbolic links.
- 62888 • The [ELOOP] optional error condition is added.

62889 The normative text is updated to avoid use of the term “must” for application requirements.

62890 **Issue 7**

62891 Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the  
62892 [ENOTDIR] error.

62893 Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final  
62894 component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

62895 Austin Group Interpretation 1003.1-2001 #143 is applied.

62896 Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error  
62897 condition also applies to the case in which a component of *new* does not exist.

62898 Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

62899 The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API  
62900 Set Part 2.

62901 Changes are made related to support for finegrained timestamps.

62902 Changes are made to allow a directory to be opened for searching.

62903 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0508 [324], XSH/TC1-2008/0509 [147],  
62904 XSH/TC1-2008/0510 [379], XSH/TC1-2008/0511 [278], and XSH/TC1-2008/0512 [278] are  
62905 applied.

62906 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0311 [873], XSH/TC2-2008/0312 [591],  
62907 XSH/TC2-2008/0313 [716], XSH/TC2-2008/0314 [817], XSH/TC2-2008/0315 [817], and  
62908 XSH/TC2-2008/0316 [591] are applied.

62909 **Issue 8**

62910 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
62911 filenames containing any bytes that have the encoded value of a <newline> character.

62912 Austin Group Defect 293 is applied, adding the [EILSEQ] error.

62913 Austin Group Defect 1200 is applied, correcting the argument names in the [ELOOP] errors.

62914

Austin Group Defect 1330 is applied, removing obsolescent interfaces.

62915

Austin Group Defect 1380 is applied, changing text using the term “link” in line with its updated definition.

62916

62917 **NAME**

62918           rewind — reset the file position indicator in a stream

62919 **SYNOPSIS**

62920           #include &lt;stdio.h&gt;

62921           void rewind(FILE \*stream);

62922 **DESCRIPTION**62923 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
62924 conflict between the requirements described here and the ISO C standard is unintentional. This  
62925 volume of POSIX.1-2024 defers to the ISO C standard.

62926       The call:

62927       rewind(stream)

62928       shall be equivalent to:

62929       (void) fseek(stream, 0L, SEEK\_SET)

62930       except that *rewind()* shall also ensure the error indicator is clear when the function returns.62931 CX       Since *rewind()* does not return a value, an application wishing to detect errors should clear *errno*,  
62932 then call *rewind()*, and if *errno* is non-zero, assume an error has occurred.62933 **RETURN VALUE**62934       The *rewind()* function shall not return a value.62935 **ERRORS**62936 CX       Refer to *fseek()* with the exception of [EINVAL] which does not apply.62937 **EXAMPLES**

62938       None.

62939 **APPLICATION USAGE**

62940       None.

62941 **RATIONALE**

62942       None.

62943 **FUTURE DIRECTIONS**

62944       None.

62945 **SEE ALSO**62946       Section 2.5 (on page 521), *fseek()*

62947       XBD &lt;stdio.h&gt;

62948 **CHANGE HISTORY**

62949       First released in Issue 1. Derived from Issue 1 of the SVID.

62950 **Issue 6**

62951       Extensions beyond the ISO C standard are marked.

62952 **Issue 7**

62953       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0513 [14] is applied.

62954 **Issue 8**62955       Austin Group Defect 1414 is applied, clarifying that *rewind()* ensures the error indicator is clear  
62956 when the function returns.

62957 **NAME**

62958           rewinddir — reset the position of a directory stream to the beginning of a directory

62959 **SYNOPSIS**

62960           #include <dirent.h>

62961           void rewinddir(DIR \*dirp);

62962 **DESCRIPTION**

62963           The *rewinddir()* function shall reset the position of the directory stream to which *dirp* refers to the  
62964 beginning of the directory. It shall also cause the directory stream to refer to the current state of  
62965 the corresponding directory, as a call to *opendir()* would have done. If *dirp* does not refer to a  
62966 directory stream, the effect is undefined.

62967           After a call to the *fork()* function, either the parent or child (but not both) may continue  
62968 XSI       processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and  
62969 child processes use these functions, the result is undefined.

62970 **RETURN VALUE**

62971           The *rewinddir()* function shall not return a value.

62972 **ERRORS**

62973           No errors are defined.

62974 **EXAMPLES**

62975           None.

62976 **APPLICATION USAGE**

62977           The *rewinddir()* function should be used in conjunction with *opendir()*, *readdir()*, and *closedir()* to  
62978 examine the contents of the directory. This method is recommended for portability.

62979 **RATIONALE**

62980           None.

62981 **FUTURE DIRECTIONS**

62982           None.

62983 **SEE ALSO**

62984           *closedir()*, *fdopendir()*, *readdir()*

62985           XBD <dirent.h>, <sys/types.h>

62986 **CHANGE HISTORY**

62987           First released in Issue 2.

62988 **Issue 6**

62989           In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

62990           The following new requirements on POSIX implementations derive from alignment with the  
62991 Single UNIX Specification:

- 62992           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
62993 required for conforming implementations of previous POSIX specifications, it was not  
62994 required for UNIX applications.

62995 **NAME**

62996 rint, rintf, rintl — round-to-nearest integral value

62997 **SYNOPSIS**

```
62998 #include <math.h>
62999 double rint(double x);
63000 float rintf(float x);
63001 long double rintl(long double x);
```

63002 **DESCRIPTION**

63003 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 63004 conflict between the requirements described here and the ISO C standard is unintentional. This  
 63005 volume of POSIX.1-2024 defers to the ISO C standard.

63006 These functions shall return the integral value (represented as a **double**) nearest  $x$  in the  
 63007 direction of the current rounding mode. The current rounding mode is implementation-defined.

63008 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to  
 63009 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be  
 63010 equivalent to *ceil()*. If the current rounding mode rounds towards zero, then *rint()* shall be  
 63011 MX equivalent to *trunc()*. If the current rounding mode rounds towards nearest, then *rint()* differs  
 63012 from *round()* in that halfway cases are rounded to even rather than away from zero.

63013 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that  
 63014 they may raise the inexact floating-point exception if the result differs in value from the  
 63015 argument.

63016 An application wishing to check for error situations should set *errno* to zero and call  
 63017 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 63018 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 63019 zero, an error has occurred.

63020 **RETURN VALUE**

63021 Upon successful completion, these functions shall return the integer (represented as a double  
 63022 MX precision number) nearest  $x$  in the direction of the current rounding mode. The result shall have  
 63023 the same sign as  $x$ .

63024 MX If  $x$  is NaN, a NaN shall be returned.

63025 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

63026 **ERRORS**

63027 No errors are defined.

63028 **EXAMPLES**

63029 None.

63030 **APPLICATION USAGE**

63031 The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
 63032 return value should be tested before assigning it to an integer type to avoid the undefined  
 63033 results of an integer overflow.

63034 **RATIONALE**

63035 None.

63036 **FUTURE DIRECTIONS**

63037 None.

63038 **SEE ALSO**63039 *abs()*, *ceil()*, *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*, *nearbyint()*

63040 XBD Section 4.23 (on page 109), &lt;math.h&gt;

63041 **CHANGE HISTORY**

63042 First released in Issue 4, Version 2.

63043 **Issue 5**

63044 Moved from X/OPEN UNIX extension to BASE.

63045 **Issue 6**

63046 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 63047 • The *rintf()* and *rintl()* functions are added.
- 63048 • The *rint()* function is no longer marked as an extension.
- 63049 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
63050 revised to align with the ISO/IEC 9899:1999 standard.
- 63051 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard  
63052 are marked.

63053 **Issue 7**

63054 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0514 [346], XSH/TC1-2008/0515 [346],  
63055 XSH/TC1-2008/0516 [346], XSH/TC1-2008/0517 [346], and XSH/TC1-2008/0518 [346] are  
63056 applied.

63057 **NAME**

63058           rmdir — remove a directory

63059 **SYNOPSIS**

63060           #include &lt;unistd.h&gt;

63061           int rmdir(const char \*path);

63062 **DESCRIPTION**63063           The *rmdir()* function shall remove a directory whose name is given by *path*. The directory shall  
63064           be removed only if it is an empty directory.63065           If the directory is the root directory or the current working directory of any process, it is  
63066           unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].63067           If *path* names a symbolic link, then *rmdir()* shall fail and set *errno* to [ENOTDIR].63068           If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir()* shall  
63069           fail.63070           If the directory's link count becomes 0 and no process has the directory open, the space occupied  
63071           by the directory shall be freed and the directory shall no longer be accessible. If one or more  
63072           processes have the directory open when the last link is removed, the dot and dot-dot entries, if  
63073           present, shall be removed before *rmdir()* returns and no new entries may be created in the  
63074           directory, but the directory shall not be removed until all references to the directory are closed.63075           If the directory is not an empty directory, *rmdir()* shall fail and set *errno* to [EEXIST] or  
63076           [ENOTEMPTY].63077           Upon successful completion, *rmdir()* shall mark for update the last data modification and last  
63078           file status change timestamps of the parent directory.63079 **RETURN VALUE**63080           Upon successful completion, the function *rmdir()* shall return 0. Otherwise, -1 shall be returned,  
63081           and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.63082 **ERRORS**63083           The *rmdir()* function shall fail if:63084           [EACCES]           Search permission is denied on a component of the path prefix, or write  
63085           permission is denied on the parent directory of the directory to be removed.63086           [EBUSY]           The directory to be removed is currently in use by the system or some process  
63087           and the implementation considers this to be an error.

63088           [EEXIST] or [ENOTEMPTY]

63089                           The *path* argument names a directory that is not an empty directory, or there  
63090                           are hard links to the directory other than dot or a single entry in dot-dot.63091           [EINVAL]           The *path* argument contains a last component that is dot.

63092           [EIO]           A physical I/O error has occurred.

63093           [ELOOP]           A loop exists in symbolic links encountered during resolution of the *path*  
63094           argument.

63095           [ENAMETOOLONG]

63096                           The length of a component of a pathname is longer than {NAME\_MAX}.

63097           [ENOENT]           A component of *path* does not name an existing file, or the *path* argument  
63098           names a nonexistent directory or points to an empty string.

- 63099 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a  
63100 symbolic link to a directory.
- 63101 XSI [EPERM] or [EACCES]  
63102 The S\_ISVTX flag is set on the directory containing the file referred to by the  
63103 *path* argument and the process does not satisfy the criteria specified in XBD  
63104 [Section 4.5](#) (on page 96).
- 63105 [EROFS] The directory entry to be removed resides on a read-only file system.
- 63106 The *rmdir()* function may fail if:
- 63107 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
63108 resolution of the *path* argument.
- 63109 [ENAMETOOLONG]  
63110 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
63111 symbolic link produced an intermediate result with a length that exceeds  
63112 {PATH\_MAX}.

### 63113 EXAMPLES

#### 63114 Removing a Directory

63115 The following example shows how to remove a directory named `/home/cnd/mod1`.

```
63116 #include <unistd.h>
63117 int status;
63118 ...
63119 status = rmdir("/home/cnd/mod1");
```

### 63120 APPLICATION USAGE

63121 None.

### 63122 RATIONALE

63123 The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the  
63124 condition when the directory to be removed does not exist or *new* already exists. When the 1984  
63125 /usr/group standard was published, it contained [EEXIST] instead. When these functions were  
63126 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore,  
63127 several existing applications and implementations support/use both forms, and no agreement  
63128 could be reached on either value. All implementations are required to supply both [EEXIST] and  
63129 [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-  
63130 language **case** statements.

63131 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the  
63132 parent directory to be removed is not clear, particularly in the presence of multiple links to a  
63133 directory.

63134 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are  
63135 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or  
63136 [ENOTEMPTY] clarifies the behavior in this case.

63137 If the current working directory of the process is being removed, that should be an allowed  
63138 error.

63139 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in  
63140 [Section 2.3](#) (on page 507) about returning any one of the possible errors permits that behavior to  
63141 continue. The [ELOOP] error may be returned if more than {SYMLOOP\_MAX} symbolic links

63142 are encountered during resolution of the *path* argument.

63143 **FUTURE DIRECTIONS**

63144 None.

63145 **SEE ALSO**

63146 [Section 2.3](#) (on page 507), *mkdir()*, *remove()*, *rename()*, *unlink()*

63147 [XBD Section 4.5](#) (on page 96), [<unistd.h>](#)

63148 **CHANGE HISTORY**

63149 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63150 **Issue 6**

63151 The following new requirements on POSIX implementations derive from alignment with the  
63152 Single UNIX Specification:

- 63153 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 63154 • The [EIO] mandatory error condition is added.
- 63155 • The [ELOOP] mandatory error condition is added.
- 63156 • A second [ENAMETOOLONG] is added as an optional error condition.

63157 The following changes were made to align with the IEEE P1003.1a draft standard:

- 63158 • The [ELOOP] optional error condition is added.

63159 **Issue 7**

63160 Austin Group Interpretation 1003.1-2001 #143 is applied.

63161 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
63162 operations when the S\_ISVTX bit is set.

63163 Changes are made related to support for finegrained timestamps.

63164 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0519 [324] is applied.

63165 **NAME**

63166 round, roundf, roundl — round to the nearest integer value in a floating-point format

63167 **SYNOPSIS**

63168 #include &lt;math.h&gt;

63169 double round(double x);

63170 float roundf(float x);

63171 long double roundl(long double x);

63172 **DESCRIPTION**63173 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
63174 conflict between the requirements described here and the ISO C standard is unintentional. This  
63175 volume of POSIX.1-2024 defers to the ISO C standard.63176 These functions shall round their argument to the nearest integer value in floating-point format,  
63177 rounding halfway cases away from zero, regardless of the current rounding direction.

63178 MX These functions may raise the inexact floating-point exception for finite non-integer arguments.

63179 **RETURN VALUE**63180 MX Upon successful completion, these functions shall return the rounded integer value. The result  
63181 shall have the same sign as  $x$ .63182 MX If  $x$  is NaN, a NaN shall be returned.63183 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.63184 **ERRORS**

63185 No errors are defined.

63186 **EXAMPLES**

63187 None.

63188 **APPLICATION USAGE**63189 The integral value returned by these functions need not be expressible as an `intmax_t`. The  
63190 return value should be tested before assigning it to an integer type to avoid the undefined  
63191 results of an integer overflow.63192 **RATIONALE**

63193 None.

63194 **FUTURE DIRECTIONS**

63195 None.

63196 **SEE ALSO**63197 [feclearexcept\(\)](#), [fetestexcept\(\)](#)63198 XBD [Section 4.23](#) (on page 109), [<math.h>](#)63199 **CHANGE HISTORY**

63200 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

63201 **Issue 7**

63202 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0520 [346] is applied.

63203 **Issue 8**63204 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
63205 standard.

63206 **NAME**

63207 scalbn, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT\_RADIX

63208 **SYNOPSIS**

```
63209 #include <math.h>
63210 double scalbn(double x, long n);
63211 float scalblnf(float x, long n);
63212 long double scalblnl(long double x, long n);
63213 double scalbn(double x, int n);
63214 float scalbnf(float x, int n);
63215 long double scalbnl(long double x, int n);
```

63216 **DESCRIPTION**

63217 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 63218 conflict between the requirements described here and the ISO C standard is unintentional. This  
 63219 volume of POSIX.1-2024 defers to the ISO C standard.

63220 These functions shall compute  $x * FLT\_RADIX^n$  efficiently, not normally by computing  
 63221  $FLT\_RADIX^n$  explicitly.

63222 An application wishing to check for error situations should set *errno* to zero and call  
 63223 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 63224 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 63225 zero, an error has occurred.

63226 **RETURN VALUE**63227 Upon successful completion, these functions shall return  $x * FLT\_RADIX^n$ .

63228 MX If the calculation does not overflow or underflow, the returned value shall be exact and shall be  
 63229 independent of the current rounding direction mode.

63230 If the result would cause overflow, a range error shall occur and these functions shall return  
 63231  $\pm HUGE\_VAL$ ,  $\pm HUGE\_VALF$ , and  $\pm HUGE\_VALL$  (according to the sign of  $x$ ) as appropriate for  
 63232 the return type of the function.

63233 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 63234 MXX and *scalbn*(), *scalblnf*(), *scalblnl*(), *scalbn*(), *scalbnf*(), and *scalbnl*() shall return 0.0, or (if IEC  
 63235 60559 Floating-Point is not supported) an implementation-defined value no greater in  
 63236 magnitude than DBL\_MIN, FLT\_MIN, LDBL\_MIN, DBL\_MIN, FLT\_MIN, and LDBL\_MIN,  
 63237 respectively.

63238 MX If  $x$  is NaN, a NaN shall be returned.63239 If  $x$  is  $\pm 0$  or  $\pm Inf$ ,  $x$  shall be returned.63240 If  $n$  is 0,  $x$  shall be returned.

63241 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 63242 the correct value shall be returned.

63243 **ERRORS**

63244 These functions shall fail if:

63245 Range Error The result overflows.

63246 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 63247 then *errno* shall be set to [ERANGE]. If the integer expression  
 63248 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 63249 floating-point exception shall be raised.

63250 These functions may fail if:

63251 Range Error The result underflows.

63252 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
63253 then *errno* shall be set to [ERANGE]. If the integer expression  
63254 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
63255 floating-point exception shall be raised.

#### 63256 EXAMPLES

63257 None.

#### 63258 APPLICATION USAGE

63259 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
63260 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 63261 RATIONALE

63262 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*  
63263 function from the Single UNIX Specification. The difference is that the *scalb()* function has a  
63264 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.  
63265 The three functions whose second type is **long** are provided because the factor required to scale  
63266 from the smallest positive floating-point value to the largest finite one, on many  
63267 implementations, is too large to represent in the minimum-width **int** format.

#### 63268 FUTURE DIRECTIONS

63269 None.

#### 63270 SEE ALSO

63271 [\*feclearexcept\(\)\*](#), [\*fetestexcept\(\)\*](#)

63272 XBD Section 4.23 (on page 109), [<math.h>](#)

#### 63273 CHANGE HISTORY

63274 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

#### 63275 Issue 7

63276 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0521 [68] and XSH/TC1-2008/0522  
63277 [68] are applied.

#### 63278 Issue 8

63279 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
63280 standard.

63281 **NAME**

63282       scandir — scan a directory

63283 **SYNOPSIS**

63284       #include &lt;dirent.h&gt;

```
63285       int scandir(const char *dir, struct dirent ***namelist,  
63286                   int (*sel)(const struct dirent *),  
63287                   int (*compar)(const struct dirent **, const struct dirent **));
```

63288 **DESCRIPTION**63289       Refer to *alphasort()*.

63290 **NAME**

63291           scanf — convert formatted input

63292 **SYNOPSIS**

63293           #include <stdio.h>

63294           int scanf(const char \*restrict *format*, ...);

63295 **DESCRIPTION**

63296           Refer to *fscanf()*.

**63297 NAME**

63298 sched\_get\_priority\_max, sched\_get\_priority\_min — get priority limits (**REALTIME**)

**63299 SYNOPSIS**

```
63300 PS|TPS #include <sched.h>
63301 int sched_get_priority_max(int policy);
63302 int sched_get_priority_min(int policy);
```

**63303 DESCRIPTION**

63304 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the appropriate  
63305 maximum or minimum, respectively, for the scheduling policy specified by *policy*.

63306 The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.

**63307 RETURN VALUE**

63308 If successful, the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the  
63309 appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a  
63310 value of  $-1$  and set *errno* to indicate the error.

**63311 ERRORS**

63312 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall fail if:

63313 [EINVAL] The value of the *policy* parameter does not represent a defined scheduling  
63314 policy.

**63315 EXAMPLES**

63316 None.

**63317 APPLICATION USAGE**

63318 None.

**63319 RATIONALE**

63320 None.

**63321 FUTURE DIRECTIONS**

63326 XBD **<sched.h>**

**63327 CHANGE HISTORY**

63328 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**63329 Issue 6**

63330 These functions are marked as part of the Process Scheduling option.

63331 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63332 implementation does not support the Process Scheduling option.

63333 The [ESRCH] error condition has been removed since these functions do not take a *pid*  
63334 argument.

63335 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin  
63336 code in the SYNOPSIS to PS|TPS.

63337 **NAME**63338 sched\_getparam — get scheduling parameters (**REALTIME**)63339 **SYNOPSIS**

```
63340 PS #include <sched.h>
63341 int sched_getparam(pid_t pid, struct sched_param *param);
```

63342 **DESCRIPTION**

63343 The *sched\_getparam()* function shall return the scheduling parameters of a process specified by  
63344 *pid* in the **sched\_param** structure pointed to by *param*.

63345 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
63346 parameters for the process whose process ID is equal to *pid* shall be returned.

63347 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of  
63348 the *sched\_getparam()* function is unspecified if the value of *pid* is negative.

63349 **RETURN VALUE**

63350 Upon successful completion, the *sched\_getparam()* function shall return zero. If the call to  
63351 *sched\_getparam()* is unsuccessful, the function shall return a value of  $-1$  and set *errno* to indicate  
63352 the error.

63353 **ERRORS**

63354 The *sched\_getparam()* function shall fail if:

63355 [EPERM] The requesting process does not have permission to obtain the scheduling  
63356 parameters of the specified process.

63357 [ESRCH] No process can be found corresponding to that specified by *pid*.

63358 **EXAMPLES**

63359 None.

63360 **APPLICATION USAGE**

63361 None.

63362 **RATIONALE**

63363 None.

63364 **FUTURE DIRECTIONS**

63365 None.

63366 **SEE ALSO**

63369 **CHANGE HISTORY**

63370 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

63371 **Issue 6**

63372 The *sched\_getparam()* function is marked as part of the Process Scheduling option.

63373 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63374 implementation does not support the Process Scheduling option.

63375 **NAME**63376 sched\_getscheduler — get scheduling policy (**REALTIME**)63377 **SYNOPSIS**

```
63378 PS #include <sched.h>
63379 int sched_getscheduler(pid_t pid);
```

63380 **DESCRIPTION**

63381 The *sched\_getscheduler()* function shall return the scheduling policy of the process specified by  
 63382 *pid*. If the value of *pid* is negative, the behavior of the *sched\_getscheduler()* function is  
 63383 unspecified.

63384 The values that can be returned by *sched\_getscheduler()* are defined in the **<sched.h>** header.

63385 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 63386 policy shall be returned for the process whose process ID is equal to *pid*.

63387 If *pid* is zero, the scheduling policy shall be returned for the calling process.

63388 **RETURN VALUE**

63389 Upon successful completion, the *sched\_getscheduler()* function shall return the scheduling policy  
 63390 of the specified process. If unsuccessful, the function shall return  $-1$  and set *errno* to indicate the  
 63391 error.

63392 **ERRORS**

63393 The *sched\_getscheduler()* function shall fail if:

63394 [EPERM] The requesting process does not have permission to determine the scheduling  
 63395 policy of the specified process.

63396 [ESRCH] No process can be found corresponding to that specified by *pid*.

63397 **EXAMPLES**

63398 None.

63399 **APPLICATION USAGE**

63400 None.

63401 **RATIONALE**

63402 None.

63403 **FUTURE DIRECTIONS**

63404 None.

63405 **SEE ALSO**

63406 [sched\\_getparam\(\)](#), [sched\\_setparam\(\)](#), [sched\\_setscheduler\(\)](#)

63407 XBD **<sched.h>**

63408 **CHANGE HISTORY**

63409 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

63410 **Issue 6**

63411 The *sched\_getscheduler()* function is marked as part of the Process Scheduling option.

63412 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 63413 implementation does not support the Process Scheduling option.

63414 **NAME**63415 sched\_rr\_get\_interval — get execution time limits (**REALTIME**)63416 **SYNOPSIS**

```
63417 PS|TPS #include <sched.h>
63418 int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

63419 **DESCRIPTION**

63420 The *sched\_rr\_get\_interval()* function shall update the **timespec** structure referenced by the  
63421 *interval* argument to contain the current execution time limit (that is, time quantum) for the  
63422 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process  
63423 shall be returned.

63424 **RETURN VALUE**

63425 If successful, the *sched\_rr\_get\_interval()* function shall return zero. Otherwise, it shall return a  
63426 value of -1 and set *errno* to indicate the error.

63427 **ERRORS**

63428 The *sched\_rr\_get\_interval()* function shall fail if:

63429 [ESRCH] No process can be found corresponding to that specified by *pid*.

63430 **EXAMPLES**

63431 None.

63432 **APPLICATION USAGE**

63433 None.

63434 **RATIONALE**

63435 None.

63436 **FUTURE DIRECTIONS**

63437 None.

63438 **SEE ALSO**

63442 **CHANGE HISTORY**

63443 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

63444 **Issue 6**

63445 The *sched\_rr\_get\_interval()* function is marked as part of the Process Scheduling option.

63446 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63447 implementation does not support the Process Scheduling option.

63448 IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in  
63449 the SYNOPSIS to PS|TPS.

63450 **NAME**63451 sched\_setparam — set scheduling parameters (**REALTIME**)63452 **SYNOPSIS**

```
63453 PS #include <sched.h>
63454 int sched_setparam(pid_t pid, const struct sched_param *param);
```

63455 **DESCRIPTION**

63456 The *sched\_setparam()* function shall set the scheduling parameters of the process specified by *pid*  
 63457 to the values specified by the **sched\_param** structure pointed to by *param*. The value of the  
 63458 *sched\_priority* member in the **sched\_param** structure shall be any integer within the inclusive  
 63459 priority range for the current scheduling policy of the process specified by *pid*. Higher  
 63460 numerical values for the priority represent higher priorities. If the value of *pid* is negative, the  
 63461 behavior of the *sched\_setparam()* function is unspecified.

63462 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 63463 parameters shall be set for the process whose process ID is equal to *pid*.

63464 If *pid* is zero, the scheduling parameters shall be set for the calling process.

63465 The conditions under which one process has permission to change the scheduling parameters of  
 63466 another process are implementation-defined.

63467 Implementations may require the requesting process to have appropriate privileges to set its  
 63468 own scheduling parameters or those of another process.

63469 See [Scheduling Policies](#) (on page 531) for a description on how this function affects the  
 63470 scheduling of the threads within the target process.

63471 SS If the current scheduling policy for the target process is not SCHED\_FIFO, SCHED\_RR, or  
 63472 SCHED\_SPORADIC, the result is implementation-defined; this case includes the  
 63473 SCHED\_OTHER policy.

63474 SS The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 63475 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

63476 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
 63477 function to succeed; if not, the function shall fail. It is unspecified whether the  
 63478 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
 63479 rounded to align with the resolution of the clock being used.

63480 This function is not atomic with respect to other threads in the process. Threads may continue to  
 63481 execute while this function call is in the process of changing the scheduling policy for the  
 63482 underlying kernel-scheduled entities used by the process contention scope threads.

63483 **RETURN VALUE**

63484 If successful, the *sched\_setparam()* function shall return zero.

63485 If the call to *sched\_setparam()* is unsuccessful, the priority shall remain unchanged, and the  
 63486 function shall return a value of  $-1$  and set *errno* to indicate the error.

63487 **ERRORS**

63488 The *sched\_setparam()* function shall fail if:

63489 [EINVAL] One or more of the requested scheduling parameters is outside the range  
 63490 defined for the scheduling policy of the specified *pid*.

63491	[EPERM]	The requesting process does not have permission to set the scheduling parameters for the specified process, or does not have appropriate privileges to invoke <i>sched_setparam()</i> .
63492		
63493		
63494	[ESRCH]	No process can be found corresponding to that specified by <i>pid</i> .
63495	<b>EXAMPLES</b>	
63496		None.

63522		

63523 **NAME**63524 sched\_setscheduler — set scheduling policy and parameters (**REALTIME**)63525 **SYNOPSIS**

```
63526 PS #include <sched.h>
63527 int sched_setscheduler(pid_t pid, int policy,
63528     const struct sched_param *param);
```

63529 **DESCRIPTION**

63530 The *sched\_setscheduler()* function shall set the scheduling policy and scheduling parameters of  
 63531 the process specified by *pid* to *policy* and the parameters specified in the **sched\_param** structure  
 63532 pointed to by *param*, respectively. The value of the *sched\_priority* member in the **sched\_param**  
 63533 structure shall be any integer within the inclusive priority range for the scheduling policy  
 63534 specified by *policy*. If the value of *pid* is negative, the behavior of the *sched\_setscheduler()*  
 63535 function is unspecified.

63536 The possible values for the *policy* parameter are defined in the **<sched.h>** header.

63537 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 63538 policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

63539 If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling  
 63540 process.

63541 The conditions under which one process has appropriate privileges to change the scheduling  
 63542 parameters of another process are implementation-defined.

63543 Implementations may require that the requesting process have permission to set its own  
 63544 scheduling parameters or those of another process. Additionally, implementation-defined  
 63545 restrictions may apply as to the appropriate privileges required to set the scheduling policy of  
 63546 the process, or the scheduling policy of another process, to a particular value.

63547 The *sched\_setscheduler()* function shall be considered successful if it succeeds in setting the  
 63548 scheduling policy and scheduling parameters of the process specified by *pid* to the values  
 63549 specified by *policy* and the structure pointed to by *param*, respectively.

63550 See [Scheduling Policies](#) (on page 531) for a description on how this function affects the  
 63551 scheduling of the threads within the target process.

63552 SS If the current scheduling policy for the target process is not SCHED\_FIFO, SCHED\_RR, or  
 63553 SCHED\_SPORADIC, the result is implementation-defined; this case includes the  
 63554 SCHED\_OTHER policy.

63555 SS The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 63556 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

63557 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,SS\_REPL\_MAX] for the  
 63558 function to succeed; if not, the function shall fail. It is unspecified whether the  
 63559 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
 63560 rounded to align with the resolution of the clock being used.

63561 This function is not atomic with respect to other threads in the process. Threads may continue to  
 63562 execute while this function call is in the process of changing the scheduling policy and  
 63563 associated scheduling parameters for the underlying kernel-scheduled entities used by the  
 63564 process contention scope threads.

63565 **RETURN VALUE**

63566 Upon successful completion, the function shall return the former scheduling policy of the  
 63567 specified process. If the *sched\_setscheduler()* function fails to complete successfully, the policy  
 63568 and scheduling parameters shall remain unchanged, and the function shall return a value of -1  
 63569 and set *errno* to indicate the error.

63570 **ERRORS**

63571 The *sched\_setscheduler()* function shall fail if:

63572 [EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters  
 63573 contained in *param* is outside the valid range for the specified scheduling  
 63574 policy.

63575 [EPERM] The requesting process does not have permission to set either or both of the  
 63576 scheduling parameters or the scheduling policy of the specified process.

63577 [ESRCH] No process can be found corresponding to that specified by *pid*.

63578 **EXAMPLES**

63579 None.

63580 **APPLICATION USAGE**

63589 **CHANGE HISTORY**

63590 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

63591 **Issue 6**

63592 The *sched\_setscheduler()* function is marked as part of the Process Scheduling option.

63593 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 63594 implementation does not support the Process Scheduling option.

63595 The following new requirements on POSIX implementations derive from alignment with the  
 63596 Single UNIX Specification:

- 63597 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is  
 63598 added.

- 63599 • Sections describing two-level scheduling and atomicity of the function are added.

63600 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

63601 **Issue 7**

63602 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

63603 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
 63604 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

**63605 NAME**

63606 sched\_yield — yield the processor

**63607 SYNOPSIS**

63608 #include <sched.h>

63609 int sched\_yield(void);

**63610 DESCRIPTION**

63611 The *sched\_yield()* function shall force the running thread to relinquish the processor until it again  
63612 becomes the head of its thread list. It takes no arguments.

**63613 RETURN VALUE**

63614 The *sched\_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a  
63615 value of -1 and set *errno* to indicate the error.

**63616 ERRORS**

63617 No errors are defined.

**63618 EXAMPLES**

63619 None.

**63620 APPLICATION USAGE**

63621 The conceptual model for scheduling semantics in POSIX.1-2024 defines a set of thread lists. This  
63622 set of thread lists is always present regardless of the scheduling options supported by the  
63623 system. On a system where the Process Scheduling option is not supported, portable  
63624 applications should not make any assumptions regarding whether threads from other processes  
63625 will be on the same thread list.

**63626 RATIONALE**

63627 None.

**63628 FUTURE DIRECTIONS**

63629 None.

**63630 SEE ALSO**

63631 XBD <[sched.h](#)>

**63632 CHANGE HISTORY**

63633 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
63634 POSIX Threads Extension.

**63635 Issue 6**

63636 The *sched\_yield()* function is now marked as part of the Process Scheduling and Threads options.

**63637 Issue 7**

63638 SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

63639 The *sched\_yield()* function is moved to the Base.

63640 **NAME**

63641 secure\_getenv — get value of an environment variable

63642 **SYNOPSIS**

63643 #include <stdlib.h>

63644 CX `char *secure_getenv(const char *name);`

63645 **DESCRIPTION**

63646 Refer to *getenv()*.

63647 **NAME**

63648 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

63649 **SYNOPSIS**

```
63650 XSI #include <stdlib.h>  
63651 unsigned short *seed48(unsigned short seed16v[3]);
```

63652 **DESCRIPTION**63653 Refer to *drand48()*.

63654 **NAME**

63655 seekdir — set the position of a directory stream

63656 **SYNOPSIS**

```
63657 XSI #include <dirent.h>  
63658 void seekdir(DIR *dirp, long loc);
```

63659 **DESCRIPTION**

63660 The *seekdir()* function shall set the position of the next *readdir()* operation on the directory  
63661 stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been  
63662 returned from an earlier call to *telldir()* using the same directory stream. The new position  
63663 reverts to the one associated with the directory stream when *telldir()* was performed.

63664 If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()*  
63665 occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to  
63666 *readdir()* are unspecified.

63667 **RETURN VALUE**63668 The *seekdir()* function shall not return a value.63669 **ERRORS**

63670 No errors are defined.

63671 **EXAMPLES**

63672 None.

63673 **APPLICATION USAGE**

63674 None.

63675 **RATIONALE**

63676 The original standard developers perceived that there were restrictions on the use of the  
63677 *seekdir()* and *telldir()* functions related to implementation details, and for that reason these  
63678 functions need not be supported on all POSIX-conforming systems. They are required on  
63679 implementations supporting the XSI option.

63680 One of the perceived problems of implementation is that returning to a given point in a directory  
63681 is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-  
63682 trees, hashing functions, or other similar mechanisms to order their directories are considered.  
63683 The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a  
63684 given directory entry will be seen at all, or more than once.

63685 On systems not supporting these functions, their capability can sometimes be accomplished by  
63686 saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to  
63687 relocate the position from which the filename was saved.

63688 **FUTURE DIRECTIONS**

63689 None.

63690 **SEE ALSO**63691 *fdopendir()*, *readdir()*, *telldir()*63692 XBD [<dirent.h>](#), [<sys/types.h>](#)63693 **CHANGE HISTORY**

63694 First released in Issue 2.

63695 **Issue 6**

63696 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

63697 **Issue 7**

63698 SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should  
63699 have been returned from an earlier call to *telldir()* using the same directory stream.

63700 **NAME**

63701           select — synchronous I/O multiplexing

63702 **SYNOPSIS**

63703           #include <sys/select.h>

```
63704           int select(int nfds, fd_set *restrict readfds,  
63705                      fd_set *restrict writefds, fd_set *restrict errorfds,  
63706                      struct timeval *restrict timeout);
```

63707 **DESCRIPTION**

63708           Refer to [pselect\(\)](#).

63709 **NAME**

63710 sem\_clockwait, sem\_timedwait — lock a semaphore

63711 **SYNOPSIS**

```
63712 #include <semaphore.h>
63713 int sem_clockwait(sem_t *restrict sem, clockid_t clock_id,
63714                 const struct timespec *restrict abstime);
63715 int sem_timedwait(sem_t *restrict sem,
63716                 const struct timespec *restrict abstime);
```

63717 **DESCRIPTION**

63718 The *sem\_clockwait()* and *sem\_timedwait()* functions shall lock the semaphore referenced by *sem* as  
 63719 in the *sem\_wait()* function. However, if the semaphore cannot be locked without waiting for  
 63720 another process or thread to unlock the semaphore by performing a *sem\_post()* function, this  
 63721 wait shall be terminated when the specified timeout expires.

63722 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 63723 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 63724 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 63725 call.

63726 For *sem\_timedwait()*, the timeout shall be based on the CLOCK\_REALTIME clock. For  
 63727 *sem\_clockwait()*, the timeout shall be based on the clock specified by the *clock\_id* argument. The  
 63728 resolution of the timeout shall be the resolution of the clock on which it is based.  
 63729 Implementations shall support passing CLOCK\_REALTIME and CLOCK\_MONOTONIC to  
 63730 *sem\_clockwait()* as the *clock\_id* argument.

63731 Under no circumstance shall the function fail with a timeout if the semaphore can be locked  
 63732 immediately. The validity of the *abstime* need not be checked if the semaphore can be locked  
 63733 immediately.

63734 **RETURN VALUE**

63735 The *sem\_clockwait()* and *sem\_timedwait()* functions shall return zero if the calling process  
 63736 successfully performed the semaphore lock operation on the semaphore designated by *sem*. If  
 63737 the call was unsuccessful, the state of the semaphore shall be unchanged, and the functions shall  
 63738 return a value of -1 and set *errno* to indicate the error.

63739 **ERRORS**

63740 The *sem\_clockwait()* and *sem\_timedwait()* functions shall fail if:

63741 [EINVAL] The process or thread would have blocked, and either the *abstime* parameter  
 63742 specified a nanoseconds field value less than zero or greater than or equal to  
 63743 1000 million, or the *sem\_clockwait()* function was passed an invalid or  
 63744 unsupported *clock\_id* value.

63745 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

63746 The *sem\_clockwait()* and *sem\_timedwait()* functions may fail if:

63747 [EDEADLK] A deadlock condition was detected.

63748 [EINTR] A signal interrupted the function.

63749 [EINVAL] The *sem* argument does not refer to a valid semaphore.

63750 **EXAMPLES**

63751 The program shown below operates on an unnamed semaphore. The program expects two  
 63752 command-line arguments. The first argument specifies a seconds value that is used to set an  
 63753 alarm timer to generate a SIGALRM signal. This handler performs a *sem\_post()* to increment the  
 63754 semaphore that is being waited on in *main()* using *sem\_clockwait()*. The second command-line  
 63755 argument specifies the length of the timeout, in seconds, for *sem\_clockwait()*.

```

63756 #include <unistd.h>
63757 #include <stdio.h>
63758 #include <stdlib.h>
63759 #include <semaphore.h>
63760 #include <time.h>
63761 #include <assert.h>
63762 #include <errno.h>
63763 #include <signal.h>

63764 sem_t sem;

63765 static void
63766 handler(int sig)
63767 {
63768     int sav_errno = errno;
63769     static const char info_msg[] = "sem_post() from handler\n";
63770     write(STDOUT_FILENO, info_msg, sizeof info_msg - 1);
63771     if (sem_post(&sem) == -1) {
63772         static const char err_msg[] = "sem_post() failed\n";
63773         write(STDERR_FILENO, err_msg, sizeof err_msg - 1);
63774         _exit(EXIT_FAILURE);
63775     }
63776     errno = sav_errno;
63777 }

63778 int
63779 main(int argc, char *argv[])
63780 {
63781     struct sigaction sa;
63782     struct timespec ts;
63783     int s;

63784     if (argc != 3) {
63785         fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
63786             argv[0]);
63787         exit(EXIT_FAILURE);
63788     }

63789     if (sem_init(&sem, 0, 0) == -1) {
63790         perror("sem_init");
63791         exit(EXIT_FAILURE);
63792     }

63793     /* Establish SIGALRM handler; set alarm timer using argv[1] */

63794     sa.sa_handler = handler;
63795     sigemptyset(&sa.sa_mask);
63796     sa.sa_flags = 0;
63797     if (sigaction(SIGALRM, &sa, NULL) == -1) {

```

```

63798         perror("sigaction");
63799         exit(EXIT_FAILURE);
63800     }
63801     alarm(atoi(argv[1]));
63802     /* Calculate relative interval as current time plus
63803        number of seconds given argv[2] */
63804     if (clock_gettime(CLOCK_MONOTONIC, &ts) == -1) {
63805         perror("clock_gettime");
63806         exit(EXIT_FAILURE);
63807     }
63808     ts.tv_sec += atoi(argv[2]);
63809     printf("main() about to call sem_clockwait()\n");
63810     while ((s = sem_clockwait(&sem, CLOCK_MONOTONIC, &ts)) == -1 &&
63811         errno == EINTR)
63812         continue; /* Restart if interrupted by handler */
63813     /* Check what happened */
63814     if (s == -1) {
63815         if (errno == ETIMEDOUT)
63816             printf("sem_clockwait() timed out\n");
63817         else
63818             perror("sem_clockwait");
63819     } else
63820         printf("sem_clockwait() succeeded\n");
63821     exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
63822 }

```

### 63823 APPLICATION USAGE

63824 Applications using these functions may be subject to priority inversion, as discussed in XBD  
63825 [Section 3.275](#) (on page 72).

### 63826 RATIONALE

63827 None.

### 63828 FUTURE DIRECTIONS

63829 None.

### 63830 SEE ALSO

63831 [sem\\_post\(\)](#), [sem\\_trywait\(\)](#), [semctl\(\)](#), [semget\(\)](#), [semop\(\)](#), [time\(\)](#)

63832 XBD [Section 3.275](#) (on page 72), [<semaphore.h>](#), [<time.h>](#)

### 63833 CHANGE HISTORY

63834 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

63835 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS  
63836 section so that the [EINVAL] error becomes optional.

### 63837 Issue 7

63838 The [sem\\_timedwait\(\)](#) function is moved from the Semaphores option to the Base.

63839 Functionality relating to the Timers option is moved to the Base.

63840 An example is added.

- 63841 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0529 [138] is applied.
- 63842 **Issue 8**
- 63843 Austin Group Defect 592 is applied, removing text relating to **<time.h>** from the SYNOPSIS and
- 63844 DESCRIPTION sections.
- 63845 Austin Group Defect 1216 is applied, adding *sem\_clockwait()*.

**63846 NAME**

63847 sem\_close — close a named semaphore

**63848 SYNOPSIS**

```
63849 #include <semaphore.h>
63850 int sem_close(sem_t *sem);
```

**63851 DESCRIPTION**

63852 The *sem\_close()* function shall indicate that the calling process is finished using the named  
63853 semaphore indicated by *sem*. The effects of calling *sem\_close()* for an unnamed semaphore (one  
63854 created by *sem\_init()*) are undefined. The *sem\_close()* function shall deallocate (that is, make  
63855 available for reuse by a subsequent *sem\_open()* by this process) any system resources allocated  
63856 by the system for use by this process for this semaphore. If the semaphore indicated by *sem* is  
63857 implemented using a file descriptor, the file descriptor shall be closed. The effect of subsequent  
63858 use of the semaphore indicated by *sem* by this process is undefined. If any threads in the calling  
63859 process are currently blocked on the semaphore, the behavior is undefined. If the semaphore  
63860 has not been removed with a successful call to *sem\_unlink()*, then *sem\_close()* has no effect on the  
63861 state of the semaphore. If the *sem\_unlink()* function has been successfully invoked for *name* after  
63862 the most recent call to *sem\_open()* with O\_CREAT for this semaphore, then when all processes  
63863 that have opened the semaphore close all semaphore handles to it, the semaphore is no longer  
63864 accessible.

**63865 RETURN VALUE**

63866 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
63867 returned and *errno* set to indicate the error.

**63868 ERRORS**

63869 The *sem\_close()* function may fail if:

63870 [EINVAL] The *sem* argument is not a valid semaphore descriptor.

**63871 EXAMPLES**

63872 None.

**63873 APPLICATION USAGE**

63874 None.

**63875 RATIONALE**

63876 None.

**63877 FUTURE DIRECTIONS**

63878 None.

**63879 SEE ALSO**

63880 [semctl\(\)](#), [semget\(\)](#), [semop\(\)](#), [sem\\_init\(\)](#), [sem\\_open\(\)](#), [sem\\_unlink\(\)](#)

**63882 CHANGE HISTORY**

63883 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**63884 Issue 6**

63885 The *sem\_close()* function is marked as part of the Semaphores option.

63886 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63887 implementation does not support the Semaphores option.

63888 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS  
63889 section so that the [EINVAL] error becomes optional.

63890 **Issue 7**

63891 The *sem\_close()* function is moved from the Semaphores option to the Base.

63892 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0523 [37] is applied.

63893 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0317 [870] is applied.

63894 **Issue 8**

63895 Austin Group Defect 368 is applied, adding a requirement that if *sem* is implemented using a file  
63896 descriptor, *sem\_close()* closes the file descriptor.

63897 Austin Group Defect 1324 is applied, clarifying the circumstances under which an unlinked  
63898 semaphore is no longer accessible.

**63899 NAME**

63900 sem\_destroy — destroy an unnamed semaphore

**63901 SYNOPSIS**

```
63902 #include <semaphore.h>
63903 int sem_destroy(sem_t *sem);
```

**63904 DESCRIPTION**

63905 The *sem\_destroy()* function shall destroy the unnamed semaphore indicated by *sem*. If an  
63906 unnamed semaphore is implemented using a file descriptor, the file descriptor shall be closed.  
63907 Only a semaphore that was created using *sem\_init()* can be destroyed using *sem\_destroy()*; the  
63908 effect of calling *sem\_destroy()* with a named semaphore is undefined. The effect of subsequent  
63909 use of the semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem\_init()*.

63910 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The  
63911 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

**63912 RETURN VALUE**

63913 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
63914 returned and *errno* set to indicate the error.

**63915 ERRORS**

63916 The *sem\_destroy()* function may fail if:

- |       |          |   |
|-------|----------|---|
| 63917 | [EINVAL] | The <i>sem</i> argument is not a valid semaphore.       |
| 63918 | [EBUSY]  | There are currently processes blocked on the semaphore. |

63929 XBD [<semaphore.h>](#)

**63930 CHANGE HISTORY**

63931 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**63932 Issue 6**

63933 The *sem\_destroy()* function is marked as part of the Semaphores option.

63934 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63935 implementation does not support the Semaphores option.

63936 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/114 is applied, updating the ERRORS  
63937 section so that the [EINVAL] error becomes optional.

63938 **Issue 7**

63939 The *sem\_destroy()* function is moved from the Semaphores option to the Base.

63940 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0524 [37] is applied.

63941 **Issue 8**

63942 Austin Group Defect 368 is applied, adding a requirement that if an unnamed semaphore is  
63943 implemented using a file descriptor, *sem\_destroy()* closes the file descriptor.

**63944 NAME**

63945 sem\_getvalue — get the value of a semaphore

**63946 SYNOPSIS**

63947 #include <semaphore.h>

63948 int sem\_getvalue(sem\_t \*restrict sem, int \*restrict sval);

**63949 DESCRIPTION**

63950 The *sem\_getvalue()* function shall update the location referenced by the *sval* argument to have  
63951 the value of the semaphore referenced by *sem* without affecting the state of the semaphore. The  
63952 updated value represents an actual semaphore value that occurred at some unspecified time  
63953 during the call, but it need not be the actual value of the semaphore when it is returned to the  
63954 calling process.

63955 If *sem* is locked, then the object to which *sval* points shall either be set to zero or to a negative  
63956 number whose absolute value represents the number of processes waiting for the semaphore at  
63957 some unspecified time during the call.

**63958 RETURN VALUE**

63959 Upon successful completion, the *sem\_getvalue()* function shall return a value of zero. Otherwise,  
63960 it shall return a value of -1 and set *errno* to indicate the error.

**63961 ERRORS**

63962 The *sem\_getvalue()* function may fail if:

63963 [EINVAL] The *sem* argument does not refer to a valid semaphore.

**63964 EXAMPLES**

63965 None.

**63966 APPLICATION USAGE**

63967 None.

**63968 RATIONALE**

63969 None.

**63970 FUTURE DIRECTIONS**

63971 None.

**63972 SEE ALSO**

63973 [semctl\(\)](#), [semget\(\)](#), [semop\(\)](#), [sem\\_clockwait\(\)](#), [sem\\_post\(\)](#), [sem\\_trywait\(\)](#)

63974 XBD [<semaphore.h>](#)

**63975 CHANGE HISTORY**

63976 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**63977 Issue 6**

63978 The *sem\_getvalue()* function is marked as part of the Semaphores option.

63979 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63980 implementation does not support the Semaphores option.

63981 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
63982 1003.1d-1999.

63983 The **restrict** keyword is added to the *sem\_getvalue()* prototype for alignment with the  
63984 ISO/IEC 9899:1999 standard.

63985 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

63986 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS

63987 section so that the [EINVAL] error becomes optional.

63988 **Issue 7**

63989 The *sem\_getvalue()* function is moved from the Semaphores option to the Base.

63990 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0525 [37] is applied.

**63991 NAME**

63992 sem\_init — initialize an unnamed semaphore

**63993 SYNOPSIS**

63994 #include <semaphore.h>

63995 int sem\_init(sem\_t \*sem, int pshared, unsigned value);

**63996 DESCRIPTION**

63997 The *sem\_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of  
63998 the initialized semaphore shall be *value*. Following a successful call to *sem\_init()*, the semaphore  
63999 can be used in subsequent calls to *sem\_clockwait()*, *sem\_destroy()*, *sem\_post()*, *sem\_timedwait()*,  
64000 *sem\_trywait()*, and *sem\_wait()*. This semaphore shall remain usable until the semaphore is  
64001 destroyed. An unnamed semaphore may be implemented using a file descriptor.

64002 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;  
64003 in this case, any process that can access the semaphore *sem* can use *sem* for performing  
64004 *sem\_clockwait()*, *sem\_destroy()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, and *sem\_wait()*  
64005 operations.

64006 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any  
64007 thread in this process can use *sem* for performing *sem\_clockwait()*, *sem\_destroy()*, *sem\_post()*,  
64008 *sem\_timedwait()*, *sem\_trywait()*, and *sem\_wait()* operations.

64009 See [Section 2.9.9](#) (on page 548) for further requirements.

64010 Attempting to initialize an already initialized semaphore results in undefined behavior.

**64011 RETURN VALUE**

64012 Upon successful completion, the *sem\_init()* function shall initialize the semaphore in *sem* and  
64013 return 0. Otherwise, it shall return -1 and set *errno* to indicate the error.

**64014 ERRORS**

64015 The *sem\_init()* function shall fail if:

64016 [EINVAL] The *value* argument exceeds {SEM\_VALUE\_MAX}.

64017 [ENOSPC] A resource required to initialize the semaphore has been exhausted, or the  
64018 limit on semaphores ({SEM\_NSEMS\_MAX}) has been reached.

64019 [EPERM] The process lacks appropriate privileges to initialize the semaphore.

64020 The *sem\_init()* function may fail if:

64021 [EMFILE] All file descriptors available to the process are currently open.

64022 [ENFILE] The maximum allowable number of files is currently open in the system.

**64023 EXAMPLES**

64024 None.

**64025 APPLICATION USAGE**

64026 None.

**64027 RATIONALE**

64028 None.

**64029 FUTURE DIRECTIONS**

64030 None.

64031 **SEE ALSO**64032 [sem\\_clockwait\(\)](#), [sem\\_destroy\(\)](#), [sem\\_post\(\)](#), [sem\\_trywait\(\)](#)64033 XBD <[semaphore.h](#)>64034 **CHANGE HISTORY**

64035 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

64036 **Issue 6**64037 The `sem_init()` function is marked as part of the Semaphores option.64038 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
64039 implementation does not support the Semaphores option.64040 The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std  
64041 1003.1d-1999.64042 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/116 is applied, updating the  
64043 DESCRIPTION to add the `sem_timedwait()` function for alignment with IEEE Std 1003.1d-1999.64044 **Issue 7**

64045 SD5-XSH-ERN-176 is applied.

64046 The `sem_init()` function is moved from the Semaphores option to the Base.

64047 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0526 [37] is applied.

64048 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0318 [972] is applied.

64049 **Issue 8**64050 Austin Group Defect 368 is applied, adding a statement that an unnamed semaphore may be  
64051 implemented using a file descriptor and adding the [EMFILE] and [ENFILE] errors.64052 Austin Group Defect 1216 is applied, adding `sem_clockwait()`.

64053 **NAME**

64054 sem\_open — initialize and open a named semaphore

64055 **SYNOPSIS**

64056 #include &lt;semaphore.h&gt;

64057 sem\_t \*sem\_open(const char \*name, int oflag, ...);

64058 **DESCRIPTION**

64059 The *sem\_open()* function shall establish a connection between a named semaphore and a process.  
 64060 A named semaphore may be implemented using a file descriptor. Following a call to *sem\_open()*  
 64061 with semaphore name *name*, the process may reference the semaphore associated with *name*  
 64062 using the semaphore handle returned from the call. This semaphore can be used in subsequent  
 64063 calls to *sem\_clockwait()*, *sem\_close()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, and *sem\_wait()*.  
 64064 The semaphore remains usable by this process until the semaphore is closed by a successful call  
 64065 to *sem\_close()*, *\_exit()*, or one of the *exec* functions.

64066 The *oflag* argument controls whether the semaphore is created or merely accessed by the call to  
 64067 *sem\_open()*. The following flag bits may be set in *oflag*:

64068 **O\_CREAT** This flag is used to create a semaphore if it does not already exist. If **O\_CREAT** is  
 64069 set and the semaphore already exists, then **O\_CREAT** has no effect, except as noted  
 64070 under **O\_EXCL**. Otherwise, *sem\_open()* creates a named semaphore. The **O\_CREAT**  
 64071 flag requires a third and a fourth argument: *mode*, which is of type **mode\_t**, and  
 64072 *value*, which is of type **unsigned**. The semaphore is created with an initial value of  
 64073 *value*. Valid initial values for semaphores are less than or equal to  
 64074 {SEM\_VALUE\_MAX}.

64075 The user ID of the semaphore shall be set to the effective user ID of the process.  
 64076 The group ID of the semaphore shall be set to the effective group ID of the process;  
 64077 however, if the *name* argument is visible in the file system, the group ID may be set  
 64078 to the group ID of the containing directory. The permission bits of the semaphore  
 64079 are set to the value of the *mode* argument except those set in the file mode creation  
 64080 mask of the process. When bits in *mode* other than the file permission bits are  
 64081 specified, the effect is unspecified.

64082 After the semaphore named *name* has been created by *sem\_open()* with the  
 64083 **O\_CREAT** flag, other processes can connect to the semaphore by calling  
 64084 *sem\_open()* with the same value of *name*.

64085 **O\_EXCL** If **O\_EXCL** and **O\_CREAT** are set, *sem\_open()* fails if the semaphore *name* exists.  
 64086 The check for the existence of the semaphore and the creation of the semaphore if it  
 64087 does not exist are atomic with respect to other processes executing *sem\_open()* with  
 64088 **O\_EXCL** and **O\_CREAT** set. If **O\_EXCL** is set and **O\_CREAT** is not set, the effect is  
 64089 undefined.

64090 If flags other than **O\_CREAT** and **O\_EXCL** are specified in the *oflag* parameter, the  
 64091 effect is unspecified.

64092 The *name* argument points to a string naming a semaphore object. It is unspecified whether the  
 64093 name appears in the file system and is visible to functions that take pathnames as arguments.  
 64094 The *name* argument conforms to the construction rules for a pathname, except that the  
 64095 interpretation of <slash> characters other than the leading <slash> character in *name* is  
 64096 implementation-defined, and that the length limits for the *name* argument are implementation-  
 64097 defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If  
 64098 *name* begins with the <slash> character, then processes calling *sem\_open()* with the same value of  
 64099 *name* shall refer to the same semaphore object, as long as that name has not been removed. If

- 64100 *name* does not begin with the <slash> character, the effect is implementation-defined.
- 64101 If a process makes multiple successful calls to *sem\_open()* with the same value for *name*, there  
64102 have been no intervening calls to *sem\_unlink()* for *name*, and at least one open handle for this  
64103 semaphore has not been closed with a *sem\_close()* call, it is implementation-defined whether the  
64104 same handle or a unique handle is returned for each such successful call.
- 64105 References to copies of the semaphore produce undefined results.
- 64106 **RETURN VALUE**
- 64107 Upon successful completion, the *sem\_open()* function shall return the address of the semaphore.  
64108 Otherwise, it shall return a value of SEM\_FAILED and set *errno* to indicate the error. The symbol  
64109 SEM\_FAILED is defined in the <semaphore.h> header. No successful return from *sem\_open()*  
64110 shall return the value SEM\_FAILED.
- 64111 **ERRORS**
- 64112 If any of the following conditions occur, the *sem\_open()* function shall return SEM\_FAILED and  
64113 set *errno* to the corresponding value:
- 64114 [EACCES] The named semaphore exists and the permissions specified by *oflag* are  
64115 denied, or the named semaphore does not exist and permission to create the  
64116 named semaphore is denied.
- 64117 [EEXIST] O\_CREAT and O\_EXCL are set and the named semaphore already exists.
- 64118 [EINTR] The *sem\_open()* operation was interrupted by a signal.
- 64119 [EINVAL] The *sem\_open()* operation is not supported for the given name, or O\_CREAT  
64120 was specified in *oflag* and *value* was greater than {SEM\_VALUE\_MAX}.
- 64121 [ENOENT] O\_CREAT is not set and the named semaphore does not exist.
- 64122 [ENOMEM] There is insufficient memory for the creation of the new named semaphore.
- 64123 [ENOSPC] There is insufficient space on a storage device for the creation of the new  
64124 named semaphore.
- 64125 If any of the following conditions occur, the *sem\_open()* function may return SEM\_FAILED and  
64126 set *errno* to the corresponding value:
- 64127 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this  
64128 process.
- 64129 [ENAMETOOLONG]
- 64130 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
64131 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
64132 systems, or has a pathname component that is longer than  
64133 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
64134 longer than {\_XOPEN\_NAME\_MAX} on XSI systems.
- 64135 [ENFILE] Too many semaphore descriptors or file descriptors are currently open in the  
64136 system.

**64137 EXAMPLES**

64138 None.

**64139 APPLICATION USAGE**

64140 None.

**64141 RATIONALE**

64142 Early drafts required an error return value of `-1` with the type `sem_t *` for the `sem_open()`  
64143 function, which is not guaranteed to be portable across implementations. The revised text  
64144 provides the symbolic error code `SEM_FAILED` to eliminate the type conflict.

**64145 FUTURE DIRECTIONS**

64146 A future version might require the `sem_open()` and `sem_unlink()` functions to have semantics  
64147 similar to normal file system operations.

**64148 SEE ALSO**

**64151 CHANGE HISTORY**

64152 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**64153 Issue 6**

64154 The `sem_open()` function is marked as part of the Semaphores option.

64155 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an  
64156 implementation does not support the Semaphores option.

64157 The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std  
64158 1003.1d-1999.

64159 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the  
64160 DESCRIPTION to add the `sem_timedwait()` function for alignment with IEEE Std 1003.1d-1999.

64161 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the  
64162 DESCRIPTION to describe the conditions to return the same semaphore address on a call to  
64163 `sem_open()`. The words “and at least one previous successful `sem_open()` call for this semaphore  
64164 has not been matched with a `sem_close()` call” are added.

**64165 Issue 7**

64166 Austin Group Interpretation 1003.1-2001 #066 is applied, updating the `[ENOSPC]` error case and  
64167 adding the `[ENOMEM]` error case.

64168 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the `name` argument and  
64169 adding `[ENAMETOOLONG]` as a “may fail” error.

64170 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

64171 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
64172 user ID and group ID of the semaphore.

64173 The `sem_open()` function is moved from the Semaphores option to the Base.

64174 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0527 [37] is applied.

**64175 Issue 8**

64176 Austin Group Defect 368 is applied, adding a statement that a named semaphore may be  
64177 implemented using a file descriptor and changing the ERRORS section.

64178 Austin Group Defect 1216 is applied, adding `sem_clockwait()`.

64179  
64180  
64181

Austin Group Defect 1324 is applied, making it implementation-defined whether the same handle or a unique handle is returned when multiple successful calls to *sem\_open()* are made with the same value for *name*.

64182 **NAME**

64183 sem\_post — unlock a semaphore

64184 **SYNOPSIS**

64185 #include &lt;semaphore.h&gt;

64186 int sem\_post(sem\_t \*sem);

64187 **DESCRIPTION**64188 The *sem\_post()* function shall unlock the semaphore referenced by *sem* by performing a  
64189 semaphore unlock operation on that semaphore.64190 If the semaphore value resulting from this operation is positive, then no threads were blocked  
64191 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.64192 If the value of the semaphore resulting from this operation is zero, then one of the threads  
64193 blocked waiting for the semaphore shall be allowed to return successfully from its call to  
64194 *sem\_wait()*. If the Process Scheduling option is supported, the thread to be unblocked shall be  
64195 chosen in a manner appropriate to the scheduling policies and parameters in effect for the  
64196 blocked threads. In the case of the schedulers SCHED\_FIFO and SCHED\_RR, the highest  
64197 priority waiting thread shall be unblocked, and if there is more than one highest priority thread  
64198 blocked waiting for the semaphore, then the highest priority thread that has been waiting the  
64199 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread  
64200 to unblock is unspecified.64201 SS If the Process Sporadic Server option is supported, and the scheduling policy is  
64202 SCHED\_SPORADIC, the semantics are as per SCHED\_FIFO above.64203 The *sem\_post()* function shall be async-signal-safe and may be invoked from a signal-catching  
64204 function.64205 **RETURN VALUE**64206 If successful, the *sem\_post()* function shall return zero; otherwise, the function shall return -1  
64207 and set *errno* to indicate the error.64208 **ERRORS**64209 The *sem\_post()* function shall fail if:

64210 [EOVERFLOW] The maximum allowable value of the semaphore would be exceeded.

64211 The *sem\_post()* function may fail if:64212 [EINVAL] The *sem* argument does not refer to a valid semaphore.64213 **EXAMPLES**64214 See *sem\_clockwait()*.64215 **APPLICATION USAGE**

64216 None.

64217 **RATIONALE**

64218 None.

64219 **FUTURE DIRECTIONS**

64220 None.

64221 **SEE ALSO**64222 *semctl()*, *semget()*, *semop()*, *sem\_clockwait()*, *sem\_trywait()*

64223 XBD Section 4.15.2 (on page 104), &lt;semaphore.h&gt;

64224 **CHANGE HISTORY**

64225 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

64226 **Issue 6**

64227 The *sem\_post()* function is marked as part of the Semaphores option.

64228 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
64229 implementation does not support the Semaphores option.

64230 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
64231 1003.1d-1999.

64232 SCHED\_SPORADIC is added to the list of scheduling policies for which the thread that is to be  
64233 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

64234 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS  
64235 section so that the [EINVAL] error becomes optional.

64236 **Issue 7**

64237 Austin Group Interpretation 1003.1-2001 #156 is applied.

64238 The *sem\_post()* function is moved from the Semaphores option to the Base.

64239 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0528 [37] is applied.

64240 **Issue 8**

64241 Austin Group Defect 315 is applied, adding the [E\_OVERFLOW] error.

64242 **NAME**

64243       sem\_timedwait — lock a semaphore

64244 **SYNOPSIS**

64245       #include &lt;semaphore.h&gt;

64246       int sem\_timedwait(sem\_t \*restrict sem,  
64247                        const struct timespec \*restrict abstime);64248 **DESCRIPTION**64249       Refer to *sem\_clockwait()*.

64250 **NAME**

64251 sem\_trywait, sem\_wait — lock a semaphore

64252 **SYNOPSIS**

```
64253 #include <semaphore.h>
64254 int sem_trywait(sem_t *sem);
64255 int sem_wait(sem_t *sem);
```

64256 **DESCRIPTION**

64257 The *sem\_trywait()* function shall lock the semaphore referenced by *sem* only if the semaphore is  
 64258 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not  
 64259 lock the semaphore.

64260 The *sem\_wait()* function shall lock the semaphore referenced by *sem* by performing a semaphore  
 64261 lock operation on that semaphore. If the semaphore value is currently zero, then the calling  
 64262 thread shall not return from the call to *sem\_wait()* until it either locks the semaphore or the call is  
 64263 interrupted by a signal.

64264 Upon successful return, the state of the semaphore shall be locked and shall remain locked until  
 64265 the *sem\_post()* function is executed and returns successfully.

64266 The *sem\_wait()* function is interruptible by the delivery of a signal.

64267 **RETURN VALUE**

64268 The *sem\_trywait()* and *sem\_wait()* functions shall return zero if the calling process successfully  
 64269 performed the semaphore lock operation on the semaphore designated by *sem*. If the call was  
 64270 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a  
 64271 value of  $-1$  and set *errno* to indicate the error.

64272 **ERRORS**

64273 The *sem\_trywait()* function shall fail if:

64274 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the  
 64275 *sem\_trywait()* operation.

64276 The *sem\_trywait()* and *sem\_wait()* functions may fail if:

64277 [EDEADLK] A deadlock condition was detected.

64278 [EINTR] A signal interrupted this function.

64279 [EINVAL] The *sem* argument does not refer to a valid semaphore.

64280 **EXAMPLES**

64281 None.

64282 **APPLICATION USAGE**

64283 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 64284 [Section 3.275](#) (on page 72).

64285 **RATIONALE**

64286 None.

64287 **FUTURE DIRECTIONS**

64288 None.

64289 **SEE ALSO**

64290 [semctl\(\)](#), [semget\(\)](#), [semop\(\)](#), [sem\\_clockwait\(\)](#), [sem\\_post\(\)](#)

64291 XBD [Section 3.275](#) (on page 72), [Section 4.15.2](#) (on page 104), [<semaphore.h>](#)

64292 **CHANGE HISTORY**

64293 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

64294 **Issue 6**

64295 The *sem\_trywait()* and *sem\_wait()* functions are marked as part of the Semaphores option.

64296 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
64297 implementation does not support the Semaphores option.

64298 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
64299 1003.1d-1999.

64300 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS  
64301 section so that the [EINVAL] error becomes optional.

64302 **Issue 7**

64303 SD5-XSH-ERN-54 is applied, removing the *sem\_wait()* function from the "shall fail" error cases.

64304 The *sem\_trywait()* and *sem\_wait()* functions are moved from the Semaphores option to the Base.  
64305 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0530 [37] is applied.

64306 **NAME**

64307 sem\_unlink — remove a named semaphore

64308 **SYNOPSIS**

64309 #include &lt;semaphore.h&gt;

64310 int sem\_unlink(const char \*name);

64311 **DESCRIPTION**

64312 The *sem\_unlink()* function shall remove the semaphore named by the string *name*. If the  
64313 semaphore named by *name* is currently referenced by other processes, then *sem\_unlink()* shall  
64314 have no effect on the state of the semaphore. If one or more processes have the semaphore open  
64315 when *sem\_unlink()* is called, destruction of the semaphore is postponed until all references to the  
64316 semaphore have been destroyed by calls to *sem\_close()*, *\_exit()*, or *exec*. Calls to *sem\_open()* to  
64317 recreate or reconnect to the semaphore refer to a new semaphore after *sem\_unlink()* is called. The  
64318 *sem\_unlink()* call shall not block until all references have been destroyed; it shall return  
64319 immediately.

64320 **RETURN VALUE**

64321 Upon successful completion, the *sem\_unlink()* function shall return a value of 0. Otherwise, the  
64322 semaphore shall not be changed and the function shall return a value of -1 and set *errno* to  
64323 indicate the error.

64324 **ERRORS**64325 The *sem\_unlink()* function shall fail if:

64326 [EACCES] Permission is denied to unlink the named semaphore.

64327 [ENOENT] The named semaphore does not exist.

64328 The *sem\_unlink()* function may fail if:

64329 [ENAMETOOLONG]

64330 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems  
64331 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
64332 systems, or has a pathname component that is longer than  
64333 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
64334 longer than `{_XOPEN_NAME_MAX}` on XSI systems. A call to *sem\_unlink()*  
64335 with a *name* argument that contains the same semaphore name as was  
64336 previously used in a successful *sem\_open()* call shall not give an  
64337 [ENAMETOOLONG] error.

64338 **EXAMPLES**

64339 None.

64340 **APPLICATION USAGE**

64341 None.

64342 **RATIONALE**

64343 None.

64344 **FUTURE DIRECTIONS**

64345 A future version might require the *sem\_open()* and *sem\_unlink()* functions to have semantics  
64346 similar to normal file system operations.

64347 **SEE ALSO**64348 *semctl()*, *semget()*, *semop()*, *sem\_close()*, *sem\_open()*

64349 XBD &lt;semaphore.h&gt;

64350 **CHANGE HISTORY**

64351 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

64352 **Issue 6**

64353 The *sem\_unlink()* function is marked as part of the Semaphores option.

64354 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
64355 implementation does not support the Semaphores option.

64356 **Issue 7**

64357 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
64358 ``shall fail'' to a ``may fail'' error.

64359 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

64360 The *sem\_unlink()* function is moved from the Semaphores option to the Base.

64361 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0531 [37] is applied.

64362 **NAME**

64363           sem\_wait — lock a semaphore

64364 **SYNOPSIS**

64365           #include <semaphore.h>

64366           int sem\_wait(sem\_t \*sem);

64367 **DESCRIPTION**

64368           Refer to *sem\_trywait()*.

64369 **NAME**

64370 semctl — XSI semaphore control operations

64371 **SYNOPSIS**

```
64372 XSI #include <sys/sem.h>
64373 int semctl(int semid, int semnum, int cmd, ...);
```

64374 **DESCRIPTION**

64375 The *semctl()* function operates on XSI semaphores (see XBD [Section 4.20](#), on page 108). It is  
 64376 unspecified whether this function interoperates with the realtime interprocess communication  
 64377 facilities defined in [Section 2.8](#) (on page 527).

64378 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.  
 64379 The fourth argument is optional and depends upon the operation requested. If required, it is of  
 64380 type **union semun**, which the application shall explicitly declare:

```
64381 union semun {
64382     int val;
64383     struct semid_ds *buf;
64384     unsigned short *array;
64385 } arg;
```

64386 Each operation shall be performed atomically.

64387 The following semaphore control operations as specified by *cmd* are executed with respect to the  
 64388 semaphore specified by *semid* and *semnum*. The level of permission required for each operation  
 64389 is shown with each command; see [Section 2.7](#) (on page 526). The symbolic names for the values  
 64390 of *cmd* are defined in the `<sys/sem.h>` header:

64391	GETVAL	Return the value of <i>semval</i> ; see <code>&lt;sys/sem.h&gt;</code> . Requires read permission.
64392	SETVAL	Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value corresponding to the specified semaphore in all processes is cleared. Also, the <i>sem_ctime</i> timestamp shall be set to the current time, as described in <a href="#">Section 2.7.1</a> (on page 526). Requires alter permission; see <a href="#">Section 2.7</a> (on page 526).
64393		
64394		
64395		
64396		
64397	GETPID	Return the value of <i>sempid</i> . Requires read permission.
64398	GETNCNT	Return the value of <i>semmcnt</i> . Requires read permission.
64399	GETZCNT	Return the value of <i>semzcnt</i> . Requires read permission.

64400 The following values of *cmd* operate on each *semval* in the set of semaphores:

64401	GETALL	Return the value of <i>semval</i> for each semaphore in the semaphore set and place into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . Requires read permission.
64402		
64403		
64404	SETALL	Set the value of <i>semval</i> for each semaphore in the semaphore set according to the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> values corresponding to each specified semaphore in all processes are cleared. Also, the <i>sem_ctime</i> timestamp shall be set to the current time, as described in <a href="#">Section 2.7.1</a> (on page 526). Requires alter permission.
64405		
64406		
64407		
64408		
64409		

64410		The following values of <i>cmd</i> are also available:
64411	IPC_STAT	Place the current value of each member of the <b>semid_ds</b> data structure associated with <i>semid</i> into the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . The contents of this structure are defined in <b>&lt;sys/sem.h&gt;</b> . Requires read permission.
64412		
64413		
64414		
64415	IPC_SET	Set the value of the following members of the <b>semid_ds</b> data structure associated with <i>semid</i> to the corresponding value found in the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> :
64416		
64417		
64418		<code>sem_perm.uid</code>
64419		<code>sem_perm.gid</code>
64420		<code>sem_perm.mode</code>
64421		The mode bits specified in <a href="#">Section 2.7.1</a> (on page 526) are copied into the corresponding bits of the <i>sem_perm.mode</i> associated with <i>semid</i> . The stored values of any other bits are unspecified. The <i>sem_ctime</i> timestamp shall be set to the current time, as described in <a href="#">Section 2.7.1</a> (on page 526).
64422		
64423		
64424		
64425		This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the <b>semid_ds</b> data structure associated with <i>semid</i> .
64426		
64427		
64428		
64429	IPC_RMID	Remove the semaphore identifier specified by <i>semid</i> from the system and destroy the set of semaphores and <b>semid_ds</b> data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the <b>semid_ds</b> data structure associated with <i>semid</i> .
64430		
64431		
64432		
64433		
64434		
64435	<b>RETURN VALUE</b>	
64436		If successful, the value returned by <i>semctl()</i> depends on <i>cmd</i> as follows:
64437	GETVAL	The value of <i>semval</i> .
64438	GETPID	The value of <i>sempid</i> .
64439	GETNCNT	The value of <i>semmcnt</i> .
64440	GETZCNT	The value of <i>semzcnt</i> .
64441	All others	0.
64442		Otherwise, <i>semctl()</i> shall return <code>-1</code> and set <i>errno</i> to indicate the error.
64443	<b>ERRORS</b>	
64444		The <i>semctl()</i> function shall fail if:
64445	[EACCES]	Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 526).
64446		
64447	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the value of <i>semnum</i> is less than 0 or greater than or equal to <i>sem_nsems</i> , or the value of <i>cmd</i> is not a valid command.
64448		
64449		
64450	[EPERM]	The argument <i>cmd</i> is equal to <code>IPC_RMID</code> or <code>IPC_SET</code> and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the data structure associated with <i>semid</i> .
64451		
64452		
64453		

64454 [ERANGE] The argument *cmd* is equal to SETVAL or SETALL and the value to which  
64455 *semval* is to be set is greater than the system-imposed maximum.

#### 64456 EXAMPLES

64457 Refer to *semop()*.

#### 64458 APPLICATION USAGE

64459 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a  
64460 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for  
64461 backwards-compatibility.

64462 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
64463 Application developers who need to use IPC should design their applications so that modules  
64464 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
64465 alternative interfaces.

#### 64466 RATIONALE

64467 None.

#### 64468 FUTURE DIRECTIONS

64469 None.

#### 64470 SEE ALSO

64471 [Section 2.7](#) (on page 526), [Section 2.8](#) (on page 527), *semget()*, *semop()*, *sem\_close()*, *sem\_destroy()*,  
64472 *sem\_getvalue()*, *sem\_init()*, *sem\_open()*, *sem\_post()*, *sem\_trywait()*, *sem\_unlink()*

64473 [XBD Section 4.20](#) (on page 108), [<sys/sem.h>](#)

#### 64474 CHANGE HISTORY

64475 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 64476 Issue 5

64477 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
64478 DIRECTIONS to the APPLICATION USAGE section.

#### 64479 Issue 7

64480 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0532 [345], XSH/TC1-2008/0533 [345],  
64481 XSH/TC1-2008/0534 [345], and XSH/TC1-2008/0535 [335] are applied.

64482 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0319 [532] is applied.

64483 **NAME**

64484 semget — get set of XSI semaphores

64485 **SYNOPSIS**

```
64486 XSI      #include <sys/sem.h>
64487      int semget(key_t key, int nsems, int semflg);
```

64488 **DESCRIPTION**

64489 The *semget()* function operates on XSI semaphores (see XBD [Section 4.20](#), on page 108). It is  
 64490 unspecified whether this function interoperates with the realtime interprocess communication  
 64491 facilities defined in [Section 2.8](#) (on page 527).

64492 The *semget()* function shall return the semaphore identifier associated with *key*.

64493 A semaphore identifier with its associated **semid\_ds** data structure and its associated set of  
 64494 *nsems* semaphores (see [<sys/sem.h>](#)) is created for *key* if one of the following is true:

- 64495 • The argument *key* is equal to `IPC_PRIVATE`.
- 64496 • The argument *key* does not already have a semaphore identifier associated with it and  
 64497 (*semflg* & `IPC_CREAT`) is non-zero.

64498 Upon creation, the **semid\_ds** data structure associated with the new semaphore identifier is  
 64499 initialized as follows:

- 64500 • In the operation permissions structure *sem\_perm.cuid*, *sem\_perm.uid*, *sem\_perm.cgid*, and  
 64501 *sem\_perm.gid* shall be set to the effective user ID and effective group ID, respectively, of the  
 64502 calling process.
- 64503 • The low-order 9 bits of *sem\_perm.mode* shall be set to the low-order 9 bits of *semflg*.
- 64504 • The variable *sem\_nsems* shall be set to the value of *nsems*.
- 64505 • The variable *sem\_otime* shall be set to 0 and *sem\_ctime* shall be set to the current time, as  
 64506 described in [Section 2.7.1](#) (on page 526).

64507 Upon creation, the value of the *semval*, *sempid*, *semncnt*, and *semzcnt* members of all *nsems*  
 64508 semaphores in the associated semaphore set shall be set to zero.

64509 **RETURN VALUE**

64510 Upon successful completion, *semget()* shall return a non-negative integer, namely a semaphore  
 64511 identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

64512 **ERRORS**

64513 The *semget()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 64514 | [EACCES] | A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see <a href="#">Section 2.7</a> (on page 526).  |
| 64515 |          |   |
| 64516 |          |   |
| 64517 | [EEXIST] | A semaphore identifier exists for the argument <i>key</i> but $((semflg \& IPC\_CREAT) \&\& (semflg \& IPC\_EXCL))$ is non-zero.  |
| 64518 |          |   |
| 64519 | [EINVAL] | The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0. |
| 64520 |          |   |
| 64521 |          |   |
| 64522 |          |   |

64523 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*  
64524 &IPC\_CREAT) is equal to 0.

64525 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the  
64526 maximum number of allowed semaphores system-wide would be exceeded.

#### 64527 EXAMPLES

64528 Refer to *semop()*.

#### 64529 APPLICATION USAGE

64530 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
64531 Application developers who need to use IPC should design their applications so that modules  
64532 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
64533 alternative interfaces.

#### 64534 RATIONALE

64535 None.

#### 64536 FUTURE DIRECTIONS

64537 None.

#### 64542 CHANGE HISTORY

64543 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 64544 Issue 5

64545 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
64546 DIRECTIONS to a new APPLICATION USAGE section.

#### 64547 Issue 6

64548 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/122 is applied, updating the  
64549 DESCRIPTION from “each semaphore in the set shall not be initialized” to “each semaphore in  
64550 the set need not be initialized”.

#### 64551 Issue 7

64552 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0536 [335,439] and  
64553 XSH/TC1-2008/0537 [344] are applied.

#### 64554 Issue 8

64555 Austin Group Defect 377 is applied, adding a requirement that the value of the *semval*, *sempid*,  
64556 *semncnt*, and *semzcnt* members of all semaphores in a semaphore set be initialized to zero when a  
64557 call to *semget()* creates a semaphore set.

64558 **NAME**

64559 semop — XSI semaphore operations

64560 **SYNOPSIS**

```
64561 XSI #include <sys/sem.h>
64562 int semop(int semid, struct sembuf *sops, size_t nsops);
```

64563 **DESCRIPTION**

64564 The *semop()* function operates on XSI semaphores (see XBD [Section 4.20](#), on page 108). It is  
 64565 unspecified whether this function interoperates with the realtime interprocess communication  
 64566 facilities defined in [Section 2.8](#) (on page 527).

64567 The *semop()* function shall perform atomically a user-defined array of semaphore operations in  
 64568 array order on the set of semaphores associated with the semaphore identifier specified by the  
 64569 argument *semid*.

64570 The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The  
 64571 implementation shall not modify elements of this array unless the application uses  
 64572 implementation-defined extensions.

64573 The argument *nsops* is the number of such structures in the array.

64574 Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
<b>unsigned short</b>	<i>sem_num</i>	Semaphore number.
<b>short</b>	<i>sem_op</i>	Semaphore operation.
<b>short</b>	<i>sem_flg</i>	Operation flags.

64575 Each semaphore operation specified by *sem\_op* is performed on the corresponding semaphore  
 64580 specified by *semid* and *sem\_num*.

64581 If all of the semaphore operations complete successfully, *semop()* shall return 0. If a semaphore  
 64582 operation fails or blocks, all changes to *semadj* and *semval* values performed by completed  
 64583 semaphore operations in the array before the operation that failed or blocked shall be undone  
 64584 before *semop()* returns or blocks, respectively. When a semaphore operation blocks, the change  
 64585 to *semncnt* or *semzcnt* indicating which semaphore operation blocked shall not be undone until  
 64586 the operation unblocks.

64587 For each operation in the array of semaphore operations, the variable *sem\_op* specifies one of  
 64588 three semaphore operations:

- 64589 1. If *sem\_op* is a negative integer and the calling process has alter permission, one of the  
 64590 following shall occur:
  - 64591 • If *semval* (see `<sys/sem.h>`) is greater than or equal to the absolute value of *sem\_op*,  
 64592 the absolute value of *sem\_op* shall be subtracted from *semval*. Also, if (*sem\_flg* &  
 64593 SEM\_UNDO) is non-zero, the absolute value of *sem\_op* shall be added to the *semadj*  
 64594 value of the calling process for the specified semaphore. If this is not the last  
 64595 operation in the array of semaphore operations to be performed, processing shall  
 64596 continue with the next operation in the array.
  - 64597 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* & IPC\_NOWAIT) is  
 64598 non-zero, the operation shall fail with *errno* set to [EAGAIN].

- 64599 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* & IPC\_NOWAIT) is 0,  
 64600 *semop()* shall increment the *semncnt* associated with the specified semaphore and  
 64601 suspend execution of the calling thread (block) until one of the following conditions  
 64602 occurs:
- 64603 — The value of *semval* changes. When this occurs, the value of *semncnt* associated  
 64604 with the specified semaphore shall be decremented and the array of  
 64605 semaphore operations shall be reevaluated.
  - 64606 — The *semid* for which the calling thread is awaiting action is removed from the  
 64607 system. When this occurs, the operation shall fail with *errno* set to [EIDRM].
  - 64608 — The calling thread receives a signal that is to be caught. When this occurs, the  
 64609 value of *semncnt* associated with the specified semaphore shall be  
 64610 decremented, and the calling thread shall resume execution in the manner  
 64611 prescribed in *sigaction()*.
- 64612 2. If *sem\_op* is a positive integer and the calling process has alter permission, the value of  
 64613 *sem\_op* shall be added to *semval* and, if (*sem\_flg* & SEM\_UNDO) is non-zero, the value of  
 64614 *sem\_op* shall be subtracted from the *semadj* value of the calling process for the specified  
 64615 semaphore. If this is not the last operation in the array of semaphore operations to be  
 64616 performed, processing shall continue with the next operation in the array.
- 64617 3. If *sem\_op* is 0 and the calling process has read permission, one of the following shall occur:
- 64618 • If *semval* is 0, this is a successful operation. If this is not the last operation in the  
 64619 array of semaphore operations to be performed, processing shall continue with the  
 64620 next operation in the array.
  - 64621 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is non-zero, the operation shall  
 64622 fail with *errno* set to [EAGAIN].
  - 64623 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is 0, *semop()* shall increment the  
 64624 *semzcnt* associated with the specified semaphore and suspend execution of the  
 64625 calling thread (block) until one of the following occurs:
    - 64626 — The value of *semval* changes. When this occurs, the value of *semzcnt* associated  
 64627 with the specified semaphore shall be decremented and the array of  
 64628 semaphore operations shall be reevaluated.
    - 64629 — The *semid* for which the calling thread is awaiting action is removed from the  
 64630 system. When this occurs, the operation shall fail with *errno* set to [EIDRM].
    - 64631 — The calling thread receives a signal that is to be caught. When this occurs, the  
 64632 value of *semzcnt* associated with the specified semaphore shall be  
 64633 decremented, and the calling thread shall resume execution in the manner  
 64634 prescribed in *sigaction()*.

64635 Upon successful completion of all of the semaphore operations specified in the array pointed to  
 64636 by *sops*, the value of *sempid* for each semaphore specified in the array shall be set to the process  
 64637 ID of the calling process and the *sem\_otime* timestamp associated with the semaphore set shall be  
 64638 set to the current time, as described in [Section 2.7.1](#) (on page 526).

#### 64639 RETURN VALUE

64640 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 64641 indicate the error.

64642 **ERRORS**64643 The *semop()* function shall fail if:

64644	[E2BIG]	The value of <i>nsops</i> is greater than the system-imposed maximum.
64645	[EACCES]	Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 526).
64647	[EAGAIN]	The operation would result in suspension of the calling thread but ( <i>sem_flg</i> & <i>IPC_NOWAIT</i> ) is non-zero.
64649	[EFBIG]	The value of <i>sem_num</i> is greater than or equal to the number of semaphores in the set associated with <i>semid</i> .
64651	[EIDRM]	The semaphore identifier <i>semid</i> is removed from the system.
64652	[EINTR]	The <i>semop()</i> function was interrupted by a signal.
64653	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a <i>SEM_UNDO</i> would exceed the system-imposed limit.
64656	[ENOSPC]	The limit on the number of individual processes requesting a <i>SEM_UNDO</i> would be exceeded.
64658	[ERANGE]	An operation would cause a <i>semval</i> to overflow the system-imposed limit, or an operation would cause a <i>semadj</i> value to overflow the system-imposed limit.

64661 **EXAMPLES**64662 **Setting Values in Semaphores**64663 The following example sets the values of the two semaphores associated with the *semid* identifier to the values contained in the *sb* array.

```

64665 #include <sys/sem.h>
64666 ...
64667 int semid;
64668 struct sembuf sb[2];
64669 int nsops = 2;
64670 int result;

64671 // Code to initialize semid.
64672 ...

64673 // Adjust value of semaphore in the semaphore array semid.
64674 sb[0].sem_num = 0;
64675 sb[0].sem_op = -1;
64676 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
64677 sb[1].sem_num = 1;
64678 sb[1].sem_op = 1;
64679 sb[1].sem_flg = 0;

64680 result = semop(semid, sb, nsops);

```

64681 **Creating a Semaphore Identifier**

64682 The following example gets a semaphore key using the *ftok()* function, then creates or uses an  
 64683 existing semaphore set associated with that key using the *semget()* function.

64684 If this process creates the semaphore set, the program uses a call to *semop()* to initialize it to the  
 64685 value in the *sbuf* array. The number of processes that can execute concurrently is set to 2.

64686 The final call to *semop()* acquires the semaphore and waits until it is free; the SEM\_UNDO  
 64687 option releases the semaphore when the process exits, waiting until there are less than two  
 64688 processes running concurrently.

```

64689 #include <errno.h>
64690 #include <stdio.h>
64691 #include <stdlib.h>
64692 #include <sys/sem.h>
64693 #include <sys/stat.h>
64694 ...
64695 struct sembuf sbuf;
64696 int semid;
64697 key_t semkey;
64698 ...
64699 // Get a key for the semaphore set.
64700 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
64701     perror("IPC error: ftok");
64702     exit(1);
64703 }
64704 // Create the semaphore set associated with this key
64705 if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
64706     S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1) {
64707     // Initialize the semaphore.
64708     sbuf.sem_num = 0;
64709     sbuf.sem_op = 2; // Set the number of runs without queuing.
64710     sbuf.sem_flg = 0;
64711     if (semop(semid, &sbuf, 1) == -1) {
64712         perror("IPC error: semop");
64713         exit(1);
64714     }
64715 } else if (errno == EEXIST) {
64716     // The semaphore set already exists; get its semaphore ID.
64717     if ((semid = semget(semkey, 0, 0)) == -1) {
64718         perror("IPC error 1: semget");
64719         exit(1);
64720     }
64721 } else {
64722     perror("IPC error 2: semget");
64723     exit(1);
64724 }
64725 // Since the semget() initialized the semaphore to 0, the
64726 // following semop() will block until the creating process

```

```

64727 // completes the initialization above. Processes will also
64728 // block in the following semop() call if two other processes
64729 // have already passed this point and are still running.
64730 sbuf.sem_num = 0;
64731 sbuf.sem_op = -1;
64732 sbuf.sem_flg = SEM_UNDO;
64733 if (semop(semid, &sbuf, 1) == -1) {
64734     perror("IPC Error: semop");
64735     exit(1);
64736 }

```

#### 64737 APPLICATION USAGE

64738 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
 64739 Application developers who need to use IPC should design their applications so that modules  
 64740 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
 64741 alternative interfaces.

#### 64742 RATIONALE

64743 None.

#### 64744 FUTURE DIRECTIONS

64745 None.

#### 64751 CHANGE HISTORY

64752 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 64753 Issue 5

64754 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 64755 DIRECTIONS to a new APPLICATION USAGE section.

#### 64756 Issue 7

64757 SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the  
 64758 operations in *sops* will be performed when there are multiple operations.

64759 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0538 [329,429], XSH/TC1-2008/0539  
 64760 [345,428], XSH/TC1-2008/0540 [329,429], XSH/TC1-2008/0541 [335], and XSH/TC1-2008/0542  
 64761 [291,429] are applied.

#### 64762 Issue 8

64763 Austin Group Defect 377 is applied, changing the EXAMPLES section.

64764 Austin Group Defect 628 is applied, clarifying how *semop()* behaves when there is more than  
 64765 one operation in the array specified by *sops*.

64766 **NAME**

64767 send — send a message on a socket

64768 **SYNOPSIS**

64769 #include &lt;sys/socket.h&gt;

64770 ssize\_t send(int socket, const void \*buffer, size\_t length, int flags);

64771 **DESCRIPTION**

64772 The *send()* function shall initiate transmission of a message from the specified socket to its peer.  
 64773 The *send()* function shall send a message only when the socket is connected. If the socket is a  
 64774 connectionless-mode socket, the message shall be sent to the pre-specified peer address.

64775 The *send()* function takes the following arguments:64776 *socket* Specifies the socket file descriptor.64777 *buffer* Points to the buffer containing the message to send.64778 *length* Specifies the length of the message in bytes.

64779 *flags* Specifies the type of message transmission. Values of this argument are  
 64780 formed by logically OR'ing zero or more of the following flags:

64781 MSG\_EOR Terminates a record (if supported by the protocol).

64782 MSG\_OOB Sends out-of-band data on sockets that support out-of-  
 64783 band communications. The significance and semantics  
 64784 of out-of-band data are protocol-specific.

64785 MSG\_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to  
 64786 send is made on a stream-oriented socket that is no  
 64787 longer connected. The [EPIPE] error shall still be  
 64788 returned.

64789 The length of the message to be sent is specified by the *length* argument. If the message is too  
 64790 long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.

64791 Successful completion of a call to *send()* does not guarantee delivery of the message. A return  
 64792 value of  $-1$  indicates only locally-detected errors.

64793 If space is not available at the sending socket to hold the message to be transmitted, and the  
 64794 socket file descriptor does not have O\_NONBLOCK set, *send()* shall block until space is  
 64795 available or a timeout occurs (see SO\_SNDTIMEO in [Section 2.10.16](#), on page 554). If space is  
 64796 not available at the sending socket to hold the message to be transmitted, and the socket file  
 64797 descriptor does have O\_NONBLOCK set, *send()* shall fail. The *select()* and *poll()* functions can  
 64798 be used to determine when it is possible to send more data.

64799 The socket in use may require the process to have appropriate privileges to use the *send()*  
 64800 function.

64801 **RETURN VALUE**

64802 Upon successful completion, *send()* shall return the number of bytes sent. Otherwise,  $-1$  shall be  
 64803 returned and *errno* set to indicate the error.

64804 **ERRORS**64805 The *send()* function shall fail if:

64806 [EAGAIN] or [EWOULDBLOCK]

64807 The socket's file descriptor is marked O\_NONBLOCK and the requested  
 64808 operation would block. See also SO\_SNDTIMEO in [Section 2.10.16](#) (on page  
 64809 554).

64810	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
64811	[ECONNRESET]	A connection was forcibly closed by a peer.
64812	[EDESTADDRREQ]	
64813		The socket is not connection-mode and no peer address is set.
64814	[EINTR]	A signal interrupted <i>send()</i> before any data was transmitted.
64815	[EMSGSIZE]	The message is too large to be sent all at once, as the socket requires.
64816	[ENOTCONN]	The socket is not connected.
64817	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
64818	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
64819		
64820	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.
64821		
64822		
64823		
64824		The <i>send()</i> function may fail if:
64825	[EACCES]	The calling process does not have appropriate privileges.
64826	[EIO]	An I/O error occurred while reading from or writing to the file system.
64827	[ENETDOWN]	The local network interface used to reach the destination is down.
64828	[ENETUNREACH]	
64829		No route to the network is present.
64830	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.

**EXAMPLES**

64831 None.  
64832

**APPLICATION USAGE**

64834 If the *socket* argument refers to a connection-mode socket, the *send()* function is equivalent to *sendto()* (with any value for the *dest\_addr* and *dest\_len* arguments, as they are ignored in this case). If the *socket* argument refers to a socket and the *flags* argument is 0, the *send()* function is equivalent to *write()*.

**CHANGE HISTORY**

64846 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.  
64847

64848 **Issue 7**

64849 Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify  
64850 the behavior when the socket is a connectionless-mode socket.

64851 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
64852 API Set Part 2.

64853 The [EPIPE] error is modified.

64854 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0543 [463] is applied.

64855 **Issue 8**

64856 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
64857 [Section 2.10.16](#) (on page 554).

64858 **NAME**

64859 sendmsg — send a message on a socket using a message structure

64860 **SYNOPSIS**

64861 #include &lt;sys/socket.h&gt;

64862 ssize\_t sendmsg(int socket, const struct msghdr \*message, int flags);

64863 **DESCRIPTION**

64864 The *sendmsg()* function shall send a message through a connection-mode or connectionless-mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified in **msghdr** (overriding the pre-specified peer address), or the function shall return  $-1$  and set *errno* to [EISCONN]. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

64871 The *sendmsg()* function takes the following arguments:

64872	<i>socket</i>	Specifies the socket file descriptor.
64873	<i>message</i>	Points to a <b>msghdr</b> structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored.
64874		
64875		
64876	<i>flags</i>	Specifies the type of message transmission. The application may specify 0 or the following flag:
64877		
64878	MSG_EOR	Terminates a record (if supported by the protocol).
64879	MSG_OOB	Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
64880		
64881		
64882	MSG_NOSIGNAL	Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.
64883		
64884		
64885		

64886 The *msg\_iov* and *msg\_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg\_iov* is sent in turn.

64891 Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A return value of  $-1$  indicates only locally-detected errors.

64893 If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have O\_NONBLOCK set, the *sendmsg()* function shall block until space is available or a timeout occurs (see SO\_SNDTIMEO in [Section 2.10.16](#), on page 554). If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have O\_NONBLOCK set, the *sendmsg()* function shall fail.

64898 If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendmsg()* shall fail if the SO\_BROADCAST option is not set for the socket.

64900 The socket in use may require the process to have appropriate privileges to use the *sendmsg()* function.

64902 **RETURN VALUE**

64903 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, `-1`  
 64904 shall be returned and *errno* set to indicate the error.

64905 **ERRORS**

64906 The *sendmsg()* function shall fail if:

64907 [EAGAIN] or [EWOULDBLOCK]

64908 The socket's file descriptor is marked `O_NONBLOCK` and the requested  
 64909 operation would block. See also `SO_SNDTIMEO` in [Section 2.10.16](#) (on page  
 64910 554).

64911 [EAFNOSUPPORT]

64912 Addresses in the specified address family cannot be used with this socket.

64913 [EBADF] The *socket* argument is not a valid file descriptor.

64914 [ECONNRESET] A connection was forcibly closed by a peer.

64915 [EINTR] A signal interrupted *sendmsg()* before any data was transmitted.

64916 [EINVAL] The sum of the *iov\_len* values overflows an `ssize_t`.

64917 [EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the  
 64918 *msg\_iovlen* member of the `msghdr` structure pointed to by *message* is less than  
 64919 or equal to 0 or is greater than `{IOV_MAX}`.

64920 [ENOTCONN] The socket is connection-mode but is not connected.

64921 [ENOTSOCK] The *socket* argument does not refer to a socket.

64922 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
 64923 more of the values set in *flags*.

64924 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
 64925 no longer connected. In the latter case, and if the socket is of type  
 64926 `SOCK_STREAM` or `SOCK_SEQPACKET` and the `MSG_NOSIGNAL` flag is not  
 64927 set, the `SIGPIPE` signal is generated to the calling thread.

64928 If the address family of the socket is `AF_UNIX`, then *sendmsg()* shall fail if:

64929 [EIO] An I/O error occurred while reading from or writing to the file system.

64930 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
 64931 in the socket address.

64932 [ENAMETOOLONG]

64933 The length of a component of a pathname is longer than `{NAME_MAX}`.

64934 [ENOENT]

64935 A component of the pathname does not name an existing file or the path name  
 is an empty string.

64936 [ENOTDIR]

64937 A component of the path prefix of the pathname in the socket address names  
 64938 an existing file that is neither a directory nor a symbolic link to a directory, or  
 64939 the pathname in the socket address contains at least one non-`<slash>` character  
 64940 and ends with one or more trailing `<slash>` characters and the last pathname  
 64941 component names an existing file that is neither a directory nor a symbolic  
 link to a directory.

64942 The *sendmsg()* function may fail if:

64943 [EACCES] Search permission is denied for a component of the path prefix; or write access  
64944 to the named socket is denied.

64945 [EDESTADDRREQ]  
64946 The socket is not connection-mode and does not have its peer address set, and  
64947 no destination address was specified.

64948 [EHOSTUNREACH]  
64949 The destination host cannot be reached (probably because the host is down or  
64950 a remote router cannot reach it).

64951 [EIO] An I/O error occurred while reading from or writing to the file system.

64952 [EISCONN] A destination address was specified and the socket is already connected.

64953 [ENETDOWN] The local network interface used to reach the destination is down.

64954 [ENETUNREACH]  
64955 No route to the network is present.

64956 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

64957 [ENOMEM] Insufficient memory was available to fulfill the request.

64958 If the address family of the socket is AF\_UNIX, then *sendmsg()* may fail if:

64959 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
64960 resolution of the pathname in the socket address.

64961 [ENAMETOOLONG]  
64962 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
64963 symbolic link produced an intermediate result with a length that exceeds  
64964 {PATH\_MAX}.

**64965 EXAMPLES**

64966 Done.

**64967 APPLICATION USAGE**

64968 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

**64969 RATIONALE**

64970 None.

**64971 FUTURE DIRECTIONS**

64972 None.

**64977 CHANGE HISTORY**

64978 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

64979 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
64980 [ELOOP] error condition is added.

64981 **Issue 7**

64982 Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

64983 Austin Group Interpretation 1003.1-2001 #143 is applied.

64984 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
64985 API Set Part 2.

64986 The [EPIPE] error is modified.

64987 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0544 [324] is applied.

64988 **Issue 8**

64989 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
64990 [Section 2.10.16](#) (on page 554).

64991 **NAME**

64992 sendto — send a message on a socket

64993 **SYNOPSIS**

```
64994 #include <sys/socket.h>
64995 ssize_t sendto(int socket, const void *message, size_t length,
64996               int flags, const struct sockaddr *dest_addr,
64997               socklen_t dest_len);
```

64998 **DESCRIPTION**64999 The *sendto()* function shall send a message through a connection-mode or connectionless-mode  
65000 socket.

65001 If the socket is a connectionless-mode socket, the message shall be sent to the address specified  
65002 by *dest\_addr* if no pre-specified peer address has been set. If a peer address has been pre-  
65003 specified, either the message shall be sent to the address specified by *dest\_addr* (overriding the  
65004 pre-specified peer address), or the function shall return  $-1$  and set *errno* to [EISCONN].

65005 If the socket is connection-mode, *dest\_addr* shall be ignored.65006 The *sendto()* function takes the following arguments:

65007	<i>socket</i>	Specifies the socket file descriptor.
65008	<i>message</i>	Points to a buffer containing the message to be sent.
65009	<i>length</i>	Specifies the size of the message in bytes.
65010	<i>flags</i>	Specifies the type of message transmission. Values of this argument are 65011 formed by logically OR'ing zero or more of the following flags:
65012	MSG_EOR	Terminates a record (if supported by the protocol).
65013	MSG_OOB	Sends out-of-band data on sockets that support out-of- 65014 band data. The significance and semantics of out-of- 65015 band data are protocol-specific.
65016	MSG_NOSIGNAL	Requests not to send the SIGPIPE signal if an attempt to 65017 send is made on a stream-oriented socket that is no 65018 longer connected. The [EPIPE] error shall still be 65019 returned.
65020	<i>dest_addr</i>	Points to a <b>sockaddr</b> structure containing the destination address. The length 65021 and format of the address depend on the address family of the socket.
65022	<i>dest_len</i>	Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>dest_addr</i> 65023 argument.

65024 If the address family of the socket is AF\_UNIX, the application shall ensure that a null  
65025 terminator after the pathname is included in the *sun\_path* member of *dest\_addr* as a **sockaddr\_un**  
65026 structure, and that *dest\_len* is at least `offsetof(struct sockaddr_un, sun_path) + 1`  
65027 plus the length of the pathname.

65028 If the socket protocol supports broadcast and the specified address is a broadcast address for the  
65029 socket protocol, *sendto()* shall fail if the SO\_BROADCAST option is not set for the socket.

65030 The *dest\_addr* argument specifies the address of the target.65031 The *length* argument specifies the length of the message.65032 Successful completion of a call to *sendto()* does not guarantee delivery of the message. A return

- 65033 value of `-1` indicates only locally-detected errors.
- 65034 If space is not available at the sending socket to hold the message to be transmitted and the  
65035 socket file descriptor does not have `O_NONBLOCK` set, `sendto()` shall block until space is  
65036 available or a timeout occurs (see `SO_SNDTIMEO` in [Section 2.10.16](#), on page 554). If space is  
65037 not available at the sending socket to hold the message to be transmitted and the socket file  
65038 descriptor does have `O_NONBLOCK` set, `sendto()` shall fail.
- 65039 The socket in use may require the process to have appropriate privileges to use the `sendto()`  
65040 function.
- 65041 **RETURN VALUE**
- 65042 Upon successful completion, `sendto()` shall return the number of bytes sent. Otherwise, `-1` shall  
65043 be returned and `errno` set to indicate the error.
- 65044 **ERRORS**
- 65045 The `sendto()` function shall fail if:
- 65046 [EAFNOSUPPORT]  
65047 Addresses in the specified address family cannot be used with this socket.
- 65048 [EAGAIN] or [EWOULDBLOCK]  
65049 The socket's file descriptor is marked `O_NONBLOCK` and the requested  
65050 operation would block. See also `SO_SNDTIMEO` in [Section 2.10.16](#) (on page  
65051 554).
- 65052 [EBADF] The *socket* argument is not a valid file descriptor.
- 65053 [ECONNRESET] A connection was forcibly closed by a peer.
- 65054 [EINTR] A signal interrupted `sendto()` before any data was transmitted.
- 65055 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.
- 65056 [ENOTCONN] The socket is connection-mode but is not connected.
- 65057 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 65058 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
65059 more of the values set in *flags*.
- 65060 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
65061 no longer connected. In the latter case, and if the socket is of type  
65062 `SOCK_STREAM` or `SOCK_SEQPACKET` and the `MSG_NOSIGNAL` flag is not  
65063 set, the `SIGPIPE` signal is generated to the calling thread.
- 65064 If the address family of the socket is `AF_UNIX`, then `sendto()` shall fail if:
- 65065 [EIO] An I/O error occurred while reading from or writing to the file system.
- 65066 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
65067 in the socket address.
- 65068 [ENAMETOOLONG]  
65069 The length of a component of a pathname is longer than `{NAME_MAX}`.
- 65070 [ENOENT] A component of the pathname does not name an existing file or the pathname  
65071 is an empty string.
- 65072 [ENOTDIR] A component of the path prefix of the pathname in the socket address names  
65073 an existing file that is neither a directory nor a symbolic link to a directory, or  
65074 the pathname in the socket address contains at least one non-`<slash>` character

65075 and ends with one or more trailing <slash> characters and the last pathname  
65076 component names an existing file that is neither a directory nor a symbolic  
65077 link to a directory.

65078 The *sendto()* function may fail if:

65079 [EACCES] Search permission is denied for a component of the path prefix; or write access  
65080 to the named socket is denied.

65081 [EDESTADDRREQ]  
65082 The socket is not connection-mode and does not have its peer address set, and  
65083 no destination address was specified.

65084 [EHOSTUNREACH]  
65085 The destination host cannot be reached (probably because the host is down or  
65086 a remote router cannot reach it).

65087 [EINVAL] The *dest\_len* argument is not a valid length for the address family.

65088 [EIO] An I/O error occurred while reading from or writing to the file system.

65089 [EISCONN] A destination address was specified and the socket is already connected.

65090 [ENETDOWN] The local network interface used to reach the destination is down.

65091 [ENETUNREACH]  
65092 No route to the network is present.

65093 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

65094 [ENOMEM] Insufficient memory was available to fulfill the request.

65095 If the address family of the socket is AF\_UNIX, then *sendto()* may fail if:

65096 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
65097 resolution of the pathname in the socket address.

65098 [ENAMETOOLONG]  
65099 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
65100 symbolic link produced an intermediate result with a length that exceeds  
65101 {PATH\_MAX}.

#### 65102 EXAMPLES

65103 None.

#### 65104 APPLICATION USAGE

65105 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

65106 For AF\_UNIX sockets, some implementations support an extension where *dest\_len* does not have  
65107 to include a null terminator for the pathname stored in *sun\_path*, which in turn allows a  
65108 pathname to be one byte longer. However, such usage is not portable, and carries a risk of  
65109 accessing beyond the intended bounds of the pathname length.

#### 65110 RATIONALE

65111 None.

#### 65112 FUTURE DIRECTIONS

65113 None.

65118 **CHANGE HISTORY**

65119 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

65120 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
65121 [ELOOP] error condition is added.

65122 **Issue 7**

65123 Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN]  
65124 error and the DESCRIPTION.

65125 Austin Group Interpretation 1003.1-2001 #143 is applied, clarifying the [ENAMETOOLONG]  
65126 error condition.

65127 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
65128 API Set Part 2.

65129 The [EPIPE] error is modified.

65130 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0545 [324] is applied.

65131 **Issue 8**

65132 Austin Group Defect 561 is applied, changing the requirements for the *sun\_path* member of the  
65133 **sockaddr\_un** structure.

65134 Austin Group Defect 1429 is applied, clarifying the behavior on timeout by adding references to  
65135 [Section 2.10.16](#) (on page 554).

65136 **NAME**

65137 setbuf — assign buffering to a stream

65138 **SYNOPSIS**

65139 #include &lt;stdio.h&gt;

65140 void setbuf(FILE \*restrict stream, char \*restrict buf);

65141 **DESCRIPTION**

65142 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
65143 conflict between the requirements described here and the ISO C standard is unintentional. This  
65144 volume of POSIX.1-2024 defers to the ISO C standard.

65145 Except that it returns no value, the function call:

65146 setbuf(stream, buf)

65147 shall be equivalent to:

65148 setvbuf(stream, buf, \_IOFBF, BUFSIZ)

65149 if *buf* is not a null pointer, or to:

65150 setvbuf(stream, buf, \_IONBF, BUFSIZ)

65151 if *buf* is a null pointer.65152 **RETURN VALUE**65153 The *setbuf()* function shall not return a value.65154 **ERRORS**

65155 Although the *setvbuf()* interface may set *errno* in defined ways, the value of *errno* after a call to  
65156 *setbuf()* is unspecified.

65157 **EXAMPLES**

65158 None.

65159 **APPLICATION USAGE**

65160 A common source of error is allocating buffer space as an “automatic” variable in a code block,  
65161 and then failing to close the stream in the same block.

65162 With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ  
65163 bytes are used for the buffer area.

65164 Since *errno* is not required to be unchanged on success, in order to correctly detect and possibly  
65165 recover from errors, applications should use *setvbuf()* instead of *setbuf()*.

65166 **RATIONALE**

65167 None.

65168 **FUTURE DIRECTIONS**

65169 None.

65170 **SEE ALSO**65171 [Section 2.5](#) (on page 521), *fopen()*, *setvbuf()*65172 XBD [<stdio.h>](#)65173 **CHANGE HISTORY**

65174 First released in Issue 1. Derived from Issue 1 of the SVID.

65175 **Issue 6**

65176 The prototype for *setbuf()* is updated for alignment with the ISO/IEC 9899:1999 standard.

65177 **Issue 7**

65178 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0546 [397], XSH/TC1-2008/0547 [397],  
65179 and XSH/TC1-2008/0548 [14] are applied.

65180 **NAME**

65181 setegid — set the effective group ID

65182 **SYNOPSIS**

65183 #include &lt;unistd.h&gt;

65184 int setegid(gid\_t gid);

65185 **DESCRIPTION**

65186 If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate  
65187 privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group  
65188 ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

65189 The *setegid()* function shall not affect the supplementary group list in any way.

65190 **RETURN VALUE**

65191 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
65192 indicate the error.

65193 **ERRORS**

65194 The *setegid()* function shall fail if:

65195 [EINVAL] The value of the *gid* argument is invalid and is not supported by the  
65196 implementation.

65197 [EPERM] The process does not have appropriate privileges and *gid* does not match the  
65198 real group ID or the saved set-group-ID.

65199 **EXAMPLES**

65200 None.

65201 **APPLICATION USAGE**

65202 None.

65203 **RATIONALE**

65204 Refer to the RATIONALE section in *setuid()*.

65205 **FUTURE DIRECTIONS**

65206 None.

65210 XBD <sys/types.h>, <unistd.h>

65211 **CHANGE HISTORY**

65212 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

65213 **Issue 8**

65214 Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
65215 SEE ALSO.

65216 **NAME**

65217 setenv — add or change environment variable

65218 **SYNOPSIS**

```
65219 CX #include <stdlib.h>
65220 int setenv(const char *envname, const char *envval, int overwrite);
```

65221 **DESCRIPTION**

65222 The *setenv()* function shall update or add a variable in the environment of the calling process.  
 65223 The *envname* argument points to a string containing the name of an environment variable to be  
 65224 added or altered. The environment variable shall be set to the value to which *envval* points. The  
 65225 function shall fail if *envname* points to a string which contains an '=' character. If the  
 65226 environment variable named by *envname* already exists and the value of *overwrite* is non-zero,  
 65227 the function shall return success and the environment shall be updated. If the environment  
 65228 variable named by *envname* already exists and the value of *overwrite* is zero, the function shall  
 65229 return success and the environment shall remain unchanged.

65230 The *setenv()* function shall update the list of pointers to which *environ* points.

65231 The strings described by *envname* and *envval* are copied by this function.

65232 The *setenv()* function need not be thread-safe.

65233 **RETURN VALUE**

65234 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
 65235 indicate the error, and the environment shall be unchanged.

65236 **ERRORS**

65237 The *setenv()* function shall fail if:

65238 [EINVAL] The *envname* argument points to an empty string or points to a string  
 65239 containing an '=' character.

65240 [ENOMEM] Insufficient memory was available to add a variable or its value to the  
 65241 environment.

65242 **EXAMPLES**

65243 None.

65244 **APPLICATION USAGE**

65245 See *exec()* for restrictions on changing the environment in multi-threaded applications.

65246 **RATIONALE**

65247 Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular, if  
 65248 the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an  
 65249 obsolete copy of the environment (as may any other copy of *environ*). However, other than the  
 65250 aforementioned restriction, the standard developers intended that the traditional method of  
 65251 walking through the environment by way of the *environ* pointer must be supported.

65252 It was decided that *setenv()* should be required by this version because it addresses a piece of  
 65253 missing functionality, and does not impose a significant burden on the implementor.

65254 There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()*  
 65255 function should be required as a mandatory function. The *setenv()* function was chosen because  
 65256 it permitted the implementation of the *unsetenv()* function to delete environmental variables,  
 65257 without specifying an additional interface. The *putenv()* function is available as part of the XSI  
 65258 option.

65259 The standard developers considered requiring that *setenv()* indicate an error when a call to it  
65260 would result in exceeding {ARG\_MAX}. The requirement was rejected since the condition might  
65261 be temporary, with the application eventually reducing the environment size. The ultimate  
65262 success or failure depends on the size at the time of a call to *exec*, which returns an indication of  
65263 this error condition.

65264 See also the RATIONALE section in *getenv()*.

#### 65265 FUTURE DIRECTIONS

#### 65270 CHANGE HISTORY

65271 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

65272 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/55 is applied, adding references to *exec* in  
65273 the APPLICATION USAGE and SEE ALSO sections.

#### 65274 Issue 7

65275 Austin Group Interpretation 1003.1-2001 #156 is applied.

65276 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0549 [167], XSH/TC1-2008/0550 [185],  
65277 XSH/TC1-2008/0551 [167], and XSH/TC1-2008/0552 [38] are applied.

65278 **NAME**

65279            seteuid — set effective user ID

65280 **SYNOPSIS**

65281            #include &lt;unistd.h&gt;

65282            int seteuid(uid\_t uid);

65283 **DESCRIPTION**

65284            If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate  
 65285 privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID  
 65286 and saved set-user-ID shall remain unchanged.

65287            The *seteuid()* function shall not affect the supplementary group list in any way.

65288 **RETURN VALUE**

65289            Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 65290 indicate the error.

65291 **ERRORS**

65292            The *seteuid()* function shall fail if:

65293            [EINVAL]            The value of the *uid* argument is invalid and is not supported by the  
 65294 implementation.

65295            [EPERM]            The process does not have appropriate privileges and *uid* does not match the  
 65296 real user ID or the saved set-user-ID.

65297 **EXAMPLES**

65298            None.

65299 **APPLICATION USAGE**

65300            None.

65301 **RATIONALE**65302            Refer to the RATIONALE section in *setuid()*.65303 **FUTURE DIRECTIONS**

65304            None.

 65307 *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*

65308            XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

65309 **CHANGE HISTORY**

65310            First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

65311            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/123 is applied, making an editorial  
 65312 correction to the [EPERM] error in the ERRORS section.

65313 **Issue 8**

65314            Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
 65315 SEE ALSO.

65316 **NAME**

65317 setgid — set-group-ID

65318 **SYNOPSIS**

65319 #include &lt;unistd.h&gt;

65320 int setgid(gid\_t gid);

65321 **DESCRIPTION**65322 If the process has appropriate privileges, *setgid()* shall set the real group ID, effective group ID,  
65323 and the saved set-group-ID of the calling process to *gid*.65324 If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the  
65325 saved set-group-ID, *setgid()* shall set the effective group ID to *gid*; the real group ID and saved  
65326 set-group-ID shall remain unchanged.65327 The *setgid()* function shall not affect the supplementary group list in any way.

65328 Any supplementary group IDs of the calling process shall remain unchanged.

65329 **RETURN VALUE**65330 Upon successful completion, 0 is returned. Otherwise, -1 shall be returned and *errno* set to  
65331 indicate the error.65332 **ERRORS**65333 The *setgid()* function shall fail if:65334 [EINVAL] The value of the *gid* argument is invalid and is not supported by the  
65335 implementation.65336 [EPERM] The process does not have appropriate privileges and *gid* does not match the  
65337 real group ID or the saved set-group-ID.65338 **EXAMPLES**

65339 None.

65340 **APPLICATION USAGE**

65341 None.

65342 **RATIONALE**65343 Refer to the RATIONALE section in *setuid()*.65344 **FUTURE DIRECTIONS**

65345 None.

65346 **SEE ALSO**65347 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getresgid()*, *getresuid()*, *getuid()*, *setegid()*, *seteuid()*, *setregid()*,

65349 XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

65350 **CHANGE HISTORY**

65351 First released in Issue 1. Derived from Issue 1 of the SVID.

65352 **Issue 6**

65353 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

65354 The following new requirements on POSIX implementations derive from alignment with the  
65355 Single UNIX Specification:

65356 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
65357 required for conforming implementations of previous POSIX specifications, it was not  
65358 required for UNIX applications.

65359 • Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS  
65360 requirement.

65361 The following changes were made to align with the IEEE P1003.1a draft standard:

65362 • The effects of `setgid()` in processes without appropriate privileges are changed.

65363 • A requirement that the supplementary group list is not affected is added.

65364 **Issue 8**

65365 Austin Group Defect 1344 is applied, adding `getresgid()`, `getresuid()`, `setresgid()`, and `setresuid()` to  
65366 SEE ALSO.

65367 **NAME**

65368           setgrent — reset the group database to the first entry

65369 **SYNOPSIS**

```
65370 XSI       #include <grp.h>  
65371       void setgrent(void);
```

65372 **DESCRIPTION**

65373       Refer to *endgrent()*.

65374 **NAME**

65375 sethostent — network host database functions

65376 **SYNOPSIS**

65377 #include &lt;netdb.h&gt;

65378 void sethostent(int *stayopen*);65379 **DESCRIPTION**65380 Refer to *endhostent()*.

65381 **NAME**

65382 setjmp — set jump point for a non-local goto

65383 **SYNOPSIS**

65384 #include &lt;setjmp.h&gt;

65385 int setjmp(jmp\_buf env);

65386 **DESCRIPTION**

65387 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65388 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65389 volume of POSIX.1-2024 defers to the ISO C standard.

65390 A call to *setjmp()* shall save the calling environment in its *env* argument for later use by  
 65391 *longjmp()*.

65392 It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in  
 65393 order to access an actual function, or a program defines an external identifier with the name  
 65394 *setjmp*, the behavior is undefined.

65395 An application shall ensure that an invocation of *setjmp()* appears in one of the following  
 65396 contexts only:

- 65397 • The entire controlling expression of a selection or iteration statement
- 65398 • One operand of a relational or equality operator with the other operand an integral  
 65399 constant expression, with the resulting expression being the entire controlling expression  
 65400 of a selection or iteration statement
- 65401 • The operand of a unary '!' operator with the resulting expression being the entire  
 65402 controlling expression of a selection or iteration
- 65403 • The entire expression of an expression statement (possibly cast to **void**)

65404 If the invocation appears in any other context, the behavior is undefined.

65405 **RETURN VALUE**

65406 If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to  
 65407 *longjmp()*, *setjmp()* shall return a non-zero value.

65408 **ERRORS**

65409 No errors are defined.

65410 **EXAMPLES**

65411 None.

65412 **APPLICATION USAGE**

65413 In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-  
 65414 level subroutine of a program.

65415 **RATIONALE**

65416 None.

65417 **FUTURE DIRECTIONS**

65418 None.

65419 **SEE ALSO**

65420 [longjmp\(\)](#), [sigsetjmp\(\)](#)

65421 XBD [<setjmp.h>](#)

65422 **CHANGE HISTORY**

65423 First released in Issue 1. Derived from Issue 1 of the SVID.

65424 **Issue 6**

65425 The normative text is updated to avoid use of the term “must” for application requirements.

65426 **NAME**65427 setkey — set encoding key (**CRYPT**)65428 **SYNOPSIS**

```
65429 OB XSI #include <stdlib.h>  
65430 void setkey(const char *key);
```

65431 **DESCRIPTION**

65432 The *setkey()* function provides access to an implementation-defined encoding algorithm. The  
65433 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical  
65434 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is  
65435 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used  
65436 with the algorithm to encode a string *block* passed to *encrypt()*.

65437 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to  
65438 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on  
65439 return, an error has occurred.

65440 The *setkey()* function need not be thread-safe.

65441 **RETURN VALUE**

65442 No values are returned.

65443 **ERRORS**

65444 The *setkey()* function shall fail if:

65445 [ENOSYS] The functionality is not supported on this implementation.

65446 **EXAMPLES**

65447 None.

65448 **APPLICATION USAGE**

65449 Decoding need not be implemented in all environments. This is related to government  
65450 restrictions in some countries on encryption and decryption routines. Historical practice has  
65451 been to ship a different version of the encryption library without the decryption feature in the  
65452 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

65453 **RATIONALE**

65454 None.

65455 **FUTURE DIRECTIONS**

65456 The *setkey()* function may be removed in a future version.

65457 **SEE ALSO**

65458 [crypt\(\)](#), [encrypt\(\)](#)

65459 XBD [<stdlib.h>](#)

65460 **CHANGE HISTORY**

65461 First released in Issue 1. Derived from Issue 1 of the SVID.

65462 **Issue 5**

65463 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

65464 **Issue 7**

65465 Austin Group Interpretation 1003.1-2001 #156 is applied.

65466 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0320 [899] is applied.

65467 **Issue 8**  
65468

Austin Group Defect 1192 is applied, marking the *setkey()* function as obsolescent.

65469 **NAME**

65470 setlocale — set program locale

65471 **SYNOPSIS**

65472 #include &lt;locale.h&gt;

65473 char \*setlocale(int category, const char \*locale);

65474 **DESCRIPTION**

65475 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65476 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65477 volume of POSIX.1-2024 defers to the ISO C standard.

65478 The *setlocale()* function selects the appropriate piece of the global locale, as specified by the  
 65479 *category* and *locale* arguments, and can be used to change or query the entire global locale or  
 65480 portions thereof. The value LC\_ALL for *category* names the entire global locale; other values for  
 65481 *category* name only a part of the global locale:

65482 LC\_COLLATE Affects the behavior of regular expressions and the collation functions.

65483 LC\_CTYPE Affects the behavior of regular expressions, character classification, character  
 65484 conversion functions, and wide-character functions.

65485 CX LC\_MESSAGES Affects the affirmative and negative response expressions returned by  
 65486 *nl\_langinfo()* and the way message catalogs are located. It may also affect the  
 65487 behavior of functions that return or write message strings.

65488 LC\_MONETARY Affects the behavior of functions that handle monetary values.

65489 LC\_NUMERIC Affects the behavior of functions that handle numeric values.

65490 LC\_TIME Affects the behavior of the time conversion functions.

65491 The *locale* argument is a pointer to a character string containing the required setting of *category*.  
 65492 The contents of this string are implementation-defined. In addition, the following preset values  
 65493 of *locale* are defined for all settings of *category*:

65494 CX "POSIX" Specifies the minimal environment for C-language translation called the  
 65495 POSIX locale. The POSIX locale is the default global locale at entry to *main()*.

65496 "C" Equivalent to "POSIX".

65497 CX "" Specifies an implementation-defined native environment. The determination  
 65498 of the name of the new locale for the specified category depends on the value  
 65499 of the associated environment variables, *LC\_\** and *LANG*; see XBD Chapter 7  
 65500 (on page 127) and Chapter 8 (on page 167).

65501 A null pointer Directs *setlocale()* to query the current global locale setting and return the  
 65502 name of the locale if *category* is not LC\_ALL, or a string which encodes the  
 65503 locale name(s) for all of the individual categories if *category* is LC\_ALL.

65504 CX Setting all of the categories of the global locale is similar to successively setting each individual  
 65505 category of the global locale, except that all error checking is done before any actions are  
 65506 performed. To set all the categories of the global locale, *setlocale()* can be invoked as:

```
65507 setlocale(LC_ALL, "");
```

65508 In this case, *setlocale()* shall first verify that the values of all the environment variables it needs  
 65509 according to the precedence rules (described in XBD Chapter 8, on page 167) indicate supported  
 65510 locales. If the value of any of these environment variable searches yields a locale that is not  
 65511 supported (and non-null), *setlocale()* shall return a null pointer and the global locale shall not be

65512 changed. If all environment variables name supported locales, *setlocale()* shall proceed as if it  
 65513 had been called for each category, using the appropriate value from the associated environment  
 65514 variable or from the implementation-defined default if there is no such value.

65515 The global locale established using *setlocale()* shall only be used in threads for which no current  
 65516 locale has been set using *uselocale()* or whose current locale has been set to the global locale  
 65517 using *uselocale(LC\_GLOBAL\_LOCALE)*.

65518 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 65519 *setlocale()*.

65520 The *setlocale()* function need not be thread-safe; however, it shall avoid data races with all  
 65521 function calls that do not affect and are not affected by the global locale.

#### 65522 RETURN VALUE

65523 Upon successful completion, *setlocale()* shall return the string associated with the specified  
 65524 category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the global locale  
 65525 shall not be changed.

65526 A null pointer for *locale* shall cause *setlocale()* to return a pointer to the string associated with the  
 65527 specified *category* for the current global locale. The global locale shall not be changed.

65528 The string returned by *setlocale()* is such that a subsequent call with that string and its associated  
 65529 *category* shall restore that part of the global locale. The application shall not modify the string  
 65530 CX returned. The returned string pointer might be invalidated or the string content might be  
 65531 CX overwritten by a subsequent call to *setlocale()*. The returned pointer might also be invalidated if  
 65532 the calling thread is terminated.

#### 65533 ERRORS

65534 No errors are defined.

#### 65535 EXAMPLES

65536 None.

#### 65537 APPLICATION USAGE

65538 The following code illustrates how a program can initialize the international environment for  
 65539 one language, while selectively modifying the global locale such that regular expressions and  
 65540 string operations can be applied to text recorded in a different language:

```
65541 setlocale(LC_ALL, "De");  
65542 setlocale(LC_COLLATE, "Fr@dict");
```

65543 Internationalized programs can initiate language operation according to environment variable  
 65544 settings (see XBD Section 8.2, on page 169) by calling *setlocale()* as follows:

```
65545 setlocale(LC_ALL, "");
```

65546 Changing the setting of *LC\_MESSAGES* has no effect on catalogs that have already been opened  
 65547 by calls to *catopen()*.

65548 In order to make use of different locale settings while multiple threads are running, applications  
 65549 should use *uselocale()* in preference to *setlocale()*.

#### 65550 RATIONALE

65551 References to the international environment or locale in the following text relate to the global  
 65552 locale for the process. This can be overridden for individual threads using *uselocale()*.

65553 The ISO C standard defines a collection of functions to support internationalization. One of the  
 65554 most significant aspects of these functions is a facility to set and query the *international*  
 65555 *environment*. The international environment is a repository of information that affects the

65556 behavior of certain functionality, namely:

- 65557 1. Character handling
- 65558 2. Collating
- 65559 3. Date/time formatting
- 65560 4. Numeric editing
- 65561 5. Monetary formatting
- 65562 6. Messaging

65563 The `setlocale()` function provides the application developer with the ability to set all or portions,  
65564 called *categories*, of the international environment. These categories correspond to the areas of  
65565 functionality mentioned above. The syntax for `setlocale()` is as follows:

```
65566 char *setlocale(int category, const char *locale);
```

65567 where *category* is the name of one of following categories, namely:

```
65568     LC_COLLATE
65569     LC_CTYPE
65570     LC_MESSAGES
65571     LC_MONETARY
65572     LC_NUMERIC
65573     LC_TIME
```

65574 In addition, a special value called `LC_ALL` directs `setlocale()` to set all categories.

65575 There are two primary uses of `setlocale()`:

- 65576 1. Querying the international environment to find out what it is set to
- 65577 2. Setting the international environment, or *locale*, to a specific value

65578 The behavior of `setlocale()` in these two areas is described below. Since it is difficult to describe  
65579 the behavior in words, examples are used to illustrate the behavior of specific uses.

65580 To query the international environment, `setlocale()` is invoked with a specific category and the  
65581 null pointer as the locale. The null pointer is a special directive to `setlocale()` that tells it to query  
65582 rather than set the international environment. The following syntax is used to query the name of  
65583 the international environment:

```
65584 setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
65585          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

65586 The `setlocale()` function shall return the string corresponding to the current international  
65587 environment. This value may be used by a subsequent call to `setlocale()` to reset the international  
65588 environment to this value. However, it should be noted that the return value from `setlocale()`  
65589 may be a pointer to a static area within the function and is not guaranteed to remain unchanged  
65590 (that is, it may be modified by a subsequent call to `setlocale()`). Therefore, if the purpose of  
65591 calling `setlocale()` is to save the value of the current international environment so it can be  
65592 changed and reset later, the return value should be copied to an array of `char` in the calling  
65593 program.

65594 There are three ways to set the international environment with `setlocale()`:

65595 *setlocale(category, string)*

65596 This usage sets a specific *category* in the international environment to a specific value  
65597 corresponding to the value of the *string*. A specific example is provided below:

```
65598 setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

65599 In this example, all categories of the international environment are set to the locale  
65600 corresponding to the string "fr\_FR.ISO-8859-1", or to the French language as spoken in  
65601 France using the ISO/IEC 8859-1:1998 standard codeset.

65602 If the string does not correspond to a valid locale, *setlocale()* shall return a null pointer and  
65603 the international environment is not changed. Otherwise, *setlocale()* shall return the name of  
65604 the locale just set.

65605 *setlocale(category, "C")*

65606 The ISO C standard states that one locale must exist on all conforming implementations.  
65607 The name of the locale is C and corresponds to a minimal international environment needed  
65608 to support the C programming language.

65609 *setlocale(category, "")*

65610 This sets a specific category to an implementation-defined default. This corresponds to the  
65611 value of the environment variables.

#### 65612 FUTURE DIRECTIONS

65613 None.

#### 65623 CHANGE HISTORY

65624 First released in Issue 3.

#### 65625 Issue 5

65626 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 65627 Issue 6

65628 Extensions beyond the ISO C standard are marked.

65629 The normative text is updated to avoid use of the term ``must'' for application requirements.

65630 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the  
65631 DESCRIPTION to clarify the behavior of:

```
65632 setlocale(LC_ALL, "");
```

#### 65633 Issue 7

65634 Functionality relating to the Threads option is moved to the Base.

65635 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0553 [302], XSH/TC1-2008/0554 [303],  
65636 XSH/TC1-2008/0555 [302], XSH/TC1-2008/0556 [302], XSH/TC1-2008/0557 [302],  
65637 XSH/TC1-2008/0558 [302], XSH/TC1-2008/0559 [302], XSH/TC1-2008/0560 [288],  
65638 XSH/TC1-2008/0561 [302], XSH/TC1-2008/0562 [302], XSH/TC1-2008/0563 [302],

65639 XSH/TC1-2008/0564 [302], XSH/TC1-2008/0565 [302], XSH/TC1-2008/0566 [302],  
65640 XSH/TC1-2008/0567 [288], XSH/TC1-2008/0568 [288], and XSH/TC1-2008/0569 [303] are  
65641 applied.

65642 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0321 [826], XSH/TC2-2008/0322 [826],  
65643 and XSH/TC2-2008/0323 [596] are applied.

65644 **Issue 8**

65645 Austin Group Defect 1220 is applied, adding *getlocalename\_l()* to the SEE ALSO section.

65646 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
65647 standard.

65648 **NAME**

65649 setlogmask — set the log priority mask

65650 **SYNOPSIS**65651 XSI `#include <syslog.h>`65652 `int setlogmask(int maskpri);`65653 **DESCRIPTION**65654 Refer to *closelog()*.

65655 **NAME**  
65656           setnetent — network database function

65657 **SYNOPSIS**  
65658           #include <netdb.h>  
65659           void setnetent(int *stayopen*);

65660 **DESCRIPTION**  
65661           Refer to *endnetent()*.

65662 **NAME**

65663 setpgid — set process group ID for job control

65664 **SYNOPSIS**

65665 #include &lt;unistd.h&gt;

65666 int setpgid(pid\_t pid, pid\_t pgid);

65667 **DESCRIPTION**65668 The *setpgid()* function shall either join an existing process group or create a new process group  
65669 within the session of the calling process.

65670 The process group ID of a session leader shall not change.

65671 Upon successful completion, the process group ID of the process with a process ID that matches  
65672 *pid* shall be set to *pgid*.65673 As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0,  
65674 the process ID of the indicated process shall be used.65675 **RETURN VALUE**65676 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno*  
65677 shall be set to indicate the error.65678 **ERRORS**65679 The *setpgid()* function shall fail if:65680 [EACCES] The value of the *pid* argument matches the process ID of a child process of the  
65681 calling process and the child process has successfully executed one of the *exec*  
65682 functions.65683 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by  
65684 the implementation.65685 [EPERM] The process indicated by the *pid* argument is a session leader.65686 [EPERM] The value of the *pid* argument matches the process ID of a child process of the  
65687 calling process and the child process is not in the same session as the calling  
65688 process.65689 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of  
65690 the process indicated by the *pid* argument and there is no process with a  
65691 process group ID that matches the value of the *pgid* argument in the same  
65692 session as the calling process.65693 [ESRCH] The value of the *pid* argument does not match the process ID of the calling  
65694 process or of a child process of the calling process.65695 **EXAMPLES**

65696 None.

65697 **APPLICATION USAGE**

65698 None.

65699 **RATIONALE**65700 The *setpgid()* function shall group processes together for the purpose of signaling, placement in  
65701 foreground or background, and other job control actions.65702 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed  
65703 the specified new process group to assume any value. This presents certain security problems  
65704 and is more flexible than necessary to support job control.

65705 To provide tighter security, *setpgid()* only allows the calling process to join a process group  
65706 already in use inside its session or create a new process group whose process group ID was  
65707 equal to its process ID.

65708 When a job control shell spawns a new job, the processes in the job must be placed into a new  
65709 process group via *setpgid()*. There are two timing constraints involved in this action:

- 65710 1. The new process must be placed in the new process group before the appropriate  
65711 program is launched via one of the *exec* functions.
- 65712 2. The new process must be placed in the new process group before the shell can correctly  
65713 send signals to the new process group.

65714 To address these constraints, the following actions are performed. The new processes call  
65715 *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first  
65716 constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of  
65717 *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that  
65718 the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization  
65719 property was considered, but it was decided instead to merely allow the parent shell process to  
65720 adjust the process group of its child processes via *setpgid()*. Both timing constraints are now  
65721 satisfied by having both the parent shell and the child attempt to adjust the process group of the  
65722 child process; it does not matter which succeeds first.

65723 Since it would be confusing to an application to have its process group change after it began  
65724 executing (that is, after *exec*), and because the child process would already have adjusted its  
65725 process group before this, the [EACCES] error was added to disallow this.

65726 One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original  
65727 process group (the one in effect when the job control shell was executed). A job control shell  
65728 does this before returning control back to its parent when it is terminating or suspending itself as  
65729 a way of restoring its job control “state” back to what its parent would expect. (Note that the  
65730 original process group of the job control shell typically matches the process group of its parent,  
65731 but this is not necessarily always the case.)

#### 65732 FUTURE DIRECTIONS

65733 None.

#### 65734 SEE ALSO

65735 *exec*, *getpgrp()*, *setsid()*, *tcsetpgrp()*

65736 XBD [<sys/types.h>](#), [<unistd.h>](#)

#### 65737 CHANGE HISTORY

65738 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 65739 Issue 6

65740 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

65741 The following new requirements on POSIX implementations derive from alignment with the  
65742 Single UNIX Specification:

- 65743 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
65744 required for conforming implementations of previous POSIX specifications, it was not  
65745 required for UNIX applications.
- 65746 • The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be  
65747 defined in this version. This is a FIPS requirement.

65748  
65749  
65750  
65751

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the process ID of the indicated process shall be used”. This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

65752 **NAME**

65753           setpriority — set the nice value

65754 **SYNOPSIS**

```
65755 XSI       #include <sys/resource.h>  
65756       int setpriority(int which, id_t who, int nice);
```

65757 **DESCRIPTION**

65758       Refer to *getpriority()*.

65759 **NAME**  
65760 setprotoent — network protocol database functions

65761 **SYNOPSIS**  
65762 #include <netdb.h>  
65763 void setprotoent(int stayopen);

65764 **DESCRIPTION**  
65765 Refer to *endprotoent()*.

65766 **NAME**

65767           setpwent — user database function

65768 **SYNOPSIS**

```
65769 XSI       #include <pwd.h>
```

```
65770       void setpwent(void);
```

65771 **DESCRIPTION**

65772       Refer to *endpwent()*.

65773 **NAME**

65774 setregid — set real and effective group IDs

65775 **SYNOPSIS**

```
65776 XSI #include <unistd.h>
65777 int setregid(gid_t rgid, gid_t egid);
```

65778 **DESCRIPTION**65779 The *setregid()* function shall set the real and effective group IDs of the calling process.65780 If *rgid* is  $-1$ , the real group ID shall not be changed; if *egid* is  $-1$ , the effective group ID shall not  
65781 be changed.

65782 The real and effective group IDs may be set to different values in the same call.

65783 Only a process with appropriate privileges can set the real group ID and the effective group ID  
65784 to any valid value.65785 A non-privileged process can set either the real group ID to the saved set-group-ID from one of  
65786 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group  
65787 ID.65788 If the real group ID is being set (*rgid* is not  $-1$ ), or the effective group ID is being set to a value  
65789 not equal to the real group ID, then the saved set-group-ID of the current process shall be set  
65790 equal to the new effective group ID.

65791 Any supplementary group IDs of the calling process remain unchanged.

65792 **RETURN VALUE**65793 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
65794 indicate the error, and neither of the group IDs are changed.65795 **ERRORS**65796 The *setregid()* function shall fail if:65797 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.65798 [EPERM] The process does not have appropriate privileges and a change other than  
65799 changing the real group ID to the saved set-group-ID, or changing the  
65800 effective group ID to the real group ID or the saved set-group-ID, was  
65801 requested.65802 **EXAMPLES**

65803 None.

65804 **APPLICATION USAGE**65805 If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can  
65806 only set its effective group ID back to the previous value if *rgid* was  $-1$  in the *setregid()* call, since  
65807 the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the  
65808 *setregid()* call, then the saved set-group-ID will also have been changed to the real user ID.65809 **RATIONALE**65810 Earlier versions of this standard did not specify whether the saved set-group-ID was affected by  
65811 *setregid()* calls. This version specifies common existing practice that constitutes an important  
65812 security feature. The ability to set both the effective group ID and saved set-group-ID to be the  
65813 same as the real group ID means that any security weakness in code that is executed after that  
65814 point cannot result in malicious code being executed with the previous effective group ID.  
65815 Privileged applications could already do this using just *setgid()*, but for non-privileged

65816 applications the only standard method available is to use this feature of *setregid()*.

65817 **FUTURE DIRECTIONS**

65818 None.

65819 **SEE ALSO**

65820 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getresgid()*, *getresuid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*,  
65821 *setresgid()*, *setresuid()*, *setreuid()*, *setuid()*

65822 XBD <**unistd.h**>

65823 **CHANGE HISTORY**

65824 First released in Issue 4, Version 2.

65825 **Issue 5**

65826 Moved from X/OPEN UNIX extension to BASE.

65827 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the  
65828 *exec* family of functions, not just *execve()*.

65829 **Issue 7**

65830 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-  
65831 group-ID to be the same as the real group ID.

65832 **Issue 8**

65833 Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
65834 SEE ALSO.

65835 **NAME**

65836 setresgid — set real group ID, effective group ID, and saved set-group-ID

65837 **SYNOPSIS**

```
65838 XSI #include <unistd.h>
65839 int setresgid(gid_t rgid, gid_t egid, gid_t sgid);
```

65840 **DESCRIPTION**65841 The *setresgid()* function shall set the real group ID, effective group ID, and saved set-group-ID of  
65842 the calling process to the values specified by *rgid*, *egid*, and *sgid*, respectively.65843 If an argument is  $-1$ , the corresponding ID shall not be changed.65844 Only a process with appropriate privileges can set the real group ID, effective group ID, and  
65845 saved set-group-ID to any valid value.65846 A non-privileged process can set its real group ID, effective group ID, and saved set-group-ID,  
65847 each to one of the values that it currently holds in its real group ID, effective group ID, or saved  
65848 set-group-ID.65849 The real group ID, effective group ID, and saved set-group-ID can be set to different values in  
65850 the same call.

65851 Any supplementary group IDs of the calling process shall remain unchanged.

65852 **RETURN VALUE**65853 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
65854 indicate the error, and none of the IDs shall be changed.65855 **ERRORS**65856 The *setresgid()* function shall fail if:65857 [EINVAL] The value of the *rgid*, *egid*, or *sgid* argument is invalid or out-of-range.65858 [EPERM] The calling process does not have appropriate privileges and an attempt was  
65859 made to change the real group ID, effective group ID, or saved set-group-ID to  
65860 a value that is not currently present in one of those IDs.65861 **EXAMPLES**

65862 None.

65872 XBD &lt;unistd.h&gt;

65873 **CHANGE HISTORY**  
65874 First released in Issue 8.

65875 **NAME**

65876 setresuid — set real user ID, effective user ID, and saved set-user-ID

65877 **SYNOPSIS**

```
65878 XSI #include <unistd.h>
65879 int setresuid(uid_t ruid, uid_t euid, uid_t suid);
```

65880 **DESCRIPTION**

65881 The *setresuid()* function shall set the real user ID, effective user ID, and saved set-user-ID of the  
 65882 calling process to the values specified by *ruid*, *euid*, and *suid*, respectively.

65883 If an argument is  $-1$ , the corresponding ID shall not be changed.

65884 Only a process with appropriate privileges can set the real user ID, effective user ID, and saved  
 65885 set-user-ID to any valid value.

65886 A non-privileged process can set its real user ID, effective user ID, and saved set-user-ID, each to  
 65887 one of the values that it currently holds in its real user ID, effective user ID, or saved set-user-ID.

65888 The real user ID, effective user ID, and saved set-user-ID can be set to different values in the  
 65889 same call.

65890 **RETURN VALUE**

65891 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
 65892 indicate the error, and none of the IDs shall be changed.

65893 **ERRORS**

65894 The *setresuid()* function shall fail if:

65895 [EINVAL] The value of the *ruid*, *euid*, or *suid* argument is invalid or out-of-range.

65896 [EPERM] The calling process does not have appropriate privileges and an attempt was  
 65897 made to change the real user ID, effective user ID, or saved set-user-ID to a  
 65898 value that is not currently present in one of those IDs or an attempt was made  
 65899 to change the real user ID to a value not permitted by the implementation.

65912 **CHANGE HISTORY**

65913 First released in Issue 8.

65914 **NAME**

65915 setreuid — set real and effective user IDs

65916 **SYNOPSIS**

```
65917 XSI #include <unistd.h>
65918 int setreuid(uid_t ruid, uid_t euid);
```

65919 **DESCRIPTION**

65920 The *setreuid()* function shall set the real and effective user IDs of the current process to the  
65921 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is *-1*, the corresponding effective  
65922 or real user ID of the current process shall be left unchanged.

65923 A process with appropriate privileges can set either ID to any value. An unprivileged process  
65924 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or  
65925 saved user ID of the process.

65926 If the real user ID is being set (*ruid* is not *-1*), or the effective user ID is being set to a value not  
65927 equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to  
65928 the new effective user ID.

65929 It is unspecified whether a process without appropriate privileges is permitted to change the real  
65930 user ID to match the current effective user ID or saved set-user-ID of the process.

65931 **RETURN VALUE**

65932 Upon successful completion, 0 shall be returned. Otherwise, *-1* shall be returned and *errno* set to  
65933 indicate the error.

65934 **ERRORS**

65935 The *setreuid()* function shall fail if:

65936 [EINVAL] The value of the *ruid* or *euid* argument is invalid or out-of-range.

65937 [EPERM] The current process does not have appropriate privileges, and either an  
65938 attempt was made to change the effective user ID to a value other than the real  
65939 user ID or the saved set-user-ID or an attempt was made to change the real  
65940 user ID to a value not permitted by the implementation.

65941 **EXAMPLES**65942 **Setting the Effective User ID to the Real User ID**

65943 The following example sets the effective user ID of the calling process to the real user ID, so that  
65944 files created later will be owned by the current user. It also sets the saved set-user-ID to the real  
65945 user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
65946 #include <unistd.h>
65947 #include <sys/types.h>
65948 ...
65949 setreuid(getuid(), getuid());
65950 ...
```

65951 **APPLICATION USAGE**

65952 None.

65953 **RATIONALE**

65954 Earlier versions of this standard did not specify whether the saved set-user-ID was affected by  
65955 *setreuid()* calls. This version specifies common existing practice that constitutes an important  
65956 security feature. The ability to set both the effective user ID and saved set-user-ID to be the same  
65957 as the real user ID means that any security weakness in code that is executed after that point  
65958 cannot result in malicious code being executed with the previous effective user ID. Privileged  
65959 applications could already do this using just *setuid()*, but for non-privileged applications the  
65960 only standard method available is to use this feature of *setreuid()*.

65961 **FUTURE DIRECTIONS**

65962 None.

65967 **CHANGE HISTORY**

65968 First released in Issue 4, Version 2.

65969 **Issue 5**

65970 Moved from X/OPEN UNIX extension to BASE.

65971 **Issue 7**

65972 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective user ID and the saved  
65973 set-user-ID to be the same as the real user ID.

65974 **Issue 8**

65975 Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
65976 SEE ALSO.

65977 **NAME**

65978           setrlimit — control maximum resource consumption

65979 **SYNOPSIS**

65980           #include <sys/resource.h>

65981           int setrlimit(int *resource*, const struct rlimit \*rlp);

65982 **DESCRIPTION**

65983           Refer to [getrlimit\(\)](#).

65984 **NAME**  
65985       setservent — network services database functions

65986 **SYNOPSIS**  
65987       #include <netdb.h>  
65988       void setservent(int *stayopen*);

65989 **DESCRIPTION**  
65990       Refer to *endservent()*.

65991 **NAME**

65992 setsid — create session and set process group ID

65993 **SYNOPSIS**

65994 #include &lt;unistd.h&gt;

65995 pid\_t setsid(void);

65996 **DESCRIPTION**

65997 The *setsid()* function shall create a new session, if the calling process is not a process group leader. Upon return the calling process shall be the session leader of this new session, shall be the process group leader of a new process group, and shall have no controlling terminal. The process group ID of the calling process shall be set equal to the process ID of the calling process.

66001 The calling process shall be the only process in the new process group and the only process in the new session.

66003 **RETURN VALUE**

66004 Upon successful completion, *setsid()* shall return the value of the new process group ID of the calling process. Otherwise, it shall return `-1` and set *errno* to indicate the error.

66006 **ERRORS**66007 The *setsid()* function shall fail if:

66008 [EPERM] The calling process is already a process group leader, or the process group ID of a process other than the calling process matches the process ID of the calling process.

66011 **EXAMPLES**

66012 None.

66013 **APPLICATION USAGE**

66014 None.

66015 **RATIONALE**

66016 The *setsid()* function is similar to the *setpgrp()* function of System V. System V, without job control, groups processes into process groups and creates new process groups via *setpgrp()*; only one process group may be part of a login session.

66019 Job control allows multiple process groups within a login session. In order to limit job control actions so that they can only affect processes in the same login session, this volume of POSIX.1-2024 adds the concept of a session that is created via *setsid()*. The *setsid()* function also creates the initial process group contained in the session. Additional process groups can be created via the *setpgid()* function. A System V process group would correspond to a POSIX System Interfaces session containing a single POSIX process group. Note that this function requires that the calling process not be a process group leader. The usual way to ensure this is true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function guarantees that the process ID of the new process does not match any existing process group ID.

66028 **FUTURE DIRECTIONS**

66029 None.

66030 **SEE ALSO**66031 [getsid\(\)](#), [setpgid\(\)](#)66032 XBD [<sys/types.h>](#), [<unistd.h>](#)

66033 **CHANGE HISTORY**

66034 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

66035 **Issue 6**

66036 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

66037 The following new requirements on POSIX implementations derive from alignment with the  
66038 Single UNIX Specification:

- 66039 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
66040 required for conforming implementations of previous POSIX specifications, it was not  
66041 required for UNIX applications.

66042 **Issue 7**

66043 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0570 [421] is applied.

66044 **Issue 8**

66045 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

66046 **NAME**

66047 setsockopt — set the socket options

66048 **SYNOPSIS**

66049 #include &lt;sys/socket.h&gt;

```
66050 int setsockopt(int socket, int level, int option_name,
66051               const void *option_value, socklen_t option_len);
```

66052 **DESCRIPTION**

66053 The *setsockopt()* function shall set the option specified by the *option\_name* argument, at the  
 66054 protocol level specified by the *level* argument, to the value pointed to by the *option\_value*  
 66055 argument for the socket associated with the file descriptor specified by the *socket* argument.

66056 The *level* argument specifies the protocol level at which the option resides. To set options at the  
 66057 socket level, specify the *level* argument as SOL\_SOCKET. To set options at other levels, supply  
 66058 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate  
 66059 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO\_TCP  
 66060 as defined in the <netinet/in.h> header.

66061 The *option\_name* argument specifies a single option to set. It can be one of the socket-level  
 66062 options defined in <sys/socket.h> and described in Section 2.10.16 (on page 554). If *option\_name*  
 66063 is equal to SO\_RCVTIMEO or SO\_SNDTIMEO and the implementation supports setting the  
 66064 option, it is unspecified whether the **struct timeval** pointed to by *option\_value* is stored as  
 66065 provided by this function or is rounded up to align with the resolution of the clock being used. If  
 66066 *setsockopt()* is called with *option\_name* equal to SO\_ACCEPTCONN, SO\_ERROR, or SO\_TYPE,  
 66067 the behavior is unspecified.

66068 **RETURN VALUE**

66069 Upon successful completion, *setsockopt()* shall return 0. Otherwise, -1 shall be returned and  
 66070 *errno* set to indicate the error.

66071 **ERRORS**

66072 The *setsockopt()* function shall fail if:

- |       |               |   |
|-------|---------------|---|
| 66073 | [EBADF]       | The <i>socket</i> argument is not a valid file descriptor.  |
| 66074 | [EDOM]        | The send and receive timeout values are too big to fit into the timeout fields in the socket structure. |
| 66075 |               |   |
| 66076 | [EINVAL]      | The specified option is invalid at the specified socket level or the socket has been shut down.         |
| 66077 |               |   |
| 66078 | [EISCONN]     | The socket is already connected, and a specified option cannot be set while the socket is connected.    |
| 66079 |               |   |
| 66080 | [ENOPROTOOPT] | The option is not supported by the protocol.  |
| 66081 |               |   |
| 66082 | [ENOTSOCK]    | The <i>socket</i> argument does not refer to a socket.  |
| 66083 |               | The <i>setsockopt()</i> function may fail if:   |
| 66084 | [ENOMEM]      | There was insufficient memory available for the operation to complete.                                  |
| 66085 | [ENOBUFS]     | Insufficient resources are available in the system to complete the call.                                |

**66086 EXAMPLES**

66087 None.

**66088 APPLICATION USAGE**

66089 The *setsockopt()* function provides an application program with the means to control socket  
66090 behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts,  
66091 or permit socket data broadcasts. The `<sys/socket.h>` header defines the socket-level options  
66092 available to *setsockopt()*.

66093 Options may exist at multiple protocol levels. The `SO_` options are always present at the  
66094 uppermost socket level.

66095 It is implementation-defined which socket options, if any, are inherited from a listening socket to  
66096 an accepted socket by *accept()* or *accept4()*.

**66097 RATIONALE**

66098 None.

**66099 FUTURE DIRECTIONS**

**66104 CHANGE HISTORY**

66105 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

66106 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the `SO_LINGER`  
66107 option in the DESCRIPTION to refer to the calling thread rather than the process.

**66108 Issue 7**

66109 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options  
66110 that is now in [Section 2.10.16](#) (on page 554).

66111 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0571 [369] is applied.

**66112 Issue 8**

66113 Austin Group Defect 1337 is applied, clarifying socket option default values.

66114 **NAME**

66115            setstate — switch pseudo-random number generator state arrays

66116 **SYNOPSIS**

```
66117 XSI        #include <stdlib.h>  
66118            char *setstate(char *state);
```

66119 **DESCRIPTION**

66120            Refer to *initstate()*.

66121 **NAME**

66122 setuid — set user ID

66123 **SYNOPSIS**

66124 #include &lt;unistd.h&gt;

66125 int setuid(uid\_t uid);

66126 **DESCRIPTION**66127 If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and  
66128 the saved set-user-ID of the calling process to *uid*.66129 If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the  
66130 saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-  
66131 user-ID shall remain unchanged.66132 The *setuid()* function shall not affect the supplementary group list in any way.66133 **RETURN VALUE**66134 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
66135 indicate the error.66136 **ERRORS**66137 The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more  
66138 of the following are true:66139 [EINVAL] The value of the *uid* argument is invalid and not supported by the  
66140 implementation.66141 [EPERM] The process does not have appropriate privileges and *uid* does not match the  
66142 real user ID or the saved set-user-ID.66143 **EXAMPLES**

66144 None.

66145 **APPLICATION USAGE**

66146 None.

66147 **RATIONALE**66148 The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged  
66149 processes reflect the behavior of different historical implementations. For portability, it is  
66150 recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions  
66151 instead.66152 The saved set-user-ID capability allows a program to regain the effective user ID established at  
66153 the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the  
66154 effective group ID established at the last *exec* call. These capabilities are derived from System V.  
66155 Without them, a program might have to run as superuser in order to perform the same  
66156 functions, because superuser can write on the user's files. This is a problem because such a  
66157 program can write on any user's files, and so must be carefully written to emulate the  
66158 permissions of the calling process properly. In System V, these capabilities have traditionally  
66159 been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The  
66160 fact that the behavior of those functions was different for privileged processes made them  
66161 difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently  
66162 for privileged and unprivileged users. When the caller had appropriate privileges, the function  
66163 set the real user ID, effective user ID, and saved set-user ID of the calling process on  
66164 implementations that supported it. When the caller did not have appropriate privileges, the  
66165 function set only the effective user ID, subject to permission checks. The former use is generally  
66166 needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

66167 scope of POSIX.1-2024. These utilities wish to change the user ID irrevocably to a new value,  
66168 generally that of an unprivileged user. The latter use is needed for conforming applications that  
66169 are installed with the set-user-ID bit and need to perform operations using the real user ID.

66170 POSIX.1-2024 augments the latter functionality with a mandatory feature named  
66171 `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user  
66172 ID back and forth between the values of its *exec*-time real user ID and effective user ID.  
66173 Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this  
66174 feature to work properly when it happened to be executed with (implementation-defined)  
66175 appropriate privileges. Furthermore, the application did not even have a means to tell whether it  
66176 had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as  
66177 evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-2024.  
66178 However, there are implementors who have been reluctant to support it given the limitation  
66179 described above.

66180 The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which  
66181 always sets both the real and effective user IDs, like *setuid()* in POSIX.1-2024 for privileged  
66182 users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in POSIX.1-2024  
66183 for non-privileged users). This separation of functionality into distinct functions seems desirable.  
66184 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of  
66185 switching the effective user ID back and forth via *setreuid()*, which permits reversing the real  
66186 and effective user IDs. This model seems less desirable than the saved set-user-ID because the  
66187 real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses  
66188 them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be  
66189 deprecated or removed.

66190 The solution here is:

- 66191 • Require that all implementations support the functionality of the saved set-user-ID, which  
66192 is set by the *exec* functions and by privileged calls to *setuid()*.
- 66193 • Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for  
66194 non-privileged and privileged processes.

66195 Historical systems have provided two mechanisms for a set-user-ID process to change its  
66196 effective user ID to be the same as its real user ID in such a way that it could return to the  
66197 original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID,  
66198 or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs.  
66199 The changes included in POSIX.1-2024 provide a new mechanism using *seteuid()* in conjunction  
66200 with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have  
66201 a saved set-user-ID for each process, and most of the behavior controlled by  
66202 `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined.  
66203 The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally  
66204 be required to maintain compatibility with the older mechanisms previously supported by their  
66205 systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS`  
66206 behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID  
66207 allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the  
66208 saved set-user-ID unmodified, the process would then have an effective user ID equal to the  
66209 original real user ID, and both real and saved set-user-ID would be equal to the original effective  
66210 user ID. In that state, the real user would be unable to kill the process, even though the effective  
66211 user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS`  
66212 was used. This is obviously not acceptable. The alternative choice, which is used in at least one  
66213 implementation, is to change the saved set-user-ID to the effective user ID during most calls to  
66214 *setreuid()*. The standard developers considered that alternative to be less correct than the  
66215 retention of the old behavior of *kill()* in such systems. Current conforming applications shall

66216 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to  
66217 check the saved set-user-ID rather than the effective user ID.

#### 66218 FUTURE DIRECTIONS

66223 XBD [<sys/types.h>](#), [<unistd.h>](#)

#### 66224 CHANGE HISTORY

66225 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 66226 Issue 6

66227 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

66228 The following new requirements on POSIX implementations derive from alignment with the  
66229 Single UNIX Specification:

- 66230 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
66231 required for conforming implementations of previous POSIX specifications, it was not  
66232 required for UNIX applications.
- 66233 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS  
66234 requirement.

66235 The following changes were made to align with the IEEE P1003.1a draft standard:

- 66236 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 66237 • A requirement that the supplementary group list is not affected is added.

#### 66238 Issue 8

66239 Austin Group Defect 1344 is applied, adding *getresgid()*, *getresuid()*, *setresgid()*, and *setresuid()* to  
66240 SEE ALSO.

66241 **NAME**

66242 setutxent — reset the user accounting database to the first entry

66243 **SYNOPSIS**

```
66244 XSI #include <utmpx.h>  
66245 void setutxent(void);
```

66246 **DESCRIPTION**

66247 Refer to *endutxent()*.

66248 **NAME**

66249 setvbuf — assign buffering to a stream

66250 **SYNOPSIS**

66251 #include &lt;stdio.h&gt;

66252 int setvbuf(FILE \*restrict stream, char \*restrict buf, int type,  
66253 size\_t size);66254 **DESCRIPTION**66255 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
66256 conflict between the requirements described here and the ISO C standard is unintentional. This  
66257 volume of POSIX.1-2024 defers to the ISO C standard.66258 The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an  
66259 open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is  
66260 performed on the stream. The argument *type* determines how *stream* shall be buffered, as  
66261 follows:

- 66262
- {\_IOFBF} shall cause input/output to be fully buffered.
  - {\_IOLBF} shall cause input/output to be line buffered.
  - {\_IONBF} shall cause input/output to be unbuffered.

66265 If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by  
66266 *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the  
66267 size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are  
66268 unspecified.66269 For information about streams, see [Section 2.5](#) (on page 521).66270 **RETURN VALUE**66271 Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value  
66272 CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to  
66273 indicate the error.66274 **ERRORS**66275 The *setvbuf()* function may fail if:66276 CX [EBADF] The stream is not a memory stream and the file descriptor underlying the  
66277 stream is not valid.66278 **EXAMPLES**

66279 None.

66280 **APPLICATION USAGE**66281 A common source of error is allocating buffer space as an “automatic” variable in a code block,  
66282 and then failing to close the stream in the same block.66283 With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are  
66284 used for the buffer area.66285 Applications should note that many implementations only provide line buffering on input from  
66286 terminal devices.66287 **RATIONALE**

66288 None.

66289 **FUTURE DIRECTIONS**

66290 None.

66291 **SEE ALSO**66292 [Section 2.5](#) (on page 521), [fopen\(\)](#), [setbuf\(\)](#)66293 XBD [<stdio.h>](#)66294 **CHANGE HISTORY**

66295 First released in Issue 1. Derived from Issue 1 of the SVID.

66296 **Issue 6**

66297 Extensions beyond the ISO C standard are marked.

66298 The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.66299 **Issue 8**

66300 Austin Group Defect 1144 is applied, changing the [EBADF] error condition.

66301 **NAME**66302 shm\_open — open a shared memory object (**REALTIME**)66303 **SYNOPSIS**

```
66304 SHM #include <sys/mman.h>
66305 int shm_open(const char *name, int oflag, mode_t mode);
```

66306 **DESCRIPTION**

66307 The *shm\_open()* function shall establish a connection between a shared memory object and a file  
 66308 descriptor. It shall create an open file description that refers to the shared memory object and a  
 66309 file descriptor that refers to that open file description. The file descriptor shall be allocated as  
 66310 described in [Section 2.6](#) (on page 525), and can be used by other functions to refer to that shared  
 66311 memory object. The *name* argument points to a string naming a shared memory object. It is  
 66312 unspecified whether the name appears in the file system and is visible to other functions that  
 66313 take pathnames as arguments. The *name* argument conforms to the construction rules for a  
 66314 pathname, except that the interpretation of <slash> characters other than the leading <slash>  
 66315 character in *name* is implementation-defined, and that the length limits for the *name* argument  
 66316 are implementation-defined and need not be the same as the pathname limits {PATH\_MAX} and  
 66317 {NAME\_MAX}. If *name* begins with the <slash> character, then processes calling *shm\_open()*  
 66318 with the same value of *name* refer to the same shared memory object, as long as that name has  
 66319 not been removed. If *name* does not begin with the <slash> character, the effect is  
 66320 implementation-defined.

66321 If successful, *shm\_open()* shall return a file descriptor for the shared memory object. The open  
 66322 file description is new, and therefore the file descriptor does not share it with any other  
 66323 processes. It is unspecified whether the file offset is set. The FD\_CLOEXEC file descriptor flag  
 66324 associated with the new file descriptor shall be set.

66325 The file status flags and file access modes of the open file description shall be set according to  
 66326 the value of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags.  
 66327 Applications specify exactly one of the first two values (access modes) below in the value of  
 66328 *oflag*:

66329 O\_RDONLY Open for read access only.

66330 O\_RDWR Open for read or write access.

66331 Any combination of the remaining flags can be specified in the value of *oflag*:

66332 O\_CREAT If the shared memory object exists, this flag has no effect, except as noted  
 66333 under O\_EXCL below. Otherwise, the shared memory object is created. The  
 66334 user ID of the shared memory object shall be set to the effective user ID of the  
 66335 process. The group ID of the shared memory object shall be set to the effective  
 66336 group ID of the process; however, if the *name* argument is visible in the file  
 66337 system, the group ID may be set to the group ID of the containing directory.  
 66338 The permission bits of the shared memory object shall be set to the value of  
 66339 the *mode* argument except those set in the file mode creation mask of the  
 66340 process. When bits in *mode* other than the file permission bits are set, the effect  
 66341 is unspecified. The *mode* argument does not affect whether the shared memory  
 66342 object is opened for reading, for writing, or for both. The shared memory  
 66343 object has a size of zero.

66344 O\_EXCL If O\_EXCL and O\_CREAT are set, *shm\_open()* fails if the shared memory  
 66345 object exists. The check for the existence of the shared memory object and the  
 66346 creation of the object if it does not exist is atomic with respect to other

66347 processes executing *shm\_open()* naming the same shared memory object with  
 66348 O\_EXCL and O\_CREAT set. If O\_EXCL is set and O\_CREAT is not set, the  
 66349 result is undefined.

66350 O\_TRUNC If the shared memory object exists, and it is successfully opened O\_RDWR, the  
 66351 object shall be truncated to zero length and the mode and owner shall be  
 66352 unchanged by this function call. The result of using O\_TRUNC with  
 66353 O\_RDONLY is undefined.

66354 The following functions shall be atomic with respect to each other in the effects specified in  
 66355 POSIX.1-2024 when they operate on shared memory objects:

66356 *close()*, *ftruncate()*, *mmap()*, *shm\_open()*, *shm\_unlink()*

66357 If two threads each call one of these functions, each call shall either see all of the specified effects  
 66358 of the other call, or none of them. The requirement on the *close()* function shall also apply  
 66359 whenever a file descriptor is successfully closed, however caused (for example, as a consequence  
 66360 of calling *close()*, calling *dup2()*, or of process termination).

66361 When a shared memory object is created, the state of the shared memory object, including all  
 66362 data associated with the shared memory object, persists until the shared memory object is  
 66363 unlinked and all other references are gone. It is unspecified whether the name and shared  
 66364 memory object state remain valid after a system reboot.

#### 66365 RETURN VALUE

66366 Upon successful completion, the *shm\_open()* function shall return a non-negative integer  
 66367 representing the file descriptor. Otherwise, it shall return  $-1$  and set *errno* to indicate the error.

#### 66368 ERRORS

66369 The *shm\_open()* function shall fail if:

66370 [EACCES] The shared memory object exists and the permissions specified by *oflag* are  
 66371 denied, or the shared memory object does not exist and permission to create  
 66372 the shared memory object is denied, or O\_TRUNC is specified and write  
 66373 permission is denied.

66374 [EEXIST] O\_CREAT and O\_EXCL are set and the named shared memory object already  
 66375 exists.

66376 [EINTR] The *shm\_open()* operation was interrupted by a signal.

66377 [EINVAL] The *shm\_open()* operation is not supported for the given name.

66378 [EMFILE] All file descriptors available to the process are currently open.

66379 [ENFILE] Too many shared memory objects are currently open in the system.

66380 [ENOENT] O\_CREAT is not set and the named shared memory object does not exist.

66381 [ENOSPC] There is insufficient space for the creation of the new shared memory object.

66382 The *shm\_open()* function may fail if:

66383 [ENAMETOOLONG]

66384 The length of the *name* argument exceeds  $\{\_POSIX\_PATH\_MAX\}$  on systems  
 66385 XSI that do not support the XSI option `or exceeds  $\{\_XOPEN\_PATH\_MAX\}$  on XSI`  
 66386 `systems,` or has a pathname component that is longer than  
 66387 XSI  $\{\_POSIX\_NAME\_MAX\}$  on systems that do not support the XSI option `or`  
 66388 `longer than  $\{\_XOPEN\_NAME\_MAX\}$  on XSI systems.`

66389 **EXAMPLES**66390 **Creating and Mapping a Shared Memory Object**

66391 The following code segment demonstrates the use of *shm\_open()* to create a shared memory  
66392 object which is then sized using *ftruncate()* before being mapped into the process address space  
66393 using *mmap()*:

```
66394 #include <unistd.h>
66395 #include <sys/mman.h>
66396 ...
66397 #define MAX_LEN 10000
66398 struct region {          /* Defines "structure" of shared memory */
66399     int len;
66400     char buf[MAX_LEN];
66401 };
66402 struct region *rptr;
66403 int fd;
66404
66404 /* Create shared memory object and set its size */
66405 fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
66406 if (fd == -1)
66407     /* Handle error */;
66408
66408 if (ftruncate(fd, sizeof(struct region)) == -1)
66409     /* Handle error */;
66410
66410 /* Map shared memory object */
66411 rptr = mmap(NULL, sizeof(struct region),
66412            PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
66413 if (rptr == MAP_FAILED)
66414     /* Handle error */;
66415
66415 /* Now we can refer to mapped region using fields of rptr;
66416    for example, rptr->len */
66417 ...
```

66418 **APPLICATION USAGE**

66419 None.

66420 **RATIONALE**

66421 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a  
66422 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared  
66423 Memory Objects option is supported, the *shm\_open()* function shall obtain a descriptor to the  
66424 shared memory object to be mapped.

66425 There is ample precedent for having a file descriptor represent several types of objects. In the  
66426 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.  
66427 Many implementations simply have an operations vector, which is indexed by the file descriptor  
66428 type and does very different operations. Note that in some cases the file descriptor passed to  
66429 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned  
66430 by alternate functions, such as *pipe()*. The latter technique is used by *shm\_open()*.

66431 Note that such shared memory objects can actually be implemented as mapped files. In both  
66432 cases, the size can be set after the open using *ftruncate()*. The *shm\_open()* function itself does not

66433 create a shared object of a specified size because this would duplicate an extant function that set  
66434 the size of an object referenced by a file descriptor.

66435 On implementations where memory objects are implemented using the existing file system, the  
66436 *shm\_open()* function may be implemented using a macro that invokes *open()*, and the  
66437 *shm\_unlink()* function may be implemented using a macro that invokes *unlink()*.

66438 For implementations without a permanent file system, the definition of the name of the memory  
66439 objects is allowed not to survive a system reboot. Note that this allows systems with a  
66440 permanent file system to implement memory objects as data structures internal to the  
66441 implementation as well.

66442 On implementations that choose to implement memory objects using memory directly, a  
66443 *shm\_open()* followed by an *truncate()* and *close()* can be used to preallocate a shared memory  
66444 area and to set the size of that preallocation. This may be necessary for systems without virtual  
66445 memory hardware support in order to ensure that the memory is contiguous.

66446 The set of valid open flags to *shm\_open()* was restricted to *O\_RDONLY*, *O\_RDWR*, *O\_CREAT*,  
66447 and *O\_TRUNC* because these could be easily implemented on most memory mapping systems.  
66448 This volume of POSIX.1-2024 is silent on the results if the implementation cannot supply the  
66449 requested file access because of implementation-defined reasons, including hardware ones. The  
66450 *O\_CLOEXEC* open flag is not listed, because all shared memory objects are created with the  
66451 *FD\_CLOEXEC* flag already set; an application can later use *fcntl()* to clear that flag to allow the  
66452 shared memory file descriptor to be preserved across the *exec* family of functions.

66453 The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the  
66454 implementation cannot complete a request.

66455 [EACCES] indicates for implementation-defined reasons, probably hardware-related, that the  
66456 implementation cannot comply with a requested mode because it conflicts with another  
66457 requested mode. An example might be that an application desires to open a memory object two  
66458 times, mapping different areas with different access modes. If the implementation cannot map a  
66459 single area into a process space in two places, which would be required if different access modes  
66460 were required for the two areas, then the implementation may inform the application at the time  
66461 of the second open.

66462 [ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the  
66463 implementation cannot comply with a requested mode at all. An example would be that the  
66464 hardware of the implementation cannot support write-only shared memory areas.

66465 On all implementations, it may be desirable to restrict the location of the memory objects to  
66466 specific file systems for performance (such as a RAM disk) or implementation-defined reasons  
66467 (shared memory supported directly only on certain file systems). The *shm\_open()* function may  
66468 be used to enforce these restrictions. There are a number of methods available to the application  
66469 to determine an appropriate name of the file or the location of an appropriate directory. One way  
66470 is from the environment via *getenv()*. Another would be from a configuration file.

66471 This volume of POSIX.1-2024 specifies that memory objects have initial contents of zero when  
66472 created. This is consistent with current behavior for both files and newly allocated memory. For  
66473 those implementations that use physical memory, it would be possible that such  
66474 implementations could simply use available memory and give it to the process uninitialized.  
66475 This, however, is not consistent with standard behavior for the uninitialized data area, the stack,  
66476 and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security  
66477 reasons. Thus, initializing memory objects to zero is required.

**66478 FUTURE DIRECTIONS**

66479 A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics  
66480 similar to normal file system operations.

**66485 CHANGE HISTORY**

66486 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**66487 Issue 6**

66488 The *shm\_open()* function is marked as part of the Shared Memory Objects option.

66489 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
66490 implementation does not support the Shared Memory Objects option.

66491 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the  
66492 EXAMPLES section.

**66493 Issue 7**

66494 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
66495 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

66496 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

66497 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
66498 user ID and group ID of the shared memory object.

66499 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0324 [835], XSH/TC2-2008/0325 [835],  
66500 and XSH/TC2-2008/0326 [835] are applied.

**66501 Issue 8**

66502 Austin Group Defect 411 is applied, adding a sentence about O\_CLOEXEC to the RATIONALE  
66503 section.

66504 Austin Group Defect 593 is applied, removing a reference to <fcntl.h> from the DESCRIPTION  
66505 section.

66506 Austin Group Defect 695 is applied, adding atomicity requirements to operations on shared  
66507 memory objects.

66508 **NAME**66509 shm\_unlink — remove a shared memory object (**REALTIME**)66510 **SYNOPSIS**

```
66511 SHM #include <sys/mman.h>
66512 int shm_unlink(const char *name);
```

66513 **DESCRIPTION**

66514 The *shm\_unlink()* function shall remove the name of the shared memory object named by the  
66515 string pointed to by *name*.

66516 If one or more references to the shared memory object exist when the object is unlinked, the  
66517 name shall be removed before *shm\_unlink()* returns, but the removal of the memory object  
66518 contents shall be postponed until all open and map references to the shared memory object have  
66519 been removed.

66520 Even if the object continues to exist after the last *shm\_unlink()*, reuse of the name shall  
66521 subsequently cause *shm\_open()* to behave as if no shared memory object of this name exists (that  
66522 is, *shm\_open()* shall fail if **O\_CREAT** is not set, or shall create a new shared memory object if  
66523 **O\_CREAT** is set).

66524 **RETURN VALUE**

66525 Upon successful completion, a value of zero shall be returned. Otherwise, a value of  $-1$  shall be  
66526 returned and *errno* set to indicate the error. If  $-1$  is returned, the named shared memory object  
66527 shall not be changed by this function call.

66528 **ERRORS**

66529 The *shm\_unlink()* function shall fail if:

66530 [EACCES] Permission is denied to unlink the named shared memory object.

66531 [ENOENT] The named shared memory object does not exist.

66532 The *shm\_unlink()* function may fail if:

66533 [ENAMETOOLONG]

66534 The length of the *name* argument exceeds  $\{\_POSIX\_PATH\_MAX\}$  on systems  
66535 XSI that do not support the XSI option or exceeds  $\{\_XOPEN\_PATH\_MAX\}$  on XSI  
66536 systems, or has a pathname component that is longer than  
66537 XSI  $\{\_POSIX\_NAME\_MAX\}$  on systems that do not support the XSI option or  
66538 longer than  $\{\_XOPEN\_NAME\_MAX\}$  on XSI systems. A call to *shm\_unlink()*  
66539 with a *name* argument that contains the same shared memory object name as  
66540 was previously used in a successful *shm\_open()* call shall not give an  
66541 [ENAMETOOLONG] error.

66542 **EXAMPLES**

66543 None.

66544 **APPLICATION USAGE**

66545 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual  
66546 fashion. Names of memory objects that were allocated with *shm\_open()* are deleted with  
66547 *shm\_unlink()*. Note that the actual memory object is not destroyed until the last close and  
66548 unmap on it have occurred if it was already in use.

**66549 RATIONALE**

66550 None.

**66551 FUTURE DIRECTIONS**

66552 A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics  
66553 similar to normal file system operations.

**66554 SEE ALSO**

66555 *close()*, *mmap()*, *munmap()*, *shmat()*, *shmctl()*, *shmdt()*, *shm\_open()*

66556 XBD <[sys/mman.h](#)>

**66557 CHANGE HISTORY**

66558 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**66559 Issue 6**

66560 The *shm\_unlink()* function is marked as part of the Shared Memory Objects option.

66561 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm\_unlink()*  
66562 will not attach to the old shared memory object.

66563 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
66564 implementation does not support the Shared Memory Objects option.

**66565 Issue 7**

66566 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
66567 ``shall fail'' to a ``may fail'' error.

66568 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

66569 **NAME**

66570 shmat — XSI shared memory attach operation

66571 **SYNOPSIS**

```
66572 XSI #include <sys/shm.h>
66573 void *shmat(int shmId, const void *shmaddr, int shmflg);
```

66574 **DESCRIPTION**

66575 The *shmat()* function operates on XSI shared memory (see XBD [Section 3.332](#), on page 80). It is  
 66576 unspecified whether this function interoperates with the realtime interprocess communication  
 66577 facilities defined in [Section 2.8](#) (on page 527).

66578 The *shmat()* function attaches the shared memory segment associated with the shared memory  
 66579 identifier specified by *shmId* to the address space of the calling process. The segment is attached  
 66580 at the address specified by one of the following criteria:

- 66581 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected  
 66582 by the system.
- 66583 • If *shmaddr* is not a null pointer and (*shmflg* & SHM\_RND) is non-zero, the segment is  
 66584 attached at the address given by ((**char** \*)*shmaddr* - ((**uintptr\_t**)*shmaddr* % SHMLBA)). The  
 66585 character '%' is the C-language remainder operator.
- 66586 • If *shmaddr* is not a null pointer and (*shmflg* & SHM\_RND) is 0, the segment is attached at  
 66587 the address given by *shmaddr*.
- 66588 • The segment is attached for reading if (*shmflg* & SHM\_RDONLY) is non-zero and the  
 66589 calling process has read permission; otherwise, if (*shmflg* & SHM\_RDONLY) is 0 and the  
 66590 calling process has read and write permission, the segment is attached for reading and  
 66591 writing.

66592 **RETURN VALUE**

66593 Upon successful completion, *shmat()* shall increment the value of *shm\_nattch* in the data  
 66594 structure associated with the shared memory ID of the attached shared memory segment and  
 66595 return the segment's start address. Also, the *shm\_atime* timestamp shall be set to the current  
 66596 time, as described in [Section 2.7.1](#) (on page 526).

66597 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return  
 66598 SHM\_FAILED, and *errno* shall be set to indicate the error.

66599 **ERRORS**

66600 The *shmat()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 66601 | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 526).  |
| 66602 |          |  |
| 66603 | [EINVAL] | The value of <i>shmId</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of (( <b>char</b> *) <i>shmaddr</i> - (( <b>uintptr_t</b> ) <i>shmaddr</i> % SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, ( <i>shmflg</i> & SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory. |
| 66604 |          |  |
| 66605 |          |  |
| 66606 |          |  |
| 66607 |          |  |
| 66608 | [EMFILE] | The number of shared memory segments attached to the calling process would exceed the system-imposed limit.  |
| 66609 |          |  |
| 66610 | [ENOMEM] | The available data space is not large enough to accommodate the shared memory segment.   |
| 66611 |          |  |

**66612 EXAMPLES**

66613 None.

**66614 APPLICATION USAGE**

66615 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
66616 Application developers who need to use IPC should design their applications so that modules  
66617 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
66618 alternative interfaces.

**66619 RATIONALE**

66620 The symbol SHM\_FAILED is used for the failure return of *shmat()* for consistency with  
66621 MAP\_FAILED for *mmap()*. However, SHM\_FAILED is required to have the same value as  
66622 ((**void \***)(**intptr\_t**)-1) to provide backwards compatibility for applications written to earlier  
66623 versions of this standard, where the failure return was specified as (**void \***)-1. This means that  
66624 implementations need to ensure that *shmat()* cannot return ((**void \***)(**intptr\_t**)-1) on a successful  
66625 call.

**66626 FUTURE DIRECTIONS**

66627 None.

**66632 CHANGE HISTORY**

66633 First released in Issue 2. Derived from Issue 2 of the SVID.

**66634 Issue 5**

66635 Moved from SHARED MEMORY to BASE.

66636 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
66637 DIRECTIONS to a new APPLICATION USAGE section.

**66638 Issue 6**

66639 The Open Group Corrigendum U021/13 is applied.

**66640 Issue 7**

66641 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0572 [345] is applied.

66642 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0327 [522] is applied.

**66643 Issue 8**

66644 Austin Group Defect 1237 is applied, changing ``*shmaddr - ...*'' to ``(char \*)*shmaddr - ...*''.

66645 Austin Group Defect 1238 is applied, changing the DESCRIPTION to avoid an ambiguous use of  
66646 ``it''.

66647 Austin Group Defect 1239 is applied, adding SHM\_FAILED.

66648 **NAME**

66649 shmctl — XSI shared memory control operations

66650 **SYNOPSIS**

```
66651 XSI      #include <sys/shm.h>
66652      int shmctl(int shmid, int cmd, struct shmids *buf);
```

66653 **DESCRIPTION**

66654 The *shmctl()* function operates on XSI shared memory (see XBD [Section 3.332](#), on page 80). It is  
 66655 unspecified whether this function interoperates with the realtime interprocess communication  
 66656 facilities defined in [Section 2.8](#) (on page 527).

66657 The *shmctl()* function provides a variety of shared memory control operations as specified by  
 66658 *cmd*. The following values for *cmd* are available:

66659 **IPC\_STAT** Place the current value of each member of the **shmids** data structure  
 66660 associated with *shmid* into the structure pointed to by *buf*. The contents of the  
 66661 structure are defined in **<sys/shm.h>**.

66662 **IPC\_SET** Set the value of the following members of the **shmids** data structure  
 66663 associated with *shmid* to the corresponding value found in the structure  
 66664 pointed to by *buf*:

```
66665     shm_perm.uid
66666     shm_perm.gid
66667     shm_perm.mode     Low-order nine bits.
```

66668 Also, the *shm\_ctime* timestamp shall be set to the current time, as described in  
 66669 [Section 2.7.1](#) (on page 526).

66670 **IPC\_SET** can only be executed by a process that has an effective user ID equal  
 66671 to either that of a process with appropriate privileges or to the value of  
 66672 *shm\_perm.cuid* or *shm\_perm.uid* in the **shmids** data structure associated with  
 66673 *shmid*.

66674 **IPC\_RMID** Remove the shared memory identifier specified by *shmid* from the system. The  
 66675 shared memory segment and **shmids** data structure associated with it shall  
 66676 be destroyed when all processes with the segment attached have either  
 66677 detached the segment or terminated. If the segment is not attached to any  
 66678 process, it shall be destroyed immediately. **IPC\_RMID** can only be executed by  
 66679 a process that has an effective user ID equal to either that of a process with  
 66680 appropriate privileges or to the value of *shm\_perm.cuid* or *shm\_perm.uid* in the  
 66681 **shmids** data structure associated with *shmid*.

66682 **RETURN VALUE**

66683 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 66684 indicate the error.

66685 **ERRORS**

66686 The *shmctl()* function shall fail if:

66687 **[EACCES]** The argument *cmd* is equal to **IPC\_STAT** and the calling process does not have  
 66688 read permission; see [Section 2.7](#) (on page 526).

66689 **[EINVAL]** The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*  
 66690 is not a valid command.

66691 [EPERM] The argument *cmd* is equal to IPC\_RMID or IPC\_SET and the effective user ID  
66692 of the calling process is not equal to that of a process with appropriate  
66693 privileges and it is not equal to the value of *shm\_perm.cuid* or *shm\_perm.uid* in  
66694 the data structure associated with *shmid*.

66695 The *shmctl()* function may fail if:

66696 [EOVERFLOW] The *cmd* argument is IPC\_STAT and the *gid* or *uid* value is too large to be  
66697 stored in the structure pointed to by the *buf* argument.

#### 66698 EXAMPLES

66699 None.

#### 66700 APPLICATION USAGE

66701 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
66702 Application developers who need to use IPC should design their applications so that modules  
66703 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
66704 alternative interfaces.

66723 **NAME**

66724 shmdt — XSI shared memory detach operation

66725 **SYNOPSIS**

```
66726 XSI #include <sys/shm.h>
66727 int shmdt(const void *shmaddr);
```

66728 **DESCRIPTION**

66729 The *shmdt()* function operates on XSI shared memory (see XBD [Section 3.332](#), on page 80). It is  
66730 unspecified whether this function interoperates with the realtime interprocess communication  
66731 facilities defined in [Section 2.8](#) (on page 527).

66732 The *shmdt()* function detaches the shared memory segment located at the address specified by  
66733 *shmaddr* from the address space of the calling process.

66734 **RETURN VALUE**

66735 Upon successful completion, *shmdt()* shall decrement the value of *shm\_nattch* in the data  
66736 structure associated with the shared memory ID of the attached shared memory segment and  
66737 return 0. Also, the *shm\_dtime* timestamp shall be set to the current time, as described in [Section](#)  
66738 [2.7.1](#) (on page 526).

66739 Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return  $-1$ , and *errno*  
66740 shall be set to indicate the error.

66741 **ERRORS**66742 The *shmdt()* function shall fail if:

66743 [EINVAL] The value of *shmaddr* is not the data segment start address of a shared memory  
66744 segment.

66745 **EXAMPLES**

66746 None.

66747 **APPLICATION USAGE**

66748 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
66749 Application developers who need to use IPC should design their applications so that modules  
66750 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
66751 alternative interfaces.

66760 **CHANGE HISTORY**

66761 First released in Issue 2. Derived from Issue 2 of the SVID.

66762 **Issue 5**

66763 Moved from SHARED MEMORY to BASE.

66764 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
66765 DIRECTIONS to a new APPLICATION USAGE section.

66766 **Issue 7**

66767 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0574 [345] is applied.

66768 **NAME**

66769 shmget — get an XSI shared memory segment

66770 **SYNOPSIS**

```
66771 XSI #include <sys/shm.h>
66772 int shmget(key_t key, size_t size, int shmflg);
```

66773 **DESCRIPTION**

66774 The *shmget()* function operates on XSI shared memory (see XBD [Section 3.332](#), on page 80). It is  
 66775 unspecified whether this function interoperates with the realtime interprocess communication  
 66776 facilities defined in [Section 2.8](#) (on page 527).

66777 The *shmget()* function shall return the shared memory identifier associated with *key*.

66778 A shared memory identifier, associated data structure, and shared memory segment of at least  
 66779 *size* bytes (see [<sys/shm.h>](#)) are created for *key* if one of the following is true:

- 66780 • The argument *key* is equal to `IPC_PRIVATE`.
- 66781 • The argument *key* does not already have a shared memory identifier associated with it and  
 66782 (*shmflg* & `IPC_CREAT`) is non-zero.

66783 Upon creation, the data structure associated with the new shared memory identifier shall be  
 66784 initialized as follows:

- 66785 • The values of *shm\_perm.cuid*, *shm\_perm.uid*, *shm\_perm.cgid*, and *shm\_perm.gid* are set to the  
 66786 effective user ID and effective group ID, respectively, of the calling process.
- 66787 • The low-order nine bits of *shm\_perm.mode* are set to the low-order nine bits of *shmflg*.
- 66788 • The value of *shm\_segsz* is set to the value of *size*.
- 66789 • The values of *shm\_lpid*, *shm\_nattch*, *shm\_atime*, and *shm\_dtime* are set to 0.
- 66790 • The value of *shm\_ctime* is set to the current time, as described in [Section 2.7.1](#) (on page 526).

66791 When the shared memory segment is created, it shall be initialized with all zero values.

66792 **RETURN VALUE**

66793 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared  
 66794 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

66795 **ERRORS**

66796 The *shmget()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 66797 | [EACCES] | A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see <a href="#">Section 2.7</a> (on page 526). |
| 66798 |          |   |
| 66799 |          |   |
| 66800 | [EEXIST] | A shared memory identifier exists for the argument <i>key</i> but ( <i>shmflg</i> & <code>IPC_CREAT</code> ) && ( <i>shmflg</i> & <code>IPC_EXCL</code> ) is non-zero.                                  |
| 66801 |          |   |
| 66802 | [EINVAL] | A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.   |
| 66803 |          |   |
| 66804 | [EINVAL] | No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> .                                   |
| 66805 |          |   |
| 66806 | [ENOENT] | A shared memory identifier does not exist for the argument <i>key</i> and ( <i>shmflg</i> & <code>IPC_CREAT</code> ) is 0.  |
| 66807 |          |   |

66808 [ENOMEM] A shared memory identifier and associated shared memory segment are to be  
66809 created, but the amount of available physical memory is not sufficient to fill  
66810 the request.

66811 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on  
66812 the maximum number of allowed shared memory identifiers system-wide  
66813 would be exceeded.

#### 66814 EXAMPLES

66815 None.

#### 66816 APPLICATION USAGE

66817 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
66818 Application developers who need to use IPC should design their applications so that modules  
66819 using the IPC routines described in [Section 2.7](#) (on page 526) can be easily modified to use the  
66820 alternative interfaces.

#### 66821 RATIONALE

66822 None.

#### 66823 FUTURE DIRECTIONS

66824 None.

66834 DIRECTIONS to a new APPLICATION USAGE section.

#### 66835 Issue 7

66836 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0575 [345], XSH/TC1-2008/0576 [363],  
66837 and XSH/TC1-2008/0577 [344] are applied.

66838 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0328 [640] is applied.

66839 **NAME**

66840 shutdown — shut down socket send and receive operations

66841 **SYNOPSIS**

66842 #include &lt;sys/socket.h&gt;

66843 int shutdown(int *socket*, int *how*);66844 **DESCRIPTION**66845 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket  
66846 associated with the file descriptor *socket* to be shut down.66847 The *shutdown()* function takes the following arguments:66848 *socket* Specifies the file descriptor of the socket.66849 *how* Specifies the type of shutdown. The values are as follows:

66850 SHUT\_RD Disables further receive operations.

66851 SHUT\_WR Disables further send operations.

66852 SHUT\_RDWR Disables further send and receive operations.

66853 The *shutdown()* function disables subsequent send and/or receive operations on a socket,  
66854 depending on the value of the *how* argument.66855 **RETURN VALUE**66856 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*  
66857 set to indicate the error.66858 **ERRORS**66859 The *shutdown()* function shall fail if:66860 [EBADF] The *socket* argument is not a valid file descriptor.66861 [EINVAL] The *how* argument is invalid.

66862 [ENOTCONN] The socket is not connected.

66863 [ENOTSOCK] The *socket* argument does not refer to a socket.66864 The *shutdown()* function may fail if:

66865 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

66866 **EXAMPLES**

66867 None.

66868 **APPLICATION USAGE**66869 The file descriptor remains open after *shutdown()* returns to the calling application.66870 **RATIONALE**

66871 None.

66872 **FUTURE DIRECTIONS**

66876 *socket()*, *write()*

66877 XBD &lt;sys/socket.h&gt;

66878 **CHANGE HISTORY**

66879 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

66880 **Issue 8**

66881 Austin Group Defect 1475 is applied, changing the APPLICATION USAGE section and adding  
66882 *close()* to the SEE ALSO section.

66883 **NAME**

66884 sig2str, str2sig — translate between signal names and numbers

66885 **SYNOPSIS**

```
66886 CX #include <signal.h>
66887 int sig2str(int signum, char *str);
66888 int str2sig(const char *restrict str, int *restrict pnum);
```

66889 **DESCRIPTION**

66890 The *sig2str()* function shall translate the signal number specified by *signum* to a signal name and  
 66891 shall store this string in the location specified by *str*. The application shall ensure that *str* points  
 66892 to a location that can store the string including the terminating null byte. The symbolic constant  
 66893 SIG2STR\_MAX defined in **<signal.h>** gives the maximum number of bytes required.

66894 If *signum* is equal to 0, the behavior is unspecified.

66895 If *signum* is equal to one of the symbolic constants listed in the table of signal numbers in  
 66896 **<signal.h>**, the stored signal name shall be the name of the symbolic constant without the **SIG**  
 66897 prefix.

66898 If *signum* is equal to SIGRTMIN or SIGRTMAX, the stored string shall be "RTMIN" or "RTMAX",  
 66899 respectively.

66900 If *signum* is between SIGRTMIN+1 and (SIGRTMIN+SIGRTMAX)/2 inclusive, the stored string  
 66901 shall be of the form "RTMIN+n", where *n* is the shortest decimal representation of the value of  
 66902 *signum*-SIGRTMIN.

66903 If *signum* is between (SIGRTMIN+SIGRTMAX)/2 + 1 and SIGRTMAX-1 inclusive, the stored  
 66904 string shall be either of the form "RTMIN+n" or of the form "RTMAX-m", where *n* is the shortest  
 66905 decimal representation of the value of *signum*-SIGRTMIN and *m* is the shortest decimal  
 66906 representation of the value of SIGRTMAX-*signum*.

66907 If *signum* is a valid, supported signal number, is either less than SIGRTMIN or greater than  
 66908 SIGRTMAX, and is not equal to one of the symbolic constants listed in the table of signal  
 66909 numbers in **<signal.h>**, the stored string shall uniquely identify the signal number *signum* in an  
 66910 unspecified manner.

66911 The *str2sig()* function shall translate the signal name in the string pointed to by *str* to a signal  
 66912 number and shall store this value in the location specified by *pnum*.

66913 If *str* points to a string containing the name of one of the symbolic constants listed in the table of  
 66914 signal numbers in **<signal.h>**, without the **SIG** prefix, the stored signal number shall be equal to  
 66915 the value of the symbolic constant.

66916 If *str* points to the string "RTMIN" or "RTMAX", the stored value shall be equal to SIGRTMIN or  
 66917 SIGRTMAX, respectively.

66918 If *str* points to a string of the form "RTMIN+n", where *n* is a decimal representation of a number  
 66919 between 1 and SIGRTMAX-SIGRTMIN-1 inclusive, the stored value shall be equal to  
 66920 SIGRTMIN+n.

66921 If *str* points to a string of the form "RTMAX-n", where *n* is a decimal representation of a number  
 66922 between 1 and SIGRTMAX-SIGRTMIN-1 inclusive, the stored value shall be equal to  
 66923 SIGRTMAX-n.

66924 If *str* points to a string containing a decimal representation of a valid, supported signal number,  
 66925 the value stored in the location pointed to by *pnum* shall be equal to that number.

66926 If *str* points to a string containing a decimal representation of the value 0 and the string was not  
66927 returned by a previous successful call to *sig2str()* with a *signum* argument of 0, the behavior is  
66928 unspecified.

66929 If *str* points to a string returned by a previous successful call to *sig2str(signum, str)*, the value  
66930 stored in the location pointed to by *pnum* shall be equal to *signum*.

66931 If *str* points to a string that does not meet any of the above criteria, *str2sig()* shall store a value in  
66932 the location pointed to by *pnum* if and only if it recognizes the string as an additional  
66933 implementation-dependent form of signal name.

#### 66934 RETURN VALUE

66935 If *signum* is a valid, supported signal number (that is, one for which *kill()* does not return  $-1$   
66936 with *errno* set to [EINVAL]), the *sig2str()* function shall return 0; otherwise, if *signum* is not equal  
66937 to 0, it shall return  $-1$ .

66938 If *str2sig()* stores a value in the location pointed to by *pnum*, it shall return 0; otherwise, it shall  
66939 return  $-1$ .

#### 66940 ERRORS

66941 No errors are defined.

#### 66942 EXAMPLES

66943 None.

#### 66944 APPLICATION USAGE

66945 None.

#### 66946 RATIONALE

66947 Historical versions of these functions translated a *signum* value 0 to "EXIT" (and vice versa), so  
66948 that they could be used by the shell for the *trap* utility. When adding the functions to this  
66949 standard, the standard developers felt that they should be aimed at more general-purpose use,  
66950 and consequently requiring this behavior did not seem appropriate and so the behavior in this  
66951 case has been made unspecified.

#### 66952 FUTURE DIRECTIONS

66953 None.

#### 66954 SEE ALSO

#### 66957 CHANGE HISTORY

66958 First released in Issue 8.

## 66959 NAME

66960 sigaction — examine and change a signal action

## 66961 SYNOPSIS

```
66962 CX #include <signal.h>
66963 int sigaction(int sig, const struct sigaction *restrict act,
66964 struct sigaction *restrict oact);
```

## 66965 DESCRIPTION

66966 The *sigaction()* function allows the calling process to examine and/or specify the action to be  
 66967 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are  
 66968 defined in `<signal.h>`.

66969 The structure **sigaction**, used to describe an action to be taken, is defined in the `<signal.h>`  
 66970 header to include at least the following members:

Member Type	Member Name	Description
<b>void(*) (int)</b>	<i>sa_handler</i>	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
<b>sigset_t</b>	<i>sa_mask</i>	Additional set of signals to be blocked during execution of signal-catching function.
<b>int</b>	<i>sa_flags</i>	Special flags to affect behavior of signal.
<b>void(*) (int, siginfo_t *, void *)</b>	<i>sa_sigaction</i>	Pointer to a signal-catching function.

66980 The storage occupied by *sa\_handler* and *sa\_sigaction* may overlap, and a conforming application  
 66981 shall not use both simultaneously.

66982 If the argument *act* is not a null pointer, it points to a structure specifying the action to be  
 66983 associated with the specified signal. If the argument *oact* is not a null pointer, the action  
 66984 previously associated with the signal is stored in the location pointed to by the argument *oact*. If  
 66985 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to  
 66986 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall  
 66987 not be added to the signal mask using this mechanism; this restriction shall be enforced by the  
 66988 system without causing an error to be indicated.

66989 If the SA\_SIGINFO flag (see below) is cleared in the *sa\_flags* field of the **sigaction** structure, the  
 66990 *sa\_handler* field identifies the action to be associated with the specified signal. If the  
 66991 SA\_SIGINFO flag is set in the *sa\_flags* field, the *sa\_sigaction* field specifies a signal-catching  
 66992 function.

66993 The *sa\_flags* field can be used to modify the behavior of the specified signal.

66994 The following flags, defined in the `<signal.h>` header, can be set in *sa\_flags*:

66995 XSI SA\_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children  
 66996 continue.

66997 If *sig* is SIGCHLD and the SA\_NOCLDSTOP flag is not set in *sa\_flags*, and  
 66998 the implementation supports the SIGCHLD signal, then a SIGCHLD  
 66999 signal shall be generated for the calling process whenever any of its child  
 67000 XSI processes stop and a SIGCHLD signal may be generated for the calling  
 67001 process whenever any of its stopped child processes are continued. If *sig*  
 67002 is SIGCHLD and the SA\_NOCLDSTOP flag is set in *sa\_flags*, then the  
 67003 implementation shall not generate a SIGCHLD signal in this way.

67004	XSI	<b>SA_ONSTACK</b>	If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.
67005			
67006			
67007		<b>SA_RESETHAND</b>	If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.
67008			
67009		<b>Note:</b>	SIGILL and SIGTRAP cannot be automatically reset when delivered;
67010			the system silently enforces this restriction.
67011			Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.
67012			
67013			In addition, if this flag is set, <i>sigaction()</i> may behave as if the SA_NODEFER flag were also set.
67014			
67015		<b>SA_RESTART</b>	This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If an interruptible function which uses a timeout is restarted, the duration of the timeout following the restart is set to an unspecified value that does not exceed the original timeout value. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR].
67016			
67017			
67018			
67019			
67020			
67021			
67022			
67023		<b>SA_SIGINFO</b>	If cleared and the signal is caught, the signal-catching function shall be entered as:
67024			
67025			<pre>void func(int signo);</pre>
67026			where <i>signo</i> is the only argument to the signal-catching function. In this case, the application shall use the <i>sa_handler</i> member to describe the signal-catching function and the application shall not modify the <i>sa_sigaction</i> member.
67027			
67028			
67029			
67030			If SA_SIGINFO is set and the signal is caught, the signal-catching function shall be entered as:
67031			
67032			<pre>void func(int signo, siginfo_t *info, void *context);</pre>
67033			where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type <b>siginfo_t</b> explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type <b>ucontext_t</b> to refer to the receiving thread's context that was interrupted when the signal was delivered. In this case, the application shall use the <i>sa_sigaction</i> member to describe the signal-catching function and the application shall not modify the <i>sa_handler</i> member.
67034			
67035			
67036			
67037			
67038			
67039			
67040			
67041			The <i>si_signo</i> member contains the system-generated signal number.
67042	XSI		The <i>si_errno</i> member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.
67043			
67044			
67045			The <i>si_code</i> member contains a code identifying the cause of the signal, as described in <a href="#">Section 2.4.3</a> (on page 516).
67046			

67047 XSI SA\_NOCLDWAIT If *sig* does not equal SIGCHLD, the behavior is unspecified. Otherwise,  
67048 the behavior of the SA\_NOCLDWAIT flag is as specified in [Consequences](#)  
67049 [of Process Termination](#) (on page 568).

67050 SA\_NODEFER If set and *sig* is caught, *sig* shall not be added to the thread's signal mask  
67051 on entry to the signal handler unless it is included in *sa\_mask*. Otherwise,  
67052 *sig* shall always be added to the thread's signal mask on entry to the  
67053 signal handler.

67054 When a signal is caught by a signal-catching function installed by *sigaction()*, a new signal mask  
67055 is calculated and installed for the duration of the signal-catching function (or until a call to either  
67056 *sigprocmask()* or *sigsuspend()* is made). This mask is formed by taking the union of the current  
67057 signal mask and the value of the *sa\_mask* for the signal being delivered, and unless  
67058 SA\_NODEFER or SA\_RESETHAND is set, then including the signal being delivered. If and  
67059 when the user's signal handler returns normally, the original signal mask is restored.

67060 Once an action is installed for a specific signal, it shall remain installed until another action is  
67061 explicitly requested (by another call to *sigaction()*), until the SA\_RESETHAND flag causes  
67062 resetting of the handler, or until one of the *exec* functions is called.

67063 If the previous action for *sig* had been established by *signal()*, the values of the fields returned in  
67064 the structure pointed to by *oact* are unspecified, and in particular *oact->sa\_handler* is not  
67065 necessarily the same value passed to *signal()*. However, if a pointer to the same structure or a  
67066 copy thereof is passed to a subsequent call to *sigaction()* via the *act* argument, handling of the  
67067 signal shall be as if the original call to *signal()* were repeated.

67068 If *sigaction()* fails, no new signal handler is installed.

67069 It is unspecified whether an attempt to set the action for a signal that cannot be caught or  
67070 ignored to SIG\_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

67071 If SA\_SIGINFO is not set in *sa\_flags*, then the disposition of subsequent occurrences of *sig* when  
67072 it is already pending is implementation-defined; the signal-catching function shall be invoked  
67073 with a single argument. If SA\_SIGINFO is set in *sa\_flags*, then subsequent occurrences of *sig*  
67074 generated by *sigqueue()* or as a result of any signal-generating function that supports the  
67075 specification of an application-defined value (when *sig* is already pending) shall be queued in  
67076 FIFO order until delivered or accepted; the signal-catching function shall be invoked with three  
67077 arguments. The application specified value is passed to the signal-catching function as the  
67078 *si\_value* member of the **siginfo\_t** structure.

67079 The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the  
67080 same signal is unspecified.

67081 **RETURN VALUE**

67082 Upon successful completion, *sigaction()* shall return 0; otherwise, -1 shall be returned, *errno* shall  
67083 be set to indicate the error, and no new signal-catching function shall be installed.

67084 **ERRORS**67085 The *sigaction()* function shall fail if:67086 [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
67087 signal that cannot be caught or ignore a signal that cannot be ignored.67088 The *sigaction()* function may fail if:67089 [EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be  
67090 caught or ignored (or both).67091 In addition, on systems that do not support the XSI option, the *sigaction()* function may fail if the  
67092 SA\_SIGINFO flag is set in the *sa\_flags* field of the **sigaction** structure for a signal not in the range  
67093 SIGRTMIN to SIGRTMAX.67094 **EXAMPLES**67095 **Establishing a Signal Handler**67096 The following example demonstrates the use of *sigaction()* to establish a handler for the SIGINT  
67097 signal.

```

67098 #include <signal.h>
67099 static void handler(int signum)
67100 {
67101     /* Take appropriate actions for signal delivery */
67102 }
67103 int main(void)
67104 {
67105     struct sigaction sa;
67106     sa.sa_handler = handler;
67107     sigemptyset(&sa.sa_mask);
67108     sa.sa_flags = SA_RESTART; /* Restart functions if
67109                             interrupted by handler */
67110     if (sigaction(SIGINT, &sa, NULL) == -1)
67111         /* Handle error */;
67112     /* Further code */
67113 }

```

67114 **APPLICATION USAGE**

67115 The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In  
67116 particular, *sigaction()* and *signal()* should not be used in the same process to control the same  
67117 signal. The behavior of async-signal-safe functions, as defined in their respective  
67118 DESCRIPTION sections, is as specified by this volume of POSIX.1-2024, regardless of invocation  
67119 from a signal-catching function. This is the only intended meaning of the statement that async-  
67120 signal-safe functions may be used in signal-catching functions without restrictions. Applications  
67121 must still consider all effects of such functions on such things as data structures, files, and  
67122 process state. In particular, application developers need to consider the restrictions on  
67123 interactions when interrupting *sleep()* and interactions among multiple handles for a file  
67124 description. The fact that any specific function is listed as async-signal-safe does not necessarily  
67125 mean that invocation of that function from a signal-catching function is recommended.

67126 In order to prevent errors arising from interrupting non-async-signal-safe function calls,  
67127 applications should protect calls to these functions either by blocking the appropriate signals or

67128 through the use of some programmatic semaphore (see *semget()*, *sem\_init()*, *sem\_open()*, and so  
 67129 on). Note in particular that even the “safe” functions may modify *errno*; the signal-catching  
 67130 function, if not executing as an independent thread, should save and restore its value in order to  
 67131 avoid the possibility that delivery of a signal in between an error return from a function that sets  
 67132 *errno* and the subsequent examination of *errno* could result in the signal-catching function  
 67133 changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of  
 67134 application routines and asynchronous data access. Note that *longjmp()* and *siglongjmp()* are not  
 67135 in the list of async-signal-safe functions. This is because the code executing after *longjmp()* and  
 67136 *siglongjmp()* can call any unsafe functions with the same danger as calling those unsafe  
 67137 functions directly from the signal handler. Applications that use *longjmp()* and *siglongjmp()* from  
 67138 within signal handlers require rigorous protection in order to be portable. Many of the other  
 67139 functions that are excluded from the list are traditionally implemented using either *malloc()* or  
 67140 *free()* functions or the standard I/O library, both of which traditionally use data structures in a  
 67141 non-async-signal-safe manner. Since any combination of different functions using a common  
 67142 data structure can cause async-signal-safety problems, this volume of POSIX.1-2024 does not  
 67143 define the behavior when any unsafe function is called in a signal handler that interrupts an  
 67144 unsafe function.

67145 Usually, the signal is executed on the stack that was in effect before the signal was delivered. An  
 67146 alternate stack may be specified to receive a subset of the signals being caught.

67147 When the signal handler returns, the receiving thread resumes execution at the point it was  
 67148 interrupted unless the signal handler makes other arrangements. If *longjmp()* is used to leave the  
 67149 signal handler, then the signal mask must be explicitly restored.

67150 This volume of POSIX.1-2024 defines the third argument of a signal handling function when  
 67151 SA\_SIGINFO is set as a **void \*** instead of a **ucontext\_t \***, but without requiring type checking.  
 67152 New applications should explicitly cast the third argument of the signal handling function to  
 67153 **ucontext\_t \***.

67154 The BSD optional four argument signal handling function is not supported by this volume of  
 67155 POSIX.1-2024. The BSD declaration would be:

```
67156 void handler(int sig, int code, struct sigcontext *scp,  
67157             char *addr);
```

67158 where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer  
 67159 to the **sigcontext** structure, and *addr* is additional address information. Much the same  
 67160 information is available in the objects pointed to by the second argument of the signal handler  
 67161 specified when SA\_SIGINFO is set.

67162 Since the *sigaction()* function is allowed but not required to set SA\_NODEFER when the  
 67163 application sets the SA\_RESETHAND flag, applications which depend on the SA\_RESETHAND  
 67164 functionality for the newly installed signal handler must always explicitly set SA\_NODEFER  
 67165 when they set SA\_RESETHAND in order to be portable.

67166 See also the rationale for Realtime Signal Generation and Delivery in XRAT [Section B.2.4.2](#) (on  
 67167 page 3749).

## 67168 RATIONALE

67169 Although this volume of POSIX.1-2024 requires that signals that cannot be ignored shall not be  
 67170 added to the signal mask when a signal-catching function is entered, there is no explicit  
 67171 requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact*  
 67172 argument. In other words, if SIGKILL is included in the *sa\_mask* field of *act*, it is unspecified  
 67173 whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa\_mask*  
 67174 field of *oact*.

67175 The SA\_NOCLDSTOP flag, when supplied in the *act->sa\_flags* parameter, allows overloading  
 67176 SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated  
 67177 child. Most conforming applications that catch SIGCHLD are expected to install signal-catching  
 67178 functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on  
 67179 each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of  
 67180 interest, the use of the SA\_NOCLDSTOP flag can prevent the overhead from invoking the  
 67181 signal-catching routine when they stop.

67182 Some historical implementations also define other mechanisms for stopping processes, such as  
 67183 the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when  
 67184 processes stop due to this mechanism; however, that is beyond the scope of this volume of  
 67185 POSIX.1-2024.

67186 This volume of POSIX.1-2024 requires that calls to *sigaction()* that supply a NULL *act* argument  
 67187 succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or  
 67188 SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases  
 67189 and, in this respect, their behavior varies from *sigaction()*.

67190 This volume of POSIX.1-2024 requires that *sigaction()* properly save and restore a signal action  
 67191 set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is  
 67192 true, nor could there be given the greater amount of information conveyed by the **sigaction**  
 67193 structure. Because of this, applications should avoid using both functions for the same signal in  
 67194 the same process. Since this cannot always be avoided in case of general-purpose library  
 67195 routines, they should always be implemented with *sigaction()*.

67196 It was intended that the *signal()* function should be implementable as a library routine using  
 67197 *sigaction()*.

67198 The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990  
 67199 standard to allow the application to request on a per-signal basis via an additional signal action  
 67200 flag that the extra parameters, including the application-defined signal value, if any, be passed to  
 67201 the signal-catching function.

#### 67202 FUTURE DIRECTIONS

67208 XBD <**signal.h**>

#### 67209 CHANGE HISTORY

67210 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 67211 Issue 5

67212 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX  
 67213 Threads Extension.

67214 In the DESCRIPTION, the second argument to *func* when SA\_SIGINFO is set is no longer  
 67215 permitted to be NULL, and the description of permitted **siginfo\_t** contents is expanded by  
 67216 reference to <**signal.h**>.

67217 Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP]  
 67218 error is deleted.

67219 **Issue 6**

67220 The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on  
67221 Other Functions”, a reference to *sigpending()* is added.

67222 In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal  
67223 Effects on Other Functions” are moved to a separate section of this volume of POSIX.1-2024.

67224 Text describing functionality from the Realtime Signals Extension option is marked.

67225 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 67226 • The [ENOTSUP] error condition is added.

67227 The normative text is updated to avoid use of the term “must” for application requirements.

67228 The **restrict** keyword is added to the *sigaction()* prototype for alignment with the  
67229 ISO/IEC 9899: 1999 standard.

67230 References to the *wait3()* function are removed.

67231 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
67232 extension over the ISO C standard.

67233 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table  
67234 describing the **sigaction** structure.

67235 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the  
67236 DESCRIPTION duplicated later in the same section.

67237 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the  
67238 DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread  
67239 rather than the process.

67240 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the  
67241 EXAMPLES section.

67242 **Issue 7**

67243 Austin Group Interpretation 1003.1-2001 #004 is applied.

67244 Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the  
67245 SA\_NODEFER flag with respect to the signal mask, and clarifying the SA\_RESTART flag for  
67246 interrupted functions which use timeouts.

67247 Austin Group Interpretation 1003.1-2001 #156 is applied.

67248 SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

67249 SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement  
67250 that when the SA\_RESETHAND flag is set, *sigaction()* shall behave as if the SA\_NODEFER flag  
67251 were also set.

67252 Functionality relating to the Realtime Signals Extension option is moved to the Base.

67253 The description of the *si\_code* member is replaced with a reference to [Section 2.4.3](#) (on page 516).

67254 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0578 [66] and XSH/TC1-2008/0579  
67255 [140] are applied.

67256 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0329 [690] and XSH/TC2-2008/0330  
67257 [491] are applied.

67258 **Issue 8**

67259 Austin Group Defect 1138 is applied, adding *sig2str()* to the SEE ALSO section.

67260 Austin Group Defect 1195 is applied, changing `main()` to `main(void)`.

67261 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

67262 **NAME**

67263 sigaddset — add a signal to a signal set

67264 **SYNOPSIS**

```
67265 CX #include <signal.h>
67266 int sigaddset(sigset_t *set, int signo);
```

67267 **DESCRIPTION**

67268 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed  
67269 to by *set*.

67270 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
67271 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
67272 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
67273 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
67274 *sigwaitinfo()*, the results are undefined.

67275 **RETURN VALUE**

67276 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*  
67277 to indicate the error.

67278 **ERRORS**

67279 The *sigaddset()* function may fail if:

67280 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

67281 **EXAMPLES**

67282 None.

67283 **APPLICATION USAGE**

67284 None.

67285 **RATIONALE**

67286 None.

67287 **FUTURE DIRECTIONS**

67288 None.

67292 XBD [<signal.h>](#)

67293 **CHANGE HISTORY**

67294 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67295 **Issue 5**

67296 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
67297 previous issues.

67298 **Issue 6**

67299 The normative text is updated to avoid use of the term “must” for application requirements.

67300 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
67301 extension over the ISO C standard.

67302 **NAME**

67303 sigaltstack — set and get signal alternate stack context

67304 **SYNOPSIS**

```
67305 XSI #include <signal.h>
67306 int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

67307 **DESCRIPTION**

67308 The *sigaltstack()* function allows a process to define and examine the state of an alternate stack  
 67309 for signal handlers for the current thread. Signals that have been explicitly declared to execute  
 67310 on the alternate stack shall be delivered on the alternate stack.

67311 If *ss* is not a null pointer, it points to a **stack\_t** structure that specifies the alternate signal stack  
 67312 that shall take effect upon return from *sigaltstack()*. The *ss\_flags* member specifies the new stack  
 67313 state. If it is set to *SS\_DISABLE*, the stack is disabled and *ss\_sp* and *ss\_size* are ignored.  
 67314 Otherwise, the stack shall be enabled, and the *ss\_sp* and *ss\_size* members specify the new address  
 67315 and size of the stack.

67316 The range of addresses starting at *ss\_sp* up to but not including *ss\_sp+ss\_size* is available to the  
 67317 implementation for use as the stack. This function makes no assumptions regarding which end  
 67318 is the stack base and in which direction the stack grows as items are pushed.

67319 If *oss* is not a null pointer, upon successful completion it shall point to a **stack\_t** structure that  
 67320 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss\_sp*  
 67321 and *ss\_size* members specify the address and size of that stack. The *ss\_flags* member specifies the  
 67322 stack's state, and may contain one of the following values:

67323 **SS\_ONSTACK** The process is currently executing on the alternate signal stack. Attempts to  
 67324 modify the alternate signal stack while the process is executing on it fail. This  
 67325 flag shall not be modified by processes.

67326 **SS\_DISABLE** The alternate signal stack is currently disabled.

67327 The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to  
 67328 cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ*  
 67329 is defined to be the minimum stack size for a signal handler. In computing an alternate stack  
 67330 size, a program should add that amount to its stack requirements to allow for the system  
 67331 implementation overhead. The constants *SS\_ONSTACK*, *SS\_DISABLE*, *SIGSTKSZ*, and  
 67332 *MINSIGSTKSZ* are defined in **<signal.h>**.

67333 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new  
 67334 process image.

67335 In some implementations, a signal (whether or not indicated to execute on the alternate stack)  
 67336 shall always execute on the alternate stack if it is delivered while another signal is being caught  
 67337 using the alternate stack.

67338 Use of this function by library threads that are not bound to kernel-scheduled entities results in  
 67339 undefined behavior.

67340 **RETURN VALUE**

67341 Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return *-1* and set *errno*  
 67342 to indicate the error.

67343 **ERRORS**67344 The *sigaltstack()* function shall fail if:67345 [EINVAL] The *ss* argument is not a null pointer, and the *ss\_flags* member pointed to by *ss*  
67346 has *SS\_ONSTACK* or invalid flags set.67347 [ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.

67348 [EPERM] An attempt was made to modify an active stack.

67349 **EXAMPLES**67350 **Allocating Memory for an Alternate Stack**

67351 The following example illustrates a method for allocating memory for an alternate stack.

```
67352 #include <signal.h>
67353 ...
67354 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
67355     /* Error return. */
67356     sigstk.ss_size = SIGSTKSZ;
67357     sigstk.ss_flags = 0;
67358     if (sigaltstack(&sigstk, (stack_t *)0) < 0)
67359         perror("sigaltstack");
```

67360 **APPLICATION USAGE**

67361 On some implementations, stack space is automatically extended as needed. On those  
67362 implementations, automatic extension is typically not available for an alternate stack. If the stack  
67363 overflows, the behavior is undefined.

67364 **RATIONALE**

67365 None.

67366 **FUTURE DIRECTIONS**

67367 None.

67373 **Issue 5**

67374 Moved from X/OPEN UNIX extension to BASE.

67375 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in  
67376 previous issues.

67377 **Issue 6**

67378 The normative text is updated to avoid use of the term “must” for application requirements.

67379 The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the  
67380 ISO/IEC 9899:1999 standard.

67381 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence  
67382 to include “for the current thread”.

67383 **Issue 8**  
67384

Austin Group Defect 1187 is applied, changing the description of the [EINVAL] error.

67385 **NAME**

67386 sigdelset — delete a signal from a signal set

67387 **SYNOPSIS**

```
67388 CX #include <signal.h>
67389 int sigdelset(sigset_t *set, int signo);
```

67390 **DESCRIPTION**

67391 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set  
 67392 pointed to by *set*.

67393 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
 67394 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
 67395 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
 67396 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
 67397 *sigwaitinfo()*, the results are undefined.

67398 **RETURN VALUE**

67399 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno*  
 67400 to indicate the error.

67401 **ERRORS**

67402 The *sigdelset()* function may fail if:

67403 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
 67404 number.

67417 **CHANGE HISTORY**

67418 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67419 **Issue 5**

67420 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
 67421 previous issues.

67422 **Issue 6**

67423 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
 67424 extension over the ISO C standard.

**67425 NAME**

67426 sigemptyset — initialize and empty a signal set

**67427 SYNOPSIS**

```
67428 CX #include <signal.h>  
67429 int sigemptyset(sigset_t *set);
```

**67430 DESCRIPTION**

67431 The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined  
67432 in POSIX.1-2024 are excluded.

**67433 RETURN VALUE**

67434 Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return -1 and set  
67435 *errno* to indicate the error.

**67436 ERRORS**

67437 No errors are defined.

**67438 EXAMPLES**

67439 None.

**67440 APPLICATION USAGE**

67441 None.

**67442 RATIONALE**

67443 The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or set)  
67444 all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the  
67445 structure, such as a version field, to permit binary-compatibility between releases where the size  
67446 of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any  
67447 other use of the signal set, even if such use is read-only (for example, as an argument to  
67448 *sigpending()*). This function is not intended for dynamic allocation.

67449 The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or  
67450 exclude) all the signals defined in this volume of POSIX.1-2024. Although it is outside the scope  
67451 of this volume of POSIX.1-2024 to place this requirement on signals that are implemented as  
67452 extensions, it is recommended that implementation-defined signals also be affected by these  
67453 functions. However, there may be a good reason for a particular signal not to be affected. For  
67454 example, blocking or ignoring an implementation-defined signal may have undesirable side-  
67455 effects, whereas the default action for that signal is harmless. In such a case, it would be  
67456 preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.

67457 In early proposals there was no distinction between invalid and unsupported signals (the names  
67458 of optional signals that were not supported by an implementation were not defined by that  
67459 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.  
67460 With that distinction, it is not necessary to require implementations of these functions to  
67461 determine whether an optional signal is actually supported, as that could have a significant  
67462 performance impact for little value. The error could have been required for invalid signals and  
67463 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is  
67464 optional in both cases.

**67465 FUTURE DIRECTIONS**

67466 None.

67501 **CHANGE HISTORY**

67502 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67503 **Issue 6**

67504 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
67505 extension over the ISO C standard.

67506 **NAME**

67507 sigismember — test for a signal in a signal set

67508 **SYNOPSIS**

```
67509 CX #include <signal.h>
67510 int sigismember(const sigset_t *set, int signo);
```

67511 **DESCRIPTION**

67512 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set  
67513 pointed to by *set*.

67514 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
67515 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
67516 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
67517 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
67518 *sigwaitinfo()*, the results are undefined.

67519 **RETURN VALUE**

67520 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of  
67521 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.

67522 **ERRORS**

67523 The *sigismember()* function may fail if:

67524 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
67525 number.

67526 **EXAMPLES**

67527 None.

67528 **APPLICATION USAGE**

67529 None.

67530 **RATIONALE**

67531 None.

67538 **CHANGE HISTORY**

67539 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67540 **Issue 5**

67541 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
67542 previous issues.

67543 **Issue 6**

67544 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
67545 extension over the ISO C standard.

67546 **NAME**

67547 siglongjmp — non-local goto with signal handling

67548 **SYNOPSIS**

```
67549 CX #include <setjmp.h>
67550 _Noreturn void siglongjmp(sigjmp_buf env, int val);
```

67551 **DESCRIPTION**67552 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 67553 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 67554 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env*
- 67555 argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

67556 **RETURN VALUE**

67557 After *siglongjmp()* is completed, thread execution shall continue as if the corresponding

67558 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function

67559 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

67560 **ERRORS**

67561 No errors are defined.

67562 **EXAMPLES**

67563 None.

67564 **APPLICATION USAGE**

67565 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant

67566 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

67567 **RATIONALE**

67568 None.

67575 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

67576 **Issue 5**

67577 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

67578 **Issue 6**67579 The DESCRIPTION is rewritten in terms of *longjmp()*.

67580 The SYNOPSIS is marked CX since the presence of this function in the [<setjmp.h>](#) header is an

67581 extension over the ISO C standard.

67582 **Issue 8**67583 Austin Group Defect 1302 is applied, adding `_Noreturn` to the SYNOPSIS.

67584 **NAME**

67585 signal — signal management

67586 **SYNOPSIS**

67587 #include &lt;signal.h&gt;

67588 void (\*signal(int sig, void (\*func)(int)))(int);

67589 **DESCRIPTION**

67590 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 67591 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67592 volume of POSIX.1-2024 defers to the ISO C standard.

67593 The *signal()* function chooses one of three ways in which receipt of the signal number *sig* is to be  
 67594 subsequently handled. If the value of *func* is SIG\_DFL, default handling for that signal shall  
 67595 occur. If the value of *func* is SIG\_IGN, the signal shall be ignored. Otherwise, the application  
 67596 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of  
 67597 such a function because of a signal, or (recursively) of any further functions called by that  
 67598 invocation (other than functions in the standard library), is called a “signal handler”.

67599 When a signal occurs, and *func* points to a function, it is implementation-defined whether the  
 67600 equivalent of a:

67601 `signal(sig, SIG_DFL);`

67602 is executed or the implementation prevents some implementation-defined set of signals (at least  
 67603 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*  
 67604 is SIGILL, the implementation may alternatively define that no action is taken.) Next the  
 67605 equivalent of:

67606 `(*func)(sig);`

67607 is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or  
 67608 SIGSEGV or any other implementation-defined value corresponding to a computational  
 67609 exception, the behavior is undefined. Otherwise, the program shall resume execution at the  
 67610 point it was interrupted. The ISO C standard places a restriction on applications relating to the  
 67611 CX use of *raise()* from signal handlers. This restriction does not apply to POSIX applications, as  
 67612 POSIX.1-2024 requires *raise()* to be async-signal-safe (see [Section 2.4.3](#), on page 516).

67613 CX If the process is multi-threaded, or if the process is single-threaded and a signal handler is  
 67614 executed other than as the result of:

67615 CX • The process calling *abort()*, *raise()*, *kill()*, *pthread\_kill()*, or *sigqueue()* to generate a signal  
 67616 that is not blocked

67617 CX • A pending signal being unblocked and being delivered before the call that unblocked it  
 67618 returns

67619 the behavior is undefined if:

67620 CX • The signal handler refers to any object other than *errno* with static or thread storage  
 67621 CX duration that is not a lock-free atomic object, and not a non-modifiable object (for  
 67622 example, string literals, objects that were defined with a const-qualified type, and objects  
 67623 in memory that is mapped read-only), other than by assigning a value to an object  
 67624 CX declared as **volatile sig\_atomic\_t**, unless the previous modification (if any) to the object  
 67625 happens before the signal handler is called and the return from the signal handler happens  
 67626 before the next modification (if any) to the object.

67627 CX       • The signal handler calls any function defined in this standard other than one of the  
67628               functions listed in Section 2.4 (on page 513).

67629       At program start-up, the equivalent of:

67630       `signal(sig, SIG_IGN);`

67631       is executed for some signals, and the equivalent of:

67632       `signal(sig, SIG_DFL);`

67633 CX       is executed for all other signals (see *exec*).

67634       The *signal()* function shall not change the setting of *errno* if successful.

67635 CX       The *signal()* function is required to be thread-safe. (See Section 2.9.1 (on page 537).)

#### 67636 RETURN VALUE

67637       If the request can be honored, *signal()* shall return the value of *func* for the most recent call to  
67638       *signal()* for the specified signal *sig*. Otherwise, *SIG\_ERR* shall be returned and a positive value  
67639       shall be stored in *errno*.

#### 67640 ERRORS

67641       The *signal()* function shall fail if:

67642 CX       [EINVAL]       The *sig* argument is not a valid signal number or an attempt is made to catch a  
67643               signal that cannot be caught or ignore a signal that cannot be ignored.

67644       The *signal()* function may fail if:

67645 CX       [EINVAL]       An attempt was made to set the action to *SIG\_DFL* for a signal that cannot be  
67646               caught or ignored (or both).

#### 67647 EXAMPLES

67648       None.

#### 67649 APPLICATION USAGE

67650       The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
67651       signals; new applications should use *sigaction()* rather than *signal()*.

#### 67652 RATIONALE

67653       The ISO C standard says that the use of *signal()* in a multi-threaded program results in  
67654       undefined behavior. However, POSIX.1 has required *signal()* to be thread-safe since before  
67655       threads were added to the ISO C standard.

#### 67656 FUTURE DIRECTIONS

67657       None.

#### 67658 SEE ALSO

67659       Section 2.4 (on page 513), *exec*, *pause()*, *raise()*, *sigaction()*, *sigsuspend()*, *waitid()*

67660       XBD <signal.h>

#### 67661 CHANGE HISTORY

67662       First released in Issue 1. Derived from Issue 1 of the SVID.

#### 67663 Issue 5

67664       Moved from X/OPEN UNIX extension to BASE.

67665       The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of  
67666       the process to its original state before returning.

67667       The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends

67668 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to  
67669 [EINTR].

67670 **Issue 6**

67671 Extensions beyond the ISO C standard are marked.

67672 The normative text is updated to avoid use of the term “must” for application requirements.

67673 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

67674 References to the *wait3()* function are removed.

67675 The *sighold()*, *sigignore()*, *sigrelse()*, and *sigset()* functions are split out onto their own reference  
67676 page.

67677 **Issue 7**

67678 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0580 [275], XSH/TC1-2008/0581 [66],  
67679 and XSH/TC1-2008/0582 [105] are applied.

67680 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0331 [785] is applied.

67681 **Issue 8**

67682 Austin Group Defect 728 is applied, reducing the set of circumstances in which undefined  
67683 behavior results when a signal handler refers to an object with static or thread storage duration.

67684 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
67685 standard.

67686 **NAME**

67687 signbit — test sign

67688 **SYNOPSIS**

67689 #include &lt;math.h&gt;

67690 int signbit(real-floating x);

67691 **DESCRIPTION**

67692 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
67693 conflict between the requirements described here and the ISO C standard is unintentional. This  
67694 volume of POSIX.1-2024 defers to the ISO C standard.

67695 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,  
67696 zeros, and infinities have a sign bit.

67697 **RETURN VALUE**

67698 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is  
67699 negative.

67700 **ERRORS**

67701 No errors are defined.

67702 **EXAMPLES**

67703 None.

67713 **CHANGE HISTORY**

67714 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

67715 **NAME**

67716 signgam — log gamma function

67717 **SYNOPSIS**

```
67718 XSI #include <math.h>  
67719 extern int signgam;
```

67720 **DESCRIPTION**

67721 Refer to *lgamma()*.

67722 **NAME**

67723 sigpending — examine pending signals

67724 **SYNOPSIS**

```
67725 CX #include <signal.h>
67726 int sigpending(sigset_t *set);
```

67727 **DESCRIPTION**

67728 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of  
67729 signals that are blocked from delivery to the calling thread and that are pending on the process  
67730 or the calling thread.

67731 **RETURN VALUE**

67732 Upon successful completion, *sigpending()* shall return 0; otherwise, -1 shall be returned and  
67733 *errno* set to indicate the error.

67734 **ERRORS**

67735 No errors are defined.

67736 **EXAMPLES**

67737 None.

67738 **APPLICATION USAGE**

67748 First released in Issue 3.

67749 **Issue 5**

67750 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

67751 **Issue 6**

67752 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
67753 extension over the ISO C standard.

67754 **NAME**

67755 sigprocmask — examine and change blocked signals

67756 **SYNOPSIS**

```
67757 CX #include <signal.h>
67758 int sigprocmask(int how, const sigset_t *restrict set,
67759 sigset_t *restrict oset);
```

67760 **DESCRIPTION**

67761 Refer to [pthread\\_sigmask\(\)](#).

67762 **NAME**

67763 sigqueue — queue a signal to a process

67764 **SYNOPSIS**

```
67765 CX #include <signal.h>
67766 int sigqueue(pid_t pid, int signo, union sigval value);
```

67767 **DESCRIPTION**

67768 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value  
 67769 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking  
 67770 is performed but no signal is actually sent. The null signal can be used to check the validity of  
 67771 *pid*.

67772 The conditions required for a process to have permission to queue a signal to another process are  
 67773 the same as for the *kill()* function.

67774 The *sigqueue()* function shall return immediately. If SA\_SIGINFO is set for *signo* and if the  
 67775 resources were available to queue the signal, the signal shall be queued and sent to the receiving  
 67776 process. If SA\_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving  
 67777 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this  
 67778 call.

67779 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked  
 67780 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*  
 67781 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the  
 67782 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the  
 67783 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.  
 67784 The selection order between realtime and non-realtime signals, or between multiple pending  
 67785 non-realtime signals, is unspecified.

67786 **RETURN VALUE**

67787 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*  
 67788 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set  
 67789 *errno* to indicate the error.

67790 **ERRORS**

67791 The *sigqueue()* function shall fail if:

67792 [EAGAIN] No resources are available to queue the signal. The process has already  
 67793 queued {SIGQUEUE\_MAX} signals that are still pending at the receiver(s), or  
 67794 a system-wide resource limit has been exceeded.

67795 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

67796 [EPERM] The process does not have appropriate privileges to send the signal to the  
 67797 receiving process.

67798 [ESRCH] The process *pid* does not exist.

**67799 EXAMPLES**

67800 None.

**67801 APPLICATION USAGE**

67802 None.

**67803 RATIONALE**

67804 The *sigqueue()* function allows an application to queue a realtime signal to itself or to another  
67805 process, specifying the application-defined value. This is common practice in realtime  
67806 applications on existing realtime systems. It was felt that specifying another function in the  
67807 *sig...* name space already carved out for signals was preferable to extending the interface to  
67808 *kill()*.

67809 Such a function became necessary when the put/get event function of the message queues was  
67810 removed. It should be noted that the *sigqueue()* function implies reduced performance in a  
67811 security-conscious implementation as the access permissions between the sender and receiver  
67812 have to be checked on each send when the *pid* is resolved into a target process. Such access  
67813 checks were necessary only at message queue open in the previous interface.

67814 The standard developers required that *sigqueue()* have the same semantics with respect to the  
67815 null signal as *kill()*, and that the same permission checking be used. But because of the difficulty  
67816 of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the  
67817 interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function  
67818 queues a signal to a single process specified by the *pid* argument.

67819 The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An  
67820 explicit limit on the number of queued signals that a process could send was introduced. While  
67821 the limit is “per-sender”, this volume of POSIX.1-2024 does not specify that the resources be part  
67822 of the state of the sender. This would require either that the sender be maintained after exit until  
67823 all signals that it had sent to other processes were handled or that all such signals that had not  
67824 yet been acted upon be removed from the queue(s) of the receivers. This volume of  
67825 POSIX.1-2024 does not preclude this behavior, but an implementation that allocated queuing  
67826 resources from a system-wide pool (with per-sender limits) and that leaves queued signals  
67827 pending after the sender exits is also permitted.

**67828 FUTURE DIRECTIONS**

67829 None.

**67830 SEE ALSO**

67831 [Section 2.8.1](#) (on page 528)

67832 XBD [<signal.h>](#)

**67833 CHANGE HISTORY**

67834 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
67835 POSIX Threads Extension.

**67836 Issue 6**

67837 The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

67838 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
67839 implementation does not support the Realtime Signals Extension option.

**67840 Issue 7**

67841 The *sigqueue()* function is moved from the Realtime Signals Extension option to the Base.

67842 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0332 [844] is applied.

67843 **NAME**

67844 sigsetjmp — set jump point for a non-local goto

67845 **SYNOPSIS**

```
67846 CX #include <setjmp.h>
67847 int sigsetjmp(sigjmp_buf env, int savemask);
```

67848 **DESCRIPTION**67849 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 67850 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 67851 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 67852 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

67854 **RETURN VALUE**

67855 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from  
 67856 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

67857 **ERRORS**

67858 No errors are defined.

67859 **EXAMPLES**

67860 None.

67861 **APPLICATION USAGE**

67862 The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for  
 67863 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

67864 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified  
 67865 whether the signal mask is saved.

67866 **RATIONALE**

67867 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to  
 67868 permit implementors to recognize the name in the compiler and not implement an actual  
 67869 function. These same restrictions apply to the *sigsetjmp()* macro.

67870 There are processors that cannot easily support these calls, but this was not considered a  
 67871 sufficient reason to exclude them.

67872 4.2 BSD and 4.3 BSD provided functions named *\_setjmp()* and *\_longjmp()* that, together with  
 67873 *setjmp()* and *longjmp()*, provided the same functionality as *sigsetjmp()* and *siglongjmp()*. On  
 67874 those systems, *setjmp()* and *longjmp()* saved and restored signal masks, while *\_setjmp()* and  
 67875 *\_longjmp()* did not. On System V Release 3 and in corresponding issues of the SVID, *setjmp()*  
 67876 and *longjmp()* were explicitly defined not to save and restore signal masks. In order to permit  
 67877 existing practice in both cases, the relation of *setjmp()* and *longjmp()* to signal masks is not  
 67878 specified, and a new set of functions is defined instead.

67879 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching  
 67880 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts  
 67881 saved by other threads would be at best a questionable practice and were not considered worthy  
 67882 of standardization.

67883 **FUTURE DIRECTIONS**

67884 None.

67885 **SEE ALSO**67886 *pthread\_sigmask()*, *siglongjmp()*, *signal()*, *sigsuspend()*67887 XBD **<setjmp.h>**67888 **CHANGE HISTORY**

67889 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67890 **Issue 5**

67891 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

67892 **Issue 6**67893 The DESCRIPTION is reworded in terms of *setjmp()*.67894 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an extension over the ISO C standard.67896 **Issue 8**

67897 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

67898 **NAME**

67899 sigsuspend — wait for a signal

67900 **SYNOPSIS**

```
67901 CX #include <signal.h>
67902 int sigsuspend(const sigset_t *sigmask);
```

67903 **DESCRIPTION**

67904 The *sigsuspend()* function shall atomically both replace the current signal mask of the calling  
 67905 thread with the set of signals pointed to by *sigmask* and suspend the thread until delivery of a  
 67906 signal whose action is either to execute a signal-catching function or to terminate the process.  
 67907 This shall not cause any other signals that may have been pending on the process to become  
 67908 pending on the thread.

67909 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to  
 67910 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching  
 67911 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*  
 67912 call.

67913 It is not possible to block signals that cannot be ignored. This is enforced by the system without  
 67914 causing an error to be indicated.

67915 **RETURN VALUE**

67916 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion  
 67917 return value. If a return occurs,  $-1$  shall be returned and *errno* set to indicate the error.

67918 **ERRORS**

67919 The *sigsuspend()* function shall fail if:

67920 [EINTR] A signal is caught by the calling process and control is returned from the  
 67921 signal-catching function.

67922 **EXAMPLES**

67923 None.

67924 **APPLICATION USAGE**

67925 Normally, at the beginning of a critical code section, a specified set of signals is blocked using  
 67926 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait  
 67927 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was  
 67928 returned by the *sigprocmask()* call.

67929 **RATIONALE**

67930 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
 67931 can install an additional cancellation handler which resets the signal mask to the expected value.

```
67932 void cleanup(void *arg)
67933 {
67934     sigset_t *ss = (sigset_t *) arg;
67935     pthread_sigmask(SIG_SETMASK, ss, NULL);
67936 }
67937 int call_sigsuspend(const sigset_t *mask)
67938 {
67939     sigset_t oldmask;
67940     int result;
67941     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
67942     pthread_cleanup_push(cleanup, &oldmask);
```

```
67943         result = sigsuspend(mask);
67944         pthread_cleanup_pop(0);
67945         return result;
67946     }
```

**67947 FUTURE DIRECTIONS**

67948 None.

67951 XBD [<signal.h>](#)

**67952 CHANGE HISTORY**

67953 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**67954 Issue 5**

67955 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**67956 Issue 6**

67957 The text in the RETURN VALUE section has been changed from “suspends process execution”  
67958 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

67959 Text in the APPLICATION USAGE section has been replaced.

67960 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
67961 extension over the ISO C standard.

**67962 Issue 7**

67963 SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

**67964 Issue 8**

67965 Austin Group Defect 1201 is applied, clarifying the atomicity requirements for [sigsuspend\(\)](#).

67966 Austin Group Defect 1223 is applied, changing the example code in the RATIONALE.

67967 **NAME**

67968 sigtimedwait, sigwaitinfo — wait for queued signals

67969 **SYNOPSIS**

```
67970 CX #include <signal.h>
67971 int sigtimedwait(const sigset_t *restrict set,
67972 siginfo_t *restrict info,
67973 const struct timespec *restrict timeout);
67974 int sigwaitinfo(const sigset_t *restrict set,
67975 siginfo_t *restrict info);
```

67976 **DESCRIPTION**

67977 The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals  
67978 specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the  
67979 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-  
67980 valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall return  
67981 immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. The  
67982 CLOCK\_MONOTONIC clock shall be used to measure the time interval specified by the *timeout*  
67983 argument.

67984 The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of  
67985 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the  
67986 lowest numbered one. The selection order between realtime and non-realtime signals, or  
67987 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at  
67988 the time of the call, the calling thread shall be suspended until one or more signals in *set* become  
67989 pending or until it is interrupted by an unblocked, caught signal.

67990 The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function, except that the return  
67991 value and the error reporting method are different (see RETURN VALUE), and that if the *info*  
67992 argument is non-NULL, the selected signal number shall be stored in the *si\_signo* member, and  
67993 the cause of the signal shall be stored in the *si\_code* member. If any value is queued to the  
67994 selected signal, the first such queued value shall be dequeued and, if the *info* argument is non-  
67995 NULL, the value shall be stored in the *si\_value* member of *info*. The system resource used to  
67996 queue the signal shall be released and returned to the system for other use. If no value is  
67997 queued, the content of the *si\_value* member is undefined. If no further signals are queued for the  
67998 selected signal, the pending indication for that signal shall be reset.

67999 **RETURN VALUE**

68000 Upon successful completion (that is, one of the signals specified by *set* is pending or is  
68001 generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise,  
68002 the function shall return a value of  $-1$  and set *errno* to indicate the error.

68003 **ERRORS**

68004 The *sigtimedwait()* function shall fail if:

68005 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.

68006 The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

68007 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be  
68008 documented in system documentation whether this error causes these  
68009 functions to fail.

68010 The *sigtimedwait()* function may also fail if:  
 68011 [EINVAL] The *timeout* argument specified a *tv\_nsec* value less than zero or greater than  
 68012 or equal to 1 000 million.  
 68013 An implementation should only check for this error if no signal is pending in *set* and it is  
 68014 necessary to wait.

#### 68015 EXAMPLES

68016 None.

#### 68017 APPLICATION USAGE

68018 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application developers  
 68019 should note that this is inconsistent with other functions such as *pthread\_cond\_timedwait()* that  
 68020 return [ETIMEDOUT].

68021 Note that in order to ensure that generated signals are queued and signal values passed to  
 68022 *sigqueue()* are available in *si\_value*, applications which use *sigwaitinfo()* or *sigtimedwait()* need to  
 68023 set the SA\_SIGINFO flag for each signal in the set (see Section 2.4, on page 513). This means  
 68024 setting each signal to be handled by a three-argument signal-catching function, even if the  
 68025 handler will never be called. It is not possible (portably) to set a signal handler to SIG\_DFL  
 68026 while setting the SA\_SIGINFO flag, because assigning to the *sa\_handler* member of **struct**  
 68027 **sigaction** instead of the *sa\_sigaction* member would result in undefined behavior, and SIG\_DFL  
 68028 need not be assignment-compatible with *sa\_sigaction*. Even if an assignment of SIG\_DFL to  
 68029 *sa\_sigaction* is accepted by the compiler, the implementation need not treat this value as special—  
 68030 it could just be taken as the address of a signal-catching function.

#### 68031 RATIONALE

68032 Existing programming practice on realtime systems uses the ability to pause waiting for a  
 68033 selected set of events and handle the first event that occurs in-line instead of in a signal-handling  
 68034 function. This allows applications to be written in an event-directed style similar to a state  
 68035 machine. This style of programming is useful for largescale transaction processing in which the  
 68036 overall throughput of an application and the ability to clearly track states are more important  
 68037 than the ability to minimize the response time of individual event handling.

68038 It is possible to construct a signal-waiting macro function out of the realtime signal function  
 68039 mechanism defined in this volume of POSIX.1-2024. However, such a macro has to include the  
 68040 definition of a generalized handler for all signals to be waited on. A significant portion of the  
 68041 overhead of handler processing can be avoided if the signal-waiting function is provided by the  
 68042 kernel. This volume of POSIX.1-2024 therefore provides two signal-waiting functions—one that  
 68043 waits indefinitely and one with a timeout—as part of the overall realtime signal function  
 68044 specification.

68045 The specification of a function with a timeout allows an application to be written that can be  
 68046 broken out of a wait after a set period of time if no event has occurred. It was argued that setting  
 68047 a timer event before the wait and recognizing the timer event in the wait would also implement  
 68048 the same functionality, but at a lower performance level. Because of the performance  
 68049 degradation associated with the user-level specification of a timer event and the subsequent  
 68050 cancellation of that timer event after the wait completes for a valid event, and the complexity  
 68051 associated with handling potential race conditions associated with the user-level method, the  
 68052 separate function has been included.

68053 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*  
 68054 function defined by this volume of POSIX.1-2024. The only difference is that *sigwaitinfo()* returns  
 68055 the queued signal value in the *value* argument. The return of the queued value is required so that  
 68056 applications can differentiate between multiple events queued to the same signal number.

68057 The two distinct functions are being maintained because some implementations may choose to  
 68058 implement the POSIX Threads Extension functions and not implement the queued signals  
 68059 extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value*  
 68060 argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a  
 68061 macro on *sigwaitinfo()*.

68062 The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns  
 68063 regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed  
 68064 wait, and immediate return, and concerns regarding consistency with other functions where the  
 68065 conditional and timed waits were separate functions from the pure blocking function. The  
 68066 semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a macro  
 68067 with a null pointer for *timeout*.

68068 The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-  
 68069 generated signals. One important question was how many threads that are suspended in a call  
 68070 to a *sigwait()* function for a signal should return from the call when the signal is sent. Four  
 68071 choices were considered:

- 68072 1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
- 68073 2. One or more threads return.
- 68074 3. All waiting threads return.
- 68075 4. Exactly one thread returns.

68076 Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The  
 68077 “one or more” behavior made implementation of conforming packages easy at the expense of  
 68078 forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in  
 68079 application code in order to achieve predictable behavior. There was concern that the “all  
 68080 waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU  
 68081 resources by replicating the signals in the general case. Furthermore, no convincing examples  
 68082 could be presented that delivery to all was either simpler or more powerful than delivery to one.

68083 Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait*  
 68084 function for a signal should return when that signal occurs. This is not an onerous restriction as:

- 68085 • A multi-way signal wait can be built from the single-way wait.
- 68086 • Signals should only be handled by application-level code, as library routines cannot guess  
 68087 what the application wants to do with signals generated for the entire process.
- 68088 • Applications can thus arrange for a single thread to wait for any given signal and call any  
 68089 needed routines upon its arrival.

68090 In an application that is using signals for interprocess communication, signal processing is  
 68091 typically done in one place. Alternatively, if the signal is being caught so that process cleanup  
 68092 can be done, the signal handler thread can call separate process cleanup routines for each  
 68093 portion of the application. Since the application main line started each portion of the application,  
 68094 it is at the right abstraction level to tell each portion of the application to clean up.

68095 Certainly, there exist programming styles where it is logical to consider waiting for a single  
 68096 signal in multiple threads. A simple *sigwait\_multiple()* routine can be constructed to achieve this  
 68097 goal. A possible implementation would be to have each *sigwait\_multiple()* caller registered as  
 68098 having expressed interest in a set of signals. The caller then waits on a thread-specific condition  
 68099 variable. A single server thread calls a *sigwait()* function on the union of all registered signals.  
 68100 When the *sigwait()* function returns, the appropriate state is set and condition variables are  
 68101 broadcast. New *sigwait\_multiple()* callers may cause the pending *sigwait()* call to be canceled

68102 and reissued in order to update the set of signals being waited for.

68103 **FUTURE DIRECTIONS**

68104 None.

68109 **CHANGE HISTORY**

68110 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
68111 POSIX Threads Extension.

68112 **Issue 6**

68113 These functions are marked as part of the Realtime Signals Extension option.

68114 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the `sigwaitinfo()` function  
68115 has been corrected so that the second argument is of type `siginfo_t *`.

68116 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
68117 implementation does not support the Realtime Signals Extension option.

68118 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
68119 CLOCK\_MONOTONIC clock, if supported, is used to measure timeout intervals.

68120 The `restrict` keyword is added to the `sigtimedwait()` and `sigwaitinfo()` prototypes for alignment  
68121 with the ISO/IEC 9899:1999 standard.

68122 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the  
68123 RETURN VALUE section to that in the original base document (“An implementation should  
68124 only check for this error if no signal is pending in *set* and it is necessary to wait”).

68125 **Issue 7**

68126 The `sigtimedwait()` and `sigwaitinfo()` functions are moved from the Realtime Signals Extension  
68127 option to the Base.

68128 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0583 [392] is applied.

68129 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0333 [815] is applied.

68130 **Issue 8**

68131 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

68132 **NAME**

68133 sigwait — wait for queued signals

68134 **SYNOPSIS**

```
68135 CX #include <signal.h>
68136 int sigwait(const sigset_t *restrict set, int *restrict sig);
```

68137 **DESCRIPTION**

68138 The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's  
 68139 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to  
 68140 the call to *sigwait()* there are multiple pending instances of a single signal number, it is  
 68141 implementation-defined whether upon successful return there are any remaining pending  
 68142 signals for that signal number. If the implementation supports queued signals and there are  
 68143 multiple signals queued for the signal number selected, the first such queued signal shall cause a  
 68144 return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the  
 68145 time of the call, the thread shall be suspended until one or more becomes pending. The signals  
 68146 defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior  
 68147 is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

68148 If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these  
 68149 threads shall return from *sigwait()* with the signal number. If more than a single thread is  
 68150 blocked in *sigwait()* for a signal when that signal is generated for the process, it is unspecified  
 68151 which of the waiting threads returns from *sigwait()*. If the signal is generated for a specific  
 68152 thread, as by *pthread\_kill()*, only that thread shall return.

68153 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it  
 68154 shall be the lowest numbered one. The selection order between realtime and non-realtime  
 68155 signals, or between multiple pending non-realtime signals, is unspecified.

68156 **RETURN VALUE**

68157 Upon successful completion, *sigwait()* shall store the signal number of the received signal at the  
 68158 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to  
 68159 indicate the error.

68160 **ERRORS**

68161 The *sigwait()* function may fail if:

68162 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

68163 **EXAMPLES**

68164 None.

68165 **APPLICATION USAGE**

68166 None.

68167 **RATIONALE**

68168 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-2024  
 68169 provides the *sigwait()* function. For most cases where a thread has to wait for a signal, the  
 68170 *sigwait()* function should be quite convenient, efficient, and adequate.

68171 However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that  
 68172 could be used by threads. After some consideration, threads were allowed to use semaphores  
 68173 and *sem\_post()* was defined to be async-signal-safe.

68174 In summary, when it is necessary for code run in response to an asynchronous signal to notify a  
 68175 thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation  
 68176 provides semaphores, they also can be used, either following *sigwait()* or from within a signal

68177 handling routine previously registered with *sigaction()*.

68178 **FUTURE DIRECTIONS**

68179 None.

68180 **SEE ALSO**

68184 **CHANGE HISTORY**

68185 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
68186 POSIX Threads Extension.

68187 **Issue 6**

68188 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the  
68189 ISO/IEC 9899:1999 standard.

68190 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the  
68191 DESCRIPTION to state that if more than a single thread is blocked in *sigwait()*, it is unspecified  
68192 which of the waiting threads returns, and that if a signal is generated for a specific thread only  
68193 that thread shall return.

68194 **Issue 7**

68195 Functionality relating to the Realtime Signals Extension option is moved to the Base.

68196 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0584 [76] is applied.

68197 **NAME**

68198 sigwaitinfo — wait for queued signals

68199 **SYNOPSIS**68200 

```
#include <signal.h>
```

68201 

```
int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

68202 **DESCRIPTION**68203 Refer to *sigtimedwait()*.

68204 **NAME**

68205 sin, sinf, sinl — sine function

68206 **SYNOPSIS**

```
68207 #include <math.h>
68208 double sin(double x);
68209 float sinf(float x);
68210 long double sinl(long double x);
```

68211 **DESCRIPTION**

68212 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 68213 conflict between the requirements described here and the ISO C standard is unintentional. This  
 68214 volume of POSIX.1-2024 defers to the ISO C standard.

68215 These functions shall compute the sine of their argument  $x$ , measured in radians.

68216 An application wishing to check for error situations should set *errno* to zero and call  
 68217 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 68218 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 68219 zero, an error has occurred.

68220 **RETURN VALUE**

68221 Upon successful completion, these functions shall return the sine of  $x$ .

68222 MX If  $x$  is NaN, a NaN shall be returned.

68223 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

68224 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

68225 MXX If  $x$  is subnormal,  $x$  should be returned.

68226 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *sin()*, *sinf()*, and *sinl()* shall  
 68227 return an implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN,  
 68228 and LDBL\_MIN, respectively.

68229 **ERRORS**

68230 These functions shall fail if:

68231 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ .

68232 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 68233 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 68234 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 68235 shall be raised.

68236 These functions may fail if:

68237 MX **Range Error** The value of  $x$  is subnormal

68238 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 68239 then *errno* shall be set to [ERANGE]. If the integer expression  
 68240 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 68241 floating-point exception shall be raised.

68242 **EXAMPLES**68243 **Taking the Sine of a 45-Degree Angle**

```

68244 #include <math.h>
68245 ...
68246 double radians = 45.0 * M_PI / 180;
68247 double result;
68248 ...
68249 result = sin(radians);

```

68250 **APPLICATION USAGE**

68251 These functions may lose accuracy when their argument is near a multiple of  $\pi$  or is far from 0.0.

68252 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
68253 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

68254 **RATIONALE**

68255 None.

68256 **FUTURE DIRECTIONS**

68257 None.

68258 **SEE ALSO**

68259 [asin\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#)

68261 **CHANGE HISTORY**

68262 First released in Issue 1. Derived from Issue 1 of the SVID.

68263 **Issue 5**

68264 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
68265 in previous issues.

68266 **Issue 6**

68267 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

68268 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
68269 revised to align with the ISO/IEC 9899:1999 standard.

68270 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
68271 marked.

68272 **Issue 7**

68273 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0585 [68] and XSH/TC1-2008/0586  
68274 [320] are applied.

68275 **Issue 8**

68276 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when *x* is  
68277 subnormal to avoid the need for two shading changes.

68278 **NAME**

68279           sinh, sinhf, sinh1 — hyperbolic sine functions

68280 **SYNOPSIS**

```
68281       #include <math.h>
68282       double sinh(double x);
68283       float  sinhf(float x);
68284       long double sinh1(long double x);
```

68285 **DESCRIPTION**

68286 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
68287 conflict between the requirements described here and the ISO C standard is unintentional. This  
68288 volume of POSIX.1-2024 defers to the ISO C standard.

68289       These functions shall compute the hyperbolic sine of their argument *x*.

68290       An application wishing to check for error situations should set *errno* to zero and call  
68291 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
68292 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
68293 zero, an error has occurred.

68294 **RETURN VALUE**

68295       Upon successful completion, these functions shall return the hyperbolic sine of *x*.

68296       If the result would cause an overflow, a range error shall occur and  $\pm$ HUGE\_VAL,  
68297  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (with the same sign as *x*) shall be returned as appropriate for  
68298 the type of the function.

68299 MX       If *x* is NaN, a NaN shall be returned.

68300       If *x* is  $\pm 0$  or  $\pm$ Inf, *x* shall be returned.

68301 MXX     If *x* is subnormal, *x* should be returned.

68302 MX       If *x* is subnormal, a range error may occur and, if *x* is not returned, *sinh*(*x*), *sinhf*(*x*), and *sinh1*(*x*)  
68303 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
68304 FLT\_MIN, and LDBL\_MIN, respectively.

68305 **ERRORS**

68306       These functions shall fail if:

68307       Range Error       The result would cause an overflow.

68308               If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
68309 then *errno* shall be set to [ERANGE]. If the integer expression  
68310 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
68311 floating-point exception shall be raised.

68312       These functions may fail if:

68313 MX       Range Error       The value *x* is subnormal.

68314               If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
68315 then *errno* shall be set to [ERANGE]. If the integer expression  
68316 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
68317 floating-point exception shall be raised.

**68318 EXAMPLES**

68319 None.

**68320 APPLICATION USAGE**

68321 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
68322 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**68323 RATIONALE**

**68330 CHANGE HISTORY**

68331 First released in Issue 1. Derived from Issue 1 of the SVID.

**68332 Issue 5**

68333 The DESCRIPTION is updated to indicate how an application should check for an error. This  
68334 text was previously published in the APPLICATION USAGE section.

**68335 Issue 6**

68336 The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

68337 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
68338 revised to align with the ISO/IEC 9899:1999 standard.

68339 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
68340 marked.

**68341 Issue 7**

68342 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0587 [68] is applied.

**68343 Issue 8**

68344 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when *x* is  
68345 subnormal to avoid the need for two shading changes.

68346 **NAME**

68347       sinl — sine function

68348 **SYNOPSIS**

68349       #include <math.h>

68350       long double sinl(long double *x*);

68351 **DESCRIPTION**

68352       Refer to *sin()*.

68353 **NAME**

68354 sleep — suspend execution for an interval of time

68355 **SYNOPSIS**

68356 #include &lt;unistd.h&gt;

68357 unsigned sleep(unsigned *seconds*);68358 **DESCRIPTION**

68359 The *sleep()* function shall cause the calling thread to be suspended from execution until either  
 68360 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is  
 68361 delivered to the calling thread and its action is to invoke a signal-catching function or to  
 68362 terminate the process. The suspension time may be longer than requested due to the scheduling  
 68363 of other activity by the system.

68364 In single-threaded programs, *sleep()* may make use of SIGALRM. In multi-threaded programs,  
 68365 *sleep()* shall not make use of SIGALRM and the remainder of this DESCRIPTION does not apply.

68366 If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the  
 68367 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()*  
 68368 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also  
 68369 unspecified whether it remains pending after *sleep()* returns or it is discarded.

68370 If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a  
 68371 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from  
 68372 delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

68373 If a signal-catching function interrupts *sleep()* and examines or changes either the time a  
 68374 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or  
 68375 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

68376 If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an  
 68377 environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and  
 68378 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also  
 68379 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is  
 68380 restored as part of the environment.

68381 **RETURN VALUE**

68382 If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()*  
 68383 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested  
 68384 time minus the time actually slept) in seconds.

68385 **ERRORS**

68386 No errors are defined.

68387 **EXAMPLES**

68388 None.

68389 **APPLICATION USAGE**

68390 None.

68391 **RATIONALE**

68392 There are two general approaches to the implementation of the *sleep()* function. One is to use the  
 68393 *alarm()* function to schedule a SIGALRM signal and then suspend the calling thread waiting for  
 68394 that signal. The other is to implement an independent facility. This volume of POSIX.1-2024  
 68395 permits either approach in single-threaded programs, but the simple alarm/suspend  
 68396 implementation is not appropriate for multi-threaded programs.

68397 In order to comply with the requirement that no primitive shall change a process attribute unless

68398 explicitly described by this volume of POSIX.1-2024, an implementation using SIGALRM must  
 68399 carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the action  
 68400 previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has  
 68401 been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to  
 68402 that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-  
 68403 catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()*  
 68404 would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The  
 68405 action and blocking for SIGALRM must be saved and restored.

68406 Historical implementations often implement the SIGALRM-based version using *alarm()* and  
 68407 *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*.  
 68408 Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid  
 68409 that window. That implementation introduces a different problem: when the SIGALRM signal  
 68410 interrupts a signal-catching function installed by the user to catch a different signal, the  
 68411 *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*,  
 68412 *alarm()*, and *sigsuspend()* can avoid these problems.

68413 Despite all reasonable care, there are several very subtle, but detectable and unavoidable,  
 68414 differences between the two types of implementations. These are the cases mentioned in this  
 68415 volume of POSIX.1-2024 where some other activity relating to SIGALRM takes place, and the  
 68416 results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of  
 68417 concern to most applications.

68418 See also the discussion of the term *realtime* in *alarm()*.

68419 Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early  
 68420 under *alarm()* applies to *sleep()* as well.

68421 Application developers should note that the type of the argument *seconds* and the return value of  
 68422 *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application  
 68423 cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX}, which the  
 68424 ISO C standard sets as 65 535, and any application passing a larger value is restricting its  
 68425 portability. A different type was considered, but historical implementations, including those  
 68426 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

68427 Scheduling delays may cause the process to return from the *sleep()* function significantly after  
 68428 the requested time. In such cases, the return value should be set to zero, since the formula  
 68429 (requested time minus the time actually spent) yields a negative number and *sleep()* returns an  
 68430 **unsigned**.

#### 68431 FUTURE DIRECTIONS

68432 A future version of this standard may require that *sleep()* does not make use of SIGALRM in all  
 68433 programs, not just multi-threaded programs.

#### 68437 CHANGE HISTORY

68438 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 68439 Issue 5

68440 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

68441 **Issue 6**

68442 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/132 is applied, making a correction in the  
68443 RATIONALE section.

68444 **Issue 7**

68445 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0334 [625] is applied.

68446 **Issue 8**

68447 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

68448 **NAME**

68449            snprintf — print formatted output

68450 **SYNOPSIS**

68451            #include <stdio.h>

68452            int snprintf(char \*restrict *s*, size\_t *n*,  
68453                const char \*restrict *format*, ...);

68454 **DESCRIPTION**

68455            Refer to *fprintf()*.

68456 **NAME**

68457 socketmark — determine whether a socket is at the out-of-band mark

68458 **SYNOPSIS**

68459 #include &lt;sys/socket.h&gt;

68460 int socketmark(int s);

68461 **DESCRIPTION**

68462 The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at  
 68463 the out-of-band data mark (see [Section 2.10.12](#), on page 552). If the protocol for the socket  
 68464 supports out-of-band data by marking the stream with an out-of-band data mark, the  
 68465 *socketmark()* function shall return 1 when all data preceding the mark has been read and the out-  
 68466 of-band data mark is the first element in the receive queue. The *socketmark()* function shall not  
 68467 remove the mark from the stream.

68468 **RETURN VALUE**

68469 Upon successful completion, the *socketmark()* function shall return a value indicating whether  
 68470 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data  
 68471 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data  
 68472 precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it  
 68473 shall return a value of -1 and set *errno* to indicate the error.

68474 **ERRORS**68475 The *socketmark()* function shall fail if:68476 [EBADF] The *s* argument is not a valid file descriptor.68477 [ENOTTY] The file associated with the *s* argument is not a socket.68478 **EXAMPLES**

68479 None.

68480 **APPLICATION USAGE**

68481 The use of this function between receive operations allows an application to determine which  
 68482 received data precedes the out-of-band data and which follows the out-of-band data.

68483 There is an inherent race condition in the use of this function. On an empty receive queue, the  
 68484 current read of the location might well be at the “mark”, but the system has no way of knowing  
 68485 that the next data segment that will arrive from the network will carry the mark, and  
 68486 *socketmark()* will return false, and the next read operation will silently consume the mark.

68487 Hence, this function can only be used reliably when the application already knows that the out-  
 68488 of-band data has been seen by the system or that it is known that there is data waiting to be read  
 68489 at the socket (via SIGURG or *select()*). See [Section 2.10.11](#) (on page 552), [Section 2.10.12](#) (on page  
 68490 552), [Section 2.10.14](#) (on page 553), and *pselect()* for details.

68491 **RATIONALE**

68492 The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which  
 68493 implemented the same functionality on many implementations. Using a wrapper function  
 68494 follows the adopted conventions to avoid specifying commands to the *ioctl()* function. The  
 68495 *socketmark()* function could be implemented as follows:

```
68496 #include <sys/ioctl.h>
68497 int socketmark(int s)
68498 {
68499     int val;
68500     if (ioctl(s, SIOCATMARK, &val) == -1)
```

```
68501         return (-1);
68502     return (val);
68503 }
```

68504 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of  
68505 SIOCATMARK.

68506 **FUTURE DIRECTIONS**

68507 None.

68511 **CHANGE HISTORY**

68512 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

68513 **Issue 7**

68514 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

68515 **Issue 8**

68516 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

68517 **NAME**

68518 socket — create an endpoint for communication

68519 **SYNOPSIS**

68520 #include &lt;sys/socket.h&gt;

68521 int socket(int *domain*, int *type*, int *protocol*);68522 **DESCRIPTION**

68523 The *socket()* function shall create an unbound socket in a communications domain, and return a  
 68524 file descriptor that can be used in later function calls that operate on sockets. The file descriptor  
 68525 shall be allocated as described in [Section 2.6](#) (on page 525).

68526 The *socket()* function takes the following arguments:

68527 *domain* Specifies the communications domain in which a socket is to be created.

68528 *type* Specifies the type of socket to be created.

68529 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*  
 68530 of 0 causes *socket()* to use an unspecified default protocol appropriate for the  
 68531 requested socket type.

68532 The *domain* argument specifies the address family used in the communications domain. The  
 68533 address families supported by the system are implementation-defined.

68534 Symbolic constants that can be used for the domain argument are defined in the <sys/socket.h>  
 68535 header.

68536 The *type* argument specifies the socket type, which determines the semantics of communication  
 68537 over the socket. The following socket types are defined; implementations may specify additional  
 68538 socket types:

68539 SOCK\_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte streams,  
 68540 and may provide a transmission mechanism for out-of-band data.

68541 SOCK\_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages of  
 68542 fixed maximum length.

## 68543 SOCK\_SEQPACKET

68544 Provides sequenced, reliable, bidirectional, connection-mode transmission  
 68545 paths for records. A record can be sent using one or more output operations  
 68546 and received using one or more input operations, but a single operation never  
 68547 transfers part of more than one record. Record boundaries are visible to the  
 68548 receiver via the MSG\_EOR flag.

68549 Additionally, the *type* argument can contain the bitwise-inclusive OR of flags from the following  
 68550 list:

68551 SOCK\_CLOEXEC Atomically set the FD\_CLOEXEC flag on the new file descriptor.

68552 SOCK\_CLOFORK Atomically set the FD\_CLOFORK flag on the new file descriptor.

68553 SOCK\_NONBLOCK Set the O\_NONBLOCK file status flag on the new file description.

68554 Implementations may define additional flags.

68555 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
 68556 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
 68557 be used. The protocols supported by the system are implementation-defined.

68558 The process may need to have appropriate privileges to use the *socket()* function or to create

68559 some sockets.

#### 68560 RETURN VALUE

68561 Upon successful completion, *socket()* shall return a non-negative integer, the socket file  
68562 descriptor. Otherwise, a value of  $-1$  shall be returned and *errno* set to indicate the error.

#### 68563 ERRORS

68564 The *socket()* function shall fail if:

68565 [EAFNOSUPPORT]

68566 The implementation does not support the specified address family.

68567 [EMFILE] All file descriptors available to the process are currently open.

68568 [ENFILE] No more file descriptors are available for the system.

68569 [EPROTONOSUPPORT]

68570 The value of *protocol* is non-zero and either the protocol is not supported by  
68571 the address family or the protocol is not supported by the implementation.

68572 [EPROTOTYPE] The value of *protocol* is non-zero and the socket type is not supported by the  
68573 protocol.

68574 OB [ESOCKTNOSUPPORT] or [EPROTONOSUPPORT] or [EPROTOTYPE]

68575 The socket type is not supported by the address family, or the socket type is  
68576 not supported by the implementation.

68577 The *socket()* function may fail if:

68578 [EACCES] The process does not have appropriate privileges.

68579 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

68580 [ENOMEM] Insufficient memory was available to fulfill the request.

#### 68581 EXAMPLES

68582 None.

#### 68583 APPLICATION USAGE

68584 The documentation for specific address families specifies which protocols each address family  
68585 supports. The documentation for specific protocols specifies which socket types each protocol  
68586 supports.

68587 The application can determine whether an address family is supported by trying to create a  
68588 socket with *domain* set to the protocol in question.

#### 68589 RATIONALE

68590 The use of the SOCK\_CLOEXEC and SOCK\_CLOFORK flags in the *type* argument of *socket()* is  
68591 necessary to avoid a data race in multi-threaded applications. Without SOCK\_CLOFORK, a file  
68592 descriptor is leaked into a child process created by one thread in the window between another  
68593 thread calling *socket()* and using *fcntl()* to set the FD\_CLOFORK flag. Without  
68594 SOCK\_CLOEXEC, a file descriptor intentionally inherited by child processes is similarly leaked  
68595 into an executed program if FD\_CLOEXEC is not set atomically. The SOCK\_NONBLOCK flag is  
68596 for convenience in avoiding additional *fcntl()* calls.

68597 Historically the standard did not specify the *errno* value to be used when the socket type is not  
68598 supported, and there were differences between implementations. Some reused the existing  
68599 standard [EPROTONOSUPPORT] or [EPROTOTYPE] values while others set *errno* to a (then)  
68600 non-standard value of [ESOCKTNOSUPPORT]. All three values are permitted in this version of  
68601 the standard, but the use of [EPROTONOSUPPORT] or [EPROTOTYPE] is considered to be  
68602 misleading when no protocol is specified (that is, the value of *protocol* is zero) and consequently

68603 those alternatives have been marked obsolescent. If *protocol* is non-zero, since there is no  
68604 precedence between error conditions, all three values will still be permitted even after the  
68605 obsolescent alternatives for the [ESOCKTNOSUPPORT] condition have been removed.

#### 68606 FUTURE DIRECTIONS

68607 A future version of this standard may disallow setting *errno* to [EPROTONOSUPPORT] or  
68608 [EPROTOTYPE] when the socket type is not supported and *protocol* is zero.

#### 68613 CHANGE HISTORY

68614 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

#### 68615 Issue 7

68616 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0335 [835] is applied.

#### 68617 Issue 8

68618 Austin Group Defects 411 and 1318 are applied, adding SOCK\_CLOEXEC, SOCK\_CLOFORK,  
68619 and SOCK\_NONBLOCK.

68620 Austin Group Defect 1067 is applied, adding the [ESOCKTNOSUPPORT] error and changing the  
68621 [EPROTONOSUPPORT] and [EPROTOTYPE] errors.

68622 Austin Group Defect 1475 is applied, adding *close()* to the SEE ALSO section.

68623 **NAME**

68624 socketpair — create a pair of connected sockets

68625 **SYNOPSIS**

```
68626 #include <sys/socket.h>
68627 int socketpair(int domain, int type, int protocol,
68628               int socket_vector[2]);
```

68629 **DESCRIPTION**

68630 The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*,  
 68631 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two  
 68632 sockets shall be identical. The file descriptors used in referencing the created sockets shall be  
 68633 returned in *socket\_vector*[0] and *socket\_vector*[1]. The file descriptors shall be allocated as  
 68634 described in [Section 2.6](#) (on page 525).

68635 The *socketpair()* function takes the following arguments:

68636	<i>domain</i>	Specifies the communications domain in which the sockets are to be created.
68637	<i>type</i>	Specifies the type of sockets to be created.
68638	<i>protocol</i>	Specifies a particular protocol to be used with the sockets. Specifying a 68639 <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol 68640 appropriate for the requested socket type.
68641	<i>socket_vector</i>	Specifies a 2-integer array to hold the file descriptors of the created socket pair.

68642 The *type* argument specifies the socket type, which determines the semantics of communications  
 68643 over the socket. The following socket types are defined; implementations may specify additional  
 68644 socket types:

68645	SOCK_STREAM	Provides sequenced, reliable, bidirectional, connection-mode byte 68646 streams, and may provide a transmission mechanism for out-of-band 68647 data.
68648	SOCK_DGRAM	Provides datagrams, which are connectionless-mode, unreliable messages 68649 of fixed maximum length.
68650	SOCK_SEQPACKET	Provides sequenced, reliable, bidirectional, connection-mode transmission 68651 paths for records. A record can be sent using one or more output 68652 operations and received using one or more input operations, but a single 68653 operation never transfers part of more than one record. Record 68654 boundaries are visible to the receiver via the MSG_EOR flag.

68655 Additionally, the *type* argument can contain the bitwise-inclusive OR of flags from the following  
 68656 list:

68657	SOCK_CLOEXEC	Atomically set the FD_CLOEXEC flag on the new file descriptors.
68658	SOCK_CLOFORK	Atomically set the FD_CLOFORK flag on the new file descriptors.
68659	SOCK_NONBLOCK	Set the O_NONBLOCK file status flag on the new file descriptions.

68660 Implementations may define additional flags.

68661 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
 68662 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
 68663 be used. The protocols supported by the system are implementation-defined.

68664 The process may need to have appropriate privileges to use the *socketpair()* function or to create  
 68665 some sockets.

68666 **RETURN VALUE**

68667 Upon successful completion, this function shall return 0; otherwise, `-1` shall be returned and  
 68668 *errno* set to indicate the error, no file descriptors shall be allocated, and the contents of  
 68669 *socket\_vector* shall be left unmodified.

68670 **ERRORS**

68671 The *socketpair()* function shall fail if:

68672 [EAFNOSUPPORT]

68673 The implementation does not support the specified address family.

68674 [EMFILE]

68675 All, or all but one, of the file descriptors available to the process are currently open.

68676 [ENFILE]

No more file descriptors are available for the system.

68677 [EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.

68678 [EPROTONOSUPPORT]

68679 The protocol is not supported by the address family, or the protocol is not  
 68680 supported by the implementation.

68681 [EPROTOTYPE] The socket type is not supported by the protocol.

68682 The *socketpair()* function may fail if:

68683 [EACCES]

The process does not have appropriate privileges.

68684 [ENOBUFS]

Insufficient resources were available in the system to perform the operation.

68685 [ENOMEM]

Insufficient memory was available to fulfill the request.

68686 **EXAMPLES**

68687 None.

68688 **APPLICATION USAGE**

68689 The documentation for specific address families specifies which protocols each address family  
 68690 supports. The documentation for specific protocols specifies which socket types each protocol  
 68691 supports.

68692 The *socketpair()* function is used primarily with UNIX domain sockets and need not be  
 68693 supported for other domains.

68694 **RATIONALE**

68695 The use of the `SOCK_CLOEXEC` and `SOCK_CLOFORK` flags in the *type* argument of *socketpair()*  
 68696 is necessary to avoid a data race in multi-threaded applications. Without `SOCK_CLOFORK`, a  
 68697 file descriptor is leaked into a child process created by one thread in the window between  
 68698 another using *socketpair()* and using *fcntl()* to set the `FD_CLOFORK` flag. Without  
 68699 `SOCK_CLOEXEC`, a file descriptor intentionally inherited by child processes is similarly leaked  
 68700 into an executed program if `FD_CLOEXEC` is not set atomically.

68701 Since socket pairs are often used for communication between a parent and child process,  
 68702 `SOCK_CLOFORK` has to be used with care in order for the pair to be usable. If the parent will be  
 68703 writing and the child will be reading, `SOCK_CLOFORK` should be used when creating the pair,  
 68704 and then *fcntl()* should be used to clear `FD_CLOFORK` for the read side of the pair. This  
 68705 prevents the write side from leaking into other children, ensuring the child will get end-of-file  
 68706 when the parent closes the write side (although the read side can still be leaked). If the parent  
 68707 will be reading and the child will be writing, or if the socket pair will be used bidirectionally,  
 68708 there is no way to prevent the write side(s) being leaked (short of preventing other threads from  
 68709 creating child processes) in order to ensure the parent gets end-of-file when the child closes its

68710 side, and so the two processes should use an alternative method of indicating the end of  
68711 communications, for example using *shutdown()*.

68712 Arranging for FD\_CLOEXEC to be set appropriately is more straightforward. The parent should  
68713 use SOCK\_CLOEXEC when creating the socket pair and the child should clear FD\_CLOEXEC  
68714 on the side to be passed to the new program before calling an *exec* family function to execute it.

68715 The SOCK\_NONBLOCK flag is for convenience in avoiding additional *fcntl()* calls.

#### 68716 FUTURE DIRECTIONS

68717 None.

#### 68718 SEE ALSO

68719 [Section 2.6](#) (on page 525), *socket()*

68720 XBD [<sys/socket.h>](#)

#### 68721 CHANGE HISTORY

68722 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

#### 68723 Issue 7

68724 The description of the [EMFILE] error condition is aligned with the *pipe()* function.

68725 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0336 [835] and XSH/TC2-2008/0337  
68726 [483,835] are applied.

#### 68727 Issue 8

68728 Austin Group Defects 411 and 1318 are applied, adding SOCK\_CLOEXEC, SOCK\_CLOFORK,  
68729 and SOCK\_NONBLOCK.

68730 **NAME**

68731        sprintf — print formatted output

68732 **SYNOPSIS**

68733        #include &lt;stdio.h&gt;

68734        int sprintf(char \*restrict *s*, const char \*restrict *format*, ...);68735 **DESCRIPTION**68736        Refer to *fprintf()*.

68737 **NAME**

68738 sqrt, sqrtf, sqrtl — square root function

68739 **SYNOPSIS**

```
68740 #include <math.h>
68741 double sqrt(double x);
68742 float sqrtf(float x);
68743 long double sqrtl(long double x);
```

68744 **DESCRIPTION**

68745 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 68746 conflict between the requirements described here and the ISO C standard is unintentional. This  
 68747 volume of POSIX.1-2024 defers to the ISO C standard.

68748 These functions shall compute the square root of their argument  $x$ ,  $\sqrt{x}$ .

68749 An application wishing to check for error situations should set *errno* to zero and call  
 68750 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 68751 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 68752 zero, an error has occurred.

68753 **RETURN VALUE**

68754 Upon successful completion, these functions shall return the square root of  $x$ .

68755 MX The returned value shall be dependent on the current rounding direction mode.

68756 MX For finite values of  $x < -0$ , a domain error shall occur, and either a NaN (if supported), or an  
 68757 implementation-defined value shall be returned.

68758 MX If  $x$  is NaN, a NaN shall be returned.

68759 If  $x$  is  $\pm 0$  or  $+\text{Inf}$ ,  $x$  shall be returned.

68760 If  $x$  is  $-\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

68761 **ERRORS**

68762 These functions shall fail if:

68763 MX Domain Error The finite value of  $x$  is  $< -0$ , or  $x$  is  $-\text{Inf}$ .

68764 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 68765 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 68766 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 68767 shall be raised.

68768 **EXAMPLES**68769 **Taking the Square Root of 9.0**

```
68770 #include <math.h>
68771 ...
68772 double x = 9.0;
68773 double result;
68774 ...
68775 result = sqrt(x);
```

68776 **APPLICATION USAGE**

68777 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
68778 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

68779 **RATIONALE**

68780 None.

68781 **FUTURE DIRECTIONS**

68782 None.

68783 **SEE ALSO**

68784 *feclearexcept()*, *fetetestexcept()*, *isnan()*

68785 XBD Section 4.23 (on page 109), <math.h>, <stdio.h>

68786 **CHANGE HISTORY**

68787 First released in Issue 1. Derived from Issue 1 of the SVID.

68788 **Issue 5**

68789 The DESCRIPTION is updated to indicate how an application should check for an error. This  
68790 text was previously published in the APPLICATION USAGE section.

68791 **Issue 6**

68792 The *sqrtf()* and *sqrtl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

68793 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
68794 revised to align with the ISO/IEC 9899:1999 standard.

68795 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
68796 marked.

68797 **Issue 7**

68798 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0588 [320] is applied.

68799 **Issue 8**

68800 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
68801 standard.

68802 **NAME**

68803           srand — pseudo-random number generator

68804 **SYNOPSIS**

68805           #include <stdlib.h>

68806           void srand(unsigned seed);

68807 **DESCRIPTION**

68808           Refer to *rand()*.

68809 **NAME**

68810           srand48 — seed the uniformly distributed double-precision pseudo-random number generator

68811 **SYNOPSIS**

```
68812 XSI       #include <stdlib.h>  
68813       void srand48(long seedval);
```

68814 **DESCRIPTION**68815       Refer to *drand48()*.

68816 **NAME**

68817           srandom — seed pseudo-random number generator

68818 **SYNOPSIS**

68819 XSI        #include <stdlib.h>

68820           void srandom(unsigned *seed*);

68821 **DESCRIPTION**

68822           Refer to *initstate()*.

68823 **NAME**

68824        scanf — convert formatted input

68825 **SYNOPSIS**

68826        #include &lt;stdio.h&gt;

68827        int sscanf(const char \*restrict *s*, const char \*restrict *format*, ...);68828 **DESCRIPTION**68829        Refer to *fscanf()*.

68830 **NAME**

68831           stat — get file status

68832 **SYNOPSIS**

68833           #include &lt;sys/stat.h&gt;

68834           int stat(const char \*restrict *path*, struct stat \*restrict *buf*);68835 **DESCRIPTION**68836           Refer to *fstatat()*.

68837 **NAME**

68838           statvfs — get file system information

68839 **SYNOPSIS**

68840           #include &lt;sys/statvfs.h&gt;

68841           int statvfs(const char \*restrict *path*, struct statvfs \*restrict *buf*);68842 **DESCRIPTION**68843           Refer to [fstatvfs\(\)](#).

68844 **NAME**

68845            stderr, stdin, stdout — standard I/O streams

68846 **SYNOPSIS**

68847            #include &lt;stdio.h&gt;

68848            extern FILE \*stderr, \*stdin, \*stdout;

68849 **DESCRIPTION**

68850 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 68851            conflict between the requirements described here and the ISO C standard is unintentional. This  
 68852            volume of POSIX.1-2024 defers to the ISO C standard.

68853            A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type  
 68854            **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer  
 68855            to designate the stream in all further transactions. Normally, there are three open streams with  
 68856            constant pointers declared in the <stdio.h> header and associated with the standard open files.

68857            At program start-up, three streams shall be predefined and already open: *stdin* (standard input,  
 68858            for conventional input) for reading, *stdout* (standard output, for conventional output) for  
 68859            writing, and *stderr* (standard error, for diagnostic output) for writing. When opened, *stderr* shall  
 68860 CX        not be fully buffered; *stdin* and *stdout* shall be fully buffered if and only if the file descriptor  
 68861            associated with the stream is determined not to be associated with an interactive device.

68862 CX        The following symbolic values in <unistd.h> define the file descriptors that shall be associated  
 68863            with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

68864            STDIN\_FILENO        Standard input value, *stdin*. Its value is 0.68865            STDOUT\_FILENO       Standard output value, *stdout*. Its value is 1.68866            STDERR\_FILENO       Standard error value, *stderr*. Its value is 2.

68867            These file descriptors are often all associated with a single open file description which has access  
 68868            mode O\_RDWR (e.g., in the case of a terminal device for a login shell). However, the *stderr*, *stdin*,  
 68869            and *stdout* streams need not be opened for both reading and writing at program start-up in this  
 68870            case.

68871 **RETURN VALUE**

68872            None.

68873 **ERRORS**

68874            No errors are defined.

68875 **EXAMPLES**

68876            None.

68877 **APPLICATION USAGE**

68878            None.

68879 **RATIONALE**

68880            None.

68881 **FUTURE DIRECTIONS**

68882            None.

68883 **SEE ALSO**68884            *fclose()*, *feof()*, *ferror()*, *fileno()*, *fopen()*, *fprintf()*, *fread()*, *fscanf()*, *fseek()*, *getc()*, *isatty()*, *popen()*,  
 68885            *putc()*, *puts()*, *read()*, *setbuf()*, *setvbuf()*, *tmpfile()*, *ungetc()*, *vfprintf()*

68886            XBD &lt;stdio.h&gt;, &lt;unistd.h&gt;

68887 **CHANGE HISTORY**

68888 First released in Issue 1.

68889 **Issue 6**

68890 Extensions beyond the ISO C standard are marked.

68891 A note that *stderr* is expected to be open for reading and writing is added to the DESCRIPTION.68892 **Issue 8**68893 Austin Group Defect 1347 is applied, clarifying the requirements for how *stderr*, *stdin*, and *stdout*  
68894 are opened at program start-up.

68895 **NAME**

68896 stpcpy — copy a string and return a pointer to the end of the result

68897 **SYNOPSIS**

```
68898 CX #include <string.h>  
68899 char *stpcpy(char *restrict s1, const char *restrict s2);
```

68900 **DESCRIPTION**

68901 Refer to *strcpy()*.

68902 **NAME**

68903 stpncpy — copy fixed length string, returning a pointer to the array end

68904 **SYNOPSIS**

```
68905 CX #include <string.h>  
68906 char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);
```

68907 **DESCRIPTION**68908 Refer to *strncpy()*.

68909 **NAME**

68910 str2sig — translate between signal names and numbers

68911 **SYNOPSIS**

68912 CX `#include <signal.h>`

68913 `int str2sig(const char *restrict str, int *restrict pnum);`

68914 **DESCRIPTION**

68915 Refer to [sig2str\(\)](#).

68916 **NAME**68917 `strcasecmp`, `strcasecmp_l`, `strncasecmp`, `strncasecmp_l` — case-insensitive string comparisons68918 **SYNOPSIS**

```
68919 #include <strings.h>
68920 int strcasecmp(const char *s1, const char *s2);
68921 int strcasecmp_l(const char *s1, const char *s2,
68922                 locale_t locale);
68923 int strncasecmp(const char *s1, const char *s2, size_t n);
68924 int strncasecmp_l(const char *s1, const char *s2,
68925                  size_t n, locale_t locale);
```

68926 **DESCRIPTION**

68927 The `strcasecmp()` and `strcasecmp_l()` functions shall compare, while ignoring differences in case,  
68928 the string pointed to by `s1` to the string pointed to by `s2`. The `strncasecmp()` and `strncasecmp_l()`  
68929 functions shall compare, while ignoring differences in case, not more than `n` bytes from the  
68930 string pointed to by `s1` to the string pointed to by `s2`.

68931 The `strcasecmp()` and `strncasecmp()` functions use the current locale to determine the case of the  
68932 characters.

68933 The `strcasecmp_l()` and `strncasecmp_l()` functions use the locale represented by `locale` to determine  
68934 the case of the characters.

68935 When the `LC_CTYPE` category of the locale being used is from the POSIX locale, these functions  
68936 shall behave as if the strings had been converted to lowercase and then a byte comparison  
68937 performed, and `errno` shall not be changed on valid input. Otherwise, the results are unspecified.

68938 The behavior is undefined if the `locale` argument to `strcasecmp_l()` or `strncasecmp_l()` is the special  
68939 locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

68940 **RETURN VALUE**

68941 Upon completion, `strcasecmp()` and `strcasecmp_l()` shall return an integer greater than, equal to,  
68942 or less than 0, if the string pointed to by `s1` is, ignoring case, greater than, equal to, or less than  
68943 the string pointed to by `s2`, respectively.

68944 Upon successful completion, `strncasecmp()` and `strncasecmp_l()` shall return an integer greater  
68945 than, equal to, or less than 0, if the possibly null-terminated array pointed to by `s1` is, ignoring  
68946 case, greater than, equal to, or less than the possibly null-terminated array pointed to by `s2`,  
68947 respectively.

68948 **ERRORS**

68949 No errors are defined.

68950 **EXAMPLES**

68951 None.

68952 **APPLICATION USAGE**

68953 None.

68954 **RATIONALE**

68955 None.

68956 **FUTURE DIRECTIONS**

68957 None.

68958 **SEE ALSO**68959 [wcscasecmp\(\)](#)68960 XBD <[strings.h](#)>68961 **CHANGE HISTORY**

68962 First released in Issue 4, Version 2.

68963 **Issue 5**

68964 Moved from X/OPEN UNIX extension to BASE.

68965 **Issue 7**68966 The *strcasecmp()* and *strncasecmp()* functions are moved from the XSI option to the Base.68967 The *strcasecmp\_l()* and *strncasecmp\_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.68969 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0589 [302], XSH/TC1-2008/0590 [294],  
68970 XSH/TC1-2008/0591 [283], and XSH/TC1-2008/0592 [283] are applied.68971 **Issue 8**68972 Austin Group Defect 448 is applied, adding a requirement that *errno* is not changed on valid  
68973 input.

68974 **NAME**

68975        strcat — concatenate two strings

68976 **SYNOPSIS**

68977        #include &lt;string.h&gt;

68978        char \*strcat(char \*restrict s1, const char \*restrict s2);

68979 **DESCRIPTION**

68980 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
68981        conflict between the requirements described here and the ISO C standard is unintentional. This  
68982        volume of POSIX.1-2024 defers to the ISO C standard.

68983        The *strcat()* function shall append a copy of the string pointed to by *s2* (including the  
68984        terminating NUL character) to the end of the string pointed to by *s1*. The initial byte of *s2*  
68985        overwrites the NUL character at the end of *s1*. If copying takes place between objects that  
68986        overlap, the behavior is undefined.

68987 CX        The *strcat()* function shall not change the setting of *errno* on valid input.

68988 **RETURN VALUE**68989        The *strcat()* function shall return *s1*; no return value is reserved to indicate an error.68990 **ERRORS**

68991        No errors are defined.

68992 **EXAMPLES**

68993        None.

68994 **APPLICATION USAGE**

68995        This version is aligned with the ISO C standard; this does not affect compatibility with XPG3  
68996        applications. Reliable error detection by this function was never guaranteed.

68997 **RATIONALE**

68998        None.

68999 **FUTURE DIRECTIONS**

69000        None.

69001 **SEE ALSO**69002        [strncat\(\)](#)69003        XBD [<string.h>](#)69004 **CHANGE HISTORY**

69005        First released in Issue 1. Derived from Issue 1 of the SVID.

69006 **Issue 6**69007        The *strcat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.69008 **Issue 8**

69009        Austin Group Defect 448 is applied, adding a requirement that *strcat()* does not change the  
69010        setting of *errno* on valid input.

69011 **NAME**

69012           strchr — string scanning operation

69013 **SYNOPSIS**

69014           #include &lt;string.h&gt;

69015           char \*strchr(const char \*s, int c);

69016 **DESCRIPTION**

69017 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
69018       conflict between the requirements described here and the ISO C standard is unintentional. This  
69019       volume of POSIX.1-2024 defers to the ISO C standard.

69020       The *strchr()* function shall locate the first occurrence of *c* (converted to a **char**) in the string  
69021       pointed to by *s*. The terminating NUL character is considered to be part of the string.

69022 CX       The *strchr()* function shall not change the setting of *errno* on valid input.

69023 **RETURN VALUE**

69024       Upon completion, *strchr()* shall return a pointer to the byte, or a null pointer if the byte was not  
69025       found.

69026 **ERRORS**

69027       No errors are defined.

69028 **EXAMPLES**

69029       None.

69030 **APPLICATION USAGE**

69031       None.

69032 **RATIONALE**

69033       None.

69034 **FUTURE DIRECTIONS**

69035       None.

69036 **SEE ALSO**69037       [strrchr\(\)](#)69038       XBD [<string.h>](#)69039 **CHANGE HISTORY**

69040       First released in Issue 1. Derived from Issue 1 of the SVID.

69041 **Issue 6**

69042       Extensions beyond the ISO C standard are marked.

69043 **Issue 8**

69044       Austin Group Defect 448 is applied, adding a requirement that *strchr()* does not change the  
69045       setting of *errno* on valid input.

69046 **NAME**

69047 strcmp — compare two strings

69048 **SYNOPSIS**

69049 #include &lt;string.h&gt;

69050 int strcmp(const char \*s1, const char \*s2);

69051 **DESCRIPTION**

69052 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 69053 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69054 volume of POSIX.1-2024 defers to the ISO C standard.

69055 The *strcmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

69056 The sign of a non-zero return value shall be determined by the sign of the difference between the  
 69057 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
 69058 being compared.

69059 CX The *strcmp()* function shall not change the setting of *errno* on valid input.

69060 **RETURN VALUE**

69061 Upon completion, *strcmp()* shall return an integer greater than, equal to, or less than 0, if the  
 69062 string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*,  
 69063 respectively.

69064 **ERRORS**

69065 No errors are defined.

69066 **EXAMPLES**69067 **Checking a Password Entry**

69068 The following example compares the information read from standard input to the value of the  
 69069 name of the user entry. If the *strcmp()* function returns 0 (indicating a match), a further check  
 69070 will be made to see if the user entered the proper old password. The *crypt()* function shall  
 69071 encrypt the old password entered by the user, using the value of the encrypted password in the  
 69072 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the  
 69073 structure, the entered password *oldpasswd* is the correct user's password. Finally, the program  
 69074 encrypts the new password so that it can store the information in the **passwd** structure.

```

69075 #include <string.h>
69076 #include <unistd.h>
69077 #include <stdio.h>
69078 ...
69079 int valid_change;
69080 struct passwd *p;
69081 char user[100];
69082 char oldpasswd[100];
69083 char newpasswd[100];
69084 char savepasswd[100];
69085 ...
69086 if (strcmp(p->pw_name, user) == 0) {
69087     if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
69088         strcpy(savepasswd, crypt(newpasswd, user));
69089         p->pw_passwd = savepasswd;
69090         valid_change = 1;
69091     }

```

```
69092         else {
69093             fprintf(stderr, "Old password is not valid\n");
69094         }
69095     }
69096     ...
```

**69097 APPLICATION USAGE**

69098 None.

**69099 RATIONALE**

69100 None.

69105 XBD <[string.h](#)>

**69106 CHANGE HISTORY**

69107 First released in Issue 1. Derived from Issue 1 of the SVID.

**69108 Issue 6**

69109 Extensions beyond the ISO C standard are marked.

**69110 Issue 8**

69111 Austin Group Defect 448 is applied, adding a requirement that *strcmp()* does not change the  
69112 setting of *errno* on valid input.

69113 **NAME**

69114 strcoll, strcoll\_l — string comparison using collating information

69115 **SYNOPSIS**

```
69116 #include <string.h>
69117 int strcoll(const char *s1, const char *s2);
69118 CX int strcoll_l(const char *s1, const char *s2,
69119 locale_t locale);
```

69120 **DESCRIPTION**

69121 CX For `strcoll()`: The functionality described on this reference page is aligned with the ISO C  
 69122 standard. Any conflict between the requirements described here and the ISO C standard is  
 69123 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

69124 CX The `strcoll()` and `strcoll_l()` functions shall compare the string pointed to by `s1` to the string  
 69125 pointed to by `s2`, both interpreted as appropriate to the `LC_COLLATE` category of the current  
 69126 CX locale, or of the locale represented by `locale`, respectively.

69127 CX The `strcoll()` and `strcoll_l()` functions shall not change the setting of `errno` if successful.

69128 Since no return value is reserved to indicate an error, an application wishing to check for error  
 69129 CX situations should set `errno` to 0, then call `strcoll()`, or `strcoll_l()` then check `errno`.

69130 CX The behavior is undefined if the `locale` argument to `strcoll_l()` is the special locale object  
 69131 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

69132 **RETURN VALUE**

69133 Upon successful completion, `strcoll()` shall return an integer greater than, equal to, or less than 0,  
 69134 according to whether the string pointed to by `s1` is greater than, equal to, or less than the string  
 69135 CX pointed to by `s2` when both are interpreted as appropriate to the current locale. On error,  
 69136 `strcoll()` may set `errno`, but no return value is reserved to indicate an error.

69137 Upon successful completion, `strcoll_l()` shall return an integer greater than, equal to, or less than  
 69138 0, according to whether the string pointed to by `s1` is greater than, equal to, or less than the  
 69139 string pointed to by `s2` when both are interpreted as appropriate to the locale represented by  
 69140 `locale`. On error, `strcoll_l()` may set `errno`, but no return value is reserved to indicate an error.

69141 **ERRORS**

69142 These functions may fail if:

69143 CX `[EINVAL]` The `s1` or `s2` arguments contain characters outside the domain of the collating  
 69144 sequence.

69145 **EXAMPLES**69146 **Comparing Nodes**

69147 The following example uses an application-defined function, `node_compare()`, to compare two  
 69148 nodes based on an alphabetical ordering of the `string` field.

```
69149 #include <string.h>
69150 ...
69151 struct node { /* These are stored in the table. */
69152     char *string;
69153     int length;
69154 };
69155 ...
```

```
69156     int node_compare(const void *node1, const void *node2)
69157     {
69158         return strcoll(((const struct node *)node1)->string,
69159                       ((const struct node *)node2)->string);
69160     }
69161     ...
```

**69162 APPLICATION USAGE**

69163 The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

**69164 RATIONALE**

69165 None.

**69166 FUTURE DIRECTIONS**

69167 None.

**69168 SEE ALSO**

69170 XBD [\*\*<string.h>\*\*](#)

**69171 CHANGE HISTORY**

69172 First released in Issue 3.

**69173 Issue 5**

69174 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

**69175 Issue 6**

69176 Extensions beyond the ISO C standard are marked.

69177 The following new requirements on POSIX implementations derive from alignment with the  
69178 Single UNIX Specification:

- 69179 • The [EINVAL] optional error condition is added.

69180 An example is added.

**69181 Issue 7**

69182 The *strcoll\_1()* function is added from The Open Group Technical Standard, 2006, Extended API  
69183 Set Part 4.

69184 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0593 [283] and XSH/TC1-2008/0594  
69185 [283] are applied.

69186 **NAME**

69187 stpcpy, strcpy — copy a string

69188 **SYNOPSIS**

69189 #include &lt;string.h&gt;

69190 CX char \*stpcpy(char \*restrict s1, const char \*restrict s2);

69191 char \*strcpy(char \*restrict s1, const char \*restrict s2);

69192 **DESCRIPTION**

69193 CX For `strcpy()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

69196 CX The `stpcpy()` and `strcpy()` functions shall copy the string pointed to by `s2` (including the terminating NUL character) into the array pointed to by `s1`.

69198 If copying takes place between objects that overlap, the behavior is undefined.

69199 CX The `strcpy()` and `stpcpy()` functions shall not change the setting of `errno` on valid input.

69200 **RETURN VALUE**

69201 CX The `stpcpy()` function shall return a pointer to the terminating NUL character copied into the `s1` buffer.

69203 The `strcpy()` function shall return `s1`.

69204 No return values are reserved to indicate an error.

69205 **ERRORS**

69206 No errors are defined.

69207 **EXAMPLES**69208 **Construction of a Multi-Part Message in a Single Buffer**

69209 #include &lt;string.h&gt;

69210 #include &lt;stdio.h&gt;

69211 int

69212 main (void)

69213 {

69214 char buffer [10];

69215 char \*name = buffer;

69216 name = stpcpy (stpcpy (stpcpy (name, "ice"), "-"), "cream");

69217 puts (buffer);

69218 return 0;

69219 }

69220 **Initializing a String**

69221 The following example copies the string "-----" into the `permstring` variable.

69222 #include &lt;string.h&gt;

69223 ...

69224 static char permstring[11];

69225 ...

69226 strcpy (permstring, "-----");

69227 ...

69228 **Storing a Key and Data**

69229 The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the  
 69230 key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there.  
 69231 (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct**  
 69232 **element** \*.)

```

69233 #include <string.h>
69234 #include <stdlib.h>
69235 #include <stdio.h>
69236 ...
69237 /* Structure used to read data and store it. */
69238 struct element {
69239     char *key;
69240     char *data;
69241 };
69242 struct element *tbl, *curtbl;
69243 char *key, *data;
69244 int count;
69245 ...
69246 void dbfree(struct element *, int);
69247 ...
69248 if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
69249     perror("malloc"); dbfree(tbl, count); return NULL;
69250 }
69251 strcpy(curtbl->key, key);
69252 if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
69253     perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
69254 }
69255 strcpy(curtbl->data, data);
69256 ...

```

69257 **APPLICATION USAGE**

69258 Character movement is performed differently in different implementations. Thus, overlapping  
 69259 moves may yield surprises.

69260 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3  
 69261 applications. Reliable error detection by this function was never guaranteed.

69262 **RATIONALE**

69263 None.

69264 **FUTURE DIRECTIONS**

69265 None.

69269 **CHANGE HISTORY**

69270 First released in Issue 1. Derived from Issue 1 of the SVID.

69271 **Issue 6**

69272 The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

69273 **Issue 7**

69274 The *strcpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
69275 Set Part 1.

69276 **Issue 8**

69277 Austin Group Defect 448 is applied, adding a requirement that *strcpy()* and *strcpy()* do not  
69278 change the setting of *errno* on valid input.

69279 Austin Group Defect 1787 is applied, changing the NAME section.

69280 **NAME**

69281 strcspn — get the length of a complementary substring

69282 **SYNOPSIS**

69283 #include &lt;string.h&gt;

69284 size\_t strcspn(const char \*s1, const char \*s2);

69285 **DESCRIPTION**69286 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
69287 conflict between the requirements described here and the ISO C standard is unintentional. This  
69288 volume of POSIX.1-2024 defers to the ISO C standard.69289 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
69290 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.69291 CX The *strcspn()* function shall not change the setting of *errno* on valid input.69292 **RETURN VALUE**69293 The *strcspn()* function shall return the length of the computed segment of the string pointed to  
69294 by *s1*; no return value is reserved to indicate an error.69295 **ERRORS**

69296 No errors are defined.

69297 **EXAMPLES**

69298 None.

69299 **APPLICATION USAGE**

69300 None.

69301 **RATIONALE**

69302 None.

69303 **FUTURE DIRECTIONS**

69304 None.

69305 **SEE ALSO**69306 [strspn\(\)](#)69307 XBD <[string.h](#)>69308 **CHANGE HISTORY**

69309 First released in Issue 1. Derived from Issue 1 of the SVID.

69310 **Issue 5**69311 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and  
69312 not *s1* itself as was previously stated.69313 **Issue 6**69314 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is  
69315 updated to indicate that the computed segment length is returned, not the *s1* length.69316 **Issue 8**69317 Austin Group Defect 448 is applied, adding a requirement that *strcspn()* does not change the  
69318 setting of *errno* on valid input.

69319 **NAME**69320 `strdup`, `strndup` — duplicate a specific number of bytes from a string69321 **SYNOPSIS**

```
69322 CX #include <string.h>
69323 char *strdup(const char *s);
69324 char *strndup(const char *s, size_t size);
```

69325 **DESCRIPTION**

69326 The `strdup()` function shall return a pointer to a new string, which is a duplicate of the string  
69327 pointed to by `s`. The returned pointer can be passed to `free()`. A null pointer is returned if the  
69328 new string cannot be created.

69329 The `strndup()` function shall be equivalent to the `strdup()` function, duplicating the provided `s` in  
69330 a new block of memory allocated as if by using `malloc()`, with the exception being that `strndup()`  
69331 copies at most `size` bytes from the array `s` into the newly allocated memory, terminating the new  
69332 string with a null byte. If `s` contains a null terminator within the first `size` bytes, all bytes in `s` up  
69333 to and including the null terminator shall be copied into the new memory buffer. The `strndup()`  
69334 function shall not examine more than `size` bytes of the array pointed to by `s`. The newly created  
69335 string shall always be properly terminated.

69336 **RETURN VALUE**

69337 The `strdup()` function shall return a pointer to a new string on success. Otherwise, it shall return  
69338 a null pointer and set `errno` to indicate the error.

69339 Upon successful completion, the `strndup()` function shall return a pointer to the newly allocated  
69340 memory containing the duplicated string. Otherwise, it shall return a null pointer and set `errno`  
69341 to indicate the error.

69342 **ERRORS**

69343 These functions shall fail if:

69344 [ENOMEM] Storage space available is insufficient.

69345 **EXAMPLES**

69346 None.

69347 **APPLICATION USAGE**

69348 For functions that allocate memory as if by `malloc()`, the application should release such memory  
69349 when it is no longer required by a call to `free()`. For `strdup()` and `strndup()`, this is the return  
69350 value.

69351 Implementations are free to `malloc()` a buffer containing either  $(size + 1)$  bytes or  $(strlen(s, size) + 1)$  bytes. Applications should not assume that `strndup()` will allocate  $(size + 1)$  bytes when `strlen(s)` is smaller than `size`.

69354 **RATIONALE**

69355 None.

69356 **FUTURE DIRECTIONS**

69357 None.

69358 **SEE ALSO**

69359 [free\(\)](#), [wcsdup\(\)](#)

69360 XBD [<string.h>](#)

69361 **CHANGE HISTORY**

69362 First released in Issue 4, Version 2.

69363 **Issue 5**

69364 Moved from X/OPEN UNIX extension to BASE.

69365 **Issue 7**69366 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the ``may fail'' [ENOMEM]  
69367 error to become a ``shall fail'' error.69368 The *strdup()* function is moved from the XSI option to the Base.69369 The *strndup()* function is added from The Open Group Technical Standard, 2006, Extended API  
69370 Set Part 1.69371 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
69372 *malloc()*.

69373 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0338 [738] is applied.

69374 **Issue 8**69375 Austin Group Defect 1019 is applied, clarifying that the *strndup()* argument *s* need not point to a  
69376 null-terminated string.

69377 **NAME**

69378            strerror, strerror\_l, strerror\_r — get error message string

69379 **SYNOPSIS**

69380            #include &lt;string.h&gt;

69381            char \*strerror(int *errnum*);69382 CX         char \*strerror\_l(int *errnum*, locale\_t *locale*);69383            int strerror\_r(int *errnum*, char \**strerrbuf*, size\_t *buflen*);69384 **DESCRIPTION**69385 CX         For *strerror()*: The functionality described on this reference page is aligned with the ISO C  
69386 standard. Any conflict between the requirements described here and the ISO C standard is  
69387 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.69388            The *strerror()* function shall map the error number in *errnum* to a locale-dependent error  
69389 message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*,  
69390 but *strerror()* shall map any value of type **int** to a message.69391 CX         The application shall not modify the string returned. The returned string pointer might be  
69392 CX         invalidated or the string content might be overwritten by a subsequent call to *strerror()*, or by a  
69393 subsequent call to *strerror\_l()* in the same thread. The returned pointer and the string content  
69394 might also be invalidated if the calling thread is terminated.69395 CX         The string may be overwritten by a subsequent call to *strerror\_l()* in the same thread.69396            The contents of the error message strings returned by *strerror()* should be determined by the  
69397 setting of the *LC\_MESSAGES* category in the current locale.69398            The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
69399 *strerror()*.69400 CX         The *strerror()* and *strerror\_l()* functions shall not change the setting of *errno* if successful.69401            Since no return value is reserved to indicate an error of *strerror()*, an application wishing to  
69402 check for error situations should set *errno* to 0, then call *strerror()*, then check *errno*. Similarly,  
69403 since *strerror\_l()* is required to return a string for some errors, an application wishing to check  
69404 for all error situations should set *errno* to 0, then call *strerror\_l()*, then check *errno*.69405            The *strerror()* function need not be thread-safe; however, *strerror()* shall avoid data races with all  
69406 other functions.69407 CX         The *strerror\_l()* function shall map the error number in *errnum* to a locale-dependent error  
69408 message string in the locale represented by *locale* and shall return a pointer to it.69409            The *strerror\_r()* function shall map the error number in *errnum* to a locale-dependent error  
69410 message string and shall return the string in the buffer pointed to by *strerrbuf*, with length  
69411 *buflen*.69412 CX         If the value of *errnum* is a valid error number, the message string shall indicate what error  
69413 occurred; if the value of *errnum* is zero, the message string shall either be an empty string or  
69414 indicate that no error occurred; otherwise, if these functions complete successfully, the message  
69415 string shall indicate that an unknown error occurred.69416 CX         The behavior is undefined if the *locale* argument to *strerror\_l()* is the special locale object  
69417 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

69418 **RETURN VALUE**

69419 Upon completion, whether successful or not, *strerror()* shall return a pointer to the generated  
 69420 CX message string. On error *errno* may be set, but no return value is reserved to indicate an error.

69421 Upon successful completion, *strerror\_l()* shall return a pointer to the generated message string. If  
 69422 *errnum* is not a valid error number, *errno* may be set to [EINVAL], but a pointer to a message  
 69423 string shall still be returned. If any other error occurs, *errno* shall be set to indicate the error and  
 69424 a null pointer shall be returned.

69425 Upon successful completion, *strerror\_r()* shall return 0. Otherwise, an error number shall be  
 69426 returned to indicate the error.

69427 **ERRORS**

69428 These functions may fail if:

69429 CX [EINVAL] The value of *errnum* is neither a valid error number nor zero.

69430 The *strerror\_r()* function shall fail if:

69431 CX [ERANGE] Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the  
 69432 generated message string.

69433 **EXAMPLES**

69434 None.

69435 **APPLICATION USAGE**

69436 Historically in some implementations, calls to *perror()* would overwrite the string that the  
 69437 pointer returned by *strerror()* points to. Such implementations did not conform to the ISO C  
 69438 standard; however, application developers should be aware of this behavior if they wish their  
 69439 applications to be portable to such implementations.

69440 Applications should use *strerror\_l()* rather than *strerror()* or *strerror\_r()* to avoid thread safety  
 69441 and possible alternative (non-conforming) versions of these functions in some implementations.

69442 **RATIONALE**

69443 The *strerror\_l()* function is required to be thread-safe, thereby eliminating the need for an  
 69444 equivalent to the *strerror\_r()* function.

69445 Earlier versions of this standard did not explicitly require that the error message strings returned  
 69446 by *strerror()* and *strerror\_r()* provide any information about the error. This version of the  
 69447 standard requires a meaningful message for any successful completion.

69448 Since no return value is reserved to indicate a *strerror()* error, but all calls (whether successful or  
 69449 not) must return a pointer to a message string, on error *strerror()* can return a pointer to an  
 69450 empty string or a pointer to a meaningful string that can be printed.

69451 Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied  
 69452 as the value of *errnum*, applications should be prepared to handle any of the following:

- 69453 1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer  
 69454 to an empty string.
- 69455 2. Successful completion: *errno* is unchanged and the return value points to a string like  
 69456 "unknown error" or "error number xxx" (where xxx is the value of *errnum*).
- 69457 3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string  
 69458 like "unknown error" or "error number xxx" (where xxx is the value of *errnum*).  
 69459 Since applications frequently use the return value of *strerror()* as an argument to  
 69460 functions like *fprintf()* (without checking the return value) and since applications have no  
 69461 way to parse an error message string to determine whether *errnum* represents a valid

69462 error number, implementations are encouraged to implement #3. Similarly,  
 69463 implementations are encouraged to have *strerror\_r()* return [EINVAL] and put a string  
 69464 like "unknown error" or "error number xxx" in the buffer pointed to by *strrdbuf*  
 69465 when the value of *errnum* is not a valid error number.

69466 Additionally, implementations are encouraged to null terminate *strrdbuf* when failing with  
 69467 [ERANGE] for any size other than *buflen* of zero.

69468 Some applications rely on being able to set *errno* to 0 before calling a function with no reserved  
 69469 value to indicate an error, then call *strerror(errno)* afterwards to detect whether an error occurred  
 69470 (because *errno* changed) or to indicate success (because *errno* remained zero). This usage pattern  
 69471 requires that *strerror(0)* succeed with useful results. Previous versions of the standard did not  
 69472 specify the behavior when *errnum* is zero.

#### 69473 FUTURE DIRECTIONS

69474 None.

#### 69475 SEE ALSO

69476 *perror()*

69477 XBD <*string.h*>

#### 69478 CHANGE HISTORY

69479 First released in Issue 3.

#### 69480 Issue 5

69481 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

69482 A note indicating that the *strerror()* function need not be reentrant is added to the  
 69483 DESCRIPTION.

#### 69484 Issue 6

69485 Extensions beyond the ISO C standard are marked.

69486 The following new requirements on POSIX implementations derive from alignment with the  
 69487 Single UNIX Specification:

- 69488 • In the RETURN VALUE section, the fact that *errno* may be set is added.
- 69489 • The [EINVAL] optional error condition is added.

69490 The normative text is updated to avoid use of the term “must” for application requirements.

69491 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.

69492 The *strerror\_r()* function is marked as part of the Thread-Safe Functions option.

#### 69493 Issue 7

69494 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

69495 Austin Group Interpretation 1003.1-2001 #156 is applied.

69496 Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the  
 69497 generated error message is an empty string.

69498 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

69499 The *strerror\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
 69500 Set Part 4.

69501 The *strerror\_r()* function is moved from the Thread-Safe Functions option to the Base.

69502 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0595 [75], XSH/TC1-2008/0596 [447],

- 69503 XSH/TC1-2008/0597 [382,428], XSH/TC1-2008/0598 [283], XSH/TC1-2008/0599 [382,428],  
69504 XSH/TC1-2008/0600 [283], and XSH/TC1-2008/0601 [382,428] are applied.
- 69505 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0339 [656] is applied.
- 69506 **Issue 8**
- 69507 Austin Group Defect 398 is applied, changing the [ERANGE] error from “may fail” to “shall  
69508 fail”.
- 69509 Austin Group Defect 655 is applied, changing the APPLICATION USAGE section.
- 69510 Austin Group Defect 1302 is applied, aligning the *strerror()* function with the  
69511 ISO/IEC 9899:2018 standard.

69512 **NAME**

69513 strfmon, strfmon\_l — convert monetary value to a string

69514 **SYNOPSIS**

```
69515 #include <monetary.h>
69516 ssize_t strfmon(char *restrict s, size_t maxsize,
69517     const char *restrict format, ...);
69518 ssize_t strfmon_l(char *restrict s, size_t maxsize,
69519     locale_t locale, const char *restrict format, ...);
```

69520 **DESCRIPTION**

69521 The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the  
 69522 string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

69523 The format is a character string, beginning and ending in its initial state, if any, that contains two  
 69524 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*  
 69525 *specifications*, each of which shall result in the fetching of zero or more arguments which are  
 69526 converted and formatted. The results are undefined if there are insufficient arguments for the  
 69527 format. If the format is exhausted while arguments remain, the excess arguments are simply  
 69528 ignored.

69529 The application shall ensure that a conversion specification consists of the following sequence:

- 69530 • A '%' character
- 69531 • Optional flags
- 69532 • Optional field width
- 69533 • Optional left precision
- 69534 • Optional right precision
- 69535 • A required conversion specifier character that determines the conversion to be performed

69536 The *strfmon\_l()* function shall be equivalent to the *strfmon()* function, except that the locale data  
 69537 used is from the locale represented by *locale*.

69538 **Flags**

69539 One or more of the following optional flags can be specified to control the conversion:

69540 =*f* An '=' followed by a single character *f* which is used as the numeric fill character. In  
 69541 order to work with precision or width counts, the fill character shall be a single byte  
 69542 character; if not, the behavior is undefined. The default numeric fill character is the  
 69543 <space>. This flag does not affect field width filling which always uses the <space>.  
 69544 This flag is ignored unless a left precision (see below) is specified.

69545 ^ Do not format the currency amount with grouping characters. The default is to insert  
 69546 the grouping characters if defined for the current locale.

69547 + or ( Specify the style of representing positive and negative currency amounts. Only one of  
 69548 '+' or '(' may be specified.

69549 If '+' is specified, the locale's **positive\_sign** and **negative\_sign** values shall be used  
 69550 (for example, in many locales, the empty string if positive and '-' if negative).  
 69551 However, if both values would be returned by *localeconv()* as empty strings, *strfmon()*  
 69552 shall fail. The placement of the signs (if not empty) shall depend on the locale settings:

69553 • For the *n* conversion specifier, the placement specified by the locale's  
69554 **p\_sign\_posn** and **n\_sign\_posn** values shall be used.

69555 • For the *i* conversion specifier, the placement specified by the locale's  
69556 **int\_p\_sign\_posn** and **int\_n\_sign\_posn** values shall be used.

69557 If a sign's placement cannot be determined from these locale values because a value  
69558 that needs to be used would be returned by *localeconv()* as 0 or {CHAR\_MAX}, the sign  
69559 shall be placed as if the relevant value was 1.

69560 If ' (' is specified, negative amounts shall be enclosed within parentheses and the  
69561 locale's **positive\_sign** and **negative\_sign** values shall not be used.

69562 If neither flag is specified, the style used shall depend on the locale settings:

69563 • For the *n* conversion specifier, the style specified by the locale's **p\_sign\_posn** and  
69564 **n\_sign\_posn** values shall be used.

69565 • For the *i* conversion specifier, the style specified by the locale's **int\_p\_sign\_posn**  
69566 and **int\_n\_sign\_posn** values shall be used.

69567 If the style cannot be determined from these locale values because a value that needs to  
69568 be used would be returned by *localeconv()* as {CHAR\_MAX}, the style used shall be that  
69569 specified for the '+' flag; if this would cause *strfmon()* to fail because the locale's  
69570 **positive\_sign** and **negative\_sign** values would both be returned by *localeconv()* as  
69571 empty strings, *strfmon()* shall behave as if the **negative\_sign** value was the string "-".

69572 ! Suppress the currency symbol from the output conversion.

69573 - Specify the alignment. If this flag is present the result of the conversion is left-justified  
69574 (padded to the right) rather than right-justified. This flag shall be ignored unless a field  
69575 width (see below) is specified.

## 69576 Field Width

69577 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result  
69578 of the conversion is right-justified (or left-justified if the flag '-' is specified). The  
69579 default is 0.

## 69580 Left Precision

69581 *#n* A '#' followed by a decimal digit string *n* specifying a maximum number of digits  
69582 expected to be formatted to the left of the radix character. This option can be used to  
69583 keep the formatted output from multiple calls to the *strfmon()* function aligned in the  
69584 same columns. It can also be used to fill unused positions with a special character as in  
69585 "\$\*\*\*123.45". This option causes an amount to be formatted as if it has the number  
69586 of digits specified by *n*. If more than *n* digit positions are required, this conversion  
69587 specification is ignored. Digit positions in excess of those actually required are filled  
69588 with the numeric fill character (see the *=f* flag above).

69589 If grouping has not been suppressed with the '^' flag, and it is defined for the current  
69590 locale, grouping separators are inserted before the fill characters (if any) are added.  
69591 Grouping separators are not applied to fill characters even if the fill character is a digit.

69592 To ensure alignment, any characters appearing before or after the number in the  
69593 formatted output such as currency or sign symbols are padded as necessary with  
69594 <space> characters to make their positive and negative formats an equal length.

69595 **Right Precision**

69596 .*p* A <period> followed by a decimal digit string *p* specifying the number of digits after  
 69597 the radix character. If the value of the right precision *p* is 0, no radix character appears.  
 69598 If a right precision is not included, a default specified by the current locale is used. The  
 69599 amount being formatted is rounded to the specified number of digits prior to  
 69600 formatting.

69601 **Conversion Specifier Characters**

69602 The conversion specifier characters and their meanings are:

69603 *i* The **double** argument is formatted according to the locale's international currency  
 69604 format (for example, in the US: USD 1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result  
 69605 of the conversion is unspecified.

69606 *n* The **double** argument is formatted according to the locale's national currency format  
 69607 (for example, in the US: \$1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result of the  
 69608 conversion is unspecified.

69609  $\%$  Convert to a ' $\%$ '; no argument is converted. The entire conversion specification shall  
 69610 be  $\%\%$ .

69611 **Locale Information**

69612 The *LC\_MONETARY* category of the current locale affects the behavior of this function including  
 69613 the monetary radix character (which may be different from the numeric radix character affected  
 69614 by the *LC\_NUMERIC* category), the grouping separator, the currency symbols, and formats. The  
 69615 international currency symbol should be conformant with the ISO 4217:2015 standard.

69616 If the value of *maxsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.

69617 The behavior is undefined if the *locale* argument to *strfmon\_l()* is the special locale object  
 69618 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

69619 **RETURN VALUE**

69620 If all conversions are successful and the total number of resulting bytes including the  
 69621 terminating null byte is not more than *maxsize*, these functions shall return the number of bytes  
 69622 placed into the array pointed to by *s*, not including the terminating NUL character. Otherwise,  
 69623 -1 shall be returned, the contents of the array are unspecified, and *errno* shall be set to indicate  
 69624 the error.

69625 **ERRORS**

69626 These functions shall fail if:

69627 [E2BIG] Conversion stopped due to lack of space in the buffer.

69628 [EINVAL] The '+' flag was included in a conversion specification and the locale's  
 69629 **positive\_sign** and **negative\_sign** values would both be returned by  
 69630 *localeconv()* as empty strings.

69631 **EXAMPLES**

69632 Given a locale for the US and the values 123.45, -123.45, and 3456.781, the following output  
69633 might be produced. Square brackets (" [ ] ") are used in this example to delimit the output.

69634	%n	[\$123.45]	Default formatting
69635		[-\$123.45]	
69636		[\$3,456.78]	
69637	%11n	[ \$123.45]	Right align within an 11-character field
69638		[-\$123.45]	
69639		[ \$3,456.78]	
69640	%#5n	[ \$ 123.45]	Aligned columns for values up to 99999
69641		[-\$ 123.45]	
69642		[ \$ 3,456.78]	
69643	%=*#5n	[ \$***123.45]	Specify a fill character
69644		[-\$***123.45]	
69645		[ \$*3,456.78]	
69646	%=0#5n	[ \$000123.45]	Fill characters do not use grouping
69647		[-\$000123.45]	even if the fill character is a digit
69648		[ \$03,456.78]	
69649	%^#5n	[ \$ 123.45]	Disable the grouping separator
69650		[-\$ 123.45]	
69651		[ \$ 3456.78]	
69652	%^#5.0n	[ \$ 123]	Round off to whole units
69653		[-\$ 123]	
69654		[ \$ 3457]	
69655	%^#5.4n	[ \$ 123.4500]	Increase the precision
69656		[-\$ 123.4500]	
69657		[ \$ 3456.7810]	
69658	%(#5n	[ \$ 123.45 ]	Use an alternative pos/neg style
69659		[ (\$ 123.45 )]	
69660		[ \$ 3,456.78 ]	
69661	%!(#5n	[ 123.45 ]	Disable the currency symbol
69662		[ ( 123.45 )]	
69663		[ 3,456.78 ]	
69664	%-14#5.4n	[ \$ 123.4500 ]	Left-justify the output
69665		[-\$ 123.4500 ]	
69666		[ \$ 3,456.7810 ]	
69667	%14#5.4n	[ \$ 123.4500]	Corresponding right-justified output
69668		[ -\$ 123.4500]	
69669		[ \$ 3,456.7810]	

69670 See also the EXAMPLES section in *fprintf()*.

69671 **APPLICATION USAGE**

69672 The '+' flag should be used with care, because if the locale's **positive\_sign** and **negative\_sign**  
69673 values are both empty strings, there is no way to distinguish negative from positive values with  
69674 signs and therefore *strfmon()* fails. If the application has a preference for signs but parentheses  
69675 are acceptable, it should try *strfmon()* with the '+' flag first, and if it fails with [EINVAL] then

69676 repeat the call without the '+' flag.

#### 69677 RATIONALE

69678 The [EINVAL] error condition applies only when the '+' flag is used because this flag indicates  
69679 that the application requires the use of signs, and if there are no signs in the locale data then this  
69680 requirement cannot be satisfied. When neither '+' nor '(' is used, the application is requesting  
69681 whatever formatting is appropriate for the locale, and so *strfmon()* has a fallback of using a '-'  
69682 sign for negative values in cases where the locale data does not indicate parentheses should be  
69683 used and has no signs.

#### 69684 FUTURE DIRECTIONS

69685 Lowercase conversion characters are reserved for future standards use and uppercase for  
69686 implementation-defined use.

#### 69687 SEE ALSO

69688 *fprintf()*, *localeconv()*

69689 XBD <monetary.h>

#### 69690 CHANGE HISTORY

69691 First released in Issue 4.

#### 69692 Issue 5

69693 Moved from ENHANCED I18N to BASE.

69694 The [ENOSYS] error is removed.

69695 Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than  
69696 {SSIZE\_MAX}.

#### 69697 Issue 6

69698 The normative text is updated to avoid use of the term “must” for application requirements.

69699 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the  
69700 ISO/IEC 9899:1999 standard.

69701 The EXAMPLES section is reworked, clarifying the output format.

#### 69702 Issue 7

69703 SD5-XSH-ERN-29 is applied, updating the examples for % (#5n and %! (#5n.

69704 SD5-XSH-ERN-233 is applied, changing the definition of the '+' or '(' flags to refer to  
69705 multiple locales.

69706 The *strfmon()* function is moved from the XSI option to the Base.

69707 The *strfmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
69708 Set Part 4.

69709 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0602 [302], XSH/TC1-2008/0603 [283],  
69710 and XSH/TC1-2008/0604 [283] are applied.

#### 69711 Issue 8

69712 Austin Group Defect 1199 is applied, changing the requirements for the '+' and '(' flags and  
69713 adding the [EINVAL] error.

69714 **NAME**

69715 strptime, strptime\_l — convert date and time to a string

69716 **SYNOPSIS**

69717 #include &lt;time.h&gt;

```
69718 size_t strptime(char *restrict s, size_t maxsize,
69719               const char *restrict format, const struct tm *restrict timeptr);
```

```
69720 CX size_t strptime_l(char *restrict s, size_t maxsize,
69721                  const char *restrict format, const struct tm *restrict timeptr,
69722                  locale_t locale);
```

69723 **DESCRIPTION**

69724 CX For *strptime()*: The functionality described on this reference page is aligned with the ISO C  
 69725 standard. Any conflict between the requirements described here and the ISO C standard is  
 69726 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

69727 The *strptime()* function shall place bytes into the array pointed to by *s* as controlled by the string  
 69728 pointed to by *format*. The application shall ensure that the format is a character string, beginning  
 69729 and ending in its initial shift state, if any. The format string consists of zero or more conversion  
 69730 specifications and ordinary characters.

69731 Each conversion specification is introduced by the '%' character after which the following  
 69732 appear in sequence:

- 69733 CX
- An optional flag:
    - 69734 0 The zero character ('0'), which specifies that the character used as the padding  
 69735 character is '0',
    - 69736 + The <plus-sign> character ('+'), which specifies that the character used as the  
 69737 padding character is '0', and that if and only if the field being produced consumes  
 69738 more than four bytes to represent a year (for %F, %G, or %Y) or more than two bytes to  
 69739 represent the year divided by 100 (for %C) then a leading <plus-sign> character shall  
 69740 be included if the year being processed is greater than or equal to zero or a leading  
 69741 <hyphen-minus> character ('-') shall be included if the year is less than zero.
  - 69742 The default padding character is unspecified.
  - An optional minimum field width. If the converted value, including any leading '+' or  
 69743 '-' sign, has fewer bytes than the minimum field width and the padding character is not  
 69744 the NUL character, the output shall be padded on the left (after any leading '+' or '-'  
 69745 sign) with the padding character.
  - An optional E or O modifier.
  - A terminating conversion specifier character that indicates the type of conversion to be  
 69746 applied.

69750 CX The results are unspecified if more than one flag character is specified, a flag character is  
 69751 specified without a minimum field width; a minimum field width is specified without a flag  
 69752 character; a modifier is specified with a flag or with a minimum field width; or if a minimum  
 69753 field width is specified for any conversion specifier other than C, F, G, or Y.

69754 All ordinary characters (including the terminating NUL character) are copied unchanged into  
 69755 the array. If copying takes place between objects that overlap, the behavior is undefined. No  
 69756 more than *maxsize* bytes are placed into the array. Each conversion specifier is replaced by  
 69757 appropriate characters as described in the following list. The appropriate characters are

- 69758 determined using the *LC\_TIME* category of the current locale and by the values of zero or more  
 69759 members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the  
 69760 description. If any of the specified values are outside the normal range, the characters stored are  
 69761 unspecified.
- 69762 CX The *strptime\_l()* function shall be equivalent to the *strptime()* function, except that the locale data  
 69763 used is from the locale represented by *locale*.
- 69764 Local timezone information shall be set as though *strptime()* called *tzset()*.
- 69765 The following conversion specifiers shall be supported:
- 69766 a Replaced by the locale's abbreviated weekday name. [*tm\_wday*]
- 69767 A Replaced by the locale's full weekday name. [*tm\_wday*]
- 69768 b Replaced by the locale's abbreviated month name. [*tm\_mon*]
- 69769 B Replaced by the locale's full month name. [*tm\_mon*]
- 69770 c Replaced by the locale's appropriate date and time representation. (See the Base  
 69771 Definitions volume of POSIX.1-2024, <**time.h**>.)
- 69772 C Replaced by the year divided by 100 and truncated to an integer, as a decimal number.  
 69773 [*tm\_year*]
- 69774 If a minimum field width is not specified:
- 69775 • If the year is between 0 and 9999 inclusive, two characters shall be placed into the  
 69776 array pointed to by *s*, including a leading '0' if there would otherwise be only a  
 69777 single digit.
  - 69778 CX • If the year is less than 0 or greater than 9999, the number of characters placed into  
 69779 the array pointed to by *s* shall be the number of digits and leading sign characters  
 69780 (if any) in the result of dividing the year by 100 and truncating, or two, whichever  
 69781 is greater.
- 69782 CX If a minimum field width is specified, the number of characters placed into the array  
 69783 pointed to by *s* shall be the number of digits and leading sign characters (if any) in the  
 69784 result of dividing the year by 100 and truncating, or the minimum field width,  
 69785 whichever is greater.
- 69786 d Replaced by the day of the month as a decimal number [01,31]. [*tm\_mday*]
- 69787 D Equivalent to *%m/%d/%y*. [*tm\_mon, tm\_mday, tm\_year*]
- 69788 e Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded  
 69789 by a space. [*tm\_mday*]
- 69790 F Equivalent to *%Y-%m-%d* if no flag and no minimum field width are specified. (For  
 69791 years between 1000 and 9999 inclusive this provides the ISO 8601-1:2019 standard  
 69792 complete representation, extended format date representation of a specific day.)  
 69793 [*tm\_year, tm\_mon, tm\_mday*]
- 69794 CX If a minimum field width of *x* is specified, the year shall be output as if by the *Y*  
 69795 specifier (described below) with whatever flag was given and a minimum field width  
 69796 of *x*−6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.
- 69797 If the minimum field width is specified to be 10, and the year is four digits long, then  
 69798 the output string produced shall match the ISO 8601-1:2019 standard subclause 4.1.2.2  
 69799 complete representation, extended format date representation of a specific day. If a +

69800		flag is specified, a minimum field width of $x$ is specified, and $x-7$ bytes are sufficient to hold the digits of the year (not including any needed sign character), then the output shall match the ISO 8601-1:2019 standard subclause 4.1.2.4 complete representation, expanded format date representation of a specific day.
69801		
69802		
69803		
69804	g	Replaced by the last 2 digits of the week-based year (see below) as a decimal number [00,99]. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
69805		
69806	G	Replaced by the week-based year (see below) as a decimal number (for example, 1977). [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
69807		
69808	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by $s$ shall be the number of digits and leading sign characters (if any) in the year, or the minimum field width, whichever is greater.
69809		
69810		
69811	h	Equivalent to %b. [ <i>tm_mon</i> ]
69812	H	Replaced by the hour (24-hour clock) as a decimal number [00,23]. [ <i>tm_hour</i> ]
69813	I	Replaced by the hour (12-hour clock) as a decimal number [01,12]. [ <i>tm_hour</i> ]
69814	j	Replaced by the day of the year as a decimal number [001,366]. [ <i>tm_yday</i> ]
69815	m	Replaced by the month as a decimal number [01,12]. [ <i>tm_mon</i> ]
69816	M	Replaced by the minute as a decimal number [00,59]. [ <i>tm_min</i> ]
69817	n	Replaced by a <newline>.
69818	p	Replaced by the locale's equivalent of either a.m. or p.m. [ <i>tm_hour</i> ]
69819	CX	r
69820		Replaced by the time in 12-hour clock notation; if the 12-hour format is not supported in the locale, this shall be either an empty string or the time in a 24-hour clock notation. In the POSIX locale this shall be equivalent to %I:%M:%S %p. [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]
69821		
69822	R	Replaced by the time in 24-hour notation (%H:%M). [ <i>tm_hour</i> , <i>tm_min</i> ]
69823	CX	s
69824		Replaced by the number of seconds since the Epoch as a decimal number, calculated as described for <i>mktime()</i> . [ <i>tm_year</i> , <i>tm_mon</i> , <i>tm_mday</i> , <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> , <i>tm_isdst</i> ]
69825	S	Replaced by the second as a decimal number [00,60]. [ <i>tm_sec</i> ]
69826	t	Replaced by a <tab>.
69827	T	Replaced by the time (%H:%M:%S). [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]
69828	u	Replaced by the weekday as a decimal number [1,7], with 1 representing Monday. [ <i>tm_wday</i> ]
69829		
69830	U	Replaced by the week number of the year as a decimal number [00,53]. The first Sunday of January is the first day of week 1; days in the new year before this are in week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
69831		
69832		
69833	V	Replaced by the week number of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1. Both January 4th and the first Thursday of January are always in week 1. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
69834		
69835		
69836		
69837		
69838	w	Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday. [ <i>tm_wday</i> ]
69839		

69840	W	Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
69841		
69842		
69843	x	Replaced by the locale's appropriate date representation. (See the Base Definitions volume of POSIX.1-2024, < <b>time.h</b> >.)
69844		
69845	X	Replaced by the locale's appropriate time representation. (See the Base Definitions volume of POSIX.1-2024, < <b>time.h</b> >.)
69846		
69847	y	Replaced by the last two digits of the year as a decimal number [00,99]. [ <i>tm_year</i> ]
69848	Y	Replaced by the year as a decimal number (for example, 1997). [ <i>tm_year</i> ]
69849	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> shall be the number of digits and leading sign characters (if any) in the year, or the minimum field width, whichever is greater.
69850		
69851		
69852	z	Replaced by the offset from UTC in the ISO 8601-1:2019 standard format (+hhmm or -hhmm), or by no characters if no timezone is determinable. For example, "-0430" means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight saving time offset is used. If <i>tm_isdst</i> is negative, no characters are returned.
69853		
69854	CX	[ <i>tm_isdst</i> , <i>tm_gmtoff</i> ]
69855		
69856		
69857	CX	
69858	Z	Replaced by the timezone name or abbreviation, or by no bytes if no timezone information exists. [ <i>tm_isdst</i> , <i>tm_zone</i> ]
69859	CX	
69860	%	Replaced by %.
69861		If a conversion specification does not correspond to any of the above, the behavior is undefined.
69862	CX	If a <b>struct tm</b> broken-down time structure is created by <i>localtime()</i> or <i>localtime_r()</i> , or modified by <i>mktime()</i> , and the value of <i>TZ</i> is subsequently modified, the results of the %Z and %z <i>strftime()</i> conversion specifiers are undefined, when <i>strftime()</i> is called with such a broken-down time structure.
69863		
69864		
69865		
69866		If a <b>struct tm</b> broken-down time structure is created or modified by <i>gmtime()</i> or <i>gmtime_r()</i> , it is unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the current local timezone, when <i>strftime()</i> is called with such a broken-down time structure.
69867		
69868		

### 69869 Modified Conversion Specifiers

69870		Some conversion specifiers can be modified by the E or O modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist for the current locale (see ERA in XBD Section 7.3.5, on page 152), the behavior shall be as if the unmodified conversion specification were used.
69871		
69872		
69873		
69874		
69875	%EC	Replaced by the locale's alternative appropriate date and time representation.
69876	%EC	Replaced by the name of the base year (period) in the locale's alternative representation.
69877		
69878	%Ex	Replaced by the locale's alternative date representation.
69879	%EX	Replaced by the locale's alternative time representation.

69880		%Ey	Replaced by the offset from %EC (year only) in the locale's alternative representation.
69881		%EY	Replaced by the full alternative year representation.
69882	CX	%Ob	Replaced by the locale's abbreviated alternative month name.
69883	CX	%OB	Replaced by the locale's alternative appropriate full month name.
69884		%Od	Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading zeros if there is any alternative symbol for zero; otherwise, with leading <space> characters.
69885			
69886			
69887		%Oe	Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading <space> characters.
69888			
69889		%OH	Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.
69890		%OI	Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.
69891		%Om	Replaced by the month using the locale's alternative numeric symbols.
69892		%OM	Replaced by the minutes using the locale's alternative numeric symbols.
69893		%OS	Replaced by the seconds using the locale's alternative numeric symbols.
69894		%Ou	Replaced by the weekday as a number in the locale's alternative representation (Monday=1).
69895			
69896		%OU	Replaced by the week number of the year (Sunday as the first day of the week, rules corresponding to %U) using the locale's alternative numeric symbols.
69897			
69898		%OV	Replaced by the week number of the year (Monday as the first day of the week, rules corresponding to %V) using the locale's alternative numeric symbols.
69899			
69900		%Ow	Replaced by the number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
69901			
69902		%OW	Replaced by the week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
69903			
69904		%Oy	Replaced by the year (offset from %C) using the locale's alternative numeric symbols.
69905			%g, %G, and %v give values according to the ISO 8601-1:2019 standard week-based year. In this system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th, which is also the week that includes the first Thursday of the year, and is also the first week that contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January 1999, %G is replaced by 1998 and %v is replaced by 53. If December 29th, 30th, or 31st is a Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday 30th December 1997, %G is replaced by 1998 and %v is replaced by 01.
69906			
69907			
69908			
69909			
69910			
69911			
69912			
69913			If a conversion specifier is not one of the above, the behavior is undefined.
69914	CX		The behavior is undefined if the <i>locale</i> argument to <i>strptime_l()</i> is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.
69915			
69916		<b>RETURN VALUE</b>	
69917			If successful, these functions shall return the number of bytes placed into the array pointed to by <i>s</i> , not including the terminating NUL character. If successful, <i>errno</i> shall not be changed.
69918	CX		Otherwise, 0 shall be returned, <i>errno</i> shall be set to indicate the error, and the contents of the array are unspecified.
69919	CX		
69920			

69921 **ERRORS**

69922	CX	These functions shall fail if:
69923	[ERANGE]	The total number of resulting bytes including the terminating NUL character is more than <i>maxsize</i> .
69924		
69925		These functions may fail if:
69926	[EINVAL]	The <i>format</i> string includes a %s conversion and the number of seconds since the Epoch would be negative.
69927		
69928	[EOVERFLOW]	The <i>format</i> string includes a %s conversion and the number of seconds since the Epoch cannot be represented in a <b>time_t</b> .
69929		

69930 **EXAMPLES**69931 **Getting a Localized Date String**

69932 The following example first sets the locale to the user's default. The locale information will be  
 69933 used in the *nl\_langinfo()* and *strptime()* functions. The *nl\_langinfo()* function returns the localized  
 69934 date string which specifies how the date is laid out. The *strptime()* function takes this  
 69935 information and, using the **tm** structure for values, places the date and time information into  
 69936 *datestring*.

```
69937 #include <time.h>
69938 #include <locale.h>
69939 #include <langinfo.h>
69940 ...
69941 struct tm *tm;
69942 char datestring[256];
69943 ...
69944 setlocale (LC_ALL, "");
69945 ...
69946 strptime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
69947 ...
```

69948 **APPLICATION USAGE**

69949 A return value of 0 may indicate either success or failure if a format is the empty string or  
 69950 consists of conversion specifications such as %p or %Z that are replaced by no characters in the  
 69951 current locale or because of the current setting of *tzname[]*, respectively. To distinguish between  
 69952 success and failure when *strptime()* returns 0, an application can set *errno* to 0 before calling  
 69953 *strptime()* and test whether *errno* is 0 afterwards.

69954 The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

69955 Some of the conversion specifications are duplicates of others. They are included for  
 69956 compatibility with *nl\_cxtime()* and *nl\_ascxtime()*, which were published in Issue 2.

69957 The %C, %F, %G, and %Y format specifiers in *strptime()* always print full values, but the *strptime()*  
 69958 %C, %F, and %Y format specifiers only scan two digits (assumed to be the first two digits of a  
 69959 four-digit year) for %C and four digits (assumed to be the entire (four-digit) year) for %F and %Y.  
 69960 This mimics the behavior of *printf()* and *scanf()*; that is:

```
69961 printf("%2d", x = 1000);
69962 prints "1000", but:
69963 scanf("%2d", &x);
```

69964 when given "1000" as input will only store 10 in *x*). Applications using extended ranges of  
 69965 years must be sure that the number of digits specified for scanning years with *strptime()* matches  
 69966 the number of digits that will actually be present in the input stream. Historic implementations  
 69967 of the *%Y* conversion specification (with no flags and no minimum field width) produced  
 69968 different output formats. Some always produced at least four digits (with 0 fill for years from 0  
 69969 through 999) while others only produced the number of digits present in the year (with no fill  
 69970 and no padding). These two forms can be produced with the '0' flag and a minimum field  
 69971 width options using the conversions specifications *%04Y* and *%01Y*, respectively. Similarly,  
 69972 because *%Y* is part of *%F*, field widths of 10 and 7 (*%010F*, *%07F*), respectively, produce the same  
 69973 effect in the year portion of the *%F* conversion result.

69974 In the past, the C and POSIX standards specified that *%F* produced an ISO 8601-1:2019 standard  
 69975 date format, but didn't specify which one. For years in the range [1000,9999], POSIX.1-2024  
 69976 requires that the output produced match the ISO 8601-1:2019 standard complete representation  
 69977 extended format (YYYY-MM-DD) and for years greater than 9999 produce output that matches  
 69978 the ISO 8601-1:2019 standard expanded representation extended format *±YYYYY-MM-DD*). For  
 69979 years less than 1000, *%F* is not required to produce an ISO 8601-1:2019 standard format when  
 69980 used without specifying at least a minimum field width. As stated above, some implementations  
 69981 pad *%Y* conversions with zeros to four digits, in which case *%F* produces an ISO 8601-1:2019  
 69982 standard format; other implementations do not pad *%Y* with zeros, in which case *%F* does not  
 69983 produce an ISO 8601-1:2019 standard format. To fully meet ISO 8601-1:2019 standard  
 69984 requirements, the producer and consumer must agree on a date format that has a specific  
 69985 number of bytes reserved to hold the characters used to represent the years that is sufficiently  
 69986 large to hold all values that will be shared. For example, the  *%+13F* conversion specification will  
 69987 produce output matching the format "*±YYYYYY-MM-DD*" (a leading '+' or '-' sign; a six-digit,  
 69988 0-filled year; a '-' ; a two-digit, leading 0-filled month; another '-' ; and the two-digit, leading  
 69989 0-filled day within the month).

69990 Note that if the year being printed is greater than 9999, the resulting string from the unadorned  
 69991 *%F* conversion specifications will not conform to the ISO 8601-1:2019 standard extended format,  
 69992 complete representation for a date and will instead be an extended format, expanded  
 69993 representation (presumably without the required agreement between the date's producer and  
 69994 consumer).

69995 In the C or POSIX locale, the *E* and *O* modifiers are ignored and the replacement strings for the  
 69996 following specifiers are:

69997	<i>%a</i>	The first three characters of <i>%A</i> .
69998	<i>%A</i>	One of Sunday, Monday, ..., Saturday.
69999	<i>%b</i>	The first three characters of <i>%B</i> .
70000	<i>%B</i>	One of January, February, ..., December.
70001	<i>%c</i>	Equivalent to <i>%a %b %e %T %Y</i> .
70002	<i>%p</i>	One of AM or PM.
70003	<i>%r</i>	Equivalent to <i>%I:%M:%S %p</i> .
70004	<i>%x</i>	Equivalent to <i>%m/%d/%y</i> .
70005	<i>%X</i>	Equivalent to <i>%T</i> .
70006	<i>%Z</i>	Implementation-defined.

## 70007 RATIONALE

70008 The %Y conversion specification to *strptime()* was frequently assumed to be a four-digit year, but  
70009 the ISO C standard does not specify that %Y is restricted to any subset of allowed values from the  
70010 *tm\_year* field. Similarly, the %C conversion specification was assumed to be a two-digit field and  
70011 the first part of the output from the %F conversion specification was assumed to be a four-digit  
70012 field. Since *tm\_year* is a signed **int** with a width of at least 32 bits and **time\_t** is required to have a  
70013 width of at least 64 bits (in conforming programming environments), these assumptions no  
70014 longer hold.

70015 POSIX.1-2024 now allows the format specifications %0xC, %0xF, %0xG, and %0xY (where 'x' is  
70016 a string of decimal digits used to specify printing and scanning of a string of *x* decimal digits)  
70017 with leading zero fill characters. Allowing applications to set the field width enables them to  
70018 agree on the number of digits to be printed and scanned in the ISO 8601-1:2019 standard  
70019 expanded representation of a year (for %F, %G, and %Y) or all but the last two digits of the year  
70020 (for %C). This is based on a feature in some versions of GNU **libc**'s *strptime()*. The GNU version  
70021 allows specifying space, zero, or no-fill characters in *strptime()* format strings, but does not allow  
70022 any flags to be specified in *strptime()* format strings. These implementations also allow these  
70023 flags to be specified for any numeric field. POSIX.1-2024 only requires the zero fill flag ('0') and  
70024 only requires that it be recognized when processing %C, %F, %G, and %Y specifications when a  
70025 minimum field width is also specified. The '0' flag is the only flag needed to produce and scan  
70026 the ISO 8601-1:2019 standard year fields using the extended format forms. POSIX.1-2024 also  
70027 allows applications to specify the same flag and field width specifiers to be used in both  
70028 *strptime()* and *strptime()* format strings for symmetry. Systems may provide other flag characters  
70029 and may accept flags in conjunction with conversion specifiers other than %C, %F, %G, and %Y;  
70030 but portable applications cannot depend on such extensions.

70031 POSIX.1-2024 now also allows the format specifications %+xC, %+xF, %+xG, and %+xY (where  
70032 'x' is a string of decimal digits used to specify printing and scanning of a string of 'x' decimal  
70033 digits) with leading zero fill characters and a leading '+' sign character if the year being  
70034 converted is more than four digits or a minimum field width is specified that allows room for  
70035 more than four digits for the year. This allows date providers and consumers to agree on a  
70036 specific number of digits to represent a year as required by the ISO 8601-1:2019 standard  
70037 expanded representation formats. The expanded representation formats all require the year to  
70038 begin with a leading '+' or '-' sign. (All of these specifiers can also provide a leading '-'  
70039 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or  
70040 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm\_year*  
70041 to assume values corresponding to years before year 1, but the use of such years provided  
70042 unspecified results.)

70043 Some earlier version of this standard specified that applications wanting to use *strptime()* to scan  
70044 dates and times printed by *strptime()* should provide non-digit characters between fields to  
70045 separate years from months and days. It also supported %F to print and scan the  
70046 ISO 8601-1:2019 standard extended format, complete representation date for years 1 through  
70047 9999 (i.e., YYYY-MM-DD). However, many applications were written to print (using *strptime()*)  
70048 and scan (using *strptime()*) dates written using the basic format complete representation (four-  
70049 digit years) and truncated representation (two-digit years) specified by the ISO 8601-1:2019  
70050 standard representation of dates and times which do not have any separation characters  
70051 between fields. The ISO 8601-1:2019 standard also specifies basic format expanded  
70052 representation where the creator and consumer of these fields agree beforehand to represent  
70053 years as leading zero-filled strings of an agreed length of more than four digits to represent a  
70054 year (again with no separation characters when year, month, and day are all displayed).  
70055 Applications producing and consuming expanded representations are encouraged to use the  
70056 '+' flag and an appropriate maximum field width to scan the year including the leading sign.

70057 Note that even without the '+' flag, years less than zero may be represented with a leading  
70058 <hyphen-minus> for %F, %G, and %Y conversion specifications. Using negative years results in  
70059 unspecified behavior.

70060 If a format specification %+xF with the field width *x* greater than 11 is specified and the width is  
70061 large enough to display the full year, the output string produced will match the ISO 8601-1:2019  
70062 standard subclause 4.1.2.4 expanded representation, extended format date representation for a  
70063 specific day. (For years in the range [1,99999], %+12F is sufficient for an agreed five-digit year  
70064 with a leading sign using the ISO 8601-1:2019 standard expanded representation, extended  
70065 format for a specific day "+YYYY-MM-DD".) Note also that years less than 0 may produce a  
70066 leading <hyphen-minus> character ('-') when using %Y or %C whether or not the '0' or '+'  
70067 flags are used.

70068 The difference between the '0' flag and the '+' flag is whether the leading '+' character will  
70069 be provided for years >9999 as required for the ISO 8601-1:2019 standard extended  
70070 representation format containing a year. For example:

	Year	Conversion Specification	strptime() Output	strptime() Scan Back
70071	1970	%Y	1970	1970
70072	1970	%+4Y	1970	1970
70073	27	%Y	27 or 0027	27
70074	270	%Y	270 or 0270	270
70075	270	%+4Y	0270	270
70076	17	%C%y	0017	17
70077	270	%C%y	0270	270
70078	12345	%Y	12345	1234*
70079	12345	%+4Y	+12345	123*
70080	12345	%05Y	12345	12345
70081	270	%+5Y or %+3C%y	+0270	270
70082	12345	%+5Y or %+3C%y	+12345	1234*
70083	12345	%06Y or %04C%y	012345	12345
70084	12345	%+6Y or %+4C%y	+12345	12345
70085	123456	%08Y or %06C%y	00123456	123456
70086	123456	%+8Y or %+6C%y	+0123456	123456

70089 In the cases above marked with a \* in the *strptime()* scan back field, the implied or specified  
70090 number of characters scanned by *strptime()* was less than the number of characters output by  
70091 *strptime()* using the same format; so the remaining digits of the year were dropped when the  
70092 output date produced by *strptime()* was scanned back in by *strptime()*.

#### 70093 FUTURE DIRECTIONS

70098 XBD Section 7.3.5 (on page 152), <[time.h](#)>

70099 **CHANGE HISTORY**

70100 First released in Issue 3.

70101 **Issue 5**70102 The description of %OV is changed to be consistent with %V and defines Monday as the first day  
70103 of the week.

70104 The description of %Oy is clarified.

70105 **Issue 6**

70106 Extensions beyond the ISO C standard are marked.

70107 The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from  
70108 ``Otherwise, it is week 53 of the previous year, and the next week is week 1'' to ``Otherwise, it is  
70109 the last week of the previous year, and the next week is week 1''.70110 The following new requirements on POSIX implementations derive from alignment with the  
70111 Single UNIX Specification:

- 70112
- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
  - The modified conversion specifiers are added for consistency with the ISO POSIX-2  
70113 standard *date* utility.
- 70114

70115 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 70116
- The *strptime()* prototype is updated.
  - The DESCRIPTION is extensively revised.
  - The %z conversion specifier is added.
- 70117
- 
- 70118

70119 An example is added.

70120 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

70121 **Issue 7**

70122 Austin Group Interpretation 1003.1-2001 #163 is applied.

70123 The *strptime\_1()* function is added from The Open Group Technical Standard, 2006, Extended API  
70124 Set Part 4.70125 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0605 [283], XSH/TC1-2008/0606 [283],  
70126 XSH/TC1-2008/0607 [193], and XSH/TC1-2008/0608 [193] are applied.70127 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0340 [584], XSH/TC2-2008/0341 [796],  
70128 XSH/TC2-2008/0342 [584], and XSH/TC2-2008/0343 [584] are applied.70129 **Issue 8**70130 Austin Group Defects 169, 1386, and 1612 are applied, adding the s conversion and requiring  
70131 *errno* to be unchanged on success and set on error.

70132 Austin Group Defects 258 and 1166 are applied, adding the OB and Ob modified conversions.

70133 Austin Group Defect 472 is applied, changing the description of the C conversion.

70134 Austin Group Defect 739 is applied, changing the %F conversion to match the ISO C standard  
70135 when no flag and no minimum field width are specified.70136 Austin Group Defect 1125 is applied, changing ``Local timezone information is used'' to ``Local  
70137 timezone information shall be set''.

70138 Austin Group Defect 1253 is applied, changing ``daylight savings'' to ``daylight saving''.

- 70139 Austin Group Defect 1307 is applied, changing the `r` conversion in relation to locales that do not  
70140 support the 12-hour clock format.
- 70141 Austin Group Defects 1313 and 1354 are applied, changing text relating to the ISO 8601-1:2019  
70142 standard in the APPLICATION USAGE section.
- 70143 Austin Group Defect 1462 is applied, changing the RATIONALE section.
- 70144 Austin Group Defect 1533 is applied, adding `tm_gmtoff` and `tm_zone` to the `tm` structure.
- 70145 Austin Group Defect 1562 is applied, clarifying that it is the application's responsibility to  
70146 ensure that the format is a character string, beginning and ending in its initial shift state, if any.

70147 **NAME**

70148 strlcat, strlcpy — size-bounded string concatenation and copying

70149 **SYNOPSIS**

```
70150 CX #include <string.h>
70151     size_t strlcat(char *restrict dst, const char *restrict src,
70152                  size_t dstsize);
70153     size_t strlcpy(char *restrict dst, const char *restrict src,
70154                  size_t dstsize);
```

70155 **DESCRIPTION**

70156 The *strlcpy()* and *strlcat()* functions copy and concatenate strings, stopping when either a NUL  
 70157 terminator in the source string is encountered or the specified full size of the destination buffer is  
 70158 reached. They NUL terminate the result if there is room. The application should ensure that  
 70159 room for the NUL terminator is included in *dstsize*.

70160 The *strlcpy()* function shall copy not more than *dstsize* – 1 bytes from the string pointed to by *src*  
 70161 to the array pointed to by *dst*; a NUL byte in *src* and bytes that follow it shall not be copied. A  
 70162 terminating NUL byte shall be appended to the result, unless *dstsize* is 0. If copying takes place  
 70163 between objects that overlap, the behavior is undefined.

70164 The *strlcat()* function shall append not more than *dstsize* – *strlen(dst)* – 1 bytes from the string  
 70165 pointed to by *src* to the end of the string pointed to by *dst*; a NUL byte in *src* and bytes that  
 70166 follow it shall not be appended. The initial byte of *src* shall overwrite the NUL byte at the end of  
 70167 *dst*. A terminating NUL byte shall be appended to the result, unless its location would be at or  
 70168 beyond *dst* + *dstsize*. If copying takes place between objects that overlap, the behavior is  
 70169 undefined.

70170 The *strlcpy()* and *strlcat()* functions shall not change the setting of *errno* on valid input.

70171 **RETURN VALUE**

70172 Upon successful completion, the *strlcpy()* function shall return the length of the string pointed to  
 70173 by *src*; that is, the number of bytes in the string, not including the terminating NUL byte.

70174 Upon successful completion, the *strlcat()* function shall return the initial length of the string (if  
 70175 any) pointed to by *dst*, as limited by *dstsize*, plus the length of the string pointed to by *src*; that is,  
 70176 the value that would be returned by *strlen(dst, dstsize)* + *strlen(src)* before the *strlcat()* call.

70177 No return values are reserved to indicate an error.

70178 **ERRORS**

70179 No errors are defined.

70180 **EXAMPLES**

70181 The following example detects truncation while combining a path prefix (including trailing  
 70182 <slash>) and a filename to produce a portable pathname:

```
70183 char *prefix, *filenam, pathnam[_POSIX_PATH_MAX];
70184
70185 if (strlcpy(pathnam, prefix, sizeof pathnam) >= sizeof pathnam ||
70186     strlcat(pathnam, filenam, sizeof pathnam) >= sizeof pathnam)
70187 {
70188     // truncation occurred
70189     ...
70190 }
```

70190 This code ensures there is room for the NUL terminator by:

- 70191 • Calling *strncpy()* with a non-zero *dstsize* argument.
- 70192 • Only calling *strlcat()* if the return value of *strncpy()* indicated that truncation did not occur.

**70193 APPLICATION USAGE**

70194 The return value of the *strncpy()* and *strlcat()* functions follows the same convention as  
70195 *snprintf()*; that is, they return the total length of the string they tried to create. If the return value  
70196 is greater than or equal to *dstsize*, the output string has been truncated.

**70197 RATIONALE**

70198 None.

**70199 FUTURE DIRECTIONS**

70200 None.

**70201 SEE ALSO**

70203 XBD <**string.h**>

**70204 CHANGE HISTORY**

70205 First released in Issue 8.

70206 **NAME**

70207            strlen, strlen — get length of fixed size string

70208 **SYNOPSIS**

70209            #include &lt;string.h&gt;

70210            size\_t strlen(const char \*s);

70211 CX         size\_t strnlen(const char \*s, size\_t maxlen);

70212 **DESCRIPTION**70213 CX         For *strlen()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.70216         The *strlen()* function shall compute the number of bytes in the string to which *s* points, not including the terminating NUL character.70218 CX         The *strnlen()* function shall compute the smaller of the number of bytes in the array to which *s* points, not including any terminating NUL character, or the value of the *maxlen* argument. The *strnlen()* function shall never examine more than *maxlen* bytes of the array pointed to by *s*.70221 CX         The *strlen()* and *strnlen()* functions shall not change the setting of *errno* on valid input.70222 **RETURN VALUE**70223         The *strlen()* function shall return the length of *s*; no return value shall be reserved to indicate an error.70225 CX         The *strnlen()* function shall return the number of bytes preceding the first null byte in the array to which *s* points, if *s* contains a null byte within the first *maxlen* bytes; otherwise, it shall return *maxlen*.70228 **ERRORS**

70229         No errors are defined.

70230 **EXAMPLES**70231            **Getting String Lengths**70232         The following example sets the maximum length of *key* and *data* by using *strlen()* to get the lengths of those strings.

```

70234         #include <string.h>
70235         ...
70236         struct element {
70237             char *key;
70238             char *data;
70239         };
70240         ...
70241         char *key, *data;
70242         int len;

70243         *keylength = *datalength = 0;
70244         ...
70245         if ((len = strlen(key)) > *keylength)
70246             *keylength = len;
70247         if ((len = strlen(data)) > *datalength)
70248             *datalength = len;
70249         ...
```

70250 **APPLICATION USAGE**

70251 None.

70252 **RATIONALE**

70253 None.

70254 **FUTURE DIRECTIONS**

70255 None.

70256 **SEE ALSO**70257 *strlcat()*, *wcslen()*70258 XBD <**string.h**>70259 **CHANGE HISTORY**

70260 First released in Issue 1. Derived from Issue 1 of the SVID.

70261 **Issue 5**70262 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not  
70263 *s* itself as was previously stated.70264 **Issue 7**70265 The *strlen()* function is added from The Open Group Technical Standard, 2006, Extended API  
70266 Set Part 1.

70267 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0344 [560] is applied.

70268 **Issue 8**70269 Austin Group Defect 448 is applied, adding a requirement that *strlen()* and *strlen()* do not  
70270 change the setting of *errno* on valid input.70271 Austin Group Defect 986 is applied, adding *strlcat()* to the SEE ALSO section.

70272 **NAME**

70273 strncasecmp, strncasecmp\_l — case-insensitive string comparisons

70274 **SYNOPSIS**

70275 #include &lt;strings.h&gt;

70276 int strncasecmp(const char \*s1, const char \*s2, size\_t n);

70277 int strncasecmp\_l(const char \*s1, const char \*s2,

70278 size\_t n, locale\_t locale);

70279 **DESCRIPTION**70280 Refer to *strcasecmp()*.

70281 **NAME**

70282 strncat — concatenate a string with part of another

70283 **SYNOPSIS**

70284 #include &lt;string.h&gt;

70285 char \*strncat(char \*restrict s1, const char \*restrict s2, size\_t n);

70286 **DESCRIPTION**70287 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70288 conflict between the requirements described here and the ISO C standard is unintentional. This  
70289 volume of POSIX.1-2024 defers to the ISO C standard.70290 The *strncat()* function shall append not more than *n* bytes (a NUL character and bytes that  
70291 follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by  
70292 *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL  
70293 character is always appended to the result. If copying takes place between objects that overlap,  
70294 the behavior is undefined.70295 CX The *strncat()* function shall not change the setting of *errno* on valid input.70296 **RETURN VALUE**70297 The *strncat()* function shall return *s1*; no return value shall be reserved to indicate an error.70298 **ERRORS**

70299 No errors are defined.

70300 **EXAMPLES**

70301 None.

70302 **APPLICATION USAGE**

70303 None.

70304 **RATIONALE**

70305 None.

70313 **Issue 6**70314 The *strncat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.70315 **Issue 8**70316 Austin Group Defect 448 is applied, adding a requirement that *strncat()* does not change the  
70317 setting of *errno* on valid input.70318 Austin Group Defect 986 is applied, adding *strlcat()* to the SEE ALSO section.

70319 **NAME**

70320 strncmp — compare part of two strings

70321 **SYNOPSIS**

70322 #include &lt;string.h&gt;

70323 int strncmp(const char \*s1, const char \*s2, size\_t n);

70324 **DESCRIPTION**

70325 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70326 conflict between the requirements described here and the ISO C standard is unintentional. This  
70327 volume of POSIX.1-2024 defers to the ISO C standard.

70328 The *strncmp()* function shall compare not more than *n* bytes (bytes that follow a NUL character  
70329 are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

70330 The sign of a non-zero return value is determined by the sign of the difference between the  
70331 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
70332 being compared.

70333 CX The *strncmp()* function shall not change the setting of *errno* on valid input.

70334 **RETURN VALUE**

70335 Upon successful completion, *strncmp()* shall return an integer greater than, equal to, or less than  
70336 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the  
70337 possibly null-terminated array pointed to by *s2* respectively.

70338 **ERRORS**

70339 No errors are defined.

70340 **EXAMPLES**

70341 None.

70342 **APPLICATION USAGE**

70343 None.

70344 **RATIONALE**

70345 None.

70346 **FUTURE DIRECTIONS**

70347 None.

70348 **SEE ALSO**70349 [strcmp\(\)](#)70350 XBD [<string.h>](#)70351 **CHANGE HISTORY**

70352 First released in Issue 1. Derived from Issue 1 of the SVID.

70353 **Issue 6**

70354 Extensions beyond the ISO C standard are marked.

70355 **Issue 8**70356 Austin Group Defect 448 is applied, adding a requirement that *strncmp()* does not change the  
70357 setting of *errno* on valid input.

70358 **NAME**

70359           stpnncpy, strncpy — copy fixed length string, returning a pointer to the array end

70360 **SYNOPSIS**

70361           #include &lt;string.h&gt;

70362 CX       char \*stpnncpy(char \*restrict s1, const char \*restrict s2, size\_t n);

70363       char \*strncpy(char \*restrict s1, const char \*restrict s2, size\_t n);

70364 **DESCRIPTION**70365 CX       For *strncpy()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.70366 CX       The *stpnncpy()* and *strncpy()* functions shall copy not more than *n* bytes (bytes that follow a NUL character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.70367       If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

70368       If copying takes place between objects that overlap, the behavior is undefined.

70369 CX       The *strncpy()* and *stpnncpy()* functions shall not change the setting of *errno* on valid input.70374 **RETURN VALUE**70375 CX       If a NUL character is written to the destination, the *stpnncpy()* function shall return the address of the first such NUL character. Otherwise, it shall return *&s1[n]*.70376       The *strncpy()* function shall return *s1*.

70377       No return values are reserved to indicate an error.

70379 **ERRORS**

70380       No errors are defined.

70381 **EXAMPLES**

70382       None.

70383 **APPLICATION USAGE**70384       Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that the *s2* and *s1* arrays do not overlap.

70385       Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

70386       If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not null-terminated.70387 **RATIONALE**

70388       None.

70389 **FUTURE DIRECTIONS**

70390       None.

70391 **SEE ALSO**70392       [strcpy\(\)](#), [strlcat\(\)](#), [wcsncpy\(\)](#)70393       XBD [<string.h>](#)

70397 **CHANGE HISTORY**

70398 First released in Issue 1. Derived from Issue 1 of the SVID.

70399 **Issue 6**

70400 The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

70401 **Issue 7**

70402 The *stpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

70404 **Issue 8**

70405 Austin Group Defect 448 is applied, adding a requirement that *strncpy()* and *stpncpy()* do not change the setting of *errno* on valid input.

70407 Austin Group Defect 986 is applied, adding *strlcat()* to the SEE ALSO section.

70408 **NAME**

70409           strndup — duplicate a specific number of bytes from a string

70410 **SYNOPSIS**

70411 CX       #include <string.h>

70412       char \*strndup(const char \*s, size\_t size);

70413 **DESCRIPTION**

70414       Refer to *strdup()*.

70415 **NAME**

70416 strnlen — get length of fixed size string

70417 **SYNOPSIS**

```
70418 CX #include <string.h>  
70419 size_t strnlen(const char *s, size_t maxlen);
```

70420 **DESCRIPTION**70421 Refer to *strlen()*.

70422 **NAME**

70423 strpbrk — scan a string for a byte

70424 **SYNOPSIS**

70425 #include &lt;string.h&gt;

70426 char \*strpbrk(const char \*s1, const char \*s2);

70427 **DESCRIPTION**

70428 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70429 conflict between the requirements described here and the ISO C standard is unintentional. This  
70430 volume of POSIX.1-2024 defers to the ISO C standard.

70431 The *strpbrk()* function shall locate the first occurrence in the string pointed to by *s1* of any byte  
70432 from the string pointed to by *s2*.

70433 CX The *strpbrk()* function shall not change the setting of *errno* on valid input.

70434 **RETURN VALUE**

70435 Upon successful completion, *strpbrk()* shall return a pointer to the byte or a null pointer if no  
70436 byte from *s2* occurs in *s1*.

70437 **ERRORS**

70438 No errors are defined.

70439 **EXAMPLES**

70440 None.

70441 **APPLICATION USAGE**

70442 None.

70443 **RATIONALE**

70444 None.

70445 **FUTURE DIRECTIONS**

70446 None.

70447 **SEE ALSO**70448 [strchr\(\)](#), [strrchr\(\)](#)70449 XBD [<string.h>](#)70450 **CHANGE HISTORY**

70451 First released in Issue 1. Derived from Issue 1 of the SVID.

70452 **Issue 8**

70453 Austin Group Defect 448 is applied, adding a requirement that *strpbrk()* does not change the  
70454 setting of *errno* on valid input.

70455 **NAME**

70456 strptime — date and time conversion

70457 **SYNOPSIS**

```
70458 XSI      #include <time.h>
70459      char *strptime(const char *restrict buf, const char *restrict format,
70460                    struct tm *restrict tm);
```

70461 **DESCRIPTION**

70462 The *strptime()* function shall convert the character string pointed to by *buf* to values which are  
 70463 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

70464 The application shall ensure that the format is a character string, beginning and ending in its  
 70465 initial shift state, if any. The format is composed of zero or more directives. Each directive is  
 70466 composed of one of the following: one or more white-space bytes; an ordinary character (neither  
 70467 '%' nor a white-space byte); or a conversion specification.

70468 Each conversion specification is introduced by the '%' character after which the following  
 70469 appear in sequence:

- 70470 • An optional flag, the zero character ('0') or the <plus-sign> character ('+'), which is  
 70471 ignored.
- 70472 • An optional field width. If a field width is specified, it shall be interpreted as a string of  
 70473 decimal digits that determine the maximum number of bytes converted for the conversion  
 70474 rather than the number of bytes specified below in the description of the conversion  
 70475 specifiers.
- 70476 • An optional E or O modifier.
- 70477 • A terminating conversion specifier character that indicates the type of conversion to be  
 70478 applied.

70479 The conversions are determined using the *LC\_TIME* category of the current locale. The  
 70480 application shall ensure that there are white-space bytes or other non-alphanumeric bytes  
 70481 between any two conversion specifications unless all of the adjacent conversion specifications  
 70482 convert a known, fixed number of characters. In the following list, the maximum number of  
 70483 characters scanned (excluding the one matching the next directive) is as follows:

- 70484 • If a maximum field width is specified, then that number
- 70485 • Otherwise, the pattern "{x}" indicates that the maximum is *x*
- 70486 • Otherwise, the pattern "[x,y]" indicates that the value shall fall within the range given  
 70487 (both bounds being inclusive), and the maximum number of characters scanned shall be  
 70488 the maximum required to represent any value in the range without leading zeros and  
 70489 without a leading <plus-sign>

70490 The following conversion specifiers are supported.

70491 The results are unspecified if a modifier is specified with a flag or with a minimum field width,  
 70492 or if a field width is specified for any conversion specifier other than C, F, G, Y, or Z.

- 70493 a The day of the week, using the locale's weekday names; either the abbreviated or full  
 70494 name can be specified. The *tm\_wday* member of the **tm** structure pointed to by *tm* shall  
 70495 be set to the corresponding day of the week number (Sunday=0).

70496	A	Equivalent to %a.
70497	b	The month, using the locale's month names; either the abbreviated or full version of either the default or the alternative month name can be specified. The <i>tm_mon</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to the corresponding month number.
70498		
70499		
70500		
70501	c	Replaced by the locale's appropriate date and time representation. The members of the <b>tm</b> structure pointed to by <i>tm</i> shall be set as specified for the conversions present in the locale's <b>d_t_fmt</b> value.
70502		
70503		
70504	C	All but the last two digits of the year {2}; leading zeros shall be permitted but shall not be required. A leading '+' or '-' character shall be permitted before any leading zeros but shall not be required. The <i>tm_year</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to the number formed by appending the last two digits of the year to these digits, minus 1900. If a <i>y</i> conversion is also performed, the last two digits of the year shall be those processed by the <i>y</i> conversion; otherwise, they shall be 00.
70505		
70506		
70507		
70508		
70509		
70510	d	The day of the month [01,31]; leading zeros shall be permitted but shall not be required. The <i>tm_mday</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number.
70511		
70512	D	Equivalent to %m/%d/%y.
70513	e	Equivalent to %d.
70514	F	This specifier is similar to %Y-%m-%d where the characters up to the first <hyphen-minus> separator shall be converted as for %Y but with unlimited field width, the characters between the two <hyphen-minus> separators shall be converted as for %m, and the characters after the last <hyphen-minus> separator shall be converted as for %d. If a field width is specified, each of the %Y, %m, and %d conversions shall not convert any characters past the overall %F field width. The members of the <b>tm</b> structure pointed to by <i>tm</i> shall be set as specified for the Y, m, and d conversions.
70515		
70516		
70517		
70518		
70519		
70520		
70521		
70522	g	The last 2 digits of the week-based year (see below) as a decimal number (for example, 77). Leading zeros shall be permitted but shall not be required. A leading '+' or '-' character shall be permitted before any leading zeros but shall not be required. The effect of this year, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70523		
70524		
70525	G	The week-based year (see below) as a decimal number (for example, 1977). Leading zeros shall be permitted but shall not be required. A leading '+' or '-' character shall be permitted before any leading zeros but shall not be required. The effect of this year, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70526		
70527		
70528		
70529	h	Equivalent to %b.
70530	H	The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be required. The <i>tm_hour</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number.
70531		
70532		
70533	I	The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be required. If a <i>p</i> conversion is also performed, the <i>tm_hour</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to the hour, by the 24-hour clock, corresponding to the combined results of the <b>I</b> and <i>p</i> conversions. If a <i>p</i> conversion is not also performed, the behavior is unspecified.
70534		
70535		
70536		
70537		
70538	j	The day number of the year [001,366]; leading zeros shall be permitted but shall not be required. The <i>tm_yday</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number minus 1.
70539		
70540		

70541	m	The month number [01,12]; leading zeros shall be permitted but shall not be required.
70542		The <i>tm_mon</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number
70543		minus 1.
70544	M	The minute [00,59]; leading zeros shall be permitted but shall not be required. The
70545		<i>tm_min</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number.
70546	n	Any white-space bytes.
70547	p	The locale's equivalent of a.m. or p.m. If an <b>I</b> conversion is also performed, the <i>tm_hour</i>
70548		member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set as specified for the <b>I</b>
70549		conversion; otherwise, the behavior is unspecified.
70550	r	12-hour clock time, if the 12-hour format is supported in the locale (see XBD <a href="#">Section</a>
70551		<a href="#">7.3.5</a> , on page 152); in the POSIX locale, this shall be equivalent to <code>%I:%M:%S %p</code> . The
70552		members of the <b>tm</b> structure pointed to by <i>tm</i> shall be set as specified for the
70553		conversions present in the locale's <i>t_fmt_ampm</i> value.
70554	R	Equivalent to <code>%H:%M</code> .
70555	s	The number of seconds since the Epoch as a decimal number (see XBD <a href="#">Section 4.19</a> , on
70556		page 107); leading zeros shall be permitted but shall not be required. The effect of this
70557		number, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70558	S	The seconds [00,60]; leading zeros shall be permitted but shall not be required. The
70559		<i>tm_sec</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number.
70560	t	Any white-space bytes.
70561	T	Equivalent to <code>%H:%M:%S</code> .
70562	u	The weekday as a decimal number [1,7], with 1 representing Monday. The <i>tm_wday</i>
70563		member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number modulo 7.
70564	U	The week number of the year (Sunday as the first day of the week) as a decimal
70565		number [00,53]; leading zeros shall be permitted but shall not be required. The effect of
70566		this week number, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70567	V	The week number of the week-based year (see below) as a decimal number [01,53].
70568		Leading zeros shall be permitted but shall not be required. The effect of this week
70569		number, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70570	w	The weekday as a decimal number [0,6], with 0 representing Sunday. The <i>tm_wday</i>
70571		member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this number.
70572	W	The week number of the year (Monday as the first day of the week) as a decimal
70573		number [00,53]; leading zeros shall be permitted but shall not be required. The effect of
70574		this week number, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70575	x	The date, using the locale's date format. The members of the <b>tm</b> structure pointed to by
70576		<i>tm</i> shall be set as specified for the conversions present in the locale's <i>d_fmt</i> value.
70577	X	The time, using the locale's time format. The members of the <b>tm</b> structure pointed to by
70578		<i>tm</i> shall be set as specified for the conversions present in the locale's <i>t_fmt</i> value.
70579	y	The last two digits of the year; leading zeros shall be permitted but shall not be
70580		required. A leading '+' or '-' character shall be permitted before any leading zeros
70581		but shall not be required. If a <b>C</b> conversion is not also performed, values in the range
70582		[69,99] shall refer to years 1969 to 1999 inclusive and values in the range [00,68] shall
70583		refer to years 2000 to 2068 inclusive. If a <b>C</b> conversion is also performed, the <i>tm_year</i>

70584		member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set as specified for the C
70585		conversion; otherwise, the <i>tm_year</i> member shall be set to the calculated year minus
70586		1900.
70587	<b>Note:</b>	It is expected that in a future version of this standard the default century inferred
70588		from a 2-digit year will change. (This would apply to all commands accepting a
70589		2-digit year as input.)
70590	Y	The full year {4}; leading zeros shall be permitted but shall not be required. A leading
70591		'+' or '-' character shall be permitted before any leading zeros but shall not be
70592		required. The <i>tm_year</i> member of the <b>tm</b> structure pointed to by <i>tm</i> shall be set to this
70593		number minus 1900.
70594	z	The offset from UTC in the ISO 8601-1:2019 standard format (+hhmm or -hhmm). For
70595		example, "-0430" means 4 hours 30 minutes behind UTC (west of Greenwich). The
70596		effect of this offset, if any, on the <b>tm</b> structure pointed to by <i>tm</i> is unspecified.
70597	Z	The timezone name. If this name matches the name pointed to by <i>tzname</i> [1], and the
70598		names pointed to by <i>tzname</i> [0] and <i>tzname</i> [1] differ, then the <i>tm_isdst</i> member of the <b>tm</b>
70599		structure pointed to by <i>tm</i> shall be set to 1. Otherwise, if this name matches the name
70600		pointed to by <i>tzname</i> [0] then the <i>tm_isdst</i> member of the <b>tm</b> structure pointed to by <i>tm</i>
70601		shall be set to 0. The <i>tm_zone</i> and <i>tm_gmtoff</i> members of the structure may also be set in
70602		an unspecified manner. Members other than <i>tm_isdst</i> , <i>tm_zone</i> , and <i>tm_gmtoff</i> may be
70603		affected if an <i>s</i> conversion is also performed but shall otherwise not be affected.
70604	%	Replaced by %.

### Modified Conversion Specifiers

70605		Some conversion specifiers can be modified by the E and O modifier characters to indicate that
70606		an alternative format or specification should be used rather than the one normally used by the
70607		unmodified conversion specifier. If the alternative format or specification does not exist in the
70608		current locale, the behavior shall be as if the unmodified conversion specification were used.
70609		
70610	%Ec	The locale's alternative appropriate date and time representation.
70611	%EC	The name of the base year (period) in the locale's alternative representation.
70612	%Ex	The locale's alternative date representation.
70613	%EX	The locale's alternative time representation.
70614	%Ey	The offset from %EC (year only) in the locale's alternative representation.
70615	%EY	The full alternative year representation.
70616	%Ob	Equivalent to %b.
70617	%OB	Equivalent to %B.
70618	%Od	The day of the month using the locale's alternative numeric symbols; leading zeros
70619		shall be permitted but shall not be required.
70620	%Oe	Equivalent to %Od.
70621	%Oh	Equivalent to %b.
70622	%OH	The hour (24-hour clock) using the locale's alternative numeric symbols.
70623	%OI	The hour (12-hour clock) using the locale's alternative numeric symbols.

70624	%Om	The month using the locale's alternative numeric symbols.
70625	%OM	The minutes using the locale's alternative numeric symbols.
70626	%OS	The seconds using the locale's alternative numeric symbols.
70627	%OU	The week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.
70628		
70629	%OV	The same as %V but using the locale's alternative numeric symbols.
70630	%Ow	The number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
70631		
70632	%OW	The week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
70633		
70634	%Oy	The year (offset from %C) using the locale's alternative numeric symbols.
70635	%g, %G, and %V convert values according to the ISO 8601-1:2019 standard week-based year. In this system, weeks begin on a Monday and week 1 of the week-based year is the week that includes January 4th, which is also the week that includes the first Thursday of the year, and is also the first week that contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding week-based year (thus, the string "1998 53 6" with format specifier "%G %V %u" represents Saturday 2nd January 1999). If December 29th, 30th, or 31st is a Monday, it and any following days are part of week 1 of the following week-based year (thus, the string "1998 01 2" with format specifier "%G %V %u" represents Tuesday 30th December 1997).	
70636		
70637		
70638		
70639		
70640		
70641		
70642		
70643		
70644	A conversion specification composed of white-space bytes is executed by scanning input up to the first non-white-space byte (which remains unscanned), or until no more characters can be scanned.	
70645		
70646		
70647	A conversion specification that is an ordinary character is executed by scanning the next character from the buffer. If the character scanned from the buffer differs from the one comprising the directive, the directive fails, and the differing and subsequent characters remain unscanned.	
70648		
70649		
70650		
70651	A series of conversion specifications composed of %n, %t, white-space bytes, or any combination is executed by scanning up to the first non-white-space byte (which remains unscanned), or until no more characters can be scanned.	
70652		
70653		
70654	Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the affected <b>tm</b> structure members are set as specified in the description of the conversion specification. Case is ignored when matching items in <i>buf</i> such as month or weekday names. If no match is found, <i>strptime()</i> fails and no more characters are scanned.	
70655		
70656		
70657		
70658		
70659		
70660		
70661	<b>RETURN VALUE</b>	
70662	Upon successful completion, <i>strptime()</i> shall return a pointer to the character following the last character parsed. Otherwise, a null pointer shall be returned.	
70663		
70664	<b>ERRORS</b>	
70665	No errors are defined.	

## 70666 EXAMPLES

70667 **Convert a Date-Plus-Time String to Broken-Down Time and Then into Seconds**

70668 The following example demonstrates the use of *strptime()* to convert a string into broken-down  
70669 time. The broken-down time is then converted into seconds since the Epoch using *mktime()*.

```
70670 #include <time.h>
70671 ...
70672 struct tm tm;
70673 time_t t;
70674 if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
70675     /* Handle error */;
70676 printf("year: %d; month: %d; day: %d;\n",
70677        tm.tm_year, tm.tm_mon, tm.tm_mday);
70678 printf("hour: %d; minute: %d; second: %d\n",
70679        tm.tm_hour, tm.tm_min, tm.tm_sec);
70680 printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);
70681 tm.tm_isdst = -1; /* Not set by strptime(); tells mktime()
70682                  to determine whether daylight saving time
70683                  is in effect */
70684 t = mktime(&tm);
70685 if (t == -1)
70686     /* Handle error */;
70687 printf("seconds since the Epoch: %ld\n", (long) t);"
```

## 70688 APPLICATION USAGE

70689 Several “equivalent to” formats and the special processing of white-space characters are  
70690 provided in order to ease the use of identical format strings for *strptime()* and *strptime()*.

70691 It should be noted that dates constructed by the *strptime()* function with the %Y or %C%Y  
70692 conversion specifiers may have values larger than 9999. If the *strptime()* function is used to read  
70693 such values using %C%Y or %Y, the year values will be truncated to four digits. Applications  
70694 should use %+w%Y or %+xY with *w* and *x* set large enough to contain the full value of any years  
70695 that will be printed or scanned.

70696 The effect of the *s* conversion is unspecified because existing implementations differ in behavior.  
70697 Some do a conversion equivalent to *gmtime()*, ignoring all available timezone information; some  
70698 do a conversion equivalent to *localtime()*, using the same timezone it would use and ignoring  
70699 any timezone information provided by a *z* or *Z* conversion. Although none has been observed,  
70700 there may be existing (or future) implementations that use timezone information provided by a  
70701 *z* or *Z* conversion, although using the latter would not be reliable as timezone names are often  
70702 ambiguous. Applications that need to convert a seconds since the Epoch value to a **tm** structure  
70703 should call *gmtime()* or *localtime()* (or their thread-safe equivalents) directly.

70704 The effect of the *z* conversion is unspecified because existing implementations differ in behavior.  
70705 Some just use it to set the *tm\_gmtoff* member of the **tm** structure; some use the value to adjust the  
70706 other field members to represent UTC, convert the resulting time to a seconds since the Epoch  
70707 value, and then convert back to a **tm** structure by the equivalent of *localtime()*. An application  
70708 that needs either of these behaviors should perform the necessary processing explicitly itself.

70709 Although the *Z* conversion might be expected to set the *tm\_zone* member of the **tm** structure, no  
70710 existing implementation has been found that sets it. Applications that need it set should set it

- 70711 explicitly after calling *strptime()*.
- 70712 See also the APPLICATION USAGE section in *strptime()*.
- 70713 It is unspecified whether multiple calls to *strptime()* using the same **tm** structure will update the  
 70714 current contents of the structure or overwrite all contents of the structure. Conforming  
 70715 applications should make a single call to *strptime()* with a format and all data needed to  
 70716 completely specify the date and time being converted.
- 70717 **RATIONALE**
- 70718 See the RATIONALE section for *strptime()*.
- 70719 **FUTURE DIRECTIONS**
- 70720 None.
- 70721 **SEE ALSO**
- 70722 *fprintf()*, *fscanf()*, *strptime()*, *time()*
- 70723 XBD <**time.h**>
- 70724 **CHANGE HISTORY**
- 70725 First released in Issue 4.
- 70726 **Issue 5**
- 70727 Moved from ENHANCED I18N to BASE.
- 70728 The [ENOSYS] error is removed.
- 70729 The exact meaning of the %y and %Oy specifiers is clarified in the DESCRIPTION.
- 70730 **Issue 6**
- 70731 The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.
- 70732 The normative text is updated to avoid use of the term “must” for application requirements.
- 70733 The **restrict** keyword is added to the *strptime()* prototype for alignment with the  
 70734 ISO/IEC 9899:1999 standard.
- 70735 The Open Group Corrigendum U047/2 is applied.
- 70736 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
 70737 specification” for consistency with *strptime()*.
- 70738 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the  
 70739 EXAMPLES section.
- 70740 **Issue 7**
- 70741 Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and  
 70742 APPLICATION USAGE sections.
- 70743 Austin Group Interpretation 1003.1-2001 #163 is applied.
- 70744 SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression  
 70745 that %Y is 4-digit years.
- 70746 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0345 [920] and XSH/TC2-2008/0346  
 70747 [919] are applied.
- 70748 **Issue 8**
- 70749 Austin Group Defect 169 is applied, adding the s conversion.
- 70750 Austin Group Defects 258 and 1166 are applied, adding the Ob, OB, and Oh modified  
 70751 conversions.

- 70752 Austin Group Defect 879 is applied, adding the F, g, G, u, V, z, and Z conversions and the OV  
70753 modified conversion, and adding a statement to the week number conversions that their effect  
70754 on the **tm** structure pointed to by *tm* is unspecified.
- 70755 Austin Group Defect 1163 is applied, clarifying the handling of white space in the format string.
- 70756 Austin Group Defect 1307 is applied, changing the r conversion in relation to locales that do not  
70757 support the 12-hour clock format.
- 70758 Austin Group Defect 1562 is applied, clarifying that it is the application's responsibility to  
70759 ensure that the format is a character string, beginning and ending in its initial shift state, if any.
- 70760 Austin Group Defect 1727 is applied, clarifying which members of the **tm** structure are updated  
70761 by each conversion.

70762 **NAME**

70763 strrchr — string scanning operation

70764 **SYNOPSIS**

70765 #include &lt;string.h&gt;

70766 char \*strrchr(const char \*s, int c);

70767 **DESCRIPTION**

70768 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70769 conflict between the requirements described here and the ISO C standard is unintentional. This  
70770 volume of POSIX.1-2024 defers to the ISO C standard.

70771 The *strrchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string  
70772 pointed to by *s*. The terminating NUL character is considered to be part of the string.

70773 CX The *strrchr()* function shall not change the setting of *errno* on valid input.

70774 **RETURN VALUE**

70775 Upon successful completion, *strrchr()* shall return a pointer to the byte or a null pointer if *c* does  
70776 not occur in the string.

70777 **ERRORS**

70778 No errors are defined.

70779 **EXAMPLES**70780 **Finding the Base Name of a File**

70781 The following example uses *strrchr()* to get a pointer to the base name of a file. The *strrchr()*  
70782 function searches backwards through the name of the file to find the last '/' character in *name*.  
70783 This pointer (plus one) will point to the base name of the file.

```
70784 #include <string.h>
70785 ...
70786 const char *name;
70787 char *basename;
70788 ...
70789 basename = strrchr(name, '/') + 1;
70790 ...
```

70791 **APPLICATION USAGE**

70792 None.

70793 **RATIONALE**

70794 None.

70795 **FUTURE DIRECTIONS**

70796 None.

70797 **SEE ALSO**70798 [strchr\(\)](#)70799 XBD [<string.h>](#)70800 **CHANGE HISTORY**

70801 First released in Issue 1. Derived from Issue 1 of the SVID.

70802 **Issue 8**

70803

70804

Austin Group Defect 448 is applied, adding a requirement that *strchr()* does not change the setting of *errno* on valid input.

70805 **NAME**

70806 strsignal — get signal message string

70807 **SYNOPSIS**

```
70808 CX #include <string.h>  
70809 char *strsignal(int signum);
```

70810 **DESCRIPTION**

70811 The *strsignal()* function shall map the signal number in *signum* to an implementation-defined  
70812 string and shall return a pointer to it. It shall use the same set of messages as the *psignal()*  
70813 function.

70814 The application shall not modify the string returned. The returned pointer might be invalidated  
70815 or the string content might be overwritten by a subsequent call to *strsignal()* or *setlocale()*. The  
70816 returned pointer might also be invalidated if the calling thread is terminated.

70817 The contents of the message strings returned by *strsignal()* should be determined by the setting  
70818 of the *LC\_MESSAGES* category in the current locale.

70819 The implementation shall behave as if no function defined in this standard calls *strsignal()*.

70820 Since no return value is reserved to indicate an error, an application wishing to check for error  
70821 situations should set *errno* to 0, then call *strsignal()*, then check *errno*.

70822 The *strsignal()* function need not be thread-safe.

70823 **RETURN VALUE**

70824 Upon successful completion, *strsignal()* shall return a pointer to a string. Otherwise, if *signum* is  
70825 not a valid signal number, the return value is unspecified.

70826 **ERRORS**

70827 No errors are defined.

70828 **EXAMPLES**

70829 None.

70830 **APPLICATION USAGE**

70831 None.

70832 **RATIONALE**

70833 If *signum* is not a valid signal number, some implementations return NULL, while for others the  
70834 *strsignal()* function returns a pointer to a string containing an unspecified message denoting an  
70835 unknown signal. POSIX.1-2024 leaves this return value unspecified.

70836 **FUTURE DIRECTIONS**

70837 None.

70838 **SEE ALSO**

70841 **CHANGE HISTORY**

70842 First released in Issue 7.

70843 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0609 [75] is applied.

70844 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0347 [656] is applied.

70845 **Issue 8**

70846 Austin Group Defect 1138 is applied, adding *sig2str()* to the SEE ALSO section.

70847 Austin Group Defect 1474 is applied, changing the NAME section.

70848 **NAME**

70849 strspn — get length of a substring

70850 **SYNOPSIS**

70851 #include &lt;string.h&gt;

70852 size\_t strspn(const char \*s1, const char \*s2);

70853 **DESCRIPTION**

70854 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70855 conflict between the requirements described here and the ISO C standard is unintentional. This  
70856 volume of POSIX.1-2024 defers to the ISO C standard.

70857 The *strspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
70858 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

70859 CX The *strspn()* function shall not change the setting of *errno* on valid input.

70860 **RETURN VALUE**

70861 The *strspn()* function shall return the computed length; no return value is reserved to indicate an  
70862 error.

70863 **ERRORS**

70864 No errors are defined.

70865 **EXAMPLES**

70866 None.

70867 **APPLICATION USAGE**

70868 None.

70869 **RATIONALE**

70870 None.

70871 **FUTURE DIRECTIONS**

70872 None.

70873 **SEE ALSO**70874 [strcspn\(\)](#)70875 XBD [<string.h>](#)70876 **CHANGE HISTORY**

70877 First released in Issue 1. Derived from Issue 1 of the SVID.

70878 **Issue 5**

70879 The RETURN VALUE section is updated to indicate that *strspn()* returns the length of *s*, and not  
70880 *s* itself as was previously stated.

70881 **Issue 7**

70882 SD5-XSH-ERN-182 is applied.

70883 **Issue 8**

70884 Austin Group Defect 448 is applied, adding a requirement that *strspn()* does not change the  
70885 setting of *errno* on valid input.

70886 **NAME**

70887        strstr — find a substring

70888 **SYNOPSIS**

70889        #include &lt;string.h&gt;

70890        char \*strstr(const char \*s1, const char \*s2);

70891 **DESCRIPTION**

70892 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
70893        conflict between the requirements described here and the ISO C standard is unintentional. This  
70894        volume of POSIX.1-2024 defers to the ISO C standard.

70895        The *strstr()* function shall locate the first occurrence in the string pointed to by *s1* of the  
70896        sequence of bytes (excluding the terminating NUL character) in the string pointed to by *s2*.

70897 CX        The *strstr()* function shall not change the setting of *errno* on valid input.

70898 **RETURN VALUE**

70899        Upon successful completion, *strstr()* shall return a pointer to the located string or a null pointer  
70900        if the string is not found.

70901        If *s2* points to a string with zero length, the function shall return *s1*.

70902 **ERRORS**

70903        No errors are defined.

70904 **EXAMPLES**

70905        None.

70906 **APPLICATION USAGE**

70907        None.

70908 **RATIONALE**

70909        None.

70910 **FUTURE DIRECTIONS**

70911        None.

70912 **SEE ALSO**

70913        [memmem\(\)](#), [strchr\(\)](#)

70914        XBD [<string.h>](#)

70915 **CHANGE HISTORY**

70916        First released in Issue 3. Included for alignment with the ANSI C standard.

70917 **Issue 8**

70918        Austin Group Defect 448 is applied, adding a requirement that *strstr()* does not change the  
70919        setting of *errno* on valid input.

70920        Austin Group Defect 1061 is applied, adding *memmem()* to the SEE ALSO section.

70921 **NAME**70922 `strtod, strtodf, strtold` — convert a string to a double-precision number70923 **SYNOPSIS**70924 `#include <stdlib.h>`70925 `double strtod(const char *restrict nptr, char **restrict endptr);`70926 `float strtodf(const char *restrict nptr, char **restrict endptr);`70927 `long double strtold(const char *restrict nptr, char **restrict endptr);`70928 **DESCRIPTION**70929 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
70930 conflict between the requirements described here and the ISO C standard is unintentional. This  
70931 volume of POSIX.1-2024 defers to the ISO C standard.70932 These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**,  
70933 and **long double** representation, respectively. First, they decompose the input string into three  
70934 parts:

- 70935
1. An initial, possibly empty, sequence of white-space bytes
  - 70936 2. A subject sequence interpreted as a floating-point constant or representing infinity or  
70937 NaN
  - 70938 3. A final string of one or more unrecognized characters, including the terminating NUL  
70939 character of the input string

70940 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
70941 the result.70942 The expected form of the subject sequence is an optional '+' or '-' sign, then one of the  
70943 following:

- 70944
- A non-empty sequence of decimal digits optionally containing a radix character; then an  
70945 optional exponent part consisting of the character 'e' or the character 'E', optionally  
70946 followed by a '+' or '-' character, and then followed by one or more decimal digits
  - 70947 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
70948 character; then an optional binary exponent part consisting of the character 'p' or the  
70949 character 'P', optionally followed by a '+' or '-' character, and then followed by one or  
70950 more decimal digits
  - 70951 • One of INF or INFINITY, ignoring case
  - 70952 • One of NAN or NAN(*n-char-sequence*<sub>opt</sub>), ignoring case in the NAN part, where:

70953 `n-char-sequence:`70954 `digit`70955 `nondigit`70956 `n-char-sequence digit`70957 `n-char-sequence nondigit`70958 The subject sequence is defined as the longest initial subsequence of the input string, starting  
70959 with the first non-white-space byte, that is of the expected form. The subject sequence contains  
70960 no characters if the input string is not of the expected form.70961 If the subject sequence has the expected form for a floating-point number, the sequence of  
70962 characters starting with the first digit or the decimal-point character (whichever occurs first)  
70963 shall be interpreted as a floating constant of the C language, except that the radix character shall  
70964 be used in place of a period, and that if neither an exponent part nor a radix character appears in

70965 a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal  
 70966 floating-point number, an exponent part of the appropriate type with value zero is assumed to  
 70967 follow the last digit in the string. If the subject sequence begins with a <hyphen-minus>, the  
 70968 sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be  
 70969 interpreted as an infinity, if representable in the return type, else as if it were a floating constant  
 70970 that is too large for the range of the return type. A character sequence NAN or NAN(*n-char-*  
 70971 *sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a  
 70972 subject sequence part that does not have the expected form; the meaning of the *n-char* sequences  
 70973 is implementation-defined. A pointer to the final string is stored in the object pointed to by  
 70974 *endptr*, provided that *endptr* is not a null pointer.

70975 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the value  
 70976 resulting from the conversion is correctly rounded.

70977 CX The radix character is defined in the current locale (category *LC\_NUMERIC*). In the POSIX  
 70978 locale, or in a locale where the radix character is not defined, the radix character shall default to  
 70979 a <period> ('.').

70980 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
 70981 accepted.

70982 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 70983 performed; the value of *nptr* is stored in the object pointed to by *endptr*, provided that *endptr* is  
 70984 not a null pointer.

70985 These functions shall not change the setting of *errno* if successful.

70986 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 70987 for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

#### 70988 RETURN VALUE

70989 Upon successful completion, these functions shall return the converted value. If no conversion  
 70990 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

70991 If the correct value would cause an overflow and default rounding is in effect, ±HUGE\_VAL,  
 70992 ±HUGE\_VALF, or ±HUGE\_VALL shall be returned (according to the sign of the value), and *errno*  
 70993 shall be set to [ERANGE].

70994 If the correct value would cause an underflow, a value whose magnitude is no greater than the  
 70995 CX smallest normalized positive number in the return type shall be returned and *errno* set to  
 70996 [ERANGE].

#### 70997 ERRORS

70998 These functions shall fail if:

70999 [ERANGE] The value to be returned would cause overflow and default rounding is in  
 71000 CX effect or the value to be returned would cause underflow.

71001 These functions may fail if:

71002 CX [EINVAL] No conversion could be performed.

71003 **EXAMPLES**

71004 None.

71005 **APPLICATION USAGE**

71006 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 71007 result is not exactly representable, the result should be one of the two numbers in the  
 71008 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 71009 extra stipulation that the error should have a correct sign for the current rounding direction.

71010 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in <float.h>)  
 71011 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 71012 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 71013 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the  
 71014 values of *L*, *D*, and *U* satisfy  $L \leq D \leq U$ . The result should be one of the (equal or adjacent)  
 71015 values that would be obtained by correctly rounding *L* and *U* according to the current rounding  
 71016 direction, with the extra stipulation that the error with respect to *D* should have a correct sign  
 71017 for the current rounding direction.

71018 The changes to *strtod()* introduced by the ISO/IEC 9899:1999 standard can alter the behavior of  
 71019 well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier  
 71020 versions of this standard. One such example would be:

```

71021 int
71022 what_kind_of_number (char *s)
71023 {
71024     char *endp;
71025     double d;
71026     long l;

71027     d = strtod(s, &endp);
71028     if (s != endp && *endp == '\0')
71029         printf("It's a float with value %g\n", d);
71030     else
71031     {
71032         l = strtol(s, &endp, 0);
71033         if (s != endp && *endp == '\0')
71034             printf("It's an integer with value %ld\n", l);
71035         else
71036             return 1;
71037     }
71038     return 0;
71039 }
```

71040 If the function is called with:

```
71041 what_kind_of_number ("0x10")
```

71042 an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
71043 It's an integer with value 16
```

71044 With the ISO/IEC 9899:1999 standard, the result is:

```
71045 It's a float with value 16
```

71046 The change in behavior is due to the inclusion of floating-point numbers in hexadecimal  
 71047 notation without requiring that either a decimal point or the binary exponent be present.

71048	<b>RATIONALE</b>
71049	None.
71050	<b>FUTURE DIRECTIONS</b>
71051	None.
71052	<b>SEE ALSO</b>
71053	<i>fscanf()</i> , <i>isspace()</i> , <i>localeconv()</i> , <i>setlocale()</i> , <i>strtol()</i>

71055	<b>CHANGE HISTORY</b>
71056	First released in Issue 1. Derived from Issue 1 of the SVID.
71057	<b>Issue 5</b>
71058	The DESCRIPTION is updated to indicate that <i>errno</i> is not changed if the function is successful.
71059	<b>Issue 6</b>
71060	Extensions beyond the ISO C standard are marked.
71061	The following new requirements on POSIX implementations derive from alignment with the
71062	Single UNIX Specification:
71063	• In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
71064	added if no conversion could be performed.
71065	The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
71066	• The <i>strtod()</i> function is updated.
71067	• The <i>strtof()</i> and <i>strtold()</i> functions are added.
71068	• The DESCRIPTION is extensively revised.
71069	ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
71070	IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second
71071	paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.
71072	<b>Issue 7</b>
71073	Austin Group Interpretation 1003.1-2001 #015 is applied.
71074	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0610 [302], XSH/TC1-2008/0611 [94],
71075	and XSH/TC1-2008/0612 [105] are applied.
71076	POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0348 [584] and XSH/TC2-2008/0349
71077	[796] are applied.
71078	<b>Issue 8</b>
71079	Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.
71080	Austin Group Defect 1213 is applied, correcting some typographic errors in the APPLICATION
71081	USAGE section.
71082	Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018
71083	standard.
71084	Austin Group Defect 1686 is applied, adding CX shading to some text in the RETURN VALUE
71085	section.

71086 **NAME**

71087 strtoimax, strtoumax — convert string to integer type

71088 **SYNOPSIS**

71089 #include &lt;inttypes.h&gt;

71090 intmax\_t strtoimax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
71091 int *base*);71092 uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
71093 int *base*);71094 **DESCRIPTION**71095 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71096 conflict between the requirements described here and the ISO C standard is unintentional. This  
71097 volume of POSIX.1-2024 defers to the ISO C standard.71098 These functions shall be equivalent to the *strtol()*, *strtoll()*, *strtoul()*, and *strtoull()* functions,  
71099 except that the initial portion of the string shall be converted to **intmax\_t** and **uintmax\_t**  
71100 representation, respectively.71101 **RETURN VALUE**

71102 These functions shall return the converted value, if any.

71103 CX If no conversion could be performed, zero shall be returned and *errno* may be set to [EINVAL].71104 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].71105 If the correct value is outside the range of representable values, {INTMAX\_MAX},  
71106 {INTMAX\_MIN}, or {UINTMAX\_MAX} shall be returned (according to the return type and sign  
71107 of the value, if any), and *errno* shall be set to [ERANGE].71108 **ERRORS**

71109 These functions shall fail if:

71110 CX [EINVAL] The value of *base* is not supported.

71111 [ERANGE] The value to be returned is not representable.

71112 These functions may fail if:

71113 [EINVAL] No conversion could be performed.

71114 **EXAMPLES**

71115 None.

71116 **APPLICATION USAGE**71117 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
71118 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
71119 an [EINVAL] error before examining *\*endptr*.71120 **RATIONALE**

71121 None.

71122 **FUTURE DIRECTIONS**

71123 None.

71124 **SEE ALSO**71125 [strtol\(\)](#), [strtoul\(\)](#)71126 XBD [<inttypes.h>](#)

71127 **CHANGE HISTORY**

71128 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

71129 **Issue 7**

71130 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0613 [453] and XSH/TC1-2008/0614  
71131 [453] are applied.

71132 **NAME**

71133            strtok, strtok\_r — split string into tokens

71134 **SYNOPSIS**

71135            #include &lt;string.h&gt;

71136            char \*strtok(char \*restrict *s*, const char \*restrict *sep*);71137 CX         char \*strtok\_r(char \*restrict *s*, const char \*restrict *sep*,71138            char \*\*restrict *state*);71139 **DESCRIPTION**71140 CX         For *strtok()*: The functionality described on this reference page is aligned with the ISO C  
71141 standard. Any conflict between the requirements described here and the ISO C standard is  
71142 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.71143            A sequence of calls to *strtok()* breaks the string pointed to by *s* into a sequence of tokens, each of  
71144 which is delimited by a byte from the string pointed to by *sep*. The first call in the sequence has *s*  
71145 as its first argument, and is followed by calls with a null pointer as their first argument. The  
71146 separator string pointed to by *sep* may be different from call to call.71147            The first call in the sequence searches the string pointed to by *s* for the first byte that is *not*  
71148 contained in the current separator string pointed to by *sep*. If no such byte is found, then there  
71149 are no tokens in the string pointed to by *s* and *strtok()* shall return a null pointer. If such a byte is  
71150 found, it is the start of the first token.71151            The *strtok()* function then searches from there for a byte that *is* contained in the current separator  
71152 string. If no such byte is found, the current token extends to the end of the string pointed to by *s*,  
71153 and subsequent searches for a token shall return a null pointer. If such a byte is found, it is  
71154 overwritten by a NUL character, which terminates the current token. The *strtok()* function saves  
71155 a pointer to the following byte, from which the next search for a token shall start.71156            Each subsequent call, with a null pointer as the value of the first argument, starts searching from  
71157 the saved pointer and behaves as described above.71158            The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
71159 *strtok()*.71160            The *strtok()* function need not be thread-safe; however, *strtok()* shall avoid data races with all  
71161 other functions.71162 CX         The *strtok\_r()* function shall be equivalent to *strtok()*, except that *strtok\_r()* shall be thread-safe  
71163 and the argument *state* points to a user-provided pointer that allows *strtok\_r()* to maintain state  
71164 between calls which scan the same string. The application shall ensure that the pointer pointed  
71165 to by *state* is unique for each string (*s*) being processed concurrently by *strtok\_r()* calls. The  
71166 application need not initialize the pointer pointed to by *state* to any particular value. The  
71167 implementation shall not update the pointer pointed to by *state* to point (directly or indirectly) to  
71168 resources, other than within the string *s*, that need to be freed or released by the caller.71169 CX         The *strtok()* and *strtok\_r()* functions shall not change the setting of *errno* on valid input.71170 **RETURN VALUE**71171            Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,  
71172 if there is no token, *strtok()* shall return a null pointer.71173 CX         The *strtok\_r()* function shall return a pointer to the token found, or a null pointer when no token  
71174 is found.

71175 **ERRORS**

71176 No errors are defined.

71177 **EXAMPLES**71178 **Searching for Word Separators**

71179 The following example searches for tokens separated by &lt;space&gt; characters.

```

71180 #include <string.h>
71181 ...
71182 char *token;
71183 char line[] = "LINE TO BE SEPARATED";
71184 char *search = " ";

71185 /* Token will point to "LINE". */
71186 token = strtok(line, search);

71187 /* Token will point to "TO". */
71188 token = strtok(NULL, search);

```

71189 **Find First two Fields in a Buffer**

71190 The following example uses *strtok()* to find two character strings (a key and data associated with  
 71191 that key) separated by any combination of <space>, <tab>, or <newline> characters at the start  
 71192 of the array of characters pointed to by *buffer*.

```

71193 #include <string.h>
71194 ...
71195 char *buffer;
71196 ...
71197 struct element {
71198     char *key;
71199     char *data;
71200 } e;
71201 ...
71202 // Load the buffer...
71203 ...
71204 // Get the key and its data...
71205 e.key = strtok(buffer, " \t\n");
71206 e.data = strtok(NULL, " \t\n");
71207 // Process the rest of the contents of the buffer...
71208 ...

```

71209 **APPLICATION USAGE**

71210 Note that if *sep* is the empty string, *strtok()* and *strtok\_r()* return a pointer to the remainder of the  
 71211 string being tokenized.

71212 The *strtok\_r()* function is thread-safe and stores its state in a user-supplied buffer instead of  
 71213 possibly using a static data area that may be overwritten by an unrelated call from another  
 71214 thread.

71215 **RATIONALE**

71216 The *strtok()* function searches for a separator string within a larger string. It returns a pointer to  
 71217 the last substring between separator strings. This function uses static storage to keep track of  
 71218 the current string position between calls. The new function, *strtok\_r()*, takes an additional

- 71219 argument, *state*, to keep track of the current position in the string.
- 71220 **FUTURE DIRECTIONS**
- 71221 None.
- 71222 **SEE ALSO**
- 71223 XBD <[string.h](#)>
- 71224 **CHANGE HISTORY**
- 71225 First released in Issue 1. Derived from Issue 1 of the SVID.
- 71226 **Issue 5**
- 71227 The *strtok\_r()* function is included for alignment with the POSIX Threads Extension.
- 71228 A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.
- 71229 **Issue 6**
- 71230 Extensions beyond the ISO C standard are marked.
- 71231 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.
- 71232 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
- 71233 The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.
- 71234
- 71235 The **restrict** keyword is added to the *strtok()* and *strtok\_r()* prototypes for alignment with the
- 71236 ISO/IEC 9899:1999 standard.
- 71237 **Issue 7**
- 71238 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 71239 SD5-XSH-ERN-235 is applied, correcting an example.
- 71240 The *strtok\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 71241 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0615 [177] is applied.
- 71242 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0350 [878] is applied.
- 71243 **Issue 8**
- 71244 Austin Group Defect 448 is applied, adding a requirement that *strtok()* and *strtok\_r()* do not
- 71245 change the setting of *errno* on valid input.
- 71246 Austin Group Defect 1302 is applied, aligning the *strtok()* function with the ISO/IEC 9899:2018
- 71247 standard.

71248 **NAME**

71249            strtol, strtoll — convert a string to a long integer

71250 **SYNOPSIS**

71251            #include &lt;stdlib.h&gt;

71252            long strtol(const char \*restrict *nptr*, char \*\*restrict *endptr*, int *base*);71253            long long strtoll(const char \*restrict *nptr*, char \*\*restrict *endptr*,71254                    int *base*)71255 **DESCRIPTION**

71256 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 71257 conflict between the requirements described here and the ISO C standard is unintentional. This  
 71258 volume of POSIX.1-2024 defers to the ISO C standard.

71259        These functions shall convert the initial portion of the string pointed to by *nptr* to a type **long**  
 71260 and **long long** representation, respectively. First, they decompose the input string into three  
 71261 parts:

- 71262            1. An initial, possibly empty, sequence of white-space bytes
- 71263            2. A subject sequence interpreted as an integer represented in some radix determined by the  
 71264 value of *base*
- 71265            3. A final string of one or more unrecognized characters, including the terminating NUL  
 71266 character of the input string.

71267        Then they shall attempt to convert the subject sequence to an integer, and return the result.

71268        If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
 71269 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
 71270 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
 71271 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
 71272 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 71273 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

71274        If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 71275 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 71276 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
 71277 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
 71278 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
 71279 digits, following the sign if present.

71280        The subject sequence is defined as the longest initial subsequence of the input string, starting  
 71281 with the first non-white-space byte, that is of the expected form. The subject sequence shall  
 71282 contain no characters if the input string is empty or consists entirely of white-space bytes, or if  
 71283 the first non-white-space byte is other than a sign or a permissible letter or digit.

71284        If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
 71285 characters starting with the first digit shall be interpreted as an integer constant. If the subject  
 71286 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
 71287 base for conversion, ascribing to each letter its value as given above. If the subject sequence  
 71288 begins with a <hyphen-minus>, the resulting value shall be the negative of the converted value.  
 71289 A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that  
 71290 *endptr* is not a null pointer.

71291 CX        In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
 71292 accepted.

71293 If the subject sequence is empty or does not have the expected form, no conversion is performed;  
 71294 the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a  
 71295 null pointer.

71296 These functions shall not change the setting of *errno* if successful.

71297 Since 0, {LONG\_MIN} or {LLONG\_MIN}, and {LONG\_MAX} or {LLONG\_MAX} are returned  
 71298 on error and are also valid returns on success, an application wishing to check for error  
 71299 situations should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

#### 71300 RETURN VALUE

71301 Upon successful completion, these functions shall return the converted value, if any. If no  
 71302 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

71303 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

71304 If the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
 71305 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
 71306 *errno* set to [ERANGE].

#### 71307 ERRORS

71308 These functions shall fail if:

71309 CX [EINVAL] The value of *base* is not supported.

71310 [ERANGE] The value to be returned is not representable.

71311 These functions may fail if:

71312 [EINVAL] No conversion could be performed.

#### 71313 EXAMPLES

71314 None.

#### 71315 APPLICATION USAGE

71316 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
 71317 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
 71318 an [EINVAL] error before examining *\*endptr*.

#### 71319 RATIONALE

71320 None.

#### 71321 FUTURE DIRECTIONS

71322 None.

#### 71323 SEE ALSO

71324 *fscanf()*, *isalpha()*, *strtod()*

71325 XBD <stdlib.h>

#### 71326 CHANGE HISTORY

71327 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 71328 Issue 5

71329 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 71330 Issue 6

71331 Extensions beyond the ISO C standard are marked.

71332 The following new requirements on POSIX implementations derive from alignment with the  
 71333 Single UNIX Specification:

- 71334 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
71335 added if no conversion could be performed.

71336 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 71337 • The *strtol()* prototype is updated.  
71338 • The *strtoll()* function is added.

71339 **Issue 7**

71340 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0616 [453], XSH/TC1-2008/0617 [105],  
71341 XSH/TC1-2008/0618 [453], XSH/TC1-2008/0619 [453], and XSH/TC1-2008/0620 [453] are  
71342 applied.

71343 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0351 [892], XSH/TC2-2008/0352 [584],  
71344 XSH/TC2-2008/0353 [796], and XSH/TC2-2008/0354 [892] are applied.

71345 **Issue 8**

71346 Austin Group Defect 700 is applied, clarifying how a subject sequence beginning with <hyphen-  
71347 minus> is converted.

71348 Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.

71349 **NAME**

71350 strtold — convert a string to a double-precision number

71351 **SYNOPSIS**

71352 #include &lt;stdlib.h&gt;

71353 long double strtold(const char \*restrict *nptr*, char \*\*restrict *endptr*);71354 **DESCRIPTION**71355 Refer to *strtod()*.

71356 **NAME**

71357            **strtoll** — convert a string to a long integer

71358 **SYNOPSIS**

71359            #include <stdlib.h>

71360            long long strtoll(const char \*restrict *str*, char \*\*restrict *endptr*,  
71361                            int *base*);

71362 **DESCRIPTION**

71363            Refer to *strtol()*.

71364 **NAME**

71365 strtoul, strtoull — convert a string to an unsigned long

71366 **SYNOPSIS**

71367 #include &lt;stdlib.h&gt;

```
71368 unsigned long strtoul(const char *restrict str,
71369 char **restrict endptr, int base);
71370 unsigned long long strtoull(const char *restrict str,
71371 char **restrict endptr, int base);
```

71372 **DESCRIPTION**

71373 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 71374 conflict between the requirements described here and the ISO C standard is unintentional. This  
 71375 volume of POSIX.1-2024 defers to the ISO C standard.

71376 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned  
 71377 long** and **unsigned long long** representation, respectively. First, they decompose the input string  
 71378 into three parts:

- 71379 1. An initial, possibly empty, sequence of white-space bytes
- 71380 2. A subject sequence interpreted as an integer represented in some radix determined by the  
 71381 value of *base*
- 71382 3. A final string of one or more unrecognized characters, including the terminating NUL  
 71383 character of the input string

71384 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
 71385 result.

71386 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
 71387 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
 71388 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
 71389 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
 71390 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 71391 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

71392 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 71393 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 71394 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
 71395 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
 71396 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
 71397 digits, following the sign if present.

71398 The subject sequence is defined as the longest initial subsequence of the input string, starting  
 71399 with the first non-white-space byte, that is of the expected form. The subject sequence shall  
 71400 contain no characters if the input string is empty or consists entirely of white-space bytes, or if  
 71401 the first non-white-space byte is other than a sign or a permissible letter or digit.

71402 If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
 71403 characters starting with the first digit shall be interpreted as an integer constant. If the subject  
 71404 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
 71405 base for conversion, ascribing to each letter its value as given above. If the subject sequence  
 71406 begins with a <hyphen-minus>, the resulting value shall be the negative of the converted value;  
 71407 this action shall be performed in the return type. A pointer to the final string shall be stored in  
 71408 the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

71409 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
71410 accepted.

71411 If the subject sequence is empty or does not have the expected form, no conversion shall be  
71412 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*  
71413 is not a null pointer.

71414 These functions shall not change the setting of *errno* if successful.

71415 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and are also valid returns  
71416 on success, an application wishing to check for error situations should set *errno* to 0, then call  
71417 *strtol()* or *strtoll()*, then check *errno*.

#### 71418 RETURN VALUE

71419 Upon successful completion, these functions shall return the converted value, if any. If no  
71420 conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

71421 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

71422 If the correct value is outside the range of representable values, {ULONG\_MAX} or  
71423 {ULLONG\_MAX} shall be returned and *errno* set to [ERANGE].

#### 71424 ERRORS

71425 These functions shall fail if:

71426 CX [EINVAL] The value of *base* is not supported.

71427 [ERANGE] The value to be returned is not representable.

71428 These functions may fail if:

71429 CX [EINVAL] No conversion could be performed.

#### 71430 EXAMPLES

71431 None.

#### 71432 APPLICATION USAGE

71433 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
71434 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
71435 an [EINVAL] error before examining *\*endptr*.

#### 71436 RATIONALE

71437 None.

#### 71438 FUTURE DIRECTIONS

71439 None.

#### 71440 SEE ALSO

71441 [fscanf\(\)](#), [isalpha\(\)](#), [strtod\(\)](#), [strtol\(\)](#)

71442 XBD <stdlib.h>

#### 71443 CHANGE HISTORY

71444 First released in Issue 4. Derived from the ANSI C standard.

#### 71445 Issue 5

71446 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

71447 **Issue 6**

71448 Extensions beyond the ISO C standard are marked.

71449 The following new requirements on POSIX implementations derive from alignment with the  
71450 Single UNIX Specification:

- 71451 • The [EINVAL] error condition is added for when the value of *base* is not supported.
- 71452 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
71453 added if no conversion could be performed.

71454 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 71455 • The *strtoul()* prototype is updated.
- 71456 • The *strtoull()* function is added.

71457 **Issue 7**

71458 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0621 [105], XSH/TC1-2008/0622 [453],  
71459 and XSH/TC1-2008/0623 [453] are applied.

71460 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0355 [584] and XSH/TC2-2008/0356  
71461 [796] are applied.

71462 **Issue 8**

71463 Austin Group Defect 700 is applied, clarifying how a subject sequence beginning with <hyphen-  
71464 minus> is converted.

71465 Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.

71466 **NAME**

71467        strtoumax — convert a string to an integer type

71468 **SYNOPSIS**

71469        #include <inttypes.h>

71470        uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
71471                           int *base*);

71472 **DESCRIPTION**

71473        Refer to *strtoimax()*.

71474 **NAME**

71475 strxfrm, strxfrm\_l — string transformation

71476 **SYNOPSIS**

71477 #include &lt;string.h&gt;

71478 size\_t strxfrm(char \*restrict s1, const char \*restrict s2, size\_t n);

71479 CX size\_t strxfrm\_l(char \*restrict s1, const char \*restrict s2,

71480 size\_t n, locale\_t locale);

71481 **DESCRIPTION**71482 CX For *strxfrm()*: The functionality described on this reference page is aligned with the ISO C  
71483 standard. Any conflict between the requirements described here and the ISO C standard is  
71484 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.71485 CX The *strxfrm()* and *strxfrm\_l()* functions shall transform the string pointed to by *s2* and place the  
71486 resulting string into the array pointed to by *s1*. The transformation is such that if *strcmp()* is  
71487 applied to two transformed strings, it shall return a value greater than, equal to, or less than 0,  
71488 CX corresponding to the result of *strcoll()* or *strcoll\_l()*, respectively, applied to the same two  
71489 CX original strings with the same locale. No more than *n* bytes are placed into the resulting array  
71490 pointed to by *s1*, including the terminating NUL character. If *n* is 0, *s1* is permitted to be a null  
71491 pointer. If copying takes place between objects that overlap, the behavior is undefined.71492 CX The *strxfrm()* and *strxfrm\_l()* functions shall not change the setting of *errno* if successful.71493 Since no return value is reserved to indicate an error, an application wishing to check for error  
71494 CX situations should set *errno* to 0, then call *strxfrm()* or *strxfrm\_l()*, then check *errno*.71495 CX The behavior is undefined if the *locale* argument to *strxfrm\_l()* is the special locale object  
71496 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.71497 **RETURN VALUE**71498 CX Upon successful completion, *strxfrm()* and *strxfrm\_l()* shall return the length of the  
71499 transformed string (not including the terminating NUL character). If the value returned is *n* or  
71500 more, the contents of the array pointed to by *s1* are unspecified.71501 CX On error, *strxfrm()* and *strxfrm\_l()* may set *errno* but no return value is reserved to indicate an  
71502 error.71503 **ERRORS**

71504 These functions may fail if:

71505 CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the  
71506 domain of the collating sequence.71507 **EXAMPLES**

71508 None.

71509 **APPLICATION USAGE**71510 The transformation function is such that two transformed strings can be ordered by *strcmp()* as  
71511 appropriate to collating sequence information in the current locale (category *LC\_COLLATE*).71512 The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the  
71513 *s1* array prior to making the transformation.

71514 **RATIONALE**

71515 None.

71516 **FUTURE DIRECTIONS**

71517 None.

71518 **SEE ALSO**71519 [strcmp\(\)](#), [strcoll\(\)](#)71520 XBD <[string.h](#)>71521 **CHANGE HISTORY**

71522 First released in Issue 3. Included for alignment with the ISO C standard.

71523 **Issue 5**71524 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.71525 **Issue 6**

71526 Extensions beyond the ISO C standard are marked.

71527 The following new requirements on POSIX implementations derive from alignment with the  
71528 Single UNIX Specification:

- 71529
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
71530 added if no conversion could be performed.

71531 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.71532 **Issue 7**71533 The *strxfrm\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
71534 Set Part 4.71535 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0624 [283], XSH/TC1-2008/0625 [283],  
71536 and XSH/TC1-2008/0626 [302] are applied.

71537 **NAME**

71538 swab — swap bytes

71539 **SYNOPSIS**

```
71540 XSI #include <unistd.h>
71541 void swab(const void *restrict src, void *restrict dest,
71542          ssize_t nbytes);
```

71543 **DESCRIPTION**

71544 The *swab()* function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to  
71545 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab()*  
71546 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If  
71547 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is  
71548 negative, *swab()* does nothing.

71549 **RETURN VALUE**

71550 None.

71551 **ERRORS**

71552 No errors are defined.

71553 **EXAMPLES**

71554 None.

71555 **APPLICATION USAGE**

71556 None.

71557 **RATIONALE**

71558 None.

71559 **FUTURE DIRECTIONS**

71560 None.

71561 **SEE ALSO**71562 XBD <[unistd.h](#)>71563 **CHANGE HISTORY**

71564 First released in Issue 1. Derived from Issue 1 of the SVID.

71565 **Issue 6**

71566 The **restrict** keyword is added to the *swab()* prototype for alignment with the  
71567 ISO/IEC 9899:1999 standard.

71568 **NAME**

71569 swprintf — print formatted wide-character output

71570 **SYNOPSIS**

71571 #include <stdio.h>

71572 #include <wchar.h>

71573 int swprintf(wchar\_t \*restrict *ws*, size\_t *n*,

71574 const wchar\_t \*restrict *format*, ...);

71575 **DESCRIPTION**

71576 Refer to *fwprintf()*.

71577 **NAME**

71578 swscanf — convert formatted wide-character input

71579 **SYNOPSIS**

71580 #include &lt;stdio.h&gt;

71581 #include &lt;wchar.h&gt;

71582 int swscanf(const wchar\_t \*restrict ws,

71583 const wchar\_t \*restrict format, ...);

71584 **DESCRIPTION**71585 Refer to *fwscanf()*.

71586 **NAME**71587 `symlink, symlinkat` — make a symbolic link71588 **SYNOPSIS**71589 `#include <unistd.h>`71590 `int symlink(const char *path1, const char *path2);`71591 OH `#include <fcntl.h>`71592 `int symlinkat(const char *path1, int fd, const char *path2);`71593 **DESCRIPTION**

71594 The `symlink()` function shall create a symbolic link called `path2` that contains the string pointed to  
71595 by `path1` (`path2` is the name of the symbolic link created, `path1` is the string contained in the  
71596 symbolic link).

71597 The string pointed to by `path1` shall be treated only as a string and shall not be validated as a  
71598 pathname.

71599 If the `symlink()` function fails for any reason other than [EIO], any file named by `path2` shall be  
71600 unaffected.

71601 If `path2` names a symbolic link, `symlink()` shall fail and set `errno` to [EEXIST].

71602 The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's  
71603 group ID shall be set to the group ID of the parent directory or to the effective group ID of the  
71604 process. Implementations shall provide a way to initialize the symbolic link's group ID to the  
71605 group ID of the parent directory. Implementations may, but need not, provide an  
71606 implementation-defined way to initialize the symbolic link's group ID to the effective group ID  
71607 of the calling process.

71608 The values of the file mode bits for the created symbolic link are unspecified. All interfaces  
71609 specified by POSIX.1-2024 shall behave as if the contents of symbolic links can always be read,  
71610 except that the value of the file mode bits returned in the `st_mode` field of the `stat` structure is  
71611 unspecified.

71612 Upon successful completion, `symlink()` shall mark for update the last data access, last data  
71613 modification, and last file status change timestamps of the symbolic link. Also, the last data  
71614 modification and last file status change timestamps of the directory that contains the new entry  
71615 shall be marked for update.

71616 The `symlinkat()` function shall be equivalent to the `symlink()` function except in the case where  
71617 `path2` specifies a relative path. In this case the symbolic link is created relative to the directory  
71618 associated with the file descriptor `fd` instead of the current working directory. If the access mode  
71619 of the open file description associated with the file descriptor is not `O_SEARCH`, the function  
71620 shall check whether directory searches are permitted using the current permissions of the  
71621 directory underlying the file descriptor. If the access mode is `O_SEARCH`, the function shall not  
71622 perform the check.

71623 If `symlinkat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working  
71624 directory shall be used and the behavior shall be identical to a call to `symlink()`.

71625 **RETURN VALUE**

71626 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
71627 return `-1` and set `errno` to indicate the error.

71628 **ERRORS**

71629 These functions shall fail if:

71630 [EACCES] Write permission is denied in the directory where the symbolic link is being  
 71631 created, or search permission is denied for a component of the path prefix of  
 71632 *path2*.

71633 [EEXIST] The *path2* argument names an existing file.

71634 [EILSEQ] The last pathname component of *path2* is not a portable filename, and cannot  
 71635 be created in the target directory.

71636 [EIO] An I/O error occurs while reading from or writing to the file system.

71637 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path2*  
 71638 argument.

71639 [ENAMETOOLONG]

71640 The length of a component of the pathname specified by the *path2* argument is  
 71641 longer than {NAME\_MAX} or the length of the *path1* argument is longer than  
 71642 {SYMLINK\_MAX}.

71643 [ENOENT] A component of the path prefix of *path2* does not name an existing file or *path2*  
 71644 is an empty string.

71645 [ENOENT] or [ENOTDIR]

71646 The *path2* argument contains at least one non-`<slash>` character and ends with  
 71647 one or more trailing `<slash>` characters. If *path2* without the trailing `<slash>`  
 71648 characters would name an existing file, an [ENOENT] error shall not occur.

71649 [ENOSPC] The directory in which the entry for the new symbolic link is being placed  
 71650 cannot be extended because no space is left on the file system containing the  
 71651 directory, or the new symbolic link cannot be created because no space is left  
 71652 on the file system which shall contain the link, or the file system is out of file-  
 71653 allocation resources.

71654 [ENOTDIR] A component of the path prefix of *path2* names an existing file that is neither a  
 71655 directory nor a symbolic link to a directory.

71656 [EROFS] The new symbolic link would reside on a read-only file system.

71657 The *symlinkat()* function shall fail if:

71658 [EACCES] The access mode of the open file description associated with *fd* is not  
 71659 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
 71660 directory searches.

71661 [EBADF] The *path2* argument does not specify an absolute path and the *fd* argument is  
 71662 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

71663 [ENOTDIR] The *path2* argument is not an absolute path and *fd* is a file descriptor  
 71664 associated with a non-directory file.

71665 These functions may fail if:

71666 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 71667 resolution of the *path2* argument.

71668 [ENAMETOOLONG]

71669 The length of the *path2* argument exceeds {PATH\_MAX} or pathname  
 71670 resolution of a symbolic link in the *path2* argument produced an intermediate

71671 result with a length that exceeds {PATH\_MAX}.

71672 **EXAMPLES**

71673 None.

71674 **APPLICATION USAGE**

71675 Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a  
71676 hard link guarantees the existence of a file, even after the original name has been removed. A  
71677 symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not  
71678 exist when the link is created. A symbolic link can cross file system boundaries.

71679 Normal permission checks are made on each component of the symbolic link pathname during  
71680 its resolution.

71681 **RATIONALE**

71682 The purpose of the *symlinkat()* function is to create symbolic links in directories other than the  
71683 current working directory without exposure to race conditions. Any part of the path of a file  
71684 could be changed in parallel to a call to *symlink()*, resulting in unspecified behavior. By opening  
71685 a file descriptor for the target directory and using the *symlinkat()* function it can be guaranteed  
71686 that the created symbolic link is located relative to the desired directory.

71687 Implementations are encouraged to have *symlink()* and *symlinkat()* report an [EILSEQ] error if  
71688 the last component of *path2* contains any bytes that have the encoded value of a <newline>  
71689 character.

71690 **FUTURE DIRECTIONS**

71691 None.

71692 **SEE ALSO**

71693 *fdopendir()*, *fstatat()*, *lchown()*, *link()*, *open()*, *readlink()*, *rename()*, *unlink()*

71695 **CHANGE HISTORY**

71696 First released in Issue 4, Version 2.

71697 **Issue 5**

71698 Moved from X/OPEN UNIX extension to BASE.

71699 **Issue 6**

71700 The following changes were made to align with the IEEE P1003.1a draft standard:

- 71701 • The DESCRIPTION text is updated.
- 71702 • The [ELOOP] optional error condition is added.

71703 **Issue 7**

71704 Austin Group Interpretation 1003.1-2001 #143 is applied.

71705 The *symlinkat()* function is added from The Open Group Technical Standard, 2006, Extended  
71706 API Set Part 2.

71707 Additions have been made describing how *symlink()* sets the user and group IDs and file mode  
71708 of the symbolic link, and its effect on timestamps.

71709 Changes are made to allow a directory to be opened for searching.

71710 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0627 [146,428], XSH/TC1-2008/0628  
71711 [461], XSH/TC1-2008/0629 [146,428], XSH/TC1-2008/0630 [146,428,436], XSH/TC1-2008/0631  
71712 [324], XSH/TC1-2008/0632 [278], XSH/TC1-2008/0633 [278], and XSH/TC1-2008/0634 [151] are  
71713 applied.

71714 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0357 [873], XSH/TC2-2008/0358 [591],  
71715 XSH/TC2-2008/0359 [641], XSH/TC2-2008/0360 [817], XSH/TC2-2008/0361 [822],  
71716 XSH/TC2-2008/0362 [817], and XSH/TC2-2008/0363 [591] are applied.

71717 **Issue 8**

71718 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of  
71719 filenames containing any bytes that have the encoded value of a <newline> character.

71720 Austin Group Defect 293 is applied, adding the [EILSEQ] error.

71721 **NAME**

71722 sync — schedule file system updates

71723 **SYNOPSIS**

```
71724 XSI #include <unistd.h>  
71725 void sync(void);
```

71726 **DESCRIPTION**71727 The *sync()* function shall cause all information in memory that updates file systems to be  
71728 scheduled for writing out to all file systems.71729 The writing, although scheduled, is not necessarily complete upon return from *sync()*.71730 **RETURN VALUE**71731 The *sync()* function shall not return a value.71732 **ERRORS**

71733 No errors are defined.

71749 **NAME**

71750 sysconf — get configurable system variables

71751 **SYNOPSIS**

71752 #include &lt;unistd.h&gt;

71753 long sysconf(int name);

71754 **DESCRIPTION**

71755 The *sysconf()* function provides a method for the application to determine the current value of a  
 71756 configurable system limit or option (*variable*). The implementation shall support all of the  
 71757 variables listed in the following table and may support others.

71758 The *name* argument represents the system variable to be queried. The following table lists the  
 71759 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,  
 71760 and the symbolic constants defined in <unistd.h> that are the corresponding values used for  
 71761 *name*.

71882 † The nature of an execution unit and the precise conditions under which an execution unit is  
71883 considered to be available, or can be made available, or how many threads it can execute in  
71884 parallel, are implementation-defined.

## 71885 RETURN VALUE

71886 If *name* is an invalid value, *sysconf()* shall return  $-1$  and set *errno* to indicate the error. If the  
71887 variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and  
71888 the variable has no limit, *sysconf()* shall return  $-1$  without changing the value of *errno*. Note that  
71889 indefinite limits do not imply infinite limits; see **<limits.h>**.

71890 Otherwise, *sysconf()* shall return the current variable value on the system. The value returned  
71891 shall not be more restrictive than the corresponding value described to the application when it  
71892 was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value returned for *name*  
71893 arguments other than *\_SC\_NPROCESSORS\_ONLN* shall not change during the lifetime of the  
71894 calling process, except that *sysconf(\_SC\_OPEN\_MAX)* may return different values before and  
71895 after a call to *setrlimit()* which changes the *RLIMIT\_NOFILE* soft limit.

71896 If the variable corresponding to *name* is dependent on an unsupported option, the results are  
71897 unspecified.

71898 **ERRORS**71899 The *sysconf()* function shall fail if:71900 [EINVAL] The value of the *name* argument is invalid.71901 **EXAMPLES**

71902 None.

71903 **APPLICATION USAGE**71904 As `-1` is a permissible return value in a successful situation, an application wishing to check for  
71905 error situations should set *errno* to 0, then call *sysconf()*, and, if it returns `-1`, check to see if *errno*  
71906 is non-zero.71907 Application developers should check whether an option, such as `_POSIX_SPORADIC_SERVER`,  
71908 is supported prior to obtaining and using values for related variables, such as  
71909 `_POSIX_SS_REPL_MAX`.71910 Although the queries `_SC_NPROCESSORS_CONF` and `_SC_NPROCESSORS_ONLN` provide a  
71911 way for a class of “heavy-load” application to estimate the optimal number of threads that can  
71912 be created to maximize throughput, real-world environments have complications that affect the  
71913 actual efficiency that can be achieved. For example:

- 71914
- There may be more than one “heavy-load” application running on the system.
  - The system may be on battery power, and applications should co-ordinate with the system  
71915 to ensure that a long-running task can pause, resume, and successfully complete even in  
71916 the event of a power outage.
- 71917

71918 In case a portable “heavy-load” application wants to avoid the use of extensions, its developers  
71919 may wish to create threads based on the logical partition of the long-running task, or utilize  
71920 heuristics such as the ratio between CPU time and real time.71921 **RATIONALE**71922 This functionality was added in response to requirements of application developers and of  
71923 system vendors who deal with many international system configurations. It is closely related to  
71924 *pathconf()* and *fpathconf()*.71925 Although a conforming application can run on all systems by never demanding more resources  
71926 than the minimum values published in this volume of POSIX.1-2024, it is useful for that  
71927 application to be able to use the actual value for the quantity of a resource available on any  
71928 given system. To do this, the application makes use of the value of a symbolic constant in  
71929 `<limits.h>` or `<unistd.h>`.71930 However, once compiled, the application must still be able to cope if the amount of resource  
71931 available is increased. To that end, an application may need a means of determining the quantity  
71932 of a resource, or the presence of an option, at execution time.

71933 Two examples are offered:

- 71934
1. Applications may wish to act differently on systems with or without job control.  
71935 Applications vendors who wish to distribute only a single binary package to all instances  
71936 of a computer architecture would be forced to assume job control is never available if it  
71937 were to rely solely on the `<unistd.h>` value published in this volume of POSIX.1-2024.
  2. International applications vendors occasionally require knowledge of the number of clock  
71938 ticks per second. Without these facilities, they would be required to either distribute their  
71939 applications partially in source form or to have 50 Hz and 60 Hz versions for the various  
71940 countries in which they operate.
- 71941

71942 It is the knowledge that many applications are actually distributed widely in executable form  
 71943 that leads to this facility. If limited to the most restrictive values in the headers, such applications  
 71944 would have to be prepared to accept the most limited environments offered by the smallest  
 71945 microcomputers. Although this is entirely portable, there was a consensus that they should be  
 71946 able to take advantage of the facilities offered by large systems, without the restrictions  
 71947 associated with source and object distributions.

71948 During the discussions of this feature, it was pointed out that it is almost always possible for an  
 71949 application to discern what a value might be at runtime by suitably testing the various functions  
 71950 themselves. And, in any event, it could always be written to adequately deal with error returns  
 71951 from the various functions. In the end, it was felt that this imposed an unreasonable level of  
 71952 complication and sophistication on the application developer.

71953 This runtime facility is not meant to provide ever-changing values that applications have to  
 71954 check multiple times. The values are seen as changing no more frequently than once per system  
 71955 initialization, such as by a system administrator or operator with an automatic configuration  
 71956 program. This volume of POSIX.1-2024 specifies that they shall not change within the lifetime of  
 71957 the process.

71958 Some values apply to the system overall and others vary at the file system or directory level. The  
 71959 latter are described in *fpathconf()*.

71960 Note that all values returned must be expressible as integers. String values were considered, but  
 71961 the additional flexibility of this approach was rejected due to its added complexity of  
 71962 implementation and use.

71963 Some values, such as {PATH\_MAX}, are sometimes so large that they must not be used to, say,  
 71964 allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic  
 71965 constant is not even defined in this case.

71966 Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is  
 71967 infinite, returning an error indicating that some other resource limit has been reached is  
 71968 conforming behavior.

#### 71969 **FUTURE DIRECTIONS**

71970 None.

#### 71971 **SEE ALSO**

71972 *confstr()*, *fpathconf()*

71973 XBD <limits.h>, <unistd.h>

71974 XCU *getconf*

#### 71975 **CHANGE HISTORY**

71976 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 71977 **Issue 5**

71978 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 71979 Threads Extension.

71980 The *\_XBS\_* variables and name values are added to the table of system variables in the  
 71981 DESCRIPTION. These are all marked EX.

#### 71982 **Issue 6**

71983 The symbol CLK\_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks  
 71984 per second”.

71985 The symbol {PASS\_MAX} is removed.

71986 The following changes were made to align with the IEEE P1003.1a draft standard:

- 71987 • Table entries are added for the following variables: `_SC_REGEX`, `_SC_SHELL`,  
71988 `_SC_REGEX_VERSION`, `_SC_SYMLINK_MAX`.

71989 The following `sysconf()` variables and their associated names are added for alignment with  
71990 IEEE Std 1003.1d-1999:

71991 `_POSIX_ADVISORY_INFO`  
71992 `_POSIX_CPUTIME`  
71993 `_POSIX_SPAWN`  
71994 `_POSIX_SPORADIC_SERVER`  
71995 `_POSIX_THREAD_CPUTIME`  
71996 `_POSIX_THREAD_SPORADIC_SERVER`  
71997 `_POSIX_TIMEOUTS`

71998 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- 71999 • A statement expressing the dependency of support for some system variables on  
72000 implementation options is added.
- 72001 • The following system variables are added:

72002 `_POSIX_BARRIERS`  
72003 `_POSIX_CLOCK_SELECTION`  
72004 `_POSIX_MONOTONIC_CLOCK`  
72005 `_POSIX_READER_WRITER_LOCKS`  
72006 `_POSIX_SPIN_LOCKS`  
72007 `_POSIX_TYPED_MEMORY_OBJECTS`

72008 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

72009 `_POSIX2_PBS`  
72010 `_POSIX2_PBS_ACCOUNTING`  
72011 `_POSIX2_PBS_LOCATE`  
72012 `_POSIX2_PBS_MESSAGE`  
72013 `_POSIX2_PBS_TRACK`

72014 The following `sysconf()` variables and their associated names are added for alignment with  
72015 IEEE Std 1003.1q-2000:

72016 `_POSIX_TRACE`  
72017 `_POSIX_TRACE_EVENT_FILTER`  
72018 `_POSIX_TRACE_INHERIT`  
72019 `_POSIX_TRACE_LOG`

72020 The macros associated with the `c89` programming models are marked `LEGACY`, and new  
72021 equivalent macros associated with `c99` are introduced.

72022 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the  
72023 DESCRIPTION to denote that the `_PC*` and `_SC*` symbols are now required to be supported. A  
72024 corresponding change has been made in the Base Definitions volume of POSIX.1-2024. The  
72025 deletion in the second paragraph removes some duplicated text. Additional symbols that were  
72026 erroneously omitted from this reference page have been added.

72027 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the  
72028 RETURN VALUE section that the value returned for `sysconf(_SC_OPEN_MAX)` may change if a

- 72029 call to *setrlimit()* adjusts the RLIMIT\_NOFILE soft limit.
- 72030 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the  
72031 DESCRIPTION to remove an erroneous entry for \_POSIX\_SYMLINK\_MAX. This corrects an  
72032 error in IEEE Std 1003.1-2001/Cor 1-2002.
- 72033 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing  
72034 \_POSIX\_FILE\_LOCKING, \_POSIX\_MULTI\_PROCESS, \_POSIX2\_C\_VERSION, and  
72035 \_XOPEN\_XCU\_VERSION (and their associated \_SC\_\* variables) from the DESCRIPTION and  
72036 APPLICATION USAGE sections.
- 72037 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following  
72038 constants (and their associated \_SC\_\* variables) to the DESCRIPTION:
- 72039        \_POSIX\_SS\_REPL\_MAX  
72040        \_POSIX\_TRACE\_EVENT\_NAME\_MAX  
72041        \_POSIX\_TRACE\_NAME\_MAX  
72042        \_POSIX\_TRACE\_SYS\_MAX  
72043        \_POSIX\_TRACE\_USER\_EVENT\_MAX
- 72044 The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables  
72045 are dependent on unsupported options, the results are unspecified.
- 72046 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing  
72047 \_REGEX\_VERSION and \_SC\_REGEX\_VERSION.
- 72048 **Issue 7**
- 72049 Austin Group Interpretation 1003.1-2001 #160 is applied.
- 72050 SD5-XSH-ERN-166 is applied, changing “Maximum size” to “Initial size” for the “Maximum  
72051 size of ...” entries in the table in the DESCRIPTION.
- 72052 The variables for the supported programming environments are updated to be V7 and the  
72053 LEGACY variables are removed.
- 72054 The following constants are added:
- 72055        \_POSIX\_THREAD\_ROBUST\_PRIO\_INHERIT  
72056        \_POSIX\_THREAD\_ROBUST\_PRIO\_PROTECT
- 72057 The \_XOPEN\_UUCP variable and its associated \_SC\_XOPEN\_UUCP value is added to the table  
72058 of system variables.
- 72059 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0364 [752] is applied.
- 72060 **Issue 8**
- 72061 Austin Group Defect 51 is applied, moving the *getrlimit()* and *setrlimit()* functions, excluding  
72062 the RLIMIT\_CPU and RLIMIT\_FSIZE limits, from the XSI option to the Base.
- 72063 Austin Group Defects 339 and 1608 are applied, adding \_SC\_NPROCESSORS\_CONF and  
72064 \_SC\_NPROCESSORS\_ONLN.
- 72065 Austin Group Defect 729 is applied, adding \_SC\_DEVICE\_CONTROL.
- 72066 Austin Group Defect 741 is applied, adding \_SC\_NSIG.
- 72067 Austin Group Defect 1330 is applied, removing obsolescent interfaces and changing “\_V7\_” to  
72068 “\_V8\_” and “\_V6\_” to “\_V7\_”.

72069 **NAME**

72070 syslog — log a message

72071 **SYNOPSIS**

72072 XSI `#include <syslog.h>`

72073 `void syslog(int priority, const char *message, ... /* argument */);`

72074 **DESCRIPTION**

72075 Refer to [closelog\(\)](#).

72076 **NAME**

72077 system — issue a command

72078 **SYNOPSIS**

72079 #include &lt;stdlib.h&gt;

72080 int system(const char \*command);

72081 **DESCRIPTION**

72082 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72083 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72084 volume of POSIX.1-2024 defers to the ISO C standard.

72085 If *command* is a null pointer, the *system()* function shall determine whether the host environment  
 72086 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the  
 72087 string pointed to by *command* to that command processor to be executed in an implementation-  
 72088 defined manner; this might then cause the program calling *system()* to behave in a non-  
 72089 conforming manner or to terminate.

72090 CX The *system()* function shall behave as if a child process were created using *fork()*, and the child  
 72091 process invoked the *sh* utility using *execl()* as follows:

72092 

```
execl(<shell path>, "sh", "-c", "--", command, (char *)0);
```

72093 where <shell path> is an unspecified pathname for the *sh* utility. It is implementation-defined  
 72094 whether the handlers registered with *pthread\_atfork()* are called as part of the creation of the  
 72095 child process.

72096 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the  
 72097 SIGCHLD signal, while waiting for the command to terminate. If this might cause the  
 72098 application to miss a signal that would have killed it, then the application should examine the  
 72099 return value from *system()* and take whatever action is appropriate to the application if the  
 72100 command terminated due to receipt of a signal.

72101 The *system()* function shall not affect the termination status of any child of the calling processes  
 72102 other than the process or processes it itself creates.

72103 The *system()* function shall not return until the child process has terminated.

72104 If concurrent calls to *system()* are made from multiple threads, it is unspecified whether:

- 72105 • each call saves and restores the dispositions of the SIGINT and SIGQUIT signals  
 72106 independently, or
- 72107 • in a set of concurrent calls the dispositions in effect after the last call returns are those that  
 72108 were in effect on entry to the first call.

72109 If a thread is cancelled while it is in a call to *system()*, it is unspecified whether the child process  
 72110 is terminated and waited for, or is left running.

72111 **RETURN VALUE**

72112 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor  
 72113 CX is available, or zero if none is available. The *system()* function shall always return non-zero  
 72114 when *command* is NULL.

72115 CX If *command* is not a null pointer, *system()* shall return the termination status of the command  
 72116 language interpreter in the format specified by *waitpid()*. The termination status shall be as  
 72117 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents  
 72118 the command language interpreter from executing after the child process is created, the return  
 72119 value from *system()* shall be as if the command language interpreter had terminated using

72120 `exit(127)` or `_exit(127)`. If a child process cannot be created, or if the termination status for the  
 72121 command language interpreter cannot be obtained, `system()` shall return `-1` and set `errno` to  
 72122 indicate the error.

## 72123 ERRORS

72124 CX The `system()` function may set `errno` values as described by `fork()`.

72125 In addition, `system()` may fail if:

72126 CX [ECHILD] The status of the child process created by `system()` is no longer available.

## 72127 EXAMPLES

72128 None.

## 72129 APPLICATION USAGE

72130 If the return value of `system()` is not `-1`, its value can be decoded through the use of the macros  
 72131 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

72132 Note that, while `system()` must ignore `SIGINT` and `SIGQUIT` and block `SIGCHLD` while waiting  
 72133 for the child to terminate, the handling of signals in the executed command is as specified by  
 72134 `fork()` and `exec`. For example, if `SIGINT` is being caught or is set to `SIG_DFL` when `system()` is  
 72135 called, then the child is started with `SIGINT` handling set to `SIG_DFL`.

72136 Ignoring `SIGINT` and `SIGQUIT` in the parent process prevents coordination problems (two  
 72137 processes reading from the same terminal, for example) when the executed command ignores or  
 72138 catches one of the signals. It is also usually the correct action when the user has given a  
 72139 command to the application to be executed synchronously (as in the `!` command in many  
 72140 interactive applications). In either case, the signal should be delivered only to the child process,  
 72141 not to the application itself. There is one situation where ignoring the signals might have less  
 72142 than the desired effect. This is when the application uses `system()` to perform some task invisible  
 72143 to the user. If the user typed the interrupt character ("`^C`", for example) while `system()` is being  
 72144 used in this way, one would expect the application to be killed, but only the executed command  
 72145 is killed. Applications that use `system()` in this way should carefully check the return status from  
 72146 `system()` to see if the executed command was successful, and should take appropriate action  
 72147 when the command fails.

72148 Blocking `SIGCHLD` while waiting for the child to terminate prevents the application from  
 72149 catching the signal and obtaining status from `system()`'s child process before `system()` can get the  
 72150 status itself.

72151 The context in which the utility is ultimately executed may differ from that in which `system()`  
 72152 was called. For example, file descriptors that have the `FD_CLOEXEC` or `FD_CLOFORK` flag set  
 72153 are closed, and the process ID and parent process ID are different. Also, if the executed utility  
 72154 changes its environment variables or its current working directory, that change is not reflected in  
 72155 the caller's context.

72156 There is no defined way for an application to find the specific path for the shell. However,  
 72157 `confstr()` can provide a value for `PATH` that is guaranteed to find the `sh` utility.

72158 Although `system()` is required to be thread-safe, it is recommended that concurrent calls from  
 72159 multiple threads are avoided, since `system()` is not required to coordinate the saving and  
 72160 restoring of the dispositions of the `SIGINT` and `SIGQUIT` signals across a set of overlapping  
 72161 calls, and therefore the signals might end up being set to ignored after the last call returns.  
 72162 Applications should also avoid cancelling a thread while it is in a call to `system()` as the child  
 72163 process may be left running in that event. In addition, if another thread alters the disposition of  
 72164 the `SIGCHLD` signal, a call to `signal()` may produce unexpected results.

72165 **RATIONALE**

72166 The *system()* function should not be used by programs that have set user (or group) ID  
 72167 privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used  
 72168 instead. This prevents any unforeseen manipulation of the environment of the user that could  
 72169 cause execution of commands not anticipated by the calling program.

72170 There are three levels of specification for the *system()* function. The ISO C standard gives the  
 72171 most basic. It requires that the function exists, and defines a way for an application to query  
 72172 whether a command language interpreter exists. It says nothing about the command language  
 72173 or the environment in which the command is interpreted.

72174 POSIX.1-2024 places additional restrictions on *system()*. It requires that if there is a command  
 72175 language interpreter, the environment must be as specified by *fork()* and *exec*. This ensures, for  
 72176 example, that close-on-exec works, that process-owned file locks are not inherited, and that the  
 72177 process ID is different. It also specifies the return value from *system()* when the command line  
 72178 can be run, thus giving the application some information about the command's completion  
 72179 status.

72180 Finally, POSIX.1-2024 requires the command to be interpreted as in the shell command language  
 72181 defined in the Shell and Utilities volume of POSIX.1-2024.

72182 Note that, *system(NULL)* is required to return non-zero, indicating that there is a command  
 72183 language interpreter. At first glance, this would seem to conflict with the ISO C standard which  
 72184 allows *system(NULL)* to return zero. There is no conflict, however. A system must have a  
 72185 command language interpreter, and is non-conforming if none is present. It is therefore  
 72186 permissible for the *system()* function on such a system to implement the behavior specified by  
 72187 the ISO C standard as long as it is understood that the implementation does not conform to  
 72188 POSIX.1-2024 if *system(NULL)* returns zero.

72189 It was explicitly decided that when *command* is NULL, *system()* should not be required to check  
 72190 to make sure that the command language interpreter actually exists with the correct mode, that  
 72191 there are enough processes to execute it, and so on. The call *system(NULL)* could, theoretically,  
 72192 check for such problems as too many existing child processes, and return zero. However, it  
 72193 would be inappropriate to return zero due to such a (presumably) transient condition. If some  
 72194 condition exists that is not under the control of this application and that would cause any  
 72195 *system()* call to fail, that system has been rendered non-conforming.

72196 Early drafts required, or allowed, *system()* to return with *errno* set to [EINTR] if it was  
 72197 interrupted with a signal. This error return was removed, and a requirement that *system()* not  
 72198 return until the child has terminated was added. This means that if a *waitpid()* call in *system()*  
 72199 exits with *errno* set to [EINTR], *system()* must reissue the *waitpid()*. This change was made for  
 72200 two reasons:

- 72201 1. There is no way for an application to clean up if *system()* returns [EINTR], short of calling  
 72202 *wait()*, and that could have the undesirable effect of returning the status of children other  
 72203 than the one started by *system()*.
- 72204 2. While it might require a change in some historical implementations, those  
 72205 implementations already have to be changed because they use *wait()* instead of *waitpid()*.

72206 Note that if the application is catching SIGCHLD signals, it will receive such a signal before a  
 72207 successful *system()* call returns.

72208 To conform to POSIX.1-2024, *system()* must use *waitpid()*, or some similar function, instead of  
 72209 *wait()*.

72210 The following code sample illustrates how *system()* might be implemented on an

```

72211 implementation conforming to POSIX.1-2024.
72212 int system(const char *cmd)
72213 {
72214     int stat;
72215     pid_t pid;
72216     struct sigaction sa, savintr, savequit;
72217     sigset_t saveblock;
72218     if (cmd == NULL)
72219         return(1);
72220     sa.sa_handler = SIG_IGN;
72221     sigemptyset(&sa.sa_mask);
72222     sa.sa_flags = 0;
72223     sigemptyset(&savintr.sa_mask);
72224     sigemptyset(&savequit.sa_mask);
72225     sigaction(SIGINT, &sa, &savintr);
72226     sigaction(SIGQUIT, &sa, &savequit);
72227     sigaddset(&sa.sa_mask, SIGCHLD);
72228     pthread_sigmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
72229     if ((pid = fork()) == 0) {
72230         sigaction(SIGINT, &savintr, (struct sigaction *)0);
72231         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
72232         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
72233         execl("/bin/sh", "sh", "-c", "--", cmd, (char *)0);
72234         _exit(127);
72235     }
72236     if (pid == -1) {
72237         stat = -1; /* errno comes from fork() */
72238     } else {
72239         while (waitpid(pid, &stat, 0) == -1) {
72240             if (errno != EINTR) {
72241                 stat = -1;
72242                 break;
72243             }
72244         }
72245     }
72246     sigaction(SIGINT, &savintr, (struct sigaction *)0);
72247     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
72248     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
72249     return(stat);
72250 }

```

72251 Note that, while a particular implementation of *system()* (such as the one above) can assume a  
72252 particular path for the shell, such a path is not necessarily valid on another system. The above  
72253 example is not portable, and is not intended to be.

72254 Earlier versions of this standard did not require *system()* to be thread-safe because it alters the  
72255 process-wide disposition of the SIGINT and SIGQUIT signals. It is now required to be thread-  
72256 safe to align with the ISO C standard, which (since the introduction of threads in 2011) requires  
72257 that it avoids data races. However, the function is not required to coordinate the saving and  
72258 restoring of the dispositions of the SIGINT and SIGQUIT signals across a set of overlapping  
72259 calls, and the above example does not do so. The example also does not terminate and wait for  
72260 the child process if the calling thread is cancelled, and so would leak a process ID in that event.

72261 One reviewer suggested that an implementation of *system()* might want to use an environment  
 72262 variable such as *SHELL* to determine which command interpreter to use. The supposed  
 72263 implementation would use the default command interpreter if the one specified by the  
 72264 environment variable was not available. This would allow a user, when using an application that  
 72265 prompts for command lines to be processed using *system()*, to specify a different command  
 72266 interpreter. Such an implementation is discouraged. If the alternate command interpreter did not  
 72267 follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-2024, then  
 72268 changing *SHELL* would render *system()* non-conforming. This would affect applications that  
 72269 expected the specified behavior from *system()*, and since the Shell and Utilities volume of  
 72270 POSIX.1-2024 does not mention that *SHELL* affects *system()*, the application would not know  
 72271 that it needed to unset *SHELL*.

72272 Earlier versions of this standard required the *command* string to be passed as the next argument  
 72273 after "-c" (omitting "--"). This meant that portable applications needed to take care not to  
 72274 pass a command string beginning with <hyphen-minus> ('-') or <plus-sign> ('+'), as it  
 72275 would then be interpreted as containing options. Now that implementations are required to pass  
 72276 the "--", applications no longer need to do this.

#### 72277 FUTURE DIRECTIONS

72278 None.

#### 72283 CHANGE HISTORY

72284 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 72285 Issue 6

72286 Extensions beyond the ISO C standard are marked.

#### 72287 Issue 7

72288 Austin Group Interpretation 1003.1-2001 #055 is applied, clarifying the thread-safety of this  
 72289 function and treatment of *at\_fork()* handlers.

72290 Austin Group Interpretation 1003.1-2001 #156 is applied.

72291 SD5-XSH-ERN-30 is applied.

72292 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0365 [627] is applied.

#### 72293 Issue 8

72294 Austin Group Defect 768 is applied, adding OFD-owned file locks.

72295 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
 72296 standard.

72297 Austin Group Defect 1317 is applied, making it implementation-defined whether the handlers  
 72298 registered with *pthread\_atfork()* are called.

72299 Austin Group Defect 1318 is applied, adding *FD\_CLOFORK*.

72300 Austin Group Defect 1440 is applied, adding a "--" argument to the specified *execl()* call.

72301 **NAME**

72302 tan, tanf, tanl — tangent function

72303 **SYNOPSIS**

```
72304 #include <math.h>
72305 double tan(double x);
72306 float tanf(float x);
72307 long double tanl(long double x);
```

72308 **DESCRIPTION**

72309 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72310 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72311 volume of POSIX.1-2024 defers to the ISO C standard.

72312 These functions shall compute the tangent of their argument  $x$ , measured in radians.

72313 An application wishing to check for error situations should set *errno* to zero and call  
 72314 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 72315 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 72316 zero, an error has occurred.

72317 **RETURN VALUE**

72318 Upon successful completion, these functions shall return the tangent of  $x$ .

72319 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 72320 MXX and *tan()*, *tanf()*, and *tanl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an  
 72321 implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN, and  
 72322 LDBL\_MIN, respectively.

72323 MX If  $x$  is NaN, a NaN shall be returned.

72324 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

72325 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 72326 defined value shall be returned.

72327 MXX If  $x$  is subnormal,  $x$  should be returned.

72328 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *tan()*, *tanf()*, and *tanl()* shall  
 72329 return an implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN,  
 72330 and LDBL\_MIN, respectively.

72331 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 72332 the correct value shall be returned.

72333 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*  
 72334 shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively, with the same sign  
 72335 as the correct value of the function.

72336 **ERRORS**

72337 These functions shall fail if:

72338 MX **Domain Error** The value of  $x$  is  $\pm\text{Inf}$ .

72339 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 72340 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 72341 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 72342 shall be raised.

72343 XSI **Range Error** The result overflows  
 72344 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 72345 then *errno* shall be set to [ERANGE]. If the integer expression  
 72346 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 72347 floating-point exception shall be raised.

72348 These functions may fail if:

72349 MX **Range Error** The result underflows, or the value of *x* is subnormal.  
 72350 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 72351 then *errno* shall be set to [ERANGE]. If the integer expression  
 72352 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 72353 floating-point exception shall be raised.

## 72354 EXAMPLES

### 72355 Taking the Tangent of a 45-Degree Angle

```
72356 #include <math.h>
72357 ...
72358 double radians = 45.0 * M_PI / 180;
72359 double result;
72360 ...
72361 result = tan (radians);
```

## 72362 APPLICATION USAGE

72363 There are no known floating-point representations such that for a normal argument,  $\tan(x)$  is  
 72364 either overflow or underflow.

72365 These functions may lose accuracy when their argument is near a multiple of  $\pi/2$  or is far from  
 72366 0.0.

72367 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 72368 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

## 72369 RATIONALE

## 72376 CHANGE HISTORY

72377 First released in Issue 1. Derived from Issue 1 of the SVID.

### 72378 Issue 5

72379 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
 72380 in previous issues.

### 72381 Issue 6

72382 The [tanf\(\)](#) and [tanl\(\)](#) functions are added for alignment with the ISO/IEC 9899:1999 standard.

72383 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 72384 revised to align with the ISO/IEC 9899:1999 standard.

- 72385 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
72386 marked.
- 72387 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last  
72388 paragraph in the RETURN VALUE section.
- 72389 **Issue 7**
- 72390 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0635 [68], XSH/TC1-2008/0636 [68],  
72391 and XSH/TC1-2008/0637 [68] are applied.
- 72392 **Issue 8**
- 72393 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when  $x$  is  
72394 subnormal to avoid the need for two shading changes.

72395 **NAME**

72396 tanh, tanhf, tanhl — hyperbolic tangent functions

72397 **SYNOPSIS**

```
72398 #include <math.h>
72399 double tanh(double x);
72400 float tanhf(float x);
72401 long double tanhl(long double x);
```

72402 **DESCRIPTION**

72403 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
72404 conflict between the requirements described here and the ISO C standard is unintentional. This  
72405 volume of POSIX.1-2024 defers to the ISO C standard.

72406 These functions shall compute the hyperbolic tangent of their argument  $x$ .

72407 An application wishing to check for error situations should set *errno* to zero and call  
72408 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
72409 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
72410 zero, an error has occurred.

72411 **RETURN VALUE**

72412 Upon successful completion, these functions shall return the hyperbolic tangent of  $x$ .

72413 MX If  $x$  is NaN, a NaN shall be returned.

72414 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

72415 If  $x$  is  $\pm\text{Inf}$ ,  $\pm 1$  shall be returned.

72416 MXX If  $x$  is subnormal,  $x$  should be returned.

72417 MX If  $x$  is subnormal, a range error may occur and, if  $x$  is not returned, *tanh()*, *tanhf()*, and *tanhl()*  
72418 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
72419 FLT\_MIN, and LDBL\_MIN, respectively.

72420 **ERRORS**

72421 These functions may fail if:

72422 MX **Range Error** The value of  $x$  is subnormal.

72423 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
72424 then *errno* shall be set to [ERANGE]. If the integer expression  
72425 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
72426 floating-point exception shall be raised.

72427 **EXAMPLES**

72428 None.

72429 **APPLICATION USAGE**

72430 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
72431 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

72432 **RATIONALE**

72433 None.

72434 **FUTURE DIRECTIONS**

72435 None.

72439 **CHANGE HISTORY**

72440 First released in Issue 1. Derived from Issue 1 of the SVID.

72441 **Issue 5**72442 The DESCRIPTION is updated to indicate how an application should check for an error. This  
72443 text was previously published in the APPLICATION USAGE section.72444 **Issue 6**72445 The *tanhf()* and *tanhfll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.72446 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
72447 revised to align with the ISO/IEC 9899:1999 standard.72448 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
72449 marked.72450 **Issue 7**

72451 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0638 [68] is applied.

72452 **Issue 8**72453 Austin Group Defect 1382 is applied, rearranging the text describing the behavior when *x* is  
72454 subnormal to avoid the need for two shading changes.

72455 **NAME**

72456 tanl — tangent function

72457 **SYNOPSIS**

72458 #include &lt;math.h&gt;

72459 long double tanl(long double *x*);72460 **DESCRIPTION**72461 Refer to *tan()*.

72462 **NAME**

72463 tcdrain — wait for transmission of output

72464 **SYNOPSIS**

72465 #include &lt;termios.h&gt;

72466 int tcdrain(int *fildev*);72467 **DESCRIPTION**72468 The *tcdrain()* function shall block until all output written to the object referred to by *fildev* is  
72469 transmitted. The *fildev* argument is an open file descriptor associated with a terminal.72470 Any attempts to use *tcdrain()* from a process which is a member of a background process group  
72471 on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a  
72472 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
72473 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.72474 **RETURN VALUE**72475 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72476 indicate the error.72477 **ERRORS**72478 The *tcdrain()* function shall fail if:72479 [EBADF] The *fildev* argument is not a valid file descriptor.72480 [EINTR] A signal interrupted *tcdrain()*.72481 [EIO] The process group of the writing process is orphaned, the calling thread is not  
72482 blocking SIGTTOU, and the process is not ignoring SIGTTOU.72483 [ENOTTY] The file associated with *fildev* is not a terminal.72484 **EXAMPLES**

72491 None.

72492 **SEE ALSO**72493 [tcflush\(\)](#)

72494 XBD Chapter 11 (on page 199), &lt;termios.h&gt;

72495 **CHANGE HISTORY**

72496 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72497 **Issue 6**

72498 The following new requirements on POSIX implementations derive from alignment with the  
72499 Single UNIX Specification:

72500 • In the DESCRIPTION, the final paragraph is no longer conditional on  
72501 `_POSIX_JOB_CONTROL`. This is a FIPS requirement.

72502 • The [EIO] error is added.

72503 **Issue 7**

72504 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0639 [79], XSH/TC1-2008/0640 [79],  
72505 and XSH/TC1-2008/0641 [79] are applied.

72506 **NAME**

72507 tcflow — suspend or restart the transmission or reception of data

72508 **SYNOPSIS**

72509 #include &lt;termios.h&gt;

72510 int tcflow(int *fildes*, int *action*);72511 **DESCRIPTION**72512 The *tcflow()* function shall suspend or restart transmission or reception of data on the object  
72513 referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file  
72514 descriptor associated with a terminal.

- 72515 • If *action* is TCOOFF, output shall be suspended.
- 72516 • If *action* is TCOON, suspended output shall be restarted.
- 72517 • If *action* is TCIOFF and *fildes* refers to a terminal device, the system shall transmit a STOP  
72518 character, which is intended to cause the terminal device to stop transmitting data to the  
72519 system. If *fildes* is associated with a pseudo-terminal, the STOP character need not be  
72520 transmitted.
- 72521 • If *action* is TCION and *fildes* refers to a terminal device, the system shall transmit a START  
72522 character, which is intended to cause the terminal device to start transmitting data to the  
72523 system. If *fildes* is associated with a pseudo-terminal, the START character need not be  
72524 transmitted.

72525 The default on the opening of a terminal file is that neither its input nor its output are  
72526 suspended.

72527 Attempts to use *tcflow()* from a process which is a member of a background process group on a  
72528 *fildes* associated with its controlling terminal, shall cause the process group to be sent a  
72529 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
72530 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

72531 **RETURN VALUE**

72532 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72533 indicate the error.

72534 **ERRORS**72535 The *tcflow()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 72536 | [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.  |

72548 None.

72549 **SEE ALSO**72550 [tcsendbreak\(\)](#)72551 XBD [Chapter 11](#) (on page 199), [<termios.h>](#)72552 **CHANGE HISTORY**

72553 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72554 **Issue 6**72555 The following new requirements on POSIX implementations derive from alignment with the  
72556 Single UNIX Specification:

- 72557
- The [EIO] error is added.

72558 **Issue 7**72559 SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and  
72560 STOP characters.72561 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0642 [79], XSH/TC1-2008/0643 [79],  
72562 and XSH/TC1-2008/0644 [79] are applied.

72563 **NAME**

72564 tcflush — flush non-transmitted output data, non-read input data, or both

72565 **SYNOPSIS**

72566 #include &lt;termios.h&gt;

72567 int tcflush(int *fildev*, int *queue\_selector*);72568 **DESCRIPTION**72569 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildev*  
72570 (an open file descriptor associated with a terminal) but not transmitted, or data received but not  
72571 read, depending on the value of *queue\_selector*:

- 72572 • If *queue\_selector* is TCIFLUSH, it shall flush data received but not read.
- 72573 • If *queue\_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- 72574 • If *queue\_selector* is TCIOFLUSH, it shall flush both data received but not read and data  
72575 written but not transmitted.

72576 Attempts to use *tcflush()* from a process which is a member of a background process group on a  
72577 *fildev* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU  
72578 signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU  
72579 signals, the process shall be allowed to perform the operation, and no signal is sent.

72580 **RETURN VALUE**72581 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72582 indicate the error.72583 **ERRORS**72584 The *tcflush()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 72585 | [EBADF]  | The <i>fildev</i> argument is not a valid file descriptor.                      |
| 72586 | [EINVAL] | The <i>queue_selector</i> argument is not a supported value.                    |
| 72587 | [EIO]    | The process group of the writing process is orphaned, the calling thread is not |
| 72588 |          | blocking SIGTTOU, and the process is not ignoring SIGTTOU.                      |
| 72589 | [ENOTTY] | The file associated with <i>fildev</i> is not a terminal.                       |

72595 None.

72596 **FUTURE DIRECTIONS**

72597 None.

72598 **SEE ALSO**72599 [tcdrain\(\)](#)72600 XBD [Chapter 11](#) (on page 199), [<termios.h>](#)72601 **CHANGE HISTORY**

72602 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72603 **Issue 6**

72604 The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE  
72605 sections, references to *tcflow()* are replaced with *tcflush()*.

72606 The following new requirements on POSIX implementations derive from alignment with the  
72607 Single UNIX Specification:

- 72608 • In the DESCRIPTION, the final paragraph is no longer conditional on  
72609 `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- 72610 • The [EIO] error is added.

72611 **Issue 7**

72612 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0645 [79], XSH/TC1-2008/0646 [79],  
72613 and XSH/TC1-2008/0647 [79] are applied.

72614 **NAME**

72615 tcgetattr — get the parameters associated with the terminal

72616 **SYNOPSIS**

72617 #include &lt;termios.h&gt;

72618 int tcgetattr(int *fildev*, struct termios \**termios\_p*);72619 **DESCRIPTION**72620 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev*  
72621 and store them in the **termios** structure referenced by *termios\_p*. The *fildev* argument is an open  
72622 file descriptor associated with a terminal.72623 The *termios\_p* argument is a pointer to a **termios** structure.72624 The *tcgetattr()* operation is allowed from any process.72625 If the terminal device supports different input and output baud rates, the baud rates stored in  
72626 the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are  
72627 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall  
72628 be the actual baud rate. If the terminal device does not support split baud rates, the input baud  
72629 rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).72630 **RETURN VALUE**72631 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72632 indicate the error.72633 **ERRORS**72634 The *tcgetattr()* function shall fail if:72635 [EBADF] The *fildev* argument is not a valid file descriptor.72636 [ENOTTY] The file associated with *fildev* is not a terminal.72637 **EXAMPLES**

72638 None.

72639 **APPLICATION USAGE**

72640 None.

72641 **RATIONALE**72642 Care must be taken when changing the terminal attributes. Applications should always do a  
72643 *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only  
72644 the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the  
72645 terminal state whenever it is done with the terminal. This is necessary because terminal  
72646 attributes apply to the underlying port and not to each individual open instance; that is, all  
72647 processes that have used the terminal see the latest attribute changes.72648 A program that uses these functions should be written to catch all signals and take other  
72649 appropriate actions to ensure that when the program terminates, whether planned or not, the  
72650 terminal device's state is restored to its original state.72651 Existing practice dealing with error returns when only part of a request can be honored is based  
72652 on calls to the *ioctl()* function. In historical BSD and System V implementations, the  
72653 corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if  
72654 some of the requested changes could not be made. Many existing applications assume this  
72655 behavior and would no longer work correctly if the return value were changed from zero to -1  
72656 in this case.

72657 Note that either specification has a problem. When zero is returned, it implies everything

72658 succeeded even if some of the changes were not made. When -1 is returned, it implies  
72659 everything failed even though some of the changes were made.

72660 Applications that need all of the requested changes made to work properly should follow  
72661 *tcsetattr()* with a call to *tcgetattr()* and compare the appropriate field values.

72662 **FUTURE DIRECTIONS**

72663 None.

72667 **CHANGE HISTORY**

72668 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72669 **Issue 6**

72670 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.  
72671 Previously, the number zero was also allowed but was obsolescent.

72672 **NAME**

72673 tcgetpgrp — get the foreground process group ID

72674 **SYNOPSIS**

72675 #include &lt;unistd.h&gt;

72676 pid\_t tcgetpgrp(int *fildev*);72677 **DESCRIPTION**72678 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process  
72679 group associated with the terminal.72680 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does  
72681 not match the process group ID of any existing process group.72682 The *tcgetpgrp()* function is allowed from a process that is a member of a background process  
72683 group; however, the information may be subsequently changed by a process that is a member of  
72684 a foreground process group.72685 **RETURN VALUE**72686 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the  
72687 foreground process associated with the terminal. Otherwise,  $-1$  shall be returned and *errno* set to  
72688 indicate the error.72689 **ERRORS**72690 The *tcgetpgrp()* function shall fail if:72691 [EBADF] The *fildev* argument is not a valid file descriptor.72692 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
72693 controlling terminal.72694 **EXAMPLES**

72695 None.

72696 **APPLICATION USAGE**

72697 None.

72698 **RATIONALE**

72699 None.

72702 **SEE ALSO**72703 [setsid\(\)](#), [setpgid\(\)](#), [tcsetpgrp\(\)](#)72704 XBD [<sys/types.h>](#), [<unistd.h>](#)72705 **CHANGE HISTORY**

72706 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72707 **Issue 6**72708 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.72709 The following new requirements on POSIX implementations derive from alignment with the  
72710 Single UNIX Specification:

- 72711
- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
72712 required for conforming implementations of previous POSIX specifications, it was not  
72713 required for UNIX applications.

72714  
72715

- In the DESCRIPTION, text previously conditional on support for `_POSIX_JOB_CONTROL` is now mandatory. This is a FIPS requirement.

72716 **NAME**

72717 tcgetsid — get the process group ID for the session leader for the controlling terminal

72718 **SYNOPSIS**

72719 #include <termios.h>

72720 pid\_t tcgetsid(int *fildev*);

72721 **DESCRIPTION**

72722 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal  
72723 specified by *fildev* is the controlling terminal.

72724 **RETURN VALUE**

72725 Upon successful completion, *tcgetsid()* shall return the process group ID of the session  
72726 associated with the terminal. Otherwise, a value of -1 shall be returned and *errno* set to indicate  
72727 the error.

72728 **ERRORS**

72729 The *tcgetsid()* function shall fail if:

72730 [EBADF] The *fildev* argument is not a valid file descriptor.

72731 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
72732 controlling terminal.

72743 **CHANGE HISTORY**

72744 First released in Issue 4, Version 2.

72745 **Issue 5**

72746 Moved from X/OPEN UNIX extension to BASE.

72747 The [EACCES] error has been removed from the list of mandatory errors, and the description of  
72748 [ENOTTY] has been reworded.

72749 **Issue 7**

72750 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section.

72751 The *tcgetsid()* function is moved from the XSI option to the Base.

72752 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0648 [421] is applied.

72753 **NAME**

72754 tcgetwinsize — get the size of a terminal window

72755 **SYNOPSIS**

72756 #include &lt;termios.h&gt;

72757 int tcgetwinsize(int *fildev*, struct winsize \**winsize\_p*);72758 **DESCRIPTION**

72759 The *tcgetwinsize()* function shall get the terminal window size associated with the terminal  
 72760 referred to by *fildev* and store it in the **winsize** structure pointed to by *winsize\_p*. The *fildev*  
 72761 argument is an open file descriptor associated with a terminal. The *winsize\_p* argument is a  
 72762 pointer to a **winsize** structure.

72763 If the terminal referred to by *fildev* was opened without O\_TTY\_INIT and is not a pseudo-  
 72764 terminal, and the terminal window size has not been set by a call to *tcsetwinsize()*, the terminal  
 72765 window size is unspecified.

72766 If the terminal was opened with O\_TTY\_INIT or is a pseudo-terminal, and the terminal window  
 72767 size has not been set by a call to *tcsetwinsize()*, the terminal window size shall be set to an  
 72768 appropriate default (see *open()*).

72769 If the terminal window size has been set by a call to *tcsetwinsize()*, the values set by that call  
 72770 shall be returned.

72771 **RETURN VALUE**

72772 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 72773 indicate the error.

72774 **ERRORS**72775 The *tcgetwinsize()* function shall fail if:72776 [EBADF] The *fildev* argument is not a valid file descriptor.72777 [ENOTTY] The file associated with *fildev* is not a terminal.72778 **EXAMPLES**

72779 #include &lt;stdint.h&gt;

72780 #include &lt;stdio.h&gt;

72781 #include &lt;stdlib.h&gt;

72782 #include &lt;errno.h&gt;

72783 #include &lt;signal.h&gt;

72784 #include &lt;termios.h&gt;

72785 #include &lt;unistd.h&gt;

72850         sigprocmask(SIG_UNBLOCK, &winch_set, NULL);
72851         newsize = 0;
72852     }
72853     printf("row = %3hu, col = %3hu\n", ws.ws_row, ws.ws_col);
72854
72855     // process inbuf ...
72856 }
72857 }

```

#### 72858 APPLICATION USAGE

72859 Applications should take care to avoid race conditions and other undefined behavior when  
72860 calling `tcgetwinsize()` from signal handlers. A common but incorrect idiom is to establish a signal  
72861 handler for SIGWINCH from which `tcgetwinsize()` is called to update a global **winsize** structure.  
72862 This usage is incorrect as accessing a **winsize** structure is not guaranteed to be an atomic  
72863 operation. Instead, applications should have `tcgetwinsize()` write to a local structure and copy  
72864 each member the application is interested in to a global variable of type **volatile sig\_atomic\_t**.  
72865 Furthermore, SIGWINCH should be blocked from delivery while the terminal size is read from  
72866 these global variables to further avoid race conditions. A simpler alternative, if the application is  
72867 structured in a suitable way, is just to set a flag in the signal handler and then call `tcgetwinsize()`  
72868 (and clear the flag) at an appropriate place in the code if the flag has been set.

72869 Multi-threaded applications should avoid the signal handler idiom in general. Instead, it is  
72870 advised to use `sigwait()` to wait for the delivery of a SIGWINCH signal.

72871 If the terminal window size changes while a process is in the background, it is not notified via  
72872 SIGWINCH (which is sent only to the foreground process group). Applications can handle this  
72873 case by calling `tcgetwinsize()` if the process receives SIGCONT, to check whether the terminal  
72874 window size changed while the process was stopped.

72875 If a background process writes to a terminal and the TOSTOP flag is clear (see XBD [Section](#)  
72876 [11.2.5](#), on page 210), the process might not receive SIGTTOU or SIGWINCH signals and thus  
72877 might not be notified when the terminal window size might have changed. Such processes must  
72878 periodically poll the current terminal window size if needed.

#### 72879 RATIONALE

72880 The `tcgetwinsize()` function is provided to allow applications to query the current terminal  
72881 window size. This is necessary for applications intended to be run in terminals whose terminal  
72882 window size can be changed at runtime. Conventionally, a SIGWINCH signal is delivered to a  
72883 controlling terminal's foreground process group whenever its terminal window size is changed.  
72884 By installing a signal handler for SIGWINCH, a process can detect the change to the controlling  
72885 terminal's window size and take action, e.g. by redrawing its user interface to the new size.

72891 **CHANGE HISTORY**

72892       First released in Issue 8.

72893 **NAME**

72894 tcsendbreak — send a break for a specific duration

72895 **SYNOPSIS**

72896 #include &lt;termios.h&gt;

72897 int tcsendbreak(int *fildev*, int *duration*);72898 **DESCRIPTION**

72899 If the terminal is using asynchronous serial data transmission, *tcsendbreak()* shall cause  
72900 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it  
72901 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5  
72902 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period  
72903 of time.

72904 The *fildev* argument is an open file descriptor associated with a terminal.

72905 If the terminal is not using asynchronous serial data transmission, it is implementation-defined  
72906 whether *tcsendbreak()* sends data to generate a break condition or returns without taking any  
72907 action.

72908 Attempts to use *tcsendbreak()* from a process which is a member of a background process group  
72909 on a *fildev* associated with its controlling terminal shall cause the process group to be sent a  
72910 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
72911 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

72912 **RETURN VALUE**

72913 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72914 indicate the error.

72915 **ERRORS**

72916 The *tcsendbreak()* function shall fail if:

72917 [EBADF] The *fildev* argument is not a valid file descriptor.

72918 [EIO] The process group of the writing process is orphaned, the calling thread is not  
72919 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

72920 [ENOTTY] The file associated with *fildev* is not a terminal.

72921 **EXAMPLES**

72922 None.

72923 **APPLICATION USAGE**

72924 None.

72925 **RATIONALE**

72926 None.

72927 **FUTURE DIRECTIONS**

72928 None.

72931 **CHANGE HISTORY**

72932 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

72933 **Issue 6**

72934 The following new requirements on POSIX implementations derive from alignment with the  
72935 Single UNIX Specification:

- 72936 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now  
72937 mandated. This is a FIPS requirement.
- 72938 • The [EIO] error is added.

72939 **Issue 7**

72940 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0649 [79], XSH/TC1-2008/0650 [79],  
72941 and XSH/TC1-2008/0651 [79] are applied.

72942 **NAME**

72943 tcsetattr — set the parameters associated with the terminal

72944 **SYNOPSIS**

72945 #include &lt;termios.h&gt;

72946 int tcsetattr(int *fildev*, int *optional\_actions*,  
72947 const struct termios \**termios\_p*);72948 **DESCRIPTION**72949 The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the  
72950 open file descriptor *fildev* (an open file descriptor associated with a terminal) from the **termios**  
72951 structure referenced by *termios\_p* as follows:

- 72952 • If *optional\_actions* is TCSANOW, the change shall occur immediately.
- 72953 • If *optional\_actions* is TCSADRAIN, the change shall occur after all output written to *fildev* is  
72954 transmitted. This function should be used when changing parameters that affect output.
- 72955 • If *optional\_actions* is TCSAFLUSH, the change shall occur after all output written to *fildev* is  
72956 transmitted, and all input so far received but not read shall be discarded before the change  
72957 is made.

72958 If the output baud rate stored in the **termios** structure pointed to by *termios\_p* is the zero baud  
72959 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the  
72960 line.72961 If the input baud rate stored in the **termios** structure pointed to by *termios\_p* is 0, the input baud  
72962 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.72963 The *tcsetattr()* function shall return successfully if it was able to perform any of the requested  
72964 actions, even if some of the requested actions could not be performed. It shall set all the  
72965 attributes that the implementation supports as requested and leave all the attributes not  
72966 supported by the implementation unchanged. If no part of the request can be honored, it shall  
72967 return  $-1$  and set *errno* to [EINVAL]. If the input and output baud rates differ and are a  
72968 combination that is not supported, neither baud rate shall be changed. A subsequent call to  
72969 *tcsetattr()* shall return the actual state of the terminal device (reflecting both the changes made  
72970 and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values  
72971 found in the **termios** structure under any circumstances.72972 The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios\_p*  
72973 was not derived from the result of a call to *tcgetattr()* on *fildev*; an application should modify  
72974 only fields and flags defined by this volume of POSIX.1-2024 between the call to *tcgetattr()* and  
72975 *tcsetattr()*, leaving all other fields and flags unmodified.72976 No actions defined by this volume of POSIX.1-2024, other than a call to *tcsetattr()*, a close of the  
72977 last file descriptor in the system associated with this terminal device, or an open of the first file  
72978 descriptor in the system associated with this terminal device (using the O\_TTY\_INIT flag if it is  
72979 non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes  
72980 defined by this volume of POSIX.1-2024 to change.72981 If *tcsetattr()* is called from a process which is a member of a background process group on a *fildev*  
72982 associated with its controlling terminal:

- 72983 • If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU  
72984 signals, the operation completes normally and no signal is sent.

- 72985           • Otherwise, a SIGTTOU signal shall be sent to the process group.

#### 72986 RETURN VALUE

72987           Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
72988           indicate the error.

#### 72989 ERRORS

72990           The *tcsetattr()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 72991 | [EBADF]  | The <i>fildev</i> argument is not a valid file descriptor.  |
| 72992 | [EINTR]  | A signal interrupted <i>tcsetattr()</i> .   |
| 72993 | [EINVAL] | The <i>optional_actions</i> argument is not a supported value, or an attempt was<br>72994           made to change an attribute represented in the <b>termios</b> structure to an<br>72995           unsupported value. |
| 72996 | [EIO]    | The process group of the writing process is orphaned, the calling thread is not<br>72997           blocking SIGTTOU, and the process is not ignoring SIGTTOU.   |
| 72998 | [ENOTTY] | The file associated with <i>fildev</i> is not a terminal.   |

#### 72999 EXAMPLES

73000           None.

#### 73001 APPLICATION USAGE

73002           If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to  
73003           determine what baud rates were actually selected.

73004           In general, there are two reasons for an application to change the parameters associated with a  
73005           terminal device:

- |       |    |   |
|-------|----|---|
| 73006 | 1. | The device already has working parameter settings but the application needs a different<br>73007           behavior, such as non-canonical mode instead of canonical mode. The application sets (or<br>73008           clears) only a few flags or <i>c_cc[]</i> values. Typically, the terminal device in this case is either<br>73009           the controlling terminal for the process or a pseudo-terminal.  |
| 73010 | 2. | The device is a modem or similar piece of equipment connected by a serial line, and it<br>73011           was not open before the application opened it. In this case, the application needs to<br>73012           initialize all of the parameter settings “from scratch”. However, since the <b>termios</b><br>73013           structure may include both standard and non-standard parameters, the application<br>73014           cannot just initialize the whole structure in an arbitrary way (e.g., using <i>memset()</i> ) as this<br>73015           may cause some of the non-standard parameters to be set incorrectly, resulting in non-<br>73016           conforming behavior of the terminal device. Conversely, the application cannot just set<br>73017           the standard parameters, assuming that the non-standard parameters will already have<br>73018           suitable values, as the device might previously have been used with non-conforming<br>73019           parameter settings (and some implementations retain the settings from one use to the<br>73020           next). The solution is to open the terminal device using the <i>O_TTY_INIT</i> flag to initialize<br>73021           the terminal device to have conforming parameter settings, obtain those settings using<br>73022 <i>tcgetattr()</i> , and then set all of the standard parameters to the desired settings. |

#### 73023 RATIONALE

73024           The *tcsetattr()* function can be interrupted in the following situations:

- |       |   |  |
|-------|---|--|
| 73025 | • | It is interrupted while waiting for output to drain.                             |
| 73026 | • | It is called from a process in a background process group and SIGTTOU is caught. |

73027           See also the RATIONALE section in *tcgetattr()*.

73028 **FUTURE DIRECTIONS**

73029 Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be  
73030 supported in a future version of this volume of POSIX.1-2024.

73031 **SEE ALSO**

73032 *cfgetispeed()*, *tcgetattr()*

73033 XBD Chapter 11 (on page 199), `<termios.h>`

73034 **CHANGE HISTORY**

73035 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

73036 **Issue 6**

73037 The following new requirements on POSIX implementations derive from alignment with the  
73038 Single UNIX Specification:

- 73039 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now  
73040 mandated. This is a FIPS requirement.
- 73041 • The [EIO] error is added.

73042 In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of  
73043 a background process group is clarified.

73044 **Issue 7**

73045 Austin Group Interpretation 1003.1-2001 #144 is applied.

73046 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0652 [79], XSH/TC1-2008/0653 [79],  
73047 and XSH/TC1-2008/0654 [79] are applied.

73048 **NAME**

73049 tcsetpgrp — set the foreground process group ID

73050 **SYNOPSIS**

73051 #include &lt;unistd.h&gt;

73052 int tcsetpgrp(int *fildes*, pid\_t *pgid\_id*);73053 **DESCRIPTION**

73054 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID  
 73055 associated with the terminal to *pgid\_id*. The application shall ensure that the file associated with  
 73056 *fildes* is the controlling terminal of the calling process and the controlling terminal is currently  
 73057 associated with the session of the calling process. The application shall ensure that the value of  
 73058 *pgid\_id* matches a process group ID of a process in the same session as the calling process.

73059 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on  
 73060 a *fildes* associated with its controlling terminal shall cause the process group to be sent a  
 73061 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
 73062 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

73063 **RETURN VALUE**

73064 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 73065 indicate the error.

73066 **ERRORS**73067 The *tcsetpgrp()* function shall fail if:73068 [EBADF] The *fildes* argument is not a valid file descriptor.73069 [EINTR] A signal interrupted *tcsetpgrp()*.73070 [EINVAL] This implementation does not support the value in the *pgid\_id* argument.

73071 [EIO] The process group of the writing process is orphaned, the calling thread is not  
 73072 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

73073 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
 73074 controlling terminal, or the controlling terminal is no longer associated with  
 73075 the session of the calling process.

73076 [EPERM] The value of *pgid\_id* is a value supported by the implementation, but does not  
 73077 match the process group ID of a process in the same session as the calling  
 73078 process.

73079 **EXAMPLES**

73080 None.

73081 **APPLICATION USAGE**

73082 None.

73083 **RATIONALE**

73084 None.

73085 **FUTURE DIRECTIONS**

73086 None.

73087 **SEE ALSO**73088 [tcgetpgrp\(\)](#)73089 XBD [<sys/types.h>](#), [<unistd.h>](#)

73090 **CHANGE HISTORY**

73091 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

73092 **Issue 6**

73093 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

73094 The following new requirements on POSIX implementations derive from alignment with the  
73095 Single UNIX Specification:

73096 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
73097 required for conforming implementations of previous POSIX specifications, it was not  
73098 required for UNIX applications.

73099 • In the DESCRIPTION and ERRORS sections, text previously conditional on  
73100 `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

73101 The normative text is updated to avoid use of the term “must” for application requirements.

73102 The Open Group Corrigendum U047/4 is applied.

73103 **Issue 7**

73104 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0655 [79] and XSH/TC1-2008/0656  
73105 [79] are applied.

73106 **Issue 8**

73107 Austin Group Defect 1126 is applied, adding the [EINTR] error.

73108 **NAME**

73109 tcsetwinsize — set the size of a terminal window

73110 **SYNOPSIS**

73111 #include &lt;termios.h&gt;

73112 int tcsetwinsize(int *fildev*, const struct winsize \**winsize\_p*);73113 **DESCRIPTION**

73114 The *tcsetwinsize()* function shall set the terminal window size associated with the terminal  
 73115 referred to by the open file descriptor *fildev* (an open file descriptor associated with a terminal)  
 73116 from the **winsize** structure referenced by *winsize\_p*. The change shall occur immediately.

73117 If the terminal size was changed successfully, a SIGWINCH shall be delivered to the foreground  
 73118 process group associated with the terminal. No signal shall be delivered if the terminal size was  
 73119 changed to the same value it had before the *tcsetwinsize()* call. A SIGWINCH may also be  
 73120 delivered to an implementation-defined set of other processes.

73121 The *tcsetwinsize()* function shall return successfully if it was able to update all members of the  
 73122 **winsize** structure associated with the terminal.

73123 It is unspecified whether changing the terminal window size causes any changes to the size of  
 73124 the terminal's font.

73125 The effect of *tcsetwinsize()* is undefined if the value of the **winsize** structure pointed to by  
 73126 *winsize\_p* was not derived from the result of a call to *tcgetwinsize()* on *fildev*; an application  
 73127 should modify only fields defined by this volume of POSIX.1-2024 between the call to  
 73128 *tcgetwinsize()* and *tcsetwinsize()*, leaving all other fields unmodified.

73129 No actions defined by this volume of POSIX.1-2024, other than a call to *tcsetwinsize()*, a close of  
 73130 the last file descriptor in the system associated with this terminal device, or an open of the first  
 73131 file descriptor in the system associated with this terminal device (using the O\_TTY\_INIT flag if it  
 73132 is non-zero and the device is not a pseudo-terminal), shall cause the terminal window size to  
 73133 change.

73134 If *tcsetwinsize()* is called from a process which is a member of a background process group on a  
 73135 *fildev* associated with its controlling terminal:

- 73136 • If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU  
 73137 signals, the operation completes normally and no signal is sent.
- 73138 • Otherwise, a SIGTTOU signal shall be sent to the process group.

73139 **RETURN VALUE**

73140 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the terminal  
 73141 window size shall not be changed, and *errno* shall be set to indicate the error.

73142 **ERRORS**

73143 The *tcsetwinsize()* function shall fail if:

- 73144 [EBADF] The *fildev* argument is not a valid file descriptor.
- 73145 [EIO] The process group of the writing process is orphaned, the calling thread is not  
 73146 blocking SIGTTOU, and the process is not ignoring SIGTTOU.
- 73147 [ENOTTY] The file associated with *fildev* is not a terminal.

73148 The *tcsetwinsize()* function may fail if:

73149 [EINVAL] An attempt was made to change an attribute represented in the **winsize**  
73150 structure to an unsupported value.

73151 **EXAMPLES**

73152 None.

73153 **APPLICATION USAGE**

73154 If the terminal window of a pseudo terminal is resized, the attached manager process should  
73155 invoke *tcsetwinsize()* to relay the new terminal window size to the foreground process group.

73156 If a process attached to the subsidiary device of a pseudo-terminal calls *tcsetwinsize()*, the  
73157 attached manager process should attempt to change the screen to reflect the new size.

73158 **RATIONALE**

73159 This standard does not mention the *ws\_xpixel* and *ws\_ypixel* fields that appear in the **winsize**  
73160 structure of some historical implementations. With current hardware, it is not obvious that the  
73161 **unsigned short** type used for these fields is sufficient and no uses of these fields in portable code  
73162 were found. However, since these and other fields may be included in the **winsize** structure, the  
73163 standard requires that applications use *tcgetwinsize()* to initialize any fields that may be  
73164 provided by an implementation before setting the *ws\_cols* and *ws\_rows* fields using *tcsetwinsize()*  
73165 to avoid unintentionally destroying data in other fields in this structure.

73166 **FUTURE DIRECTIONS**

73167 None.

73168 **SEE ALSO**

73169 [\*tcgetwinsize\(\)\*](#)

73170 XBD [<termios.h>](#)

73171 **CHANGE HISTORY**

73172 First released in Issue 8.

73173 **NAME**

73174 tdelete, tfind, tsearch, twalk — manage a binary search tree

73175 **SYNOPSIS**

```

73176 XSI #include <search.h>
73177 void *tdelete(const void *restrict key,
73178             posix_tnode **restrict rootp,
73179             int (*compar)(const void *, const void *));
73180 posix_tnode *tfind(const void *key,
73181                  posix_tnode *const *rootp,
73182                  int (*compar)(const void *, const void *));
73183 posix_tnode *tsearch(const void *key,
73184                    posix_tnode **rootp,
73185                    int (*compar)(const void *, const void *));
73186 void twalk(const posix_tnode *root,
73187           void (*action)(const posix_tnode *, VISIT, int));

```

73188 **DESCRIPTION**

73189 The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees.  
 73190 Comparisons are made with a user-supplied routine, the address of which is passed as the  
 73191 *compar* argument. This routine is called with two arguments, which are the pointers to the  
 73192 elements being compared. The application shall ensure that the user-supplied routine returns an  
 73193 integer less than, equal to, or greater than 0, according to whether the first argument is to be  
 73194 considered less than, equal to, or greater than the second argument. The comparison function  
 73195 need not compare every byte, so arbitrary data may be contained in the elements in addition to  
 73196 the values being compared.

73197 The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element  
 73198 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed  
 73199 to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key*  
 73200 shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a  
 73201 pointer to this node returned. Only pointers are copied, so the application shall ensure that the  
 73202 calling routine stores the data. The *rootp* argument points to a variable that points to the root  
 73203 node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree;  
 73204 in this case, the variable shall be set to point to the node which shall be at the root of the new  
 73205 tree.

73206 Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found.  
 73207 However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the  
 73208 same as for *tsearch()*.

73209 The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same  
 73210 as for *tsearch()*. The variable pointed to by *rootp* shall be set to a pointer to the new root of the  
 73211 tree if the root of the tree was changed. If the deleted node was the root of the tree and had no  
 73212 children, the variable pointed to by *rootp* shall be set to a null pointer. The *tdelete()* function shall  
 73213 return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the  
 73214 deleted node was the root node, or a null pointer if the node is not found.

73215 If *tsearch()* adds an element to a tree, or *tdelete()* successfully deletes an element from a tree, the  
 73216 concurrent use of that tree in another thread, or use of pointers produced by a previous call to  
 73217 *tfind()* or *tsearch()*, produces undefined results.

73218 The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root  
 73219 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below

73220 that node.) The argument *action* is the name of a routine to be invoked at each node. This routine  
 73221 is, in turn, called with three arguments. The first argument shall be the address of the node being  
 73222 visited. The structure pointed to by this argument is unspecified and shall not be modified by  
 73223 the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-  
 73224 element to access the element stored in the node. The second argument shall be a value from an  
 73225 enumeration data type:

```
73226 typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

73227 (defined in `<search.h>`), depending on whether this is the first, second, or third time that the  
 73228 node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a  
 73229 leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

73230 If the calling function alters the pointer to the root, the result is undefined.

73231 If the functions pointed to by *action* or *compar* (for any of these binary search functions) change  
 73232 the tree, the results are undefined.

73233 These functions are thread-safe only as long as multiple threads do not access the same tree.

#### 73234 RETURN VALUE

73235 If the node is found, both *tsearch()* and *tfind()* shall return a pointer to it. If not, *tfind()* shall  
 73236 return a null pointer, and *tsearch()* shall return a pointer to the inserted item.

73237 A null pointer shall be returned by *tsearch()* if there is not enough space available to create a new  
 73238 node.

73239 A null pointer shall be returned by *tdelete()*, *tfind()*, and *tsearch()* if *rootp* is a null pointer on  
 73240 entry.

73241 The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified  
 73242 non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

73243 The *twalk()* function shall not return a value.

73244 In all cases where a pointer to a node is returned, the structure pointed to by the return value is  
 73245 unspecified and shall not be modified by the application, but it shall be possible to cast a  
 73246 pointer-to-node into a pointer-to-pointer-to-element to access the element stored in the node.

#### 73247 ERRORS

73248 No errors are defined.

#### 73249 EXAMPLES

73250 The following code reads in strings and stores structures containing a pointer to each string and  
 73251 a count of its length. It then walks the tree, printing out the stored strings and their lengths in  
 73252 alphabetical order.

```
73253 #include <limits.h>
73254 #include <search.h>
73255 #include <stdlib.h>
73256 #include <string.h>
73257 #include <stdio.h>

73258 struct element {          /* Pointers to these are stored in the tree. */
73259     int     count;
73260     char    string[];
73261 };

73262 posix_tnode *root = NULL;          /* This points to the root. */
```

```

73263     int main(void)
73264     {
73265         char    str[_POSIX2_LINE_MAX+1];
73266         int     length = 0;
73267         struct element *elementptr;
73268         posix_tnode *node;
73269         void    print_node(const posix_tnode *, VISIT, int);
73270         int     node_compare(const void *, const void *);

73271         while (fgets(str, sizeof(str), stdin)) {
73272             /* Set element. */
73273             length = strlen(str);
73274             if (str[length-1] == '\n')
73275                 str[--length] = '\0';
73276             elementptr = malloc(sizeof(struct element) + length + 1);
73277             strcpy(elementptr->string, str);
73278             elementptr->count = 1;
73279             /* Put element into the tree. */
73280             node = tsearch((void *)elementptr, &root, node_compare);
73281             if (node == NULL) {
73282                 fprintf(stderr,
73283                     "tsearch: Not enough space available\n");
73284                 exit(EXIT_FAILURE);
73285             }
73286             else if (*(struct element **)node != elementptr) {
73287                 /* A node containing the element already exists */
73288                 (*(struct element **)node)->count++;
73289                 free(elementptr);
73290             }
73291         }
73292         twalk(root, print_node);

73293         /* Delete all nodes in the tree */
73294         while (root != NULL) {
73295             elementptr = *(struct element **)root;
73296             printf("deleting node: string = %s, count = %d\n",
73297                 elementptr->string,
73298                 elementptr->count);
73299             tdelete((void *)elementptr, &root, node_compare);
73300             free(elementptr);
73301         }

73302         return 0;
73303     }

73304     /*
73305     * This routine compares two nodes, based on an
73306     * alphabetical ordering of the string field.
73307     */
73308     int
73309     node_compare(const void *node1, const void *node2)
73310     {
73311         return strcmp(((const struct element *) node1)->string,
73312             ((const struct element *) node2)->string);

```

```

73313     }
73314     /*
73315     *   This routine prints out a node, the second time
73316     *   twalk encounters it or if it is a leaf.
73317     */
73318     void
73319     print_node(const posix_tnode *ptr, VISIT order, int level)
73320     {
73321         const struct element *p = *(const struct element **) ptr;
73322
73323         if (order == postorder || order == leaf) {
73324             (void) printf("string = %s, count = %d\n",
73325                p->string, p->count);
73326         }
73327     }

```

### 73327 APPLICATION USAGE

73328 The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()*  
73329 and *tsearch()*.

73330 There are two nomenclatures used to refer to the order in which tree nodes are visited. The  
73331 *twalk()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node  
73332 before any of its children, after its left child and before its right, and after both its children. The  
73333 alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which  
73334 could result in some confusion over the meaning of **postorder**.

73335 Since the return value of *tdelete()* is an unspecified non-null pointer in the case that the root of  
73336 the tree has been deleted, applications should only use the return value of *tdelete()* as indication  
73337 of success or failure in this case and should not assume it can be dereferenced. However, the  
73338 only way that applications can tell if this case may have occurred is by checking whether the  
73339 variable pointed to by *rootp* changed. Since this variable can change for other reasons (for  
73340 example, tree balancing), using the return value of *tdelete()* as anything other than a boolean  
73341 indicator is unreliable at best and is discouraged. Some implementations in this case will return  
73342 a pointer to the new root of the tree (or to an empty tree if the deleted root node was the only  
73343 node in the tree); other implementations return arbitrary non-null pointers.

### 73344 RATIONALE

73345 Implementations are encouraged to use balanced trees to reduce the depth of the trees that are  
73346 created and improve tree search times.

### 73347 FUTURE DIRECTIONS

73348 None.

### 73352 CHANGE HISTORY

73353 First released in Issue 1. Derived from Issue 1 of the SVID.

### 73354 Issue 5

73355 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
73356 previous issues.

73357 **Issue 6**

73358 The normative text is updated to avoid use of the term “must” for application requirements.

73359 The **restrict** keyword is added to the *tdelete()* prototype for alignment with the  
73360 ISO/IEC 9899:1999 standard.

73361 **Issue 7**

73362 Austin Group Interpretation 1003.1-2001 #149 is applied, clarifying concurrent use of the tree in  
73363 another thread.

73364 Austin Group Interpretation 1003.1-2001 #151 is applied, clarifying behavior for *tdelete()* when  
73365 the deleted node is the root node.

73366 Austin Group Interpretation 1003.1-2001 #153 is applied.

73367 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0366 [551] is applied.

73368 **Issue 8**

73369 Austin Group Defect 1011 is applied, changing some prototypes to use **posix\_tnode** instead of  
73370 **void**, and changing the required behavior for *tdelete()* when the root of the tree changes.

73371 Austin Group Defect 1470 is applied, changing the EXAMPLES section.

73372 **NAME**

73373 telldir — current location of a named directory stream

73374 **SYNOPSIS**

```
73375 XSI #include <dirent.h>  
73376 long telldir(DIR *dirp);
```

73377 **DESCRIPTION**73378 The *telldir()* function shall obtain the current location associated with the directory stream  
73379 specified by *dirp*.73380 If the most recent operation on the directory stream was a *seekdir()*, the directory position  
73381 returned from the *telldir()* shall be the same as that supplied as a *loc* argument for *seekdir()*.73382 **RETURN VALUE**73383 Upon successful completion, *telldir()* shall return the current location of the specified directory  
73384 stream.73385 **ERRORS**

73386 No errors are defined.

73387 **EXAMPLES**

73388 None.

73389 **APPLICATION USAGE**

73390 None.

73391 **RATIONALE**

73392 None.

73393 **FUTURE DIRECTIONS**

73394 None.

73395 **SEE ALSO**73396 *fdopendir()*, *readdir()*, *seekdir()*73397 XBD <[dirent.h](#)>73398 **CHANGE HISTORY**

73399 First released in Issue 2.

73400 **NAME**

73401 textdomain — text domain manipulation function

73402 **SYNOPSIS**

73403 #include <libintl.h>

73404 char \*textdomain(const char \*domainname);

73405 **DESCRIPTION**

73406 Refer to *bindtextdomain()*.

73407 **NAME**

73408 tfind — search binary search tree

73409 **SYNOPSIS**

```
73410 XSI #include <search.h>
73411 void *tfind(const void *key, void *const *rootp,
73412 int (*compar)(const void *, const void *));
```

73413 **DESCRIPTION**73414 Refer to [tdelete\(\)](#).

73415 **NAME**

73416 tgamma, tgammaf, tgammal — compute gamma() function

73417 **SYNOPSIS**

```
73418 #include <math.h>
73419 double tgamma(double x);
73420 float tgammaf(float x);
73421 long double tgammal(long double x);
```

73422 **DESCRIPTION**

73423 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 73424 conflict between the requirements described here and the ISO C standard is unintentional. This  
 73425 volume of POSIX.1-2024 defers to the ISO C standard.

73426 These functions shall compute  $\Gamma(x)$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ .

73427 An application wishing to check for error situations should set *errno* to zero and call  
 73428 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 73429 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 73430 zero, an error has occurred.

73431 **RETURN VALUE**

73432 Upon successful completion, these functions shall return the gamma of *x*.

73433 If *x* is a negative integer, either a domain error or a pole error may occur and either a NaN (if  
 73434 supported) or  $\pm\text{Inf}$  (if supported), respectively, or an implementation-defined value shall be  
 73435 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 73436 occur and a NaN shall be returned.

73437 If *x* is  $\pm 0$ , *tgamma()*, *tgammaf()*, and *tgammal()* shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  
 73438 MX  $\pm\text{HUGE\_VALL}$ , respectively. On systems that support the IEC 60559 Floating-Point option, a  
 73439 CX pole error shall occur; otherwise, a pole error may occur.

73440 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,  
 73441 and *tgammal()* shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , or  $\pm\text{HUGE\_VALL}$ , respectively, with  
 73442 the same sign as the correct value of the function.

73443 MX If the correct value would cause underflow, and is not representable, a range error may occur,  
 73444 MX and *tgamma()*, *tgammaf()*, and *tgammal()* shall return 0.0, or (if IEC 60559 Floating-Point is not  
 73445 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 73446 FLT\_MIN, and LDBL\_MIN, respectively.

73447 MX If the correct value would cause underflow, and is representable, a range error may occur and  
 73448 the correct value shall be returned.

73449 If *x* is subnormal and  $1/x$  is representable,  $1/x$  should be returned.

73450 MX If *x* is NaN, a NaN shall be returned.

73451 If *x* is  $+\text{Inf}$ , *x* shall be returned.

73452 If *x* is  $-\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

73453 **ERRORS**

73454 These functions shall fail if:

73455	MX	<b>Domain Error</b>	The value of $x$ is a negative integer, or $x$ is $-\text{Inf}$ .
73456			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73457			then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i>
73458			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
73459			shall be raised.
73460	MX	<b>Pole Error</b>	The value of $x$ is zero.
73461			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73462			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
73463			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
73464			floating-point exception shall be raised.
73465		<b>Range Error</b>	The value overflows.
73466			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73467			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
73468			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
73469			floating-point exception shall be raised.
73470			These functions may fail if:
73471		<b>Domain Error</b>	The value of $x$ is a negative integer.
73472			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73473			then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i>
73474			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
73475			shall be raised.
73476		<b>Pole Error</b>	The value of $x$ is zero or a negative integer.
73477			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73478			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
73479			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
73480			floating-point exception shall be raised.
73481		<b>Range Error</b>	The result underflows.
73482			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
73483			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
73484			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
73485			floating-point exception shall be raised.

**73486 EXAMPLES**

73487 None.

**73488 APPLICATION USAGE**73489 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
73490 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.**73491 RATIONALE**73492 This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and  
73493 *lgamma()* functions.**73494 FUTURE DIRECTIONS**

73495 None.

73496 **SEE ALSO**73497 *feclearexcept()*, *fetestexcept()*, *lgamma()*

73498 XBD Section 4.23 (on page 109), &lt;math.h&gt;

73499 **CHANGE HISTORY**

73500 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

73501 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third  
73502 paragraph in the RETURN VALUE section.73503 **Issue 7**

73504 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

73505 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0660 [68], XSH/TC1-2008/0661 [320],  
73506 and XSH/TC1-2008/0662 [68] are applied.73507 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0367 [604] and XSH/TC2-2008/0368  
73508 [630] are applied.73509 **Issue 8**73510 Austin Group Defect 1461 is applied, changing the requirements for a negative integer argument  
73511 to match the ISO C standard.

73512 **NAME**

73513 thrd\_create — thread creation

73514 **SYNOPSIS**

73515 #include &lt;threads.h&gt;

73516 int thrd\_create(thrd\_t \*thr, thrd\_start\_t func, void \*arg);

73517 **DESCRIPTION**

73518 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 73519 conflict between the requirements described here and the ISO C standard is unintentional. This  
 73520 volume of POSIX.1-2024 defers to the ISO C standard.

73521 The *thrd\_create()* function shall create a new thread executing *func(arg)*. If the *thrd\_create()*  
 73522 function succeeds, it shall set the object pointed to by *thr* to the identifier of the newly created  
 73523 thread. (A thread's identifier might be reused for a different thread once the original thread has  
 73524 exited and either been detached or joined to another thread.) The completion of the *thrd\_create()*  
 73525 function shall synchronize with the beginning of the execution of the new thread.

73526 CX The signal state of the new thread shall be initialized as follows:

- 73527 • The signal mask shall be inherited from the creating thread.
- 73528 • The set of signals pending for the new thread shall be empty.

73529 The thread-local current locale shall not be inherited from the creating thread.

73530 The floating-point environment shall be inherited from the creating thread.

73531 XSI The alternate stack shall not be inherited from the creating thread.

73532 Returning from *func* shall have the same behavior as invoking *thrd\_exit()* with the value  
 73533 returned from *func*.

73534 If *thrd\_create()* fails, no new thread shall be created and the contents of the location referenced  
 73535 by *thr* are undefined.

73536 CX The *thrd\_create()* function shall not be affected if the calling thread executes a signal handler  
 73537 during the call.

73538 **RETURN VALUE**

73539 The *thrd\_create()* function shall return *thrd\_success* on success, or *thrd\_nomem* if no  
 73540 memory could be allocated for the thread requested, or *thrd\_error* if the request could not be  
 73541 CX honored, such as if the system-imposed limit on the total number of threads in a process  
 73542 {PTHREAD\_THREADS\_MAX} would be exceeded.

73543 **ERRORS**

73544 See RETURN VALUE.

73545 **EXAMPLES**

73546 None.

73547 **APPLICATION USAGE**

73548 There is no requirement on the implementation that the ID of the created thread be available  
 73549 before the newly created thread starts executing. The calling thread can obtain the ID of the  
 73550 created thread through the *thr* argument of the *thrd\_create()* function, and the newly created  
 73551 thread can obtain its ID by a call to *thrd\_current()*.

73552 **RATIONALE**

73553 The *thrd\_create()* function is not affected by signal handlers for the reasons stated in XRAT  
73554 [Section B.2.3](#) (on page 3742).

73555 **FUTURE DIRECTIONS**

73556 None.

73557 **SEE ALSO**

73589 **CHANGE HISTORY**

73590       First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73591 **NAME**

73592 thrd\_detach — detach a thread

73593 **SYNOPSIS**

73594 #include &lt;threads.h&gt;

73595 int thrd\_detach(thrd\_t *thr*);73596 **DESCRIPTION**

73597 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
73598 conflict between the requirements described here and the ISO C standard is unintentional. This  
73599 volume of POSIX.1-2024 defers to the ISO C standard.

73600 The *thrd\_detach()* function shall change the thread *thr* from joinable to detached, indicating to  
73601 the implementation that any resources allocated to the thread can be reclaimed when that thread  
73602 terminates. The application shall ensure that the thread identified by *thr* has not been previously  
73603 detached or joined with another thread.

73604 CX The *thrd\_detach()* function shall not be affected if the calling thread executes a signal handler  
73605 during the call.

73606 **RETURN VALUE**

73607 The *thrd\_detach()* function shall return `thrd_success` on success or `thrd_error` if the request  
73608 could not be honored.

73609 **ERRORS**

73610 No errors are defined.

73611 **EXAMPLES**

73612 None.

73613 **APPLICATION USAGE**

73614 None.

73615 **RATIONALE**

73616 The *thrd\_detach()* function is not affected by signal handlers for the reasons stated in XRAT  
73617 [Section B.2.3](#) (on page 3742).

73618 **FUTURE DIRECTIONS**

73619 None.

73620 **SEE ALSO**73621 [pthread\\_detach\(\)](#), [thrd\\_create\(\)](#), [thrd\\_join\(\)](#)73622 XBD [<threads.h>](#)73623 **CHANGE HISTORY**

73624 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73625 **NAME**

73626 thrd\_equal — compare thread IDs

73627 **SYNOPSIS**

73628 #include &lt;threads.h&gt;

73629 int thrd\_equal(thrd\_t thr0, thrd\_t thr1);

73630 **DESCRIPTION**

73631 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
73632 conflict between the requirements described here and the ISO C standard is unintentional. This  
73633 volume of POSIX.1-2024 defers to the ISO C standard.

73634 The *thrd\_equal()* function shall determine whether the thread identified by *thr0* refers to the  
73635 thread identified by *thr1*.

73636 CX The *thrd\_equal()* function shall not be affected if the calling thread executes a signal handler  
73637 during the call.

73638 **RETURN VALUE**

73639 The *thrd\_equal()* function shall return a non-zero value if *thr0* and *thr1* are equal; otherwise, zero  
73640 shall be returned.

73641 CX If either *thr0* or *thr1* is not a valid thread ID and is not equal to PTHREAD\_NULL (which is  
73642 defined in <pthread.h>), the behavior is undefined.

73643 **ERRORS**

73644 No errors are defined.

73645 **EXAMPLES**

73646 None.

73647 **APPLICATION USAGE**

73648 None.

73649 **RATIONALE**73650 See the RATIONALE section for *pthread\_equal()*.

73651 The *thrd\_equal()* function is not affected by signal handlers for the reasons stated in XRAT  
73652 Section B.2.3 (on page 3742).

73653 **FUTURE DIRECTIONS**

73654 None.

73655 **SEE ALSO**73656 *pthread\_equal()*, *thrd\_current()*

73658 **CHANGE HISTORY**

73659 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73660 **NAME**

73661 thrd\_exit — thread termination

73662 **SYNOPSIS**

73663 #include &lt;threads.h&gt;

73664 \_Noreturn void thrd\_exit(int res);

73665 **DESCRIPTION**

73666 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
73667 conflict between the requirements described here and the ISO C standard is unintentional. This  
73668 volume of POSIX.1-2024 defers to the ISO C standard.

73669 CX For every thread-specific storage key (regardless of whether it has type `tss_t` or `pthread_key_t`)  
73670 which was created with a non-null destructor and for which the value is non-null, `thrd_exit()`  
73671 shall set the value associated with the key to a null pointer value and then invoke the destructor  
73672 with its previous value. The order in which destructors are invoked is unspecified.

73673 If after this process there remain keys with both non-null destructors and values, the  
73674 CX implementation shall repeat this process up to `{PTHREAD_DESTRUCTOR_ITERATIONS}`  
73675 times.

73676 Following this, the `thrd_exit()` function shall terminate execution of the calling thread and shall  
73677 CX set its exit status to `res`. Thread termination shall not release any application visible process  
73678 resources, including, but not limited to, mutexes and file descriptors, nor shall it perform any  
73679 process-level cleanup actions, including, but not limited to, calling any `atexit()` routines that  
73680 might exist.

73681 An implicit call to `thrd_exit()` is made when a thread that was created using `thrd_create()` returns  
73682 from the start routine that was used to create it (see `thrd_create()`).

73683 CX The behavior of `thrd_exit()` is undefined if called from a destructor function that was invoked as  
73684 a result of either an implicit or explicit call to `thrd_exit()`.

73685 The process shall exit with an exit status of zero after the last thread has been terminated. The  
73686 behavior shall be as if the implementation called `exit()` with a zero argument at thread  
73687 termination time.

73688 **RETURN VALUE**

73689 This function shall not return a value.

73690 **ERRORS**

73691 No errors are defined.

73692 **EXAMPLES**

73693 None.

73694 **APPLICATION USAGE**

73695 Calls to `thrd_exit()` should not be made from threads created using `pthread_create()` or via a  
73696 SIGEV\_THREAD notification, as their exit status has a different type (`void *` instead of `int`). If  
73697 `thrd_exit()` is called from the initial thread and it is not the last thread to terminate, other threads  
73698 should not try to obtain its exit status using `pthread_join()`.

73699 **RATIONALE**

73700 The normal mechanism by which a thread that was started using `thrd_create()` terminates is to  
73701 return from the function that was specified in the `thrd_create()` call that started it. The `thrd_exit()`  
73702 function provides the capability for such a thread to terminate without requiring a return from  
73703 the start routine of that thread, thereby providing a function analogous to `exit()`.

73704 Regardless of the method of thread termination, the destructors for any existing thread-specific

73705 data are executed.

73706 **FUTURE DIRECTIONS**

73707 None.

73708 **SEE ALSO**

73709 *exit()*, *pthread\_create()*, *thrd\_join()*

73710 XBD <**threads.h**>

73711 **CHANGE HISTORY**

73712 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73713 **NAME**

73714 thrd\_join — wait for thread termination

73715 **SYNOPSIS**

73716 #include &lt;threads.h&gt;

73717 int thrd\_join(thrd\_t *thr*, int \**res*);73718 **DESCRIPTION**

73719 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 73720 conflict between the requirements described here and the ISO C standard is unintentional. This  
 73721 volume of POSIX.1-2024 defers to the ISO C standard.

73722 The *thrd\_join()* function shall join the thread identified by *thr* with the current thread by  
 73723 blocking until the other thread has terminated. If the parameter *res* is not a null pointer,  
 73724 *thrd\_join()* shall store the thread's exit status in the integer pointed to by *res*. The termination of  
 73725 the other thread shall synchronize with the completion of the *thrd\_join()* function. The  
 73726 application shall ensure that the thread identified by *thr* has not been previously detached or  
 73727 joined with another thread.

73728 The results of multiple simultaneous calls to *thrd\_join()* specifying the same target thread are  
 73729 undefined.

73730 The behavior is undefined if the value specified by the *thr* argument to *thrd\_join()* refers to the  
 73731 calling thread.

73732 CX It is unspecified whether a zombie thread counts against {PTHREAD\_THREADS\_MAX}.

73733 If *thr* refers to a thread that was created using *pthread\_create()* or via a SIGEV\_THREAD  
 73734 notification and the thread terminates, or has already terminated, by returning from its start  
 73735 routine, the behavior of *thrd\_join()* is undefined. If *thr* refers to a thread that terminates, or has  
 73736 already terminated, by calling *pthread\_exit()* or by being cancelled, the behavior of *thrd\_join()* is  
 73737 undefined.

73738 The *thrd\_join()* function shall not be affected if the calling thread executes a signal handler  
 73739 during the call.

73740 **RETURN VALUE**

73741 The *thrd\_join()* function shall return *thrd\_success* on success or *thrd\_error* if the request  
 73742 could not be honored.

73743 CX It is implementation-defined whether *thrd\_join()* detects deadlock situations; if it does detect  
 73744 them, it shall return *thrd\_error* when one is detected.

73745 **ERRORS**

73746 See RETURN VALUE.

73747 **EXAMPLES**

73748 None.

73749 **APPLICATION USAGE**

73750 None.

73751 **RATIONALE**

73752 The *thrd\_join()* function provides a simple mechanism allowing an application to wait for a  
 73753 thread to terminate. After the thread terminates, the application may then choose to clean up  
 73754 resources that were used by the thread. For instance, after *thrd\_join()* returns, any application-  
 73755 provided stack storage could be reclaimed.

73756 The *thrd\_join()* or *thrd\_detach()* function should eventually be called for every thread that is

- 73757 created using *thrd\_create()* so that storage associated with the thread may be reclaimed.
- 73758 The *thrd\_join()* function cannot be used to obtain the exit status of a thread that was created  
73759 using *pthread\_create()* or via a SIGEV\_THREAD notification and which terminates by returning  
73760 from its start routine, or of a thread that terminates by calling *pthread\_exit()*, because such  
73761 threads have a **void \*** exit status, instead of the **int** that *thrd\_join()* returns via its *res* argument.
- 73762 The *thrd\_join()* function cannot be used to obtain the exit status of a thread that terminates by  
73763 being cancelled because it has no way to indicate that a thread was cancelled. (The *pthread\_join()*  
73764 function does this by returning a reserved **void \*** exit status; it is not possible to reserve an **int**  
73765 value for this purpose without introducing a conflict with the ISO C standard.) The standard  
73766 developers considered adding a *thrd\_canceled* enumeration constant that *thrd\_join()* would  
73767 return in this case. However, this return would be unexpected in code that is written to conform  
73768 to the ISO C standard, and it would also not solve the problem that threads which use only ISO  
73769 C **<threads.h>** interfaces (such as ones created by third party libraries written to conform to the  
73770 ISO C standard) have no way to handle being cancelled, as the ISO C standard does not provide  
73771 cancellation cleanup handlers.
- 73772 The *thrd\_join()* function is not affected by signal handlers for the reasons stated in XRAT [Section](#)  
73773 [B.2.3](#) (on page 3742).
- 73774 **FUTURE DIRECTIONS**
- 73775 None.

73781 **NAME**

73782 thrd\_sleep — suspend execution for an interval

73783 **SYNOPSIS**

73784 #include &lt;threads.h&gt;

73785 int thrd\_sleep(const struct timespec \*duration,  
73786 struct timespec \*remaining);73787 **DESCRIPTION**73788 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
73789 conflict between the requirements described here and the ISO C standard is unintentional. This  
73790 volume of POSIX.1-2024 defers to the ISO C standard.73791 The *thrd\_sleep()* function shall suspend execution of the calling thread until either the interval  
73792 specified by *duration* has elapsed or a signal is delivered to the calling thread whose action is to  
73793 invoke a signal-catching function or to terminate the process. If interrupted by a signal and the  
73794 *remaining* argument is not null, the amount of time remaining (the requested interval minus the  
73795 time actually slept) shall be stored in the interval it points to. The *duration* and *remaining*  
73796 arguments can point to the same object.73797 The suspension time may be longer than requested because the interval is rounded up to an  
73798 integer multiple of the sleep resolution or because of the scheduling of other activity by the  
73799 system. But, except for the case of being interrupted by a signal, the suspension time shall not be  
73800 less than that specified, as measured by the system clock TIME\_UTC.73801 **RETURN VALUE**73802 The *thrd\_sleep()* function shall return zero if the requested time has elapsed,  $-1$  if it has been  
73803 interrupted by a signal, or a negative value (which may also be  $-1$ ) if it fails for any other reason.73804 CX If it returns a negative value, it shall set *errno* to indicate the error.73805 **ERRORS**73806 CX The *thrd\_sleep()* function shall fail if:73807 [EINTR] The *thrd\_sleep()* function was interrupted by a signal.73808 [EINVAL] The *duration* argument specified a nanosecond value less than zero or greater  
73809 than or equal to 1 000 million.73810 **EXAMPLES**

73811 None.

73812 **APPLICATION USAGE**73813 Since the return value may be  $-1$  for errors other than [EINTR], applications should examine  
73814 *errno* to distinguish [EINTR] from other errors (and thus determine whether the unslept time is  
73815 available in the interval pointed to by *remaining*).73816 **RATIONALE**73817 The *thrd\_sleep()* function is identical to the *nanosleep()* function except that the return value may  
73818 be any negative value when it fails with an error other than [EINTR].73819 **FUTURE DIRECTIONS**

73820 None.

73821 **SEE ALSO**73822 [nanosleep\(\)](#)73823 XBD [<threads.h>](#), [<time.h>](#)

73824 **CHANGE HISTORY**

73825 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73826 **NAME**

73827 thrd\_yield — yield the processor

73828 **SYNOPSIS**

73829 #include &lt;threads.h&gt;

73830 void thrd\_yield(void);

73831 **DESCRIPTION**

73832 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
73833 conflict between the requirements described here and the ISO C standard is unintentional. This  
73834 volume of POSIX.1-2024 defers to the ISO C standard.

73835 CX The *thrd\_yield()* function shall force the running thread to relinquish the processor until it again  
73836 becomes the head of its thread list.

73837 **RETURN VALUE**

73838 This function shall not return a value.

73839 **ERRORS**

73840 No errors are defined.

73841 **EXAMPLES**

73842 None.

73843 **APPLICATION USAGE**73844 See the APPLICATION USAGE section for *sched\_yield()*.73845 **RATIONALE**

73846 The *thrd\_yield()* function is identical to the *sched\_yield()* function except that it does not return a  
73847 value.

73848 **FUTURE DIRECTIONS**

73849 None.

73850 **SEE ALSO**73851 *sched\_yield()*

73852 XBD &lt;threads.h&gt;

73853 **CHANGE HISTORY**

73854 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

73855 **NAME**

73856           time — get time

73857 **SYNOPSIS**

```
73858       #include <time.h>
73859       time_t time(time_t *tloc);
```

73860 **DESCRIPTION**

73861 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
73862       conflict between the requirements described here and the ISO C standard is unintentional. This  
73863       volume of POSIX.1-2024 defers to the ISO C standard.

73864 CX       The *time()* function shall return the value of time in seconds since the Epoch.

73865       The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,  
73866       no value is stored.

73867 **RETURN VALUE**

73868       Upon successful completion, *time()* shall return the value of time. Otherwise, **(time\_t)−1** shall be  
73869       returned.

73870 **ERRORS**

73871       The *time()* function may fail if:

73872 CX       [**EOverflow**] The number of seconds since the Epoch will not fit in an object of type **time\_t**.

73873 **EXAMPLES**73874           **Getting the Current Time**

73875       The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
73876       the Epoch, *localtime()* to convert that value to a broken-down time, and *asctime()* to convert the  
73877       broken-down time values into a printable string.

```
73878       #include <stdio.h>
73879       #include <time.h>
73880       int main(void)
73881       {
73882       time_t result;
73883           result = time(NULL);
73884           printf("%s%ju secs since the Epoch\n",
73885                 asctime(localtime(&result)),
73886                 (uintmax_t)result);
73887           return(0);
73888       }
```

73889       This example writes the current time to *stdout* in a form like this:

```
73890       Wed Jun 26 10:32:15 1996
73891       835810335 secs since the Epoch
```

73892 **Timing an Event**

73893 The following example gets the current time, prints it out in the user's format, and prints the  
73894 number of minutes to an event being timed.

```
73895 #include <time.h>
73896 #include <stdio.h>
73897 ...
73898 time_t now;
73899 int minutes_to_event;
73900 ...
73901 time(&now);
73902 minutes_to_event = ...;
73903 printf("The time is ");
73904 puts(asctime(localtime(&now)));
73905 printf("There are %d minutes to the event.\n",
73906        minutes_to_event);
73907 ...
```

73908 **APPLICATION USAGE**

73909 None.

73910 **RATIONALE**

73911 The *time()* function returns a value in seconds while *clock\_gettime()* returns a **struct timespec**  
73912 (seconds and nanoseconds) and is therefore capable of returning more precise times. The *times()*  
73913 function is also capable of more precision than *time()* as it returns a value in clock ticks,  
73914 although it returns the elapsed time since an arbitrary point such as system boot time, not since  
73915 the epoch.

73916 Earlier versions of this standard allowed the width of **time\_t** to be less than 64 bits. A 32-bit  
73917 signed integer (as used in many historical implementations) fails in the year 2038, and although  
73918 a 32-bit unsigned integer does not fail until 2106 the preferred solution is to make **time\_t** wider  
73919 rather than to make it unsigned.

73920 On some systems the *time()* function is implemented using a system call that does not return an  
73921 error condition in addition to the return value. On these systems it is impossible to differentiate  
73922 between valid and invalid return values and hence overflow conditions cannot be reliably  
73923 detected.

73924 The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C  
73925 standard.

73926 Many historical implementations (including Version 7) and the 1984 /usr/group standard use  
73927 **long** instead of **time\_t**. This volume of POSIX.1-2024 uses the latter type in order to agree with  
73928 the ISO C standard.

73929 **FUTURE DIRECTIONS**

73930 None.

73935 **CHANGE HISTORY**

73936 First released in Issue 1. Derived from Issue 1 of the SVID.

73937 **Issue 6**

73938 Extensions beyond the ISO C standard are marked.

73939 The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.

73940 **Issue 7**

73941 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0663 [106], XSH/TC1-2008/0664 [350],  
73942 XSH/TC1-2008/0665 [106], XSH/TC1-2008/0666 [350], and XSH/TC1-2008/0667 [350] are  
73943 applied.

73944 **Issue 8**

73945 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

73946 Austin Group Defect 1462 is applied, changing the RATIONALE and FUTURE DIRECTIONS  
73947 sections.

73948 **NAME**

73949 timer\_create — create a per-process timer

73950 **SYNOPSIS**

```
73951 CX #include <signal.h>
73952 #include <time.h>
73953 int timer_create(clockid_t clockid, struct sigevent *restrict evp,
73954 timer_t *restrict timerid);
```

73955 **DESCRIPTION**

73956 The *timer\_create()* function shall create a per-process timer using the specified clock, *clock\_id*, as  
 73957 the timing base. The *timer\_create()* function shall return, in the location referenced by *timerid*, a  
 73958 timer ID of type **timer\_t** used to identify the timer in timer requests. This timer ID shall be  
 73959 unique within the calling process until the timer is deleted. The particular clock, *clock\_id*, is  
 73960 defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return  
 73961 from *timer\_create()*.

73962 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the  
 73963 application, defines the asynchronous notification to occur as specified in [Section 2.4.1](#) (on page  
 73964 513) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument  
 73965 pointed to a **sigevent** structure with the *sigev\_notify* member having the value SIGEV\_SIGNAL,  
 73966 the *sigev\_signo* having a default signal number, and the *sigev\_value* member having the value of  
 73967 the timer ID.

73968 Each implementation shall define a set of clocks that can be used as timing bases for per-process  
 73969 timers. All implementations shall support CLOCK\_REALTIME and CLOCK\_MONOTONIC as  
 73970 values for *clock\_id*.

73971 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed  
 73972 and deleted by an *exec*.

73973 CPT If \_POSIX\_CPUTIME is defined, implementations shall support *clock\_id* values representing the  
 73974 CPU-time clock of the calling process.

73975 TCT If \_POSIX\_THREAD\_CPUTIME is defined, implementations shall support *clock\_id* values  
 73976 representing the CPU-time clock of the calling thread.

73977 CPT|TCT It is implementation-defined whether a *timer\_create()* function will succeed if the value defined  
 73978 by *clock\_id* corresponds to the CPU-time clock of a process or thread different from the process  
 73979 or thread invoking the function.

73980 TSA If *evp->sigev\_notify* is SIGEV\_THREAD and *sev->sigev\_notify\_attributes* is not NULL, if the  
 73981 attribute pointed to by *sev->sigev\_notify\_attributes* has a thread stack address specified by a call  
 73982 to *pthread\_attr\_setstack()*, the results are unspecified if the signal is generated more than once.

73983 **RETURN VALUE**

73984 If the call succeeds, *timer\_create()* shall return zero and update the location referenced by *timerid*  
 73985 to a **timer\_t**, which can be passed to the per-process timer calls. If an error occurs, the function  
 73986 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if  
 73987 an error occurs.

73988 **ERRORS**73989 The *timer\_create()* function shall fail if:

73990 [EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

73991	[EAGAIN]	The calling process has already created all of the timers it is allowed by this implementation.
73992		
73993	[EINVAL]	The specified clock ID is not defined.
73994	CPT TCT [ENOTSUP]	The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by <i>clock_id</i> and associated with a process or thread different from the process or thread invoking <i>timer_create()</i> .
73995		
73996		

#### 73997 EXAMPLES

73998 None.

#### 73999 APPLICATION USAGE

74000 If a timer is created which has *evp->sigev\_sigev\_notify* set to SIGEV\_THREAD and the attribute pointed to by *evp->sigev\_notify\_attributes* has a thread stack address specified by a call to *pthread\_attr\_setstack()*, the memory dedicated as a thread stack cannot be recovered. The reason for this is that the threads created in response to a timer expiration are created detached, or in an unspecified way if the thread attribute's *detachstate* is PTHREAD\_CREATE\_JOINABLE. In neither case is it valid to call *pthread\_join()*, which makes it impossible to determine the lifetime of the created thread which thus means the stack memory cannot be reused.

#### 74007 RATIONALE

##### 74008 Periodic Timer Overrun and Resource Allocation

74009 The specified timer facilities may deliver realtime signals (that is, queued signals) on implementations that support this option. Since realtime applications cannot afford to lose notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it must be possible to ensure that sufficient resources exist to deliver the signal when the event occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a request and a subsequent signal generation. If the request cannot allocate the signal delivery resources, it can fail the call with an [EAGAIN] error.

74016 Periodic timers are a special case. A single request can generate an unspecified number of signals. This is not a problem if the requesting process can service the signals as fast as they are generated, thus making the signal delivery resources available for delivery of subsequent periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the currently pending signal has been delivered.

74022 Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a pending signal are generated, it is implementation-defined whether a signal is delivered for each occurrence. This is not adequate for some realtime applications. So a mechanism is required to allow applications to detect how many timer expirations were delayed without requiring an indefinite amount of system resources to store the delayed expirations.

74027 The specified facilities provide for an overrun count. The overrun count is defined as the number of extra timer expirations that occurred between the time a timer expiration signal is generated and the time the signal is delivered. The signal-catching function, if it is concerned with overruns, can retrieve this count on entry. With this method, a periodic timer only needs one “signal queuing resource” that can be allocated at the time of the *timer\_create()* function call.

74032 A function is defined to retrieve the overrun count so that an application need not allocate static storage to contain the count, and an implementation need not update this storage asynchronously on timer expirations. But, for some high-frequency periodic applications, the overhead of an additional system call on each timer expiration may be prohibitive. The functions, as defined, permit an implementation to maintain the overrun count in user space,

74037 associated with the *timerid*. The *timer\_getoverrun()* function can then be implemented as a macro  
 74038 that uses the *timerid* argument (which may just be a pointer to a user space structure containing  
 74039 the counter) to locate the overrun count with no system call overhead. Other implementations,  
 74040 less concerned with this class of applications, can avoid the asynchronous update of user space  
 74041 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

#### 74042 **Timer Expiration Signal Parameters**

74043 The realtime signals functionality supports an application-specific datum that is delivered to the  
 74044 extended signal handler. This value is explicitly specified by the application, along with the  
 74045 signal number to be delivered, in a **sigevent** structure. The type of the application-defined value  
 74046 can be either an integer constant or a pointer. This explicit specification of the value, as opposed  
 74047 to always sending the timer ID, was selected based on existing practice.

74048 It is common practice for realtime applications (on non-POSIX systems or realtime extended  
 74049 POSIX systems) to use the parameters of event handlers as the case label of a switch statement or  
 74050 as a pointer to an application-defined data structure. Since *timer\_ids* are dynamically allocated  
 74051 by the *timer\_create()* function, they can be used for neither of these functions without additional  
 74052 application overhead in the signal handler; for example, to search an array of saved timer IDs to  
 74053 associate the ID with a constant or application data structure.

#### 74054 **FUTURE DIRECTIONS**

74055 None.

#### 74059 **CHANGE HISTORY**

74060 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

##### 74061 **Issue 6**

74062 The *timer\_create()* function is marked as part of the Timers option.

74063 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 74064 implementation does not support the Timers option.

74065 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

74066 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the  
 74067 requirement for the CLOCK\_MONOTONIC clock under the Monotonic Clock option.

74068 The **restrict** keyword is added to the *timer\_create()* prototype for alignment with the  
 74069 ISO/IEC 9899:1999 standard.

74070 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the  
 74071 DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created  
 74072 with the notification method set to SIGEV\_THREAD.

##### 74073 **Issue 7**

74074 The *timer\_create()* function is moved from the Timers option to the Base.

##### 74075 **Issue 8**

74076 Austin Group Defect 1116 is applied, removing a reference to the Realtime Signals Extension  
 74077 option that existed in earlier versions of this standard.

74078 Austin Group Defect 1346 is applied, requiring support for Monotonic Clock.

74079 **NAME**

74080 timer\_delete — delete a per-process timer

74081 **SYNOPSIS**

```
74082 CX #include <time.h>  
74083 int timer_delete(timer_t timerid);
```

74084 **DESCRIPTION**

74085 The *timer\_delete()* function deletes the specified timer, *timerid*, previously created by the  
74086 *timer\_create()* function. If the timer is armed when *timer\_delete()* is called, the behavior shall be  
74087 as if the timer is automatically disarmed before removal. The disposition of pending signals for  
74088 the deleted timer is unspecified.

74089 The behavior is undefined if the value specified by the *timerid* argument to *timer\_delete()* does  
74090 not correspond to a timer ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*.

74091 **RETURN VALUE**

74092 If successful, the *timer\_delete()* function shall return a value of zero. Otherwise, the function shall  
74093 return a value of -1 and set *errno* to indicate the error.

74094 **ERRORS**

74095 No errors are defined.

74096 **EXAMPLES**

74097 None.

74098 **APPLICATION USAGE**

74099 None.

74100 **RATIONALE**

74101 If an implementation detects that the value specified by the *timerid* argument to *timer\_delete()*  
74102 does not correspond to a timer ID returned by *timer\_create()* but not yet deleted by  
74103 *timer\_delete()*, it is recommended that the function should fail and report an [EINVAL] error.

74104 **FUTURE DIRECTIONS**

74105 None.

74106 **SEE ALSO**74107 [timer\\_create\(\)](#)74108 XBD [<time.h>](#)74109 **CHANGE HISTORY**

74110 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

74111 **Issue 6**74112 The *timer\_delete()* function is marked as part of the Timers option.

74113 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
74114 implementation does not support the Timers option.

74115 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS  
74116 section so that the [EINVAL] error becomes optional.

74117 **Issue 7**74118 The *timer\_delete()* function is moved from the Timers option to the Base.

74119 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0369 [659] is applied.

74120 **NAME**

74121 timer\_getoverrun, timer\_gettime, timer\_settime — per-process timers

74122 **SYNOPSIS**

```
74123 CX #include <time.h>
74124 int timer_getoverrun(timer_t timerid);
74125 int timer_gettime(timer_t timerid, struct itimerspec *value);
74126 int timer_settime(timer_t timerid, int flags,
74127     const struct itimerspec *restrict value,
74128     struct itimerspec *restrict ovalue);
```

74129 **DESCRIPTION**

74130 The *timer\_gettime()* function shall store the amount of time until the specified timer, *timerid*,  
 74131 expires and the reload value of the timer into the space pointed to by the *value* argument. The  
 74132 *it\_value* member of this structure shall contain the amount of time before the timer expires, or  
 74133 zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if  
 74134 the timer was armed with absolute time. The *it\_interval* member of *value* shall contain the reload  
 74135 value last set by *timer\_settime()*.

74136 The *timer\_settime()* function shall set the time until the next expiration of the timer specified by  
 74137 *timerid* from the *it\_value* member of the *value* argument and arm the timer if the *it\_value* member  
 74138 of *value* is non-zero. If the specified timer was already armed when *timer\_settime()* is called, this  
 74139 call shall reset the time until next expiration to the *value* specified. If the *it\_value* member of *value*  
 74140 is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending  
 74141 expiration notifications is unspecified.

74142 If the flag `TIMER_ABSTIME` is not set in the argument *flags*, *timer\_settime()* shall behave as if the  
 74143 time until next expiration is set to be equal to the interval specified by the *it\_value* member of  
 74144 *value*. That is, the timer shall expire in *it\_value* nanoseconds from when the call is made. If the  
 74145 flag `TIMER_ABSTIME` is set in the argument *flags*, *timer\_settime()* shall behave as if the time  
 74146 until next expiration is set to be equal to the difference between the absolute time specified by  
 74147 the *it\_value* member of *value* and the current value of the clock associated with *timerid*. That is,  
 74148 the timer shall expire when the clock reaches the value specified by the *it\_value* member of *value*.  
 74149 If the specified time has already passed, the function shall succeed and the expiration  
 74150 notification shall be made.

74151 The reload value of the timer shall be set to the value specified by the *it\_interval* member of  
 74152 *value*. When a timer is armed with a non-zero *it\_interval*, a periodic (or repetitive) timer is  
 74153 specified.

74154 Time values that are between two consecutive non-negative integer multiples of the resolution of  
 74155 the specified timer shall be rounded up to the larger multiple of the resolution. Quantization  
 74156 error shall not cause the timer to expire earlier than the rounded time value.

74157 If the argument *ovalue* is not `NULL`, the *timer\_settime()* function shall store, in the location  
 74158 referenced by *ovalue*, a value representing the previous amount of time before the timer would  
 74159 have expired, or zero if the timer was disarmed, together with the previous timer reload value.  
 74160 Timers shall not expire before their scheduled time.

74161 Only a single signal shall be queued to the process for a given timer at any point in time. When a  
 74162 timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun  
 74163 shall occur. When a timer expiration signal is delivered to or accepted by a process, the  
 74164 *timer\_getoverrun()* function shall return the timer expiration overrun count for the specified  
 74165 timer. The overrun count returned contains the number of extra timer expirations that occurred  
 74166 between the time the signal was generated (queued) and when it was delivered or accepted, up

74167 to but not including an implementation-defined maximum of {DELAYTIMER\_MAX}. If the  
 74168 number of such extra expirations is greater than or equal to {DELAYTIMER\_MAX}, then the  
 74169 overrun count shall be set to {DELAYTIMER\_MAX}. The value returned by *timer\_getoverrun()*  
 74170 shall apply to the most recent expiration signal delivery or acceptance for the timer. If no  
 74171 expiration signal has been delivered for the timer, the return value of *timer\_getoverrun()* is  
 74172 unspecified.

74173 The behavior is undefined if the value specified by the *timerid* argument to *timer\_getoverrun()*,  
 74174 *timer\_gettime()*, or *timer\_settime()* does not correspond to a timer ID returned by *timer\_create()*  
 74175 but not yet deleted by *timer\_delete()*.

#### 74176 RETURN VALUE

74177 If the *timer\_getoverrun()* function succeeds, it shall return the timer expiration overrun count as  
 74178 explained above.

74179 If the *timer\_gettime()* or *timer\_settime()* functions succeed, a value of 0 shall be returned.

74180 If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to  
 74181 indicate the error.

#### 74182 ERRORS

74183 The *timer\_settime()* function shall fail if:

74184 [EINVAL] A *value* structure specified a nanosecond value less than zero or greater than  
 74185 or equal to 1 000 million, and the *it\_value* member of that structure did not  
 74186 specify zero seconds and nanoseconds.

74187 The *timer\_settime()* function may fail if:

74188 [EINVAL] The *it\_interval* member of *value* is not zero and the timer was created with  
 74189 notification by creation of a new thread (*sigev\_sigev\_notify* was  
 74190 SIGEV\_THREAD) and a fixed stack address has been set in the thread  
 74191 attribute pointed to by *sigev\_notify\_attributes*.

#### 74192 EXAMPLES

74193 None.

#### 74194 APPLICATION USAGE

74195 Using fixed stack addresses is problematic when timer expiration is signaled by the creation of a  
 74196 new thread. Since it cannot be assumed that the thread created for one expiration is finished  
 74197 before the next expiration of the timer, it could happen that two threads use the same memory as  
 74198 a stack at the same time. This is invalid and produces undefined results.

#### 74199 RATIONALE

74200 Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The  
 74201 inverse of this tick rate is the clock resolution, also called the clock granularity, which in either  
 74202 case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for  
 74203 these common rates. The granularity of practical clocks implies that if one reads a given clock  
 74204 twice in rapid succession, one may get the same time value twice; and that timers must wait for  
 74205 the next clock tick after the theoretical expiration time, to ensure that a timer never returns too  
 74206 soon. Note also that the granularity of the clock may be significantly coarser than the resolution  
 74207 of the data format used to set and get time and interval values. Also note that some  
 74208 implementations may choose to adjust time and/or interval values to exactly match the ticks of  
 74209 the underlying clock.

74210 This volume of POSIX.1-2024 defines functions that allow an application to determine the  
 74211 implementation-supported resolution for the clocks and requires an implementation to  
 74212 document the resolution supported for timers and *nanosleep()* if they differ from the supported

- 74213 clock resolution. This is more of a procurement issue than a runtime application issue.
- 74214 If an implementation detects that the value specified by the *timerid* argument to  
74215 *timer\_getoverrun()*, *timer\_gettime()*, or *timer\_settime()* does not correspond to a timer ID returned  
74216 by *timer\_create()* but not yet deleted by *timer\_delete()*, it is recommended that the function  
74217 should fail and report an [EINVAL] error.
- 74218 **FUTURE DIRECTIONS**
- 74219 None.
- 74220 **SEE ALSO**
- 74221 *clock\_getres()*, *timer\_create()*
- 74222 XBD <time.h>
- 74223 **CHANGE HISTORY**
- 74224 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
- 74225 **Issue 6**
- 74226 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are marked as part of the  
74227 Timers option.
- 74228 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
74229 implementation does not support the Timers option.
- 74230 The [EINVAL] error condition is updated to include the following: “and the *it\_value* member of  
74231 that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC  
74232 Interpretation 1003.1 #89.
- 74233 The DESCRIPTION for *timer\_getoverrun()* is updated to clarify that “If no expiration signal has  
74234 been delivered for the timer, or if the Realtime Signals Extension is not supported, the return  
74235 value of *timer\_getoverrun()* is unspecified”.
- 74236 The **restrict** keyword is added to the *timer\_settime()* prototype for alignment with the  
74237 ISO/IEC 9899:1999 standard.
- 74238 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS  
74239 section so that the mandatory [EINVAL] error (“The *timerid* argument does not correspond to an  
74240 ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*”) becomes optional.
- 74241 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS  
74242 section to include an optional [EINVAL] error for the case when a timer is created with the  
74243 notification method set to SIGEV\_THREAD. APPLICATION USAGE text is also added.
- 74244 **Issue 7**
- 74245 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are moved from the Timers  
74246 option to the Base.
- 74247 Functionality relating to the Realtime Signals Extension option is moved to the Base.
- 74248 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0370 [659] is applied.

74249 **NAME**

74250 times — get process and waited-for child process times

74251 **SYNOPSIS**

74252 #include &lt;sys/times.h&gt;

74253 clock\_t times(struct tms \*buffer);

74254 **DESCRIPTION**74255 The *times()* function shall fill the **tms** structure pointed to by *buffer* with time-accounting  
74256 information. The **tms** structure is defined in <sys/times.h>.

74257 All times are measured in terms of the number of clock ticks used.

74258 The times of a terminated child process shall be included in the *tms\_cutime* and *tms\_cstime*  
74259 elements of the parent when *wait()*, *waitid()*, or *waitpid()* returns the process ID of this  
74260 terminated child. If a child process has not waited for its children, their times shall not be  
74261 included in its times.74262 • The *tms\_utime* structure member is the CPU time charged for the execution of user  
74263 instructions of the calling process.74264 • The *tms\_stime* structure member is the CPU time charged for execution by the system on  
74265 behalf of the calling process.74266 • The *tms\_cutime* structure member is the sum of the *tms\_utime* and *tms\_cutime* times of the  
74267 child processes.74268 • The *tms\_cstime* structure member is the sum of the *tms\_stime* and *tms\_cstime* times of the  
74269 child processes.74270 **RETURN VALUE**74271 Upon successful completion, *times()* shall return the elapsed real time, in clock ticks, since an  
74272 arbitrary point in the past (for example, system start-up time). This point does not change from  
74273 one invocation of *times()* within the process to another. The return value may overflow the  
74274 possible range of type **clock\_t**. If *times()* fails, (**clock\_t**)-1 shall be returned and *errno* set to  
74275 indicate the error.74276 **ERRORS**74277 The *times()* function shall fail if:74278 [EOVERFLOW] The return value would overflow the range of **clock\_t**.74279 **EXAMPLES**74280 **Timing a Database Lookup**74281 The following example defines two functions, *start\_clock()* and *end\_clock()*, that are used to time  
74282 a lookup. It also defines variables of type **clock\_t** and **tms** to measure the duration of  
74283 transactions. The *start\_clock()* function saves the beginning times given by the *times()* function.  
74284 The *end\_clock()* function gets the ending times and prints the difference between the two times.74285 #include <sys/times.h>  
74286 #include <stdio.h>  
74287 ...  
74288 void start\_clock(void);  
74289 void end\_clock(char \*msg);  
74290 ...  
74291 static clock\_t st\_time;  
74292 static clock\_t en\_time;

```

74293     static struct tms st_cpu;
74294     static struct tms en_cpu;
74295     ...
74296     void
74297     start_clock()
74298     {
74299         st_time = times(&st_cpu);
74300     }

74301     /* This example assumes that the result of each subtraction
74302        is within the range of values that can be represented in
74303        an integer type. */
74304     void
74305     end_clock(char *msg)
74306     {
74307         en_time = times(&en_cpu);

74308         fputs(msg, stdout);
74309         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
74310             (intmax_t)(en_time - st_time),
74311             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
74312             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
74313     }

```

#### 74314 APPLICATION USAGE

74315 Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per  
74316 second as it may vary from system to system.

#### 74317 RATIONALE

74318 The accuracy of the times reported is intentionally left unspecified to allow implementations  
74319 flexibility in design, from uniprocessor to multi-processor networks.

74320 The inclusion of times of child processes is recursive, so that a parent process may collect the  
74321 total times of all of its descendants. But the times of a child are only added to those of its parent  
74322 when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process  
74323 can always see the total times of all its descendants; see also the discussion of the term  
74324 “realtime” in `alarm()`.

74325 If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a  
74326 year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual  
74327 systems that run continuously for longer than that. This volume of POSIX.1-2024 permits an  
74328 implementation to make the reference point for the returned value be the start-up time of the  
74329 process, rather than system start-up time.

74330 The term “charge” in this context has nothing to do with billing for services. The operating  
74331 system accounts for time used in this way. That information must be correct, regardless of how  
74332 that information is used.

#### 74333 FUTURE DIRECTIONS

74334 None.

#### 74335 SEE ALSO

74336 `alarm()`, `exec`, `fork()`, `sysconf()`, `time()`, `wait()`, `waitid()`

74337 XBD <`sys/times.h`>

74338 **CHANGE HISTORY**

74339 First released in Issue 1. Derived from Issue 1 of the SVID.

74340 **Issue 7**

74341 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0371 [644] is applied.

74342 **NAME**

74343       timespec\_get — get time

74344 **SYNOPSIS**

74345       #include &lt;time.h&gt;

74346       int timespec\_get(struct timespec \*ts, int base);

74347 **DESCRIPTION**

74348 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
74349 conflict between the requirements described here and the ISO C standard is unintentional. This  
74350 volume of POSIX.1-2024 defers to the ISO C standard.

74351       The *timespec\_get()* function shall set the interval pointed to by *ts* to hold the current calendar  
74352 time based on the specified time base.

74353 CX       If *base* is `TIME_UTC`, the members of *ts* shall be set to the same values as would be set by a call  
74354 to *clock\_gettime*(`CLOCK_REALTIME`, *ts*). If the number of seconds will not fit in an object of  
74355 type `time_t`, the function shall return zero.

74356 **RETURN VALUE**

74357       If the *timespec\_get()* function is successful it shall return the non-zero value *base*; otherwise, it  
74358 shall return zero.

74359 **ERRORS**

74360       See DESCRIPTION.

74361 **EXAMPLES**

74362       None.

74363 **APPLICATION USAGE**

74364       None.

74365 **RATIONALE**

74366       None.

74367 **FUTURE DIRECTIONS**

74368       None.

74369 **SEE ALSO**74370       *clock\_getres()*, *time()*74371       XBD <[time.h](#)>74372 **CHANGE HISTORY**

74373       First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

74374 **NAME**

74375            timezone — difference from UTC and local standard time

74376 **SYNOPSIS**

```
74377 XSI        #include <time.h>
74378            extern long timezone;
```

74379 **DESCRIPTION**74380            Refer to [tzset\(\)](#).

74381 **NAME**

74382 tmpfile — create a temporary file

74383 **SYNOPSIS**

74384 #include &lt;stdio.h&gt;

74385 FILE \*tmpfile(void);

74386 **DESCRIPTION**

74387 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 74388 conflict between the requirements described here and the ISO C standard is unintentional. This  
 74389 volume of POSIX.1-2024 defers to the ISO C standard.

74390 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file  
 74391 shall be automatically deleted when all references to the file are closed. The file shall be opened  
 74392 as in *fopen()* for update (*wb+*), except that implementations may restrict the permissions, either  
 74393 by clearing the file mode bits or setting them to the value `S_IRUSR | S_IWUSR`.

74394 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is  
 74395 killed while it is processing a call to *tmpfile()*.

74396 An error message may be written to standard error if the stream cannot be opened.

74397 **RETURN VALUE**

74398 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is  
 74399 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

74400 **ERRORS**74401 The *tmpfile()* function shall fail if:

74402 CX [EINTR] A signal was caught during *tmpfile()*.

74403 CX [EMFILE] All file descriptors available to the process are currently open.

74404 CX [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

74405 CX [ENFILE] The maximum allowable number of files is currently open in the system.

74406 CX [ENOSPC] The directory or file system which would contain the new file cannot be  
 74407 expanded.

74408 The *tmpfile()* function may fail if:

74409 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

74410 CX [ENOMEM] Insufficient storage space is available.

74411 **EXAMPLES**74412 **Creating a Temporary File**

74413 The following example creates a temporary file for update, and returns a pointer to a stream for  
 74414 the created file in the *fp* variable.

74415 #include &lt;stdio.h&gt;

74416 ...

74417 FILE \*fp;

74418 fp = tmpfile ();

74419 **APPLICATION USAGE**

74420 It should be possible to open at least {TMP\_MAX} temporary files during the lifetime of the  
 74421 program (this limit may be shared with *tmpnam()*) and there should be no limit on the number  
 74422 simultaneously open other than this limit and any limit on the number of open file descriptors  
 74423 or streams ({OPEN\_MAX}, {FOPEN\_MAX}, {STREAM\_MAX}).

74424 In multi-threaded applications, the *tmpfile()* function can leak file descriptors into child  
 74425 processes. Applications should instead use *mkostemp()* with the O\_CLOEXEC or O\_CLOFORK  
 74426 flag, or both, followed by *fdopen()*, to avoid the leak.

74427 **RATIONALE**

74428 None.

74429 **FUTURE DIRECTIONS**

74430 None.

74431 **SEE ALSO**

74432 [Section 2.5](#) (on page 521), *fopen()*, *mkdtemp()*, *tmpnam()*, *unlink()*

74433 XBD <stdio.h>

74434 **CHANGE HISTORY**

74435 First released in Issue 1. Derived from Issue 1 of the SVID.

74436 **Issue 5**

74437 Large File Summit extensions are added.

74438 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
 74439 in previous issues.

74440 **Issue 6**

74441 Extensions beyond the ISO C standard are marked.

74442 The following new requirements on POSIX implementations derive from alignment with the  
 74443 Single UNIX Specification:

- 74444 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
 74445 large files.
- 74446 • The [EMFILE] optional error condition is added.

74447 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999  
 74448 standard.

74449 **Issue 7**

74450 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may  
 74451 restrict the permissions of the file created.

74452 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

74453 SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for  
 74454 {STREAM\_MAX} streams open.

74455 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0668 [14] is applied.

74456 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0372 [678] is applied.

74457 **Issue 8**

74458 Austin Group Defects 411 and 1318 are applied, changing the APPLICATION USAGE section.

74459

Austin Group Defect 1296 is applied, removing [Eoverflow] from the ERRORS section.

74460 **NAME**

74461 tmpnam — create a name for a temporary file

74462 **SYNOPSIS**

```
74463 OB #include <stdio.h>
74464 char *tmpnam(char *s);
```

74465 **DESCRIPTION**

74466 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 74467 conflict between the requirements described here and the ISO C standard is unintentional. This  
 74468 volume of POSIX.1-2024 defers to the ISO C standard.

74469 The *tmpnam()* function shall generate a string that is a valid pathname that does not name an  
 74470 existing file. The function is potentially capable of generating {TMP\_MAX} different strings, but  
 74471 any or all of them may already be in use by existing files and thus not be suitable return values.

74472 The *tmpnam()* function generates a different string each time it is called from the same process,  
 74473 up to {TMP\_MAX} times. If it is called more than {TMP\_MAX} times, the behavior is  
 74474 implementation-defined.

74475 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 74476 *tmpnam()*.

74477 If called with a null pointer argument, the *tmpnam()* function need not be thread-safe; however,  
 74478 such calls shall avoid data races with calls to *tmpnam()* with a non-null argument and with calls  
 74479 to all other functions.

74480 **RETURN VALUE**

74481 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can  
 74482 be generated, the *tmpnam()* function shall return a null pointer.

74483 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and  
 74484 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the  
 74485 argument *s* is not a null pointer, it is presumed to point to an array of at least `L_tmpnam` **chars**;  
 74486 *tmpnam()* shall write its result in that array and shall return the argument as its value.

74487 **ERRORS**

74488 No errors are defined.

74489 **EXAMPLES**74490 **Generating a Pathname**74491 The following example generates a unique pathname and stores it in the array pointed to by *ptr*.

```
74492 #include <stdio.h>
74493 ...
74494 char pathname[L_tmpnam+1];
74495 char *ptr;
74496 ptr = tmpnam(pathname);
```

74497 **APPLICATION USAGE**74498 This function only creates pathnames. It is the application's responsibility to create and remove  
74499 the files.74500 Between the time a pathname is created and the file is opened, it is possible for some other  
74501 process to create a file with the same name. Applications may find *tmpfile()* more useful.

74502 Applications should use the *tmpfile()*, *mkostemp()*, *mkstemp()*, or *mkdtemp()* functions instead of  
74503 the obsolescent *tmpnam()* function.

74504 **RATIONALE**

74505 None.

74506 **FUTURE DIRECTIONS**

74507 The *tmpnam()* function may be removed in a future version, but not until after it has been  
74508 removed from the ISO C standard.

74509 **SEE ALSO**

74510 *fopen()*, *open()*, *mkdtemp()*, *tmpfile()*, *unlink()*

74511 XBD <stdio.h>

74512 **CHANGE HISTORY**

74513 First released in Issue 1. Derived from Issue 1 of the SVID.

74514 **Issue 5**

74515 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

74516 **Issue 6**

74517 Extensions beyond the ISO C standard are marked.

74518 The normative text is updated to avoid use of the term “must” for application requirements.

74519 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

74520 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/142 is applied, updating the  
74521 DESCRIPTION to allow implementations of the *tempnam()* function to call *tmpnam()*.

74522 **Issue 7**

74523 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *tmpnam()* function  
74524 need not be thread-safe if called with a NULL parameter.

74525 The *tmpnam()* function is marked obsolescent.

74526 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0669 [291] and XSH/TC1-2008/0670  
74527 [291,429] are applied.

74528 **Issue 8**

74529 Austin Group Defect 411 is applied, adding *mkostemp()*.

74530 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
74531 standard.

74532 Austin Group Defect 1330 is applied, changing the FUTURE DIRECTIONS section and  
74533 removing obsolescent interfaces.

74534 **NAME**

74535           tolower, tolower\_l — transliterate uppercase characters to lowercase

74536 **SYNOPSIS**

74537           #include &lt;ctype.h&gt;

74538           int tolower(int c);

74539 CX       int tolower\_l(int c, locale\_t locale);

74540 **DESCRIPTION**

74541 CX       For *tolower()*: The functionality described on this reference page is aligned with the ISO C  
74542 standard. Any conflict between the requirements described here and the ISO C standard is  
74543 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

74544 CX       The *tolower()* and *tolower\_l()* functions have as a domain a type **int**, the value of which is  
74545 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the  
74546 CX       behavior is undefined. If the argument of *tolower()* or *tolower\_l()* represents an uppercase letter,  
74547 and there exists a corresponding lowercase letter as defined by character type information in the  
74548 CX       current locale or in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the  
74549 result shall be the corresponding lowercase letter. All other arguments in the domain are  
74550 returned unchanged.

74551 CX       The behavior is undefined if the *locale* argument to *tolower\_l()* is the special locale object  
74552 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

74553 **RETURN VALUE**

74554 CX       Upon successful completion, the *tolower()* and *tolower\_l()* functions shall return the lowercase  
74555 letter corresponding to the argument passed; otherwise, they shall return the argument  
74556 unchanged.

74557 **ERRORS**

74558           No errors are defined.

74559 **EXAMPLES**

74560           None.

74561 **APPLICATION USAGE**

74562           None.

74563 **RATIONALE**

74564           None.

74565 **FUTURE DIRECTIONS**

74566           None.

74567 **SEE ALSO**74568           [setlocale\(\)](#), [uselocale\(\)](#)74569           XBD Chapter 7 (on page 127), [<ctype.h>](#), [<locale.h>](#)74570 **CHANGE HISTORY**

74571           First released in Issue 1. Derived from Issue 1 of the SVID.

74572 **Issue 6**

74573           Extensions beyond the ISO C standard are marked.

74574 **Issue 7**

74575  
74576

The *tolower\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

74577  
74578

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0671 [283] and XSH/TC1-2008/0672 [283] are applied.

74579 **NAME**

74580            toupper, toupper\_l — transliterate lowercase characters to uppercase

74581 **SYNOPSIS**

```
74582            #include <ctype.h>
74583            int toupper(int c);
74584 CX         int toupper_l(int c, locale_t locale);
```

74585 **DESCRIPTION**

74586 CX         For `toupper()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

74589 CX         The `toupper()` and `toupper_l()` functions have as a domain a type `int`, the value of which is representable as an **unsigned char** or the value of EOF. If the argument has any other value, the behavior is undefined.

74592 CX         If the argument of `toupper()` or `toupper_l()` represents a lowercase letter, and there exists a corresponding uppercase letter as defined by character type information in the current locale or in the locale represented by `locale`, respectively (category `LC_CTYPE`), the result shall be the corresponding uppercase letter.

74596            All other arguments in the domain are returned unchanged.

74597 CX         The behavior is undefined if the `locale` argument to `toupper_l()` is the special locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

74599 **RETURN VALUE**

74600 CX         Upon successful completion, `toupper()` and `toupper_l()` shall return the uppercase letter corresponding to the argument passed; otherwise, they shall return the argument unchanged.

74602 **ERRORS**

74603            No errors are defined.

74604 **EXAMPLES**

74605            None.

74606 **APPLICATION USAGE**

74607            None.

74608 **RATIONALE**

74609            None.

74610 **FUTURE DIRECTIONS**

74611            None.

74612 **SEE ALSO**

74613            [setlocale\(\)](#), [uselocale\(\)](#)

74614            XBD Chapter 7 (on page 127), [<ctype.h>](#), [<locale.h>](#)

74615 **CHANGE HISTORY**

74616            First released in Issue 1. Derived from Issue 1 of the SVID.

74617 **Issue 6**

74618            Extensions beyond the ISO C standard are marked.

74619 **Issue 7**

74620 SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section.

74621 The *toupper\_1()* function is added from The Open Group Technical Standard, 2006, Extended API  
74622 Set Part 4.

74623 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0673 [283] and XSH/TC1-2008/0674  
74624 [283] are applied.

74625 **NAME**

74626 towctrans, towctrans\_l — wide-character transliteration

74627 **SYNOPSIS**

```
74628 #include <wctype.h>
74629 wint_t towctrans(wint_t wc, wctrans_t desc);
74630 CX wint_t towctrans_l(wint_t wc, wctrans_t desc,
74631 locale_t locale);
```

74632 **DESCRIPTION**

74633 CX For `towctrans()`: The functionality described on this reference page is aligned with the ISO C  
 74634 standard. Any conflict between the requirements described here and the ISO C standard is  
 74635 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

74636 CX The `towctrans()` and `towctrans_l()` functions shall transliterate the wide-character code `wc` using  
 74637 the mapping described by `desc`.

74638 CX The current setting of the `LC_CTYPE` category in the current locale or in the locale represented  
 74639 CX by `locale`, respectively, should be the same as during the call to `wctrans()` or `wctrans_l()` that  
 74640 returned the value `desc`.

74641 If the value of `desc` is invalid (that is, not obtained by a call to `wctrans()` or `desc` is invalidated by a  
 74642 subsequent call to `setlocale()` that has affected category `LC_CTYPE`), the result is unspecified.

74643 CX If the value of `desc` is invalid (that is, not obtained by a call to `wctrans_l()` with the same locale  
 74644 object `locale`) the result is unspecified.

74645 CX An application wishing to check for error situations should set `errno` to 0 before calling  
 74646 `towctrans()` or `towctrans_l()`.

74647 If `errno` is non-zero on return, an error has occurred.

74648 The behavior is undefined if the `locale` argument to `towctrans_l()` is the special locale object  
 74649 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

74650 **RETURN VALUE**

74651 CX If successful, the `towctrans()` and `towctrans_l()` functions shall return the mapped value of `wc`  
 74652 CX using the mapping described by `desc`, or the value of `wc` unchanged if `desc` is zero. Otherwise,  
 74653 they shall return `wc` unchanged.

74654 **ERRORS**

74655 These functions may fail if:

74656 CX `[EINVAL]` `desc` contains an invalid transliteration descriptor.

74657 **EXAMPLES**

74658 None.

74659 **APPLICATION USAGE**

74660 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the  
 74661 table below, the functions in the left column are equivalent to the functions in the right column.

74662	<code>tolower(wc)</code>	<code>towctrans(wc, wctrans("tolower"))</code>
74663	<code>tolower_l(wc, locale)</code>	<code>towctrans_l(wc, wctrans("tolower"), locale)</code>
74664	<code>toupper(wc)</code>	<code>towctrans(wc, wctrans("toupper"))</code>
74665	<code>toupper_l(wc, locale)</code>	<code>towctrans_l(wc, wctrans("toupper"), locale)</code>

74666 **RATIONALE**

74667 None.

74668 **FUTURE DIRECTIONS**

74669 None.

74670 **SEE ALSO**74671 *tolower()*, *toupper()*, *wctrans()*74672 XBD <**wctype.h**>74673 **CHANGE HISTORY**

74674 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

74675 **Issue 6**

74676 Extensions beyond the ISO C standard are marked.

74677 **Issue 7**74678 The *towctrans\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.74679  
74680 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0675 [302], XSH/TC1-2008/0676 [283],  
74681 and XSH/TC1-2008/0677 [283] are applied.74682 **Issue 8**74683 Austin Group Defect 1302 is applied, aligning the *towctrans()* function with the  
74684 ISO/IEC 9899:2018 standard.

74685 **NAME**

74686           tolower, tolower\_l — transliterate uppercase wide-character code to lowercase

74687 **SYNOPSIS**

74688           #include &lt;wctype.h&gt;

74689           wint\_t tolower(wint\_t wc);

74690 CX       wint\_t tolower\_l(wint\_t wc, locale\_t locale);

74691 **DESCRIPTION**74692 CX       For *tolower()*: The functionality described on this reference page is aligned with the ISO C  
74693 standard. Any conflict between the requirements described here and the ISO C standard is  
74694 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.74695 CX       The *tolower()* and *tolower\_l()* functions have as a domain a type **wint\_t**, the value of which  
74696 the application shall ensure is a character representable as a **wchar\_t**, and a wide-character code  
74697 corresponding to a valid character in the locale used by the function or the value of WEOF. If  
74698 CX       the argument has any other value, the behavior is undefined. If the argument of *tolower()* or  
74699 *tolower\_l()* represents an uppercase wide-character code, and there exists a corresponding  
74700 CX       lowercase wide-character code as defined by character type information in the current locale or  
74701 in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the result shall be the  
74702 corresponding lowercase wide-character code. All other arguments in the domain are returned  
74703 unchanged.74704 CX       The behavior is undefined if the *locale* argument to *tolower\_l()* is the special locale object  
74705 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.74706 **RETURN VALUE**74707 CX       Upon successful completion, the *tolower()* and *tolower\_l()* functions shall return the  
74708 lowercase letter corresponding to the argument passed; otherwise, they shall return the  
74709 argument unchanged.74710 **ERRORS**

74711           No errors are defined.

74712 **EXAMPLES**

74713           None.

74714 **APPLICATION USAGE**

74715           None.

74716 **RATIONALE**

74717           None.

74718 **FUTURE DIRECTIONS**

74719           None.

74720 **SEE ALSO**74721           [setlocale\(\)](#), [uselocale\(\)](#)74722           XBD Chapter 7 (on page 127), [<locale.h>](#), [<wctype.h>](#)74723 **CHANGE HISTORY**

74724           First released in Issue 4.

74725 **Issue 5**

74726 The following change has been made in this version for alignment with  
74727 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 74728       • The SYNOPSIS has been changed to indicate that this function and associated data types  
74729       are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

74730 **Issue 6**

74731 The normative text is updated to avoid use of the term “must” for application requirements.

74732 **Issue 7**

74733 The `towlower_l()` function is added from The Open Group Technical Standard, 2006, Extended  
74734 API Set Part 4.

74735 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0678 [302], XSH/TC1-2008/0679 [283],  
74736 and XSH/TC1-2008/0680 [283] are applied.

74737 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0373 [685] is applied.

74738 **NAME**

74739 towupper, towupper\_l — transliterate lowercase wide-character code to uppercase

74740 **SYNOPSIS**

74741 #include &lt;wctype.h&gt;

74742 wint\_t towupper(wint\_t wc);

74743 CX wint\_t towupper\_l(wint\_t wc, locale\_t locale);

74744 **DESCRIPTION**74745 CX For *towupper()*: The functionality described on this reference page is aligned with the ISO C  
74746 standard. Any conflict between the requirements described here and the ISO C standard is  
74747 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.74748 CX The *towupper()* and *towupper\_l()* functions have as a domain a type **wint\_t**, the value of which  
74749 the application shall ensure is a character representable as a **wchar\_t**, and a wide-character code  
74750 corresponding to a valid character in the locale used by the function or the value of WEOF. If  
74751 CX the argument has any other value, the behavior is undefined. If the argument of *towupper()* or  
74752 *towupper\_l()* represents a lowercase wide-character code, and there exists a corresponding  
74753 CX uppercase wide-character code as defined by character type information in the current locale or  
74754 in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the result shall be the  
74755 corresponding uppercase wide-character code. All other arguments in the domain are returned  
74756 unchanged.74757 CX The behavior is undefined if the *locale* argument to *towupper\_l()* is the special locale object  
74758 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.74759 **RETURN VALUE**74760 CX Upon successful completion, the *towupper()* and *towupper\_l()* functions shall return the  
74761 uppercase letter corresponding to the argument passed. Otherwise, they shall return the  
74762 argument unchanged.74763 **ERRORS**

74764 No errors are defined.

74765 **EXAMPLES**

74766 None.

74767 **APPLICATION USAGE**

74768 None.

74769 **RATIONALE**

74770 None.

74771 **FUTURE DIRECTIONS**

74772 None.

74773 **SEE ALSO**74774 [setlocale\(\)](#), [uselocale\(\)](#)74775 XBD [Chapter 7](#) (on page 127), [<locale.h>](#), [<wctype.h>](#)74776 **CHANGE HISTORY**

74777 First released in Issue 4.

74778 **Issue 5**

74779 The following change has been made in this version for alignment with  
74780 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 74781 • The SYNOPSIS has been changed to indicate that this function and associated data types  
74782 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

74783 **Issue 6**

74784 The normative text is updated to avoid use of the term “must” for application requirements.

74785 **Issue 7**

74786 The `towupper_l()` function is added from The Open Group Technical Standard, 2006, Extended  
74787 API Set Part 4.

74788 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0681 [302], XSH/TC1-2008/0682 [283],  
74789 and XSH/TC1-2008/0683 [283] are applied.

74790 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0374 [685] is applied.

74791 **NAME**

74792 trunc, truncf, trunc1 — round to truncated integer value

74793 **SYNOPSIS**

74794 #include &lt;math.h&gt;

74795 double trunc(double x);

74796 float truncf(float x);

74797 long double trunc1(long double x);

74798 **DESCRIPTION**74799 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
74800 conflict between the requirements described here and the ISO C standard is unintentional. This  
74801 volume of POSIX.1-2024 defers to the ISO C standard.74802 These functions shall round their argument to the integer value, in floating format, nearest to but  
74803 no larger in magnitude than the argument.

74804 MX These functions may raise the inexact floating-point exception for finite non-integer arguments.

74805 **RETURN VALUE**

74806 Upon successful completion, these functions shall return the truncated integer value.

74807 MX The returned value shall be exact, shall be independent of the current rounding direction mode,  
74808 and shall have the same sign as  $x$ .74809 MX If  $x$  is NaN, a NaN shall be returned.74810 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.74811 **ERRORS**

74812 No errors are defined.

74813 **EXAMPLES**

74814 None.

74815 **APPLICATION USAGE**74816 The integral value returned by these functions need not be expressible as an `intmax_t`. The  
74817 return value should be tested before assigning it to an integer type to avoid the undefined  
74818 results of an integer overflow.74819 **RATIONALE**

74820 None.

74821 **FUTURE DIRECTIONS**

74822 None.

74823 **SEE ALSO**

74824 XBD &lt;math.h&gt;

74825 **CHANGE HISTORY**

74826 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

74827 **Issue 7**

74828 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0684 [346] is applied.

74829 **Issue 8**74830 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
74831 standard.

74832 **NAME**

74833 truncate — truncate a file to a specified length

74834 **SYNOPSIS**

74835 #include &lt;unistd.h&gt;

74836 int truncate(const char \*path, off\_t length);

74837 **DESCRIPTION**74838 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be  
74839 equal to *length* bytes.74840 If the file previously was larger than *length*, the extra data is discarded. If the file was previously  
74841 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

74842 The application shall ensure that the process has write permission for the file.

74843 If the request would cause the file size to exceed the soft file size limit for the process, the  
74844 XSI request shall fail and the implementation shall generate a SIGXFSZ signal for the thread.74845 The *truncate()* function shall not modify the file offset for any open file descriptions associated  
74846 with the file. Upon successful completion, *truncate()* shall mark for update the last data  
74847 modification and last file status change timestamps of the file, and the S\_ISUID and S\_ISGID bits  
74848 of the file mode may be cleared.74849 **RETURN VALUE**74850 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*  
74851 set to indicate the error.74852 **ERRORS**74853 The *truncate()* function shall fail if:74854 [EACCES] A component of the path prefix denies search permission, or write permission  
74855 is denied on the file.

74856 [EFBIG] or [EINVAL]

74857 The *length* argument is greater than the maximum file size.74858 XSI [EFBIG] The *length* argument exceeds the file size limit of the process. A SIGFSZ  
74859 signal shall also be generated for the thread.

74860 [EINTR] A signal was caught during execution.

74861 [EINVAL] The *length* argument is less than 0 or the *path* argument refers to a file, other  
74862 than a directory, on which this operation is not possible (for example, a FIFO  
74863 or socket).

74864 [EIO] An I/O error occurred while reading from or writing to a file system.

74865 [EISDIR] The named file is a directory.

74866 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
74867 argument.

74868 [ENAMETOOLONG]

74869 The length of a component of a pathname is longer than {NAME\_MAX}.

74870 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.74871 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
74872 directory nor a symbolic link to a directory, or the *path* argument contains at  
74873 least one non-`<slash>` character and ends with one or more trailing `<slash>`

74874 characters and the last pathname component names an existing file that is  
 74875 neither a directory nor a symbolic link to a directory.

74876 [EROFS] The named file resides on a read-only file system.

74877 The *truncate()* function may fail if:

74878 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 74879 resolution of the *path* argument.

74880 [ENAMETOOLONG]  
 74881 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 74882 symbolic link produced an intermediate result with a length that exceeds  
 74883 {PATH\_MAX}.

**74884 EXAMPLES**

74885 None.

**74886 APPLICATION USAGE**

74887 None.

**74888 RATIONALE**

**74895 CHANGE HISTORY**

74896 First released in Issue 4, Version 2.

**74897 Issue 5**

74898 Moved from X/OPEN UNIX extension to BASE.

74899 Large File Summit extensions are added.

**74900 Issue 6**

74901 This reference page is split out from the *ftruncate()* reference page.

74902 The normative text is updated to avoid use of the term “must” for application requirements.

74903 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 74904 [ELOOP] error condition is added.

**74905 Issue 7**

74906 Austin Group Interpretation 1003.1-2001 #143 is applied.

74907 The *truncate()* function is moved from the XSI option to the Base.

74908 Changes are made related to support for finegrained timestamps.

74909 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 74910 pathname exists but is not a directory or a symbolic link to a directory.

74911 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0685 [324] is applied.

74912 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0375 [489] is applied.

74913 **Issue 8**

74914 Austin Group Defects 308 and 1087 are applied, clarifying the handling of [EFBIG] errors.

74915 Austin Group Defect 1381 is applied, adding a second condition to the [EINVAL] error and  
74916 rearranging the ERRORS section into alphabetical order.

74917 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
74918 relating to the file size limit for the process.

74919 **NAME**  
74920 truncf, trunc — round to truncated integer value

74921 **SYNOPSIS**  
74922 #include <math.h>  
74923 float truncf(float x);  
74924 long double trunc (long double x);

74925 **DESCRIPTION**  
74926 Refer to *trunc()*.

74927 **NAME**

74928 tsearch — search a binary search tree

74929 **SYNOPSIS**

```
74930 XSI #include <search.h>
74931 void *tsearch(const void *key, void **rootp,
74932 int (*compar)(const void *, const void *));
```

74933 **DESCRIPTION**

74934 Refer to [tdelete\(\)](#).

74935 **NAME**

74936 tss\_create — thread-specific data key creation

74937 **SYNOPSIS**

74938 #include &lt;threads.h&gt;

74939 int tss\_create(tss\_t \*key, tss\_dtor\_t dtor);

74940 **DESCRIPTION**

74941 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 74942 conflict between the requirements described here and the ISO C standard is unintentional. This  
 74943 volume of POSIX.1-2024 defers to the ISO C standard.

74944 The *tss\_create()* function shall create a thread-specific storage pointer with destructor *dtor*, which  
 74945 can be null.

74946 A null pointer value shall be associated with the newly created key in all existing threads. Upon  
 74947 subsequent thread creation, the value associated with all keys shall be initialized to a null  
 74948 pointer value in the new thread.

74949 Destructors associated with thread-specific storage shall not be invoked at process termination.

74950 The behavior is undefined if the *tss\_create()* function is called from within a destructor.

74951 CX The *tss\_create()* function shall not be affected if the calling thread executes a signal handler  
 74952 during the call.

74953 **RETURN VALUE**

74954 If the *tss\_create()* function is successful, it shall set the thread-specific storage pointed to by *key* to  
 74955 a value that uniquely identifies the newly created pointer and shall return *thrd\_success*;  
 74956 otherwise, *thrd\_error* shall be returned and the thread-specific storage pointed to by *key* has  
 74957 an indeterminate value.

74958 **ERRORS**

74959 No errors are defined.

74960 **EXAMPLES**

74961 None.

74962 **APPLICATION USAGE**

74963 The *tss\_create()* function performs no implicit synchronization. It is the responsibility of the  
 74964 application writer to ensure that it is called exactly once per key before use of the key.

74965 **RATIONALE**

74966 If the value associated with a key needs to be updated during the lifetime of the thread, it may  
 74967 be necessary to release the storage associated with the old value before the new value is bound.  
 74968 Although the *tss\_set()* function could do this automatically, this feature is not needed often  
 74969 enough to justify the added complexity. Instead, the application is responsible for freeing the  
 74970 stale storage:

74971 old = tss\_get(key);

74972 new = allocate();

74973 destructor(old);

74974 tss\_set(key, new);

74975 There is no notion of a destructor-safe function. If an application does not call *thrd\_exit()* or  
 74976 *pthread\_exit()* from a signal handler, or if, while calling async-unsafe functions, it blocks any  
 74977 signal whose handler might call *thrd\_exit()* or *pthread\_exit()*, all functions can be safely called  
 74978 from destructors.

74979           The *tss\_create()* function is not affected by signal handlers for the reasons stated in XRAT [Section](#)  
74980           [B.2.3](#) (on page 3742).

74981   **FUTURE DIRECTIONS**

74982           None.

74983   **SEE ALSO**

74984           [pthread\\_exit\(\)](#), [pthread\\_key\\_create\(\)](#), [thrd\\_exit\(\)](#), [tss\\_delete\(\)](#), [tss\\_get\(\)](#)

74985           XBD [<threads.h>](#)

74986   **CHANGE HISTORY**

74987           First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

74988 **NAME**

74989 tss\_delete — thread-specific data key deletion

74990 **SYNOPSIS**

74991 #include &lt;threads.h&gt;

74992 void tss\_delete(tss\_t key);

74993 **DESCRIPTION**

74994 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
74995 conflict between the requirements described here and the ISO C standard is unintentional. This  
74996 volume of POSIX.1-2024 defers to the ISO C standard.

74997 The *tss\_delete()* function shall release any resources used by the thread-specific storage identified  
74998 by *key*. The thread-specific data values associated with *key* need not be null at the time  
74999 *tss\_delete()* is called. It is the responsibility of the application to free any application storage or  
75000 perform any cleanup actions for data structures related to the deleted key or associated thread-  
75001 specific data in any threads; this cleanup can be done either before or after *tss\_delete()* is called.

75002 The application shall ensure that the *tss\_delete()* function is only called with a value for *key* that  
75003 was returned by a call to *tss\_create()* before the thread commenced executing destructors.

75004 If *tss\_delete()* is called while another thread is executing destructors, whether this will affect the  
75005 number of invocations of the destructor associated with *key* on that thread is unspecified.

75006 The *tss\_delete()* function shall be callable from within destructor functions. Calling *tss\_delete()*  
75007 shall not result in the invocation of any destructors. Any destructor function that was associated  
75008 with *key* shall no longer be called upon thread exit.

75009 Any attempt to use *key* following the call to *tss\_delete()* results in undefined behavior.

75010 CX The *tss\_delete()* function shall not be affected if the calling thread executes a signal handler  
75011 during the call.

75012 **RETURN VALUE**

75013 This function shall not return a value.

75014 **ERRORS**

75015 No errors are defined.

75016 **EXAMPLES**

75017 None.

75018 **APPLICATION USAGE**

75019 None.

75020 **RATIONALE**

75021 A thread-specific data key deletion function has been included in order to allow the resources  
75022 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys  
75023 can arise, among other scenarios, when a dynamically loaded module that allocated a key is  
75024 unloaded.

75025 Conforming applications are responsible for performing any cleanup actions needed for data  
75026 structures associated with the key to be deleted, including data referenced by thread-specific  
75027 data values. No such cleanup is done by *tss\_delete()*. In particular, destructor functions are not  
75028 called. See the RATIONALE for *pthread\_key\_delete()* for the reasons for this division of  
75029 responsibility.

75030 The *tss\_delete()* function is not affected by signal handlers for the reasons stated in XRAT [Section](#)  
75031 [B.2.3](#) (on page 3742).

75032 **FUTURE DIRECTIONS**

75033 None.

75034 **SEE ALSO**

75035 *pthread\_key\_delete()*, *tss\_create()*

75036 XBD <threads.h>

75037 **CHANGE HISTORY**

75038 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

75039 **NAME**

75040 tss\_get, tss\_set — thread-specific data management

75041 **SYNOPSIS**

```
75042 #include <threads.h>
75043 void *tss_get(tss_t key);
75044 int tss_set(tss_t key, void *val);
```

75045 **DESCRIPTION**

75046 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 75047 conflict between the requirements described here and the ISO C standard is unintentional. This  
 75048 volume of POSIX.1-2024 defers to the ISO C standard.

75049 The `tss_get()` function shall return the value for the current thread held in the thread-specific  
 75050 storage identified by `key`.

75051 The `tss_set()` function shall set the value for the current thread held in the thread-specific storage  
 75052 identified by `key` to `val`. This action shall not invoke the destructor associated with the `key` on the  
 75053 value being replaced.

75054 The application shall ensure that the `tss_get()` and `tss_set()` functions are only called with a value  
 75055 for `key` that was returned by a call to `tss_create()` before the thread commenced executing  
 75056 destructors.

75057 The effect of calling `tss_get()` or `tss_set()` after `key` has been deleted with `tss_delete()` is undefined.

75058 CX Both `tss_get()` and `tss_set()` can be called from a thread-specific data destructor function. A call  
 75059 to `tss_get()` for the thread-specific data key being destroyed shall return a null pointer, unless the  
 75060 value is changed (after the destructor starts) by a call to `tss_set()`. Calling `tss_set()` from a  
 75061 thread-specific data destructor function may result either in lost storage (after at least  
 75062 {PTHREAD\_DESTRUCTOR\_ITERATIONS} attempts at destruction) or in an infinite loop.

75063 These functions shall not be affected if the calling thread executes a signal handler during the  
 75064 call.

75065 **RETURN VALUE**

75066 The `tss_get()` function shall return the value for the current thread. If no thread-specific data  
 75067 value is associated with `key`, then a null pointer shall be returned.

75068 The `tss_set()` function shall return `thrd_success` on success or `thrd_error` if the request  
 75069 could not be honored.

75070 **ERRORS**

75071 No errors are defined.

75072 **EXAMPLES**

75073 None.

75074 **APPLICATION USAGE**

75075 None.

75076 **RATIONALE**

75077 These functions are not affected by signal handlers for the reasons stated in XRAT [Section B.2.3](#)  
 75078 (on page 3742).

75079 **FUTURE DIRECTIONS**

75080 None.

75081 **SEE ALSO**

75082 *pthread\_getspecific(), tss\_create()*

75083 XBD <**threads.h**>

75084 **CHANGE HISTORY**

75085 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

75086 **NAME**75087 `ttyname, ttyname_r` — find the pathname of a terminal75088 **SYNOPSIS**75089 `#include <unistd.h>`75090 `char *ttyname(int fd);`75091 `int ttyname_r(int fd, char *name, size_t namesize);`75092 **DESCRIPTION**

75093 The `ttyname()` function shall return a pointer to a string containing a null-terminated pathname  
75094 of the terminal associated with file descriptor *fd*. The application shall not modify the string  
75095 returned. The returned pointer might be invalidated or the string content might be overwritten  
75096 by a subsequent call to `ttyname()`. The returned pointer and the string content might also be  
75097 invalidated if the calling thread is terminated.

75098 The `ttyname()` function need not be thread-safe.

75099 The `ttyname_r()` function shall store the null-terminated pathname of the terminal associated  
75100 with the file descriptor *fd* in the character array referenced by *name*. The array is *namesize*  
75101 characters long and should have space for the name and the terminating null character. The  
75102 maximum length of the terminal name shall be {TTY\_NAME\_MAX}.

75103 **RETURN VALUE**

75104 Upon successful completion, `ttyname()` shall return a pointer to a string. Otherwise, a null  
75105 pointer shall be returned and `errno` set to indicate the error.

75106 If successful, the `ttyname_r()` function shall return zero. Otherwise, an error number shall be  
75107 returned to indicate the error.

75108 **ERRORS**

75109 These functions may fail if:

75110 [EBADF] The *fd* argument is not a valid file descriptor.

75111 [ENOTTY] The file associated with the *fd* argument is not a terminal.

75112 The `ttyname_r()` function shall fail if:

75113 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned  
75114 including the terminating null character.

75115 **EXAMPLES**

75116 None.

75117 **APPLICATION USAGE**

75118 None.

75119 **RATIONALE**

75120 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a  
75121 reference to an undefined term.

75122 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-  
75123 zero value if it fails. The non-thread-safe version may return the name in a static data area that  
75124 may be overwritten by each call.

75125 **FUTURE DIRECTIONS**

75126 None.

75127 **SEE ALSO**

75128 XBD <unistd.h>

75129 **CHANGE HISTORY**

75130 First released in Issue 1. Derived from Issue 1 of the SVID.

75131 **Issue 5**

75132 The *ttynamename\_r()* function is included for alignment with the POSIX Threads Extension.

75133 A note indicating that the *ttynamename()* function need not be reentrant is added to the  
75134 DESCRIPTION.

75135 **Issue 6**

75136 The *ttynamename\_r()* function is marked as part of the Thread-Safe Functions option.

75137 The following new requirements on POSIX implementations derive from alignment with the  
75138 Single UNIX Specification:

- 75139 • The statement that *errno* is set on error is added.
- 75140 • The [EBADF] and [ENOTTY] optional error conditions are added.

75141 **Issue 7**

75142 Austin Group Interpretation 1003.1-2001 #156 is applied.

75143 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

75144 The *ttynamename\_r()* function is moved from the Thread-Safe Functions option to the Base.

75145 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0686 [75] is applied.

75146 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0376 [656] is applied.

75147 **Issue 8**

75148 Austin Group Defect 398 is applied, combining the duplicated [EBADF] and [ENOTTY] errors  
75149 and changing the [ERANGE] error from “may fail” to “shall fail”.

75150 **NAME**

75151 twalk — traverse a binary search tree

75152 **SYNOPSIS**

```
75153 XSI #include <search.h>
75154 void twalk(const void *root,
75155           void (*action)(const void *, VISIT, int ));
```

75156 **DESCRIPTION**75157 Refer to *tdelete()*.

75158 **NAME**

75159 daylight, timezone, tzname, tzset — set timezone conversion information

75160 **SYNOPSIS**

75161 #include &lt;time.h&gt;

```
75162 XSI extern int daylight;
75163      extern long timezone;
75164 CX   extern char *tzname[2];
75165      void tzset(void);
```

75166 **DESCRIPTION**

75167 The `tzset()` function shall use the value of the environment variable `TZ` to set time conversion information used by `ctime()`, `localtime()`, `mktime()`, and `strptime()`. If `TZ` is absent from the environment, implementation-defined default timezone information shall be used.

75170 The `tzset()` function shall set the external variable `tzname` as follows:

```
75171      tzname[0] = "std";
75172      tzname[1] = "dst";
```

75173 where `std` and `dst` are as described in XBD Chapter 8 (on page 167).

75174 XSI The `tzset()` function also shall set the external variable `daylight` to 0 if Daylight Saving Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable `timezone` shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

75178 XSI If a thread accesses `tzname`, `daylight`, or `timezone` directly while another thread is in a call to `tzset()`, or to any function that is required or allowed to set timezone information as if by calling `tzset()`, the behavior is undefined.

75181 **RETURN VALUE**

75182 The `tzset()` function shall not return a value.

75183 **ERRORS**

75184 No errors are defined.

75185 **EXAMPLES**

75186 Example `TZ` variables and their timezone differences are given in the table below:

<i>TZ</i>	<i>timezone</i>
EST5EDT	5*60*60
GMT0	0*60*60
JST-9	-9*60*60
MET-1MEST	-1*60*60
MST7MDT	7*60*60
PST8PDT	8*60*60

75194 **APPLICATION USAGE**

75195 Since the `ctime()`, `localtime()`, `mktime()`, `strptime()`, and `strptime_l()` functions are required to set timezone information as if by calling `tzset()`, there is no need for an explicit `tzset()` call before using these functions. However, portable applications should call `tzset()` explicitly before using `localtime_r()` because setting timezone information is optional for that function.

75199 **RATIONALE**

75200 None.

75201 **FUTURE DIRECTIONS**

75202 None.

75203 **SEE ALSO**75204 *ctime()*, *localtime()*, *mktime()*, *strftime()*75205 XBD Chapter 8 (on page 167), [<time.h>](#)75206 **CHANGE HISTORY**

75207 First released in Issue 1. Derived from Issue 1 of the SVID.

75208 **Issue 6**

75209 The example is corrected.

75210 **Issue 7**

75211 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0377 [880] is applied.

75212 **Issue 8**

75213 Austin Group Defect 1253 is applied, changing ``Daylight Savings'' to ``Daylight Saving''.

75214 Austin Group Defect 1410 is applied, removing the *ctime\_r()* function.

75215 **NAME**

75216 umask — set and get the file mode creation mask

75217 **SYNOPSIS**

75218 #include &lt;sys/stat.h&gt;

75219 mode\_t umask(mode\_t *cmask*);75220 **DESCRIPTION**

75221 The *umask()* function shall set the file mode creation mask of the process to *cmask* and return the  
 75222 previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) shall be  
 75223 XSI used; the S\_ISVTX bit shall be ignored, and the meaning of the other bits is implementation-  
 75224 defined.

75225 The file mode creation mask of the process is used to turn off permission bits in the *mode*  
 75226 argument supplied during calls to the following functions:

- 75227 • *open()*, *openat()*, *creat()*, *mkdir()*, *mkdirat()*, *mkfifo()*, and *mkfifoat()*
- 75228 XSI • *mknod()*, *mknodat()*
- 75229 MSG • *mq\_open()*
- 75230 • *sem\_open()*

75231 Permission bit positions that are set in *cmask* are cleared in the mode of the created file.

75232 **RETURN VALUE**

75233 The file permission bits in the value returned by *umask()* shall be the previous value of the file  
 75234 XSI mode creation mask. The S\_ISVTX bit in the returned value shall be clear. The state of any  
 75235 other bits in the returned value is unspecified, except that a subsequent call to *umask()* with the  
 75236 returned value as *cmask* shall leave the state of the mask the same as its state before the first call,  
 75237 including any unspecified use of those bits.

75238 **ERRORS**

75239 No errors are defined.

75240 **EXAMPLES**

75241 None.

75242 **APPLICATION USAGE**

75243 None.

75244 **RATIONALE**

75245 Unsigned argument and return types for *umask()* were proposed. The return type and the  
 75246 argument were both changed to **mode\_t**.

75247 Historical implementations have made use of additional bits in *cmask* for their implementation-  
 75248 defined purposes. The addition of the text that the meaning of other bits of the field is  
 75249 implementation-defined permits these implementations to conform to this volume of  
 75250 POSIX.1-2024.

75251 **FUTURE DIRECTIONS**

75252 None.

75253 **SEE ALSO**75254 *creat()*, *exec*, *mkdir()*, *mkfifo()*, *mknod()*, *mq\_open()*, *open()*, *sem\_open()*

75255 XBD &lt;sys/stat.h&gt;, &lt;sys/types.h&gt;

75256 **CHANGE HISTORY**

75257 First released in Issue 1. Derived from Issue 1 of the SVID.

75258 **Issue 6**

75259 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

75260 The following new requirements on POSIX implementations derive from alignment with the  
75261 Single UNIX Specification:

- 75262 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
75263 required for conforming implementations of previous POSIX specifications, it was not  
75264 required for UNIX applications.

75265 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the `mknod()`,  
75266 `mq_open()`, and `sem_open()` functions to the DESCRIPTION and SEE ALSO sections.

75267 **Issue 8**

75268 Austin Group Defect 1522 is applied, adding requirements relating to the S\_ISVTX bit.

75269 **NAME**

75270            uname — get the name of the current system

75271 **SYNOPSIS**

75272            #include <sys/utsname.h>

75273            int uname(struct utsname \*name);

75274 **DESCRIPTION**

75275            The *uname()* function shall store information identifying the current system in the structure pointed to by *name*.

75277            The *uname()* function uses the **utsname** structure defined in <sys/utsname.h>.

75278            The *uname()* function shall return a string naming the current system in the character array *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-defined communications network. The arrays *release* and *version* shall further identify the operating system. The array *machine* shall contain a name that identifies the hardware that the system is running on.

75283            The format of each member is implementation-defined.

75284 **RETURN VALUE**

75285            Upon successful completion, a non-negative value shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

75287 **ERRORS**

75288            No errors are defined.

75289 **EXAMPLES**

75290            None.

75291 **APPLICATION USAGE**

75292            The inclusion of the *nodename* member in this structure does not imply that it is sufficient information for interfacing to communications networks.

75294 **RATIONALE**

75295            The values of the structure members are not constrained to have any relation to the version of this volume of POSIX.1-2024 implemented in the operating system. An application should instead depend on `_POSIX_VERSION` and related constants defined in <unistd.h>.

75298            This volume of POSIX.1-2024 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not enough for use with many networks.

75302            The *uname()* function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.

75305            4.3 BSD has *gethostname()* and *gethostid()*, which return a symbolic name and a numeric value, respectively. There are related *sethostname()* and *sethostid()* functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.

75309 **FUTURE DIRECTIONS**

75310            None.

75311 **SEE ALSO**

75312 XBD <[sys/utsname.h](#)>

75313 **CHANGE HISTORY**

75314 First released in Issue 1. Derived from Issue 1 of the SVID.

75315 **NAME**

75316 ungetc — push byte back into input stream

75317 **SYNOPSIS**

75318 #include &lt;stdio.h&gt;

75319 int ungetc(int *c*, FILE \**stream*);75320 **DESCRIPTION**

75321 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 75322 conflict between the requirements described here and the ISO C standard is unintentional. This  
 75323 volume of POSIX.1-2024 defers to the ISO C standard.

75324 The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back  
 75325 onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by  
 75326 subsequent reads on that stream in the reverse order of their pushing. A successful intervening  
 75327 CX call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fseeko()*,  
 75328 CX *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back bytes for the stream. The  
 75329 external storage corresponding to the stream shall be unchanged.

75330 One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream  
 75331 without an intervening read or file-positioning operation on that stream, the operation may fail.

75332 If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall  
 75333 be left unchanged.

75334 A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The file-position  
 75335 indicator for the stream shall be decremented by each successful call to *ungetc()*; if its value was  
 75336 0 before a call, its value is unspecified after the call. The value of the file-position indicator after  
 75337 all pushed-back bytes have been read shall be the same as it was before the bytes were pushed  
 75338 back.

75339 **RETURN VALUE**

75340 Upon successful completion, *ungetc()* shall return the byte pushed back after conversion.  
 75341 Otherwise, it shall return EOF.

75342 **ERRORS**

75343 No errors are defined.

75344 **EXAMPLES**

75345 None.

75346 **APPLICATION USAGE**

75347 None.

75348 **RATIONALE**

75349 The ISO C standard includes the text “The value of the file position indicator for the stream after  
 75350 reading or discarding all pushed-back characters shall be the same as it was before the characters  
 75351 were pushed back.” POSIX.1 omits “or discarding” from this because it is redundant—in the  
 75352 ISO C standard the discarding is done by file positioning functions and does not affect the  
 75353 position set by those functions. In particular, a relative seek using *fseek()* or *fseeko()* with  
 75354 SEEK\_CUR adjusts the position relative to the position on entry to the function, not the position  
 75355 after the pushed-back bytes have been discarded. POSIX.1 also requires *fflush()* to discard  
 75356 pushed back bytes in situations where the ISO C standard says the behavior of *fflush()* is  
 75357 undefined.

75358 **FUTURE DIRECTIONS**

75359 The ISO C standard states that the use of *ungetc()* on a binary stream where the file position  
75360 indicator is zero prior to the call is an obsolescent feature. In POSIX.1 there is no distinction  
75361 between binary and text streams, so this applies to all streams. This feature may be removed in  
75362 a future version of this standard.

75370 [87], and XSH/TC1-2008/0689 [14] are applied.

75371 **Issue 8**

75372 Austin Group Defect 701 is applied, clarifying how the file-position indicator for the stream is  
75373 updated.

75374 Austin Group Defect 1302 is applied, changing the FUTURE DIRECTIONS section.

75375 **NAME**

75376 ungetwc — push wide-character code back into the input stream

75377 **SYNOPSIS**

75378 #include &lt;stdio.h&gt;

75379 #include &lt;wchar.h&gt;

75380 wint\_t ungetwc(wint\_t *wc*, FILE \**stream*);75381 **DESCRIPTION**

75382 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 75383 conflict between the requirements described here and the ISO C standard is unintentional. This  
 75384 volume of POSIX.1-2024 defers to the ISO C standard.

75385 The *ungetwc()* function shall push the character corresponding to the wide-character code  
 75386 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters  
 75387 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A  
 75388 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function  
 75389 CX (*fseek()*, *fseeko()*, *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back characters for  
 75390 the stream. The external storage corresponding to the stream is unchanged.

75391 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on  
 75392 the same stream without an intervening read or file-positioning operation on that stream, the  
 75393 operation may fail.

75394 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream  
 75395 shall be left unchanged.

75396 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the  
 75397 file-position indicator for the stream after a successful call to *ungetwc()* is unspecified until all  
 75398 pushed-back wide characters are read or discarded; its value after all pushed-back wide  
 75399 characters have been read shall be the same as it was before the wide characters were pushed  
 75400 back.

75401 **RETURN VALUE**

75402 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to  
 75403 the pushed-back character. Otherwise, it shall return WEOF.

75404 **ERRORS**75405 The *ungetwc()* function may fail if:

75406 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not  
 75407 correspond to a valid character.

75408 **EXAMPLES**

75409 None.

75410 **APPLICATION USAGE**

75411 None.

75412 **RATIONALE**

75413 The ISO C standard includes the text “The value of the file position indicator for the stream after  
 75414 reading or discarding all pushed-back wide characters shall be the same as it was before the  
 75415 wide characters were pushed back.” POSIX.1 omits “or discarding” from this because it is  
 75416 redundant—in the ISO C standard the discarding is done by file positioning functions and does  
 75417 not affect the position set by those functions. In particular, a relative seek using *fseek()* or *fseeko()*  
 75418 with SEEK\_CUR adjusts the position relative to the position on entry to the function, not the  
 75419 position after the pushed-back wide characters have been discarded. POSIX.1 also requires  
 75420 *fflush()* to discard pushed back wide characters in situations where the ISO C standard says the

- 75421 behavior of *fflush()* is undefined.
- 75422 **FUTURE DIRECTIONS**
- 75423 None.

- 75435 [87], and XSH/TC1-2008/0692 [14] are applied.
- 75436 **Issue 8**
- 75437 Austin Group Defect 701 is applied, clarifying how the file-position indicator for the stream is
- 75438 updated.
- 75439 Austin Group Defect 1374 is applied, correcting a conflict with the ISO C standard regarding the
- 75440 value of the file-position indicator for the stream after a successful call to *ungetwc()*.

75441 **NAME**

75442 unlink, unlinkat — remove a directory entry

75443 **SYNOPSIS**

75444 #include <unistd.h>

75445 int unlink(const char \*path);

75446 OH #include <fcntl.h>

75447 int unlinkat(int fd, const char \*path, int flag);

75448 **DESCRIPTION**

75449 The *unlink()* function shall remove the directory entry named by *path* and shall decrement the  
 75450 link count of the file referenced by the directory entry. If *path* names a symbolic link, *unlink()*  
 75451 shall remove the symbolic link and shall not affect any file named by the contents of the  
 75452 symbolic link.

75453 When the file’s link count becomes 0 and no process has a reference to the file via an open file  
 75454 descriptor or a memory mapping (see *mmap()*), the space occupied by the file shall be freed and  
 75455 the file shall no longer be accessible. If one or more processes have such a reference to the file  
 75456 when the last link is removed, the link shall be removed before *unlink()* returns, but the removal  
 75457 of the file contents shall be postponed until there are no such references to the file. When the  
 75458 space occupied by the file has been freed, the file’s serial number (*st\_ino*), and therefore the file  
 75459 identity (see XBD <*sys/stat.h*>), shall become available for reuse.

75460 The *path* argument shall not name a directory unless the process has appropriate privileges and  
 75461 the implementation supports using *unlink()* on directories.

75462 Upon successful completion, *unlink()* shall mark for update the last data modification and last  
 75463 file status change timestamps of the parent directory. Also, if the file’s link count is not 0, the last  
 75464 file status change timestamp of the file shall be marked for update.

75465 The *unlinkat()* function shall be equivalent to the *unlink()* or *rmdir()* function except in the case  
 75466 where *path* specifies a relative path. In this case the directory entry to be removed is determined  
 75467 relative to the directory associated with the file descriptor *fd* instead of the current working  
 75468 directory. If the access mode of the open file description associated with the file descriptor is not  
 75469 O\_SEARCH, the function shall check whether directory searches are permitted using the current  
 75470 permissions of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the  
 75471 function shall not perform the check.

75472 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 75473 in <*fcntl.h*>:

75474 AT\_REMOVEDIR

75475 Remove the directory entry specified by *fd* and *path* as a directory, not a normal file.

75476 If *unlinkat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 75477 directory shall be used and the behavior shall be identical to a call to *unlink()* or *rmdir()*  
 75478 respectively, depending on whether or not the AT\_REMOVEDIR bit is set in *flag*.

75479 **RETURN VALUE**

75480 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 75481 return -1 and set *errno* to indicate the error. If -1 is returned, the named file shall not be changed.

75482 **ERRORS**

75483 These functions shall fail and shall not unlink the file if:

75484	[EACCES]	Search permission is denied for a component of the path prefix, or write permission is denied on the directory containing the directory entry to be removed.
75485		
75486		
75487	[EBUSY]	The file named by the <i>path</i> argument cannot be unlinked because it is being used by the system or another process and the implementation considers this an error.
75488		
75489		
75490	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
75491		
75492	[ENAMETOOLONG]	
75493		The length of a component of a pathname is longer than {NAME_MAX}.
75494	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
75495	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
75496		
75497		
75498		
75499		
75500	XSI [EPERM] or [EACCES]	
75501		The S_ISVTX flag is set on the directory containing the file referred to by the <i>path</i> argument and the process does not satisfy the criteria specified in XBD <a href="#">Section 4.5</a> (on page 96).
75502		
75503		
75504	[EROFS]	The directory entry to be unlinked is part of a read-only file system.
75505		The <i>unlink()</i> function shall fail and shall not unlink the file if:
75506	[EPERM]	The file named by <i>path</i> is a directory, and either the calling process does not have appropriate privileges or the implementation prohibits using <i>unlink()</i> on directories.
75507		
75508		
75509		The <i>unlinkat()</i> function shall fail and shall not unlink the file if:
75510	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
75511		
75512		
75513	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
75514		
75515	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
75516		
75517	[EEXIST] or [ENOTEMPTY]	
75518		The <i>flag</i> parameter has the AT_REMOVEDIR bit set and the <i>path</i> argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.
75519		
75520		
75521	[ENOTDIR]	The <i>flag</i> parameter has the AT_REMOVEDIR bit set and <i>path</i> does not name a directory.
75522		
75523	[EPERM]	The file named by <i>path</i> is a directory, the <i>flag</i> parameter does not have the AT_REMOVEDIR bit set, and either the calling process does not have appropriate privileges or the implementation prohibits using <i>unlink()</i> on directories.
75524		
75525		
75526		

- 75527 These functions may fail and not unlink the file if:
- 75528 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during
  - 75529 resolution of the *path* argument.
  - 75530 [ENAMETOOLONG]
  - 75531 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a
  - 75532 symbolic link produced an intermediate result with a length that exceeds
  - 75533 {PATH\_MAX}.
  - 75534 [ETXTBSY] The entry to be unlinked is the last directory entry to a pure procedure (shared
  - 75535 text) file that is being executed.

75536 The *unlinkat()* function may fail and not unlink the file if:

- 75537 [EINVAL] The value of the *flag* argument is not valid.

## 75538 EXAMPLES

### 75539 Removing a Link to a File

75540 The following example shows how to remove a link to a file named `/home/cnd/mod1` by

75541 removing the entry named `/modules/pass1`.

```
75542 #include <unistd.h>
75543 char *path = "/modules/pass1";
75544 int status;
75545 ...
75546 status = unlink(path);
```

### 75547 Checking for an Error

75548 The following example fragment creates a temporary password lock file named `LOCKFILE`,

75549 which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for

75550 writing, *unlink()* is used to remove the link between the file descriptor and `LOCKFILE`.

```
75551 #include <sys/types.h>
75552 #include <stdio.h>
75553 #include <fcntl.h>
75554 #include <errno.h>
75555 #include <unistd.h>
75556 #include <sys/stat.h>
75557 #define LOCKFILE "/etc/ptmp"
75558 int pfd; /* Integer for file descriptor returned by open call. */
75559 FILE *fpfd; /* File pointer for use in putpwent(). */
75560 ...
75561 /* Open password Lock file. If it exists, this is an error. */
75562 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
75563 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
75564     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
75565     exit(1);
75566 }
75567 /* Lock file created; proceed with fdopen of lock file so that
75568 putpwent() can be used.
```

```

75569     */
75570     if ((fpfd = fdopen(pfd, "w")) == NULL) {
75571         close(pfd);
75572         unlink(LOCKFILE);
75573         exit(1);
75574     }

```

### 75575 Replacing Files

75576 The following example fragment uses *unlink()* to discard links to files, so that they can be  
75577 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error  
75578 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can  
75579 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```

75580     #include <sys/types.h>
75581     #include <stdio.h>
75582     #include <fcntl.h>
75583     #include <errno.h>
75584     #include <unistd.h>
75585     #include <sys/stat.h>
75586
75587     #define LOCKFILE "/etc/ptmp"
75588     #define PASSWDFILE "/etc/passwd"
75589     #define SAVEFILE "/etc/opasswd"
75590     ...
75591     /* If no change was made, assume error and leave passwd unchanged. */
75592     if (!valid_change) {
75593         fprintf(stderr, "Could not change password for user %s\n", user);
75594         unlink(LOCKFILE);
75595         exit(1);
75596     }
75597
75598     /* Change permissions on new password file. */
75599     chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);
75600
75601     /* Remove saved password file. */
75602     unlink(SAVEFILE);
75603
75604     /* Save current password file. */
75605     link(PASSWDFILE, SAVEFILE);
75606
75607     /* Remove current password file. */
75608     unlink(PASSWDFILE);
75609
75610     /* Save new password file as current password file. */
75611     link(LOCKFILE, PASSWDFILE);
75612
75613     /* Remove lock file. */
75614     unlink(LOCKFILE);
75615
75616     exit(0);

```

### 75609 APPLICATION USAGE

75610 Applications should use *rmdir()* to remove a directory.

75611 **RATIONALE**

75612 Unlinking a directory is restricted to the superuser in many historical implementations for  
75613 reasons given in *link()* (see also *rename()*).

75614 The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume  
75615 of POSIX.1-2024 does not cover the system administration concepts of mounting and  
75616 unmounting, the description of the error was changed to “resource busy”. (This meaning is used  
75617 by some device drivers when a second process tries to open an exclusive use device.) The  
75618 wording is also intended to allow implementations to refuse to remove a directory if it is the root  
75619 or current working directory of any process.

75620 The standard developers reviewed TR 24715-2006 and noted that LSB-conforming  
75621 implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change  
75622 to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was  
75623 considered, but decided against since it would break existing strictly conforming and  
75624 conforming applications. Applications written for portability to both POSIX.1-2024 and the LSB  
75625 should be prepared to handle either error code.

75626 The purpose of the *unlinkat()* function is to remove directory entries in directories other than the  
75627 current working directory without exposure to race conditions. Any part of the path of a file  
75628 could be changed in parallel to a call to *unlink()*, resulting in unspecified behavior. By opening a  
75629 file descriptor for the target directory and using the *unlinkat()* function it can be guaranteed that  
75630 the removed directory entry is located relative to the desired directory.

75631 **FUTURE DIRECTIONS**

75632 None.

75633 **SEE ALSO**

75634 *close()*, *link()*, *remove()*, *rename()*, *rmdir()*, *symlink()*

75635 XBD Section 4.5 (on page 96), [<fcntl.h>](#), [<sys/stat.h>](#), [<unistd.h>](#)

75636 **CHANGE HISTORY**

75637 First released in Issue 1. Derived from Issue 1 of the SVID.

75638 **Issue 5**

75639 The [EBUSY] error is added to the optional part of the ERRORS section.

75640 **Issue 6**

75641 The following new requirements on POSIX implementations derive from alignment with the  
75642 Single UNIX Specification:

- 75643 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 75644 • The [ELOOP] mandatory error condition is added.
- 75645 • A second [ENAMETOOLONG] is added as an optional error condition.
- 75646 • The [ETXTBSY] optional error condition is added.

75647 The following changes were made to align with the IEEE P1003.1a draft standard:

- 75648 • The [ELOOP] optional error condition is added.

75649 The normative text is updated to avoid use of the term “must” for application requirements.

75650 **Issue 7**

75651 Austin Group Interpretation 1003.1-2001 #143 is applied.

75652 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
75653 operations when the S\_ISVTX bit is set.

- 75654 Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM]  
75655 and [EISDIR].
- 75656 The *unlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API  
75657 Set Part 2.
- 75658 Changes are made related to support for finegrained timestamps.
- 75659 Changes are made to allow a directory to be opened for searching.
- 75660 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
75661 pathname exists but is not a directory or a symbolic link to a directory.
- 75662 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0693 [461], XSH/TC1-2008/0694 [324],  
75663 XSH/TC1-2008/0695 [278], and XSH/TC1-2008/0696 [278] are applied.
- 75664 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0378 [873], XSH/TC2-2008/0379 [591],  
75665 XSH/TC2-2008/0380 [817], and XSH/TC2-2008/0381 [817] are applied.
- 75666 **Issue 8**
- 75667 Austin Group Defect 1314 is applied, clarifying that file identities become available for reuse  
75668 after the space occupied by the file has been freed.
- 75669 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 75670 Austin Group Defect 1380 is applied, changing text using the term “link” in line with its  
75671 updated definition.
- 75672 Austin Group Defect 1385 is applied, clarifying that the file contents are not removed until there  
75673 are no references to the file via open file descriptors or memory mappings.
- 75674 Austin Group Defect 1574 is applied, splitting the [EPERM] error into separate entries for  
75675 *unlink()* and *unlinkat()*.

75676 **NAME**

75677 unlockpt — unlock a pseudo-terminal manager/subsidiary pair

75678 **SYNOPSIS**

```
75679 XSI #include <stdlib.h>  
75680 int unlockpt(int fildev);
```

75681 **DESCRIPTION**75682 The *unlockpt()* function shall unlock the subsidiary pseudo-terminal device associated with the  
75683 manager device to which *fildev* refers.75684 Conforming applications shall ensure that they call *unlockpt()* before opening the subsidiary side  
75685 of a pseudo-terminal device.75686 **RETURN VALUE**75687 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*  
75688 to indicate the error.75689 **ERRORS**75690 The *unlockpt()* function may fail if:75691 [EBADF] The *fildev* argument is not a file descriptor open for writing.75692 [EINVAL] The *fildev* argument is not associated with a manager pseudo-terminal device.75693 **EXAMPLES**

75694 None.

75695 **APPLICATION USAGE**

75696 None.

75697 **RATIONALE**75698 See the RATIONALE section for *posix\_openpt()*.75699 **FUTURE DIRECTIONS**

75700 None.

75701 **SEE ALSO**75702 *grantpt()*, *open()*, *posix\_openpt()*, *ptsname()*

75703 XBD &lt;stdlib.h&gt;

75704 **CHANGE HISTORY**

75705 First released in Issue 4, Version 2.

75706 **Issue 5**

75707 Moved from X/OPEN UNIX extension to BASE.

75708 **Issue 6**

75709 The normative text is updated to avoid use of the term “must” for application requirements.

75710 **Issue 7**

75711 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0697 [96] is applied.

75712 **Issue 8**75713 Austin Group Defect 1466 is applied, changing the terminology used for pseudo-terminal  
75714 devices.

75715 **NAME**

75716           unsetenv — remove an environment variable

75717 **SYNOPSIS**

```
75718 CX       #include <stdlib.h>
75719       int unsetenv(const char *name);
```

75720 **DESCRIPTION**

75721       The *unsetenv()* function shall remove an environment variable from the environment of the  
 75722       calling process. The *name* argument points to a string, which is the name of the variable to be  
 75723       removed. The named argument shall not contain an '=' character. If the named variable does  
 75724       not exist in the current environment, the environment shall be unchanged and the function is  
 75725       considered to have completed successfully.

75726       The *unsetenv()* function shall update the list of pointers to which *environ* points.

75727       The *unsetenv()* function need not be thread-safe.

75728 **RETURN VALUE**

75729       Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
 75730       indicate the error, and the environment shall be unchanged.

75731 **ERRORS**

75732       The *unsetenv()* function shall fail if:

75733	[EINVAL]	The <i>name</i> argument points to an empty string, or points to a string containing
75734		an '=' character.

75735 **EXAMPLES**

75736       None.

75737 **APPLICATION USAGE**

75738       None.

75739 **RATIONALE**

75740       Refer to the RATIONALE section in *setenv()*.

75741 **FUTURE DIRECTIONS**

75742       None.

75743 **SEE ALSO**

75744       *getenv()*, *setenv()*

75745       XBD <stdlib.h>, <sys/types.h>

75746 **CHANGE HISTORY**

75747       First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

75748 **Issue 7**

75749       Austin Group Interpretation 1003.1-2001 #156 is applied.

75750       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0698 [167] and XSH/TC1-2008/0699  
 75751       [185] are applied.

75752 **NAME**

75753           uselocale — use locale in current thread

75754 **SYNOPSIS**

```
75755 CX       #include <locale.h>
75756       locale_t uselocale(locale_t newloc);
```

75757 **DESCRIPTION**75758       The *uselocale()* function shall set or query the current locale for the calling thread.75759       The value for the *newloc* argument shall be one of the following:

- 75760           1. A value returned by the *newlocale()* or *duplocale()* functions
- 75761           2. The special locale object descriptor LC\_GLOBAL\_LOCALE
- 75762           3. **(locale\_t)0**

75763       If the *newloc* argument is **(locale\_t)0**, the current locale shall not be changed; this value can be used to query the current locale setting. If the *newloc* argument is LC\_GLOBAL\_LOCALE, any thread-local locale for the calling thread shall be uninstalled; the thread shall again use the global locale as the current locale, and changes to the global locale shall affect the thread. Otherwise, the locale represented by *newloc* shall be installed as a thread-local locale to be used as the current locale for the calling thread.

75769       Once the *uselocale()* function has been called to install a thread-local locale, the behavior of every interface using data from the current locale shall be affected for the calling thread. The current locale for other threads shall remain unchanged.

75772 **RETURN VALUE**

75773       Upon successful completion, the *uselocale()* function shall return a handle for the thread-local locale that was in use as the current locale for the calling thread on entry to the function, or LC\_GLOBAL\_LOCALE if no thread-local locale was in use. Otherwise, *uselocale()* shall return **(locale\_t)0** and set *errno* to indicate the error.

75777 **ERRORS**75778       The *uselocale()* function may fail if:75779       [EINVAL]           *newloc* is not a valid locale object and is not **(locale\_t)0**.75780 **EXAMPLES**

75781       None.

75782 **APPLICATION USAGE**

75783       Unlike the *setlocale()* function, the *uselocale()* function does not allow replacing some locale categories only. Applications that need to install a locale which differs only in a few categories must use *newlocale()* to change a locale object equivalent to the currently used locale and install it.

75787 **RATIONALE**

75788       None.

75789 **FUTURE DIRECTIONS**

75790       None.

75791 **SEE ALSO**75792 *duplocale()*, *freelocale()*, *getlocalename\_1()*, *newlocale()*, *setlocale()*

75794 **CHANGE HISTORY**

75795 First released in Issue 7.

75796 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0700 [290] and XSH/TC1-2008/0701  
75797 [334] are applied.

75798 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0382 [582] is applied.

75799 **Issue 8**75800 Austin Group Defect 1220 is applied, adding *getlocalename\_1()* to the SEE ALSO section.

75801 **NAME**

75802 utimensat, utimes — set file access and modification times

75803 **SYNOPSIS**

75804 #include <sys/stat.h>

75805 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2],  
75806 int *flag*);

75807 XSI #include <sys/time.h>

75808 int utimes(const char \**path*, const struct timeval *times*[2]);

75809 **DESCRIPTION**

75810 Refer to [futimens\(\)](#).

75811 **NAME**

75812       va\_arg, va\_copy, va\_end, va\_start — handle variable argument list

75813 **SYNOPSIS**

75814       #include &lt;stdarg.h&gt;

75815       type va\_arg(va\_list ap, type);

75816       void va\_copy(va\_list dest, va\_list src);

75817       void va\_end(va\_list ap);

75818       void va\_start(va\_list ap, argN);

75819 **DESCRIPTION**75820       Refer to XBD [<stdarg.h>](#)

75821 **NAME**

75822       vasprintf — format output of a stdarg argument list

75823 **SYNOPSIS**

75824       #include <stdarg.h>

75825       #include <stdio.h>

75826       int vasprintf(char \*\*restrict ptr, const char \*restrict format,

75827           va\_list ap);

75828 **DESCRIPTION**

75829       Refer to *vfprintf()*.

75830 **NAME**

75831 vasprintf, vdprintf, vfprintf, vprintf, vsnprintf, vsprintf — format output of a stdarg argument  
75832 list

75833 **SYNOPSIS**

```
75834 #include <stdarg.h>
75835 #include <stdio.h>
```

```
75836 CX int vasprintf(char **restrict ptr, const char *restrict format,
75837                va_list ap);
75838 int vdprintf(int fildes, const char *restrict format, va_list ap);
75839 int vfprintf(FILE *restrict stream, const char *restrict format,
75840             va_list ap);
75841 int vprintf(const char *restrict format, va_list ap);
75842 int vsnprintf(char *restrict s, size_t n, const char *restrict format,
75843              va_list ap);
75844 int vsprintf(char *restrict s, const char *restrict format, va_list ap);
```

75845 **DESCRIPTION**

75846 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
75847 conflict between the requirements described here and the ISO C standard is unintentional. This  
75848 volume of POSIX.1-2024 defers to the ISO C standard.

75849 CX The *vasprintf()*, *vdprintf()*, *vfprintf()*, *vprintf()*, *vsnprintf()*, and *vsprintf()* functions shall be  
75850 CX equivalent to the *asprintf()*, *dprintf()*, *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* functions  
75851 respectively, except that instead of being called with a variable number of arguments, they are  
75852 called with an argument list as defined by **<stdarg.h>**.

75853 These functions shall not invoke the *va\_end* macro. As these functions invoke the *va\_arg* macro,  
75854 the value of *ap* after the return is unspecified.

75855 **RETURN VALUE**

75856 Refer to *fprintf()*.

75857 **ERRORS**

75858 Refer to *fprintf()*.

75859 **EXAMPLES**

75860 None.

75861 **APPLICATION USAGE**

75862 Applications using these functions should call *va\_end(ap)* afterwards to clean up.

75863 **RATIONALE**

75864 None.

75865 **FUTURE DIRECTIONS**

75866 None.

75867 **SEE ALSO**

75868 [Section 2.5](#) (on page 521), *fprintf()*

75869 XBD **<stdarg.h>**, **<stdio.h>**

75870 **CHANGE HISTORY**

75871 First released in Issue 1. Derived from Issue 1 of the SVID.

75872 **Issue 5**

75873 The *vsnprintf()* function is added.

75874 **Issue 6**

75875 The *vfprintf()*, *vprintf()*, *vsprintf()*, and *vsnprintf()* functions are updated for alignment with the  
75876 ISO/IEC 9899:1999 standard.

75877 **Issue 7**

75878 The *vdprintf()* function is added to complement the *dprintf()* function from The Open Group  
75879 Technical Standard, 2006, Extended API Set Part 1.

75880 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0703 [14] is applied.

75881 **Issue 8**

75882 Austin Group Defect 1496 is applied, adding the *vasprintf()* function.

75883 **NAME**75884 `vfscanf`, `vscanf`, `vsscanf` — format input of a `stdarg` argument list75885 **SYNOPSIS**75886 `#include <stdarg.h>`75887 `#include <stdio.h>`75888 `int vfscanf(FILE *restrict stream, const char *restrict format,`  
75889 `va_list arg);`75890 `int vscanf(const char *restrict format, va_list arg);`75891 `int vsscanf(const char *restrict s, const char *restrict format,`  
75892 `va_list arg);`75893 **DESCRIPTION**75894 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
75895 conflict between the requirements described here and the ISO C standard is unintentional. This  
75896 volume of POSIX.1-2024 defers to the ISO C standard.75897 The `vscanf()`, `vfscanf()`, and `vsscanf()` functions shall be equivalent to the `scanf()`, `fscanf()`, and  
75898 `sscanf()` functions, respectively, except that instead of being called with a variable number of  
75899 arguments, they are called with an argument list as defined in the `<stdarg.h>` header. These  
75900 functions shall not invoke the `va_end` macro. As these functions invoke the `va_arg` macro, the  
75901 value of `ap` after the return is unspecified.75902 **RETURN VALUE**75903 Refer to `fscanf()`.75904 **ERRORS**75905 Refer to `fscanf()`.75906 **EXAMPLES**

75907 None.

75908 **APPLICATION USAGE**75909 Applications using these functions should call `va_end(ap)` afterwards to clean up.75910 **RATIONALE**

75911 None.

75912 **FUTURE DIRECTIONS**

75913 None.

75914 **SEE ALSO**75915 [Section 2.5](#) (on page 521), `fscanf()`75916 XBD `<stdarg.h>`, `<stdio.h>`75917 **CHANGE HISTORY**

75918 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

75919 **Issue 7**

75920 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0704 [14] is applied.

75921 **NAME**

75922 vfwprintf, vswprintf, vwprintf — wide-character formatted output of a stdarg argument list

75923 **SYNOPSIS**

```
75924 #include <stdarg.h>
75925 #include <stdio.h>
75926 #include <wchar.h>

75927 int vfwprintf(FILE *restrict stream, const wchar_t *restrict format,
75928             va_list arg);
75929 int vswprintf(wchar_t *restrict ws, size_t n,
75930             const wchar_t *restrict format, va_list arg);
75931 int vwprintf(const wchar_t *restrict format, va_list arg);
```

75932 **DESCRIPTION**

75933 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 75934 conflict between the requirements described here and the ISO C standard is unintentional. This  
 75935 volume of POSIX.1-2024 defers to the ISO C standard.

75936 The *vfwprintf()*, *vswprintf()*, and *vwprintf()* functions shall be equivalent to *fwprintf()*, *swprintf()*,  
 75937 and *wprintf()* respectively, except that instead of being called with a variable number of  
 75938 arguments, they are called with an argument list as defined by **<stdarg.h>**.

75939 These functions shall not invoke the *va\_end* macro. However, as these functions do invoke the  
 75940 *va\_arg* macro, the value of *ap* after the return is unspecified.

75941 **RETURN VALUE**75942 Refer to *fwprintf()*.75943 **ERRORS**75944 Refer to *fwprintf()*.75945 **EXAMPLES**

75946 None.

75947 **APPLICATION USAGE**75948 Applications using these functions should call *va\_end(ap)* afterwards to clean up.75949 **RATIONALE**

75950 None.

75951 **FUTURE DIRECTIONS**

75952 None.

75953 **SEE ALSO**75954 [Section 2.5](#) (on page 521), *fwprintf()*75955 XBD **<stdarg.h>**, **<stdio.h>**, **<wchar.h>**75956 **CHANGE HISTORY**

75957 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 75958 (E).

75959 **Issue 6**

75960 The *vfwprintf()*, *vswprintf()*, and *vwprintf()* prototypes are updated for alignment with the  
 75961 ISO/IEC 9899:1999 standard.

75962 **Issue 7**  
75963

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0705 [14] is applied.

75964 **NAME**

75965 vfwscanf, vswscanf, vwscanf — wide-character formatted input of a stdarg argument list

75966 **SYNOPSIS**

```
75967 #include <stdarg.h>
75968 #include <stdio.h>
75969 #include <wchar.h>

75970 int vfwscanf(FILE *restrict stream, const wchar_t *restrict format,
75971             va_list arg);
75972 int vswscanf(const wchar_t *restrict ws, const wchar_t *restrict format,
75973             va_list arg);
75974 int vwscanf(const wchar_t *restrict format, va_list arg);
```

75975 **DESCRIPTION**

75976 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 75977 conflict between the requirements described here and the ISO C standard is unintentional. This  
 75978 volume of POSIX.1-2024 defers to the ISO C standard.

75979 The *vfwscanf()*, *vswscanf()*, and *vwscanf()* functions shall be equivalent to the *fscanf()*,  
 75980 *swscanf()*, and *wscanf()* functions, respectively, except that instead of being called with a variable  
 75981 number of arguments, they are called with an argument list as defined in the **<stdarg.h>** header.  
 75982 These functions shall not invoke the *va\_end* macro. As these functions invoke the *va\_arg* macro,  
 75983 the value of *ap* after the return is unspecified.

75984 **RETURN VALUE**75985 Refer to *fscanf()*.75986 **ERRORS**75987 Refer to *fscanf()*.75988 **EXAMPLES**

75989 None.

75990 **APPLICATION USAGE**75991 Applications using these functions should call *va\_end(ap)* afterwards to clean up.75992 **RATIONALE**

75993 None.

75994 **FUTURE DIRECTIONS**

75995 None.

75996 **SEE ALSO**75997 [Section 2.5](#) (on page 521), *fscanf()*75998 XBD **<stdarg.h>**, **<stdio.h>**, **<wchar.h>**75999 **CHANGE HISTORY**

76000 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

76001 **Issue 7**

76002 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0706 [14] is applied.

76003 **NAME**

76004 vprintf — format the output of a stdarg argument list

76005 **SYNOPSIS**

76006 #include &lt;stdarg.h&gt;

76007 #include &lt;stdio.h&gt;

76008 int vprintf(const char \*restrict *format*, va\_list *ap*);76009 **DESCRIPTION**76010 Refer to *vfprintf()*.

76011 **NAME**

76012           vscanf — format input of a stdarg argument list

76013 **SYNOPSIS**

76014           #include &lt;stdarg.h&gt;

76015           #include &lt;stdio.h&gt;

76016           int vscanf(const char \*restrict *format*, va\_list *arg*);76017 **DESCRIPTION**76018           Refer to *vfprintf()*.

76019 **NAME**

76020        vsprintf, vsprintf — format output of a stdarg argument list

76021 **SYNOPSIS**

76022        #include &lt;stdarg.h&gt;

76023        #include &lt;stdio.h&gt;

```
76024        int vsnprintf(char *restrict s, size_t n,
76025                    const char *restrict format, va_list ap);
76026        int vsprintf(char *restrict s, const char *restrict format,
76027                    va_list ap);
```

76028 **DESCRIPTION**76029        Refer to *fprintf()*.

76030 **NAME**

76031 vsscanf — format input of a stdarg argument list

76032 **SYNOPSIS**

76033 #include &lt;stdarg.h&gt;

76034 #include &lt;stdio.h&gt;

76035 int vsscanf(const char \*restrict *s*, const char \*restrict *format*,76036 va\_list *arg*);76037 **DESCRIPTION**76038 Refer to *vfscanf()*.

76039 **NAME**

76040 vswprintf — wide-character formatted output of a stdarg argument list

76041 **SYNOPSIS**

76042 #include &lt;stdarg.h&gt;

76043 #include &lt;stdio.h&gt;

76044 #include &lt;wchar.h&gt;

76045 int vswprintf(wchar\_t \*restrict *ws*, size\_t *n*,76046 const wchar\_t \*restrict *format*, va\_list *arg*);76047 **DESCRIPTION**76048 Refer to *vfwprintf()*.

76049 **NAME**

76050 vswscanf — wide-character formatted input of a stdarg argument list

76051 **SYNOPSIS**

76052 #include &lt;stdarg.h&gt;

76053 #include &lt;stdio.h&gt;

76054 #include &lt;wchar.h&gt;

76055 int vswscanf(const wchar\_t \*restrict *ws*, const wchar\_t \*restrict *format*,  
76056 va\_list *arg*);76057 **DESCRIPTION**76058 Refer to *vfwscanf()*.

76059 **NAME**

76060 vwprintf — wide-character formatted output of a stdarg argument list

76061 **SYNOPSIS**

76062 #include &lt;stdarg.h&gt;

76063 #include &lt;stdio.h&gt;

76064 #include &lt;wchar.h&gt;

76065 int vwprintf(const wchar\_t \*restrict *format*, va\_list *arg*);76066 **DESCRIPTION**76067 Refer to *vwprintf()*.

76068 **NAME**

76069       vwscanf — wide-character formatted input of a stdarg argument list

76070 **SYNOPSIS**

76071       #include &lt;stdarg.h&gt;

76072       #include &lt;stdio.h&gt;

76073       #include &lt;wchar.h&gt;

76074       int vwscanf(const wchar\_t \*restrict *format*, va\_list *arg*);76075 **DESCRIPTION**76076       Refer to [vwscanf\(\)](#).

76077 **NAME**

76078 wait, waitpid — wait for a child process to stop or terminate

76079 **SYNOPSIS**

76080 #include &lt;sys/wait.h&gt;

76081 pid\_t wait(int \*stat\_loc);

76082 pid\_t waitpid(pid\_t pid, int \*stat\_loc, int options);

76083 **DESCRIPTION**

76084 The *wait()* and *waitpid()* functions shall obtain status information (see [Section 2.12](#), on page 563) pertaining to one of the caller's child processes. The *wait()* function obtains status information for process termination from any child process. The *waitpid()* function obtains status information for process termination, and optionally process stop and/or continue, from a specified subset of the child processes.

76089 The *wait()* function shall cause the calling thread to become blocked until status information generated by child process termination is made available to the thread, or until delivery of a signal whose action is either to execute a signal-catching function or to terminate the process, or an error occurs. If termination status information is available prior to the call to *wait()*, return shall be immediate. If termination status information is available for two or more child processes, the order in which their status is reported is unspecified.

76095 As described in [Section 2.12](#) (on page 563), the *wait()* and *waitpid()* functions consume the status information they obtain.

76097 The behavior when multiple threads are blocked in *wait()*, *waitid()*, or *waitpid()* is described in [Section 2.12](#) (on page 563).

76099 The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is **(pid\_t)-1** and the *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and *options* arguments.

76102 The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()* function shall only return the status of a child process from this set:

- 76104 • If *pid* is equal to **(pid\_t)-1**, *status* is requested for any child process. In this respect, *waitpid()* is then equivalent to *wait()*.
- 76106 • If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is requested.
- 76108 • If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that of the calling process.
- 76110 • If *pid* is less than **(pid\_t)-1**, *status* is requested for any child process whose process group ID is equal to the absolute value of *pid*.

76112 The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the following flags, defined in the **<sys/wait.h>** header:

76114 XSI **WCONTINUED** The *waitpid()* function shall report the status of any continued child process specified by *pid* whose status has not been reported since it continued from a job control stop.

76117 **WNOHANG** The *waitpid()* function shall not suspend execution of the calling thread if *status* is not immediately available for one of the child processes specified by *pid*.

76120 WUNTRACED The status of any child processes specified by *pid* that are stopped, and whose  
 76121 status has not yet been reported since they stopped, shall also be reported to  
 76122 the requesting process.

76123 If *wait()* or *waitpid()* return because the status of a child process is available, these functions  
 76124 shall return a value equal to the process ID of the child process. In this case, if the value of the  
 76125 argument *stat\_loc* is not a null pointer, information shall be stored in the location pointed to by  
 76126 *stat\_loc*. The value stored at the location pointed to by *stat\_loc* shall be 0 if and only if the status  
 76127 returned is from a terminated child process that terminated by one of the following means:

- 76128 1. The process returned 0 from *main()*.
- 76129 2. The process called *\_exit()* or *exit()* with a *status* argument of 0.
- 76130 3. The process was terminated because the last thread in the process terminated.

76131 Regardless of its value, this information may be interpreted using the following macros, which  
 76132 are defined in **<sys/wait.h>** and evaluate to integral expressions; the *stat\_val* argument is the  
 76133 integer value pointed to by *stat\_loc*.

76134 WIFEXITED(*stat\_val*)  
 76135 Evaluates to a non-zero value if *status* was returned for a child process that terminated  
 76136 normally.

76137 WEXITSTATUS(*stat\_val*)  
 76138 If the value of WIFEXITED(*stat\_val*) is non-zero, this macro shall evaluate to the low-order 8  
 76139 bits of the *status* argument that the child process passed to *\_exit()* or *exit()*, or the value the  
 76140 child process returned from *main()*.

76141 WIFSIGNALED(*stat\_val*)  
 76142 Evaluates to a non-zero value if *status* was returned for a child process that terminated due  
 76143 to the receipt of a signal that was not caught (see **<signal.h>**).

76144 WCOREDUMP(*stat\_val*)  
 76145 If the value of WIFSIGNALED(*stat\_val*) is non-zero, this macro shall evaluate to a non-zero  
 76146 value if the creation of a core image of the terminated child was attempted.

76147 WTERMSIG(*stat\_val*)  
 76148 If the value of WIFSIGNALED(*stat\_val*) is non-zero, this macro shall evaluate to the number  
 76149 of the signal that caused the termination of the child process.

76150 WIFSTOPPED(*stat\_val*)  
 76151 Evaluates to a non-zero value if *status* was returned for a child process that stopped due to  
 76152 the receipt of a signal that was not caught (see **<signal.h>**).

76153 WSTOPSIG(*stat\_val*)  
 76154 If the value of WIFSTOPPED(*stat\_val*) is non-zero, this macro shall evaluate to the number  
 76155 of the signal that caused the child process to stop.

76156 XSI WIFCONTINUED(*stat\_val*)  
 76157 Evaluates to a non-zero value if *status* was returned for a child process that has continued  
 76158 from a job control stop.

76159 SPN It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
 76160 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a WIFSTOPPED(*stat\_val*) before  
 76161 subsequent calls to *wait()* or *waitpid()* indicate WIFEXITED(*stat\_val*) as the result of an error  
 76162 detected before the new process image starts executing.

76163 It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes

76164 created by `posix_spawn()` or `posix_spawnp()` can indicate a `WIFSIGNALED(stat_val)` if a signal is  
 76165 sent to the parent's process group after `posix_spawn()` or `posix_spawnp()` is called.

76166 If the information pointed to by `stat_loc` was stored by a call to `waitpid()` that specified the  
 76167 XSI `WUNTRACED` flag and did not specify the `WCONTINUED` flag, exactly one of the macros  
 76168 `WIFEXITED(*stat_loc)`, `WIFSIGNALED(*stat_loc)`, and `WIFSTOPPED(*stat_loc)` shall evaluate to a  
 76169 non-zero value.

76170 XSI If the information pointed to by `stat_loc` was stored by a call to `waitpid()` that specified the  
 76171 `WUNTRACED` and `WCONTINUED` flags, exactly one of the macros `WIFEXITED(*stat_loc)`,  
 76172 `WIFSIGNALED(*stat_loc)`, `WIFSTOPPED(*stat_loc)`, and `WIFCONTINUED(*stat_loc)` shall  
 76173 evaluate to a non-zero value.

76174 If the information pointed to by `stat_loc` was stored by a call to `waitpid()` that did not specify the  
 76175 XSI `WUNTRACED` or `WCONTINUED` flags, or by a call to the `wait()` function, exactly one of the  
 76176 macros `WIFEXITED(*stat_loc)` and `WIFSIGNALED(*stat_loc)` shall evaluate to a non-zero value.

76177 XSI If the information pointed to by `stat_loc` was stored by a call to `waitpid()` that did not specify the  
 76178 `WUNTRACED` flag and specified the `WCONTINUED` flag, exactly one of the macros  
 76179 `WIFEXITED(*stat_loc)`, `WIFSIGNALED(*stat_loc)`, and `WIFCONTINUED(*stat_loc)` shall evaluate  
 76180 to a non-zero value.

76181 If the implementation queues the `SIGCHLD` signal, then if `wait()` or `waitpid()` returns because  
 76182 the status of a child process is available, any pending `SIGCHLD` signal associated with the  
 76183 process ID of the child process shall be discarded. Any other pending `SIGCHLD` signals shall  
 76184 remain pending.

76185 Otherwise, if `SIGCHLD` is blocked, if `wait()` or `waitpid()` return because the status of a child  
 76186 process is available, any pending `SIGCHLD` signal shall be cleared unless the status of another  
 76187 child process is available.

76188 For all other conditions, it is unspecified whether child *status* will be available when a `SIGCHLD`  
 76189 signal is delivered.

76190 There may be additional implementation-defined circumstances under which `wait()` or `waitpid()`  
 76191 report *status*. This shall not occur unless the calling process or one of its child processes  
 76192 explicitly makes use of a non-standard extension. In these cases the interpretation of the  
 76193 reported *status* is implementation-defined.

76194 If a parent process terminates without waiting for all of its child processes to terminate, the  
 76195 remaining child processes shall be assigned a new parent process ID corresponding to an  
 76196 implementation-defined system process.

#### 76197 RETURN VALUE

76198 If `wait()` or `waitpid()` returns because the status of a child process is available, these functions  
 76199 shall return a value equal to the process ID of the child process for which *status* is reported. If  
 76200 `wait()` or `waitpid()` returns due to the delivery of a signal to the calling process, `-1` shall be  
 76201 returned and `errno` set to `[EINTR]`. If `waitpid()` was invoked with `WNOHANG` set in *options*, it  
 76202 has at least one child process specified by *pid* for which *status* is not available, and *status* is not  
 76203 available for any process specified by *pid*, `0` is returned. Otherwise, `-1` shall be returned, and  
 76204 `errno` set to indicate the error.

#### 76205 ERRORS

76206 The `wait()` function shall fail if:

76207 `[ECHILD]` The calling process has no existing unwaited-for child processes.

76208	[EINTR]	The function was interrupted by a signal. The value of the location pointed to by <i>stat_loc</i> is undefined.
76209		
76210		The <i>waitpid()</i> function shall fail if:
76211	[ECHILD]	The process specified by <i>pid</i> does not exist or is not a child of the calling process, or the process group specified by <i>pid</i> does not exist or does not have any member process that is a child of the calling process.
76212		
76213		
76214	[EINTR]	The function was interrupted by a signal. The value of the location pointed to by <i>stat_loc</i> is undefined.
76215		
76216	[EINVAL]	The <i>options</i> argument is not valid.

## 76217 EXAMPLES

### 76218 Waiting for a Child Process and then Checking its Status

76219 The following example demonstrates the use of *waitpid()*, *fork()*, and the macros used to  
 76220 interpret the status value returned by *waitpid()* (and *wait()*). The code segment creates a child  
 76221 process which does some unspecified work. Meanwhile the parent loops performing calls to  
 76222 *waitpid()* to monitor the status of the child. The loop terminates when child termination is  
 76223 detected.

```

76224 #include <stdio.h>
76225 #include <stdlib.h>
76226 #include <unistd.h>
76227 #include <sys/wait.h>
76228 ...
76229 pid_t child_pid, wpid;
76230 int status;
76231 child_pid = fork();
76232 if (child_pid == -1) {          /* fork() failed */
76233     perror("fork");
76234     exit(EXIT_FAILURE);
76235 }
76236 if (child_pid == 0) {          /* This is the child */
76237     /* Child does some work and then terminates */
76238     ...
76239 } else {                       /* This is the parent */
76240     do {
76241         wpid = waitpid(child_pid, &status, WUNTRACED
76242 #ifdef WCONTINUED             /* Not all implementations support this */
76243     | WCONTINUED
76244 #endif
76245     );
76246         if (wpid == -1) {
76247             perror("waitpid");
76248             exit(EXIT_FAILURE);
76249         }
76250         if (WIFEXITED(status)) {
76251             printf("child exited, status=%d\n", WEXITSTATUS(status));
76252         } else if (WIFSIGNALED(status)) {

```

```

76253         printf("child killed (signal %d)\n", WTERMSIG(status));
76254     } else if (WIFSTOPPED(status)) {
76255         printf("child stopped (signal %d)\n", WSTOPSIG(status));
76256 #ifdef WIFCONTINUED     /* Not all implementations support this */
76257     } else if (WIFCONTINUED(status)) {
76258         printf("child continued\n");
76259 #endif
76260     } else {     /* Non-standard case -- may never happen */
76261         printf("Unexpected status (0x%x)\n", status);
76262     }
76263     } while (!WIFEXITED(status) && !WIFSIGNALED(status));
76264 }

```

### 76265 **Waiting for a Child Process in a Signal Handler for SIGCHLD**

76266 The following example demonstrates how to use *waitpid()* in a signal handler for SIGCHLD  
76267 without passing *-1* as the *pid* argument. (See the APPLICATION USAGE section below for the  
76268 reasons why passing a *pid* of *-1* is not recommended.) The method used here relies on the  
76269 standard behavior of *waitpid()* when SIGCHLD is blocked. On historical non-conforming  
76270 systems, the status of some child processes might not be reported.

```

76271 #include <stdlib.h>
76272 #include <stdio.h>
76273 #include <signal.h>
76274 #include <sys/types.h>
76275 #include <sys/wait.h>
76276 #include <unistd.h>
76277 #define CHILDREN 10
76278 static void
76279 handle_sigchld(int signum, siginfo_t *sinfo, void *unused)
76280 {
76281     int sav_errno = errno;
76282     int status;
76283     /*
76284     * Obtain status information for the child which
76285     * caused the SIGCHLD signal and write its exit code
76286     * to stdout.
76287     */
76288     if (sinfo->si_code != CLD_EXITED)
76289     {
76290         static char msg[] = "wrong si_code\n";
76291         write(2, msg, sizeof msg - 1);
76292     }
76293     else if (waitpid(sinfo->si_pid, &status, 0) == -1)
76294     {
76295         static char msg[] = "waitpid() failed\n";
76296         write(2, msg, sizeof msg - 1);
76297     }
76298     else if (!WIFEXITED(status))
76299     {

```

```
76300         static char msg[] = "WIFEXITED was false\n";
76301         write(2, msg, sizeof msg - 1);
76302     }
76303     else
76304     {
76305         int code = WEXITSTATUS(status);
76306         char buf[2];
76307         buf[0] = '0' + code;
76308         buf[1] = '\n';
76309         write(1, buf, 2);
76310     }
76311     errno = sav_errno;
76312 }

76313 int
76314 main(void)
76315 {
76316     int i;
76317     pid_t pid;
76318     struct sigaction sa;

76319     sa.sa_flags = SA_SIGINFO;
76320     sa.sa_sigaction = handle_sigchld;
76321     sigemptyset(&sa.sa_mask);
76322     if (sigaction(SIGCHLD, &sa, NULL) == -1)
76323     {
76324         perror("sigaction");
76325         exit(EXIT_FAILURE);
76326     }
76327     for (i = 0; i < CHILDREN; i++)
76328     {
76329         switch (pid = fork())
76330         {
76331             case -1:
76332                 perror("fork");
76333                 exit(EXIT_FAILURE);
76334             case 0:
76335                 sleep(2);
76336                 _exit(i);
76337         }
76338     }

76339     /* Wait for all the SIGCHLD signals, then terminate on SIGALRM */
76340     alarm(3);
76341     for (;;)
76342         pause();

76343     return 0; /* NOTREACHED */
76344 }
```

76345 **APPLICATION USAGE**

76346 Calls to *wait()* will collect information about any child process. This may result in interactions  
 76347 with other interfaces that may be waiting for their own children (such as by use of *system()*). For  
 76348 this and other reasons it is recommended that portable applications not use *wait()*, but instead  
 76349 use *waitpid()*. For these same reasons, the use of *waitpid()* with a *pid* argument of *-1*, and the use  
 76350 of *waitid()* with the *idtype* argument set to *P\_ALL*, are also not recommended for portable  
 76351 applications.

76352 XSI As specified in [Consequences of Process Termination](#) (on page 568), if the calling process has  
 76353 *SA\_NOCLDWAIT* set or has *SIGCHLD* set to *SIG\_IGN*, then the termination of a child process  
 76354 will not cause status information to become available to a thread blocked in *wait()*, *waitid()*, or  
 76355 *waitpid()*. Thus, a thread blocked in one of the wait functions will remain blocked unless some  
 76356 other condition causes the thread to resume execution (such as an [ECHILD] failure due to no  
 76357 remaining children in the set of waited-for children).

76358 **RATIONALE**

76359 A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the  
 76360 calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an  
 76361 *exec* or other function calls) from the parent. If a child produces grandchildren by further use of  
 76362 *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()*  
 76363 from the original parent process. Nothing in this volume of POSIX.1-2024 prevents an  
 76364 implementation from providing extensions that permit a process to get *status* from a grandchild  
 76365 or any other process, but a process that does not use such extensions must be guaranteed to see  
 76366 *status* from only its direct children.

76367 The *waitpid()* function is provided for three reasons:

- 76368 1. To support job control
- 76369 2. To permit a non-blocking version of the *wait()* function
- 76370 3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without  
 76371 interfering with other terminated children for which the process has not waited

76372 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The  
 76373 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The  
 76374 *WUNTRACED* flag is used only in conjunction with job control on systems supporting job  
 76375 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped  
 76376 processes in that implementation: processes being traced via the *ptrace()* debugging facility and  
 76377 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of  
 76378 POSIX.1-2024, only the second type is relevant. The name *WUNTRACED* was retained because  
 76379 its usage is the same, even though the name is not intuitively meaningful in this context.

76380 The third reason for the *waitpid()* function is to permit independent sections of a process to  
 76381 spawn and wait for children without interfering with each other. For example, the following  
 76382 problem occurs in developing a portable shell, or command interpreter:

```
76383 stream = popen("/bin/true");
76384 (void) system("sleep 100");
76385 (void) pclose(stream);
```

76386 On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

76387 The status values are retrieved by macros, rather than given as specific bit encodings as they are  
 76388 in most historical implementations (and thus expected by existing programs). This was  
 76389 necessary to eliminate a limitation on the number of signals an implementation can support that  
 76390 was inherent in the traditional encodings. This volume of POSIX.1-2024 does require that a *status*

76391 value of zero corresponds to a process calling `_exit(0)`, as this is the most common encoding  
76392 expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

76393 These macros syntactically operate on an arbitrary integer value. The behavior is undefined  
76394 unless that value is one stored by a successful call to `wait()` or `waitpid()` in the location pointed to  
76395 by the `stat_loc` argument. An early proposal attempted to make this clearer by specifying each  
76396 argument as `*stat_loc` rather than `stat_val`. However, that did not follow the conventions of other  
76397 specifications in this volume of POSIX.1-2024 or traditional usage. It also could have implied  
76398 that the argument to the macro must literally be `*stat_loc`; in fact, that value can be stored or  
76399 passed as an argument to other functions before being interpreted by these macros.

76400 The extension that affects `wait()` and `waitpid()` and is common in historical implementations is  
76401 the `ptrace()` function. It is called by a child process and causes that child to stop and return a  
76402 `status` that appears identical to the `status` indicated by WIFSTOPPED. The `status` of `ptrace()`  
76403 children is traditionally returned regardless of the WUNTRACED flag (or by the `wait()`  
76404 function). Most applications do not need to concern themselves with such extensions because  
76405 they have control over what extensions they or their children use. However, applications, such  
76406 as command interpreters, that invoke arbitrary processes may see this behavior when those  
76407 arbitrary processes misuse such extensions.

76408 On implementations that support the creation of a file containing a core image on some process  
76409 terminations, the `WCOREDUMP(stat_val)` macro indicates whether creation of a core image was  
76410 attempted. If it returns a non-zero value this does not necessarily mean that the core image was  
76411 created, only that it was attempted. For example, if the `RLIMIT_CORE` limit for the process is 0,  
76412 this prevents creation of the file; `WCOREDUMP(stat_val)` returning non-zero in this case  
76413 indicates that the file would have been created if the limit had not been 0.

76414 Allowing the `wait()` family of functions to discard a pending SIGCHLD signal that is associated  
76415 with a successfully waited-for child process puts them into the `sigwait()` and `sigwaitinfo()`  
76416 category with respect to SIGCHLD.

76417 This definition allows implementations to treat a pending SIGCHLD signal as accepted by the  
76418 process in `wait()`, with the same meaning of “accepted” as when that word is applied to the  
76419 `sigwait()` family of functions.

76420 Allowing the `wait()` family of functions to behave this way permits an implementation to be able  
76421 to deal precisely with SIGCHLD signals.

76422 In particular, an implementation that does accept (discard) the SIGCHLD signal can make the  
76423 following guarantees regardless of the queuing depth of signals in general (the list of waitable  
76424 children can hold the SIGCHLD queue):

- 76425 1. If a SIGCHLD signal handler is established via `sigaction()` without the `SA_RESETHAND`  
76426 flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal  
76427 will be delivered to or accepted by the process for every child process that terminates.
- 76428 2. A single `wait()` issued from a SIGCHLD signal handler can be guaranteed to return  
76429 immediately with status information for a child process.
- 76430 3. When `SA_SIGINFO` is requested, the SIGCHLD signal handler can be guaranteed to  
76431 receive a non-null pointer to a `siginfo_t` structure that describes a child process for which  
76432 a wait via `waitpid()` or `waitid()` will not block or fail.
- 76433 4. The `system()` function will not cause the SIGCHLD handler of a process to be called as a  
76434 result of the `fork()/exec` executed within `system()` because `system()` will accept the  
76435 SIGCHLD signal when it performs a `waitpid()` for its child process. This is a desirable  
76436 behavior of `system()` so that it can be used in a library without causing side-effects to the

76437 application linked with the library.

76438 An implementation that does not permit the *wait()* family of functions to accept (discard) a  
76439 pending SIGCHLD signal associated with a successfully waited-for child, cannot make the  
76440 guarantees described above for the following reasons:

76441 **Guarantee #1**

76442 Although it might be assumed that reliable queuing of all SIGCHLD signals generated by  
76443 the system can make this guarantee, the counter-example is the case of a process that blocks  
76444 SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the  
76445 implementation supports queued signals, then eventually the system will run out of  
76446 memory for the queue. The guarantee cannot be made because there must be some limit to  
76447 the depth of queuing.

76448 **Guarantees #2 and #3**

76449 These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD  
76450 signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()*  
76451 function) will result in an invocation of the handler when SIGCHLD is unblocked, after the  
76452 process has disappeared.

76453 **Guarantee #4**

76454 Although possible to make this guarantee, *system()* would have to set the SIGCHLD  
76455 handler to SIG\_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded  
76456 (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This  
76457 would have the undesirable side-effect of discarding all SIGCHLD signals pending to the  
76458 process.

76459 **FUTURE DIRECTIONS**

76460 None.

76461 **SEE ALSO**

76464 **CHANGE HISTORY**

76465 First released in Issue 1. Derived from Issue 1 of the SVID.

76466 **Issue 5**

76467 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

76468 **Issue 6**

76469 The following new requirements on POSIX implementations derive from alignment with the  
76470 Single UNIX Specification:

- 76471 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
76472 required for conforming implementations of previous POSIX specifications, it was not  
76473 required for UNIX applications.

76474 The following changes were made to align with the IEEE P1003.1a draft standard:

- 76475 • The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

76476 The semantics of *WIFSTOPPED(stat\_val)*, *WIFEXITED(stat\_val)*, and *WIFSIGNALED(stat\_val)*  
76477 are defined with respect to *posix\_spawn()* or *posix\_spawnnp()* for alignment with IEEE Std  
76478 1003.1d-1999.

76479 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

76480 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the

- 76481           EXAMPLES section.
- 76482 **Issue 7**
- 76483           SD5-XSH-ERN-202 is applied.
- 76484           APPLICATION USAGE is added, recommending that the *wait()* function not be used.
- 76485           An additional example for *waitpid()* is added.
- 76486           POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0707 [421], XSH/TC1-2008/0708 [166],  
76487           XSH/TC1-2008/0709 [166], and XSH/TC1-2008/0710 [69] are applied.
- 76488           POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0384 [690], XSH/TC2-2008/0385 [691],  
76489           and XSH/TC2-2008/0386 [690] are applied.
- 76490 **Issue 8**
- 76491           Austin Group Defect 1116 is applied, removing text related to the Realtime Signals Extension  
76492           option that existed in earlier versions of this standard.
- 76493           Austin Group Defects 1141 and 1363 are applied, adding WCOREDUMP, changing the  
76494           description of WIFSTOPPED, and changing the RATIONALE section.
- 76495           Austin Group Defect 1570 is applied, removing extra spacing in "==".

76496 **NAME**76497 `waitid` — wait for a child process to change state76498 **SYNOPSIS**76499 `#include <sys/wait.h>`76500 `int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);`76501 **DESCRIPTION**76502 The `waitid()` function shall obtain status information (see [Section 2.12](#), on page 563) pertaining to  
76503 termination, stop, and/or continue events in one of the caller's child processes.76504 The `waitid()` function shall cause the calling thread to become blocked until an error occurs or  
76505 status information becomes available to the calling thread that satisfies all of the following  
76506 properties ("matching status information"):

- 76507 • The status information is from one of the child processes in the set of child processes  
76508 specified by the `idtype` and `id` arguments.
- 76509 • The state change in the status information matches one of the state change flags set in the  
76510 `options` argument.

76511 If matching status information is available prior to the call to `waitid()`, return shall be immediate.  
76512 If matching status information is available for two or more child processes, the order in which  
76513 their status is reported is unspecified.76514 As described in [Section 2.12](#) (on page 563), the `waitid()` function consumes the status information  
76515 it obtains unless the `WNOWAIT` flag is set in the `options` argument.76516 The behavior when multiple threads are blocked in `wait()`, `waitid()`, or `waitpid()` is described in  
76517 [Section 2.12](#) (on page 563).76518 The `waitid()` function shall record the obtained status information in the structure pointed to by  
76519 `infop`. The fields of the structure pointed to by `infop` shall be filled in as described under "Pointer  
76520 to a Function" in [Section 2.4.3](#) (on page 516).76521 The `idtype` and `id` arguments are used to specify which children `waitid()` waits for.76522 If `idtype` is `P_PID`, `waitid()` shall wait for the child with a process ID equal to `(pid_t)id`.76523 If `idtype` is `P_PGID`, `waitid()` shall wait for any child with a process group ID equal to `(pid_t)id`.76524 If `idtype` is `P_ALL`, `waitid()` shall wait for any children and `id` is ignored.76525 The `options` argument is used to specify which state changes `waitid()` shall wait for. It is formed  
76526 by OR'ing together the following flags:76527 **WCONTINUED** Status shall be returned for any continued child process whose status either  
76528 has not been reported since it continued from a job control stop or has been  
76529 reported only by calls to `waitid()` with the `WNOWAIT` flag set.76530 **WEXITED** Wait for processes that have terminated.76531 **WNOHANG** Do not hang if no status is available; return immediately.76532 **WNOWAIT** Keep the process whose status is returned in `infop` in a waitable state. This  
76533 shall not affect the state of the process; the process may be waited for again  
76534 after this call completes.76535 **WSTOPPED** Status shall be returned for any child that has stopped upon receipt of a signal,  
76536 and whose status either has not been reported since it stopped or has been  
76537 reported only by calls to `waitid()` with the `WNOWAIT` flag set.

76538 Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to  
76539 be OR'ed in with the *options* argument.

76540 The application shall ensure that the *infop* argument points to a **siginfo\_t** structure. If *waitid()*  
76541 returns because a child process was found that satisfied the conditions indicated by the  
76542 arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the  
76543 system with the status of the process; the *si\_signo* member shall be set equal to SIGCHLD. If  
76544 *waitid()* returns because WNOHANG was specified and status is not available for any process  
76545 specified by *idtype* and *id*, then the *si\_signo* and *si\_pid* members of the structure pointed to by  
76546 *infop* shall be set to zero and the values of other members of the structure are unspecified.

#### 76547 RETURN VALUE

76548 If WNOHANG was specified and status is not available for any process specified by *idtype* and  
76549 *id*, 0 shall be returned. If *waitid()* returns due to the change of state of one of its children, 0 shall  
76550 be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

#### 76551 ERRORS

76552 The *waitid()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 76553 | [ECHILD] | The calling process has no existing unwaited-for child processes.  |
| 76554 | [EINTR]  | The <i>waitid()</i> function was interrupted by a signal. The values of the fields of<br>76555 the structure pointed to by <i>infop</i> are undefined. |
| 76556 | [EINVAL] | An invalid value was specified for <i>options</i> , or <i>idtype</i> and <i>id</i> specify an invalid<br>76557 set of processes.                       |

#### 76558 EXAMPLES

76559 None.

#### 76560 APPLICATION USAGE

76561 Calls to *waitid()* with *idtype* equal to P\_ALL will collect information about any child process.  
76562 This may result in interactions with other interfaces that may be waiting for their own children  
76563 (such as by use of *system()*). For this reason it is recommended that portable applications not  
76564 use *waitid()* with *idtype* of P\_ALL. See also APPLICATION USAGE for *wait()*.

76565 XSI As specified in [Consequences of Process Termination](#) (on page 568), if the calling process has  
76566 SA\_NOCLDWAIT set or has SIGCHLD set to SIG\_IGN, then the termination of a child process  
76567 will not cause status information to become available to a thread blocked in *wait()*, *waitid()*, or  
76568 *waitpid()*. Thus, a thread blocked in one of the wait functions will remain blocked unless some  
76569 other condition causes the thread to resume execution (such as an [ECHILD] failure due to no  
76570 remaining children in the set of waited-for children).

#### 76571 RATIONALE

76572 None.

#### 76573 FUTURE DIRECTIONS

76574 None.

#### 76575 SEE ALSO

#### 76578 CHANGE HISTORY

76579 First released in Issue 4, Version 2.

76580 **Issue 5**

76581 Moved from X/OPEN UNIX extension to BASE.

76582 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

76583 **Issue 6**

76584 The normative text is updated to avoid use of the term “must” for application requirements.

76585 **Issue 7**

76586 Austin Group Interpretation 1003.1-2001 #060 is applied, updating the DESCRIPTION.

76587 The *waitid()* function is moved from the XSI option to the Base.

76588 APPLICATION USAGE is added, recommending that the *waitid()* function not be used with *idtype* equal to P\_ALL.

76590 The description of the WNOHANG flag is updated.

76591 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0711 [154], XSH/TC1-2008/0712 [154], and XSH/TC1-2008/0713 [153] are applied.

76593 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0387 [690] is applied.

76594 **Issue 8**

76595 Austin Group Defect 1332 is applied, changing the description of WEXITED.

76596 Austin Group Defect 1547 is applied, changing the description of [EINTR].

76597 **NAME**

76598           waitpid — wait for a child process to stop or terminate

76599 **SYNOPSIS**

76600           #include <sys/wait.h>

76601           pid\_t waitpid(pid\_t *pid*, int \**stat\_loc*, int *options*);

76602 **DESCRIPTION**

76603           Refer to *wait()*.

76604 **NAME**

76605           wcpcpy — copy a wide-character string, returning a pointer to its end

76606 **SYNOPSIS**

```
76607 CX       #include <wchar.h>  
76608       wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

76609 **DESCRIPTION**76610       Refer to *wcscopy()*.

76611 **NAME**

76612           wcpncpy — copy a fixed-size wide-character string, returning a pointer to its end

76613 **SYNOPSIS**

```
76614 CX       #include <wchar.h>
76615       wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
76616                       size_t n);
```

76617 **DESCRIPTION**76618       Refer to *wcsncpy()*.

76619 **NAME**76620 `wrtomb` — convert a wide-character code to a character (restartable)76621 **SYNOPSIS**76622 `#include <wchar.h>`76623 `size_t wrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);`76624 **DESCRIPTION**76625 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
76626 conflict between the requirements described here and the ISO C standard is unintentional. This  
76627 volume of POSIX.1-2024 defers to the ISO C standard.76628 If *s* is a null pointer, the `wrtomb()` function shall be equivalent to the call:76629 `wrtomb(buf, L'\0', ps)`76630 where *buf* is an internal buffer.76631 If *s* is not a null pointer, the `wrtomb()` function shall determine the number of bytes needed to  
76632 represent the character that corresponds to the wide character given by *wc* (including any shift  
76633 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At  
76634 most {MB\_CUR\_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,  
76635 preceded by any shift sequence needed to restore the initial shift state. The resulting state  
76636 described shall be the initial conversion state.76637 If *ps* is a null pointer, the `wrtomb()` function shall use its own internal **mbstate\_t** object, which is  
76638 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
76639 pointed to by *ps* shall be used to completely describe the current conversion state of the  
76640 associated character sequence. The implementation shall behave as if no function defined in this  
76641 volume of POSIX.1-2024 calls `wrtomb()`.76642 If called with a null *ps* argument, the `wrtomb()` function need not be thread-safe; however, such  
76643 calls shall avoid data races with calls to `wrtomb()` with a non-null argument and with calls to all  
76644 other functions.76645 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.76646 The `wrtomb()` function shall not change the setting of *errno* if successful.76647 **RETURN VALUE**76648 The `wrtomb()` function shall return the number of bytes stored in the array object (including any  
76649 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this  
76650 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size\_t**)-1;  
76651 the conversion state shall be undefined.76652 **ERRORS**76653 The `wrtomb()` function shall fail if:

76654 [EILSEQ] An invalid wide-character code is detected.

76655 The `wrtomb()` function may fail if:76656 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

76657 **EXAMPLES**

76658 None.

76659 **APPLICATION USAGE**

76660 None.

76661 **RATIONALE**

76662 None.

76663 **FUTURE DIRECTIONS**

76664 None.

76665 **SEE ALSO**76666 *mbsinit()*, *wcsrtombs()*76667 XBD <**wchar.h**>76668 **CHANGE HISTORY**76669 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
76670 (E).76671 **Issue 6**

76672 In the DESCRIPTION, a note on using this function in a threaded application is added.

76673 Extensions beyond the ISO C standard are marked.

76674 The normative text is updated to avoid use of the term “must” for application requirements.

76675 The *wcr tomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.76676 **Issue 7**76677 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcr tomb()* function  
76678 need not be thread-safe if called with a NULL *ps* argument.

76679 Austin Group Interpretation 1003.1-2001 #170 is applied.

76680 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0714 [88] and XSH/TC1-2008/0715  
76681 [105] are applied.76682 **Issue 8**76683 Austin Group Defect 1302 is applied, aligning this function with the ISO/IEC 9899:2018  
76684 standard.

76685 **NAME**

76686 wscasecmp, wscasecmp\_l, wcsncasecmp, wcsncasecmp\_l — case-insensitive wide-character  
76687 string comparison

76688 **SYNOPSIS**

```
76689 CX #include <wchar.h>
76690 int wscasecmp(const wchar_t *ws1, const wchar_t *ws2);
76691 int wscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
76692 locale_t locale);
76693 int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
76694 int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
76695 size_t n, locale_t locale);
```

76696 **DESCRIPTION**

76697 The *wscasecmp()* and *wcsncasecmp()* functions are the wide-character equivalent of the  
76698 *strcasecmp()* and *strncasecmp()* functions, respectively.

76699 The *wscasecmp()* and *wscasecmp\_l()* functions shall compare, while ignoring differences in case,  
76700 the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*.

76701 The *wcsncasecmp()* and *wcsncasecmp\_l()* functions shall compare, while ignoring differences in  
76702 case, not more than *n* wide-characters from the wide-character string pointed to by *ws1* to the  
76703 wide-character string pointed to by *ws2*.

76704 The *wscasecmp()* and *wcsncasecmp()* functions use the current locale to determine the case of the  
76705 wide characters.

76706 The *wscasecmp\_l()* and *wcsncasecmp\_l()* functions use the locale represented by *locale* to  
76707 determine the case of the wide characters.

76708 When the *LC\_CTYPE* category of the locale being used is from the POSIX locale, these functions  
76709 shall behave as if the wide-character strings had been converted to lowercase and then a  
76710 comparison of wide-character codes performed. Otherwise, the results are unspecified.

76711 The information for *wscasecmp\_l()* and *wcsncasecmp\_l()* about the case of the characters comes  
76712 from the locale represented by *locale*.

76713 The behavior is undefined if the *locale* argument to *wscasecmp\_l()* or *wcsncasecmp\_l()* is the  
76714 special locale object *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

76715 **RETURN VALUE**

76716 Upon completion, the *wscasecmp()* and *wscasecmp\_l()* functions shall return an integer greater  
76717 than, equal to, or less than 0 if the wide-character string pointed to by *ws1* is, ignoring case,  
76718 greater than, equal to, or less than the wide-character string pointed to by *ws2*, respectively.

76719 Upon completion, the *wcsncasecmp()* and *wcsncasecmp\_l()* functions shall return an integer  
76720 greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed  
76721 to by *ws1* is, ignoring case, greater than, equal to, or less than the possibly null wide-character  
76722 terminated string pointed to by *ws2*, respectively.

76723 No return values are reserved to indicate an error.

76724 **ERRORS**

76725 No errors are defined.

76726 **EXAMPLES**

76727       None.

76728 **APPLICATION USAGE**

76729       None.

76730 **RATIONALE**

76731       None.

76732 **FUTURE DIRECTIONS**

76733       None.

76734 **SEE ALSO**76735       [strcasecmp\(\)](#), [wcscmp\(\)](#), [wcsncmp\(\)](#)76736       XBD <[wchar.h](#)>76737 **CHANGE HISTORY**

76738       First released in Issue 7.

76739       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0716 [294], XSH/TC1-2008/0717 [283],  
76740       and XSH/TC1-2008/0718 [283] are applied.

76741 **NAME**

76742 wscat — concatenate two wide-character strings

76743 **SYNOPSIS**

76744 #include &lt;wchar.h&gt;

76745 wchar\_t \*wscat(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2);

76746 **DESCRIPTION**

76747 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
76748 conflict between the requirements described here and the ISO C standard is unintentional. This  
76749 volume of POSIX.1-2024 defers to the ISO C standard.

76750 The `wscat()` function shall append a copy of the wide-character string pointed to by `ws2`  
76751 (including the terminating null wide-character code) to the end of the wide-character string  
76752 pointed to by `ws1`. The initial wide-character code of `ws2` shall overwrite the null wide-character  
76753 code at the end of `ws1`. If copying takes place between objects that overlap, the behavior is  
76754 undefined.

76755 CX The `wscat()` function shall not change the setting of `errno` on valid input.

76756 **RETURN VALUE**76757 The `wscat()` function shall return `ws1`; no return value is reserved to indicate an error.76758 **ERRORS**

76759 No errors are defined.

76760 **EXAMPLES**

76761 None.

76762 **APPLICATION USAGE**

76763 None.

76764 **RATIONALE**

76765 None.

76766 **FUTURE DIRECTIONS**

76767 None.

76768 **SEE ALSO**76769 [wscncat\(\)](#)76770 XBD [<wchar.h>](#)76771 **CHANGE HISTORY**

76772 First released in Issue 4. Derived from the MSE working draft.

76773 **Issue 6**

76774 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, `s1` is  
76775 changed to `ws1`.

76776 The `wscat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

76777 **Issue 8**

76778 Austin Group Defect 448 is applied, adding a requirement that `wscat()` does not change the  
76779 setting of `errno` on valid input.

76780 **NAME**76781 `wcschr` — wide-character string scanning operation76782 **SYNOPSIS**76783 `#include <wchar.h>`76784 `wchar_t *wcschr(const wchar_t *ws, wchar_t wc);`76785 **DESCRIPTION**

76786 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
76787 conflict between the requirements described here and the ISO C standard is unintentional. This  
76788 volume of POSIX.1-2024 defers to the ISO C standard.

76789 The `wcschr()` function shall locate the first occurrence of `wc` in the wide-character string pointed  
76790 to by `ws`. The application shall ensure that the value of `wc` is a character representable as a type  
76791 `wchar_t` and a wide-character code corresponding to a valid character in the current locale. The  
76792 terminating null wide-character code is considered to be part of the wide-character string.

76793 CX The `wcschr()` function shall not change the setting of `errno` on valid input.

76794 **RETURN VALUE**

76795 Upon completion, `wcschr()` shall return a pointer to the wide-character code, or a null pointer if  
76796 the wide-character code is not found.

76797 **ERRORS**

76798 No errors are defined.

76799 **EXAMPLES**

76800 None.

76801 **APPLICATION USAGE**

76802 None.

76803 **RATIONALE**

76804 None.

76805 **FUTURE DIRECTIONS**

76806 None.

76807 **SEE ALSO**76808 [wcsrchr\(\)](#)76809 XBD [<wchar.h>](#)76810 **CHANGE HISTORY**

76811 First released in Issue 4. Derived from the MSE working draft.

76812 **Issue 6**

76813 The normative text is updated to avoid use of the term “must” for application requirements.

76814 **Issue 8**

76815 Austin Group Defect 448 is applied, adding a requirement that `wcschr()` does not change the  
76816 setting of `errno` on valid input.

76817 **NAME**

76818 wscmp — compare two wide-character strings

76819 **SYNOPSIS**

76820 #include &lt;wchar.h&gt;

76821 int wscmp(const wchar\_t \*ws1, const wchar\_t \*ws2);

76822 **DESCRIPTION**

76823 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
76824 conflict between the requirements described here and the ISO C standard is unintentional. This  
76825 volume of POSIX.1-2024 defers to the ISO C standard.

76826 The *wscmp()* function shall compare the wide-character string pointed to by *ws1* to the wide-  
76827 character string pointed to by *ws2*.

76828 The sign of a non-zero return value shall be determined by the sign of the difference between the  
76829 values of the first pair of wide-character codes that differ in the objects being compared.

76830 CX The *wscmp()* function shall not change the setting of *errno* on valid input.

76831 **RETURN VALUE**

76832 Upon completion, *wscmp()* shall return an integer greater than, equal to, or less than 0, if the  
76833 wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character  
76834 string pointed to by *ws2*, respectively.

76835 **ERRORS**

76836 No errors are defined.

76837 **EXAMPLES**

76838 None.

76839 **APPLICATION USAGE**

76840 None.

76841 **RATIONALE**

76842 None.

76843 **FUTURE DIRECTIONS**

76844 None.

76845 **SEE ALSO**76846 [wscasecmp\(\)](#), [wcsncmp\(\)](#)76847 XBD [<wchar.h>](#)76848 **CHANGE HISTORY**

76849 First released in Issue 4. Derived from the MSE working draft.

76850 **Issue 8**

76851 Austin Group Defect 448 is applied, adding a requirement that *wscmp()* does not change the  
76852 setting of *errno* on valid input.

76853 **NAME**

76854 wscoll, wscoll\_l — wide-character string comparison using collating information

76855 **SYNOPSIS**

```
76856 #include <wchar.h>
76857 int wscoll(const wchar_t *ws1, const wchar_t *ws2);
76858 CX int wscoll_l(const wchar_t *ws1, const wchar_t *ws2,
76859 locale_t locale);
```

76860 **DESCRIPTION**

76861 CX For `wscoll()`: The functionality described on this reference page is aligned with the ISO C  
 76862 standard. Any conflict between the requirements described here and the ISO C standard is  
 76863 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

76864 CX The `wscoll()` and `wscoll_l()` functions shall compare the wide-character string pointed to by  
 76865 `ws1` to the wide-character string pointed to by `ws2`, both interpreted as appropriate to the  
 76866 CX `LC_COLLATE` category of the current locale, or the locale represented by `locale`, respectively.

76867 CX The `wscoll()` and `wscoll_l()` functions shall not change the setting of `errno` if successful.

76868 CX An application wishing to check for error situations should set `errno` to 0 before calling `wscoll()`  
 76869 or `wscoll_l()`. If `errno` is non-zero on return, an error has occurred.

76870 CX The behavior is undefined if the `locale` argument to `wscoll_l()` is the special locale object  
 76871 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

76872 **RETURN VALUE**

76873 CX Upon successful completion, `wscoll()` and `wscoll_l()` shall return an integer greater than, equal  
 76874 to, or less than 0, according to whether the wide-character string pointed to by `ws1` is greater  
 76875 than, equal to, or less than the wide-character string pointed to by `ws2`, when both are  
 76876 CX interpreted as appropriate to the current locale, or to the locale represented by `locale`,  
 76877 CX respectively. On error, `wscoll()` and `wscoll_l()` shall set `errno`, but no return value is reserved  
 76878 to indicate an error.

76879 **ERRORS**

76880 These functions may fail if:

76881 CX [EINVAL] The `ws1` or `ws2` arguments contain wide-character codes outside the domain of  
 76882 the collating sequence.

76883 **EXAMPLES**

76884 None.

76885 **APPLICATION USAGE**

76886 The `wcsxfrm()` and `wscmp()` functions should be used for sorting large lists.

76887 **RATIONALE**

76888 None.

76889 **FUTURE DIRECTIONS**

76890 None.

76891 **SEE ALSO**

76892 [wscmp\(\)](#), [wcsxfrm\(\)](#)

76893 XBD [<wchar.h>](#)

76894 **CHANGE HISTORY**

76895 First released in Issue 4. Derived from the MSE working draft.

76896 **Issue 5**

76897 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

76898 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

76899 **Issue 7**

76900 The *wscoll\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

76902 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0719 [302], XSH/TC1-2008/0720 [283],  
76903 and XSH/TC1-2008/0721 [283] are applied.

76904 **NAME**

76905 wpcpy, wscpy — copy a wide-character string, returning a pointer to its end

76906 **SYNOPSIS**

76907 #include &lt;wchar.h&gt;

76908 CX `wchar_t *wpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`76909 `wchar_t *wscpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`76910 **DESCRIPTION**76911 CX For `wscpy()`: The functionality described on this reference page is aligned with the ISO C  
76912 standard. Any conflict between the requirements described here and the ISO C standard is  
76913 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.76914 CX The `wpcpy()` and `wscpy()` functions shall copy the wide-character string pointed to by `ws2`  
76915 (including the terminating null wide-character code) into the array pointed to by `ws1`.76916 The application shall ensure that there is room for at least `wcslen(ws2)+1` wide characters in the  
76917 `ws1` array, and that the `ws2` and `ws1` arrays do not overlap.

76918 If copying takes place between objects that overlap, the behavior is undefined.

76919 CX The `wscpy()` and `wpcpy()` functions shall not change the setting of `errno` on valid input.76920 **RETURN VALUE**76921 CX The `wpcpy()` function shall return a pointer to the terminating null wide-character code copied  
76922 into the `ws1` buffer.76923 The `wscpy()` function shall return `ws1`.

76924 No return values are reserved to indicate an error.

76925 **ERRORS**

76926 No errors are defined.

76927 **EXAMPLES**

76928 None.

76929 **APPLICATION USAGE**

76930 None.

76931 **RATIONALE**

76932 None.

76933 **FUTURE DIRECTIONS**

76935 **SEE ALSO**76936 [strcpy\(\)](#), [wcsdup\(\)](#), [wscncpy\(\)](#)76937 XBD [<wchar.h>](#)76938 **CHANGE HISTORY**

76939 First released in Issue 4. Derived from the MSE working draft.

76940 **Issue 6**76941 The `wscpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.76942 **Issue 7**76943 The `wpcpy()` function is added from The Open Group Technical Standard, 2006, Extended API  
76944 Set Part 1.

76945 **Issue 8**

76946

76947

Austin Group Defect 448 is applied, adding a requirement that *wcscopy()* and *wcpcpy()* do not change the setting of *errno* on valid input.

76948 **NAME**

76949       wcscspn — get the length of a complementary wide substring

76950 **SYNOPSIS**

76951       #include &lt;wchar.h&gt;

76952       size\_t wcscspn(const wchar\_t \*ws1, const wchar\_t \*ws2);

76953 **DESCRIPTION**

76954 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
76955       conflict between the requirements described here and the ISO C standard is unintentional. This  
76956       volume of POSIX.1-2024 defers to the ISO C standard.

76957       The *wcscspn()* function shall compute the length (in wide characters) of the maximum initial  
76958       segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character  
76959       codes *not* from the wide-character string pointed to by *ws2*.

76960 CX       The *wcscspn()* function shall not change the setting of *errno* on valid input.

76961 **RETURN VALUE**

76962       The *wcscspn()* function shall return the length of the initial substring of *ws1*; no return value is  
76963       reserved to indicate an error.

76964 **ERRORS**

76965       No errors are defined.

76966 **EXAMPLES**

76967       None.

76968 **APPLICATION USAGE**

76969       None.

76970 **RATIONALE**

76971       None.

76972 **FUTURE DIRECTIONS**

76973       None.

76974 **SEE ALSO**76975       *wcsspn()*

76976       XBD &lt;wchar.h&gt;

76977 **CHANGE HISTORY**

76978       First released in Issue 4. Derived from the MSE working draft.

76979 **Issue 5**

76980       The RETURN VALUE section is updated to indicate that *wcscspn()* returns the length of *ws1*,  
76981       rather than *ws1* itself.

76982 **Issue 8**

76983       Austin Group Defect 448 is applied, adding a requirement that *wcscspn()* does not change the  
76984       setting of *errno* on valid input.

76985 **NAME**

76986           wcsdup — duplicate a wide-character string

76987 **SYNOPSIS**

```
76988 CX       #include <wchar.h>
76989       wchar_t *wcsdup(const wchar_t *string);
```

76990 **DESCRIPTION**76991           The *wcsdup()* function is the wide-character equivalent of the *strdup()* function.

76992           The *wcsdup()* function shall return a pointer to a new wide-character string, allocated as if by a call to *malloc()*, which is the duplicate of the wide-character string *string*. The returned pointer can be passed to *free()*. A null pointer is returned if the new wide-character string cannot be created.

76996 **RETURN VALUE**

76997           Upon successful completion, the *wcsdup()* function shall return a pointer to the newly allocated wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

76999 **ERRORS**77000           The *wcsdup()* function shall fail if:

77001           [ENOMEM]       Memory large enough for the duplicate string could not be allocated.

77002 **EXAMPLES**

77003           None.

77004 **APPLICATION USAGE**

77005           For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *wcsdup()*, this is the return value.

77007 **RATIONALE**

77008           None.

77009 **FUTURE DIRECTIONS**

77010           None.

77011 **SEE ALSO**77012           *free()*, *strdup()*, *wcscpy()*

77013           XBD &lt;wchar.h&gt;

77014 **CHANGE HISTORY**

77015           First released in Issue 7.

77016 **NAME**77017 `wcsftime` — convert date and time to a wide-character string77018 **SYNOPSIS**77019 `#include <wchar.h>`77020 `size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,`  
77021 `const wchar_t *restrict format, const struct tm *restrict timeptr);`77022 **DESCRIPTION**77023 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77024 conflict between the requirements described here and the ISO C standard is unintentional. This  
77025 volume of POSIX.1-2024 defers to the ISO C standard.77026 The `wcsftime()` function shall be equivalent to the `strftime()` function, except that:

- 77027 • The argument `wcs` points to the initial element of an array of wide characters into which  
77028 the generated output is to be placed.
- 77029 • The argument `maxsize` indicates the maximum number of wide characters to be placed in  
77030 the output array.
- 77031 • The argument `format` is a wide-character string and the conversion specifications are  
77032 replaced by corresponding sequences of wide characters. It is unspecified whether an  
77033 encoding error occurs if the format string contains `wchar_t` values that do not correspond  
77034 to members of the character set of the current locale.
- 77035 CX • Field widths specify the number of wide characters instead of the number of bytes.
- 77036 • The return value indicates the number of wide characters placed in the output array.

77037 If copying takes place between objects that overlap, the behavior is undefined.

77038 **RETURN VALUE**77039 If the total number of resulting wide-character codes including the terminating null wide-  
77040 character code is no more than `maxsize`, `wcsftime()` shall return the number of wide-character  
77041 codes placed into the array pointed to by `wcs`, not including the terminating null wide-character  
77042 code. Otherwise, zero is returned and the contents of the array are unspecified.77043 **ERRORS**

77044 No errors are defined.

77045 **EXAMPLES**

77046 None.

77047 **APPLICATION USAGE**

77048 None.

77049 **RATIONALE**

77050 None.

77051 **FUTURE DIRECTIONS**

77052 None.

77053 **SEE ALSO**77054 [strftime\(\)](#)77055 XBD [<wchar.h>](#)

77056 **CHANGE HISTORY**

77057 First released in Issue 4.

77058 **Issue 5**

77059 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

77060 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*  
77061 argument is changed from **const char \*** to **const wchar\_t \***.77062 **Issue 6**77063 The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.77064 **Issue 7**77065 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0388 [73] and XSH/TC2-2008/0389  
77066 [740] are applied.

77067 **NAME**

77068       wcslcat, wcsncpy — size-bounded wide string concatenation and copying

77069 **SYNOPSIS**

```
77070 CX     #include <wchar.h>
77071       size_t wcslcat(wchar_t *restrict dst, const wchar_t *restrict src,
77072                    size_t dstsize);
77073       size_t wcsncpy(wchar_t *restrict dst, const wchar_t *restrict src,
77074                    size_t dstsize);
```

77075 **DESCRIPTION**

77076       The *wcsncpy()* and *wcslcat()* functions copy and concatenate wide strings, stopping when either a  
77077       terminating null wide-character code in the source wide string is encountered or the specified  
77078       full size (in wide-character codes) of the destination buffer is reached. They null terminate the  
77079       result if there is room. The application should ensure that room for the terminating null wide-  
77080       character code is included in *dstsize*.

77081       The *wcsncpy()* function shall copy not more than *dstsize* – 1 wide-character codes from the wide  
77082       string pointed to by *src* to the array pointed to by *dst*; a terminating null wide-character code in  
77083       *src* and wide-character codes that follow it shall not be copied. A terminating null wide-  
77084       character code shall be appended to the result, unless *dstsize* is 0. If copying takes place between  
77085       objects that overlap, the behavior is undefined.

77086       The *wcslcat()* function shall append not more than *dstsize* – *wcslen(dst)* – 1 wide-character codes  
77087       from the wide string pointed to by *src* to the end of the wide string pointed to by *dst*; a  
77088       terminating null wide-character code in *src* and wide-character codes that follow it shall not be  
77089       appended. The initial wide-character code of *src* shall overwrite the null wide-character code at  
77090       the end of *dst*. A terminating null wide-character code shall be appended to the result, unless its  
77091       location would be at or beyond *dst* + *dstsize*. If copying takes place between objects that overlap,  
77092       the behavior is undefined.

77093       The *wcsncpy()* and *wcslcat()* functions shall not change the setting of *errno* on valid input.

77094 **RETURN VALUE**

77095       Upon successful completion, the *wcsncpy()* function shall return the length of the wide string  
77096       pointed to by *src*; that is, the number of wide-character codes in the wide string, not including  
77097       the terminating null wide-character code.

77098       Upon successful completion, the *wcslcat()* function shall return the initial length of the wide  
77099       string pointed to by *dst* plus the length of the wide string pointed to by *src*.

77100       No return values are reserved to indicate an error.

77101 **ERRORS**

77102       No errors are defined.

77103 **EXAMPLES**

77104       None.

77105 **APPLICATION USAGE**

77106       The return value of the *wcsncpy()* and *wcslcat()* functions follows the same convention as  
77107       *snprintf()*; that is, they return the total length (in wide-character codes) of the wide string they  
77108       tried to create. If the return value is greater than or equal to *dstsize*, the output wide string has  
77109       been truncated.

77156 First released in Issue 4. Derived from the MSE working draft.

77157 **Issue 7**77158 The `wcsnlen()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

77160 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0390 [560] is applied.

77161 **Issue 8**

77162 Austin Group Defect 448 is applied, adding a requirement that *wcslen()* and *wcsnlen()* do not  
77163 change the setting of *errno* on valid input.

77164 Austin Group Defect 986 is applied, adding *wcslcat()* to the SEE ALSO section.

77165 **NAME**

77166        `wcsncasecmp`, `wcsncasecmp_l` — case-insensitive wide-character string comparison

77167 **SYNOPSIS**

```
77168 CX     #include <wchar.h>
77169       int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
77170       int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
77171                       size_t n, locale_t locale);
```

77172 **DESCRIPTION**

77173       Refer to [wcscasecmp\(\)](#).

77174 **NAME**

77175           wcsncat — concatenate a wide-character string with part of another

77176 **SYNOPSIS**

77177           #include &lt;wchar.h&gt;

77178           wchar\_t \*wcsncat(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
77179                           size\_t n);77180 **DESCRIPTION**77181 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
77182       conflict between the requirements described here and the ISO C standard is unintentional. This  
77183       volume of POSIX.1-2024 defers to the ISO C standard.77184       The *wcsncat()* function shall append not more than *n* wide-character codes (a null wide-  
77185       character code and wide-character codes that follow it are not appended) from the array pointed  
77186       to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character  
77187       code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null  
77188       wide-character code shall always be appended to the result. If copying takes place between  
77189       objects that overlap, the behavior is undefined.77190 CX       The *wcsncat()* function shall not change the setting of *errno* on valid input.77191 **RETURN VALUE**77192       The *wcsncat()* function shall return *ws1*; no return value is reserved to indicate an error.77193 **ERRORS**

77247       First released in Issue 4. Derived from the MSE working draft.

77248 **Issue 8**77249       Austin Group Defect 448 is applied, adding a requirement that *wcsncmp()* does not change the  
77250 setting of *errno* on valid input.

77251 **NAME**

77252           wcsncpy, wcsncpy — copy a fixed-size wide-character string, returning a pointer to its end

77253 **SYNOPSIS**

77254           #include &lt;wchar.h&gt;

77255 CX        wchar\_t \*wcpncpy(wchar\_t restrict \*ws1, const wchar\_t \*restrict ws2,  
77256            size\_t n);77257        wchar\_t \*wcsncpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
77258            size\_t n);77259 **DESCRIPTION**77260 CX        For *wcsncpy()*: The functionality described on this reference page is aligned with the ISO C  
77261 standard. Any conflict between the requirements described here and the ISO C standard is  
77262 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.77263 CX        The *wcpncpy()* and *wcsncpy()* functions shall copy not more than *n* wide-character codes (wide-  
77264 character codes that follow a null wide-character code are not copied) from the array pointed to  
77265 by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the  
77266 behavior is undefined.77267            If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character  
77268 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,  
77269 until *n* wide-character codes in all are written.77270 CX        The *wcsncpy()* and *wcpncpy()* functions shall not change the setting of *errno* on valid input.77271 **RETURN VALUE**77272 CX        If any null wide-character codes were written into the destination, the *wcpncpy()* function shall  
77273 return the address of the first such null wide-character code. Otherwise, it shall return *&ws1[n]*.77274            The *wcsncpy()* function shall return *ws1*.

77275            No return values are reserved to indicate an error.

77276 **ERRORS**

77277            No errors are defined.

77278 **EXAMPLES**

77279            None.

77280 **APPLICATION USAGE**77281            If there is no null wide-character code in the first *n* wide-character codes of the array pointed to  
77282 by *ws2*, the result is not null-terminated.77283 **RATIONALE**

77284            None.

77285 **FUTURE DIRECTIONS**

77286            None.

77287 **SEE ALSO**77288            [strncpy\(\)](#), [wcscpy\(\)](#), [wcsncpy\(\)](#)77289            XBD [<wchar.h>](#)77290 **CHANGE HISTORY**

77291            First released in Issue 4. Derived from the MSE working draft.

77292 **Issue 6**

77293 The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

77294 **Issue 7**

77295 The *wcpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
77296 Set Part 1.

77297 **Issue 8**

77298 Austin Group Defect 448 is applied, adding a requirement that *wcsncpy()* and *wcpncpy()* do not  
77299 change the setting of *errno* on valid input.

77300 Austin Group Defect 986 is applied, adding *wslcat()* to the SEE ALSO section.

77301 **NAME**

77302       wcsnlen — get length of a fixed-sized wide-character string

77303 **SYNOPSIS**

```
77304 CX       #include <wchar.h>  
77305       size_t wcsnlen(const wchar_t *ws, size_t maxlen);
```

77306 **DESCRIPTION**77307       Refer to *wcslen()*.

77308 **NAME**

77309           wcsnrtoombs — convert wide-character string to multi-byte string

77310 **SYNOPSIS**

```
77311 CX       #include <wchar.h>
77312           size_t wcsnrtoombs(char *restrict dst, const wchar_t **restrict src,
77313                           size_t nwc, size_t len, mbstate_t *restrict ps);
```

77314 **DESCRIPTION**77315           Refer to *wcsrtoombs()*.

77316 **NAME**

77317 wcpbrk — scan a wide-character string for a wide-character code

77318 **SYNOPSIS**

77319 #include &lt;wchar.h&gt;

77320 wchar\_t \*wcpbrk(const wchar\_t \*ws1, const wchar\_t \*ws2);

77321 **DESCRIPTION**77322 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77323 conflict between the requirements described here and the ISO C standard is unintentional. This  
77324 volume of POSIX.1-2024 defers to the ISO C standard.77325 The *wcpbrk()* function shall locate the first occurrence in the wide-character string pointed to by  
77326 *ws1* of any wide-character code from the wide-character string pointed to by *ws2*.77327 CX The *wcpbrk()* function shall not change the setting of *errno* on valid input.77328 **RETURN VALUE**77329 Upon successful completion, *wcpbrk()* shall return a pointer to the wide-character code or a null  
77330 pointer if no wide-character code from *ws2* occurs in *ws1*.77331 **ERRORS**

77332 No errors are defined.

77333 **EXAMPLES**

77334 None.

77335 **APPLICATION USAGE**

77336 None.

77337 **RATIONALE**

77338 None.

77339 **FUTURE DIRECTIONS**

77340 None.

77341 **SEE ALSO**77342 [wcschr\(\)](#), [wcsrchr\(\)](#)77343 XBD [<wchar.h>](#)77344 **CHANGE HISTORY**

77345 First released in Issue 4. Derived from the MSE working draft.

77346 **Issue 8**77347 Austin Group Defect 448 is applied, adding a requirement that *wcpbrk()* does not change the  
77348 setting of *errno* on valid input.

77349 **NAME**

77350 wcsrchr — wide-character string scanning operation

77351 **SYNOPSIS**

77352 #include &lt;wchar.h&gt;

77353 wchar\_t \*wcsrchr(const wchar\_t \*ws, wchar\_t wc);

77354 **DESCRIPTION**

77355 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77356 conflict between the requirements described here and the ISO C standard is unintentional. This  
77357 volume of POSIX.1-2024 defers to the ISO C standard.

77358 The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed  
77359 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type  
77360 **wchar\_t** and a wide-character code corresponding to a valid character in the current locale. The  
77361 terminating null wide-character code shall be considered to be part of the wide-character string.

77362 CX The *wcsrchr()* function shall not change the setting of *errno* on valid input.

77363 **RETURN VALUE**

77364 Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null  
77365 pointer if *wc* does not occur in the wide-character string.

77366 **ERRORS**

77367 No errors are defined.

77368 **EXAMPLES**

77369 None.

77370 **APPLICATION USAGE**

77371 None.

77372 **RATIONALE**

77373 None.

77374 **FUTURE DIRECTIONS**

77375 None.

77380 First released in Issue 4. Derived from the MSE working draft.

77381 **Issue 6**

77382 The normative text is updated to avoid use of the term “must” for application requirements.

77383 **Issue 8**

77384 Austin Group Defect 448 is applied, adding a requirement that *wcsrchr()* does not change the  
77385 setting of *errno* on valid input.

77386 **NAME**77387 `wcsnrtombs`, `wcsrtombs` — convert a wide-character string to a character string (restartable)77388 **SYNOPSIS**77389 `#include <wchar.h>`

```
77390 CX   size_t wcsnrtombs(char *restrict dst, const wchar_t **restrict src,
77391         size_t nwc, size_t len, mbstate_t *restrict ps);
77392     size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,
77393         size_t len, mbstate_t *restrict ps);
```

77394 **DESCRIPTION**

77395 CX For `wcsrtombs()`: The functionality described on this reference page is aligned with the ISO C  
 77396 standard. Any conflict between the requirements described here and the ISO C standard is  
 77397 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.

77398 The `wcsrtombs()` function shall convert a sequence of wide characters from the array indirectly  
 77399 pointed to by `src` into a sequence of corresponding characters, beginning in the conversion state  
 77400 described by the object pointed to by `ps`. If `dst` is not a null pointer, the converted characters  
 77401 shall then be stored into the array pointed to by `dst`. Conversion continues up to and including a  
 77402 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the  
 77403 following cases:

- 77404 • When a code is reached that does not correspond to a valid character
- 77405 • When the next character would exceed the limit of `len` total bytes to be stored in the array  
 77406 pointed to by `dst` (and `dst` is not a null pointer)

77407 Each conversion shall take place as if by a call to the `wcrtomb()` function.

77408 If `dst` is not a null pointer, the pointer object pointed to by `src` shall be assigned either a null  
 77409 pointer (if conversion stopped due to reaching a terminating null wide character) or the address  
 77410 just past the last wide character converted (if any). If conversion stopped due to reaching a  
 77411 terminating null wide character, the resulting state described shall be the initial conversion state.

77412 If `ps` is a null pointer, the `wcsrtombs()` function shall use its own internal `mbstate_t` object, which  
 77413 is initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object  
 77414 pointed to by `ps` shall be used to completely describe the current conversion state of the  
 77415 associated character sequence.

77416 If called with a null `ps` argument, the `wcsrtombs()` function need not be thread-safe; however,  
 77417 such calls shall avoid data races with calls to `wcsrtombs()` with a non-null argument and with  
 77418 calls to all other functions.

77419 CX The `wcsnrtombs()` function shall be equivalent to the `wcsrtombs()` function, except that the  
 77420 conversion is limited to the first `nwc` wide characters.

77421 If called with a null `ps` argument, the `wcsnrtombs()` function need not be thread-safe; however,  
 77422 such calls shall avoid data races with calls to `wcsnrtombs()` with a non-null argument and with  
 77423 calls to all other functions.

77424 These functions shall not change the setting of `errno` if successful.

77425 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

77426 The implementation shall behave as if no function defined in System Interfaces volume of  
 77427 POSIX.1-2024 calls these functions.

77428 **RETURN VALUE**

77429 If conversion stops because a code is reached that does not correspond to a valid character, an  
 77430 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in  
 77431 *errno* and return (**size\_t**)-1; the conversion state is undefined. Otherwise, these functions shall  
 77432 return the number of bytes in the resulting character sequence, not including the terminating  
 77433 null (if any).

77434 **ERRORS**

77435 These functions shall fail if:

77436 [EILSEQ] A wide-character code does not correspond to a valid character.

77437 These functions may fail if:

77438 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

77439 **EXAMPLES**

77440 None.

77441 **APPLICATION USAGE**

77442 None.

77443 **RATIONALE**

77444 None.

77445 **FUTURE DIRECTIONS**

77446 None.

77449 XBD <[wchar.h](#)>

77450 **CHANGE HISTORY**

77451 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 77452 (E).

77453 **Issue 6**

77454 In the DESCRIPTION, a note on using this function in a threaded application is added.

77455 Extensions beyond the ISO C standard are marked.

77456 The normative text is updated to avoid use of the term “must” for application requirements.

77457 The *wcsrtoombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

77458 **Issue 7**

77459 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcsrtoombs()* function  
 77460 need not be thread-safe if called with a NULL *ps* argument.

77461 Austin Group Interpretation 1003.1-2001 #170 is applied.

77462 The *wcsnrtoombs()* function is added from The Open Group Technical Standard, 2006, Extended  
 77463 API Set Part 1.

77464 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0722 [109,105] is applied.

77465 **Issue 8**

77466 Austin Group Defect 1302 is applied, aligning these functions with the ISO/IEC 9899:2018  
 77467 standard.

77468 **NAME**77469 `wcsspnp` — get the length of a wide substring77470 **SYNOPSIS**77471 `#include <wchar.h>`77472 `size_t wcsspnp(const wchar_t *ws1, const wchar_t *ws2);`77473 **DESCRIPTION**77474 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77475 conflict between the requirements described here and the ISO C standard is unintentional. This  
77476 volume of POSIX.1-2024 defers to the ISO C standard.77477 The `wcsspnp()` function shall compute the length (in wide characters) of the maximum initial  
77478 segment of the wide-character string pointed to by `ws1` which consists entirely of wide-character  
77479 codes from the wide-character string pointed to by `ws2`.77480 CX The `wcsspnp()` function shall not change the setting of `errno` on valid input.77481 **RETURN VALUE**77482 The `wcsspnp()` function shall return the length of the initial substring of `ws1`; no return value is  
77483 reserved to indicate an error.77484 **ERRORS**

77485 No errors are defined.

77486 **EXAMPLES**

77487 None.

77488 **APPLICATION USAGE**

77489 None.

77490 **RATIONALE**

77491 None.

77492 **FUTURE DIRECTIONS**

77493 None.

77494 **SEE ALSO**77495 [wcscspnp\(\)](#)77496 XBD [<wchar.h>](#)77497 **CHANGE HISTORY**

77498 First released in Issue 4. Derived from the MSE working draft.

77499 **Issue 5**77500 The RETURN VALUE section is updated to indicate that `wcsspnp()` returns the length of `ws1`  
77501 rather than `ws1` itself.77502 **Issue 8**77503 Austin Group Defect 448 is applied, adding a requirement that `wcsspnp()` does not change the  
77504 setting of `errno` on valid input.

77505 **NAME**77506 `wcsstr` — find a wide-character substring77507 **SYNOPSIS**77508 `#include <wchar.h>`77509 `wchar_t *wcsstr(const wchar_t *restrict ws1,`  
77510 `const wchar_t *restrict ws2);`77511 **DESCRIPTION**77512 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77513 conflict between the requirements described here and the ISO C standard is unintentional. This  
77514 volume of POSIX.1-2024 defers to the ISO C standard.77515 The `wcsstr()` function shall locate the first occurrence in the wide-character string pointed to by  
77516 `ws1` of the sequence of wide characters (excluding the terminating null wide character) in the  
77517 wide-character string pointed to by `ws2`.77518 CX The `wcsstr()` function shall not change the setting of `errno` on valid input.77519 **RETURN VALUE**77520 Upon successful completion, `wcsstr()` shall return a pointer to the located wide-character string,  
77521 or a null pointer if the wide-character string is not found.77522 If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.77523 **ERRORS**

77524 No errors are defined.

77525 **EXAMPLES**

77526 None.

77527 **APPLICATION USAGE**

77528 None.

77529 **RATIONALE**

77530 None.

77532 None.

77533 **SEE ALSO**77534 [`wcschr\(\)`](#)77535 XBD [`<wchar.h>`](#)77536 **CHANGE HISTORY**77537 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
77538 (E).77539 **Issue 6**77540 The `wcsstr()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.77541 **Issue 8**77542 Austin Group Defect 448 is applied, adding a requirement that `wcsstr()` does not change the  
77543 setting of `errno` on valid input.

77544 **NAME**

77545 wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

77546 **SYNOPSIS**

77547 #include &lt;wchar.h&gt;

77548 double wcstod(const wchar\_t \*restrict *nptr*, wchar\_t \*\*restrict *endptr*);77549 float wcstof(const wchar\_t \*restrict *nptr*, wchar\_t \*\*restrict *endptr*);77550 long double wcstold(const wchar\_t \*restrict *nptr*,77551 wchar\_t \*\*restrict *endptr*);77552 **DESCRIPTION**

77553 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 77554 conflict between the requirements described here and the ISO C standard is unintentional. This  
 77555 volume of POSIX.1-2024 defers to the ISO C standard.

77556 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
 77557 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the  
 77558 input wide-character string into three parts:

- 77559 1. An initial, possibly empty, sequence of white-space wide characters
- 77560 2. A subject sequence interpreted as a floating-point constant or representing infinity or  
 77561 NaN
- 77562 3. A final wide-character string of one or more unrecognized wide-character codes,  
 77563 including the terminating null wide-character code of the input wide-character string

77564 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
 77565 the result.

77566 The expected form of the subject sequence is an optional '+' or '-' sign, then one of the  
 77567 following:

- 77568 • A non-empty sequence of decimal digits optionally containing a radix character; then an  
 77569 optional exponent part consisting of the wide character 'e' or the wide character 'E',  
 77570 optionally followed by a '+' or '-' wide character, and then followed by one or more  
 77571 decimal digits
- 77572 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
 77573 character; then an optional binary exponent part consisting of the wide character 'p' or  
 77574 the wide character 'P', optionally followed by a '+' or '-' wide character, and then  
 77575 followed by one or more decimal digits
- 77576 • One of INF or INFINITY, or any other wide string equivalent except for case
- 77577 • One of NAN or NAN(*n-wchar-sequence<sub>opt</sub>*), or any other wide string ignoring case in the  
 77578 NAN part, where:

77579 n-wchar-sequence:

77580 digit

77581 nondigit

77582 n-wchar-sequence digit

77583 n-wchar-sequence nondigit

77584 The subject sequence is defined as the longest initial subsequence of the input wide string,  
 77585 starting with the first non-white-space wide character, that is of the expected form. The subject  
 77586 sequence contains no wide characters if the input wide string is not of the expected form.

77587 If the subject sequence has the expected form for a floating-point number, the sequence of wide  
 77588 characters starting with the first digit or the radix character (whichever occurs first) shall be

77589 interpreted as a floating constant according to the rules of the C language, except that the radix  
 77590 character shall be used in place of a period, and that if neither an exponent part nor a radix  
 77591 character appears in a decimal floating-point number, or if a binary exponent part does not  
 77592 appear in a hexadecimal floating-point number, an exponent part of the appropriate type with  
 77593 value zero shall be assumed to follow the last digit in the string. If the subject sequence begins  
 77594 with a <hyphen-minus>, the sequence shall be interpreted as negated. A wide-character  
 77595 sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type,  
 77596 else as if it were a floating constant that is too large for the range of the return type. A wide-  
 77597 character sequence NAN or NAN(*n-wchar-sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if  
 77598 supported in the return type, else as if it were a subject sequence part that does not have the  
 77599 expected form; the meaning of the *n-wchar* sequences is implementation-defined. A pointer to  
 77600 the final wide string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not  
 77601 a null pointer.

77602 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the  
 77603 conversion shall be rounded in an implementation-defined manner.

77604 CX The radix character shall be as defined in the current locale (category *LC\_NUMERIC*). In the  
 77605 POSIX locale, or in a locale where the radix character is not defined, the radix character shall  
 77606 default to a <period> ( ' . ' ).

77607 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
 77608 accepted.

77609 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 77610 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
 77611 *endptr* is not a null pointer.

77612 These functions shall not change the setting of *errno* if successful.

77613 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 77614 for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check  
 77615 *errno*.

#### 77616 RETURN VALUE

77617 Upon successful completion, these functions shall return the converted value. If no conversion  
 77618 CX could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

77619 If the correct value would cause an overflow and default rounding is in effect, ±HUGE\_VAL,  
 77620 ±HUGE\_VALF, or ±HUGE\_VALL shall be returned (according to the sign of the value), and *errno*  
 77621 shall be set to [ERANGE].

77622 If the correct value would cause underflow, a value whose magnitude is no greater than the  
 77623 CX smallest normalized positive number in the return type shall be returned and *errno* set to  
 77624 [ERANGE].

#### 77625 ERRORS

77626 The *wcstod()* function shall fail if:

77627 [ERANGE] The value to be returned would cause overflow and default rounding is in  
 77628 CX effect or the value to be returned would cause underflow.

77629 The *wcstod()* function may fail if:

77630 CX [EINVAL] No conversion could be performed.

77631 **EXAMPLES**

77632 None.

77633 **APPLICATION USAGE**

77634 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 77635 result is not exactly representable, the result should be one of the two numbers in the  
 77636 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 77637 extra stipulation that the error should have a correct sign for the current rounding direction.

77638 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in `<float.h>`)  
 77639 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 77640 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 77641 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the  
 77642 values of *L*, *D*, and *U* satisfy " $L \leq D \leq U$ ". The result should be one of the (equal or  
 77643 adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current  
 77644 rounding direction, with the extra stipulation that the error with respect to *D* should have a  
 77645 correct sign for the current rounding direction.

77646 **RATIONALE**

77647 None.

77648 **FUTURE DIRECTIONS**

77649 None.

77650 **SEE ALSO**77651 [\*fscanf\(\)\*](#), [\*iswspace\(\)\*](#), [\*localeconv\(\)\*](#), [\*setlocale\(\)\*](#), [\*wcstol\(\)\*](#)77652 XBD [Chapter 7](#) (on page 127), `<float.h>`, `<wchar.h>`77653 **CHANGE HISTORY**

77654 First released in Issue 4. Derived from the MSE working draft.

77655 **Issue 5**77656 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.77657 **Issue 6**

77658 Extensions beyond the ISO C standard are marked.

77659 The following new requirements on POSIX implementations derive from alignment with the  
 77660 Single UNIX Specification:

- 77661 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 77662 added if no conversion could be performed.

77663 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 77664 • The *wcstod()* prototype is updated.
- 77665 • The *wcstof()* and *wcstold()* functions are added.
- 77666 • If the correct value for *wcstod()* would cause underflow, the return value changed from 0  
 77667 (as specified in Issue 5) to the smallest normalized positive number.
- 77668 • The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are  
 77669 extensively updated.

77670 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

77671 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second  
 77672 paragraph in the RETURN VALUE section.

77673 **Issue 7**

77674 Austin Group Interpretation 1003.1-2001 #015 is applied.

77675 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0723 [302] and XSH/TC1-2008/0724  
77676 [105] are applied.77677 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0391 [584] and XSH/TC2-2008/0392  
77678 [796] are applied.77679 **Issue 8**

77680 Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.

77681 Austin Group Defect 1686 is applied, addressing some inconsistencies with *strtod*().

77682 **NAME**77683 `wcstoimax`, `wcstoumax` — convert a wide-character string to an integer type77684 **SYNOPSIS**

```
77685 #include <stddef.h>
77686 #include <inttypes.h>
77687
77687 intmax_t wcstoimax(const wchar_t *restrict nptr,
77688                   wchar_t **restrict endptr, int base);
77689
77689 uintmax_t wcstoumax(const wchar_t *restrict nptr,
77690                    wchar_t **restrict endptr, int base);
```

77691 **DESCRIPTION**

77692 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 77693 conflict between the requirements described here and the ISO C standard is unintentional. This  
 77694 volume of POSIX.1-2024 defers to the ISO C standard.

77695 These functions shall be equivalent to the `wcstol()`, `wcstoll()`, `wcstoul()`, and `wcstoull()` functions,  
 77696 respectively, except that the initial portion of the wide string shall be converted to `intmax_t` and  
 77697 `uintmax_t` representation, respectively.

77698 **RETURN VALUE**

77699 These functions shall return the converted value, if any.

77700 If no conversion could be performed, zero shall be returned. If the correct value is outside the  
 77701 range of representable values, `{INTMAX_MAX}`, `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall  
 77702 be returned (according to the return type and sign of the value, if any), and `errno` shall be set to  
 77703 `[ERANGE]`.

77704 **ERRORS**

77705 These functions shall fail if:

77706 `[EINVAL]` The value of `base` is not supported.77707 `[ERANGE]` The value to be returned is not representable.

77708 These functions may fail if:

77709 `[EINVAL]` No conversion could be performed.77710 **EXAMPLES**

77711 None.

77712 **APPLICATION USAGE**

77713 None.

77714 **RATIONALE**

77715 None.

77716 **FUTURE DIRECTIONS**

77717 None.

77718 **SEE ALSO**77719 `wcstol()`, `wcstoul()`77720 XBD `<inttypes.h>`, `<stddef.h>`77721 **CHANGE HISTORY**

77722 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

77723 **NAME**

77724 wcstok — split a wide-character string into tokens

77725 **SYNOPSIS**

77726 #include &lt;wchar.h&gt;

77727 wchar\_t \*wcstok(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
77728 wchar\_t \*\*restrict ptr);77729 **DESCRIPTION**77730 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77731 conflict between the requirements described here and the ISO C standard is unintentional. This  
77732 volume of POSIX.1-2024 defers to the ISO C standard.77733 A sequence of calls to *wcstok()* shall break the wide-character string pointed to by *ws1* into a  
77734 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-  
77735 character string pointed to by *ws2*. The *ptr* argument points to a caller-provided **wchar\_t** pointer  
77736 into which the *wcstok()* function shall store information necessary for it to continue scanning the  
77737 same wide-character string.77738 The first call in the sequence has *ws1* as its first argument, and is followed by calls with a null  
77739 pointer as their first argument. The separator string pointed to by *ws2* may be different from call  
77740 to call.77741 The first call in the sequence shall search the wide-character string pointed to by *ws1* for the first  
77742 wide-character code that is *not* contained in the current separator string pointed to by *ws2*. If no  
77743 such wide-character code is found, then there are no tokens in the wide-character string pointed  
77744 to by *ws1* and *wcstok()* shall return a null pointer. If such a wide-character code is found, it shall  
77745 be the start of the first token.77746 The *wcstok()* function shall then search from there for a wide-character code that *is* contained in  
77747 the current separator string. If no such wide-character code is found, the current token extends  
77748 to the end of the wide-character string pointed to by *ws1*, and subsequent searches for a token  
77749 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a  
77750 null wide character, which terminates the current token. The *wcstok()* function shall save a  
77751 pointer to the following wide-character code, from which the next search for a token shall start.77752 Each subsequent call, with a null pointer as the value of the first argument, shall start searching  
77753 from the saved pointer and behave as described above.77754 The implementation shall behave as if no function calls *wcstok()*.77755 CX The *wcstok()* function shall not change the setting of *errno* on valid input.77756 **RETURN VALUE**77757 Upon successful completion, the *wcstok()* function shall return a pointer to the first wide-  
77758 character code of a token. Otherwise, if there is no token, *wcstok()* shall return a null pointer.77759 **ERRORS**

77760 No errors are defined.

77761 **EXAMPLES**

77762 None.

77763 **APPLICATION USAGE**

77764 None.

77765 **RATIONALE**

77766 None.

77767 **FUTURE DIRECTIONS**

77768 None.

77769 **SEE ALSO**77770 XBD [<wchar.h>](#)77771 **CHANGE HISTORY**

77772 First released in Issue 4.

77773 **Issue 5**77774 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is  
77775 added to the definition of *wcstok()* in the SYNOPSIS.77776 **Issue 6**77777 The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.77778 **Issue 8**77779 Austin Group Defect 448 is applied, adding a requirement that *wcstok()* does not change the  
77780 setting of *errno* on valid input.

77781 **NAME**

77782           wcstol, wcstoll — convert a wide-character string to a long integer

77783 **SYNOPSIS**

```
77784     #include <wchar.h>
77785     long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,
77786                int base);
77787     long long wcstoll(const wchar_t *restrict nptr,
77788                      wchar_t **restrict endptr, int base);
```

77789 **DESCRIPTION**

77790 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 77791 conflict between the requirements described here and the ISO C standard is unintentional. This  
 77792 volume of POSIX.1-2024 defers to the ISO C standard.

77793 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
 77794 **long** and **long long**, respectively. First, they shall decompose the input string into three parts:

- 77795       1. An initial, possibly empty, sequence of white-space wide characters
- 77796       2. A subject sequence interpreted as an integer represented in some radix determined by the  
 77797       value of *base*
- 77798       3. A final wide-character string of one or more unrecognized wide-character codes,  
 77799       including the terminating null wide-character code of the input wide-character string

77800 Then they shall attempt to convert the subject sequence to an integer, and return the result.

77801 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
 77802 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
 77803 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
 77804 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
 77805 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 77806 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

77807 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 77808 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 77809 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
 77810 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
 77811 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code  
 77812 representations of 0x or 0X may optionally precede the sequence of letters and digits, following  
 77813 the sign if present.

77814 The subject sequence is defined as the longest initial subsequence of the input wide-character  
 77815 string, starting with the first non-white-space wide character, that is of the expected form. The  
 77816 subject sequence contains no wide-character codes if the input wide-character string is empty or  
 77817 consists entirely of white-space wide characters, or if the first non-white-space wide character is  
 77818 other than a sign or a permissible letter or digit.

77819 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes  
 77820 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
 77821 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for  
 77822 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
 77823 <hyphen-minus>, the resulting value shall be the negative of the converted value. A pointer to  
 77824 the final wide-character string shall be stored in the object pointed to by *endptr*, provided that  
 77825 *endptr* is not a null pointer.

77826 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
77827 accepted.

77828 If the subject sequence is empty or does not have the expected form, no conversion shall be  
77829 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
77830 *endptr* is not a null pointer.

77831 These functions shall not change the setting of *errno* if successful.

77832 Since 0, {LONG\_MIN} or {LLONG\_MIN} and {LONG\_MAX} or {LLONG\_MAX} are returned on  
77833 error and are also valid returns on success, an application wishing to check for error situations  
77834 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.

#### 77835 RETURN VALUE

77836 Upon successful completion, these functions shall return the converted value, if any. If no  
77837 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If  
77838 the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
77839 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
77840 *errno* set to [ERANGE].

#### 77841 ERRORS

77842 These functions shall fail if:

77843 CX [EINVAL] The value of *base* is not supported.

77844 [ERANGE] The value to be returned is not representable.

77845 These functions may fail if:

77846 CX [EINVAL] No conversion could be performed.

#### 77847 EXAMPLES

77848 None.

#### 77849 APPLICATION USAGE

77850 None.

#### 77851 RATIONALE

77852 None.

#### 77858 CHANGE HISTORY

77859 First released in Issue 4. Derived from the MSE working draft.

#### 77860 Issue 5

77861 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 77862 Issue 6

77863 Extensions beyond the ISO C standard are marked.

77864 The following new requirements on POSIX implementations derive from alignment with the  
77865 Single UNIX Specification:

- 77866 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
77867 added if no conversion could be performed.

77868 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 77869 • The *wcstol()* prototype is updated.
- 77870 • The *wcstoll()* function is added.

77871 **Issue 7**

77872 SD5-XSH-ERN-56 is applied, removing the reference to **unsigned long** and **unsigned long long**  
77873 from the DESCRIPTION.

77874 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0725 [105] is applied.

77875 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0393 [584] and XSH/TC2-2008/0394  
77876 [796] are applied.

77877 **Issue 8**

77878 Austin Group Defect 700 is applied, clarifying how a subject sequence beginning with <hyphen-  
77879 minus> is converted.

77880 Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.

77881 **NAME**

77882           wcstold — convert a wide-character string to a double-precision number

77883 **SYNOPSIS**

77884           #include &lt;wchar.h&gt;

77885           long double wcstold(const wchar\_t \*restrict *nptr*,77886                            wchar\_t \*\*restrict *endptr*);77887 **DESCRIPTION**77888           Refer to *wcstod()*.

77889 **NAME**

77890           wcstoll — convert a wide-character string to a long integer

77891 **SYNOPSIS**

77892           #include <wchar.h>

77893           long long wcstoll(const wchar\_t \*restrict *nptr*,  
77894                            wchar\_t \*\*restrict *endptr*, int *base*);

77895 **DESCRIPTION**

77896           Refer to *wcstol()*.

77897 **NAME**

77898 wcstombs — convert a wide-character string to a character string

77899 **SYNOPSIS**

77900 #include &lt;stdlib.h&gt;

77901 size\_t wcstombs(char \*restrict s, const wchar\_t \*restrict pwcs,  
77902 size\_t n);77903 **DESCRIPTION**77904 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
77905 conflict between the requirements described here and the ISO C standard is unintentional. This  
77906 volume of POSIX.1-2024 defers to the ISO C standard.77907 The *wcstombs()* function shall convert the sequence of wide-character codes that are in the array  
77908 pointed to by *pwcs* into a sequence of characters that begins in the initial shift state and store  
77909 these characters into the array pointed to by *s*, stopping if a character would exceed the limit of *n*  
77910 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to  
77911 *wctomb()*, except that the shift state of *wctomb()* shall not be affected.77912 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.77913 No more than *n* bytes shall be modified in the array pointed to by *s*. If copying takes place  
77914 CX between objects that overlap, the behavior is undefined. If *s* is a null pointer, *wcstombs()* shall  
77915 return the length required to convert the entire array regardless of the value of *n*, but no values  
77916 are stored.77917 **RETURN VALUE**77918 If a wide-character code is encountered that does not correspond to a valid character (of one or  
77919 more bytes each), *wcstombs()* shall return (**size\_t**)−1. Otherwise, *wcstombs()* shall return the  
77920 number of bytes stored in the character array, not including any terminating null byte. The array  
77921 shall not be null-terminated if the value returned is *n*.77922 **ERRORS**77923 The *wcstombs()* function shall fail if:

77924 CX [EILSEQ] A wide-character code does not correspond to a valid character.

77925 **EXAMPLES**

77926 None.

77927 **APPLICATION USAGE**

77928 None.

77929 **RATIONALE**

77930 None.

77931 **FUTURE DIRECTIONS**

77932 None.

77933 **SEE ALSO**77934 [mblen\(\)](#), [mbtowc\(\)](#), [mbstowcs\(\)](#), [wctomb\(\)](#)77935 XBD [<stdlib.h>](#)77936 **CHANGE HISTORY**

77937 First released in Issue 4. Derived from the ISO C standard.

77938 **Issue 6**

77939 The following new requirements on POSIX implementations derive from alignment with the  
77940 Single UNIX Specification:

- 77941 • The DESCRIPTION states the effect of when *s* is a null pointer.
- 77942 • The [EILSEQ] error condition is added.

77943 The *wcstombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

77944 **Issue 7**

77945 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

77946 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0726 [109] is applied.

77947 **NAME**77948 `wcstoul, wcstoull` — convert a wide-character string to an unsigned long77949 **SYNOPSIS**

```
77950 #include <wchar.h>
77951 unsigned long wcstoul(const wchar_t *restrict nptr,
77952     wchar_t **restrict endptr, int base);
77953 unsigned long long wcstoull(const wchar_t *restrict nptr,
77954     wchar_t **restrict endptr, int base);
```

77955 **DESCRIPTION**

77956 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 77957 conflict between the requirements described here and the ISO C standard is unintentional. This  
 77958 volume of POSIX.1-2024 defers to the ISO C standard.

77959 The `wcstoul()` and `wcstoull()` functions shall convert the initial portion of the wide-character  
 77960 string pointed to by `nptr` to **unsigned long** and **unsigned long long** representation, respectively.  
 77961 First, they shall decompose the input wide-character string into three parts:

- 77962 1. An initial, possibly empty, sequence of white-space wide characters
- 77963 2. A subject sequence interpreted as an integer represented in some radix determined by the  
 77964 value of `base`
- 77965 3. A final wide-character string of one or more unrecognized wide-character codes,  
 77966 including the terminating null wide-character code of the input wide-character string

77967 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
 77968 result.

77969 If `base` is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
 77970 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
 77971 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
 77972 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
 77973 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 77974 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

77975 If the value of `base` is between 2 and 36, the expected form of the subject sequence is a sequence  
 77976 of letters and digits representing an integer with the radix specified by `base`, optionally preceded  
 77977 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
 77978 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
 77979 than that of `base` shall be permitted. If the value of `base` is 16, the wide-character codes 0x or 0X  
 77980 may optionally precede the sequence of letters and digits, following the sign if present.

77981 The subject sequence is defined as the longest initial subsequence of the input wide-character  
 77982 string, starting with the first non-white-space wide character, that is of the expected form. The  
 77983 subject sequence contains no wide-character codes if the input wide-character string is empty or  
 77984 consists entirely of white-space wide characters, or if the first non-white-space wide character is  
 77985 other than a sign or a permissible letter or digit.

77986 If the subject sequence has the expected form and `base` is 0, the sequence of wide-character codes  
 77987 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
 77988 the expected form and the value of `base` is between 2 and 36, it shall be used as the base for  
 77989 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
 77990 <hyphen-minus>, the resulting value shall be the negative of the converted value; this action  
 77991 shall be performed in the return type. A pointer to the final wide-character string shall be stored  
 77992 in the object pointed to by `endptr`, provided that `endptr` is not a null pointer.

77993 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
77994 accepted.

77995 If the subject sequence is empty or does not have the expected form, no conversion shall be  
77996 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
77997 *endptr* is not a null pointer.

77998 These functions shall not change the setting of *errno* if successful.

77999 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and 0 is also a valid return  
78000 on success, an application wishing to check for error situations should set *errno* to 0, then call  
78001 *wcstoul()* or *wcstoull()*, then check *errno*.

#### 78002 RETURN VALUE

78003 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted  
78004 CX value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to  
78005 indicate the error. If the correct value is outside the range of representable values,  
78006 {ULONG\_MAX} or {ULLONG\_MAX} respectively shall be returned and *errno* set to [ERANGE].

#### 78007 ERRORS

78008 These functions shall fail if:

78009 CX [EINVAL] The value of *base* is not supported.

78010 [ERANGE] The value to be returned is not representable.

78011 These functions may fail if:

78012 CX [EINVAL] No conversion could be performed.

#### 78013 EXAMPLES

#### 78024 CHANGE HISTORY

78025 First released in Issue 4. Derived from the MSE working draft.

#### 78026 Issue 5

78027 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 78028 Issue 6

78029 Extensions beyond the ISO C standard are marked.

78030 The following new requirements on POSIX implementations derive from alignment with the  
78031 Single UNIX Specification:

- 78032 • The [EINVAL] error condition is added for when the value of *base* is not supported.

78033 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
78034 added if no conversion could be performed.

78035 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 78036 • The *wcstoul()* prototype is updated.
- 78037 • The *wcstoull()* function is added.

78038 **Issue 7**

78039 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0727 [105] is applied.

78040 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0395 [584] and XSH/TC2-2008/0396  
78041 [796] are applied.

78042 **Issue 8**

78043 Austin Group Defect 700 is applied, clarifying how a subject sequence beginning with <hyphen-  
78044 minus> is converted.

78045 Austin Group Defect 1163 is applied, clarifying the handling of white space in the input string.

78046 **NAME**

78047       wcstoumax — convert a wide-character string to an integer type

78048 **SYNOPSIS**

78049       #include &lt;stddef.h&gt;

78050       #include &lt;inttypes.h&gt;

78051       uintmax\_t wcstoumax(const wchar\_t \*restrict *nptr*,78052                    wchar\_t \*\*restrict *endptr*, int *base*);78053 **DESCRIPTION**78054       Refer to *wcstoimax()*.

78055 **NAME**78056 `wcswidth` — number of column positions of a wide-character string78057 **SYNOPSIS**

```
78058 XSI #include <wchar.h>
78059 int wcswidth(const wchar_t *pwcs, size_t n);
```

78060 **DESCRIPTION**

78061 The `wcswidth()` function shall determine the number of column positions required for  $n$  wide-  
78062 character codes (or fewer than  $n$  wide-character codes if a null wide-character code is  
78063 encountered before  $n$  wide-character codes are exhausted) in the string pointed to by `pwcs`.

78064 The `wcswidth()` function shall not change the setting of `errno` on valid input.

78065 **RETURN VALUE**

78066 The `wcswidth()` function either shall return 0 (if `pwcs` points to a null wide-character code), or  
78067 return the number of column positions to be occupied by the wide-character string pointed to by  
78068 `pwcs`, or return -1 (if any of the first  $n$  wide-character codes in the wide-character string pointed  
78069 to by `pwcs` is not a printable wide-character code).

78070 **ERRORS**

78071 No errors are defined.

78072 **EXAMPLES**

78073 None.

78074 **APPLICATION USAGE**

78075 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
78076 return value for a non-printable wide character is not specified.

78077 **RATIONALE**

78078 None.

78079 **FUTURE DIRECTIONS**

78080 None.

78081 **SEE ALSO**

78082 [wctype\(\)](#)

78083 [XBD Section 3.75](#) (on page 42), [<wchar.h>](#)

78084 **CHANGE HISTORY**

78085 First released in Issue 4. Derived from the MSE working draft.

78086 **Issue 6**

78087 The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

78088 **Issue 8**

78089 Austin Group Defect 448 is applied, adding a requirement that `wcswidth()` does not change the  
78090 setting of `errno` on valid input.

78091 **NAME**

78092           wcsxfrm, wcsxfrm\_l — wide-character string transformation

78093 **SYNOPSIS**

78094           #include &lt;wchar.h&gt;

78095           size\_t wcsxfrm(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
78096                           size\_t n);78097 CX        size\_t wcsxfrm\_l(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
78098                           size\_t n, locale\_t locale);78099 **DESCRIPTION**78100 CX        For `wcsxfrm()`: The functionality described on this reference page is aligned with the ISO C  
78101 standard. Any conflict between the requirements described here and the ISO C standard is  
78102 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.78103 CX        The `wcsxfrm()` and `wcsxfrm_l()` functions shall transform the wide-character string pointed to  
78104 by `ws2` and place the resulting wide-character string into the array pointed to by `ws1`. The  
78105 transformation shall be such that if `wcscmp()` is applied to two transformed wide strings, it shall  
78106 CX        return a value greater than, equal to, or less than 0, corresponding to the result of `wcscoll()` and  
78107 `wcscoll_l()` applied to the same two original wide-character strings, and the same `LC_COLLATE`  
78108 CX        category of the current locale or the locale object `locale`, respectively. No more than `n` wide-  
78109 character codes shall be placed into the resulting array pointed to by `ws1`, including the  
78110 terminating null wide-character code. If `n` is 0, `ws1` is permitted to be a null pointer. If copying  
78111 takes place between objects that overlap, the behavior is undefined.78112 CX        The `wcsxfrm()` and `wcsxfrm_l()` functions shall not change the setting of `errno` if successful.78113        Since no return value is reserved to indicate an error, an application wishing to check for error  
78114 situations should set `errno` to 0, then call `wcsxfrm()` or `wcsxfrm_l()`, then check `errno`.78115        The behavior is undefined if the `locale` argument to `wcsxfrm_l()` is the special locale object  
78116 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.78117 **RETURN VALUE**78118 CX        The `wcsxfrm()` and `wcsxfrm_l()` functions shall return the length of the transformed wide-  
78119 character string (not including the terminating null wide-character code). If the value returned is  
78120 `n` or more, the contents of the array pointed to by `ws1` are unspecified.78121 CX        On error, the `wcsxfrm()` and `wcsxfrm_l()` functions may set `errno`, but no return value is reserved  
78122 to indicate an error.78123 **ERRORS**

78124        These functions may fail if:

78125 CX        [EINVAL]        The wide-character string pointed to by `ws2` contains wide-character codes  
78126                           outside the domain of the collating sequence.

78127 **EXAMPLES**

78128 None.

78129 **APPLICATION USAGE**

78130 The transformation function is such that two transformed wide-character strings can be ordered  
78131 by *wscmp()* as appropriate to collating sequence information in the current locale (category  
78132 *LC\_COLLATE*).

78133 The fact that when *n* is 0 *ws1* is permitted to be a null pointer is useful to determine the size of  
78134 the *ws1* array prior to making the transformation.

78135 **RATIONALE**

78136 None.

78137 **FUTURE DIRECTIONS**

78138 None.

78139 **SEE ALSO**78140 *wscmp()*, *wscoll()*78141 XBD <[wchar.h](#)>78142 **CHANGE HISTORY**

78143 First released in Issue 4. Derived from the MSE working draft.

78144 **Issue 5**

78145 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

78146 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.78147 **Issue 6**

78148 In earlier versions, this function was required to return -1 on error.

78149 Extensions beyond the ISO C standard are marked.

78150 The following new requirements on POSIX implementations derive from alignment with the  
78151 Single UNIX Specification:

- 78152 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
78153 added if no conversion could be performed.

78154 The *wcsxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.78155 **Issue 7**

78156 The *wcsxfrm\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
78157 API Set Part 4.

78158 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0728 [302], XSH/TC1-2008/0729 [283],  
78159 XSH/TC1-2008/0730 [283], and XSH/TC1-2008/0731 [302] are applied.

78160 **NAME**

78161 wctob — wide-character to single-byte conversion

78162 **SYNOPSIS**

78163 #include &lt;stdio.h&gt;

78164 #include &lt;wchar.h&gt;

78165 int wctob(wint\_t c);

78166 **DESCRIPTION**

78167 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
78168 conflict between the requirements described here and the ISO C standard is unintentional. This  
78169 volume of POSIX.1-2024 defers to the ISO C standard.

78170 The *wctob()* function shall determine whether *c* corresponds to a member of the extended  
78171 character set whose character representation is a single byte when in the initial shift state.

78172 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

78173 CX The *wctob()* function shall not change the setting of *errno* on valid input.

78174 **RETURN VALUE**

78175 The *wctob()* function shall return EOF if *c* does not correspond to a character with length one in  
78176 the initial shift state. Otherwise, it shall return the single-byte representation of that character as  
78177 an **unsigned char** converted to **int**.

78178 **ERRORS**

78179 No errors are defined.

78180 **EXAMPLES**

78181 None.

78182 **APPLICATION USAGE**

78183 None.

78184 **RATIONALE**

78185 None.

78186 **FUTURE DIRECTIONS**

78187 None.

78188 **SEE ALSO**78189 [btowc\(\)](#)78190 XBD [<stdio.h>](#), [<wchar.h>](#)78191 **CHANGE HISTORY**

78192 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
78193 (E).

78194 **Issue 8**

78195 Austin Group Defect 448 is applied, adding a requirement that *wctob()* does not change the  
78196 setting of *errno* on valid input.

78197 **NAME**

78198 wctomb — convert a wide-character code to a character

78199 **SYNOPSIS**

78200 #include &lt;stdlib.h&gt;

78201 int wctomb(char \*s, wchar\_t wchar);

78202 **DESCRIPTION**

78203 CX Except for requirements relating to data races, the functionality described on this reference page  
 78204 is aligned with the ISO C standard. Any other conflict between the requirements described here  
 78205 and the ISO C standard is unintentional. This volume of POSIX.1-2024 defers to the ISO C  
 78206 standard for all *wctomb()* functionality except in relation to data races.

78207 The *wctomb()* function shall determine the number of bytes needed to represent the character  
 78208 corresponding to the wide-character code whose value is *wchar* (including any change in the  
 78209 shift state). It shall store the character representation (possibly multiple bytes and any special  
 78210 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most  
 78211 {MB\_CUR\_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any  
 78212 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift  
 78213 state.

78214 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 78215 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
 78216 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 78217 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 78218 null pointer shall cause this function to return a non-zero value if encodings have state  
 78219 dependency, and 0 otherwise. Changing the *LC\_CTYPE* category causes the shift state of this  
 78220 function to be unspecified.

78221 CX The *wctomb()* function need not be thread-safe; however, it shall avoid data races with all other  
 78222 functions.

78223 The implementation shall behave as if no function defined in this volume of POSIX.1-2024 calls  
 78224 *wctomb()*.

78225 **RETURN VALUE**

78226 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,  
 78227 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*  
 78228 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the  
 78229 number of bytes that constitute the character corresponding to the value of *wchar*.

78230 In no case shall the value returned be greater than the value of the {MB\_CUR\_MAX} macro.

78231 **ERRORS**78232 The *wctomb()* function shall fail if:

78233 CX [EILSEQ] An invalid wide-character code is detected.

78234 **EXAMPLES**

78235 None.

78236 **APPLICATION USAGE**

78237 None.

78238 **RATIONALE**

78239 When the ISO C standard introduced threads in C11, it required *wctomb()* to avoid data races  
78240 (with itself as well as with other functions), whereas POSIX.1-2008 did not require it to be  
78241 thread-safe, and in many implementations it did not avoid data races with itself and still does  
78242 not. The ISO C committee intend to change the requirements in a future version of the ISO C  
78243 standard, but since POSIX.1 currently refers to C17 it is necessary for it not to defer to the ISO C  
78244 standard regarding data races in order to continue to allow this function not to avoid data races  
78245 with itself.

78246 **FUTURE DIRECTIONS**

78247 It is expected that a change in a future version of the ISO C standard will allow a future version  
78248 of this standard to remove the data race exception from the statement that it defers to the ISO C  
78249 standard.

78250 **SEE ALSO**78251 [mblen\(\)](#), [mbtowc\(\)](#), [mbstowcs\(\)](#), [wcstombs\(\)](#)78252 XBD <[stdlib.h](#)>78253 **CHANGE HISTORY**

78254 First released in Issue 4. Derived from the ANSI C standard.

78255 **Issue 6**

78256 Extensions beyond the ISO C standard are marked.

78257 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

78258 **Issue 7**

78259 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

78260 **Issue 8**

78261 Austin Group Defects 708 and 1302 are applied, aligning this function with the  
78262 ISO/IEC 9899:2018 standard, except in relation to data races.

78263 Austin Group Defect 1572 is applied, removing CX shading from some text derived from the  
78264 ISO C standard.

78265 **NAME**

78266 wctrans, wctrans\_l — define character mapping

78267 **SYNOPSIS**

78268 #include &lt;wctype.h&gt;

78269 wctrans\_t wctrans(const char \*charclass);

78270 CX wctrans\_t wctrans\_l(const char \*charclass, locale\_t locale);

78271 **DESCRIPTION**78272 CX For *wctrans()*: The functionality described on this reference page is aligned with the ISO C  
78273 standard. Any conflict between the requirements described here and the ISO C standard is  
78274 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.78275 CX The *wctrans()* and *wctrans\_l()* functions are defined for valid character mapping names  
78276 identified in the current locale. The *charclass* is a string identifying a generic character mapping  
78277 name for which codeset-specific information is required. The following character mapping  
78278 names are defined in all locales: **tolower** and **toupper**.78279 These functions shall return a value of type **wctrans\_t**, which can be used as the second  
78280 CX argument to subsequent calls of *towctrans()* and *towctrans\_l()*.78281 CX The *wctrans()* and *wctrans\_l()* functions shall determine values of **wctrans\_t** according to the  
78282 CX rules of the coded character set defined by character mapping information in the current locale  
78283 or in the locale represented by *locale*, respectively (category *LC\_CTYPE*).78284 The values returned by *wctrans()* shall be valid until a call to *setlocale()* that modifies the  
78285 category *LC\_CTYPE*.78286 CX The values returned by *wctrans\_l()* shall be valid only in calls to *towctrans\_l()* with a locale  
78287 represented by *locale* with the same *LC\_CTYPE* category value.78288 The behavior is undefined if the *locale* argument to *wctrans\_l()* is the special locale object  
78289 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.78290 **RETURN VALUE**78291 CX The *wctrans()* and *wctrans\_l()* functions shall return 0 and may set *errno* to indicate the error if  
78292 the given character mapping name is not valid for the current locale (category *LC\_CTYPE*);  
78293 otherwise, they shall return a non-zero object of type **wctrans\_t** that can be used in calls to  
78294 CX *towctrans()* and *towctrans\_l()*.78295 **ERRORS**

78296 These functions may fail if:

78297 CX [EINVAL] The character mapping name pointed to by *charclass* is not valid in the current  
78298 locale.78299 **EXAMPLES**

78300 None.

78301 **APPLICATION USAGE**

78302 None.

78303 **RATIONALE**

78304 None.

78305 **FUTURE DIRECTIONS**

78306 None.

78307 **SEE ALSO**78308 [towctrans\(\)](#)78309 XBD [<wctype.h>](#)78310 **CHANGE HISTORY**

78311 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

78312 **Issue 7**78313 The *wctrans\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
78314 API Set Part 4.78315 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0732 [302], XSH/TC1-2008/0733 [289],  
78316 XSH/TC1-2008/0734 [283], and XSH/TC1-2008/0735 [283] are applied.

78317 **NAME**

78318 wctype, wctype\_l — define character class

78319 **SYNOPSIS**

78320 #include &lt;wctype.h&gt;

78321 wctype\_t wctype(const char \*property);

78322 CX wctype\_t wctype\_l(const char \*property, locale\_t locale);

78323 **DESCRIPTION**78324 CX For *wctype()*: The functionality described on this reference page is aligned with the ISO C  
78325 standard. Any conflict between the requirements described here and the ISO C standard is  
78326 unintentional. This volume of POSIX.1-2024 defers to the ISO C standard.78327 CX The *wctype()* and *wctype\_l()* functions are defined for valid character class names as defined in  
78328 CX the current locale or in the locale represented by *locale*, respectively.78329 The *property* argument is a string identifying a generic character class for which codeset-specific  
78330 type information is required. The following character class names shall be defined in all locales:

78331	<b>alnum</b>	<b>digit</b>	<b>punct</b>
78332	<b>alpha</b>	<b>graph</b>	<b>space</b>
78333	<b>blank</b>	<b>lower</b>	<b>upper</b>
78334	<b>cntrl</b>	<b>print</b>	<b>xdigit</b>

78335 Additional character class names defined in the locale definition file (category *LC\_CTYPE*) can  
78336 also be specified.78337 These functions shall return a value of type **wctype\_t**, which can be used as the second  
78338 CX argument to subsequent calls of *iswctype()* and *iswctype\_l()*.78339 CX The *wctype()* and *wctype\_l()* functions shall determine values of **wctype\_t** according to the  
78340 CX rules of the coded character set defined by character type information in the current locale or in  
78341 the locale represented by *locale*, respectively (category *LC\_CTYPE*).78342 The values returned by *wctype()* shall be valid until a call to *setlocale()* that modifies the category  
78343 *LC\_CTYPE*.78344 CX The values returned by *wctype\_l()* shall be valid only in calls to *iswctype\_l()* with a locale  
78345 represented by *locale* with the same *LC\_CTYPE* category value.78346 The behavior is undefined if the *locale* argument to *wctype\_l()* is the special locale object  
78347 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.78348 **RETURN VALUE**78349 CX The *wctype()* and *wctype\_l()* functions shall return 0 if the given character class name is not  
78350 valid for the current locale (category *LC\_CTYPE*); otherwise, they shall return an object of type78351 CX **wctype\_t** that can be used in calls to *iswctype()* and *iswctype\_l()*.78352 **ERRORS**

78353 No errors are defined.

78354 **EXAMPLES**

78355 None.

78356 **APPLICATION USAGE**

78357 None.

78358 **RATIONALE**

78359 None.

78361 None.

78362 **SEE ALSO**78363 [\*iswctype\(\)\*](#)78364 XBD [\*\*<wctype.h>\*\*](#)78365 **CHANGE HISTORY**

78366 First released in Issue 4.

78367 **Issue 5**78368 The following change has been made in this version for alignment with  
78369 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 78370
- The SYNOPSIS has been changed to indicate that this function and associated data types  
78371 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

78372 **Issue 7**78373 The *wctype\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
78374 Set Part 4.78375 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0736 [302], XSH/TC1-2008/0737 [283],  
78376 and XSH/TC1-2008/0738 [283] are applied.

78377 **NAME**

78378           wctype — number of column positions of a wide-character code

78379 **SYNOPSIS**

```
78380 XSI       #include <wctype.h>
78381       int wctype(wchar_t wc);
```

78382 **DESCRIPTION**

78383       The *wctype()* function shall determine the number of column positions required for the wide  
78384 character *wc*. The application shall ensure that the value of *wc* is a character representable as a  
78385 **wchar\_t**, and is a wide-character code corresponding to a valid character in the current locale.

78386       The *wctype()* function shall not change the setting of *errno* on valid input.

78387 **RETURN VALUE**

78388       The *wctype()* function shall either return 0 (if *wc* is a null wide-character code), or return the  
78389 number of column positions to be occupied by the wide-character code *wc*, or return -1 (if *wc*  
78390 does not correspond to a printable wide-character code).

78391 **ERRORS**

78392       No errors are defined.

78393 **EXAMPLES**

78394       None.

78395 **APPLICATION USAGE**

78396       This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
78397 return value for a non-printable wide character is not specified.

78398 **RATIONALE**

78399       None.

78400 **FUTURE DIRECTIONS**

78401       None.

78402 **SEE ALSO**

78403       *wcsnwidth()*

78404       XBD <[wctype.h](#)>

78405 **CHANGE HISTORY**

78406       First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
78407 draft.

78408 **Issue 6**

78409       The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

78410       The normative text is updated to avoid use of the term “must” for application requirements.

78411 **Issue 8**

78412       Austin Group Defect 448 is applied, adding a requirement that *wctype()* does not change the  
78413 setting of *errno* on valid input.

78414 **NAME**

78415 wmemchr — find a wide character in memory

78416 **SYNOPSIS**

78417 #include &lt;wchar.h&gt;

78418 wchar\_t \*wmemchr(const wchar\_t \*ws, wchar\_t wc, size\_t n);

78419 **DESCRIPTION**

78420 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
78421 conflict between the requirements described here and the ISO C standard is unintentional. This  
78422 volume of POSIX.1-2024 defers to the ISO C standard.

78423 The *wmemchr()* function shall locate the first occurrence of *wc* in the initial *n* wide characters of  
78424 the object pointed to by *ws*. This function shall not be affected by locale and all **wchar\_t** values  
78425 shall be treated identically. The null wide character and **wchar\_t** values not corresponding to  
78426 valid characters shall not be treated specially.

78427 If *n* is zero, the application shall ensure that *ws* is a valid pointer and the function behaves as if  
78428 no valid occurrence of *wc* is found.

78429 CX The *wmemchr()* function shall not change the setting of *errno* on valid input.

78430 **RETURN VALUE**

78431 The *wmemchr()* function shall return a pointer to the located wide character, or a null pointer if  
78432 the wide character does not occur in the object.

78433 **ERRORS**

78434 No errors are defined.

78435 **EXAMPLES**

78436 None.

78437 **APPLICATION USAGE**

78438 None.

78439 **RATIONALE**

78440 None.

78441 **FUTURE DIRECTIONS**

78442 None.

78443 **SEE ALSO**78444 [wmemcmp\(\)](#), [wmemcpy\(\)](#), [wmemmove\(\)](#), [wmemset\(\)](#)78445 XBD [<wchar.h>](#)78446 **CHANGE HISTORY**

78448 (E).

78449 **Issue 6**

78450 The normative text is updated to avoid use of the term “must” for application requirements.

78451 **Issue 8**

78452 Austin Group Defect 448 is applied, adding a requirement that *wmemchr()* does not change the  
78453 setting of *errno* on valid input.

78454 **NAME**

78455 wmemcmp — compare wide characters in memory

78456 **SYNOPSIS**

78457 #include &lt;wchar.h&gt;

78458 int wmemcmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

78459 **DESCRIPTION**

78460 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
78461 conflict between the requirements described here and the ISO C standard is unintentional. This  
78462 volume of POSIX.1-2024 defers to the ISO C standard.

78463 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by  
78464 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be  
78465 affected by locale and all **wchar\_t** values shall be treated identically. The null wide character and  
78466 **wchar\_t** values not corresponding to valid characters shall not be treated specially.

78467 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
78468 shall behave as if the two objects compare equal.

78469 CX The *wmemcmp()* function shall not change the setting of *errno* on valid input.

78470 **RETURN VALUE**

78471 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,  
78472 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object  
78473 pointed to by *ws2*.

78474 **ERRORS**

78475 No errors are defined.

78476 **EXAMPLES**

78477 None.

78478 **APPLICATION USAGE**

78479 None.

78529 (E).78530 **Issue 6**

78531 The normative text is updated to avoid use of the term “must” for application requirements.

78532 The *wmemcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.78533 **Issue 8**78534 Austin Group Defect 448 is applied, adding a requirement that *wmemcpy()* does not change the  
78535 setting of *errno* on valid input.

78536 **NAME**

78537 wmemmove — copy wide characters in memory with overlapping areas

78538 **SYNOPSIS**

78539 #include &lt;wchar.h&gt;

78540 wchar\_t \*wmemmove(wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

78541 **DESCRIPTION**

78542 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
78543 conflict between the requirements described here and the ISO C standard is unintentional. This  
78544 volume of POSIX.1-2024 defers to the ISO C standard.

78545 The *wmemmove()* function shall copy *n* wide characters from the object pointed to by *ws2* to the  
78546 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object  
78547 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not  
78548 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary  
78549 array are copied into the object pointed to by *ws1*.

78550 This function shall not be affected by locale and all **wchar\_t** values shall be treated identically.  
78551 The null wide character and **wchar\_t** values not corresponding to valid characters shall not be  
78552 treated specially.

78553 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
78554 shall copy zero wide characters.

78555 CX The *wmemmove()* function shall not change the setting of *errno* on valid input.

78556 **RETURN VALUE**78557 The *wmemmove()* function shall return the value of *ws1*.78558 **ERRORS**

78559 No errors are defined

78560 **EXAMPLES**

78561 None.

78562 **APPLICATION USAGE**

78563 None.

78564 **RATIONALE**

78565 None.

78566 **FUTURE DIRECTIONS**

78567 None.

78568 **SEE ALSO**78569 [wmemchr\(\)](#), [wmemcmp\(\)](#), [wmemcpy\(\)](#), [wmemset\(\)](#)78570 XBD [<wchar.h>](#)78571 **CHANGE HISTORY**

78576 **Issue 8**

78577

78578

Austin Group Defect 448 is applied, adding a requirement that *wmemmove()* does not change the setting of *errno* on valid input.

78579 **NAME**

78580 wmemset — set wide characters in memory

78581 **SYNOPSIS**

78582 #include &lt;wchar.h&gt;

78583 wchar\_t \*wmemset(wchar\_t \*ws, wchar\_t wc, size\_t n);

78584 **DESCRIPTION**

78585 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 78586 conflict between the requirements described here and the ISO C standard is unintentional. This  
 78587 volume of POSIX.1-2024 defers to the ISO C standard.

78588 The *wmemset()* function shall copy the value of *wc* into each of the first *n* wide characters of the  
 78589 object pointed to by *ws*. This function shall not be affected by locale and all **wchar\_t** values shall  
 78590 be treated identically. The null wide character and **wchar\_t** values not corresponding to valid  
 78591 characters shall not be treated specially.

78592 If *n* is zero, the application shall ensure that *ws* is a valid pointer, and the function shall copy  
 78593 zero wide characters.

78594 CX The *wmemset()* function shall not change the setting of *errno* on valid input.

78595 **RETURN VALUE**78596 The *wmemset()* functions shall return the value of *ws*.78597 **ERRORS**

78598 No errors are defined.

 78617 setting of *errno* on valid input.

78618 **NAME**  
 78619 wordexp, wordfree — perform word expansions

78620 **SYNOPSIS**

```
78621 #include <wordexp.h>
78622 int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
78623             int flags);
78624 void wordfree(wordexp_t *pwordexp);
```

78625 **DESCRIPTION**

78626 The *wordexp()* function shall perform word expansions as described in XCU Section 2.6 (on page  
 78627 2483), subject to quoting as described in XCU Section 2.2 (on page 2472), and place the list of  
 78628 expanded words into the structure pointed to by *pwordexp*.

78629 The *words* argument is a pointer to a string containing one or more words to be expanded. The  
 78630 expansions shall be the same as would be performed by the command line interpreter if *words*  
 78631 were the part of a command line representing the arguments to a utility. Therefore, the  
 78632 application shall ensure that *words* does not contain an unquoted <newline> character or any of  
 78633 the unquoted shell special characters '|', '&', ';', '<', '>' except in the context of command  
 78634 substitution as specified in XCU Section 2.6.3 (on page 2489). It also shall not contain unquoted  
 78635 parentheses or braces, except in the context of command or variable substitution. The  
 78636 application shall ensure that every member of *words* which it expects to have expanded by  
 78637 *wordexp()* does not contain an unquoted initial comment character. The application shall also  
 78638 ensure that any words which it intends to be ignored (because they begin or continue a  
 78639 comment) are deleted from *words*. If the argument *words* contains an unquoted comment  
 78640 character (<number-sign>) that is the beginning of a token, *wordexp()* shall either treat the  
 78641 comment character as a regular character, or interpret it as a comment indicator and ignore the  
 78642 remainder of *words*.

78643 The structure type **wordexp\_t** is defined in the <**wordexp.h**> header and includes at least the  
 78644 following members:

Member Type	Member Name	Description
size_t	<i>we_wordc</i>	Count of words matched by <i>words</i> .
char **	<i>we_wordv</i>	Pointer to list of expanded words.
size_t	<i>we_offs</i>	Slots to reserve at the beginning of <i>pwordexp-&gt;we_wordv</i> .

78650 The *wordexp()* function shall store the number of generated words into *pwordexp->we\_wordc* and  
 78651 a pointer to a list of pointers to words in *pwordexp->we\_wordv*. Each individual field created  
 78652 during field splitting (see XCU Section 2.6.5, on page 2491) or pathname expansion (see XCU  
 78653 Section 2.6.6, on page 2493) shall be a separate word in the *pwordexp->we\_wordv* list. The words  
 78654 shall be in order as described in XCU Section 2.6 (on page 2483). The first pointer after the last  
 78655 word pointer shall be a null pointer. The expansion of special parameters described in XCU  
 78656 Section 2.5.2 (on page 2479) is unspecified.

78657 It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()*  
 78658 function shall allocate other space as needed, including memory pointed to by  
 78659 *pwordexp->we\_wordv*. The *wordfree()* function shall free any memory associated with *pwordexp*  
 78660 from a previous call to *wordexp()*. The *wordfree()* function shall not modify *errno* if *pwordexp* was  
 78661 previously modified by *wordexp()* and not yet freed.

78662 The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the bitwise-  
 78663 inclusive OR of zero or more of the following constants, which are defined in <**wordexp.h**>:

78664	WRDE_APPEND	Append words generated to the ones from a previous call to <i>wordexp()</i> .
78665	WRDE_DOOFFS	Make use of <i>pwordexp-&gt;we_offs</i> . If this flag is set, <i>pwordexp-&gt;we_offs</i> is used to specify how many null pointers to add to the beginning of <i>pwordexp-&gt;we_wordv</i> . In other words, <i>pwordexp-&gt;we_wordv</i> shall point to <i>pwordexp-&gt;we_offs</i> null pointers, followed by <i>pwordexp-&gt;we_wordc</i> word pointers, followed by a null pointer.
78666		
78667		
78668		
78669		
78670	WRDE_NOCMD	If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-2024, fail if command substitution, as specified in XCU Section 2.6.3 (on page 2489), is requested.
78671		
78672		
78673	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result shall be the same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> without WRDE_REUSE.
78674		
78675		
78676		
78677	WRDE_SHOWERR	Do not redirect <i>stderr</i> to <b>/dev/null</b> .
78678	WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.
78679		
78680		The WRDE_APPEND flag can be used to append a new set of words to those generated by a previous call to <i>wordexp()</i> . The following rules apply to applications when two or more calls to <i>wordexp()</i> are made with the same value of <i>pwordexp</i> and without intervening calls to <i>wordfree()</i> :
78681		
78682		1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.
78683		2. All of the calls shall set WRDE_DOOFFS, or all shall not set it.
78684		3. After the second and each subsequent call, <i>pwordexp-&gt;we_wordv</i> shall point to a list containing the following:
78685		
78686		a. Zero or more null pointers, as specified by WRDE_DOOFFS and <i>pwordexp-&gt;we_offs</i>
78687		
78688		b. Pointers to the words that were in the <i>pwordexp-&gt;we_wordv</i> list before the call, in the same order as before
78689		
78690		c. Pointers to the new words generated by the latest call, in the specified order
78691		4. The count returned in <i>pwordexp-&gt;we_wordc</i> shall be the total number of words from all of the calls.
78692		
78693		5. The application can change any of the fields after a call to <i>wordexp()</i> , but if it does it shall reset them to the original value before a subsequent call, using the same <i>pwordexp</i> value, to <i>wordfree()</i> or <i>wordexp()</i> with the WRDE_APPEND or WRDE_REUSE flag.
78694		
78695		
78696		If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-2024, and <i>words</i> contains an unquoted character—<newline>, ' ', '&', ';', '<', '>', '(', ')', '{', '}'—in an inappropriate context, <i>wordexp()</i> shall fail, and the number of expanded words shall be 0.
78697		
78698		
78699		
78700		Unless WRDE_SHOWERR is set in <i>flags</i> , <i>wordexp()</i> shall redirect <i>stderr</i> to <b>/dev/null</b> for any utilities executed as a result of command substitution while expanding <i>words</i> . If WRDE_SHOWERR is set, <i>wordexp()</i> may write messages to <i>stderr</i> if syntax errors are detected while expanding <i>words</i> , unless the <i>stderr</i> stream has wide orientation in which case the behavior is undefined. It is unspecified whether any write errors encountered while outputting such messages will affect the <i>stderr</i> error indicator or the value of <i>errno</i> .
78701		
78702		
78703		
78704		
78705		
78706		The application shall ensure that if WRDE_DOOFFS is set, then <i>pwordexp-&gt;we_offs</i> has the same

78707 value for each *wordexp()* call and *wordfree()* call using a given *pwordexp*.

78708 The results are unspecified if WRDE\_APPEND and WRDE\_REUSE are both specified.

78709 The following constants are defined as error return values:

78710 WRDE\_BADCHAR One of the unquoted characters—<newline>, '|', '&', ';', '<', '>',  
78711 '(', ')', '{', '}'—appears in *words* in an inappropriate context.

78712 WRDE\_BADVAL Reference to undefined shell variable when WRDE\_UNDEF is set in *flags*.

78713 WRDE\_CMDSUB Command substitution requested when WRDE\_NOCMD was set in *flags*.

78714 WRDE\_NOSPACE Attempt to allocate memory failed.

78715 WRDE\_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated  
78716 string.

#### 78717 RETURN VALUE

78718 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described  
78719 in <*wordexp.h*>, shall be returned to indicate an error. If *wordexp()* returns the value  
78720 WRDE\_NOSPACE, then *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall be updated to  
78721 reflect any words that were successfully expanded. In other error cases, if the WRDE\_APPEND  
78722 flag was specified, *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall not be modified.

78723 The *wordfree()* function shall not return a value.

#### 78724 ERRORS

78725 No errors are defined.

#### 78726 EXAMPLES

78727 None.

#### 78728 APPLICATION USAGE

78729 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's  
78730 expansions on a word or words obtained from a user. For example, if the application prompts  
78731 for a pathname (or list of pathnames) and then uses *wordexp()* to process the input, the user  
78732 could respond with anything that would be valid as input to the shell.

78733 The WRDE\_NOCMD flag is provided for applications that, for security or other reasons, want to  
78734 prevent a user from executing shell commands. Disallowing unquoted shell special characters  
78735 also prevents unwanted side-effects, such as executing a command or writing a file.

78736 POSIX.1-2024 does not require the *wordexp()* function to be thread-safe if passed an expression  
78737 referencing an environment variable while any other thread is concurrently modifying any  
78738 environment variable; see *exec* (on page 866).

78739 Even though the WRDE\_SHOWERR flag allows the implementation to write messages to *stderr*  
78740 during command substitution or syntax errors, this standard does not provide any way to detect  
78741 write failures during the output of such messages.

78742 Applications which use wide-character output functions with *stderr* should ensure that any calls  
78743 to *wordexp()* do not write to *stderr*, by avoiding use of the WRDE\_SHOWERR flag.

#### 78744 RATIONALE

78745 This function was included as an alternative to *glob()*. There had been continuing controversy  
78746 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*  
78747 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*  
78748 (which is faster, but which only performs pathname expansion, without tilde or parameter  
78749 expansion) this will satisfy the majority of applications.

78750 While *wordexp()* could be implemented entirely as a library routine, it is expected that most  
78751 implementations run a shell in a subprocess to do the expansion.

78752 Two different approaches have been proposed for how the required information might be  
78753 presented to the shell and the results returned. They are presented here as examples.

78754 One proposal is to extend the *echo* utility by adding a `-q` option. This option would cause *echo* to  
78755 add a `<backslash>` before each `<backslash>` and `<blank>` that occurs within an argument. The  
78756 *wordexp()* function could then invoke the shell as follows:

```
78757 (void) strcpy(buffer, "echo -q");
78758 (void) strcat(buffer, words);
78759 if ((flags & WRDE_SHOWERR) == 0)
78760     (void) strcat(buffer, "2>/dev/null");
78761 f = popen(buffer, "r");
```

78762 The *wordexp()* function would read the resulting output, remove unquoted `<backslash>`  
78763 characters, and break into words at unquoted `<blank>` characters. If the `WRDE_NOCMD` flag  
78764 was set, *wordexp()* would have to scan *words* before starting the subshell to make sure that there  
78765 would be no command substitution. In any case, it would have to scan *words* for unquoted  
78766 special characters.

78767 Another proposal is to add the following options to *sh*:

78768 `-w wordlist`

78769 This option provides a wordlist expansion service to applications. The words in *wordlist*  
78770 shall be expanded and the following written to standard output:

- 78771 1. The count of the number of words after expansion, in decimal, followed by a null  
78772 byte
- 78773 2. The number of bytes needed to represent the expanded words (not including null  
78774 separators), in decimal, followed by a null byte
- 78775 3. The expanded words, each terminated by a null byte

78776 If an error is encountered during word expansion, *sh* exits with a non-zero status after  
78777 writing the former to report any words successfully expanded

78778 `-P` Run in “protected” mode. If specified with the `-w` option, no command substitution shall  
78779 be performed.

78780 With these options, *wordexp()* could be implemented fairly simply by creating a subprocess  
78781 using *fork()* and executing *sh* using the line:

```
78782 execl(<shell path>, "sh", "-P", "-w", words, (char *)0);
```

78783 after directing standard error to `/dev/null`.

78784 It seemed objectionable for a library routine to write messages to standard error, unless explicitly  
78785 requested, so *wordexp()* is required to redirect standard error to `/dev/null` to ensure that no  
78786 messages are generated, even for commands executed for command substitution. The  
78787 `WRDE_SHOWERR` flag can be specified to request that error messages be written.

78788 The `WRDE_REUSE` flag allows the implementation to avoid the expense of freeing and  
78789 reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when  
78790 `WRDE_REUSE` is set.

78791 **FUTURE DIRECTIONS**

78792 None.

78793 **SEE ALSO**78794 *exec*, *fnmatch()*, *glob()*78795 XBD <[wordexp.h](#)>78796 XCU [Chapter 2](#) (on page 2472)78797 **CHANGE HISTORY**

78815           wprintf — print formatted wide-character output

78816 **SYNOPSIS**

78817           #include &lt;stdio.h&gt;

78818           #include &lt;wchar.h&gt;

78819           int wprintf(const wchar\_t \*restrict *format*, ...);78820 **DESCRIPTION**78821           Refer to *fwprintf()*.

78822 **NAME**

78823 pwrite, write — write on a file

78824 **SYNOPSIS**

```
78825 #include <unistd.h>
78826 ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
78827               off_t offset);
78828 ssize_t write(int fildes, const void *buf, size_t nbyte);
```

78829 **DESCRIPTION**

78830 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the  
78831 file associated with the open file descriptor, *fildes*.

78832 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the  
78833 *write()* function may detect and return errors as described below. In the absence of errors, or if  
78834 error detection is not performed, the *write()* function shall return zero and have no other results.  
78835 If *nbyte* is zero and the file is not a regular file, the results are unspecified.

78836 On a regular file or other file capable of seeking, the actual writing of data shall proceed from  
78837 the position in the file indicated by the file offset associated with *fildes*. Before successful return  
78838 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a  
78839 regular file, if the position of the last byte written is greater than or equal to the length of the file,  
78840 the length of the file shall be set to this position plus one.

78841 On a file not capable of seeking, writing shall always take place starting at the current position.  
78842 The value of a file offset associated with such a device is undefined.

78843 If the O\_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file  
78844 prior to each write and no intervening file modification operation shall occur between changing  
78845 the file offset and the write operation.

78846 If a *write()* requests that more bytes be written than there is room for (for example, the file size  
78847 limit of the process or the physical end of a medium), only as many bytes as there is room for  
78848 shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a  
78849 limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would  
78850 give a failure return (except as noted below).

78851 If the request would cause the file size to exceed the soft file size limit for the process and there  
78852 XSI is no room for any bytes to be written, the request shall fail and the implementation shall  
78853 generate a SIGXFSZ signal for the thread.

78854 If *write()* is interrupted by a signal before it writes any data, it shall return  $-1$  with *errno* set to  
78855 [EINTR].

78856 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the  
78857 number of bytes written.

78858 If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

78859 After a *write()* to a regular file has successfully returned:

- 78860 • Any successful *read()* from each byte position in the file that was modified by that write  
78861 shall return the data specified by the *write()* for that position until such byte positions are  
78862 again modified.
- 78863 • Any subsequent successful *write()* to the same byte position in the file shall overwrite that  
78864 file data.

78865 Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the  
78866 following exceptions:

- 78867 • There is no file offset associated with a pipe or FIFO, hence each write request shall  
78868 append to the end of the pipe or FIFO.
- 78869 • Write requests of {PIPE\_BUF} bytes or less shall not be interleaved with data from other  
78870 threads performing write operations on the same pipe or FIFO. Writes of greater than  
78871 {PIPE\_BUF} bytes may have data interleaved, on arbitrary boundaries, with write  
78872 operations by other threads, whether or not the O\_NONBLOCK flag of the file status flags  
78873 is set.
- 78874 • If the O\_NONBLOCK flag is clear, a write request may cause the thread to block, but on  
78875 normal completion it shall return *nbyte*.
- 78876 • If the O\_NONBLOCK flag is set, *write()* requests shall be handled differently, in the  
78877 following ways:
  - 78878 — The *write()* function shall not block the thread.
  - 78879 — A write request for {PIPE\_BUF} or fewer bytes shall have the following effect: if there  
78880 is sufficient space available in the pipe or FIFO, *write()* shall transfer all the data and  
78881 return the number of bytes requested. Otherwise, *write()* shall transfer no data and  
78882 return  $-1$  with *errno* set to [EAGAIN].
  - 78883 — A write request for more than {PIPE\_BUF} bytes shall cause one of the following:
    - 78884 — When at least one byte can be written, transfer what it can and return the  
78885 number of bytes written. When all data previously written to the pipe or FIFO  
78886 is read, it shall transfer at least {PIPE\_BUF} bytes.
    - 78887 — When no data can be written, transfer no data, and return  $-1$  with *errno* set to  
78888 [EAGAIN].

78889 When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-  
78890 blocking writes and cannot accept the data immediately:

- 78891 • If the O\_NONBLOCK flag is clear, *write()* shall block the calling thread until the data can  
78892 be accepted.
- 78893 • If the O\_NONBLOCK flag is set, *write()* shall not block the thread. If some data can be  
78894 written without blocking the thread, *write()* shall write what it can and return the number  
78895 of bytes written. Otherwise, it shall return  $-1$  and set *errno* to [EAGAIN].

78896 Upon successful completion, where *nbyte* is greater than 0, *write()* shall mark for update the last  
78897 data modification and last file status change timestamps of the file, and if the file is a regular file,  
78898 the S\_ISUID and S\_ISGID bits of the file mode may be cleared.

78899 For regular files, no data transfer shall occur past the offset maximum established in the open  
78900 file description associated with *fildev*.

78901 If *fildev* refers to a socket, *write()* shall be equivalent to *send()* with no flags set.

78902 SIO If the O\_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as  
78903 defined by synchronized I/O data integrity completion.

78904 If the O\_SYNC bit has been set, write I/O operations on the file descriptor shall complete as  
78905 defined by synchronized I/O file integrity completion.

78906 SHM If *fildev* refers to a shared memory object, the result of the *write()* function is unspecified.

78907	TYM	If <i>fildest</i> refers to a typed memory object, the result of the <i>write()</i> function is unspecified.
78908		The <i>pwrite()</i> function shall be equivalent to <i>write()</i> , except that it writes into a given position and does not change the file offset (regardless of whether <code>O_APPEND</code> is set). The first three arguments to <i>pwrite()</i> are the same as <i>write()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file. An attempt to perform a <i>pwrite()</i> on a file that is incapable of seeking shall result in an error.
78909		
78910		
78911		
78912		
78913		<b>RETURN VALUE</b>
78914		Upon successful completion, these functions shall return the number of bytes actually written to the file associated with <i>fildest</i> . This number shall never be greater than <i>nbyte</i> . Otherwise, <code>-1</code> shall be returned and <i>errno</i> set to indicate the error.
78915		
78916		
78917		<b>ERRORS</b>
78918		These functions shall fail if:
78919		[EAGAIN] The file is neither a pipe, nor a FIFO, nor a socket, the <code>O_NONBLOCK</code> flag is set for the file descriptor, and the thread would be delayed in the <i>write()</i> operation.
78920		
78921		
78922		[EBADF] The <i>fildest</i> argument is not a valid file descriptor open for writing.
78923		[EFBIG] An attempt was made to write a file that exceeds the implementation-defined maximum file size and there was no room for any bytes to be written.
78924		
78925		[EFBIG] An attempt was made to write a file that exceeds the file size limit of the process, and there was no room for any bytes to be written. A <code>SIGXFSZ</code> signal shall also be generated for the thread.
78926	XSI	
78927		
78928		[EFBIG] The file is a regular file, <i>nbyte</i> is greater than 0, and the starting position is greater than or equal to the offset maximum established in the open file description associated with <i>fildest</i> .
78929		
78930		
78931		[EINTR] The write operation was terminated due to the receipt of a signal, and no data was transferred.
78932		
78933		[EIO] The process is a member of a background process group attempting to write to its controlling terminal, <code>TOSTOP</code> is set, the calling thread is not blocking <code>SIGTTOU</code> , the process is not ignoring <code>SIGTTOU</code> , and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
78934		
78935		
78936		
78937		
78938		[ENOSPC] There was no free space remaining on the device containing the file.
78939		The <i>pwrite()</i> function shall fail if:
78940		[EINVAL] The file is a regular file or block special file, and the <i>offset</i> argument is negative. The file offset shall remain unchanged.
78941		
78942		[ESPIPE] The file is incapable of seeking.
78943		The <i>write()</i> function shall fail if:
78944		[EAGAIN] The file is a pipe or FIFO, the <code>O_NONBLOCK</code> flag is set for the file descriptor, and the thread would be delayed in the write operation.
78945		
78946		[EAGAIN] or [EWOULDBLOCK]
78947		The file is a socket, the <code>O_NONBLOCK</code> flag is set for the file descriptor, and the thread would be delayed in the write operation.
78948		

- 78949 [ECONNRESET] A write was attempted on a socket that is not connected.
- 78950 [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
78951 any process, or that only has one end open. A SIGPIPE signal shall also be sent  
78952 to the thread.
- 78953 [EPIPE] A write was attempted on a socket that is shut down for writing, or is no  
78954 longer connected. In the latter case, if the socket is of type SOCK\_STREAM, a  
78955 SIGPIPE signal shall also be sent to the thread.
- 78956 These functions may fail if:
- 78957 [EIO] A physical I/O error has occurred.
- 78958 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 78959 [ENXIO] A request was made of a nonexistent device, or the request was outside the  
78960 capabilities of the device.
- 78961 The *write()* function may fail if:
- 78962 [EACCES] A write was attempted on a socket and the calling process does not have  
78963 appropriate privileges.
- 78964 [ENETDOWN] A write was attempted on a socket and the local network interface used to  
78965 reach the destination is down.
- 78966 [ENETUNREACH]  
78967 A write was attempted on a socket and no route to the network is present.

## 78968 EXAMPLES

### 78969 Writing from a Buffer

78970 The following example writes data from the buffer pointed to by *buf* to the file associated with  
78971 the file descriptor *fd*.

```
78972 #include <sys/types.h>
78973 #include <string.h>
78974 ...
78975 char buf[20];
78976 size_t nbytes;
78977 ssize_t bytes_written;
78978 int fd;
78979 ...
78980 strcpy(buf, "This is a test\n");
78981 nbytes = strlen(buf);
78982 bytes_written = write(fd, buf, nbytes);
78983 ...
```

## 78984 APPLICATION USAGE

78985 None.

## 78986 RATIONALE

78987 See also the RATIONALE section in *read()*.

78988 An attempt to write to a pipe or FIFO has several major characteristics:

78989 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not  
 78990 interleaved with data from any other thread. This is useful when there are multiple  
 78991 writers sending data to a single reader. Applications need to know how large a write  
 78992 request can be expected to be performed atomically. This maximum is called {PIPE\_BUF}.  
 78993 This volume of POSIX.1-2024 does not say whether write requests for more than  
 78994 {PIPE\_BUF} bytes are atomic, but requires that writes of {PIPE\_BUF} or fewer bytes shall  
 78995 be atomic.

78996 • *Blocking/immediate*: Blocking is only possible with O\_NONBLOCK clear. If there is enough  
 78997 space for all the data requested to be written immediately, the implementation should do  
 78998 so. Otherwise, the calling thread may block; that is, pause until enough space is available  
 78999 for writing. The effective size of a pipe or FIFO (the maximum amount that can be written  
 79000 in one operation without blocking) may vary dynamically, depending on the  
 79001 implementation, so it is not possible to specify a fixed value for it.

79002 • *Complete/partial/deferred*: A write request:

```
79003 int fildes;  
79004 size_t nbyte;  
79005 ssize_t ret;  
79006 char *buf;  
  
79007 ret = write(fildes, buf, nbyte);
```

79008 may return:

79009 Complete *ret=nbyte*

79010 Partial *ret<nbyte*

79011 This shall never happen if *nbyte* ≤ {PIPE\_BUF}. If it does happen (with  
 79012 *nbyte* > {PIPE\_BUF}), this volume of POSIX.1-2024 does not guarantee  
 79013 atomicity, even if *ret* ≤ {PIPE\_BUF}, because atomicity is guaranteed according  
 79014 to the amount *requested*, not the amount *written*.

79015 Deferred: *ret=-1, errno=[EAGAIN]*

79016 This error indicates that a later request may succeed. It does not indicate that  
 79017 it *shall* succeed, even if *nbyte* ≤ {PIPE\_BUF}, because if no process reads from  
 79018 the pipe or FIFO, the write never succeeds. An application could usefully  
 79019 count the number of times [EAGAIN] is caused by a particular value of  
 79020 *nbyte* > {PIPE\_BUF} and perhaps do later writes with a smaller value, on the  
 79021 assumption that the effective size of the pipe or FIFO may have decreased.

79022 Partial and deferred writes are only possible with O\_NONBLOCK set.

79023 The relations of these properties are shown in the following tables:

Write to a Pipe or FIFO with O_NONBLOCK clear			
Immediately Writable:	None	Some	<i>nbyte</i>
<i>nbyte</i> ≤ {PIPE_BUF}	Atomic blocking <i>nbyte</i>	Atomic blocking <i>nbyte</i>	Atomic immediate <i>nbyte</i>
<i>nbyte</i> > {PIPE_BUF}	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>

79029 If the O\_NONBLOCK flag is clear, a write request shall block if the amount writable  
 79030 immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never  
 79031 block.

79032  
79033  
79034  
79035  
79036

Write to a Pipe or FIFO with O_NONBLOCK set			
Immediately Writable:	None	Some	<i>nbyte</i>
<i>nbyte</i> ≤ {PIPE_BUF}	-1, [EAGAIN]	-1, [EAGAIN]	Atomic <i>nbyte</i>
<i>nbyte</i> > {PIPE_BUF}	-1, [EAGAIN]	< <i>nbyte</i> or -1, [EAGAIN]	≤ <i>nbyte</i> or -1, [EAGAIN]

79037  
79038  
79039  
79040  
79041  
79042

There is no exception regarding partial writes when O\_NONBLOCK is set. With the exception of writing to an empty pipe or FIFO, this volume of POSIX.1-2024 does not specify exactly when a partial write is performed since that would require specifying internal details of the implementation. Every application should be prepared to handle partial writes when O\_NONBLOCK is set and the requested amount is greater than {PIPE\_BUF}, just as every application should be prepared to handle partial writes on other kinds of file descriptors.

79043  
79044  
79045

The intent of forcing writing at least one byte if any can be written is to assure that each write makes progress if there is any room in the pipe or FIFO. If the pipe or FIFO is empty, {PIPE\_BUF} bytes must be written; if not, at least some progress must have been made.

79046  
79047  
79048  
79049  
79050  
79051  
79052  
79053  
79054

Where this volume of POSIX.1-2024 requires -1 to be returned and *errno* set to [EAGAIN], most historical implementations return zero (with the O\_NDELAY flag set, which is the historical predecessor of O\_NONBLOCK, but is not itself in this volume of POSIX.1-2024). The error indications in this volume of POSIX.1-2024 were chosen so that an application can distinguish these cases from end-of-file. While *write()* cannot receive an indication of end-of-file, *read()* can, and the two functions have similar return values. Also, some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file indication; for those systems, a return value of zero from *write()* indicates a successful write of an end-of-file indication.

79055  
79056

Implementations are allowed, but not required, to perform error checking for *write()* requests of zero bytes.

79057  
79058  
79059

The concept of a {PIPE\_MAX} limit (indicating the maximum number of bytes that can be written to a pipe or FIFO in a single operation) was considered, but rejected, because this concept would unnecessarily limit application writing.

79060

See also the discussion of O\_NONBLOCK in *read()*.

79061  
79062  
79063  
79064  
79065  
79066

Writes can be serialized with respect to other reads and writes. If a *read()* of file data can be proven (by any means) to occur after a *write()* of the data, it must reflect that *write()*, even if the calls are made by different threads. A similar requirement applies to multiple write operations to the same file position. This is needed to guarantee the propagation of data from *write()* calls to subsequent *read()* calls. This requirement is particularly significant for networked file systems, where some caching schemes violate these semantics.

79067  
79068  
79069  
79070  
79071

Note that this is specified in terms of *read()* and *write()*. The XSI extensions *readv()* and *writew()* also obey these semantics. A new “high-performance” write analog that did not follow these serialization requirements would also be permitted by this wording. This volume of POSIX.1-2024 is also silent about any effects of application-level caching (such as that done by *stdio*).

79072  
79073  
79074  
79075  
79076

This volume of POSIX.1-2024 does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as [EBADF], the concept is meaningless since no file is involved. For errors that are detected immediately, such as [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

79077

This volume of POSIX.1-2024 does not specify the behavior of concurrent writes to a regular file

79078 from multiple threads, except that each write is atomic (see [Section 2.9.7](#), on page 547).  
79079 Applications should use some form of concurrency control.

79080 This volume of POSIX.1-2024 intentionally does not specify any *pwrite()* errors related to pipes,  
79081 FIFOs, and sockets other than [ESPIPE].

#### 79082 FUTURE DIRECTIONS

#### 79087 CHANGE HISTORY

79088 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 79089 Issue 5

79090 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
79091 Threads Extension.

79092 Large File Summit extensions are added.

79093 The *pwrite()* function is added.

#### 79094 Issue 6

79095 The DESCRIPTION states that the *write()* function does not block the thread. Previously this  
79096 said “process” rather than “thread”.

79097 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
79098 marked as part of the XSI STREAMS Option Group.

79099 The following new requirements on POSIX implementations derive from alignment with the  
79100 Single UNIX Specification:

79101 • The DESCRIPTION now states that if *write()* is interrupted by a signal after it has  
79102 successfully written some data, it returns the number of bytes written. In the POSIX.1-1988  
79103 standard, it was optional whether *write()* returned the number of bytes written, or whether  
79104 it returned  $-1$  with *errno* set to [EINTR]. This is a FIPS requirement.

79105 • The following changes are made to support large files:

79106 — For regular files, no data transfer occurs past the offset maximum established in the  
79107 open file description associated with the *fildev*.

79108 — A second [EFBIG] error condition is added.

79109 • The [EIO] error condition is added.

79110 • The [EPIPE] error condition is added for when a pipe has only one end open.

79111 • The [ENXIO] optional error condition is added.

79112 Text referring to sockets is added to the DESCRIPTION.

79113 The following changes were made to align with the IEEE P1003.1a draft standard:

79114 • The effect of reading zero bytes is clarified.

79115 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
79116 *write()* results are unspecified for typed memory objects.

79117 The following error conditions are added for operations on sockets: [EAGAIN],

- 79118 [EWOULDBLOCK], [ECONNRESET], [ENOTCONN], and [EPIPE].
- 79119 The [EIO] error is made optional.
- 79120 The [ENOBUFS] error is added for sockets.
- 79121 The following error conditions are added for operations on sockets: [EACCES], [ENETDOWN],  
79122 and [ENETUNREACH].
- 79123 The *writenv()* function is split out into a separate reference page.
- 79124 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/146 is applied, updating text in the  
79125 ERRORS section from “a SIGPIPE signal is generated to the calling process” to “a SIGPIPE  
79126 signal shall also be sent to the thread”.
- 79127 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/147 is applied, making a correction to the  
79128 RATIONALE.
- 79129 **Issue 7**
- 79130 The *pwrite()* function is moved from the XSI option to the Base.
- 79131 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 79132 SD5-XSH-ERN-160 is applied, updating the DESCRIPTION to clarify the requirements for the  
79133 *pwrite()* function, and to change the use of the phrase “file pointer” to “file offset”.
- 79134 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0742 [219], XSH/TC1-2008/0743 [215],  
79135 XSH/TC1-2008/0744 [79], and XSH/TC1-2008/0745 [215] are applied.
- 79136 POSIX.1-2008, Technical Corrigendum 2, XSH/TC2-2008/0401 [676,710] and  
79137 XSH/TC2-2008/0402 [966] are applied.
- 79138 **Issue 8**
- 79139 Austin Group Defect 308 is applied, clarifying the handling of [EFBIG] errors.
- 79140 Austin Group Defect 1330 is applied, removing obsolescent interfaces.
- 79141 Austin Group Defect 1430 is applied, clarifying that requirements relating to data interleaving  
79142 on pipes and FIFOs apply to write operations in other threads, not just other processes, and  
79143 changing some uses of “pipe” to “pipe or FIFO”.
- 79144 Austin Group Defect 1669 is applied, removing XSI shading from part of the [EFBIG] error  
79145 relating to the file size limit for the process.

79146 **NAME**

79147 writev — write a vector

79148 **SYNOPSIS**

```
79149 XSI #include <sys/uio.h>
79150      ssize_t writev(int fildev, const struct iovec *iov, int iovcnt);
```

79151 **DESCRIPTION**

79152 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*  
 79153 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*  
 79154 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*-1]. The *iovcnt* argument is valid if greater than 0 and less than  
 79155 or equal to {IOV\_MAX}, as defined in <limits.h>.

79156 Each *iovec* entry specifies the base address and length of an area in memory from which data  
 79157 should be written. The *writev()* function shall always write a complete area before proceeding to  
 79158 the next.

79159 If *fildev* refers to a regular file and all of the *iov\_len* members in the array pointed to by *iov* are 0,  
 79160 *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

79161 If the sum of the *iov\_len* values is greater than {SSIZE\_MAX}, the operation shall fail and no data  
 79162 shall be transferred.

79163 **RETURN VALUE**

79164 Upon successful completion, *writev()* shall return the number of bytes actually written.  
 79165 Otherwise, it shall return a value of -1, the file-pointer shall remain unchanged, and *errno* shall  
 79166 be set to indicate an error.

79167 **ERRORS**79168 Refer to *write()*.79169 In addition, the *writev()* function shall fail if:79170 [EINVAL] The sum of the *iov\_len* values in the *iov* array would overflow an *ssize\_t*.79171 The *writev()* function may fail and set *errno* to:79172 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.79173 **EXAMPLES**79174 **Writing Data from an Array**

79175 The following example writes data from the buffers specified by members of the *iov* array to the  
 79176 file associated with the file descriptor *fd*.

```
79177 #include <sys/types.h>
79178 #include <sys/uio.h>
79179 #include <unistd.h>
79180 ...
79181 ssize_t bytes_written;
79182 int fd;
79183 char *buf0 = "short string\n";
79184 char *buf1 = "This is a longer string\n";
79185 char *buf2 = "This is the longest string in this example\n";
79186 int iocnt;
79187 struct iovec iov[3];
```

```
79188     iov[0].iov_base = buf0;
79189     iov[0].iov_len = strlen(buf0);
79190     iov[1].iov_base = buf1;
79191     iov[1].iov_len = strlen(buf1);
79192     iov[2].iov_base = buf2;
79193     iov[2].iov_len = strlen(buf2);
79194     ...
79195     iovcnt = sizeof(iov) / sizeof(struct iovec);
79196     bytes_written = writev(fd, iov, iovcnt);
79197     ...
```

**79198 APPLICATION USAGE**

79199 None.

**79200 RATIONALE**

79201 Refer to *write()*.

**79202 FUTURE DIRECTIONS**

**79207 CHANGE HISTORY**

79208 First released in Issue 4, Version 2.

**79209 Issue 6**

79210 Split out from the *write()* reference page.

79211 **NAME**

79212           wscanf — convert formatted wide-character input

79213 **SYNOPSIS**

79214           #include &lt;stdio.h&gt;

79215           #include &lt;wchar.h&gt;

79216           int wscanf(const wchar\_t \*restrict *format*, ...);79217 **DESCRIPTION**79218           Refer to *fwscanf()*.

79219 **NAME**79220 `y0, y1, yn` — Bessel functions of the second kind79221 **SYNOPSIS**

```
79222 XSI      #include <math.h>
79223         double y0(double x);
79224         double y1(double x);
79225         double yn(int n, double x);
```

79226 **DESCRIPTION**

79227 The `y0()`, `y1()`, and `yn()` functions shall compute Bessel functions of  $x$  of the second kind of  
 79228 orders 0, 1, and  $n$ , respectively.  $y0(x)$  shall be equivalent to  $yn(0, x)$ , and  $y1(x)$  shall be equivalent  
 79229 to  $yn(1, x)$ .

79230 An application wishing to check for error situations should set `errno` to zero and call  
 79231 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 79232 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 79233 zero, an error has occurred.

79234 **RETURN VALUE**

79235 Upon successful completion, these functions shall return the relevant Bessel value of  $x$  of the  
 79236 second kind.

79237 MXX **If  $x$  is NaN, NaN shall be returned.**

79238 MXX If the  $x$  argument to these functions is negative, **either NaN (if supported) or** the same return  
 79239 value as when  $x$  is 0.0 (see below) shall be returned, and a domain error may occur.

79240 If  $x$  is 0.0, `y0()` and `y1()` shall return `-HUGE_VAL` and a pole error may occur. If  $x$  is 0.0 and  $n$  is  
 79241 not both negative and odd, `yn()` shall return `-HUGE_VAL` and a pole error may occur. If  $x$  is 0.0  
 79242 and  $n$  is negative and odd, `yn()` shall return `+HUGE_VAL` and a pole error may occur.

79243 MXX **If  $x$  is +Inf, +0 shall be returned.**

79244 MXX If the correct result would cause underflow **and is not representable,** a range error may occur,  
 79245 MXX and the function shall return `0.0`, **or** (if the IEC 60559 Floating-Point option is not supported) an  
 79246 implementation-defined value no greater in magnitude than `DBL_MIN`.

79247 MXX **If the correct result would cause underflow, and is representable, a range error may occur and**  
 79248 **the correct value shall be returned.**

79249 If the correct result of calling `y1()` would cause overflow, `-HUGE_VAL` shall be returned and a  
 79250 range error may occur. If  $n$  is not both negative and odd, and the correct result of calling `yn()`  
 79251 would cause overflow, `-HUGE_VAL` shall be returned and a range error may occur. If  $n$  is  
 79252 negative and odd, and the correct result of calling `yn()` would cause overflow, `+HUGE_VAL`  
 79253 shall be returned and a range error may occur.

79254 **ERRORS**

79255 These functions may fail if:

79256 Domain Error The value of  $x$  is negative.

79257 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 79258 then `errno` shall be set to `[EDOM]`. If the integer expression (`math_errhandling`  
 79259 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception  
 79260 shall be raised.

79261	Pole Error	The value of $x$ is zero.
79262		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
79263		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
79264		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
79265		floating-point exception shall be raised.
79266	Range Error	The value of $x$ is too large in magnitude, or the correct result would cause
79267		underflow.
79268		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
79269		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
79270		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
79271		floating-point exception shall be raised.
79272		The <i>y1()</i> and <i>yn()</i> functions may fail if:
79273	Range Error	The correct result would cause overflow.
79274		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
79275		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
79276		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
79277		floating-point exception shall be raised.
79278	<b>EXAMPLES</b>	
79279		None.
79280	<b>APPLICATION USAGE</b>	
79281		On error, the expressions ( <i>math_errhandling</i> & MATH_ERRNO) and ( <i>math_errhandling</i> &
79282		MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.
79283	<b>RATIONALE</b>	
79284		None.
79285	<b>FUTURE DIRECTIONS</b>	
79286		None.
79287	<b>SEE ALSO</b>	
79288		<i>feclearexcept()</i> , <i>fetestexcept()</i> , <i>isnan()</i> , <i>j0()</i>
79289		XBD Section 4.23 (on page 109), < <b>math.h</b> >
79290	<b>CHANGE HISTORY</b>	
79291		First released in Issue 1. Derived from Issue 1 of the SVID.
79292	<b>Issue 5</b>	
79293		The DESCRIPTION is updated to indicate how an application should check for an error. This
79294		text was previously published in the APPLICATION USAGE section.
79295	<b>Issue 6</b>	
79296		The normative text is updated to avoid use of the term “must” for application requirements.
79297		The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
79298		with the ISO/IEC 9899:1999 standard.
79299		IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/148 is applied, updating the RETURN
79300		VALUE and ERRORS sections. The changes are made for consistency with the general rules
79301		stated in “Treatment of Error Conditions for Mathematical Functions” in the Base Definitions
79302		volume of POSIX.1-2024.

79303 **Issue 7**

79304 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0746 [68] is applied.

79305 **Issue 8**

79306 Austin Group Defect 714 is applied, changing the behavior of these functions for special cases to  
79307 be a better match for their mathematical behavior.

# Introduction

79315

The Shell and Utilities volume of POSIX.1-2024 describes the commands and utilities offered to application programs by POSIX-conformant systems.

79316

79317

## 1.1 Relationship to Other Documents

79318

### 1.1.1 System Interfaces

79319

This subsection describes some of the features provided by the System Interfaces volume of POSIX.1-2024 that are assumed to be globally available on all systems conforming to this volume of POSIX.1-2024. This subsection does not attempt to detail all of the features defined in the System Interfaces volume of POSIX.1-2024 that are required by all of the utilities defined in this volume of POSIX.1-2024; the utility and function descriptions point out additional functionality required to provide the corresponding specific features needed by each.

79320

79321

79322

79323

79324

79325

The following subsections describe frequently used concepts. Many of these concepts are described in the Base Definitions volume of POSIX.1-2024. Utility and function description statements override these defaults when appropriate.

79326

79327

79328

#### 1.1.1.1 Process Attributes

79329

The following process attributes, as described in the System Interfaces volume of POSIX.1-2024, are assumed to be supported for all processes in this volume of POSIX.1-2024:

79330

79331

Controlling Terminal            Real Group ID

79332

Current Working Directory    Real User ID

79333

Effective Group ID            Root Directory

79334

Effective User ID            Saved Set-Group-ID

79335

File Descriptors            Saved Set-User-ID

79336

File Mode Creation Mask    Session Membership

79337

Process Group ID            Supplementary Group IDs

79338

Process ID

79339

A conforming implementation may include additional process attributes.

79340

#### 1.1.1.2 Concurrent Execution of Processes

79341

The following functionality of the *fork()* function defined in the System Interfaces volume of POSIX.1-2024 shall be available on all systems conforming to this volume of POSIX.1-2024:

79342

79343

1. Independent processes shall be capable of executing independently without either process terminating.

79344

79345 2. A process shall be able to create a new process with all of the attributes referenced in  
 79346 [Section 1.1.1.1](#) (on page 2453), determined according to the semantics of a call to the *fork()*  
 79347 function defined in the System Interfaces volume of POSIX.1-2024 followed by a call in  
 79348 the child process to one of the *exec* functions defined in the System Interfaces volume of  
 79349 POSIX.1-2024.

79350 1.1.1.3 *File Access Permissions*

79351 The file access control mechanism described by XBD [Section 4.7](#) (on page 97) shall apply to all  
 79352 files on an implementation conforming to this volume of POSIX.1-2024.

79353 1.1.1.4 *File Read, Write, and Creation*

79354 If a file that does not exist is to be written, it shall be created as described below, unless the  
 79355 utility description states otherwise.

79356 When a file that does not exist is created, the following features defined in the System Interfaces  
 79357 volume of POSIX.1-2024 shall apply unless the utility or function description states otherwise:

- 79358 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 79359 2. The group ID of the file shall be set to the effective group ID of the calling process or the  
 79360 group ID of the directory in which the file is being created.
- 79361 3. If the file is a regular file, the permission bits of the file shall be set to:

79362 S\_IROTH | S\_IWOTH | S\_IRGRP | S\_IWGRP | S\_IRUSR | S\_IWUSR

79363 (see the description of *File Modes* in XBD [Chapter 14](#) (on page 221), `<sys/stat.h>`) except  
 79364 that the bits specified by the file mode creation mask of the process shall be cleared. If the  
 79365 file is a directory, the permission bits shall be set to:

79366 S\_IRWXU | S\_IRWXG | S\_IRWXO

79367 except that the bits specified by the file mode creation mask of the process shall be  
 79368 cleared.

- 79369 4. The last data access, last data modification, and last file status change timestamps of the  
 79370 file shall be updated as specified in XBD [Section 4.12](#) (on page 98).
- 79371 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length  
 79372 zero.
- 79373 6. If the file is a symbolic link, the effect shall be undefined unless the {POSIX2\_SYMLINKS}  
 79374 variable is in effect for the directory in which the symbolic link would be created.
- 79375 7. Unless otherwise specified, the file created shall be a regular file.

79376 When an attempt is made to create a file that already exists, the utility shall take the action  
 79377 indicated in [Table 1-1](#) (on page 2455) corresponding to the type of the file the utility is trying to  
 79378 create and the type of the existing file, unless the utility description states otherwise.

79393

The following codes are used in [Table 1-1](#):

79394

79395

79396

**F** Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with an exit status that indicates an error occurred, depending on the description of the utility.

79397

79398

79399

79400

**FL** Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

79401

79402

**O** Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

79403

79404

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.

79405

79406

2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

79407

**OF** The named file shall be opened with the consequences defined for that file type.

79408

79409

79410

**RF** Regular file. When attempting to create a regular file, and the existing file is a regular file:

1. The user ID, group ID, and permission bits of the file shall not be changed.

2. The file shall be truncated to zero length.

3. The last data modification and last file status change timestamps shall be marked for update.

79413

— The effect is implementation-defined unless specified by the utility description.

79414

**U** The effect is unspecified unless specified by the utility description.

79415

\* There is no portable way to create a file of this type.

79416

\*\* Not portable.

79417

79418

79419

When a file is to be appended, the file shall be opened in a manner equivalent to using the `O_APPEND` flag, without the `O_TRUNC` flag, in the `open()` function defined in the System Interfaces volume of POSIX.1-2024.

79420

When a file is to be read or written, the file shall be opened with an access mode corresponding

79421 to the operation to be performed. If file access permissions deny access, the requested operation  
79422 shall fail.

#### 79423 1.1.1.5 File Removal

79424 When a directory that is the root directory or current working directory of any process is  
79425 removed, the effect is implementation-defined. If file access permissions deny access, the  
79426 requested operation shall fail. Otherwise, when a file is removed:

- 79427 1. Its directory entry shall be removed from the file system.
- 79428 2. The link count of the file shall be decremented.
- 79429 3. If the file is an empty directory (see XBD [Section 3.119](#), on page 48):
  - 79430 a. If no process has the directory open, the space occupied by the directory shall be  
79431 freed and the directory shall no longer be accessible.
  - 79432 b. If one or more processes have the directory open, the directory contents shall be  
79433 preserved until all references to the file have been closed.
- 79434 4. If the file is a directory that is not empty, the last file status change timestamp shall be  
79435 marked for update.
- 79436 5. If the file is not a directory:
  - 79437 a. If the link count becomes zero:
    - 79438 i. If no process has the file open, the space occupied by the file shall be freed  
79439 and the file shall no longer be accessible.
    - 79440 ii. If one or more processes have the file open, the file contents shall be  
79441 preserved until all references to the file have been closed.
  - 79442 b. If the link count is not reduced to zero, the last file status change timestamp shall  
79443 be marked for update.
- 79444 6. The last data modification and last file status change timestamps of the containing  
79445 directory shall be marked for update.

#### 79446 1.1.1.6 File Time Values

79447 All files shall have the three time values described by XBD [Section 4.12](#) (on page 98).

#### 79448 1.1.1.7 File Contents

79449 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of  
79450 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the  
79451 following operations defined in the System Interfaces volume of POSIX.1-2024:

```
79452 while (read (fildes, buf, nbytes) > 0)
79453     ;
```

79454 If the file is indicated by a pathname *pathname*, the file descriptor shall be determined by the  
79455 equivalent of the following operation defined in the System Interfaces volume of POSIX.1-2024:

```
79456 fildes = open (pathname, O_RDONLY);
```

79457 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data  
79458 returned by *read()* would vary with different values, the value shall be one that results in the

79459 most data being returned.

79460 If the `read()` function calls would return an error, it is unspecified whether the contents of the file  
79461 are considered to include any data from offsets in the file beyond where the error would be  
79462 returned.

#### 79463 1.1.1.8 Pathname Resolution

79464 The pathname resolution algorithm, described by XBD Section 4.16 (on page 105), shall be used  
79465 by implementations conforming to this volume of POSIX.1-2024; see also XBD Section 4.8 (on  
79466 page 97).

#### 79467 1.1.1.9 Changing the Current Working Directory

79468 When the current working directory (see XBD Section 3.94, on page 45) is to be changed, unless  
79469 the utility or function description states otherwise, the operation shall succeed unless a call to  
79470 the `chdir()` function defined in the System Interfaces volume of POSIX.1-2024 would fail when  
79471 invoked with the new working directory pathname as its argument.

#### 79472 1.1.1.10 Establish the Locale

79473 The functionality of the `setlocale()` function defined in the System Interfaces volume of  
79474 POSIX.1-2024 shall be available on all systems conforming to this volume of POSIX.1-2024; that  
79475 is, utilities that require the capability of establishing an international operating environment  
79476 shall be permitted to set the specified category of the international environment.

#### 79477 1.1.1.11 Actions Equivalent to Functions

79478 Some utility descriptions specify that a utility performs actions equivalent to a function defined  
79479 in the System Interfaces volume of POSIX.1-2024. Such specifications require only that the  
79480 external effects be equivalent, not that any effect within the utility and visible only to the utility  
79481 be equivalent.

### 79482 1.1.2 Concepts Derived from the ISO C Standard

79483 Some of the standard utilities perform complex data manipulation using their own procedure  
79484 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS  
79485 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type  
79486 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,  
79487 as described in the following sections. Note that there is no requirement that the standard  
79488 utilities be implemented in any particular programming language.

#### 79489 1.1.2.1 Arithmetic Precision and Operations

79490 Integer variables and constants, including the values of operands and option-arguments, used  
79491 by the standard utilities listed in this volume of POSIX.1-2024 shall be implemented as  
79492 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as  
79493 equivalent to the ISO C standard **double** type. Conversions between types shall be as described  
79494 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned  
79495 by the input to the application.

79496 Arithmetic operators and control flow keywords shall be implemented as equivalent to those in

79497 the cited ISO C standard section, as listed in [Table 1-2](#).

79498 **Note:** The comma operator (section 6.5.17 of the ISO C standard) is intentionally not included in the  
79499 table. It need not be supported by implementations.

79500 **Table 1-2** Selected ISO C Standard Operators and Control Flow Keywords

79501	Operation	ISO C Standard Equivalent Reference
79502	()	Section 6.5.1, Primary Expressions
79503	postfix ++	Section 6.5.2, Postfix Operators
79504	postfix --	
79505	unary +	Section 6.5.3, Unary Operators
79506	unary -	
79507	prefix ++	
79508	prefix --	
79509	~	
79510	!	
79511	sizeof()	
79512	*	Section 6.5.5, Multiplicative Operators
79513	/	
79514	%	
79515	+	Section 6.5.6, Additive Operators
79516	-	
79517	<<	Section 6.5.7, Bitwise Shift Operators
79518	>>	
79519	<, <=	Section 6.5.8, Relational Operators
79520	>, >=	
79521	==	Section 6.5.9, Equality Operators
79522	!=	
79523	&	Section 6.5.10, Bitwise AND Operator
79524	^	Section 6.5.11, Bitwise Exclusive OR Operator
79525		Section 6.5.12, Bitwise Inclusive OR Operator
79526	&&	Section 6.5.13, Logical AND Operator
79527		Section 6.5.14, Logical OR Operator
79528	expr?expr:expr	Section 6.5.15, Conditional Operator
79529	=, *=, /=, %=, +=, -=	Section 6.5.16, Assignment Operators
79530	<<=, >>=, &=, ^=,  =	
79531	if ()	Section 6.8.4, Selection Statements
79532	if () ... else	
79533	switch ()	
79534	while ()	Section 6.8.5, Iteration Statements
79535	do ... while ()	
79536	for ()	
79537	goto	Section 6.8.6, Jump Statements
79538	continue	
79539	break	
79540	return	

79541 The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5,  
79542 Expressions, of the ISO C standard.

### 79543 1.1.2.2 Mathematical Functions

79544 Any mathematical functions with the same names as those in the following sections of the ISO C  
79545 standard:

- 79546 • Section 7.12, Mathematics, `<math.h>`
- 79547 • Section 7.22.2, Pseudo-Random Sequence Generation Functions

79548 shall be implemented to return the results equivalent to those returned from a call to the  
79549 corresponding function described in the ISO C standard.

## 79550 1.2 Utility Limits

79551 This section lists magnitude limitations imposed by a specific implementation. The braces  
79552 notation, {LIMIT}, is used in this volume of POSIX.1-2024 to indicate these values, but the braces  
79553 are not part of the name.

79554 **Table 1-3** Utility Limit Minimum Values

Name	Description	Value
{POSIX2_BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	2 048
{POSIX2_BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	1 000
{POSIX2_COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see the <b>border_start</b> keyword in XBD <a href="#">Section 7.3.2</a> (on page 139).	2
{POSIX2_EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	32
{POSIX2_LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <code>&lt;newline&gt;</code> .	2 048
{POSIX_RE_DUP_MAX}	Maximum number of repeated occurrences of a BRE or ERE interval expression; see XBD <a href="#">Section 9.3.6</a> (on page 185) and <a href="#">Section 9.4.6</a> (on page 189).	255

79580 The values specified in [Table 1-3](#) represent the lowest values conforming implementations shall  
79581 provide and, consequently, the largest values on which an application can rely without further  
79582 enquiries, as described below. These values shall be accessible to applications via the *getconf*

79583 utility (see *getconf*, on page 2973).

79584 Implementations may provide more liberal, or less restrictive, values than shown in Table 1-3  
79585 (on page 2459). These possibly more liberal values are accessible using the symbols in Table 1-4.

79586 The *sysconf()* function defined in the System Interfaces volume of POSIX.1-2024 or the *getconf*  
79587 utility return the value of each symbol on each specific implementation. The value so retrieved is  
79588 the largest, or most liberal, value that is available throughout the session lifetime, as determined  
79589 at session creation. The literal names shown in the table apply only to the *getconf* utility; the  
79590 high-level language binding describes the exact form of each name to be used by the interfaces  
79591 in that binding.

79592 All numeric limits defined by the System Interfaces volume of POSIX.1-2024, such as  
79593 {PATH\_MAX}, shall also apply to this volume of POSIX.1-2024. All the utilities defined by this  
79594 volume of POSIX.1-2024 are implicitly limited by these values, unless otherwise noted in the  
79595 utility descriptions.

79596 It is not guaranteed that the application can actually reach the specified limit of an  
79597 implementation in any given case, or at all, as a lack of virtual memory or other resources may  
79598 prevent this. The limit value indicates only that the implementation does not specifically impose  
79599 any arbitrary, more restrictive limit.

79600 **Table 1-4** Symbolic Utility Limits

Name	Description	Minimum Value
{BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_BASE_MAX}
{BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	{POSIX2_BC_DIM_MAX}
{BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_SCALE_MAX}
{BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	{POSIX2_BC_STRING_MAX}
{COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE order</i> keyword in the locale definition file; see the <i>order_start</i> keyword in XBD Section 7.3.2 (on page 139).	{POSIX2_COLL_WEIGHTS_MAX}
{EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	{POSIX2_EXPR_NEST_MAX}

Name	Description	Minimum Value
{LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	{POSIX2_LINE_MAX}
{RE_DUP_MAX}	Maximum number of repeated occurrences of a BRE or ERE interval expression; see XBD <a href="#">Section 9.3.6</a> (on page 185) and <a href="#">Section 9.4.6</a> (on page 189).	{POSIX_RE_DUP_MAX}

The following value may be a constant within an implementation or may vary from one pathname to another.

{POSIX2\_SYMLINKS}

When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2\_SYMLINKS} is undefined.

### 1.3 Grammar Conventions

Portions of this volume of POSIX.1-2024 are expressed in terms of a special grammar notation. It is used to portray the complex syntax of certain program input. The grammar is based on the syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input, suitable for program use; the lexical processing and all semantic requirements are described only in textual form. The grammar is not based on source used in any traditional implementation and has not been tested with the semantic code that would normally be required to accompany it. Furthermore, there is no implication that the partial *yacc* code presented represents the most efficient, or only, means of supporting the complex syntax within the utility. Implementations may use other programming languages or algorithms, as long as the syntax supported is the same as that represented by the grammar.

The following typographical conventions are used in the grammar; they have no significance except to aid in reading.

- The identifiers for the reserved words of the language are shown with a leading capital letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- The identifiers for terminals in the grammar are all named with uppercase letters and underscores; for example, **NEWLINE**, **ASSIGN\_OP**, **NAME**.
- The identifiers for non-terminals are all lowercase.

## 79663 1.4 Utility Description Defaults

79664 This section describes all of the subsections used within the utility descriptions, including:

- 79665 • Intended usage of the section
- 79666 • Global defaults that affect all the standard utilities
- 79667 • The meanings of notations used in this volume of POSIX.1-2024 that are specific to
- 79668 individual utility sections

### 79669 NAME

79670 This section gives the name or names of the utility and briefly states its purpose.

### 79671 SYNOPSIS

79672 The SYNOPSIS section summarizes the syntax of the calling sequence for the utility,  
79673 including options, option-arguments, and operands. Standards for utility naming are  
79674 described in XBD [Section 12.2](#) (on page 215); for describing the utility's arguments in  
79675 XBD [Section 12.1](#) (on page 213).

### 79676 DESCRIPTION

79677 The DESCRIPTION section describes the actions of the utility. If the utility has a very  
79678 complex set of subcommands or its own procedural language, an EXTENDED  
79679 DESCRIPTION section is also provided. Most explanations of optional functionality are  
79680 omitted here, as they are usually explained in the OPTIONS section.

79681 As stated in [Section 1.1.1.11](#) (on page 2457), some functions are described in terms of  
79682 equivalent functionality. When specific functions are cited, the implementation shall  
79683 provide equivalent functionality including side-effects associated with successful  
79684 execution of the function. The treatment of errors and intermediate results from the  
79685 individual functions cited is generally not specified by this volume of POSIX.1-2024.  
79686 See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all  
79687 actions associated with errors encountered by the utility.

79688 A standard utility shall not be treated as a declaration utility unless explicitly stated in  
79689 this section.

### 79690 OPTIONS

79691 The OPTIONS section describes the utility options and option-arguments, and how  
79692 they modify the actions of the utility. Standard utilities that have options either fully  
79693 comply with XBD [Section 12.2](#) (on page 215) or describe all deviations. Apparent  
79694 disagreements between functionality descriptions in the OPTIONS and DESCRIPTION  
79695 (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS  
79696 section.

79697 Each OPTIONS section that uses the phrase “The ... utility shall conform to the Utility  
79698 Syntax Guidelines ...” refers only to the use of the utility as specified by this volume of  
79699 POSIX.1-2024; implementation extensions should also conform to the guidelines, but  
79700 may allow exceptions for historical practice.

79701 Unless otherwise stated in the utility description, when given an option unrecognized  
79702 by the implementation, or when a required option-argument is not provided, standard  
79703 utilities shall issue a diagnostic message to standard error and exit with an exit status  
79704 that indicates an error occurred.

79705 All utilities in this volume of POSIX.1-2024 shall be capable of processing arguments  
79706 using eight-bit transparency.

79707 **Default Behavior:** When this section is listed as “None.”, it means that the  
79708 implementation need not support any options. Standard utilities that do not accept

79709 options, but that do accept operands, shall recognize "--" as a first argument to be  
79710 discarded.

79711 The requirement for recognizing "--" is because conforming applications need a way  
79712 to shield their operands from any arbitrary options that the implementation may  
79713 provide as an extension. For example, if the standard utility *foo* is listed as taking no  
79714 options, and the application needed to give it a pathname with a leading <hyphen-  
79715 minus>, it could safely do it as:

79716 `foo -- -myfile`

79717 and avoid any problems with `-m` used as an extension.

## 79718 OPERANDS

79719 The OPERANDS section describes the utility operands, and how they affect the actions  
79720 of the utility. Apparent disagreements between functionality descriptions in the  
79721 OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be  
79722 resolved in favor of the OPERANDS section.

79723 If an operand naming a file can be specified as '-', which means to use the standard  
79724 input instead of a named file, this is explicitly stated in this section. Unless otherwise  
79725 stated, the use of multiple instances of '-' to mean standard input in a single  
79726 command produces unspecified results.

79727 Unless otherwise stated, the standard utilities that accept operands shall process those  
79728 operands in the order specified in the command line.

79729 **Default Behavior:** When this section is listed as "None.", it means that the  
79730 implementation need not support any operands.

## 79731 STDIN

79732 The STDIN section describes the standard input of the utility. This section is frequently  
79733 merely a reference to the following section, as many utilities treat standard input and  
79734 input files in the same manner. Unless otherwise stated, all restrictions described in the  
79735 INPUT FILES section shall apply to this section as well.

79736 Use of a terminal for standard input can cause any of the standard utilities that read  
79737 standard input to stop when used in the background. For this reason, applications  
79738 should not use interactive features in scripts to be placed in the background.

79739 The specified standard input format of the standard utilities shall not depend on the  
79740 existence or value of the environment variables defined in this volume of POSIX.1-2024,  
79741 except as provided by this volume of POSIX.1-2024.

79742 **Default Behavior:** When this section is listed as "Not used.", it means that the standard  
79743 input shall not be read when the utility is used as described by this volume of  
79744 POSIX.1-2024.

## 79745 INPUT FILES

79746 The INPUT FILES section describes the files, other than the standard input, used as  
79747 input by the utility. It includes files named as operands and option-arguments as well  
79748 as other files that are referred to, such as start-up and initialization files, databases, and  
79749 so on. Commonly-used files are generally described in one place and cross-referenced  
79750 by other utilities.

79751 All utilities in this volume of POSIX.1-2024 shall be capable of processing input files  
79752 using eight-bit transparency.

79753 When a standard utility reads a seekable input file and terminates without an error  
79754 before it reaches end-of-file, the utility shall ensure that the file offset in the open file

79755 description is properly positioned just past the last byte processed by the utility. For  
 79756 files that are not seekable, the state of the file offset in the open file description for that  
 79757 file is unspecified. A conforming application shall not assume that the following three  
 79758 commands are equivalent:

```
79759 tail -n +2 file
79760 (sed -n 1q; cat) < file
79761 cat file | (sed -n 1q; cat)
```

79762 The second command is equivalent to the first only when the file is seekable. The third  
 79763 command leaves the file offset in the open file description in an unspecified state. Other  
 79764 utilities, such as *head*, *read*, and *sh*, have similar properties.

79765 Some of the standard utilities, such as filters, process input files a line or a block at a  
 79766 time and have no restrictions on the maximum input file size. Some utilities may have  
 79767 size limitations that are not as obvious as file space or memory limitations. Such  
 79768 limitations should reflect resource limitations of some sort, not arbitrary limits set by  
 79769 implementors. Implementations shall document those utilities that are limited by  
 79770 constraints other than file system space, available memory, and other limits specifically  
 79771 cited by this volume of POSIX.1-2024, and identify what the constraint is and indicate a  
 79772 way of estimating when the constraint would be reached. Similarly, some utilities  
 79773 descend the directory tree (recursively). Implementations shall also document any  
 79774 limits that they may have in descending the directory tree that are beyond limits cited  
 79775 by this volume of POSIX.1-2024.

79776 When an input file is described as a “text file”, the utility produces undefined results if  
 79777 given input that is not from a text file, unless otherwise stated. Some utilities (for  
 79778 example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline>  
 79779 convention; unless otherwise stated, the utility need not be able to accumulate more  
 79780 than {LINE\_MAX} bytes from a set of multiple, continued input lines. Thus, for a  
 79781 conforming application the total of all the continued lines in a set cannot exceed  
 79782 {LINE\_MAX}. If a utility using the escaped <newline> convention detects an end-of-  
 79783 file condition immediately after an escaped <newline>, the results are unspecified.

79784 Record formats are described in a notation similar to that used by the C-language  
 79785 function, *printf()*. See XBD Chapter 5 (on page 113) for a description of this notation.  
 79786 The format description is intended to be sufficiently rigorous to allow other  
 79787 applications to generate these input files. However, since <blank>s can legitimately be  
 79788 included in some of the fields described by the standard utilities, particularly in locales  
 79789 other than the POSIX locale, this intent is not always realized.

79790 **Default Behavior:** When this section is listed as “None.”, it means that no input files  
 79791 are required to be supplied when the utility is used as described by this volume of  
 79792 POSIX.1-2024.

## 79793 ENVIRONMENT VARIABLES

79794 The ENVIRONMENT VARIABLES section lists what variables affect the utility’s  
 79795 execution.

79796 The entire manner in which environment variables described in this volume of  
 79797 POSIX.1-2024 affect the behavior of each utility is described in the ENVIRONMENT  
 79798 VARIABLES section for that utility, in conjunction with the global effects of the *LANG*,  
 79799 XSI *LC\_ALL*, and *NLSPATH* environment variables described in XBD Chapter 8 (on page  
 79800 167). The existence or value of environment variables described in this volume of  
 79801 POSIX.1-2024 shall not otherwise affect the specified behavior of the standard utilities.  
 79802 Any effects of the existence or value of environment variables not described by this  
 79803 volume of POSIX.1-2024 upon the standard utilities are unspecified.

79804 For those standard utilities that use environment variables as a means for selecting a  
 79805 utility to execute (such as *CC* in *make*), the string provided to the utility is subjected to  
 79806 the path search described for *PATH* in XBD [Chapter 8](#) (on page 167).

79807 All utilities in this volume of POSIX.1-2024 shall be capable of processing environment  
 79808 variable names and values using eight-bit transparency.

79809 **Default Behavior:** When this section is listed as “None.”, it means that the behavior of  
 79810 the utility is not directly affected by environment variables described by this volume of  
 79811 POSIX.1-2024 when the utility is used as described by this volume of POSIX.1-2024.

## 79812 ASYNCHRONOUS EVENTS

79813 The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as  
 79814 signals and what signals are caught.

79815 **Default Behavior:** When this section is listed as “Default.”, or it refers to “the standard  
 79816 action” for any signal, it means that the action taken as a result of the signal shall be as  
 79817 follows:

- 79818 • If the action inherited from the invoking process, according to the rules of  
 79819 inheritance of signal actions defined in the System Interfaces volume of  
 79820 POSIX.1-2024, is for the signal to be ignored, the utility shall ignore the signal.
- 79821 • If the action inherited from the invoking process, according to the rules of  
 79822 inheritance of signal actions defined in System Interfaces volume of  
 79823 POSIX.1-2024, is the default signal action, the result of the utility’s execution shall  
 79824 be as if the default signal action had been taken.

79825 When the required action is for the signal to terminate the utility, the utility may catch  
 79826 the signal, perform some additional processing (such as deleting temporary files),  
 79827 restore the default signal action, and resignal itself.

## 79828 STDOUT

79829 The STDOUT section completely describes the standard output of the utility. This  
 79830 section is frequently merely a reference to the following section, OUTPUT FILES,  
 79831 because many utilities treat standard output and output files in the same manner.

79832 Use of a terminal for standard output may cause any of the standard utilities that write  
 79833 standard output to stop when used in the background. For this reason, applications  
 79834 should not use interactive features in scripts to be placed in the background.

79835 Record formats are described in a notation similar to that used by the C-language  
 79836 function, *printf()*. See XBD [Chapter 5](#) (on page 113) for a description of this notation.

79837 The specified standard output of the standard utilities shall not depend on the  
 79838 existence or value of the environment variables defined in this volume of POSIX.1-2024,  
 79839 except as provided by this volume of POSIX.1-2024.

79840 Some of the standard utilities describe their output using the verb *display*, defined in  
 79841 XBD [Section 3.107](#) (on page 46). Output described in the STDOUT sections of such  
 79842 utilities may be produced using means other than standard output. When standard  
 79843 output is directed to a terminal, the output described shall be written directly to the  
 79844 terminal. Otherwise, the results are undefined.

79845 **Default Behavior:** When this section is listed as “Not used.”, it means that the standard  
 79846 output shall not be written when the utility is used as described by this volume of  
 79847 POSIX.1-2024.

79848 **STDERR**

79849 The STDERR section describes the standard error output of the utility. Only those  
79850 messages that are purposely sent by the utility are described.

79851 Use of a terminal for standard error may cause any of the standard utilities that write  
79852 standard error output to stop when used in the background. For this reason,  
79853 applications should not use interactive features in scripts to be placed in the  
79854 background.

79855 The format of diagnostic messages for most utilities is unspecified, but the language  
79856 and cultural conventions of diagnostic and informative messages whose format is  
79857 unspecified by this volume of POSIX.1-2024 should be affected by the setting of  
79858 XSI *LC\_MESSAGES* and *NLSPATH*.

79859 The specified standard error output of standard utilities shall not depend on the  
79860 existence or value of the environment variables defined in this volume of POSIX.1-2024,  
79861 except as provided by this volume of POSIX.1-2024.

79862 **Default Behavior:** When this section is listed as “The standard error shall be used only  
79863 for diagnostic messages.”, it means that, unless otherwise stated, the diagnostic  
79864 messages shall be sent to the standard error only when the exit status indicates that an  
79865 error occurred and the utility is used as described by this volume of POSIX.1-2024.

79866 When this section is listed as “Not used.”, it means that the standard error shall not be  
79867 used when the utility is used as described in this volume of POSIX.1-2024.

79868 **OUTPUT FILES**

79869 The OUTPUT FILES section completely describes the files created or modified by the  
79870 utility. Temporary or system files that are created for internal usage by this utility or  
79871 other parts of the implementation (for example, spool, log, and audit files) are not  
79872 described in this, or any, section. The utilities creating such files and the names of such  
79873 files are unspecified. If applications are written to use temporary or intermediate files,  
79874 they should use the *TMPDIR* environment variable, if it is set and represents an  
79875 accessible directory, to select the location of temporary files.

79876 Implementations shall ensure that temporary files, when used by the standard utilities,  
79877 are named so that different utilities or multiple instances of the same utility can operate  
79878 simultaneously without regard to their working directories, or any other process  
79879 characteristic other than process ID. There are two exceptions to this rule:

- 79880 1. Resources for temporary files other than the name space (for example, disk  
79881 space, available directory entries, or number of processes allowed) are not  
79882 guaranteed.
- 79883 2. Certain standard utilities generate output files that are intended as input for  
79884 other utilities (for example, *lex* generates *lex.yy.c*), and these cannot have unique  
79885 names. These cases are explicitly identified in the descriptions of the respective  
79886 utilities.

79887 Any temporary file created by the implementation shall be removed by the  
79888 implementation upon a utility’s successful exit, exit because of errors, or before  
79889 termination by any of the SIGHUP, SIGINT, or SIGTERM signals, unless specified  
79890 otherwise by the utility description.

79891 Receipt of the SIGQUIT signal should generally cause termination (unless in some  
79892 debugging mode) that would bypass any attempted recovery actions.

79893 Record formats are described in a notation similar to that used by the C-language  
79894 function, *printf()*; see XBD Chapter 5 (on page 113) for a description of this notation.

79895 **Default Behavior:** When this section is listed as “None.”, it means that no files are  
 79896 created or modified as a consequence of direct action on the part of the utility when the  
 79897 utility is used as described by this volume of POSIX.1-2024. However, the utility may  
 79898 create or modify system files, such as log files, that are outside the utility’s normal  
 79899 execution environment.

#### 79900 EXTENDED DESCRIPTION

79901 The EXTENDED DESCRIPTION section provides a place for describing the actions of  
 79902 very complicated utilities, such as text editors or language processors, which typically  
 79903 have elaborate command languages.

79904 **Default Behavior:** When this section is listed as “None.”, no further description is  
 79905 necessary.

#### 79906 EXIT STATUS

79907 The EXIT STATUS section describes the values the utility shall return to the calling  
 79908 program, or shell, and the conditions that cause these values to be returned. Usually,  
 79909 utilities return zero for successful completion and values greater than zero for various  
 79910 error conditions. If specific numeric values are listed in this section, the system shall  
 79911 use those values for the errors described. In some cases, status values are listed more  
 79912 loosely, such as >0. A strictly conforming application shall not rely on any specific  
 79913 value in the range shown and shall be prepared to receive any value in the range.

79914 For example, a utility may list zero as a successful return, 1 as a failure for a specific  
 79915 reason, and >1 as “an error occurred”. In this case, unspecified conditions may cause a  
 79916 2 or 3, or other value, to be returned. A conforming application should be written so  
 79917 that it tests for successful exit status values (zero in this case), rather than relying upon  
 79918 the single specific error value listed in this volume of POSIX.1-2024. In that way, it has  
 79919 maximum portability, even on implementations with extensions.

79920 Unspecified error conditions may be represented by specific values not listed in this  
 79921 volume of POSIX.1-2024.

79922 **Default Behavior:** When the description of exit status 0 is “Successful completion”, it  
 79923 means that exit status 0 shall indicate that all of the actions the utility is required to  
 79924 perform were completed successfully.

#### 79925 CONSEQUENCES OF ERRORS

79926 The CONSEQUENCES OF ERRORS section describes the effects on the environment,  
 79927 file systems, process state, and so on, when error conditions occur. It does not describe  
 79928 error messages produced or exit status values used.

79929 The many reasons for failure of a utility are generally not specified by the utility  
 79930 descriptions. Utilities may terminate prematurely if they encounter: invalid usage of  
 79931 options, arguments, or environment variables; invalid usage of the complex syntaxes  
 79932 expressed in EXTENDED DESCRIPTION sections; resource exhaustion; difficulties  
 79933 accessing, creating, reading, or writing files; or difficulties associated with the  
 79934 privileges of the process.

79935 The following shall apply to each utility, unless otherwise stated:

- 79936 • If the requested action cannot be performed on an operand representing a file,  
 79937 directory, user, process, and so on, the utility shall issue a diagnostic message to  
 79938 standard error and continue processing the next operand in sequence, but the  
 79939 final exit status shall be one that indicates an error occurred.

79940 For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if  
 79941 the requested action cannot be performed on a file or directory encountered in the

79942 hierarchy, the utility shall issue a diagnostic message to standard error and  
 79943 continue processing the remaining files in the hierarchy, but the final exit status  
 79944 shall be one that indicates an error occurred.

79945 **Note:** If the requested action is to write one or more pathnames in a format that has  
 79946 <newline> as a terminator or separator, and a pathname to be written contains  
 79947 any bytes that have the encoded value of a <newline> character, this should be  
 79948 treated as an action that cannot be performed. A future version of this standard  
 79949 may require that utilities treat this as an error.

79950 • If the requested action characterized by an option or option-argument cannot be  
 79951 performed, the utility shall issue a diagnostic message to standard error and the  
 79952 exit status returned shall be one that indicates an error occurred.

79953 • When an unrecoverable error condition is encountered, the utility shall exit with  
 79954 an exit status that indicates an error occurred.

79955 • A diagnostic message shall be written to standard error whenever an error  
 79956 condition occurs.

79957 When a utility encounters an error condition several actions are possible, depending on  
 79958 the severity of the error and the state of the utility. Included in the possible actions of  
 79959 various utilities are: deletion of temporary or intermediate work files; deletion of  
 79960 incomplete files; validity checking of the file system or directory.

79961 **Default Behavior:** When this section is listed as “Default.”, it means that any changes  
 79962 to the environment, file systems, process state, and so on are unspecified.

#### 79963 APPLICATION USAGE

79964 This section is informative.

79965 The APPLICATION USAGE section gives advice to the application programmer or  
 79966 user about the way the utility should be used.

#### 79967 EXAMPLES

79968 This section is informative.

79969 The EXAMPLES section gives one or more examples of usage, where appropriate. In  
 79970 the event of conflict between an example and a normative part of the specification, the  
 79971 normative material is to be taken as correct.

79972 In all examples, quoting has been used, showing how sample commands (utility names  
 79973 combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to  
 79974 the *system()* function defined in the System Interfaces volume of POSIX.1-2024. Such  
 79975 quoting would not be used if the utility is invoked using one of the *exec* functions  
 79976 defined in the System Interfaces volume of POSIX.1-2024.

#### 79977 RATIONALE

79978 This section is informative.

79979 This section contains historical information concerning the contents of this volume of  
 79980 POSIX.1-2024 and why features were included or discarded by the standard  
 79981 developers.

#### 79982 FUTURE DIRECTIONS

79983 This section is informative.

79984 The FUTURE DIRECTIONS section should be used as a guide to current thinking; there  
 79985 is not necessarily a commitment to implement all of these future directions in their  
 79986 entirety.

79987           **SEE ALSO**  
 79988           This section is informative.  
 79989           The SEE ALSO section lists related entries.

79990           **CHANGE HISTORY**  
 79991           This section is informative.  
 79992           This section shows the derivation of the entry and any significant changes that have  
 79993           been made to it.

79994           Certain of the standard utilities describe how they can invoke other utilities or applications, such  
 79995           as by passing a command string to the command interpreter. The external influences (STDIN,  
 79996           ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF  
 79997           ERRORS, and so on) of such invoked utilities are not described in the section concerning the  
 79998           standard utility that invokes them.

## 79999 1.5 Considerations for Utilities in Support of Files of Arbitrary Size

80000           The following utilities support files of any size up to the maximum that can be created by the  
 80001           implementation. This support includes correct writing of file size-related values (such as file  
 80002           sizes and offsets, line numbers, and block counts) and correct interpretation of command line  
 80003           arguments that contain such values.

80004	<i>basename</i>	Return non-directory portion of pathname.
80005	<i>cat</i>	Concatenate and print files.
80006	<i>cd</i>	Change working directory.
80007	<i>chgrp</i>	Change file group ownership.
80008	<i>chmod</i>	Change file modes.
80009	<i>chown</i>	Change file ownership.
80010	<i>cksum</i>	Write file checksums and sizes.
80011	<i>cmp</i>	Compare two files.
80012	<i>cp</i>	Copy files.
80013	<i>dd</i>	Convert and copy a file.
80014	<i>df</i>	Report free disk space.
80015	<i>dirname</i>	Return directory portion of pathname.
80016	<i>du</i>	Estimate file space usage.
80017	<i>find</i>	Find files.
80018	<i>ln</i>	Link files.
80019	<i>ls</i>	List directory contents.
80020	<i>mkdir</i>	Make directories.
80021	<i>mv</i>	Move files.
80022	<i>pathchk</i>	Check pathnames.

# Shell Command Language

80061 This chapter contains the definition of the Shell Command Language.

## 80062 2.1 Shell Introduction

80063 The shell is a command language interpreter. This chapter describes the syntax of that command  
80064 language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the  
80065 System Interfaces volume of POSIX.1-2024.

80066 The shell operates according to the following general overview of operations. The specific  
80067 details are included in the cited sections of this chapter.

- 80068 1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and  
80069 *popen()* functions defined in the System Interfaces volume of POSIX.1-2024. If the first  
80070 line of a file of shell commands starts with the characters "#!", the results are  
80071 unspecified.
- 80072 2. The shell breaks the input into tokens: words and operators; see [Section 2.3](#).
- 80073 3. The shell parses the input into simple commands (see [Section 2.9.1](#)) and compound  
80074 commands (see [Section 2.9.4](#)).
- 80075 4. For each word within a command, the shell processes <backslash>-escape sequences  
80076 inside dollar-single-quotes (see [Section 2.2.4](#)) and then performs various word expansions  
80077 (see [Section 2.6](#)). In the case of a simple command, the results usually include a list of  
80078 pathnames and fields to be treated as a command name and arguments; see [Section 2.9](#).
- 80079 5. The shell performs redirection (see [Section 2.7](#)) and removes redirection operators and  
80080 their operands from the parameter list.
- 80081 6. The shell executes a function (see [Section 2.9.5](#)), built-in (see [Section 2.15](#)), executable file,  
80082 or script, giving the names of the arguments as positional parameters numbered 1 to *n*,  
80083 and the name of the command (or in the case of a function within a script, the name of the  
80084 script) as special parameter 0 (see [Section 2.9.1.4](#)).
- 80085 7. The shell optionally waits for the command to complete and collects the exit status (see  
80086 [Section 2.8.2](#)).

## 80087 2.2 Quoting

80088 Quoting is used to remove the special meaning of certain characters or words to the shell.  
80089 Quoting can be used to preserve the literal meaning of the special characters in the next  
80090 paragraph, prevent reserved words from being recognized as such, and prevent parameter  
80091 expansion and command substitution within here-document processing (see [Section 2.7.4](#)).

80092 The application shall quote the following characters if they are to represent themselves:

80093 | & ; < > ( ) \$ ` \ " ' <space> <tab> <newline>

80094 and the following might need to be quoted under certain circumstances. That is, these

80095 characters are sometimes special depending on conditions described elsewhere in this volume of  
80096 POSIX.1-2024:

80097 \* ? [ ] ^ - ! # ~ = % { , }

80098 **Note:** A future version of this standard may extend the conditions under which these characters are  
80099 special. Therefore applications should quote them whenever they are intended to represent  
80100 themselves. This does not apply to <hyphen-minus> ('-') since it is in the portable filename  
80101 character set.

80102 The various quoting mechanisms are the escape character, single-quotes, double-quotes, and  
80103 dollar-single-quotes. The here-document represents another form of quoting; see [Section 2.7.4](#).

### 80104 2.2.1 Escape Character (Backslash)

80105 A <backslash> that is not quoted shall preserve the literal value of the following character, with  
80106 the exception of a <newline>. If a <newline> immediately follows the <backslash>, the shell  
80107 shall interpret this as line continuation. The <backslash> and <newline> shall be removed before  
80108 splitting the input into tokens. Since the escaped <newline> is removed entirely from the input  
80109 and is not replaced by any white space, it cannot serve as a token separator.

### 80110 2.2.2 Single-Quotes

80111 Enclosing characters in single-quotes (' ') shall preserve the literal value of each character  
80112 within the single-quotes. A single-quote cannot occur within single-quotes.

### 80113 2.2.3 Double-Quotes

80114 Enclosing characters in double-quotes (" ") shall preserve the literal value of all characters  
80115 within the double-quotes, with the exception of the characters backquote, <dollar-sign>, and  
80116 <backslash>, as follows:

80117 § The <dollar-sign> shall retain its special meaning introducing parameter expansion (see  
80118 [Section 2.6.2](#)), a form of command substitution (see [Section 2.6.3](#)), and arithmetic expansion  
80119 (see [Section 2.6.4](#)), but shall not retain its special meaning introducing the dollar-single-  
80120 quotes form of quoting (see [Section 2.2.4](#)).

80121 The input characters within the quoted string that are also enclosed between "\$ (" and the  
80122 matching ') ' shall not be affected by the double-quotes, but rather shall define the  
80123 command(s) whose output replaces the "\$ (...)" when the word is expanded. The  
80124 tokenizing rules in [Section 2.3](#) shall be applied recursively to find the matching ') '.

80125 For the four varieties of parameter expansion that provide for substring processing (see  
80126 [Section 2.6.2](#)), within the string of characters from an enclosed "\$ {" to the matching ' } ' ,  
80127 the double-quotes within which the expansion occurs shall have no effect on the handling  
80128 of any special characters.

80129 For parameter expansions other than the four varieties that provide for substring  
80130 processing, within the string of characters from an enclosed "\$ {" to the matching ' } ' , the  
80131 double-quotes within which the expansion occurs shall preserve the literal value of all  
80132 characters, with the exception of the characters double-quote, backquote, <dollar-sign>, and  
80133 <backslash>. If any unescaped double-quote characters occur within the string, other than  
80134 in embedded command substitutions, the behavior is unspecified. The backquote and  
80135 <dollar-sign> characters shall follow the same rules as for characters in double-quotes  
80136 described in this section. The <backslash> character shall follow the same rules as for

80137 characters in double-quotes described in this section except that it shall additionally retain  
 80138 its special meaning as an escape character when followed by '}' and this shall prevent the  
 80139 escaped '}' from being considered when determining the matching '}' (using the rule in  
 80140 [Section 2.6.2](#)).

80141 ‧ The backquote shall retain its special meaning introducing the other form of command  
 80142 substitution (see [Section 2.6.3](#)). The portion of the quoted string from the initial backquote  
 80143 and the characters up to the next backquote that is not preceded by a <backslash>, having  
 80144 escape characters removed, defines that command whose output replaces "`...`" when  
 80145 the word is expanded. Either of the following cases produces undefined results:

- 80146 • A quoted (single-quoted, double-quoted, or dollar-single-quoted) string that begins,  
 80147 but does not end, within the "`...`" sequence
- 80148 • A "`...`" sequence that begins, but does not end, within the same double-quoted  
 80149 string

80150 \ Outside of "\$(...)" and "\${...}" the <backslash> shall retain its special meaning as an  
 80151 escape character (see [Section 2.2.1](#)) only when immediately followed by one of the following  
 80152 characters:

80153 \$ ` \ <newline>

80154 or by a double-quote character that would otherwise be considered special (see [Section 2.6.4](#)  
 80155 (on page 2490) and [Section 2.7.4](#), on page 2495).

80156 When double-quotes are used to quote a parameter expansion, command substitution, or  
 80157 arithmetic expansion, the literal value of all characters within the result of the expansion shall be  
 80158 preserved.

80159 The application shall ensure that a double-quote that is not within "\$(...)" nor within  
 80160 "\${...}" is immediately preceded by a <backslash> in order to be included within double-  
 80161 quotes. The parameter '@' has special meaning inside double-quotes and is described in [Section](#)  
 80162 [2.5.2](#).

## 80163 2.2.4 Dollar-Single-Quotes

80164 A sequence of characters starting with a <dollar-sign> immediately followed by a single-quote  
 80165 (\$') shall preserve the literal value of all characters up to an unescaped terminating single-quote  
 80166 ('), with the exception of certain <backslash>-escape sequences, as follows:

- 80167 • \" yields a <quotation-mark> (double-quote) character, but note that <quotation-mark>  
 80168 can be included unescaped.
- 80169 • \' yields an <apostrophe> (single-quote) character.
- 80170 • \\ yields a <backslash> character.
- 80171 • \a yields an <alert> character.
- 80172 • \b yields a <backspace> character.
- 80173 • \e yields an <ESC> character.
- 80174 • \f yields a <form-feed> character.
- 80175 • \n yields a <newline> character.
- 80176 • \r yields a <carriage-return> character.

- 80177           • `\t` yields a <tab> character.
- 80178           • `\v` yields a <vertical-tab> character.
- 80179           • `\cX` yields the control character listed in the **Value** column of [Table 3-21](#) in the OPERANDS section of the `stty` utility when *X* is one of the characters listed in the **^c** column of the same table, except that `\c\\` yields the <FS> control character since the <backslash> character has to be escaped.
- 80180
- 80181
- 80182
- 80183           • `\xXX` yields the byte whose value is the hexadecimal value *XX* (one or more hexadecimal digits). If more than two hexadecimal digits follow `\x`, the results are unspecified.
- 80184
- 80185           • `\ddd` yields the byte whose value is the octal value *ddd* (one to three octal digits).
- 80186           • The behavior of an unescaped <backslash> immediately followed by any other character, including <newline>, is unspecified.
- 80187

80188           In cases where a variable number of characters can be used to specify an escape sequence (`\xXX` and `\ddd`), the escape sequence shall be terminated by the first character that is not of the expected type or, for `\ddd` sequences, when the maximum number of characters specified has been found, whichever occurs first.

80192           These <backslash>-escape sequences shall be processed (replaced with the bytes or characters they yield) immediately prior to word expansion (see [Section 2.6](#)) of the word in which the dollar-single-quotes sequence occurs.

80195           If a `\xXX` or `\ddd` escape sequence yields a byte whose value is 0, it is unspecified whether that null byte is included in the result or if that byte and any following regular characters and escape sequences up to the terminating unescaped single-quote are evaluated and discarded.

80198           If the octal value specified by `\ddd` will not fit in a byte, the results are unspecified.

80199           If a `\e` or `\cX` escape sequence specifies a character that does not have an encoding in the locale in effect when these <backslash>-escape sequences are processed, the result is implementation-defined. However, implementations shall not replace an unsupported character with bytes that do not form valid characters in that locale's character set.

80203           If a <backslash>-escape sequence represents a single-quote character (for example `\'`), that sequence shall not terminate the dollar-single-quote sequence.

## 80205   2.3   Token Recognition

80206           The shell shall read its input in terms of lines. (For details about how the shell reads its input, see the description of *sh*.) The input lines can be of unlimited length. These lines shall be parsed using two major modes: ordinary token recognition and processing of here-documents.

80209           When an **io\_here** token has been recognized by the grammar (see [Section 2.10](#)), one or more of the subsequent lines immediately following the next **NEWLINE** token form the body of a here-document and shall be parsed according to the rules of [Section 2.7.4](#). Any non-**NEWLINE** tokens (including more **io\_here** tokens) that are recognized while searching for the next **NEWLINE** token shall be saved for processing after the here-document has been parsed. If a saved token is an **io\_here** token, the corresponding here-document shall start on the line immediately following the line containing the trailing delimiter of the previous here-document. If any saved token includes a <newline> character, the behavior is unspecified.

80217           When it is not processing an **io\_here**, the shell shall break its input into tokens by applying the first applicable rule below to each character in turn in its input. At the start of input or after a previous token has just been delimited, the first or next token, respectively, shall start with the first character that has not already been included in a token and is not discarded according to

80221 the rules below. Once a token has started, zero or more characters from the input shall be  
80222 appended to the token until the end of the token is delimited according to one of the rules below.  
80223 When both the start and end of a token have been delimited, the characters forming the token  
80224 shall be exactly those in the input between the two delimiters, including any quoting characters.  
80225 If a rule below indicates that a token is delimited, and no characters have been included in the  
80226 token, that empty token shall be discarded.

- 80227 1. If the end of input is recognized, the current token (if any) shall be delimited.
- 80228 2. If the previous character was used as part of an operator and the current character is not  
80229 quoted and can be used with the previous characters to form an operator, it shall be used  
80230 as part of that (operator) token.
- 80231 3. If the previous character was used as part of an operator and the current character cannot  
80232 be used with the previous characters to form an operator, the operator containing the  
80233 previous character shall be delimited.
- 80234 4. If the current character is an unquoted <backslash>, single-quote, or double-quote or is  
80235 the first character of an unquoted <dollar-sign> single-quote sequence, it shall affect  
80236 quoting for subsequent characters up to the end of the quoted text. The rules for quoting  
80237 are as described in [Section 2.2](#). During token recognition no substitutions shall be  
80238 actually performed, and the result token shall contain exactly the characters that appear  
80239 in the input unmodified, including any embedded or enclosing quotes or substitution  
80240 operators, between the start and the end of the quoted text. The token shall not be  
80241 delimited by the end of the quoted field.
- 80242 5. If the current character is an unquoted '\$' or '`', the shell shall identify the start of any  
80243 candidates for parameter expansion ([Section 2.6.2](#)), command substitution ([Section 2.6.3](#)),  
80244 or arithmetic expansion ([Section 2.6.4](#)) from their introductory unquoted character  
80245 sequences: '\${' or '\$(', '\$(' or '`', and '\$(', respectively. The shell shall read  
80246 sufficient input to determine the end of the unit to be expanded (as explained in the cited  
80247 sections). While processing the characters, if instances of expansions or quoting are  
80248 found nested within the substitution, the shell shall recursively process them in the  
80249 manner specified for the construct that is found. For '\$(' and '`' only, if instances of  
80250 **io\_here** tokens are found nested within the substitution, they shall be parsed according to  
80251 the rules of [Section 2.7.4](#); if the terminating ')' or '`' of the substitution occurs before  
80252 the **NEWLINE** token marking the start of the here-document, the behavior is unspecified.  
80253 The characters found from the beginning of the substitution to its end, allowing for any  
80254 recursion necessary to recognize embedded constructs, shall be included unmodified in  
80255 the result token, including any embedded or enclosing substitution operators or quotes.  
80256 The token shall not be delimited by the end of the substitution.
- 80257 6. If the current character is not quoted and can be used as the first character of a new  
80258 operator, the current token (if any) shall be delimited. The current character shall be used  
80259 as the beginning of the next (operator) token.
- 80260 7. If the current character is an unquoted <blank>, any token containing the previous  
80261 character is delimited and the current character shall be discarded.
- 80262 8. If the previous character was part of a word, the current character shall be appended to  
80263 that word.
- 80264 9. If the current character is a '#', it and all subsequent characters up to, but excluding, the  
80265 next <newline> shall be discarded as a comment. The <newline> that ends the line is not  
80266 considered part of the comment.

80267 10. The current character is used as the start of a new word.

80268 Once a token is delimited, it is categorized as required by the grammar in [Section 2.10](#).

80269 In situations where the shell parses its input as a *program*, once a *complete\_command* has been  
80270 recognized by the grammar (see [Section 2.10](#)), the *complete\_command* shall be executed before the  
80271 next *complete\_command* is tokenized and parsed.

### 80272 2.3.1 Alias Substitution

80273 After a token has been categorized as type **TOKEN** (see [Section 2.10.1](#)), including (recursively)  
80274 any token resulting from an alias substitution, the **TOKEN** shall be subject to alias substitution if  
80275 all of the following conditions are true:

- 80276 • The **TOKEN** does not contain any quoting characters.
- 80277 • The **TOKEN** is a valid alias name (see [XBD Section 3.10](#)).
- 80278 • An alias with that name is in effect.
- 80279 • The **TOKEN** did not either fully or, optionally, partially result from an alias substitution of  
80280 the same alias name at any earlier recursion level.
- 80281 • Either the **TOKEN** is being considered for alias substitution because it follows an alias  
80282 substitution whose replacement value ended with a <blank> (see below) or the **TOKEN**  
80283 could be parsed as the command name word of a simple command (see [Section 2.10](#)),  
80284 based on this **TOKEN** and the tokens (if any) that preceded it, but ignoring whether any  
80285 subsequent characters would allow that.

80286 except that if the **TOKEN** meets the above conditions and would be recognized as a reserved  
80287 word (see [Section 2.4](#)) if it occurred in an appropriate place in the input, it is unspecified  
80288 whether the **TOKEN** is subject to alias substitution.

80289 When a **TOKEN** is subject to alias substitution, the value of the alias shall be processed as if it  
80290 had been read from the input instead of the **TOKEN**, with token recognition (see [Section 2.3](#))  
80291 resuming at the start of the alias value. When the end of the alias value is reached, the shell may  
80292 behave as if an additional <space> character had been read from the input after the **TOKEN** that  
80293 was replaced. If it does not add this <space>, it is unspecified whether the current token is  
80294 delimited before token recognition is applied to the character (if any) that followed the **TOKEN**  
80295 in the input.

80296 **Note:** A future version of this standard may disallow adding this <space>.

80297 If the value of the alias replacing the **TOKEN** ends in a <blank> that would be unquoted after  
80298 substitution, and optionally if it ends in a <blank> that would be quoted after substitution, the  
80299 shell shall check the next token in the input, if it is a **TOKEN**, for alias substitution; this process  
80300 shall continue until a **TOKEN** is found that is not a valid alias or an alias value does not end in  
80301 such a <blank>.

80302 An implementation may defer the effect of a change to an alias but the change shall take effect  
80303 no later than the completion of the currently executing *complete\_command* (see [Section 2.10](#)).  
80304 Changes to aliases shall not take effect out of order. Implementations may provide predefined  
80305 aliases that are in effect when the shell is invoked.

80306 When used as specified by this volume of POSIX.1-2024, alias definitions shall not be inherited  
80307 by separate invocations of the shell or by the utility execution environments invoked by the  
80308 shell; see [Section 2.13](#).

## 80309 2.4 Reserved Words

80310 Reserved words are words that have special meaning to the shell; see [Section 2.9](#). The following  
80311 words shall be recognized as reserved words:

80312	<b>!</b>	<b>do</b>	<b>esac</b>	<b>in</b>
80313	<b>{</b>	<b>done</b>	<b>fi</b>	<b>then</b>
80314	<b>}</b>	<b>elif</b>	<b>for</b>	<b>until</b>
80315	<b>case</b>	<b>else</b>	<b>if</b>	<b>while</b>

80316 This recognition shall only occur when none of the characters is quoted and when the word is  
80317 used as:

- 80318 • The first word of a command
- 80319 • The first word following one of the reserved words other than **case**, **for**, or **in**
- 80320 • The third word in a **case** command (only **in** is valid in this case)
- 80321 • The third word in a **for** command (only **in** and **do** are valid in this case)

80322 See the grammar in [Section 2.10](#).

80323 When used in circumstances where reserved words are recognized (described above), the  
80324 following words may be recognized as reserved words, in which case the results are unspecified  
80325 except as described below for **time**:

80326	<b>[</b>	<b>]</b>	<b>function</b>	<b>namespace</b>	<b>select</b>	<b>time</b>
-------	----------	----------	-----------------	------------------	---------------	-------------

80327 When the word **time** is recognized as a reserved word in circumstances where it would, if it  
80328 were not a reserved word, be the command name (see [Section 2.9.1.1](#)) of a simple command that  
80329 would execute the *time* utility in a manner other than one for which *time* states that the results  
80330 are unspecified, the behavior shall be as specified for the *time* utility.

80331 When used in circumstances where reserved words are recognized (described above), all words  
80332 whose final character is a <colon> (':') are reserved; their use in those circumstances produces  
80333 unspecified results.

## 80334 2.5 Parameters and Variables

80335 A parameter can be denoted by a name, a number, or one of the special characters listed in  
80336 [Section 2.5.2](#). A variable is a parameter denoted by a name.

80337 A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can  
80338 only be unset by using the *unset* special built-in command.

80339 Parameters can contain arbitrary byte sequences, except for the null byte. The shell shall process  
80340 their values as characters only when performing operations that are described in this standard in  
80341 terms of characters.

80342 **2.5.1 Positional Parameters**

80343 A positional parameter is a parameter denoted by a decimal representation of a positive integer.  
 80344 The digits denoting the positional parameters shall always be interpreted as a decimal value,  
 80345 even if there is a leading zero. When a positional parameter with more than one digit is  
 80346 specified, the application shall enclose the digits in braces (see [Section 2.6.2](#)).

80347 Examples:

- 80348 • "\$8", "\${8}", "\${08}", "\${008}", etc. all expand to the value of the eighth positional  
 80349 parameter.
- 80350 • "\${10}" expands to the value of the tenth positional parameter.
- 80351 • "\$10" expands to the value of the first positional parameter followed by the character '0'.

80352 **Note:** 0 is a special parameter, not a positional parameter, and therefore the results of expanding  
 80353 \${00} are unspecified.

80354 Positional parameters are initially assigned when the shell is invoked (see *sh*), temporarily  
 80355 replaced when a shell function is invoked (see [Section 2.9.5](#)), and can be reassigned with the *set*  
 80356 special built-in command.

80357 **2.5.2 Special Parameters**

80358 Listed below are the special parameters and the values to which they shall expand. Only the  
 80359 values of the special parameters are listed; see [Section 2.6](#) for a detailed summary of all the  
 80360 stages involved in expanding words.

80361 @ Expands to the positional parameters, starting from one, initially producing one field for  
 80362 each positional parameter that is set. When the expansion occurs in a context where field  
 80363 splitting will be performed, any empty fields may be discarded and each of the non-empty  
 80364 fields shall be further split as described in [Section 2.6.5](#). When the expansion occurs within  
 80365 double-quotes, the behavior is unspecified unless one of the following is true:

- 80366 • Field splitting as described in [Section 2.6.5](#) would be performed if the expansion were  
 80367 not within double-quotes (regardless of whether field splitting would have any effect;  
 80368 for example, if *IFS* is null).
- 80369 • The double-quotes are within the *word* of a  $\${parameter:-word}$  or a  $\${parameter:+word}$   
 80370 expansion (with or without the <colon>; see [Section 2.6.2](#)) which would have been  
 80371 subject to field splitting if *parameter* had been expanded instead of *word*.

80372 If one of these conditions is true, the initial fields shall be retained as separate fields, except  
 80373 that if the parameter being expanded was embedded within a word, the first field shall be  
 80374 joined with the beginning part of the original word and the last field shall be joined with the  
 80375 end part of the original word. In all other contexts the results of the expansion are  
 80376 unspecified. If there are no positional parameters, the expansion of '@' shall generate zero  
 80377 fields, even when '@' is within double-quotes; however, if the expansion is embedded  
 80378 within a word which contains one or more other parts that expand to a quoted null string,  
 80379 these null string(s) shall still produce an empty field, except that if the other parts are all  
 80380 within the same double-quotes as the '@', it is unspecified whether the result is zero fields  
 80381 or one empty field.

80382 \* Expands to the positional parameters, starting from one, initially producing one field for  
 80383 each positional parameter that is set. When the expansion occurs in a context where field  
 80384 splitting will be performed, any empty fields may be discarded and each of the non-empty  
 80385 fields shall be further split as described in [Section 2.6.5](#). When the expansion occurs in a

- 80386 context where field splitting will not be performed, the initial fields shall be joined to form a  
 80387 single field with the value of each parameter separated by the first character of the *IFS*  
 80388 variable if *IFS* contains at least one character, or separated by a <space> if *IFS* is unset, or  
 80389 with no separation if *IFS* is set to a null string.
- 80390 # Expands to the shortest representation of the decimal number of positional parameters. The  
 80391 command name (parameter 0) shall not be counted in the number given by '# ' because it is  
 80392 a special parameter, not a positional parameter.
- 80393 ? Expands to the shortest representation of the decimal exit status (see [Section 2.8.2](#)) of the  
 80394 pipeline (see [Section 2.9.2](#)) executed from the current shell execution environment (not a  
 80395 subshell environment) that most recently either terminated or, optionally but only if the  
 80396 shell is interactive and job control is enabled, was stopped by a signal. If this pipeline  
 80397 terminated, the status value shall be its exit status; otherwise, the status value shall be the  
 80398 same as the exit status that would have resulted if the pipeline had been terminated by a  
 80399 signal with the same number as the signal that stopped it. The value of the special  
 80400 parameter '?' shall be set to 0 during initialization of the shell. When a subshell  
 80401 environment is created, the value of the special parameter '?' from the invoking shell  
 80402 environment shall be preserved in the subshell.
- 80403 **Note:** In `var=$(some_command); echo $?` the output is the exit status of `some_command`,  
 80404 which is executed in a subshell environment, but this is because its exit status becomes the  
 80405 exit status of the assignment command `var=$(some_command)` (see [Section 2.9.1](#)) and  
 80406 this assignment command is the most recently completed pipeline. Likewise for any  
 80407 pipeline consisting entirely of a simple command that has no command word, but contains  
 80408 one or more command substitutions. (See [Section 2.9.1](#).)
- 80409 – (Hyphen.) Expands to the current option flags (the single-letter option names concatenated  
 80410 into a string) as specified on invocation, by the *set* special built-in command, or implicitly  
 80411 by the shell. It is unspecified whether the `-c` and `-s` options are included in the expansion  
 80412 of "\$-". The `-i` option shall be included in "\$-" if the shell is interactive, regardless of  
 80413 whether it was specified on invocation.
- 80414 \$ Expands to the shortest representation of the decimal process ID of the invoked shell. In a  
 80415 subshell (see [Section 2.13](#)), '\$ ' shall expand to the same value as that of the current shell.
- 80416 ! Expands to the shortest representation of the decimal process ID associated with the most  
 80417 recent asynchronous AND-OR list (see [Section 2.9.3.1](#)) executed from the current shell  
 80418 execution environment, or to the shortest representation of the decimal process ID of the  
 80419 last command specified in the currently executing pipeline in the job-control background  
 80420 job that most recently resumed execution through the use of *bg*, whichever is the most  
 80421 recent.
- 80422 0 (Zero.) Expands to the name of the shell or shell script. See *sh* for a detailed description of  
 80423 how this name is derived.
- 80424 See the description of the *IFS* variable in [Section 2.5.3](#).

80425 **2.5.3 Shell Variables**

80426 Variables shall be initialized from the environment (as defined by XBD Chapter 8 and the *exec*  
 80427 function in the System Interfaces volume of POSIX.1-2024) and can be given new values with  
 80428 variable assignment commands. Shell variables shall be initialized only from environment  
 80429 variables that have valid names. If a variable is initialized from the environment, it shall be  
 80430 marked for export immediately; see the *export* special built-in. New variables can be defined and  
 80431 initialized with variable assignments, with the *read* or *getopts* utilities, with the *name* parameter  
 80432 in a **for** loop, with the  $\${name=word}$  expansion, or with other mechanisms provided as  
 80433 implementation extensions.

80434 The following variables shall affect the execution of the shell:

80435 UP **ENV** The processing of the *ENV* shell variable shall be supported if the system  
 80436 supports the User Portability Utilities option.

80437 This variable, when and only when an interactive shell is invoked, shall be  
 80438 subjected to parameter expansion (see Section 2.6.2) by the shell and the  
 80439 resulting value shall be used as a pathname of a file. Before any interactive  
 80440 commands are read, the shell shall tokenize (see Section 2.3) the contents of  
 80441 the file, parse the tokens as a *program* (see Section 2.10), and execute the  
 80442 resulting commands in the current environment. (In other words, the contents  
 80443 of the *ENV* file are not parsed as a single *compound\_list*. This distinction  
 80444 matters because it influences when aliases take effect.) The file need not be  
 80445 executable. If the expanded value of *ENV* is not an absolute pathname, the  
 80446 results are unspecified. *ENV* shall be ignored if the user's real and effective  
 80447 user IDs or real and effective group IDs are different.

80448 **HOME** The pathname of the user's home directory. The contents of *HOME* are used in  
 80449 tilde expansion (see Section 2.6.1).

80450 **IFS** A string treated as a list of characters that is used for field splitting, expansion  
 80451 of the '\*' special parameter, and to split lines into fields with the *read* utility.  
 80452 If the value of *IFS* includes any bytes that do not form part of a valid character,  
 80453 the results of field splitting, expansion of '\*', and use of the *read* utility are  
 80454 unspecified.

80455 If *IFS* is not set, it shall behave as normal for an unset variable, except that  
 80456 field splitting by the shell and line splitting by the *read* utility shall be  
 80457 performed as if the value of *IFS* is <space><tab><newline>; see Section 2.6.5.

80458 The shell shall set *IFS* to <space><tab><newline> when it is invoked.

80459 **LANG** Provide a default value for the internationalization variables that are unset or  
 80460 null. (See XBD Section 8.2 for the precedence of internationalization variables  
 80461 used to determine the values of locale categories.)

80462 **LC\_ALL** The value of this variable overrides the *LC\_\** variables and *LANG*, as  
 80463 described in XBD Chapter 8.

80464 **LC\_COLLATE** Determine the behavior of range expressions, equivalence classes, and multi-  
 80465 character collating elements within pattern matching.

80466 **LC\_CTYPE** Determine the interpretation of sequences of bytes of text data as characters  
 80467 (for example, single-byte as opposed to multi-byte characters), which  
 80468 characters are defined as letters (character class **alpha**) and <blank> characters  
 80469 (character class **blank**), and the behavior of character classes within pattern  
 80470 matching. Changing the value of *LC\_CTYPE* after the shell has started shall  
 80471 not affect the lexical processing of shell commands in the current shell

80472			execution environment or its subshells. Invoking a shell script or performing
80473			<code>exec sh</code> subjects the new shell to the changes in <code>LC_CTYPE</code> .
80474		<code>LC_MESSAGES</code>	Determine the language in which messages should be written.
80475	UP	<code>LINENO</code>	The processing of the <code>LINENO</code> shell variable shall be supported if the system
80476			supports the User Portability Utilities option.
80477			Set by the shell to a decimal number representing the current sequential line
80478			number (numbered starting with 1) within a script or function before it
80479			executes each command. If the user unsets or resets <code>LINENO</code> , the variable may
80480			lose its special meaning for the life of the shell. If the shell is not currently
80481			executing a script or function, the value of <code>LINENO</code> is unspecified.
80482	XSI	<code>NLSPATH</code>	Determine the location of message catalogs for the processing of
80483			<code>LC_MESSAGES</code> .
80484		<code>PATH</code>	A string formatted as described in XBD Chapter 8, used to effect command
80485			interpretation; see Section 2.9.1.4.
80486		<code>PPID</code>	Set by the shell to the decimal value of its parent process ID during
80487			initialization of the shell. In a subshell (see Section 2.13), <code>PPID</code> shall be set to
80488			the same value as that of the parent of the current shell. For example, <code>echo</code>
80489			<code>\$PPID</code> and ( <code>echo \$PPID</code> ) would produce the same value.
80490	UP	<code>PS1</code>	The processing of the <code>PS1</code> shell variable shall be supported if the system
80491			supports the User Portability Utilities option.
80492			Each time an interactive shell is ready to read a command, the value of this
80493			variable shall be subjected to parameter expansion (see Section 2.6.2) and
80494			exclamation-mark expansion (see below). Whether the value is also subjected
80495			to command substitution (see Section 2.6.3) or arithmetic expansion (see
80496			Section 2.6.4) or both is unspecified. After expansion, the value shall be
80497			written to standard error.
80498			The expansions shall be performed in two passes, where the result of the first
80499			pass is input to the second pass. One of the passes shall perform only the
80500			exclamation-mark expansion described below. The other pass shall perform
80501			the other expansion(s) according to the rules in Section 2.6. Which of the two
80502			passes is performed first is unspecified.
80503			The default value shall be <code>"\$ "</code> . For users who have specific additional
80504			implementation-defined privileges, the default may be another,
80505			implementation-defined value.
80506			Exclamation-mark expansion: The shell shall replace each instance of the
80507			<exclamation-mark> character ( <code>'!'</code> ) with the history file number (see
80508			Command History List) of the next command to be typed. An <exclamation-
80509			mark> character escaped by another <exclamation-mark> character (that is,
80510			<code>"!!"</code> ) shall expand to a single <exclamation-mark> character.
80511	UP	<code>PS2</code>	The processing of the <code>PS2</code> shell variable shall be supported if the system
80512			supports the User Portability Utilities option.
80513			Each time the user enters a <newline> prior to completing a command line in
80514			an interactive shell, the value of this variable shall be subjected to parameter
80515			expansion (see Section 2.6.2). Whether the value is also subjected to command
80516			substitution (see Section 2.6.3) or arithmetic expansion (see Section 2.6.4) or
80517			both is unspecified. After expansion, the value shall be written to standard

80518		error. The default value shall be "> ".
80519	UP	<i>PS4</i>
80520		The processing of the <i>PS4</i> shell variable shall be supported if the system supports the User Portability Utilities option.
80521		When an execution trace ( <i>set -x</i> ) is being performed, before each line in the execution trace, the value of this variable shall be subjected to parameter expansion (see <a href="#">Section 2.6.2</a> ). Whether the value is also subjected to command substitution (see <a href="#">Section 2.6.3</a> ) or arithmetic expansion (see <a href="#">Section 2.6.4</a> ) or both is unspecified. After expansion, the value shall be written to standard error. The default value shall be "+ ".
80522		
80523		
80524		
80525		
80526		
80527		<i>PWD</i>
80528		Set by the shell and by the <i>cd</i> utility. In the shell the value shall be initialized from the environment as follows. If a value for <i>PWD</i> is passed to the shell in the environment when it is executed, the value is an absolute pathname of the current working directory that is no longer than { <i>PATH_MAX</i> } bytes including the terminating null byte, and the value does not contain any components that are dot or dot-dot, then the shell shall set <i>PWD</i> to the value from the environment. Otherwise, if a value for <i>PWD</i> is passed to the shell in the environment when it is executed, the value is an absolute pathname of the current working directory, and the value does not contain any components that are dot or dot-dot, then it is unspecified whether the shell sets <i>PWD</i> to the value from the environment or sets <i>PWD</i> to the pathname that would be output by <i>pwd -P</i> . Otherwise, the <i>sh</i> utility sets <i>PWD</i> to the pathname that would be output by <i>pwd -P</i> . In cases where <i>PWD</i> is set to the value from the environment, the value can contain components that refer to files of type symbolic link. In cases where <i>PWD</i> is set to the pathname that would be output by <i>pwd -P</i> , if there is insufficient permission on the current working directory, or on any parent of that directory, to determine what that pathname would be, the value of <i>PWD</i> is unspecified. Assignments to this variable may be ignored. If an application sets or unsets the value of <i>PWD</i> , the behaviors of the <i>cd</i> and <i>pwd</i> utilities are unspecified.

## 80547 2.6 Word Expansions

80548 This section describes the various expansions that are performed on words. Not all expansions  
 80549 are performed on every word, as explained in the following sections and elsewhere in this  
 80550 chapter. The expansions that are performed for a given word shall be performed in the following  
 80551 order:

- 80552 1. Tilde expansion (see [Section 2.6.1](#)), parameter expansion (see [Section 2.6.2](#)), command  
 80553 substitution (see [Section 2.6.3](#)), and arithmetic expansion (see [Section 2.6.4](#)) shall be  
 80554 performed, beginning to end. See item 5 in [Section 2.3](#).
- 80555 2. Field splitting (see [Section 2.6.5](#)) shall be performed on the portions of the fields  
 80556 generated by step 1.
- 80557 3. Pathname expansion (see [Section 2.6.6](#)) shall be performed, unless *set -f* is in effect.
- 80558 4. Quote removal (see [Section 2.6.7](#)), if performed, shall always be performed last.

80559 Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and  
 80560 quote removals that occur within a single word shall expand to a single field, except as  
 80561 described below. The shell shall create multiple fields or no fields from a single word only as a  
 80562 result of field splitting, pathname expansion, or the following cases:

80563 1. Parameter expansion of the special parameters '@' and '\*', as described in [Section 2.5.2](#),  
80564 can create multiple fields or no fields from a single word.

80565 2. When the expansion occurs in a context where field splitting will be performed, a word  
80566 that contains all of the following somewhere within it, before any expansions are applied,  
80567 in the order specified:

- 80568 • an unquoted <left-curly-bracket> ('{') that is not immediately preceded by an  
80569 unquoted <dollar-sign> ('\$')

- 80570 • one or more unquoted <comma> (',') characters or a sequence that consists of two  
80571 adjacent <period> ('.') characters surrounded by other characters (which can also  
80572 be <period> characters)

- 80573 • an unquoted <right-curly-bracket> ('}') )

80574 may be subject to an additional implementation-defined form of expansion that can create  
80575 multiple fields from a single word. This expansion, if supported, shall be applied before  
80576 all the other word expansions are applied. The other expansions shall then be applied to  
80577 each field that results from this expansion.

80578 When the expansions in this section are performed other than in the context of preparing a  
80579 command for execution, they shall be carried out in the current shell execution environment.

80580 When expanding words for a command about to be executed, and the word will be the  
80581 command name or an argument to the command, the expansions shall be carried out in the  
80582 current shell execution environment. (The environment for the command to be executed is  
80583 unknown until the command word is known.)

80584 When expanding the words in a command about to be executed that are used with variable  
80585 assignments or redirections, it is unspecified whether the expansions are carried out in the  
80586 current execution environment or in the environment of the command about to be executed.

80587 The '\$' character is used to introduce parameter expansion, command substitution, or  
80588 arithmetic evaluation. If a '\$' that is neither within single-quotes nor escaped by a <backslash>  
80589 is immediately followed by a character that is not a <space>, not a <tab>, not a <newline>, and  
80590 is not one of the following:

- 80591 • A numeric character
- 80592 • The name of one of the special parameters (see [Section 2.5.2](#))
- 80593 • A valid first character of a variable name
- 80594 • A <left-curly-bracket> ('{')
- 80595 • A <left-parenthesis>
- 80596 • A single-quote

80597 the result is unspecified. If a '\$' that is neither within single-quotes nor escaped by a  
80598 <backslash> is immediately followed by a <space>, <tab>, or a <newline>, or is not followed by  
80599 any character, the '\$' shall be treated as a literal character.

80600 **2.6.1 Tilde Expansion**

80601 A ``tilde-prefix'' consists of an unquoted <tilde> character at the beginning of a word, followed  
 80602 by all of the characters preceding the first unquoted <slash> in the word, or all the characters in  
 80603 the word if there is no <slash>. In an assignment (see XBD Section 4.26), multiple tilde-prefixes  
 80604 can be used: one at the beginning of the word (that is, following the <equals-sign> of the  
 80605 assignment), or one following any unquoted <colon>, or both. A tilde-prefix in an assignment is  
 80606 terminated by the first unquoted <colon> or <slash>, or the end of the assignment word.

80607 If the tilde-prefix consists of only the <tilde> character, it shall be replaced by the value of the  
 80608 variable *HOME*. If *HOME* is unset, the results are unspecified.

80609 Otherwise, the characters in the tilde-prefix following the <tilde> shall be treated as a possible  
 80610 login name from the user database. If these characters do not form a portable login name (see  
 80611 the description of the *LOGNAME* environment variable in XBD Section 8.3), the results are  
 80612 unspecified.

80613 **Note:** Since the tilde-prefix is not subject to further word expansions after the <tilde> is removed to  
 80614 obtain the login name, none of the following has a portable login name following the <tilde>:

```
80615 ~"string"
80616 ~'string'
80617 ~$var
80618 ~\bin
```

80619 owing to the presence of ' ', '\ ', '\$ ', '\\ ', and '/' characters in the login name.

80620 If the characters in the tilde-prefix following the <tilde> form a portable login name, the tilde-  
 80621 prefix shall be replaced by a pathname of the initial working directory associated with the login  
 80622 name. The pathname shall be obtained as if by using the *getpwnam()* function as defined in the  
 80623 System Interfaces volume of POSIX.1-2024. If the system does not recognize the login name, the  
 80624 results are unspecified.

80625 The pathname that replaces the tilde-prefix shall be treated as if quoted to prevent it being  
 80626 altered by field splitting and pathname expansion; if a <slash> follows the tilde-prefix and the  
 80627 pathname ends with a <slash>, the trailing <slash> from the pathname should be omitted from  
 80628 the replacement. If the word being expanded consists of only the <tilde> character and *HOME*  
 80629 is set to the null string, this produces an empty field (as opposed to zero fields) as the expanded  
 80630 word.

80631 **Note:** A future version of this standard may require that if a <slash> follows the tilde-prefix and the  
 80632 pathname ends with a <slash>, the trailing <slash> from the pathname is omitted from the  
 80633 replacement.

80634 **2.6.2 Parameter Expansion**

80635 The format for parameter expansion is as follows:

```
80636 ${expression}
```

80637 where *expression* consists of all characters until the matching '}'. Any '}' escaped by a  
 80638 <backslash> or within a quoted string, and characters in embedded arithmetic expansions,  
 80639 command substitutions, and variable expansions, shall not be examined in determining the  
 80640 matching '}'.

80641 The simplest form for parameter expansion is:

```
80642 ${parameter}
```

- 80643 The value, if any, of *parameter* shall be substituted.
- 80644 The parameter name or symbol can be enclosed in braces, which are optional except for  
80645 positional parameters with more than one digit or when *parameter* is a name and is followed by a  
80646 character that could be interpreted as part of the name.
- 80647 For a parameter that is not enclosed in braces:
- 80648 • If the parameter is a name, the expansion shall use the longest valid name (see XBD  
80649 [Section 3.216](#)), whether or not the variable denoted by that name exists.
  - 80650 • Otherwise, the parameter is a single-character symbol, and behavior is unspecified if that  
80651 character is neither a digit nor one of the special parameters (see [Section 2.5.2](#)).
- 80652 In addition, a parameter expansion can be modified by using one of the following formats. In  
80653 each case that a value of *word* is needed (based on the state of *parameter*, as described below),  
80654 *word* shall be subjected to tilde expansion, parameter expansion, command substitution,  
80655 arithmetic expansion, and quote removal. If *word* is not needed, it shall not be expanded. The  
80656 '}' character that delimits the following parameter expansion modifications shall be  
80657 determined as described previously in this section and in [Section 2.2.3](#). If *parameter* is '\*' or  
80658 '@', the result of the expansion is unspecified.
- 80659  $\${parameter}:-[word]$  **Use Default Values.** If *parameter* is unset or null, the expansion of *word*  
80660 (or an empty string if *word* is omitted) shall be substituted; otherwise, the  
80661 value of *parameter* shall be substituted.
- 80662  $\${parameter}:= [word]$  **Assign Default Values.** If *parameter* is unset or null, quote removal shall  
80663 be performed on the expansion of *word* and the result (or an empty string  
80664 if *word* is omitted) shall be assigned to *parameter*. In all cases, the final  
80665 value of *parameter* shall be substituted. Only variables, not positional  
80666 parameters or special parameters, can be assigned in this way.
- 80667  $\${parameter}?:[word]$  **Indicate Error if Null or Unset.** If *parameter* is unset or null, the  
80668 expansion of *word* (or a message indicating it is unset if *word* is omitted)  
80669 shall be written to standard error and the shell exits with a non-zero exit  
80670 status. Otherwise, the value of *parameter* shall be substituted. An  
80671 interactive shell need not exit.
- 80672  $\${parameter}+ [word]$  **Use Alternative Value.** If *parameter* is unset or null, null shall be  
80673 substituted; otherwise, the expansion of *word* (or an empty string if *word*  
80674 is omitted) shall be substituted.
- 80675 In the parameter expansions shown previously, use of the <colon> in the format shall result in a  
80676 test for a parameter that is unset or null; omission of the <colon> shall result in a test for a  
80677 parameter that is only unset. If *parameter* is '#' and the colon is omitted, the application shall  
80678 ensure that *word* is specified (this is necessary to avoid ambiguity with the string length  
80679 expansion). The following table summarizes the effect of the <colon>:

	<i>parameter</i> <b>Set and Not Null</b>	<i>parameter</i> <b>Set But Null</b>	<i>parameter</i> <b>Unset</b>
80680	<code>\${parameter:-word}</code>	substitute <i>parameter</i>	substitute <i>word</i>
80681	<code>\${parameter-word}</code>	substitute <i>parameter</i>	substitute <i>word</i>
80682	<code>\${parameter:=word}</code>	substitute <i>parameter</i>	assign <i>word</i>
80683	<code>\${parameter=word}</code>	substitute <i>parameter</i>	assign <i>word</i>
80684	<code>\${parameter?word}</code>	substitute <i>parameter</i>	error, exit
80685	<code>\${parameter?word}</code>	substitute <i>parameter</i>	error, exit
80686	<code>\${parameter+word}</code>	substitute <i>word</i>	substitute null
80687	<code>\${parameter+word}</code>	substitute <i>word</i>	substitute null

In all cases shown with “substitute”, the expression is replaced with the value shown. In all cases shown with “assign”, *parameter* is assigned that value, which also replaces the expression.

`#{parameter}` **String Length.** The shortest decimal representation of the length in characters of the value of *parameter* shall be substituted. If *parameter* is '\*' or '@', the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail.

The following four varieties of parameter expansion provide for character substring processing. In each case, pattern matching notation (see Section 2.14), rather than regular expression notation, shall be used to evaluate the patterns. If *parameter* is '#', '\*', or '@', the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail. Enclosing the full parameter expansion string in double-quotes shall not cause the following four varieties of pattern characters to be quoted, whereas quoting characters within the braces shall have this effect. In each variety, if *word* is omitted, the empty pattern shall be used.

`{parameter%[word]}` **Remove Smallest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the suffix matched by the *pattern* deleted. If present, *word* shall not begin with an unquoted '%'.

`{parameter%%[word]}` **Remove Largest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the largest portion of the suffix matched by the *pattern* deleted.

`{parameter#[word]}` **Remove Smallest Prefix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the prefix matched by the *pattern* deleted. If present, *word* shall not begin with an unquoted '#'.

`{parameter##[word]}` **Remove Largest Prefix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the largest portion of the prefix matched by the *pattern* deleted.

## Examples

`{parameter}`

In this example, the effects of omitting braces are demonstrated.

a=1

set 2

echo \${a}b-\$ab-\${1}0-\${10}-\${10}

**1b--20--20**

```

80724     ${parameter-word}
80725         This example demonstrates the difference between unset and set to the empty string, as well
80726         as the rules for finding the delimiting close brace.

80727         foo=asdf
80728         echo ${foo-bar}xyz}
80729         asdfxyz}
80730         foo=
80731         echo ${foo-bar}xyz}
80732         xyz}
80733         unset foo
80734         echo ${foo-bar}xyz}
80735         barxyz}

80736     ${parameter:-word}
80737         In this example, ls is executed only if x is null or unset. (The  $(ls)$  command substitution
80738         notation is explained in Section 2.6.3.)
80739         ${x:-$(ls)}

80740     ${parameter:=word}
80741         unset X
80742         echo ${X:=abc}
80743         abc

80744     ${parameter:?word}
80745         unset posix
80746         echo ${posix:?}
80747         sh: posix: parameter null or not set

80748     ${parameter:+word}
80749         set a b c
80750         echo ${3:+posix}
80751         posix

80752     ${#parameter}
80753         HOME=/usr/posix
80754         echo ${#HOME}
80755         10

80756     ${parameter%word}
80757         x=file.c
80758         echo ${x%.c}.o
80759         file.o

80760     ${parameter%%word}
80761         x=posix/src/std
80762         echo ${x%%/*}
80763         posix

80764     ${parameter#word}
80765         x=$HOME/src/cmd
80766         echo ${x#$HOME}
80767         /src/cmd

```

```

80768     ${parameter##*word}
80769         x=/one/two/three
80770         echo ${x##*/}
80771         three

```

80772 The double-quoting of patterns is different depending on where the double-quotes are placed:

80773 "\$ {x#\*} " The <asterisk> is a pattern character.

80774 \${x#"\*" } The literal <asterisk> is quoted and not special.

### 80775 2.6.3 Command Substitution

80776 Command substitution allows the output of one or more commands to be substituted in place of  
80777 the commands themselves. Command substitution shall occur when command(s) are enclosed  
80778 as follows:

80779 \$ ( *commands* )

80780 or (backquoted version):

80781 ` *commands* `

80782 The shell shall expand the command substitution by executing *commands* in a subshell  
80783 environment (see [Section 2.13](#)) and replacing the command substitution (the text of the  
80784 *commands* string plus the enclosing "\$ () " or backquotes) with the standard output of the  
80785 command(s); if the output ends with one or more bytes that have the encoded value of a  
80786 <newline> character, they shall not be included in the replacement. Any such bytes that occur  
80787 elsewhere shall be included in the replacement; however, they might be treated as field  
80788 delimiters and eliminated during field splitting, depending on the value of *IFS* and quoting that  
80789 is in effect. If the output contains any null bytes, the behavior is unspecified.

80790 Within the backquoted style of command substitution, if the command substitution is not within  
80791 double-quotes, <backslash> shall retain its literal meaning, except when followed by: '\$', '`',  
80792 or <backslash>. See [Section 2.2.3](#) for the handling of <backslash> when the command  
80793 substitution is within double-quotes. The search for the matching backquote shall be satisfied  
80794 by the first unquoted non-escaped backquote; during this search, if a non-escaped backquote is  
80795 encountered within a shell comment, a here-document, an embedded command substitution of  
80796 the \$(*commands*) form, or a quoted string, undefined results occur. A quoted string that begins,  
80797 but does not end, within the "` . . . `" sequence produces undefined results.

80798 With the \$(*commands*) form, all characters following the open parenthesis to the matching closing  
80799 parenthesis constitute the *commands* string.

80800 With both the backquoted and \$(*commands*) forms, the *commands* string shall be tokenized (see  
80801 [Section 2.3](#)) and parsed (see [Section 2.10](#)). It is unspecified whether the *commands* string is  
80802 parsed and executed incrementally as a *program* (as for a shell script), or is parsed as a single  
80803 *compound\_list* that is executed after the string has been completely parsed. In addition, it is  
80804 unspecified whether the terminating ')' of the \$(*commands*) form can result from alias  
80805 substitution. With the \$(*commands*) form any syntactically correct *program* can be used for  
80806 *commands*, except that:

- 80807 • If the *commands* string consists solely of redirections, the results are unspecified.
- 80808 • If the *commands* string is parsed as a single *compound\_list*, before any commands are  
80809 executed, *alias* and *unalias* commands in *commands* have no effect during parsing (see  
80810 [Section 2.3.1](#)). Strictly conforming applications shall ensure that the *commands* string does

80811 not depend on alias changes taking effect incrementally as would be the case if parsed and  
80812 executed as a *program*.

- 80813 • The behavior is unspecified if the terminating ' ) ' is not present in the token containing  
80814 the command substitution; that is, if the ' ) ' is expected to result from alias substitution.

80815 The results of command substitution shall not be processed for further tilde expansion,  
80816 parameter expansion, command substitution, or arithmetic expansion.

80817 Command substitution can be nested. To specify nesting within the backquoted version, the  
80818 application shall precede the inner backquotes with <backslash> characters; for example:

80819 `\` commands \``

80820 The syntax of the shell command language has an ambiguity for expansions beginning with  
80821 "\$ ( ", which can introduce an arithmetic expansion or a command substitution that starts with  
80822 a subshell. Arithmetic expansion has precedence; that is, the shell shall first determine whether  
80823 it can parse the expansion as an arithmetic expansion and shall only parse the expansion as a  
80824 command substitution if it determines that it cannot parse the expansion as an arithmetic  
80825 expansion. The shell need not evaluate nested expansions when performing this determination.  
80826 If it encounters the end of input without already having determined that it cannot parse the  
80827 expansion as an arithmetic expansion, the shell shall treat the expansion as an incomplete  
80828 arithmetic expansion and report a syntax error. A conforming application shall ensure that it  
80829 separates the "\$ ( " and ' ( ' into two tokens (that is, separate them with white space) in a  
80830 command substitution that starts with a subshell. For example, a command substitution  
80831 containing a single subshell could be written as:

80832 `$ ( ( commands ) )`

#### 80833 2.6.4 Arithmetic Expansion

80834 Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and  
80835 substituting its value. The format for arithmetic expansion shall be as follows:

80836 `$ ( ( expression ) )`

80837 The expression shall be treated as if it were in double-quotes, except that a double-quote inside  
80838 the expression is not treated specially. The shell shall expand all tokens in the expression for  
80839 parameter expansion, command substitution, and quote removal.

80840 Next, the shell shall treat this as an arithmetic expression and substitute the value of the  
80841 expression. The arithmetic expression shall be processed according to the rules given in [Section](#)  
80842 [1.1.2.1](#), with the following exceptions:

- 80843 • Only signed long integer arithmetic is required.
- 80844 • Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in  
80845 the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- 80846 • The *sizeof*( ) operator and the prefix and postfix "++" and "--" operators are not required.
- 80847 • Selection, iteration, and jump statements are not supported.

80848 All changes to variables in an arithmetic expression shall be in effect after the arithmetic  
80849 expansion, as in the parameter expansion "\${x=value}" .

80850 If the shell variable *x* contains a value that forms a valid integer constant, optionally including a  
80851 leading <plus-sign> or <hyphen-minus>, then the arithmetic expansions "\$ ( ( x ) )" and  
80852 "\$ ( ( \$ x ) )" shall return the same value.

80853 As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell  
 80854 may use a signed integer type with a rank larger than the rank of **signed long**. The shell may  
 80855 use a real-floating type instead of **signed long** as long as it does not affect the results in cases  
 80856 where there is no overflow. If the expression is invalid, or the contents of a shell variable used in  
 80857 the expression are not recognized by the shell, the expansion fails and the shell shall write a  
 80858 diagnostic message to standard error indicating the failure.

### 80859 **Examples**

80860 A simple example using arithmetic expansion:

```
80861 # repeat a command 100 times
80862 x=100
80863 while [ $x -gt 0 ]
80864 do
80865     command
80866     x=$((x-1))
80867 done
```

### 80868 **2.6.5 Field Splitting**

80869 After parameter expansion (Section 2.6.2), command substitution (Section 2.6.3), and arithmetic  
 80870 expansion (Section 2.6.4), if the shell variable *IFS* (see Section 2.5.3) is set and its value is not  
 80871 empty, or if *IFS* is unset, the shell shall scan each field containing results of expansions and  
 80872 substitutions that did not occur in double-quotes for field splitting; zero, one or multiple fields  
 80873 can result.

80874 For the remainder of this section, any reference to the results of an expansion, or results of  
 80875 expansions, shall be interpreted to mean the results from one or more unquoted variable or  
 80876 arithmetic expansions, or unquoted command substitutions.

80877 If the *IFS* variable is set and has an empty string as its value, no field splitting shall occur.  
 80878 However, if an input field which contained the results of an expansion is entirely empty, it shall  
 80879 be removed. Note that this occurs before quote removal; any input field that contains any  
 80880 quoting characters can never be empty at this point. After the removal of any such fields from  
 80881 the input, the possibly modified input field list shall become the output.

80882 Each input field shall be considered in sequence, first to last, with the results of the algorithm  
 80883 described in this section causing output fields to be generated, which shall remain in the same  
 80884 order as the input fields from which they originated.

80885 Fields which contain no results from expansions shall not be affected by field splitting, and shall  
 80886 remain unaltered, simply moving from the list of input fields to be next in the list of output  
 80887 fields.

80888 In the remainder of this description, it is assumed that there is present in the field at least one  
 80889 expansion result; this assumption will not be restated. Field splitting only ever alters those parts  
 80890 of the field.

80891 For the purposes of this section, the term “*IFS* white space” is used to mean any of the white-  
 80892 space bytes (see XBD Section 3.413 (on page 92), Section 3.414 (on page 92), and Section 3.415, on  
 80893 page 92) <space>, <tab>, or <newline> from the portable character set (see XBD Section 6.1, on  
 80894 page 117) which are present in the value of the *IFS* variable, and perhaps other white-space  
 80895 characters. It is implementation-defined whether other white-space characters which appear in

80896 the value of *IFS* are also considered as “*IFS* white space”. The three characters above specified as  
80897 *IFS* white-space bytes are always *IFS* white space, when they occur in the value of *IFS*,  
80898 regardless of whether they are white-space characters in any relevant locale. For other locale-  
80899 specific white-space characters allowed by the implementation it is unspecified whether the  
80900 character is considered as *IFS* white space if it is white space at the time it is assigned to the *IFS*  
80901 variable, or if it is white space at the time field splitting occurs. (The locale might have changed  
80902 between those events.)

80903 If the *IFS* variable is unset, then for the purposes of this section, but without altering the value of  
80904 the variable, its value shall be considered to contain the three single-byte characters <space>,  
80905 <tab>, and <newline> from the portable character set, all of which are *IFS* white-space  
80906 characters.

80907 The shell shall use the byte sequences that form the characters in the value of the *IFS* variable as  
80908 delimiters. Each of the characters <space>, <tab>, and <newline> which appears in the value of  
80909 *IFS* shall be a single-byte delimiter. The shell shall use these delimiters as field terminators to  
80910 split the results of expansions, along with other adjacent bytes, into separate fields, as described  
80911 below. Note that these delimiters terminate a field; they do not, of themselves, cause a new field  
80912 to start—subsequent bytes that are not from the results of an expansion, or that do not form *IFS*  
80913 white-space characters are required for a new field to begin.

80914 Note that the shell processes arbitrary bytes from the input fields; there is no requirement that  
80915 those bytes form valid characters.

80916 If the results of the algorithm are that no fields are delimited; that is, if the input field is wholly  
80917 empty or consists entirely of *IFS* white space, the result shall be zero fields (rather than an empty  
80918 field).

80919 For the purposes of this section, when a field is said to be delimited, then the candidate field, as  
80920 generated below shall become an output field. When the algorithm transforms a candidate into  
80921 an output field it shall be appended to the current list of output fields.

80922 Each field containing the results from an expansion shall be processed in order, intermixed with  
80923 fields not containing the results of expansions, processed as described above, as if by using the  
80924 following algorithm, examining bytes in the input field, from beginning to end:

- 80925 • Begin with an empty candidate field and the input as specified above.
- 80926 • When instructed to start the next iteration of the loop, this is the start of the loop. While the  
80927 input (as modified by earlier iterations of this loop) is not empty:
  - 80928 — Consider the leading remaining byte or byte sequence of the input. No such byte  
80929 sequence shall contain data such that some bytes in the sequence resulted from an  
80930 expansion, and others did not, nor which contains bytes resulting from the results of  
80931 more than one expansion. If the byte or sequence of bytes is:
    - 80932 1. A byte (or sequence of bytes) in the input which did not result from an  
80933 expansion:

80934 Append this byte (or sequence) to the candidate, and remove it from the  
80935 input. Start the next iteration of the loop.
    - 80936 2. A byte sequence in the input which resulted from an expansion and which  
80937 does not form a character in *IFS*:

80938 Append the first byte of the sequence to the candidate, and remove that byte  
80939 from the input. Start the next iteration of the loop.

80940 3. A byte sequence in the input which resulted from an expansion and which  
80941 forms an *IFS* white space character:

80942 Remove that byte sequence from the input, consider the new leading input  
80943 byte sequence, and repeat this step.

80944 4. A byte sequence in the input which resulted from an expansion and which  
80945 forms an *IFS* character that is not *IFS* white space:

80946 Remove that byte sequence from the input, but note it was observed.

80947 At this point, if the candidate is not empty, or if a sequence of bytes representing an  
80948 *IFS* character that is not *IFS* white space was seen at step 4, then a field is said to have  
80949 been delimited, and the candidate shall become an output field.

80950 — Empty (clear) the candidate, and start the next iteration of the loop.

80951 • Once the input is empty, the candidate shall become an output field if and only if it is not  
80952 empty.

80953 The ordered list of output fields so produced, which might be empty, shall replace the list of  
80954 input fields.

## 80955 2.6.6 Pathname Expansion

80956 After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be  
80957 expanded using the algorithm described in [Section 2.14](#), qualified by the rules in [Section 2.14.3](#).

## 80958 2.6.7 Quote Removal

80959 The quote character sequence `<dollar-sign> single-quote` and the single-character quote  
80960 characters (`<backslash>`, `single-quote`, and `double-quote`) that were present in the original word  
80961 shall be removed unless they have themselves been quoted. Note that the single-quote character  
80962 that terminates a `<dollar-sign> single-quote` sequence is itself a single-character quote character.

80963 **Note:** After quote removal the shell still remembers which characters were quoted. This is necessary  
80964 for purposes such as matching patterns in a `case` conditional construct (see [Section 2.9.4.3](#) and  
80965 [Section 2.14](#)).

## 80966 2.7 Redirection

80967 Redirection is used to open and close files for the current shell execution environment (see  
80968 [Section 2.13](#)) or for any command. Redirection operators can be used with numbers representing  
80969 file descriptors (see [XBD Section 3.141](#)) as described below.

80970 The overall format used for redirection is:

80971 `[n] redir-op word`

80972 The number *n* is an optional one or more digit decimal number designating the file descriptor  
80973 number; the application shall ensure it is delimited from any preceding text and immediately  
80974 precedes the redirection operator *redir-op* (with no intervening `<blank>` characters allowed). If *n*  
80975 is quoted, the number shall not be recognized as part of the redirection expression. For example:

80976 `echo \2>a`

80977 writes the character 2 into file `a`. If any part of *redir-op* is quoted, no redirection expression is

80978 recognized. For example:

80979 `echo 2>a`

80980 writes the characters `2>a` to standard output. The optional number, redirection operator, and  
80981 *word* shall not appear in the arguments provided to the command to be executed (if any).

80982 The shell may support an additional format used for redirection:

80983 `{location}redir-op word`

80984 where *location* is non-empty and indicates a location where an integer value can be stored, such  
80985 as the name of a shell variable. If this format is supported its behavior is implementation-  
80986 defined.

80987 The largest file descriptor number supported in shell redirections is implementation-defined;  
80988 however, all implementations shall support at least 0 to 9, inclusive, for use by the application.

80989 If the redirection operator is "`<<`" or "`<<-`", the word that follows the redirection operator shall  
80990 be subjected to quote removal; it is unspecified whether any of the other expansions occur. For  
80991 the other redirection operators, the word that follows the redirection operator shall be subjected  
80992 to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and  
80993 quote removal. Pathname expansion shall not be performed on the word by a non-interactive  
80994 shell; an interactive shell may perform it, but if the expansion would result in more than one  
80995 word it is unspecified whether the redirection proceeds without pathname expansion being  
80996 performed or the redirection fails.

80997 **Note:** A future version of this standard may require that the redirection fails in this case.

80998 If more than one redirection operator is specified with a command, the order of evaluation is  
80999 from beginning to end.

81000 A failure to open or create a file shall cause a redirection to fail.

## 81001 2.7.1 Redirecting Input

81002 Input redirection shall cause the file whose name results from the expansion of *word* to be  
81003 opened for reading on the designated file descriptor, or standard input if the file descriptor is  
81004 not specified.

81005 The general format for redirecting input is:

81006 `[n]<word`

81007 where the optional *n* represents the file descriptor number. If the number is omitted, the  
81008 redirection shall refer to standard input (file descriptor 0).

## 81009 2.7.2 Redirecting Output

81010 The two general formats for redirecting output are:

81011 `[n]>word`

81012 `[n]>|word`

81013 where the optional *n* represents the file descriptor number. If the number is omitted, the  
81014 redirection shall refer to standard output (file descriptor 1).

81015 Output redirection using the '`>`' format shall fail if the *noclobber* option is set (see the  
81016 description of `set -C`) and the file named by the expansion of *word* exists and is either a regular  
81017 file or a symbolic link that resolves to a regular file; it may also fail if the file is a symbolic link

81018 that does not resolve to an existing file. The check for existence, file creation, and open  
 81019 operations shall be performed atomically as is done by the *open()* function as defined in System  
 81020 Interfaces volume of POSIX.1-2024 when the *O\_CREAT* and *O\_EXCL* flags are set, except that if  
 81021 the file exists and is a symbolic link, the open operation need not fail with [EEXIST] unless the  
 81022 symbolic link resolves to an existing regular file. Performing these operations atomically  
 81023 ensures that the creation of lock files and unique (often temporary) files is reliable, with  
 81024 important caveats detailed in Section C.2.7.2 (on page 3891). The check for the type of the file  
 81025 need not be performed atomically with the check for existence, file creation, and open  
 81026 operations. If not, there is a potential race condition that may result in a misleading shell  
 81027 diagnostic message when redirection fails. See XRAT Section C.2.7.2 (on page 3891) for more  
 81028 details.

81029 In all other cases (*noclobber* not set, redirection using '>' does not fail for the reasons stated  
 81030 above, or redirection using the ">|" format), output redirection shall cause the file whose name  
 81031 results from the expansion of *word* to be opened for output on the designated file descriptor, or  
 81032 standard output if none is specified. If the file does not exist, it shall be created as an empty file;  
 81033 otherwise, it shall be opened as if the *open()* function was called with the *O\_TRUNC* flag set.

### 81034 2.7.3 Appending Redirected Output

81035 Appended output redirection shall cause the file whose name results from the expansion of  
 81036 *word* to be opened for output on the designated file descriptor. The file shall be opened as if the  
 81037 *open()* function as defined in the System Interfaces volume of POSIX.1-2024 was called with the  
 81038 *O\_APPEND* flag set. If the file does not exist, it shall be created.

81039 The general format for appending redirected output is as follows:

```
81040 [n]>>word
```

81041 where the optional *n* represents the file descriptor number. If the number is omitted, the  
 81042 redirection refers to standard output (file descriptor 1).

### 81043 2.7.4 Here-Document

81044 The redirection operators "<<" and "<<-" both allow redirection of subsequent lines read by  
 81045 the shell to the input of a command. The redirected lines are known as a "here-document".

81046 The here-document shall be treated as a single word that begins after the next **NEWLINE** token  
 81047 and continues until there is a line containing only the delimiter and a <newline>, with no  
 81048 <blank> characters in between. Then the next here-document starts, if there is one. For the  
 81049 purposes of locating this terminating line, the end of a *command\_string* operand (see *sh*) shall be  
 81050 treated as a <newline> character, and the end of the *commands* string in  $\$(commands)$  and  
 81051  $\`commands\`$  may be treated as a <newline>. If the end of input is reached without finding the  
 81052 terminating line, the shell should, but need not, treat this as a redirection error. The format is as  
 81053 follows:

```
81054 [n]<<word  

  81055     here-document  

  81056 delimiter
```

81057 where the optional *n* represents the file descriptor number. If the number is omitted, the here-  
 81058 document refers to standard input (file descriptor 0). It is unspecified whether the file descriptor  
 81059 is opened as a regular file or some other type of file. Portable applications cannot rely on the file  
 81060 descriptor being seekable (see XSH *lseek()*).

81061 If any part of *word* is quoted, not counting double-quotes outside a command substitution if the  
 81062 here-document is inside one, the delimiter shall be formed by performing quote removal on  
 81063 *word*, and the here-document lines shall not be expanded. Otherwise:

- 81064 • The delimiter shall be the *word* itself.
- 81065 • The removal of <backslash><newline> for line continuation (see [Section 2.2.1](#)) shall be  
 81066 performed during the search for the trailing delimiter. (As a consequence, the trailing  
 81067 delimiter is not recognized immediately after a <newline> that was removed by line  
 81068 continuation.) It is unspecified whether the line containing the trailing delimiter is itself  
 81069 subject to this line continuation.
- 81070 • All lines of the here-document shall be expanded, when the redirection operator is  
 81071 evaluated but after the trailing delimiter for the here-document has been located, for  
 81072 parameter expansion, command substitution, and arithmetic expansion. If the redirection  
 81073 operator is never evaluated (because the command it is part of is not executed), the here-  
 81074 document shall be read without performing any expansions.
- 81075 • Any <backslash> characters in the input shall behave as the <backslash> inside double-  
 81076 quotes (see [Section 2.2.3](#)). However, the double-quote character ( ' " ' ) shall not be treated  
 81077 specially within a here-document, except when the double-quote appears within "\$ ( ) ",  
 81078 "` ` ", or "\${ } ".

81079 If the redirection operator is "<<-", all leading <tab> characters shall be stripped from input  
 81080 lines after <backslash><newline> line continuation (when it applies) has been performed, and  
 81081 from the line containing the trailing delimiter. Stripping of leading <tab> characters shall occur  
 81082 as the here-document is read from the shell input (and consequently does not affect any <tab>  
 81083 characters that result from expansions).

81084 If more than one "<<" or "<<-" operator is specified on a line, the here-document associated  
 81085 with the first operator shall be supplied first by the application and shall be read first by the  
 81086 shell.

81087 When a here-document is read from a terminal device and the shell is interactive, it shall write  
 81088 the contents of the variable *PS2*, processed as described in [Section 2.5.3](#), to standard error before  
 81089 reading each line of input until the delimiter has been recognized.

## 81090 Examples

81091 An example of a here-document follows:

```
81092 cat <<eof1; cat <<eof2
81093 Hi,
81094 eof1
81095 Helene.
81096 eof2
```

### 81097 **2.7.5 Duplicating an Input File Descriptor**

81098 The redirection operator:

81099 `[n] <&word`

81100 shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one  
81101 or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be  
81102 made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent an  
81103 already open file descriptor, a redirection error shall result (see [Section 2.8.1](#)); if the file  
81104 descriptor denoted by *word* represents an open file descriptor that is not open for input, a  
81105 redirection error may result. If *word* evaluates to '-', file descriptor *n*, or standard input if *n* is  
81106 not specified, shall be closed. Attempts to close a file descriptor that is not open shall not  
81107 constitute an error. If *word* evaluates to something else, the behavior is unspecified.

### 81108 **2.7.6 Duplicating an Output File Descriptor**

81109 The redirection operator:

81110 `[n] >&word`

81111 shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to  
81112 one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall  
81113 be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent  
81114 an already open file descriptor, a redirection error shall result (see [Section 2.8.1](#)); if the file  
81115 descriptor denoted by *word* represents an open file descriptor that is not open for output, a  
81116 redirection error may result. If *word* evaluates to '-', file descriptor *n*, or standard output if *n* is  
81117 not specified, is closed. Attempts to close a file descriptor that is not open shall not constitute an  
81118 error. If *word* evaluates to something else, the behavior is unspecified.

### 81119 **2.7.7 Open File Descriptors for Reading and Writing**

81120 The redirection operator:

81121 `[n] <>word`

81122 shall cause the file whose name is the expansion of *word* to be opened for both reading and  
81123 writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does  
81124 not exist, it shall be created.

## 81125 **2.8 Exit Status and Errors**

### 81126 **2.8.1 Consequences of Shell Errors**

81127 Certain errors shall cause the shell to write a diagnostic message to standard error and exit as  
81128 shown in the following table:

	<b>Error</b>	<b>Non-Interactive Shell</b>	<b>Interactive Shell</b>	<b>Shell Diagnostic Message Required</b>
81129	Shell language syntax error	shall exit	shall not exit	yes
81130				
81131	Special built-in utility error	shall exit <sup>1</sup>	shall not exit	no <sup>2</sup>
81132	Other utility (not a special built-in) error	shall not exit	shall not exit	no <sup>3</sup>
81133				
81134	Redirection error with special built-in utilities	shall exit	shall not exit	yes
81135				
81136	Redirection error with compound commands	shall not exit	shall not exit	yes
81137				
81138	Redirection error with function execution	shall not exit	shall not exit	yes
81139				
81140	Redirection error with other utilities (not special built-ins)	shall not exit	shall not exit	yes
81141				
81142	Variable assignment error	shall exit	shall not exit	yes
81143	Expansion error	shall exit	shall not exit	yes
81144	Command not found	may exit	shall not exit	yes
81145	Unrecoverable read error when reading commands	shall exit <sup>4</sup>	shall exit <sup>4</sup>	yes
81146				
81147				

81148 Notes:

- 81149 1. The shell shall exit only if the special built-in utility is executed directly. If it is executed  
81150 via the *command* utility, the shell shall not exit.
- 81151 2. Although special built-ins are part of the shell, a diagnostic message written by a special  
81152 built-in is not considered to be a shell diagnostic message, and can be redirected like any  
81153 other utility.
- 81154 3. The shell is not required to write a diagnostic message, but the utility itself shall write a  
81155 diagnostic message if required to do so.
- 81156 4. If an unrecoverable read error occurs when reading commands, other than from the *file*  
81157 operand of the *dot* special built-in, the shell shall execute no further commands (including  
81158 any already successfully read but not yet executed) other than any specified in a  
81159 previously defined EXIT *trap* action. An unrecoverable read error while reading from the  
81160 *file* operand of the *dot* special built-in shall be treated as a special built-in utility error.

81161 An expansion error is one that occurs when the shell expansions defined in [Section 2.6](#) are  
81162 carried out (for example, "\$ {x!y}", because '!' is not a valid operator); an implementation  
81163 may treat these as syntax errors if it is able to detect them during tokenization, rather than  
81164 during expansion.

81165 If any of the errors shown as "shall exit" or "may exit" occur in a subshell environment, the shell  
81166 shall (respectively, may) exit from the subshell environment with a non-zero status and continue  
81167 in the environment from which that subshell environment was invoked.

81168 In all of the cases shown in the table where an interactive shell is required not to exit and a non-  
81169 interactive shell is required to exit, an interactive shell shall not perform any further processing  
81170 of the command in which the error occurred.

## 81171 2.8.2 Exit Status for Commands

81172 Each command has an exit status that can influence the behavior of other shell commands. The  
81173 exit status of commands that are not utilities is documented in this section. The exit status of the  
81174 standard utilities is documented in their respective sections.

81175 The exit status of a command shall be determined as follows:

- 81176 • If the command is not found, the exit status shall be 127.
- 81177 • Otherwise, if the command name is found, but it is not an executable utility, the exit status  
81178 shall be 126.
- 81179 • Otherwise, if the command terminated due to the receipt of a signal, the shell shall assign  
81180 it an exit status greater than 128. The exit status shall identify, in an implementation-  
81181 defined manner, which signal terminated the command. Note that shell implementations  
81182 are permitted to assign an exit status greater than 255 if a command terminates due to a  
81183 signal.
- 81184 • Otherwise, the exit status shall be the value obtained by the equivalent of the  
81185 WEXITSTATUS macro applied to the status obtained by the *wait()* function (as defined in  
81186 the System Interfaces volume of POSIX.1-2024). Note that for C programs, this value is  
81187 equal to the result of performing a modulo 256 operation on the value passed to *\_Exit()*,  
81188 *\_exit()*, or *exit()* or returned from *main()*.

## 81189 2.9 Shell Commands

81190 This section describes the basic structure of shell commands. The following command  
81191 descriptions each describe a format of the command that is only used to aid the reader in  
81192 recognizing the command type, and does not formally represent the syntax. In particular, the  
81193 representations include spacing between tokens in some places where <blank>s would not be  
81194 necessary (when one of the tokens is an operator). Each description discusses the semantics of  
81195 the command; for a formal definition of the command language, consult [Section 2.10](#).

81196 A *command* is one of the following:

- 81197 • Simple command (see [Section 2.9.1](#))
- 81198 • Pipeline (see [Section 2.9.2](#))
- 81199 • List compound-list (see [Section 2.9.3](#))
- 81200 • Compound command (see [Section 2.9.4](#))
- 81201 • Function definition (see [Section 2.9.5](#))

81202 Unless otherwise stated, the exit status of a command shall be that of the last simple command  
81203 executed by the command. There shall be no limit on the size of any shell command other than  
81204 that imposed by the underlying system (memory constraints, {ARG\_MAX}, and so on).

81205 **2.9.1 Simple Commands**

81206 A “simple command” is a sequence of optional variable assignments and redirections, in any  
81207 sequence, optionally followed by words and redirections.

81208 *2.9.1.1 Order of Processing*

81209 When a given simple command is required to be executed (that is, when any conditional  
81210 construct such as an AND-OR list or a **case** statement has not bypassed the simple command),  
81211 the following expansions, assignments, and redirections shall all be performed from the  
81212 beginning of the command text to the end:

- 81213 1. The words that are recognized as variable assignments or redirections according to  
81214 [Section 2.10.2](#) are saved for processing in steps 3 and 4.
- 81215 2. The first word (if any) that is not a variable assignment or redirection shall be expanded.  
81216 If any fields remain following its expansion, the first field shall be considered the  
81217 command name. If no fields remain, the next word (if any) shall be expanded, and so on,  
81218 until a command name is found or no words remain. If there is a command name and it is  
81219 recognized as a declaration utility, then any remaining words after the word that  
81220 expanded to produce the command name, that would be recognized as a variable  
81221 assignment in isolation, shall be expanded as a variable assignment (tilde expansion after  
81222 the first <equals-sign> and after any unquoted <colon>, parameter expansion, command  
81223 substitution, arithmetic expansion, and quote removal, but no field splitting or pathname  
81224 expansion); while remaining words that would not be a variable assignment in isolation  
81225 shall be subject to regular expansion (tilde expansion for only a leading <tilde>,  
81226 parameter expansion, command substitution, arithmetic expansion, field splitting,  
81227 pathname expansion, and quote removal). For all other command names, words after the  
81228 word that produced the command name shall be subject only to regular expansion. All  
81229 fields resulting from the expansion of the word that produced the command name and  
81230 the subsequent words, except for the field containing the command name, shall be the  
81231 arguments for the command.
- 81232 3. Redirections shall be performed as described in [Section 2.7](#).
- 81233 4. Each variable assignment shall be expanded for tilde expansion, parameter expansion,  
81234 command substitution, arithmetic expansion, and quote removal prior to assigning the  
81235 value.

81236 In the preceding list, the order of steps 3 and 4 may be reversed if no command name results  
81237 from step 2 or if the command name matches the name of a special built-in utility; see [Section](#)  
81238 [2.15](#).

81239 When determining whether a command name is a declaration utility, an implementation may  
81240 use only lexical analysis. It is unspecified whether assignment context will be used if the  
81241 command name would only become recognized as a declaration utility after word expansions.

81242 *2.9.1.2 Variable Assignments*

81243 Variable assignments shall be performed as follows:

- 81244 • If no command name results, variable assignments shall affect the current execution  
81245 environment.
- 81246 • If the command name is not a special built-in utility or function, the variable assignments  
81247 shall be exported for the execution environment of the command and shall not affect the  
81248 current execution environment except as a side-effect of the expansions performed in step

- 81249 4. In this case it is unspecified:
- 81250 — Whether or not the assignments are visible for subsequent expansions in step 4
- 81251 — Whether variable assignments made as side-effects of these expansions are visible for
- 81252 subsequent expansions in step 4, or in the current shell execution environment, or
- 81253 both
- 81254 • If the command name is a standard utility implemented as a function (see XBD [Section](#)
  - 81255 [4.25](#)), the effect of variable assignments shall be as if the utility was not implemented as a
  - 81256 function.
  - 81257 • If the command name is a special built-in utility, variable assignments shall affect the
  - 81258 current execution environment before the utility is executed and remain in effect when the
  - 81259 command completes; if an assigned variable is further modified by the utility, the
  - 81260 modifications made by the utility shall persist. Unless the *set -a* option is on (see *set*), it is
  - 81261 unspecified:
    - 81262 — Whether or not the variables gain the *export* attribute during the execution of the
    - 81263 special built-in utility
    - 81264 — Whether or not *export* attributes gained as a result of the variable assignments persist
    - 81265 after the completion of the special built-in utility
    - 81266 • If the command name is a function that is not a standard utility implemented as a function,
    - 81267 variable assignments shall affect the current execution environment during the execution
    - 81268 of the function. It is unspecified:
      - 81269 — Whether or not the variable assignments persist after the completion of the function
      - 81270 — Whether or not the variables gain the *export* attribute during the execution of the
      - 81271 function
      - 81272 — Whether or not *export* attributes gained as a result of the variable assignments persist
      - 81273 after the completion of the function (if variable assignments persist after the
      - 81274 completion of the function)
- 81275 If any of the variable assignments attempt to assign a value to a variable for which the *readonly*
- 81276 attribute is set in the current shell environment (regardless of whether the assignment is made in
- 81277 that environment), a variable assignment error shall occur. See [Section 2.8.1](#) for the consequences
- 81278 of these errors.

#### 81279 2.9.1.3 *Commands with no Command Name*

81280 If a simple command has no command name after word expansion (see [Section 2.9.1.1](#)), any

81281 redirections shall be performed in a subshell environment; it is unspecified whether this subshell

81282 environment is the same one as that used for a command substitution within the command. (To

81283 affect the current execution environment, see the *exec* special built-in.) If any of the redirections

81284 performed in the current shell execution environment fail, the command shall immediately fail

81285 with an exit status greater than zero, and the shell shall write an error message indicating the

81286 failure. See [Section 2.8.1](#) for the consequences of these failures on interactive and non-interactive

81287 shells.

81288 Additionally, if there is no command name but the command contains a command substitution,

81289 the command shall complete with the exit status of the command substitution whose exit status

81290 was the last to be obtained. Otherwise, the command shall complete with a zero exit status.

## 81291 2.9.1.4 Command Search and Execution

81292 If a simple command has a command name and an optional list of arguments after word  
81293 expansion (see [Section 2.9.1.1](#)), the following actions shall be performed:

81294 1. If the command name does not contain any <slash> characters, the first successful step in  
81295 the following sequence shall occur:

81296 a. If the command name matches the name of a special built-in utility, that special  
81297 built-in utility shall be invoked.

81298 b. If the command name matches the name of a utility listed in the following table,  
81299 the results are unspecified.

81300	<i>alloc</i>	<i>compcall</i>	<i>compvalues</i>	<i>history</i>	<i>print</i>
81301	<i>autoload</i>	<i>compctl</i>	<i>declare</i>	<i>hist</i>	<i>pushd</i>
81302	<i>bind</i>	<i>compdescribe</i>	<i>dirs</i>	<i>integer</i>	<i>readarray</i>
81303	<i>bindkey</i>	<i>compfiles</i>	<i>disable</i>	<i>let</i>	<i>repeat</i>
81304	<i>builtin</i>	<i>compgen</i>	<i>disown</i>	<i>local</i>	<i>savehistory</i>
81305	<i>bye</i>	<i>compgroups</i>	<i>dosh</i>	<i>login</i>	<i>source</i>
81306	<i>caller</i>	<i>complete</i>	<i>echoct</i>	<i>logout</i>	<i>shopt</i>
81307	<i>cap</i>	<i>compound</i>	<i>echoit</i>	<i>map</i>	<i>stop</i>
81308	<i>chdir</i>	<i>compquote</i>	<i>enum</i>	<i>mapfile</i>	<i>suspend</i>
81309	<i>clone</i>	<i>comptags</i>	<i>float</i>	<i>nameref</i>	<i>typeset</i>
81310	<i>comparuments</i>	<i>comptry</i>	<i>help</i>	<i>popd</i>	<i>whence</i>

81311 c. If the command name matches the name of a function known to this shell, the  
81312 function shall be invoked as described in [Section 2.9.5](#). If the implementation has  
81313 provided a standard utility in the form of a function, and that function definition  
81314 still exists (i.e. has not been removed using *unset -f* or replaced via another  
81315 function definition with the same name), it shall not be recognized at this point. It  
81316 shall be invoked in conjunction with the path search in step 1e.

81317 d. If the command name matches the name of an intrinsic utility (see [Section 1.7](#), on  
81318 page 2470), that utility shall be invoked.

81319 e. Otherwise, the command shall be searched for using the *PATH* environment  
81320 variable as described in [XBD Chapter 8](#):

81321 i. If the search is successful:

81322 a. If the system has implemented the utility as a built-in or as a shell  
81323 function, and the built-in or function is associated with the directory  
81324 that was most recently tested during the successful *PATH* search, that  
81325 built-in or function shall be invoked.

81326 b. Otherwise, the shell shall execute a non-built-in utility as described  
81327 in [Section 2.9.1.6](#).

81328 Once a utility has been searched for and found (either as a result of this  
81329 specific search or as part of an unspecified shell start-up activity), an  
81330 implementation may remember its location and need not search for the  
81331 utility again unless the *PATH* variable has been the subject of an assignment.  
81332 If the remembered location fails for a subsequent invocation, the shell shall  
81333 repeat the search to find the new location for the utility, if any.

81334 ii. If the search is unsuccessful, the command shall fail with an exit status of  
81335 127 and the shell shall write an error message.

- 81336 2. If the command name contains at least one <slash>, the shell shall execute a non-built-in  
81337 utility as described in [Section 2.9.1.6](#).

81338 2.9.1.5 *Standard File Descriptors*

81339 If the utility would be executed with file descriptor 0, 1, or 2 closed, implementations may  
81340 execute the utility with the file descriptor open to an unspecified file. If a standard utility or a  
81341 conforming application is executed with file descriptor 0 not open for reading or with file  
81342 descriptor 1 or 2 not open for writing, the environment in which the utility or application is  
81343 executed shall be deemed non-conforming, and consequently the utility or application might not  
81344 behave as described in this standard.

81345 2.9.1.6 *Non-built-in Utility Execution*

81346 When the shell executes a non-built-in utility, if the execution is not being made via the *exec*  
81347 special built-in utility, the shell shall execute the utility in a separate utility environment (see  
81348 [Section 2.13](#)).

81349 If the execution is being made via the *exec* special built-in utility, the shell shall not create a  
81350 separate utility environment for this execution; the new process image shall replace the current  
81351 shell execution environment. If the current shell environment is a subshell environment, the new  
81352 process image shall replace the subshell environment and the shell shall continue in the  
81353 environment from which that subshell environment was invoked.

81354 In either case, execution of the utility in the specified environment shall be performed as follows:

- 81355 1. If the command name does not contain any <slash> characters, the command name shall  
81356 be searched for using the *PATH* environment variable as described in [XBD Chapter 8](#) (on  
81357 page 167):

- 81358 a. If the search is successful, the shell shall execute the utility with actions equivalent  
81359 to calling the *execl()* function as defined in the System Interfaces volume of  
81360 POSIX.1-2024 with the *path* argument set to the pathname resulting from the  
81361 search, *arg0* set to the command name, and the remaining *execl()* arguments set to  
81362 the command arguments (if any) and the null terminator.

81363 If the *execl()* function fails due to an error equivalent to the [ENOEXEC] error  
81364 defined in the System Interfaces volume of POSIX.1-2024, the shell shall execute a  
81365 command equivalent to having a shell invoked with the pathname resulting from  
81366 the search as its first operand, with any remaining arguments passed to the new  
81367 shell, except that the value of "\$0" in the new shell may be set to the command  
81368 name. The shell may apply a heuristic check to determine if the file to be executed  
81369 could be a script and may bypass this command execution if it determines that the  
81370 file cannot be a script. In this case, it shall write an error message, and the  
81371 command shall fail with an exit status of 126.

81372 **Note:** A common heuristic for rejecting files that cannot be a script is locating a NUL  
81373 byte prior to a <newline> byte within a fixed-length prefix of the file. Since *sh* is  
81374 required to accept input files with unlimited line lengths, the heuristic check  
81375 cannot be based on line length.

81376 It is unspecified whether environment variables that were passed to the shell when  
81377 it was invoked, but were not used to initialize shell variables (see [Section 2.5.3](#))  
81378 because they had invalid names, are included in the environment passed to *execl()*  
81379 and (if *execl()* fails as described above) to the new shell.

81380 b. If the search is unsuccessful, the command shall fail with an exit status of 127 and  
81381 the shell shall write an error message.

81382 2. If the command name contains at least one <slash>:

81383 a. If the named utility exists, the shell shall execute the utility with actions equivalent  
81384 to calling the *execl()* function defined in the System Interfaces volume of  
81385 POSIX.1-2024 with the *path* and *arg0* arguments set to the command name, and the  
81386 remaining *execl()* arguments set to the command arguments (if any) and the null  
81387 terminator.

81388 If the *execl()* function fails due to an error equivalent to the [ENOEXEC] error, the  
81389 shell shall execute a command equivalent to having a shell invoked with the  
81390 command name as its first operand, with any remaining arguments passed to the  
81391 new shell. The shell may apply a heuristic check to determine if the file to be  
81392 executed could be a script and may bypass this command execution if it  
81393 determines that the file cannot be a script. In this case, it shall write an error  
81394 message, and the command shall fail with an exit status of 126.

81395 **Note:** A common heuristic for rejecting files that cannot be a script is locating a NUL  
81396 byte prior to a <newline> byte within a fixed-length prefix of the file. Since *sh* is  
81397 required to accept input files with unlimited line lengths, the heuristic check  
81398 cannot be based on line length.

81399 It is unspecified whether environment variables that were passed to the shell when  
81400 it was invoked, but were not used to initialize shell variables (see [Section 2.5.3](#))  
81401 because they had invalid names, are included in the environment passed to *execl()*  
81402 and (if *execl()* fails as described above) to the new shell.

81403 b. If the named utility does not exist, the command shall fail with an exit status of 127  
81404 and the shell shall write an error message.

## 81405 2.9.2 Pipelines

81406 A *pipeline* is a sequence of one or more commands separated by the control operator '|'. For  
81407 each command but the last, the shell shall connect the standard output of the command to the  
81408 standard input of the next command as if by creating a pipe and passing the write end of the  
81409 pipe as the standard output of the command and the read end of the pipe as the standard input  
81410 of the next command.

81411 The format for a pipeline is:

```
81412 [!] command1 [ | command2 ... ]
```

81413 If the pipeline begins with the reserved word ! and *command1* is a subshell command, the  
81414 application shall ensure that the ( operator at the beginning of *command1* is separated from the !  
81415 by one or more <blank> characters. The behavior of the reserved word ! immediately followed  
81416 by the ( operator is unspecified.

81417 The standard output of *command1* shall be connected to the standard input of *command2*. The  
81418 standard input, standard output, or both of a command shall be considered to be assigned by  
81419 the pipeline before any redirection specified by redirection operators that are part of the  
81420 command (see [Section 2.7](#)).

81421 If the pipeline is not in the background (see [Section 2.9.3.1](#) and [Section 2.11](#)), the shell shall wait  
81422 for the last command specified in the pipeline to complete, and may also wait for all commands  
81423 to complete.

81424 **Exit Status**

81425 The exit status of a pipeline shall depend on whether or not the *pipefail* option (see *set*) is enabled  
 81426 and whether or not the pipeline begins with the `!` reserved word, as described in the following  
 81427 table. The *pipefail* option determines which command in the pipeline the exit status is derived  
 81428 from; the `!` reserved word causes the exit status to be the logical NOT of the exit status of that  
 81429 command. The shell shall use the *pipefail* setting at the time it begins execution of the pipeline,  
 81430 not the setting at the time it sets the exit status of the pipeline. (For example, in `command1 |`  
 81431 `set -o pipefail` the exit status of `command1` has no effect on the exit status of the pipeline,  
 81432 even if the shell executes `set -o pipefail` in the current shell environment.)

<i>pipefail</i> Enabled	Begins with <code>!</code>	Exit Status
no	no	The exit status of the last (rightmost) command specified in the pipeline.
no	yes	Zero, if the last (rightmost) command in the pipeline returned a non-zero exit status; otherwise, 1.
yes	no	Zero, if all commands in the pipeline returned an exit status of 0; otherwise, the exit status of the last (rightmost) command specified in the pipeline that returned a non-zero exit status.
yes	yes	Zero, if any command in the pipeline returned a non-zero exit status; otherwise, 1.

81444 **2.9.3 Lists**

81445 An *AND-OR list* is a sequence of one or more pipelines separated by the operators `&&` and  
 81446 `||`.

81447 A *list* is a sequence of one or more AND-OR lists separated by the operators `;` and `&'`.

81448 The operators `&&` and `||` shall have equal precedence and shall be evaluated with left  
 81449 associativity. For example, both of the following commands write solely **bar** to standard output:

```
81450 false && echo foo || echo bar
81451 true || echo foo && echo bar
```

81452 A `;` separator or a `&'` or `<newline>` terminator shall cause the preceding AND-OR list to be  
 81453 executed sequentially; an `&'` separator or terminator shall cause asynchronous execution of the  
 81454 preceding AND-OR list.

81455 The term “compound-list” is derived from the grammar in [Section 2.10](#); it is equivalent to a  
 81456 sequence of *lists*, separated by `<newline>` characters, that can be preceded or followed by an  
 81457 arbitrary number of `<newline>` characters.

81458 **Examples**

81459 The following is an example that illustrates `<newline>` characters in compound-lists:

```
81460 while
81461     # a couple of <newline>s
81462     # a list
81463     date && who || ls; cat file
81464     # a couple of <newline>s
81465     # another list
```

```

81466         wc file > output & true
81467     do
81468         # 2 lists
81469         ls
81470         cat file
81471     done

```

### 81472 2.9.3.1 Asynchronous AND-OR Lists

81473 If an AND-OR list is terminated by the control operator `&` ('&'), the shell shall  
81474 execute the AND-OR list asynchronously in a subshell environment. This subshell shall execute  
81475 in the background; that is, the shell shall not wait for the subshell to terminate before executing  
81476 the next command (if any); if there are no further commands to execute, the shell shall not wait  
81477 for the subshell to terminate before exiting.

81478 If job control is enabled (see *set*, `-m`), the AND-OR list shall become a job-control background  
81479 job and a job number shall be assigned to it. If job control is disabled, the AND-OR list may  
81480 become a non-job-control background job, in which case a job number shall be assigned to it; if  
81481 no job number is assigned it shall become a background command but not a background job.

81482 A job-control background job can be controlled as described in [Section 2.11](#).

81483 The process ID associated with the asynchronous AND-OR list shall become known in the  
81484 current shell execution environment; see [Section 2.13](#). This process ID shall remain known until  
81485 any one of the following occurs (and, unless otherwise specified, may continue to remain known  
81486 after it occurs).

- 81487 • The process terminates and the application waits for the process ID or the corresponding  
81488 job ID (see *wait*).
- 81489 • If the asynchronous AND-OR list did not become a background job: another asynchronous  
81490 AND-OR list is invoked before "\$!" (corresponding to the previous asynchronous AND-  
81491 OR list) is expanded in the current shell execution environment.
- 81492 • If the asynchronous AND-OR list became a background job: the *jobs* utility reports the  
81493 termination status of that job.
- 81494 • If the shell is interactive and the asynchronous AND-OR list became a background job: a  
81495 message indicating completion of the corresponding job is written to standard error. If *set*  
81496 `-b` is enabled, it is unspecified whether the process ID is removed from the list of known  
81497 process IDs when the message is written or immediately prior to when the shell writes the  
81498 next prompt for input.

81499 The implementation need not retain more than the {CHILD\_MAX} most recent entries in its list  
81500 of known process IDs in the current shell execution environment.

81501 If, and only if, job control is disabled, the standard input for the subshell in which an  
81502 asynchronous AND-OR list is executed shall initially be assigned to an open file description that  
81503 behaves as if `/dev/null` had been opened for reading only. This initial assignment shall be  
81504 overridden by any explicit redirection of standard input within the AND-OR list.

81505 If the shell is interactive and the asynchronous AND-OR list became a background job, the job  
81506 number and the process ID associated with the job shall be written to standard error using the  
81507 format:

```
81508 "[%d] %d\n", <job-number>, <process-id>
```

81509 If the shell is interactive and the asynchronous AND-OR list did not become a background job,  
81510 the process ID associated with the asynchronous AND-OR list shall be written to standard error  
81511 in an unspecified format.

81512 **Exit Status**

81513 The exit status of an asynchronous AND-OR list shall be zero.

81514 The exit status of the subshell in which the AND-OR list is asynchronously executed can be  
81515 obtained using the *wait* utility.

81516 2.9.3.2 *Sequential AND-OR Lists*

81517 AND-OR lists that are separated by a <semicolon> ( ';' ) shall be executed sequentially. The  
81518 format for executing AND-OR lists sequentially shall be:

81519 *aolist1* [ ; *aolist2* ] . . .

81520 Each AND-OR list shall be expanded and executed in the order specified.

81521 If job control is enabled, the AND-OR lists shall form all or part of a foreground job that can be  
81522 controlled as described in [Section 2.11](#).

81523 **Exit Status**

81524 The exit status of a sequential AND-OR list shall be the exit status of the last pipeline in the  
81525 AND-OR list that is executed.

81526 2.9.3.3 *AND Lists*

81527 The control operator "&&" denotes an AND list. The format shall be:

81528 *command1* [ && *command2* ] . . .

81529 First *command1* shall be executed. If its exit status is zero, *command2* shall be executed, and so on,  
81530 until a command has a non-zero exit status or there are no more commands left to execute. The  
81531 commands are expanded only if they are executed.

81532 **Exit Status**

81533 The exit status of an AND list shall be the exit status of the last command that is executed in the  
81534 list.

81535 2.9.3.4 *OR Lists*

81536 The control operator " | | " denotes an OR List. The format shall be:

81537 *command1* [ | | *command2* ] . . .

81538 First, *command1* shall be executed. If its exit status is non-zero, *command2* shall be executed, and  
81539 so on, until a command has a zero exit status or there are no more commands left to execute.

81540 **Exit Status**

81541 The exit status of an OR list shall be the exit status of the last command that is executed in the  
81542 list.

81543 **2.9.4 Compound Commands**

81544 The shell has several programming constructs that are “compound commands”, which provide  
81545 control flow for commands. Each of these compound commands has a reserved word or control  
81546 operator at the beginning, and a corresponding terminator reserved word or operator at the end.  
81547 In addition, each can be followed by redirections on the same line as the terminator. Each  
81548 redirection shall apply to all the commands within the compound command that do not  
81549 explicitly override that redirection.

81550 In the descriptions below, the exit status of some compound commands is stated in terms of the  
81551 exit status of a *compound-list*. The exit status of a *compound-list* shall be the value that the special  
81552 parameter ' ? ' (see [Section 2.5.2](#)) would have immediately after execution of the *compound-list*.

81553 **2.9.4.1 Grouping Commands**

81554 The format for grouping commands is as follows:

81555 ( *compound-list* ) Execute *compound-list* in a subshell environment; see [Section 2.13](#).  
81556 Variable assignments and built-in commands that affect the environment  
81557 shall not remain in effect after the list finishes.

81558 If a character sequence beginning with " ( " would be parsed by the shell  
81559 as an arithmetic expansion if preceded by a '\$', shells which implement  
81560 an extension whereby " ( *expression* ) " is evaluated as an arithmetic  
81561 expression may treat the " ( " as introducing as an arithmetic evaluation  
81562 instead of a grouping command. A conforming application shall ensure  
81563 that it separates the two leading ' ( ' characters with white space to  
81564 prevent the shell from performing an arithmetic evaluation.

81565 { *compound-list* ; } Execute *compound-list* in the current process environment. The semicolon  
81566 shown here is an example of a control operator delimiting the } reserved  
81567 word. Other delimiters are possible, as shown in [Section 2.10](#); a  
81568 <newline> is frequently used.

81569 **Exit Status**

81570 The exit status of a grouping command shall be the exit status of *compound-list*.

81571 **2.9.4.2 The for Loop**

81572 The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for**  
81573 loop requires that the reserved words **do** and **done** be used to delimit the sequence of  
81574 commands.

81575 The format for the **for** loop is as follows:

```
81576 for name [ in [word ... ] ]
81577 do
81578     compound-list
81579 done
```

81580 First, the list of words following **in** shall be expanded to generate a list of items. Then, the  
 81581 variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no  
 81582 items result from the expansion, the *compound-list* shall not be executed. Omitting:

81583 `in word...`

81584 shall be equivalent to:

81585 `in "$@"`

## 81586 **Exit Status**

81587 If there is at least one item in the list of items, the exit status of a **for** command shall be the exit  
 81588 status of the last *compound-list* executed. If there are no items, the exit status shall be zero.

### 81589 2.9.4.3 *Case Conditional Construct*

81590 The conditional construct **case** shall execute the *compound-list* corresponding to the first *pattern*  
 81591 (see [Section 2.14](#)), if any are present, that is matched by the string resulting from the tilde  
 81592 expansion, parameter expansion, command substitution, arithmetic expansion, and quote  
 81593 removal of the given word. The reserved word **in** shall denote the beginning of the patterns to  
 81594 be matched. Multiple patterns with the same *compound-list* shall be delimited by the '|'   
 81595 symbol. The control operator ')' terminates a list of patterns corresponding to a given action.  
 81596 The terminated pattern list and the following *compound-list* is called a **case** statement *clause*.  
 81597 Each **case** statement clause, with the possible exception of the last, shall be terminated with  
 81598 either ";" or "&". The **case** construct terminates with the reserved word **esac** (**case** reversed).

81599 The format for the **case** construct is as follows:

```
81600 case word in
81601     [(pattern | pattern) ... ] compound-list terminator ...
81602     [(pattern | pattern) ... ] compound-list
81603 esac
```

81604 Where *terminator* is either ";" or "&" and is optional for the last *compound-list*.

81605 In order from the beginning to the end of the **case** statement, each *pattern* that labels a *compound-*  
 81606 *list* shall be subjected to tilde expansion, parameter expansion, command substitution, and  
 81607 arithmetic expansion, and the result of these expansions shall be compared against the  
 81608 expansion of *word*, according to the rules described in [Section 2.14](#) (which also describes the  
 81609 effect of quoting parts of the pattern). After the first match, no more patterns in the **case**  
 81610 statement shall be expanded, and the *compound-list* of the matching clause shall be executed. If  
 81611 the **case** statement clause is terminated by ";;", no further clauses shall be examined. If the  
 81612 **case** statement clause is terminated by "&", then the *compound-list* (if any) of each subsequent  
 81613 clause shall be executed, in order, until either a clause terminated by ";;" is reached and its  
 81614 *compound-list* (if any) executed or there are no further clauses in the **case** statement. The order of  
 81615 expansion and comparison of multiple *patterns* that label a *compound-list* statement is  
 81616 unspecified.

81617 **Exit Status**

81618 The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be  
81619 the exit status of the *compound-list* of the last clause to be executed.

81620 2.9.4.4 *The if Conditional Construct*

81621 The **if** command shall execute a *compound-list* and use its exit status to determine whether to  
81622 execute another *compound-list*.

81623 The format for the **if** construct is as follows:

```
81624 if compound-list
81625 then
81626     compound-list
81627 [elif compound-list
81628 then
81629     compound-list] ...
81630 [else
81631     compound-list]
81632 fi
```

81633 The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be  
81634 executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed,  
81635 in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command  
81636 shall complete. Otherwise, the **else** *compound-list* shall be executed.

81637 **Exit Status**

81638 The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that  
81639 was executed, or zero, if none was executed.

81640 **Note:** Although the exit status of the **if** or **elif** *compound-list* is ignored when determining the exit  
81641 status of the **if** command, it is available through the special parameter '?' (see [Section 2.5.2](#))  
81642 during execution of the next **then**, **elif**, or **else** *compound-list* (if any is executed) in the normal  
81643 way.

81644 2.9.4.5 *The while Loop*

81645 The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has  
81646 a zero exit status.

81647 The format of the **while** loop is as follows:

```
81648 while compound-list-1
81649 do
81650     compound-list-2
81651 done
```

81652 The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command  
81653 shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

81654 **Exit Status**

81655 The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or  
81656 zero if none was executed.

81657 **Note:** Since the exit status of *compound-list-1* is ignored when determining the exit status of the **while**  
81658 command, it is not possible to obtain the status of the command that caused the loop to exit,  
81659 other than via the special parameter '?' (see [Section 2.5.2](#)) during execution of *compound-list-1*,  
81660 for example:

```
81661 while some_command; st=$?; false; do ...
```

81662 The exit status of *compound-list-1* is available through the special parameter '?' during  
81663 execution of *compound-list-2*, but is known to be zero at that point anyway.

81664 2.9.4.6 *The until Loop*

81665 The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has  
81666 a non-zero exit status.

81667 The format of the **until** loop is as follows:

```
81668 until compound-list-1
81669 do
81670     compound-list-2
81671 done
```

81672 The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command  
81673 completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

81674 **Exit Status**

81675 The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or  
81676 zero if none was executed.

81677 **Note:** Although the exit status of *compound-list-1* is ignored when determining the exit status of the  
81678 **until** command, it is available through the special parameter '?' (see [Section 2.5.2](#)) during  
81679 execution of *compound-list-2* in the normal way.

81680 **2.9.5 Function Definition Command**

81681 A function is a user-defined name that is used as a simple command to call a compound  
81682 command with new positional parameters. A function is defined with a "function definition  
81683 command".

81684 The format of a function definition command is as follows:

```
81685 fname ( ) compound-command [io-redirect ...]
```

81686 The function is named *fname*; the application shall ensure that it is a name (see [XBD Section 3.216](#))  
81687 and that it is not the name of a special built-in utility. An implementation may allow other  
81688 characters in a function name as an extension. The implementation shall maintain separate name  
81689 spaces for functions and variables.

81690 The argument *compound-command* represents a compound command, as described in [Section 2.9.4](#).  
81691

81692 When the function is declared, none of the expansions in [Section 2.6](#) shall be performed on the  
81693 text in *compound-command* or *io-redirect*; all expansions shall be performed as normal each time

81694 the function is called. Similarly, the optional *io-redirect* redirections and any variable assignments  
 81695 within *compound-command* shall be performed during the execution of the function itself, not the  
 81696 function definition. See [Section 2.8.1](#) for the consequences of failures of these operations on  
 81697 interactive and non-interactive shells.

81698 When a function is executed, it shall have the syntax-error properties described for special built-  
 81699 in utilities in the first item in the enumerated list at the beginning of [Section 2.15](#).

81700 The *compound-command* shall be executed whenever the function name is specified as the name  
 81701 of a simple command (see [Section 2.9.1.4](#)). The operands to the command temporarily shall  
 81702 become the positional parameters during the execution of the *compound-command*; the special  
 81703 parameter '#' also shall be changed to reflect the number of operands. The special parameter 0  
 81704 shall be unchanged. When the function completes, the values of the positional parameters and  
 81705 the special parameter '#' shall be restored to the values they had before the function was  
 81706 executed. If the special built-in *return* (see *return*) is executed in the *compound-command*, the  
 81707 function completes and execution shall resume with the next command after the function call.

## 81708 **Exit Status**

81709 The exit status of a function definition shall be zero if the function was declared successfully;  
 81710 otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit  
 81711 status of the last command executed by the function.

## 81712 **2.10 Shell Grammar**

81713 The following grammar defines the Shell Command Language. This formal syntax shall take  
 81714 precedence over the preceding text syntax description.

### 81715 **2.10.1 Shell Grammar Lexical Conventions**

81716 The input language to the shell shall be first recognized at the character level. The resulting  
 81717 tokens shall be classified by their immediate context according to the following rules (applied in  
 81718 order). These rules shall be used to determine what a "token" is that is subject to parsing at the  
 81719 token level. The rules for token recognition in [Section 2.3](#) shall apply.

- 81720 1. If the token is an operator, the token identifier for that operator shall result.
- 81721 2. If the string consists solely of digits and the delimiter character is one of '<' or '>', the  
 81722 token identifier **IO\_NUMBER** shall result.
- 81723 3. If the string contains at least three characters, begins with a <left-curly-bracket> ('{')  
 81724 and ends with a <right-curly-bracket> ('}'), and the delimiter character is one of '<' or  
 81725 '>', the token identifier **IO\_LOCATION** may result; if the result is not **IO\_LOCATION**,  
 81726 the token identifier **TOKEN** shall result.
- 81727 4. Otherwise, the token identifier **TOKEN** shall result.

81728 Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields  
 81729 **WORD**, a **NAME**, an **ASSIGNMENT\_WORD**, or one of the reserved words below, dependent  
 81730 upon the context. Some of the productions in the grammar below are annotated with a rule  
 81731 number from the following list. When a **TOKEN** is seen where one of those annotated  
 81732 productions could be used to reduce the symbol, the applicable rule shall be applied to convert  
 81733 the token identifier type of the **TOKEN** to:

- 81734 • The token identifier of the recognized reserved word, for rule 1
  - 81735 • A token identifier acceptable at that point in the grammar, for all other rules
- 81736 The reduction shall then proceed based upon the token identifier type yielded by the rule  
 81737 applied. When more than one rule applies, the highest numbered rule shall apply (which in turn  
 81738 may refer to another rule). (Note that except in rule 7, the presence of an '=' in the token has no  
 81739 effect.)
- 81740 The **WORD** tokens shall have the word expansion rules applied to them immediately before the  
 81741 associated command is executed, not at the time the command is parsed.

## 81742 2.10.2 Shell Grammar Rules

- 81743 1. [Command Name]
- 81744 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word  
 81745 shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any  
 81746 state where only a reserved word could be the next correct token, proceed as above.
- 81747 **Note:** Because at this point quoting characters (<backslash>, single-quote, <quotation-mark>,  
 81748 and the <dollar-sign> single-quote sequence) are retained in the token, quoted strings  
 81749 cannot be recognized as reserved words. This rule also implies that reserved words are  
 81750 not recognized except in certain positions in the input, such as after a <newline> or  
 81751 <semicolon>; the grammar presumes that if the reserved word is intended, it is properly  
 81752 delimited by the user, and does not attempt to reflect that requirement directly. Also  
 81753 note that line joining is done before tokenization, as described in [Section 2.2.1](#), so  
 81754 escaped <newline> characters are already removed at this point.
- 81755 Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or  
 81756 applies globally.
- 81757 2. [Redirection to or from filename]
- 81758 The expansions specified in [Section 2.7](#) shall occur. As specified there, exactly one field  
 81759 can result (or the result is unspecified), and there are additional requirements on  
 81760 pathname expansion.
- 81761 3. [Redirection from here-document]
- 81762 Quote removal shall be applied to the word to determine the delimiter that is used to find  
 81763 the end of the here-document that begins after the next <newline>.
- 81764 4. [Case statement termination]
- 81765 When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall  
 81766 result. Otherwise, the token **WORD** shall be returned.
- 81767 5. [NAME in for]
- 81768 When the **TOKEN** meets the requirements for a name (see XBD [Section 3.216](#)), the token  
 81769 identifier **NAME** shall result. Otherwise, the token **WORD** shall be returned.
- 81770 6. [Third word of **for** and **case**]
- 81771 a. [**case** only]
- 81772 When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall  
 81773 result. Otherwise, the token **WORD** shall be returned.

- 81774                   b. [for only]
- 81775                    When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in**  
81776                    or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.
- 81777                   (For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If  
81778                    <newline> characters are present at the indicated location, it is the token after them that is  
81779                    treated in this fashion.)
- 81780                   7. [Assignment preceding command name]
- 81781                    a. [When the first word]
- 81782                    If the **TOKEN** is exactly a reserved word, the token identifier for that reserved  
81783                    word shall result. Otherwise, 7b shall be applied.
- 81784                    b. [Not the first word]
- 81785                    If the **TOKEN** contains an unquoted (as determined while applying rule 4 from  
81786                    Section 2.3) <equals-sign> character that is not part of an embedded parameter  
81787                    expansion, command substitution, or arithmetic expansion construct (as  
81788                    determined while applying rule 5 from Section 2.3):
- 81789                      — If the **TOKEN** begins with '=', then the token **WORD** shall be returned.
- 81790                      — If all the characters in the **TOKEN** preceding the first such <equals-sign>  
81791                      form a valid name (see XBD Section 3.216, on page 63), the token  
81792                      **ASSIGNMENT\_WORD** shall be returned.
- 81793                      — Otherwise, it is implementation-defined whether the token **WORD** or  
81794                      **ASSIGNMENT\_WORD** is returned, or the **TOKEN** is processed in some  
81795                      other way.
- 81796                    Otherwise, the token **WORD** shall be returned.
- 81797                    If a returned **ASSIGNMENT\_WORD** token begins with a valid name, assignment of the  
81798                    value after the first <equals-sign> to the name shall occur as specified in Section 2.9.1. If a  
81799                    returned **ASSIGNMENT\_WORD** token does not begin with a valid name, the way in  
81800                    which the token is processed is unspecified.
- 81801                   8. [**NAME** in function]
- 81802                    When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word  
81803                    shall result. Otherwise, when the **TOKEN** meets the requirements for a name, the token  
81804                    identifier **NAME** shall result. Otherwise, rule 7 applies.
- 81805                   9. [Body of function]
- 81806                    Word expansion and assignment shall never occur, even when required by the rules  
81807                    above, when this rule is being parsed. Each **TOKEN** that might either be expanded or  
81808                    have assignment applied to it shall instead be returned as a single **WORD** consisting only  
81809                    of characters that are exactly the token described in Section 2.3.

## 82002 2.11 Job Control

82003 Job control is defined (see XBD [Section 3.181](#), on page 57) as a facility that allows users  
82004 selectively to stop (suspend) the execution of processes and continue (resume) their execution at  
82005 a later point. It is jointly supplied by the terminal I/O driver and a command interpreter. The  
82006 shell is one such command interpreter and job control in the shell is enabled by *set -m* (which is  
82007 enabled by default in interactive shells). The remainder of this section describes the job control  
82008 facility provided by the shell. Requirements relating to background jobs stated in this section  
82009 only apply to job-control background jobs.

82010 If the shell has a controlling terminal and it is the controlling process for the terminal session, it  
82011 shall initially set the foreground process group ID associated with the terminal to its own

82012 process group ID. Otherwise, if it has a controlling terminal, it shall initially perform the  
82013 following steps if interactive and may perform them if non-interactive:

- 82014 1. If its process group is the foreground process group associated with the terminal, the shell  
82015 shall set its process group ID to its process ID (if they are not already equal) and set the  
82016 foreground process group ID associated with the terminal to its process group ID.
- 82017 2. If its process group is not the foreground process group associated with the terminal  
82018 (which would result from it being started by a job-control shell as a background job), the  
82019 shell shall either stop itself by sending itself a SIGTTIN signal or, if interactive, attempt to  
82020 read from standard input (which generates a SIGTTIN signal if standard input is the  
82021 controlling terminal). If it is stopped, then when it continues execution (after receiving a  
82022 SIGCONT signal) it shall repeat these steps.

82023 Subsequently, the shell shall change the foreground process group associated with its controlling  
82024 terminal when a foreground job is running as noted in the description below.

82025 When job control is enabled, the shell shall create one or more jobs when it executes a list (see  
82026 [Section 2.9.3](#)) that has one of the following forms:

- 82027 • A single asynchronous AND-OR list
- 82028 • One or more sequentially executed AND-OR lists followed by at most one asynchronous  
82029 AND-OR list

82030 For the purposes of job control, a list that includes more than one asynchronous AND-OR list  
82031 shall be treated as if it were split into multiple separate lists, each ending with an asynchronous  
82032 AND-OR list.

82033 When a job consisting of a single asynchronous AND-OR list is created, it shall form a  
82034 *background job* and the associated process ID shall be that of a child process that is made a  
82035 process group leader, with all other processes (if any) that the shell creates to execute the AND-  
82036 OR list initially having this process ID as their process group ID.

82037 For a list consisting of one or more sequentially executed AND-OR lists followed by at most one  
82038 asynchronous AND-OR list, the whole list shall form a single *foreground job* up until the  
82039 sequentially executed AND-OR lists have all completed execution, at which point the  
82040 asynchronous AND-OR list (if any) shall form a background job as described above.

82041 For each pipeline in a foreground job, if the pipeline is executed while the list is still a  
82042 foreground job, the set of processes comprising the pipeline, and any processes descended from  
82043 it, shall all be in the same process group, unless the shell executes some of the commands in the  
82044 pipeline in the current shell execution environment and others in a subshell environment; in this  
82045 case the process group ID of the current shell need not change (or cannot change if it is the  
82046 session leader), and consequently the process group ID that the other processes all share may  
82047 differ from the process group ID of the current shell (which means that a SIGSTOP, SIGTSTP,  
82048 SIGTTIN, or SIGTTOU signal sent to one of those process groups does not cause the whole  
82049 pipeline to stop).

82050 A background job that was created on execution of an asynchronous AND-OR list can be  
82051 brought into the foreground by means of the *fg* utility (if supported); in this case the entire job  
82052 shall become a single foreground job. If a process that the shell subsequently waits for is part of  
82053 this foreground job and is stopped by a signal, the entire job shall become a suspended job and  
82054 the behavior shall be as if the process had been stopped while the job was running in the  
82055 background.

82056 When a foreground job is created, or a background job is brought into the foreground by the *fg*  
82057 utility, if the shell has a controlling terminal it shall set the foreground process group ID  
82058 associated with the terminal as follows:

- 82059 • If the job was originally created as a background job, the foreground process group ID  
82060 shall be set to the process ID of the process that the shell made a process group leader  
82061 when it executed the asynchronous AND-OR list.
- 82062 • If the job was originally created as a foreground job, the foreground process group ID shall  
82063 be set as follows when each pipeline in the job is executed:
  - 82064 — If the shell is not itself executing, in the current shell execution environment, all of  
82065 the commands in the pipeline, the foreground process group ID shall be set to the  
82066 process group ID that is shared by the other processes executing the pipeline (see  
82067 above).
  - 82068 — If all of the commands in the pipeline are being executed by the shell itself in the  
82069 current shell execution environment, the foreground process group ID shall be set to  
82070 the process group ID of the shell.

82071 When a foreground job terminates, or becomes a suspended job (see below), if the shell has a  
82072 controlling terminal it shall set the foreground process group ID associated with the terminal to  
82073 the process group ID of the shell.

82074 Each background job (whether suspended or not) shall have associated with it a job number and  
82075 a process ID that is known in the current shell execution environment. When a background job is  
82076 brought into the foreground by means of the *fg* utility, the associated job number shall be  
82077 removed from the shell's background jobs list and the associated process ID shall be removed  
82078 from the list of process IDs known in the current shell execution environment.

82079 If a process that the shell is waiting for is part of a foreground job that was started as a  
82080 foreground job and is stopped by a catchable signal (SIGTSTP, SIGTTIN, or SIGTTOU):

- 82081 • If the currently executing AND-OR list within the list comprising the foreground job  
82082 consists of a single pipeline in which all of the commands are simple commands, the shell  
82083 shall either create a suspended job consisting of at least that AND-OR list and the  
82084 remaining (if any) AND-OR lists in the same list, or create a suspended job consisting of  
82085 just that AND-OR list and discard the remaining (if any) AND-OR lists in the same list.
- 82086 • Otherwise, the shell shall create a suspended job consisting of a set of commands, from  
82087 within the list comprising the foreground job, that is unspecified except that the set shall  
82088 include at least the pipeline to which the stopped process belongs. Commands in the  
82089 foreground job that have not already completed and are not included in the suspended job  
82090 shall be discarded.

82091 **Note:** Although only a pipeline of simple commands is guaranteed to remain intact if started in the  
82092 foreground and subsequently suspended, it is possible to ensure that a complex AND-OR list  
82093 will remain intact when suspended by starting it in the background and immediately bringing  
82094 it into the foreground. For example:

```
82095 command1 && command2 | { command3 || command4; } & fg
```

82096 If a process that the shell is waiting for is part of a foreground job that was started as a  
82097 foreground job and is stopped by a SIGSTOP signal, the behavior shall be as described above for  
82098 a catchable signal unless the shell was executing a built-in utility in the current shell execution  
82099 environment when the SIGSTOP was delivered, resulting in the shell itself being stopped by the  
82100 signal, in which case if the shell subsequently receives a SIGCONT signal and has one or more  
82101 child processes that remain stopped, the shell shall create a suspended job as if only those child  
82102 processes had been stopped.

82103 When a suspended job is created as a result of a foreground job being stopped, it shall be  
82104 assigned a job number, and an interactive shell shall write, and a non-interactive shell may  
82105 write, a message to standard error, formatted as described by the *jobs* utility (without the *-l*

option) for a suspended job. The message may indicate that the commands comprising the job include commands that have already completed; in this case the completed commands shall not be repeated if execution of the job is subsequently continued. If the shell is interactive, it shall save the terminal settings before changing them to the settings it needs to read further commands.

When a process associated with a background job is stopped by a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal, the shell shall convert the (non-suspended) background job into a suspended job and an interactive shell shall write a message to standard error, formatted as described by the *jobs* utility (without the *-l* option) for a suspended job, at the following time:

- If *set -b* is enabled, the message shall be written either immediately after the job became suspended or immediately prior to writing the next prompt for input.
- If *set -b* is disabled, the message shall be written immediately prior to writing the next prompt for input.

Execution of a suspended job can be continued as a foreground job by means of the *fg* utility (if supported), or as a (non-suspended) background job either by means of the *bg* utility (if supported) or by sending the stopped processes a SIGCONT signal. The *fg* and *bg* utilities shall send a SIGCONT signal to the process group of the process(es) whose stopped wait status caused the shell to suspend the job. If the shell has a controlling terminal, the *fg* utility shall send the SIGCONT signal after it has set the foreground process group ID associated with the terminal (see above). If the *fg* utility is used from an interactive shell to bring into the foreground a suspended job that was created from a foreground job, before it sends the SIGCONT signal the *fg* utility shall restore the terminal settings to the ones that the shell saved when the job was suspended.

When a background job completes or is terminated by a signal, an interactive shell shall write a message to standard error, formatted as described by the *jobs* utility (without the *-l* option) for a job that completed or was terminated by a signal, respectively, at the following time:

- If *set -b* is enabled, the message shall be written immediately after the job completes or is terminated.
- If *set -b* is disabled, the message shall be written immediately prior to writing the next prompt for input.

In each case above where an interactive shell writes a message immediately prior to writing the next prompt for input, the same message may also be written by a non-interactive shell, at any of the following times:

- After the next time a foreground job terminates or is suspended
- Before the shell parses further input
- Before the shell exits

## 2.12 Signals and Error Handling

If job control is disabled (see the description of *set -m*) when the shell executes an asynchronous AND-OR list, the commands in the list shall inherit from the shell a signal action of ignored (SIG\_IGN) for the SIGINT and SIGQUIT signals. In all other cases, commands executed by the shell shall inherit the same signal actions as those inherited by the shell from its parent unless a signal action is modified by the *trap* special built-in (see *trap*)

When a signal for which a trap has been set is received while the shell is waiting for the completion of a utility executing a foreground command, the trap associated with that signal

82150 shall not be executed until after the foreground command has completed. When the shell is  
 82151 waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a  
 82152 signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit  
 82153 status >128, immediately after which the trap associated with that signal shall be taken.

82154 If multiple signals are pending for the shell for which there are associated trap actions, the order  
 82155 of execution of trap actions is unspecified.

## 82156 2.13 Shell Execution Environment

82157 A shell execution environment consists of the following:

- 82158 • Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- 82159 • Working directory as set by *cd*
- 82160 • File creation mask set by *umask*
- 82161 • File size limit as set by *ulimit*
- 82162 • Current traps set by *trap*
- 82163 • Shell parameters that are set by variable assignment (see the *set* special built-in) or from  
 82164 the System Interfaces volume of POSIX.1-2024 environment inherited by the shell when it  
 82165 begins (see the *export* special built-in)
- 82166 • Shell functions; see [Section 2.9.5](#)
- 82167 • Options turned on at invocation or by *set*
- 82168 • Background jobs and their associated process IDs, and process IDs of child processes  
 82169 created to execute asynchronous AND-OR lists while job control is disabled; together these  
 82170 process IDs constitute the process IDs “known to this shell environment”. If the  
 82171 implementation supports non-job-control background jobs, the list of known process IDs  
 82172 and the list of background jobs may form a single list even though this standard describes  
 82173 them as being updated separately. See [Section 2.9.3.1](#)
- 82174 • Shell aliases; see [Section 2.3.1](#)

82175 Utilities other than the special built-ins (see [Section 2.15](#)) shall be invoked in a separate  
 82176 environment that consists of the following. The initial value of these objects shall be the same as  
 82177 that for the parent shell, except as noted below.

- 82178 • Open files inherited on invocation of the shell, open files controlled by the *exec* special  
 82179 built-in plus any modifications, and additions specified by any redirections to the utility
- 82180 • Current working directory
- 82181 • File creation mask
- 82182 • If the utility is a shell script, traps caught by the shell shall be set to the default values and  
 82183 traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell  
 82184 script, the trap actions (default or ignore) shall be mapped into the appropriate signal  
 82185 handling actions for the utility
- 82186 • Variables with the *export* attribute, along with those explicitly exported for the duration of  
 82187 the command, shall be passed to the utility environment variables
- 82188 • It is unspecified whether environment variables that were passed to the invoking shell  
 82189 when it was invoked itself, but were not used to initialize shell variables (see [Section 2.5.3](#))  
 82190 because they had invalid names, are included in the invoked utility’s environment.

82191 The environment of the shell process shall not be changed by the utility unless explicitly  
82192 specified by the utility description (for example, *cd* and *umask*).

82193 A subshell environment shall be created as a duplicate of the shell environment, except that:

- 82194 • Unless specified otherwise (see *trap*), traps that are not being ignored shall be set to the  
82195 default action.
- 82196 • If the shell is interactive, the subshell shall behave as a non-interactive shell in all respects  
82197 except:
  - 82198 — The expansion of the special parameter '-' may continue to indicate that it is  
82199 interactive.
  - 82200 — The *set -n* option may be ignored.

82201 Changes made to the subshell environment shall not affect the shell environment. Command  
82202 substitution, commands that are grouped with parentheses, and asynchronous AND-OR lists  
82203 shall be executed in a subshell environment. Additionally, each command of a multi-command  
82204 pipeline is in a subshell environment; as an extension, however, any or all commands in a  
82205 pipeline may be executed in the current environment. Except where otherwise stated, all other  
82206 commands shall be executed in the current shell environment.

## 82207 2.14 Pattern Matching Notation

82208 The pattern matching notation described in this section is used to specify patterns for matching  
82209 character strings in the shell. This notation is also used by some other utilities (*find*, *pax*, and  
82210 optionally *make*) and by some system interfaces (*fnmatch()*, *glob()*, and *wordexp()*). Historically,  
82211 pattern matching notation is related to, but slightly different from, the regular expression  
82212 notation described in XBD Chapter 9. For this reason, the description of the rules for this pattern  
82213 matching notation are based on the description of regular expression notation, modified to  
82214 account for the differences.

82215 If an attempt is made to use pattern matching notation to match a string that contains one or  
82216 more bytes that do not form part of a valid character, the behavior is unspecified. Since  
82217 pathnames can contain such bytes, portable applications need to ensure that the current locale is  
82218 the C or POSIX locale when performing pattern matching (or expansion) on arbitrary  
82219 pathnames.

### 82220 2.14.1 Patterns Matching a Single Character

82221 The following patterns shall match a single character: ordinary characters, special pattern  
82222 characters, and pattern bracket expressions. The pattern bracket expression also shall match a  
82223 single collating element.

82224 In a pattern, or part of one, where a shell-quoting `<backslash>` can be used, a `<backslash>`  
82225 character shall escape the following character as described in Section 2.2.1, regardless of whether  
82226 or not the `<backslash>` is inside a bracket expression. (The sequence `"\"` represents one literal  
82227 `<backslash>`.)

82228 In a pattern, or part of one, where a shell-quoting `<backslash>` cannot be used to preserve the  
82229 literal value of a character that would otherwise be treated as special:

- 82230 • A `<backslash>` character that is not inside a bracket expression shall preserve the literal  
82231 value of the following character, unless the following character is in a part of the pattern  
82232 where shell quoting can be used and is a shell quoting character, in which case the

82233 behavior is unspecified.

- 82234 • For the shell only, it is unspecified whether or not a <backslash> character inside a bracket
- 82235 expression preserves the literal value of the following character.

82236 All of the requirements and effects of quoting on ordinary, shell special, and special pattern  
82237 characters shall apply to escaping in this context, except where specified otherwise. (Situations  
82238 where this applies include word expansions when a pattern used in pathname expansion is not  
82239 present in the original word but results from an earlier expansion, or the argument to the *find*  
82240 *-name* or *-path* primary as passed to *find*, or the *pattern* argument to the *fnmatch()* and *glob()*  
82241 functions when FNM\_NOESCAPE or GLOB\_NOESCAPE is not set in *flags*, respectively.)

82242 If a pattern ends with an unescaped <backslash>, the behavior is unspecified.

82243 An ordinary character is a pattern that shall match itself. In a pattern, or part of one, where a  
82244 shell-quoting <backslash> can be used, an ordinary character can be any character in the  
82245 supported character set except for NUL, those special shell characters in [Section 2.2](#) that require  
82246 quoting, and the three special pattern characters described below. In a pattern, or part of one,  
82247 where a shell-quoting <backslash> cannot be used to preserve the literal value of a character that  
82248 would otherwise be treated as special, an ordinary character can be any character in the  
82249 supported character set except for NUL and the three special pattern characters described below.  
82250 Matching shall be based on the bit pattern used for encoding the character, not on the graphic  
82251 representation of the character. If any character (ordinary, shell special, or pattern special) is  
82252 quoted, or escaped with a <backslash>, that pattern shall match the character itself. The  
82253 application shall ensure that it quotes or escapes any character that would otherwise be treated  
82254 as special, in order for it to be matched as an ordinary character.

82255 When unquoted, unescaped, and not inside a bracket expression, the following three characters  
82256 shall have special meaning in the specification of patterns:

- 82257 ? A <question-mark> is a pattern that shall match any character.
- 82258 \* An <asterisk> is a pattern that shall match multiple characters, as described in [Section](#)  
82259 [2.14.2](#).
- 82260 [ A <left-square-bracket> shall introduce a bracket expression if the characters following it  
82261 meet the requirements for bracket expressions stated in XBD [Section 9.3.5](#), except that the  
82262 <exclamation-mark> character ('!') shall replace the <circumflex> character ('^') in its  
82263 role in a non-matching list in the regular expression notation. A bracket expression starting  
82264 with an unquoted <circumflex> character produces unspecified results. A <left-square-  
82265 bracket> that does not introduce a valid bracket expression shall match the character itself.

## 82266 2.14.2 Patterns Matching Multiple Characters

82267 The following rules are used to construct patterns matching multiple characters from patterns  
82268 matching a single character:

- 82269 1. The <asterisk> ('\*') is a pattern that shall match any string, including the null string.
- 82270 2. The concatenation of patterns matching a single character is a valid pattern that shall  
82271 match the concatenation of the single characters or collating elements matched by each of  
82272 the concatenated patterns.
- 82273 3. The concatenation of one or more patterns matching a single character with one or more  
82274 <asterisk> characters is a valid pattern. In such patterns, each <asterisk> shall match a  
82275 string of zero or more characters, matching the greatest possible number of characters  
82276 that still allows the remainder of the pattern to match the string.

82277 **2.14.3 Patterns Used for Filename Expansion**

82278 The rules described so far in [Section 2.14.1](#) and [Section 2.14.2](#) are qualified by the following rules  
82279 that apply when pattern matching notation is used for filename expansion:

- 82280 1. The <slash> character in a pathname shall be explicitly matched by using one or more  
82281 <slash> characters in the pattern; it shall neither be matched by the <asterisk> or  
82282 <question-mark> special characters nor by a bracket expression. <slash> characters in the  
82283 pattern shall be identified before bracket expressions; thus, a <slash> cannot be included  
82284 in a pattern bracket expression used for filename expansion. If a <slash> character is  
82285 found following an unescaped <left-square-bracket> character before a corresponding  
82286 <right-square-bracket> is found, the open bracket shall be treated as an ordinary  
82287 character. For example, the pattern "a[b/c]d" does not match such pathnames as **abd**  
82288 or **a/d**. It only matches a pathname of literally **a[b/c]d**.
- 82289 2. If a filename begins with a <period> ( '.' ), the <period> shall be explicitly matched by  
82290 using a <period> as the first character of the pattern or immediately following a <slash>  
82291 character. The leading <period> shall not be matched by:
  - 82292 • The <asterisk> or <question-mark> special characters
  - 82293 • A bracket expression containing a non-matching list, such as "[!a]", a range  
82294 expression, such as "[%-0]", or a character class expression, such as  
82295 "[[:punct:]]"

82296 It is unspecified whether an explicit <period> in a bracket expression matching list, such  
82297 as "[.abc]", can match a leading <period> in a filename.

- 82298 3. If a specified pattern contains any '\*', '?', or '[' characters that will be treated as  
82299 special (see [Section 2.14.1](#)), it shall be matched against existing filenames and pathnames,  
82300 as appropriate; if directory entries for dot and dot-dot exist, they may be ignored. Each  
82301 component that contains any such characters shall require read permission in the  
82302 directory containing that component. Each component that contains a <backslash> that  
82303 will be treated as special may require read permission in the directory containing that  
82304 component. Any component, except the last, that does not contain any '\*', '?', or '['  
82305 characters that will be treated as special shall require search permission. If these  
82306 permissions are denied, or if an attempt to open or search a pathname as a directory, or an  
82307 attempt to read an opened directory, fails because of an error condition that is related to  
82308 file system contents, this shall not be considered an error and pathname expansion shall  
82309 continue as if the pathname had named an existing directory which had been successfully  
82310 opened and read, or searched, and no matching directory entries had been found in it. For  
82311 other error conditions it is unspecified whether pathname expansion fails or they are  
82312 treated the same as when permission is denied.

82313 For example, given the pattern:

```
82314 /foo/bar/x*/bam
```

82315 search permission is needed for directories **/** and **foo**, search and read permissions are  
82316 needed for directory **bar**, and search permission is needed for each **x\*** directory.

82317 If the pattern matches any existing filenames or pathnames, the pattern shall be replaced  
82318 with those filenames and pathnames, sorted according to the collating sequence in effect  
82319 in the current locale. If this collating sequence does not have a total ordering of all  
82320 characters (see [XBD Section 7.3.2](#), on page 139), any filenames or pathnames that collate  
82321 equally shall be further compared byte-by-byte using the collating sequence for the  
82322 POSIX locale.

82323 If the pattern contains an open bracket ( '[' ) that does not introduce a bracket expression

82324 as in XBD [Section 9.3.5](#), it is unspecified whether other unquoted '\*', '?', '[' or  
 82325 <backslash> characters within the same slash-delimited component of the pattern retain  
 82326 their special meanings or are treated as ordinary characters. For example, the pattern  
 82327 "a\*[/b\*" may match all filenames beginning with 'b' in the directory "a\*[" or it may  
 82328 match all filenames beginning with 'b' in all directories with names beginning with 'a'  
 82329 and ending with '['.

82330 If the pattern does not match any existing filenames or pathnames, the pattern string shall  
 82331 be left unchanged.

82332 **Note:** A future version of this standard may require that directory entries for dot and dot-dot  
 82333 are ignored (if they exist) when matching patterns against existing filenames. For  
 82334 example, when expanding the pattern ".\*" the result would not include dot and dot-  
 82335 dot.

82336 4. If a specified pattern does not contain any '\*', '?' or '[' characters that will be treated  
 82337 as special, the pattern string shall be left unchanged.

## 82338 2.15 Special Built-In Utilities

82339 The following "special built-in" utilities shall be supported in the shell command language. The  
 82340 output of each command, if any, shall be written to standard output, subject to the normal  
 82341 redirection and piping possible with all commands.

82342 The term "built-in" implies that there is no need to execute a separate executable file because the  
 82343 utility is implemented in the shell itself. An implementation may choose to make any utility a  
 82344 built-in; however, the special built-in utilities described here differ from regular built-in utilities  
 82345 in two respects:

- 82346 1. An error in a special built-in utility may cause a shell executing that utility to abort, while  
 82347 an error in a regular built-in utility shall not cause a shell executing that utility to abort.  
 82348 (See [Section 2.8.1](#) for the consequences of errors on interactive and non-interactive shells.)  
 82349 If a special built-in utility encountering an error does not abort the shell, its exit value  
 82350 shall be non-zero.
- 82351 2. As described in [Section 2.9.1](#), variable assignments preceding the invocation of a special  
 82352 built-in utility affect the current execution environment; this shall not be the case with a  
 82353 regular built-in or other utility.

82354 The special built-in utilities in this section need not be provided in a manner accessible via the  
 82355 *exec* family of functions defined in the System Interfaces volume of POSIX.1-2024.

82356 Some of the special built-ins are described as conforming to XBD [Section 12.2](#). For those that are  
 82357 not, the requirement in [Section 1.4](#) that "--" be recognized as a first argument to be discarded  
 82358 does not apply and a conforming application shall not use that argument.

82359 **NAME**

82360 break — exit from for, while, or until loop

82361 **SYNOPSIS**82362 break [*n*]82363 **DESCRIPTION**

82364 If *n* is specified, the *break* utility shall exit from the *n*th enclosing **for**, **while**, or **until** loop. If *n* is  
82365 not specified, *break* shall behave as if *n* was specified as 1. Execution shall continue with the  
82366 command immediately following the exited loop. The application shall ensure that the value of  
82367 *n* is a positive decimal integer. If *n* is greater than the number of enclosing loops, the outermost  
82368 enclosing loop shall be exited. If there is no enclosing loop, the behavior is unspecified.

82369 A loop shall enclose a *break* or *continue* command if the loop lexically encloses the command. A  
82370 loop lexically encloses a *break* or *continue* command if the command is:

- 82371 • Executing in the same execution environment (see [Section 2.13](#)) as the compound-list of the  
82372 loop's do-group (see [Section 2.10.2](#)), and
- 82373 • Contained in a compound-list associated with the loop (either in the compound-list of the  
82374 loop's do-group or, if the loop is a **while** or **until** loop, in the compound-list following the  
82375 **while** or **until** reserved word), and
- 82376 • Not in the body of a function whose function definition command (see [Section 2.9.5](#)) is  
82377 contained in a compound-list associated with the loop.

82378 If *n* is greater than the number of lexically enclosing loops and there is a non-lexically enclosing  
82379 loop in progress in the same execution environment as the *break* or *continue* command, it is  
82380 unspecified whether that loop encloses the command.

82381 **OPTIONS**

82382 None.

82383 **OPERANDS**

82384 See the DESCRIPTION.

82385 **STDIN**

82386 Not used.

82387 **INPUT FILES**

82388 None.

82389 **ENVIRONMENT VARIABLES**

82390 None.

82391 **ASYNCHRONOUS EVENTS**

82392 Default.

82393 **STDOUT**

82394 Not used.

82395 **STDERR**

82396 The standard error shall be used only for diagnostic messages.

82397 **OUTPUT FILES**

82398 None.

82399 **EXTENDED DESCRIPTION**

82400 None.

82401 **EXIT STATUS**

82402 0 Successful completion.

82403 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.82404 **CONSEQUENCES OF ERRORS**

82405 Default.

82406 **APPLICATION USAGE**

82407 None.

82408 **EXAMPLES**

```
82409     for i in *
82410     do
82411         if test -d "$i"
82412         then break
82413         fi
82414     done
```

82415 The results of running the following example are unspecified: there are two loops in progress  
 82416 when the *break* command is executed, and they are in the same execution environment, but  
 82417 neither loop is lexically enclosing the *break* command. (There are no loops lexically enclosing the  
 82418 *continue* commands, either.)

```
82419     foo() {
82420         for j in 1 2; do
82421             echo 'break 2' >/tmp/do_break
82422             echo "  sourcing /tmp/do_break ($j)..."
82423             # the behavior of the break from running the following command
82424             # results in unspecified behavior:
82425             . /tmp/do_break

82426             do_continue() { continue 2; }
82427             echo "  running do_continue ($j)..."
82428             # the behavior of the continue in the following function call
82429             # results in unspecified behavior (if execution reaches this
82430             # point):
82431             do_continue

82432             trap 'continue 2' USR1
82433             echo "  sending SIGUSR1 to self ($j)..."
82434             # the behavior of the continue in the trap invoked from the
82435             # following signal results in unspecified behavior (if
82436             # execution reaches this point):
82437             kill -s USR1 $$
82438             sleep 1
82439         done
82440     }
82441     for i in 1 2; do
82442         echo "running foo ($i)..."
82443         foo
82444     done
```

82445 **RATIONALE**

82446 In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer  
82447 to a label associated with the appropriate loop as a preferable alternative to the *n* method.  
82448 However, this volume of POSIX.1-2024 does reserve the name space of command names ending  
82449 with a <colon>. It is anticipated that a future implementation could take advantage of this and  
82450 provide something like:

```
82451 outofloop: for i in a b c d e  
82452 do  
82453     for j in 0 1 2 3 4 5 6 7 8 9  
82454     do  
82455         if test -r "${i}${j}"  
82456         then break outofloop  
82457         fi  
82458     done  
82459 done
```

82460 and that this might be standardized after implementation experience is achieved.

82461 **FUTURE DIRECTIONS**

82462 None.

82463 **SEE ALSO**

82465 **CHANGE HISTORY**82466 **Issue 6**

82467 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82468 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82469 behavior is intended.

82470 **Issue 7**

82471 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0046 [842] is applied.

82472 **Issue 8**

82473 Austin Group Defect 1058 is applied, clarifying that the requirement for *n* to be a positive  
82474 decimal integer is a requirement on the application.

82475 **NAME**

82476 colon — null utility

82477 **SYNOPSIS**82478 : [*argument...*]82479 **DESCRIPTION**82480 This utility shall do nothing except return a 0 exit status. It is used when a command is needed,  
82481 as in the **then** condition of an **if** command, but nothing is to be done by the command.82482 **OPTIONS**82483 This utility shall not recognize the "--" argument in the manner specified by Guideline 10 of  
82484 XBD [Section 12.2](#) (on page 215).

82485 Implementations shall not support any options.

82486 **OPERANDS**

82487 See the DESCRIPTION.

82488 **STDIN**

82489 Not used.

82490 **INPUT FILES**

82491 None.

82492 **ENVIRONMENT VARIABLES**

82493 None.

82494 **ASYNCHRONOUS EVENTS**

82495 Default.

82496 **STDOUT**

82497 Not used.

82498 **STDERR**

82499 Not used.

82500 **OUTPUT FILES**

82501 None.

82502 **EXTENDED DESCRIPTION**

82503 None.

82504 **EXIT STATUS**

82505 Zero.

82506 **CONSEQUENCES OF ERRORS**

82507 None.

82508 **APPLICATION USAGE**82509 See the APPLICATION USAGE for *true*.82510 **EXAMPLES**82511 : "\${X=abc}"  
82512 if false  
82513 then :  
82514 else printf '%s\n' "\$X"  
82515 fi  
82516 **abc**

82517 As with any of the special built-ins, the null utility can also have variable assignments and

82518 redirections associated with it, such as:

82519 `x=y : > z`

82520 which sets variable *x* to the value *y* (so that it persists after the null utility completes) and creates  
82521 or truncates file *z*; if the file cannot be created or truncated, a non-interactive shell exits (see  
82522 [Section 2.8.1](#)).

82523 **RATIONALE**

82524 None.

82525 **FUTURE DIRECTIONS**

82526 None.

82529 **CHANGE HISTORY**

82530 **Issue 6**

82531 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82532 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82533 behavior is intended.

82534 **Issue 7**

82535 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82536 **Issue 8**

82537 Austin Group Defect 1272 is applied, clarifying that the null utility does not process its  
82538 arguments, does not recognize the "--" end-of-options delimiter, does not support any options,  
82539 and does not write to standard error.

82540 Austin Group Defect 1640 is applied, changing the APPLICATION USAGE section.

82541 **NAME**

82542 continue — continue for, while, or until loop

82543 **SYNOPSIS**82544 continue [*n*]82545 **DESCRIPTION**

82546 If *n* is specified, the *continue* utility shall return to the top of the *n*th enclosing **for**, **while**, or **until**  
82547 loop. If *n* is not specified, *continue* shall behave as if *n* was specified as 1. Returning to the top of  
82548 the loop involves repeating the condition list of a **while** or **until** loop or performing the next  
82549 assignment of a **for** loop, and re-executing the loop if appropriate.

82550 The application shall ensure that the value of *n* is a positive decimal integer. If *n* is greater than  
82551 the number of enclosing loops, the outermost enclosing loop shall be used. If there is no  
82552 enclosing loop, the behavior is unspecified.

82553 The meaning of “enclosing” shall be as specified in the description of the *break* utility.

82554 **OPTIONS**

82555 None.

82556 **OPERANDS**

82557 See the DESCRIPTION.

82558 **STDIN**

82559 Not used.

82560 **INPUT FILES**

82561 None.

82562 **ENVIRONMENT VARIABLES**

82563 None.

82564 **ASYNCHRONOUS EVENTS**

82565 Default.

82566 **STDOUT**

82567 Not used.

82568 **STDERR**

82569 The standard error shall be used only for diagnostic messages.

82570 **OUTPUT FILES**

82571 None.

82572 **EXTENDED DESCRIPTION**

82573 None.

82574 **EXIT STATUS**

82575 0 Successful completion.

82576 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.82577 **CONSEQUENCES OF ERRORS**

82578 Default.

**82579 APPLICATION USAGE**

82580 None.

**82581 EXAMPLES**

```
82582     for i in *
82583     do
82584         if test -d "$i"
82585         then continue
82586         fi
82587         printf "%s" is not a directory.\n' "$i"
82588     done
```

**82589 RATIONALE**

82590 None.

**82591 FUTURE DIRECTIONS**

82592 None.

**82593 SEE ALSO**

82594 [Section 2.15](#)

**82595 CHANGE HISTORY****82596 Issue 6**

82597 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82598 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82599 behavior is intended.

**82600 Issue 7**

82601 The example is changed to use the *printf* utility rather than *echo*.

82602 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0046 [842] is applied.

**82603 Issue 8**

82604 Austin Group Defect 1058 is applied, clarifying that the requirement for *n* to be a positive  
82605 decimal integer is a requirement on the application.

82606 **NAME**

82607 dot — execute commands in the current environment

82608 **SYNOPSIS**

82609 . *file*

82610 **DESCRIPTION**

82611 The shell shall tokenize (see [Section 2.3](#)) the contents of the *file*, parse the tokens (see [Section 2.10](#)), and execute the resulting commands in the current environment. It is unspecified whether  
82612 the commands are parsed and executed as a *program* (as for a shell script) or are parsed as a  
82613 single *compound\_list* that is executed after the entire file has been parsed.  
82614

82615 If *file* does not contain a <slash>, the shell shall use the search path specified by *PATH* to find the  
82616 directory containing *file*. Unlike normal command search, however, the file searched for by the  
82617 *dot* utility need not be executable. If no readable file is found, a non-interactive shell shall abort;  
82618 an interactive shell shall write a diagnostic message to standard error.

82619 The *dot* special built-in shall support XBD [Section 12.2](#) (on page 215), except for Guidelines 1 and  
82620 2.

82621 **OPTIONS**

82622 None.

82623 **OPERANDS**

82624 See the DESCRIPTION.

82625 **STDIN**

82626 Not used.

82627 **INPUT FILES**

82628 See the DESCRIPTION.

82629 **ENVIRONMENT VARIABLES**

82630 See the DESCRIPTION.

82631 **ASYNCHRONOUS EVENTS**

82632 Default.

82633 **STDOUT**

82634 Not used.

82635 **STDERR**

82636 The standard error shall be used only for diagnostic messages.

82637 **OUTPUT FILES**

82638 None.

82639 **EXTENDED DESCRIPTION**

82640 None.

82641 **EXIT STATUS**

82642 If no readable file was found or if the commands in the file could not be parsed, and the shell is  
82643 interactive (and therefore does not abort; see [Section 2.8.1](#)), the exit status shall be non-zero.  
82644 Otherwise, return the value of the last command executed, or a zero exit status if no command is  
82645 executed.

82646 **CONSEQUENCES OF ERRORS**

82647 Default.

82648 **APPLICATION USAGE**

82649 None.

82650 **EXAMPLES**

```
82651     cat foobar
82652     foo=hello bar=world
82653     . ./foobar
82654     echo $foo $bar
82655     hello world
```

82656 **RATIONALE**

82657 Some older implementations searched the current directory for the *file*, even if the value of *PATH*  
82658 disallowed it. This behavior was omitted from this volume of POSIX.1-2024 due to concerns  
82659 about introducing the susceptibility to trojan horses that the user might be trying to avoid by  
82660 leaving **dot** out of *PATH*.

82661 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.  
82662 This is a valid extension that allows a *dot* script to behave identically to a function.

82663 **FUTURE DIRECTIONS**

82664 None.

82665 **SEE ALSO**82666 [Section 2.15, \*return\*](#)82667 **CHANGE HISTORY**82668 **Issue 6**

82669 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82670 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82671 behavior is intended.

82672 **Issue 7**

82673 SD5-XCU-ERN-164 is applied.

82674 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0038 [114] and XCU/TC1-2008/0039  
82675 [214] are applied.

82676 **Issue 8**

82677 Austin Group Defect 252 is applied, adding a requirement for *dot* to support XBD [Section 12.2](#)  
82678 (except for Guidelines 1 and 2, since the utility's name is ' . ').

82679 Austin Group Defect 953 is applied, clarifying how the commands in the *file* are parsed.

82680 Austin Group Defect 1265 is applied, updating the DESCRIPTION to align with the changes  
82681 made to [Section 2.8.1](#) between Issue 6 and Issue 7.

82682 **NAME**

82683 eval — construct command by concatenating arguments

82684 **SYNOPSIS**82685 eval [*argument...*]82686 **DESCRIPTION**

82687 The *eval* utility shall construct a command string by concatenating *arguments* together,  
82688 separating each with a <space> character. The constructed command string shall be tokenized  
82689 (see [Section 2.3](#)), parsed (see [Section 2.10](#)), and executed by the shell in the current environment.  
82690 It is unspecified whether the commands are parsed and executed as a *program* (as for a shell  
82691 script) or are parsed as a single *compound\_list* that is executed after the entire constructed  
82692 command string has been parsed.

82693 **OPTIONS**

82694 None.

82695 **OPERANDS**

82696 See the DESCRIPTION.

82697 **STDIN**

82698 Not used.

82699 **INPUT FILES**

82700 None.

82701 **ENVIRONMENT VARIABLES**

82702 None.

82703 **ASYNCHRONOUS EVENTS**

82704 Default.

82705 **STDOUT**

82706 Not used.

82707 **STDERR**

82708 The standard error shall be used only for diagnostic messages.

82709 **OUTPUT FILES**

82710 None.

82711 **EXTENDED DESCRIPTION**

82712 None.

82713 **EXIT STATUS**

82714 If there are no *arguments*, or only null *arguments*, *eval* shall return a zero exit status; otherwise, it  
82715 shall return the exit status of the command defined by the string of concatenated *arguments*  
82716 separated by <space> characters, or a non-zero exit status if the concatenation could not be  
82717 parsed as a command and the shell is interactive (and therefore did not abort).

82718 **CONSEQUENCES OF ERRORS**

82719 Default.

**82720 APPLICATION USAGE**

82721 Since *eval* is not required to recognize the "--" end of options delimiter, in cases where the  
82722 argument(s) to *eval* might begin with '-' it is recommended that the first argument is prefixed  
82723 by a string that will not alter the commands to be executed, such as a <space> character:

```
82724 eval " $commands"
```

82725 or:

```
82726 eval " $(some_command)"
```

**82727 EXAMPLES**

```
82728 foo=10 x=foo
```

```
82729 y='$'$x
```

```
82730 echo $y
```

```
82731 $foo
```

```
82732 eval y='$'$x
```

```
82733 echo $y
```

```
82734 10
```

**82735 RATIONALE**

82736 This standard allows, but does not require, *eval* to recognize "--". Although this means  
82737 applications cannot use "--" to protect against options supported as an extension (or errors  
82738 reported for unsupported options), the nature of the *eval* utility is such that other means can be  
82739 used to provide this protection (see APPLICATION USAGE above).

**82740 FUTURE DIRECTIONS**

82741 None.

**82742 SEE ALSO**

82743 [Section 2.15](#)

**82744 CHANGE HISTORY****82745 Issue 6**

82746 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82747 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82748 behavior is intended.

**82749 Issue 7**

82750 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82751 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0040 [114], XCU/TC1-2008/0041 [163],  
82752 and XCU/TC1-2008/0042 [163] are applied.

**82753 Issue 8**

82754 Austin Group Defect 953 is applied, clarifying how the commands in the constructed command  
82755 string are parsed.

82756 **NAME**82757 `exec` — perform redirections in the current shell or execute a utility82758 **SYNOPSIS**82759 `exec` [*utility* [*argument...*]]82760 **DESCRIPTION**

82761 If `exec` is specified with no operands, any redirections associated with the `exec` command shall be  
82762 made in the current shell execution environment. If any file descriptors with numbers greater  
82763 than 2 are opened by those redirections, it is unspecified whether those file descriptors remain  
82764 open when the shell invokes another utility. Scripts concerned that child shells could misuse  
82765 open file descriptors can always close them explicitly, as shown in one of the following  
82766 examples. If the result of the redirections would be that file descriptor 0, 1, or 2 is closed,  
82767 implementations may open the file descriptor to an unspecified file.

82768 If `exec` is specified with a *utility* operand, the shell shall execute a non-built-in utility as described  
82769 in [Section 2.9.1.6](#) with *utility* as the command name and the *argument* operands (if any) as the  
82770 command arguments.

82771 If the `exec` command fails, a non-interactive shell shall exit from the current shell execution  
82772 UP environment; an interactive shell may exit from a subshell environment but shall not exit if the  
82773 current shell environment is not a subshell environment.

82774 If the `exec` command fails and the shell does not exit, any redirections associated with the `exec`  
82775 command that were successfully made shall take effect in the current shell execution  
82776 environment.

82777 The `exec` special built-in shall support XBD [Section 12.2](#) (on page 215).

82778 **OPTIONS**

82779 None.

82780 **OPERANDS**

82781 See the DESCRIPTION.

82782 **STDIN**

82783 Not used.

82784 **INPUT FILES**

82785 None.

82786 **ENVIRONMENT VARIABLES**82787 The following environment variable shall affect the execution of `exec`:

82788 *PATH* Determine the search path when looking for the utility given as the *utility* operand;  
82789 see XBD [Section 8.3](#) (on page 174).

82790 **ASYNCHRONOUS EVENTS**

82791 Default.

82792 **STDOUT**

82793 Not used.

82794 **STDERR**

82795 The standard error shall be used only for diagnostic messages.

82796 **OUTPUT FILES**

82797 None.

82798 **EXTENDED DESCRIPTION**

82799 None.

82800 **EXIT STATUS**

82801 If *utility* is specified and is executed, *exec* shall not return to the shell; rather, the exit status of the  
82802 current shell execution environment shall be the exit status of *utility*. If *utility* is specified and an  
82803 attempt to execute it as a non-built-in utility fails, the exit status shall be as described in [Section](#)  
82804 [2.9.1.6](#). If a redirection error occurs (see [Section 2.8.1](#)), the exit status shall be a value in the range  
82805 1–125. Otherwise, *exec* shall return a zero exit status.

82806 **CONSEQUENCES OF ERRORS**

82807 Default.

82808 **APPLICATION USAGE**

82809 None.

82810 **EXAMPLES**82811 Open *readfile* as file descriptor 3 for reading:82812 `exec 3< readfile`82813 Open *writefile* as file descriptor 4 for writing:82814 `exec 4> writefile`

82815 Make file descriptor 5 a copy of file descriptor 0:

82816 `exec 5<&0`

82817 Close file descriptor 3:

82818 `exec 3<&-`82819 Cat the file **maggie** by replacing the current shell with the *cat* utility:82820 `exec cat maggie`

82821 An application that is not concerned with strict conformance can make use of optional `%g`  
82822 support known to be present in the implementation's *printf* utility by ensuring that any shell  
82823 built-in version is not executed instead, and using a subshell so that the shell continues  
82824 afterwards:

82825 `(exec printf '%g\n' "$float_value")`82826 **RATIONALE**

82827 Most historical implementations were not conformant in that:

82828 `foo=bar exec cmd`82829 did not pass **foo** to **cmd**.82830 **FUTURE DIRECTIONS**

82831 None.

82832 **SEE ALSO**82833 [Section 2.15](#)82834 **CHANGE HISTORY**

- 82835 **Issue 6**  
82836 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82837 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82838 behavior is intended.
- 82839 **Issue 7**  
82840 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 82841 **Issue 8**  
82842 Austin Group Defect 252 is applied, adding a requirement for *exec* to support XBD [Section 12.2](#).  
82843 Austin Group Defect 1157 is applied, clarifying the execution of non-built-in utilities.  
82844 Austin Group Defect 1587 is applied, changing the ENVIRONMENT VARIABLES section.

82845 **NAME**

82846 exit — cause the shell to exit

82847 **SYNOPSIS**82848 exit [*n*]82849 **DESCRIPTION**

82850 The *exit* utility shall cause the shell to exit from its current execution environment. If the current  
82851 execution environment is a subshell environment, the shell shall exit from the subshell  
82852 environment and continue in the environment from which that subshell environment was  
82853 invoked; otherwise, the shell utility shall terminate. The wait status of the shell or subshell shall  
82854 be determined by the unsigned decimal integer *n*, if specified.

82855 If *n* is specified and has a value between 0 and 255 inclusive, the wait status of the shell or  
82856 subshell shall indicate that it exited with exit status *n*. If *n* is specified and has a value greater  
82857 than 256 that corresponds to an exit status the shell assigns to commands terminated by a valid  
82858 signal (see [Section 2.8.2](#)), the wait status of the shell or subshell shall indicate that it was  
82859 terminated by that signal. No other actions associated with the signal, such as execution of *trap*  
82860 actions or creation of a core image, shall be performed by the shell.

82861 If *n* is specified and is not an unsigned decimal integer, or has a value of 256, or has a value  
82862 greater than 256 but not corresponding to an exit status the shell assigns to commands  
82863 terminated by a valid signal, the wait status of the shell or subshell is unspecified.

82864 If *n* is not specified, the result shall be as if *n* were specified with the current value of the special  
82865 parameter '?' (see [Section 2.5.2](#)), except that if the *exit* command would cause the end of  
82866 execution of a *trap* action, the value for the special parameter '?' that is considered "current"  
82867 shall be the value it had immediately preceding the *trap* action.

82868 A *trap* action on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is  
82869 invoked in that *trap* action itself, in which case the shell shall exit immediately. It is unspecified  
82870 whether setting a new *trap* action on **EXIT** during execution of a *trap* action on **EXIT** will cause  
82871 the new *trap* action to be executed before the shell terminates.

82872 **OPTIONS**

82873 None.

82874 **OPERANDS**

82875 See the DESCRIPTION.

82876 **STDIN**

82877 Not used.

82878 **INPUT FILES**

82879 None.

82880 **ENVIRONMENT VARIABLES**

82881 None.

82882 **ASYNCHRONOUS EVENTS**

82883 Default.

82884 **STDOUT**

82885 Not used.

82886 **STDERR**

82887 The standard error shall be used only for diagnostic messages.

82888 **OUTPUT FILES**

82889 None.

82890 **EXTENDED DESCRIPTION**

82891 None.

82892 **EXIT STATUS**82893 The *exit* utility causes the shell to exit from its current execution environment, and therefore does  
82894 not itself return an exit status.82895 **CONSEQUENCES OF ERRORS**

82896 Default.

82897 **APPLICATION USAGE**82898 As explained in other sections, certain exit status values have been reserved for special uses and  
82899 should be used by applications only for those purposes:

82900 126 A file to be executed was found, but it was not an executable utility.

82901 127 A utility to be executed was not found.

82902 128 An unrecoverable read error was detected by the shell while reading commands, except  
82903 from the *file* operand of the *dot* special built-in.

82904 &gt;128 A command was interrupted by a signal.

82905 **EXAMPLES**82906 Exit with a *true* value:82907 `exit 0`82908 Exit with a *false* value:82909 `exit 1`

82910 Propagate error handling from within a subshell:

82911 

```
(  
82912     command1 || exit 1  
82913     command2 || exit 1  
82914     exec command3  
82915 ) > outputfile || exit 1  
82916 echo "outputfile created successfully"
```

82917 **RATIONALE**82918 The behavior of *exit* when given an invalid argument or unknown option is unspecified, because  
82919 of differing practices in the various historical implementations. A value larger than 255 might be  
82920 truncated by the shell, and be unavailable even to a parent process that uses *waitid()* to get the  
82921 full exit value. It is recommended that implementations that detect any usage error should cause  
82922 a non-zero exit status (or, if the shell is interactive and the error does not cause the shell to abort,  
82923 store a non-zero value in "\$?"), but even this was not done historically in all shells.82924 See also [Section C.2.8.2](#) (on page 3894).82925 **FUTURE DIRECTIONS**

82926 None.

82927 **SEE ALSO**82928 [Section 2.15](#)82929 **CHANGE HISTORY**82930 **Issue 6**

82931 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
82932 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
82933 behavior is intended.

82934 **Issue 7**

82935 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0047 [717], XCU/TC2-2008/0048  
82936 [960], XCU/TC2-2008/0049 [717], and XCU/TC2-2008/0050 [960] are applied.

82937 **Issue 8**

82938 Austin Group Defect 51 is applied, specifying the behavior when *n* has a value greater than 256  
82939 that corresponds to an exit status the shell assigns to commands terminated by a valid signal.

82940 Austin Group Defect 1029 is applied, changing ``trap'' to ``trap action'' in the DESCRIPTION  
82941 section.

82942 Austin Group Defect 1309 is applied, changing the EXIT STATUS section.

82943 Austin Group Defect 1425 is applied, clarifying the requirements for a *trap* action on **EXIT**.

82944 Austin Group Defect 1602 is applied, clarifying the behavior of *exit* in a *trap* action.

82945 Austin Group Defect 1629 is applied, adding exit status 128 to the APPLICATION USAGE  
82946 section.

82947 **NAME**

82948 export — set the export attribute for variables

82949 **SYNOPSIS**

82950 export name [=word] . . .

82951 export -p

82952 **DESCRIPTION**

82953 The shell shall give the *export* attribute to the variables corresponding to the specified *names*,  
82954 which shall cause them to be in the environment of subsequently executed commands. If the  
82955 name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.

82956 The *export* special built-in shall be a declaration utility. Therefore, if *export* is recognized as the  
82957 command name of a simple command, then subsequent words of the form *name=word* shall be  
82958 expanded in an assignment context. See [Section 2.9.1.1](#).

82959 The *export* special built-in shall support XBD [Section 12.2](#).

82960 When **-p** is specified, *export* shall write to the standard output the names and values of all  
82961 exported variables, in the following format:

82962 "export %s=%s\n", <name>, <value>

82963 if *name* is set, and:

82964 "export %s\n", <name>

82965 if *name* is unset.

82966 The shell shall format the output, including the proper use of quoting, so that it is suitable for  
82967 reinput to the shell as commands that achieve the same exporting results, except:

- 82968 1. Read-only variables with values cannot be reset.
- 82969 2. Variables that were unset at the time they were output need not be reset to the unset state  
82970 if a value is assigned to the variable between the time the state was saved and the time at  
82971 which the saved output is reinput to the shell.

82972 When no arguments are given, the results are unspecified.

82973 **OPTIONS**

82974 See the DESCRIPTION.

82975 **OPERANDS**

82976 See the DESCRIPTION.

82977 **STDIN**

82978 Not used.

82979 **INPUT FILES**

82980 None.

82981 **ENVIRONMENT VARIABLES**

82982 None.

82983 **ASYNCHRONOUS EVENTS**

82984 Default.

82985 **STDOUT**

82986 See the DESCRIPTION.

82987 **STDERR**

82988 The standard error shall be used only for diagnostic messages.

82989 **OUTPUT FILES**

82990 None.

82991 **EXTENDED DESCRIPTION**

82992 None.

82993 **EXIT STATUS**

82994 0 Successful completion.

82995 >0 At least one operand could not be processed as requested, such as a *name* operand that  
 82996 could not be exported or an attempt to modify a *readonly* variable using a *name=word*  
 82997 operand, or the **-p** option was specified and a write error occurred.

82998 **CONSEQUENCES OF ERRORS**

82999 Default.

83000 **APPLICATION USAGE**83001 Note that, unless *X* was previously marked *readonly*, the value of "\$?" after:83002 `export X=$(false)`

83003 will be 0 (because *export* successfully set *X* to the empty string) and that execution continues,  
 83004 even if *set -e* is in effect. In order to detect command substitution failures, a user must separate  
 83005 the assignment from the export, as in:

83006 `X=$(false)`83007 `export X`

83008 In shells that support extended assignment syntax, for example to allow an array to be  
 83009 populated with a single assignment, such extensions can typically only be used in assignments  
 83010 specified as arguments to *export* if the command word is literally *export*, and not if it is some  
 83011 other word that expands to *export*. For example:

83012 `# Shells that support array assignment as an extension generally`83013 `# support this:`83014 `export x=(1 2 3); echo ${x[0]} # outputs 1`83015 `# But generally do not support this:`83016 `e=export; $e x=(1 2 3); echo ${x[0]} # syntax error`83017 **EXAMPLES**83018 Export *PWD* and *HOME* variables:83019 `export PWD HOME`83020 Set and export the *PATH* variable:83021 `export PATH="/local/bin:$PATH"`

83022 Save and restore all exported variables:

83023 `export -p > temp-file`83024 `unset a lot of variables`83025 `... processing`83026 `./temp-file`

83027 **Note:** If LANG, LC\_CTYPE or LC\_ALL are left altered or unset in the above example prior to sourcing  
83028 `temp-file`, the results may be undefined.

### 83029 RATIONALE

83030 Some historical shells use the no-argument case as the functional equivalent of what is required  
83031 here with `-p`. This feature was left unspecified because it is not historical practice in all shells,  
83032 and some scripts may rely on the now-unspecified results on their implementations. Attempts to  
83033 specify the `-p` output as the default case were unsuccessful in achieving consensus. The `-p`  
83034 option was added to allow portable access to the values that can be saved and then later restored  
83035 using; for example, a *dot* script.

83036 Some implementations extend the shell's assignment syntax, for example to allow an array to be  
83037 populated with a single assignment, and in order for such an extension to be usable in  
83038 assignments specified as arguments to *export* these shells have *export* as a separate token in their  
83039 grammar. This standard only permits an extension of this nature when the input to the shell  
83040 would contain a syntax error according to the standard grammar. Note that although *export* can  
83041 be a separate token in the shell's grammar, it cannot be a reserved word since *export* is a  
83042 candidate for alias substitution whereas reserved words are not (see [Section 2.3.1](#)).

### 83043 FUTURE DIRECTIONS

83044 None.

### 83048 CHANGE HISTORY

#### 83049 Issue 6

83050 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

83051 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83052 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83053 behavior is intended.

83054 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to  
83055 the end of the first paragraph of the DESCRIPTION: ``If the name of a variable is followed by  
83056 `=word`, then the value of that variable shall be set to `word`.``. The reason for this change is that the  
83057 SYNOPSIS for *export* includes:

```
83058 export name [=word] . . .
```

83059 but the meaning of the optional `=word` is never explained in the text.

#### 83060 Issue 7

83061 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0043 [352] is applied.

83062 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0051 [654] and XCU/TC2-2008/0052  
83063 [960] are applied.

#### 83064 Issue 8

83065 Austin Group Defect 351 is applied, requiring *export* to be a declaration utility.

83066 Austin Group Defect 367 is applied, changing the EXIT STATUS section.

83067 Austin Group Defect 1258 is applied, changing the EXAMPLES section.

83068  
83069

Austin Group Defect 1393 is applied, changing the APPLICATION USAGE and RATIONALE sections.

83070 **NAME**

83071           readonly — set the readonly attribute for variables

83072 **SYNOPSIS**

83073           readonly name [=word] . . .

83074           readonly -p

83075 **DESCRIPTION**

83076           The variables whose *names* are specified shall be given the *readonly* attribute. The values of  
83077           variables with the *readonly* attribute cannot be changed by subsequent assignment or use of the  
83078           *export*, *getopts*, *readonly*, or *read* utilities, nor can those variables be unset by the *unset* utility. As  
83079           described in XBD [Section 8.1](#), conforming applications shall not request to mark a variable as  
83080           *readonly* if it is documented as being manipulated by a shell built-in utility, as it may render  
83081           those utilities unable to complete successfully. If the name of a variable is followed by *=word*,  
83082           then the value of that variable shall be set to *word*.

83083           The *readonly* special built-in shall be a declaration utility. Therefore, if *readonly* is recognized as  
83084           the command name of a simple command, then subsequent words of the form *name=word* shall  
83085           be expanded in an assignment context. See [Section 2.9.1.1](#).

83086           The *readonly* special built-in shall support XBD [Section 12.2](#).

83087           When *-p* is specified, *readonly* writes to the standard output the names and values of all read-  
83088           only variables, in the following format:

83089           "readonly %s=%s\n", <name>, <value>

83090           if *name* is set, and

83091           "readonly %s\n", <name>

83092           if *name* is unset.

83093           The shell shall format the output, including the proper use of quoting, so that it is suitable for  
83094           reinput to the shell as commands that achieve the same value and *readonly* attribute-setting  
83095           results in a shell execution environment in which:

- 83096           1. Variables with values at the time they were output do not have the *readonly* attribute set.
- 83097           2. Variables that were unset at the time they were output do not have a value at the time at  
83098           which the saved output is reinput to the shell.

83099           When no arguments are given, the results are unspecified.

83100 **OPTIONS**

83101           See the DESCRIPTION.

83102 **OPERANDS**

83103           See the DESCRIPTION.

83104 **STDIN**

83105           Not used.

83106 **INPUT FILES**

83107           None.

83108 **ENVIRONMENT VARIABLES**

83109           None.

83110 **ASYNCHRONOUS EVENTS**

83111 Default.

83112 **STDOUT**

83113 See the DESCRIPTION.

83114 **STDERR**

83115 The standard error shall be used only for diagnostic messages.

83116 **OUTPUT FILES**

83117 None.

83118 **EXTENDED DESCRIPTION**

83119 None.

83120 **EXIT STATUS**

83121 0 Successful completion.

83122 >0 At least one operand could not be processed as requested, such as a *name* operand that  
 83123 could not be marked *readonly* or an attempt to modify an already *readonly* variable using a  
 83124 *name=word* operand, or the **-p** option was specified and a write error occurred.

83125 **CONSEQUENCES OF ERRORS**

83126 Default.

83127 **APPLICATION USAGE**

83128 In shells that support extended assignment syntax, for example to allow an array to be  
 83129 populated with a single assignment, such extensions can typically only be used in assignments  
 83130 specified as arguments to *readonly* if the command word is literally *readonly*, and not if it is some  
 83131 other word that expands to *readonly*. For example:

```
83132 # Shells that support array assignment as an extension generally
83133 # support this:
83134 readonly x=(1 2 3); echo ${x[0]} # outputs 1
83135 # But generally do not support this:
83136 r=readonly; $r x=(1 2 3); echo ${x[0]} # syntax error
```

83137 **EXAMPLES**83138 `readonly HOME`83139 **RATIONALE**

83140 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of  
 83141 POSIX.1-2024 allows this behavior, but does not require it.

83142 The **-p** option allows portable access to the values that can be saved and then later restored  
 83143 using, for example, a *dot* script. Also see the RATIONALE for *export* for a description of the no-  
 83144 argument and **-p** output cases and a related example.

83145 Read-only functions were considered, but they were omitted as not being historical practice or  
 83146 particularly useful. Furthermore, functions must not be read-only across invocations to preclude  
 83147 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-  
 83148 known utility with the intent of subverting the real intent of the user) of administrative or  
 83149 security-relevant (or security-conscious) shell scripts.

83150 Attempts to set the *readonly* attribute on certain variables, such as *PWD*, may have surprising  
 83151 results. Either *readonly* will reject the attempt, or the attempt will succeed but the shell will  
 83152 continue to alter the contents of *PWD* during the *cd* utility, or the attempt will succeed and  
 83153 render the *cd* utility inoperative (since it must not change directories if it cannot also update

83154 *PWD*).

83155 Some implementations extend the shell's assignment syntax, for example to allow an array to be  
83156 populated with a single assignment, and in order for such an extension to be usable in  
83157 assignments specified as arguments to *readonly* these shells have *readonly* as a separate token in  
83158 their grammar. This standard only permits an extension of this nature when the input to the  
83159 shell would contain a syntax error according to the standard grammar. Note that although  
83160 *readonly* can be a separate token in the shell's grammar, it cannot be a reserved word since  
83161 *readonly* is a candidate for alias substitution whereas reserved words are not (see [Section 2.3.1](#)).

#### 83162 **FUTURE DIRECTIONS**

83163 None.

#### 83164 **SEE ALSO**

83165 [Section 2.9.1.1](#), [Section 2.15](#)

83166 [XBD Section 12.2](#)

#### 83167 **CHANGE HISTORY**

##### 83168 **Issue 6**

83169 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

83170 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83171 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83172 behavior is intended.

83173 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to  
83174 the end of the first paragraph of the DESCRIPTION: ``If the name of a variable is followed by  
83175 *=word*, then the value of that variable shall be set to *word*.''. The reason for this change is that the  
83176 SYNOPSIS for *readonly* includes:

```
83177 readonly name [=word] . . .
```

83178 but the meaning of the optional ``*=word*'' is never explained in the text.

##### 83179 **Issue 7**

83180 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0052 [960] is applied.

##### 83181 **Issue 8**

83182 Austin Group Defect 351 is applied, requiring *readonly* to be a declaration utility.

83183 Austin Group Defect 367 is applied, clarifying that the values of *readonly* variables cannot be  
83184 changed by subsequent use of the *export*, *getopts*, *readonly*, or *read* utilities, and changing the EXIT  
83185 STATUS, EXAMPLES and RATIONALE sections.

83186 Austin Group Defect 1393 is applied, changing the APPLICATION USAGE and RATIONALE  
83187 sections.

83188 **NAME**

83189 return — return from a function or dot script

83190 **SYNOPSIS**83191 return [*n*]83192 **DESCRIPTION**83193 The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the  
83194 shell is not currently executing a function or *dot* script, the results are unspecified.83195 **OPTIONS**

83196 None.

83197 **OPERANDS**

83198 See the DESCRIPTION.

83199 **STDIN**

83200 Not used.

83201 **INPUT FILES**

83202 None.

83203 **ENVIRONMENT VARIABLES**

83204 None.

83205 **ASYNCHRONOUS EVENTS**

83206 Default.

83207 **STDOUT**

83208 Not used.

83209 **STDERR**

83210 The standard error shall be used only for diagnostic messages.

83211 **OUTPUT FILES**

83212 None.

83213 **EXTENDED DESCRIPTION**

83214 None.

83215 **EXIT STATUS**83216 The exit status shall be *n*, if specified, except that the behavior is unspecified if *n* is not an  
83217 unsigned decimal integer or is greater than 255. If *n* is not specified, the result shall be as if *n*  
83218 were specified with the current value of the special parameter '?' (see [Section 2.5.2](#)), except that  
83219 if the *return* command would cause the end of execution of a *trap* action, the value for the special  
83220 parameter '?' that is considered ``current'' shall be the value it had immediately preceding the  
83221 *trap* action.83222 **CONSEQUENCES OF ERRORS**

83223 Default.

83224 **APPLICATION USAGE**

83225 None.

83226 **EXAMPLES**

83227 None.

83228 **RATIONALE**

83229 The behavior of *return* when not in a function or *dot* script differs between the System V shell  
83230 and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is  
83231 the same as *exit*.

83232 The results of returning a number greater than 255 are undefined because of differing practices  
83233 in the various historical implementations. Some shells AND out all but the low-order 8 bits;  
83234 others allow larger values, but not of unlimited size.

83235 See the discussion of appropriate exit status values under *exit*.

83236 **FUTURE DIRECTIONS**

83237 None.

83238 **SEE ALSO**83239 [Section 2.9.5](#), [Section 2.15](#), *dot*83240 **CHANGE HISTORY**83241 **Issue 6**

83242 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83243 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83244 behavior is intended.

83245 **Issue 7**

83246 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0044 [214] and XCU/TC1-2008/0045  
83247 [214] are applied.

83248 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0052 [960] is applied.

83249 **Issue 8**

83250 Austin Group Defect 1309 is applied, changing the EXIT STATUS section.

83251 Austin Group Defect 1602 is applied, clarifying the behavior of *return* in a *trap* action.

83252 **NAME**

83253 set — set or unset options and positional parameters

83254 **SYNOPSIS**83255 set [-abCefhmnvux] [-o *option*] [*argument...*]83256 set [+abCefhmnvux] [+o *option*] [*argument...*]83257 set -- [*argument...*]

83258 set -o

83259 set +o

83260 **DESCRIPTION**

83261 If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables  
 83262 in the collation sequence of the current locale. Each *name* shall start on a separate line, using the  
 83263 format:

83264 "%s=%s\n", <*name*>, <*value*>

83265 The *value* string shall be written with appropriate quoting; see the description of shell quoting in  
 83266 [Section 2.2](#). The output shall be suitable for reinput to the shell, setting or resetting, as far as  
 83267 possible, the variables that are currently set; read-only variables cannot be reset.

83268 When options are specified, they shall set or unset attributes of the shell, as described below.  
 83269 When *arguments* are specified, they cause positional parameters to be set or unset, as described  
 83270 below. Setting or unsetting attributes and positional parameters are not necessarily related  
 83271 actions, but they can be combined in a single invocation of *set*.

83272 The *set* special built-in shall support XBD [Section 12.2](#) except that options can be specified with  
 83273 either a leading <hyphen-minus> (meaning enable the option) or <plus-sign> (meaning disable  
 83274 it) unless otherwise specified.

83275 Implementations shall support the options in the following list in both their <hyphen-minus>  
 83276 and <plus-sign> forms. These options can also be specified as options to *sh*.

83277 **-a** Set the *export* attribute for all variable assignments. When this option is on, whenever a  
 83278 value is assigned to a variable in the current shell execution environment, the *export*  
 83279 attribute shall be set for the variable. This applies to all forms of assignment, including  
 83280 those made as a side-effect of variable expansions or arithmetic expansions, and those made  
 83281 as a result of the operation of the *cd*, *getopts*, or *read* utilities.

83282 **Note:** As discussed in [Section 2.9.1](#), not all variable assignments happen in the current execution  
 83283 environment. When an assignment happens in a separate execution environment the  
 83284 *export* attribute is still set for the variable, but that does not affect the current execution  
 83285 environment.

83286 **-b** This option shall be supported if the implementation supports the User Portability Utilities  
 83287 option. When job control and **-b** are both enabled, the shell shall write asynchronous  
 83288 notifications of background job completions (including termination by a signal), and may  
 83289 write asynchronous notifications of background job suspensions. See [Section 2.11](#) for  
 83290 details. When job control is disabled, the **-b** option shall have no effect. Asynchronous  
 83291 notification shall not be enabled by default.

83292 **-C** (Uppercase C.) Prevent existing regular files from being overwritten by the shell's '>'   
 83293 redirection operator (see [Section 2.7.2](#)); the '>|' redirection operator shall override this  
 83294 *noclobber* option for an individual file.

83295 **-e** When this option is on, when any command fails (for any of the reasons listed in [Section](#)  
 83296 [2.8.1](#) or by returning an exit status greater than zero), the shell immediately shall exit, as if  
 83297 by executing the *exit* special built-in utility with no arguments, with the following  
 83298 exceptions:

- 83299 1. The failure of any individual command in a multi-command pipeline, or of any  
 83300 subshell environments in which command substitution was performed during word  
 83301 expansion, shall not cause the shell to exit. Only the failure of the pipeline itself shall  
 83302 be considered.
- 83303 2. The **-e** setting shall be ignored when executing the compound list following the  
 83304 **while**, **until**, **if**, or **elif** reserved word, a pipeline beginning with the **!** reserved word,  
 83305 or any command of an AND-OR list other than the last.
- 83306 3. If the exit status of a compound command other than a subshell command was the  
 83307 result of a failure while **-e** was being ignored, then **-e** shall not apply to this  
 83308 command.

83309 This requirement applies to the shell environment and each subshell environment  
 83310 separately. For example, in:

```
83311 set -e; (false; echo one) | cat; echo two
```

83312 the *false* command causes the subshell to exit without executing *echo one*; however, *echo*  
 83313 *two* is executed because the exit status of the pipeline `(false; echo one) | cat` is  
 83314 zero.

83315 In

```
83316 set -e; echo $(false; echo one) two
```

83317 the *false* command causes the subshell in which the command substitution is performed to  
 83318 exit without executing *echo one*; the exit status of the subshell is ignored and the shell  
 83319 then executes the word-expanded command *echo two*.

83320 **-f** The shell shall disable pathname expansion.

83321 **-h** Setting this option may speed up *PATH* searches (see [XBD Chapter 8](#)). This option may be  
 83322 enabled by default.

83323 **-m** This option shall be supported if the implementation supports the User Portability Utilities  
 83324 option. When this option is enabled, the shell shall perform job control actions as described  
 83325 in [Section 2.11](#). This option shall be enabled by default for interactive shells.

83326 **-n** The shell shall read commands but does not execute them; this can be used to check for  
 83327 shell script syntax errors. Interactive shells and subshells of interactive shells, recursively,  
 83328 may ignore this option.

83329 **-o** Write the current settings of the options to standard output in an unspecified format.

83330 **+o** Write the current option settings to standard output in a format that is suitable for reinput  
 83331 to the shell as commands that achieve the same options settings.

83332 **-o option**

83333 Set various options, many of which shall be equivalent to the single option letters. The  
 83334 following values of *option* shall be supported:

83335 *allexport* Equivalent to **-a**.

83336	<i>errexist</i>	Equivalent to <b>-e</b> .
83337	<i>ignoreeof</i>	Prevent an interactive shell from exiting on end-of-file. This setting prevents accidental logouts when <control>-D is entered. A user shall explicitly <i>exit</i> to leave the interactive shell. This option shall be supported if the system supports the User Portability Utilities option.
83338		
83339		
83340		
83341	<i>monitor</i>	Equivalent to <b>-m</b> . This option shall be supported if the system supports the User Portability Utilities option.
83342		
83343	<i>noclobber</i>	Equivalent to <b>-C</b> (uppercase C).
83344	<i>noglob</i>	Equivalent to <b>-f</b> .
83345	<i>noexec</i>	Equivalent to <b>-n</b> .
83346	OB <i>nolog</i>	Prevent the entry of function definitions into the command history; see <a href="#">Command History List</a> . This option may have no effect; it is kept for compatibility with previous versions of the standard. This option shall be supported if the system supports the User Portability Utilities option.
83347		
83348		
83349		
83350	<i>notify</i>	Equivalent to <b>-b</b> .
83351	<i>nounset</i>	Equivalent to <b>-u</b> .
83352	<i>pipefail</i>	Derive the exit status of a pipeline from the exit statuses of all of the commands in the pipeline, not just the last (rightmost) command, as described in <a href="#">Section 2.9.2</a> .
83353		
83354		
83355	<i>verbose</i>	Equivalent to <b>-v</b> .
83356	<i>vi</i>	Allow shell command line editing using the built-in <i>vi</i> editor. Enabling <i>vi</i> mode shall disable any other command line editing mode provided as an implementation extension. This option shall be supported if the system supports the User Portability Utilities option.
83357		
83358		
83359		
83360		It need not be possible to set <i>vi</i> mode on for certain block-mode terminals.
83361	<i>xtrace</i>	Equivalent to <b>-x</b> .
83362	<b>-u</b>	When the shell tries to expand, in a parameter expansion or an arithmetic expansion, an unset parameter other than the '@' and '*' special parameters, it shall write a message to standard error and the expansion shall fail with the consequences specified in <a href="#">Section 2.8.1</a> .
83363		
83364		
83365	<b>-v</b>	The shell shall write its input to standard error as it is read.
83366	<b>-x</b>	The shell shall write to standard error a trace for each command after it expands the command and before it executes it. It is unspecified whether the command that turns tracing off is traced.
83367		
83368		
83369		The default for all these options shall be off (unset) unless stated otherwise in the description of the option or unless the shell was invoked with them on; see <i>sh</i> .
83370		
83371		The remaining arguments shall be assigned in order to the positional parameters. The special parameter '#' shall be set to reflect the number of positional parameters. All positional parameters shall be unset before any new values are assigned.
83372		
83373		
83374		If the first argument is '-', the results are unspecified.
83375		The special argument "--" immediately following the <i>set</i> command name can be used to delimit the arguments if the first argument begins with '+' or '-', or to prevent inadvertent listing of all shell variables when there are no arguments. The command <i>set --</i> without <i>argument</i>
83376		
83377		

83378 shall unset all positional parameters and set the special parameter '# ' to zero.

83379 **OPTIONS**

83380 See the DESCRIPTION.

83381 **OPERANDS**

83382 See the DESCRIPTION.

83383 **STDIN**

83384 Not used.

83385 **INPUT FILES**

83386 None.

83387 **ENVIRONMENT VARIABLES**

83388 None.

83389 **ASYNCHRONOUS EVENTS**

83390 Default.

83391 **STDOUT**

83392 See the DESCRIPTION.

83393 **STDERR**

83394 The standard error shall be used only for diagnostic messages.

83395 **OUTPUT FILES**

83396 None.

83397 **EXTENDED DESCRIPTION**

83398 None.

83399 **EXIT STATUS**

83400 0 Successful completion.

83401 >0 An invalid option was specified, or an error occurred.

83402 **CONSEQUENCES OF ERRORS**

83403 Default.

83404 **APPLICATION USAGE**

83405 Application writers should avoid relying on *set -e* within functions. For example, in the  
83406 following script:

```
83407 set -e
83408 start () {
83409     some_server
83410     echo some_server started successfully
83411 }
83412 start || echo >&2 some_server failed
```

83413 the *-e* setting is ignored within the function body (because the function is a command in an  
83414 AND-OR list other than the last). Therefore, if *some\_server* fails, the function carries on to  
83415 echo "some\_server started successfully", and the exit status of the function is zero  
83416 (which means "some\_server failed" is not output).

83417 Use of *set -n* causes the shell to parse the rest of the script without executing any commands,  
83418 meaning that *set +n* cannot be used to undo the effect. Syntax checking is more commonly done  
83419 via *sh -n script\_name*.

83420 **EXAMPLES**

83421 Write out all variables and their values:

83422 `set`

83423 Set \$1, \$2, and \$3 and set "\$#" to 3:

83424 `set c a b`83425 Turn on the `-x` and `-v` options:83426 `set -xv`

83427 Unset all positional parameters:

83428 `set --`83429 Set \$1 to the value of *x*, even if it begins with '-' or '+':83430 `set -- "$x"`83431 Set the positional parameters to the expansion of *x*, even if *x* expands with a leading '-' or '+':83432 `set -- $x`83433 **RATIONALE**

83434 The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the  
 83435 Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether  
 83436 the `set --` form might be misinterpreted as being equivalent to `set` without any options or  
 83437 arguments. The functionality of this form has been adopted from the KornShell. In System V, `set`  
 83438 `--` only unsets parameters if there is at least one argument; the only way to unset all parameters  
 83439 is to use *shift*. Using the KornShell version should not affect System V scripts because there  
 83440 should be no reason to issue it without arguments deliberately; if it were issued as, for example:

83441 `set -- "$@"`

83442 and there were in fact no arguments resulting from "\$@", unsetting the parameters would have  
 83443 no result.

83444 The `set +` form in early proposals was omitted as being an unnecessary duplication of `set` alone  
 83445 and not widespread historical practice.

83446 The *noclobber* option was changed to allow `set -C` as well as the `set -o noclobber` option. The  
 83447 single-letter version was added so that the historical "\$-" paradigm would not be broken; see  
 83448 [Section 2.5.2](#).

83449 The description of the `-e` option is intended to match the behavior of the 1988 version of the  
 83450 KornShell.

83451 The `-h` option is related to command name hashing. See *hash*. The normative description is  
 83452 deliberately vague because the way this option works varies between shell implementations.

83453 Earlier versions of this standard specified `-h` as a way to locate and remember utilities to be  
 83454 invoked by functions as those functions are defined (the utilities are normally located when the  
 83455 function is executed). However, this did not match existing practice in most shells.

83456 The following `set` options were omitted intentionally with the following rationale:

83457 **-k** The `-k` option was originally added by the author of the Bourne shell to make it easier for  
 83458 users of pre-release versions of the shell. In early versions of the Bourne shell the construct  
 83459 `set name=value` had to be used to assign values to shell variables. The problem with `-k` is  
 83460 that the behavior affects parsing, virtually precluding writing any compilers. To explain the

83461 behavior of `-k`, it is necessary to describe the parsing algorithm, which is implementation-  
83462 defined. For example:

```
83463 set -k; echo name=value
```

83464 and:

```
83465 set -k  
83466 echo name=value
```

83467 behave differently. The interaction with functions is even more complex. What is more, the  
83468 `-k` option is never needed, since the command line could have been reordered.

83469 `-t` The `-t` option is hard to specify and almost never used. The only known use could be done  
83470 with here-documents. Moreover, the behavior with *ksh* and *sh* differs. The reference page  
83471 says that it exits after reading and executing one command. What is one command? If the  
83472 input is *date;date*, *sh* executes both *date* commands while *ksh* does only the first.

83473 Consideration was given to rewriting *set* to simplify its confusing syntax. A specific suggestion  
83474 was that the *unset* utility should be used to unset options instead of using the non-*getopt*(-)-able  
83475 `+option` syntax. However, the conclusion was reached that the historical practice of using `+option`  
83476 was satisfactory and that there was no compelling reason to modify such widespread historical  
83477 practice.

83478 The `-o` option was adopted from the KornShell to address user needs. In addition to its  
83479 generally friendly interface, `-o` is needed to provide the *vi* command line editing mode, for  
83480 which historical practice yields no single-letter option name. (Although it might have been  
83481 possible to invent such a letter, it was recognized that other editing modes would be developed  
83482 and `-o` provides ample name space for describing such extensions.)

83483 Historical implementations are inconsistent in the format used for `-o` option status reporting.  
83484 The `+o` format without an option-argument was added to allow portable access to the options  
83485 that can be saved and then later restored using, for instance, a dot script.

83486 Historically, *sh* did trace the command `set +x`, but *ksh* did not.

83487 The *ignoreeof* setting prevents accidental logouts when the end-of-file character (typically  
83488 `<control>-D`) is entered. A user shall explicitly *exit* to leave the interactive shell.

83489 The `set -m` option was added to apply only to the UPE because it applies primarily to interactive  
83490 use, not shell script applications.

83491 The ability to do asynchronous notification became available in the 1988 version of the  
83492 KornShell. To have it occur, the user had to issue the command:

```
83493 trap "jobs -n" CLD
```

83494 The C shell provides two different levels of an asynchronous notification capability. The  
83495 environment variable *notify* is analogous to what is done in `set -b` or `set -o notify`. When set, it  
83496 notifies the user immediately of background job completions. When unset, this capability is  
83497 turned off.

83498 The other notification ability comes through the built-in utility *notify*. The syntax is:

```
83499 notify [%job ... ]
```

83500 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when  
83501 the state of the current job changes. If given operands, *notify* asynchronously informs the user of  
83502 changes in the states of the specified jobs.

83503 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,

83504 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX  
83505 environment variable name).

83506 The *set -b* option was selected as a compromise.

83507 The *notify* built-in was considered to have more functionality than was required for simple  
83508 asynchronous notification.

83509 Historically, some shells applied the *-u* option to all parameters including *\$@* and *\$\**. The  
83510 standard developers felt that this was a misfeature since it is normal and common for *\$@* and *\$\**  
83511 to be used in shell scripts regardless of whether they were passed any arguments. Treating these  
83512 uses as an error when no arguments are passed reduces the value of *-u* for its intended purpose  
83513 of finding spelling mistakes in variable names and uses of unset positional parameters.

#### 83514 FUTURE DIRECTIONS

83515 A future version of this standard may remove the *-o nolog* option.

#### 83516 SEE ALSO

83517 [Section 2.15, \*hash\*](#)

83518 [XBD Section 4.26, Section 12.2](#)

#### 83519 CHANGE HISTORY

##### 83520 Issue 6

83521 The obsolescent *set* command name followed by *'-'* has been removed.

83522 The following new requirements on POSIX implementations derive from alignment with the  
83523 Single UNIX Specification:

- 83524 • The *nolog* option is added to *set -o*.

83525 IEEE PASC Interpretation 1003.2 #167 is applied, clarifying that the options default also takes  
83526 into account the description of the option.

83527 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83528 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83529 behavior is intended.

83530 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/8 is applied, changing the square  
83531 brackets in the example in RATIONALE to be in bold, which is the typeface used for optional  
83532 items.

##### 83533 Issue 7

83534 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
83535 argument is *'-'*.

83536 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83537 XSI shading is removed from the *-h* functionality.

83538 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0046 [52], XCU/TC1-2008/0047  
83539 [155,280], XCU/TC1-2008/0048 [52], XCU/TC1-2008/0049 [52], and XCU/TC1-2008/0050  
83540 [155,430] are applied.

83541 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0053 [584], XCU/TC2-2008/0054  
83542 [717], XCU/TC2-2008/0055 [717], and XCU/TC2-2008/0056 [960] are applied.

83543 **Issue 8**

- 83544 Austin Group Defect 559 is applied, changing the description of the `-u` option.
- 83545 Austin Group Defect 789 is applied, adding `-o pipefail`.
- 83546 Austin Group Defect 981 is applied, changing the description of the `-o nolog` option and the  
83547 FUTURE DIRECTIONS section.
- 83548 Austin Group Defects 1009 and 1555 are applied, changing the description of the `-a` option.
- 83549 Austin Group Defect 1016 is applied, changing the description of the `-C` option.
- 83550 Austin Group Defect 1055 is applied, adding a paragraph about the `-n` option to the  
83551 APPLICATION USAGE section.
- 83552 Austin Group Defect 1063 is applied, changing the description of the `-h` option.
- 83553 Austin Group Defect 1150 is applied, changing the description of the `-e` option.
- 83554 Austin Group Defect 1207 is applied, clarifying which option-arguments of the `-o` option are  
83555 related to the User Portability Utilities option.
- 83556 Austin Group Defect 1254 is applied, changing the descriptions of the `-b` and `-m` options.
- 83557 Austin Group Defect 1384 is applied, allowing subshells of interactive shells to ignore the `-n`  
83558 option.

**83559 NAME**

83560 shift — shift positional parameters

**83561 SYNOPSIS**

83562 shift [*n*]

**83563 DESCRIPTION**

83564 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of  
83565 parameter (1+*n*), parameter 2 shall be assigned the value of parameter (2+*n*), and so on. The  
83566 parameters represented by the numbers "\$#" down to "\$#-*n*+1" shall be unset, and the  
83567 parameter '#' is updated to reflect the new number of positional parameters.

83568 The value *n* shall be an unsigned decimal integer less than or equal to the value of the special  
83569 parameter '#'. If *n* is not given, it shall be assumed to be 1. If *n* is 0, the positional and special  
83570 parameters are not changed.

**83571 OPTIONS**

83572 None.

**83573 OPERANDS**

83574 See the DESCRIPTION.

**83575 STDIN**

83576 Not used.

**83577 INPUT FILES**

83578 None.

**83579 ENVIRONMENT VARIABLES**

83580 None.

**83581 ASYNCHRONOUS EVENTS**

83582 Default.

**83583 STDOUT**

83584 Not used.

**83585 STDERR**

83586 The standard error shall be used only for diagnostic messages and the warning message  
83587 specified in EXIT STATUS.

**83588 OUTPUT FILES**

83589 None.

**83590 EXTENDED DESCRIPTION**

83591 None.

**83592 EXIT STATUS**

83593 If the *n* operand is invalid or is greater than "\$#", this may be treated as an error and a non-  
83594 interactive shell may exit; if the shell does not exit in this case, a non-zero exit status shall be  
83595 returned and a warning message shall be written to standard error. Otherwise, zero shall be  
83596 returned.

**83597 CONSEQUENCES OF ERRORS**

83598 Default.

83599 **APPLICATION USAGE**

83600 None.

83679 DESCRIPTION from: "Write the accumulated user and system times for the shell and for all of  
83680 its child processes ..." to: "The *times* utility shall write the accumulated user and system times for  
83681 the shell and for all of its child processes ...".83682 **Issue 7**

83683 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0056 [960] is applied.

83684 **NAME**

83685 trap — trap signals

83686 **SYNOPSIS**83687 trap *n* [*condition...*]83688 trap -p [*condition...*]83689 trap [*action condition...*]83690 **DESCRIPTION**

83691 If the **-p** option is not specified and the first operand is an unsigned decimal integer, the shell  
 83692 shall treat all operands as conditions, and shall reset each condition to the default value.  
 83693 Otherwise, if the **-p** option is not specified and there are operands, the first operand shall be  
 83694 treated as an action and the remaining as conditions.

83695 If *action* is '-', the shell shall reset each *condition* to the default value. If *action* is null (""), the  
 83696 shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read  
 83697 and executed by the shell when one of the corresponding conditions arises. The action of *trap*  
 83698 shall override a previous action (either default action or one explicitly set). The value of "\$?"  
 83699 after the *trap* action completes shall be the value it had before the *trap* action was executed.

83700 The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name,  
 83701 without the SIG prefix, as listed in the tables of signal names in the <signal.h> header defined in  
 83702 XBD Chapter 14; for example, HUP, INT, QUIT, TERM. Implementations may permit names  
 83703 with the SIG prefix or ignore case in signal names as an extension. Setting a trap for SIGKILL or  
 83704 SIGSTOP produces undefined results.

83705 The EXIT condition shall occur when the shell terminates normally (exits), and may occur when  
 83706 the shell terminates abnormally as a result of delivery of a signal (other than SIGKILL) whose  
 83707 *trap* action is the default.

83708 The environment in which the shell executes a *trap* action on EXIT shall be identical to the  
 83709 environment immediately after the last command executed before the *trap* action on EXIT was  
 83710 executed.

83711 If *action* is neither '-' nor the empty string, then each time a matching *condition* arises, the *action*  
 83712 shall be executed in a manner equivalent to:

83713 eval *action*

83714 Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although  
 83715 no error need be reported when attempting to do so. An interactive shell may reset or catch  
 83716 signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed  
 83717 with another *trap* command.

83718 When a subshell is entered, traps that are not being ignored shall be set to the default actions,  
 83719 except in the case of a command substitution containing only a single *trap* command, when the  
 83720 traps need not be altered. Implementations may check for this case using only lexical analysis;  
 83721 for example, if `trap` and \$( trap -- ) do not alter the traps in the subshell, cases such as  
 83722 assigning var=trap and then using \$( \$var ) may still alter them. This does not imply that the  
 83723 *trap* command cannot be used within the subshell to set new traps.

83724 The *trap* command with no operands shall write to standard output a list of commands  
 83725 associated with each of a set of conditions; if the **-p** option is not specified, this set shall contain  
 83726 only the conditions that are not in the default state (including signals that were ignored on entry  
 83727 to a non-interactive shell); if the **-p** option is specified, the set shall contain all conditions, except  
 83728 that it is unspecified whether conditions corresponding to the SIGKILL and SIGSTOP signals are  
 83729 included in the set. If the command is executed in a subshell, the implementation does not

83730 perform the optional check described above for a command substitution containing only a single  
 83731 *trap* command, and no *trap* commands with operands have been executed since entry to the  
 83732 subshell, the list shall contain the commands that were associated with each condition  
 83733 immediately before the subshell environment was entered. Otherwise, the list shall contain the  
 83734 commands currently associated with each condition. The format shall be:

```
83735 "trap -- %s %s ...\n", <action>, <condition> ...
```

83736 The shell shall format the output, including the proper use of quoting, so that it is suitable for  
 83737 reinput to the shell as commands that achieve the same trapping results for the set of conditions  
 83738 included in the output, except for signals that were ignored on entry to the shell as described  
 83739 above. If this set includes conditions corresponding to the SIGKILL and SIGSTOP signals, the  
 83740 shell shall accept them when the output is reinput to the shell (where accepting them means  
 83741 they do not cause a non-zero exit status, a diagnostic message, or undefined behavior). For  
 83742 example:

```
83743 save_traps=$(trap -p)
```

```
83744 ...
83745 eval "$save_traps"
```

83746 or:

```
83747 save_traps=$(trap -p INT QUIT)
83748 trap "some command" INT QUIT
```

```
83749 ...
83750 eval "$save_traps"
```

83751 XSI XSI-conformant systems also allow numeric signal numbers for the conditions corresponding to  
 83752 the following signal names:

```
83753 1  SIGHUP
83754 2  SIGINT
83755 3  SIGQUIT
83756 6  SIGABRT
83757 9  SIGKILL
83758 14 SIGALRM
83759 15 SIGTERM
```

83760 XSI If an invalid signal name **or number** is specified, the *trap* utility shall write a warning message  
 83761 to standard error.

83762 The *trap* special built-in shall conform to XBD [Section 12.2](#).

## 83763 OPTIONS

83764 The following option shall be supported:

83765 **-p** Write to standard output a list of commands associated with each *condition* operand. The  
 83766 behavior when there are no operands is specified in the DESCRIPTION section.

83767 The shell shall format the output, including the proper use of quoting, so that it is suitable  
 83768 for reinput to the shell as commands that achieve the same trapping results for the specified  
 83769 set of conditions. If a *condition* operand is a condition corresponding to the SIGKILL or

83770 SIGSTOP signal, and *trap -p* without any operands would not include it in the set of  
 83771 conditions for which it writes output, the behavior is undefined if the output is reinput to  
 83772 the shell.

#### 83773 OPERANDS

83774 See the DESCRIPTION.

#### 83775 STDIN

83776 Not used.

#### 83777 INPUT FILES

83778 None.

#### 83779 ENVIRONMENT VARIABLES

83780 None.

#### 83781 ASYNCHRONOUS EVENTS

83782 Default.

#### 83783 STDOUT

83784 See the DESCRIPTION.

#### 83785 STDERR

83786 The standard error shall be used only for diagnostic messages and warning messages about  
 83787 XSI invalid signal names or numbers.

#### 83788 OUTPUT FILES

83789 None.

#### 83790 EXTENDED DESCRIPTION

83791 None.

#### 83792 EXIT STATUS

83793 XSI If the trap name or number is invalid, a non-zero exit status shall be returned; otherwise, zero  
 83794 XSI shall be returned. For both interactive and non-interactive shells, invalid signal names or  
 83795 numbers shall not be considered an error and shall not cause the shell to abort.

#### 83796 CONSEQUENCES OF ERRORS

83797 Default.

#### 83798 APPLICATION USAGE

83799 When the *-p* option is not used, since *trap* with no operands does not output commands to  
 83800 restore traps that are currently set to default, these need to be restored separately. The  
 83801 RATIONALE section shows examples and describes their drawbacks.

#### 83802 EXAMPLES

83803 Write out a list of all traps and actions:

83804 `trap`

83805 Set a trap so the *logout* utility in the directory referred to by the *HOME* environment variable  
 83806 executes when the shell terminates:

83807 `trap '$HOME'/logout' EXIT`

83808 or:

83809 `trap '$HOME'/logout' 0`

83810 Unset traps on INT, QUIT, TERM, and EXIT:

83811 `trap - INT QUIT TERM EXIT`

83812 **RATIONALE**

83813 Implementations may permit lowercase signal names as an extension. Implementations may  
 83814 also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill*  
 83815 utilities in this volume of POSIX.1-2024 are now consistent in their omission of the SIG prefix for  
 83816 signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the signals  
 83817 without prefixes.

83818 Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but  
 83819 it has no effect. Portable POSIX applications cannot attempt to trap these signals.

83820 The output format is not historical practice. Since the output of historical *trap* commands is not  
 83821 portable (because numeric signal values are not portable) and had to change to become so, an  
 83822 opportunity was taken to format the output in a way that a shell script could use to save and  
 83823 then later reuse a trap if it wanted.

83824 The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is  
 83825 allowable as an extension, but was not mandated, as other shells have not used it.

83826 The text about the environment for the EXIT trap invalidates the behavior of some historical  
 83827 versions of interactive shells which, for example, close the standard input before executing a  
 83828 trap on 0. For example, in some historical interactive shell sessions the following trap on 0  
 83829 would always print "--":

```
83830 trap 'read foo; echo "--$foo--"' 0
```

83831 The command:

```
83832 trap 'eval " $cmd"' 0
```

83833 causes the contents of the shell variable *cmd* to be executed as a command when the shell exits.  
 83834 Using:

```
83835 trap '$cmd' 0
```

83836 does not work correctly if *cmd* contains any special characters such as quoting or redirections.  
 83837 Using:

```
83838 trap " $cmd" 0
```

83839 also works (the leading <space> character protects against unlikely cases where *cmd* is a decimal  
 83840 integer or begins with '-'), but it expands the *cmd* variable when the *trap* command is executed,  
 83841 not when the exit action is executed.

83842 The **-p** option was added because without it the method used to restore traps needs to include  
 83843 special handling of traps that are set to default when *trap* with no operands is used to save the  
 83844 current traps. One example is:

```
83845 save_traps=$(trap)
83846 trap "some command" INT QUIT
83847 save_traps="trap - INT QUIT; $save_traps"
```

```
83848 ...
```

```
83849 eval "$save_traps"
```

83850 but this method relies on hard-coding the commands to reset the traps that are being set. It also  
 83851 has a race condition if INT or QUIT was not set to default when saved, since it first sets them to  
 83852 default and then restores the saved traps. A more general approach would be:

```
83853 save_traps=$(trap)
83854 for sig in EXIT $( kill -l )
```

```

83855     do
83856         case "$sig" in
83857             SIGKILL | KILL | sigkill | kill | SIGSTOP | STOP | sigstop | stop)
83858                 ;;
83859             *) trap - $sig
83860                 ;;
83861             esac
83862     done
83863     eval "$save_traps"

```

83864 This has the same race condition since it first sets all traps (that can be set) to default and then  
83865 restores those that were not previously set to default.

83866 Historically, some shells behaved the same with and without `-p` when there are no operands.  
83867 This standard requires that the set of conditions differs between the two cases: with `-p` it is all  
83868 conditions (except possibly SIGKILL and SIGSTOP); without `-p` it is only the conditions that are  
83869 not in the default state.

#### 83870 FUTURE DIRECTIONS

83871 None.

#### 83872 SEE ALSO

83873 [Section 2.15](#)

83874 [XBD Section 12.2, <signal.h>](#)

#### 83875 CHANGE HISTORY

##### 83876 Issue 6

83877 XSI-conforming implementations provide the mapping of signal names to numbers given above  
83878 (previously this had been marked obsolescent). Other implementations need not provide this  
83879 optional mapping.

83880 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83881 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83882 behavior is intended.

##### 83883 Issue 7

83884 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83885 Austin Group Interpretation 1003.1-2001 #116 is applied.

83886 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0052 [53,268,440],  
83887 XCU/TC1-2008/0053 [53,268,440], XCU/TC1-2008/0054 [163], XCU/TC1-2008/0055 [163], and  
83888 XCU/TC1-2008/0056 [163] are applied.

##### 83889 Issue 8

83890 Austin Group Defect 621 is applied, clarifying when the EXIT condition occurs.

83891 Austin Group Defect 1029 is applied, clarifying the execution of *trap* actions.

83892 Austin Group Defects 1211 and 1212 are applied, adding the `-p` option and clarifying that, when  
83893 `-p` is not specified, the output of *trap* with no operands does not list conditions that are in the  
83894 default state.

83895 Austin Group Defect 1265 is applied, updating the DESCRIPTION, STDERR and EXIT STATUS  
83896 sections to align with the changes made to [Section 2.8.1](#) between Issue 6 and Issue 7.

83897

Austin Group Defect 1285 is applied, inserting a blank line between the two SYNOPSIS lines.

83898 **NAME**

83899           unset — unset values and attributes of variables and functions

83900 **SYNOPSIS**

83901           unset [-fv] name...

83902 **DESCRIPTION**

83903           The *unset* utility shall unset each variable or function definition specified by *name* that does not  
83904           have the *readonly* attribute and remove any attributes other than *readonly* that have been given to  
83905           *name* (see [Section 2.15](#) *export* and *readonly*).

83906           If *-v* is specified, *name* refers to a variable name and the shell shall unset it and remove it from  
83907           the environment. Read-only variables cannot be unset.

83908           If *-f* is specified, *name* refers to a function and the shell shall unset the function definition.

83909           If neither *-f* nor *-v* is specified, *name* refers to a variable; if a variable by that name does not  
83910           exist, it is unspecified whether a function by that name, if any, shall be unset.

83911           Unsetting a variable or function that was not previously set shall not be considered an error and  
83912           does not cause the shell to abort.

83913           The *unset* special built-in shall support XBD [Section 12.2](#).

83914           Note that:

83915           VARIABLE=

83916           is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to " ". Also, the  
83917           variables that can be *unset* should not be misinterpreted to include the special parameters (see  
83918           [Section 2.5.2](#)).

83919 **OPTIONS**

83920           See the DESCRIPTION.

83921 **OPERANDS**

83922           See the DESCRIPTION.

83923 **STDIN**

83924           Not used.

83925 **INPUT FILES**

83926           None.

83927 **ENVIRONMENT VARIABLES**

83928           None.

83929 **ASYNCHRONOUS EVENTS**

83930           Default.

83931 **STDOUT**

83932           Not used.

83933 **STDERR**

83934           The standard error shall be used only for diagnostic messages.

83935 **OUTPUT FILES**

83936           None.

83937 **EXTENDED DESCRIPTION**

83938 None.

83939 **EXIT STATUS**83940 0 All *name* operands were successfully unset.83941 >0 At least one *name* could not be unset.83942 **CONSEQUENCES OF ERRORS**

83943 Default.

83944 **APPLICATION USAGE**

83945 None.

83946 **EXAMPLES**83947 Unset *VISUAL* variable:83948 `unset -v VISUAL`83949 Unset the functions **foo** and **bar**:83950 `unset -f foo bar`83951 **RATIONALE**83952 Consideration was given to omitting the `-f` option in favor of an *unfunction* utility, but the  
83953 standard developers decided to retain historical practice.83954 The `-v` option was introduced because System V historically used one name space for both  
83955 variables and functions. When *unset* is used without options, System V historically unset either a  
83956 function or a variable, and there was no confusion about which one was intended. A portable  
83957 POSIX application can use *unset* without an option to unset a variable, but not a function; the `-f`  
83958 option must be used.83959 **FUTURE DIRECTIONS**

83960 None.

83961 **SEE ALSO**83962 [Section 2.15](#)83963 [XBD Section 12.2](#)83964 **CHANGE HISTORY**83965 **Issue 6**83966 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
83967 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
83968 behavior is intended.83969 **Issue 7**

83970 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83971 **Issue 8**83972 Austin Group Defect 1075 is applied, clarifying that *unset* removes attributes, other than  
83973 *readonly*, from the variables it unsets.

83974

Chapter 3

83975

# Utilities

83976

This chapter contains the definitions of the utilities, as follows:

83977

- Mandatory utilities that are present on every conformant system

83978

- Optional utilities that are present only on systems supporting the associated option; see [Section 1.8.1](#) (on page 7) for information on the options in this volume of POSIX.1-2024

83979

## 83980 NAME

83981 admin — create and administer SCCS files (DEVELOPMENT)

## 83982 SYNOPSIS

```

83983 XSI admin -i[name] [-n] [-a login] [-d flag] [-e login] [-f flag]
83984 [-m mrlist] [-r rel] [-t[name] [-y[comment]]] newfile
83985 admin -n [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
83986 [-t[name]] [-y[comment]] newfile...
83987 admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t[name]] file...
83988 admin -h file...
83989 admin -z file...

```

## 83990 DESCRIPTION

83991 The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named  
 83992 file does not exist, it shall be created, and its parameters shall be initialized according to the  
 83993 specified options. Parameters not initialized by an option shall be assigned a default value. If a  
 83994 named file does exist, parameters corresponding to specified options shall be changed, and other  
 83995 parameters shall be left as is.

83996 All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files  
 83997 shall be given read-only permission mode. Write permission in the parent directory is required  
 83998 to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*)  
 83999 created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode  
 84000 as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file  
 84001 shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This  
 84002 ensures that changes are made to the SCCS file only if no errors occur.

84003 The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent  
 84004 simultaneous updates to the SCCS file; see *get*.

## 84005 OPTIONS

84006 The *admin* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the *-i*, *-t*, and *-y*  
 84007 options have optional option-arguments. These optional option-arguments shall not be  
 84008 presented as separate arguments. The following options are supported:

84009 **-n** Create a new SCCS file. When *-n* is used without *-i*, the SCCS file shall be created  
 84010 with control information but without any file data.

84011 **-i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken.  
 84012 The text constitutes the first delta of the file (see the *-r* option for the delta  
 84013 numbering scheme). If the *-i* option is used, but the *name* option-argument is  
 84014 omitted, the text shall be obtained by reading the standard input. If this option is  
 84015 omitted, the SCCS file shall be created with control information but without any  
 84016 file data. The *-i* option implies the *-n* option.

84017 **-r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that  
 84018 is, the branch and sequence numbers shall be zero or missing. The level number is  
 84019 optional, and defaults to 1.

84020 **-t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be  
 84021 taken. In the case of existing SCCS files (neither *-i* nor *-n* is specified):

- 84022                   • A **-t** option without a *name* option-argument shall cause the removal of  
84023                   descriptive text (if any) currently in the SCCS file.
- 84024                   • A **-t** option with a *name* option-argument shall cause the text (if any) in the  
84025                   named file to replace the descriptive text (if any) currently in the SCCS file.
- 84026       **-f flag**   Specify a *flag*, and, possibly, a value for the *flag*, to be placed in the SCCS file.  
84027                   Several **-f** options may be supplied on a single *admin* command line.  
84028                   Implementations shall recognize the following flags and associated values:
- 84029                   **b**           Allow use of the **-b** option on a *get* command to create branch deltas.
- 84030                   **cceil**       Specify the highest release (that is, ceiling), a number less than or equal to  
84031                   9999, which may be retrieved by a *get* command for editing. The default  
84032                   value for an unspecified **c** flag shall be 9999.
- 84033                   **ffloor**      Specify the lowest release (that is, floor), a number greater than 0 but less  
84034                   than 9999, which may be retrieved by a *get* command for editing. The  
84035                   default value for an unspecified **f** flag shall be 1.
- 84036                   **dSID**       Specify the default delta number (SID) to be used by a *get* command.
- 84037                   **istr**       Treat the “No ID keywords” message issued by *get* or *delta* as a fatal error.  
84038                   In the absence of this flag, the message is only a warning. The message is  
84039                   issued if no SCCS identification keywords (see *get*) are found in the text  
84040                   retrieved or stored in the SCCS file. If a value is supplied, the application  
84041                   shall ensure that the keywords exactly match the given string; however,  
84042                   the string shall contain a keyword, and no embedded <newline>  
84043                   characters.
- 84044                   **j**           Allow concurrent *get* commands for editing on the same SID of an SCCS  
84045                   file. This allows multiple concurrent updates to the same version of the  
84046                   SCCS file.
- 84047                   **llist**       Specify a *list* of releases to which deltas can no longer be made (that is, *get*  
84048                   **-e** against one of these locked releases fails). Conforming applications  
84049                   shall use the following syntax to specify a *list*. Implementations may  
84050                   accept additional forms as an extension:
- 84051                   <list> ::= a | <range-list>  
84052                   <range-list> ::= <range> | <range-list>, <range>  
84053                   <range> ::= <SID>
- 84054                   The character *a* in the *list* shall be equivalent to specifying all releases for  
84055                   the named SCCS file. The non-terminal <SID> in range shall be the delta  
84056                   number of an existing delta associated with the SCCS file.
- 84057                   **n**           Cause *delta* to create a null delta in each of those releases (if any) being  
84058                   skipped when a delta is made in a new release (for example, in making  
84059                   delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas  
84060                   shall serve as anchor points so that branch deltas may later be created  
84061                   from them. The absence of this flag shall cause skipped releases to be  
84062                   nonexistent in the SCCS file, preventing branch deltas from being created  
84063                   from them in the future. During the initial creation of an SCCS file, the **n**  
84064                   flag may be ignored; that is, if the **-r** option is used to set the release  
84065                   number of the initial SID to a value greater than 1, null deltas need not be  
84066                   created for the “skipped” releases.

84067	<b>qtext</b>	Substitute user-definable <i>text</i> for all occurrences of the %Q% keyword in the SCCS file text retrieved by <i>get</i> .
84068		
84069	<b>mmod</b>	Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the <b>m</b> flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' . ' removed.
84070		
84071		
84072		
84073	<b>ttype</b>	Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .
84074		
84075	<b>vpgm</b>	Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the <b>m</b> option is also used even if its value is null.)
84076		
84077		
84078		
84079		
84080	<b>-d flag</b>	Remove (delete) the specified <i>flag</i> from an SCCS file. Several <b>-d</b> options may be supplied on a single <i>admin</i> command. See the <b>-f</b> option for allowable <i>flag</i> names. (The <b>l</b> flag gives a <i>list</i> of releases to be unlocked. See the <b>-f</b> option for further description of the <b>l</b> flag and the syntax of a <i>list</i> .)
84081		
84082		
84083		
84084	<b>-a login</b>	Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several <b>-a</b> options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a '!', the users so specified shall be denied permission to make deltas.
84085		
84086		
84087		
84088		
84089		
84090		
84091	<b>-e login</b>	Specify a <i>login</i> name, or numerical group ID, to be erased from the list of users allowed to make deltas (changes) to the SCCS file. Specifying a group ID is equivalent to specifying all <i>login</i> names common to that group ID. Several <b>-e</b> options may be used on a single <i>admin</i> command line.
84092		
84093		
84094		
84095	<b>-y[comment]</b>	Insert the <i>comment</i> text into the SCCS file as a comment for the initial delta in a manner identical to that of <i>delta</i> . In the POSIX locale, omission of the <b>-y</b> option shall result in a default comment line being inserted in the form:
84096		
84097		
84098		<code>"date and time created %s %s by %s", &lt;date&gt;, &lt;time&gt;, &lt;login&gt;</code>
84099		where <date> is expressed in the format of the <i>date</i> utility's %Y/%m/%d conversion specification, <time> in the format of the <i>date</i> utility's %T conversion specification format, and <login> is the login name of the user creating the file.
84100		
84101		
84102	<b>-m mrlist</b>	Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the <b>v</b> flag is set and the MR numbers are validated if the <b>v</b> flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the <b>v</b> flag is not set or MR validation fails.
84103		
84104		
84105		
84106		
84107	<b>-h</b>	Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.
84108		
84109		
84110		

84111            **-z**            Recompute the SCCS file checksum and store it in the first line of the SCCS file (see  
 84112                            the **-h** option above). Note that use of this option on a truly corrupted file may  
 84113                            prevent future detection of the corruption.

#### 84114 **OPERANDS**

84115            The following operands shall be supported:

84116            *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*  
 84117                            utility shall behave as though each file in the directory were specified as a named  
 84118                            file, except that non-SCCS files (last component of the pathname does not begin  
 84119                            with **s**.) and unreadable files shall be silently ignored.

84120            *newfile*        A pathname of an SCCS file to be created.

84121            If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each  
 84122                            line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-  
 84123                            SCCS files and unreadable files shall be silently ignored.

#### 84124 **STDIN**

84125            The standard input shall be a text file used only if **-i** is specified without an option-argument or  
 84126                            if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is  
 84127                            <SOH> in the POSIX locale, the results are unspecified.

#### 84128 **INPUT FILES**

84129            The existing SCCS files shall be text files of an unspecified format.

84130            The application shall ensure that the file named by the **-i** option's *name* option-argument shall  
 84131                            be a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results  
 84132                            are unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the  
 84133                            header for this file shall be 99 999 for this delta.

#### 84134 **ENVIRONMENT VARIABLES**

84135            The following environment variables shall affect the execution of *admin*:

84136            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 84137                            (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 84138                            variables used to determine the values of locale categories.)

84139            **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
 84140                            internationalization variables.

84141            **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 84142                            characters (for example, single-byte as opposed to multi-byte characters in  
 84143                            arguments and input files).

84144            **LC\_MESSAGES**

84145                            Determine the locale that should be used to affect the format and contents of  
 84146                            diagnostic messages written to standard error and the contents of the default **-y**  
 84147                            comment.

84148            **NLSPATH**     Determine the location of messages objects and message catalogs.

#### 84149 **ASYNCHRONOUS EVENTS**

84150            Default.

#### 84151 **STDOUT**

84152            Not used.

84153 **STDERR**

84154 The standard error shall be used only for diagnostic messages.

84155 **OUTPUT FILES**

84156 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a  
84157 locking *z-file*, as described in *get* (on page 2964), may be created and deleted.

84158 **EXTENDED DESCRIPTION**

84159 None.

84160 **EXIT STATUS**

84161 The following exit values shall be returned:

84162 0 Successful completion.

84163 >0 An error occurred.

84164 **CONSEQUENCES OF ERRORS**

84165 Default.

84166 **APPLICATION USAGE**

84167 It is recommended that directories containing SCCS files be writable by the owner only, and that  
84168 SCCS files themselves be read-only. The mode of the directories should allow only the owner to  
84169 modify SCCS files contained in the directories. The mode of the SCCS files prevents any  
84170 modification at all except by SCCS commands.

84171 **EXAMPLES**

84172 None.

84173 **RATIONALE**

84174 None.

84175 **FUTURE DIRECTIONS**

84176 If this utility is directed to display a pathname that contains any bytes that have the encoded  
84177 value of a <newline> character when <newline> is a terminator or separator in the output  
84178 format being used, implementations are encouraged to treat this as an error. A future version of  
84179 this standard may require implementations to treat this as an error.

84180 If this utility is directed to create a new directory entry that contains any bytes that have the  
84181 encoded value of a <newline> character, implementations are encouraged to treat this as an  
84182 error. A future version of this standard may require implementations to treat this as an error.

84183 **SEE ALSO**

84184 *delta, get, prs, what*

84185 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

84186 **CHANGE HISTORY**

84187 First released in Issue 2.

84188 **Issue 6**

84189 The normative text is reworded to avoid use of the term “must” for application requirements,  
84190 and to emphasize the term “shall” for implementation requirements.

84191 The grammar is updated.

84192 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES  
84193 section warning that the maximum lines recorded in the file is 99 999.

84194 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h**  
84195 option.

84196 **Issue 8**

84197 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:

- 84198 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
84199 have the encoded value of a <newline> character when <newline> is a terminator or  
84200 separator in the output format being used.
- 84201 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
84202 <newline> character.

84203 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

84204 **NAME**

84205 alias — define or display aliases

84206 **SYNOPSIS**84207 `alias [alias-name[=string] . . .]`84208 **DESCRIPTION**

84209 The *alias* utility shall create or redefine alias definitions or write the values of existing alias  
 84210 definitions to standard output. An alias definition provides a string value that shall replace a  
 84211 command name when it is encountered. For information on valid string values, and the  
 84212 processing involved, see [Section 2.3.1](#) (on page 2477).

84213 An alias definition shall affect the current shell execution environment and the execution  
 84214 environments of the subshells of the current shell. When used as specified by this volume of  
 84215 POSIX.1-2024, the alias definition shall not affect the parent process of the current shell nor any  
 84216 utility environment invoked by the shell; see [Section 2.13](#) (on page 2522).

84217 **OPTIONS**

84218 None.

84219 **OPERANDS**

84220 The following operands shall be supported:

84221 *alias-name* Write the alias definition to standard output.84222 *alias-name=string*84223 Assign the value of *string* to the alias *alias-name*.

84224 If no operands are given, all alias definitions shall be written to standard output.

84225 **STDIN**

84226 Not used.

84227 **INPUT FILES**

84228 None.

84229 **ENVIRONMENT VARIABLES**84230 The following environment variables shall affect the execution of *alias*:

84231 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 84232 (See [XBD Section 8.2](#) (on page 169) for the precedence of internationalization  
 84233 variables used to determine the values of locale categories.)

84234 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 84235 internationalization variables.

84236 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 84237 characters (for example, single-byte as opposed to multi-byte characters in  
 84238 arguments).

84239 *LC\_MESSAGES*

84240 Determine the locale that should be used to affect the format and contents of  
 84241 diagnostic messages written to standard error.

84242 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.84243 **ASYNCHRONOUS EVENTS**

84244 Default.

84245 **STDOUT**

84246 The format for displaying aliases (when no operands or only *name* operands are specified) shall  
84247 be:

84248 `"%s=%s\n", name, value`

84249 The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the  
84250 shell. See the description of shell quoting in [Section 2.2](#) (on page 2472).

84251 **STDERR**

84252 The standard error shall be used only for diagnostic messages.

84253 **OUTPUT FILES**

84254 None.

84255 **EXTENDED DESCRIPTION**

84256 None.

84257 **EXIT STATUS**

84258 The following exit values shall be returned:

84259 0 Successful completion.

84260 >0 One of the *name* operands specified did not have an alias definition, or an error occurred.

84261 **CONSEQUENCES OF ERRORS**

84262 Default.

84263 **APPLICATION USAGE**

84264 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

84265 Care should be taken to avoid alias values that end with a character that could be treated as part  
84266 of an operator token, as it is unspecified whether the character that follows the alias name in the  
84267 input can be used as part of the same token (see [Section 2.3.1](#), on page 2477). For example, with:

84268 `$ alias foo='echo 0'`  
84269 `$ foo>&2`

84270 the shell can either pass the argument '0' to *echo* and redirect fd 1 to fd 2, or pass no arguments  
84271 to *echo* and redirect fd 0 to fd 2. Changing it to:

84272 `$ alias foo='echo "0"'`

84273 avoids this problem. The alternative of adding a `<space>` after the '0' would also avoid the  
84274 problem, but in addition it would alter the way the alias works, as described in [Section 2.3.1](#) (on  
84275 page 2477).

84276 Likewise, given:

84277 `$ alias foo='some_command &'`  
84278 `$ foo&`

84279 the shell may combine the two '&' characters into an `&&` (and) operator. Since the alias cannot  
84280 pass arguments to *some\_command* and thus can be expected to be invoked without arguments,  
84281 adding a `<space>` after the '&' would be an acceptable way to prevent this. Alternatively, the  
84282 alias could be specified as a grouping command:

84283 `$ alias foo='{ some_command & }'`

84284 Problems can occur for tokens other than operators as well, if the alias is used in unusual ways.  
84285 For example, with:

```
84286 $ alias foo='echo $'
84287 $ foo((123))
```

84288 some shells combine the '\$' and the "((123))" to form an arithmetic expansion, but others  
84289 do not (resulting in a syntax error).

#### 84290 EXAMPLES

84291 1. Create a short alias for a commonly used *ls* command:

```
84292 alias lf="ls -CF"
```

84293 2. Create a simple ``redo'' command to repeat previous entries in the command history file:

```
84294 alias r='fc -s'
```

84295 3. Use 1K units for *du*:

```
84296 alias du=du\ -k
```

84297 4. Set up *nohup* so that it can deal with an argument that is itself an alias name:

```
84298 alias nohup="nohup "
```

84299 5. Add the **-F** option to interactive uses of *ls*, even when executed as *xargs ls* or  
84300 *xargs -0 ls*:

```
84301 alias ls='ls -F'
84302 alias xargs='xargs '
84303 alias -- -0='-0 '
84304 find . [...] -print | xargs ls          # breaks on filenames with \n
84305                                     # (two aliases expanded)
84306 find . [...] -print0 | xargs -0 ls     # minimizes \n issues (three
84307                                     # aliases expanded)
```

#### 84308 RATIONALE

84309 The *alias* description is based on historical KornShell implementations. Known differences exist  
84310 between that and the C shell. The KornShell version was adopted to be consistent with all the  
84311 other KornShell features in this volume of POSIX.1-2024, such as command line editing.

84312 Since *alias* affects the current shell execution environment, it is generally provided as a shell  
84313 regular built-in.

84314 Historical versions of the KornShell have allowed aliases to be exported to scripts that are  
84315 invoked by the same shell. This is triggered by the *alias -x* flag; it is allowed by this volume of  
84316 POSIX.1-2024 only when an explicit extension such as *-x* is used. The standard developers  
84317 considered that aliases were of use primarily to interactive users and that they should normally  
84318 not affect shell scripts called by those users; functions are available to such scripts.

84319 Historical versions of the KornShell had not written aliases in a quoted manner suitable for  
84320 reentry to the shell, but this volume of POSIX.1-2024 has made this a requirement for all similar  
84321 output. Therefore, consistency was chosen over this detail of historical practice.

#### 84322 FUTURE DIRECTIONS

84323 None.

#### 84324 SEE ALSO

84325 [Section 2.9.5](#) (on page 2511)

84326 [XBD Chapter 8](#) (on page 167)

84327 **CHANGE HISTORY**

84328 First released in Issue 4.

84329 **Issue 6**

84330 This utility is marked as part of the User Portability Utilities option.

84331 The APPLICATION USAGE section is added.

84332 **Issue 7**

84333 The *alias* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

84335 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84336 The first example is changed to remove the creation of an alias for a standard utility that alters its behavior to be non-conforming.

84338 **Issue 8**

84339 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that this utility is required to be intrinsic.

84341 Austin Group Defect 953 is applied, clarifying that the details of how alias replacement is performed are in the cross-referenced section ([Section 2.3.1](#), on page 2477) and updating the APPLICATION USAGE section.

84344 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

84345 Austin Group Defect 1630 is applied, adding a new item in EXAMPLES.

84346 **NAME**

84347 ar — create and maintain library archives

84348 **SYNOPSIS**84349 SD ar -d [-v] *archive file...*84350 XSI ar -m [-v] *archive file...*84351 ar -m -a [-v] *posname archive file...*84352 ar -m -b [-v] *posname archive file...*84353 ar -m -i [-v] *posname archive file...*84354 XSI ar -p [-v] [-s] *archive [file...]*84355 XSI ar -q [-cv] *archive file...*84356 ar -r [-cuv] *archive file...*84357 XSI ar -r -a [-cuv] *posname archive file...*84358 ar -r -b [-cuv] *posname archive file...*84359 ar -r -i [-cuv] *posname archive file...*84360 XSI ar -t [-v] [-s] *archive [file...]*84361 XSI ar -x [-v] [-sCT] *archive [file...]*84362 **DESCRIPTION**84363 The *ar* utility is part of the Software Development Utilities option.

84364 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once  
 84365 an archive has been created, new files can be added, and existing files in an archive can be  
 84366 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the  
 84367 implementation shall format the archive so that it is usable as a library for link editing (see *c17*).  
 84368 When some of the archived files are not valid object files, the suitability of the archive for library  
 84369 XSI use is undefined. If an archive consists entirely of printable files, the entire archive shall be  
 84370 printable.

84371 When *ar* creates an archive, it creates administrative information indicating whether a symbol  
 84372 table is present in the archive. When there is at least one object file that *ar* recognizes as such in  
 84373 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is  
 84374 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update  
 84375 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the  
 84376 symbol table to be rebuilt.

84377 All *file* operands can be pathnames. However, files within archives shall be named by a filename,  
 84378 which is the last component of the pathname used when the file was entered into the archive.  
 84379 The comparison of *file* operands to the names of files in archives shall be performed by  
 84380 comparing the last component of the operand to the name of the file in the archive.

84381 It is unspecified whether multiple files in the archive may be identically named. In the case of  
 84382 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive  
 84383 having a name that is the same as the last component of the operand.

84384 **OPTIONS**

84385 The *ar* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

84386 The following options shall be supported:

- 84387 XSI **-a** Position new files in the archive after the file named by the *posname* operand.
- 84388 XSI **-b** Position new files in the archive before the file named by the *posname* operand.
- 84389 **-c** Suppress the diagnostic message that is written to standard error by default when the archive *archive* is created.
- 84391 XSI **-C** Prevent extracted files from replacing like-named files in the file system. This option is useful when **-T** is also used, to prevent truncated filenames from replacing files with the same prefix.
- 84392
- 84393
- 84394 **-d** Delete one or more *files* from *archive*.
- 84395 XSI **-i** Position new files in the archive before the file in the archive named by the *posname* operand (equivalent to **-b**).
- 84396
- 84397 XSI **-m** Move the named files in the archive. The **-a**, **-b**, or **-i** options with the *posname* operand indicate the position; otherwise, move the names files in the archive to the end of the archive.
- 84398
- 84399
- 84400 **-p** Write the contents of the *files* in the archive named by *file* operands from *archive* to the standard output. If no *file* operands are specified, the contents of all files in the archive shall be written in the order of the archive.
- 84401
- 84402
- 84403 XSI **-q** Append the named files to the end of the archive. In this case *ar* does not check whether the added files are already in the archive. This is useful to bypass the searching otherwise done when creating a large archive piece by piece.
- 84404
- 84405
- 84406 **-r** Replace or add *files* to *archive*. If the archive named by *archive* does not exist, a new archive shall be created and a diagnostic message shall be written to standard error (unless the **-c** option is specified). If no *files* are specified and the *archive* exists, the results are undefined. Files that replace existing files in the archive shall not change the order of the archive. Files that do not replace existing files in the archive shall be appended to the archive unless a **-a**, **-b**, or **-i** option specifies another position.
- 84407
- 84408
- 84409
- 84410
- 84411 XSI
- 84412 XSI **-s** Force the regeneration of the archive symbol table even if *ar* is not invoked with an option that modifies the archive contents. This option is useful to restore the archive symbol table after it has been stripped; see *strip*.
- 84413
- 84414
- 84415 **-t** Write a table of contents of *archive* to the standard output. Only the files specified by the *file* operands shall be included in the written list. If no *file* operands are specified, all files in *archive* shall be included in the order of the archive.
- 84416
- 84417
- 84418 XSI **-T** Allow filename truncation of extracted files whose archive names are longer than the file system can support. By default, extracting a file with a name that is too long shall be an error; a diagnostic message shall be written and the file shall not be extracted.
- 84419
- 84420
- 84421
- 84422 **-u** Update older files in the archive. When used with the **-r** option, files in the archive shall be replaced only if the corresponding *file* has a modification time that is at least as new as the modification time of the file in the archive.
- 84423
- 84424

84425        **-v**           Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a  
84426                   detailed file-by-file description of the archive creation and maintenance activity, as  
84427                   described in the STDOUT section.

84428                   When used with **-p**, write the name of the file in the archive to the standard output  
84429                   before writing the file in the archive itself to the standard output, as described in  
84430                   the STDOUT section.

84431                   When used with **-t**, include a long listing of information about the files in the  
84432                   archive, as described in the STDOUT section.

84433        **-x**           Extract the files in the archive named by the *file* operands from *archive*. The  
84434                   contents of the archive shall not be changed. If no *file* operands are given, all files  
84435                   in the archive shall be extracted. The modification time of each file extracted shall  
84436                   be set to the time the file is extracted from the archive.

#### 84437 **OPERANDS**

84438           The following operands shall be supported:

84439        *archive*       A pathname of the archive.

84440        *file*           A pathname. Only the last component shall be used when comparing against the  
84441                   names of files in the archive. If two or more *file* operands have the same last  
84442                   pathname component (basename), the results are unspecified. The  
84443                   implementation's archive format shall not truncate valid filenames of files added  
84444                   to or replaced in the archive.

84445 XSI        *posname*     The name of a file in the archive, used for relative positioning; see options **-m** and  
84446                   **-r**.

#### 84447 **STDIN**

84448           Not used.

#### 84449 **INPUT FILES**

84450           The archive named by *archive* shall be a file in the format created by *ar -r*.

#### 84451 **ENVIRONMENT VARIABLES**

84452           The following environment variables shall affect the execution of *ar*:

84453        **LANG**           Provide a default value for the internationalization variables that are unset or null.  
84454                   (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
84455                   variables used to determine the values of locale categories.)

84456        **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
84457                   internationalization variables.

84458        **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
84459                   characters (for example, single-byte as opposed to multi-byte characters in  
84460                   arguments and input files).

84461        **LC\_MESSAGES**

84462                   Determine the locale that should be used to affect the format and contents of  
84463                   diagnostic messages written to standard error.

84464        **LC\_TIME**       Determine the format and content for date and time strings written by *ar -tv*.

84465 XSI        **NLSPATH**     Determine the location of messages objects and message catalogs.

84466 *TMPDIR* Determine the pathname that overrides the default directory for temporary files, if  
84467 any.

84468 *TZ* Determine the timezone used to calculate date and time strings written by *ar -tv*.  
84469 If *TZ* is unset or null, an unspecified default timezone shall be used.

#### 84470 ASYNCHRONOUS EVENTS

84471 Default.

#### 84472 STDOUT

84473 If the *-d* option is used with the *-v* option, the standard output format shall be:

84474 "d - %s\n", <file>

84475 where *file* is the operand specified on the command line.

84476 If the *-p* option is used with the *-v* option, *ar* shall precede the contents of each file with:

84477 "\n<%s>\n\n", <file>

84478 where *file* is the operand specified on the command line, if *file* operands were specified, and the  
84479 name of the file in the archive if they were not.

84480 If the *-r* option is used with the *-v* option:

84481 • If *file* is already in the archive, the standard output format shall be:

84482 "r - %s\n", <file>

84483 where <file> is the operand specified on the command line.

84484 • If *file* is not already in the archive, the standard output format shall be:

84485 "a - %s\n", <file>

84486 where <file> is the operand specified on the command line.

84487 If the *-t* option is used, *ar* shall write the names of the files in the archive to the standard output  
84488 in the format:

84489 "%s\n", <file>

84490 where *file* is the operand specified on the command line, if *file* operands were specified, or the  
84491 name of the file in the archive if they were not.

84492 If the *-t* option is used with the *-v* option, the standard output format shall be:

84493 "%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>,  
84494 <group ID>, <number of bytes in member>,  
84495 <abbreviated month>, <day-of-month>, <hour>,  
84496 <minute>, <year>, <file>

84497 where:

84498 <file> Shall be the operand specified on the command line, if *file* operands were specified,  
84499 or the name of the file in the archive if they were not.

84500 <member mode>

84501 Shall be formatted the same as the <file mode> string defined in the STDOUT  
84502 section of *ls*, except that the first character, the <entry type>, is not used; the string  
84503 represents the file mode of the file in the archive at the time it was added to or  
84504 replaced in the archive.

84505 The following represent the last-modification time of a file when it was most recently added to  
84506 or replaced in the archive:

84507 <*abbreviated month*>

84508 Equivalent to the format of the %b conversion specification format in *date*.

84509 <*day-of-month*>

84510 Equivalent to the format of the %e conversion specification format in *date*.

84511 <*hour*>

Equivalent to the format of the %H conversion specification format in *date*.

84512 <*minute*>

Equivalent to the format of the %M conversion specification format in *date*.

84513 <*year*>

Equivalent to the format of the %Y conversion specification format in *date*.

84514 When *LC\_TIME* does not specify the POSIX locale, a different format and order of presentation  
84515 of these fields relative to each other may be used in a format appropriate in the specified locale.

84516 If the *-x* option is used with the *-v* option, the standard output format shall be:

84517 "x - %s\n", <*file*>

84518 where *file* is the operand specified on the command line, if *file* operands were specified, or the  
84519 name of the file in the archive if they were not.

#### 84520 **STDERR**

84521 The standard error shall be used only for diagnostic messages. The diagnostic message about  
84522 creating a new archive when *-c* is not specified shall not modify the exit status.

#### 84523 **OUTPUT FILES**

84524 Archives are files with unspecified formats.

#### 84525 **EXTENDED DESCRIPTION**

84526 None.

#### 84527 **EXIT STATUS**

84528 The following exit values shall be returned:

84529 0 Successful completion.

84530 >0 An error occurred.

#### 84531 **CONSEQUENCES OF ERRORS**

84532 Default.

#### 84533 **APPLICATION USAGE**

84534 None.

#### 84535 **EXAMPLES**

84536 None.

#### 84537 **RATIONALE**

84538 The archive format is not described. It is recognized that there are several known *ar* formats,  
84539 which are not compatible. The *ar* utility is included, however, to allow creation of archives that  
84540 are intended for use only on one machine. The archive is specified as a file, and it can be moved  
84541 as a file. This does allow an archive to be moved from one machine to another machine that uses  
84542 the same implementation of *ar*.

84543 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable “archives”. This is a not  
84544 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the  
84545 compilers, based on a historical model.

84546 In historical implementations, the `-q` option (available on XSI-conforming systems) is known to  
84547 execute quickly because *ar* does not check on whether the added members are already in the  
84548 archive. This is useful to bypass the searching otherwise done when creating a large archive  
84549 piece-by-piece. These remarks may but need not remain true for a brand new implementation of  
84550 this utility; hence, these remarks have been moved into the RATIONALE.

84551 BSD implementations historically required applications to provide the `-s` option whenever the  
84552 archive was supposed to contain a symbol table. As in this volume of POSIX.1-2024, System V  
84553 historically creates or updates an archive symbol table whenever an object file is removed from,  
84554 added to, or updated in the archive.

84555 The OPERANDS section requires what might seem to be true without specifying it: the archive  
84556 cannot truncate the filenames below `{NAME_MAX}`. Some historical implementations do so,  
84557 however, causing unexpected results for the application. Therefore, this volume of POSIX.1-2024  
84558 makes the requirement explicit to avoid misunderstandings.

84559 According to the System V documentation, the options `-dmpqrtx` are not required to begin with  
84560 a `<hyphen-minus>` ('-'). This volume of POSIX.1-2024 requires that a conforming application  
84561 use the leading `<hyphen-minus>`.

84562 The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as  
84563 an example:

84564 A file created by *ar* begins with the "magic" string `!<arch>\n`". The rest of the archive  
84565 is made up of objects, each of which is composed of a header for a file, a possible filename,  
84566 and the file contents. The header is portable between machine architectures, and, if the file  
84567 contents are printable, the archive is itself printable.

84568 The header is made up of six ASCII fields, followed by a two-character trailer. The fields  
84569 are the object name (16 characters), the file last modification time (12 characters), the user  
84570 and group IDs (each 6 characters), the file mode (8 characters), and the file size (10  
84571 characters). All numeric fields are in decimal, except for the file mode, which is in octal.

84572 The modification time is the file `st_mtime` field. The user and group IDs are the file `st_uid`  
84573 and `st_gid` fields. The file mode is the file `st_mode` field. The file size is the file `st_size` field.  
84574 The two-byte trailer is the string `"`<newline>`".

84575 Only the name field has any provision for overflow. If any filename is more than 16  
84576 characters in length or contains an embedded space, the string `"#1/"` followed by the  
84577 ASCII length of the name is written in the name field. The file size (stored in the archive  
84578 header) is incremented by the length of the name. The name is then written immediately  
84579 following the archive header.

84580 Any unused characters in any of these fields are written as `<space>` characters. If any fields  
84581 are their particular maximum number of characters in length, there is no separation  
84582 between the fields.

84583 Objects in the archive are always an even number of bytes long; files that are an odd  
84584 number of bytes long are padded with a `<newline>`, although the size in the header does  
84585 not reflect this.

84586 The *ar* utility description requires that (when all its members are valid object files) *ar* produce an  
84587 object code library, which the linkage editor can use to extract object modules. If the linkage  
84588 editor needs a symbol table to permit random access to the archive, *ar* must provide it; however,  
84589 *ar* does not require a symbol table.

84590 The BSD `-o` option was omitted. It is a rare conforming application that uses *ar* to extract object

84591 code from a library with concern for its modification time, since this can only be of importance  
 84592 to *make*. Hence, since this functionality is not deemed important for applications portability, the  
 84593 modification time of the extracted files is set to the current time.

84594 There is at least one known implementation (for a small computer) that can accommodate only  
 84595 object files for that system, disallowing mixed object and other files. The ability to handle any  
 84596 type of file is not only historical practice for most implementations, but is also a reasonable  
 84597 expectation.

84598 Consideration was given to changing the output format of *ar -tv* to the same format as the  
 84599 output of *ls -l*. This would have made parsing the output of *ar* the same as that of *ls*. This was  
 84600 rejected in part because the current *ar* format is commonly used and changes would break  
 84601 historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a  
 84602 <slash>. Changing this to be the user name and group name would not be correct if the archive  
 84603 were moved to a machine that contained a different user database. Since *ar* cannot know  
 84604 whether the archive was generated on the same machine, it cannot tell what to report.

84605 The text on the *-ur* option combination is historical practice—since one filename can easily  
 84606 represent two different files (for example, */a/foo* and */b/foo*), it is reasonable to replace the file in  
 84607 the archive even when the modification time in the archive is identical to that in the file system.

#### 84608 FUTURE DIRECTIONS

84609 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 84610 value of a <newline> character when <newline> is a terminator or separator in the output  
 84611 format being used, implementations are encouraged to treat this as an error. A future version of  
 84612 this standard may require implementations to treat this as an error.

84613 If this utility is directed to create a new directory entry that contains any bytes that have the  
 84614 encoded value of a <newline> character, implementations are encouraged to treat this as an  
 84615 error. A future version of this standard may require implementations to treat this as an error.

#### 84616 SEE ALSO

84617 *c17, date, pax, strip*

84618 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215), [<unistd.h>](#), description of  
 84619 {POSIX\_NO\_TRUNC}

#### 84620 CHANGE HISTORY

84621 First released in Issue 2.

#### 84622 Issue 5

84623 The FUTURE DIRECTIONS section is added.

#### 84624 Issue 6

84625 This utility is marked as part of the Software Development Utilities option.

84626 The STDOUT description is changed for the *-v* option to align with the IEEE P1003.2b draft  
 84627 standard.

84628 The normative text is reworded to avoid use of the term “must” for application requirements.

84629 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

84630 IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use  
 84631 “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being  
 84632 operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is  
 84633 contained in the archive.

84634 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the

84635 SYNOPSIS. The change was needed since the **-a**, **-b**, and **-i** options are mutually-exclusive, and  
84636 *posname* is required if any of these options is specified.

84637 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description  
84638 of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a  
84639 backquote followed by a <newline>.

84640 **Issue 7**

84641 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
84642 apply.

84643 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84644 The description of the **-t** option is changed to say ``Only the files specified ...''.

84645 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0057 [584] is applied.

84646 **Issue 8**

84647 Austin Group Defect 251 is applied, encouraging implementations to behave as follows:

84648 a. Report an error if a utility is directed to display a pathname that contains any bytes that  
84649 have the encoded value of a <newline> character when <newline> is a terminator or  
84650 separator in the output format being used.

84651 b. Disallow the creation of filenames containing any bytes that have the encoded value of a  
84652 <newline> character.

84653 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

84654 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

84655 **NAME**

84656           asa — interpret carriage-control characters

84657 **SYNOPSIS**84658 FR       asa [*file...*]84659 **DESCRIPTION**84660           The *asa* utility shall write its input files to standard output, mapping carriage-control characters  
84661           from the text files to line-printer control sequences in an implementation-defined manner.84662           The first character of every line shall be removed from the input, and the following actions are  
84663           performed.

84664           If the character removed is:

84665           &lt;space&gt;     The rest of the line is output without change.

84666           0           A &lt;newline&gt; is output, then the rest of the input line.

84667           1           One or more implementation-defined characters that causes an advance to the next  
84668           page shall be output, followed by the rest of the input line.84669           +           The <newline> of the previous line shall be replaced with one or more  
84670           implementation-defined characters that causes printing to return to column  
84671           position 1, followed by the rest of the input line. If the '+' is the first character in  
84672           the input, it shall be equivalent to <space>.84673           The action of the *asa* utility is unspecified upon encountering any character other than those  
84674           listed above as the first character in a line.84675 **OPTIONS**

84676           None.

84677 **OPERANDS**84678           *file*         A pathname of a text file used for input. If no *file* operands are specified, the  
84679           standard input shall be used.84680 **STDIN**84681           The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
84682           operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
84683           the standard input shall not be used. See the INPUT FILES section.84684 **INPUT FILES**

84685           The input files shall be text files.

84686 **ENVIRONMENT VARIABLES**84687           The following environment variables shall affect the execution of *asa*:84688           LANG         Provide a default value for the internationalization variables that are unset or null.  
84689                         (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
84690                         variables used to determine the values of locale categories.)84691           LC\_ALL        If set to a non-empty string value, override the values of all the other  
84692           internationalization variables.84693           LC\_CTYPE     Determine the locale for the interpretation of sequences of bytes of text data as  
84694           characters (for example, single-byte as opposed to multi-byte characters in  
84695           arguments and input files).

- 84696 *LC\_MESSAGES*  
84697 Determine the locale that should be used to affect the format and contents of  
84698 diagnostic messages written to standard error.
- 84699 XSI *NLSPATH* Determine the location of messages objects and message catalogs.
- 84700 **ASYNCHRONOUS EVENTS**  
84701 Default.
- 84702 **STDOUT**  
84703 The standard output shall be the text from the input file modified as described in the  
84704 DESCRIPTION section.
- 84705 **STDERR**  
84706 None.
- 84707 **OUTPUT FILES**  
84708 None.
- 84709 **EXTENDED DESCRIPTION**  
84710 None.
- 84711 **EXIT STATUS**  
84712 The following exit values shall be returned:  
84713 0 All input files were output successfully.  
84714 >0 An error occurred.
- 84715 **CONSEQUENCES OF ERRORS**  
84716 Default.
- 84717 **APPLICATION USAGE**  
84718 None.
- 84719 **EXAMPLES**  
84720 1. The following command:  
84721 *asa file*  
84722 permits the viewing of *file* (created by a program using FORTRAN-style carriage-control  
84723 characters) on a terminal.  
84724 2. The following command:  
84725 *a.out | asa | lp*  
84726 formats the FORTRAN output of **a.out** and directs it to the printer.
- 84727 **RATIONALE**  
84728 The *asa* utility is needed to map “standard” FORTRAN 77 output into a form acceptable to  
84729 contemporary printers. Usually, *asa* is used to pipe data to the *lp* utility; see *lp*.  
84730 This utility is generally used only by FORTRAN programs. The standard developers decided to  
84731 retain *asa* to avoid breaking the historical large base of FORTRAN applications that put carriage-  
84732 control characters in their output files. There is no requirement that a system have a FORTRAN  
84733 compiler in order to run applications that need *asa*.  
84734 Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII  
84735 <carriage-return> in response to a '+'. It is suggested that implementations treat characters  
84736 other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.

84737 However, the action is listed here as ``unspecified'', permitting an implementation to provide  
84738 extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.

84739 **FUTURE DIRECTIONS**

84740 None.

84741 **SEE ALSO**

84742 *lp*

84743 XBD [Chapter 8](#) (on page 167)

84744 **CHANGE HISTORY**

84745 First released in Issue 4.

84746 **Issue 6**

84747 This utility is marked as part of the FORTRAN Runtime Utilities option.

84748 The normative text is reworded to avoid use of the term ``must'' for application requirements.

84749 **Issue 7**

84750 Austin Group Interpretation 1003.1-2001 #092 is applied.

84751 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84752 **Issue 8**

84753 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

84754 **NAME**

84755 at — execute commands at a later time

84756 **SYNOPSIS**84757 at [-m] [-f *file*] [-q *queuename*] -t *time\_arg*84758 at [-m] [-f *file*] [-q *queuename*] *timespec...*84759 at -r *at\_job\_id...*84760 at -l -q *queuename*84761 at -l [*at\_job\_id...*]84762 **DESCRIPTION**84763 The *at* utility shall read commands from standard input and group them together as an *at-job*, to  
84764 be executed at a later time.84765 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process  
84766 group with no controlling terminal, except that the environment variables, current working  
84767 directory, file creation mask, and other implementation-defined execution-time attributes in  
84768 effect when the *at* utility is executed shall be retained and used when the *at-job* is executed.84769 When the *at-job* is submitted, the *at\_job\_id* and scheduled time shall be written to standard error.  
84770 The *at\_job\_id* is an identifier that shall be a string consisting solely of alphanumeric characters  
84771 and the <period> character. The *at\_job\_id* shall be assigned by the system when the job is  
84772 scheduled such that it uniquely identifies a particular job.84773 User notification and the processing of the job's standard output and standard error are  
84774 described under the **-m** option.84775 XSI Users shall be permitted to use *at* if their name appears in the file **at.allow** which is located in an  
84776 implementation-defined directory. If that file does not exist, the file **at.deny**, which is located in  
84777 an implementation-defined directory, shall be checked to determine whether the user shall be  
84778 denied access to *at*. If neither file exists, only a process with appropriate privileges shall be  
84779 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
84780 **at.allow** and **at.deny** files shall consist of one user name per line.84781 **OPTIONS**84782 The *at* utility shall conform to XBD [Section 12.2](#) (on page 215).

84783 The following options shall be supported:

84784 **-f file** Specify the pathname of a file to be used as the source of the *at-job*, instead of  
84785 standard input.84786 **-l** (The letter ell.) Report all jobs scheduled for the invoking user if no *at\_job\_id*  
84787 operands are specified. If *at\_job\_ids* are specified, report only information for these  
84788 jobs. The output shall be written to standard output.84789 **-m** Send mail to the invoking user after the *at-job* has run, announcing its completion.  
84790 Standard output and standard error produced by the *at-job* shall be mailed to the  
84791 user as well, unless redirected elsewhere. Mail shall be sent even if the job  
84792 produces no output.84793 If **-m** is not used, the job's standard output and standard error shall be provided to  
84794 the user by means of mail, unless they are redirected elsewhere; if there is no such  
84795 output to provide, the implementation need not notify the user of the job's  
84796 completion.

84797	<b>-q</b> <i>queuename</i>	
84798		Specify in which queue to schedule a job for submission. When used with the <b>-l</b>
84799		option, limit the search to that particular queue. By default, at-jobs shall be
84800		scheduled in queue <i>a</i> . In contrast, queue <i>b</i> shall be reserved for batch jobs; see
84801		<i>batch</i> . The meanings of all other <i>queuename</i> s are implementation-defined. If <b>-q</b> <i>b</i> is
84802		specified along with either of the <b>-t</b> <i>time_arg</i> or <i>timespec</i> arguments, the results are
84803		unspecified.
84804	<b>-r</b>	Remove the jobs with the specified <i>at_job_id</i> operands that were previously
84805		scheduled by the <i>at</i> utility.
84806	<b>-t</b> <i>time_arg</i>	Submit the job to be run at the time specified by the <i>time</i> option-argument, which
84807		the application shall ensure has the format as specified by the <i>touch -t time</i> utility.

## 84808 OPERANDS

84809 The following operands shall be supported:

84810	<i>at_job_id</i>	The name reported by a previous invocation of the <i>at</i> utility at the time the job was
84811		scheduled.
84812	<i>timespec</i>	Submit the job to be run at the date and time specified. All of the <i>timespec</i> operands
84813		are interpreted as if they were separated by <space> characters and concatenated,
84814		and shall be parsed as described in the grammar at the end of this section. The date
84815		and time shall be interpreted as being in the timezone of the user (as determined
84816		by the <i>TZ</i> variable), unless a timezone name appears as part of <i>time</i> , below.
84817		In the POSIX locale, the following describes the three parts of the time specification
84818		string. All of the values from the <i>LC_TIME</i> categories in the POSIX locale shall be
84819		recognized in a case-insensitive manner.
84820	<i>time</i>	The time can be specified as one, two, or four digits. One-digit and
84821		two-digit numbers shall be taken to be hours; four-digit numbers to
84822		be hours and minutes. The time can alternatively be specified as two
84823		numbers separated by a <colon>, meaning <i>hour:minute</i> . If the
84824		<i>LC_TIME</i> category of the locale supports 12-hour time format (see
84825		XBD Section 7.3.5, on page 152), an AM/PM indication in the form of
84826		one of the values from the <b>am_pm</b> keywords in the <i>LC_TIME</i> locale
84827		category can follow the time; otherwise, a 24-hour clock time shall be
84828		understood. A timezone name can also follow to further qualify the
84829		time. The acceptable timezone names are implementation-defined,
84830		except that they shall be case-insensitive and the string <b>utc</b> is
84831		supported to indicate the time is in Coordinated Universal Time. In
84832		the POSIX locale, the <i>time</i> field can also be one of the following
84833		tokens:
84834	<b>midnight</b>	Indicates the time 12:00 am (00:00).
84835	<b>noon</b>	Indicates the time 12:00 pm.
84836	<b>now</b>	Indicates the current day and time. Invoking <i>at</i> <b>&lt;now&gt;</b>
84837		shall submit an at-job for potentially immediate
84838		execution (that is, subject only to unspecified
84839		scheduling delays).
84840	<i>date</i>	An optional <i>date</i> can be specified as either a month name (one of the
84841		values from the <b>mon</b> or <b>abmon</b> keywords in the <i>LC_TIME</i> locale
84842		category) followed by a day number (and possibly year number

84843 preceded by a comma), or a day of the week (one of the values from  
 84844 the **day** or **abday** keywords in the *LC\_TIME* locale category). In the  
 84845 POSIX locale, two special days shall be recognized:

84846 **today** Indicates the current day.

84847 **tomorrow** Indicates the day following the current day.

84848 If no *date* is given, **today** shall be assumed if the given time is greater  
 84849 than the current time, and **tomorrow** shall be assumed if it is less. If  
 84850 the given month is less than the current month (and no year is given),  
 84851 next year shall be assumed.

84852 *increment* The optional *increment* shall be a number preceded by a <plus-sign>  
 84853 ('+') and suffixed by one of the following: **minutes**, **hours**, **days**,  
 84854 **weeks**, **months**, or **years**. (The singular forms shall also be accepted.)  
 84855 The keyword **next** shall be equivalent to an increment number of +1.  
 84856 For example, the following are equivalent commands:

```
84857 at 2pm + 1 week
84858 at 2pm next week
```

84859 The following grammar describes the precise format of *timespec* in the POSIX locale. The general  
 84860 conventions for this style of grammar are described in [Section 1.3](#) (on page 2461). This formal  
 84861 syntax shall take precedence over the preceding text syntax description. The longest possible  
 84862 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space  
 84863 shall also delimit tokens.

```
84864 %token hr24clock_hr_min
84865 %token hr24clock_hour
84866 /*
84867 An hr24clock_hr_min is a one, two, or four-digit number. A one-digit
84868 or two-digit number constitutes an hr24clock_hour. An hr24clock_hour
84869 may be any of the single digits [0,9], or may be double digits, ranging
84870 from [00,23]. If an hr24clock_hr_min is a four-digit number, the
84871 first two digits shall be a valid hr24clock_hour, while the last two
84872 represent the number of minutes, from [00,59].
84873 */
```

```
84874 %token wallclock_hr_min
84875 %token wallclock_hour

#### 84967 STDIN

84968 The standard input shall be a text file consisting of commands acceptable to the shell command  
84969 language described in [Chapter 2](#) (on page 2472). The standard input shall only be used if no `-f`  
84970 `file` option is specified.

#### 84971 INPUT FILES

84972 See the STDIN section.

84973 XSI The text files `at.allow` and `at.deny`, which are located in an implementation-defined directory,  
84974 shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
84975 denied access to the `at` and `batch` utilities.

#### 84976 ENVIRONMENT VARIABLES

84977 The following environment variables shall affect the execution of `at`:

84978 `LANG` Provide a default value for the internationalization variables that are unset or null.  
84979 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
84980 variables used to determine the values of locale categories.)

84981 `LC_ALL` If set to a non-empty string value, override the values of all the other  
84982 internationalization variables.

84983		<b>LC_CTYPE</b>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
84984			
84985			
84986		<b>LC_MESSAGES</b>	
84987			Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
84988			
84989			
84990	XSI	<b>NLSPATH</b>	Determine the location of messages objects and message catalogs.
84991		<b>LC_TIME</b>	Determine the format and contents for date and time strings written and accepted by <i>at</i> .
84992			
84993		<b>SHELL</b>	Determine a name of a command interpreter to be used to invoke the <i>at</i> -job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; or any of the preceding accompanied by a warning diagnostic about which was chosen.
84994			
84995			
84996			
84997			
84998		<b>TZ</b>	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it shall override <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
84999			
85000			
85001			
85002			
85003		<b>ASYNCHRONOUS EVENTS</b>	
85004			Default.
85005		<b>STDOUT</b>	
85006			When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.
85007			
85008			In the POSIX locale, the following shall be written to the standard output for each job when jobs are listed in response to the <i>-l</i> option:
85009			
85010			<code>"%s\t%s\n", at_job_id, &lt;date&gt;</code>
85011			where <i>date</i> shall be equivalent in format to the output of:
85012			<code>date +"%a %b %e %T %Y"</code>
85013			The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the <i>TZ</i> variable).
85014			
85015		<b>STDERR</b>	
85016			In the POSIX locale, the following shall be written to standard error when a job has been successfully submitted:
85017			
85018			<code>"job %s at %s\n", at_job_id, &lt;date&gt;</code>
85019			where <i>date</i> has the same format as that described in the STDOUT section. Neither this, nor warning messages concerning the selection of the command interpreter, shall be considered a diagnostic that changes the exit status.
85020			
85021			
85022			Diagnostic messages, if any, shall be written to standard error.

85023 **OUTPUT FILES**

85024 None.

85025 **EXTENDED DESCRIPTION**

85026 None.

85027 **EXIT STATUS**

85028 The following exit values shall be returned:

85029 0 Neither the `-l` option nor the `-r` option was specified and a job was successfully submitted;  
 85030 or, the `-l` option was specified with no `at_job_id` operands and there were no jobs to be  
 85031 listed; or, the `-l` option was specified and all job listings were successfully output; or, the `-r`  
 85032 option was specified and all of the specified jobs were successfully removed.

85033 &gt;0 An error occurred.

85034 **CONSEQUENCES OF ERRORS**

85035 If neither the `-l` option nor the `-r` option was specified, the job shall not be scheduled.  
 85036 Otherwise, the default actions specified in [Section 1.4](#) (on page 2462) apply.

85037 **APPLICATION USAGE**

85038 The format of the `at` command line shown here is guaranteed only for the POSIX locale. Other  
 85039 cultures may be supported with substantially different interfaces, although implementations are  
 85040 encouraged to provide comparable levels of functionality.

85041 Since the commands run in a separate shell invocation, running in a separate process group with  
 85042 no controlling terminal, open file descriptors, traps, and priority inherited from the invoking  
 85043 environment are lost.

85044 Some implementations do not allow substitution of different shells using `SHELL`. System V  
 85045 systems, for example, have used the login shell value for the user in `/etc/passwd`. To select  
 85046 reliably another command interpreter, the user must include it as part of the script, such as:

```
85047 $ at 1800
85048 myshell myscript
85049 EOT
85050 job ... at ...
85051 $
```

85052 **EXAMPLES**

85053 1. This sequence can be used at a terminal:

```
85054 at -m 0730 tomorrow
85055 sort < file >outfile
85056 EOT
```

85057 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a  
85058 command procedure (the sequence of output redirection specifications is significant):

```
85059 at now + 1 hour <<!
85060 diff file1 file2 2>&1 >outfile | mailx -s "outfile update" mygroup
85061 !
```

85062 Note that this always sends mail when there has been an attempt to update **outfile** and  
 85063 the body of the message will be empty unless an error occurred.

85064 3. The following shows how to capture both standard error and standard output:

```
85065 at now + 1 hour <<EOF
```

```

85066     {
85067         run-batch-processing |
85068             mailx -s "batch processing output" mygroup
85069     } 2>&1 | mailx -E -s "errors during batch processing" mygroup
85070 EOF

```

85071 4. To have a job reschedule itself, *at* can be invoked from within the at-job. For example, this  
 85072 daily processing script named **my.daily** runs every day (although *crontab* is a more  
 85073 appropriate vehicle for such work):

```

85074 # my.daily runs every day
85075 daily processing
85076 at now tomorrow < my.daily

```

85077 5. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as  
 85078 there are no ambiguities. Examples of various times and operand presentation include:

```

85079 at 0815am Jan 24
85080 at 8 :15amjan24
85081 at now "+ 1day"
85082 at 5 pm FRIday
85083 at '17
85084     utc+
85085     30minutes'

```

## 85086 RATIONALE

85087 The *at* utility reads from standard input the commands to be executed at a later time. It may be  
 85088 useful to redirect standard output and standard error within the specified commands.

85089 The *-t time* option was added as a new capability to support an internationalized way of  
 85090 specifying a time for execution of the submitted job.

85091 Early proposals added a “jobname” concept as a way of giving submitted jobs names that are  
 85092 meaningful to the user submitting them. The historical, system-specified *at\_job\_id* gives no  
 85093 indication of what the job is. Upon further reflection, it was decided that the benefit of this was  
 85094 not worth the change in historical interface.

85095 The *-q* option historically has been an undocumented option, used mainly by the *batch* utility.

85096 The System V *-m* option was added to provide a method for informing users that an at-job had  
 85097 completed. Otherwise, users are only informed when output to standard error or standard  
 85098 output are not redirected.

85099 The behavior of *at <now>* was changed in an early proposal from being unspecified to  
 85100 submitting a job for potentially immediate execution. Historical BSD *at* implementations support  
 85101 this. Historical System V implementations give an error in that case, but a change to the System  
 85102 V versions should have no backwards-compatibility ramifications.

85103 On BSD-based systems, a *-u user* option has allowed those with appropriate privileges to access  
 85104 the work of other users. Since this is primarily a system administration feature and is not  
 85105 universally implemented, it has been omitted. Similarly, a specification for the output format for  
 85106 a user with appropriate privileges viewing the queues of other users has been omitted.

85107 The *-f file* option from System V is used instead of the BSD method of using the last operand as  
 85108 the pathname. The BSD method is ambiguous—does:

```
85109 at 1200 friday
```

85110 mean the same thing if there is a file named **friday** in the current directory?

85111 The *at\_job\_id* is composed of a limited character set in historical practice, and it is mandated here  
 85112 to invalidate systems that might try using characters that require shell quoting or that could not  
 85113 be easily parsed by shell scripts.

85114 The *at* utility varies between System V and BSD systems in the way timezones are used. On  
 85115 System V systems, the *TZ* variable affects the at-job submission times and the times displayed  
 85116 for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved  
 85117 with the current specification. If the user wishes to have the timezone default to that of the  
 85118 system, they merely need to issue the *at* command immediately following an unsetting or null  
 85119 assignment to *TZ*. For example:

85120 `TZ= at noon . . .`

85121 gives the desired BSD result.

85122 While the *yacc*-like grammar specified in the OPERANDS section is lexically unambiguous with  
 85123 respect to the digit strings, a lexical analyzer would probably be written to look for and return  
 85124 digit strings in those cases. The parser could then check whether the digit string returned is a  
 85125 valid *day\_number*, *year\_number*, and so on, based on the context.

#### 85126 FUTURE DIRECTIONS

85127 None.

#### 85128 SEE ALSO

85129 *batch*, *crontab*

85130 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

#### 85131 CHANGE HISTORY

85132 First released in Issue 2.

#### 85133 Issue 6

85134 This utility is marked as part of the User Portability Utilities option.

85135 The following new requirements on POSIX implementations derive from alignment with the  
 85136 Single UNIX Specification:

- 85137 • If `-m` is not used, the job's standard output and standard error are provided to the user by  
 85138 mail.

85139 The effects of using the `-q` and `-t` options as defined in the IEEE P1003.2b draft standard are  
 85140 specified.

85141 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 85142 Issue 7

85143 The *at* utility is moved from the User Portability Utilities option to the Base. User Portability  
 85144 Utilities is now an option for interactive utilities.

85145 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
 85146 by the *at* utility.

85147 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

#### 85148 Issue 8

85149 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

85150 Austin Group Defect 1307 is applied, changing the *timespec* operand in relation to locales that do  
 85151 not support the 12-hour clock format.

85152 Austin Group Defect 1330 is applied, removing obsolescent interfaces.

- 85153 Austin Group Defect 1368 is applied, changing the EXAMPLES section.
- 85154 Austin Group Defect 1377 is applied, correcting a typographic error in the description of the `-q`  
85155 option.
- 85156 Austin Group Defect 1495 is applied, changing the EXIT STATUS and CONSEQUENCES OF  
85157 ERRORS sections.

85158 **NAME**

85159 awk — pattern scanning and processing language

85160 **SYNOPSIS**85161 awk [-F *sepstring*] [-v *assignment*]... *program* [*argument*...]85162 awk [-F *sepstring*] -f *progfile* [-f *progfile*]... [-v *assignment*]...85163 [*argument*...]85164 **DESCRIPTION**

85165 The *awk* utility shall execute programs written in the *awk* programming language, which is  
 85166 specialized for textual data manipulation. An *awk* program is a sequence of patterns and  
 85167 corresponding actions. When input is read that matches a pattern, the action associated with that  
 85168 pattern is carried out.

85169 Input shall be interpreted as a sequence of records. By default, a record is a line, less its  
 85170 terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of  
 85171 input shall be matched in turn against each pattern in the program. For each pattern matched,  
 85172 the associated action shall be executed.

85173 The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field  
 85174 is a string of non-<blank> non-<newline> characters. This default <blank> and <newline> field  
 85175 delimiter can be changed by using the **FS** built-in variable or the **-F *sepstring*** option. The *awk*  
 85176 utility shall denote the first field in a record \$1, the second \$2, and so on. The symbol \$0 shall  
 85177 refer to the entire record; setting any other field causes the re-evaluation of \$0. Assigning to \$0  
 85178 shall reset the values of all other fields and the **NF** built-in variable.

85179 **OPTIONS**85180 The *awk* utility shall conform to XBD [Section 12.2](#) (on page 215).

85181 The following options shall be supported:

85182 **-F *sepstring*** Define the input field separator. This option shall be equivalent to:85183 **-v *FS=sepstring***

85184 except that if **-F *sepstring*** and **-v *FS=sepstring*** are both used, it is unspecified  
 85185 whether the **FS** assignment resulting from **-F *sepstring*** is processed in command  
 85186 line order or is processed after the last **-v *FS=sepstring***. See the description of the  
 85187 **FS** built-in variable, and how it is used, in the EXTENDED DESCRIPTION section.

85188 **-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. A pathname of  
 85189 '-' shall denote the standard input. If multiple instances of this option are  
 85190 specified, the concatenation of the files specified as *progfile* in the order specified  
 85191 shall be the *awk* program. The *awk* program can alternatively be specified in the  
 85192 command line as a single argument.

85193 **-v *assignment***

85194 The application shall ensure that the *assignment* argument is in the same form as an  
 85195 *assignment* operand. The specified variable assignment shall occur prior to  
 85196 executing the *awk* program, including the actions associated with **BEGIN** patterns  
 85197 (if any). Multiple occurrences of this option can be specified.

85198 **OPERANDS**

85199 The following operands shall be supported:

85200 *program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk*  
 85201 program. The application shall supply the *program* operand as a single argument to  
 85202 *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.

85203 *argument* Either of the following two types of *argument* can be intermixed:

85204 *file* A pathname of a file that contains the input to be read, which is  
 85205 matched against the set of patterns in the program. If no *file* operands  
 85206 or their equivalents, achieved by modifying the *awk* variables **ARGV**  
 85207 and **ARGC**, are specified, or if a *file* operand is '-', the standard  
 85208 input shall be used.

85209 *assignment* An operand that begins with an <underscore> or alphabetic  
 85210 character from the portable character set (see the table in XBD [Section](#)  
 85211 [6.1](#), on page 117), followed by a sequence of underscores, digits, and  
 85212 alphabetic characters from the portable character set, followed by the '='  
 85213 character, shall specify a variable assignment rather than a pathname.  
 85214 The characters before the '=' represent the name of an *awk* variable;  
 85215 if that name is an *awk* reserved word (see [Grammar](#), on page 2624)  
 85216 the behavior is undefined. The characters following the <equals-  
 85217 sign> shall be interpreted as if they appeared in the *awk* program  
 85218 preceded and followed by a double-quote ('"') character, as a  
 85219 **STRING** token (see [Grammar](#), on page 2624), except that if the last  
 85220 character is an unescaped <backslash>, it shall be interpreted as a  
 85221 literal <backslash> rather than as the first character of the sequence  
 85222 "\\". The variable shall be assigned the value of that **STRING**  
 85223 token and, if appropriate, shall be considered a *numeric string* (see  
 85224 [Expressions in awk](#), on page 2608), the variable shall also be assigned  
 85225 its numeric value. Each such variable assignment shall occur just  
 85226 prior to the processing of the following *file*, if any. Thus, an  
 85227 assignment before the first *file* argument shall be executed after the  
 85228 **BEGIN** actions (if any), while an assignment after the last *file*  
 85229 argument shall occur before the **END** actions (if any). If there are no  
 85230 *file* arguments or their equivalents, achieved by modifying the *awk*  
 85231 variables **ARGV** and **ARGC**, assignments shall be executed before  
 85232 processing the standard input.

### 85233 STDIN

85234 The standard input shall be used only if no *file* operands or their equivalents, achieved by  
 85235 modifying the *awk* variables **ARGV** and **ARGC**, are specified; or if a *file* operand, or its  
 85236 equivalent, is '-'; or if a *progfile* option-argument is '-'; see the INPUT FILES section. If the  
 85237 *awk* program contains no actions and no patterns, but is otherwise a valid *awk* program,  
 85238 standard input and any *file* operands shall not be read and *awk* shall exit with a return status of  
 85239 zero.

### 85240 INPUT FILES

85241 Input files to the *awk* program from any of the following sources shall be text files:

- 85242 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV**  
 85243 and **ARGC**
- 85244 • Standard input in the absence of any *file* operands, or their equivalents
- 85245 • Arguments to the **getline** function

85246 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,  
 85247 implementations shall support records terminated with the specified separator up to  
 85248 {LINE\_MAX} bytes and may support longer records.

85249 If **-f progfile** is specified, the application shall ensure that the files named by each of the *progfile*

85250 option-arguments are text files and their concatenation, in the same order as they appear in the  
85251 arguments, is an *awk* program.

#### 85252 ENVIRONMENT VARIABLES

85253 The following environment variables shall affect the execution of *awk*:

85254 *LANG* Provide a default value for the internationalization variables that are unset or null.  
85255 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
85256 variables used to determine the values of locale categories.)

85257 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
85258 internationalization variables.

#### 85259 *LC\_COLLATE*

85260 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
85261 character collating elements within regular expressions and in comparisons of  
85262 string values.

85263 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
85264 characters (for example, single-byte as opposed to multi-byte characters in  
85265 arguments and input files), the behavior of character classes within regular  
85266 expressions, the identification of characters as letters, and the mapping of  
85267 uppercase and lowercase characters for the **toupper** and **tolower** functions.

#### 85268 *LC\_MESSAGES*

85269 Determine the locale that should be used to affect the format and contents of  
85270 diagnostic messages written to standard error.

#### 85271 *LC\_NUMERIC*

85272 Determine the radix character used when interpreting numeric input, performing  
85273 conversions between numeric and string values, and formatting numeric output.  
85274 Regardless of locale, the <period> character (the decimal-point character of the  
85275 POSIX locale) is the decimal-point character recognized in processing *awk*  
85276 programs (including assignments in command line arguments).

85277 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

85278 *PATH* Determine the search path when looking for commands executed by *system(expr)*,  
85279 or input and output pipes; see XBD Chapter 8 (on page 167).

85280 In addition, all environment variables shall be visible via the *awk* variable **ENVIRON**.

#### 85281 ASYNCHRONOUS EVENTS

85282 Default.

#### 85283 STDOUT

85284 The nature of the output files depends on the *awk* program.

#### 85285 STDERR

85286 The standard error shall be used only for diagnostic messages.

#### 85287 OUTPUT FILES

85288 The nature of the output files depends on the *awk* program.

## 85289 EXTENDED DESCRIPTION

## 85290 Overall Program Structure

85291 An *awk* program is composed of pairs of the form:85292 *pattern { action }*

85293 Either the pattern or the action (including the enclosing brace characters) can be omitted.

85294 A missing pattern shall match any record of input, and a missing action shall be equivalent to:

85295 *{ print }*

85296 Execution of the *awk* program shall start by first executing the actions associated with all **BEGIN**  
 85297 patterns in the order they occur in the program. Then each *file* operand (or standard input if no  
 85298 files were specified) shall be processed in turn by reading data from the file until a record  
 85299 separator is seen (<newline> by default). Before the first reference to a field in the record is  
 85300 evaluated, the record shall be split into fields, according to the rules in [Regular Expressions](#) (on  
 85301 page 2615), using the value of **FS** that was current at the time the record was read. Each pattern  
 85302 in the program then shall be evaluated in the order of occurrence, and the action associated with  
 85303 each pattern that matches the current record executed. The action for a matching pattern shall be  
 85304 executed before evaluating subsequent patterns. Finally, the actions associated with all **END**  
 85305 patterns shall be executed in the order they occur in the program.

## 85306 Expressions in awk

85307 Expressions describe computations used in *patterns* and *actions*. In the following table, valid  
 85308 expression operations are given in groups from highest precedence first to lowest precedence  
 85309 last, with equal-precedence operators grouped between horizontal lines. In expression  
 85310 evaluation, where the grammar is formally ambiguous, higher precedence operators shall be  
 85311 evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent  
 85312 any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side  
 85313 of an assignment operator). The precise syntax of expressions is given in [Grammar](#) (on page  
 85314 2624).

85315 **Table 3-1** Expressions in Decreasing Precedence in *awk*

Syntax	Name	Type of Result	Associativity
( <i>expr</i> )	Grouping	Type of <i>expr</i>	N/A
<i>\$expr</i>	Field reference	Uninitialized or String	N/A
<i>lvalue</i> ++	Post-increment	Numeric	N/A
<i>lvalue</i> --	Post-decrement	Numeric	N/A
++ <i>lvalue</i>	Pre-increment	Numeric	N/A
-- <i>lvalue</i>	Pre-decrement	Numeric	N/A
<i>expr</i> ^ <i>expr</i>	Exponentiation	Numeric	Right
! <i>expr</i>	Logical not	Numeric	N/A
+ <i>expr</i>	Unary plus	Numeric	N/A
- <i>expr</i>	Unary minus	Numeric	N/A
<i>expr</i> * <i>expr</i>	Multiplication	Numeric	Left
<i>expr</i> / <i>expr</i>	Division	Numeric	Left
<i>expr</i> % <i>expr</i>	Modulus	Numeric	Left

	Syntax	Name	Type of Result	Associativity
85330				
85331	$expr + expr$	Addition	Numeric	Left
85332	$expr - expr$	Subtraction	Numeric	Left
85333	$expr expr$	String concatenation	String	Left
85334	$expr < expr$	Less than	Numeric	None
85335	$expr <= expr$	Less than or equal to	Numeric	None
85336	$expr != expr$	Not equal to	Numeric	None
85337	$expr == expr$	Equal to	Numeric	None
85338	$expr > expr$	Greater than	Numeric	None
85339	$expr >= expr$	Greater than or equal to	Numeric	None
85340	$expr \sim expr$	ERE match	Numeric	None
85341	$expr !\sim expr$	ERE non-match	Numeric	None
85342	$expr$ in array	Array membership	Numeric	Left
85343	( $index$ ) in array	Multi-dimension array membership	Numeric	Left
85344				
85345	$expr \&\& expr$	Logical AND	Numeric	Left
85346	$expr \ \  expr$	Logical OR	Numeric	Left
85347	$expr1 ? expr2 : expr3$	Conditional expression	Type of selected $expr2$ or $expr3$	Right
85348				
85349	$lvalue \hat{=} expr$	Exponentiation assignment	Numeric	Right
85350	$lvalue \% = expr$	Modulus assignment	Numeric	Right
85351	$lvalue * = expr$	Multiplication assignment	Numeric	Right
85352	$lvalue / = expr$	Division assignment	Numeric	Right
85353	$lvalue + = expr$	Addition assignment	Numeric	Right
85354	$lvalue - = expr$	Subtraction assignment	Numeric	Right
85355	$lvalue = expr$	Assignment	Type of $expr$	Right

85356 Each expression shall have either a string value, a numeric value, or both. Except as stated for  
 85357 specific contexts, the value of an expression shall be implicitly converted to the type needed for  
 85358 the context in which it is used. A string value shall be converted to a numeric value either by the  
 85359 equivalent of the following calls to functions defined by the ISO C standard:

```
85360 setlocale(LC_NUMERIC, "");
85361 numeric_value = atof(string_value);
```

85362 or by converting the initial portion of the string to type **double** representation as follows:

85363 The input string is decomposed into two parts: an initial, possibly empty, sequence of  
 85364 white-space characters (as specified by *isspace()*) and a subject sequence interpreted as a  
 85365 floating-point constant.

85366 The expected form of the subject sequence is an optional '+' or '-' sign, then a non-  
 85367 empty sequence of digits optionally containing a radix character, then an optional  
 85368 exponent part. An exponent part consists of 'e' or 'E', followed by an optional sign,  
 85369 followed by one or more decimal digits.

85370 The sequence starting with the first digit or the radix character (whichever occurs first) is  
 85371 interpreted as a floating constant of the C language, except that the radix character shall be  
 85372 used in place of a <period>, and if neither an exponent part nor a radix character appears,  
 85373 a radix character is assumed to follow the last digit in the string. If the subject sequence  
 85374 begins with a <hyphen-minus>, the value resulting from the conversion is negated.

85375 A numeric value that is exactly equal to the value of an integer (see [Section 1.1.2](#), on page 2457)

85376 shall be converted to a string by the equivalent of a call to the **sprintf** function (see [String](#)  
 85377 [Functions](#), on page 2621) with the string "%d" as the *fmt* argument and the numeric value being  
 85378 converted as the first and only *expr* argument. Any other numeric value shall be converted to a  
 85379 string by the equivalent of a call to the **sprintf** function with the value of the variable  
 85380 **CONVFMT** as the *fmt* argument and the numeric value being converted as the first and only  
 85381 *expr* argument. The result of the conversion is unspecified if the value of **CONVFMT** is not a  
 85382 floating-point format specification. This volume of POSIX.1-2024 specifies no explicit  
 85383 conversions between numbers and strings. An application can force an expression to be treated  
 85384 as a number by adding zero to it, or can force it to be treated as a string by concatenating the null  
 85385 string (" ") to it.

85386 A string value shall be considered a *numeric string* if it comes from one of the following:

- 85387 1. Field variables
- 85388 2. Input from the *getline()* function
- 85389 3. **FILENAME**
- 85390 4. **ARGV** array elements
- 85391 5. **ENVIRON** array elements
- 85392 6. Array elements created by the *split()* function
- 85393 7. A command line variable assignment
- 85394 8. Variable assignment from another numeric string variable

85395 and an implementation-dependent condition corresponding to either case (a) or (b) below is  
 85396 met.

- 85397 a. After the equivalent of the following calls to functions defined by the ISO C standard,  
 85398 *string\_value\_end* would differ from *string\_value*, and any characters before the terminating  
 85399 null character in *string\_value\_end* would be <blank> characters:

```
85400 char *string_value_end;  
85401 setlocale(LC_NUMERIC, "");  
85402 numeric_value = strtod(string_value, &string_value_end);
```

- 85403 b. After all the following conversions have been applied, the resulting string would lexically  
 85404 be recognized as a **NUMBER** token as described by the lexical conventions in [Grammar](#)  
 85405 (on page 2624):

- 85406 — All leading and trailing <blank> characters are discarded.
- 85407 — If the first non-<blank> is '+' or '-', it is discarded.
- 85408 — Each occurrence of the radix character from the current locale is changed to a  
 85409 <period>.

85410 In case (a) the numeric value of the *numeric string* shall be the value that would be returned by  
 85411 the *strtod()* call. In case (b) if the first non-<blank> is '-', the numeric value of the *numeric*  
 85412 *string* shall be the negation of the numeric value of the recognized **NUMBER** token; otherwise,  
 85413 the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER**  
 85414 token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that  
 85415 term is used in this section.

85416 When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall  
 85417 be treated as false and any other value shall be treated as true. Otherwise, a string value of the  
 85418 null string shall be treated as false and any other value shall be treated as true. A Boolean

85419 context shall be one of the following:

- 85420 • The first subexpression of a conditional expression
- 85421 • An expression operated on by logical NOT, logical AND, or logical OR
- 85422 • The second expression of a **for** statement
- 85423 • The expression of an **if** statement
- 85424 • The expression of the **while** clause in either a **while** or **do...while** statement
- 85425 • An expression used as a pattern (as in Overall Program Structure)

85426 All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C  
85427 standard (see [Section 1.1.2](#), on page 2457).

85428 The value of the expression:

85429 `expr1 ^ expr2`

85430 shall be equivalent to the value returned by the ISO C standard function call:

85431 `pow(expr1, expr2)`

85432 The expression:

85433 `lvalue ^= expr`

85434 shall be equivalent to the ISO C standard expression:

85435 `lvalue = pow(lvalue, expr)`

85436 except that `lvalue` shall be evaluated only once. The value of the expression:

85437 `expr1 % expr2`

85438 shall be equivalent to the value returned by the ISO C standard function call:

85439 `fmod(expr1, expr2)`

85440 The expression:

85441 `lvalue %= expr`

85442 shall be equivalent to the ISO C standard expression:

85443 `lvalue = fmod(lvalue, expr)`

85444 except that `lvalue` shall be evaluated only once.

85445 Variables and fields shall be set by the assignment statement:

85446 `lvalue = expression`

85447 and the type of *expression* shall determine the resulting variable type. The assignment includes  
85448 the arithmetic assignments ("`+=`", "`-=`", "`*=`", "`/=`", "`%=`", "`^=`", "`++`", "`--`") all of which  
85449 shall produce a numeric result. The left-hand side of an assignment and the target of increment  
85450 and decrement operators can be one of a variable, an array with index, or a field selector.

85451 The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not  
85452 be declared. They shall initially be empty, and their sizes shall change dynamically. The  
85453 subscripts, or element identifiers, are strings, providing a type of associative array capability. An  
85454 array name followed by a subscript within square brackets can be used as an lvalue and thus as  
85455 an expression, as described in the grammar; see [Grammar](#) (on page 2624). Unsubscripted array  
85456 names can be used in only the following contexts:

- 85457 • A parameter in a function definition or function call
- 85458 • The **NAME** token following any use of the keyword **in** as specified in the grammar (see
- 85459 [Grammar](#), on page 2624); if the name used in this context is not an array name, the
- 85460 behavior is undefined
- 85461 • The **NAME** token following the keyword **Delete** without a subscript as specified in the
- 85462 grammar (see [Grammar](#), on page 2624); if the name used in this context is not an array
- 85463 name, the behavior is undefined.

85464 A valid array *index* shall consist of one or more <comma>-separated expressions, similar to the  
 85465 way in which multi-dimensional arrays are indexed in some programming languages. Because  
 85466 *awk* arrays are really one-dimensional, such a <comma>-separated list shall be converted to a  
 85467 single string by concatenating the string values of the separate expressions, each separated from  
 85468 the other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be  
 85469 equivalent:

```
85470 var[expr1, expr2, ... exprn]
```

```
85471 var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]
```

85472 The application shall ensure that a multi-dimensioned *index* used with the **in** operator is  
 85473 parenthesized. The **in** operator, which tests for the existence of a particular array element, shall  
 85474 not cause that element to exist. Any other reference to a nonexistent array element shall  
 85475 automatically create it.

85476 Comparisons (with the '<', '<=', '!=', '==', '>', and '>=' operators) shall be made  
 85477 numerically:

- 85478 • if both operands are numeric,
- 85479 • if one is numeric and the other has a string value that is a numeric string,
- 85480 • if both have string values that are numeric strings, or
- 85481 • if one is numeric and the other has the uninitialized value.

85482 Otherwise, operands shall be converted to strings as required and a string comparison shall be  
 85483 made as follows:

- 85484 • For the '!=' and '==' operators, the strings shall be compared to check if they are  
 85485 identical (not to check if they collate equally).
- 85486 • For the other operators, the strings shall be compared using the locale-specific collation  
 85487 sequence.

85488 The value of the comparison expression shall be 1 if the relation is true, or 0 if the relation is  
 85489 false.

## 85490 Variables and Special Variables

85491 Variables can be used in an *awk* program by referencing them. With the exception of function  
 85492 parameters (see [User-Defined Functions](#), on page 2624), they are not explicitly declared.  
 85493 Function parameter names shall be local to the function; all other variable names shall be global.  
 85494 The same name shall not be used as both a function parameter name and as the name of a  
 85495 function or a special *awk* variable. The same name shall not be used both as a variable name with  
 85496 global scope and as the name of a function. The same name shall not be used within the same  
 85497 scope both as a scalar variable and as an array. Uninitialized variables, including scalar  
 85498 variables, array elements, and field variables, shall have an uninitialized value. An uninitialized  
 85499 value shall have both a numeric value of zero and a string value of the empty string. Evaluation

85500 of variables with an uninitialized value, to either string or numeric, shall be determined by the  
85501 context in which they are used.

85502 Field variables shall be designated by a '\$' followed by a number or numerical expression. The  
85503 effect of the field number *expression* evaluating to anything other than a non-negative integer is  
85504 unspecified; uninitialized variables or string values need not be converted to numeric values in  
85505 this context. New field variables can be created by assigning a value to them. References to  
85506 nonexistent fields (that is, fields after \$NF), shall evaluate to the uninitialized value. Such  
85507 references shall not create new fields. However, assigning to a nonexistent field (for example,  
85508 \$(NF+2)=5) shall increase the value of NF; create any intervening fields with the uninitialized  
85509 value; and cause the value of \$0 to be recomputed, with the fields being separated by the value  
85510 of OFS. Each field variable shall have a string value or an uninitialized value when created.  
85511 Field variables shall have the uninitialized value when created from \$0 using FS and the variable  
85512 does not contain any characters. If appropriate, the field variable shall be considered a numeric  
85513 string (see [Expressions in awk](#), on page 2608).

85514 Implementations shall support the following other special variables that are set by *awk*:

85515 **ARGC** A number determining when the iteration described for ARGV stops. When an  
85516 *awk* program starts, ARGC shall be initialized to the number of elements in the  
85517 ARGV array. ARGC can be updated by the *awk* program and by assignment  
85518 operands. If ARGC is set to a value less than 1, the behavior is unspecified. It is  
85519 unspecified whether alterations to ARGC can be made using the -v option.

85520 **ARGV** An array containing, initially, the command name (see [Section 2.9.1](#), on page 2500)  
85521 used to invoke *awk* in ARGV[0] and the command line arguments, if any,  
85522 excluding options and the *program* operand, in ARGV[1] through ARGV[ARGC-1].  
85523 The elements in ARGV can be assigned new values or deleted, and new elements  
85524 can be added. Note that alterations to ARGV cannot be made using either the  
85525 *assignment* operand or the -v option, because an operand with a '[' before '=' is  
85526 treated as a *file* operand, not an *assignment* operand, and applications are required  
85527 to ensure that the -v option-argument has the same form as an *assignment* operand.  
85528 (See the OPTIONS and OPERANDS sections.)

85529 After processing the BEGIN actions, if any, *awk* begins iterating over the elements  
85530 of ARGV, processing them as if they were *argument* operands. It shall behave as if  
85531 the implementation maintains an internal counter that is initialized to 1 and  
85532 increments by 1 at the end of each iteration. For each iteration, the following shall  
85533 occur:

- 85534 • If the internal counter is greater than or equal to the current value of ARGC  
85535 and no *file* operands have been processed, *awk* shall set FILENAME to '-'  
85536 and process standard input as if it was given as a file operand. The internal  
85537 counter shall not be incremented at the end of this iteration.
- 85538 • Otherwise, if the internal counter is greater than or equal to the current value  
85539 of ARGC, the iterations shall stop and processing of the END actions, if any,  
85540 shall begin. Any ARGV elements with index values greater than or equal to  
85541 ARGC shall not be processed as *argument* operands.
- 85542 • Otherwise, if the element ARGV[*internal counter value*] does not exist, it is  
85543 unspecified whether that element is created. No other action shall be taken.
- 85544 • Otherwise, if ARGV[*internal counter value*] is a null string, no action shall be  
85545 taken.

85546		• Otherwise, if ARGV[ <i>internal counter value</i> ] matches the format of an
85547		assignment operand (see OPERANDS), awk shall process the assignment.
85548		• Otherwise, ARGV[ <i>internal counter value</i> ] shall be treated as a file operand,
85549		FILENAME shall be set to that value, and the named file, or standard input if
85550		the value is '-', shall be processed as an input file.
85551		Since only non-null elements are processed, setting an element of ARGV to the
85552		null string or deleting it means that it shall not be treated as an argument operand.
85553	<b>CONVFMT</b>	The printf format for converting numbers to strings (except for output statements,
85554		where OFMT is used); "%.6g" by default.
85555	<b>ENVIRON</b>	An array representing the value of the environment, as described in the exec
85556		functions defined in the System Interfaces volume of POSIX.1-2024. The indices of
85557		the array shall be strings consisting of the names of the environment variables, and
85558		the value of each array element shall be a string consisting of the value of that
85559		variable. If appropriate, the environment variable shall be considered a numeric
85560		string (see Expressions in awk, on page 2608); the array element shall also have its
85561		numeric value.
85562		In all cases where the behavior of awk is affected by environment variables
85563		(including the environment of any commands that awk executes via the system
85564		function or via pipeline redirections with the print statement, the printf statement,
85565		or the getline function), the environment used shall be the environment at the time
85566		awk began executing; it is implementation-defined whether any modification of
85567		ENVIRON affects this environment.
85568	<b>FILENAME</b>	The pathname used to open the current input file, or '-' if the file is standard
85569		input. Inside a BEGIN action FILENAME shall be unset. Inside an END action the
85570		value shall be the name of the last input file processed. If an application changes
85571		the value of FILENAME, the results are unspecified.
85572	<b>FNR</b>	The ordinal number of the current record in the current file. Inside a BEGIN action
85573		the value shall be zero. Inside an END action the value shall be the number of the
85574		last record processed in the last file processed.
85575	<b>FS</b>	Input field separator regular expression; a <space> by default.
85576	<b>NF</b>	The number of fields in the current record. Inside a BEGIN action, the use of NF is
85577		undefined unless a getline function without a var argument is executed previously.
85578		Inside an END action, NF shall retain the value it had for the last record read,
85579		unless a subsequent, redirected, getline function without a var argument is
85580		performed prior to entering the END action.
85581	<b>NR</b>	The ordinal number of the current record from the start of input. Inside a BEGIN
85582		action the value shall be zero. Inside an END action the value shall be the number
85583		of the last record processed. Records skipped by the nextfile statement shall not
85584		be included.
85585	<b>OFMT</b>	The printf format for converting numbers to strings in output statements (see
85586		Output Statements, on page 2619); "%.6g" by default. The result of the conversion
85587		is unspecified if the value of OFMT is not a floating-point format specification.
85588	<b>OFS</b>	The print statement output field separator; <space> by default.

85589	<b>ORS</b>	The <b>print</b> statement output record separator; a <newline> by default.
85590	<b>RLENGTH</b>	The length of the string matched by the <b>match</b> function.
85591	<b>RS</b>	The first character of the string value of <b>RS</b> shall be the input record separator; a <newline> by default. If <b>RS</b> contains more than one character, the results are unspecified. If <b>RS</b> is null, then records are separated by sequences consisting of a <newline> plus one or more blank lines, leading or trailing blank lines shall not result in empty records at the beginning or end of the input, and a <newline> shall always be a field separator, no matter what the value of <b>FS</b> is.
85592		
85593		
85594		
85595		
85596		
85597	<b>RSTART</b>	The starting position of the string matched by the <b>match</b> function, numbering from 1. This shall always be equivalent to the return value of the <b>match</b> function.
85598		
85599	<b>SUBSEP</b>	The subscript separator string for multi-dimensional arrays; the default value is implementation-defined.
85600		

### 85601 **Regular Expressions**

85602 The *awk* utility shall make use of the extended regular expression notation (see XBD [Section 9.4](#),  
85603 on page 187) except that it shall allow the use of C-language conventions for escaping special  
85604 characters within the EREs, as specified in the table in XBD [Chapter 5](#) (on page 113) for '\\',  
85605 '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v' and in the following table for other sequences;  
85606 these escape sequences shall be recognized both inside and outside bracket expressions. Note  
85607 that records need not be separated by <newline> characters and string constants can contain  
85608 <newline> characters, so even the "\\n" sequence is valid in *awk* EREs. Using a <slash>  
85609 character within the lexical token **ERE** (except as one of the two delimiters) requires the escaping  
85610 shown in the following table.

85611

Table 3-2 Escape Sequences in *awk*

Escape Sequence	Description	Meaning
\ "	<backslash> <quotation-mark>	In the lexical token <b>STRING</b> , <quotation-mark> character. Otherwise undefined.
\ /	<backslash> <slash>	In the lexical token <b>ERE</b> , <slash> character. Otherwise undefined.
\ ddd	A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined. If the digits produce a value greater than octal 377, the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.
\ ., \ [, \ (, \ *, \ +, \ ?, \ {, \  , \ ^, \ \$	A <backslash> character followed by a character that has a special meaning in EREs (see XBD Section 9.4), other than <backslash>.	In the lexical token <b>ERE</b> when not inside a bracket expression, the sequence shall represent itself. Otherwise undefined.
\\	Two <backslash> characters.	In the lexical token <b>ERE</b> , the sequence shall represent itself. In the lexical token <b>STRING</b> , it shall represent a single <backslash>.
\ c	A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 113) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').	Undefined

85640

85641

85642

85643

85644

85645

85646

85647

85648

85649

85650

85651

85652

85653

A regular expression can be matched against a specific field or string by using one of the two regular expression matching operators, '~' and '!~'. These operators shall interpret their right-hand operand as a regular expression and their left-hand operand as a string. If the regular expression matches the string, the '~' expression shall evaluate to a value of 1, and the '!~' expression shall evaluate to a value of 0. (The regular expression matching operation is as defined by the term *matched* in XBD Section 9.1 (on page 179), where a match occurs on any part of the string unless the regular expression is limited with the <circumflex> or <dollar-sign> special characters.) If the regular expression does not match the string, the '~' expression shall evaluate to a value of 0, and the '!~' expression shall evaluate to a value of 1. If the right-hand operand is any expression other than the lexical token **ERE**, the string value of the expression shall be interpreted as an extended regular expression, including the escape conventions described above. Note that these escape conventions shall also be applied in determining the value of a string literal (the lexical token **STRING**), and thus shall be applied a second time when a string literal is used in this context.

85654

85655

85656

When an **ERE** token appears as an expression in any context other than as the right-hand of the '~' or '!~' operator or as one of the built-in function arguments described below, the value of the resulting expression shall be the equivalent of:

85657

```
$0 ~ /ere/
```

85658 The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function  
 85659 (see [String Functions](#), on page 2621) shall be interpreted as extended regular expressions. These  
 85660 can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner  
 85661 as the right-hand side of the '*~*' or '!~' operator.

85662 An extended regular expression can be used to separate fields by assigning a string containing  
 85663 the expression to the built-in variable **FS**, either directly or as a consequence of using the **-F**  
 85664 *sepstring* option. The default value of the **FS** variable shall be a single `<space>`. The following  
 85665 describes **FS** behavior:

- 85666 1. If **FS** is a null string, the behavior is unspecified.
- 85667 2. If **FS** is a single character:
  - 85668 a. If **FS** is `<space>`, skip leading and trailing `<blank>` and `<newline>` characters;  
 85669 fields shall be delimited by sets of one or more `<blank>` or `<newline>` characters.
  - 85670 b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single  
 85671 occurrence of *c*.
- 85672 3. Otherwise, the string value of **FS** shall be considered to be an extended regular  
 85673 expression. Each occurrence of a sequence of one or more characters matching the  
 85674 extended regular expression shall delimit fields.

85675 When ERE matching is performed against input records; that is, the match is against \$0 and the  
 85676 current value of \$0 resulted from processing an input record, record separator characters (the  
 85677 first character of the value of the variable **RS**, `<newline>` by default) cannot be embedded in the  
 85678 expression, and no expression shall match the record separator character. If the record separator  
 85679 is not `<newline>`, `<newline>` characters embedded in the expression can be matched. When ERE  
 85680 matching is not performed against input records, it shall be based on text strings; any character  
 85681 (including `<newline>` and the record separator) can be embedded in the pattern, and an  
 85682 appropriate pattern shall match any character. However, in all *awk* ERE matching, the use of one  
 85683 or more NUL characters in the pattern, input record, or text string produces undefined results.

## 85684 **Patterns**

85685 A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or  
 85686 one of the two special patterns **BEGIN** or **END**.

## 85687 **Special Patterns**

85688 The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern  
 85689 shall be matched once and its associated action executed before the first record of input is read—  
 85690 except possibly by use of the **getline** function (see [Input/Output and General Functions](#), on  
 85691 page 2623) in a prior **BEGIN** action—and before command line assignment is done. Each **END**  
 85692 pattern shall be matched once and its associated action executed after the last record of input has  
 85693 been read, or if there is no further input file to process following a **nextfile** statement. These two  
 85694 patterns shall have associated actions.

85695 **BEGIN** and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns  
 85696 shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order  
 85697 specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern  
 85698 in a program.

85699 If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action  
 85700 contains no **getline** function, *awk* shall exit without reading its input when the last statement in  
 85701 the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern

85702 **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the  
85703 statements in the **END** actions are executed.

### 85704 **Expression Patterns**

85705 An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the  
85706 result is true, the pattern shall be considered to match, and the associated action (if any) shall be  
85707 executed. If the result is false, the action shall not be executed.

### 85708 **Pattern Ranges**

85709 A pattern range consists of two expressions separated by a comma; in this case, the action shall  
85710 be performed for all records between a match of the first expression and the following match of  
85711 the second expression, inclusive. At this point, the pattern range can be repeated starting at  
85712 input records subsequent to the end of the matched range.

### 85713 **Actions**

85714 An action is a sequence of statements as shown in the grammar in [Grammar](#) (on page 2624).  
85715 Any single statement can be replaced by a statement list enclosed in curly braces. The  
85716 application shall ensure that statements in a statement list are separated by <newline> or  
85717 <semicolon> characters. Statements in a statement list shall be executed sequentially in the order  
85718 that they appear.

85719 The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero  
85720 or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement  
85721 following the **else** shall be executed.

85722 The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard  
85723 (see [Section 1.1.2](#), on page 2457), except that the Boolean expressions shall be treated as  
85724 described in [Expressions in awk](#) (on page 2608), and except in the case of:

85725 `for (variable in array)`

85726 which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of  
85727 adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue**  
85728 statement occurs outside of a loop, the behavior is undefined.

85729 The **delete** statement shall remove either a specified individual array element or, if no element is  
85730 specified, all array elements. Thus, the following code:

85731 `for (index in array)`  
85732  `delete array[index]`

85733 is equivalent to:

85734 `delete array`

85735 Both delete all elements of the array.

85736 The **next** statement shall cause all further processing of the current input record to be  
85737 abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or  
85738 **END** action.

85739 The **nextfile** statement shall cause all further processing of the current input file to be  
85740 abandoned. The behavior is undefined if a **nextfile** statement appears or is invoked in a **BEGIN**  
85741 or **END** action, or in a user-defined function.

85742 The **exit** statement shall invoke all **END** actions in the order in which they occur in the program

85743 source and then terminate the program without reading further input. An **exit** statement inside  
 85744 an **END** action shall terminate the program without further execution of **END** actions. If an  
 85745 expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*,  
 85746 unless subsequent errors are encountered or a subsequent **exit** statement with an expression is  
 85747 executed.

## 85748 Output Statements

85749 Both **print** and **printf** statements shall write to standard output by default. The output shall be  
 85750 written to the location specified by *output\_redirection* if one is supplied, as follows:

```
85751 > expression
85752 >> expression
85753 | expression
```

85754 In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into  
 85755 which to write (for '>' or '>>') or as a command to be executed (for '|' or '|'). Using the first two  
 85756 forms, if the file of that name is not currently open, it shall be opened, creating it if necessary  
 85757 and using the first form, truncating the file. The output then shall be appended to the file. As  
 85758 long as the file remains open, subsequent calls in which *expression* evaluates to the same string  
 85759 value shall simply append output to the file. The file remains open until the **close** function (see  
 85760 [Input/Output and General Functions](#), on page 2623) is called with an expression that evaluates  
 85761 to the same string value.

85762 The third form shall write output onto a stream piped to the input of a command. The stream  
 85763 shall be created if no stream is currently open with the value of *expression* as its command name.  
 85764 The stream created shall be equivalent to one created by a call to the *popen()* function defined in  
 85765 the System Interfaces volume of POSIX.1-2024 with the value of *expression* as the *command*  
 85766 argument and a value of *w* as the *mode* argument. As long as the stream remains open,  
 85767 subsequent calls in which *expression* evaluates to the same string value shall write output to the  
 85768 existing stream. The stream shall remain open until the **close** function (see [Input/Output and  
 85769 General Functions](#), on page 2623) is called with an expression that evaluates to the same string  
 85770 value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in  
 85771 the System Interfaces volume of POSIX.1-2024.

85772 As described in detail by the grammar in [Grammar](#) (on page 2624), these output statements shall  
 85773 take a <comma>-separated list of *expressions* referred to in the grammar by the non-terminal  
 85774 symbols **expr\_list**, **print\_expr\_list**, or **print\_expr\_list\_opt**. This list is referred to here as the  
 85775 *expression list*, and each member is referred to as an *expression argument*.

85776 The **print** statement shall write the value of each expression argument onto the indicated output  
 85777 stream separated by the current output field separator (see variable **OFS** above), and terminated  
 85778 by the output record separator (see variable **ORS** above). All expression arguments shall be  
 85779 taken as strings, being converted if necessary; this conversion shall be as described in  
 85780 [Expressions in awk](#) (on page 2608), with the exception that the **printf** format in **OFMT** shall be  
 85781 used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole  
 85782 input record (\$0).

85783 The **printf** statement shall produce output based on a notation similar to the File Format  
 85784 Notation used to describe file formats in this volume of POSIX.1-2024 (see [XBD Chapter 5](#), on  
 85785 page 113). Output shall be produced as specified with the first *expression* argument as the string  
 85786 *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the  
 85787 following exceptions:

- 85788 1. The *format* shall be an actual character string rather than a graphical representation.  
 85789 Therefore, it cannot contain empty character positions. The <space> in the *format* string,  
 85790 in any context other than a *flag* of a conversion specification, shall be treated as an  
 85791 ordinary character that is copied to the output.
- 85792 2. If the character set contains a ' $\Delta$ ' character and that character appears in the *format*  
 85793 string, it shall be treated as an ordinary character that is copied to the output.
- 85794 3. The *escape sequences* beginning with a <backslash> character shall be treated as sequences  
 85795 of ordinary characters that are copied to the output. Note that these same sequences shall  
 85796 be interpreted lexically by *awk* when they appear in literal strings, but they shall not be  
 85797 treated specially by the **printf** statement.
- 85798 4. A *field width* or *precision* can be specified as the '\*' character instead of a digit string. In  
 85799 this case the next argument from the expression list shall be fetched and its numeric value  
 85800 taken as the field width or precision.
- 85801 5. The implementation shall not precede or follow output from the *d* or *u* conversion  
 85802 specifier characters with <blank> characters not specified by the *format* string.
- 85803 6. The implementation shall not precede output from the *o* conversion specifier character  
 85804 with leading zeros not specified by the *format* string.
- 85805 7. For the *c* conversion specifier character: if the argument has a numeric value, the  
 85806 character whose encoding is that value shall be output. If the value is zero or is not the  
 85807 encoding of any character in the character set, the behavior is undefined. If the argument  
 85808 does not have a numeric value, the first character of the string value shall be output; if the  
 85809 string does not contain any characters, the behavior is undefined.
- 85810 8. For each conversion specification that consumes an argument, the next expression  
 85811 argument shall be evaluated. With the exception of the *c* conversion specifier character,  
 85812 the value shall be converted (according to the rules specified in [Expressions in awk](#), on  
 85813 page 2608) to the appropriate type for the conversion specification.
- 85814 9. If there are insufficient expression arguments to satisfy all the conversion specifications in  
 85815 the *format* string, the behavior is undefined.
- 85816 10. If any character sequence in the *format* string begins with a '%' character, but does not  
 85817 form a valid conversion specification, the behavior is unspecified.

85818 Both **print** and **printf** can output at least {LINE\_MAX} bytes.

## 85819 Functions

85820 The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and  
 85821 general.

85822 Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an  
 85823 array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is  
 85824 passed as a parameter that the function uses as an array. Function parameters shall be passed by  
 85825 value if scalar and by reference if array name.

85826 **Arithmetic Functions**

85827 The arithmetic functions, except for **int**, shall be based on the ISO C standard (see [Section 1.1.2](#),  
 85828 on page 2457). The behavior is undefined in cases where the ISO C standard specifies that an  
 85829 error be returned or that the behavior is undefined. Although the grammar (see [Grammar](#), on  
 85830 page 2624) permits built-in functions to appear with no arguments or parentheses, unless the  
 85831 argument or parentheses are indicated as optional in the following list (by displaying them  
 85832 within the " [ ] " brackets), such use is undefined.

85833 **atan2**(*y,x*) Return arctangent of *y/x* in radians in the range  $[-\pi,\pi]$ .

85834 **cos**(*x*) Return cosine of *x*, where *x* is in radians.

85835 **sin**(*x*) Return sine of *x*, where *x* is in radians.

85836 **exp**(*x*) Return the exponential function of *x*.

85837 **log**(*x*) Return the natural logarithm of *x*.

85838 **sqrt**(*x*) Return the square root of *x*.

85839 **int**(*x*) Return the argument truncated to an integer. Truncation shall be toward 0 when  
 85840 *x*>0.

85841 **rand**() Return a floating point pseudo-random number *n*, such that  $0\leq n<1$ .

85842 **srand**(*expr*) Set the seed value for **rand** to *expr* or use the seconds since the Epoch if *expr* is  
 85843 omitted. The previous seed value shall be returned. The behavior is unspecified if  
 85844 *expr* is not an integer expression or if the value of *expr* is not within the range 0  
 85845 through  $2^{31}-1$  (2 147 483 647), inclusive. The initial seed value is unspecified if **rand**  
 85846 is called without calling **srand** first. The **srand** function uses the argument as a  
 85847 seed for a new sequence of pseudo-random numbers to be returned by subsequent  
 85848 calls to **rand**. If **srand** is then called with the same seed value, the sequence of  
 85849 pseudo-random numbers shall be repeated.

85850 **String Functions**

85851 The string functions in the following list shall be supported. Although the grammar (see  
 85852 [Grammar](#), on page 2624) permits built-in functions to appear with no arguments or parentheses,  
 85853 unless the argument or parentheses are indicated as optional in the following list (by displaying  
 85854 them within the " [ ] " brackets), such use is undefined.

85855 **gsub**(*ere, repl[, in]*)

85856 Behave like **sub** (see below), except that it shall replace all occurrences of the  
 85857 regular expression (like the *ed* utility global substitute) in \$0 or in the *in* argument,  
 85858 when specified.

85859 **index**(*s, t*) Return the position, in characters, numbering from 1, in string *s* where string *t* first  
 85860 occurs, or zero if it does not occur at all.

85861 **length**(*[arg]*)

85862 If *arg* is an array, return the number of elements in the array; otherwise, return the  
 85863 length, in characters, of *arg* taken as a string, or of the whole record, \$0, if there is  
 85864 no argument.

85865 **match**(*s, ere*) Return the position, in characters, numbering from 1, in string *s* where the  
 85866 extended regular expression *ere* occurs, or zero if it does not occur at all. RSTART  
 85867 shall be set to the starting position (which is the same as the returned value), zero  
 85868 if no match is found; RLENGTH shall be set to the length of the matched string, -1

85869 if no match is found.

85870 **split**(*s*, *a*[], *fs* )

85871 Split the string *s* into array elements *a*[1], *a*[2], . . . , *a*[*n*], and return *n*. All elements

85872 of the array shall be deleted before the split is performed. The separation shall be

85873 done with the ERE *fs* or with the field separator **FS** if *fs* is not given. Each array

85874 element shall have a string value when created and, if appropriate, the array

85875 element shall be considered a numeric string (see [Expressions in awk](#), on page

85876 2608). The effect of a null string as the value of *fs* is unspecified.

85877 **sprintf**(*fmt*, *expr*, *expr*, . . . )

85878 Format the expressions according to the **printf** format given by *fmt* and return the

85879 resulting string.

85880 **sub**(*ere*, *repl*[], *in* )

85881 Substitute the string *repl* in place of the first instance of the extended regular

85882 expression *ERE* in string *in* and return the number of substitutions. An

85883 <ampersand> ('&') appearing in the string *repl* shall be replaced by the string

85884 from *in* that matches the ERE. An <ampersand> preceded with a <backslash> shall

85885 be interpreted as the literal <ampersand> character. An occurrence of two

85886 consecutive <backslash> characters shall be interpreted as just a single literal

85887 <backslash> character. Any other occurrence of a <backslash> (for example,

85888 preceding any other character) shall be treated as a literal <backslash> character.

85889 Note that if *repl* is a string literal (the lexical token **STRING**; see [Grammar](#), on page

85890 2624), the handling of the <ampersand> character occurs after any lexical

85891 processing, including any lexical <backslash>-escape sequence processing. If *in* is

85892 specified and it is not an lvalue (see [Expressions in awk](#), on page 2608), the

85893 behavior is undefined. If *in* is omitted, *awk* shall use the current record (\$0) in its

85894 place.

85895 **substr**(*s*, *m*[], *n* )

85896 Return the at most *n*-character substring of *s* that begins at position *m*, numbering

85897 from 1. If *n* is omitted, or if *n* specifies more characters than are left in the string,

85898 the length of the substring shall be limited by the length of the string *s*.

85899 **tolower**(*s*) Return a string based on the string *s*. Each character in *s* that is an uppercase letter

85900 specified to have a **tolower** mapping by the *LC\_CTYPE* category of the current

85901 locale shall be replaced in the returned string by the lowercase letter specified by

85902 the mapping. Other characters in *s* shall be unchanged in the returned string.

85903 **toupper**(*s*) Return a string based on the string *s*. Each character in *s* that is a lowercase letter

85904 specified to have a **toupper** mapping by the *LC\_CTYPE* category of the current

85905 locale is replaced in the returned string by the uppercase letter specified by the

85906 mapping. Other characters in *s* are unchanged in the returned string.

85907 All of the preceding functions that take *ERE* as a parameter expect a pattern or a string valued

85908 expression that is a regular expression as defined in [Regular Expressions](#) (on page 2615).

85909 **Input/Output and General Functions**

85910 The input/output and general functions are:

85911 **close**(*expression*)

85912 Close the file or pipe opened by a **print** or **printf** statement or a call to **getline** with  
 85913 the same string-valued *expression*. The limit on the number of open *expression*  
 85914 arguments is implementation-defined. If the close was successful, the function  
 85915 shall return zero; otherwise, it shall return non-zero.

85916 **fflush**([*expression*])

85917 Write any unwritten data to the file or piped stream opened by a **print** or **printf**  
 85918 statement with the same string-valued *expression*. If no argument, or if *expression*  
 85919 evaluates to the null string, then write all such data for all such open files and  
 85920 piped streams, and standard output.

85921 If **fflush** is successful, it shall return 0; otherwise, it shall return non-zero.85922 *expression* | **getline** [*var*]

85923 Read a record of input from a stream piped from the output of a command. The  
 85924 stream shall be created if no stream is currently open with the value of *expression* as  
 85925 its command name. The stream created shall be equivalent to one created by a call  
 85926 to the *popen*(*r*) function with the value of *expression* as the *command* argument and a  
 85927 value of *r* as the *mode* argument. As long as the stream remains open, subsequent  
 85928 calls in which *expression* evaluates to the same string value shall read subsequent  
 85929 records from the stream. The stream shall remain open until the **close** function is  
 85930 called with an expression that evaluates to the same string value. At that time, the  
 85931 stream shall be closed as if by a call to the *pclose*(*r*) function. If *var* is omitted, \$0 and  
 85932 **NR** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered  
 85933 a numeric string (see [Expressions in awk](#), on page 2608).

85934 The **getline** operator can form ambiguous constructs when there are  
 85935 unparenthesized operators (including concatenate) to the left of the '|' (to the  
 85936 beginning of the expression containing **getline**). In the context of the '\$' operator,  
 85937 '|' shall behave as if it had a lower precedence than '\$'. The result of evaluating  
 85938 other operators is unspecified, and conforming applications shall parenthesize  
 85939 properly all such usages.

85940 **getline** Set \$0 to the next input record from the current input file. This form of **getline** shall  
 85941 set the **NR**, **NR**, and **FNR** variables.

85942 **getline** *var* Set variable *var* to the next input record from the current input file and, if  
 85943 appropriate, *var* shall be considered a numeric string (see [Expressions in awk](#), on  
 85944 page 2608). This form of **getline** shall set the **FNR** and **NR** variables.

85945 **getline** [*var*] < *expression*

85946 Read the next record of input from a named file. The *expression* shall be evaluated  
 85947 to produce a string that is used as a pathname. If the file of that name is not  
 85948 currently open, it shall be opened. As long as the stream remains open, subsequent  
 85949 calls in which *expression* evaluates to the same string value shall read subsequent  
 85950 records from the file. The file shall remain open until the **close** function is called  
 85951 with an expression that evaluates to the same string value. If *var* is omitted, \$0 and  
 85952 **NR** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered  
 85953 a numeric string (see [Expressions in awk](#), on page 2608).

85954 The **getline** operator can form ambiguous constructs when there are  
 85955 unparenthesized binary operators (including concatenate) to the right of the '<'

85956 (up to the end of the expression containing the **getline**). The result of evaluating  
85957 such a construct is unspecified, and conforming applications shall parenthesize  
85958 properly all such usages.

85959 **system**(*expression*)

85960 Execute the command given by *expression* in a manner equivalent to the *system()*  
85961 function defined in the System Interfaces volume of POSIX.1-2024 and return the  
85962 exit status of the command.

85963 All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

85964 Where strings are used as the name of a file or pipeline, the application shall ensure that the  
85965 strings are textually identical. The terminology “same string value” implies that “equivalent  
85966 strings”, even those that differ only by <space> characters, represent different files.

## 85967 User-Defined Functions

85968 The *awk* language also provides user-defined functions. Such functions can be defined as:

```
85969 function name([parameter, ...]) { statements }
```

85970 A function can be referred to anywhere in an *awk* program; in particular, its use can precede its  
85971 definition. The scope of a function is global.

85972 The number of parameters in the function definition need not match the number of parameters  
85973 in the function call. Excess formal parameters can be used as local variables. If fewer arguments  
85974 are supplied in a function call than are in the function definition, the extra parameters that are  
85975 used in the function body as scalars shall evaluate to the uninitialized value until they are  
85976 otherwise initialized, and the extra parameters that are used in the function body as arrays shall  
85977 be treated as uninitialized arrays where each element evaluates to the uninitialized value until  
85978 otherwise initialized.

85979 When invoking a function, no white space can be placed between the function name and the  
85980 opening parenthesis. Function calls can be nested and recursive calls can be made upon  
85981 functions. Upon return from any nested or recursive function call, the values of all of the calling  
85982 function’s parameters shall be unchanged, except for array parameters passed by reference. The  
85983 **return** statement can be used to return a value. If a **return** statement appears outside of a  
85984 function definition, the behavior is undefined.

85985 In the function definition, <newline> characters shall be optional before the opening brace and  
85986 after the closing brace. Function definitions can appear anywhere in the program where a  
85987 *pattern-action* pair is allowed.

## 85988 Grammar

85989 The grammar in this section and the lexical conventions in the following section shall together  
85990 describe the syntax for *awk* programs. The general conventions for this style of grammar are  
85991 described in [Section 1.3](#) (on page 2461). A valid program can be represented as the non-terminal  
85992 symbol *program* in the grammar. This formal syntax shall take precedence over the preceding  
85993 text syntax description.

```
85994 %token NAME NUMBER STRING ERE
85995 %token FUNC_NAME /* Name followed by '(' without white space. */

85996 /* Keywords */
85997 %token Begin End
85998 /* 'BEGIN' 'END' */
```

```

85999 %token      Break   Continue  Delete   Do      Else
86000 /*          'break' 'continue' 'delete' 'do' 'else' */

86001 %token      Exit    For      Function  If      In      Next
86002 /*          'exit' 'for' 'function' 'if' 'in' 'next' */

86279 This grammar has several ambiguities that shall be resolved as follows:

- 86280 • Operator precedence and associativity shall be as described in [Table 3-1](#) (on page 2608).
- 86281 • In case of ambiguity, an **else** shall be associated with the most immediately preceding **if**
- 86282 that would satisfy the grammar.

86283 • In some contexts, a <slash> (' / ') that is used to surround an ERE could also be the  
 86284 division operator. This shall be resolved in such a way that wherever the division operator  
 86285 could appear, a <slash> is assumed to be the division operator. (There is no unary division  
 86286 operator.)

86287 Each expression in an *awk* program shall conform to the precedence and associativity rules, even  
 86288 when this is not needed to resolve an ambiguity. For example, because '\$' has higher  
 86289 precedence than '++', the string "\$x++--" is not a valid *awk* expression, even though it is  
 86290 unambiguously parsed by the grammar as "\$ (x++) --".

86291 One convention that might not be obvious from the formal grammar is where <newline>  
 86292 characters are acceptable. There are several obvious placements such as terminating a statement,  
 86293 and a <backslash> can be used to escape <newline> characters between any lexical tokens. In  
 86294 addition, <newline> characters without <backslash> characters can follow a comma, an open  
 86295 brace, logical AND operator ("&&"), logical OR operator ("||"), the **do** keyword, the **else**  
 86296 keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```
86297 { print $1,  
86298         $2 }
```

### 86299 Lexical Conventions

86300 The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as  
 86301 follows:

- 86302 1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a  
 86303 given point.
- 86304 2. A comment shall consist of any characters beginning with the <number-sign> character  
 86305 and terminated by, but excluding the next occurrence of, a <newline>. Comments shall  
 86306 have no effect, except to delimit lexical tokens.
- 86307 3. The <newline> shall be recognized as the token **NEWLINE**.
- 86308 4. A <backslash> character immediately followed by a <newline> shall have no effect.
- 86309 5. The token **STRING** shall represent a string constant. A string constant shall begin with  
 86310 the character '"'. Within a string constant, a <backslash> character shall be considered  
 86311 to begin an escape sequence as specified in the table in XBD [Chapter 5](#) (on page 113)  
 86312 ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences  
 86313 in [Table 3-2](#) (on page 2616) shall be recognized. A <newline> shall not occur within a  
 86314 string constant. A string constant shall be terminated by the first unescaped occurrence of  
 86315 the character '"' after the one that begins the string constant. The value of the string  
 86316 shall be the sequence of all unescaped characters and values of escape sequences  
 86317 between, but not including, the two delimiting '"' characters.
- 86318 6. The token **ERE** represents an extended regular expression constant. An ERE constant  
 86319 shall begin with the <slash> character. Within an ERE constant, a <backslash> character  
 86320 shall be considered to begin an escape sequence as specified in the table in XBD [Chapter 5](#)  
 86321 (on page 113). In addition, the escape sequences in [Table 3-2](#) (on page 2616) shall be  
 86322 recognized. The application shall ensure that a <newline> does not occur within an ERE  
 86323 constant. An ERE constant shall be terminated by the first unescaped occurrence of the  
 86324 <slash> character after the one that begins the ERE constant. The extended regular  
 86325 expression represented by the ERE constant shall be the sequence of all unescaped  
 86326 characters and values of escape sequences between, but not including, the two delimiting  
 86327 <slash> characters.

- 86328 7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE**  
86329 tokens.
- 86330 8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall  
86331 either be equivalent to the **decimal-floating-constant** token as specified by the ISO C  
86332 standard, or it shall be a sequence of decimal digits and shall be evaluated as an integer  
86333 constant in decimal. In addition, implementations may accept numeric constants with the  
86334 form and numeric value equivalent to the **hexadecimal-constant** and **hexadecimal-**  
86335 **floating-constant** tokens as specified by the ISO C standard. Note that these forms do not  
86336 use the radix character from the current locale; they always use a <period>.
- 86337 If the value is too large or too small to be representable (see [Section 1.1.2](#), on page 2457),  
86338 the behavior is undefined.
- 86339 9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see  
86340 XBD [Section 6.1](#), on page 117), beginning with an <underscore> or alphabetic character,  
86341 shall be considered a word.
- 86342 10. The following words are keywords that shall be recognized as individual tokens; the  
86343 name of the token is the same as the keyword:

86344	<b>BEGIN</b>	<b>delete</b>	<b>END</b>	<b>function</b>	<b>in</b>	<b>print</b>	<b>while</b>
86345	<b>break</b>	<b>do</b>	<b>exit</b>	<b>getline</b>	<b>next</b>	<b>printf</b>	
86346	<b>continue</b>	<b>else</b>	<b>for</b>	<b>if</b>	<b>nextfile</b>	<b>return</b>	

- 86347 11. The following words are names of built-in functions and shall be recognized as the token  
86348 **BUILTIN\_FUNC\_NAME**:

86349	<b>atan2</b>	<b>fflush</b>	<b>int</b>	<b>match</b>	<b>split</b>	<b>srand</b>	<b>system</b>
86350	<b>close</b>	<b>gsub</b>	<b>length</b>	<b>rand</b>	<b>sprintf</b>	<b>sub</b>	<b>tolower</b>
86351	<b>cos</b>	<b>index</b>	<b>log</b>	<b>sin</b>	<b>sqrt</b>	<b>substr</b>	<b>toupper</b>
86352	<b>exp</b>						

86353 The above-listed keywords and names of built-in functions are considered reserved  
86354 words.

- 86355 12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in  
86356 function and is not followed immediately (without any delimiters) by the ' (' character.
- 86357 13. The token **FUNC\_NAME** shall consist of a word that is not a keyword or a name of a  
86358 built-in function, followed immediately (without any delimiters) by the ' (' character.  
86359 The ' (' character shall not be included as part of the token.
- 86360 14. The following two-character sequences shall be recognized as the named tokens:

Token Name	Sequence	Token Name	Sequence
86361 <b>ADD_ASSIGN</b>	+=	<b>NO_MATCH</b>	!~
86362 <b>SUB_ASSIGN</b>	-=	<b>EQ</b>	==
86363 <b>MUL_ASSIGN</b>	*=	<b>LE</b>	<=
86364 <b>DIV_ASSIGN</b>	/=	<b>GE</b>	>=
86365 <b>MOD_ASSIGN</b>	%=	<b>NE</b>	!=
86366 <b>POW_ASSIGN</b>	^=	<b>INCR</b>	++
86367 <b>OR</b>		<b>DECR</b>	--
86368 <b>AND</b>	&&	<b>APPEND</b>	>>

86370 15. The following single characters shall be recognized as tokens whose names are the  
86371 character:

86372 <newline> { } ( ) [ ] , ; + - \* % ^ ! > < | ? : ~ \$ =

86373 There is a lexical ambiguity between the token **ERE** and the tokens **'/'** and **DIV\_ASSIGN**.  
86374 When an input sequence begins with a <slash> character in any syntactic context where the  
86375 token **'/'** or **DIV\_ASSIGN** could appear as the next token in a valid program, the longer of  
86376 those two tokens that can be recognized shall be recognized. In any other syntactic context  
86377 where the token **ERE** could appear as the next token in a valid program, the token **ERE** shall be  
86378 recognized.

#### 86379 EXIT STATUS

86380 The following exit values shall be returned:

86381 0 All input files were processed successfully.

86382 >0 An error occurred.

86383 The exit status can be altered within the program by using an **exit** expression.

#### 86384 CONSEQUENCES OF ERRORS

86385 If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a  
86386 diagnostic message to standard error and terminate without any further action.

86387 If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk*  
86388 program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

#### 86389 APPLICATION USAGE

86390 Since <backslash> has a special meaning both in the *assignment* option-argument to the **-v**  
86391 option and in the *assignment* operand, applications that need to pass strings to *awk* without  
86392 special interpretation of <backslash> should not use these methods but should instead make use  
86393 of the **ARGV** or **ENVIRON** array.

86394 The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in  
86395 the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with  
86396 bytes.

86397 Because the concatenation operation is represented by adjacent expressions rather than an  
86398 explicit operator, it is often necessary to use parentheses to enforce the proper evaluation  
86399 precedence.

86400 When using *awk* to process pathnames, it is recommended that **LC\_ALL**, or at least **LC\_CTYPE**  
86401 and **LC\_COLLATE**, are set to **POSIX** or **C** in the environment, since pathnames can contain byte  
86402 sequences that do not form valid characters in some locales, in which case the utility's behavior  
86403 would be undefined. In the **POSIX** locale each byte is a valid single-byte character, and therefore  
86404 this problem is avoided.

86405 Since the **"=="** operator checks if strings are identical, not whether they collate equally,  
86406 applications needing to check whether strings collate equally can use:

86407 a <= b && a >= b

86408 To specify a *file* operand naming a file with a name containing an <equals-sign>, users can use  
86409 **"/** as the first two characters of a relative file pathname that starts with an <underscore> or  
86410 an alphabetic character to keep the *file* operand from being interpreted as an *assignment* operand.  
86411 Similarly, **"/-** can be used to access a file named **'-'** in the current directory rather than use  
86412 standard input.

86413 **EXAMPLES**

86414 The *awk* program specified in the command line is most easily specified within single-quotes (for  
 86415 example, '*program*') for applications using *sh*, because *awk* programs commonly contain  
 86416 characters that are special to the shell, including double-quotes. In the cases where an *awk*  
 86417 program contains single-quote characters, it is usually easiest to specify most of the program as  
 86418 strings within single-quotes concatenated by the shell with quoted single-quote characters. For  
 86419 example:

```
86420 awk '/'\''/ { print "quote:", $0 }
```

86421 prints all lines from the standard input containing a single-quote character, prefixed with *quote*..

86422 The following are examples of simple *awk* programs:

- 86423 1. Write to the standard output all input lines for which field 3 is greater than 5:

```
86424     $3 > 5
```

- 86425 2. Write every tenth line:

```
86426     (NR % 10) == 0
```

- 86427 3. Write any line with a substring matching the regular expression:

```
86428     /(G|D)(2[0-9][[:alpha:]]*)/
```

- 86429 4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits  
 86430 and characters. This example uses character classes **digit** and **alpha** to match language-  
 86431 independent digit and alphabetic characters respectively:

```
86432     /(G|D)([[:digit:]][[:alpha:]]*)/
```

- 86433 5. Write any line in which the second field matches the regular expression and the fourth  
 86434 field does not:

```
86435     $2 ~ /xyz/ && $4 !~ /xyz/
```

- 86436 6. Write any line in which the second field contains a <backslash>:

```
86437     $2 ~ /\\"/>

```

- 86438 7. Write any line in which the second field contains a <backslash>. Note that  
 86439 <backslash>-escapes are interpreted twice; once in lexical processing of the string and  
 86440 once in processing the regular expression:

```
86441     $2 ~ "\\\"/>

```

- 86442 8. Write the second to the last and the last field in each line. Separate the fields by a <colon>:

```
86443     {OFS=":";print $(NF-1), $NF}
```

- 86444 9. Write the line number and number of fields in each line. The three strings representing  
 86445 the line number, the <colon>, and the number of fields are concatenated and that string is  
 86446 written to standard output:

```
86447     {print NR ":" NF}
```

- 86448 10. Write lines longer than 72 characters:

```
86449     length($0) > 72
```

- 86450 11. Write the first two fields in opposite order separated by **OFS**:

```
86451     { print $2, $1 }
```

- 86452 12. Same, with input fields separated by a <comma> or <space> and <tab> characters, or  
86453 both:
- ```
86454 BEGIN { FS = ", [ \t]* | [ \t]+" }
86455       { print $2, $1 }
```
- 86456 13. Add up the first column, print sum, and average:
- ```
86457       { s += $1 }
86458 END   { print "sum is ", s, " average is", s/NR }
```
- 86459 14. Write fields in reverse order, one per line (many lines out for each line in):
- ```
86460     { for (i = NF; i > 0; --i) print $i }
```
- 86461 15. Write all lines between occurrences of the strings **start** and **stop**:
- ```
86462     /start/, /stop/
```
- 86463 16. Write all lines whose first field is different from the previous one:
- ```
86464     $1 != prev { print; prev = $1 }
```
- 86465 17. Simulate *echo*:
- ```
86466 BEGIN {
86467     for (i = 1; i < ARGV; ++i)
86468         printf("%s%s", ARGV[i], i==ARGC-1?"\n":" ")
86469 }
```
- 86470 18. Write the path prefixes contained in the *PATH* environment variable, one per line:
- ```
86471 BEGIN {
86472     n = split (ENVIRON["PATH"], path, ":")
86473     for (i = 1; i <= n; ++i)
86474         print path[i]
86475 }
```
- 86476 19. If there is a file named **input** containing page headers of the form:
- ```
86477 Page #
```
- 86478 and a file named **program** that contains:
- ```
86479 /Page/   { $2 = n++; }
86480         { print }
```
- 86481 then the command line:
- ```
86482 awk -f program n=5 input
```
- 86483 prints the file **input**, filling in page numbers starting at 5.

#### 86484 RATIONALE

86485 This description is based on the new *awk*, “*nawk*”, (see the referenced *The AWK Programming*  
86486 *Language*), which introduced a number of new features to the historical *awk*:

- 86487 1. New keywords: **delete**, **do**, **function**, **return**
- 86488 2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**

- 86489 3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
- 86490 4. New expression operators: **?**, **:**, **..**, **^**
- 86491 5. The **FS** variable and the third argument to **split**, now treated as extended regular
- 86492 expressions.
- 86493 6. The operator precedence, changed to more closely match the C language. Two examples
- 86494 of code that operate differently are:
- ```
86495 while ( n /= 10 > 1) ...
86496 if (!"wk" ~ /bwk/) ...
```

86497 Several features have been added based on newer implementations of *awk*:

- 86498 • Multiple instances of **-f profile** are permitted.
- 86499 • The new option **-v assignment**.
- 86500 • The new predefined variable **ENVIRON**.
- 86501 • New built-in functions **toupper** and **tolower**.
- 86502 • More formatting capabilities are added to **printf** to match the ISO C standard.

86503 Earlier versions of this standard required implementations to support multiple adjacent

86504 `<semicolon>`s, lines with one or more `<semicolon>` before a rule (*pattern-action* pairs), and lines

86505 with only `<semicolon>`(s). These are not required by this standard and are considered poor

86506 programming practice, but can be accepted by an implementation of *awk* as an extension.

86507 The overall *awk* syntax has always been based on the C language, with a few features from the

86508 shell command language and other sources. Because of this, it is not completely compatible with

86509 any other language, which has caused confusion for some users. It is not the intent of the

86510 standard developers to address such issues. A few relatively minor changes toward making the

86511 language more compatible with the ISO C standard were made; most of these changes are based

86512 on similar changes in recent implementations, as described above. There remain several C-

86513 language conventions that are not in *awk*. One of the notable ones is the `<comma>` operator,

86514 which is commonly used to specify multiple expressions in the C language **for** statement. Also,

86515 there are various places where *awk* is more restrictive than the C language regarding the type of

86516 expression that can be used in a given context. These limitations are due to the different features

86517 that the *awk* language does provide.

86518 Regular expressions in *awk* have been extended somewhat from historical implementations to

86519 make them a pure superset of extended regular expressions, as defined by POSIX.1-2024 (see

86520 XBD Section 9.4, on page 187). The main extensions are internationalization features and

86521 interval expressions. Historical implementations of *awk* have long supported

86522 `<backslash>`-escape sequences as an extension to extended regular expressions, and this

86523 extension has been retained despite inconsistency with other utilities. The number of escape

86524 sequences recognized in both extended regular expressions and strings has varied (generally

86525 increasing with time) among implementations. The set specified by POSIX.1-2024 includes most

86526 sequences known to be supported by popular implementations and by the ISO C standard. One

86527 sequence that is not supported is hexadecimal value escapes beginning with `'\x'`. This would

86528 allow values expressed in more than 9 bits to be used within *awk* as in the ISO C standard.

86529 However, because this syntax has a non-deterministic length, it does not permit the subsequent

86530 character to be a hexadecimal digit. This limitation can be dealt with in the C language by the

86531 use of lexical string concatenation. In the *awk* language, concatenation could also be a solution

86532 for strings, but not for extended regular expressions (either lexical ERE tokens or strings used

86533 dynamically as regular expressions). Because of this limitation, the feature has not been added to

86534 POSIX.1-2024.

86535 When a string variable is used in a context where an extended regular expression normally  
86536 appears (where the lexical token ERE is used in the grammar) the string does not contain the  
86537 literal <slash> characters.

86538 Some versions of *awk* allow the form:

```
86539 func name(args, ... ) { statements }
```

86540 This has been deprecated by the authors of the language, who asked that it not be specified.

86541 Historical implementations of *awk* produce an error if a **next** statement is executed in a **BEGIN**  
86542 action, and cause *awk* to terminate if a **next** statement is executed in an **END** action. This  
86543 behavior has not been documented, and it was not believed that it was necessary to standardize  
86544 it.

86545 The specification of conversions between string and numeric values is much more detailed than  
86546 in the documentation of historical implementations or in the referenced *The AWK Programming*  
86547 *Language*. Although most of the behavior is designed to be intuitive, the details are necessary to  
86548 ensure compatible behavior from different implementations. This is especially important in  
86549 relational expressions since the types of the operands determine whether a string or numeric  
86550 comparison is performed. From the perspective of an application developer, it is usually  
86551 sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating  
86552 a null string) when the type of an expression does not obviously match what is needed. The  
86553 intent has been to specify historical practice in almost all cases. The one exception is that, in  
86554 historical implementations, variables and constants maintain both string and numeric values  
86555 after their original value is converted by any use. This means that referencing a variable or  
86556 constant can have unexpected side-effects. For example, with historical implementations the  
86557 following program:

```
86558 {  
86559     a = "+2"  
86560     b = 2  
86561     if (NR % 2)  
86562         c = a + b  
86563     if (a == b)  
86564         print "numeric comparison"  
86565     else  
86566         print "string comparison"  
86567 }
```

86568 would perform a numeric comparison (and output numeric comparison) for each odd-  
86569 numbered line, but perform a string comparison (and output string comparison) for each even-  
86570 numbered line. POSIX.1-2024 ensures that comparisons will be numeric if necessary. With  
86571 historical implementations, the following program:

```
86572 BEGIN {  
86573     OFMT = "%e"  
86574     print 3.14  
86575     OFMT = "%f"  
86576     print 3.14  
86577 }
```

86578 would output "3.140000e+00" twice, because in the second **print** statement the constant  
86579 "3.14" would have a string value from the previous conversion. POSIX.1-2024 requires that the  
86580 output of the second **print** statement be "3.140000". The behavior of historical

86581 implementations was seen as too unintuitive and unpredictable.

86582 It was pointed out that with the rules contained in early drafts, the following script would print  
86583 nothing:

```
86584 BEGIN {
86585     y[1.5] = 1
86586     OFMT = "%e"
86587     print y[1.5]
86588 }
```

86589 Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to  
86590 affecting output conversions of numbers to strings and **CONVFMT** is used for internal  
86591 conversions, such as comparisons or array indexing. The default value is the same as that for  
86592 **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it  
86593 will receive the historical behavior associated with internal string conversions.

86594 The POSIX *awk* lexical and syntactic conventions are specified more formally than in other  
86595 sources. Again the intent has been to specify historical practice. One convention that may not be  
86596 obvious from the formal grammar as in other verbal descriptions is where <newline> characters  
86597 are acceptable. There are several obvious placements such as terminating a statement, and a  
86598 <backslash> can be used to escape <newline> characters between any lexical tokens. In addition,  
86599 <newline> characters without <backslash> characters can follow a comma, an open brace, a  
86600 logical AND operator ("&&"), a logical OR operator ("||"), the **do** keyword, the **else** keyword,  
86601 and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```
86602 { print $1,
86603     $2 }
```

86604 The requirement that *awk* add a trailing <newline> to the program argument text is to simplify  
86605 the grammar, making it match a text file in form. There is no way for an application or test suite  
86606 to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

86607 POSIX.1-2024 requires several changes from historical implementations in order to support  
86608 internationalization. Probably the most subtle of these is the use of the decimal-point character,  
86609 defined by the *LC\_NUMERIC* category of the locale, in representations of floating-point  
86610 numbers. This locale-specific character is used in recognizing numeric input, in converting  
86611 between strings and numeric values, and in formatting output. However, regardless of locale,  
86612 the <period> character (the decimal-point character of the POSIX locale) is the decimal-point  
86613 character recognized in processing *awk* programs (including assignments in command line  
86614 arguments). This is essentially the same convention as the one used in the ISO C standard. The  
86615 difference is that the C language includes the *setlocale()* function, which permits an application  
86616 to modify its locale. Because of this capability, a C application begins executing with its locale set  
86617 to the C locale, and only executes in the environment-specified locale after an explicit call to  
86618 *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as  
86619 inappropriate for POSIX.1-2024. It is possible to execute an *awk* program explicitly in any desired  
86620 locale by setting the environment in the shell.

86621 The undefined behavior resulting from NULs in extended regular expressions allows future  
86622 extensions for the GNU *gawk* program to process binary data.

86623 The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic  
86624 errors) is undefined because it was considered overly limiting on implementations to specify. In  
86625 most cases such errors can be expected to produce a diagnostic and a non-zero exit status.  
86626 However, some implementations may choose to extend the language in ways that make use of  
86627 certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but

86628 otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect  
 86629 in some implementations. Also, different implementations might detect a given error during an  
 86630 initial parsing of the program (before reading any input files) while others might detect it when  
 86631 executing the program after reading some input. Implementors should be aware that diagnosing  
 86632 errors as early as possible and producing useful diagnostics can ease debugging of applications,  
 86633 and thus make an implementation more usable.

86634 The unspecified behavior from using multi-character **RS** values is to allow possible future  
 86635 extensions based on extended regular expressions used for record separators. Historical  
 86636 implementations take the first character of the string and ignore the others.

86637 Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future  
 86638 extension that would split up a string into an array of individual characters.

86639 In the context of the **getline** function, equally good arguments for different precedences of the |  
 86640 and < operators can be made. Historical practice has been that:

86641 `getline < "a" "b"`

86642 is parsed as:

86643 `( getline < "a" ) "b"`

86644 although many would argue that the intent was that the file **ab** should be read. However:

86645 `getline < "x" + 1`

86646 parses as:

86647 `getline < ( "x" + 1 )`

86648 Similar problems occur with the | version of **getline**, particularly in combination with \$. For  
 86649 example:

86650  `$"echo hi" | getline`

86651 (This situation is particularly problematic when used in a **print** statement, where the |**getline**  
 86652 part might be a redirection of the **print**.)

86653 Since in most cases such constructs are not (or at least should not) be used (because they have a  
 86654 natural ambiguity for which there is no conventional parsing), the meaning of these constructs  
 86655 has been made explicitly unspecified. (The effect is that a conforming application that runs into  
 86656 the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual  
 86657 uses of such constructs.

86658 Grammars can be written that would cause an error under these circumstances. Where  
 86659 backwards-compatibility is not a large consideration, implementors may wish to use such  
 86660 grammars.

86661 Some historical implementations have allowed some built-in functions to be called without an  
 86662 argument list, the result being a default argument list chosen in some "reasonable" way. Use of  
 86663 **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely  
 86664 known or widely used; this particular form is documented in various places (for example, most  
 86665 historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as  
 86666 legitimate practice. With this exception, default argument lists have always been undocumented  
 86667 and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-  
 86668 defined functions. They add no useful functionality and preclude possible future extensions that  
 86669 might need to name functions without calling them. Not standardizing them seems the simplest  
 86670 course. The standard developers considered that **length** merited special treatment, however,  
 86671 since it has been documented in the past and sees possibly substantial use in historical

86672 programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the  
86673 obsolescent marking for XSI-conforming implementations and many otherwise conforming  
86674 applications depend on this feature.

86675 In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive  
86676 <backslash> characters should be used in the string to ensure a single <backslash> will precede  
86677 the <ampersand> when the resultant string is passed to the function. (For example, to specify  
86678 one literal <ampersand> in the replacement string, use **gsub(ERE, "\\&")**.)

86679 Historically, the only special character in the *repl* argument of **sub** and **gsub** string functions was  
86680 the <ampersand> ('&') character and preceding it with the <backslash> character was used to  
86681 turn off its special meaning.

86682 The description in the ISO POSIX-2:1993 standard introduced behavior such that the  
86683 <backslash> character was another special character and it was unspecified whether there were  
86684 any other special characters. This description introduced several portability problems, some of  
86685 which are described below, and so it has been replaced with the more historical description.  
86686 Some of the problems include:

- 86687 • Historically, to create the replacement string, a script could use **gsub(ERE, "\\&")**, but  
86688 with the ISO POSIX-2:1993 standard wording, it was necessary to use **gsub(ERE,**  
86689 **"\\\\&")**. The <backslash> characters are doubled here because all string literals are  
86690 subject to lexical analysis, which would reduce each pair of <backslash> characters to a  
86691 single <backslash> before being passed to **gsub**.
- 86692 • Since it was unspecified what the special characters were, for portable scripts to guarantee  
86693 that characters are printed literally, each character had to be preceded with a <backslash>.  
86694 (For example, a portable script had to use **gsub(ERE, "\\h\\i")** to produce a replacement  
86695 string of "hi".)

86696 The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe  
86697 historical practice because of the way numeric strings are compared as numbers. The current  
86698 rules cause the following code:

```
86699 if (0 == "000")
86700     print "strange, but true"
86701 else
86702     print "not true"
```

86703 to do a numeric comparison, causing the **if** to succeed. It should be intuitively obvious that this  
86704 is incorrect behavior, and indeed, no historical implementation of *awk* actually behaves this way.

86705 To fix this problem, the definition of *numeric string* was enhanced to include only those values  
86706 obtained from specific circumstances (mostly external sources) where it is not possible to  
86707 determine unambiguously whether the value is intended to be a string or a numeric.

86708 Variables that are assigned to a numeric string shall also be treated as a numeric string. (For  
86709 example, the notion of a numeric string can be propagated across assignments.) In comparisons,  
86710 all variables having the uninitialized value are to be treated as a numeric operand evaluating to  
86711 the numeric value zero.

86712 Uninitialized variables include all types of variables including scalars, array elements, and  
86713 fields. The definition of an uninitialized value in [Variables and Special Variables](#) (on page 2612)  
86714 is necessary to describe the value placed on uninitialized variables and on fields that are valid  
86715 (for example, < \$NF) but have no characters in them and to describe how these variables are to  
86716 be used in comparisons. A valid field, such as \$1, that has no characters in it can be obtained  
86717 from an input line of "\t\t" when FS=' \t '. Historically, the comparison (\$1<10) was done

86718 numerically after evaluating `$1` to the value zero.

86719 The phrase "... also shall have the numeric value of the numeric string" was removed from  
86720 several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary  
86721 implementation detail. It is not necessary for POSIX.1-2024 to specify that these objects be  
86722 assigned two different values. It is only necessary to specify that these objects may evaluate to  
86723 two different values depending on context.

86724 Historical implementations of *awk* did not parse hexadecimal integer or floating constants like  
86725 "0xa" and "0xap0". Due to an oversight, the 2001 through 2004 editions of this standard  
86726 required support for hexadecimal floating constants. This was due to the reference to *atof()*.  
86727 This version of the standard allows but does not require implementations to use *atof()* and  
86728 includes a description of how floating-point numbers are recognized as an alternative to match  
86729 historic behavior. The intent of this change is to allow implementations to recognize floating-  
86730 point constants according to either the ISO/IEC 9899:1990 standard or ISO/IEC 9899:1999  
86731 standard, and to allow (but not require) implementations to recognize hexadecimal integer  
86732 constants.

86733 Historical implementations of *awk* did not support floating-point infinities and NaNs in *numeric*  
86734 *strings*; e.g., "-INF" and "NaN". However, implementations that use the *atof()* or *strtod()*  
86735 functions to do the conversion picked up support for these values if they used a  
86736 ISO/IEC 9899:1999 standard version of the function instead of a ISO/IEC 9899:1990 standard  
86737 version. Due to an oversight, the 2001 through 2004 editions of this standard did not allow  
86738 support for infinities and NaNs, but in this revision support is allowed (but not required). This is  
86739 a silent change to the behavior of *awk* programs; for example, in the POSIX locale the expression:

86740 (`"-INF" + 0 < 0`)

86741 formerly had the value 0 because "-INF" converted to 0, but now it may have the value 0 or 1.

86742 Deleting all elements of an array one element at a time, via:

```
86743 for (index in array)
86744     delete array[index]
```

86745 is usually not efficient. This standard requires `delete array` to have the same effects, and this  
86746 was supported in most implementations as a more efficient operation. It is also possible to use  
86747 `split("", array)` to achieve the same effect and efficiency.

## 86748 FUTURE DIRECTIONS

86749 If this utility is directed to create a new directory entry that contains any bytes that have the  
86750 encoded value of a <newline> character, implementations are encouraged to treat this as an  
86751 error. A future version of this standard may require implementations to treat this as an error.

86752 A future version of this standard may require **srand** to accept any numeric value and calculate  
86753 the seed by taking the provided value, converting it to an integer, and calculating the integer  
86754 value modulo  $2^n$  where  $n$  is an implementation-defined value greater than or equal to 32.

86755 A future version of this standard may require the initial seed for the **rand** function (the seed  
86756 value used if **srand** is not called) to be an integer between 0 and  $2^n-1$  inclusive where  $n$  is an  
86757 implementation-defined value greater than or equal to 32. Additionally, the initial seed value  
86758 may be required to be a (pseudo-)random value such that two invocations of *awk* are unlikely to  
86759 emit the same sequence of random values (unless the seed is explicitly set to the same value via  
86760 **srand**).

86761 A future version of this standard may define a new **posix\_srand** function that enables  
86762 application authors to set the seed to a (pseudo-)random value generated by the system.  
86763 Alternatively, the specification of the **srand** function may be altered to provide some means to

- 86764 set the default seed value to a (pseudo-)random value.

- 86797
- 86798
- 86799 **Issue 8**
- 86800 Austin Group Defect 251 is applied, encouraging implementations to disallow the creation of filenames containing any bytes that have the encoded value of a `<newline>` character.
- 86801
- 86802 Austin Group Defects 544 and 1136 are applied, requiring implementations to accept the **delete** statement with an unsubscripted array name.
- 86803
- 86804 Austin Group Defect 607 is applied, adding the **nextfile** statement.

- 86805 Austin Group Defect 634 is applied, adding the **fflush** function.
- 86806 Austin Group Defects 974 and 1451 are applied, clarifying the **ARGC**, **ARGV** and **FILENAME**  
86807 variables, and adding to APPLICATION USAGE.
- 86808 Austin Group Defect 983 is applied, changing the descriptions of the **rand** and **srand** functions  
86809 and the FUTURE DIRECTIONS section.
- 86810 Austin Group Defect 1070 is applied, requiring the "!=" and "==" operators to perform string  
86811 comparisons by checking if the strings are identical (and not by checking if they collate equally).
- 86812 Austin Group Defect 1105 is applied, clarifying the requirements for <backslash> escaping.
- 86813 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.
- 86814 Austin Group Defect 1198 is applied, requiring comparisons to be performed numerically when  
86815 both operands have string values that are numeric strings.
- 86816 Austin Group Defect 1277 is applied, clarifying that using a <slash> character within an ERE  
86817 requires escaping only if it is within the lexical token **ERE**.
- 86818 Austin Group Defect 1320 is applied, clarifying the condition under which ERE matching is  
86819 against input records.
- 86820 Austin Group Defect 1395 is applied, changing the requirements for string to number  
86821 conversion.
- 86822 Austin Group Defect 1468 is applied, clarifying the behavior when **FS** is an ERE that can match  
86823 the null string.
- 86824 Austin Group Defect 1566 is applied, specifying the behavior of the **length** function when  
86825 passed an array argument.

86826 **NAME**

86827 `basename` — return non-directory portion of a pathname

86828 **SYNOPSIS**

86829 `basename string [suffix]`

86830 **DESCRIPTION**

86831 The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.254](#) (on page 68).  
 86832 The string *string* shall be converted to the filename corresponding to the last pathname  
 86833 component in *string* and then the suffix string *suffix*, if present, shall be removed. This shall be  
 86834 done by performing actions equivalent to the following steps in order:

- 86835 1. If *string* is a null string, it is unspecified whether the resulting string is '.' or a null  
 86836 string. In either case, skip steps 2 through 6.
- 86837 2. If *string* is `"/"`, it is implementation-defined whether steps 3 to 6 are skipped or  
 86838 processed.
- 86839 3. If *string* consists entirely of `<slash>` characters, *string* shall be set to a single `<slash>`  
 86840 character. In this case, skip steps 4 to 6.
- 86841 4. If there are any trailing `<slash>` characters in *string*, they shall be removed.
- 86842 5. If there are any `<slash>` characters remaining in *string*, the prefix of *string* up to and  
 86843 including the last `<slash>` character in *string* shall be removed.
- 86844 6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is  
 86845 identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed  
 86846 from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an  
 86847 error if *suffix* is not found in *string*.

86848 The resulting string shall be written to standard output.

86849 **OPTIONS**

86850 None.

86851 **OPERANDS**

86852 The following operands shall be supported:

86853 *string* A string.

86854 *suffix* A string.

86855 **STDIN**

86856 Not used.

86857 **INPUT FILES**

86858 None.

86859 **ENVIRONMENT VARIABLES**

86860 The following environment variables shall affect the execution of *basename*:

86861 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 86862 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 86863 variables used to determine the values of locale categories.)

86864 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 86865 internationalization variables.

86866 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 86867 characters (for example, single-byte as opposed to multi-byte characters in  
 86868 arguments).

86869 **LC\_MESSAGES**  
 86870 Determine the locale that should be used to affect the format and contents of  
 86871 diagnostic messages written to standard error.

86872 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

86873 **ASYNCHRONOUS EVENTS**  
 86874 Default.

86875 **STDOUT**  
 86876 The *basename* utility shall write a line to the standard output in the following format:  
 86877 "%s\n", <resulting string>

86878 **STDERR**  
 86879 The standard error shall be used only for diagnostic messages.

86880 **OUTPUT FILES**  
 86881 None.

86882 **EXTENDED DESCRIPTION**  
 86883 None.

86884 **EXIT STATUS**  
 86885 The following exit values shall be returned:  
 86886 0 Successful completion.  
 86887 >0 An error occurred.

86888 **CONSEQUENCES OF ERRORS**  
 86889 Default.

86890 **APPLICATION USAGE**  
 86891 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 86892 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
 86893 to the beginning of a pathname unless they can ensure that there are more or less than two or are  
 86894 prepared to deal with the implementation-defined consequences.

86895 **EXAMPLES**  
 86896 If the string *string* is a valid pathname:  
 86897 `$(basename -- "string")`  
 86898 produces a filename that could be used to open the file named by *string* in the directory returned  
 86899 by:  
 86900 `$(dirname -- "string")`  
 86901 If the string *string* is not a valid pathname, the same algorithm is used, but the result need not be  
 86902 a valid filename. The *basename* utility is not expected to make any judgements about the validity  
 86903 of *string* as a pathname; it just follows the specified algorithm to produce a result string.

86904 The following shell script compiles `/usr/src/cmd/cat.c` and moves the output to a file named `cat`  
 86905 in the current directory when invoked with the argument `/usr/src/cmd/cat` or with the argument  
 86906 `/usr/src/cmd/cat.c`:  
 86907 `c17 -- "$(dirname -- "$1")/$(basename -- "$1" .c) .c" &&`  
 86908 `mv a.out "$(basename -- "$1" .c) "`

86909 The EXAMPLES section of the *basename()* function (see XSH [basename\(\)](#)) includes a table  
 86910 showing examples of the results of processing several sample pathnames by the *basename()* and

86911 *dirname()* functions and by the *basename* and *dirname* utilities.

#### 86912 RATIONALE

86913 The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid  
86914 pathname:

86915 `$(basename -- "string")`

86916 would be a valid filename for the file in the directory:

86917 `$(dirname -- "string")`

86918 This would not work for the early proposal versions of these utilities due to the way it specified  
86919 handling of trailing `<slash>` characters.

86920 Since the definition of *pathname* specifies implementation-defined behavior for pathnames  
86921 starting with two `<slash>` characters, this volume of POSIX.1-2024 specifies similar  
86922 implementation-defined behavior for the *basename* and *dirname* utilities.

#### 86923 FUTURE DIRECTIONS

86924 If this utility is directed to display a pathname that contains any bytes that have the encoded  
86925 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
86926 format being used, implementations are encouraged to treat this as an error. A future version of  
86927 this standard may require implementations to treat this as an error.

#### 86932 CHANGE HISTORY

86933 First released in Issue 2.

#### 86934 Issue 6

86935 IEEE PASC Interpretation 1003.2 #164 is applied.

86936 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 86937 Issue 7

86938 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0065 [192,538], XCU/TC1-2008/0066  
86939 [192,538], and XCU/TC1-2008/0067 [192,430,538] are applied.

86940 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0065 [612] is applied.

#### 86941 Issue 8

86942 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
86943 directed to display a pathname that contains any bytes that have the encoded value of a  
86944 `<newline>` character when `<newline>` is a terminator or separator in the output format being  
86945 used.

86946 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

86947 **NAME**

86948           batch — schedule commands to be executed in a batch queue

86949 **SYNOPSIS**86950           *batch*86951 **DESCRIPTION**86952           The *batch* utility shall read commands from standard input and schedule them for execution in a  
86953           batch queue. It shall be the equivalent of the command:

86954           at -q b -m now

86955           where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to  
86956           the batch queue with no time constraints and shall be run by the system using algorithms, based  
86957           on unspecified factors, that may vary with each invocation of *batch*.86958 XSI        Users shall be permitted to use *batch* if their name appears in the file **at.allow** which is located in  
86959           an implementation-defined directory. If that file does not exist, the file **at.deny**, which is located  
86960           in an implementation-defined directory, shall be checked to determine whether the user shall be  
86961           denied access to *batch*. If neither file exists, only a process with appropriate privileges shall be  
86962           allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
86963           **at.allow** and **at.deny** files shall consist of one user name per line.86964 **OPTIONS**

86965           None.

86966 **OPERANDS**

86967           None.

86968 **STDIN**86969           The standard input shall be a text file consisting of commands acceptable to the shell command  
86970           language described in [Chapter 2](#) (on page 2472).86971 **INPUT FILES**86972 XSI        The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,  
86973           shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
86974           denied access to the *at* and *batch* utilities.86975 **ENVIRONMENT VARIABLES**86976           The following environment variables shall affect the execution of *batch*:86977           **LANG**        Provide a default value for the internationalization variables that are unset or null.  
86978                        (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
86979                        variables used to determine the values of locale categories.)86980           **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
86981                        internationalization variables.86982           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
86983                        characters (for example, single-byte as opposed to multi-byte characters in  
86984                        arguments and input files).86985           **LC\_MESSAGES**86986                        Determine the locale that should be used to affect the format and contents of  
86987                        diagnostic messages written to standard error and informative messages written to  
86988                        standard output.86989           **LC\_TIME**     Determine the format and contents for date and time strings written by *batch*.

| 87024 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 87025 |     |                               | The job shall not be scheduled.                                                                                                                                                                                                                                                                                                                                                                                  |

87026 **APPLICATION USAGE**

87027 It may be useful to redirect standard output within the specified commands.

87028 **EXAMPLES**

87029 1. This sequence can be used at a terminal:

```
87030     batch
87031     sort < file >outfile
87032     EOT
```

87033 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a  
87034 command procedure (the sequence of output redirection specifications is significant):

```
87035     batch <<!
87036     diff file1 file2 2>&1 >outfile | mailx -s "outfile update" mygroup
87037     !
```

87038 Note that this always sends mail when there has been an attempt to update **outfile** and  
87039 the body of the message will be empty unless an error occurred.

87040 3. The following shows how to capture both standard error and standard output:

```
87041     batch <<EOF
87042     {
87043         run-batch-processing |
87044         mailx -s "batch processing output" mygroup
87045     } 2>&1 | mailx -E -s "errors during batch processing" mygroup
87046     EOF
```

87047 **RATIONALE**87048 Early proposals described *batch* in a manner totally separated from *at*, even though the historical  
87049 model treated it almost as a synonym for *at -qb*. A number of features were added to list and  
87050 control batch work separately from those in *at*. Upon further reflection, it was decided that the  
87051 benefit of this did not merit the change to the historical interface.87052 The **-m** option was included on the equivalent *at* command because it is historical practice to  
87053 mail results to the submitter, even if all job-produced output is redirected. As explained in the  
87054 RATIONALE for *at*, the **now** keyword submits the job for immediate execution (after scheduling  
87055 delays), despite some historical systems where *at now* would have been considered an error.87056 **FUTURE DIRECTIONS**

87057 None.

87058 **SEE ALSO**87059 [\*at\*](#)87060 [XBD Chapter 8](#) (on page 167)87061 **CHANGE HISTORY**

87062 First released in Issue 2.

87063 **Issue 6**

87064 This utility is marked as part of the User Portability Utilities option.

87065 The NAME is changed to align with the IEEE P1003.2b draft standard.

87066 The normative text is reworded to avoid use of the term “must” for application requirements.

87067 **Issue 7**

87068 The *batch* utility is moved from the User Portability Utilities option to the Base. User Portability  
87069 Utilities is now an option for interactive utilities.

87070 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
87071 by the *batch* utility.

87072 **Issue 8**

87073 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

87074 Austin Group Defect 1368 is applied, changing the EXAMPLES section.

87075 **NAME**

87076 bc — arbitrary-precision arithmetic language

87077 **SYNOPSIS**87078 bc [-l] [*file...*]87079 **DESCRIPTION**

87080 The *bc* utility shall implement an arbitrary precision calculator. It shall take input from any files  
 87081 given, then read from the standard input. If the standard input and standard output to *bc* are  
 87082 attached to a terminal, the invocation of *bc* shall be considered to be *interactive*, causing  
 87083 behavioral constraints described in the following sections.

87084 **OPTIONS**87085 The *bc* utility shall conform to XBD [Section 12.2](#) (on page 215).

87086 The following option shall be supported:

87087 **-l** (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the  
 87088 default zero; see the EXTENDED DESCRIPTION section.

87089 **OPERANDS**

87090 The following operand shall be supported:

87091 *file* A pathname of a text file containing *bc* program statements. After all *files* have  
 87092 been read, *bc* shall read the standard input.

87093 **STDIN**

87094 See the INPUT FILES section.

87095 **INPUT FILES**

87096 Input files shall be text files containing a sequence of comments, statements, and function  
 87097 definitions that shall be executed as they are read.

87098 **ENVIRONMENT VARIABLES**87099 The following environment variables shall affect the execution of *bc*:

87100 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 87101 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 87102 variables used to determine the values of locale categories.)

87103 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 87104 internationalization variables.

87105 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 87106 characters (for example, single-byte as opposed to multi-byte characters in  
 87107 arguments and input files).

87108 **LC\_MESSAGES**

87109 Determine the locale that should be used to affect the format and contents of  
 87110 diagnostic messages written to standard error.

87111 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.87112 **ASYNCHRONOUS EVENTS**

87113 Default.

87114 **STDOUT**

87115 The output of the *bc* utility shall be controlled by the program read, and consist of zero or more  
 87116 lines containing the value of all executed expressions without assignments. The radix and  
 87117 precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the  
 87118 EXTENDED DESCRIPTION section.

87119 **STDERR**

87120 The standard error shall be used only for diagnostic messages.

87121 **OUTPUT FILES**

87122 None.

87123 **EXTENDED DESCRIPTION**87124 **Grammar**

87125 The grammar in this section and the lexical conventions in the following section shall together  
 87126 describe the syntax for *bc* programs. The general conventions for this style of grammar are  
 87127 described in [Section 1.3](#) (on page 2461). A valid program can be represented as the non-terminal  
 87128 symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax  
 87129 description.

```

### 87230 Lexical Conventions in bc

87231 The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as  
 87232 follows:

- 87233 1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a  
 87234 given point.
- 87235 2. A comment shall consist of any characters beginning with the two adjacent characters  
 87236 `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`.  
 87237 Comments shall have no effect except to delimit lexical tokens.
- 87238 3. The `<newline>` shall be recognized as the token **NEWLINE**.
- 87239 4. The token **STRING** shall represent a string constant; it shall consist of any characters  
 87240 beginning with the double-quote character (`"`) and terminated by another occurrence  
 87241 of the double-quote character. The value of the string is the sequence of all characters  
 87242 between, but not including, the two double-quote characters. All characters shall be taken  
 87243 literally from the input, and there is no way to specify a string containing a double-quote  
 87244 character. The length of the value of each string shall be limited to `{BC_STRING_MAX}`  
 87245 bytes.
- 87246 5. A `<blank>` shall have no effect except as an ordinary character if it appears within a  
 87247 **STRING** token, or to delimit a lexical token other than **STRING**.
- 87248 6. The combination of a `<backslash>` character immediately followed by a `<newline>` shall  
 87249 have no effect other than to delimit lexical tokens with the following exceptions:
  - 87250 • It shall be interpreted as the character sequence `"\<newline>"` in **STRING** tokens.

- 87251                   • It shall be ignored as part of a multi-line **NUMBER** token.
- 87252           7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the  
87253           following grammar:
- 87254           **NUMBER** : integer  
87255                   | '.' integer  
87256                   | integer '.'  
87257                   | integer '.' integer  
87258                   ;  
  
87259           integer : digit  
87260                   | integer digit  
87261                   ;  
  
87262           digit : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7  
87263                   | 8 | 9 | A | B | C | D | E | F  
87264                   ;  
  
87265           8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by  
87266           the value of the internal register **ibase** (described below). Each of the **digit** characters  
87267           shall have the value from 0 to 15 in the order listed here, and the <period> character shall  
87268           represent the radix point. The behavior is undefined if digits greater than or equal to the  
87269           value of **ibase** appear in the token. However, note the exception for single-digit values  
87270           being assigned to **ibase** and **obase** themselves, in [Operations in bc](#) (on page 2656).  
  
87271           9. The following keywords shall be recognized as tokens:
- 87272           **auto**       **ibase**       **length**      **return**      **while**  
87273           **break**      **if**        **obase**       **scale**  
87274           **define**     **for**       **quit**       **sqrt**  
  
87275           10. Any of the following characters occurring anywhere except within a keyword shall be  
87276           recognized as the token **LETTER**:
- 87277           a b c d e f g h i j k l m n o p q r s t u v w x y z  
  
87278           11. The following single-character and two-character sequences shall be recognized as the  
87279           token **ASSIGN\_OP**:
- 87280           =   +=   -=   \*=   /=   %=   ^=  
  
87281           12. If an '=' character, as the beginning of a token, is followed by a '-' character with no  
87282           intervening delimiter, the behavior is undefined.  
  
87283           13. The following single-characters shall be recognized as the token **MUL\_OP**:
- 87284           \*   /   %  
87285           14. The following single-character and two-character sequences shall be recognized as the  
87286           token **REL\_OP**:
- 87287           ==   <=   >=   !=   <   >  
  
87288           15. The following two-character sequences shall be recognized as the token **INCR\_DECR**:
- 87289           ++   --  
  
87290           16. The following single characters shall be recognized as tokens whose names are the  
87291           character:

87292 <newline> ( ) , + - ; [ ] ^ { }

87293 17. The token **EOF** is returned when the end of input is reached.

### 87294 Operations in bc

87295 There are three kinds of identifiers: ordinary identifiers, array identifiers, and function  
87296 identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed  
87297 by square brackets ("[]"). An array subscript is required except in an argument or auto list.  
87298 Arrays are singly dimensioned and can contain up to {BC\_DIM\_MAX} elements. Indexing shall  
87299 begin at zero so an array is indexed from 0 to {BC\_DIM\_MAX}-1. Subscripts shall be truncated  
87300 to integers. The application shall ensure that function identifiers are followed by parentheses,  
87301 possibly enclosing arguments. The three types of identifiers do not conflict.

87302 The following table summarizes the rules for precedence and associativity of all operators.  
87303 Operators on the same line shall have the same precedence; rows are in order of decreasing  
87304 precedence.

87305 **Table 3-3** Operators in *bc*

| Operator                  | Associativity |
|---------------------------|---------------|
| ++, --                    | N/A           |
| unary -                   | N/A           |
| ^                         | Right to left |
| *, /, %                   | Left to right |
| +, binary -               | Left to right |
| =, +=, -=, *=, /=, %=, ^= | Right to left |
| ==, <=, >=, !=, <, >      | None          |

87314 Each expression or named expression has a *scale*, which is the number of decimal digits that  
87315 shall be maintained as the fractional portion of the expression.

87316 *Named expressions* are places where values are stored. Named expressions shall be valid on the  
87317 left side of an assignment. The value of a named expression shall be the value stored in the place  
87318 named. Simple identifiers and array elements are named expressions; they have an initial value  
87319 of zero and an initial scale of zero.

87320 The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an  
87321 expression consisting of the name of one of these registers shall be zero; values assigned to any  
87322 of these registers are truncated to integers. The **scale** register shall contain a global value used in  
87323 computing the scale of expressions (as described below). The value of the register **scale** is  
87324 limited to  $0 \leq \text{scale} \leq \{\text{BC\_SCALE\_MAX}\}$  and shall have a default value of zero. The **ibase** and  
87325 **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be  
87326 limited to:

87327  $2 \leq \text{ibase} \leq 16$

87328 The value of **obase** shall be limited to:

87329  $2 \leq \text{obase} \leq \{\text{BC\_BASE\_MAX}\}$

87330 When either **ibase** or **obase** is assigned a single **digit** value from the list in [Lexical Conventions](#)  
87331 [in bc](#) (on page 2654), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to  
87332 base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when  
87333 digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall  
87334 have initial values of 10.

87335 Internal computations shall be conducted as if in decimal, regardless of the input and output  
87336 bases, to the specified number of decimal digits. When an exact result is not achieved (for  
87337 example, **scale**=0; 3.2/1), the result shall be truncated.

87338 For all values of **obase** specified by this volume of POSIX.1-2024, *bc* shall output numeric values  
87339 by performing each of the following steps in order:

- 87340 1. If the value is less than zero, a <hyphen-minus> ('-') character shall be output.
- 87341 2. One of the following is output, depending on the numerical value:
  - 87342 • If the absolute value of the numerical value is greater than or equal to one, the  
87343 integer portion of the value shall be output as a series of digits appropriate to **obase**  
87344 (as described below), most significant digit first. The most significant non-zero digit  
87345 shall be output next, followed by each successively less significant digit.
  - 87346 • If the absolute value of the numerical value is less than one but greater than zero  
87347 and the scale of the numerical value is greater than zero, it is unspecified whether  
87348 the character 0 is output.
  - 87349 • If the numerical value is zero, the character 0 shall be output.
- 87350 3. If the scale of the value is greater than zero and the numeric value is not zero, a <period>  
87351 character shall be output, followed by a series of digits appropriate to **obase** (as described  
87352 below) representing the most significant portion of the fractional part of the value. If *s*  
87353 represents the scale of the value being output, the number of digits output shall be *s* if  
87354 **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s*  
87355 if **obase** is less than 10. For **obase** values other than 10, this should be the number of  
87356 digits needed to represent a precision of 10<sup>*s*</sup>.

87357 For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

87358 0 1 2 3 4 5 6 7 8 9 A B C D E F

87359 which represent the values zero to 15, inclusive, respectively.

87360 For bases greater than 16, each digit shall be written as a separate multi-digit decimal number.  
87361 Each digit except the most significant fractional digit shall be preceded by a single <space>. For  
87362 bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1 000, three-  
87363 digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be  
87364 written as:

87365 Δ01Δ15Δ24

87366 and in base 125, as:

87367 Δ008Δ024

87368 Very large numbers shall be split across lines with 70 characters per line in the POSIX locale;  
87369 other locales may split at different character boundaries. Lines that are continued shall end with  
87370 a <backslash>.

87371 A function call shall consist of a function name followed by parentheses containing a  
87372 <comma>-separated list of expressions, which are the function arguments. A whole array  
87373 passed as an argument shall be specified by the array name followed by empty square brackets.  
87374 All function arguments shall be passed by value. As a result, changes made to the formal  
87375 parameters shall have no effect on the actual arguments. If the function terminates by executing  
87376 a **return** statement, the value of the function shall be the value of the expression in the  
87377 parentheses of the **return** statement or shall be zero if no expression is provided or if there is no  
87378 **return** statement.

87379 The result of **sqrt**(*expression*) shall be the square root of the expression. The result shall be  
 87380 truncated in the least significant decimal place. The scale of the result shall be the scale of the  
 87381 expression or the value of **scale**, whichever is larger.

87382 The result of **length**(*expression*) shall be the total number of significant decimal digits in the  
 87383 expression. The scale of the result shall be zero.

87384 The result of **scale**(*expression*) shall be the scale of the expression. The scale of the result shall be  
 87385 zero.

87386 A numeric constant shall be an expression. The scale shall be the number of digits that follow the  
 87387 radix point in the input representing the constant, or zero if no radix point appears.

87388 The sequence ( *expression* ) shall be an expression with the same value and scale as *expression*.  
 87389 The parentheses can be used to alter the normal precedence.

87390 The semantics of the unary and binary operators are as follows:

87391 *-expression*

87392 The result shall be the negative of the *expression*. The scale of the result shall be the scale of  
 87393 *expression*.

87394 The unary increment and decrement operators shall not modify the scale of the named  
 87395 expression upon which they operate. The scale of the result shall be the scale of that named  
 87396 expression.

87397 *++named-expression*

87398 The named expression shall be incremented by one. The result shall be the value of the  
 87399 named expression after incrementing.

87400 *--named-expression*

87401 The named expression shall be decremented by one. The result shall be the value of the  
 87402 named expression after decrementing.

87403 *named-expression++*

87404 The named expression shall be incremented by one. The result shall be the value of the  
 87405 named expression before incrementing.

87406 *named-expression--*

87407 The named expression shall be decremented by one. The result shall be the value of the  
 87408 named expression before decrementing.

87409 The exponentiation operator, <circumflex> ('^'), shall bind right to left.

87410 *expression^expression*

87411 The result shall be the first *expression* raised to the power of the second *expression*. If the  
 87412 second expression is not an integer, the behavior is undefined. If *a* is the scale of the left  
 87413 expression and *b* is the absolute value of the right expression, the scale of the result shall be:

87414 if  $b \geq 0$   $\min(a * b, \max(\text{scale}, a))$  if  $b < 0$   $\text{scale}$

87415 The multiplicative operators ('\*', '/', '%') shall bind left to right.

87416 *expression\*expression*

87417 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two  
 87418 expressions, then the scale of the result shall be:

87419  $\min(a+b, \max(\text{scale}, a, b))$

87420 *expression/expression*  
 87421 The result shall be the quotient of the two expressions. The scale of the result shall be the  
 87422 value of **scale**.

87423 *expression%expression*  
 87424 For expressions *a* and *b*, *a%b* shall be evaluated equivalent to the steps:

87425 1. Compute *a/b* to current scale.

87426 2. Use the result to compute:

87427  $a - (a / b) * b$

87428 to scale:

87429  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

87430 The scale of the result shall be:

87431  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

87432 When **scale** is zero, the '%' operator is the mathematical remainder operator.

87433 The additive operators ('+', '-') shall bind left to right.

87434 *expression+expression*

87435 The result shall be the sum of the two expressions. The scale of the result shall be the  
 87436 maximum of the scales of the expressions.

87437 *expression-expression*

87438 The result shall be the difference of the two expressions. The scale of the result shall be the  
 87439 maximum of the scales of the expressions.

87440 The assignment operators ('=', "+=", "-=", "\*=", "/=", "%=", "^=") shall bind right to left.

87441 *named-expression=expression*

87442 This expression shall result in assigning the value of the expression on the right to the  
 87443 named expression on the left. The scale of both the named expression and the result shall be  
 87444 the scale of *expression*.

87445 The compound assignment forms:

87446 *named-expression <operator>= expression*

87447 shall be equivalent to:

87448 *named-expression=named-expression <operator> expression*

87449 except that the *named-expression* shall be evaluated only once.

87450 Unlike all other operators, the relational operators ('<', '>', "<=", ">=", "==", "!=") shall be  
 87451 only valid as the object of an **if**, **while**, or inside a **for** statement.

87452 *expression1<expression2*

87453 The relation shall be true if the value of *expression1* is strictly less than the value of  
 87454 *expression2*.

87455 *expression1>expression2*

87456 The relation shall be true if the value of *expression1* is strictly greater than the value of  
 87457 *expression2*.

87458 *expression1*<=*expression2*  
 87459 The relation shall be true if the value of *expression1* is less than or equal to the value of  
 87460 *expression2*.

87461 *expression1*>=*expression2*  
 87462 The relation shall be true if the value of *expression1* is greater than or equal to the value of  
 87463 *expression2*.

87464 *expression1*==*expression2*  
 87465 The relation shall be true if the values of *expression1* and *expression2* are equal.

87466 *expression1*!=*expression2*  
 87467 The relation shall be true if the values of *expression1* and *expression2* are unequal.

87468 There are only two storage classes in *bc*: global and automatic (local). Only identifiers that are  
 87469 local to a function need be declared with the **auto** command. The arguments to a function shall  
 87470 be local to the function. All other identifiers are assumed to be global and available to all  
 87471 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as auto  
 87472 shall be allocated on entry to the function and released on returning from the function. They  
 87473 therefore do not retain values between function calls. Auto arrays shall be specified by the array  
 87474 name followed by empty square brackets. On entry to a function, the old values of the names  
 87475 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the  
 87476 function returns, reference to these names shall refer only to the new values.

87477 References to any of these names from other functions that are called from this function also  
 87478 refer to the new value until one of those functions uses the same name for a local variable.

87479 When a statement is an expression, unless the main operator is an assignment, execution of the  
 87480 statement shall write the value of the expression followed by a <newline>.

87481 When a statement is a string, execution of the statement shall write the value of the string.

87482 Statements separated by <semicolon> or <newline> characters shall be executed sequentially. In  
 87483 an interactive invocation of *bc*, each time a <newline> is read that satisfies the grammatical  
 87484 production:

```
87485 input_item : semicolon_list NEWLINE
```

87486 the sequential list of statements making up the **semicolon\_list** shall be executed immediately  
 87487 and any output produced by that execution shall be written without any delay due to buffering.

87488 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

87489 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;  
 87490 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the  
 87491 *relation* is false, execution shall resume after *statement*.

87492 A **for** statement(**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

```
87493 first-expression  

  87494 while (relation) {  

  87495     statement  

  87496     last-expression  

  87497 }
```

87498 The application shall ensure that all three expressions are present.

87499 The **break** statement shall cause termination of a **for** or **while** statement.

87500 The **auto** statement (**auto** *identifier* [*,identifier*] ...) shall cause the values of the identifiers to be

87501 pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers  
 87502 shall be specified by following the array name by empty square brackets. The application shall  
 87503 ensure that the **auto** statement is the first statement in a function definition.

87504 A **define** statement:

```
87505 define LETTER ( opt_define_list ) {
87506     opt_auto_define_list
87507     statement_list
87508 }
```

87509 defines a function named **LETTER**. If a function named **LETTER** was previously defined, the  
 87510 **define** statement shall replace the previous definition. The expression:

```
87511 LETTER ( opt_argument_list )
```

87512 shall invoke the function named **LETTER**. The behavior is undefined if the number of  
 87513 arguments in the invocation does not match the number of parameters in the definition.  
 87514 Functions shall be defined before they are invoked. A function shall be considered to be defined  
 87515 within its own body, so recursive calls are valid. The values of numeric constants within a  
 87516 function shall be interpreted in the base specified by the value of the **ibase** register when the  
 87517 function is invoked.

87518 The **return** statements (**return** and **return(expression)**) shall cause termination of a function,  
 87519 popping of its auto variables, and specification of the result of the function. The first form shall  
 87520 be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the  
 87521 value and scale of the expression returned.

87522 The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement  
 87523 occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

87524 The following functions shall be defined when the **-I** option is specified:

```
87525 s( expression )
87526     Sine of argument in radians.
```

```
87527 c( expression )
87528     Cosine of argument in radians.
```

```
87529 a( expression )
87530     Arctangent of argument.
```

```
87531 l( expression )
87532     Natural logarithm of argument.
```

```
87533 e( expression )
87534     Exponential function of argument.
```

```
87535 j( expression1, expression2 )
87536     Bessel function of expression2 of the first kind of integer order expression1.
```

87537 The scale of the result returned by these functions shall be the value of the **scale** register at the  
 87538 time the function is invoked. The value of the **scale** register after these functions have completed  
 87539 their execution shall be the same value it had upon invocation. The behavior is undefined if any  
 87540 of these functions is invoked with an argument outside the domain of the mathematical  
 87541 function.

87542 **EXIT STATUS**

87543 The following exit values shall be returned:

87544 0 All input files were processed successfully.

87545 *unspecified* An error occurred.87546 **CONSEQUENCES OF ERRORS**87547 If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic message to standard error and terminate without any further action.87549 In an interactive invocation of *bc*, the utility should print an error message and recover following any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined behavior.87552 **APPLICATION USAGE**87553 Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.87554 For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by interactive users (who can react to error messages) or by application programs that can somehow validate the answers returned as not including error messages.87558 The *bc* utility always uses the <period> ( '.' ) character to represent a radix point, regardless of any decimal-point character specified as part of the current locale. In languages like C or *awk*, the <period> character is used in program source, so it can be portable and unambiguous, while the locale-specific character is used in input and output. Because there is no distinction between source and input in *bc*, this arrangement would not be possible. Using the locale-specific character in *bc*'s input would introduce ambiguities into the language; consider the following example in a locale with a <comma> as the decimal-point character:87565 

```
define f(a,b) {
87566     ...
87567 }
87568 ...
87569 f(1, 2, 3)
```

87570 Because of such ambiguities, the &lt;period&gt; character is used in input. Having input follow different conventions from output would be confusing in either pipeline usage or interactive usage, so the &lt;period&gt; is also used in output.

87573 **EXAMPLES**87574 In the shell, the following assigns an approximation of the first ten digits of ' $\pi$ ' to the variable *x*:87575 

```
x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)
```

87576 The following *bc* program prints the same approximation of ' $\pi$ ', with a label, to standard output:87578 

```
scale = 10
87579 "pi equals "
87580 104348 / 33215
```

87581 The following defines a function to compute an approximate value of the exponential function (note that such a function is predefined if the *-I* option is specified):87583 

```
scale = 20
87584 define e(x){
87585     auto a, b, c, i, s
```

```

87586     a = 1
87587     b = 1
87588     s = 1
87589     for (i = 1; 1 == 1; i++){
87590         a = a*x
87591         b = b*i
87592         c = a/b
87593         if (c == 0) {
87594             return(s)
87595         }
87596         s = s+c
87597     }
87598 }

```

87599 The following prints approximate values of the exponential function of the first ten integers:

```

87600 for (i = 1; i <= 10; ++i) {
87601     e(i)
87602 }

```

#### 87603 RATIONALE

87604 The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to  
 87605 be part of this volume of POSIX.1-2024 because *bc* was thought to have a more intuitive  
 87606 programmatic interface. Current implementations that implement *bc* using *dc* are expected to be  
 87607 compliant.

87608 The exit status for error conditions has been left unspecified for several reasons:

- 87609 • The *bc* utility is used in both interactive and non-interactive situations. Different exit codes  
 87610 may be appropriate for the two uses.
- 87611 • It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions,  
 87612 and syntax errors are all possibilities.
- 87613 • It is not clear what utility the exit status has.
- 87614 • In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with  
 87615 *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc*  
 87616 aborted.

87617 The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief  
 87618 that *bc file1 file2* is used most often when at least *file1* contains data/function  
 87619 declarations/initializations. Having *bc* continue with prerequisite files missing is probably not  
 87620 useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check  
 87621 all its files for accessibility before opening any of them.

87622 There was considerable debate on the appropriateness of the language accepted by *bc*. Several  
 87623 reviewers preferred to see either a pure subset of the C language or some changes to make the  
 87624 language more compatible with C. While the *bc* language has some obvious similarities to C, it  
 87625 has never claimed to be compatible with any version of C. An interpreter for a subset of C might  
 87626 be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility  
 87627 is known in historical practice, and it was not within the scope of this volume of POSIX.1-2024 to  
 87628 define such a language and utility. If and when they are defined, it may be appropriate to  
 87629 include them in a future version of this standard. This left the following alternatives:

- 87630 1. Exclude any calculator language from this volume of POSIX.1-2024.
- 87631 The consensus of the standard developers was that a simple programmatic calculator  
87632 language is very useful for both applications and interactive users. The only arguments  
87633 for excluding any calculator were that it would become obsolete if and when a C-  
87634 compatible one emerged, or that the absence would encourage the development of such a  
87635 C-compatible one. These arguments did not sufficiently address the needs of current  
87636 application developers.
- 87637 2. Standardize the historical *dc*, possibly with minor modifications.
- 87638 The consensus of the standard developers was that *dc* is a fundamentally less usable  
87639 language and that that would be far too severe a penalty for avoiding the issue of being  
87640 similar to but incompatible with C.
- 87641 3. Standardize the historical *bc*, possibly with minor modifications.
- 87642 This was the approach taken. Most of the proponents of changing the language would not  
87643 have been satisfied until most or all of the incompatibilities with C were resolved. Since  
87644 most of the changes considered most desirable would break historical applications and  
87645 require significant modification to historical implementations, almost no modifications  
87646 were made. The one significant modification that was made was the replacement of the  
87647 historical *bc* assignment operators "=", and so on, with the more modern "+=", and so  
87648 on. The older versions are considered to be fundamentally flawed because of the lexical  
87649 ambiguity in uses like  $a=-1$ .
- 87650 In order to permit implementations to deal with backwards-compatibility as they see fit,  
87651 the behavior of this one ambiguous construct was made undefined. (At least three  
87652 implementations have been known to support this change already, so the degree of  
87653 change involved should not be great.)
- 87654 The '%' operator is the mathematical remainder operator when **scale** is zero. The behavior of  
87655 this operator for other values of **scale** is from historical implementations of *bc*, and has been  
87656 maintained for the sake of historical applications despite its non-intuitive nature.
- 87657 Historical implementations permit setting **ibase** and **obase** to a broader range of values. This  
87658 includes values less than 2, which were not seen as sufficiently useful to standardize. These  
87659 implementations do not interpret input properly for values of **ibase** that are greater than 16. This  
87660 is because numeric constants are recognized syntactically, rather than lexically, as described in  
87661 this volume of POSIX.1-2024. They are built from lexical tokens of single hexadecimal digits and  
87662 <period> characters. Since <blank> characters between tokens are not visible at the syntactic  
87663 level, it is not possible to recognize the multi-digit "digits" used in the higher bases properly.  
87664 The ability to recognize input in these bases was not considered useful enough to require  
87665 modifying these implementations. Note that the recognition of numeric constants at the  
87666 syntactic level is not a problem with conformance to this volume of POSIX.1-2024, as it does not  
87667 impact the behavior of conforming applications (and correct *bc* programs). Historical  
87668 implementations also accept input with all of the digits '0'-'9' and 'A'-'F' regardless of the  
87669 value of **ibase**; since digits with value greater than or equal to **ibase** are not really appropriate,  
87670 the behavior when they appear is undefined, except for the common case of:
- ```
87671 ibase=8;
87672     /* Process in octal base. */
87673     ...
87674 ibase=A
87675     /* Restore decimal base. */
```
- 87676 In some historical implementations, if the expression to be written is an uninitialized array

87677 element, a leading <space> and/or up to four leading 0 characters may be output before the  
 87678 character zero. This behavior is considered a bug; it is unlikely that any currently conforming  
 87679 application relies on:

```
87680 echo 'b[3]' | bc
```

87681 returning 00000 rather than 0.

87682 Exact calculation of the number of fractional digits to output for a given value in a base other  
 87683 than 10 can be computationally expensive. Historical implementations use a faster  
 87684 approximation, and this is permitted. Note that the requirements apply only to values of **obase**  
 87685 that this volume of POSIX.1-2024 requires implementations to support (in particular, not to 1, 0,  
 87686 or negative bases, if an implementation supports them as an extension).

87687 Historical implementations of *bc* did not allow array parameters to be passed as the last  
 87688 parameter to a function. When *bc* was first standardized in Issue 4, this restriction was allowed.  
 87689 To make *bc* more widely useful, and because there are implementations without this restriction,  
 87690 the allowance for the restriction has been removed.

#### 87691 FUTURE DIRECTIONS

87692 None.

#### 87693 SEE ALSO

87694 [Section 1.3](#) (on page 2461), *awk*

87695 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

#### 87696 CHANGE HISTORY

87697 First released in Issue 4.

#### 87698 Issue 5

87699 The FUTURE DIRECTIONS section is added.

#### 87700 Issue 6

87701 Updated to align with the IEEE P1003.2b draft standard, which included resolution of several  
 87702 interpretations of the ISO POSIX-2: 1993 standard.

87703 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 87704 Issue 7

87705 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

87706 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0066 [584] and XCU/TC2-2008/0067  
 87707 [679] are applied.

#### 87708 Issue 8

87709 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

87710 Austin Group Defect 1230 is applied, changing the EXTENDED DESCRIPTION section to  
 87711 specify that array parameters can be passed as the last parameter to a function.

87712 Austin Group Defect 1570 is applied, removing extra spacing in "==".

87713 **NAME**87714 `bg` — run jobs in the background87715 **SYNOPSIS**87716 UP `bg [job_id...]`87717 **DESCRIPTION**

87718 If job control is enabled (see the description of `set -m`), the shell is interactive, and the current  
 87719 shell execution environment (see [Section 2.13](#), on page 2522) is not a subshell environment, the  
 87720 `bg` utility shall resume suspended jobs from the current shell execution environment by running  
 87721 them as background jobs, as described in [Section 2.11](#) (on page 2518); it may also do so if the  
 87722 shell is non-interactive or the current shell execution environment is a subshell environment. If  
 87723 the job specified by `job_id` is already a running background job, the `bg` utility shall have no effect  
 87724 and shall exit successfully.

87725 **OPTIONS**

87726 None.

87727 **OPERANDS**

87728 The following operand shall be supported:

87729 `job_id` Specify the job to be resumed as a background job. If no `job_id` operand is given,  
 87730 the most recently suspended job shall be used. The format of `job_id` is described in  
 87731 XBD [Section 3.182](#) (on page 57).

87732 **STDIN**

87733 Not used.

87734 **INPUT FILES**

87735 None.

87736 **ENVIRONMENT VARIABLES**87737 The following environment variables shall affect the execution of `bg`:

87738 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 87739 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 87740 variables used to determine the values of locale categories.)

87741 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 87742 internationalization variables.

87743 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 87744 characters (for example, single-byte as opposed to multi-byte characters in  
 87745 arguments).

87746 `LC_MESSAGES`

87747 Determine the locale that should be used to affect the format and contents of  
 87748 diagnostic messages written to standard error.

87749 XSI `NLSPATH` Determine the location of messages objects and message catalogs.87750 **ASYNCHRONOUS EVENTS**

87751 Default.

87752 **STDOUT**87753 The output of `bg` shall consist of a line in the format:87754 `"[%d] %s\n", <job-number>, <command>`

87755 where the fields are as follows:

87756            <*job-number*> A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using  
87757            these utilities, the job can be identified by prefixing the job number with '% '.

87758            <*command*> The associated command that was given to the shell.

#### 87759 **STDERR**

87760            The standard error shall be used only for diagnostic messages.

#### 87761 **OUTPUT FILES**

87762            None.

#### 87763 **EXTENDED DESCRIPTION**

87764            None.

#### 87765 **EXIT STATUS**

87766            The following exit values shall be returned:

87767            0 Successful completion.

87768            >0 An error occurred.

#### 87769 **CONSEQUENCES OF ERRORS**

87770            If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the  
87771            background.

#### 87772 **APPLICATION USAGE**

87773            This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

87774            A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see  
87775            XBD [Chapter 11](#) (on page 199). At that point, *bg* can put the job into the background. This is  
87776            most effective when the job is expecting no terminal input and its output has been redirected to  
87777            non-terminal files. A background job can be forced to stop when it has terminal output by  
87778            issuing the command:

```
87779            stty tostop
```

87780            A background job can be stopped with the command:

```
87781            kill -s stop job ID
```

87782            The *bg* utility does not work as expected when it is operating in its own utility execution  
87783            environment because that environment has no suspended jobs. In the following examples:

```
87784            ... | xargs bg  
87785            (bg)
```

87786            each *bg* operates in a different environment and does not share its parent shell's understanding  
87787            of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.

#### 87788 **EXAMPLES**

87789            None.

#### 87790 **RATIONALE**

87791            The extensions to the shell specified in this volume of POSIX.1-2024 have mostly been based on  
87792            features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
87793            based on the KornShell. The standard developers examined the characteristics of the C shell  
87794            versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
87795            the KornShell versions were selected for this volume of POSIX.1-2024 to maintain a degree of  
87796            uniformity with the rest of the KornShell features selected (such as the very popular command  
87797            line editing features).

- 87798 The *bg* utility is expected to wrap its output if the output exceeds the number of display  
87799 columns.
- 87800 The *bg* and *fg* utilities are not symmetric as regards the list of process IDs known in the current  
87801 shell execution environment. Whereas *fg* removes a process ID from this list, *bg* has no need to  
87802 add one to this list when it resumes execution of a suspended job in the background, because  
87803 this has already been done by the shell when the suspended background job was created (see  
87804 [Section 2.11](#), on page 2518).
- 87805 **FUTURE DIRECTIONS**  
87806 None.
- 87807 **SEE ALSO**  
87808 [Section 2.9.3.1](#) (on page 2506), *fg*, *kill*, *jobs*, *wait*  
87809 XBD [Section 3.182](#) (on page 57), [Chapter 8](#) (on page 167), [Chapter 11](#) (on page 199)
- 87810 **CHANGE HISTORY**  
87811 First released in Issue 4.
- 87812 **Issue 6**  
87813 This utility is marked as part of the User Portability Utilities option.  
87814 The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory  
87815 in this version. This is a FIPS requirement.
- 87816 **Issue 7**  
87817 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 87818 **Issue 8**  
87819 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
87820 this utility is required to be intrinsic.  
87821 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.  
87822 Austin Group Defect 1254 is applied, updating the DESCRIPTION to account for the addition of  
87823 [Section 2.11](#) (on page 2518) and adding a paragraph to RATIONALE.

87824 **NAME**

87825 c17 — compile standard C programs

87826 **SYNOPSIS**

```
87827 CD c17 [options...] pathname [[pathname] [-I directory]
87828 [-L directory] [-l library] [-R directory]]...
```

87829 **DESCRIPTION**

87830 The *c17* utility is an interface to the standard C compilation system; it shall accept source code  
 87831 written in the C language as defined in section 6 of the ISO C standard. The system conceptually  
 87832 consists of a compilation phase, encompassing Translation Phases 1 through 7 of the ISO C  
 87833 standard, and a linkage phase, for handling Phase 8 of the ISO C standard and extensions  
 87834 described here. The reference to “library components” in Phase 8 shall be taken to refer to  
 87835 components of libraries specified using the `-l` option, libraries specified as *file.a* or *file.so*  
 87836 operands, and the equivalent of a `-l c` option passed to the link editor in the manner specified in  
 87837 the EXTENDED DESCRIPTION. In addition, the compilation phase can be split into a separate  
 87838 preprocessing operation, handling Translation Phases 1 through 4, and a processing operation,  
 87839 handling Phases 5 through 7. Whether a single utility or multiple utilities for handling phases  
 87840 separately is provided by an implementation is left unspecified. The input files referenced by  
 87841 *pathname* operands and `-l` option-arguments shall be compiled and linked to produce an  
 87842 executable file or, if the `-G` option is specified, a shared library file. It is unspecified whether the  
 87843 linking of an executable file occurs entirely within the operation of *c17*; when a *pathname*  
 87844 operand or `-l` option-argument names a shared library, an executable object may be produced  
 87845 that is not fully resolved until the file is executed.

87846 If the `-c` option is specified and the `-o` option is not specified, for all *pathname* operands of the  
 87847 form *file.c* or *file.i*, the files:

87848 `$(basename pathname .c).o`

87849 or

87850 `$(basename pathname .i).o`

87851 respectively shall be created as the result of successful compilation. If the `-c` option is not  
 87852 specified, it is unspecified whether such `.o` files are created or deleted for the *file.c* and *file.i*  
 87853 operands.

87854 If there are no options that prevent link editing (such as `-c` or `-E`), and all input files compile and  
 87855 link without error, the resulting executable file or shared library file shall be written according to  
 87856 the `-o outfile` option, if present. If `-o outfile` is not specified, a resulting executable file shall be  
 87857 written to the file **a.out**; if the file to be written is a shared library file, the behavior is  
 87858 unspecified.

87859 Executable files shall be created as specified in [Section 1.1.1.4](#) (on page 2454), except that the file  
 87860 permission bits shall be set to:

87861 `S_IRWXO | S_IRWXG | S_IRWXU`87862 and the bits specified by the *umask* of the process shall be cleared.87863 **OPTIONS**87864 The *c17* utility shall conform to XBD [Section 12.2](#) (on page 215), except that:

- 87865
- Options can be interspersed with operands.

- 87866 • The order of specifying the **-L**, **-I**, and **-R** options, and the order of specifying **-I** options  
87867 with respect to *pathname* operands is significant.
- 87868 • Conforming applications shall specify each option separately; that is, grouping option  
87869 letters (for example, **-cO**) need not be recognized by all implementations.

87870 The following options shall be supported:

- 87871 **-B mode** If *mode* is **dynamic**, produce a dynamically linked executable file. If the **-B** option  
87872 is present with **-c**, **-E**, or **-G**, the result is unspecified.
- 87873 **-c** Suppress the link-edit phase of the compilation, and do not remove any object files  
87874 that are produced. The application shall ensure that all operands are of the form  
87875 *file.c* or *file.i*.
- 87876 **-D name[=value]**  
87877 Define *name* as if by a C-language **#define** directive. If no *=value* is given, a value of  
87878 1 shall be used. The **-D** option has lower precedence than the **-U** option. That is, if  
87879 *name* is used in both a **-U** and a **-D** option, *name* shall be undefined regardless of  
87880 the order of the options. Additional implementation-defined *names* may be  
87881 provided by the compiler. Implementations shall support at least 2 048 bytes of **-D**  
87882 definitions and 256 *names*.
- 87883 **-E** Copy C-language source files to standard output, executing all preprocessor  
87884 directives; no compilation shall be performed. If any operand is not a text file, the  
87885 effects are unspecified.
- 87886 **-G** Create a shared library or create object files suitable for inclusion in such a shared  
87887 library. Compilations shall be performed in a manner suitable for the creation of  
87888 shared libraries (for example, by producing position-independent code).  
87889 If **-c** is also specified, create object files suitable for inclusion in a shared library.  
87890 If **-c** is not specified, create a shared library. In this case the application shall ensure  
87891 that the file named by the **-o outfile** option-argument includes an element named  
87892 **so** or an implementation-defined element denoting a shared library, where  
87893 elements in the last component of *outfile* are separated by <period> characters, for  
87894 example **libx.so.1**; if no **-o** option is included in the options or the file named by  
87895 the **-o outfile** option does not contain an element named **so** or an implementation-  
87896 defined element denoting a shared library, the result is unspecified. If a *pathname*  
87897 operand or **-I** option-argument names a shared library and that shared library  
87898 defines an object used by the library being created, it shall become a dependency  
87899 of the created shared library.  
87900 If the **-G** option is present with **-B** or **-E**, the result is unspecified.
- 87901 **-g** Produce symbolic information in the object or executable files; the nature of this  
87902 information is unspecified, and may be modified by implementation-defined  
87903 interactions with other options.
- 87904 **-I directory** Change the algorithm for searching for headers whose names are not absolute  
87905 pathnames to look in the directory named by the *directory* pathname before looking  
87906 in the usual places. Thus, headers whose names are enclosed in double-quotes (" ")  
87907 shall be searched for first in the directory of the file with the **#include** line, then in  
87908 directories named in **-I** options, and last in the usual places. For headers whose  
87909 names are enclosed in angle brackets ("**<**" "**>**"), the header shall be searched for only  
87910 in directories named in **-I** options and then in the usual places. Directories named  
87911 in **-I** options shall be searched in the order specified. If the **-I** option is used to

- 87912 specify a directory that is one of the usual places searched by default, the results  
87913 are unspecified. Implementations shall support at least ten instances of this option  
87914 in a single *c17* command invocation.
- 87915 **-L *directory*** Change the algorithm of searching for the libraries named in the **-I** objects to look  
87916 in the directory named by the *directory* pathname before looking in the usual  
87917 places. Directories named in **-L** options shall be searched in the order specified. If  
87918 the **-L** option is used to specify a directory that is one of the usual places searched  
87919 by default, the results are unspecified. Implementations shall support at least ten  
87920 instances of this option in a single *c17* command invocation. If a directory specified  
87921 by a **-L** option contains files with names starting with any of the strings "libc.",  
87922 "libl.", "libpthread.", "libm.", "librt.", "libxnet.", or "liby.",  
87923 the results are unspecified.
- 87924 **-I *library*** Search the library named **liblibrary.a** or **liblibrary.so**. When searching for a library,  
87925 the linker shall look at each directory specified by **-L** options that appear on the  
87926 command line before this **-I** option, in the order given, and then the system default  
87927 libraries. If **liblibrary.a** and **liblibrary.so** both exist in a directory, *c17* shall use  
87928 **liblibrary.so** if either **-B dynamic** or **-G** is specified. Once a library has been found  
87929 (shared or static) in a directory, later directories in the list shall not be considered.  
87930 A library shall be searched when its name is encountered, so the placement of a **-I**  
87931 option is significant. Several standard libraries can be specified in this manner, as  
87932 described in the EXTENDED DESCRIPTION section. Implementations may  
87933 recognize implementation-defined suffixes other than **.a** and **.so** as denoting  
87934 libraries.
- 87935 **-O *optlevel*** Specify the level of code optimization. If the *optlevel* option-argument is the digit  
87936 '0', all special code optimizations shall be disabled. If it is the digit '1', the  
87937 nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
87938 the system's default optimization is unspecified. It is unspecified whether code  
87939 generated in the presence of the **-O 0** option is the same as that generated when  
87940 **-O** is omitted. Other *optlevel* values may be supported.
- 87941 **-o *outfile*** Name the output file to be produced. If the **-o** option is present with **-E**, or with **-c**  
87942 and more than one input file, the result is unspecified.
- 87943 When creating a single object file (by using **-c** with a single input file), use the  
87944 pathname *outfile*, instead of the default *file.o*, for the object file produced.
- 87945 When creating an executable file, use the pathname *outfile*, instead of the default  
87946 **a.out**, for the executable file produced.
- 87947 When creating a shared library, use the pathname *outfile* as the name of the shared  
87948 library. If no **-o outfile** option is specified when creating a shared library, the result  
87949 is unspecified.
- 87950 **-s** Produce object or executable files, or both, from which symbolic and other  
87951 information not required for proper execution using the *exec* family defined in the  
87952 System Interfaces volume of POSIX.1-2024 has been removed (stripped). If both **-g**  
87953 and **-s** options are present, the action taken is unspecified.
- 87954 **-R *directory*** If the object file format supports it, specify a directory to be searched for shared  
87955 libraries when an executable file or shared library being created by *c17* is  
87956 subsequently executed, or loaded using *dlopen()*. If *directory* contains any <colon>  
87957 or <dollar-sign> characters, the behavior is unspecified. If an implementation  
87958 provides a means for setting a default load time search location or locations, the **-R**

- option shall take precedence.
- The directory named by *directory* shall not be searched by a process performing dynamic loading if either of the following are true:
- The real and effective user IDs of that process are different and the directory has write permission for a user ID outside the set of the effective user ID of that process and any implementation-specific user IDs used for directories containing system libraries.
  - The real and effective group IDs of that process are different and the directory has write permission for group IDs other than the effective group ID of that process.
- Directories named in **-R** options shall be searched in the order specified, before the default system library locations are searched.
- If a directory specified by a **-R** option contains files with names starting with any of the strings "libc.", "libl.", "libpthread.", "libm.", "librt.", "libxnet.", or "liby.", the result is unspecified.
- If the **-R** option is present with **-c** or **-E**, the result is unspecified.
- U name** Remove any initial definition of *name*.
- Multiple instances of the **-D**, **-I**, **-L**, **-I**, **-R**, and **-U** options can be specified.

#### 87977 OPERANDS

- The application shall ensure that at least one *pathname* operand is specified. The following forms for *pathname* operands shall be supported:
- file.c* A C-language source file to be compiled and optionally linked.
- file.i* A text file containing the output of *c17 -E*, to be compiled and optionally linked. The processing already performed by *c17 -E* when the file was produced shall not be repeated when the file is compiled.
- file.a* A library of static object files typically produced by the *ar* utility, and referenced during the link-edit phase. Implementations may recognize implementation-defined suffixes other than **.a** as denoting static object file libraries.
- file.so* A library of shared object files typically produced by the *c17* utility with the **-G** option, and referenced during the link-edit phase. Implementations may recognize implementation-defined suffixes other than **.so** as denoting shared object file libraries.
- file.o* An object file produced by *c17 -c* and passed directly to the link editor. Implementations may recognize implementation-defined suffixes other than **.o** as denoting object files.
- The processing of other files is implementation-defined.

#### 87995 STDIN

87996 Not used.

#### 87997 INPUT FILES

- Each input file shall be one of the following:
- A text file containing a C-language source program or the output of *c17 -E*

- 88000           • An object file in the format produced by *c17 -c*
- 88001           • A library of object files in the format produced by archiving zero or more object files using  
88002           *ar*
- 88003           • A shared library in the format produced by *c17 -G*

88004           Implementations may supply additional utilities that produce files in these formats. Additional  
88005           input file formats are implementation-defined.

#### 88006 ENVIRONMENT VARIABLES

88007           The following environment variables shall affect the execution of *c17*:

88008           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
88009                       (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
88010                       variables used to determine the values of locale categories.)

88011           *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
88012                       internationalization variables.

88013           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
88014                       characters (for example, single-byte as opposed to multi-byte characters in  
88015                       arguments and input files).

#### 88016 *LC\_MESSAGES*

88017                       Determine the locale that should be used to affect the format and contents of  
88018                       diagnostic messages written to standard error.

88019 XSI        *NLSPATH*   Determine the location of messages objects and message catalogs.

88020           *TMPDIR*       Provide a pathname that should override the default directory for temporary files,  
88021 XSI                       if any. On XSI-conforming systems, provide a pathname that shall override the  
88022                       default directory for temporary files, if any.

#### 88023 ASYNCHRONOUS EVENTS

88024           Default.

#### 88025 STDOUT

88026           If more than one *pathname* operand ending in *.c* or *.i* (or possibly other unspecified suffixes) is  
88027           given, for each such file:

88028           "*%s*:\n", *<pathname>*

88029           may be written. These messages, if written, shall precede the processing of each input file; they  
88030           shall not be written to the standard output if they are written to the standard error, as described  
88031           in the *STDERR* section.

88032           If the *-E* option is specified, the standard output shall be a text file that represents the results of  
88033           the preprocessing stage of the language; it may contain extra information appropriate for  
88034           subsequent compilation passes and shall contain at least one line with the format:

88035           "# *%d* \"*%s*\" \n", *<line>*, *<pathname>*

88036           for each file processed as a result of a **#include** directive, unless no other output generated from  
88037           that file is present in the output, where *line* is a line number and *pathname* is the pathname used  
88038           to open the file.

88039 **STDERR**

88040 The standard error shall be used only for diagnostic messages, except that if more than one  
 88041 *pathname* operand ending in *.c* or *.i* (or possibly other unspecified suffixes) is given, for each such  
 88042 file:

88043 "%s:\n", <*pathname*>

88044 may be written to allow identification of the diagnostic and warning messages with the  
 88045 appropriate input file. These messages, if written, shall precede the processing of each input file;  
 88046 they shall not be written to the standard error if they are written to the standard output, as  
 88047 described in the STDOUT section.

88048 This utility may produce warning messages about certain conditions that do not warrant  
 88049 returning an error (non-zero) exit value.

88050 **OUTPUT FILES**

88051 Object files or executable files or both are produced in unspecified formats. If the pathname of  
 88052 an object file or executable file to be created by *c17* resolves to an existing directory entry for a  
 88053 file that is not a regular file, it is unspecified whether *c17* shall attempt to create the file or shall  
 88054 issue a diagnostic and exit with a non-zero exit status.

88055 **EXTENDED DESCRIPTION**88056 **Standard Libraries**

88057 The *c17* utility shall recognize the following *-l* options for standard libraries:

88058 **-l c** This option shall make available all interfaces referenced in the System Interfaces  
 88059 volume of POSIX.1-2024, with the possible exception of those interfaces listed as  
 88060 residing in <*aio.h*>, <*arpa/inet.h*>, <*complex.h*>, <*fenv.h*>, <*math.h*>,  
 88061 <*mqueue.h*>, <*netdb.h*>, <*net/if.h*>, <*netinet/in.h*>, <*pthread.h*>, <*sched.h*>,  
 88062 <*semaphore.h*>, <*spawn.h*>, <*sys/socket.h*>, <*threads.h*>, *pthread\_kill()* and  
 88063 *pthread\_sigmask()* in <*signal.h*>, interfaces marked as optional in <*sys/mman.h*>,  
 88064 interfaces marked as ADV (Advisory Information) in <*fcntl.h*>, and interfaces  
 88065 beginning with the prefix *clock\_* or *timer\_* in <*time.h*>. This option shall not be  
 88066 required to be present to cause a search of this library.

88067 **-l l** This option shall make available all interfaces required by the C-language output  
 88068 of *lex* that are not made available through the *-l c* option.

88069 **-l pthread** This option shall make available all interfaces referenced in <*pthread.h*> and  
 88070 <*threads.h*>, and also *pthread\_kill()* and *pthread\_sigmask()* referenced in  
 88071 <*signal.h*>. An implementation may search this library in the absence of this  
 88072 option.

88073 **-l m** This option shall make available all interfaces referenced in <*math.h*>,  
 88074 <*complex.h*>, and <*fenv.h*>. An implementation may search this library in the  
 88075 absence of this option.

88076 **-l rt** This option shall make available all interfaces referenced in <*aio.h*>, <*mqueue.h*>,  
 88077 <*sched.h*>, <*semaphore.h*>, and <*spawn.h*>, interfaces marked as optional in  
 88078 <*sys/mman.h*>, interfaces marked as ADV (Advisory Information) in <*fcntl.h*>,  
 88079 and interfaces beginning with the prefix *clock\_* and *timer\_* in <*time.h*>. An  
 88080 implementation may search this library in the absence of this option.

88081 **-l xnet** This option shall make available all interfaces referenced in <*arpa/inet.h*>,  
 88082 <*netdb.h*>, <*net/if.h*>, <*netinet/in.h*>, and <*sys/socket.h*>. An implementation  
 88083 may search this library in the absence of this option.

88084 **-l y** This option shall make available all interfaces required by the C-language output  
88085 of *yacc* that are not made available through the **-l c** option.

88086 In the absence of options that inhibit invocation of the link editor, such as **-c** or **-E**, the *c17* utility  
88087 shall cause the equivalent of a **-l c** option to be passed to the link editor after the last *pathname*  
88088 operand or **-l** option, causing it to be searched after all other object files and libraries are loaded.

88089 The libraries **c**, **l**, **m**, **pthread**, **rt**, **xnet**, and **y** shall be found as shared libraries when specified as  
88090 the option-argument to the **-l** option and may also be found as static libraries but, except for the  
88091 shared library version of the **c** library, need not exist as regular files. The implementation may  
88092 accept as **-l** option-arguments names of additional implementation-defined libraries that do not  
88093 exist as regular files.

### 88094 External Symbols

88095 The C compiler and link editor shall support the significance of external symbols up to a length  
88096 of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation-  
88097 defined maximum symbol length is unspecified.

88098 The compiler and link editor shall support a minimum of 4095 external identifiers in one  
88099 translation unit. A diagnostic message shall be written to the standard output if the  
88100 implementation-defined limit is exceeded; other actions are unspecified.

### 88101 Header Search

88102 If a file with the same name as one of the standard headers defined in XBD [Chapter 14](#) (on page  
88103 221), not provided as part of the implementation, is placed in any of the usual places that are  
88104 searched by default for headers, the results are unspecified.

### 88105 Programming Environments

88106 All implementations shall support one of the following programming environments as a default.  
88107 Implementations may support more than one of the following programming environments.  
88108 Applications can use the `_POSIX_Vn_ILP*` and `_POSIX_Vn_LP*` constants in `<unistd.h>`, and  
88109 corresponding `sysconf()` and `getconf` calls, to determine which programming environments are  
88110 supported.

88111 **Table 3-4** Programming Environments: Type Sizes

Programming Environment <i>getconf</i> Name	Bits in int	Bits in long	Bits in all pointer types	Bits in off_t
_POSIX_V8_ILP32_OFF32	32	32	32	32
_POSIX_V8_ILP32_OFFBIG	32	32	32	≥64
_POSIX_V8_LP64_OFF64	32	64	64	64
_POSIX_V8_LP64_OFFBIG	≥32	≥64	≥64	≥64

88118 All implementations shall support one or more environments where the widths of the following  
88119 types are no greater than the width of type **long**:

88120	<b>blksize_t</b>	<b>ptrdiff_t</b>	<b>tcflag_t</b>
88121	<b>cc_t</b>	<b>size_t</b>	<b>wchar_t</b>
88122	<b>mode_t</b>	<b>speed_t</b>	<b>wint_t</b>
88123	<b>nfds_t</b>	<b>ssize_t</b>	
88124	<b>pid_t</b>	<b>suseconds_t</b>	

88125 The executable files created when these environments are selected shall be in a proper format for  
 88126 execution by the *exec* family of functions. Each environment may be one of the ones in Table 3-4  
 88127 (on page 2675), or it may be another environment. The names for the environments that meet  
 88128 this requirement shall be output by a *getconf* command using the  
 88129 POSIX\_V8\_WIDTH\_RESTRICTED\_ENVS argument, as a <newline>-separated list of names  
 88130 suitable for use with the *getconf* -v option. If more than one environment meets the requirement,  
 88131 the names of all such environments shall be output on separate lines. Any of these names can  
 88132 then be used in a subsequent *getconf* command to obtain the flags specific to that environment  
 88133 with the following suffixes added as appropriate:

88134 `_CFLAGS` To get the C compiler flags.

88135 `_LDFLAGS` To get the linker/loader flags.

88136 `_LIBS` To get the libraries.

88137 This requirement may be removed in a future version.

88138 When this utility processes a file containing a function called *main()*, it shall be defined with a  
 88139 return type equivalent to **int**. Using return from the initial call to *main()* shall be equivalent  
 88140 (other than with respect to language scope issues) to calling *exit()* with the returned value.  
 88141 Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The  
 88142 implementation shall not declare a prototype for this function.

88143 Implementations provide configuration strings for C compiler flags, linker/loader flags, and  
 88144 libraries for each supported environment. When an application needs to use a specific  
 88145 programming environment rather than the implementation default programming environment  
 88146 while compiling, the application shall first verify that the implementation supports the desired  
 88147 environment. If the desired programming environment is supported, the application shall then  
 88148 invoke *c17* with the appropriate C compiler flags as the first options for the compile, the  
 88149 appropriate linker/loader flags after any other options except `-I` but before any operands or `-I`  
 88150 options, and the appropriate libraries at the end of the operands and `-I` options.

88151 Conforming applications shall not attempt to link together object files compiled for different  
 88152 programming models. Applications shall also be aware that binary data placed in shared  
 88153 memory or in files might not be recognized by applications built for other programming models.

88154 **Table 3-5** Programming Environments: *c17* Arguments

88155 88156	<b>Programming Environment</b> <i>getconf</i> Name	<b>Use</b>	<b><i>c17</i> Arguments</b> <i>getconf</i> Name
88157 88158 88159	<code>_POSIX_V8_ILP32_OFF32</code>	C Compiler Flags Linker/Loader Flags Libraries	<code>POSIX_V8_ILP32_OFF32_CFLAGS</code> <code>POSIX_V8_ILP32_OFF32_LDFLAGS</code> <code>POSIX_V8_ILP32_OFF32_LIBS</code>
88160 88161 88162	<code>_POSIX_V8_ILP32_OFFBIG</code>	C Compiler Flags Linker/Loader Flags Libraries	<code>POSIX_V8_ILP32_OFFBIG_CFLAGS</code> <code>POSIX_V8_ILP32_OFFBIG_LDFLAGS</code> <code>POSIX_V8_ILP32_OFFBIG_LIBS</code>
88163 88164 88165	<code>_POSIX_V8_LP64_OFF64</code>	C Compiler Flags Linker/Loader Flags Libraries	<code>POSIX_V8_LP64_OFF64_CFLAGS</code> <code>POSIX_V8_LP64_OFF64_LDFLAGS</code> <code>POSIX_V8_LP64_OFF64_LIBS</code>
88166 88167 88168	<code>_POSIX_V8_LPBIG_OFFBIG</code>	C Compiler Flags Linker/Loader Flags Libraries	<code>POSIX_V8_LPBIG_OFFBIG_CFLAGS</code> <code>POSIX_V8_LPBIG_OFFBIG_LDFLAGS</code> <code>POSIX_V8_LPBIG_OFFBIG_LIBS</code>

88169 In addition to the type size programming environments above, all implementations also support  
 88170 a multi-threaded programming environment that is orthogonal to all of the programming  
 88171 environments listed above. The *getconf* utility can be used to get flags for the threaded  
 88172 programming environment, as indicated in Table 3-6.

88173 **Table 3-6** Threaded Programming Environment: *c17* Arguments

88174 88175	Programming Environment <i>getconf</i> Name	Use	<i>c17</i> Arguments <i>getconf</i> Name
88176 88177	_POSIX_THREADS	C Compiler Flags Linker/Loader Flags	POSIX_V8_THREADS_CFLAGS POSIX_V8_THREADS_LDFLAGS

88178 These programming environment flags may be used in conjunction with any of the type size  
 88179 programming environments supported by the implementation.

#### 88180 EXIT STATUS

88181 The following exit values shall be returned:

- 88182 0 Successful compilation or link edit.
- 88183 >0 An error occurred.

#### 88184 CONSEQUENCES OF ERRORS

88185 When *c17* encounters a compilation error that causes an object file not to be created, it shall write  
 88186 a diagnostic to standard error and continue to compile other source code operands, but it shall  
 88187 not perform the link phase and it shall return a non-zero exit status. If the link edit is  
 88188 unsuccessful, a diagnostic message shall be written to standard error and *c17* exits with a non-  
 88189 zero status. A conforming application shall rely on the exit status of *c17*, rather than on the  
 88190 existence or mode of the executable file.

#### 88191 APPLICATION USAGE

88192 Since the *c17* utility usually creates files in the current directory during the compilation process,  
 88193 it is typically necessary to run the *c17* utility in a directory in which a file can be created.

88194 On systems providing POSIX Conformance (see XBD Chapter 2, on page 15), *c17* is required  
 88195 only with the C-Language Development option; XSI-conformant systems always provide *c17*.

88196 Since this standard requires that conforming applications define either `_POSIX_C_SOURCE` or  
 88197 `_XOPEN_SOURCE` before inclusion of any header (see XSH Section 2.2.1, on page 496), if *c17* is  
 88198 used to compile source code that includes a header without defining one of these feature test  
 88199 macros in the required manner, the behavior of *c17* itself and the results of using any files it  
 88200 generates are undefined. When *c17* is used this way, implementations are encouraged to make  
 88201 visible in headers from the ISO C standard only the symbols that are allowed by that standard,  
 88202 and otherwise to behave the same as if `_POSIX_C_SOURCE` or `_XOPEN_SOURCE` had been  
 88203 defined, but portable applications cannot rely on this.

88204 Some historical implementations have created `.o` files when `-c` is not specified and more than  
 88205 one source file is given. Since this area is left unspecified, the application cannot rely on `.o` files  
 88206 being created, but it also must be prepared for any related `.o` files that already exist being deleted  
 88207 at the completion of the link edit.

88208 There is the possible implication that if a user supplies versions of the standard functions (before  
 88209 they would be encountered by an implicit `-I c` or explicit `-I m`), that those versions would be  
 88210 used in place of the standard versions. There are various reasons this might not be true  
 88211 (functions defined as macros, manipulations for clean name space, and so on), so the existence of  
 88212 files named in the same manner as the standard libraries within the `-L` directories is explicitly

88213 stated to produce unspecified behavior.

88214 All of the functions specified in the System Interfaces volume of POSIX.1-2024 may be made  
88215 visible by implementations when the Standard C Library is searched. Conforming applications  
88216 must explicitly request searching the other standard libraries when functions made visible by  
88217 those libraries are used.

88218 In the ISO C standard the mapping from physical source characters to the C source character set  
88219 is implementation-defined. Implementations may strip white-space characters before the  
88220 terminating <newline> of a (physical) line as part of this mapping and, as a consequence of this,  
88221 one or more white-space characters (and no other characters) between a <backslash> character  
88222 and the <newline> character that terminates the line produces implementation-defined results.  
88223 Portable applications should not use such constructs.

88224 Some *c17* compilers not conforming to POSIX.1-2024 do not support trigraphs by default.

88225 Implementations may support multiple programming environments with some of them  
88226 conforming to this standard and some not conforming. The `_POSIX_Vn_ILP*` and  
88227 `_POSIX_Vn_LP*` constants in `<unistd.h>`, and corresponding `sysconf()` and `getconf` calls, only  
88228 indicate whether each programming environment is supported; they do not indicate anything  
88229 about conformance of the environments that are supported. For example, an implementation  
88230 may support the ILP32\_OFF32 environment for legacy reasons with a 32-bit `time_t`, whereas in a  
88231 conforming environment `time_t` is required to have a width of at least 64 bits. Application  
88232 writers should consult an implementation's POSIX Conformance Document for information  
88233 about the conformance of each supported programming environment.

## 88234 EXAMPLES

88235 1. The following usage example compiles `foo.c` and creates the executable file `foo`:

```
88236 c17 -o foo foo.c
```

88237 The following usage example compiles `foo.c` and creates the object file `foo.o`:

```
88238 c17 -c foo.c
```

88239 The following usage example compiles `foo.c` and creates the executable file `a.out`:

```
88240 c17 foo.c
```

88241 The following usage example compiles `foo.c`, links it with `bar.o`, and creates the  
88242 executable file `a.out`. It may also create and leave `foo.o`:

```
88243 c17 foo.c bar.o
```

88244 The following usage example preprocesses `foo.c` and `bar.c` to create `foo.i` and `bar.i`,  
88245 compiles `foo.i` and `bar.i` to create `foo.o` and `bar.o`, then links `foo.o` and `bar.o` to create the  
88246 executable file `foobar`. Each *c17* execution would ideally be invoked from a separate rule  
88247 in a makefile (see *make*, on page 3130) with suitable dependencies so that each is only  
88248 executed when it needs to be:

```
88249 c17 -E foo.c > foo.i
88250 c17 -E bar.c > bar.i
88251 c17 -c foo.i
88252 c17 -c bar.i
88253 c17 -o foobar foo.o bar.o
```

88254 2. The following example shows how an application using threads interfaces can test for  
88255 support of and use a programming environment supporting 32-bit `int`, `long`, and all  
88256 pointer types, and an `off_t` type using at least 64 bits:

```

88257 offbig_env=$(getconf _POSIX_V8_ILP32_OFFBIG)
88258 if [ $offbig_env != "-1" ] && [ $offbig_env != "undefined" ]
88259 then
88260     c17 $(getconf POSIX_V8_ILP32_OFFBIG_CFLAGS) \
88261         $(getconf POSIX_V8_THREADS_CFLAGS) -D_XOPEN_SOURCE=800 \
88262         $(getconf POSIX_V8_ILP32_OFFBIG_LDFLAGS) \
88263         $(getconf POSIX_V8_THREADS_LDFLAGS) foo.c -o foo \
88264         $(getconf POSIX_V8_ILP32_OFFBIG_LIBS) \
88265         -l pthread
88266 else
88267     echo ILP32_OFFBIG programming environment not supported
88268     exit 1
88269 fi

```

3. The following examples clarify the use and interactions of `-L` and `-I` options.

Consider the case in which module `a.c` calls function `f()` in library `libQ.a`, and module `b.c` calls function `g()` in library `libp.a`. Assume that both libraries reside in `/a/b/c`. The command line to compile and link in the desired way is:

```
c17 -L /a/b/c main.o a.c -l Q b.c -l p
```

In this case the `-L` option need only precede the first `-I` option, since both `libQ.a` and `libp.a` reside in the same directory.

Multiple `-L` options can be used when library name collisions occur. Building on the previous example, suppose that the user wants to use a new `libp.a`, in `/a/a/a`, but still wants `f()` from `/a/b/c/libQ.a`:

```
c17 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p
```

In this example, the linker searches the `-L` options in the order specified, and finds `/a/a/a/libp.a` before `/a/b/c/libp.a` when resolving references for `b.c`. The order of the `-I` options is still important, however.

4. The following example shows how an application can use a programming environment where the widths of the following types:

**blksize\_t, cc\_t, mode\_t, nfsd\_t, pid\_t, ptrdiff\_t, size\_t, speed\_t, ssize\_t, suseconds\_t, tflag\_t, wchar\_t, wint\_t**

are no greater than the width of type **long**:

```

88288 # First choose one of the listed environments ...
88289
88290 # ... if there are no additional constraints, the first one will do:
88291 CENV=$(getconf POSIX_V8_WIDTH_RESTRICTED_ENVS | head -n 1)
88292
88293 # ... or, if an environment that supports large files is preferred,
88294 # look for names that contain "OFF64" or "OFFBIG". (This chooses
88295 # the last one in the list if none match.)
88296 for CENV in $(getconf POSIX_V8_WIDTH_RESTRICTED_ENVS)
88297 do
88298     case $CENV in
88299         *OFF64*|*OFFBIG*) break ;;
88300     esac
88301 done

```

```

88301      # The chosen environment name can now be used like this:
88302      c17 $(getconf ${CENV}_CFLAGS) -D _POSIX_C_SOURCE=202405L \
88303      $(getconf ${CENV}_LDFLAGS) foo.c -o foo \
88304      $(getconf ${CENV}_LIBS)

```

88305 5. The following example shows how to create a shared library that does not depend on any  
88306 other shared library:

```

88307      c17 -G -c foo.c bar.c
88308      c17 -G -o foobar.so foo.o bar.o

```

88309 6. The following example shows how to create a dynamic executable that loads application  
88310 specific shared libraries by searching a specified list of directories when it is executed:

```

88311      c17 -G -c foo.c
88312      c17 -G -o /path/to/dir1/foo.so foo.o
88313      c17 -G -c bar.c
88314      c17 -G -o /path/to/dir2/bar.so bar.o
88315      c17 -B dynamic -L /path/to/dir1 -L /path/to/dir2 -R /path/to/dir1 \
88316      -R /path/to/dir2 -o foobar foobar.c -l foo -l bar

```

## 88317 RATIONALE

88318 The *c17* utility is based on the *c89* utility originally introduced in the ISO POSIX-2:1993  
88319 standard.

88320 Some of the changes from *c89* include the ability to intersperse options and operands (which  
88321 many *c89* implementations allowed despite it not being specified), the description of *-l* as an  
88322 option instead of an operand, and the modification to the contents of the Standard Libraries  
88323 section to account for new headers and options; for example, **<spawn.h>** added to the  
88324 description of *-l rt*.

88325 POSIX.1-2024 specifies that the *c17* utility must be able to use regular files for *\*.o* files and for  
88326 **a.out** files. Implementations are free to overwrite existing files of other types when attempting to  
88327 create object files and executable files, but are not required to do so. If something other than a  
88328 regular file is specified and using it fails for any reason, *c17* is required to issue a diagnostic  
88329 message and exit with a non-zero exit status. But for some file types, the problem may not be  
88330 noticed for a long time. For example, if a FIFO named **a.out** exists in the current directory, *c17*  
88331 may attempt to open **a.out** and will hang in the *open()* call until another process opens the FIFO  
88332 for reading. Then *c17* may write most of the **a.out** to the FIFO and fail when it tries to seek back  
88333 close to the start of the file to insert a timestamp (FIFOs are not seekable files). The *c17* utility is  
88334 also allowed to issue a diagnostic immediately if it encounters an **a.out** or *\*.o* file that is not a  
88335 regular file. For portable use, applications should ensure that any **a.out**, *-o* option-argument, or  
88336 *\*.o* files corresponding to any *\*.c* files do not conflict with names already in use that are not  
88337 regular files or symbolic links that point to regular files.

88338 Commands of the form *c17 -c -o . . .* are frequently used to directly place the *.o* file into an  
88339 alternative directory without a need to separately rename the output file. This helps to support  
88340 concurrent compilations and out of tree builds.

88341 Some implementations allow *-c -o directory* to produce *directory/file.o* even when there is more  
88342 than one input file; however, portable applications using *-c* with *-o* must compile only one file  
88343 at a time and must specify the final destination filename rather than a directory.

88344 The shared library version of the *c* library is required to exist as a regular file because the  
88345 dynamic linker needs to be able to load at least one library at execution time. Other standard  
88346 shared libraries need not exist in their own right if the interfaces the standard requires them to

88347 provide exist in the `c` library; all that is required is that they are “found” when specified as `-l`  
88348 option-arguments. Static versions of the standard libraries need not exist as regular files, even if  
88349 they are found as static libraries when specified as `-l` option-arguments.

88350 On many systems, multi-threaded applications run in a programming environment that is  
88351 distinct from that used by single-threaded applications. This multi-threaded programming  
88352 environment (in addition to needing to specify `-l pthread` at link time) may require additional  
88353 flags to be set when headers are processed at compile time (`-D_REENTRANT` being common).  
88354 This programming environment is orthogonal to the type size programming environments  
88355 discussed above and listed in Table 3-4 (on page 2675). This version of the standard adds *getconf*  
88356 utility calls to provide the C compiler flags and linker/loader flags needed to support multi-  
88357 threaded applications. Note that on a system where single-threaded applications are a special  
88358 case of a multi-threaded application, both of these *getconf* calls may return NULL strings; on  
88359 other implementations both of these strings may be non-NULL strings.

88360 The C standardization committee invented trigraphs (e.g., “??!” to represent ‘|’) to address  
88361 character portability problems in development environments based on national variants of the  
88362 7-bit ISO/IEC 646:1991 standard character set. However, these environments were already  
88363 obsolete by the time the first ISO C standard was published, and in practice trigraphs have not  
88364 been used for their intended purpose, and usually are intended to have their original meaning in  
88365 K&R C. For example, in practice a C-language source string like “What??!” is usually intended  
88366 to end in two <question-mark> characters and an <exclamation-mark>, not in ‘|’.

88367 When the `-E` option is used, execution of some `#pragma` preprocessor directives may simply  
88368 result in a copy of the directive being included in the output as part of the allowed extra  
88369 information used by subsequent compilation passes (see `STDOUT`).

88370 This standard requires that, when `-E` is used, lines beginning with ‘#’ are output identifying  
88371 the files processed as a result of `#include` directives in order that `c17 -E` can be used to generate  
88372 makefile dependencies. See *make*. Usually such lines are output each time the origin of the  
88373 subsequent lines in the output changes, and the line number after the ‘#’ is the line number in  
88374 the named file of the line from which the next line in the output was derived.

88375 When the `-R` option is not included when an executable file or shared library is being created,  
88376 some implementations use the environment variables `LD_RUN_PATH` and `LD_LIBRARY_PATH`  
88377 to determine the directories to be searched for shared libraries.

88378 Some implementations permit place-holders preceded by a <dollar-sign> character (‘\$’), such  
88379 as `$ORIGIN`, in the `-R` directory option-argument to be evaluated at load time. Some  
88380 implementations accept a colon separated list of directories for the path to search for shared  
88381 libraries, with the same effect as specifying the `-R` option multiple times. However, these  
88382 features are not universal.

88383 The name of a shared library usually contains an element named `so`. Other implementation-  
88384 defined elements are allowed for backwards compatibility with historical systems, and so that  
88385 tools can be developed on conforming systems to create libraries for multiple environments. For  
88386 example, Microsoft systems use the filename extension `.dll` (and do not allow following text) to  
88387 denote a shared library. The standard allows additional characters to be used in the name of a  
88388 library following an `so` element to permit shared library versioning information to be at the end  
88389 of the library filename rather than requiring that any such strings appear before the final  
88390 element of the library name.

88391 The decision to standardize on `so` as a required element in a shared library name was  
88392 intentional, as the alternative would have been standardizing things such as a new make macro  
88393 `$(SHLIB_EXT)` that would otherwise be needed to write a portable makefile that can compile  
88394 shared libraries despite not having a standardized element name.

88395 If a combination of direct and indirect dependencies of a shared library would require different  
88396 versions of another shared library, options that are not specified by the standard (such as **-B**  
88397 **direct**) will probably need to be used when linking that shared library, so that at runtime the  
88398 intended versions are found.

#### 88399 **FUTURE DIRECTIONS**

88400 If this utility is directed to display a pathname that contains any bytes that have the encoded  
88401 value of a <newline> character when <newline> is a terminator or separator in the output  
88402 format being used, implementations are encouraged to treat this as an error. A future version of  
88403 this standard may require implementations to treat this as an error.

88404 If this utility is directed to create a new directory entry that contains any bytes that have the  
88405 encoded value of a <newline> character, implementations are encouraged to treat this as an  
88406 error. A future version of this standard may require implementations to treat this as an error.

88407 Unlike all of the other non-OB-shaded utilities in this standard, a utility by this name probably  
88408 will not appear in the next version of this standard. This utility's name is tied to the current  
88409 revision of the ISO C standard at the time this standard is approved. Since the ISO C standard  
88410 and this standard are maintained by different organizations on different schedules, we cannot  
88411 predict what the compiler will be named in the next version of the standard.

#### 88416 **CHANGE HISTORY**

88417 First released in Issue 8. Included for alignment with the ISO/IEC 9899:2018 standard.

88418 **NAME**

88419 cal — print a calendar

88420 **SYNOPSIS**88421 XSI cal **[[*month*] *year*]**88422 **DESCRIPTION**

88423 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from  
 88424 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,  
 88425 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on  
 88426 September 14, 1752.

88427 If no operands are given, *cal* shall produce a one-month calendar for the current month in the  
 88428 current year. If only the *year* operand is given, *cal* shall produce a calendar for all twelve months  
 88429 in the given calendar year. If both *month* and *year* operands are given, *cal* shall produce a one-  
 88430 month calendar for the given month in the given year.

88431 **OPTIONS**

88432 None.

88433 **OPERANDS**

88434 The following operands shall be supported:

88435 *month* Specify the month to be displayed, represented as a decimal integer from 1  
 88436 (January) to 12 (December).

88437 *year* Specify the year for which the calendar is displayed, represented as a decimal  
 88438 integer from 1 to 9999.

88439 **STDIN**

88440 Not used.

88441 **INPUT FILES**

88442 None.

88443 **ENVIRONMENT VARIABLES**88444 The following environment variables shall affect the execution of *cal*:

88445 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 88446 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 88447 variables used to determine the values of locale categories.)

88448 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 88449 internationalization variables.

88450 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 88451 characters (for example, single-byte as opposed to multi-byte characters in  
 88452 arguments).

88453 *LC\_MESSAGES*

88454 Determine the locale that should be used to affect the format and contents of  
 88455 diagnostic messages written to standard error, and informative messages written  
 88456 to standard output.

88457 *LC\_TIME* Determine the format and contents of the calendar.

88458 *NLSPATH* Determine the location of messages objects and message catalogs.

- 88459 `TZ` Determine the timezone used to calculate the value of the current month.
- 88460 **ASYNCHRONOUS EVENTS**
- 88461 Default.
- 88462 **STDOUT**
- 88463 The standard output shall be used to display the calendar, in an unspecified format.
- 88464 **STDERR**
- 88465 The standard error shall be used only for diagnostic messages.
- 88466 **OUTPUT FILES**
- 88467 None.
- 88468 **EXTENDED DESCRIPTION**
- 88469 None.
- 88470 **EXIT STATUS**
- 88471 The following exit values shall be returned:
- 88472 `0` Successful completion.
- 88473 `>0` An error occurred.
- 88474 **CONSEQUENCES OF ERRORS**
- 88475 Default.
- 88476 **APPLICATION USAGE**
- 88477 Note that:
- 88478 `cal 83`
- 88479 refers to A.D. 83, not 1983.
- 88480 **EXAMPLES**
- 88481 None.
- 88482 **RATIONALE**
- 88483 Earlier versions of this standard incorrectly required that the command:
- 88484 `cal 2000`
- 88485 write a one-month calendar for the current calendar month (no matter what the current year is)
- 88486 in the year 2000 to standard output. This did not match historic practice in any known version of
- 88487 the `cal` utility. The description has been updated to match historic practice. When only the *year*
- 88488 operand is given, `cal` writes a twelve-month calendar for the specified year.
- 88489 **FUTURE DIRECTIONS**
- 88490 A future version of this standard may support locale-specific recognition of the date of adoption
- 88491 of the Gregorian calendar.
- 88492 **SEE ALSO**
- 88493 XBD [Chapter 8](#) (on page 167)
- 88494 **CHANGE HISTORY**
- 88495 First released in Issue 2.
- 88496 **Issue 6**
- 88497 The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of
- 88498 the Gregorian calendar.

88499 **Issue 7**

88500 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88501 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0074 [56] and XCU/TC1-2008/0075  
88502 [56] are applied.

88503 **Issue 8**

88504 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

88505 **NAME**

88506 cat — concatenate and print files

88507 **SYNOPSIS**88508 cat [-u] [*file*...]88509 **DESCRIPTION**88510 The *cat* utility shall read files in sequence and shall write their contents to the standard output in  
88511 the same sequence.88512 **OPTIONS**88513 The *cat* utility shall conform to XBD [Section 12.2](#) (on page 215).

88514 The following option shall be supported:

88515 **-u** Write bytes from the input file to the standard output without delay as each is  
88516 read.88517 **OPERANDS**

88518 The following operand shall be supported:

88519 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
88520 shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at  
88521 that point in the sequence. The *cat* utility shall not close and reopen standard input  
88522 when it is referenced in this way, but shall accept multiple occurrences of '-' as a  
88523 *file* operand.88524 **STDIN**88525 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
88526 See the INPUT FILES section.88527 **INPUT FILES**

88528 The input files can be any file type.

88529 **ENVIRONMENT VARIABLES**88530 The following environment variables shall affect the execution of *cat*:88531 **LANG** Provide a default value for the internationalization variables that are unset or null.  
88532 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
88533 variables used to determine the values of locale categories.)88534 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
88535 internationalization variables.88536 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
88537 characters (for example, single-byte as opposed to multi-byte characters in  
88538 arguments).88539 **LC\_MESSAGES**88540 Determine the locale that should be used to affect the format and contents of  
88541 diagnostic messages written to standard error.88542 **XSI** **NLSPATH** Determine the location of messages objects and message catalogs.88543 **ASYNCHRONOUS EVENTS**

88544 Default.

**88545 STDOUT**

88546 The standard output shall contain the sequence of bytes read from the input files. Nothing else  
88547 shall be written to the standard output. If the standard output is a regular file, and is the same  
88548 file as any of the input file operands, the implementation may treat this as an error.

**88549 STDERR**

88550 The standard error shall be used only for diagnostic messages.

**88551 OUTPUT FILES**

88552 None.

**88553 EXTENDED DESCRIPTION**

88554 None.

**88555 EXIT STATUS**

88556 The following exit values shall be returned:

88557 0 All input files were output successfully.

88558 >0 An error occurred.

**88559 CONSEQUENCES OF ERRORS**

88560 Default.

**88561 APPLICATION USAGE**

88562 The `-u` option has value in prototyping non-blocking reads from FIFOs. The intent is to support  
88563 the following sequence:

```
88564 mkfifo foo  
88565 cat -u foo > /dev/tty13 &  
88566 cat -u > foo
```

88567 It is unspecified whether standard output is or is not buffered in the default case. This is  
88568 sometimes of interest when standard output is associated with a terminal, since buffering may  
88569 delay the output. The presence of the `-u` option guarantees that unbuffered I/O is available. It is  
88570 implementation-defined whether the `cat` utility buffers output if the `-u` option is not specified.  
88571 Traditionally, the `-u` option is implemented using the equivalent of the `setvbuf()` function  
88572 defined in the System Interfaces volume of POSIX.1-2024.

**88573 EXAMPLES**

88574 The following command:

```
88575 cat myfile
```

88576 writes the contents of the file **myfile** to standard output.

88577 The following command:

```
88578 cat doc1 doc2 > doc.all
```

88579 concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

88580 Because of the shell language mechanism used to perform output redirection, a command such  
88581 as this:

```
88582 cat doc doc.end > doc
```

88583 causes the original data in **doc** to be lost before `cat` even begins execution. This is true whether  
88584 the `cat` command fails with an error or silently succeeds (the specification allows both  
88585 behaviors). In order to append the contents of **doc.end** without losing the original contents of  
88586 **doc**, this command should be used instead:

88587 `cat doc.end >> doc`

88588 The command:

88589 `cat start - middle - end > file`

88590 when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a  
88591 single invocation of *cat*. Note, however, that if standard input is a regular file, this would be  
88592 equivalent to the command:

88593 `cat start - middle /dev/null end > file`

88594 because the entire contents of the file would be consumed by *cat* the first time '-' was used as a  
88595 *file* operand and an end-of-file condition would be detected immediately when '-' was  
88596 referenced the second time.

### 88597 RATIONALE

88598 Historical versions of the *cat* utility include the `-e`, `-t`, and `-v`, options which permit the ends of  
88599 lines, `<tab>` characters, and invisible characters, respectively, to be rendered visible in the  
88600 output. The standard developers omitted these options because they provide too fine a degree of  
88601 control over what is made visible, and similar output can be obtained using a command such as:

88602 `sed -n l pathname`

88603 The latter also has the advantage that its output is unambiguous, whereas the output of  
88604 historical *cat -etv* is not.

88605 The `-s` option was omitted because it corresponds to different functions in BSD and System  
88606 V-based systems. The BSD `-s` option to squeeze blank lines can be accomplished by the shell  
88607 script shown in the following example:

```
88608 sed -n '  
88609 # Write non-empty lines.  
88610 ./ {  
88611     p  
88612     d  
88613 }  
88614 # Write a single empty line, then look for more empty lines.  
88615 /^$/ p  
88616 # Get next line, discard the held <newline> (empty line),  
88617 # and look for more empty lines.  
88618 :Empty  
88619 /^$/ {  
88620     N  
88621     s/././  
88622     b Empty  
88623 }  
88624 # Write the non-empty line before going back to search  
88625 # for the first in a set of empty lines.  
88626     p  
88627 '
```

88628 The System V `-s` option to silence error messages can be accomplished by redirecting the  
88629 standard error. Note that the BSD documentation for *cat* uses the term ``blank line'' to mean the  
88630 same as the POSIX ``empty line'': a line consisting only of a `<newline>`.

88631 The BSD `-n` option was omitted because similar functionality can be obtained from the `-n`  
88632 option of the *pr* utility.

88633 **FUTURE DIRECTIONS**

88634 None.

88635 **SEE ALSO**88636 *more*88637 XBD [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)88638 XSH *setvbuf()*88639 **CHANGE HISTORY**

88640 First released in Issue 2.

88643 SD5-XCU-ERN-174 is applied, changing the RATIONALE.

88644 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0073 [876] is applied.

88645 **Issue 8**88646 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

88647 **NAME**

88648 cd — change the working directory

88649 **SYNOPSIS**88650 cd [-L] [*directory*]88651 cd -P [-e] [*directory*]88652 **DESCRIPTION**

88653 The *cd* utility shall change the working directory of the current shell execution environment (see  
88654 [Section 2.13](#), on page 2522) by executing the following steps in sequence. (In the following steps,  
88655 the symbol **curpath** represents an intermediate value used to simplify the description of the  
88656 algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

- 88657 1. If no *directory* operand is given and the *HOME* environment variable is empty or  
88658 undefined, the default behavior is implementation-defined and no further steps shall be  
88659 taken.
- 88660 2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty  
88661 value, the *cd* utility shall behave as if the directory named in the *HOME* environment  
88662 variable was specified as the *directory* operand.
- 88663 3. If the *directory* operand begins with a <slash> character, set **curpath** to the operand and  
88664 proceed to step 7.
- 88665 4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
- 88666 5. Starting with the first pathname in the <colon>-separated pathnames of *CDPATH* (see the  
88667 ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the  
88668 concatenation of that pathname, a <slash> character if that pathname did not end with a  
88669 <slash> character, and the *directory* operand names a directory. If the pathname is null,  
88670 test if the concatenation of dot, a <slash> character, and the operand names a directory. In  
88671 either case, if the resulting string names an existing directory, set **curpath** to that string  
88672 and proceed to step 7. Otherwise, repeat this step with the next pathname in *CDPATH*  
88673 until all pathnames have been tested.
- 88674 6. Set **curpath** to the *directory* operand.
- 88675 7. If the *-P* option is in effect, proceed to step 10. If **curpath** does not begin with a <slash>  
88676 character, set **curpath** to the string formed by the concatenation of the value of *PWD*, a  
88677 <slash> character if the value of *PWD* did not end with a <slash> character, and **curpath**.
- 88678 8. The **curpath** value shall then be converted to canonical form as follows, considering each  
88679 component from beginning to end, in sequence:
  - 88680 a. Dot components and any <slash> characters that separate them from the next  
88681 component shall be deleted.
  - 88682 b. For each dot-dot component, if there is a preceding component and it is neither  
88683 root nor dot-dot, then:
    - 88684 i. If the preceding component does not refer (in the context of pathname  
88685 resolution with symbolic links followed) to a directory, then the *cd* utility  
88686 shall display an appropriate error message and no further steps shall be  
88687 taken.
    - 88688 ii. The preceding component, all <slash> characters separating the preceding  
88689 component from dot-dot, dot-dot, and all <slash> characters separating dot-  
88690 dot from the following component (if any) shall be deleted.

88691 c. An implementation may further simplify **curpath** by removing any trailing  
 88692 <slash> characters that are not also leading <slash> characters, replacing multiple  
 88693 non-leading consecutive <slash> characters with a single <slash>, and replacing  
 88694 three or more leading <slash> characters with a single <slash>. If, as a result of  
 88695 this canonicalization, the **curpath** variable is null, no further steps shall be taken.

88696 9. If **curpath** is longer than {PATH\_MAX} bytes (including the terminating null) and the  
 88697 *directory* operand was not longer than {PATH\_MAX} bytes (including the terminating  
 88698 null), then **curpath** shall be converted from an absolute pathname to an equivalent  
 88699 relative pathname if possible. This conversion shall always be considered possible if the  
 88700 value of *PWD*, with a trailing <slash> added if it does not already have one, is an initial  
 88701 substring of **curpath**. Whether or not it is considered possible under other circumstances  
 88702 is unspecified. Implementations may also apply this conversion if **curpath** is not longer  
 88703 than {PATH\_MAX} bytes or the *directory* operand was longer than {PATH\_MAX} bytes.

88704 10. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with  
 88705 **curpath** as the *path* argument. If these actions fail for any reason, the *cd* utility shall  
 88706 display an appropriate error message and the remainder of this step shall not be  
 88707 executed. If the **-P** option is not in effect, the *PWD* environment variable shall be set to  
 88708 the value that **curpath** had on entry to step 9 (i.e., before conversion to a relative  
 88709 pathname).

88710 If the **-P** option is in effect, the *PWD* environment variable shall be set to the string that  
 88711 would be output by *pwd -P*. If there is insufficient permission on the new directory, or on  
 88712 any parent of that directory, to determine the current working directory, the value of the  
 88713 *PWD* environment variable is unspecified. If both the **-e** and the **-P** options are in effect  
 88714 and *cd* is unable to determine the pathname of the current working directory, *cd* shall  
 88715 complete successfully but return a non-zero exit status.

88716 If, during the execution of the above steps, the *PWD* environment variable is set, the *OLDPWD*  
 88717 shell variable shall also be set to the value of the old working directory (that is the current  
 88718 working directory immediately prior to the call to *cd*). It is unspecified whether, when setting  
 88719 *OLDPWD*, the shell also causes it to be exported if it was not already.

## 88720 OPTIONS

88721 The *cd* utility shall conform to XBD [Section 12.2](#) (on page 215).

88722 The following options shall be supported by the implementation:

88723 **-e** If the **-P** option is in effect, the current working directory is successfully changed,  
 88724 and the correct value of the *PWD* environment variable cannot be determined, exit  
 88725 with exit status 1.

88726 **-L** Handle the operand dot-dot logically; symbolic link components shall not be  
 88727 resolved before dot-dot components are processed (see steps 8. and 9. in the  
 88728 DESCRIPTION).

88729 **-P** Handle the operand dot-dot physically; symbolic link components shall be  
 88730 resolved before dot-dot components are processed (see step 7. in the  
 88731 DESCRIPTION).

88732 If both **-L** and **-P** options are specified, the last of these options shall be used and all others  
 88733 ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the  
 88734 DESCRIPTION.

88735 **OPERANDS**

88736 The following operands shall be supported:

88737 *directory* An absolute or relative pathname of the directory that shall become the new  
 88738 working directory. The interpretation of a relative pathname by *cd* depends on the  
 88739 **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an  
 88740 empty string, *cd* shall write a diagnostic message to standard error and exit with  
 88741 non-zero status. If *directory* consists of a single '-' (<hyphen-minus>) character,  
 88742 the *cd* utility shall behave as if *directory* contained the value of the *OLDPWD*  
 88743 environment variable, except that after it sets the value of *PWD* it shall write the  
 88744 new value to standard output. The behavior is unspecified if *OLDPWD* does not  
 88745 start with a <slash> character.

88746 **STDIN**

88747 Not used.

88748 **INPUT FILES**

88749 None.

88750 **ENVIRONMENT VARIABLES**88751 The following environment variables shall affect the execution of *cd*:

88752 *CDPATH* A <colon>-separated list of pathnames that refer to directories. The *cd* utility shall  
 88753 use this list in its attempt to change the directory, as described in the  
 88754 DESCRIPTION. An empty string in place of a directory pathname represents the  
 88755 current directory. If *CDPATH* is not set, it shall be treated as if it were an empty  
 88756 string.

88757 *HOME* The name of the directory, used when no *directory* operand is specified.

88758 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 88759 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 88760 variables used to determine the values of locale categories.)

88761 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 88762 internationalization variables.

88763 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 88764 characters (for example, single-byte as opposed to multi-byte characters in  
 88765 arguments).

88766 *LC\_MESSAGES*

88767 Determine the locale that should be used to affect the format and contents of  
 88768 diagnostic messages written to standard error.

88769 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

88770 *OLDPWD* A pathname of the previous working directory, used when the operand is '-'. If  
 88771 an application sets or unsets the value of *OLDPWD*, the behavior of *cd* with a '-'  
 88772 operand is unspecified.

88773 *PWD* This variable shall be set as specified in the DESCRIPTION. If an application sets  
 88774 or unsets the value of *PWD*, the behavior of *cd* is unspecified.

88775 **ASYNCHRONOUS EVENTS**

88776 Default.

88777 **STDOUT**

88778 If a non-empty directory name from *CDPATH* is used, or if the operand '-' is used, and the  
 88779 absolute pathname of the new working directory can be determined, that pathname shall be  
 88780 written to the standard output as follows:

88781 "%s\n", <new directory>

88782 If an absolute pathname of the new current working directory cannot be determined, it is  
 88783 unspecified whether nothing is written to the standard output or the value of **curpath** used in  
 88784 step 10, followed by a <newline>, is written to the standard output.

88785 If a non-empty directory name from *CDPATH* is not used, and the directory argument is not  
 88786 '-', there shall be no output.

88787 **STDERR**

88788 The standard error shall be used only for diagnostic messages.

88789 **OUTPUT FILES**

88790 None.

88791 **EXTENDED DESCRIPTION**

88792 None.

88793 **EXIT STATUS**

88794 The following exit values shall be returned:

88795 0 The current working directory was successfully changed and the value of the *PWD*  
 88796 environment variable was set correctly.

88797 0 The current working directory was successfully changed, the **-e** option is not in effect, the  
 88798 **-P** option is in effect, and the correct value of the *PWD* environment variable could not be  
 88799 determined.

88800 >0 Either the **-e** option or the **-P** option is not in effect, and an error occurred.

88801 1 The current working directory was successfully changed, both the **-e** and the **-P** options are  
 88802 in effect, and the correct value of the *PWD* environment variable could not be determined.

88803 >1 Both the **-e** and the **-P** options are in effect, and an error occurred.

88804 **CONSEQUENCES OF ERRORS**

88805 The working directory shall remain unchanged.

88806 **APPLICATION USAGE**

88807 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

88808 Since *cd* affects the current shell execution environment, it is always provided as a shell regular  
 88809 built-in. If it is called in a subshell or separate utility execution environment, such as one of the  
 88810 following:

```
88811 (cd /tmp)
88812 nohup cd
88813 find . -exec cd {} \;
```

88814 it does not affect the working directory of the caller's environment.

88815 The user must have execute (search) permission in *directory* in order to change to it.

88816 Since *cd* treats the operand '-' as a special case, applications should not pass arbitrary values as  
 88817 the operand. For example, instead of:

```
88818 CDPATH= cd -P -- "$dir"
```

88819 applications should use the following:

```
88820 case $dir in
88821  (/*) cd -P "$dir";;
88822  ("") echo >&2 directory is an empty string; exit 1;;
88823  (*) CDPATH= cd -P "$dir";;
88824 esac
```

88825 If an absolute pathname of the new current working directory cannot be determined, and a non-  
88826 empty directory name from *CDPATH* is used, *cd* may write a pathname to standard output that  
88827 is not an absolute pathname.

#### 88828 EXAMPLES

88829 The following template can be used to perform processing in the directory specified by *location*  
88830 and end up in the current working directory in use before the first *cd* command was issued:

```
88831 cd location
88832 if [ $? -ne 0 ]
88833 then
88834     print error message
88835     exit 1
88836 fi
88837 ... do whatever is desired as long as the OLDPWD environment variable
88838     is not modified
88839 cd -
```

#### 88840 RATIONALE

88841 The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of  
88842 the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.

88843 A common extension when *HOME* is undefined is to get the login directory from the user  
88844 database for the invoking user. This does not occur on System V implementations.

88845 Some historical shells, such as the KornShell, took special actions when the directory name  
88846 contained a dot-dot component, selecting the logical parent of the directory, rather than the  
88847 actual parent directory; that is, it moved up one level toward the '/' in the pathname,  
88848 remembering what the user typed, rather than performing the equivalent of:

```
88849 chdir("../");
```

88850 In such a shell, the following commands would not necessarily produce equivalent output for all  
88851 directories:

```
88852 cd .. && ls      ls ..
```

88853 This behavior is now the default. It is not consistent with the definition of dot-dot in most  
88854 historical practice; that is, while this behavior has been optionally available in the KornShell,  
88855 other shells have historically not supported this functionality. The logical pathname is stored in  
88856 the *PWD* environment variable when the *cd* utility completes and this value is used to construct  
88857 the next directory name if *cd* is invoked with the *-L* option.

88858 When the *-P* option is in effect, the correct value of the *PWD* environment variable cannot be  
88859 determined on some systems, but still results in a zero exit status. The value of *PWD* doesn't  
88860 matter to some shell scripts and in those cases this is not a problem. In other cases, especially  
88861 with multiple calls to *cd*, the values of *PWD* and *OLDPWD* are important but the standard  
88862 provided no easy way to know that this was the case. The *-e* option has been added, even  
88863 though this was not historic practice, to give script writers a reliable way to know when the  
88864 value of *PWD* is not reliable.

88865 **FUTURE DIRECTIONS**

88866 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 88867 value of a <newline> character when <newline> is a terminator or separator in the output  
 88868 format being used, implementations are encouraged to treat this as an error. A future version of  
 88869 this standard may require implementations to treat this as an error.

88870 **SEE ALSO**

88871 [Section 2.13](#) (on page 2522), *pwd*  
 88872 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)  
 88873 XSH *chdir()*

88874 **CHANGE HISTORY**

88875 First released in Issue 2.

88876 **Issue 6**

88877 The following new requirements on POSIX implementations derive from alignment with the  
 88878 Single UNIX Specification:

- 88879 • The *cd* – operand, *PWD*, and *OLDPWD* are added.

88880 The *-L* and *-P* options are added to align with the IEEE P1003.2b draft standard. This also  
 88881 includes the introduction of a new description to include the effect of these options.

88882 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to  
 88883 make it clear that the *-L* and *-P* options are mutually-exclusive.

88884 **Issue 7**

88885 Austin Group Interpretation 1003.1-2001 #037 is applied.

88886 Austin Group Interpretation 1003.1-2001 #199 is applied, clarifying how the *cd* utility handles  
 88887 concatenation of two pathnames when the first pathname ends in a <slash> character.

88888 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88889 Step 7 of the processing performed by *cd* is revised to refer to **curpath** instead of “the operand”.

88890 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
 88891 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

88892 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0076 [230], XCU/TC1-2008/0077  
 88893 [240], XCU/TC1-2008/0078 [240], and XCU/TC1-2008/0079 [123] are applied.

88894 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0074 [584] is applied.

88895 **Issue 8**

88896 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
 88897 directed to display a pathname that contains any bytes that have the encoded value of a  
 88898 <newline> character when <newline> is a terminator or separator in the output format being  
 88899 used.

88900 Austin Group Defect 253 is applied, adding the *-e* option.

88901 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
 88902 this utility is required to be intrinsic.

88903 Austin Group Defect 1045 is applied, clarifying the behavior when the *directory* operand is ' - '.

88904 Austin Group Defect 1047 is applied, requiring *cd* to treat an empty *directory* operand as an error

88905 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

88906  
88907

Austin Group Defect 1527 is applied, clarifying the behavior when an absolute pathname of the new current working directory cannot be determined.

88908  
88909

Austin Group Defect 1601 is applied, clarifying that when setting *OLDPWD*, the shell need not cause it to be exported if it was not already.

88910 **NAME**88911 cflow — generate a C-language flowgraph (**DEVELOPMENT**)88912 **SYNOPSIS**

```
88913 XSI cflow [-r] [-d num] [-D name[=def]]... [-i incl] [-I dir]...
88914 [-U dir]... file...
```

88915 **DESCRIPTION**

88916 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*  
 88917 source files, and attempt to build a graph, written to standard output, charting the external  
 88918 references.

88919 **OPTIONS**

88920 The *cflow* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**,  
 88921 **-I**, and **-U** options (which are identical to their interpretation by *c17*) is significant.

88922 The following options shall be supported:

- 88923 **-d num** Indicate the depth at which the flowgraph is cut off. The application shall ensure  
 88924 that the argument *num* is a decimal integer. By default this is a very large number  
 88925 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive  
 88926 integer shall be ignored.
- 88927 **-i incl** Increase the number of included symbols. The *incl* option-argument is one of the  
 88928 following characters:
- 88929 *x* Include external and static data symbols. The default shall be to include only  
 88930 functions in the flowgraph.
- 88931 *\_* (Underscore) Include names that begin with an <underscore>. The default  
 88932 shall be to exclude these functions (and data if **-i x** is used).
- 88933 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the  
 88934 callers of each function. The listing shall also be sorted in lexicographical order by  
 88935 callee.

88936 **OPERANDS**

88937 The following operand is supported:

- 88938 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by  
 88939 **.I** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c17* input, and **.i** as the  
 88940 output of *c17* **-E**. Such files shall be processed as appropriate, determined by their  
 88941 suffix.
- 88942 Files suffixed by **.s** (conventionally assembler source) may have more limited  
 88943 information extracted from them.

88944 **STDIN**

88945 Not used.

88946 **INPUT FILES**

88947 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

88948 **ENVIRONMENT VARIABLES**

88949 The following environment variables shall affect the execution of *cflow*:

- 88950 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 88951 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 88952 variables used to determine the values of locale categories.)

- 88953 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
88954 internationalization variables.
- 88955 *LC\_COLLATE*  
88956 Determine the locale for the ordering of the output when the *-r* option is used.
- 88957 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
88958 characters (for example, single-byte as opposed to multi-byte characters in  
88959 arguments and input files).
- 88960 *LC\_MESSAGES*  
88961 Determine the locale that should be used to affect the format and contents of  
88962 diagnostic messages written to standard error.
- 88963 *NLSPATH* Determine the location of messages objects and message catalogs.
- 88964 **ASYNCHRONOUS EVENTS**  
88965 Default.
- 88966 **STDOUT**  
88967 The flowgraph written to standard output shall be formatted as follows:  
88968 "%d %s:%s\n", <reference number>, <global>, <definition>
- 88969 Each line of output begins with a reference (that is, line) number, followed by indentation of at  
88970 least one column position per level. This is followed by the name of the global, a <colon>, and  
88971 its definition. Normally globals are only functions not defined as an external or beginning with  
88972 an <underscore>; see the **OPTIONS** section for the *-i* inclusion option. For information extracted  
88973 from C-language source, the definition consists of an abstract type declaration (for example, **char**  
88974 \*) and, delimited by angle brackets, the name of the source file and the line number where the  
88975 definition was found. Definitions extracted from object files indicate the filename and location  
88976 counter under which the symbol appeared (for example, *text*).
- 88977 Once a definition of a name has been written, subsequent references to that name contain only  
88978 the reference number of the line where the definition can be found. For undefined references,  
88979 only "<>" shall be written.
- 88980 **STDERR**  
88981 The standard error shall be used only for diagnostic messages.
- 88982 **OUTPUT FILES**  
88983 None.
- 88984 **EXTENDED DESCRIPTION**  
88985 None.
- 88986 **EXIT STATUS**  
88987 The following exit values shall be returned:  
88988 0 Successful completion.  
88989 >0 An error occurred.
- 88990 **CONSEQUENCES OF ERRORS**  
88991 Default.

**88992 APPLICATION USAGE**

88993 Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can  
88994 confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

**88995 EXAMPLES**

88996 Given the following in **file.c**:

```
88997     int i;  
88998     int f ();  
88999     int g ();  
89000     int h ();  
89001     int  
89002     main(void)  
89003     {  
89004         f ();  
89005         g ();  
89006         f ();  
89007     }  
89008     int  
89009     f ()  
89010     {  
89011         i = h ();  
89012     }
```

89013 The command:

```
89014 cflow -i x file.c
```

89015 produces the output:

```
89016 1 main: int(), <file.c 6>  
89017 2   f: int(), <file.c 13>  
89018 3     h: <>  
89019 4     i: int, <file.c 1>  
89020 5     g: <>
```

**89021 RATIONALE**

89022 None.

**89023 FUTURE DIRECTIONS**

89024 None.

**89025 SEE ALSO**

89027 [XBD Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

**89028 CHANGE HISTORY**

89029 First released in Issue 2.

**89030 Issue 6**

89031 The normative text is reworded to avoid use of the term “must” for application requirements.

**89032 Issue 7**

89033 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89034 **Issue 8**

89035

Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89036

Austin Group Defect 1195 is applied, changing `main()` to `main(void)`.

89037 **NAME**

89038 chgrp — change the file group ownership

89039 **SYNOPSIS**89040 chgrp [-h] *group file...*89041 chgrp -R [-H|-L|-P] *group file...*89042 **DESCRIPTION**89043 The *chgrp* utility shall set the group ID of the file named by each *file* operand to the group ID  
89044 specified by the *group* operand.89045 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
89046 directory trees specified by the *file* operands, the *chgrp* utility shall perform actions equivalent to  
89047 the *chown()* function defined in the System Interfaces volume of POSIX.1-2024, called with the  
89048 following arguments:

- 89049
- The *file* operand shall be used as the *path* argument.
  - The user ID of the file shall be used as the *owner* argument.
  - The specified group ID shall be used as the *group* argument.

89052 Unless *chgrp* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
89053 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
89054 group-ID bits of other file types may be cleared.89055 **OPTIONS**89056 The *chgrp* utility shall conform to XBD [Section 12.2](#) (on page 215).

89057 The following options shall be supported by the implementation:

89058 **-h** For each *file* operand that names a file of type symbolic link, *chgrp* shall attempt to  
89059 set the group ID of the symbolic link instead of the file referenced by the symbolic  
89060 link.89061 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
89062 is specified on the command line, *chgrp* shall change the group of the directory  
89063 referenced by the symbolic link and all files in the file hierarchy below it.89064 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
89065 is specified on the command line or encountered during the traversal of a file  
89066 hierarchy, *chgrp* shall change the group of the directory referenced by the symbolic  
89067 link and all files in the file hierarchy below it.89068 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
89069 or encountered during the traversal of a file hierarchy, *chgrp* shall change the group  
89070 ID of the symbolic link. The *chgrp* utility shall not follow the symbolic link to any  
89071 other part of the file hierarchy.89072 **-R** Recursively change file group IDs. For each *file* operand that names a directory,  
89073 *chgrp* shall change the group of the directory and all files in the file hierarchy  
89074 below it. Unless a **-H**, **-L**, or **-P** option is specified, it is unspecified which of these  
89075 options will be used as the default.89076 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be  
89077 considered an error. The last option specified shall determine the behavior of the utility.

89078 **OPERANDS**

89079 The following operands shall be supported:

89080 *group* A group name from the group database or a numeric group ID. Either specifies a  
 89081 group ID to be given to each file named by one of the *file* operands. If a numeric  
 89082 *group* operand exists in the group database as a group name, the group ID number  
 89083 associated with that group name is used as the group ID.

89084 *file* A pathname of a file whose group ID is to be modified.

89085 **STDIN**

89086 Not used.

89087 **INPUT FILES**

89088 None.

89089 **ENVIRONMENT VARIABLES**89090 The following environment variables shall affect the execution of *chgrp*:

89091 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 89092 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 89093 variables used to determine the values of locale categories.)

89094 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 89095 internationalization variables.

89096 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 89097 characters (for example, single-byte as opposed to multi-byte characters in  
 89098 arguments).

89099 *LC\_MESSAGES*

89100 Determine the locale that should be used to affect the format and contents of  
 89101 diagnostic messages written to standard error.

89102 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

89103 **ASYNCHRONOUS EVENTS**

89104 Default.

89105 **STDOUT**

89106 Not used.

89107 **STDERR**

89108 The standard error shall be used only for diagnostic messages.

89109 **OUTPUT FILES**

89110 None.

89111 **EXTENDED DESCRIPTION**

89112 None.

89113 **EXIT STATUS**

89114 The following exit values shall be returned:

89115 0 The utility executed successfully and all requested changes were made.

89116 &gt;0 An error occurred.

**89117 CONSEQUENCES OF ERRORS**

89118 Default.

**89119 APPLICATION USAGE**

89120 Only the owner of a file or the user with appropriate privileges may change the owner or group  
89121 of a file.

89122 Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the  
89123 *group* specified is not the effective group ID or one of the supplementary group IDs of the calling  
89124 process.

**89125 EXAMPLES**

89126 None.

**89127 RATIONALE**

89128 The System V and BSD versions use different exit status codes. Some implementations used the  
89129 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
89130 can overflow the range of valid exit status values. The standard developers chose to mask these  
89131 by specifying only 0 and >0 as exit values.

89132 The functionality of *chgrp* is described substantially through references to *chown()*. In this way,  
89133 there is no duplication of effort required for describing the interactions of permissions, multiple  
89134 groups, and so on.

**89135 FUTURE DIRECTIONS**

89136 None.

**89137 SEE ALSO**

89138 *chmod*, *chown*

89139 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

89140 XSH *chown()*

**89141 CHANGE HISTORY**

89142 First released in Issue 2.

**89143 Issue 6**

89144 New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
89145 options affect the processing of symbolic links.

89146 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
89147 section to “Default.”.

89148 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to  
89149 make it clear that **-h** and **-R** are optional.

**89150 Issue 7**

89151 SD5-XCU-ERN-8 is applied, removing the **-R** from the first line of the SYNOPSIS.

89152 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89153 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0080 [237,341] is applied.

**89154 Issue 8**

89155 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89156 **NAME**

89157 chmod — change the file modes

89158 **SYNOPSIS**89159 chmod [-R] *mode file...*89160 **DESCRIPTION**89161 The *chmod* utility shall change any or all of the file mode bits of the file named by each *file*  
89162 operand in the way specified by the *mode* operand.89163 It is implementation-defined whether and how the *chmod* utility affects any alternate or  
89164 additional file access control mechanism (see XBD [Section 4.7](#), on page 97) being used for the  
89165 specified file.89166 Only a process whose effective user ID matches the user ID of the file, or a process with  
89167 appropriate privileges, shall be permitted to change the file mode bits of a file.89168 Upon successfully changing the file mode bits of a file, the *chmod* utility shall mark for update  
89169 the last file status change timestamp of the file.89170 **OPTIONS**89171 The *chmod* utility shall conform to XBD [Section 12.2](#) (on page 215).

89172 The following option shall be supported:

89173 **-R** Recursively change file mode bits. For each *file* operand that names a directory,  
89174 *chmod* shall change the file mode bits of the directory and all files in the file  
89175 hierarchy below it.89176 **OPERANDS**

89177 The following operands shall be supported:

89178 *mode* Represents the change to be made to the file mode bits of each file named by one of  
89179 the *file* operands; see the EXTENDED DESCRIPTION section.89180 *file* A pathname of a file whose file mode bits shall be modified.89181 **STDIN**

89182 Not used.

89183 **INPUT FILES**

89184 None.

89185 **ENVIRONMENT VARIABLES**89186 The following environment variables shall affect the execution of *chmod*:89187 *LANG* Provide a default value for the internationalization variables that are unset or null.  
89188 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
89189 variables used to determine the values of locale categories.)89190 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
89191 internationalization variables.89192 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
89193 characters (for example, single-byte as opposed to multi-byte characters in  
89194 arguments).89195 *LC\_MESSAGES*89196 Determine the locale that should be used to affect the format and contents of  
89197 diagnostic messages written to standard error.

- 89198 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 89199 **ASYNCHRONOUS EVENTS**
- 89200 Default.
- 89201 **STDOUT**
- 89202 Not used.
- 89203 **STDERR**
- 89204 The standard error shall be used only for diagnostic messages.
- 89205 **OUTPUT FILES**
- 89206 None.
- 89207 **EXTENDED DESCRIPTION**
- 89208 The *mode* operand shall be either a *symbolic\_mode* expression or a non-negative octal integer. The
- 89209 *symbolic\_mode* form is described by the grammar later in this section.
- 89210 Each **clause** shall specify an operation to be performed on the current file mode bits of each *file*.
- 89211 The operations shall be performed on each *file* in the order in which the **clauses** are specified.
- 89212 The **who** symbols **u**, **g**, and **o** shall specify the *user*, *group*, and *other* parts of the file mode bits,
- 89213 respectively. A **who** consisting of the symbol **a** shall be equivalent to **ugo**.
- 89214 The **perm** symbols **r**, **w**, and **x** represent the *read*, *write*, and *execute/search* portions of file mode
- 89215 bits, respectively. The **perm** symbol **s** shall represent the *set-user-ID-on-execution* (when **who**
- 89216 contains or implies **u**) and *set-group-ID-on-execution* (when **who** contains or implies **g**) bits.
- 89217 The **perm** symbol **X** shall represent the execute/search portion of the file mode bits if the file is a
- 89218 directory or if the current (unmodified) file mode bits have at least one of the execute bits
- 89219 (S\_IXUSR, S\_IXGRP, or S\_IXOTH) set. It shall be ignored if the file is not a directory and none of
- 89220 the execute bits are set in the current file mode bits.
- 89221 The **permcop** symbols **u**, **g**, and **o** shall represent the current permissions associated with the
- 89222 user, group, and other parts of the file mode bits, respectively. For the remainder of this section,
- 89223 **perm** refers to the non-terminals **perm** and **permcop** in the grammar.
- 89224 If multiple **actionlists** are grouped with a single **wholist** in the grammar, each **actionlist** shall be
- 89225 applied in the order specified with that **wholist**. The *op* symbols shall represent the operation
- 89226 performed, as follows:
- 89227 + If **perm** is not specified, the '+' operation shall not change the file mode bits.
- 89228 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and
- 89229 other permissions, except for those with corresponding bits in the file mode creation mask
- 89230 of the invoking process, shall be set.
- 89231 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.
- 89232 – If **perm** is not specified, the '-' operation shall not change the file mode bits.
- 89233 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and
- 89234 other permissions, except for those with corresponding bits in the file mode creation mask
- 89235 of the invoking process, shall be cleared.
- 89236 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be
- 89237 cleared.
- 89238 = Clear the file mode bits specified by the **who** value, or, if no **who** value is specified, all of the
- 89239 file mode bits specified in this volume of POSIX.1-2024.

89240 If **perm** is not specified, the '=' operation shall make no further modifications to the file  
89241 mode bits.

89242 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and  
89243 other permissions, except for those with corresponding bits in the file mode creation mask  
89244 of the invoking process, shall be set.

89245 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

89246 When using the symbolic mode form on a regular file, it is implementation-defined whether or  
89247 not:

- 89248 • Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all  
89249 execute bits are currently clear and none are being set are ignored.
- 89250 • Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-  
89251 on-execution bits.
- 89252 • Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all  
89253 execute bits are currently clear are ignored. However, if the command *ls -l file* writes an *s*  
89254 in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is  
89255 set, the commands *chmod u-s file* or *chmod g-s file*, respectively, shall not be ignored.

89256 When using the symbolic mode form on other file types, it is implementation-defined whether  
89257 or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are  
89258 honored.

89259 If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols  
89260 being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be  
89261 modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm**  
89262 symbol **s**.

89263 XSI The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory, it can  
89264 be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who**  
89265 symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these  
89266 combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other  
89267 than directory is unspecified.

89268 For an octal integer *mode* operand, the file mode bits shall be set absolutely.

89269 For each bit set in the octal number, the corresponding file permission bit shown in the following  
89270 table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in  
89271 the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-  
89272 execution, bits shown in the following table shall be set; if these bits are not set in the octal  
89273 number, they are cleared. For other file types, it is implementation-defined whether or not  
89274 requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are  
89275 honored.

Octal	Mode Bit	Octal	Mode Bit	Octal	Mode Bit	Octal	Mode Bit
4000	S_ISUID	0400	S_IRUSR	0040	S_IRGRP	0004	S_IROTH
2000	S_ISGID	0200	S_IWUSR	0020	S_IWGRP	0002	S_IWOTH
1000	S_ISVTX	0100	S_IXUSR	0010	S_IXGRP	0001	S_IXOTH

89280 When bits are set in the octal number other than those listed in the table above, the behavior is  
89281 unspecified.

89282 **Grammar for chmod**

89283 The grammar and lexical conventions in this section describe the syntax for the *symbolic\_mode*  
 89284 operand. The general conventions for this style of grammar are described in [Section 1.3](#) (on page  
 89285 2461). A valid *symbolic\_mode* can be represented as the non-terminal symbol *symbolic\_mode* in  
 89286 the grammar. This formal syntax shall take precedence over the preceding text syntax  
 89287 description.

89288 The lexical processing is based entirely on single characters. Implementations need not allow  
 89289 <blank> characters within the single argument being processed.

```
89290 %start    symbolic_mode
89291 %%

89292 symbolic_mode    : clause
89293                  | symbolic_mode ',' clause
89294                  ;

89295 clause           : actionlist
89296                  | wholist actionlist
89297                  ;

89298 wholist          : who
89299                  | wholist who
89300                  ;

89301 who              : 'u' | 'g' | 'o' | 'a'
89302                  ;

89303 actionlist       : action
89304                  | actionlist action
89305                  ;

89306 action           : op
89307                  | op permlist
89308                  | op permcopy
89309                  ;

89310 permcopy         : 'u' | 'g' | 'o'
89311                  ;

89312 op               : '+' | '-' | '='
89313                  ;

89314 permlist         : perm
89315                  | perm permlist
89316                  ;

89317 XSI perm         : 'r' | 'w' | 'x' | 'X' | 's' | 't'
89318                  ;
```

89319 **EXIT STATUS**

89320 The following exit values shall be returned:

89321 0 The utility executed successfully and all requested changes were made.

89322 >0 An error occurred.

89323 **CONSEQUENCES OF ERRORS**

89324 Default.

89325 **APPLICATION USAGE**

89326 Some implementations of the *chmod* utility change the mode of a directory before the files in the  
 89327 directory when performing a recursive (**-R** option) change; others change the directory mode  
 89328 after the files in the directory. If an application tries to remove read or search permission for a  
 89329 file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying  
 89330 to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users  
 89331 should not try to make a hierarchy inaccessible to themselves.

89332 Some implementations of *chmod* never used the *umask* of the process when changing modes;  
 89333 systems conformant with this volume of POSIX.1-2024 do so when **who** is not specified. Note  
 89334 the difference between:

89335 `chmod a-w file`

89336 which removes all write permissions, and:

89337 `chmod -- -w file`

89338 which removes write permissions that would be allowed if **file** was created with the same  
 89339 *umask*.

89340 Conforming applications should never assume that they know how the set-user-ID and set-  
 89341 group-ID bits on directories are interpreted.

89342 **EXAMPLES**

89343  
89344  
89345  
89346  
89347  
89348  
89349  
89350  
89351  
89352

Mode	Results
<i>a+=</i>	Equivalent to <i>a+,a=</i> ; clears all file mode bits.
<i>go+-w</i>	Equivalent to <i>go+,go-w</i> ; clears group and other write bits.
<i>g=o-w</i>	Equivalent to <i>g=o,g-w</i> ; sets group bit to match other bits and then clears group write bit.
<i>g-r+w</i>	Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.
<i>uo=g</i>	Sets owner bits to match group bits and sets other bits to match group bits.

89353 **RATIONALE**

89354 The functionality of *chmod* is described substantially through references to concepts defined in  
 89355 the System Interfaces volume of POSIX.1-2024. In this way, there is less duplication of effort  
 89356 required for describing the interactions of permissions. However, the behavior of this utility is  
 89357 not described in terms of the *chmod()* function from the System Interfaces volume of  
 89358 POSIX.1-2024 because that specification requires certain side-effects upon alternate file access  
 89359 control mechanisms that might not be appropriate, depending on the implementation.

89360 Implementations that support mandatory file and record locking as specified by the 1984  
 89361 /usr/group standard historically used the combination of set-group-ID bit set and group  
 89362 execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the  
 89363 symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory  
 89364 locking mode is not changed without explicit indication that that was what the user intended.  
 89365 Therefore, the details on how the implementation treats these conditions must be defined in the  
 89366 documentation. This volume of POSIX.1-2024 does not require mandatory locking (nor does the  
 89367 System Interfaces volume of POSIX.1-2024), but does allow it as an extension. However, this  
 89368 volume of POSIX.1-2024 does require that the *ls* and *chmod* utilities work consistently in this

89369 area. If `ls -l file` indicates that the set-group-ID bit is set, `chmod g-s file` must clear it (assuming  
89370 appropriate privileges exist to change modes).

89371 The System V and BSD versions use different exit status codes. Some implementations used the  
89372 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
89373 can overflow the range of valid exit status values. This problem is avoided here by specifying  
89374 only 0 and >0 as exit values.

89375 The System Interfaces volume of POSIX.1-2024 indicates that implementation-defined  
89376 restrictions may cause the S\_ISUID and S\_ISGID bits to be ignored. This volume of POSIX.1-2024  
89377 allows the `chmod` utility to choose to modify these bits before calling `chmod()` (or some function  
89378 providing equivalent capabilities) for non-regular files. Among other things, this allows  
89379 implementations that use the set-user-ID and set-group-ID bits on directories to enable extended  
89380 features to handle these extensions in an intelligent manner.

89381 The **X perm** symbol was adopted from BSD-based systems because it provides commonly  
89382 desired functionality when doing recursive (`-R` option) modifications. Similar functionality is  
89383 not provided by the `find` utility. Historical BSD versions of `chmod`, however, only supported **X**  
89384 with `op+`; it has been extended in this volume of POSIX.1-2024 because it is also useful with `op=`.  
89385 (It has also been added for `op-` even though it duplicates `x`, in this case, because it is intuitive  
89386 and easier to explain.)

89387 The grammar was extended with the `permcopy` non-terminal to allow historical-practice forms of  
89388 symbolic modes like `o=u -g` (that is, set the “other” permissions to the permissions of “owner”  
89389 minus the permissions of “group”).

#### 89390 FUTURE DIRECTIONS

89391 None.

89395 XSH `chmod()`

#### 89396 CHANGE HISTORY

89397 First released in Issue 2.

#### 89398 Issue 6

89399 The following new requirements on POSIX implementations derive from alignment with the  
89400 Single UNIX Specification:

- 89401 • Octal modes have been kept and made mandatory despite being marked obsolescent in the  
89402 ISO POSIX-2: 1993 standard.

89403 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
89404 section to “Default.”.

89405 The Open Group Base Resolution bwg2001-010 is applied, adding the description of the  
89406 S\_ISVTX bit and the **t perm** symbol as part of the XSI option.

89407 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded  
89408 text in the EXTENDED DESCRIPTION from:

89409 “The **perm** symbol **t** shall specify the S\_ISVTX bit and shall apply to directories only. The  
89410 effect when using it with any other file type is unspecified. It can be used with the **who**  
89411 symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**  
89412 or **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

89413 to:

89414 ``The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory,

89415 it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to

89416 specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning

89417 of these combinations is unspecified. The effect when using the **perm** symbol **t** with any

89418 file type other than directory is unspecified.”

89419 This change is to permit historical behavior.

89420 **Issue 7**

89421 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89422 Austin Group Interpretation 1003.1-2001 #130 is applied, adding text to the DESCRIPTION

89423 about about marking for update the last file status change timestamp of the file.

89424 **Issue 8**

89425 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89426 **NAME**

89427 chown — change the file ownership

89428 **SYNOPSIS**

89429 chown [-h] owner[:group] file...

89430 chown -R [-H|-L|-P] owner[:group] file...

89431 **DESCRIPTION**89432 The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID  
89433 specified by the *owner* operand.89434 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
89435 directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to  
89436 the *chown()* function defined in the System Interfaces volume of POSIX.1-2024, called with the  
89437 following arguments:

- 89438 1. The *file* operand shall be used as the *path* argument.
- 89439 2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner*  
89440 argument.
- 89441 3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used  
89442 as the *group* argument; otherwise, the group ownership shall not be changed.

89443 Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
89444 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
89445 group-ID bits of other file types may be cleared.89446 **OPTIONS**89447 The *chown* utility shall conform to XBD [Section 12.2](#) (on page 215).

89448 The following options shall be supported by the implementation:

- 89449 **-h** For each file operand that names a file of type symbolic link, *chown* shall attempt to  
89450 set the user ID of the symbolic link. If a group ID was specified, for each file  
89451 operand that names a file of type symbolic link, *chown* shall attempt to set the  
89452 group ID of the symbolic link.
- 89453 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
89454 is specified on the command line, *chown* shall change the user ID (and group ID, if  
89455 specified) of the directory referenced by the symbolic link and all files in the file  
89456 hierarchy below it.
- 89457 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
89458 is specified on the command line or encountered during the traversal of a file  
89459 hierarchy, *chown* shall change the user ID (and group ID, if specified) of the  
89460 directory referenced by the symbolic link and all files in the file hierarchy below it.
- 89461 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
89462 or encountered during the traversal of a file hierarchy, *chown* shall change the  
89463 owner ID (and group ID, if specified) of the symbolic link. The *chown* utility shall  
89464 not follow the symbolic link to any other part of the file hierarchy.
- 89465 **-R** Recursively change file user and group IDs. For each *file* operand that names a  
89466 directory, *chown* shall change the user ID (and group ID, if specified) of the  
89467 directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is  
89468 specified, it is unspecified which of these options will be used as the default.

89469 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be

89470 considered an error. The last option specified shall determine the behavior of the utility.

#### 89471 OPERANDS

89472 The following operands shall be supported:

89473 *owner[:group]* A user ID and optional group ID to be assigned to *file*. The *owner* portion of this  
 89474 operand shall be a user name from the user database or a numeric user ID. Either  
 89475 specifies a user ID which shall be given to each file named by one of the *file*  
 89476 operands. If a numeric *owner* operand exists in the user database as a user name,  
 89477 the user ID number associated with that user name shall be used as the user ID.  
 89478 Similarly, if the *group* portion of this operand is present, it shall be a group name  
 89479 from the group database or a numeric group ID. Either specifies a group ID which  
 89480 shall be given to each file. If a numeric group operand exists in the group database  
 89481 as a group name, the group ID number associated with that group name shall be  
 89482 used as the group ID.

89483 *file* A pathname of a file whose user ID is to be modified.

#### 89484 STDIN

89485 Not used.

#### 89486 INPUT FILES

89487 None.

#### 89488 ENVIRONMENT VARIABLES

89489 The following environment variables shall affect the execution of *chown*:

89490 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 89491 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 89492 variables used to determine the values of locale categories.)

89493 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 89494 internationalization variables.

89495 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 89496 characters (for example, single-byte as opposed to multi-byte characters in  
 89497 arguments).

89498 *LC\_MESSAGES*

89499 Determine the locale that should be used to affect the format and contents of  
 89500 diagnostic messages written to standard error.

89501 *XSI* *NLSPATH* Determine the location of messages objects and message catalogs.

#### 89502 ASYNCHRONOUS EVENTS

89503 Default.

#### 89504 STDOUT

89505 Not used.

#### 89506 STDERR

89507 The standard error shall be used only for diagnostic messages.

#### 89508 OUTPUT FILES

89509 None.

89510 **EXTENDED DESCRIPTION**

89511 None.

89512 **EXIT STATUS**

89513 The following exit values shall be returned:

89514 0 The utility executed successfully and all requested changes were made.

89515 &gt;0 An error occurred.

89516 **CONSEQUENCES OF ERRORS**

89517 Default.

89518 **APPLICATION USAGE**89519 Only the owner of a file or the user with appropriate privileges may change the owner or group  
89520 of a file.89521 Some implementations restrict the use of *chown* to a user with appropriate privileges.89522 **EXAMPLES**

89523 None.

89524 **RATIONALE**89525 The System V and BSD versions use different exit status codes. Some implementations used the  
89526 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
89527 can overflow the range of valid exit status values. These are masked by specifying only 0 and >0  
89528 as exit values.89529 The functionality of *chown* is described substantially through references to functions in the  
89530 System Interfaces volume of POSIX.1-2024. In this way, there is no duplication of effort required  
89531 for describing the interactions of permissions, multiple groups, and so on.89532 The 4.3 BSD method of specifying both owner and group was included in this volume of  
89533 POSIX.1-2024 because:89534 • There are cases where the desired end condition could not be achieved using the *chgrp* and  
89535 *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the  
89536 desired group and the desired owner is not a member of the current group, the *chown()*  
89537 function could fail unless both owner and group are changed at the same time.)89538 • Even if they could be changed independently, in cases where both are being changed, there  
89539 is a 100% performance penalty caused by being forced to invoke both utilities.89540 The BSD syntax *user[.group]* was changed to *user[:group]* in this volume of POSIX.1-2024 because  
89541 the <period> is a valid character in login names (as specified by the Base Definitions volume of  
89542 POSIX.1-2024, login names consist of characters in the portable filename character set). The  
89543 <colon> character was chosen as the replacement for the <period> character because it would  
89544 never be allowed as a character in a user name or group name on historical implementations.89545 The **-R** option is considered by some observers as an undesirable departure from the historical  
89546 UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there  
89547 seemed to be no good reason to require other tools to have to duplicate that functionality.  
89548 However, the **-R** option was deemed an important user convenience, is far more efficient than  
89549 forking a separate process for each element of the directory hierarchy, and is in widespread  
89550 historical use.

89551 **FUTURE DIRECTIONS**

89552 None.

89553 **SEE ALSO**89554 *chgrp, chmod*

89555 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

89556 XSH *chown()*89557 **CHANGE HISTORY**

89558 First released in Issue 2.

89559 **Issue 6**89560 New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
89561 options affect the processing of symbolic links.

89562 The normative text is reworded to avoid use of the term “must” for application requirements.

89563 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
89564 section to “Default.”.89565 The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group  
89566 ownership shall not be changed”.89567 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to  
89568 make it clear that **-h** and **-R** are optional.89569 **Issue 7**89570 SD5-XCU-ERN-9 is applied, removing the **-R** from the first line of the SYNOPSIS.

89571 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89572 The description of the **-h** and **-P** options is revised.89573 **Issue 8**89574 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89575 **NAME**

89576 cksum — write file checksums and sizes

89577 **SYNOPSIS**89578 cksum [*file*...]89579 **DESCRIPTION**

89580 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)  
 89581 for each input file, and also write to standard output the number of octets in each file. The CRC  
 89582 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996  
 89583 standard (Ethernet).

89584 The encoding for the CRC checksum is defined by the generating polynomial:

$$89585 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

89586 Mathematically, the CRC value corresponding to a given file shall be defined by the following  
 89587 procedure:

- 89588 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial  
 89589  $M(x)$  of degree  $n-1$ . These *n* bits are the bits from the file, with the most significant bit  
 89590 being the most significant bit of the first octet of the file and the last bit being the least  
 89591 significant bit of the last octet, padded with zero bits (if necessary) to achieve an integral  
 89592 number of octets, followed by one or more octets representing the length of the file as a  
 89593 binary value, least significant octet first. The smallest number of octets capable of  
 89594 representing this integer shall be used.
- 89595 2.  $M(x)$  is multiplied by  $x^{32}$  (that is, shifted left 32 bits) and divided by  $G(x)$  using mod 2  
 89596 division, producing a remainder  $R(x)$  of degree  $\leq 31$ .
- 89597 3. The coefficients of  $R(x)$  are considered to be a 32-bit sequence.
- 89598 4. The bit sequence is complemented and the result is the CRC.

89599 **OPTIONS**

89600 None.

89601 **OPERANDS**

89602 The following operand shall be supported:

89603 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard  
 89604 input shall be used.

89605 **STDIN**

89606 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 89607 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 89608 the standard input shall not be used. See the INPUT FILES section.

89609 **INPUT FILES**

89610 The input files can be any file type.

89611 **ENVIRONMENT VARIABLES**89612 The following environment variables shall affect the execution of *cksum*:

89613 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 89614 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 89615 variables used to determine the values of locale categories.)

89616 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 89617 internationalization variables.

89618 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 89619 characters (for example, single-byte as opposed to multi-byte characters in  
 89620 arguments).

89621 *LC\_MESSAGES*  
 89622 Determine the locale that should be used to affect the format and contents of  
 89623 diagnostic messages written to standard error.

89624 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

#### 89625 **ASYNCHRONOUS EVENTS**

89626 Default.

#### 89627 **STDOUT**

89628 For each file processed successfully, the *cksum* utility shall write in the following format:

89629 "%u %d %s\n", <checksum>, <# of octets>, <pathname>

89630 If no *file* operand was specified, the pathname and its leading <space> shall be omitted.

#### 89631 **STDERR**

89632 The standard error shall be used only for diagnostic messages.

#### 89633 **OUTPUT FILES**

89634 None.

#### 89635 **EXTENDED DESCRIPTION**

89636 None.

#### 89637 **EXIT STATUS**

89638 The following exit values shall be returned:

89639 0 All files were processed successfully.

89640 >0 An error occurred.

#### 89641 **CONSEQUENCES OF ERRORS**

89642 Default.

#### 89643 **APPLICATION USAGE**

89644 The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of  
 89645 the same, such as to ensure that files transmitted over noisy media arrive intact. However, this  
 89646 comparison cannot be considered cryptographically secure. This utility should be avoided  
 89647 whenever non-trivial requirements (including safety and security) have to be fulfilled.

89648 Although input files to *cksum* can be any type, the results need not be what would be expected  
 89649 on character special device files or on file types not described by the System Interfaces volume of  
 89650 POSIX.1-2024. Since this volume of POSIX.1-2024 does not specify the block size used when  
 89651 doing input, checksums of character special files need not process all of the data in those files.

89652 The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted  
 89653 between two systems and undergoes any data transformation (such as changing little-endian  
 89654 byte ordering to big-endian), identical CRC values cannot be expected. Implementations  
 89655 performing such transformations may extend *cksum* to handle such situations.

#### 89656 **EXAMPLES**

89657 None.

89658 **RATIONALE**

89659 The *cksum* utility is included in this standard for reasons of portability but is not suitable for uses  
 89660 where non-trivial requirements (including safety and security) have to be fulfilled.  
 89661 Implementations are encouraged to provide utilities that implement hash and integrity  
 89662 checksum algorithms of higher security and to keep up to date with developments in this area.

89663 The following C-language program can be used as a model to describe the algorithm. It assumes  
 89664 that a **char** is one octet. It also assumes that the entire file is available for one pass through the  
 89665 function. This was done for simplicity in demonstrating the algorithm, rather than as an  
 89666 implementation model.

89720     };

89721     unsigned long memcrc(const unsigned char *b, size_t n)
89722     {
89723     /* Input arguments:
89724     *   const unsigned char*  b == byte sequence to checksum
89725     *   size_t                n == length of sequence
89726     */

89727         register size_t i;
89728         register unsigned c, s = 0;

89729         for (i = n; i > 0; --i) {
89730             c = *b++;
89731             s = (s << 8) ^ crctab[(s >> 24) ^ c];
89732         }

89733         /* Extend with the length of the string. */
89734         while (n != 0) {
89735             c = n & 0377;
89736             n >>= 8;
89737             s = (s << 8) ^ crctab[(s >> 24) ^ c];
89738         }

89739         return ~s;
89740     }

```

89741 The historical practice of writing the number of “blocks” has been changed to writing the  
89742 number of octets, since the latter is not only more useful, but also since historical  
89743 implementations have not been consistent in defining what a “block” meant.

89744 The algorithm used was selected to increase the operational robustness of *cksum*. Neither the  
89745 System V nor BSD *sum* algorithm was selected. Since each of these was different and each was  
89746 the default behavior on those systems, no realistic compromise was available if either were  
89747 selected—some set of historical applications would break. Therefore, the name was changed to  
89748 *cksum*. Although the historical *sum* commands will probably continue to be provided for many  
89749 years, programs designed for portability across systems should use the new name.

89750 The algorithm selected is based on that used by the ISO/IEC 8802-3: 1996 standard (Ethernet) for  
89751 the frame check sequence field. The algorithm used does not match the technical definition of a  
89752 *checksum*; the term is used for historical reasons. The length of the file is included in the CRC  
89753 calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also  
89754 because it guards against inadvertent collisions between files that begin with different series of  
89755 zero octets. The chance that two different files produce identical CRCs is much greater when  
89756 their lengths are not considered. Keeping the length and the checksum of the file itself separate

89757 would yield a slightly more robust algorithm, but historical usage has always been that a single  
 89758 number (the checksum as printed) represents the signature of the file. It was decided that  
 89759 historical usage was the more important consideration.

89760 Early proposals contained modifications to the Ethernet algorithm that involved extracting table  
 89761 values whenever an intermediate result became zero. This was demonstrated to be less robust  
 89762 than the current method and mathematically difficult to describe or justify.

89763 The calculation used is identical to that given in pseudo-code in the referenced Sarwate article.  
 89764 The pseudo-code rendition is:

```
89765 X <- 0; Y <- 0;
89766 for i <- m -1 step -1 until 0 do
89767   begin
89768     T <- X(1) ^ A[i];
89769     X(1) <- X(0); X(0) <- Y(1); Y(1) <- Y(0); Y(0) <- 0;
89770     comment: f[T] and f'[T] denote the T-th words in the
89771             table f and f' ;
89772     X <- X ^ f[T]; Y <- Y ^ f'[T];
89773   end
```

89774 The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]**  
 89775 represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables  
 89776 **f** and **f'** are a single table containing 32-bit values.

89777 The referenced Sarwate article also discusses generating the table.

#### 89778 **FUTURE DIRECTIONS**

89779 If this utility is directed to display a pathname that contains any bytes that have the encoded  
 89780 value of a <newline> character when <newline> is a terminator or separator in the output  
 89781 format being used, implementations are encouraged to treat this as an error. A future version of  
 89782 this standard may require implementations to treat this as an error.

#### 89785 **CHANGE HISTORY**

89786 First released in Issue 4.

#### 89787 **Issue 7**

89788 Austin Group Interpretation 1003.1-2001 #092 is applied.

89789 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89790 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0081 [446] is applied.

#### 89791 **Issue 8**

89792 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
 89793 directed to display a pathname that contains any bytes that have the encoded value of a  
 89794 <newline> character when <newline> is a terminator or separator in the output format being  
 89795 used.

89796 Austin Group Defect 1041 is applied, changing the APPLICATION USAGE and RATIONALE  
 89797 sections.

89798 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89799 **NAME**

89800 cmp — compare two files

89801 **SYNOPSIS**89802 cmp [-l|-s] *file1 file2*89803 **DESCRIPTION**

89804 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the  
 89805 same. Under default options, if they differ, it shall write to standard output the byte and line  
 89806 number at which the first difference occurred. Bytes and lines shall be numbered beginning with  
 89807 1.

89808 **OPTIONS**89809 The *cmp* utility shall conform to XBD [Section 12.2](#) (on page 215).

89810 The following options shall be supported:

89811 **-l** (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for  
 89812 each difference.

89813 **-s** Write nothing to standard output or standard error when files differ; indicate  
 89814 differing files through exit status only. It is unspecified whether a diagnostic  
 89815 message is written to standard error when an error is encountered; if a message is  
 89816 not written, the error is indicated through exit status only.

89817 **OPERANDS**

89818 The following operands shall be supported:

89819 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 89820 be used.

89821 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 89822 shall be used.

89823 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or  
 89824 character special file, the results are undefined.

89825 **STDIN**

89826 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the  
 89827 INPUT FILES section.

89828 **INPUT FILES**

89829 The input files can be any file type.

89830 **ENVIRONMENT VARIABLES**89831 The following environment variables shall affect the execution of *cmp*:

89832 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 89833 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 89834 variables used to determine the values of locale categories.)

89835 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 89836 internationalization variables.

89837 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 89838 characters (for example, single-byte as opposed to multi-byte characters in  
 89839 arguments).

89840 **LC\_MESSAGES**

89841 Determine the locale that should be used to affect the format and contents of  
 89842 diagnostic messages written to standard error and informative messages written to

89843 standard output.

89844 XSI **NLSPATH** Determine the location of messages objects and message catalogs.

### 89845 ASYNCHRONOUS EVENTS

89846 Default.

### 89847 STDOUT

89848 In the POSIX locale, results of the comparison shall be written to standard output. When no  
89849 options are used, the format shall be:

89850 "%s %s differ: char %d, line %d\n", *file1*, *file2*,  
89851 <byte number>, <line number>

89852 When the `-l` option is used, the format shall be:

89853 "%d %o %o\n", <byte number>, <differing byte>,  
89854 <differing byte>

89855 for each byte that differs. The first <differing byte> number is from *file1* while the second is from  
89856 *file2*. In both cases, <byte number> shall be relative to the beginning of the file, beginning with 1.

89857 No output shall be written to standard output when the `-s` option is used.

### 89858 STDERR

89859 The standard error shall be used only for diagnostic messages. If the `-l` option is used and *file1*  
89860 and *file2* differ in length, or if the `-s` option is not used and *file1* and *file2* are identical for the  
89861 entire length of the shorter file, in the POSIX locale the following diagnostic message shall be  
89862 written:

89863 "cmp: EOF on %s%s\n", <name of shorter file>, <additional info>

89864 The <additional info> field shall either be null or a string that starts with a <blank> and contains  
89865 no <newline> characters. Some implementations report on the number of lines in this case.

89866 If the `-s` option is used and an error occurs, it is unspecified whether a diagnostic message is  
89867 written to standard error.

### 89868 OUTPUT FILES

89869 None.

### 89870 EXTENDED DESCRIPTION

89871 None.

### 89872 EXIT STATUS

89873 The following exit values shall be returned:

89874 0 The files are identical.

89875 1 The files are different; this includes the case where one file is identical to the first part of the  
89876 other.

89877 >1 An error occurred.

### 89878 CONSEQUENCES OF ERRORS

89879 Default.

89880 **APPLICATION USAGE**

89881 Although input files to *cmp* can be any type, the results might not be what would be expected on  
 89882 character special device files or on file types not described by the System Interfaces volume of  
 89883 POSIX.1-2024. Since this volume of POSIX.1-2024 does not specify the block size used when  
 89884 doing input, comparisons of character special files need not compare all of the data in those files.

89885 For files which are not text files, line numbers simply reflect the presence of a <newline>,  
 89886 without any implication that the file is organized into lines.

89887 Since the behavior of `-s` differs between implementations as to whether error messages are  
 89888 written, the only way to ensure consistent behavior of *cmp* when `-s` is used is to redirect  
 89889 standard error to `/dev/null`.

89890 If error messages are wanted, instead of using `-s` standard output should be redirected to  
 89891 `/dev/null`, and anything written to standard error should be discarded if the exit status is 1. For  
 89892 example:

```
89893 silent_cmp() {
89894     # compare files with no output except error messages
89895     message=$(cmp "$@" 2>&1 >/dev/null)
89896     status=$?
89897     case $status in
89898         (0|1) ;;
89899         (*) printf '%s\n' "$message" ;;
89900     esac
89901     return $status
89902 }
```

89903 **EXAMPLES**

89904 None.

89905 **RATIONALE**

89906 The global language in [Section 1.4](#) (on page 2462) indicates that using two mutually-exclusive  
 89907 options together produces unspecified results. Some System V implementations consider the  
 89908 option usage:

```
89909 cmp -l -s ...
```

89910 to be an error. They also treat:

```
89911 cmp -s -l ...
```

89912 as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

89913 The word **char** in the standard output format comes from historical usage, even though it is  
 89914 actually a byte number. When *cmp* is supported in other locales, implementations are  
 89915 encouraged to use the word *byte* or its equivalent in another language. Users should not  
 89916 interpret this difference to indicate that the functionality of the utility changed between locales.

89917 Some implementations report on the number of lines in the identical-but-shorter file case. This is  
 89918 allowed by the inclusion of the <additional info> fields in the output format. The restriction on  
 89919 having a leading <blank> and no <newline> characters is to make parsing for the filename  
 89920 easier. It is recognized that some filenames containing white-space characters make parsing  
 89921 difficult anyway, but the restriction does aid programs used on systems where the names are  
 89922 predominantly well behaved.

**89923 FUTURE DIRECTIONS**

89924 If this utility is directed to display a pathname that contains any bytes that have the encoded  
89925 value of a <newline> character when <newline> is a terminator or separator in the output  
89926 format being used, implementations are encouraged to treat this as an error. A future version of  
89927 this standard may require implementations to treat this as an error.

89928 Future versions of this standard may require that diagnostic messages are written to standard  
89929 error when the `-s` option is specified.

89932 XBD Chapter 8 (on page 167), Section 12.2 (on page 215)

**89933 CHANGE HISTORY**

89934 First released in Issue 2.

**89935 Issue 7**

89936 SD5-XCU-ERN-96 is applied, updating the STDERR section.

89937 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89938 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0075 [478] is applied.

**89939 Issue 8**

89940 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
89941 directed to display a pathname that contains any bytes that have the encoded value of a  
89942 <newline> character when <newline> is a terminator or separator in the output format being  
89943 used.

89944 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

89945 **NAME**

89946 comm — select or reject lines common to two files

89947 **SYNOPSIS**89948 comm [-123] *file1 file2*89949 **DESCRIPTION**89950 The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating  
89951 sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and  
89952 lines in both files.89953 If the lines in both files are not ordered according to the collating sequence of the current locale,  
89954 the results are unspecified.89955 If the collating sequence of the current locale does not have a total ordering of all characters (see  
89956 XBD [Section 7.3.2](#), on page 139) and any lines from the input files collate equally but are not  
89957 identical, *comm* shall treat them as different lines and shall expect them to be ordered according  
89958 to a further byte-by-byte comparison using the collating sequence for the POSIX locale; if they  
89959 are not ordered in this way, the output of *comm* can identify such lines as being both unique to  
89960 *file1* and unique to *file2* instead of being in both files.89961 **OPTIONS**89962 The *comm* utility shall conform to XBD [Section 12.2](#) (on page 215).

89963 The following options shall be supported:

- 89964 -1 Suppress the output column of lines unique to *file1*.
- 89965 -2 Suppress the output column of lines unique to *file2*.
- 89966 -3 Suppress the output column of lines duplicated in *file1* and *file2*.

89967 **OPERANDS**

89968 The following operands shall be supported:

89969 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
89970 be used.89971 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
89972 shall be used.89973 If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or  
89974 character special file, the results are undefined.89975 **STDIN**89976 The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input.  
89977 See the INPUT FILES section.89978 **INPUT FILES**

89979 The input files shall be text files.

89980 **ENVIRONMENT VARIABLES**89981 The following environment variables shall affect the execution of *comm*:89982 *LANG* Provide a default value for the internationalization variables that are unset or null.  
89983 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
89984 variables used to determine the values of locale categories.)89985 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
89986 internationalization variables.

- 89987 **LC\_COLLATE**
- 89988 Determine the locale for the collating sequence *comm* expects to have been used
- 89989 when the input files were sorted.
- 89990 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
- 89991 characters (for example, single-byte as opposed to multi-byte characters in
- 89992 arguments and input files).
- 89993 **LC\_MESSAGES**
- 89994 Determine the locale that should be used to affect the format and contents of
- 89995 diagnostic messages written to standard error.
- 89996 XSI **NLSPATH** Determine the location of messages objects and message catalogs.
- 89997 **ASYNCHRONOUS EVENTS**
- 89998 Default.
- 89999 **STDOUT**
- 90000 The *comm* utility shall produce output depending on the options selected. If the **-1**, **-2**, and **-3**
- 90001 options are all selected, *comm* shall write nothing to standard output.
- 90002 If the **-1** option is not selected, lines contained only in *file1* shall be written using the format:
- 90003 "%s\n", <line in file1>
- 90004 If the **-2** option is not selected, lines contained only in *file2* are written using the format:
- 90005 "%s%s\n", <lead>, <line in file2>
- 90006 where the string <lead> is as follows:
- 90007 <tab> The **-1** option is not selected.
- 90008 null string The **-1** option is selected.
- 90009 If the **-3** option is not selected, lines contained in both files shall be written using the format:
- 90010 "%s%s\n", <lead>, <line in both>
- 90011 where the string <lead> is as follows:
- 90012 <tab><tab> Neither the **-1** nor the **-2** option is selected.
- 90013 <tab> Exactly one of the **-1** and **-2** options is selected.
- 90014 null string Both the **-1** and **-2** options are selected.
- 90015 If the input files were ordered according to the collating sequence of the current locale, the lines
- 90016 written shall be in the collating sequence of the current locale. If the input files contained any
- 90017 lines that collated equally but were not identical and within each file those lines were ordered
- 90018 according to a further byte-by-byte comparison using the collating sequence for the POSIX
- 90019 locale, then lines written that collate equally but are not identical shall be ordered according to a
- 90020 further byte-by-byte comparison using the collating sequence for the POSIX locale.
- 90021 **STDERR**
- 90022 The standard error shall be used only for diagnostic messages.
- 90023 **OUTPUT FILES**
- 90024 None.

90025 **EXTENDED DESCRIPTION**

90026 None.

90027 **EXIT STATUS**

90028 The following exit values shall be returned:

90029 0 All input files were successfully output as specified.

90030 &gt;0 An error occurred.

90031 **CONSEQUENCES OF ERRORS**

90032 Default.

90033 **APPLICATION USAGE**90034 If the input files are not properly presorted, the output of *comm* might not be useful.

90035 When using *comm* to process pathnames, it is recommended that *LC\_ALL*, or at least *LC\_CTYPE*  
 90036 and *LC\_COLLATE*, are set to *POSIX* or *C* in the environment, since pathnames can contain byte  
 90037 sequences that do not form valid characters in some locales, in which case the utility's behavior  
 90038 would be undefined. In the *POSIX* locale each byte is a valid single-byte character, and therefore  
 90039 this problem is avoided.

90040 If the collating sequence of the current locale does not have a total ordering of all characters,  
 90041 since *comm* treats lines as being the same only if they are identical, some lines can be  
 90042 misleadingly identified as being both unique to *file1* and unique to *file2* if lines that collate  
 90043 equally but are not identical are not ordered in the way that *comm* expects. If the input does not  
 90044 come from utilities (such as *ls* and *sort*) which provide this ordering, the problem can be avoided  
 90045 by pre-sorting the input files using *sort*.

90046 **EXAMPLES**

90047 If a file named *xcu* contains a sorted list of the utilities in this volume of *POSIX.1-2024*, a file  
 90048 named *xpg3* contains a sorted list of the utilities specified in the *X/Open Portability Guide, Issue*  
 90049 *3*, and a file named *svid89* contains a sorted list of the utilities in the *System V Interface*  
 90050 *Definition Third Edition*:

90051 `comm -23 xcu xpg3 | comm -23 - svid89`

90052 would print a list of utilities in this volume of *POSIX.1-2024* not specified by either of the other  
 90053 documents:

90054 `comm -12 xcu xpg3 | comm -12 - svid89`

90055 would print a list of utilities specified by all three documents, and:

90056 `comm -12 xpg3 svid89 | comm -23 - xcu`

90057 would print a list of utilities specified by both *XPG3* and the *SVID*, but not specified in this  
 90058 volume of *POSIX.1-2024*.

90059 **RATIONALE**

90060 None.

90061 **FUTURE DIRECTIONS**

90062 None.

90063 **SEE ALSO**90064 *cmp*, *diff*, *sort*, *uniq*90065 [XBD Section 7.3.2](#) (on page 139), [Chapter 8](#) (on page 167), [Section 12.2](#) (on page 215)

90066 **CHANGE HISTORY**

90067 First released in Issue 2.

90068 **Issue 6**

90069 The normative text is reworded to avoid use of the term “must” for application requirements.

90070 **Issue 7**90071 POSIX.1-2008, Technical Corrigendum 2, XCU/TC2-2008/0076 [963], XCU/TC2-2008/0077  
90072 [663], and XCU/TC2-2008/0078 [963] are applied.90073 **Issue 8**90074 Austin Group Defect 1070 is applied, changing the requirements when any lines from the input  
90075 files collate equally but are not identical.90076 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

90077 **NAME**

90078            command — execute a simple command

90079 **SYNOPSIS**90080            command [-p] *command\_name* [*argument...*]90081            command [-p] [-v|-V] *command\_name*90082 **DESCRIPTION**90083            The *command* utility shall cause the shell to treat the arguments as a simple command, suppressing the shell function lookup that is described in [Section 2.9.1.4](#) (on page 2502), item 1c.90085            If the *command\_name* is the same as the name of one of the special built-in utilities, the special properties in the enumerated list at the beginning of [Section 2.15](#) (on page 2526) shall not occur. In every other respect, if *command\_name* is not the name of a function, the effect of *command* (with no options) shall be the same as omitting *command*, except that *command\_name* does not appear in the command word position in the *command* command, and consequently is not subject to alias substitution (see [Section 2.3.1](#), on page 2477) nor recognized as a reserved word (see [Section 2.4](#), on page 2478).90092            When the *-v* or *-V* option is used, the *command* utility shall provide information concerning how a command name is interpreted by the shell.90094            The *command* utility shall be treated as a declaration utility if the first argument passed to the utility is recognized as a declaration utility. In this case, subsequent words of the form *name=word* shall be expanded in an assignment context. See [Section 2.9.1.1](#) (on page 2500).90097 **OPTIONS**90098            The *command* utility shall conform to XBD [Section 12.2](#) (on page 215).

90099            The following options shall be supported:

90100            **-p**            Perform the command search using a default value for *PATH* that is guaranteed to find all of the standard utilities.90102            **-v**            Write a string to standard output that indicates the pathname or command that will be used by the shell, in the current shell execution environment (see [Section 2.13](#), on page 2522), to invoke *command\_name*, but do not invoke *command\_name*.90105                        • Executable utilities, regular built-in utilities, *command\_names* including a <slash> character, and any implementation-provided functions that are found using the *PATH* variable (as described in [Section 2.9.1.4](#), on page 2502), shall be written as absolute pathnames.90109                        • Shell functions, special built-in utilities, regular built-in utilities not associated with a *PATH* search, and shell reserved words shall be written as just their names.

90112                        • An alias shall be written as a command line that represents its alias definition.

90114                        • Otherwise, no output shall be written and the exit status shall reflect that the name was not found.

90116            **-V**            Write a string to standard output that indicates how the name given in the *command\_name* operand will be interpreted by the shell, in the current shell execution environment (see [Section 2.13](#), on page 2522), but do not invoke *command\_name*. Although the format of this string is unspecified, it shall indicate in which of the following categories *command\_name* falls and shall include the information stated:

- 90122 • Executable utilities, regular built-in utilities, and any implementation-
- 90123 provided functions that are found using the *PATH* variable (as described in
- 90124 [Section 2.9.1.4](#), on page 2502), shall be identified as such and include the
- 90125 absolute pathname in the string.
- 90126 • Other shell functions shall be identified as functions.
- 90127 • Aliases shall be identified as aliases and their definitions included in the
- 90128 string.
- 90129 • Special built-in utilities shall be identified as special built-in utilities.
- 90130 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 90131 as regular built-in utilities. (The term “regular” need not be used.)
- 90132 • Shell reserved words shall be identified as reserved words.

### 90133 OPERANDS

90134 The following operands shall be supported:

90135 *argument* One of the strings treated as an argument to *command\_name*.

90136 *command\_name*

90137 The name of a utility or a special built-in utility.

### 90138 STDIN

90139 Not used.

### 90140 INPUT FILES

90141 None.

### 90142 ENVIRONMENT VARIABLES

90143 The following environment variables shall affect the execution of *command*:

90144 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 90145 (See XBD [Section 8.2](#) (on page 169) for the precedence of internationalization  
 90146 variables used to determine the values of locale categories.)

90147 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 90148 internationalization variables.

90149 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 90150 characters (for example, single-byte as opposed to multi-byte characters in  
 90151 arguments).

90152 *LC\_MESSAGES*

90153 Determine the locale that should be used to affect the format and contents of  
 90154 diagnostic messages written to standard error and informative messages written to  
 90155 standard output.

90156 XSI *NLSPATH* Determine the location of messages objects and message catalogs.

90157 *PATH* Determine the search path used during the command search described in [Section](#)  
 90158 [2.9.1.4](#) (on page 2502), except as described under the *-p* option.

### 90159 ASYNCHRONOUS EVENTS

90160 Default.

90161 **STDOUT**

90162 When the `-v` option is specified, standard output shall be formatted as:

90163 `"%s\n", <pathname or command>`

90164 When the `-V` option is specified, standard output shall be formatted as:

90165 `"%s\n", <unspecified>`

90166 **STDERR**

90167 The standard error shall be used only for diagnostic messages.

90168 **OUTPUT FILES**

90169 None.

90170 **EXTENDED DESCRIPTION**

90171 None.

90172 **EXIT STATUS**

90173 When the `-v` or `-V` options are specified, the following exit values shall be returned:

90174 0 Successful completion.

90175 >0 The *command\_name* could not be found or an error occurred.

90176 Otherwise, the following exit values shall be returned:

90177 126 The utility specified by *command\_name* was found but could not be invoked.

90178 127 An error occurred in the *command* utility or the utility specified by *command\_name* could not  
90179 be found.

90180 Otherwise, the exit status of *command* shall be that of the simple command specified by the  
90181 arguments to *command*.

90182 **CONSEQUENCES OF ERRORS**

90183 Default.

90184 **APPLICATION USAGE**

90185 This utility is required to be intrinsic. See [Section 1.7](#) (on page 2470) for details.

90186 The order for command search allows functions to override regular built-ins and path searches.  
90187 This utility is necessary to allow functions that have the same name as a utility to call the utility  
90188 (instead of a recursive call to the function).

90189 The system default path is available using *getconf*; however, since *getconf* may need to have the  
90190 *PATH* set up before it can be called itself, the following can be used:

90191 `command -p getconf PATH`

90192 There are some advantages to suppressing the special characteristics of special built-ins on  
90193 occasion. For example:

90194 `command exec > unwritable-file`

90195 does not cause a non-interactive script to abort, so that the output status can be checked by the  
90196 script.

90197 The *command*, *env*, *nohup*, *time*, *timeout*, and *xargs* utilities have been specified to use exit code 127  
90198 if a utility to be invoked cannot be found, so that applications can distinguish “failure to find a  
90199 utility” from “invoked utility exited with an error indication”. However, the *command* and *nohup*  
90200 utilities also use exit code 127 when an error occurs in those utilities, which means exit code 127  
90201 is not universally a “not found” indicator. The value 127 was chosen because it is not commonly

90202 used for other meanings; most utilities use small values for “normal error conditions” and the  
 90203 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 90204 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 90205 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 90206 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 90207 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 90208 any other reason.

90209 Since the *-v* and *-V* options of *command* produce output in relation to the current shell execution  
 90210 environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell  
 90211 or separate utility execution environment, such as one of the following:

```
90212 (PATH=foo command -v)
90213 nohup command -v
```

90214 it does not necessarily produce correct results. For example, when called with *nohup* or an *exec*  
 90215 function, in a separate utility execution environment, most implementations are not able to  
 90216 identify aliases, functions, or special built-ins.

90217 Two types of regular built-ins could be encountered on a system and these are described  
 90218 separately by *command*. The description of command search in [Section 2.9.1.4](#) (on page 2502)  
 90219 allows for a standard utility to be implemented as a regular built-in as long as it is found in the  
 90220 appropriate place in a *PATH* search. So, for example, *command -v true* might yield */bin/true* or  
 90221 some similar pathname. Other implementation-defined utilities that are not defined by this  
 90222 volume of POSIX.1-2024 might exist only as built-ins and have no pathname associated with  
 90223 them. These produce output identified as (regular) built-ins. Applications encountering these are  
 90224 not able to count on *execing* them, using them with *nohup*, overriding them with a different  
 90225 *PATH*, and so on.

90226 The *command* utility takes on the expansion behavior of the command that it is wrapping.  
 90227 Therefore, in

```
90228 command command export a=~
```

90229 *command* is recognized as a declaration utility, and the command sets the variable *a* to the value  
 90230 of *\$HOME* because it performs tilde-expansion of an assignment context; while

```
90231 command echo a=~
```

90232 outputs the literal string "a=~" because regular expansion can only perform tilde-expansion at  
 90233 the beginning of the word. However, the shell need only perform lexical analysis of the next  
 90234 argument when deciding if *command* should be treated as a declaration utility; therefore, with:

```
90235 var=export; command $var a=~
```

90236 and

```
90237 command -- export a=~
```

90238 it is unspecified whether the word *a=~* is handled in an assignment context or as a regular  
 90239 expansion.

## 90240 EXAMPLES

90241 1. Make a version of *cd* that always prints out the new working directory exactly once:

```
90242 cd() {
90243     command cd "$@" >/dev/null
90244     pwd
90245 }
```

90246 2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

```
90247 IFS='
90248 '
90249 # The preceding value should be <space><tab><newline>.
90250 # Set IFS to its default value.
90251
90252 \unalias -a
90253 # Unset all possible aliases.
90254 # Note that unalias is escaped to prevent an alias
90255 # being used for unalias.
90256
90257 unset -f command
90258 # Ensure command is not a user function.
90259
90260 PATH="$ (command -p getconf PATH) :$PATH"
90261 # Put on a reliable PATH prefix.
90262
90263 # ...
```

90260 At this point, given correct permissions on the directories called by *PATH*, the script has  
 90261 the ability to ensure that any utility it calls is the intended one. It is being very cautious  
 90262 because it assumes that implementation extensions may be present that would allow user  
 90263 functions to exist when it is invoked; this capability is not specified by this volume of  
 90264 POSIX.1-2024, but it is not prohibited as an extension. For example, the *ENV* variable  
 90265 precedes the invocation of the script with a user start-up script. Such a script could define  
 90266 functions to spoof the application.

## 90267 RATIONALE

90268 Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

90269 There is nothing in the description of *command* that implies the command line is parsed any  
 90270 differently from that of any other simple command. For example:

```
90271 command a | b ; c
```

90272 is not parsed in any special way that causes ' | ' or ' ; ' to be treated other than a pipe operator  
 90273 or <semicolon> or that prevents function lookup on **b** or **c**. However, some implementations  
 90274 extend the shell’s assignment syntax, for example to allow an array to be populated with a single  
 90275 assignment, and in order for such an extension to be usable in assignments specified as  
 90276 arguments to *export* and *readonly* these shells have those utility names as separate tokens in their  
 90277 grammar. When *command* is used to execute these utilities it also needs to be a separate token in  
 90278 the grammar so that the same extended assignment syntax can still be recognized in this case.  
 90279 This standard only permits an extension of this nature when the input to the shell would contain  
 90280 a syntax error according to the standard grammar, and therefore it cannot affect how ' | ' and  
 90281 ' ; ' are parsed in the example above. Note that although *command* can be a separate token in the  
 90282 shell’s grammar, it cannot be a reserved word since *command* is a candidate for alias substitution  
 90283 whereas reserved words are not (see [Section 2.3.1](#)).

90284 The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since  
 90285 *command* also goes to the file system to search for utilities, the name *builtin* would not be  
 90286 intuitive.

90287 The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special  
 90288 built-in for the following reasons:

90289 • The removal of exportable functions made the special precedence of a special built-in  
90290 unnecessary.

90291 • A special built-in has special properties (see [Section 2.15](#), on page 2526) that were  
90292 inappropriate for invoking other utilities. For example, two commands such as:

90293 `date > unwritable-file`

90294 `command date > unwritable-file`

90295 would have entirely different results; in a non-interactive script, the former would  
90296 continue to execute the next command, the latter would abort. Introducing this semantic  
90297 difference along with suppressing functions was seen to be non-intuitive.

90298 The `-p` option is present because it is useful to be able to ensure a safe path search that finds all  
90299 the standard utilities. This search might not be identical to the one that occurs through one of the  
90300 `exec` functions (as defined in the System Interfaces volume of POSIX.1-2024) when `PATH` is unset.  
90301 At the very least, this feature is required to allow the script to access the correct version of `getconf`  
90302 so that the value of the default path can be accurately retrieved.

90303 The `command -v` and `-V` options were added to satisfy requirements from users that are  
90304 currently accomplished by three different historical utilities: `type` in the System V shell, `whence` in  
90305 the KornShell, and `which` in the C shell. Since there is no historical agreement on how and what  
90306 to accomplish here, the POSIX `command` utility was enhanced and the historical utilities were left  
90307 unmodified. The C shell `which` merely conducts a path search. The KornShell `whence` is more  
90308 elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases,  
90309 exported aliases, and undefined functions.

90310 The output format of `-V` was left mostly unspecified because human users are its only audience.  
90311 Applications should not be written to care about this information; they can use the output of `-v`  
90312 to differentiate between various types of commands, but the additional information that may be  
90313 emitted by the more verbose `-V` is not needed and should not be arbitrarily constrained in its  
90314 verbosity or localization for application parsing reasons.

#### 90315 **FUTURE DIRECTIONS**

90316 If this utility is directed to display a pathname that contains any bytes that have the encoded  
90317 value of a `<newline>` character when `<newline>` is a terminator or separator in the output  
90318 format being used, implementations are encouraged to treat this as an error. A future version of  
90319 this standard may require implementations to treat this as an error.

#### 90325 **CHANGE HISTORY**

90326 First released in Issue 4.

#### 90327 **Issue 7**

90328 Austin Group Interpretation 1003.1-2001 #196 is applied, changing the SYNOPSIS to allow `-p` to  
90329 be used with `-v` (or `-V`).

90330 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90331 The `command` utility is moved from the User Portability Utilities option to the Base. User  
90332 Portability Utilities is now an option for interactive utilities.

90333 The APPLICATION USAGE and EXAMPLES are revised to replace the non-standard  
90334 *getconf\_CS\_PATH* with *getconf PATH*.

90335 **Issue 8**

90336 Austin Group Defect 251 is applied, encouraging implementations to report an error if a utility is  
90337 directed to display a pathname that contains any bytes that have the encoded value of a  
90338 <newline> character when <newline> is a terminator or separator in the output format being  
90339 used.

90340 Austin Group Defects 351 and 1393 are applied, requiring *command* to be a declaration utility if  
90341 the first argument passed to the utility is recognized as a declaration utility.

90342 Austin Group Defect 854 is applied, adding a note to the APPLICATION USAGE section that  
90343 this utility is required to be intrinsic.

90344 Austin Group Defect 1117 is applied, changing “implementation-defined” to “implementation-  
90345 provided”.

90346 Austin Group Defect 1122 is applied, changing the description of *NLSPATH*.

90347 Austin Group Defect 1161 is applied, changing “Utilities” to “Executable utilities” in the  
90348 descriptions of the *-v* and *-V* options.

90349 Austin Group Defect 1431 is applied, changing “item 1b” to “item 1c”.

90350 Austin Group Defect 1586 is applied, adding the *timeout* utility.

90351 Austin Group Defect 1594 is applied, changing the APPLICATION USAGE section.

90352 Austin Group Defect 1637 is applied, clarifying that (when no options are specified)  
90353 *command\_name* is not subject to alias substitution nor recognized as a reserved word.

90354 **NAME**

90355 compress, uncompress, zcat — compress and decompress data

90356 **SYNOPSIS**

```

90357 XSI compress [-fv] [-b value] [-g | -m algo] [file...]
90358 compress -c [-fv] [-b value] [-g | -m algo] [file]
90359 compress -d [-cfv] [file...]
90360 uncompress [-cfv] [file...]
90361 zcat [file...]

```

90362 **DESCRIPTION**

90363 The *compress* utility, when the **-d** option is not specified, shall apply the compression algorithm  
 90364 identified by the **-g** option or the **-m algo** option to the named files to attempt to reduce their  
 90365 size without loss of information. The *compress* utility with the **-d** option shall apply the  
 90366 appropriate decompression algorithm to the named files to restore the data to their original  
 90367 state.

90368 The *uncompress* utility shall be equivalent to *compress -d*. The *zcat* utility shall be equivalent to  
 90369 *compress -c -d*. If multiple *file* operands are specified, the decompressed data from each input  
 90370 file shall be concatenated to standard output.

90371 When compressing data, unless the **-c** option is specified, after an input file other than standard  
 90372 input has been compressed, the compressed data from the input file shall be stored in a file with  
 90373 the same pathname as the input file but with an added suffix. The added suffix shall be the  
 90374 suffix associated with the algorithm (see the algorithms in Table 3-7, on page 2737). If  
 90375 appending the suffix would make the size of the last component of the output file's pathname  
 90376 exceed {NAME\_MAX} bytes, the command shall fail. If appending the suffix would make the  
 90377 size of the pathname exceed {PATH\_MAX} bytes, the command may fail.

90378 When decompressing data, unless the **-c** option is specified, after an input file other than  
 90379 standard input has been decompressed, the decompressed data from the input file shall be  
 90380 stored in a file with the same pathname as the input file but with the suffix associated with the  
 90381 **OB** algorithm removed. If *file* has no suffix associated with a known compression algorithm or *file*  
 90382 does not exist and does not have a **.Z** suffix, *file* shall be used as the name of the output file, and  
 90383 the default suffix **.Z** shall be appended to *file* to form the input pathname. The behavior is  
 90384 unspecified if the input pathname ends with a suffix other than the suffix associated with the  
 90385 algorithm used to compress the data. When the **-c** option is specified, *file* can have any suffix, or  
 90386 no suffix, and the utility shall use *file* as the input file and examine the file's contents to  
 90387 determine which algorithm to use to decompress the data (it is not an error if *file* does not have a  
 90388 suffix that matches the suffix associated with the compression algorithm).

90389 When compressing or decompressing a file other than standard input and the **-c** option is not  
 90390 specified, if the invoking process has sufficient privilege, the ownership, modes, access time, and  
 90391 modification time of the output file shall match the ownership, modes, access time, and  
 90392 modification time of the input file. After the output file has been successfully created, the input  
 90393 file shall be removed if the invoking process has sufficient privileges. If the invoking process  
 90394 does not have sufficient privileges to remove the input file (for example, if the directory has the  
 90395 S\_ISVTX bit set) the behavior depends on whether the **-f** option is specified: if **-f** is not  
 90396 specified, the output file shall be removed, a diagnostic message shall be written and the utility  
 90397 shall continue processing other files but the final exit status shall be non-zero; if **-f** is specified,  
 90398 the output file shall not be removed and it is unspecified whether the inability to remove the  
 90399 input file is treated as an error. If it is not treated as an error, a warning message may be written

90400 to standard error

90401 If no *file* operands are specified, standard input shall be compressed or decompressed to  
90402 standard output.

90403 OB If an input file that is to be removed after processing has multiple hard links, the *compress* and  
90404 *uncompress* utilities may write a diagnostic message to standard error and do nothing with the  
90405 file; this behavior may depend on whether the *-f* option is specified. If a diagnostic message is  
90406 written, the final exit status shall be non-zero.

#### 90407 OPTIONS

90408 The *compress*, *uncompress*, and *zcat* utilities shall conform to XBD [Section 12.2](#) (on page 215),  
90409 except that Guideline 1 does not apply to *uncompress* since the utility name has ten letters.

90410 The following options shall be supported:

90411 **-b** *value* If the compression algorithm is LZW, *value* specifies the maximum number of bits  
90412 to use in a code. For a conforming application, the *value* argument shall be:

90413  $9 \leq \textit{value} \leq 16$

90414 The implementation may allow values of greater than 16. The default shall be 14,  
90415 15, or 16.

90416 If the compression algorithm is DEFLATE, *value* specifies the compression level.  
90417 For a conforming application, the *value* argument shall be:

90418  $1 \leq \textit{value} \leq 9$

90419 The default shall be 6.

90420 For other algorithms, *value* specifies implementation-defined tuning.

90421 **-c** Write to standard output; the input files shall not be changed, and no output files  
90422 shall be created.

90423 **-d** Decompress files. When invoked with the *-d* option, the *compress* utility shall  
90424 restore previously compressed files to their original state.

90425 **-f** Force compression or decompression of file, even if it does not (for compression)  
90426 actually reduce the size of the file, or if the corresponding output file already  
90427 exists. If the *-f* option is not given and the standard input is a terminal, the user  
90428 shall be prompted as to whether an existing output file should be overwritten. If  
90429 the response is affirmative, the existing file shall be overwritten. If the standard  
90430 input is not a terminal and *-f* is not given, *compress* or *uncompress* shall write a  
90431 diagnostic message to standard error, the existing file shall not be overwritten, and  
90432 the utility shall exit with a status greater than zero. If the *-f* option is specified and  
90433 an input file other than standard input has multiple hard links, it is  
90434 implementation-defined whether the input file is unlinked after the corresponding  
90435 output file is successfully written, or if processing of that file is skipped and a  
90436 diagnostic message is written to standard error.

90437 **-g** Equivalent to *-m gzip*.

90438 **-m** *algo* Use the algorithm defined by *algo* to compress the files. The following algorithms  
90439 shall be supported:

90440 **Table 3-7** Compression algorithms, **-m** option-argument values, and suffixes

Algorithm	<i>algo</i>	Filename Suffix
Adaptive LZW	<b>lzw</b>	<b>.Z</b>
RFC1951 DEFLATE	<b>deflate</b>	<b>.gz</b>
Synonym for DEFLATE	<b>gzip</b>	<b>.gz</b>

90445 Other implementation-defined algorithms may be supported.

90446 If neither of the **-m algo** and **-g** options is specified, **lzw** shall be used as a default  
 90447 *algo* value. Specifying more than one of the mutually exclusive **-g** and **-m algo**  
 90448 options, or multiple **-m algo** options, shall not be considered an error. The last  
 90449 option specified shall determine the behavior of the utility.

90450 On systems not supporting the selected algorithm, the input files shall not be  
 90451 changed and an exit status greater than two shall be returned.

90452 **Note:** The Lempel-Ziv compression algorithm is described in the now-expired US  
 90453 Patent 4464650, which was issued to William Eastman, Abraham Lempel, Jacob  
 90454 Ziv, and Martin Cohn on August 7th, 1984 and assigned to Sperry Corporation.

90455 The Lempel-Ziv-Welch compression algorithm is described in the now-expired  
 90456 US Patent 4558302, which was issued to Terry A. Welch on December 10th, 1985  
 90457 and assigned to Sperry Corporation.

90458 **-v** For *compress*, write the percentage reduction of each file to standard error. For  
 90459 *uncompress*, write messages to standard error concerning the expansion of each file.

## 90460 OPERANDS

90461 The following operand shall be supported:

90462 *file* A pathname of a file to be compressed or decompressed. If a *file* is '-', the utility  
 90463 shall read from standard input at that point in the sequence and write to standard  
 90464 output. If more than one *file* operand is '-', the behavior is unspecified.

## 90465 STDIN

90466 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

## 90467 INPUT FILES

90468 If *file* operands are specified, the corresponding input files contain the data to be compressed or  
 90469 decompressed.

## 90470 ENVIRONMENT VARIABLES

90471 The following environment variables shall affect the execution of *compress*:

90472 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 90473 (See XBD Section 8.2 (on page 169) for the precedence of internationalization  
 90474 variables used to determine the values of locale categories.)

90475 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 90476 internationalization variables.

90477 *LC\_COLLATE*

90478 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 90479 character collating elements used in the extended regular expression defined for  
 90480 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

90481 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 90482 characters (for example, single-byte as opposed to multi-byte characters in  
 90483 arguments), the behavior of character classes used in the extended regular  
 90484 expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

90485 *LC\_MESSAGES*  
 90486 Determine the locale used to process affirmative responses, and the locale used to  
 90487 affect the format and contents of diagnostic messages, prompts, and the output
